1. INTRODUCTION

Ramboll Americas Engineering Solutions, Inc. (Ramboll) was retained to prepare a Technical Report on the air quality (AQ), greenhouse gas (GHG), and energy impacts for potential future development in the North Site Remainder Area ("Remainder Area Development"), in addition to the AQ, GHG, and Energy technical reports for the proposed El Dorado Hills (EDH) Costco Project located north of the Silva Valley Parkway/US 50 interchange in the El Dorado Hills community area of the unincorporated El Dorado County in California. For simplicity, the North Site Remainder Area and the proposed EDH Costco Project are collectively referred to hereafter as the proposed Project.

This Technical Report analyzes the AQ, GHG, and energy impacts of the potential Remainder Area Development at a program/plan level. Specifically, it describes the maximum development assumptions for the Remainder Area Development and estimates criteria air pollutant emissions, GHG emissions, and energy use associated with the construction and operations of this development. Additionally, this report evaluates the potential aggregate AQ, GHG, and energy impacts of the proposed Project (both the North Site Remainder Area and the EDH Costco Project).

1.1 Existing Conditions

The Project site is currently vacant grassland with scattered oak trees and seasonal drainage features. There are no permanent structures on the site. The southern edge of the property directly abuts the US 50 right-of-way, while the western boundary is adjacent to Clarksville Crossing. An approximate 7.75-acre portion of the northern site is reserved for a planned future extension of Country Club Drive, which is not part of the proposed Project.

Surrounding land uses include:

- North: Single-family residential uses and Oak Meadow Elementary School
- East: Vacant land, Tong Road, and single-family residential uses
- South: U.S. Highway 50 and Tong Road
- West: Clarksville Crossing roadway, open space, and undeveloped land

1.2 Potential Development in the North Site Remainder Area

An approximately 13.79-acre out-parcel on the North Site would remain undeveloped at this time (North Site Remainder Area). The EDH Costco Project proposes no development for the North Site Remainder Area. However, future development of the North Site Remainder Area would be made more reasonably foreseeable by the proposed annexation of the entire North Site into the El Dorado Irrigation District and the El Dorado Hills Fire Department service areas. Since such annexations are assumed to facilitate possible future development of the North Site Remainder Area, even though there is not even a conceptual or contemplated plan for build out of that land, this analysis conservatively assumes that such land would be developed consistent with the General Plan and zoning designations and density. The assumed potential commercial development of the North Site Remainder Area is approximately 138,000 square feet and 316 employees. The future extension of Country Club Drive (County Capital Improvement Project No. 36105008), when constructed by the County, would occupy a portion of the North Site near its northern edge, though the future extension is an independent project proposed by, and to be undertaken by, the County and is not analyzed as a part of the proposed Project.

2. SIGNIFICANCE THRESHOLDS

The Remainder Area Development would be adjacent to the EDH Costco Project and is subject to the identical regulatory settings and significance thresholds previously described for the EDH Costco Project in the technical reports.[1,2,3] The analysis provided in this technical memorandum evaluates whether the Project would result in any potentially significant impacts regarding the following questions:

Threshold AQ-1. Would the Project conflict with or obstruct implementation of the applicable air quality plan?

Threshold AQ-2. Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard?

Threshold AQ-3. Would the Project expose sensitive receptors to substantial pollutant concentrations?

Threshold AQ-4. Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Threshold GHG-1. Would the Project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

Threshold GHG-2. Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

Threshold ENE-1. Would the Project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation?

Threshold ENE-2. Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

2.1 Approach to Significance

As described in Section 3.2 of the EDH Costco Project Air Quality Technical Report, the El Dorado County Air Quality Management District (EDCAQMD) has established significance thresholds to assess the impacts of project-related construction and operational emissions, in its California Environmental Quality Act (CEQA) Guide. Table 3-1 in the EDH Costco Project Air Quality Technical Report shows the quantitative mass daily thresholds for construction and operation as adopted by the EDCAQMD reactive organic gases (ROG) and nitrogen oxides (NO_X) emissions. The analysis summarized in this report estimates program/plan level construction and operational mass emissions for the proposed Project and compares the emissions to these significance thresholds.

EDCAQMD has also established significance thresholds for other criteria air pollutants (CAPs) including carbon monoxide (CO), particulate matter less than 10 microns in diameter (PM_{10}), sulfur dioxide (SO_2), nitrogen dioxide, sulfates, lead, hydrogen sulfide (H_2S), and visibility-reducing particles. Project-related emissions of these pollutants are considered to

[1] Ramboll. 2025. EDH Costco Project Air Quality Technical Report.

[2] Ramboll. 2025. EDH Costco Project Greenhouse Gas Technical Report.

[3] Ramboll. 2025. EDH Costco Project Energy Technical Report.

have significant impacts if these emissions will cause or contribute to a violation of the applicable national or state ambient air quality standard. The EDCAQMD provides screening techniques to evaluate if a project's CAP emissions would have a less-than-significant impact in Chapters 4 and 6 of the EDCAQMD CEQA Guide.[4] This analysis in this report estimates the program/plan level construction and operational mass emissions of CO, PM_{10}, sulfur oxides (SO_X), and NO_X for the proposed Project and evaluates the significance of their impacts using these screening techniques established in the EDCAQMD CEQA Guide.[5]

The EDCAQMD has also established significance thresholds to assess health risk impacts of TACs from project-related emission sources on nearby sensitive receptors including residents and other human populations, which are applicable to the program-level impact analysis in this report.[6] These include a maximum incremental cancer risk of one-in-a-million (or ten-in-a-million if best available control technology for toxics (T-BACT) is applied), and incremental chronic and acute hazard indices (HIs) of 1. The analysis summarized in this report evaluates the human health risk impacts from on-site construction and operational emissions against these significance thresholds established by EDCAQMD.

This Technical Report also performs a qualitative assessment of odors from the proposed Project to evaluate if they would have the potential to generate odorous emissions that would meet the statutory definition for nuisance, in accordance with the EDCAQMD CEQA Guide.[7]

This report, relative to Threshold AQ-1, evaluates whether the proposed Project would conflict with applicable plans related to emissions, including the regional air quality attainment plans. This report, relative to Threshold AQ-2, quantifies the proposed Project's emissions during construction and operations and compares those results to the applicable EDCAQMD thresholds. Relative to Threshold AQ-3, this report includes a CO hotspots analysis and a semi-quantitative assessment of the potential health risk impacts to sensitive receptors. This report, relative to Threshold AQ-4, evaluates the potential for odor-generating activities from the proposed Project.

As discussed in Section 3.2 of the EDH Costco Greenhouse Gas Technical Report, El Dorado County provides some basic information on climate change including an overview of GHG regulations and local, state, and national efforts to address climate change; however, it has not established a quantitative or qualitative guidance to evaluate GHG emission impacts of development projects under CEQA.[8] Additionally, EDCAQMD has also not set quantitative GHG significance thresholds. In the absence of a quantitative GHG threshold from El Dorado County and EDCAQMD, this Technical Report assessed significance of GHG impacts for Threshold GHG-1 against the Placer County Air Pollution Control District (PCAPCD) GHG significance thresholds (Table 3-1 of the EDH Costco Greenhouse Gas Technical Report), in consultation with EDCAQMD and El Dorado County.

[7] Ibid.

[8] Ibid.

PCAPCD's GHG significance thresholds are reasonable to assess significance in the absence of a quantitative threshold from EDCAQMD because Placer County is similar to El Dorado County demographically, geographically, and meteorologically. Both Placer County and El Dorado County have similar land use patterns (i.e., they are both heavily made up of rural and suburban areas), with similar rates of population growth. Additionally, both counties have similar terrain and lie within the same air basin. Because of this, PCAPCD's quantitative GHG thresholds were used to assess significance against the Project relative to Threshold GHG-1.

Relative to Threshold GHG-2, this report evaluates whether the Project would conflict with the 2022 Scoping Plan Update,[9] Sacramento Area Council of Governments' (SACOG's) 2020 future Metropolitan Transportation Plan & Sustainable Communities Strategy (MTP/SCS),[10] and the El Dorado County Regional Transportation Plan (RTP) 2020-2040.[11]

This report evaluates the proposed Project's energy consumption against the six categories of potential energy-related environmental impacts from Appendix F of the CEQA Guidelines:

1. The Project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the Project including construction, operation, maintenance and/or removal. If appropriate the energy intensiveness of materials may be discussed.
2. The effects of the Project on local and regional energy supplies and on requirements for additional capacity.
3. The effects of the Project on peak and base period demands for electricity and other forms of energy.
4. The degree to which the Project complies with existing energy standards.
5. The effects of the Project on energy resources.
6. The Project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

This report, relative to Threshold ENE-1, assesses the proposed Project's electricity, natural gas, and fossil fuel consumption during construction and operation by way of the six questions above. This report, relative to Threshold ENE-2, evaluates whether the proposed Project would conflict with applicable plans related to renewable energy and energy efficiency.

3. EMISSIONS INVENTORIES AND ENERGY PROJECTIONS

This section provides a brief description of the methodology that Ramboll used to develop CAP, GHG, and energy inventories associated with the Remainder Area Development, which include one-time emissions from construction and long-term operational emissions. This section also presents the CAP, GHG, and energy inventories of the North Site Remainder Area and the proposed Project.

The analysis in this report utilized the California Emissions Estimator Model (CalEEMod) version 2022.1 methodology to quantify CAP and GHG emissions for the Remainder Area Development (**Appendix A**). This report presents assumptions only when they differ from the analysis for the EDH Costco Project, detailed in the EDH Costco Project's technical reports. Unless otherwise stated, CalEEMod default parameters were used to estimate the emission inventories.

As presented in **Section 1**, the Remainder Area Development would, at a maximum, develop 138,000 square feet of commercial/retail land uses, categorized as regional shopping center in CalEEMod. The remaining area of the parcel is conservatively assumed to be developed into asphalt-paved parking lots, totaling approximately 10.6 acres. The land use assumptions used to generate CalEEMod default construction and operational activities are included in **Appendix A**.

Construction of the North Site Remainder Area is assumed to start as early as May 2027, immediately after the EDH Costco Project construction concludes. Operation of the North Site Remainder Area is assumed to start as soon as the construction concludes.

3.1 Construction Emission Inventories and Energy Projection

Construction schedule, off-road equipment activities and on-road vehicle trip assumptions are provided in **Appendix B**. Because the material movement volumes required to construct in the Remainder Area are currently unknown, they are conservatively assumed to be the same as EDH Costco Project's Construction Scenario 2.

Criteria Air Pollutant Inventory

Average daily construction emissions for each quarter of the North Site Remainder Area construction are calculated based on CalEEMod outputs and are included in **Appendix C**.

Table 3-1 summarizes the average daily criteria pollutant emissions from construction of the North Site Remainder Area as compared to the applicable EDCAQMD thresholds. As shown in this table, the average daily unmitigated emissions of ROG and NO_X from the construction of the Remainder Area Development are below EDCAQMD's thresholds for construction. While EDCAQMD has not adopted mass daily numerical thresholds for other CAP emissions from construction, the EDCAQMD CEQA Guide[12] states that if ROG and NO_X exhaust emissions from construction are deemed not significant, then exhaust emissions of CO and PM_{10} may also be deemed not significant. Hence, air quality impacts of all CAPs (ROG, NO_X, CO, and

[12] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

PM_{10}) from the exhaust of construction equipment and on-road vehicles associated with the construction of the North Site Remainder Area are less than significant.

The EDCAQMD CEQA Guide[13] states that fugitive dust PM_{10} emissions may be assumed to be not significant, if the project complies with EDCAQMD Rule 223 and Rule 223-1 for fugitive dust control by implementing control measures that will prevent visible dust beyond the project property lines. The proposed Project will comply with these fugitive dust control rules. Hence, the air quality impacts of fugitive dust emissions from the construction North Site Remainder Area are less than significant.

North Site Remainder Area construction activities are expected to generate negligible emissions of SO_2, sulfates, lead, and H_2S. Therefore, the air quality impacts of these emissions from the construction of the North Site Remainder Area are also less than significant.

Although EDCAQMD has established separate daily mass significance thresholds for short-term construction and long-term operational phases of development projects, this analysis conservatively compares the combined average daily emissions from the construction of the Remainder Area land and the EDH Costco Project operation to EDCAQMD's mass daily construction thresholds. As shown in **Table 3-2**, these combined unmitigated average daily emissions exceed EDCAQMD's construction threshold for ROG but remain below the threshold for NO_X.

Mitigated Criteria Air Pollutant Inventory

In order to ensure that the combined average daily ROG emissions from the construction of the Remainder Area Development and the EDH Costco Project operation are below the EDCAQMD's mass daily construction thresholds, the following mitigation measure will be implemented during the construction of the Remainder Area.

- **Mitigation Measure 3.2-2: Architectural Coating Volatile Organic Compound (VOC) Limits for Development of the North Site Remainder Area**

  Future building construction of the North Site Remainder Area shall only use architectural coatings with a VOC content not exceeding 100 grams per liter during construction for all interior and exterior spaces. This requirement shall be included in plans submitted for review by the County prior to the issuance of building permits.

Additionally, the following mitigation measures that will be implemented during the construction of the EDH Costco Project to address health risk impacts and asbestos dust will also apply to the construction of the Remainder Area Development:

- **Mitigation Measure 3.2-4a: Apply Tier-4 Emission Standards to Diesel-Powered Off-Road Equipment**

  Construction equipment greater than 50 horsepower (hp) used at the site shall meet Environmental Protection Agency (EPA) Tier 4 Final emission standards for PM_{10} and particulate matter less than 2.5 microns in diameter ($PM_{2.5}$), if available. If Tier 4 Final equipment is not available, all construction equipment larger than 50 hp used at the site shall meet EPA emission standards for Tier 3 engines and include particulate matter emissions control equivalent to California Air Resources Board (CARB) Level 3 verifiable

[13] Ibid.

diesel emission control devices. This requirement shall apply to the construction of the Costco project and construction of the North Site Remainder Area.

- **Mitigation Measure 3.2-4b: Implement Asbestos Dust Mitigation Consistent with EDCAQMD Rule 223-1**

  An Asbestos Dust Mitigation Plan shall be prepared and submitted to the EDCAQMD and the County for review and approval by EDCAQMD for implementation during construction on the Costco project, future development of the North Site Remainder Area, and for off-site roadway improvements (if the presence of naturally occurring asbestos (NOA) is confirmed). The Asbestos Dust Mitigation Plan shall comply with the El Dorado County Code Chapter 8.44 (Asbestos and Dust Protection) and EDCAQMD Rule 223-2, which provides performance standards for ensuring that adverse impacts do not result from asbestos dust during construction.

Table 3-3 summarizes the average daily mitigated criteria pollutant emissions from construction of the North Site Remainder Area as compared to the applicable EDCAQMD thresholds. As shown in this table, the average daily unmitigated emissions of ROG and NO_X from the construction of the Remainder Area Development are below EDCAQMD's thresholds for construction. While EDCAQMD has not adopted mass daily numerical thresholds for other CAP emissions from construction, the EDCAQMD CEQA Guide[14] states that if ROG and NO_X exhaust emissions from construction are deemed not significant, then exhaust emissions of CO and PM_{10} may also be deemed not significant. Hence, air quality impacts of all CAPs (ROG, NO_X, CO, and PM_{10}) from the exhaust of construction equipment and on-road vehicles associated with the construction of the North Site Remainder Area are less than significant.

The EDCAQMD CEQA Guide[15] states that fugitive dust PM_{10} emissions may be assumed to be not significant, if the project complies with EDCAQMD Rule 223 and Rule 223-1 for fugitive dust control by implementing control measures that will prevent visible dust beyond the project property lines. The proposed Project will comply with these fugitive dust control rules. Hence, the air quality impacts of fugitive dust emissions from the construction North Site Remainder Area are less than significant.

North Site Remainder Area construction activities are expected to generate negligible emissions of SO_2, sulfates, lead, and H_2S. Therefore, the air quality impacts of these emissions from the construction of the North Site Remainder Area are also less than significant.

Although EDCAQMD has established separate daily mass significance thresholds for short-term construction and long-term operational phases of development projects, this analysis conservatively compares the combined average daily mitigated emissions from the construction of the Remainder Area land and the EDH Costco Project operation to EDCAQMD's mass daily construction thresholds. As shown in **Table 3-4,** with the inclusion of **Mitigation Measure 3.2-2**, which involves using low VOC paints during construction of the Remainder Area land uses, the combined average daily construction and operation emissions are below EDCAQMD's construction mass daily significance thresholds for both ROG and NO_X.

[14] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

[15] Ibid.

Greenhouse Gas Emissions Inventory

GHG emissions associated with the construction of the North Site Remainder Area are estimated using CalEEMod (**Appendix A**) and summarized in **Table 3-5**. As shown in **Table 3-5**, the annual GHG emissions associated with the construction of the North Site Remainder Area are less than the PCAPCD's GHG significance threshold for construction.[16]

Energy Projection

Energy consumption associated with the construction of the North Site Remainder Area are estimated using methodologies described in Section 4.1 of the EDH Costco Energy Technical Report and summarized in **Table 3-6**. Additional details on the fuel consumption of off-road construction equipment and on-road vehicle use during the North Site Remainder Area construction are provided in **Appendix D**.

3.2 Operational Emission Inventories and Energy Projection

A summary of the key assumptions associated with the operation of the North Site Remainder Area including mobile source activity, County-specific consumer product emission factors, and GHG emission factors for electricity are provided in **Appendix E**. These assumptions were incorporated into the CalEEMod model run in **Appendix A**.

Criteria Air Pollutant Inventory

Table 3-7 summarizes the maximum daily criteria air pollutant emissions associated with the operation of the North Site Remainder Area and the EDH Costco Project. As shown in this table, the maximum daily ROG and NO_X emissions associated with proposed Project (North Site Remainder Area and EDH Costco Project) operation are below EDCAQMD's mass daily significance thresholds for operation.

While EDCAQMD has not adopted mass daily numerical thresholds for other CAP emissions, it considers a project to have a significant impact on air quality if it will cause or contribute significantly to a violation of the National Ambient Air Quality Standards or California Ambient Air Quality Standards for CO, PM_{10}, SO_2, sulfates, lead, H_2S.

The EDCAQMD CEQA Guide[17] states that development projects, with land use types similar to the proposed Project, that are deemed less than significant for ROG and NO_X emissions based on land use size screening criteria, can also be considered less than significant for CO emissions. Using this screening approach, we can consider the air quality impacts of CO emissions from the proposed Project operation to be less than significant because the proposed Project's ROG and NO_X emissions are less than EDCAQMD's mass daily significance thresholds. Hence, the air quality impacts of operational CO emissions from the proposed Project are less than significant.

The EDCAQMD CEQA Guide[18] states that PM_{10} emissions from land development projects primarily associated with gasoline-powered vehicles may be assumed to be insignificant if the projects do not generate heavy-duty diesel vehicle trips in greater proportion than the

[16] PCAPCD CEQA Handbook. 2017. Chapter 2 Thresholds of Significance. Available at: https://www.placerair.org/DocumentCenter/View/2047/Chapter-2-Thresholds-of-Significance-PDF. Accessed: October 2025.

[17] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

[18] Ibid.

general mix of such trips in public roadways. The proposed Project is not expected to generate heavy-duty diesel vehicle trips in greater proportion than the general mix of such trips in public roadways in the vicinity of the Project site and the air quality impacts of operational PM_{10} emissions from the proposed Project are less than significant.[19]

The EDCAQMD CEQA Guide[20] states that emissions associated with project operations that are less than 10 pounds per day of a pollutant may be presumed to have impacts that are not significant for that pollutant. Since SO_X emissions associated with the proposed Project operation are less than 10 pounds per day (**Table 3-7**), emissions of these pollutants are less than significant.

The proposed Project is a development project that is not a significant source of lead, sulfates, and H_2S. Hence, the emissions of these pollutants are less than significant.

Finally, according to the EDCAQMD CEQA Guide,[21] visibility impacts from development projects can be considered less than significant. Therefore, the proposed Project impacts on visibility are less then significant.

Greenhouse Gas Emissions Inventory

Table 3-8 summarizes the annual operational GHG emissions associated with the operation of the proposed Project (3,954 metric tonnes of carbon dioxide equivalent emissions per year (MT CO_2e per year) for the North Site Remainder Area and the EDH Costco Project). Because the exact energy efficiency and sustainability features of the North Site Remainder Area are not known at the time of preparation of this report, GHG reduction features of EDH Costco Project were not assumed for the Remainder Area Development.

PCAPCD CEQA Guidelines[22] have a three-tiered approach for assessing GHG emissions from land use projects. For projects with annual operational GHG emissions between 1,100 and 10,000 MT CO_2e per year, PCAPCD recommends applying its GHG Efficiency Matrix to determine significance.

As shown in **Table 3-8**, the proposed Project's estimated annual operational emissions fall within this range. Based on a total building square footage of 303,200 square feet (138,000 square feet for the North Site Remainder Area and 165,200 square feet for the EDH Costco Project), the calculated GHG efficiency for the proposed Project is 13.04 MT CO_2e per 1,000 square feet.[23] This is below the applicable conservative threshold of 26.5 MT CO_2e per 1,000 square feet for nonresidential projects located in urban areas, as defined by PCAPCD.

[19] As noted in Section 4.3.6 of the Air Quality Technical Report, the heavy-duty diesel vehicle trips generated by the EDH Costco Project are less than 0.25% of the total Project trips. Additionally, for purposes of this analysis the heavy-duty diesel vehicle trips generated by the Remainder Area as assumed to be similar to the general fleet mix in El Dorado County, based on the default fleet mix in CalEEMod. Hence, the fraction of heavy-duty diesel vehicle trips generated by the proposed Project (EDH Costco and North Site Remainder Area) will be lower than the approximately 6% of heavy-duty diesel trucks operating on the roads in El Dorado County.

[20] Ibid.

[21] Ibid.

[22] PCAPCD CEQA Handbook. 2017. Chapter 2 Thresholds of Significance. Available at: https://www.placerair.org/DocumentCenter/View/2047/Chapter-2-Thresholds-of-Significance-PDF. Accessed: October 2025.

[23] Note, the Proposed Project GHG efficiency would be 16.94 MT CO_2e per 1,000 square feet if the analysis accounted for the greenhouse gas emission benefits associated with only the mandatory electric vehicle charging requirements (1,097 kW total power) in the 2025 California Green Building Standards Code. This value is also below the applicable conservative threshold of 26.5 MT CO_2e per 1,000 square feet for non-residential projects located in urban areas, as defined by PCAPCD.

Therefore, the proposed Project's operational GHG emissions are considered to be less than significant.

Energy Projection

Energy consumption associated with the operation of the North Site Remainder Area are estimated using methodologies described in Section 4.2 of the EDH Costco Energy Technical Report and summarized in **Table 3-9**. Additional details on the operational electricity, natural gas, diesel and gasoline consumption are provided in **Appendix F**.

4. PROGRAM-LEVEL AIR QUALITY IMPACT ANALYSIS

This section assesses the significance of the proposed Project's air pollutant emissions for purposes of CEQA.

4.1 Threshold AQ-1: Would the Project conflict with or obstruct implementation of the applicable air quality plan?

According to the EDCAQMD CEQA Guide,[24] development projects in the Mountain Counties Air Basin portion of the County are considered consistent with the applicable air quality plan if:

1. The Project does not require a change in the existing land use designation (e.g., a general plan amendment or rezone), and projected emissions of ROG and NO_X from the Project are equal or less than the emissions anticipated for the site if developed under the existing land use designation;
2. The Project does not exceed the "project alone" significance criteria;
3. The lead agency for the Project requires the Project to implement any applicable emission reduction measures contained in and/or derived from the air quality attainment plan; and
4. The Project complies with all applicable district rules and regulations.

El Dorado County's General Plan designates the Project site as Commercial (C). Zoning includes Commercial Regional–Planned Development (CR-PD), with smaller areas of Commercial Limited and Transportation Corridor. Once operational, the proposed Project would be a regional commercial center, which is consistent with the existing designation of the County's General Plan and zoning. Hence, the anticipated growth associated with the Project is generally accounted for in the 2023 Ozone Plan[25] and would be accounted for in forthcoming attainment plans.

As described in **Section 3.1** and **Section 3.2**, the air quality impacts of CAPs associated with the proposed Project construction and operation are less than significant. Therefore, the proposed Project does not exceed the "project alone" significance criteria.

The applicable air quality attainment plans for the Project area are the Sacramento Regional 8-hour Ozone Attainment and Reasonable Further Progress Plan[26] and $PM_{2.5}$ Maintenance Plan and Redesignation Request.[27] As such the proposed Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under these plans (see **Section 4.2** below for further details). Hence, the

[24] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

[25] Sacramento Region Air Quality Plans. Available at: https://ww2.arb.ca.gov/our-work/programs/california-state-implementation-plans/nonattainment-area-plans/sacramento-region. Accessed: October 2025.

[26] Ibid.

[27] EDCAQMD, Placer County Air Pollution Control District, SMAQMD, and Yolo-Solano Air Quality Management District. $PM_{2.5}$ Implementation/Maintenance Plan and Redesignation Request for Sacramento $PM_{2.5}$ Nonattainment Area. October 24. Available at: http://www.airquality.org/ProgramCoordination/Documents/PM2.5%20Imp%20and%20Redesignation%202013.pdf. Accessed: October 2025.

proposed Project is not required to implement any additional mitigation measures contained in these plans.

As described in **Section 3.1** of this report and Sections 4.2.3 and 5.1.1 of the EDH Costco Project Air Quality Technical Report the proposed Project would comply with EDCAQMD Rules 223-1 and 223-2 for fugitive dust control[28] and asbestos hazard mitigation[29] during construction. The proposed Project is located in an area where NOA could be present.[30] Although the proposed Project's Geotechnical Study[31] concluded that the potential for NOA to be encountered at levels at or exceeding regulatory threshold level is considered low, the proposed Project would implement asbestos dust mitigation measures consistent with EDCAQMD Rule 223-1 through the implementation of **Mitigation Measure 3.2-4b**. The proposed Project would also comply with all other applicable EDCAQMD rules.

Therefore, the proposed Project would not conflict with or obstruct implementation of the applicable air quality plans for the Project region.

4.2 Threshold AQ-2: Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard?

As discussed in the EDH Costco Project Air Quality Technical Report, the Project region is currently designated as non-attainment for the State 1-hour ozone (O_3) standard, the federal and the State 8-hour O_3 standard, the State PM_{10} standards, and the federal 24-hour $PM_{2.5}$ standard.

The two primary precursors for O_3 formation are ROG and NO_X. Table 4-12 of the EDH Costco Air Quality Report, and **Table 3-1** and **Table 3-7** of this report present the average daily and maximum daily ROG and NO_X emissions associated with the proposed Project construction and operation. Emissions of these O_3 precursors (ROG and NO_X) are below the EDCAQMD mass daily significance thresholds. Additionally, as described in Section 4.2.6 of the EDH Costco Air Quality Report and **Section 3** of this report, impacts of particulate matter emissions from the proposed Project construction and operation are less than significant. Hence, the proposed Project would not result in a cumulatively considerable net increase in any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard.

[31] Kleinfelder, 2024. Geotechnical Study, Proposed Costco Fuel Facility, Silva Valley Parkway, El Dorado Hills, California, CW# 18-0487. December 2024.

4.3 Threshold AQ-3: Would the Project expose sensitive receptors to substantial pollutant concentrations?

4.3.1 CO Hotspots

As discussed in Section 6.2 of the AQ Technical Report, according to the PCAPCD guidance, the CO emissions from a proposed Project's operations would be less than significant if CO emissions from vehicle operations are less than 550 pounds per day (lbs/day). As shown in **Table 3-7**, the CO emissions from mobile sources associated with the proposed Project are less than 550 lbs/day. Thus, the increase in CO emissions from the project-related increased traffic volumes at affected intersections and the on-site gasoline fueling station are less than significant and the proposed Project would not expose sensitive receptors to substantial concentrations of localized CO.

4.3.2 Health Risk Thresholds

As described in Section 7.3.1 of the EDH Costco Project Air Quality Technical Report, the cancer risk, non-cancer chronic and acute HIs at the maximally impacted residential and other sensitive receptors associated with the mitigated toxic air contaminant (TAC) emissions from the EDH Costco Project construction and operation are below EDCAQMD significance thresholds. Specifically, the maximum incremental cancer risk, non-cancer chronic and acute HIs for the Costco EDH Project are estimated to be 4.13 in a million, 0.02, and 0.50 respectively (Refer to Table 5-5 in the EDH Costco Project Air Quality Technical Report).

The primary sources of TAC emissions associated with the North Site Remainder Parcel are diesel particulate matter (DPM) emissions from construction equipment, construction trucks, and operational trucks. The construction equipment, construction truck activity, and operational truck activity associated with the development of the North Site Remainder Parcel are generally expected to be similar/lower than that of the EDH Costco Project as maximum square footage of the of commercial/retail land uses that would be developed on the North Site Remainder Area (138,000 square feet) is lower than the square footage of the warehouse that would be developed by the EDH Costco Project (165,000 square foot). Hence, the DPM emissions from the North Site Remainder Parcel and its associated cancer and chronic impacts will be similar or less than that associated with the EDH Costco Project. As a result, the maximum cancer risk and chronic HI associated with the proposed Project (North Site Remainder Area and EDH Costco Project) are expected to be less than 8.5 in a million and 0.05 respectively which are below EDCAQMD significance thresholds.

Additionally, since the North Site Remainder Parcel is expected to be developed as general retail land uses, we do not expect it to be a significant source of TACs that have acute impacts. Therefore, the acute HI for the proposed Project (North Site Remainder Area and EDH Costco Project) is expected to be similar to that of the EDH Costco Project which is below EDCAQMD significance threshold.

Therefore, the Project is not expected to expose sensitive receptors to substantial TAC concentrations.

4.4 Threshold AQ-4: Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

According to the EDCAQMD CEQA Guide,[32] common types of facilities known to produce odors include wastewater treatment plants, landfills and composting facilities, petroleum refineries, manufacturing plants such as asphalt batch plants and chemical/fiberglass manufacturing, painting and coating operations, food processing plants, rendering plants, and coffee roasters. The proposed Project would not include any of these land uses that have been identified by the EDCAQMD as being associated with odor generation and thus would not result in odors adversely affecting a substantial number of people. In addition, the proposed Project does not propose to locate any sensitive receptors near an existing source of objectional odors.

4.4.1 Construction Odors

Construction activities associated with potential odor include equipment exhaust (i.e., from off-road construction equipment), paving, and architectural coating. There are no unusual Project characteristics or construction processes that would require the use of equipment that would be more fuel intensive than is used for comparable construction activities, nor equipment that would not conform to current emission standards. It is expected that these impacts would be short-term in duration and typical of comparable activities, therefore the impacts would not adversely affect a substantial number of people and would be less than significant.

4.4.2 Operational Odors

As discussed above, the proposed Project is a commercial and retail development and does not propose any odor-generating facilities identified by the EDCAQMD. However, the proposed Project does include a gasoline fueling station. During the operation of the Project, VOCs released at the gasoline station due to refueling, spillage, and hose permeation would be controlled to minimize odors (i.e., nozzles equipped with Phase II Enhanced Vapor Recovery systems). Therefore, odor impact from the gasoline fueling station would not affect a substantial number of people and would be less than significant.

There may be some potential for other small-scale, localized odor issues to emerge around some of the proposed Project sources, such as solid waste collection, wastewater or stormwater collection/conveyance, or food preparation. However, these localized short-term odors would not affect a substantial number of people. Therefore, the proposed Project's operational odor impact is considered less than significant.

[32] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

5. PROGRAM-LEVEL GREENHOUSE GAS EMISSIONS IMPACT ANALYSIS

This section discusses the assessment of the proposed Project's GHG emissions against the CEQA significance thresholds outlined in **Section 2**.

5.1 Threshold GHG-1: Would the Project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

As noted in **Section 2.1**, in the absence of a quantitative GHG threshold from El Dorado County and EDCAQMD, this Technical Report assesses significance of the proposed Project's GHG impacts for Threshold 1 against the PCAPCD's GHG significance thresholds.

Total GHG emissions for each year of the proposed Project construction are summarized in Table 4-13 of the EDH Costco Project Greenhouse Gas Technical Report and **Table 3-5** of this report. As shown in these tables, the annual GHG emissions associated with the construction of the proposed Project (1,708 MT CO_2e in 2026, 1,866 MT CO_2e in 2027, and 197 MT CO_2e in 2028) are less than the PCAPCD's bright-line GHG significance threshold of 10,000 MT CO_2e/year for construction.

The proposed Project's annual operational GHG emissions were estimated to be 3,954 MT CO_2e per year (**Table 3-8**). These emissions are between PCAPCD's de minimis GHG emissions level (1,100 MT CO_2e/yr) and bright-line GHG significance threshold (10,000 MT CO_2e/yr) for project operation. Therefore, to evaluate the GHG impacts we estimated the proposed Project's efficiency metric in accordance with the PCAPCD's Air Quality Handbook.[33] This calculated efficiency metric (13.04 MT CO_2e per 1,000 square feet) shown in **Table 3-8**, is less than the lower of the two applicable efficiency matrix thresholds in PCAPCD's Air Quality Handbook for the operational phase of land use projects:

1. 26.5 MT CO2e/1,000 square feet for a project in an urban land use setting; and
2. 27.3 MT CO2e/1,000 square feet for a project in rural land use setting.

Therefore, the GHG emissions associated with the construction and operation of the proposed Project would not have a significant impact on the environment.

5.2 Threshold GHG-2: Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

As noted in **Section 2.1**, this Technical Report assesses the significance of the proposed Project's GHG impacts for Threshold 2 based on whether it would conflict with the 2022 Scoping Plan Update,[34] SACOG's 2020 MTP/SCS,[35] and El Dorado County RTP 2020-2040.[36]

[33] PCAPCD. 2017. 2017 CEQA Handbook Chapters. Available at: https://www.placerair.org/1801/CEQA-Handbook. Accessed: October 2025.

[35] SACOG. 2020. 2020 SACOG MTP/SCS. Available at: https://www.sacog.org/home/showpublisheddocument/76/638212804736270000. Accessed: October 2025.

[36] El Dorado County Transportation Commission. 2020. El Dorado County Regional Transportation Plan 2020-2040. November 5. Available at: https://www.edctc.org/files/2859e4e3f/RTP+2040.pdf. Accessed: October 2025.

5.2.1 2022 Scoping Plan Update

The 2022 Scoping Plan Update has a table of priority GHG reduction strategies that can be utilized by local governments. The three main priority areas addressed in this table are "Transportation Electrification", "vehicle miles travelled (VMT) Reduction", and "Building Decarbonization".[37] These measures represent the core strategies that local jurisdictions in California can implement to reduce GHGs in alignment with State goals.

The proposed Project would not conflict with the implementation of the 2022 Scoping Plan Update and Statewide Emission Reduction Targets and includes the several features and mitigation measures that support the three main priority areas for GHG reduction as described below.

While project-level design features and details are not available for the potential developments in the North Site Remainder Area at the time of preparation of this program-level analysis, the North Site Remainder Area would introduce retail/commercial land uses that are consistent with the zoning designation in a highway hub. Hence, the proposed Project, i.e., the North Site Remainder Area and the Costco EDH Project, would create new employment opportunities. Additionally, the Project site is an infill development located near an El Dorado Transit bus route (50 Express) and bus stop (El Dorado Transit Park & Ride), therefore placing jobs that are accessible via public transit. The El Dorado bus route connects to the larger Sacramento Metropolitan transit network and encourages use of local transit and rail to commute to the proposed Project. Furthermore, the proposed Project is located adjacent to homes, therefore the proposed Project would provide retail and jobs near a housing-rich area served by El Dorado Transit. Lastly, the proposed Project will implement **Mitigation Measure 3.14-2c: Develop a Transportation Demand Management (TDM) Program and Implement VMT Reduction Measures for Subsequent Developments in the North Site Remainder Area** which requires each project applicant of future proposed projects located within the North Site Remainder Area to either demonstrate through a technical analysis that its project would not exceed County VMT thresholds or implement VMT-reducing infrastructure and/or strategies within the commercial facility to mitigate those impacts. If VMT thresholds are exceeded, the applicant shall prepare and submit a TDM Plan to the County for approval, which shall include a series of measures to reduce project-related VMT. Measures may include strategies such as ridesharing initiatives (e.g., carpooling), subsidizing employee use of public transit, and promoting bicycling, walking, and the use of public transit. As noted in Section 5.2.1 of the GHG Technical Report, the EDH Costco Project will meet the Voluntary Tier 1 Electric Vehicle Charging Standards as defined in the 2025 California Green Building Standards Code[38] by installing ten direct current fast chargers that provide a total power of 1,800 kW. Additionally, these chargers will be powered by 100% renewable electrical power supplied by Pacific Gas & Electric (PG&E), as Costco has a Clean Energy Contract with PG&E. Furthermore, the Remainder Area will be required to meet the Mandatory Electric Vehicle Charging Standards as defined in the California Green Building Standards Code.

[37] CARB. 2022. Final 2022 Scoping Plan Update and Appendices. December. Available at: https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents. Accessed: October 2025.

[38] 2025 California Green Building Standards Code, Title 24, Part 11. Available online at: https://codes.iccsafe.org/content/CAGBC2025P1. Accessed: October 2025.

Additionally, as noted in Section 5.2.1 of the GHG Technical Report, the EDH Costco Project will incorporate several sustainability and energy efficiency measures including green building practices as required by the 2025 California Green Building Standards Code.[39] Refer to Section 1.2 of the GHG Technical Report for a detailed listing of these measures. Notably, the EDH Costco Project operations will be powered 100% renewable electrical power supplied by PG&E, as Costco has a Clean Energy Contract with PG&E. Furthermore, the Remainder Area will be required to meet the California Green Building Standards Code, which includes a number of energy-saving requirements for new developments.

Based on the proposed Project elements described above, the Project would not interfere with the implementation of the 2022 Scoping Plan Update and would include elements that support the goals of the plan.

5.2.2 SACOG 2020 MTP/SCS

The proposed Project would not conflict with the State's GHG reduction goals and strategies as discussed in the SACOG's 2020 MTP/SCS,[40] which fall into four priority policy areas:

1. Build vibrant places for today's and tomorrow's residents;
2. Foster the next generation of mobility solutions;
3. Modernize the way we pay for transportation infrastructure; and
4. Build and maintain a safe, reliable, and multimodal transportation system.

The proposed Project would not conflict with the implementation of the SACOG's 2020 MTP/SCS and has several elements that are expected to support the main priority policy in SACOG's 2020 MTP/SCS. As noted in **Section 5.2.1**, the Project is an infill development that would create new employment opportunities and is located near an El Dorado Transit bus route (50 Express) and bus stop (El Dorado Transit Park & Ride), therefore placing jobs that are accessible via public transit. The El Dorado bus route connects to the larger Sacramento Metropolitan transit network and encourages use of local transit and rail to commute to the Project. Furthermore, the Project is located adjacent to homes, therefore the Project would provide retail and jobs near a housing-rich area served by El Dorado Transit.

Moreover, as noted in **Section 5.2.1**, the proposed Project will implement **Mitigation Measure 3.14-2c: Develop a TDM Program and Implement VMT Reduction Measures for Subsequent Developments in the North Site Remainder Area** which requires each project applicant of future proposed projects located within the North Site Remainder Area to either demonstrate through a technical analysis that its project would not exceed County VMT thresholds or implement VMT-reducing infrastructure and/or strategies within the commercial facility to mitigate those impacts. If VMT thresholds are exceeded, the applicant shall prepare and submit a TDM Plan to the County for approval, which shall include a series of measures to reduce project-related VMT. Measures may include strategies such as ridesharing initiatives (e.g., carpooling), subsidizing employee use of public transit, and promoting bicycling, walking, and the use of public transit.

[39] 2025 California Green Building Standards Code, Title 24, Part 11. Available online at: https://codes.iccsafe.org/content/CAGBC2025P1. Accessed: October 2025.

[40] SACOG. 2020. Metropolitan Transportation Plan/Sustainable Communities Strategy. Available at: https://www.sacog.org/home/showpublisheddocument/76/638212804736270000. Accessed: October 2025.

Additionally, as noted in Section 5.2.2 of the GHG Technical Report, the EDH Costco Project would implement pedestrian network improvements as part of **Mitigation Measure 3.14-2b**, and would implement several off-site transportation improvements in coordination with the County to address the existing and future needs of the region in the immediate vicinity of the Project site.

Based on the proposed Project elements described above, the Project would not interfere with the implementation of the SACOG's 2020 MTP/SCS and would include elements that support the goals of the plan.

5.2.3 El Dorado County RTP 2020-2040

The proposed Project would not conflict with the El Dorado County 2020-2040 RTP,[41] which includes the following main goals: to improve highways, streets, and regional/inter-regional roadways, public transit, aviation, freight movement, non-motorized transportation, transportation systems management, integrated land use, air quality, and transportation planning, and funding.

The Project supports the objectives of the El Dorado County Regional Transportation Plan by providing sidewalks, bike lanes, and pedestrian connections. As noted in **Section 5.2.1**, the Project is an infill development that would create new employment opportunities and is located near an El Dorado Transit bus route (50 Express) and bus stop (El Dorado Transit Park & Ride), thereby creating jobs that are accessible via public transit. The El Dorado bus route connects to the larger Sacramento Metropolitan transit network and encourages use of local transit and rail to commute to the Project. Furthermore, the Project is located adjacent to homes, therefore the Project would provide retail and jobs near a housing-rich area served by El Dorado Transit.

Additionally, as noted in **Section 5.2.1**, the proposed Project will implement **Mitigation Measure 3.14-2c: Develop a TDM Program and Implement VMT Reduction Measures for Subsequent Developments in the North Site Remainder Area** which requires each project applicant of future proposed projects located within the North Site Remainder Area to either demonstrate through a technical analysis that its project would not exceed County VMT thresholds or implement VMT-reducing infrastructure and/or strategies within the commercial facility to mitigate those impacts. If VMT thresholds are exceeded, the applicant shall prepare and submit a TDM Plan to the County for approval, which shall include a series of measures to reduce project-related VMT. Measures may include strategies such as ridesharing initiatives (e.g., carpooling), subsidizing employee use of public transit, and promoting bicycling, walking, and the use of public transit.

Further, as described in Section 5.2.2 of the GHG Technical Report, the Project would include pedestrian network improvements as part of **Mitigation Measure 3.14-2b**, and would implement several off-site transportation improvements in coordination with the County to address the existing and future needs of the region in the immediate vicinity of the Project site.

Based on the proposed Project elements described above, the proposed Project would not interfere with the implementation of the El Dorado County 2020-2040 RTP and would include elements that support the goals of the plan.

[41] El Dorado County Transportation Commission. 2020. El Dorado County Regional Transportation Plan 2020-2040. November 5. Available at: https://www.edctc.org/files/2859e4e3f/RTP+2040.pdf. Accessed: October 2025.

5.3 Summary

As discussed in **Section 5.1**, the proposed Project is expected to result in GHG emissions that are below PCAPCD GHG thresholds for operation and construction. Additionally, as described in **Section 5.2**, the proposed Project would not conflict with the 2022 Scoping Plan Update, SACOG's 2020 MTP/SCS, or the El Dorado County RTP 2020-2040. Therefore, the proposed Project's GHG emissions will be less than significant in the context of Threshold 1 and Threshold 2. Based on the analysis above, the proposed Project's GHG emissions are not cumulatively considerable, and the proposed Project is less than significant for cumulative GHG impacts.

6. PROGRAM-LEVEL ENERGY IMPACT ANALYSIS

This section discusses the assessment of the Project's energy demand against the CEQA significance thresholds outlined in **Section 2**.

6.1 Threshold ENE-1: Would the Project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation?

6.1.1 Energy Requirements and Energy Use Efficiencies

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project including construction, operation, maintenance and/or removal. If appropriate the energy intensiveness of materials may be discussed.*

Construction of the proposed Project (North Site Remainder Area and the EDH Costco Project) would result in one-time energy consumption in the form of gasoline and diesel, shown in **Table 3-6**. There are no unusual characteristics that would require the use of equipment that would be more energy intensive than is used for comparable activities, or equipment that would not conform to the current emissions standards (and related fuel efficiencies).

The operational energy use of the proposed Project is summarized in **Table 3-7**. As expected, the program-level energy use would be greater than the energy use from the EDH Costco Project. However, neither the EDH Costco Project nor the Remainder Area Development would have unusual project characteristics that would require electricity, gasoline, natural gas, and diesel consumption that would be more energy intensive than is used for comparable activities, or equipment that would not conform to current emissions standards (and related fuel efficiencies). For example, CARB has adopted an approach to passenger vehicles that combines the control of smog-causing pollutants and GHG emissions into a single coordinated package of standards. The approach also includes efforts to support and accelerate the numbers of plug-in hybrids and zero-emissions vehicles in California. As such, operation of the proposed Project is expected to use decreasing amounts of fuel over time, due to advances in fuel economy.

6.1.2 Local and Regional Energy Supplies

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The effects of the project on local and regional energy supplies and on requirements for additional capacity.*

The off-road construction equipment used during Project construction are primarily diesel-fueled. (see **Table D-1** for additional details on construction of the North Site Remainder Area and Table 4-2 of the EDH Costco Project Energy Technical Report for construction of the EDH Costco Project). Additionally, the fleet mix for construction mobile sources is expected to be gasoline-powered and diesel-powered, based on the CalEEMod default fleet mix for worker, vendor, and hauling vehicles (see **Table D-2** for additional

details on the construction of the North Site Remainder Area and Table 4-4 of the EDH Costco Project Energy Technical Report for construction of the EDH Costco Project). Hence, the proposed Project is not expected to use any natural gas during construction.

As shown in **Table 3-6**, relative to annual countywide fuel usage projections, the proposed Project construction would use up to 0.02% of gasoline, 1.23% of diesel, and 0.000004% of electricity in the year when the most construction would occur (2027). Relative to annual statewide fuel usage projections, the proposed Project construction would use up to 0.00010% of gasoline, 0.00405% of diesel, and 0.00000002% of electricity in the year when the most construction would occur (2027). Because construction of the proposed Project is expected to occur in three years, fuel use during construction would also be temporary and negligible.

Table 3-9 summarizes the proposed Project's operational energy use compared to countywide and statewide fuel usage projections. The estimated electricity usage for the proposed Project operations are anticipated to be approximately 0.57% of the projected countywide demand in 2028, and 0.00272% of the statewide energy demand. The natural gas usage of the proposed Project operations are estimated to be 0.08% of the total countywide natural gas consumption and 0.00024% of the total statewide natural gas consumption. The proposed Project's anticipated gasoline usage is anticipated to be 0.68% of the countywide consumption and 0.00323% of the statewide consumption. As far as the proposed Project's diesel consumption goes, it is estimated to be 1.39% of the projected countywide consumption and 0.0045% of the statewide consumption. Based on these relative percentages, the proposed Project's operational energy usage would not have a substantial impact on the local or regional energy supplies or capacity.

6.1.3 Peak and Base Period Demands

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The effects of the project on peak and base period demands for electricity and other forms of energy.*

The proposed Project construction would only include minor pieces of electric-powered equipment and hence would not impact the peak and base period demands for electricity.

The proposed Project operation will not have a substantial impact on the peak and base period demands for electricity or other forms of energy. Further details and reasoning on the peak demand are described below.

In 2023, California's peak grid demand was 44,534 megawatts (MW).[42] PG&E recorded a peak demand of 19,995 MW in 2023.[43] In comparison, the Project's maximum demand is

[42] California ISO. California ISO Peak Load History 1998 through 2024. Available at: https://www.caiso.com/documents/californiaisopeakloadhistory.pdf. Accessed: October 2025.

[43] California Energy Commission. 2023. Electricity and Gas Demand Forecast. Available at: https://efiling.energy.ca.gov/GetDocument.aspx?tn=253660&DocumentContentId=88907. Accessed: October 2025.

expected to be approximately 1.9 MW in 2028,[44] Therefore, the proposed Project's operations will have a relatively negligible effect on statewide and PG&E peak demands.

6.1.4 Existing Energy Standards

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

The degree to which the project complies with existing energy standards.

The proposed Project construction requires use of on-road trucks for soil hauling and deliveries, and off-road equipment such as excavators, tractors/loaders/backhoes, forklifts, and graders. The construction activities would comply with the five-minute idling limit in the Commercial Motor Vehicle Idling Regulation[45] and the Off-Road Regulation.[46] Additionally, on-road trucks used during Project construction would be compliant with the requirements of the Tractor-Trailer Greenhouse Gas Regulation.[47]

The proposed Project's anticipated operational energy use is summarized in **Table 3-9**. There are no unusual project characteristics that would require the use of gasoline, diesel, natural gas, or electricity that would be more energy intensive than is used for comparable activities, equipment, or vehicles that would not conform to current emissions standards (and related fuel efficiencies). Additionally, as described in Section 5.1.4.2 of the EDH Costco Project Energy Technical Report, the proposed Project would meet or exceed the Title 24 energy efficiency standards in effect at the time of building permit application. Any passenger vehicles and trucks trips generated by the proposed Project would comply with existing and new state-wide vehicle efficiency regulations discussed further in **Section 6.1.6**. Furthermore, the proposed delivery trucks accessing the site would comply with the State's Commercial Motor Vehicle Idling Regulation, similar to the construction vehicles discussed above.

Therefore, the proposed Project will comply with all applicable energy standards and its energy impacts are less than significant.

6.1.5 Energy Resources

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

The effects of the project on energy resources.

As discussed in **Sections 6.1.2** and **6.1.3**, the proposed Project's use of energy will not have a substantial effect on statewide or regional energy resources. Hence, the proposed Project will not significantly impact energy resources, and its energy impacts are less than significant.

---

[44] This is a conservative estimate since it was derived by dividing the total electricity energy required for the proposed Project operation by the annual operating hours for the proposed Costco warehouse, though some sources of electricity would operate 24 hours per day for every day of the year.

[45] 13 CCR 2485: Airborne Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling. Available at: https://www.law.cornell.edu/regulations/california/13-CCR-2485. Accessed: October 2025.

[46] CARB. Frequently Asked Questions: Regulation for In-Use Off-Road Diesel-Fueled Fleets. Available at: https://ww2.arb.ca.gov/sites/default/files/classic/msprog/ordiesel/faq/idlepolicyfaq.pdf. Accessed: October 2025.

[47] CARB. Tractor-Trailer Greenhouse Gas Regulation. Available here: https://ww2.arb.ca.gov/our work/programs/ttghg-regulation/regulatory-and-guidance-documents. Accessed: October 2025.

6.1.6 Transportation Energy Use

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.*

Conventional gasoline, diesel, and natural gas vehicles consume gasoline, diesel, or natural gas, whereas electric vehicles (EVs) consume electricity that can be sourced by fossil fuels or renewables. EVs, including battery-electric vehicles and plug-in hybrid electric vehicles, comprise a growing fraction of the passenger vehicles on the roads in California. EV adoption is expected to increase over the upcoming decades due in part to improvements in battery technology and public initiatives and goals. This increase in EV adoption will decrease the fuel requirements due to transportation. New statewide regulations have been instated which will reduce emissions and fuel requirements from cars and trucks. Gasoline, diesel, and natural gas usage for the mobile sources associated with the proposed Project operation are expected to decrease over time as fleets become more fuel-efficient and switch to more electric-powered vehicles. Overall, the proposed Project would not result in wasteful, inefficient, or unnecessary consumption of transportation energy.

6.1.7 Summary

Based on the above analysis of each of the environmental impact factors identified in CEQA Guidelines Appendix F, the potential for the proposed Project to result in wasteful, inefficient, or unnecessary consumption of fuel or energy, and conversely to fail to incorporate energy efficiency measures into equipment use, transportation or other project features is less than significant.

6.2 Threshold ENE-2: Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

The proposed Project would comply with any applicable local and state plans, regulations, and policies for renewable energy or energy efficiency to the extent required by law. However, because project-level design features and details are not available for the potential developments in the North Site Remainder Area at the time of preparation of this program-level analysis, specific energy efficiency features for the Remainder Area Development will be described in any future applications filed with the County and the associated project-level review of potential environmental impacts under CEQA.

Furthermore, as show in Appendix A of the EDH Costco Project Energy Technical Report, the EDH Costco Project will commit to specific energy efficiency and renewable energy features, including but not limited to, meeting the Voluntary Tier 1 Electric Vehicle Charging Standards as defined in the 2025 California Green Building Standards Code,[48] installation of efficient irrigation systems and high-efficiency restroom fixtures, use of LED lamps, and use of building surface materials with greater solar reflectivity. Therefore, considered as a whole, the proposed Project would not conflict with or obstruct a state or local Plan for renewable energy or energy efficiency.

Proposed Project Land Use	Emissions Category	Emissions [1,2]	Unit
EDH Costco Project	Area Sources [3]	3.9	MT CO_2e/yr
EDH Costco Project	Energy Usage [3]	78	MT CO_2e/yr
EDH Costco Project	Mobile [3]	4,731	MT CO_2e/yr
EDH Costco Project	Water [3]	17	MT CO_2e/yr
EDH Costco Project	Waste Disposed [3]	224	MT CO_2e/yr
EDH Costco Project	Refrigerant [3]	0.13	MT CO_2e/yr
EDH Costco Project	Vegetation [3]	11	MT CO_2e/yr
EDH Costco Project	Generators [3]	9.6	MT CO_2e/yr
EDH Costco Project	On-Site Electric Vehicle Chargers [3]	-2,908	MT CO_2e/yr
North Site Remainder Area	Area Sources [4]	2.0	MT CO_2e/yr
North Site Remainder Area	Energy Usage [4]	122.9	MT CO_2e/yr
North Site Remainder Area	Mobile [4]	1,601	MT CO_2e/yr
North Site Remainder Area	Water [4]	15.1	MT CO_2e/yr
North Site Remainder Area	Waste Disposed [4]	45.2	MT CO_2e/yr
North Site Remainder Area	Refrigerant [4]	0.1	MT CO_2e/yr
North Site Remainder Area	Vegetation [4]	0.0	MT CO_2e/yr
Operational Emissions		**3,954**	**MT CO_2e/yr**
Calculated Efficiency Metric [5]		**13.04**	**MT CO_2e/1,000 sqft**
Operational GHG Efficiency Metric Threshold [6]		**26.50**	**MT CO_2e/1,000 sqft**
Exceeds Threshold?		NO	**-**

Notes:

[1] Emissions are presented as CO_2e, which include CO_2, CH_4, and N_2O emissions, weighted by their respective global warming potentials.

[2] Emissions totals may not add up due to rounding. Emissions shown as zero may be non-zero values; however, they are below a meaningful reporting level for this analysis.

[3] Obtained from Table 4-17 in the EDH Costco Project Greenhouse Gas Technical Report.

[4] Obtained from CalEEMod output file for the North Site Remainder Area Development in **Appendix A**.

[5] Efficiency metric is calculated as the total operational emissions divided by the sum of the building square footage of the regional shopping center and the building square footage of the EDH Costco Project (303,200 sqft).

[6] Placer County Thresholds of Significance - Chapter 2. Available at: https://www.placerair.org/DocumentCenter/View/2047/Chapter-2-Thresholds-of-Significance-PDF. Accessed: October 2025.

Abbreviations:

CalEEMod - CALifornia Emissions Estimator MODel

CH_4 - methane

CO_2 - carbon dioxide

CO_2e - carbon dioxide equivalents

EDH - El Dorado Hills

GHG - greenhouse gas

MT - metric tons

N_2O - nitrous oxide

sqft - square feet

yr - year

Table 3-9. Energy Resource Summary for Proposed Project Operation
El Dorado Hills Costco Project
El Dorado Hills, California

Energy Resource	Energy Consumption for the North Site Remainder Area Operation [1]	Energy Consumption for the EDH Costco Project Operation [2]	Total Energy Consumption for Proposed Project Operation [3]	El Dorado County Annual Consumption [4,5,6]	Proposed Project Operation Contribution to El Dorado County Annual Consumption (%)	California Annual Consumption [4,5,6]	Proposed Project Operation Contribution to California Annual Consumption (%)
Electricity (kWh/yr)	1,673,392	6,026,405	7,699,797	1,339,206,633	0.57%	282,782,592,309	0.00272%
Natural Gas (kBtu/yr)	1,192,913	1,423,224	2,616,137	3,196,879,463	0.08%	1,110,086,615,369	0.00024%
Gasoline (gallons/yr)	145,697	285,366	431,064	63,126,214	0.68%	13,365,596,850	0.00323%
Diesel (gallons/yr)	24,867	169,371	194,238	13,968,581	1.39%	4,312,144,863	0.00450%

Conversion Factors:

1,000,000 kWh/GWh
99,976.1 Btu/therm
1,000 Btu/kBtu

Notes:

[1] Estimated as a sum of the fuel consumption of Remainder Parcel operational sources listed in **Tables F-1, F-2,** and **F-5** through **F-9**.

[2] Obtained from Table 5-3 in the EDH Costco Energy Technical Report.

[3] Estimated as a sum of the energy consumption for operation of the North Site Remainder Area and the EDH Costco Project.

[4] Diesel and gasoline consumption data for El Dorado County and the State of California are obtained from EMFAC2021 and OFFROAD2021 for calendar year 2028.

[5] Electricity consumption data for El Dorado County and the State of California are obtained from https://www.energy.ca.gov/files/energy-consumption-data-files for calendar year 2024 as that was the most recent data available. Accessed: October 2025.

[6] Natural gas consumption data for El Dorado County and the State of California are obtained from https://www.energy.ca.gov/files/energy-consumption-data-files for calendar year 2024 as that was the most recent data available. Accessed: October 2025.

Abbreviations:

% - percent
Btu - British thermal unit
EDH - El Dorado Hills
EMFAC - EMission FACtors model
GWh - gigawatt hour
kBtu - kilo-British thermal unit
kWh - kilowatt hour
yr - year

North Site Remainder Area Custom Report

Table of Contents

1. Basic Project Information

1.1. Basic Project Information

1.2. Land Use Types

1.3. User-Selected Emission Reduction Measures by Emissions Sector

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

2.2. Construction Emissions by Year, Unmitigated

2.3. Construction Emissions by Year, Mitigated

2.4. Operations Emissions Compared Against Thresholds

2.5. Operations Emissions by Sector, Unmitigated

2.6. Operations Emissions by Sector, Mitigated

3. Construction Emissions Details

3.1. Site Preparation (2027) - Unmitigated

3.2. Site Preparation (2027) - Mitigated

3.3. Grading (2027) - Unmitigated

3.4. Grading (2027) - Mitigated

3.5. Building Construction (2027) - Unmitigated

3.6. Building Construction (2027) - Mitigated

3.7. Building Construction (2028) - Unmitigated

3.8. Building Construction (2028) - Mitigated

3.9. Paving (2028) - Unmitigated

3.10. Paving (2028) - Mitigated

3.11. Architectural Coating (2028) - Unmitigated

3.12. Architectural Coating (2028) - Mitigated

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

4.1.2. Mitigated

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

4.2.2. Electricity Emissions By Land Use - Mitigated

4.2.3. Natural Gas Emissions By Land Use - Unmitigated

4.2.4. Natural Gas Emissions By Land Use - Mitigated

4.3. Area Emissions by Source

4.3.1. Unmitigated

4.3.2. Mitigated

4.4. Water Emissions by Land Use

4.4.1. Unmitigated

4.4.2. Mitigated

4.5. Waste Emissions by Land Use

4.5.1. Unmitigated

4.5.2. Mitigated

4.6. Refrigerant Emissions by Land Use

4.6.1. Unmitigated

4.6.2. Mitigated

4.7. Offroad Emissions By Equipment Type

4.7.1. Unmitigated

4.7.2. Mitigated

4.8. Stationary Emissions By Equipment Type

4.8.1. Unmitigated

4.8.2. Mitigated

4.9. User Defined Emissions By Equipment Type

4.9.1. Unmitigated

4.9.2. Mitigated

4.10. Soil Carbon Accumulation By Vegetation Type

4.10.1. Soil Carbon Accumulation By Vegetation Type - Unmitigated

4.10.2. Above and Belowground Carbon Accumulation by Land Use Type - Unmitigated

4.10.3. Avoided and Sequestered Emissions by Species - Unmitigated

4.10.4. Soil Carbon Accumulation By Vegetation Type - Mitigated

4.10.5. Above and Belowground Carbon Accumulation by Land Use Type - Mitigated

4.10.6. Avoided and Sequestered Emissions by Species - Mitigated

5. Activity Data

5.1. Construction Schedule

5.2. Off-Road Equipment

5.2.1. Unmitigated

5.2.2. Mitigated

5.3. Construction Vehicles

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

5.5. Architectural Coatings

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

5.6.2. Construction Earthmoving Control Strategies

5.7. Construction Paving

5.8. Construction Electricity Consumption and Emissions Factors

5.9. Operational Mobile Sources

5.9.1. Unmitigated

5.9.2. Mitigated

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.1.2. Mitigated

5.10.2. Architectural Coatings

5.10.3. Landscape Equipment

5.10.4. Landscape Equipment - Mitigated

5.11. Operational Energy Consumption

5.11.1. Unmitigated

5.11.2. Mitigated

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

5.12.2. Mitigated

5.13. Operational Waste Generation

5.13.1. Unmitigated

5.13.2. Mitigated

5.14. Operational Refrigeration and Air Conditioning Equipment

5.14.1. Unmitigated

5.14.2. Mitigated

5.15. Operational Off-Road Equipment

5.15.1. Unmitigated

5.15.2. Mitigated

5.16. Stationary Sources

5.16.1. Emergency Generators and Fire Pumps

5.16.2. Process Boilers

5.17. User Defined

5.18. Vegetation

5.18.1. Land Use Change

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.1. Biomass Cover Type

5.18.1.1. Unmitigated

5.18.1.2. Mitigated

5.18.2. Sequestration

5.18.2.1. Unmitigated

5.18.2.2. Mitigated

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	North Site Remainder Area
Construction Start Date	5/18/2027
Operational Year	2028
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	9.40
Location	38.659852, -121.056799
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	406
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.29

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Regional Shopping Center	138	1000sqft	3.17	138,000	0.00	—	—	—

Parking Lot	10.6	Acre	10.6	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-5	Use Advanced Engine Tiers
Construction	C-6	Use Diesel Particulate Filters
Construction	C-13	Use Low-VOC Paints for Construction

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

Criteria Pollutants (lb/day for daily, ton/yr for annual) and GHGs (lb/day for daily, MT/yr for annual)

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

Architectural Coating	Air Compressors	1	6	37	0.48	Diesel	Average	N/A	Average	N/A

Notes:

[1] Based on CalEEMod default values.

[2] The mitigation measure requires that construction equipment greater than 50 hp used at the site shall be mitigated to meet USEPA Tier 4 Final emission standards for PM_{10} and $PM_{2.5}$. If Tier 4 Final equipment is viable but not available, all construction equipment larger than 50 horsepower used at the site shall meet USEPA emission standards for Tier 3 engines and include particulate matter emissions control equivalent to CARB Level 3 verifiable diesel emission control devices. To be conservative, this analysis assumed that off-road construction equipment larger than 50 horsepower are equipped with Tier 3 engines and DPFs for the mitigated emissions.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CARB - California Air Resources Board
DPF - Diesel Particulate Filter
hp - horsepower
N/A - not available
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
USEPA - United States Environmental Protection Agency

Table B-3. Construction Trip Assumptions - North Site Remainder Area
El Dorado Hills Costco Project
El Dorado Hills, California

Construction Phase Name	Worker Trips per Day [1,2]	Vendor Trips per Day [1,2]	Hauling Trips per Day [1,2]
Site Preparation	18	0	0
Grading	20	0	667
Building Construction	44	23	0
Paving	15	0	0
Architectural Coating	9	0	0

Notes:

[1] Trips are presented as one-way trips per day.

[2] Worker, vendor, and hauling trips are based on CalEEMod defaults. The one-way trip lengths for worker, vendor, and hauling trips are assumed to be the CalEEMod default values of 14.3 miles, 8.8 miles, and 20.0 miles, respectively.

Abbreviations:

CalEEMod - California Emissions Estimator Model

Table B-4. Construction Material Movement - North Site Remainder Area
El Dorado Hills Costco Project
El Dorado Hills, California

Construction Phase Name	Material Imported [1] (yd^3)	Material Exported [1] (yd^3)
Grading	107,000	53,000

Notes:

[1] Soil import and export quantities based on project-specific data.

Abbreviations:

yd^3 - cubic yard

Notes:

[1] Construction phases and duration are based on CalEEMod defaults. Refer to **Appendix B** for further details.

[2] Based on CalEEMod defaults.

[3] Estimated by summing up the maximum daily emissions for the construction phase. Maximum daily emissions for the Site Preparation; Grading; Building Construction; Paving; and Architectural Coating phases are obtained from **Appendix A**.

[4] For purposes of this analysis SO_X emissions are assumed to be equal to SO_2.

[5] Particulate matter emissions include exhaust emissions from off-road construction equipment, fugitive dust emissions from on-site construction activities, and exhaust/tire wear/brake wear/entrained road dust emissions from on-road vehicles associated with project construction. As noted in Section 4.2.3 of the Air Quality Technical Report, fugitive dust emissions will be controlled by watering the construction site twice daily in accordance with the EDCAQMD Rule 223-1. Particulate matter emissions presented here account for these control measures for fugitive dust emissions.

[6] Estimated by multiplying the maximum daily emissions by the number of construction days for each construction phase.

Abbreviations:

CalEEMod - CALifornia Emissions Estimator MODel
CO - carbon monoxide
EDCAQMD - El Dorado County Air Quality Management District
lb - pound
NO_x - nitrogen oxide compounds
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
ROG - reactive organic gases
SO_2 - sulfur dioxide
SO_x - sulfur oxide compounds

Grading (2027)	89.8	8,794
Building Construction (2027)	204.4	20,021
Building Construction (2028)	121.8	11,929
Paving (2028)	13.7	1,343
Architectural Coating (2028)	1.2	119

Constants:

10.21 kg CO_2/gallon diesel consumed in combustion engines [3]

1,000 kg CO_2/MT CO_2

Notes:

[1] Exhaust CO_2 emissions from off-road construction equipment used during the Site Preparation; Grading; Building Construction; Paving; and Architectural Coating construction phases that occur during remainder area development construction are obtained from the CalEEMod model run shown in **Appendix A**.

[2] Diesel consumption of off-road construction equipment during each construction phase is estimated as a ratio of the CO_2 emissions from these equipment to the CO_2 emission factor per gallon of diesel consumed.

[3] Obtained from the USEPA GHG Emission Factors Hub. Available at: https://www.epa.gov/system/files/documents/2025-01/ghg-emission-factors-hub-2025.pdf. Accessed: June 2025.

El Dorado Hills Costco Project
El Dorado Hills, California

Construction Phase Name [1]	Phase Duration [1] (days)	Worker Trip Rates [2] (one-way trips/day)	Vendor Trip Rates [2] (one-way trips/day)	Hauling Trip Number [2] (one-way trips/day)	Worker Trip Length [3] (miles/one-way trip)	Vendor Trip Length [3] (miles/one-way trip)	Hauling Trip Length [3] (miles/one-way trip)	Worker Vehicle Miles Traveled [4] (miles)	Vendor Vehicle Miles Traveled [4] (miles)	Hauling Vehicle Miles Traveled [4] (miles)	Worker Gasoline Fuel Consumption [5] (gallons)	Vendor Diesel Fuel Consumption [5] (gallons)	Hauling Diesel Fuel Consumption [5] (gallons)
Site Preparation (2027)	10	17.5	-	-	14.3	-	-	2,503	-	-	95	-	-
Grading (2027)	30	20.0	-	667	14.3	-	20.0	8,580	-	400,000	324	-	79,925
Building Construction (2027)	188	44.2	22.6	-	14.3	8.80	-	118,720	37,420	-	4,487	7,554	-
Building Construction (2028)	112	44.2	22.6	-	14.3	8.80	-	70,727	22,292	-	2,621	4,461	-
Paving (2028)	20	15.0	-	-	14.3	-	-	4,290	-	-	159	-	-
Architectural Coating (2028)	20	8.83	-	-	14.3	-	-	2,526	-	-	94	-	-

Notes:

[1] Construction phases and duration (**Table B-1**) are based on CalEEMod defaults. Refer to **Section 3** of the report for further details.

[2] The number of worker and vendor trips represent CalEEMod defaults based on the construction equipment used in each construction phase. The number of hauling trips were estimated by CalEEMod based on volume of soil that would be imported/exported during construction. Refer to **Appendix B** for further details.

[3] The trip lengths for on-road vehicles used during construction are CalEEMod default values.

[4] Estimated based on trip rates, trip length, and phase duration.

[5] Fuel consumption of on-road vehicles used during each construction phase are estimated as a product of the vehicle miles traveled by each vehicle type and its fuel consumption rate in gallons per mile.

[6] Fuel consumption rates for on-road vehicles are calculated using vehicle class-specific fuel consumption data from EMFAC2021 (see the supporting table below, which presents EMFAC2021 outputs for 2027 and 2028 in El Dorado-Mountain County), the fleet mix for each trip type (worker, vendor, and hauling), and vehicle miles traveled. The fleet mix for the worker, vendor, and hauling trucks are based on CalEEMod defaults. Worker vehicles are assumed to be gasoline fueled and include light duty automobiles and trucks (25% LDA, 50% LDT1, 25% LDT2). Vendor vehicles are assumed to be diesel fueled and include heavy heavy-duty trucks and medium heavy duty trucks (50% HHDT and 50% MHDT). Hauling vehicles are assumed to be diesel fueled and include heavy heavy-duty trucks (100% HHDT).

Fuel Consumption Rates by Vehicle Type: [6]

Worker Vehicles in 2027:	0.0378 gallons/mile
Worker Vehicles in 2028:	0.0371 gallons/mile
Vendor Vehicles in 2027:	0.2019 gallons/mile
Vendor Vehicles in 2028:	0.2001 gallons/mile
Haul Trucks in 2027:	0.1998 gallons/mile

Abbreviations:

CalEEMod - California Emissions Estimator Model
EMFAC - EMission FACtors model
HHDT - heavy heavy-duty trucks
LDA - light-duty automobile
LDT - light-duty truck
MHDT - medium heavy-duty trucks

Table E-1. Operational Mobile Source Assumptions - North Site Remainder Area
El Dorado Hills Costco Project
El Dorado Hills, California

Total daily trips [1,2]	2,536	trips/day
Average trip length [1]	4.52	miles
Daily VMT [1,2]	11,463	miles/day

Notes:

[1] Obtained from the July 2025 El Dorado Costco CEQA Analysis report prepared by Kittelson & Associates, Inc.

[2] For purposes of this analysis the daily trip and VMT assumptions were used for both weekdays and weekends.

Abbreviations:

CEQA - California Environmental Quality Act

VMT - vehicle miles travelled

Table E-2. Reactive Organic Gas Emission Factor for Consumer Product Usage in El Dorado County for Calendar Year 2028

El Dorado Hills Costco Project
El Dorado Hills, California

Countywide ROG Inventory for Consumer Product Usage [1] (tons/day)	County Population [2]	Total Building Square Footage in the County [3] (sqft)	ROG Emission Factors for Consumer Product Usage [4] (lb/sqft/day)
1.354	188,380	220,388,409	1.23E-05

Notes:

[1] ROG consumer products inventory for El Dorado County in calendar year 2028 was obtained from the California Emissions Projection Analysis Model, CEPAM2019v1.04. Available at: https://ww2.arb.ca.gov/applications/cepam2019v1-04-standard-emission-tool. Accessed: May 2025.

[2] Population estimates for El Dorado County in 2020 and 2028 were obtained from the State of California Department of Finance website. Available at: https://dof.ca.gov/forecasting/demographics/projections/. Accessed: May 2025.

[3] Total building square footage in 2028 was estimated as the product of the countywide building square footage per person in 2020 multiplied by the population projection for El Dorado County in calendar Year 2028.

[4] The consumer product ROG emission factor for consumer product usage is calculated as the ratio of the countywide ROG inventory for consumer product usage to the total building square footage in the county.

[5] Total building square footage in El Dorado County for 2020 was obtained from FEMA HAZUS-MH software (version 7.0). Available at: https://msc.fema.gov/portal/resources/hazus. Accessed: May 2025.

Constants:

El Dorado County Population [2] in Calendar Year 2020:	191,522
Total Building Square Footage [5] in El Dorado County in 2020:	224,064,279

Conversion Factor:

2000 lb/ton

Abbreviations:

FEMA - Federal Emergency Management Agency
lb - pound
ROG - reactive organic compounds
sqft - square foot

Table E-3. Utility GHG Emission Factor Associated with Renewable Portfolio Standard
El Dorado Hills Costco Project
El Dorado Hills, California

Energy Generated (MWh)

	2020	2021	2022	Average	Units
CO_2 Intensity Factor per Total Energy Generated [1]	160	98	56	105	lbs CO_2/MWh generated
% of Total Energy From Renewables [2]	35.1%	47.7%	38.5%	40.4%	
CO_2 Intensity Factor per Total Non-Renewable Energy [3]	247	187	91	176	lbs CO_2/MWh generated

Calculated Intensity Factors for Total Energy Delivered [4]

2027 RPS (52% Renewable Energy)	118.3	89.9	43.7	84.3	lbs CO_2/MWh generated
2028	111.8	84.9	41.3	79.7	lbs CO_2/MWh generated
2030 RPS (60% Renewable Energy)	98.6	75.0	36.4	70.3	lbs CO_2/MWh generated

Notes:

[1] Obtained from PG&E's 2024 Corporate Sustainability Reports. Note that 2023 values are not provided because they are subject to regulatory approval and verification at the time of this report preparation.

[2] Obtained from PG&E's 2021, 2022, and 2023 Corporate Sustainability Reports.

[3] The emissions metric presented here is calculated based on the total CO_2 emissions for total energy generated divided by the energy generated from non-renewable sources.

[4] The intensity factors for default RPS assumption are estimated multiplying the maximum allowable percentage of non-renewable energy per RPS and the CO_2 intensity factor per total non-renewable energy calculated above. The RPS minimum targets for renewable energy delivered are 52% for 2027 and 60% for 2030 per Senate Bill 100. The estimate provided here assumes that renewable energy sources do not result in any CO_2 emissions.

Abbreviations:

CO_2 - carbon dioxide

GHG - greenhouse gases

lbs - pounds

MWh - megawatt-hour

PG&E - Pacific Gas and Electric

RPS - Renewable Portfolio Standards

Table F-5. Operational Mobile Source Gasoline Consumption for the North Site Remainder Area
El Dorado Hills Costco Project
El Dorado Hills, California

Mobile Source Category	Mobile Source Activity [1] (miles/yr)	Mobile Source Activity Associated with Gasoline Combustion [2] (miles/yr)	Gasoline Consumption [3] (gallons/yr)
Gasoline Vehicles	3,658,816	3,658,816	144,096
Plug in Hybrid Vehicles	85,324	38,323	1,372

Constants:

Average fuel efficiency of gasoline vehicles in 2028 [4]	25 miles per gallon
Average fuel efficiency of plug-in hybrid electric vehicles in 2028 [4]	28 miles per gallon

Notes:

[1] The annual vehicle miles travelled by operational mobile sources (obtained from the CalEEMod model run in **Appendix A**) was apportioned into gasoline and plug-in-hybrid vehicle technology categories based on the operational vehicle fleet mix shown in **Table F-4.**

[2] The vehicle miles travelled associated with gasoline combustion for each vehicle technology category was estimated based on EMFAC default assumptions for gasoline and plug-in hybrid vehicles operating in El Dorado (MC) sub-area in calendar year 2028.

[3] Gasoline consumption of vehicles are estimated as a ratio of the vehicle miles traveled associated with gasoline combustion for each vehicle technology category and its average fuel efficiency in miles per gallon.

[4] The average fuel efficiency for each gasoline vehicle technology category operating in for El Dorado (MC) sub-area in calendar year 2028 is obtained from EMFAC2021.

Abbreviations:

CalEEMod - CALifornia Emissions Estimator MODel

EMFAC - EMission FACtors model

MC - Mountain County

yr - year

Table F-6. Operational Mobile Source Natural Gas Consumption for the North Site Remainder Area
El Dorado Hills Costco Project
El Dorado Hills, California

Mobile Source Category	Mobile Source Activity [1] (miles/yr)	Natural Gas Consumption [2] (kBtu/yr)
Natural Gas Vehicles	102	2,580

Constants:

Average fuel efficiency of natural gas vehicles [3] 5.73 miles per diesel equivalent gallon

Conversion Factors:[4,5]

139.3 scf of CNG per diesel equivalent gallon

1.039 kBtu per cubic foot of NG

Notes:

[1] The annual vehicle miles travelled by operational mobile sources (obtained from the CalEEMod model run in **Appendix A**) was apportioned into natural gas vehicle technology based on the operational vehicle fleet mix shown in **Table F-4**.

[2] Fuel consumption for natural gas vehicles is estimated as a ratio of vehicle miles traveled to the average fuel efficiency of natural gas vehicles.

[3] The average fuel efficiency for natural gas vehicles operating in El Dorado (MC) sub-area in calendar year 2028 is obtained from EMFAC2021.

[4] Scf of CNG per diesel equivalent gallon was obtained from the Alternative Fuels Data Center Gasoline and Diesel Gallon Equivalency Methodology. Available at: https://afdc.energy.gov/fuels/equivalency-methodology. Accessed: June 2025.

[5] kBtu per cubic foot of NG was obtained from the NRG Energy Conversion Calculator. Available at: https://www.nrg.com/resources/energy-tools/energy-conversion-calculator.html. Accessed: June 2025.

Abbreviations:

CalEEMod - CALifornia Emissions Estimator MODel
CNG - compressed natural gas
EMFAC - EMission FACtors model
kBtu - kilo-British thermal unit
MC - Mountain County
NG - natural gas
scf - standard cubic feet
yr - year

Table F-7. Operational Mobile Source Diesel Consumption for the North Site Remainder Area
El Dorado Hills Costco Project
El Dorado Hills, California

Mobile Source Category	Mobile Source Activity [1] (miles/yr)	Diesel Consumption [2] (gallons/yr)
Diesel Vehicles	268,259	24,867

Constants:

Average fuel efficiency of diesel vehicles [3] 10.79 miles per gallon

Notes:

[1] The annual vehicle miles travelled by operational mobile sources (obtained from the CalEEMod model run in **Appendix A**) was apportioned into diesel vehicle technology based on the operational vehicle fleet mix shown in **Table F-4**.

[2] Fuel consumption for diesel vehicles is estimated as a ratio of vehicle miles traveled to the average fuel efficiency of diesel vehicles.

[3] The average fuel efficiency for diesel vehicles operating in El Dorado (MC) sub-area in calendar year 2028 is obtained from EMFAC2021.

Abbreviations:

EXECUTIVE SUMMARY

HELIX Environmental Planning, Inc. (HELIX) conducted a Biological Resources Assessment (BRA) on January 9, 2025, for the Costco El Dorado Hills Project located within the unincorporated town of El Dorado Hills, El Dorado County, California. The 36.94-acre Study Area is situated in Township 9 North, Range 8 East, Sections 1 and 2, and is depicted on the U.S. Geological Survey (USGS) *Clarksville*, *California* 7.5-minute quadrangle map. The approximate center of the Study Area is at latitude 38.66200160 and longitude -121.0570744 (Study Area).

The purpose of this BRA is to assess general biological resources that occur within the Study Area, the suitability of habitats to support special-status plant and wildlife species, the presence of sensitive vegetation communities and/or habitats, and to provide recommendations for regulatory permitting and/or further analysis that may be required to facilitate the initiation of development activities planned for the Study Area.

Biological communities present within the Study Area include annual grassland (29.45 acres), purple needlegrass grassland (0.86 acre), valley foothill riparian (1.45 acres), valley oak woodland (0.34 acre), ruderal/disturbed (3.82 acres), seasonal wetland (0.19 acre), seep (0.01 acre), wetland swale (0.01 acre), ephemeral drainage (0.23 acre), intermittent drainage (0.36 acre), and perennial drainage (0.22 acre).The Study Area is separated into three portions by Silva Valley Parkway and Clarksville Road. A former home site is located on the southern portion of the Study Area and a large part of the northern portion was used to stockpile soil during the construction of the adjacent Silva Valley Parkway – U.S. Highway 50 Interchange Project. Land uses surrounding the Study Area include an elementary school, residential housing, and U.S. Highway 50.

Known or potential biological constraints in the Study Area include the following:

- Potential habitat for special-status plants including Sanford's arrowhead (*Sagittaria sanfordii*);
- Potential habitat for special-status invertebrates including Crotch's bumble bee (*Bombus crotchii*) and monarch butterfly (*Danaus plexippus*);
- Potential habitat for special-status amphibians including western spadefoot (*Spea hammondii*);
- Potential habitat for special-status reptiles including northwestern pond turtle (*Actinemys marmorata*) and coast horned lizard (*Phrynosoma blainvillii*);
- Potential habitat for migratory birds and raptors such as Cooper's hawk (*Astur cooperii*), tricolored blackbird (*Agelaius tricolor*), grasshopper sparrow (*Ammodramus savannarum*), burrowing owl (*Athene cunicularia*), Swainson's hawk (*Buteo swainsoni*), white-tailed kite (*Elanus leucurus*), California black rail (*Laterallus jamaicensis coturniculus*), and purple martin (*Progne subis*);
- Potential roosting habitat for special-status bats including pallid bat (*Antrozous pallidus*);
- Potential habitat for special-status mammals including American badger (*Taxidea taxus*);

- Purple needlegrass grassland sensitive natural community;
- Protected oak trees and oak woodland canopy; and
- Aquatic resources and riparian habitat that may be considered waters of the U.S. and/or State or regulated under California Department of Fish and Wildlife (CDFW) Section 1600.

1.0 INTRODUCTION

This report summarizes the findings of a Biological Resources Assessment (BRA) completed by HELIX Environmental Planning, Inc. (HELIX) for the 36.94-acre Costco El Dorado Hills Study Area located in the unincorporated town of El Dorado Hills, El Dorado County, California. This document addresses physical features, plant communities present, and common plant and wildlife species occurring or potentially occurring in the Study Area. Habitats within the Study Area are assessed for their suitability to support special-status species, sensitive habitats are identified and quantified, and recommendations are provided for regulatory permitting and/or further analysis required before development activities.

1.1 PROJECT LOCATION

The 36.94-acre Study Area is located in El Dorado County adjacent to U.S. Highway 50 immediately east of Silva Valley Parkway and north of Tong Road. The Study Area is located in Township 9 North, Range 8 East, Sections 1 and 2, and is depicted on the U.S. Geological Survey (USGS) *Clarksville*, *California* 7.5-minute quadrangle map. (Figure 1, *Site and Vicinity Map*). The approximate center of the Study Area is at latitude 38.6600160 and longitude -121.0570744. The 20.34-acre Study Area is contained within the Study Area.

1.2 PROJECT DESCRIPTION

The proposed project would include the construction of a Costco Wholesale Warehouse and Costco Fuel Station including associated parking, utilities, and storm water management facilities as well as multiple points of access, and a new traffic signal on Silva Valley Parkway. The fuel station will be situated within a portion of the north site. The remainder of the north site is not currently proposed for development.

The Study Area is comprised of portions of Assessor's Parcel Numbers (APNs) 122-720-002, 122-720-003, 122-720-018, 122-720-019, 122-720-020, and 122-720-021.

2.0 REGULATORY SETTING

Federal, state, and local environmental laws, regulations, and policies relevant to the California Environmental Quality Act (CEQA) review process are summarized below. The applicable CEQA significance criteria are also included in this section.

2.1 FEDERAL REGULATIONS

2.1.1 Federal Endangered Species Act

The U.S. Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction. FESA is intended to operate with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend.

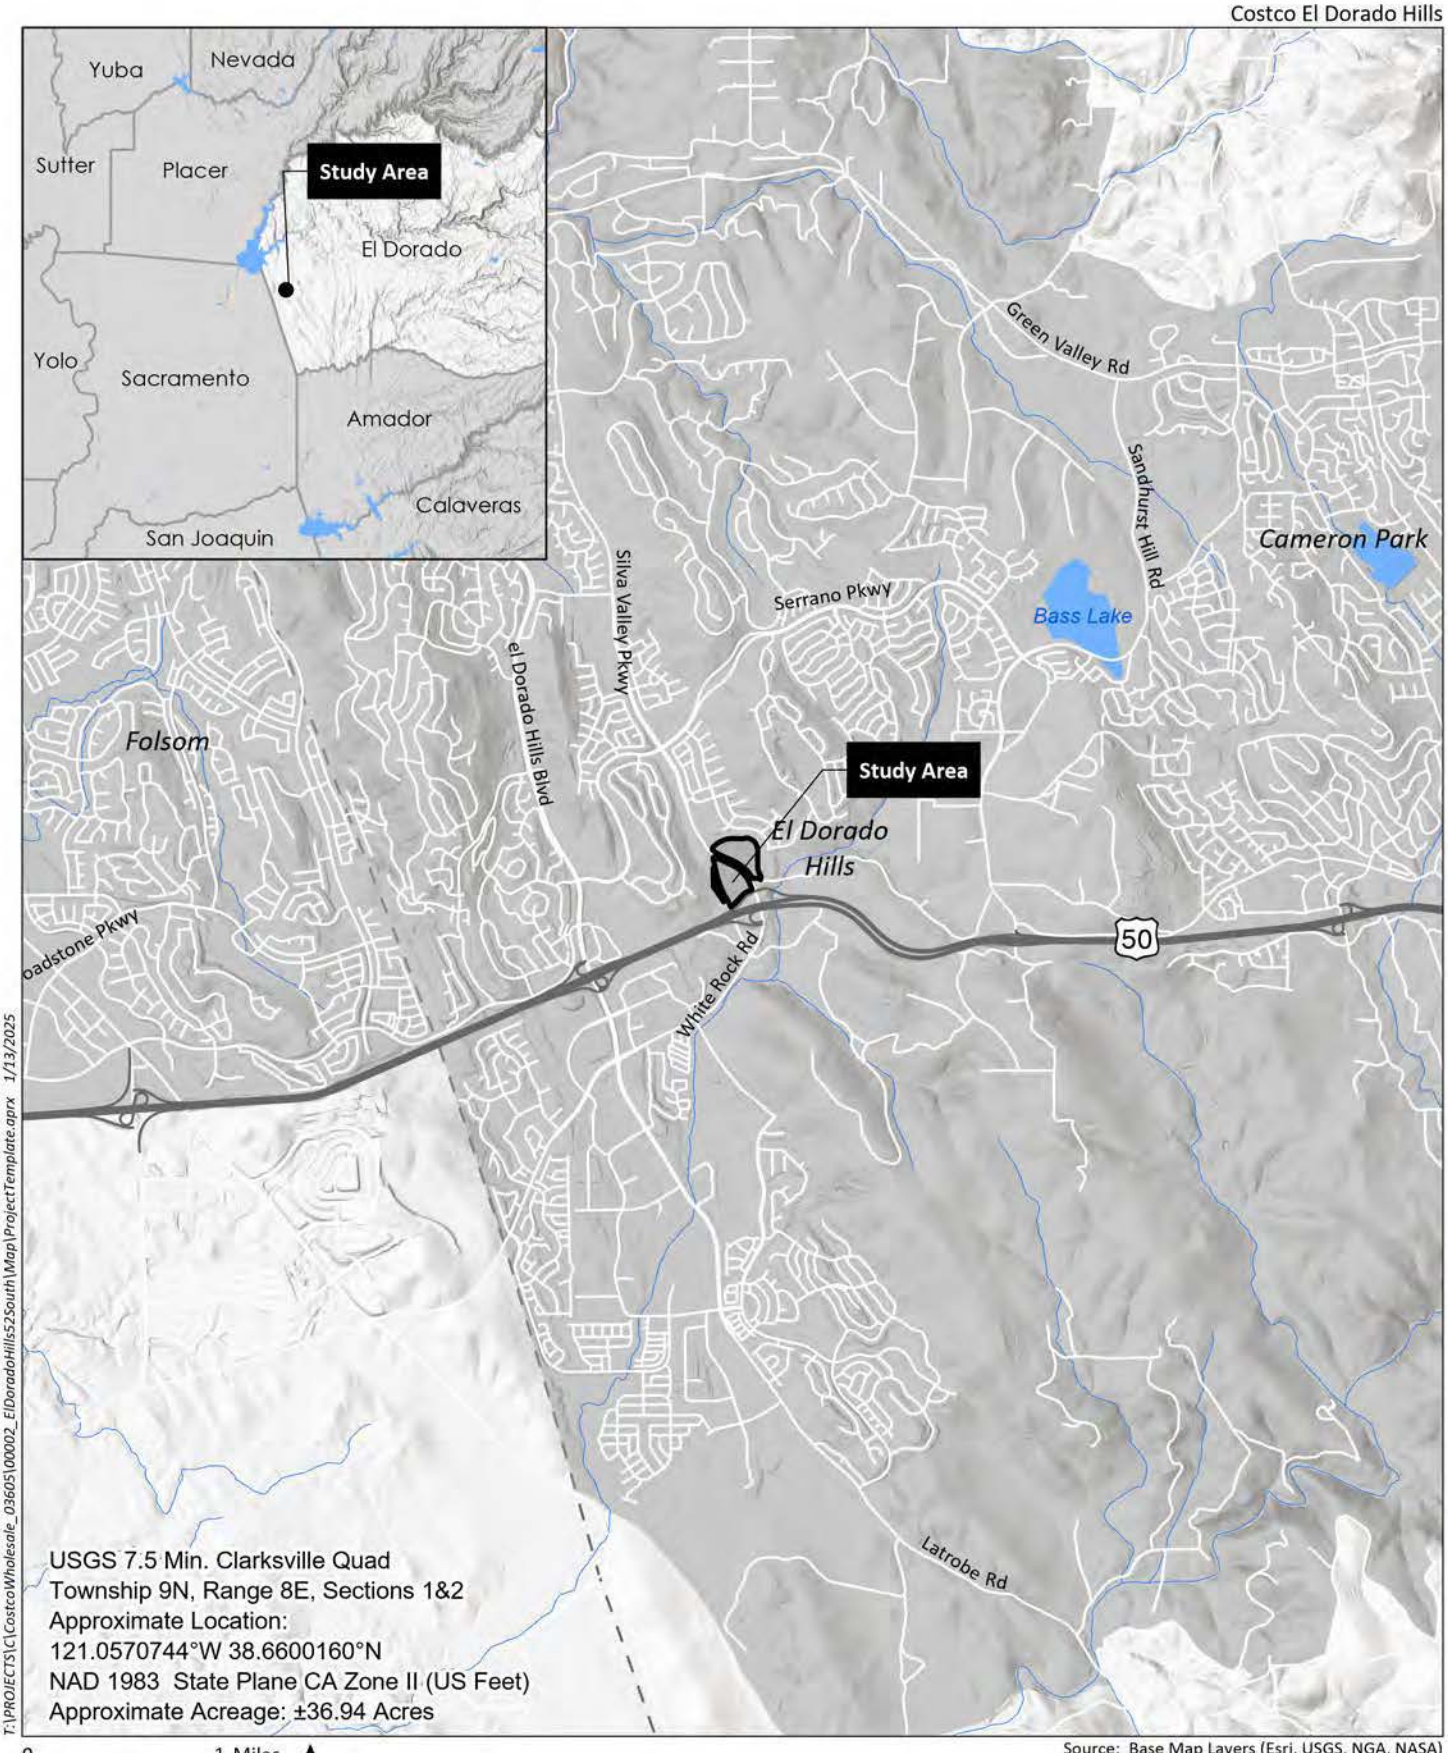
FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting

wildlife species or any attempt to engage in such conduct (FESA Section 3 [(3) (19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 Code of Federal Regulations [CFR] §17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR §17.3). Actions that result in take can result in civil or criminal penalties.

In the context of the proposed project, FESA consultation with the U.S. Fish and Wildlife Service (USFWS) or the National Marine Fisheries Service (NMFS) would be initiated if development resulted in take of a threatened or endangered species or if issuance of a Section 404 permit or other federal agency action could result in take of an endangered species or adversely modify critical habitat of such a species.

2.1.2 Migratory Bird Treaty Act

Raptors (birds of prey), migratory birds, and other avian species are protected by several state and federal laws. The federal Migratory Bird Treaty Act (MBTA) prohibits the killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of Interior.



2.1.3 The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (Eagle Act) prohibits the taking or possession of and commerce in bald and golden eagles with limited exceptions. Under the Eagle Act, it is a violation to "*take, possess, sell, purchase, barter, offer to sell, transport, export or import, at any time or in any manner, any bald eagle commonly known as the American eagle, or golden eagle, alive or dead, or any part, nest, or egg, thereof.*" Take is defined to include pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest, and disturb. Disturb is further defined in 50 CFR Part 22.3 as "*to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available (1) injury to an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior.*"

2.2 STATE JURISDICTION

2.2.1 California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to the FESA but pertains to State-listed endangered and threatened species. CESA requires state agencies to consult with the California Department of Fish and Wildlife (CDFW), when preparing CEQA documents. The purpose is to ensure that the State lead agency actions do not jeopardize the continued existence of a listed species or result in the destruction, or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code [FGC] §2080). CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur, and allows CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows CDFW to authorize exceptions to the State's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (FGC § 2081).

HELIX Environmental Planning

Site and Vicinity Map

Figure 1

2.2.2 California Department of Fish and Game Codes

California Fish and Game Code Sections 3503 and 3800 prohibit the possession, take, or needless destruction of birds, their nests, and eggs, and the salvage of dead nongame birds. California Fish and Game Code Subsection 3503.5 protects all birds in the orders of Falconiformes and Strigiformes (birds of prey). Fish and Game Code Section 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Bird Treaty Act. The Attorney General of California has released an opinion that the Fish and Game Code prohibits incidental take.

2.2.3 Native Plant Protection Act

The Native Plant Protection Act (NPPA), enacted in 1977, allows the Fish and Game Commission to designate plants as rare or endangered. There are 64 species, subspecies, and varieties of plants protected under the NPPA. The NPPA prohibits take of endangered or rare native plants, with some exceptions for agricultural and nursery operations and emergencies. Vegetation removal from canals, roads, and other sites, changes in land use, and certain other situations require proper advance notification to CDFW.

2.2.4 California Environmental Quality Act

Under the California Environmental Quality Act of 1970 (CEQA; Public Resources Code Section 21000 et seq.), lead agencies analyze whether projects would have a substantial adverse effect on a candidate, sensitive, or special-status species (Public Resources Code Section 21001[c]). These "special-status" species generally include those listed under FESA and CESA, and species that are not currently protected by statute or regulation but would be considered rare, threatened, or endangered under the criteria included in CEQA Guidelines Section 15380. Therefore, species that are considered rare are addressed under CEQA regardless of whether they are afforded protection through any other statute or regulation. The California Native Plant Society (CNPS) inventories the native flora of California and ranks species according to rarity; plants ranked as 1A, 1B, 2A, 2B, and 3 are generally considered special-status species under CEQA.[1]

Although threatened and endangered species are protected by specific federal and state statutes, CEQA Guidelines Section 15380(d) provides that a species not listed on the federal or state list of protected species may be considered rare if it can be shown to meet certain specified criteria. These criteria have been modeled after the definition in FESA and the section of the California Fish and Game Code dealing with rare or endangered plants and animals.

2.2.5 Nesting Birds

California Fish and Game Code Sections 3503 and 3800 prohibit the possession, take, or needless destruction of birds, their nests, and eggs, and the salvage of dead nongame birds. California Fish and Game Code Subsection 3503.5 protects all birds in the orders of Falconiformes and Strigiformes (birds of prey). Fish and Game Code Section 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the Migratory Bird Treaty Act or any part of such migratory nongame

[1] The California Rare Plant Rank system can be found at: http://www.cnps.org/cnps/rareplants/ranking.php.

bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the Migratory Bird Treaty Act. The Attorney General of California has released an opinion that the Fish and Game Code prohibits incidental take.

2.3 JURISDICTIONAL WATERS

2.3.1 Federal Jurisdiction

On May 25, 2023, the United States (U.S.) Supreme Court issued a decision in the case of *Sackett v. Environmental Protection Agency* (Supreme Court of the United States 2023), which will ultimately influence how federal waters are defined. The May 25, 2023, Supreme Court decision in *Sackett v. Environmental Protection Agency* determined that "the CWA extends to only those 'wetlands with a continuous surface connection to bodies that are "waters of the U.S." in their own right,' so that they are 'indistinguishable' from those waters." The U.S. Environmental Protection Agency (USEPA) and the U.S. Army Corps of Engineers (USACE) after review of the decision issued a final rule to replace the 2023 rule that amends the "Revised Definition of "Waters of the U.S." to conform key aspects of the regulatory text to the U.S. Supreme Court's May 25, 2023, decision in the case of *Sackett v. Environmental Protection Agency*.

Unless considered an exempt activity under Section 404(f) of the Federal Clean Water Act, any person, firm, or agency planning to alter or work in "waters of the U.S.," including the discharge of dredged or fill material, must first obtain authorization from the USACE under Section 404 of the Clean Water Act (CWA; 33 United States Code [USC] 1344). Permits, licenses, variances, or similar authorization may also be required by other federal, state, and local statutes. Section 10 of the Rivers and Harbors Act prohibits the obstruction or alteration of navigable waters of the U.S. without a permit from USACE (33 USC 403). Activities exempted under Section 404(f) are not exempted within navigable waters under Section 10.

The Clean Water Act (33 USC 1251-1376) provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters.

Section 401 requires that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the U.S. obtain a state certification that the discharge complies with other provisions of CWA. The Regional Water Quality Control Board (RWQCB) administers the certification program in California and may require State Water Quality Certification before other permits are issued.

Section 402 establishes a permitting system for the discharge of any pollutant (except dredged or fill material) into waters of the U.S.

Section 404 establishes a permit program administered by USACE that regulates the discharge of dredged or fill material into waters of the U.S. (including wetlands). Implementing regulations by USACE are found at 33 CFR Parts 320-332. The Section 404 (b)(1) Guidelines were developed by the USEPA in conjunction with USACE (40 CFR Part 230), allowing the discharge of dredged or fill material for non-water dependent uses into special aquatic sites only if there were no practicable alternative that would have less adverse impacts.

2.3.2 State Jurisdiction

2.3.2.1 Regional Water Quality Control Board

Any action requiring a CWA Section 404 permit, or a Rivers and Harbors Act Section 10 permit, must also obtain a CWA Section 401 Water Quality Certification. The State of California Water Quality Certification (WQC) Program was formally initiated by the State Water Resources Control Board (SWRCB) in 1990 under the requirements stipulated by section 401 of the Federal CWA. Although the CWA is a Federal law, Section 401 of the CWA recognizes that states have the primary authority and responsibility for setting water quality standards. In California, under Section 401, the State and Regional Water Boards are the authorities that certify that the issuance of a federal license or permit does not violate California's water quality standards (i.e., that they do not violate Porter-Cologne and the Water Code). The WQC Program currently issues the WQC for discharges requiring USACE's permits for fill and dredge discharges within waters of the U.S. and now also implements the State's wetland protection and hydromodification regulation program under the Porter-Cologne Water Quality Control Act.

On May 28, 2020, the SWRCB implemented the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures) for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters and Enclosed Bays and Estuaries and Ocean Waters of California (SWRCB 2019). The Procedures consist of four major elements:

I. A wetland definition;

II. A framework for determining if a feature that meets the wetland definition is a water of the State;

III. Wetland delineation procedures; and

IV. Procedures for the submittal, review, and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities.

Under the Procedures and the State Water Code (Water Code §13050[e]), "waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the State." Unless excluded by the Procedures, any activity that could result in discharge of dredged or fill material to waters of the State, which includes waters of the U.S. and non-federal waters of the State, requires filing of an application under the Procedures.

More specifically, a wetland is defined as: "*An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation*." The wetland definition encompasses the full range of wetland types commonly recognized in California, including some features not protected under federal law, and reflects current scientific understanding of the formation and functioning of wetlands (SWRCB 2019).

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Water Code Section 13000 *et seq*.) is California's statutory authority for the protection of water quality in conjunction with the federal CWA. The Porter-Cologne Act requires the SWRCB and RWQCBs under CWA to adopt and periodically update water quality control plans or basin plans. Basin plans are plans in which beneficial uses, water quality objectives, and implementation programs are established for each of the nine regions in California. The

Porter-Cologne Act also requires dischargers of pollutants or dredged or fill material to notify the RWQCBs of such activities by filing Reports of Waste Discharge and authorizes the SWRCB and RWQCBs to issue and enforce waste discharge requirements, National Pollution Discharge Elimination System (NPDES) permits, Section 401 water quality certifications, or other approvals.

2.3.2.2 California Department of Fish and Wildlife

CDFW is a trustee agency that has jurisdiction under Section 1600 *et seq.* of the California FGC. Under Sections 1602 and 1603, a private party must notify CDFW if a proposed project will "*substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds…except when the department has been notified pursuant to Section 1601.*" Additionally, CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over four inches in diameter at breast height (DBH). If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow the protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends submitting an application for a Streambed Alteration Agreement (SAA) for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater.

2.4 CEQA SIGNIFICANCE

Section 15064.7 of the State CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely on the guidance provided by the expanded Initial Study Checklist, contained in Appendix G of the State CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these examples, impacts to biological resources would normally be considered significant if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS;

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations, or by CDFW or USFWS;

- Have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and

- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish, or result in the loss of, an important biological resource, or those that would obviously conflict with local, state, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant, according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

2.4.1 California Native Plant Society

The CNPS maintains a rank of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the *Inventory of Rare and Endangered Vascular Plants of California*. Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS Rare Plant Ranking System:

Rank 1A: Plants presumed Extinct in California and either rare or extinct elsewhere

Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere

Rank 2A: Plants presumed extirpated in California but common elsewhere

Rank 2B: Plants Rare, Threatened, or Endangered in California, but more common elsewhere

Rank 3: Plants about which we need more information – A Review List

Rank 4: Plants of limited distribution – A Watch List

All plants appearing on CNPS Rank 1 or 2 are considered to meet CEQA Guidelines Section 15380 criteria. While only some of the plants ranked 3 and 4 meet the definitions of threatened or endangered species, the CNPS recommends that all Rank 3 and Rank 4 plants be evaluated for consideration under CEQA. Furthermore, the CNPS Rare Plant Rankings include levels of threat for each species. These threat ranks include the following:

0.1 -Seriously threatened in California (over 80 percent of occurrences threatened/high degree and immediacy of threat);

0.2 - Moderately threatened in California (20 to 80 percent occurrences threatened/moderate degree and immediacy of threat); and

0.3 - Not very threatened in California (less than 20 percent of occurrences threatened/low degree and immediacy of threat or no current threats known).

Threat ranks do not designate a change of environmental protections, so that each species (i.e., California Rare Plant Rank [CRPR] 1B.1, CRPR 1B.2, CRPR 1B.3, etc.) should be fully considered during preparation of environmental documents under the CEQA process.

2.4.2 California Department of Fish and Wildlife Species of Concern

Some additional fish, amphibian, reptile, bird, and mammal species may receive consideration by CDFW and lead agencies during the CEQA process, in addition to species that are formally listed under FESA and CESA or are fully protected. These species are included on the *Special Animals List*, which is maintained by CDFW. This list tracks species in California whose numbers, reproductive success, or habitat may be in decline. In addition to "Species of Special Concern" (SSC), the *Special Animals List* includes species that are tracked in the California Natural Diversity Database (CNDDB) but warrant no legal protection. These species are identified as "California Special Animals" (CSA).

2.5 EL DORADO COUNTY POLICIES AND REGULATIONS

2.5.1 General Plan

In addition to federal and State regulations described above, the El Dorado County Adopted General Plan (General Plan) includes goals, objectives, and policies regarding biological resources within the County limits (El Dorado County 2018). Sections of the General Plan regarding biological resources can be found under the Conservation and Open Space Element and applicable sections to the Project are included below:

Conservation Of Biological Resources

Goal 7.4: Wildlife and Vegetation Resources

Identify, conserve, and manage wildlife, wildlife habitat, fisheries, and vegetation resources of significant biological, ecological, and recreational value.

Objective 7.4.2: Identify and Protect Resources

Identification and protection, where feasible, of critical fish and wildlife habitat including deer winter, summer, and fawning ranges; deer migration routes; stream and river riparian habitat; lake shore habitat; fish spawning areas; wetlands; wildlife corridors; and diverse wildlife habitat.

- **Policy 7.4.2.1:** The County will coordinate wildlife and vegetation protection programs with appropriate Federal and State agencies.

- **Policy 7.4.2.2:** The County shall continue to support the Noxious Weed Management Group in its efforts to reduce and eliminate noxious weed infestations to protect native habitats and to reduce fire hazards.

- **Policy 7.4.2.3:** Consistent with Policy 9.1.3.1 of the Parks and Recreation Element, low impact uses such as trails and linear parks may be provided within river and stream buffers if all applicable mitigation measures are incorporated into the design.

- **Policy 7.4.2.4:** Protect and preserve wildlife habitat corridors within public parks and natural resource protection areas to allow for wildlife use. Recreational uses within these areas shall be limited to those activities that do not require grading or vegetation removal.

- **Policy 7.4.2.5:** Setbacks from all rivers, streams, and lakes shall be included in the Zoning Ordinance for all ministerial and discretionary development projects.

- **Policy 7.4.2.8:** Conserve contiguous blocks of important habitat to offset the effects of increased habitat loss and fragmentation elsewhere in the County through a Biological Resource Mitigation Program (Program). The Program will result in the conservation of:

    1. Habitats that support special status species;
    2. Aquatic environments including streams, rivers, and lakes;
    3. Wetland and riparian habitat;
    4. Important habitat for migratory deer herds; and
    5. Large expanses of native vegetation.

2.5.2 Oak Resources Management Plan

The County of El Dorado (County) adopted the Oak Resources Management Plan (ORMP) on October 24, 2017, and the ORMP went into effect on November 24, 2017. The ORMP designates three classes of protected oak resources:

1. Oak stands with a greater than 10 percent canopy cover or that may have historically supported greater than 10 percent canopy cover;

2. Heritage Trees, defined as any live native oak tree of the genus *Quercus* (including blue oak [*Quercus douglasii*], valley oak [*Quercus lobata*], California black oak [*Quercus kelloggii*], interior live oak [*Quercus wislizeni*], canyon live oak [*Quercus chrysolepis*], Oregon oak [*Quercus garryana*], oracle oak [*Quercus x morehus*], or hybrids thereof) with a single main trunk measuring 36 inches DBH or greater, or with a multiple trunk with an aggregate trunk diameter measuring 36 inches or greater (a tree removal permit shall be required for removal of any Heritage Tree, regardless of location within or outside of an oak woodland); and

3. Individual oak trees, defined as native oak trees with a single main trunk measuring greater than six but less than 36 inches DBH or with a multiple trunk with an aggregate trunk diameter measuring greater than ten inches DBH and is not a Heritage Tree.

The ORMP recognizes six oak woodland types: blue oak woodland, blue oak-foothill pine, coastal oak woodland, montane hardwood, montane hardwood-conifer, and valley oak woodland. An oak woodland removal permit is required prior to removal of oak trees that are part of an oak woodland and an oak tree removal permit is required prior to removal of Heritage Trees and individual oak trees. Mitigation for impacts to oak woodlands is based on the total area impacted, mitigation ratios are outlined in Table 1, *Oak Woodland Mitigation*.

Table 1
OAK WOODLAND MITIGATION

Percent of Oak Woodland Impact	Oak Woodland Mitigation Ratio
0-50 %	1:1
50.1-75%	1.5:1
75.1-100%	2:1

Mitigation for removal of Heritage Trees or individual oak trees requires on- or off-site replacement planting or payment of in-lieu fees, respectively, to the number of trunk inches removed. Replacement requirements are outlined in Table 2, *Oak Tree Replacement Quantities,* for impacts to individual oak trees.

Table 2
OAK TREE REPLACEMENT QUANTITIES

Replacement Tree Size	# of Trees Required Per Inch of Trunk Diameter Removed
Acorn	3
1-gallon/Tree Pot 4	2
5-gallon	1.5
15-gallon	1

Mitigation may be completed with a combination of the following options: acquisition of an off-site conservation easement, payment of in-lieu fees, or either on- or off-site replacement planting of up to 50 percent of the required mitigation area. Any oak woodland preserved on-site and all mitigation planting areas must be protected in perpetuity through deed restrictions or a conservation easement.

3.0 METHODS

3.1 DATABASE AND LITERATURE REVIEW

Before performing the field survey for this BRA, background research was conducted to inform and create target lists to focus the survey efforts. Accessible information in public databases pertaining to natural resources in the region of the Study Area was queried. The following site-specific published information was reviewed for this BRA:

- California Department of Fish and Wildlife (CDFW). 2025. *California Natural Diversity Database* (CNDDB). For *Clarksville, Rocklin, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek,* and *Folsom* USGS 7.5-minute series quadrangles, Sacramento, CA. [Accessed January 2, 2025];

- California Native Plant Society (CNPS). 2025. *Inventory of Rare and Endangered Plants* (online edition, v8-03 0.39) For *Clarksville, Rocklin, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek,* and *Folsom* USGS 7.5-minute series quadrangles, Sacramento, CA. [Accessed January 2, 2025];

- U.S. Fish and Wildlife Service (USFWS). 2025a. *Information for Planning and Consultation* (IPaC) for *Costco El Dorado Hills Project.* [Accessed January 2, 2025];

- U.S. Department of Agriculture (USDA), Natural Resource Conservation Service (NRCS). 2025. *Web Soil Survey*. Available online at: http://websoilsurvey.sc.egov.usda.gov. [Accessed January 2, 2025];

- USFWS 2025b. National Wetlands Inventory. Available online at: https://www.fws.gov/program/national-wetlands-inventory. [Accessed January 2, 2025]; and

- Biological reports and associated documents previously prepared for the Study Area.

The results of the database query and a five-mile radius CNDDB query for the Study Area are included in Appendix A, *CNDDB, CNPS, and USFWS Lists of Regionally Occurring Special-Status Species*.

Special-status species are plant and wildlife species that have been afforded special recognition by federal, State, or local resource agencies or organizations. They are generally of relatively limited distribution and may require specialized habitat conditions. Special-status species are defined as meeting one or more of the following criteria:

- Listed or proposed for listing under CESA or FESA;
- Protected under other regulations (e.g., Migratory Bird Treaty Act);
- Included on the CDFW Special Animals List;
- Identified as Rare Plant Rank 1 to 4 by CNPS; or
- Receive consideration during environmental review under CEQA.

General field surveys of the Study Area, excluding the portion to the west of Clarksville Road, were conducted on April 5, 2013; August 8, 2017; and October 13, 2020. A general field survey of the entire Study Area was conducted on January 9, 2025. The Study Area was systematically surveyed on foot with binoculars to ensure total search coverage, with special attention given to identifying those portions of the Study Area with the potential for supporting special-status species and sensitive habitats. During the field surveys, biologists recorded plant and animal species observed (Appendix C), as well as characterized biological communities occurring on-site. Following the site survey, the potential for each species identified in the records search to occur in the Study Area was determined based on the site surveys, soils, and species-specific information, as shown in Appendix B. Representative photos of the Study Area are provided in Appendix D.

A wetland delineation was performed on October 13, 2020, which did not include the portion of the Study Area located west of Clarksville Road. A follow up wetland delineation was conducted on January 9, 2025, by HELIX biologist Christine Gonzales to identify and delineate potential jurisdictional wetlands and other waters of the U.S. and State within the additional portion of the Study Area, verify the previous wetland delineations, adjust potential wetland boundaries as applicable, and update regulatory requirements according to current standards, policies and regulations. The results of the aquatic resource delineation are summarized herein and are discussed in detail under a separate cover (HELIX 2025a). The results are considered preliminary until USACE verifies the findings.

Botanical inventories of the Study Area, excluding the portion west of Clarksville Road, were conducted on April 24, May 26, and June 16, 2015. The botanical inventories were conducted in accordance with CDFW's protocol plant surveys. The results of the botanical surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016a). A complete list of plants observed within the Study Area is provided in Appendix C.

Protocol-level burrowing owl surveys were conducted within the Study Area, excluding the portion west of Clarksville Road, on March 12, April 24, May 26, and June 16, 2015. The surveys were conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (CDFW 2012). The results of the burrowing owl surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016b).

Protocol-level breeding and non-breeding season California red-legged frog surveys were conducted within the Study Area, excluding the portion to the west of Clarksville Road, on January 12 and 26, 2016, and February 2 and 9, 2016. The protocol-level breeding season surveys were conducted in accordance with the *Revised Guidance on Site Assessment and Field Surveys for the California Red-legged Frog* (USFWS 2005). The results of the protocol-level breeding season surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c).

An oak woodland analysis was performed to document the extent of the existing oak trees in the Study Area and anticipated impacts from the proposed project. The Oak Resources Technical Report is contained under separate cover (HELIX 2025b).

3.2 BIOLOGICAL SURVEYS

The biological field survey was conducted on January 9, 2025, by HELIX biologists Christine Gonzalez and Nicole German. The weather during the field survey was sunny with an average temperature of 60°F. The Study Area was systematically surveyed on foot to ensure total search coverage, with special attention given to portions of the Study Area with the potential to support special-status species and sensitive habitats. Binoculars were used to further extend site coverage and identify species observed. All plant and animal species observed were recorded, and all biological communities occurring on-site were characterized. An additional biological field survey was conducted on August 8, 2025, by HELIX biologist Patrick Martin to map the current extent of purple needlegrass grassland within the Study Area. All resources of interest were mapped with Global Positioning System (GPS)-capable tablets equipped with GPS receivers running ESRI Field Maps for ArcGIS with sub-meter accuracy.

Following the field survey and review of database queries, the potential for each species identified in the database query to occur within the Study Area was determined based on the field survey, soils, habitats present within the Study Area, and species-specific information, as shown in Appendix B, *Potential for Special-Status Species to Occur in the Study Area*. Species observed within the Study Area during the survey are included in Appendix C, *Plant and Wildlife Species Observed in the Study Area* and photographs taken during the survey are included in Appendix D, *Representative Site Photographs.*

4.0 RESULTS

4.1 SITE LOCATION AND DESCRIPTION

The 36.94-acre Study Area is located in El Dorado County adjacent to U.S. Highway 50 immediately east of Silva Valley Parkway and north of Tong Road. Land uses surrounding the Study Area include residential development to the north and paved roads, oak woodland, and annual grassland to the east, west, and south. The Study Area is located in Township 9 North, Range 8 East, Sections 1 and 2, and is depicted on the USGS *Clarksville*, *California* 7.5-minute quadrangle map. The approximate location of the center of the Study Area is at latitude 38.662023 and longitude -121.055946, NAD 83, and is located at an elevation between 695 feet and 795 feet above mean sea level (AMSL).

A site and vicinity map of the Study Area is included as Figure 1; a topographic map of the Study Area is included as Figure 2, *USGS Topographic Map*; and an aerial image of the Study Area is included as Figure 3, *Aerial Map*.

4.2 PHYSICAL FEATURES

4.2.1 Topography and Drainage

Topography within the Study Area ranges from relatively level to moderately sloped with elevations ranging from approximately 695 to 795 feet AMSL (211 to 242 meters).

The Study Area is in the Upper Cosumnes River watershed (USGS Hydrologic Unit Code [HUC] 18040013). The hydrologic regime on the Study Area is predominantly year-round irrigation runoff from the adjacent development to the north, seasonal stormwater runoff, direct precipitation, which primarily falls between October and June, and groundwater. Surface water runoff runs in a general northeast to southwest direction along the gently sloped topography. The intermittent and ephemeral drainages within the Study Area accumulate water and flow southwest into culverts at Clarksville Crossing Road. The perennial drainage flows south through the Study Area and is a direct tributary to Carson Creek. Carson Creek meets with Deer Creek which flows into the Cosumnes River, a traditional navigable water.

4.2.2 Soils

One soil map unit is mapped within the Study Area: Auburn silt loam, 2 to 30 percent slopes (Figure 4, *Soils Map*). The general characteristics and properties associated with this soil type are described below (NRCS 2025a).

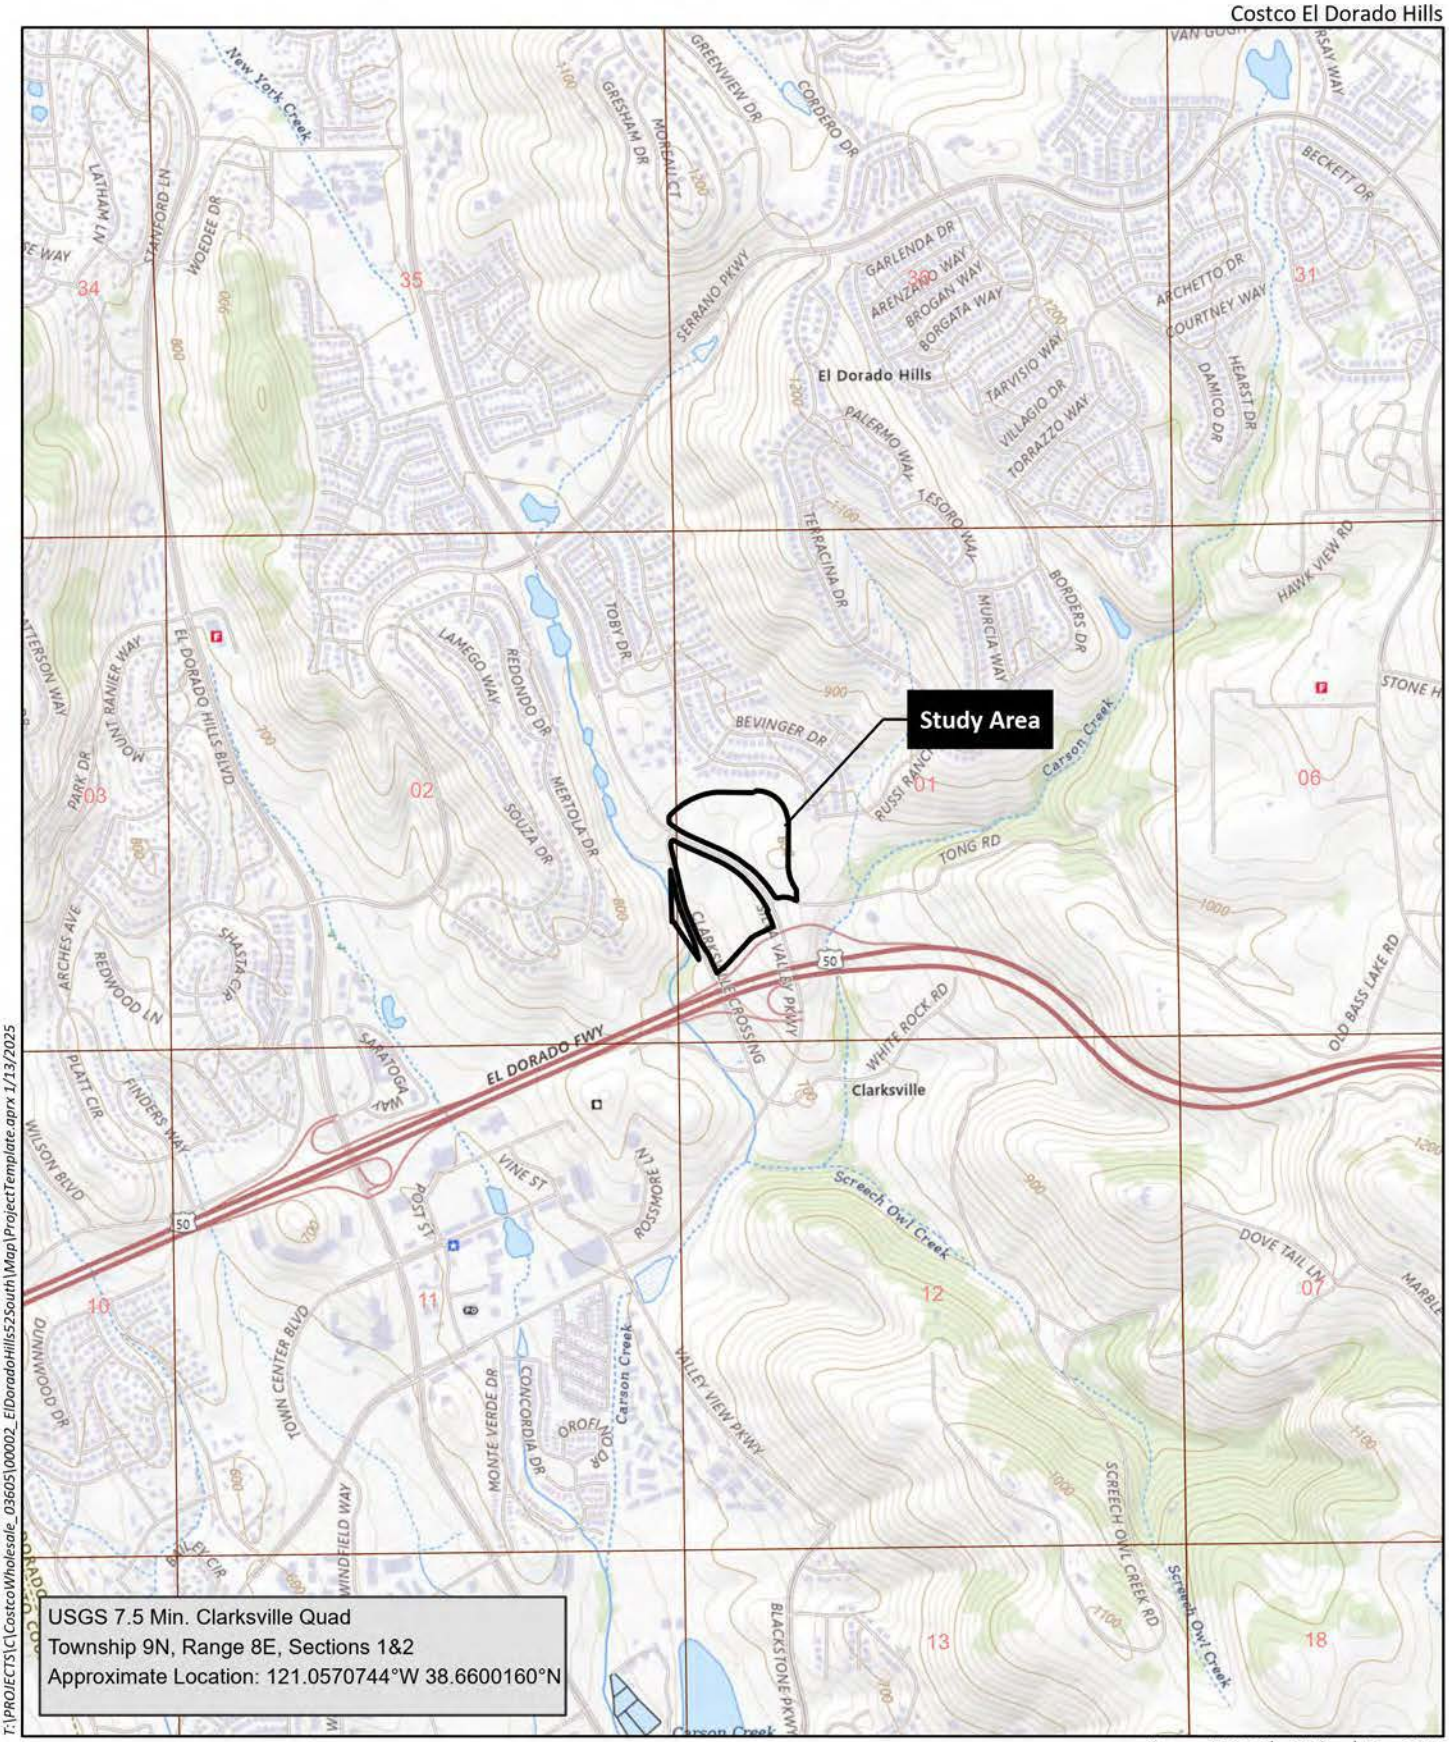
Auburn silt loam, 2 to 30 percent slopes: This soil unit has a parent material of residuum weathered from basic igneous rock and/or basic residuum weathered from metamorphic rock. It is typical of hills and ridges. A general soil profile is silt loam (0 to 14 inches), un-weathered bedrock (14 to 18 inches), and a restrictive layer at 18 inches of lithic bedrock. It is well-drained, has a low runoff class, and has no frequency of flooding or ponding. The hydric soils list for El Dorado County does not identify this soil type as hydric.

4.2.3 Climate

The climate of El Dorado County is Mediterranean, characterized by wet, cool winters and dry, hot summers. The nearest weather station with complete data to the Study Area is located in Auburn, California, approximately 14 miles north of the Study Area. Average daily maximum and minimum temperatures are 92° and 63° Fahrenheit (F) in July and 55° and 37° F in December and January. The mean annual precipitation is 34.68 inches, with 100 percent occurring as rain from October through June. The weather station received approximately 11.84 inches of rainfall from October 2024 through January 9, 2024, which is 90 percent of the average rain for this time of year (NRCS 2025b).

4.3 VEGETATION COMMUNITIES

Five upland vegetation communities occur in the Study Area, including non-native annual grassland (29.45 acres), purple needlegrass grassland (0.86 acre), valley foothill riparian (1.45 acres), valley oak woodland (0.34 acre), and ruderal/disturbed (3.82 acres). These habitat types are discussed below. A comprehensive list of all plant and wildlife species observed within the Study Area is provided in Appendix C. Representative site photographs are included in Appendix D.



4.3.1 Non-Native Annual Grassland

This vegetation community is comprised of disturbed non-native annual grassland, which is characterized primarily by an assemblage of non-native grasses and herbaceous species.

Approximately 29.45 acres of non-native annual grassland occur within the Study Area (Figure 5, *Biological Communities*). Non-native annual grassland dominates both the northern and southern portions of the Study Area. This vegetation community is characterized primarily by an assemblage of non-native annual grasses and forbs. Dominant vegetation includes ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) intermixed with red-stemmed filaree (*Erodium cicutarium*), popcornflower (*Plagiobothrys* sp.), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), scarlet pimpernel (*Anagallis arvensis*), St. John's wort (*Hypericum perforatum*), brodiaea (*Brodiaea elegans*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*).

4.3.2 Purple Needlegrass Grassland

Approximately 0.86 acre of purple needlegrass (*Stipa pulchra*) is interspersed within the annual grassland in the southern portion of the Study Area (Figure 5). Purple needlegrass grassland (Needle grass - Melic grass grassland) is listed as a sensitive plant community on the CDFW Natural Communities List and is required to be considered in CEQA documents. In order for purple needlegrass grassland to be considered a natural community at least five percent absolute cover of the species is required as a characteristic to dominant species in the herbaceous layer; the species is greater than 10 percent relative cover of the herbaceous layer; the species is characteristically present in the herbaceous layer with at least two percent absolute cover; and/or the species has a clear presence in the stand with greater than five percent absolute cover in the herbaceous layer (Sawyer *et al.* 2009). The mapped areas contain greater than 10 percent relative cover within the herbaceous layer. Therefore, the purple needlegrass patches within the Study Area are considered a sensitive habitat, since the acreage meets the minimum percentage criteria necessary to be considered a purple needlegrass grassland natural community. The purple needlegrass is interspersed with annual willow herb (*Epilobium brachycarpum*),

narrow tarweed (*Holocarpha virgata*), Spanish lotus (*Acmispon americanus*), ripgut brome, soft chess, and wild oat.

4.3.3 Valley Foothill Riparian

Valley foothill riparian habitats are found in valleys bordered by sloping alluvial fans, slightly dissected terraces, lower foothills, and coastal plains. This habitat often has a canopy layer of cottonwood (*Populus* spp.), California sycamore (*Platanus racemosa*), and valley oak (*Quercus lobata*). Subcanopy trees are white alder (*Alnus rhombifolia*), boxelder (*Acer negundo*), and Oregon ash (*Fraxinus latifolia*). The understory is comprised of wild grape (*Vitis californica*), wild rose (*Rosa californica*), blackberry (*Rubus* spp.), elderberry (*Sambucus* spp.), poison oak, willows (*Salix* spp.), herbaceous species such as sedges, and grasses. This habitat is associated with riverine habitat and often has an abrupt transition to adjacent upland habitat (Mayer and Laudenslayer 1988).

Approximately 1.45 acres of valley foothill riparian habitat occurs within the Study Area and is associated with an ephemeral drainage on the northwestern portion of the Study Area as well as a perennial drainage on the southwestern portion of the Study Area (see Figure 5). Dominant vegetation within this community includes broadleaf cattail (*Typha latifolia*), willow, spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), Himalayan blackberry (*Rubus armeniacus*), and valley oak.

4.3.4 Valley Oak Woodland

Valley oak woodland is a common vegetation community in the local region and is typically dominated by valley oaks, with other species such as sycamore, black walnut, interior live oak, boxelder, and blue oak also occurring. The shrub layer is best developed along natural drainages, becoming insignificant in the uplands with more open stands of oaks. The understory of this community is often an extension of annual grassland habitat (Mayer and Laudenslayer 1988).

Approximately 0.34 acre of valley oak woodland occurs within the Study Area (see Figure 5). Valley oak woodland is found in a small area on the southwest boundary of the Study Area where a small stand of mature valley oak trees overhangs a small intermittent drainage. The understory is primarily annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal immediately adjacent to the drainage.

4.3.5 Ruderal/Disturbed

Ruderal habitats are characterized by an assemblage of non-native and invasive plant species that readily colonize disturbed landscapes. Roadsides, construction sites, and vacant lots are all sites ruderal plant species typically occur in. Disturbed habitats typically retain a soil substrate, but the vegetation communities are either lacking or are comprised of mostly ruderal plant species.

Approximately 3.82 acres of ruderal/disturbed habitat occur within the Study Area (see Figure 5). This vegetation community in the Study Area and is largely comprised of open space adjacent to the road, and low, sparse, weedy vegetation. Ruderal/disturbed areas in the Study Area include graded roads and a stockpile area.

Dominant plant species observed in this community within the Study Area include medusahead, soft chess, yellow star-thistle (*Centaurea solstitialis*), red-stemmed filaree, and winter vetch.

4.4 SPECIAL-STATUS SPECIES

Sensitive plant and wildlife species identified during database queries were evaluated for their potential to occur within the Study Area based on the results of the field survey and the criteria described below.

The likelihood for a species to occur was classified as having either no, low, moderate, or high potential to occur within the Study Area by evaluating criteria based on the distance of the nearest documented occurrence, the presence and condition of suitable habitat, the age of the most recent documented occurrence, and the presence of mapped critical habitat.

No Potential:

- The Study Area is outside the known distribution of the species; or,
- There is no suitable habitat present for the species; or,
- The species is not known to occur within five miles of the Study Area boundary, and its dispersal capability is less than five miles.

Low Potential:

- There are no documented occurrences within five miles of the Study Area boundary, and the existing habitat is of low or marginal quality, or
- All documented occurrences within five miles of the Study Area line are believed to be extirpated, and existing habitat is of low or marginal quality, or
- Extant occurrences are documented within five miles of the Study Area, and the most recent occurrence is greater than or equal to 25 years old.

Moderate Potential:

- Documented occurrences are reported within five miles of the Study Area, the most recent occurrence is less than 25 but greater than 10 years old, and suitable habitat is present; or
- Critical habitat is mapped within the Study Area, all Primary Constituent Elements (PCEs) are present within the Study Area, and suitable habitat is present.

High Potential:

- There are extant occurrences within one mile of the Study Area, the most recent occurrence is less than 10 years old, and there is suitable habitat within the Study Area; or
- Critical habitat is mapped within the Study Area, documented occurrences are present within one mile of the Study Area, suitable habitat is present, and all PCEs are present within the Study Area.

The potential for each species to occur was determined and is summarized in Table 1 provided in Appendix B. Detailed descriptions of the species for which a high, moderate, or low potential to occur was assigned are discussed in greater detail below.

4.4.1 Listed and Special-Status Plants

According to the database query, 21 listed and/or special-status plants have the potential to occur on-site or in the vicinity of the Study Area (CDFW 2025; CNPS 2025). Based on field observations, published information, and literature review, one special-status plant, Sanford's arrowhead (*Sagittaria sanfordii*), was determined to have potential to occur within the Study Area. The remaining regional special-status plants identified in the query occur on serpentine or gabbro soils, within vernal pools, or within other habitats which do not occur in the Study Area. Additionally, focused botanical surveys were conducted within the Study Area in 2015 (Foothill Associates 2016a) and no special-status plant species were found. Special-status plants with potential to occur in the Study Area are discussed below.

Sanford's Arrowhead

Federal status – none
State status – none
CNPS Ranking – 1B.2

Species Description

Sanford's arrowhead is a perennial, rhizomatous emergent herb that is endemic to California. This aquatic plant can grow up to four feet tall, although it is usually shorter, and grows from a spherical tuber. The leaves are often submerged, variable in shape, and are long and strap-shaped or narrowly lanceolate. The leaves may grow up to nine inches long from the underwater stem. Sanford's arrowhead is monoecious, with individuals bearing both male and female flowers. The inflorescence is a raceme made up of several whorls of white flowers, with the lowest node bearing female flowers and upper nodes bearing male flowers. This species is found in freshwater marshes, swamps, ponds, and slow-moving drainages from 0 to 605 meters elevation. It blooms from May to October (CNPS 2025).

Survey History

This species was not observed in the Study Area during focused botanical surveys conducted on April 24, May 25, and June 16, 2015 (Foothill Associates 2016a) or biological field surveys conducted on October 13, 2020, and January 9, 2025. There is one documented occurrence within five miles of the Study Area. This occurrence is from 2005 and documents fewer than 100 plants growing in a wetland swale and ephemeral stream channel habitats tributary to Carson Creek, south of White Rock Road and east of Malby Crossing, approximately 2.4 miles away from the Study Area (CDFW 2025).

Habitat Suitability

The perennial drainage within the Study Area provides suitable habitat for this species; however, this species was not found during focused botanical surveys conducted within the Study Area in 2015 during the bloom period of this species (Foothill Associates 2016a) or during the January 9, 2025, field survey. Therefore, this species has a low potential to occur.

Potential for Adverse Effects

The project could impact this species if stormwater improvements are constructed within the perennial drainage. If Sanford's arrowhead is present, potential project related impacts could include an accumulation of fugitive dust or debris on leaves which could result in reduced photosynthesis or

disrupting potential pollinators by the presence and disturbance of construction equipment or crews. More direct impacts could include removal of individual plants by vegetation clearing, elimination of habitat through dewatering, crushing of plants by crews or equipment, disrupted soil quality as a result of spills or erosion, and the establishment of noxious and invasive weed species during construction and operation. However, with the implementation of recommended avoidance and minimization measures included in Section 5.1, potential project-related impacts to Sanford's arrowhead are expected to be reduced to less than significant.

4.4.2 Listed and Special-Status Wildlife

According to the database query, 31 listed and/or special-status wildlife species have the potential to occur on-site or in the vicinity of the Study Area (CDFW 2025; USFWS 2025a). Based on field observations, published information, and literature review, 20 special-status wildlife species have the potential to occur within the Study Area: Crotch's bumble bee (*Bombus crotchii*), monarch butterfly (*Danaus plexippus*), western spadefoot (*Spea hammondii*), northwestern pond turtle (*Actinemys marmorata*), coast horned lizard (*Phrynosoma blainvillii*), Cooper's hawk (*Astur cooperii*), tricolored blackbird (*Agelaius tricolor*), grasshopper sparrow (*Ammodramus savannarum*), golden eagle (*Aquila chrysaetos*), burrowing owl (*Athene cunicularia*), ferruginous hawk (*Buteo regalis*), Swainson's hawk (*Buteo swainsoni*), white-tailed kite (*Elanus leucurus*), merlin (*Falco columbarius*), bald eagle (*Haliaeetus leucocephalus*), California black rail (*Laterallus jamaicensis coturniculus*), osprey (*Pandion haliaetus*), purple martin (*Progne subis*), pallid bat (*Antrozous pallidus*), and American badger (*Taxidea taxus*).

However, the following species only have a low potential to pass through the Study Area during migration or other movements and are not expected to occur or use the Study Area in any substantial way: golden eagle, ferruginous hawk, merlin, bald eagle, and osprey. The rationale for this determination for each species is included in Appendix B. Because these species are not expected to occur or may only temporarily pass through the Study Area, no avoidance and minimization measures are recommended for these species, and they are not discussed further in this report.

The remaining nine special-status species with potential to occur in the Study Area are discussed in more detail below. In addition to these special-status wildlife species, other migratory birds and raptors protected under federal, State, and local laws/policies also have the potential to occur within the Study Area.

4.4.2.1 Invertebrates

Crotch's Bumble Bee

Federal status – None
State status – Candidate Endangered

Species Description

This species occurs in grassland and scrub habitats. New colonies are initiated by solitary queens, generally in the early spring, which typically occupy abandoned rodent burrows (CDFW 2019). This species is a generalist forager and has been reported visiting a wide variety of flowering plants. This species is a short-tongued bumble bee and food plants include *Asclepias* spp., *Antirrhinum* spp., *Clarkia* spp., *Eschscholzia* spp., *Eriogonum* spp., *Chaenactis* spp., *Lupinus* spp., *Medicago* spp., *Phacelia* spp., and *Salvia* spp. (Koch et al. 2012). The flight period for queens in California is from February to October. New

queens hibernate over the winter and initiate a new colony the following spring (CDFW 2019). Crotch's bumble bees are rare throughout their range and are in decline in the Central Valley and southern California (CDFW 2019). The most current known range of this species follows a small strip from western Trinity County south to Tehama County and along the entire Central Valley and coast south of Monterey to the southernmost portions of the State. The range is generally bound on the east by the high Sierra Nevada range and areas east of Bishop, Ridgecrest, and the Salton Sea (CDFW 2023).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Habitat Suitability

This species may occur within annual grassland habitat in the Study; however, no small mammal burrows or other underground refuge sites for this species to use as nests or overwintering sites were observed in the Study Area. A variety of flowering plants were observed within Study Area which could be used as food sources for this species. Based on the lack of documented occurrences of Crotch's bumble bee in the vicinity of the Study Area, and the fact that this species is currently rare across its range and is in decline in the foothills of California, Crotch's bumble bee has a low potential to occur on-site.

Potential for Adverse Effects

The proposed project is located in suitable habitat for this species. Implementation of the project has the potential for adverse effects to Crotch's bumble bee through colony disturbance, leading to the destruction of the colony if this species is present in the Study Area or the immediate surroundings during construction. Vegetation removal and ground disturbance may also remove potential foraging habitat for this species, contributing to the decline throughout the State. With the implementation of recommended avoidance and minimization measures included in Section 5.2, potential project-related impacts to Crotch's bumble bee are expected to be reduced to less than significant.

Monarch Butterfly

Federal status – Proposed Threatened
State status – None

Species Description

Monarch butterflies roost in wind-protected tree groves, especially with Eucalyptus spp., and species of pine or cypress with nectar and water sources nearby. Winter roost sites extend along the coast from Mendocino County to Baja California. As caterpillars, monarchs feed exclusively on the leaves of milkweed (*Asclepias* sp.) (Nial et al. 2019; USFWS 2020). Monarch butterfly migration routes pass east over the Sierra Nevada in the fall and back to the California coast in the spring. The overwintering population is located along the California coast, while summer breeding areas occur in interior California and North America, with spring breeding areas located further east (USFWS 2020).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There are no documented occurrences within five miles of the Study Area, and most records are located along the California coast (CDFW 2025).

Habitat Suitability

Narrow-leaf milkweed, a larval host plant, was observed in the Study Area and could provide larval habitat for the Monarch butterfly during summer migration. However, the Study Area is in the summer breeding range of the Monarch butterfly and not in the coastal overwintering range (USFWS 2020). Large, overwintering populations will not occur in the Study Area. However, this species could pass through the Study Area during summer migration and could also utilize milkweed patches within the Study Area as larval habitat. This species has a low potential to occur in the Study Area.

Potential for Adverse Effects

Milkweed plants are present in the Study Area that could support this species. Implementation of the project could impact Monarch butterfly if the milkweed plants are found to support this species and are disturbed/removed. However, with the implementation of proposed avoidance and minimization measures included in Section 5.2, potential project-related impacts to Monarch butterfly are expected to be reduced to less than significant.

4.4.2.2 Amphibians

Western Spadefoot

Federal status – Proposed Threatened
State status – Species of Special Concern

Species Description

Western spadefoot occurs in a variety of habitats, including mixed woodlands, grasslands, coastal sage scrub, chaparral, sandy washes, and playas. It breeds in vernal pools, depressional wetlands, puddles, and other ephemeral water features, including altered or constructed features, often after heavy rains. Breeding sites must remain inundated for at least 3 to 11 weeks for larvae to mature with water temperatures between 48 and 86 degrees Fahrenheit. Spadefoots are primarily terrestrial and require upland habitats for feeding and for constructing burrows for long, dry-season dormancy. Spadefoots typically occupy burrows up to three feet below the surface and require sandy or friable soils, which facilitate digging and water absorption. Dispersal through uplands may vary between wet and dry years but is considered to be up to 262 meters in a dry year and up to 605 meters in a wet year but is typically less (USFWS 2023).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There is one documented occurrence of this species within five miles of the Study Area, approximately 3.60 miles from the Study Area. This occurrence documents one western

spadefoot calling at night within the vicinity of Upper Blue Ravine in the Mormon Island Wetland Preserve in 2008 (CDFW 2025).

Habitat Suitability

The seasonal wetlands within the Study Area may provide suitable habitat for this species; however, the wetlands are very shallow and may not remain inundated long enough to support the breeding cycle of this species. Sandy, gravelly soils are absent from the Study Area which may further reduce the potential this species could occur. Therefore, this species has a low potential to occur in the Study Area.

Potential for Adverse Effects

The proposed project is located in marginally suitable habitat for this species. If western spadefoot is present in the work area during construction, impacts could occur through injury or mortality caused by construction workers or construction equipment. With the implementation of recommended avoidance and minimization measures included in Section 5.3, potential project-related impacts to western spadefoot are expected to be reduced to less than significant.

4.4.2.3 Reptiles

Northwestern Pond Turtle

Federal status – Proposed Threatened
State status – Species of Special Concern

Species Description

This species occurs in a variety of aquatic habitats; typically, permanent ponds, lakes, streams, irrigation ditches, canals, marshes, or pools in intermittent drainages. It appears to prefer areas lined with abundant vegetation and either rocky or muddy substrates. Basking sites such as logs, rocks, cattail mats or exposed banks are required for this species. The active season is from February to November, and breeding occurs from April to May. Overwintering occurs in upland terrestrial habitats close to water sources (approximately 300 feet), in which they will bury themselves under loose soil (CDFW 2025). Nesting sites in uplands may be as far as 400 meters (1,312 feet) or more from the aquatic habitat, although the distance is usually much less and is generally around 100 meters (328 feet) (Yolo HCP/NCCP 2018). In nonriverine habitats that experience little water level fluctuation, this species may overwinter underwater (Thomson et al. 2016).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There are seven documented occurrences within five miles of the Study Area, with the closest approximately 0.25 mile away. This occurrence documents two adult turtles basking in a wetland area upstream of the perennial drainage in the Study Area along Silva Valley Parkway in 2012. Other occurrences in the area are documented from downstream of the Study Area along Carson Creek (CDFW 2025).

Habitat Suitability

The perennial drainage within the Study Area provides suitable habitat for this species and northwestern pond turtle is known to occur in this drainage system. The intermittent drainage, seasonal wetlands, and other aquatic features on-site may also provide suitable habitat when inundated and could be used for dispersal or as temporary habitat. This species could nest or overwinter in the annual grassland, valley oak woodland, and riparian habitats within the Study Area. The perennial drainage is downstream and upstream from known occurrences in the area. This species has a high potential to occur in the Study Area.

Potential for Adverse Effects

The proposed project is located in suitable habitat for this species. If northwestern pond turtle is present in the work area during construction, impacts could occur through injury or mortality caused by construction workers or construction equipment. With the implementation of recommended avoidance and minimization measures included in Section 5.3, potential project-related impacts to northwestern pond turtle are expected to be reduced to less than significant.

Coast Horned Lizard

Federal status – None
State status – Species of Special Concern

Species Description

This species occurs in the Coast Ranges and southwestern Sierra Nevada, Transverse and Peninsular Ranges, and the southern deserts. Habitat types include chaparral, cismontane woodland, coastal scrub, desert washes, and grasslands. It is most common in lowlands along sandy washes with scattered low bushes. It requires open areas for sunning, bushes for cover, patches of loose soil, and an abundant supply of ants and other insects (CDFW 2025).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There are four documented occurrences within five miles of the Study Area, with the closest approximately 3.81 miles away. This occurrence documents one adult observed in 2007 (CDFW 2025).

Habitat Suitability

This species has a moderate potential to occur in the valley oak woodland, annual grassland, and ruderal habitats in the Study Area. However, soils within the Study Area are mostly compacted, which may be unsuitable for this species. No obvious ant hills were observed in the Study Area during the field survey which would provide foraging options for this species, but ants and other insects suitable for foraging are likely to be present in the Study Area.

Potential for Adverse Effects

The proposed project is located in suitable habitat for this species. If coast horned lizard is present in the work area during construction, impacts could occur through injury or mortality caused by construction workers or construction equipment. With the implementation of recommended avoidance and minimization measures included in Section 5.3, potential project-related impacts to coast horned lizard are expected to be reduced to less than significant.

4.4.2.4 Birds

Cooper's Hawk

Federal status – None
State status – Watch List

Species Description

This species occurs in open woodlands, riparian forests, montane coniferous forests, and other open woodland habitats. It may also occur in wooded suburban habitats. This species nests high within large trees and preys on medium-sized birds and small mammals (Zeiner et al. 1990).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. Cooper's hawk is not regularly tracked by the CNDDB but is a common species in El Dorado County and the vicinity of the Study Area (eBird 2025).

Habitat Suitability

This species has a high potential to occur in the Study Area. The valley oak woodland and valley foothill riparian habitats within the Study Ara provide suitable nesting and foraging habitat for this species. No active or abandoned nests were observed in the Study Area, but this species could nest in trees within or surrounding the Study Area. This species is known to occur in wooded suburban habitats such as those surrounding the Study Area.

Potential for Adverse Effects

The proposed project has the potential for adverse effects to Cooper's hawk through nest disturbance, leading to the destruction of eggs or nestlings if this species nests in the Study Area or the immediate surroundings. Non-breeding adults could readily avoid contact with construction equipment or personnel by moving out of the construction area. Displacement of non-breeding adults would not have a significant impact. Eggs and young still dependent on the nest would be susceptible to injury or mortality through physical contact or through nest abandonment caused by the displacement of adults. Needless destruction of eggs or young would be a violation of the Fish and Game Code and would be a significant impact. With the implementation of recommended avoidance and minimization measures included in Section 5.4, potential project-related impacts to Cooper's hawk are expected to be reduced to less than significant.

Tricolored Blackbird

Federal status – None
State status – Threatened and Species of Special Concern

Species Description

This species nests and seeks cover in emergent wetland vegetation and thorny vegetation such as Himalayan blackberry as well as cattails and tules. The nesting area must be large enough to support a minimum colony of 50 pairs as they are a highly colonial species. Typical nesting areas are in large wetlands, marshes, and large brambles of thorny vegetation near suitable foraging habitat. This species forages on the ground in croplands, grassy fields, flooded land, and edges of ponds for insects (Shuford and Gardali 2008).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There are 10 documented occurrences within five miles of the Study Area, with the closest approximately 2.25 miles away. This occurrence documents a nesting colony observed along Carson Creek in 2014. Other occurrences in the area are also along Carson Creek and areas near Latrobe Road (CDFW 2025).

Habitat Suitability

Although some emergent wetland vegetation and Himalayan blackberry brambles are present along the intermittent and ephemeral drainages in the Study Area, they are likely too small to support a nesting colony and are fragmented in the overall landscape. This species could forage in the annual grassland habitat on-site if it nests within the Study Area or at an off-site location. Based on the presence of marginally suitable nesting habitat, suitable foraging habitat within the Study Area, and nearby known documented occurrences, this species has a moderate potential to occur in the Study Area.

Potential for Adverse Effects

Proposed construction activities are not expected to impact foraging tricolored blackbirds; however, the proposed project has the potential for adverse effects to tricolored blackbirds if this species nests within the Study Area. Individual birds foraging or otherwise occurring within the Study Area could readily avoid construction areas or contact with construction equipment or personnel. Therefore, no impacts to individual tricolored blackbirds are anticipated unless this species nests on the site. In the unlikely event this species nests on-site, impacts could occur through nest disturbance, leading to the destruction of eggs or nestlings. Eggs and young still dependent on the nest would be susceptible to injury or mortality through physical contact or through nest abandonment caused by the displacement of adults. Needless destruction of eggs or young would be a violation of the Fish and Game Code and be considered a significant impact. With the implementation of recommended avoidance and minimization measures included in Section 5.4, potential project-related impacts to tricolored blackbird are expected to be reduced to less than significant.

Grasshopper Sparrow

Federal status – None
State status – Species of Special Concern

Species Description

This species is a summer resident of foothills and lowlands west of the Cascade-Sierra Nevada crest. Grasshopper sparrow occurs in grasslands with scattered shrubs or other tall structures which it utilizes as singing perches. It nests on the ground in dense grass with overhanging taller grasses and forbs (Zeiner et al. 1990).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Habitat Suitability

The annual grassland habitat within the Study Area provides suitable habitat for this species; however, the Study Area is on the far eastern edge of the known range of this species. Therefore, this species has a low potential to occur in the Study Area.

Potential for Adverse Effects

The proposed project has the potential for adverse effects to grasshopper sparrow through nest disturbance, leading to the destruction of eggs or nestlings if this species nests in the Study Area or the immediate surroundings. Non-breeding adults could readily avoid contact with construction equipment or personnel by moving out of the construction area. Displacement of non-breeding adults would not have a significant impact. Eggs and young still dependent on the nest would be susceptible to injury or mortality through physical contact or through nest abandonment caused by the displacement of adults. Needless destruction of eggs or young would be a violation of the Fish and Game Code and be considered a significant impact. With the implementation of recommended avoidance and minimization measures included in Section 5.4, potential project-related impacts to grasshopper sparrow are expected to be reduced to less than significant

Burrowing Owl

Federal status – None
State status – Candidate Endangered; Species of Special Concern

Species Description

This species occurs in a variety of open habitats; typically grasslands, desert scrub, agricultural fields, washes, and disturbed areas such as golf courses or vacant lots. Burrowing owls forage on the ground in areas with low, sparse vegetation and with an abundance of small mammal burrows. It nests in burrows, especially those of California ground squirrel (*Otospermophilus beecheyi*) but will also use other sites

such as rubble piles, pipes, and culverts. In the Central Valley of California, most foraging occurs within a 600-meter radius of the burrow (Gervais et al. 2003).

Survey History

This species was not observed in the Study Area during protocol-level surveys in 2015 (Foothill Associates 2016b) or during the biological field surveys on October 13, 2020, and January 9, 2024. There are three documented occurrences within five miles of the Study Area, with the closest approximately 1.84 miles away. This occurrence documents two adults observed at a burrow site in grassland habitat south of Highway 50 near the Sacramento/El Dorado County line (CDFW 2025).

Habitat Suitability

The annual grassland and open, ruderal/disturbed habitat in the Study Area provide potential habitat for this species; however, no small mammal burrows or other suitable nesting/refuge sites were observed in the Study Area. In addition, soils within the Study Area are very hard and compact, which likely limits the potential this species or other fossorial animals could burrow on-site. Therefore, this species has a low potential to occur on-site.

Potential for Adverse Effects

The proposed project has the potential for adverse effects to burrowing owl through nest disturbance, leading to the destruction of eggs or nestlings if this species nests in the Study Area or the immediate surroundings. Non-breeding adults could readily avoid contact with construction equipment or personnel by moving out of the construction area. Displacement of non-breeding adults would not have a significant impact. Eggs and young still dependent on the nest would be susceptible to injury or mortality through physical contact or through nest abandonment caused by the displacement of adults. Needless destruction of eggs or young would be a violation of the Fish and Game Code and be considered a significant impact. With the implementation of recommended avoidance and minimization measures included in Section 5.4, potential project-related impacts to burrowing owl are expected to be reduced to less than significant.

Swainson's Hawk

Federal status – None
State status – Threatened

Species Description

Swainson's hawks are long-distance migrants with nesting grounds in western North America, and wintering grounds in Mexico and South America. Swainson's hawks typically arrive in the California Central Valley between March and early April to establish breeding territories. Breeding occurs from late March to August, peaking in late May through July (Zeiner et al. 1990). In the Central Valley, Swainson's hawks generally nest in isolated trees, small groves of trees in agricultural land, or in large woodlands next to open grasslands or agricultural fields. This species typically nests near riparian areas; however, it has been known to nest in urban areas as well. In the Central Valley, the most commonly used trees include Fremont's cottonwood, sycamores (*Platanus* spp.), valley oaks, walnut (*Juglans* spp.), and occasionally gum trees (*Eucalyptus* spp.), redwood (*Sequoia* spp.) and pine (*Pinus* spp.) (Woodbridge 1998). Nest locations are usually in close proximity to suitable foraging habitats, which include fallow

fields, all types of grasslands, irrigated pastures, alfalfa and other hay crops, and low-growing row crops, especially post-harvest when the height of the vegetation is short and easy to observe prey (Bechard et al. 2010; SAIC 2012). Swainson's hawks leave their breeding grounds to return to their wintering grounds in late August or early September (Bloom and Van De Water 1994).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. However, these surveys occurred when this species is not expected to be present in the region. There are two documented occurrences within five miles of the Study Area, with the closest approximately 3.86 miles away. This occurrence documents one adult near the intersection of White Rock and Scott Road in 1982 (CDFW 2025).

Habitat Suitability

The non-native annual grassland and open, ruderal/disturbed habitat in the Study Area provide suitable foraging habitat for this species and several trees within the Study Area could support nesting. However, the Study Area is at the easternmost edge of this species' known range. Swainson's hawk has historically been documented in the vicinity of the Study Area and could potentially occur, but would generally be expected to occur in habitats within and closer to the Central Valley. Therefore, Swainson's hawk has a low potential to occur.

Potential for Adverse Effects

The proposed project has the potential for adverse effects to Swainson's hawk through nest disturbance, leading to the destruction of eggs or nestlings if this species nests in the Study Area or the immediate surroundings. Non-breeding adults could readily avoid contact with construction equipment or personnel by moving out of the construction area. Displacement of non-breeding adults would not have a significant impact. Eggs and young still dependent on the nest would be susceptible to injury or mortality through physical contact or through nest abandonment caused by the displacement of adults. Needless destruction of eggs or young would be a violation of the Fish and Game Code and be considered a significant impact. With the implementation of recommended avoidance and minimization measures included in Section 5.4, potential project-related impacts to Swainson's hawk are expected to be reduced to less than significant.

White-Tailed Kite

Federal status – None
State status – Fully Protected

Species Description

White-tailed kite is a year-round resident in California in coastal areas and lowlands in the Central Valley. Population sizes increase during the non-breeding season due to over-wintering migrants. It occurs in a variety of habitats including grasslands, savannah, oak woodland, riparian woodland, open suburban areas, and agriculture fields. Nest trees typically have a dense canopy or are within a dense group of trees, such as riparian forest or oak woodland. Foraging occurs within un-grazed or lightly-grazed fields, agricultural areas, and open grasslands (CDFW 2025).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There are two documented occurrences within five miles of the Study Area, with the closest approximately 2.48 miles away. This occurrence documents a nest near Sophia Parkway in 2008 (CDFW 2025).

Habitat Suitability

The valley foothill riparian and valley oak woodland provide suitable nesting habitat, and suitable foraging habitat is present in the annual grassland and open areas of the ruderal/disturbed habitat. No active or abandoned nests were observed in the Study Area, but this species could nest in trees within or surrounding the Study Area. This species is known to forage in nearby open spaces in the vicinity of the Study Area and could occur nesting in or near the Study Area. Therefore, this species has a high potential to occur.

Potential for Adverse Effects

The proposed project has the potential for adverse effects to white-tailed kite through nest disturbance, leading to the destruction of eggs or nestlings if this species nests in the Study Area or the immediate surroundings. Non-breeding adults could readily avoid contact with construction equipment or personnel by moving out of the construction area. Displacement of non-breeding adults would not have a significant impact. Eggs and young still dependent on the nest would be susceptible to injury or mortality through physical contact or through nest abandonment caused by the displacement of adults. Needless destruction of eggs or young would be a violation of the Fish and Game Code and be considered a significant impact. With the implementation of recommended avoidance and minimization measures included in Section 5.4, potential project-related impacts to white-tailed kite are expected to be reduced to less than significant.

California Black Rail

Federal status – None
State status – Threatened and Fully Protected

Species Description

The largest concentrations of this species are found in the tidal salt marshes of the northern San Francisco Bay region, primarily in San Pablo and Suisun Bays. Smaller populations also occur in San Francisco Bay, the Outer Coast of Marin County, freshwater marshes in the foothills of the Sierra Nevada, and in the Colorado River Area (Spautz et. al. 2005). This species inhabits brackish marsh habitats, primarily in the upper marsh zone dominated by alkali heath (*Frankenia salina*), cattail (*Typha* spp.), and rush (*Juncus* spp.), and prefers lower salinity environments. In the Sierra Nevada foothills, this species is a year-round resident along wetland edges where water is generally 1.2 inches or less and is typically found in wetlands 0.25 acre or larger. This species is typically associated with perennial wetlands associated with flowing water such as irrigation canals, perennial streams, and springs with dense vegetation in the Sierra Nevada foothills. It forages on the ground, under cover of dense vegetation (Richmond et al. 2010).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There is one documented occurrence within five miles of the Study Area, approximately 1.86 miles from the Study Area. The occurrence documents a breeding pair with chicks observed in 2017 (CDFW 2025).

Habitat Suitability

This species has a moderate potential to occur in the Study Area. The perennial drainage and associated riparian corridor provide suitable habitat for this species. California black rail could also potentially occur in the intermittent and ephemeral drainage corridors. Additionally, the closest occurrence is less than two miles away and is located downstream of the Study Area. Because this species is generally rare in the Sierra Nevada foothills, it has a moderate potential to occur instead of a high potential to occur.

Potential for Adverse Effects

The proposed project is located in suitable habitat for this species. The project could impact this species if it's nesting on-site during construction through nest disturbance of adjacent construction, leading to the destruction of eggs or nestlings. Non-breeding adults could readily avoid contact with construction equipment or personnel by moving out of the construction area. Displacement of non-breeding adults would not have a significant impact. Eggs and young still dependent on the nest would be susceptible to injury or mortality through physical contact or through nest abandonment caused by the displacement of adults. Needless destruction of eggs or young would be a violation of the Fish and Game Code and be considered a significant impact. With the implementation of recommended avoidance and minimization measures included in Section 5.4, potential project-related impacts to California black rail are expected to be reduced to less than significant.

Purple Martin

Federal status – None
State status – Species of Special Concern

Species Description

The purple martin occurs as an uncommon summer resident and migrant, primarily from mid-March to late September, and breeds from May to mid-August. Martins are most abundant in mesic regions, near large wetlands and other water bodies, and at upper slopes and ridges, which likely concentrate aerial insects (Shuford and Gardali 2008). This species nests in cavities in open areas with low canopy cover at the height of the nest, near large bodies of water that support high densities of large insects. Martins use a variety of cavities including bridges, large tree snags, and collapsed lava tubes. This species is very sensitive to competition from European starlings (*Sturnus vulgaris*) and is extirpated from most low-elevation areas by starlings (Shuford and Gardali 2008).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There are no documented occurrences within five miles of the Study Area. The closest documented occurrence is approximately 12.86 miles from the Study Area and documents a nesting pair observed in 2007 (CDFW 2025).

Habitat Suitability

The Study Area provides suitable foraging habitat for this species and some tree cavities that could support nesting were observed within the Study Area. However, this species is uncommon in California and there are no documented occurrences in the vicinity of the Study Area. Therefore, purple martin has a low potential to occur.

Potential for Adverse Effects

The proposed project has the potential for adverse effects to purple martin through nest disturbance, leading to the destruction of eggs or nestlings if this species nests in the Study Area or the immediate surroundings during construction. Non-breeding adults could readily avoid contact with construction equipment or personnel by moving out of the construction area. Displacement of non-breeding adults would not have a significant impact. Eggs and young still dependent on the nest would be susceptible to injury or mortality through physical contact or through nest abandonment caused by the displacement of adults. Needless destruction of eggs or young would be a violation of the Fish and Game Code and be considered a significant impact. With the implementation of recommended avoidance and minimization measures included in Section 5.4, potential project-related impacts to purple martin are expected to be reduced to less than significant.

4.4.2.5 Other Nesting Migratory Birds and Raptors

Migratory birds are protected under the MBTA of 1918 (16 USC 703-711). The MBTA makes it unlawful to take, possess, buy, sell, purchase, or barter any migratory bird listed under 50 CFR 10; this also includes feathers or other parts, nests, eggs, or products, except as allowed by implementing regulations (50 CFR 21). Additionally, Section 3503 of the California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. Section 3503.5 specifically states that it is unlawful to take, possess, or destroy any raptors (i.e., hawks, owls, eagles, and falcons), including their nests or eggs; Section 3513 specifically states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

A number of migratory birds and raptors, in addition to the species listed in Section 4.4.2, have the potential to nest in or adjacent to the Study Area. Suitable nest locations within and adjacent to the Study Area include trees, grass, artificial structures, and bare ground. With the implementation of recommended avoidance and minimization measures included in Section 5.4, potential project-related impacts to nesting birds are expected to be reduced to less than significant.

4.4.2.6 Mammals

Pallid Bat

Federal status – None
State status – Species of Special Concern

Species Description

Pallid bat occurs throughout California except for the high Sierra Nevada and the northern Coast Ranges. Suitable habitats include grasslands, shrublands, woodlands, and forests from sea level to 6,000 feet AMSL. This species is most common in open, dry habitats with rocky areas for roosting; roosts also include cliffs, abandoned buildings, bird boxes, hollow trees and under bridges. This species is primarily a crevice dweller, but recent studies have shown that they are also dependent upon tree roosts. Particularly in northern California, pallid bat is more dependent upon oak woodland and oak savannah in lower elevations and may be found in coniferous forest, including redwoods at mid to higher elevations. This species is also intolerant of roost disturbance and it has a high loyalty to roosting sites. If this species experiences frequent disturbance at a roost site, it will abandon the roost (Bolster ed. 1998).

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Habitat Suitability

Suitable habitat is present for this species within the valley oak woodland and riparian habitats, as well as isolated trees within the annual grassland. Trees with cavities/hollows were observed in the Study Area that could provide roosting habitat and this species could forage throughout the Study Area. Although there are no documented occurrences within five miles of the Study Area, because this species is known to utilize oak woodlands in lower elevations of northern California, pallid bat has a low potential to occur in the Study Area.

Potential for Adverse Effects

If trees are removed or trimmed, the project has the potential for adverse effects to pallid bat through disturbance of day roosts or maternity colonies leading to destruction of maternity colonies and/or abandonment of roost sites if this species were to roost or nest in or adjacent to the Study Area during construction. Removal of these structures may result in injury or mortality to individual bats and/or maternity colonies. Construction activities near active roost sites may also result in roost abandonment. If roost abandonment occurs during daylight hours when bats are vulnerable, bats would be subject to a higher degree of predation risk. Destruction of bats and maternity colonies would be a violation of the Fish and Game Code and be considered a significant impact. With the implementation of recommended avoidance and minimization measures included in Section 5.5, potential project-related impacts to pallid bat are expected to be reduced to less than significant.

American Badger

Federal status – None
State status – Species of Special Concern

Species Description

American badgers are found in dry, open habitats including grassland and open woodland. Suitable burrowing habitat requires dry, sandy soil. Breeding occurs in summer and early fall, with young being born from March to April.

Survey History

This species was not observed in the Study Area during biological field surveys conducted on October 13, 2020, and January 9, 2025. There is one documented occurrence within five miles of the Study, approximately 4.9 miles from the Study Area. This occurrence documents an individual badger killed on the road in 2015. CDFW considers this species to be extant in the region; however, there are no other nearby records of this species near the Study Area (CDFW 2025).

Habitat Suitability

The annual grassland within the Study Area provides suitable habitat for this species; however, friable soils are lacking in the Study Area and no dens or burrows were observed during the 2020 or 2025 field surveys. Aside from the one documented occurrence in 2015, there are no other records nearby. Therefore, this species has a low potential to occur within the Study Area.

Potential for Adverse Effects

The proposed project is located in suitable habitat for this species. If American badger is present in the work area during construction, impacts could occur through injury or mortality caused by construction workers or construction equipment. With the implementation of recommended avoidance and minimization measures included in Section 5.5, potential project-related impacts to American badger are expected to be reduced to less than significant.

4.5 SENSITIVE HABITATS

Sensitive habitats include those that are of special concern to resource agencies or those that are protected under CEQA, Section 1600 of the California Fish and Game Code (i.e., riparian areas) and/or Sections 401 and 404 of the CWA, which include wetlands and other waters of the U.S. Additionally, sensitive habitats, including native trees and oak woodland habitat, are protected under the specific policies outlined in the El Dorado County Oak Resources Management Plan. Sensitive habitats identified within the Study Area are discussed below.

4.5.1 Aquatic Habitats

Aquatic habitats that occur in the Study Area include seasonal wetland (0.19 acre), seep (0.01 acre), wetland swale (0.01 acre), ephemeral drainage (0.23 acre), intermittent drainage (0.36 acre), and perennial drainage (0.22 acre). These habitat types are discussed below.

4.5.1.1 Seasonal Wetland

A total of 0.19 acre of seasonal wetlands occurs in the Study Area (see Figure 5). Seasonal wetlands are often depressions or topographic folds within the landscape that inundate for short periods of time following intense rains, but do not maintain seasonal aquatic or saturated soil conditions for durations long enough for colonization by perennial, obligate plant species. As such, plant species in seasonal wetlands are generally of two types: species that can tolerate short periods of inundation but have not adapted to withstand sustained aquatic or saturated soil conditions, and short-lived (primarily annual) species that take advantage of ephemeral aquatic and/or saturated soil conditions. The majority of seasonal wetlands within the Study Area are adjacent to an ephemeral drainage on the northern portion of the Study Area and one is adjacent to the intermittent drainage. There are also two depressional seasonal wetlands on the Study Area that appear to have formed as a result of historic excavation as they are located next to large, steep mounds. Most are associated with the ephemeral drainage in the northern portion of the Study Area. Dominant vegetation in the seasonal wetlands includes rabbitsfoot grass (*Polypogon monspeliensis*), spike rush (*Eleocharis macrostachya*), nutsedge (*Cyperus eragrostis*), curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), ryegrass, annual hair grass (*Deschampsia danthonioides*), and rye grass (*Festuca perennis*).

4.5.1.2 Seep

A total of 0.01 acre of seep occurs in the Study Area (see Figure 5). Seeps are characterized as areas where groundwater intersects the soil surface. Typically, water flows from seeps persist for some period after the rainy season or, more rarely, nearly year-round. Seeps accessing sufficient amounts of subsurface water can support isolated wetland vegetation (such as on a hillside) or they may form the headwaters of other jurisdictional drainage or wetland features, such as wetland swales. Vegetation in seeps often consists of plant species associated with seasonal and semipermanent marsh habitats. When seeps are active for only short periods beyond the rainy season and into the warm season, herbaceous perennial wetland species typically dominate. Vegetation observed in the seep within the Study Area consisted almost entirely of iris-leaved rush (*Juncus xiphioides*).

4.5.1.3 Wetland Swale

A total of 0.01 acre of wetland swale occurs in the Study Area (see Figure 5). Seasonal wetland swales are shallow, seasonally inundated low areas within the local topography that form in soils with a subsurface layer that restricts the downward flow of water, causing water to flow over the surface or subsurface for extended and variable periods of time. Swales generally do not exhibit a defined bed/bank with an ordinary high-water mark but often drain or are connected to other aquatic features. Depending on common factors such as daily average temperatures and the amount and frequency of seasonal precipitation, swales may be saturated or flooded for days, weeks, or even months. The wetland swale within the Study Area is associated with a seasonal wetland in the northern portion of the Study Area and conveys water from that feature to an ephemeral drainage during high flow events. Dominant vegetation occurring within the wetland swale includes curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue, rye grass, annual hair grass, and rabbitsfoot grass.

4.5.1.4 Ephemeral Drainage

A total of 0.23 acre of ephemeral drainages occurs in the Study Area (see Figure 5). Ephemeral drainages are not wetlands as they do not meet the three-parameter criteria for vegetation, hydrology, and soils but do convey water and exhibit an ordinary high water mark. Water flows within ephemeral drainages are fed primarily by precipitation and surface water runoff. These features convey water during and immediately after storm events, but do not flow continuously throughout the winter and spring. Typically, these features exhibit a defined bed and bank and show signs of scouring as a result of rapid flow events. Although the channels of the ephemeral drainages within the Study Area are largely unvegetated, what vegetation is present includes winter vetch, ripgut brome, Italian ryegrass, phacelia (*Phacelia cicutaria*), and medusahead (*Elymus caput-medusae*).

4.5.1.5 Intermittent Drainage

A total of 0.36 acre of intermittent drainage occurs in the Study Area (see Figure 5). Intermittent drainages receive substantial seasonal flows of significant velocity and may appear as perennial features during the normal wet season. These seasonal flows often scour the channel of vegetation. Intermittent drainages may support fringe wetland vegetation types, such as seasonal or semi-permanent marsh or riparian wetlands. Conversely, intermittent drainages may be associated with hydrophytic vegetation communities that lack further wetland indicators. A typical hydroperiod of intermittent drainages is one that begins with the onset of substantial rains in the normal wet season and persists for an extended, variable amount of time into summer.

A brick check dam has been constructed across a portion of the intermittent drainage. This check dam has resulted in periods of water backing up during flow events that have supported the establishment of hydrophytic emergent vegetation upstream. The area containing emergent vegetation is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock, with areas of cattails, Himalayan blackberry, and a small clump of willows. This area is entirely within the ordinary high water mark of the intermittent drainage.

4.5.1.6 Perennial Drainage

A total of 0.22 acre of perennial drainage occurs in the Study Area (Figure 5). Perennial drainages may not meet the three-parameter wetland criteria for vegetation, hydrology, and soils, but do convey water and exhibit an OHWM. Perennial drainages convey water flows throughout the entire year. These drainages typically consist of a channel, bed, and bank and are devoid of wetland vegetation due to the scouring effect of flowing water. Perennial drainages are often bordered by wetland and riparian communities of various composition and cover depending on flow rates, duration of flows, and soil types.

The perennial drainage is located in the western portion of the Study Area and flows north to south. This feature originates north of the Study Area and is a direct tributary to Carson Creek. Two high-flow channels are present along the western portion of the main channel and contained flowing water during the site assessment on January 9, 2025. The perennial drainage is generally devoid of vegetation, but emergent wetland vegetation and riparian vegetation are present along the upper bank of the drainage and form a swath of valley foothill riparian habitat.

4.5.2 Valley Foothill Riparian Habitat

Valley foothill riparian habitat, as described in Section 4.3.2, is considered a sensitive habitat that may be regulated by CDFW under Section 1600 of the California Fish and Game Code. CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over four inches in DBH. If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow the protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends submitting an application for a SAA for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater. Valley foothill riparian habitat is planned to be removed or impacted as part of the proposed project as currently described.

4.5.3 Protected Trees and Oak Woodland

As discussed in Section 2.5.2, if oak trees or oak woodland are anticipated to be removed or impacted, an oak woodland removal permit is required prior to removal of oak trees that are part of an oak woodland and an oak tree removal permit is required prior to removal of Heritage Trees and individual oak trees. Mitigation for impacts to oak woodlands is based on the total area impacted, and mitigation ratios are outlined in Table 1, *Oak Woodland Mitigation*.

4.5.4 Wildlife Migration Corridors

Wildlife corridors link areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. This fragmentation of habitat can also occur when a portion of one or more habitats is converted into another habitat; for instance, when woodland or scrub habitat is altered or converted into grasslands after a disturbance such as fire, mudslide, or construction activities. Wildlife corridors mitigate the effects of this fragmentation by (1) allowing animals to move between remaining habitats thereby permitting depleted populations to be replenished and promoting genetic exchange; (2) providing escape routes from fire, predators, and human disturbances, thus reducing the risk of catastrophic events (such as fire or disease) on population or local species extinction; and (3) serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs.

The Study Area is located in an area surrounded by residential development and roads. Although some wildlife may travel through the Study Area on a local level, especially along the perennial drainage, the Study Area is not considered a wildlife migration corridor.

4.5.5 Important Biological Corridors

The *El Dorado County General Plan* identifies a number of Important Biological Corridors (IBC). The Study Area is not located within a designated IBC. The proposed project will not cause a significant reduction in the ecological functions or current ability to facilitate wildlife movement.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The 36.94-acre Study Area is split into three portions by Silva Valley Parkway and Clarksville Road and consists primarily of annual grassland. Biological communities present within the Study Area include annual grassland (29.45 acres), purple needlegrass grassland (0.86 acre), valley foothill riparian (1.45 acre), valley oak woodland (0.34 acre), ruderal/disturbed (3.82 acre), seasonal wetland (0.19 acre), seep (0.01 acre), wetland swale (0.01 acre), ephemeral drainage (0.23 acre), intermittent drainage (0.36 acre), and a perennial drainage (0.22 acre).

No special-status plant or wildlife species were observed in the Study Area during the field survey on January 9, 2025. Suitable habitats for special-status plants, special-status wildlife species, and nesting migratory birds and raptors are present in the Study Area. In addition, sensitive habitats, including valley oak woodland and individual oak trees, aquatic habitat, and riparian habitat, are present in the Study Area. Recommendations, including avoidance and minimization measures to limit or avoid impacts to special-status species, nesting birds, and sensitive habitats, are included below.

Known or potential biological constraints in the Study Area include the following:

- Potential habitat for special-status plants, including Sanford's arrowhead;
- Potential habitat for special-status invertebrates, including Crotch's bumble bee and monarch butterfly;
- Potential habitat for special-status amphibians, including western spadefoot;
- Potential habitat for special-status reptiles, including northwestern pond turtle and coast horned lizard;
- Potential habitat for migratory birds and raptors such as Cooper's hawk, tricolored blackbird, grasshopper sparrow, burrowing owl, Swainson's hawk, white-tailed kite, California black rail, and purple martin;
- Potential roosting habitat for special-status mammals, including pallid bat and American badger;
- Purple needlegrass grassland sensitive natural community;
- Protected oak trees and oak woodland; and
- Aquatic resources and riparian habitat that may be considered waters of the U.S. and/or State or regulated under CDFW Section 1600.

5.1 SPECIAL-STATUS PLANTS

The Study Area provides suitable habitat for Sanford's arrowhead within the perennial drainage and the proposed project may impact the perennial drainage to construct stormwater improvements. Botanical inventories of the Study Area, excluding the portion west of Clarksville Road, were conducted on April 24, May 26, and June 16, 2015. No special-status plants were documented to occur within the Study Area during these surveys. However, construction did not commence within two years of the 2015

botanical inventories, therefore additional botanical inventories are recommended to ensure that populations have not established in the intervening years, in accordance with CDFW's plant protocols.

To avoid potential impacts on special-status plant species with potential to occur in the Study Area, the following measures are recommended:

- Prior to implementation of project activities and during the blooming period for the special-status plant species with potential to occur on the project site, a qualified botanist shall conduct protocol-level surveys for special-status plants within the Study Area following survey methods from CDFW's *Protocols for Surveying and Evaluating Impacts on Special-Status Native Plant Populations and Natural Communities* (CDFW 2018 or most recent version). The qualified botanist shall: (1) be knowledgeable about plant taxonomy, (2) be familiar with plants of the Sierra Nevada region, including special-status plants and sensitive natural communities, (3) have experience conducting floristic botanical field surveys as described in CDFW 2018, (4) be familiar with the California Manual of Vegetation (Sawyer et al. 2009 or current version, including updated natural communities data at http://vegetation.cnps.org/), and (5) be familiar with federal and state statutes and regulations related to plants and plant collecting.

- If special-status plants are not found, the botanist shall document the findings in a report to the applicant and El Dorado County, and no further mitigation shall be required.

- If special-status plants are found during special-status plant surveys and cannot be avoided, the applicant shall, in consultation with CDFW or USFWS, as appropriate depending on species status, develop and implement a site-specific mitigation strategy to compensate for loss of occupied habitat or individuals. Mitigation measures may include preserving and enhancing existing populations, establishing populations through seed collection or transplantation from the site that is to be affected, and/or restoring or creating habitat in sufficient quantities to offset loss of occupied habitat or individuals. Potential mitigation sites could include suitable locations within or outside of the project site. Habitat and individual plants lost shall be mitigated at a minimum 1:1 ratio, considering acreage as well as function and value. Success criteria for preserved and compensatory populations shall include:

    - The extent of occupied area and plant density (number of plants per unit area) in compensatory populations shall be equal to or greater than the affected occupied habitat.

    - Compensatory and preserved populations shall be self-producing. Populations would be considered self-producing when:

        - plants reestablish annually for a minimum of five years with no human intervention such as supplemental seeding; and

        - reestablished and preserved habitats contain an occupied area and flower density comparable to existing occupied habitat areas in similar habitat types in the project vicinity.

If off-site mitigation includes dedication of conservation easements, purchase of mitigation credits, or other off-site conservation measures, the details of these measures shall be included in the mitigation plan, including information on responsible parties for long-term management, conservation easement

holders, long-term management requirements, success criteria such as those listed above and other details, as appropriate to target the preservation of long-term viable populations.

Documentation of the completion of the mitigation strategy and coordination/consultation process with CDFW or USFWS shall be provided to El Dorado County before commencement of any project construction activities.

5.2 SPECIAL-STATUS INVERTEBRATES

5.2.1 Crotch's Bumble Bee

Crotch's bumble bee has potential to occur in the annual grassland habitat within the Study Area. Implementation of the proposed project has the potential for adverse effects to this species.

The following measures are recommended to avoid or reduce potential impacts to Crotch's bumble bee.

- Initial ground-disturbing work (e.g., grading, vegetation removal, staging) shall take place between August 15 and March 15, if feasible, to avoid impacts on nesting Crotch's bumble bees.

- Regardless of the feasibility of the above limited operating period, a qualified biologist familiar with bumble bees of California and experienced using survey methods for bumble bees shall conduct a habitat assessment and focused survey for Crotch's bumble bee before the start of any ground-disturbing activities. Surveys shall be performed when Crotch's bumble bee is most likely to be identified, typically from April through August (i.e., the colony active period) when floral resources and ideal weather conditions are present, and shall follow the methods in Survey Considerations for California Endangered Species Act (CESA) Candidate Bumble Bee Species (CDFW 2023). Surveys shall be conducted during the colony active period closest to the start of planned construction activities. Survey results shall be submitted to the applicant and El Dorado County no less than seven days before construction begins.

- The applicant shall submit a survey report to CDFW within one month of survey completion and shall notify CDFW and El Dorado County within 24 hours if Crotch's bumble bees are detected.

- If Crotch's bumble bees are detected during the focused survey, appropriate avoidance measures shall be implemented. Avoidance measures shall include, but not be limited to, the following:

    - Protective buffers shall be implemented around active nesting colonies or overwintering queens until these sites are no longer active. A qualified biologist, in coordination with CDFW, shall determine the appropriate buffer size to protect nesting colonies or overwintering queens; however, the buffer shall be a minimum of 50 feet.

        - If impacts on Crotch's bumble bee cannot be avoided, the applicant shall obtain an incidental take permit (ITP) from CDFW and shall implement all avoidance measures included in the ITP.

- Documentation of compliance with this mitigation measure and any required coordination with CDFW or acquisition of an ITP shall be provided to El Dorado County before commencement of any project construction activities.

5.2.2 Monarch Butterfly

Narrow-leaf milkweed was observed in the Study Area that could provide larval habitat for Monarch butterfly during the summer breeding season (March 16 through October 31 [USFWS 2021]). As feasible, any construction activities within 25 feet of milkweed should occur outside of the summer breeding season (from approximately November 1 through March 15 [USFWS 2021]). This would reduce potential impacts on larval butterflies.

- If construction activities (e.g., ground disturbance, vegetation removal, staging) in the Study Area occur during the period when milkweed plants may host monarch eggs or caterpillars (approximately mid-March through late September) a qualified biologist shall survey the Study Area for milkweed plants. If milkweed plants are found, a qualified biologist shall inspect the milkweed plants for the presence of monarch eggs or caterpillars no more than 14 days before plant removal. If monarch eggs or caterpillars are detected, the milkweed plants shall be avoided until they are no longer being used by monarch caterpillars, as confirmed by a qualified biologist, if feasible. If no eggs or caterpillars are detected, no additional protection measures are necessary.

- Documentation of compliance with this mitigation measure shall be provided to El Dorado County before commencement of any project construction activities.

5.3 SPECIAL-STATUS AMPHIBIANS AND REPTILES

Northwestern pond turtle may utilize the perennial drainage and other aquatic features within the Study Area and may occur in upland areas in the annual grassland, valley oak woodland, and valley foothill riparian habitats. Western spadefoot may utilize the seasonal wetlands within the Study Area. USFWS may consult on the project's impacts on northwestern pond turtle during Section 7 consultation during the permitting process for impacts to waters of the U.S. Coast horned lizard may occur throughout the entire upland communities of the Study Area. To avoid potential impacts to these species, the following measures are recommended in addition to any measures required by the USFWS.

5.3.1 Coast Horned Lizard

- Within 14 days before the initiation of any construction activity, a qualified biologist familiar with the life history of coast horned lizard shall conduct a focused visual survey of habitat suitable for this species on the project site, which shall include walking linear transects of the site.

- If coast horned lizards are not detected during the focused survey, the qualified biologist shall submit a report summarizing the results of the survey to the applicant and El Dorado County, and further mitigation shall not be required.

- If coast horned lizards are detected, a qualified biologist with an appropriate CDFW Scientific Collecting Permit that allows handling of reptiles shall be present during initial ground

disturbance activities and shall inspect the project site before initiation of project activities. If coast horned lizards are detected, the qualified biologist shall move individuals into nearby suitable habitat that will not be disturbed by project activities.

- Documentation of compliance with this mitigation measure shall be provided to El Dorado County before commencement of any project construction activities.

5.3.2 Western Spadefoot

- Within 48 hours prior to project implementation, a qualified biologist shall conduct focused surveys in aquatic (i.e., wetlands) and upland (i.e., annual grassland) habitats within approximately 860 feet (262 meters) of aquatic habitat (Baumberger et al. 2019) suitable for the species. Burrows considered potentially suitable for western spadefoot shall be identified and further examined by a qualified biologist (e.g., with a burrow scope, through hand excavation) to determine whether adult western spadefoot is present in the burrow.

- If western spadefoot is not found, the qualified biologist shall submit a report summarizing the results of the survey to the applicant and El Dorado County, and further mitigation will not be required.

- If western spadefoot is detected during focused surveys, adults, tadpoles, and egg masses shall be relocated by a qualified biologist with a valid CDFW scientific collecting permit to nearby suitable habitat that will not be disturbed by project activities.

- Because western spadefoot is proposed for listing under FESA, if the species is listed before project construction activities begin that could result in injury to or mortality of western spadefoot toads (i.e., ground disturbance, grading, land conversion), then the project applicant may be required to consult with USFWS under Section 7 or Section 10 of FESA. USACE is presumed to be the federal action agency because it has jurisdiction over the aquatic habitat on the project site (see Impact 3.4-4). If it is determined, in consultation with USFWS, that take of this species could occur after implementation of the measures described above, then the project applicant may be required to obtain incidental take authorization through Section 7 consultation or a Section 10 permit pursuant to FESA. In this case, the project shall not proceed until a biological opinion is issued by USFWS.

    - Any conservation measures developed in coordination with USFWS during the course of formal or informal consultation under Section 7 or during Section 10 consultation would supersede the measures listed here.

    - Such conservation measures could include, but would not be limited to, seasonal work restrictions for initial ground disturbance, pre-construction surveys by a qualified biologist, installation of wildlife exclusion fencing, biological monitoring, and worker environmental awareness training. Additional measures could include preservation, restoration, or enhancement of habitat on- or off-site; purchase of habitat credits from an agency-approved mitigation/conservation bank; work with a local land trust to preserve land; or any other method acceptable to USFWS.

- If USFWS determines that listing of western spadefoot under FESA is not warranted, or the species is not listed prior to project completion, then the above measures related to consultation with USFWS would not be applicable. Documentation of compliance with this mitigation measure shall be provided to El Dorado County before commencement of any project construction activities.

5.3.3 Northwestern Pond Turtle

- Within 14 days prior to the initiation of any construction activities, a qualified biologist shall conduct pre-construction surveys for northwestern pond turtle in habitats for this species (i.e., the pond and suitable upland areas within 0.3 mile of the pond) that will be disturbed by construction activity.

- If northwestern pond turtles are found prior to the initiation of, or during, construction activities, a qualified biologist with an appropriate CDFW Scientific Collecting Permit that allows handling of reptiles shall relocate the turtle to a suitable habitat area outside of the project site.

- If a northwestern pond turtle nest is observed within the proposed impact area during the pre-construction survey, the nest shall be fenced off and avoided until the eggs hatch or the nest is no longer active as determined by a qualified biologist. The fenced area shall be open on one side with the opening facing the nearest aquatic habitat so that hatchling turtles can freely travel from the nest to the aquatic habitat. A qualified biologist shall monitor to ensure that hatchlings do not disperse into the construction area. If any hatchlings are observed within the project area, relocation of hatchlings shall occur as described in the encounter protocol below.

- If a northwestern pond turtle is encountered, work shall be suspended in a 100-foot radius of the animal until the animal leaves the project site on its own volition. If necessary, a qualified biologist shall notify CDFW to determine the appropriate procedures related to relocation. Any worker who inadvertently injures or kills a northwestern pond turtle or who finds a northwestern pond turtle dead, injured, or entrapped must immediately report the incident to the applicant, who must immediately notify CDFW.

- Because northwestern pond turtle is proposed for listing under FESA, if the species is listed before the completion of project construction activities that could result in injury to or mortality of turtles (i.e., ground disturbance, grading, land conversion), then the project applicant may be required to consult with USFWS under Section 7 or Section 10 of FESA. USACE is presumed to be the federal action agency because it has jurisdiction over the aquatic habitat on the project site (see Impact 3.4-4). If it is determined, in consultation with USFWS, that take of this species could occur after implementation of the measures described above, then the project applicant may be required to obtain incidental take authorization through Section 7 consultation or a Section 10 permit pursuant to FESA. In this case, the project shall not proceed until a Biological Opinion is issued by USFWS.

    - Any conservation measures developed in coordination with USFWS during the course of formal or informal consultation under Section 7 or during Section 10 consultation would supersede the measures listed here.

    - Such conservation measures could include, but would not be limited to, seasonal work restrictions for initial ground disturbance, pre-construction surveys by a qualified biologist,

installation of wildlife exclusion fencing, biological monitoring, and worker environmental awareness training. Additional measures could include preservation, restoration, or enhancement of habitat on- or off-site; purchase of habitat credits from an agency-approved mitigation/conservation bank; work with a local land trust to preserve land; or any other method acceptable to USFWS.

- If USFWS determines that listing of northwestern pond turtle under FESA is not warranted, or the species is not listed prior to project completion, then the above measures related to consultation with USFWS would not be applicable. CDFW may require mitigation for potential impacts on northwestern pond turtle as part of a streambed alteration agreement. If CDFW assigns mitigation that is more stringent than the measures proposed above, the CDFW measure shall take precedence.

- Documentation of compliance with this mitigation measure and the coordination/consultation process with CDFW and USFWS shall be provided to El Dorado County before commencement of any project construction activities.

5.4 SPECIAL-STATUS BIRDS AND NESTING MIGRATORY BIRDS AND RAPTORS

Special-status birds and migratory birds and raptors protected under federal, State, and/or local laws and policies have potential to nest and forage within the Study Area including Cooper's hawk, tricolored blackbird, grasshopper sparrow, burrowing owl, white-tailed kite, California black rail, and purple martin. The Study Area and adjacent land contain suitable habitat to support a variety of nesting birds within trees, shrubs, structures, and on bare ground.

5.4.1 Burrowing Owl

- A qualified biologist shall conduct a focused survey for burrowing owls in areas of habitat suitable for the species on and within 1,640 feet (500 meters) of the Study Area no less than 14 days before initiating ground disturbance activities using survey methods described in Appendix D of the CDFW Staff Report on Burrowing Owl Mitigation (CDFW 2012). Inaccessible areas (e.g., adjacent private property) will not be surveyed directly, but the biologist may use binoculars or a spotting scope to survey these areas.

- If no occupied burrows are found, the qualified biologist shall submit a report documenting the survey methods and results to the applicant and El Dorado County, and no further mitigation shall be required.

- If an active burrow is found within 1,640 feet of pending construction activities that would occur during the nonbreeding season (September 1 through January 31), the applicant shall establish and maintain a minimum protection buffer of 1,640 feet (500 meters) around the occupied burrow and any identified satellite burrows (i.e., non-nesting burrows that burrowing owls use to escape predators or move young into after hatching) to prevent take of the burrowing owls throughout construction. The protection buffer may be adjusted if, in consultation with CDFW, a qualified biologist determines that an alternative buffer would not disturb burrowing owl use of the burrow because of particular site features (e.g., topography, natural line-of-sight barriers), level of project disturbance, or other considerations. If the buffer is reduced, a

qualified biologist shall monitor the behavior of the burrowing owls during all project activities within 1,640 feet of the burrow. If the owls are disturbed or agitated (e.g., vocalizations, bill snaps, fluffing feathers to increase body size appearance, drooping wings and rotating them forward, crouching and weaving back and forth) by the project activities, the biologist shall have the authority to halt the activities and re-establish a buffer consistent with the first bullet until the agitated behavior ceases and normal behavior resumes.

- The buffer shall remain in place around the occupied burrow and associated satellite burrows until a qualified biologist has determined through noninvasive methods that the burrows are no longer occupied by burrowing owl. A previously occupied burrow will be considered unoccupied if surveys demonstrate that no owls have used the burrow for seven consecutive days.

- If implementation of a buffer to prevent take of burrowing owl is not feasible, the project applicant shall consult with CDFW and obtain an ITP prior to commencing project related ground-disturbing activities. The impacts of taking burrowing owl shall be minimized and fully mitigated.

- The project applicant shall compensate for the loss of burrowing owl by establishing permanent protection and perpetual management on land that provides burrowing owl habitat. Habitat management lands for burrowing owl may be established by conservation easement or fee title or credits may be purchased from a CDFW-approved conservation or mitigation bank. The compensatory mitigation shall satisfy permit conditions and all other permit conditions shall be implemented.

- Documentation of compliance with this mitigation measure and the coordination process with CDFW shall be provided to El Dorado County before commencement of any project construction activities.

5.4.2 Special-Status Birds and Other Nesting Birds

Active nests and nesting birds are protected by the California Fish and Game Code Sections 3503, 3503.5, and 3513 and the MBTA. Ground-disturbing and other development activities including grading, vegetation clearing, tree removal/trim, and construction could impact nesting birds if these activities occur during the nesting season (generally February 1 to August 31). To avoid impacts to nesting birds, all ground disturbing activity should be completed between September 1 and January 31, if feasible. If construction cannot occur outside of the nesting season, the following measures are recommended:

- To minimize the potential for loss of special-status bird species, raptors, and other native birds, project activities (e.g., tree removal, vegetation clearing, ground disturbance, staging) shall be conducted during the nonbreeding season (approximately September 1 through January 31, as determined by a qualified biologist), if feasible. If project activities are conducted during the nonbreeding season, no further mitigation shall be required.

- Within 14 days before the onset of project activities during the breeding season (approximately February 1 through August 31, as determined by a qualified biologist), a qualified biologist familiar with birds of California and with experience conducting nesting bird surveys shall conduct focused surveys for special-status birds, other nesting raptors, and other native birds. Surveys shall be conducted in accessible areas within 0.25 mile of the Study Area for Swainson's

hawk, within 500 feet of the Study Area for other raptor species and special-status birds, and within 50 feet of the Study Area for non-raptor common native bird nests.

- If no active nests are found, the qualified biologist shall submit a report documenting the survey methods and results to the applicant and El Dorado County, and no further mitigation shall be required.

- If active nests are found, impacts on nesting birds shall be avoided by establishing appropriate buffers around active nest sites identified during focused surveys to prevent disturbance to the nest. Project activity shall not commence within the buffer areas until a qualified biologist has determined that the young have fledged, the nest is no longer active, or reducing the buffer would not likely result in nest abandonment. Buffers typically shall be 0.25 mile for Swainson's hawk and 500 feet for other raptors. Buffer size for non-raptor bird species shall be determined by a qualified biologist. Factors to be considered for determining buffer size shall include presence of natural buffers provided by vegetation or topography, nest height above ground, baseline levels of noise and human activity, species sensitivity, and proposed project activities. Generally, buffer size for these species shall be at least 20 feet. The size of the buffer may be adjusted if a qualified biologist determines that such an adjustment shall not be likely to adversely affect the nest. Any buffer reduction for a special-status species shall require consultation with CDFW. Periodic monitoring of the nest by a qualified biologist during project activities shall be required if the activity has potential to adversely affect the nest, the buffer has been reduced, or if birds within active nests are showing behavioral signs of agitation (e.g., standing up from a brooding position, flying off the nest) during project activities, as determined by the qualified biologist.

- Documentation of compliance with this mitigation measure and any required coordination with CDFW shall be provided to El Dorado County before commencement of any project construction activities.

5.5 SPECIAL-STATUS MAMMALS

5.5.1 Pallid Bat

Pallid bat has potential to roost within trees in the Study Area. If trees are removed as part of the proposed project, bat roosts and maternity roosts may be impacted. The following measures are recommended to avoid potential impacts to pallid bat and other bat species:

- Prior to the start of project activities, a qualified biologist familiar with bats and bat ecology, and experienced in conducting bat surveys, shall conduct surveys for bat roosts in suitable habitat (e.g., large trees, crevices, cavities, exfoliating bark, foliage) within and adjacent to the project site.

- If no evidence of bat roosts is found, the qualified biologist shall submit a report summarizing the results of the survey to the applicant and El Dorado County, and no further study shall be required.

- If evidence of bat maternity roosts or hibernacula is observed, the species and number of bats using the roost shall be determined by a qualified biologist using noninvasive methods. Bat detectors (i.e.,

acoustic monitoring) or evening emergence surveys shall be used if deemed necessary to supplement survey efforts by the qualified biologist.

- A no-disturbance buffer of 250 feet shall be established around active pallid bat maternity roosts or hibernacula, as well as substantial maternity roosts or hibernacula of other bat species considered to be a wildlife nursery by the qualified biologist, and project activities shall not occur within this buffer until after the roosts are unoccupied as determined by a qualified biologist.

- If roosts of pallid bat are determined to be present and must be removed, the bats shall be excluded from the roosting site before the tree is removed. A program addressing compensation, exclusion methods, and roost removal procedures shall be developed in consultation with CDFW before implementation. Exclusion methods may include use of one-way doors at roost entrances (bats may leave but not reenter) or sealing roost entrances when the site can be confirmed to contain no bats. Exclusion efforts may be restricted during periods of sensitive activity (e.g., during hibernation or while females in maternity colonies are nursing young). The loss of each roost (if any) shall be replaced in consultation with CDFW and may require construction and installation of bat boxes suitable to the bat species and colony size excluded from the original roosting site. If determined necessary during consultation with CDFW, replacement roosts shall be implemented before bats are excluded from the original roost sites. Once the replacement roosts are constructed and it is confirmed that bats are not present in the original roost site by a qualified biologist, the roost tree may be removed.

- Documentation of compliance with this mitigation measure shall be provided to El Dorado County before commencement of any project construction activities.

5.5.2 American Badger

The annual grassland provides habitat for American badger. The following measures are recommended to avoid potential impacts to American badger:

- Within 14 days before commencement of project activities, a qualified wildlife biologist familiar with American badger and experience using survey methods for the species shall conduct focused surveys of habitat suitable for the species within the project site to identify any American badger dens.

- If occupied dens are not found, the qualified biologist shall submit a report summarizing the results of the survey to the applicant and El Dorado County, and further mitigation shall not be required.

- If occupied dens are found, impacts on active badger dens shall be avoided by establishing exclusion zones around all active badger dens, the size of which shall be determined by the qualified biologist such that the active badger den is not disturbed by project activities. No project activities (e.g., vegetation removal, ground disturbance, staging) shall occur within the exclusion zone until denning activities are complete or the den is abandoned, as confirmed by a qualified biologist. The qualified biologist shall monitor each den once per week to track the status of the den and to determine when it is no longer occupied. When it is no longer occupied, project activities within the exclusion zone may occur.

- If occupied dens cannot be avoided during construction, passive exclusion such as installing one-way doors on the occupied den(s) may be considered. Passive relocation shall only occur outside of the cub rearing season (generally March 1 to July 31, passive relocation could occur August 1 to February 28) to avoid impacts to cubs still dependent on the den. CDFW shall be consulted prior to performing passive relocation and an exclusion plan shall be prepared and approved by CDFW. The project proponent shall work with a qualified biologist during the CDFW consultation process, if necessary, and passive relocation shall be performed by a qualified biologist.

- Documentation of compliance with this mitigation measure shall be provided to El Dorado County before commencement of any project construction activities.

5.6 PURPLE NEEDLEGRASS GRASSLAND

The proposed project would result in the removal of purple needlegrass grassland. The following measures are recommended to compensate for loss of the purple needlegrass grassland sensitive natural community:

- The applicant shall compensate for unavoidable loss of purple needlegrass grassland such that no net loss of habitat function occurs by:

    - restoring degraded purple needlegrass grassland outside of the project site at a sufficient ratio to offset the loss of habitat function (at least 1:1); or

    - preserving existing purple needlegrass grassland of equal or better value to the sensitive natural community affected through a conservation easement at a sufficient ratio to offset the loss of habitat function (at least 1:1).

- Prepare and implement a Compensatory Mitigation Plan that includes the following:

    - For preserving existing habitat outside of the project site in perpetuity, the Compensatory Mitigation Plan shall include a summary of the proposed compensation lands (e.g., the number and type of credits, location of mitigation bank or easement), parties responsible for the long-term management of the land, and the legal and funding mechanism for long-term conservation (e.g., holder of conservation easement or fee title). The applicant shall provide evidence in the plan that the necessary mitigation has been implemented or that the applicant has entered into a legal agreement to implement it and that compensatory habitat shall be preserved in perpetuity.

    - For restoring or enhancing habitat outside of the project site, the Compensatory Mitigation Plan shall include a description of the proposed habitat improvements, success criteria that demonstrate the performance standard of maintained habitat function has been met, legal and funding mechanisms, and parties responsible for long-term management and monitoring of the restored or enhanced habitat.

    - Success criteria required to maintain habitat function for preserved and compensatory populations shall include:

- The extent of occupied area and density of plants associated with the sensitive natural community (number of plants per unit area) in compensatory habitats shall be equal to or greater than the affected occupied habitat.

- Compensatory and preserved sensitive natural communities shall be self-producing. Populations would be considered self-producing when:

  - Plants associated with sensitive natural communities reestablish annually for a minimum of five years with no human intervention such as supplemental seeding; and

  - Reestablished and preserved habitats contain an occupied area and density comparable to existing occupied habitat areas in similar habitat types in the project vicinity.

5.7 OAK TREES AND OAK WOODLAND

If impacts to oak trees or oak woodland canopy are anticipated as part of the proposed project, the appropriate tree removal permit shall be obtained and all measures included in the ORMP as outlined in Section 2.5.2 shall be followed. The Oak Resources Technical Report (HELIX 2025b) for the proposed project provides oak resource preservation recommendations and describes mitigation requirements.

5.8 AQUATIC RESOURCES AND RIPARIAN HABITAT

Approximately 0.19 acre of seasonal wetland, 0.01 acre of seep, 0.01 acre of wetland swale, 0.23 acre of ephemeral drainage, 0.36 acre of intermittent drainage, 0.22 acre of perennial drainage, and 1.45 acres of valley foothill riparian habitat were mapped within the Study Area. If impacts to these habitats are anticipated, the following measures are recommended.

5.8.1 Aquatic Resources

- The 2025 aquatic resources delineation report shall be submitted by the applicant to USACE, with a request for preliminary jurisdictional determination.

- Authorization for fill or waters of the United States shall be secured from USACE and the RWQCB through the Clean Water Act Sections 401 and 404 permitting processes. In association with the Section 404 and prior to the issuance of any grading permit, Section 401 Water Quality Certification from the Central Valley RWQCB shall be obtained. For impacts on waters of the state that are not also waters of the United States and are therefore not covered by the 401 Water Quality Certification, the applicant shall apply to the RWQCB for Waste Discharge Requirements following the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (State Water Resources Control Board 2021). Any waters of the United States or waters of the state that are affected by the project shall be replaced on a no-net-loss basis in accordance with the applicable USACE and California Water Board mitigation standards in place at the time of construction.

- Prior to commencing activity that may divert the natural flow or otherwise alter the bed or bank, of any lake or stream on the project site, the applicant shall notify CDFW, through

issuance of a Lake and Streambed Alteration Notification (notification). If CDFW determines, based on the notification, project activities trigger the need for a Lake and Streambed Alteration Agreement, the proponent shall obtain an agreement from CDFW before the activity commences. The applicant shall conduct project construction activities in accordance with the agreement, including implementing reasonable measures in the agreement necessary to protect fish and wildlife resources, when working within the bed or bank of waterways or in riparian habitats associated with those waterways. These measures may include but not be limited to demarcation of the construction area, biological monitoring, environmental awareness training for construction crews, and compensatory measures (e.g., restoration, long-term habitat management).

- Documentation of compliance with this mitigation measure and receipt of a Lake and Streambed Alteration Agreement from CDFW, as well as wetland permitting from USACE, shall be provided to El Dorado County before commencement of any project construction activities.

5.8.2 Riparian Habitat

- A Streambed Alteration Notification shall be submitted to CDFW, pursuant to Section 1602 of the California Fish and Game Code. If proposed project activities are determined to be subject to CDFW jurisdiction, the applicant shall abide by the measures to protect fish and wildlife resources required by any executed agreement prior to any vegetation removal or activity that may affect the resource. Measures to protect fish and wildlife resources shall include, at a minimum, a combination of the following mitigation.

- The applicant shall compensate for the loss of riparian habitat such that no net loss of habitat function and values occurs by:

    - restoring degraded riparian habitat outside of the project site;

    - purchasing riparian habitat credits at a CDFW-approved mitigation bank;

    - or preserving existing riparian habitat of equal or better value to the affected riparian habitat through a conservation easement at a sufficient ratio to offset the loss of riparian habitat function (at least 1:1).

- The applicant shall prepare and implement a Compensatory Mitigation Plan that includes the following:

    - For preserving existing riparian habitat outside of the project site in perpetuity, the Compensatory Mitigation Plan shall include a summary of the proposed compensation lands (e.g., the number and type of credits, location of mitigation bank or easement), parties responsible for the long-term management of the land, and the legal and funding mechanism for long-term conservation (e.g., holder of conservation easement or fee title). The applicant shall provide evidence in the plan that the necessary mitigation has been implemented or that the applicant has entered into a legal agreement to implement it and that compensatory habitat shall be preserved in perpetuity.

    - For restoring or enhancing riparian habitat outside of the project site, the Compensatory Mitigation Plan shall include a description of the proposed habitat improvements, success

criteria that demonstrate the performance standard of maintained habitat function has been met, legal and funding mechanisms, and parties responsible for long-term management and monitoring of the restored or enhanced habitat.

- Compensatory mitigation may be satisfied through compliance with permit conditions, or other authorizations obtained by the applicant (e.g., Lake and Streambed Alteration Agreement), if these requirements are equally or more effective than the mitigation identified above.

- Documentation of compliance with this mitigation measure and receipt of a Lake and Streambed Alteration Agreement from CDFW (or a letter from CDFW stating that such an Agreement is not required) shall be provided to El Dorado County before commencement of any project construction activities.

5.9 SUMMARY OF AVOIDANCE AND MINIMIZATION MEASURES

- Install wildlife exclusion fencing around the project area perimeter before construction.

- Conduct a special-status plant survey(s) between May and October to determine the presence or absence of special-status plants in the Study Area.

- Conduct a pre-construction survey for monarch butterfly within 14 days of the start of construction, if construction activities occur during the breeding season (approximately March 16 through October 31) and directly or indirectly impact milkweed.

- Conduct a habitat assessment and focused survey for Crotch's bumble bee during the colony active period (April through August).

- Conduct a pre-construction survey for western spadefoot within 48 hours of the start of construction and northwestern pond turtle and coast horned lizard within 14 hours of the start of construction. USFWS may consult on project-related effects on western spadefoot and northwestern pond turtle during the Section 7 consultation process for impacts to waters of the U.S.

- Conduct a pre-construction survey for burrowing owl and nesting birds within 14 days of the start of construction if work begins between February 1 and August 31.

- Conduct a pre-construction survey for roosting bats prior to the start of construction.

- Conduct a pre-construction survey for American badger within 14 days of the start of construction.

- Conduct an environmental awareness training for all project-related personnel before the initiation of work.

- Mitigate for the removal of purple needlegrass grassland at a 1:1 ratio and prepare a mitigation and monitoring plan.

- Obtain an applicable tree permit if oak trees or oak woodland are planned to be removed or impacted as part of the proposed project.

- If impacts to aquatic resources or riparian habitat are anticipated, submit the aquatic resources delineation report to USACE for verification, and obtain all applicable permits for fill/impact of aquatic resources and/or riparian habitat.

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A Biological Assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)

(c)). For projects other than major construction activities, the Service suggests that a biological evaluation similar to a Biological Assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a Biological Assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found in the "Endangered Species Consultation Handbook" at:

https://www.fws.gov/sites/default/files/documents/endangered-species-consultation-handbook.pdf

Migratory Birds: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts, see https://www.fws.gov/program/migratory-bird-permit/what-we-do.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures, see https://www.fws.gov/library/collections/threats-birds.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/partner/council-conservation-migratory-birds.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

- Official Species List

OFFICIAL SPECIES LIST

This list is provided pursuant to Section 7 of the Endangered Species Act, and fulfills the requirement for Federal agencies to "request of the Secretary of the Interior information whether any species which is listed or proposed to be listed may be present in the area of a proposed action".

This species list is provided by:

Sacramento Fish And Wildlife Office
Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846
(916) 414-6600

PROJECT SUMMARY

Project Code: 2025-0037289
Project Name: Costco El Dorado Hills
Project Type: Commercial Development
Project Description: Costco warehouse and gas station
Project Location:

The approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@38.66049985,-121.05649905837478,14z

Counties: El Dorado County, California

ENDANGERED SPECIES ACT SPECIES

There is a total of 13 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

REPTILES

NAME	STATUS
Northwestern Pond Turtle *Actinemys marmorata* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/1111	Proposed Threatened

AMPHIBIANS

NAME	STATUS
California Red-legged Frog *Rana draytonii* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/2891	Threatened
Foothill Yellow-legged Frog *Rana boylii* Population: South Sierra Distinct Population Segment (South Sierra DPS) No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5133	Endangered
Western Spadefoot *Spea hammondii* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5425	Proposed Threatened

INSECTS

NAME	STATUS
Monarch Butterfly *Danaus plexippus* There is **proposed** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/9743	Proposed Threatened
Valley Elderberry Longhorn Beetle *Desmocerus californicus dimorphus* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/7850	Threatened

CRUSTACEANS

NAME	STATUS
Vernal Pool Fairy Shrimp *Branchinecta lynchi* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/498	Threatened
Vernal Pool Tadpole Shrimp *Lepidurus packardi* There is **final** critical habitat for this species. Your location does not overlap the critical habitat. Species profile: https://ecos.fws.gov/ecp/species/2246	Endangered

FLOWERING PLANTS

NAME	STATUS
El Dorado Bedstraw *Galium californicum ssp. sierrae* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/5209	Endangered
Layne's Butterweed *Senecio layneae* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/4062	Threatened
Pine Hill Ceanothus *Ceanothus roderickii* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/3293	Endangered
Pine Hill Flannelbush *Fremontodendron californicum ssp. decumbens* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/4818	Endangered
Stebbins' Morning-glory *Calystegia stebbinsii* No critical habitat has been designated for this species. Species profile: https://ecos.fws.gov/ecp/species/3991	Endangered

CRITICAL HABITATS

THERE ARE NO CRITICAL HABITATS WITHIN YOUR PROJECT AREA UNDER THIS OFFICE'S JURISDICTION.

YOU ARE STILL REQUIRED TO DETERMINE IF YOUR PROJECT(S) MAY HAVE EFFECTS ON ALL ABOVE LISTED SPECIES.

Appendix B

Potential for Special-Status Species in the Region to Occur in the Study Area

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Plants			
Allium jepsonii Jepson's onion	1B.2	A perennial bulbiferous herb found on serpentine or volcanic soils in chaparral, lower montane coniferous forest, and cismontane woodlands from 984 – 4,331 feet elevation. This species blooms from April – August (CNPS 2025).	**No Potential.** Serpentine or volcanic soils do not occur in the Study Area and the Study Area is below the known elevational range of this species. There are no documented occurrences of this species within five miles of the Study Area (CDFW 2025).
Balsamorhiza macrolepis Big-scale balsamroot	1B.2	A perennial herb found on serpentine soils within chaparral, cismontane woodland, and valley and foothill grassland habitats from 295 – 5,085 feet elevation. This species blooms from March – June (CNPS 2025).	**No Potential**. Serpentine soils do not occur in the Study Area. In addition, this species was not observed during focused botanical surveys in 2015 (Foothill Associates 2016a) or biological surveys in 2020 or 2025. There are no documented occurrences of this species within five miles of the Study Area (CDFW 2025).
Calycadenia spicata Spicate calycadenia	1B.3	An annual herb found in valley and foothill grasslands and cismontane woodlands. Occurs on dry, adobe or clay soils that are gravelly or rocky; often in disturbed areas, openings, and roadsides from 131 – 4,593 feet elevation. This species blooms from May – September (CNPS 2025).	**No Potential.** Adobe or clay soils do not occur in the Study Area. One historical documented occurrence from 1910 within five miles of the Study Area (CDFW 2025).
Calystegia stebbinsii Stebbins' morning-glory	FE, SE, 1B.1	A perennial rhizomatous herb found on gabbro or serpentine soils in chaparral and cismontane woodlands from 607 – 3,576 feet elevation. This species blooms from April – July (CNPS 2025).	**No Potential.** Gabbro or serpentine soils do not occur in the Study Area. Two documented occurrences within five miles of the Study Area (CDFW 2025).
Carex xerophila Chaparral sedge	1B.2	A perennial herb found on serpentine and gabbro soils in chaparral, cismontane woodland, and lower montane coniferous forest habitats from 1,445 – 2,525 feet elevation. This species blooms from March – June (CNPS 2025).	**No Potential.** Serpentine or gabbro soils do not occur in the Study Area and the Study Area is just below the known elevational range of this species. There are three documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Ceanothus roderickii Pine Hill ceanothus	FE, SR, 1B.1	A perennial evergreen shrub found on serpentine or gabbro soils in cismontane woodland and chaparral habitats from 804 – 3,576 feet elevation. This species blooms from April – June (CNPS 2025).	**No Potential.** Serpentine or gabbro soils do not occur in the Study Area and the Study Area is just below the known elevational range of this species. Additionally, this species would have been identifiable during the survey if it were present since it is an evergreen shrub. There are four documented occurrences within five miles of the Study Area (CDFW 2025).
Chlorogalum grandiflorum Red Hills soaproot	1B.2	A perennial bulbiferous herb found on serpentine and gabbro soils in lower montane coniferous forest, cismontane woodland, and chaparral habitats from 804 – 5,545 feet elevation. This species blooms from April – May (CNPS 2025).	**No Potential.** Serpentine or gabbro soils do not occur in the Study Area and the Study Area is just below the known elevational range of this species. There are four documented occurrences within five miles of the Study Area (CDFW 2025).
Crocanthemum suffrutescens Bisbee Peak rush-rose	3.2	Shrub that occurs on serpentine, gabbro, or Ione formation soils in openings of chaparral habitat from 148 - 2,756 feet elevation. This species blooms from April – June (CNPS 2025).	**No Potential.** Suitable soil types or chaparral habitat do not occur in the Study Area. There are eight documented occurrences within five miles of the Study Area (CDFW 2025).
Downingia pusilla Dwarf downingia	2B.2	An annual herb found in vernal pools within valley and foothill grassland habitats from 3 to 1,493 feet elevation. This species blooms from March – May (CNPS 2025).	**No Potential.** Vernal pools do not occur in the Study Area. In addition, this species was not observed in the Study Area during focused botanical surveys conducted in 2015 (Foothill Associates 2016a) or during biological surveys conducted in 2020 and 2025. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Eryngium pinnatisectum Tuolumne button-celery	1B.2	An annual herb that occurs in vernal pools within grassland and cismontane woodland habitats from 105 – 5,577 feet elevation. Generally restricted to volcanic soils. This species blooms from May – August (CNPS 2025).	**No Potential.** Vernal pools or volcanic soils do not occur in the Study Area. In addition, this species was not observed in the Study Area during focused botanical surveys conducted in 2015 (Foothill Associates 2016a) or during biological surveys conducted in 2020 and 2025. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Fremontodendron decumbens Pine Hill flannelbush	FE, 1B.2	A perennial shrub that occurs on serpentine or gabbro soils in chaparral and cismontane woodland habitats. This species is often found in dry, sandy washes. Occurs from 1,296 – 6,598 feet elevation and blooms from April – July (CNPS 2025).	**No Potential.** Suitable soil types do not occur in the Study Area and the Study Area is below the known elevational range of this species. Additionally, this species would have been identifiable during the survey if it were present since it is a perennial shrub. There are three documented occurrences within five miles of the Study Area (CDFW 2025).
Galium californicum ssp. *sierrae* El Dorado bedstraw	FE, 1B.2	A perennial herb found on gabbro soils in chaparral, lower montane coniferous forest, and cismontane woodland habitats from 328 – 1,919 feet elevation. This species blooms from May – June (CNPS 2025).	**No Potential.** Gabbro soils do not occur in the Study Area. There are two documented occurrences within five miles of the Study Area (CDFW 2025).
Gratiola heterosepala Boggs Lake hedge-hyssop	SE, 1B.2	An annual herb that is restricted to clay soils in or near shallow water such as at the margins of lakes, marshes, swamps, and vernal pools from 30 to 7,545 feet elevation. This species blooms from April – August (CNPS 2025).	**No Potential**. Clay soils and suitable aquatic habitats do not occur in the Study Area. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Juncus leiospermus var. *ahartii* Ahart's dwarf rush	1B.2	An annual herb found in vernal pools and vernally mesic valley and foothill grassland habitats from 98 to 751 feet elevation. This species blooms from March – May (CNPS 2025).	**No Potential.** Vernal pools and vernally mesic grasslands do not occur in the Study Area. In addition, this species was not observed in the Study Area during focused botanical surveys conducted in 2015 (Foothill Associates 2016a) or during biological surveys conducted in 2020 and 2025. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Legenere limosa Legenere	1B.1	An annual herb found in vernal pools from 3 – 2,890 feet elevation. This species blooms from April – June (CNPS 2025).	**No Potential**. Vernal pools do not occur in the Study Area. In addition, this species was not observed in the Study Area during focused botanical surveys conducted in 2015 (Foothill Associates 2016a) or during biological surveys conducted in 2020 and 2025. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Navarretia myersii ssp. *myersii* Pincushion navarretia	1B.1	An annual herb found in vernal pools often on acidic, clay soils from 65 – 1,083 feet elevation. This species blooms from April – May (CNPS 2025).	**No Potential**. Vernal pools and clay soils do not occur in the Study Area. In addition, this species was not observed in the Study Area during focused botanical surveys conducted in 2015 (Foothill Associates 2016a) or during biological surveys conducted in 2020 and 2025. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Orcuttia tenuis Slender Orcutt grass	FT, SE, 1B.1	An annual grass that occurs in vernal pools within valley grassland and foothill woodland habitats from 32 – 4,920 feet elevation. This species blooms from May – September (CNPS 2025).	**No Potential**. Vernal pools do not occur in the Study Area. In addition, this species was not observed in the Study Area during focused botanical surveys conducted in 2015 (Foothill Associates 2016a) or during biological surveys conducted in 2020 and 2025. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Orcuttia viscida Sacramento Orcutt grass	FE, SE, 1B.1	An annual herb found in vernal pools from 49 – 278 feet elevation. This species blooms from April – July (CNPS 2025).	**No Potential**. Vernal pools do not occur in the Study Area and the Study Area is above the known elevational range of this species. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Packera layneae Layne's ragwort	FT, 1B.2	An annual herb found on rocky serpentine or gabbro soils in chaparral and cismontane woodland habitats from 656 – 3,560 feet elevation. This species blooms from April – August (CNPS 2025).	**No Potential.** Serpentine or gabbro soils do not occur in the Study Area. There are six documented occurrences within five miles of the Study Area (CDFW 2025).
Sagittaria sanfordii Sanford's arrowhead	1B.2	An emergent perennial rhizomatous herb that occurs in marshes, swamps, ponds, and slow-moving drainages from 0 to 2,132 feet elevation. This species blooms from May – October (CNPS 2025).	**Low Potential**. The perennial drainage provides suitable habitat for this species; however, it was not observed in the Study Area during focused botanical surveys conducted in 2015 (Foothill Associates 2016a) or biological surveys conducted in 2020 and 2025. If there is a population of this species upstream from the Study Area, it could be washed downstream to the Study Area and establish a population. There is one documented occurrence within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Wyethia reticulata El Dorado County mule ears	1B.2	A perennial herb found on clay or gabbro soils in chaparral, cismontane woodland, and lower montane coniferous forest habitats from 605 – 2,066 feet elevation. This species blooms from April – August (CNPS 2025).	**No Potential.** Clay or gabbro soils do not occur in the Study Area. There are twelve documented occurrences within five miles of the Study Area (CDFW 2025).
Wildlife			
Invertebrates			
Bombus crotchii Crotch's bumble bee	SCE	This species occurs in grassland and scrub habitats. New colonies are initiated by solitary queens, generally in the early spring, which typically occupy abandoned rodent burrows (CDFW 2019). This species is a generalist forager and has been reported visiting a wide variety of flowering plants. The flight period for queens in California is from February to October. New queens hibernate over the winter and initiate a new colony the following spring. Crotch's bumble bees are rare throughout their range and are in decline in the Central Valley and southern California (CDFW 2019). The most current known range of this species follows a small strip from western Trinity County south to Tehama County and along the entire Central Valley and coast south of Monterey to the southernmost portions of the State. The range is generally bound on the east by the high Sierra Nevada range and areas east of Bishop, Ridgecrest, and the Salton Sea (CDFW 2023).	**Low Potential.** This species could occur in the annual grassland habitat within the Study Area. The Study Area contains floral resources and natural habitat that may provide foraging, breeding, and overwintering habitat suitable for Crotch's bumble bee. The Study Area is within the current range of this species. Because the population of this species has declined significantly, it is considered rare throughout its range. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Bombus occidentalis Western bumble bee	SCE	This species lives in underground colonies made up of one queen, female workers, and reproductive members of the colony. New colonies are initiated by solitary queens, generally in the early spring, which typically occupy abandoned rodent burrows (Thorp et al. 1983). This species occurs in meadows and grasslands with an abundance of floral resources (CDFW 2019). The western bumble bee is a generalist forager and has been reported visiting a wide variety of flowering plants. The flight period for queens in California is from early February to late November, peaking in late June and late September. New queens hibernate over the winter and initiate a new colony the following spring (Thorp et al. 1983). Rare throughout its range and in decline west of the Sierra Nevada crest. The most current known range of this species is limited to areas near the Klamath and northern Coast Range mountains as well as mountain areas in Shasta, Plumas, Sierra, Nevada, Placer, El Dorado, Lassen, Amador, Alpine, and Calaveras counties (CDFW 2023).	**No Potential.** The range of this species includes high elevation areas in the Sierra Nevada and some areas along the northern California coast (CDFW 2023). The Study Area is outside of the current range for western bumble bee. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Branchinecta lynchi Vernal pool fairy shrimp	FT	This species generally occurs in vernal pools but may also be found in seasonal wetlands, swales, and alkali pools. Typically found in turbid water but also occurs in clear water with abundant aquatic vegetation (CDFW 2025).	**No Potential**. Vernal pools do not occur in the Study Area. Furthermore, the seasonal wetlands onsite do not provide adequate habitat for this species; the seasonal wetlands do not pond at a depth and duration for vernal pool fairy shrimp to complete their cycle. There is one documented occurrence within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Danaus plexippus Monarch butterfly	FPT	Overwintering populations of monarch butterflies roost in wind protected tree groves, especially *Eucalyptus* spp., and species of pine or cypress with nectar and water sources nearby. Winter roost sites extend along the coast from Mendocino County to Baja California. As caterpillars, monarchs feed exclusively on the leaves of milkweed (*Asclepias* sp.; Nial *et al*. 2019 and USFWS 2020). Monarch butterfly migration routes pass east over the Sierra Nevada in the fall and back to the California coast in the spring. The overwintering population is located along the Coast while summer breeding areas occur in interior California and North America with spring breeding areas located further east (USFWS 2020).	**Low Potential**. Plant species necessary for development (i.e., milkweed) were observed in the Study Area which could support monarch butterflies during migration. However, the Study Area is not located in a winter roost zone, which is the primary habitat element for the proposed threatened population of this species and proposed critical habitat. Individual butterflies may pass through the Study Area during migration and utilize milkweed, but large, overwintering populations will not occur in the Study Area. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Desmocerus californicus dimorphus Valley elderberry longhorn beetle	FT	Depends on elderberry shrubs (*Sambucus* spp.) and typically occurs near rivers or streams. Stems at least a 1-inch diameter or greater are necessary for larvae and pupae development. Adults emerge in spring until early summer and exit holes are visible on shrub stems year-round (CDFW 2025).	**No Potential**. Elderberry shrubs are present in the Study Area; however, the Study Area is located outside of the expected elevation range of this species (500 feet; USFWS 2023). There is one documented occurrence within five miles of the Study Area (CDFW 2025).
Lepidurus packardi Vernal pool tadpole shrimp	FE	This species occurs in a variety of seasonally inundated habitats, particularly low-alkalinity seasonal pools in grasslands. Known to occur in vernal pools, wetlands, and other freshwater habitats. Generally occurs in larger, deeper features where dissolved oxygen levels are higher and features remain inundated for longer periods (CDFW 2025).	**No Potential**. Vernal pools do not occur in the Study Area. Furthermore, the seasonal wetlands onsite do not provide adequate habitat for this species; the seasonal wetlands do not pond at a depth and duration for vernal pool tadpole shrimp to complete their cycle. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Fishes			
Oncorhynchus mykiss irideus Steelhead, Central Valley DPS	FT	This distinct population segment includes all naturally spawned anadromous steelhead populations below impassable barriers in the Sacramento and San Joaquin rivers and their tributaries, excluding steelhead from San Francisco and San Pablo Bays and their tributaries, as well as two artificial propagation programs: the Coleman NFH, and Feather River Hatchery steelhead hatchery programs. Steelhead spawn in rivers and streams with cool, clear, water and suitable silt free substrate (NMFS 2016).	**No Potential**. There is no suitable aquatic habitat for this species within the Study Area. Although the perennial drainage could potentially support this species, there are known passage barriers downstream of the Study Area. Latrobe Falls is the lowest known barrier along the Consumnes River that would inhibit migration to the Study Area. Culverts, log jams, and other natural barriers are also present that would impede migration to the Study Area. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Amphibians			
Rana boylii pop. *5* Foothill yellow-legged frog	FE	This population of foothill yellow-legged frog occurs in the Sierra Nevada from the South Fork American River subbasin in El Dorado County south to the Tehachapi Mountains in Kern County. Occurs in perennial rocky streams in a wide variety of habitats up to 6,400 feet elevation. This species rarely ventures far from water, and is usually found basking in the water, under surface debris, or underground within 165 feet of water. Eggs are laid in clusters attached to gravel or rocks along stream margins in flowing water. Tadpoles typically require up to four months to complete aquatic development. Breeding typically follows winter rainfall and snowmelt, which varies based upon location (Jennings and Hayes 1994).	**No Potential.** The perennial drainage within the Study Area would provide only marginally suitable habitat for this species. The ephemeral and intermittent drainages within the Study Area are hydrologically connected to the perennial drainage on the west side of Clarksville Road; however, these features do not provide breeding habitat suitable for this species. Furthermore, protocol breeding and nonbreeding surveys for California red-legged frog were conducted in the Study Area in 2015, and no evidence of California red-legged frog or foothill yellow-legged frog was observed (Foothill Associates 2016b). There are two documented occurrences within five miles of the Study Area; however, one is from 1972 and is considered extirpated (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Rana draytonii California red-legged frog	FT, SSC	Adult California red-legged frogs require dense, shrubby, or emergent riparian vegetation closely associated with deep, still, or slow-moving water. Aquatic habitat typically includes slow-moving streams, ponds, stock ponds or marsh communities with emergent vegetation. Small standing pools (less than 3 feet deep) are typically used for breeding. Nearby upland habitat with downed debris for refuge is also required for this species. They are typically found in or within 300 feet of aquatic habitat but may disperse up to two miles away from aquatic habitats. The elevational range extends from sea level to about 5,000 ft., but this species typically occurs below 3,935 ft. (CDFW 2025). This species has been extirpated from nearly 70% of its historic range and now is primarily found in coastal drainages of central California, from Marin County, south to northern Baja California, Mexico, and a few isolated populations in the foothills south of Redding and north of Fresno (USFWS 2025a).	**No Potential**. The perennial drainage within the Study Area provides marginally suitable habitat for this species; however, the Study Area is at the far western edge of the known range of this species along the Sierra Nevada foothills and there are no known nearby populations. Protocol breeding and nonbreeding surveys were conducted in the Study Area in 2015, and no evidence of this species was observed (Foothill Associates 2016b). There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Spea hammondii Western spadefoot	FPT; SSC	This species occurs in a variety of open habitats including grasslands, coastal sage scrub, chaparral, sandy washes, and playas. It can also be found in valley-foothill woodlands and appears to prefer open areas with sandy or gravelly soils. This species spends the majority of its life underground and typically emerges between October and May to breed. Breeding occurs in vernal pools, depressional wetlands, and sometimes puddles. Breeding sites must remain inundated for at least 30 days for larvae to mature (CDFW 2025).	**Low Potential**. Seasonal wetlands onsite could provide suitable breeding habitat for this species; however, the wetlands are very shallow and may not remain inundated long enough to support this species. Sandy, gravelly soils are absent from the Study Area which may further reduce the potential this species could occur. There is one documented occurrence within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Reptiles			
Actinemys marmorata Northwestern pond turtle	FPT; SSC	This species occurs in a variety of aquatic habitats; typically, permanent ponds, lakes, streams, irrigation ditches, canals, marshes, or pools in intermittent drainages. It appears to prefer areas lined with abundant vegetation and either rocky or muddy substrates. This species requires basking sites such as logs, rocks, cattail mats or exposed banks. The active season is from February to November, and breeding occurs from April to May. Overwintering occurs in upland terrestrial habitats close to water sources (approximately 300 feet), in which they will bury themselves under loose soil (CDFW 2025). Nesting sites in uplands may be as far as 400 meters (1,312 feet) or more from the aquatic habitat, although the distance is usually much less and is generally around 100 meters (328 feet) (Yolo HCP/NCCP 2018). In nonriverine habitats that experience little water level fluctuation, this species may overwinter underwater (Thomson *et al.* 2016).	**High Potential.** The perennial drainage provides suitable habitat for this species. The intermittent drainage, seasonal wetlands, and other aquatic features onsite may also provide suitable habitat when inundated and would likely be used for dispersal or as temporary habitat. This species could nest or overwinter in the annual grassland, valley oak woodland, and riparian habitats. There are seven documented occurrences within five miles of the Study Area, with one of the occurrences within the perennial drainage just north of the Study Area (CDFW 2025).
Phrynosoma blainvillii Coast horned lizard	SSC	This species occurs in the Coast Ranges, southwestern Sierra Nevada, Transverse and Peninsular Ranges, and the southern deserts of California. Suitable habitat types include chaparral, cismontane woodland, coastal scrub, desert washes, and grasslands. This species is most common in lowlands along sandy washes with scattered low bushes. It requires open areas for sunning, bushes for cover, patches of loose soil, and an abundant supply of ants and other insects (CDFW 2025).	**Moderate Potential.** This species may occur in the valley oak woodland, annual grassland, and ruderal habitats within the Study Area but the soil within the Study Area was hard and compact which may be unsuitable for this species. No obvious ant hills were observed in the Study Area. There are four documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Thamnophis gigas Giant garter snake	FT; ST	Endemic to the San Joaquin and Sacramento Valley floors. Inhabits agricultural wetlands and other waterways such as irrigation and drainage canals, sloughs, ponds, small lakes, low gradient streams, and adjacent uplands. Requires adequate water during its active season (early spring through mid-fall) to provide food and cover, emergent, herbaceous wetland vegetation for foraging and cover, grassy banks and openings in waterside vegetation for basking, and higher elevation uplands for cover and refuge from flood waters during its dormant season (winter). Inhabits small mammal burrows and other soil crevices with sunny exposure along south and west facing slopes, above prevailing flood elevations when dormant. Primarily found in marshes and sloughs as well as slow-moving creeks but absent from large rivers (USFWS 2025b).	**No Potential**. The Study Area is outside of the current known range of this species. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Birds			
Astur cooperii Cooper's hawk	WL	This species occurs in open woodlands, riparian forests, montane coniferous forests, and other open woodland habitats. May also occur in wooded suburban habitats. Nests high within a large tree and preys on medium-sized birds and small mammals (Zeiner *et al.* 1990).	**High Potential**. Suitable nesting and foraging habitat are present in the Study Area, especially in the valley oak woodland and riparian habitats. There are no documented occurrences within five miles of the Study Area (CDFW 2025). However, Cooper's hawk is not regularly tracked by the CNDDB and is a common species in El Dorado County and the vicinity of the Study Area (eBird 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Agelaius tricolor tricolored blackbird	ST; SSC	This species is common locally throughout central California. It nests and seeks cover in emergent wetland vegetation and thorny vegetation such as Himalayan blackberry (*Rubus armeniacus*). The nesting area must be large enough to support a minimum colony of 50 pairs as they are a highly colonial species. Typical nesting areas are in large wetlands, marshes, and large brambles of thorny vegetation in suitable foraging habitat. This species forages on the ground in croplands, grassy fields, flooded land, and edges of ponds for insects (Shuford and Gardali 2008).	**Moderate Potential**. Suitable nesting habitat is present along the intermittent and ephemeral drainages within the Study Area but it may be too small and fragmented to support a nesting colony. This species could forage in the annual grassland habitat onsite if it nests within the Study Area or at an offsite location. There are ten documented occurrences within five miles of the Study Area (CDFW 2025).
Ammodramus savannarum Grasshopper sparrow	SSC	This species is a summer resident of foothills and lowlands west of the Cascade-Sierra Nevada crest. It occurs in grasslands with scattered shrubs or other tall structures which it utilizes as singing perches. Nests on the ground in dense grass with overhanging taller grasses and forbs (Zeiner *et al.* 1990).	**Low Potential**. The annual grassland habitat within the Study Area provides suitable habitat for this species. However, the Study Area is on the far eastern edge of the known range of this species. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Aquila chrysaetos Golden eagle	FP	This species occurs in a variety of open and semi-open habitats; generally rolling foothills, mountain areas, sage-juniper flats, deserts, and other open habitats up to 3,822 meters elevation. Typically nests in canyons, along cliffs, and in large trees in canyons. Will occasionally use other tall structures for nesting in suitable habitats, such as electrical transmission towers. Generally avoids areas with human activity. Prey consists mostly of rodents, carrion, birds, reptiles, and occasionally small livestock; and foraging habitat is generally large, open, expanses of land (Zeiner *et al.* 1990).	**Low Potential.** Suitable nesting areas such as cliffs and canyons do not occur in or near the Study Area. This species is known to nest and forage in nearby open spaces in the vicinity of the Study Area. Golden eagles typically require nesting locations with a commanding view of the surrounding terrain, which is not present in the Study Area. This species may soar over the Study Area but is not expected to be impacted by the project as suitable large, tall nest structures are absent from the Study Area. There are two documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Athene cunicularia Burrowing owl	SCE; SSC	This species occurs in a variety of open habitats; typically grasslands, desert scrub, agricultural fields, washes, and disturbed areas such as golf courses or vacant lots. Burrowing owls forage on the ground in areas with low, sparse vegetation and with an abundance of small mammal burrows. They nest in burrows, especially those of California ground squirrel (*Otospermophilus beecheyi*), but will also use other sites such as rubble piles, pipes, and culverts. In the Central Valley of California, most foraging occurs within a 600-meter radius of the burrow (Gervais *et al.* 2003).	**Low Potential.** The annual grassland within the Study Area provides potential habitat for this species; however, no small mammal burrows or other suitable nesting/refuge sites were observed in the Study Area. In addition, soils within the Study Area are very hard and compact which likely limits the potential this species or other fossorial animals could burrow onsite. Burrowing owl was not observed during protocol level surveys conducted within the Study Area in 2015 (Foothill Associates 2016c) or during biological surveys conducted in 2020 and 2025. There are three documented occurrences within five miles of the Study Area (CDFW 2025).
Buteo regalis Ferruginous hawk	WL	This species occurs in a variety of habitats including open grasslands, sagebrush flats, desert scrub, foothills, and fringes of pinyon and juniper habitats. Ferruginous hawk mainly winters in California except for portions of the far northeast where it is also known to breed and nest. Nests on cliffs, rocky outcrops, large trees, or utility structures (CDFW 2025).	**Low Potential.** The annual grassland habitat within the Study Area provides foraging habitat for this species. This species may pass through the Study Area in winter but nesting will not occur as the Study Area is outside of the known nesting range of this species. There is one documented occurrence within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Buteo swainsoni Swainson's hawk	ST	This species occurs in a variety of open habitats including expansive grasslands, agricultural areas, and open woodlands. Breeds in California and winters in Mexico and South America. Swainson's hawks usually arrive in the Central Valley between March 1 and April 1 and migrate south between September and October. This species usually nests in trees adjacent to suitable foraging habitat but is known to forage in areas away from the nest. Nests are usually located in trees near the edges of riparian stands, in lone trees or groves of trees in agricultural fields, and in mature roadside trees. Mature oak and riparian trees are the most used nest trees, typically associated with high quality foraging habitat (CDFW 2025). Suitable foraging areas for Swainson's hawk include native grasslands or lightly grazed pastures, alfalfa and other hay crops, idle land, certain grain and row croplands, and ruderal lands. Swainson's hawks primarily feed on voles; but will take a variety of prey including small mammals, birds, and insects (CDFW 1994).	**Low Potential**. The Study Area is at the easternmost edge of this species' known range but provides suitable nesting and foraging habitat. Swainson's hawk has historically been documented in the vicinity of the Study Area and could potentially occur but would generally be expected to occur in habitats within and closer to the Central Valley. There are two documented occurrences within five miles of the Study Area (CDFW 2025).
Elanus leucurus White-tailed kite	FP	White-tailed kite is a year-round resident in California in coastal areas and lowlands in the Central Valley. Population sizes increase during the non-breeding season due to over-wintering migrants. Occurs in a variety of habitats including grasslands, savannah, oak woodland, riparian woodland, open suburban areas, and agriculture fields. Nest trees typically have a dense canopy or are within a dense group of trees, such as riparian forest or oak woodland. Foraging occurs within un-grazed or lightly-grazed fields, agricultural areas, and open grasslands (CDFW 2025).	**High Potential.** The valley foothill riparian and valley oak woodland in the Study Area provide suitable nesting habitat and the annual grassland and open areas of the Study Area provide suitable foraging habitat. This species is known to forage in nearby open spaces in the vicinity of the Study Area and could nest in or near the Study Area. There are two documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Falco columbarius Merlin	WL	This species is an uncommon winter migrant in California that breeds in Alaska and Canada. It occurs in a variety of habitats during winter including estuaries, Great Basin grassland, and valley and foothill grasslands. This species does not breed or nest within California (CDFW 2025).	**Low Potential.** The annual grassland habitat within the Study Area provides foraging habitat for this species. This species may pass through the Study Area in winter but nesting will not occur as the Study Area is outside of the known nesting range of this species. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Haliaeetus leucocephalus Bald eagle	SE, FP	Occurs in a variety of habitats near large aquatic resources such as rivers or lakes. Nests in mature trees or snags, often in remote mixed stands adjacent to water. Typically nests in the largest tree in a stand and forages near water (CDFW 2025).	**Low Potential.** There are no suitable nest trees in the Study Area and suitable foraging habitat is absent. This species is known to occur in areas surrounding Folsom Lake and may soar over the Study Area but is not expected to be impacted by the project. There are two documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Laterallus jamaicensis coturniculus California black rail	FP, ST	The largest concentrations of this species are found in the tidal salt marshes of the northern San Francisco Bay region, primarily in San Pablo and Suisun Bays. Smaller populations also occur in San Francisco Bay, the Outer Coast of Marin County, freshwater marshes in the foothills of the Sierra Nevada, and in the Colorado River Area (Spautz et. al. 2005). This species inhabits brackish marsh habitats, primarily in the upper marsh zone dominated by alkali heath (*Frankenia salina*), cattail (*Typha* spp.), and rush (*Juncus* spp.); and prefers lower salinity environments. In the Sierra Nevada foothills, this species is a year-round resident along wetland edges where water is generally 1.2 inches or less and is typically found in wetlands 0.25 acre or larger. This species is typically associated with perennial wetlands associated with flowing water such as irrigation canals, perennial streams, and springs with dense vegetation in the Sierra Nevada foothills. It forages on the ground, under cover of dense vegetation (Richmond et al. 2010).	**Moderate Potential**. The perennial drainage and adjacent riparian corridor provide suitable habitat for this species. California black rail could also potentially occur in the intermittent and ephemeral drainage corridors. There is one documented occurrence within five miles of the Study Area that documents a breeding pair downstream of the Study Area (CDFW 2025).
Pandion haliaetus Osprey	WL	Osprey breed in Northern California from the Cascade Ranges southward to Lake Tahoe, and along the coast south to Marin County. They prey primarily on fish but also predate small mammals, birds, reptiles, and invertebrates. Foraging areas include open, clear waters of rivers, lakes, reservoirs, bays, estuaries, and surf zones. Habitat and nesting requirements include large trees, snags, and dead-topped trees in open forest habitats for cover and nesting (Zeiner *et al.* 1990).	**Low Potential**. There are no suitable nest trees or structures in the Study Area that would support this species nesting and suitable foraging habitat is absent. This species is known to occur in areas surrounding Folsom Lake and may soar over the Study Area but is not expected to be impacted by the proposed project. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Phalacrocorax auratus Double-crested cormorant	WL	This species is a yearlong resident along the entire coast of California and at inland lakes, in fresh, salt, and estuarine waters. Rests in daytime and roosts overnight beside water on offshore rocks, islands, steep cliffs, dead branches of tall trees, wharfs, jetties, or even transmission lines. Nests in colonies along coastal cliffs, islands, and along lake margins in the interior of the state (CDFW 2025).	**No Potential.** Suitable nesting or roosting habitats are absent from the Study Area. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Progne subis Purple martin	SSC	This species occurs as an uncommon summer resident and migrant, primarily from mid-March to late September, and breeds from May to mid-August. Martins are most abundant in mesic regions, near large wetlands and other water bodies, and at upper slopes and ridges, which likely concentrate aerial insects (Shuford and Gardali 2008). This species nests in cavities in open areas with low canopy cover at the height of the nest, near large bodies of water that support high densities of large insects. Martins use a variety of cavities including in bridges, large tree snags, and collapsed lava tubes. This species is very sensitive to competition from European starlings and is extirpated from most low-elevation areas by starlings (Shuford and Gardali 2008).	**Low Potential.** The entire Study Area provides suitable foraging habitat for this species and some tree cavities that could support nesting were observed. Other suitable nesting cavities such as large tree snags, lava tubes, or artificial cavities do not occur in the Study Area. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Riparia riparia Bank swallow	ST	This species is found primarily in riparian and lowland habitats in California. They nest in colonies along cliffs or steep riverbanks in holes. In California, a majority of the population is situated along the Sacramento River and the Feather River. Other smaller populations persist near Monterey and north of Shasta counties (Zeiner *et al*. 1990).	**No Potential.** Suitable nesting habitat does not occur in the Study Area and the Study Area is not located near the Sacramento or Feather rivers. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Mammals			
Antrozous pallidus Pallid bat	SSC	Pallid bat occurs throughout California except for the high Sierra Nevada and the northern Coast Ranges. Suitable habitats include grasslands, shrublands, woodlands, and forests from sea level to 6,000 feet. This species is most common in open, dry habitats with rocky areas for roosting; roosts also include cliffs, abandoned buildings, bird boxes, hollow trees and under bridges. This species is primarily a crevice dweller, but recent studies have shown that they are also dependent upon tree roosts. Particularly, in northern California pallid bat is more dependent upon oak woodland and oak savannah in lower elevations and may be found in coniferous forest, including redwoods at mid to higher elevations. This species is intolerant of roost disturbance and it has a high loyalty to roosting sites. If this species experiences frequent disturbance at a roost site, they will abandon the roost (Bolster ed. 1998).	**Low Potential.** Trees within the valley oak woodland and riparian habitats, as well as isolated trees within the annual grassland could provide roosting habitat for this species. Other roost sites such as cliffs, abandoned buildings, and bridges are absent from the Study Area. This species could forage throughout the Study Area. There are no documented occurrences within five miles of the Study Area (CDFW 2025).
Pekania pennanti Fisher	SSC	This species is found in in large, mature, dense forest stands with snags and greater than 50% canopy closure. It is typically found at elevations from 3,510 – 7,000 feet elevation. This species dens in a variety of protected cavities such as hollow logs, trees, rock outcrops, and snags. Typically avoids areas with human activity (CDFW 2025).	**No Potential**. Suitable forest habitat does not occur in the Study Area and the Study area is below the known elevational range of this species. There are no documented occurrences within five miles of the Study Area (CDFW 2025).

Scientific Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur[3]
Taxidea taxus American badger	SSC	This species occurs in a variety of dry, open habitats including grasslands, open woodlands, shrublands, and open chaparral. Loose, friable soil is required for this species to dig den sites. Badgers need sufficient food, friable soils, and open, uncultivated ground. They are typically found in areas away from human activity (CDFW 2025).	**Low Potential**. Annual grassland within the Study Area provides suitable habitat for this species; however, friable soils are lacking in the Study Area and no dens or burrows were observed during the site survey on January 9, 2025. There is a nearby CNDDB recorded occurrence from 2015 located 4.9 miles northwest of the Study Area and documents an individual badger killed on the road. CDFW considers this species to be extant in the region; however, there are no other nearby records of this species near the Study Area (CDFW 2025).

[1] Sensitive species reported in CNDDB or CNPS on the "*Clarksville*" USGS quads, or in USFWS lists for the project site.

[2] Status is as follows: Federal (ESA) listing/State (CESA) listing/other CDFW status or CRPR. F = Federal; S = State of California; E = Endangered; T = Threatened; C = Candidate; P = Proposed; FP = Fully Protected; SSC = Species of Special Concern; WL = Watch List.

[3] Status in the Project site is assessed as follows. **No Potential:** The Study Area is outside the known distribution of the species; or there is no suitable habitat present for the species; or, the species is not known to occur within five miles of the Study Area boundary, and its dispersal capability is less than five miles. **Low Potential:** There are no documented occurrences within five miles of the Study Area boundary, and the existing habitat is of low or marginal quality, or all documented occurrences within five miles of the Study Area line are believed to be extirpated, and existing habitat is of low or marginal quality, or extant occurrences are documented within five miles of the Study Area, and the most recent occurrence is greater than or equal to 25 years old. **Moderate Potential:** Documented occurrences are reported within five miles of the Study Area, the most recent occurrence is less than 25 but greater than 10 years old, and suitable habitat is present; or critical habitat is mapped within the Study Area, all PCEs are present within the Study Area, and suitable habitat is present. **High Potential:** There are extant occurrences within one mile of the Study Area, the most recent occurrence is less than 10 years old, and there is suitable habitat within the Study Area; or critical habitat is mapped within the Study Area, documented occurrences are present within one mile of the Study Area, suitable habitat is present, and all PCEs are present within the Study Area.

CRPR = California Rare Plant Rank: 1B – rare, threatened, or endangered in California and elsewhere; 2B – rare, threatened, or endangered in California but more common elsewhere. Extension codes: .1 – seriously endangered; .2 – moderately endangered.

Appendix C

Plant and Animal Species Observed in the Study Area

Family	Scientific Name	Common Name
Native		
Agavaceae	*Chlorogalum pomeridianum* var. *pomeridianum*	Common soaproot
Asteraceae	*Baccharis pilularis* ssp. *consanguinea*	Coyote brush
	Centromadia fitchii	Spikeweed
	Holocarpha virgata ssp. *virgata*	Narrow tarplant
	Lasthenia fremontii	Vernal pool goldfields
Apiaceae	*Daucus pusillus*	Wild carrot
	Eryngium castrense	Great Valley button-celery
Apocynaceae	*Asclepias fascicularis*	Narrow leaf milkweed
Boraginaceae	*Plagiobothrys stipitatus*	Stalked popcorn-flower
Brassicaceae	*Rorippa curvisiliqua*	Curvepod yellow cress
Campanulaceae	*Downingia* spp.	Downingia
Convolvulaceae	*Cuscuta californica*	California dodder
Cyperaceae	*Carex praegracilis*	Field sedge
	Cyperus eragrostis	Tall flatsedge
	Eleocharis acicularis	Needle spikerush
	Eleocharis macrostachya	Pale spikerush
	Schoenoplectus californicus	California bulrush
Euphorbiaceae	*Croton setiger*	Turkey mullein
Fabaceae	*Acmispon americanus* var. *americanus*	American bird's foot trefoil
	Trifolium variegatum	Variegated clover
Fagaceae	*Quercus douglasii*	Blue oak
	Quercus lobata	Valley oak
	Quercus wislizeni	Interior live oak
Gentianaceae	*Zeltnera muehlenbergii*	Muehlenberg's centaury
Juncaceae	*Juncus bufonius*	Toad rush
	Juncus effusus	Common bog rush
	Juncus cf. *mexicanus*	Mexican rush
	Juncus cf. *tenuis*	Slender rush
	Juncus xiphioides	Iris leaved rush
Lamiaceae	*Pogogyne zizyphoroides*	Sacramento Mesa-mint
	Trichostema lanceolata	Vinegar weed
Onagraceae	*Epilobium brachycarpum*	Autumn willow weed
	Epilobium cf. *ciliatum*	Fringed willowherb
	Epilobium densiflorum	Denseflower willowherb
Phrymaceae	*Erythranthe guttata* (*Mimulus guttatus*)	Yellow monkey flower
Pinaceae	*Pinus ponderosa*	Ponderosa pine
Plantaginaceae	*Veronica* cf. *americana*	American brooklime
Poaceae	*Deschampsia danthonioides*	Annual hair grass
	Deschampsia elongata	Slender hair grass
	Festuca microstachys	Small fescue
	Muhlenbergia rigens	Deer grass
	Pleuropogon californicus	Semaphore grass
	Stipa pulchra	Purple needle grass
Polemoniaceae	*Navarretia intertexta*	Interwoven navarretia
Ranunculaceae	*Ranunculus bonariensis* var. *trisepalus*	Vernal pool buttercup
Rhamnaceae	*Frangula californica* ssp. *tomentella*	Hoary coffeeberry

Family	Scientific Name	Common Name
Rubiaceae	*Galium* sp.	Bedstraw
Rubus	*Rubus ursinus*	California blackberry
Salicaceae	*Populus fremontii [deltoides]* ssp. *fremontii*	Fremont's cottonwood
	Salix exigua	Narrow leaved willow
	Salix cf. *lasiolepis*	Arroyo willow
Themidaceae	*Brodiaea elegans*	Harvest brodiaea
	Dichelostemma capitatum ssp. *capitatum*	Wild hyacinth
Typhaceae	*Typha latifolia*	Broadleaf cattail
Viburnaceae	*Sambucus mexicana*	Elderberry
Non-Native		
Asteraceae	*Carduus pycnocephalus*	Italian thistle
	Centaurea solstitialis	Yellow star-thistle
	Cirsium vulgare	Bull thistle
	Dittrichia graveolens	Stinkwort
	Helminthotheca echioides	Bristly ox-tongue
	Hypochaeris glabra	Smooth cat's-ear
	Lactuca serriola	Prickly lettuce
	Leontodon saxatilis	Hairy hawkbit
	Senecio vulgaris	Common groundsel
	Sonchus asper	Prickly sow thistle
Lamiaceae	*Mentha pulegium*	Pennyroyal
Linaceae	*Linum usitatissimum*	Common flax
Lunulariaceae	*Lunularia cruciata*	Crescent-cup liverwort
Lythraceae	*Lythrum hyssopifolia*	Hyssop loosestrife
Fabaceae	*Vicia sativa*	Spring vetch
Geraniaceae	*Erodium botrys*	Big heron bill
	Erodium cicutarium	Coastal heron's bill
	Geranium dissectum	Cutleaf geranium
	Geranium molle	Crane's bill geranium
Haloragaceae	*Myriophyllum aquaticum*	Parrot feather watermilfoil
Hypericaceae	*Hypericum perforatum* ssp. *perforatum*	Klamathweed
Juncaceae	*Juncus capitatus*	Leafy bracted dwarf rush
Moraceae	*Ficus carica*	Edible fig
Poaceae	*Aegilops cylindrica*	Jointed goat grass
	Avena fatua	Wild oats
	Briza minor	Little rattlesnake grass
	Bromus diandrus	Ripgut brome
	Bromus hordeaceus	Soft brome
	Cynodon dactylon	Bermuda grass
	Elymus caput-medusae	Medusahead
	Festuca myuros	Rattail sixweeks grass
	Festuca perennis	Italian rye grass
	Gastridium phleoides	Nit grass
	Glyceria declinata	Low manna grass
	Hordeum marinum	Barley

Family	Scientific Name	Common Name
Poaceae (cont.)	*Paspalum dilatatum*	Dallis grass
	Poa annua	Annual blue grass
	Polypogon monspeliensis	Rabbitsfoot grass
Polygonaceae	*Persicaria* sp.	Smartweed
	Rumex crispus	Curly dock
	Rumex pulcher	Fiddle dock
Ranunculaceae	*Ranunculus muricatus*	Spiny buttercup
Rosaceae	*Prunus* sp.	Cherry tree
	Rubus armeniacus	Himalayan blackberry
Scrophulariaceae	*Verbascum blattaria*	Moth mullein

Family	Scientific Name	Common Name
Mammals		
Sciuridae	*Sciurus niger*	Eastern fox squirrel
Birds		
Accipitridae	*Buteo jamaicensis*	Red-tailed hawk
Anatidae	*Branta canadensis*	Canada goose
Columbidae	*Zenaida macroura*	Mourning dove
Corvidae	*Aphelocoma californica*	California scrub-jay
Fringillidae	*Haemorhous mexicanus*	House finch
	Spinus psaltria	Lesser goldfinch
Odontophoridae	*Callipepla californica*	California quail
	Melozone crissalis	California towhee
Paridae	*Baeolophus inornatus*	Oak titmouse
Parulidae	*Setophaga coronata*	Yellow-rumped warbler
Passerellidae	*Junco hyemalis*	Dark-eyed junco
	Pipilo maculatus	Spotted towhee
	Melozone crissalis	California towhee
	Zonotrichia leucophrys	White-crowned sparrow
Picidae	*Colaptes auratus*	Northern flicker
Sittidae	*Sitta carolinensis*	White-breasted nuthatch
Trochilidae	*Calypte anna*	Anna’s hummingbird
Troglodytidae	*Thryomanes bewickii*	Bewick’s wren
Turdidae	*Sialia mexicana*	Western bluebird
Tyrannidae	*Sayornis nigricans*	Black phoebe

EXECUTIVE SUMMARY

This report presents the results of a delineation of the aquatic resources at the ±36.94-acre Costco El Dorado Hills (formerly titled El Dorado Hills 52) site (Study Area), located in western El Dorado County, California. The potential presence of aquatic resources was assessed and re-verified following the technical guidelines provided by the U.S. Army Corps of Engineers (USACE) in the *Corps of Engineers Wetlands Delineation Manual* (USACE Manual), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0; Supplement), *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Field Guide), and the *National Ordinary High Water Mark Field Delineation Manual for Rivers and Streams* (Interim Version). These technical guidelines present wetland and ordinary high-water mark (OHWM) indicators, delineation guidance, and other information that pertains to the Arid West Region.

A total of 1.021 acres of aquatic resources and other waters of the U.S. were mapped within the Study Area. This acreage consists of 0.193 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainages, 0.360 acre of intermittent drainage, and 0.221 acre of perennial drainage. Approximately 17.9 acres of the northern portion of the Study Area was previously verified by the USACE in August of 2019 to contain 0.19 acre of waters of the U.S. (SPK-2013-00090). This acreage was carried forward in this delineation.

This page intentionally left blank

1.0 INTRODUCTION

HELIX Environmental Planning, Inc. (HELIX) has prepared this aquatic resources delineation report in support of the Costco El Dorado Hills Project (Project; formerly titled El Dorado Hills 52) to delineate potential jurisdictional wetlands and other waters of the U.S. and State on a ±36.94-acre Study Area located in western El Dorado County, California. The purpose of this delineation was to identify aquatic resources in the Study Area that would potentially qualify as waters of the U.S. and/or waters of the State. Waters of the U.S. are subject to regulatory jurisdiction by both the U.S. Army Corps of Engineers (USACE) and the applicable Regional Water Quality Control Board (RWQCB) (collectively referred to as "Agencies"). Waters of the State are subject to the jurisdiction of the RWQCB. If present, impacts to aquatic resources would potentially require obtaining regulatory permits and authorizations from one or both Agencies. Approximately 17.9 acres of the northern portion of the Study Area was previously verified by the USACE in August of 2019 to contain 0.19 acre of waters of the U.S. (SPK-2013-00090). This acreage was carried forward in this delineation. The remainder of the Study Area results presented in this document are preliminary and subject to verification by the USACE.

1.1 PROJECT LOCATION

The ±36.94-acre Study Area is located in El Dorado County north of U.S. Highway 50. It is bifurcated by Silva Valley Parkway and bordered on the west by Clarksville Crossing and on the southeast by Tong Road. The Study Area is located within Township 9 North, Range 8 East, Section 1 and 2 of the *Clarksvill*e United States Geological Survey (USGS) 7.5-minute series quadrangle (Appendix A, Figure 1, *Site and Vicinity Map* and Figure 2, *USGS Topographic Map*). The approximate center of the Study Area is at latitude 38.6600160° and longitude -121.0570744°, NAD 83, and is located at elevations between 705 feet and 795 feet above mean sea level (msl). The 20.34-acre project site is contained within the Study Area.

1.2 DRIVING DIRECTIONS

From downtown Sacramento, travel east on U.S. Highway 50 for approximately 25 miles toward El Dorado Hills and exit on Silva Valley Parkway (Exit 31) and turn right (south). Travel south on Silva Valley Parkway for approximately 0.2 mile and turn right (north) on Old Silva Valley Parkway and travel approximately 0.3 mile. The Study Area is located on the east side of the road and parking is available on the side of the road or on turnouts.

1.4 REGULATORY SETTING

1.4.1 Waters of the U.S.

On May 25, 2023, the U.S. Supreme Court issued a decision in the case of Sackett v. Environmental Protection Agency (Supreme Court of the United States 2023), which will ultimately influence how federal waters are defined. The May 25, 2023, Supreme Court decision in Sackett v. Environmental Protection Agency determined that "the CWA extends to only those 'wetlands with a continuous surface connection to bodies that are "waters of the U.S." in their own right,' so that they are 'indistinguishable' from those waters." The U.S. Environmental Protection Agency (USEPA) and the U.S. Army Corps of Engineers (USACE) after review issued a final rule to replace the 2023 rule that amends the "Revised Definition of "Waters of the U.S." to conform key aspects of the regulatory text to the U.S. Supreme Court's May 25, 2023 decision in the case of Sackett v. Environmental Protection Agency.

Unless considered an exempt activity under Section 404(f) of the Federal Clean Water Act (CWA), any person, firm, or agency planning to alter or work in "waters of the U.S.," including the discharge of dredged or fill material, must first obtain authorization from the USACE under Section 404 of the Clean Water Act (CWA; 33 USC 1344). Permits, licenses, variances, or similar authorization may also be required by other federal, state, and local statutes. Section 10 of the Rivers and Harbors Act prohibits the obstruction or alteration of navigable waters of the U.S. without a permit from USACE (33 USC 403). Activities exempted under Section 404(f) are not exempted within navigable waters under Section 10.

The Clean Water Act (33 United States Code (USC) 1251-1376) provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters.

Section 401 requires that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the U.S. obtain state certification that the discharge complies with other provisions of CWA. The Regional Water Quality Control Board (RWQCB) administers the certification program in California and may require State Water Quality Certification before other permits are issued.

Section 402 establishes a permitting system for the discharge of any pollutant (except dredged or fill material) into waters of the U.S.

Section 404 establishes a permit program administered by USACE that regulates the discharge of dredged or fill material into waters of the U.S. (including wetlands). Implementing regulations by USACE are found at 33 CFR Parts 320-332. The Section 404 (b)(1) Guidelines were developed by the USEPA in conjunction with USACE (40 CFR Part 230), allowing the discharge of dredged or fill material for non-water dependent uses into special aquatic sites only if there were no practicable alternative that would have less adverse impacts.

1.4.2 Waters of the State

Any action requiring a CWA Section 404 permit, or a Rivers and Harbors Act Section 10 permit, must also obtain a CWA Section 401 Water Quality Certification. The State of California Water Quality Certification (WQC) Program was formally initiated by the State Water Resources Control Board (SWRCB) in 1990 under the requirements stipulated by Section 401 of the Clean Water Act. Although the Clean Water Act is a federal law, Section 401 of the CWA recognizes that states have the primary authority and responsibility for setting water quality standards. In California, under Section 401, the State and

Regional Water Boards are the authorities that certify that issuance of a federal license or permit does not violate California's water quality standards (i.e., that they do not violate Porter-Cologne and the Water Code). The WQC Program currently issues the WQC for discharges requiring USACE permits for fill and dredge discharges within Waters of the United States, and now also implements the State's wetland protection and hydromodification regulation program under the Porter-Cologne Water Quality Control Act.

On May 28, 2020, the SWRCB implemented the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures) for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters and Enclosed Bays and Estuaries and Ocean Waters of California (SWRCB 2019). The Procedures consist of four major elements:

I. A wetland definition;

II. A framework for determining if a feature that meets the wetland definition is a water of the state;

III. Wetland delineation procedures; and,

IV. Procedures for the submittal, review, and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities.

Under the Procedures and the State Water Code (Water Code §13050(e)), "waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." "Waters of the State" includes all "waters of the U.S."

More specifically, a wetland is defined as: "An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation." The wetland definition encompasses the full range of wetland types commonly recognized in California, including some features not protected under federal law, and reflects current scientific understanding of the formation and functioning of wetlands (SWRCB 2019).

Unless excluded by the Procedures, any activity that could result in discharge of dredged or fill material to waters of the State, which includes waters of the U.S. and non-federal waters of the State, requires filing of an application under the Procedures.

2.0 ENVIRONMENTAL SETTING

2.1 EXISTING CONDITIONS

The Study Area is split into three sections: a northern portion and a southern portion which are bisected by Silva Valley Parkway, and a western portion that is bisected from the southern portion by Clarksville Crossing Road (Appendix A, Figure 3, *Aerial Map*). Land uses surrounding the Study Area include residential development and an elementary school to the north, open space and residential development to the west, Highway 50 and open space to the south, and a church and open space to the east.

2.2 FIELD CONDITIONS

Fieldwork for the aquatic resource delineation was conducted on January 9, 2025. Weather during the site visit was sunny, with temperatures ranging between 55 and 63 degrees Fahrenheit.

2.3 INTERSTATE OR FOREIGN COMMERCE CONNECTION

Aquatic resources in the Study Area are not used for any interstate or foreign commerce.

3.0 METHODS

3.1 DATA GATHERING

The following sources were used in preparation of this jurisdictional delineation:

- Aerial photography taken June 28, 2024, downloaded from NearMap,
- U.S. Fish and Wildlife Service's (USFWS) National Wetland Inventory online wetland mapper (USFWS 2025),
- Natural Resources Conservation Service (NRCS) web soil survey (NRCS 2025a),
- Corps of Engineers Wetlands Delineation Manual (USACE 1987),
- Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0; USACE 2008),
- A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States (Field Guide; Lichvar and McColley 2008),
- National Ordinary High Water Mark Field Delineation Manual for Rivers and Streams (Interim Version; USACE 2022),
- Field Indicators of Hydric Soils in the United States (Version 8.2; NRCS 2018), and
- USACE 2020 National Wetland Plant List for the Arid West (USACE 2020).

3.2 BOUNDARIES OF THE DELINEATION

The delineation area includes the entire 36.94-acre Study Area. Refer to the delineation map in Appendix B for the limits of the delineation.

3.3 DETERMINATION PROCEDURES

3.3.1 Delineation Methods

Criteria for determining the presence of wetlands or other waters subject to USACE jurisdiction are presented in the USACE *Wetlands Delineation Manual* (USACE 1987), the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region* (Version 2.0; USACE 2008), *A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western*

United States (Lichvar and McColley 2008), and the *National Ordinary High Water Mark Field Delineation Manual for Rivers and Streams* (Interim Version; USACE 2022).

Key criteria for determining the presence of wetlands subject to USACE jurisdiction (USACE 1987) are:

a) The presence of inundated or saturated soil conditions resulting from permanent or periodic inundation by groundwater or surface water.

b) A prevalence of vegetation typically adapted for life in saturated soil conditions (hydrophytic vegetation).

To assess whether wetlands are present, USACE requires that data be recorded on three environmental parameters: hydrology, soil, and vegetation. Positive wetland indicators for all three parameters are generally required for USACE to assert jurisdiction.

Fieldwork for the aquatic resources delineation was conducted by HELIX biologist Christine Gonzalez on January 9, 2025, in accordance with the Corps of Engineers Wetlands Delineation Manual (USACE 1987), the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West (Version 2.0; USACE 2008), A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States (Lichvar and McColley 2008), and the National Ordinary High Water Mark Field Delineation Manual for Rivers and Streams (Interim Version; USACE 2022). Vegetation, soils, and hydrologic characteristics were visually assessed by conducting meandering transects through the entire Study Area to obtain 100 percent visual coverage. Previous delineations of the Study Area were reviewed prior to the field assessment (Foothill Associates 2017, HELIX 2020, and ECORP Consulting, Inc. 2024). For portions of the Study Area that have previously been delineated, Ms. Gonzalez ground truthed the extent of aquatic resources but did not collect any additional three-parameter or OHWM data. Results of previous delineations including datasheets are incorporated into this report.

Plant species identifiable at the time of the survey were recorded in the field and are included in Appendix C. Plants observed within the Study Area were categorized with the wetland indicator status for each species, as shown in Table 1.

Table 1
WETLAND INDICATOR STATUS RATING

Indicator Status (abbreviation)	Characterization
Obligate (OBL)	Almost always occur in wetlands
Facultative Wetland (FACW)	Usually occur in wetlands, but may occur in non-wetlands
Facultative (FAC)	Occur in wetlands and non-wetlands
Facultative Upland (FACU)	Usually occur in non-wetlands, but may occur in wetlands
Upland (UPL)	Almost never occur in wetlands

The Munsell Color chart (Gretag Macbeth 2000) is used to determine moist soil colors and thus, hydric soils, if present. Data was taken at representative sample points within the Study Area to classify the site's soils, vegetation, and hydrologic characteristics. Wetland/OHWM determination data form(s) are provided in Appendix D.

Geographic coordinates of aquatic resources boundaries and locations of sample points were recorded in the field with an electronic tablet wirelessly connected to a Juniper Geode® (Global Navigation Satellite System [GNSS]) receiver unit with sub-meter accuracy. These data were exported into ArcGIS Pro 3.1.2® and used to produce the Aquatic Resources Delineation Map included as Appendix B. Representative photographs of the Study Area, and the associated sampling locations, are included as Appendix E.

3.3.2 Plant/Habitat Nomenclature

Habitat nomenclature is generally derived from *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer 1988). Plant nomenclature is taken from The Jepson Manual: Vascular Plants of California, second edition (Baldwin et al. 2012).

4.0 RESULTS

4.1 VEGETATION COMMUNITIES/HABITAT TYPES

Terrestrial biological habitats and land covers present within the Study Area include non-native annual grassland, valley foothill riparian, valley oak woodland, and ruderal/disturbed, which are described in detail below. Aquatic resources are described in Section 5.0.

4.1.1 Non-Native Annual Grassland

Non-native annual grassland dominates the northern and southern portions of the Study Area. This vegetation community is characterized primarily by an assemblage of non-native annual grasses and forbs. Dominant vegetation observed in the Study Area includes medusahead (*Elymus caput-medusae*), ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) intermixed with red-stemmed filaree (*Erodium cicutarium*), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), St. John's wort (*Hypericum perforatum*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*). Isolated valley oak (*Quercus lobata*) trees also occur in the non-native annual grassland.

4.1.2 Valley Foothill Riparian

Valley foothill riparian habitats are found in valleys bordered by sloping alluvial fans, slightly dissected terraces, lower foothills, and coastal plains. This habitat typically has a canopy layer of cottonwood (*Populus* spp.), California sycamore (*Platanus racemosa*), and valley oak. Subcanopy trees are white alder (*Alnus rhombifolia*), boxelder (*Acer negundo*), and Oregon ash (*Fraxinus latifolia*). The understory is comprised of wild grape (*Vitis californica*), wild rose (*Rosa californica*), blackberry (*Rubus* spp.), elderberry (*Sambucus* spp.), poison oak (*Toxicodendron pubescens*), willows (*Salix* spp.), herbaceous species such as sedges, and grasses. This habitat is associated with riverine habitat and often has an abrupt transition to adjacent upland habitat (Mayer and Laudenslayer 1988).

Valley foothill riparian habitat occurs within the Study Area and is associated with an ephemeral drainage in the northwestern portion of the Study Area as well as a perennial drainage in the southwestern portion of the Study Area. Dominant vegetation observed includes Fremont's cottonwood (*Populus fremontii*), valley oak (*Quercus lobata*), Himalayan blackberry (*Rubus armeniacus*), broadleaf

cattail (*Typha latifolia*), California bulrush (*Schoenoplectus californicus*), narrow leaved willow (*Salix exigua*), and Mexican rush (*Juncus* cf. *mexicanus*).

4.1.3 Valley Oak Woodland

Valley oak woodland is a common habitat type in the local region and is typically dominated by valley oaks, with other species such as California sycamore, black walnut (*Juglans nigra*), interior live oak (*Quercus wislizeni*), boxelder, and blue oak (*Quercus douglasii*) also occurring. The shrub layer is best developed along natural drainages, becoming insignificant in the uplands with more open stands of oaks. The understory of this community is often an extension of annual grassland habitat (Mayer and Laudenslayer 1988).

Valley oak woodland habitat is located in the southwest boundary of the Study Area where a small stand of mature valley oak trees overhangs an intermittent drainage. The understory is primarily non-native annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal (*Mentha pulegium*) immediately adjacent to the drainage.

4.1.4 Ruderal/Disturbed

Ruderal habitats are characterized by an assemblage of non-native and invasive plant species that readily colonize disturbed landscapes. Roadsides, construction sites, and vacant lots are all sites ruderal plant species typically occur in. Disturbed habitats typically retain a soil substrate, but the vegetation communities are either lacking or are comprised of mostly ruderal plant species.

Ruderal/disturbed habitat occurs within the Study Area and is comprised of weedy open space adjacent to road shoulders, graded dirt roads, a paved driveway, and a stockpile area.

Dominant plant species observed in this habitat within the Study Area include medusahead, soft chess, yellow star-thistle (*Centaurea solstitialis*), red-stemmed filaree, and winter vetch.

4.2 CLIMATE

The climate of El Dorado County is Mediterranean, characterized by wet, cool winters and dry, hot summers. The nearest weather station with complete data is located in Auburn, California, approximately 15 miles north of the Study Area. Average daily maximum and minimum temperatures are 92° and 63° Fahrenheit (F) in July and 55° and 37° F in December and January. The mean annual precipitation is 34.68 inches, with 100 percent occurring as rain from October through June. This weather station received approximately 11.84 inches of rainfall from October 1, 2024, through January 9, 2025, which is 34 percent of the annual rainfall for the year (NRCS 2025a).

4.3 SOILS

The Natural Resources Conservation Service (NRCS) has mapped one soil unit within the Study Area, Auburn Silt Loam, 2 to 30 Percent Slopes (Appendix A, Figure 4, *Soils Map*). The general characteristics associated with this soil type are described below (USDA, NRCS 2025b).

Auburn Silt Loam, 2 to 30 Percent Slopes (AwD): this soil unit has a parent material of residuum weathered from basic igneous rock and/or basic residuum weathered from metamorphic rock and is

typical of hills. A typical soil profile is silt loam (0-14 inches) and weathered bedrock (14-18 inches). This soil unit is well drained, has a low runoff class, and no frequency of flooding or ponding. Vegetation associated with this soil series includes annual grasses, forbs, and oaks. The hydric soils list for El Dorado County does not identify this soil as hydric (USDA, NRCS 2025c).

4.4 HYDROLOGY

The Study Area is located in the Upper Cosumnes River watershed (HUC8 18040013). The hydrologic regime on the Study Area is predominantly year-round irrigation runoff from the adjacent development to the north, seasonal stormwater runoff, direct precipitation, which primarily falls between October and June, and groundwater. Surface water runoff runs in a general northeast to southwest direction along the gently sloped topography. The intermittent and ephemeral drainages within the Study Area accumulate water and flow southwest into culverts at Clarksville Crossing Road. The perennial drainage flows south through the Study Area and is a direct tributary to Carson Creek. Carson Creek meets with Deer Creek which flows into the Consumnes River, a traditional navigable water.

4.5 USFWS NATIONAL WETLANDS INVENTORY

The USFWS National Wetlands Inventory (NWI) online database was reviewed to determine if there are any wetlands or other waters of the U.S. mapped by the USFWS in the Study Area or vicinity. The NWI identifies the perennial drainage as freshwater emergent wetland and riverine (Appendix A, Figure 5, *National Wetlands Inventory Map*). No other features are identified by the NWI within or adjacent to the Study Area.

5.0 AQUATIC RESOURCES

A total of 1.021 acres of aquatic resources have been delineated within the Study Area. This acreage consists of 0.193 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainages, 0.360 acre of intermittent drainage, and 0.221 acre of perennial drainage (Appendix B). This acreage includes 0.19 acre of waters of the U.S. that was previously verified by the USACE within a 17.9-acre portion of the northern portion of the Study Area (SPK-2013-00090). This previously verified acreage was carried forward in this delineation. A description of all of the features delineated within the Study Area are provided in the following sections.

5.1.1 Seasonal Wetland

A total of 0.193 acre of seasonal wetlands has been delineated within the Study Area (Appendix B). Seasonal wetlands are often depressions or topographic folds within the landscape that inundate for short periods of time following intense rains, but do not maintain seasonal aquatic or saturated soil conditions for durations long enough for colonization by perennial, obligate plant species. As such, plant species in seasonal wetlands are generally of two types: species that can tolerate short periods of inundation but have not adapted to withstand sustained aquatic or saturated soil conditions, and short-lived (primarily annual) species that take advantage of ephemeral aquatic and/or saturated soil conditions. The majority of seasonal wetlands within the Study Area are adjacent to an ephemeral drainage in the northern portion of the Study Area and one is adjacent to the intermittent drainage. There are also two depressional seasonal wetlands within the Study Area that appear to have formed as a result of historic excavation as they are located next to large, steep mounds. Dominant vegetation

observed in seasonal wetlands includes iris leaved rush (*Juncus xiphioides*), Italian rye grass (*Festuca perennis*), needle spikerush (*Eleocharis acicularis*), and tall cyperus (*Cyperus eragrostis*).

5.1.2 Seep

A total of 0.007 acre of seep has been delineated within the Study Area (Appendix B). Seeps are characterized as areas where subsurface flows intersect the soil surface. Typically, water flows from seeps persist for some period after the rainy season or, more rarely, nearly year-round. Seeps accessing sufficient amounts of subsurface water can support isolated wetland vegetation (such as on a hillside) or they may form the headwaters of other jurisdictional drainage or wetland features, such as wetland swales. Vegetation in seeps often consists of plant species associated with seasonal and semi-permanent marsh habitats. When seeps are active for only short periods beyond the rainy season and into the warm season, herbaceous perennial wetland species typically dominate. Vegetation observed in the seep within the Study Area consisted almost entirely of iris leaved rush. Hydric soil indicators in the seep included a redox dark surface with distinct or prominent redoximorphic features located along root channels of living roots and as concentrations in the matrix. Wetland hydrology requirements were met by oxidized rhizospheres, saturation visible on aerial imagery, and the FAC-neutral test.

5.1.3 Wetland Swale

A total of 0.006 acre of wetland swale was delineated within the Study Area (Appendix B). The wetland swale within the Study Area is associated with SW-3 on the northern portion of the Study Area and conveys water from that feature to ED-16 and during high flow events. Dominant vegetation observed in the wetland swale within the Study Area includes curly dock (*Rumex crispus*), pennyroyal (*Mentha pulegium*), coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), Italian rye grass, and annual hair grass (*Deschampsia danthonioides*).

5.1.4 Ephemeral Drainage

A total of 0.234 acre of ephemeral drainages have been delineated within the Study Area (Appendix B). Ephemeral drainages are not wetlands as they do not meet the three-parameter criteria for vegetation, hydrology, and soils but do convey water and exhibit an ordinary high water mark. Water flows within ephemeral drainages are fed primarily by precipitation and surface water runoff. These features convey water during and immediately after storm events, but do not flow continuously throughout the winter and spring. Typically, these features exhibit a defined bed and bank and show signs of scouring as a result of rapid flow events. Although the channels of the ephemeral drainages within the Study Area are largely unvegetated, what vegetation is present includes winter vetch, ripgut brome, Italian rye grass, phacelia (*Phacelia cicutaria*), and medusahead.

5.1.5 Intermittent Drainage

A total of 0.360 acre of intermittent drainage has been delineated within the Study Area (Appendix B). Intermittent drainages receive substantial seasonal flows of significant velocity and may appear as perennial features during the normal wet season. These seasonal flows often scour the channel of vegetation. Intermittent drainages may support fringe wetland vegetation types, such as seasonal or semi-permanent marsh or riparian wetlands. Conversely, intermittent drainages may be associated with hydrophytic vegetation communities that lack further wetland indicators. A typical hydroperiod of

intermittent drainages is one that begins with the onset of substantial rains in the normal wet season and persists for an extended, variable amount of time into the summer.

A brick check dam has been constructed across a portion of the intermittent drainage within the Study Area near datapoint 4a (Appendix B). This check dam has resulted in water backing up during flow events that has allowed for the establishment of hydrophytic, emergent vegetation upstream of datapoint 4a. The area containing emergent vegetation is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock, with some areas of cattails, Himalayan blackberry, and a small clump of willows. This area is entirely within the OHWM of the intermittent drainage.

5.1.6 Perennial Drainage

A total of 0.221 acre of perennial drainage has been delineated within the Study Area (Appendix B). Perennial drainages may not meet the three-parameter wetland criteria for vegetation, hydrology, and soils, but do convey water and exhibit an OHWM. Perennial drainages convey water flows throughout the entire year. These drainages typically consist of a channel, bed, and bank and are devoid of wetland vegetation due to the scouring effect of flowing water. Perennial drainages are often bordered by wetland and riparian communities of various composition and cover depending on flow rates, duration of flows, and soil types.

The perennial drainage is located in the western portion of the Study Area and flows north to south. This feature originates north of the Study Area and is a direct tributary to Carson Creek. Two high-flow channels are present along the western portion of the main channel and contained flowing water during the site assessment on January 9, 2025. The perennial drainage is generally devoid of vegetation, but emergent wetland vegetation and riparian vegetation are present along the upper bank of the drainage and form a swath of valley foothill riparian habitat.

Table 1 below provides a summary of aquatic resources mapped within the Study Area.

Table 1
AQUATIC RESOURCES IN THE STUDY AREA

Feature	Lat./Long.	Cowardin Classification[1]	Area (ac.)	Area (sq. ft.)	Length (ft.)

[1] Cowardin Codes for Wetlands: System (P = Palustrine; R = Riverine), Subsystem (4 = Intermittent; 5 = Perennial), – Class (EM = Emergent; SB = Streambed; RB = Rock bottom), – Subclass (1 = Persistent; 2 = Non-persistent).

5.2 POTENTIAL WATERS OF THE U.S.

A total of 1.021 acre of aquatic resources have been delineated within the Study Area. All aquatic resources within the Study Area are expected to qualify as waters of the U.S. as they either have a physical hydrologic connection or abut a traditional navigable water. The perennial drainage is a direct tributary to Carson Creek, which is ultimately tributary to the Consumnes River, a traditional navigable water. The intermittent and ephemeral drainages within the Study Area flow into storm drains which also appear hydrologically connected to Carson Creek. The seasonal wetlands, seep, and wetland swale either abut or appear to have a physical connection to the drainages.

5.3 POTENTIAL WATERS OF THE STATE

All aquatic resources in the Study Area (1.021 acres) are potential waters of the U.S.; therefore, they are potential waters of the State as well (see Section 1.4.1). There are no other aquatic resources in the Study Area that would be potential waters of the State.

6.0 SUMMARY

HELIX conducted an aquatic resources delineation of the ±36.94-acre Study Area for the Costco El Dorado Hills Project located in El Dorado Hills, California. A total of 1.021 acres of aquatic resources and other waters of the U.S. were mapped within the Study Area. This acreage consists of 0.193 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainage, 0.360 acre of intermittent drainage, and 0.221 acre of perennial drainage. The findings above represent a calculated estimation of the extent of aquatic resources within the Study Area and are subject to modification following USACE review and/or the verification process.

NOTES

- The boundaries and jurisdictional status of all waters shown on this map are preliminary and subject to verification by the U.S. Army Corps of Engineers.
- Approximately 17.9 acres of northern portion of Study Area was previously verified by USACE on August 19, 2019 (SPK-2013-00090)
- Northern portion originally delineated By: Kelly Bayne of Foothills Associates, December 15, 2015.
- Delineation updated By P. Martin on October 13, 2020 and C. Gonzalez on January 9, 2025.
- Aquatic resources were mapped by HELIX using an EOS Arrow Global Positioning System
- This delineation utilizes the Corps' 1987 three-parameter methodology and Arid West Supplement to delineate jurisdictional waters of the U.S.
- The Hydrologic Unit Code for this site is 18040013
- Topographic contour interval is 5 feet.
- Digital base data provided by RSC Engineering
- Coordinate System: NAD 83 UTM Zone 10N
- Projection: Transverse Mercator
- Datum: North American Datum 1983

List of Plants Observed in the Study Area

Family	Scientific Name	Common Name	Indicator Status*
Fabaceae	*Acmispon americanus* var. *americanus*	American bird's foot trefoil	UPL
Poaceae	*Aegilops cylindrica*	Jointed goat grass	--
Apocynaceae	*Asclepias fascicularis*	Narrow leaf milkweed	--
Poaceae	*Avena fatua*	Wild oats	--
Asteraceae	*Baccharis pilularis* ssp. *consanguinea*	Coyote brush	--
Poaceae	*Briza minor*	Little rattlesnake grass	FAC
Themidaceae	*Brodiaea elegans*	Harvest brodiaea	FACU
Poaceae	*Bromus diandrus*	Ripgut brome	--
Poaceae	*Bromus hordeaceus*	Soft brome	FACU
Asteraceae	*Carduus pycnocephalus*	Italian thistle	--
Cyperaceae	*Carex praegracilis*	Field sedge	FACW
Cyperaceae	*Cyperus eragrostis*	Tall flatsedge	FACW
Asteraceae	*Centaurea solstitialis*	Yellow star-thistle	--
Asteraceae	*Centromadia fitchii*	Spikeweed	FACU
Agavaceae	*Chlorogalum pomeridianum* var. *pomeridianum*	Common soaproot	--
Asteraceae	*Cirsium vulgare*	Bull thistle	FACU
Euphorbiaceae	*Croton setiger*	Turkey mullein	--
Convolvulaceae	*Cuscuta californica*	California dodder	--
Poaceae	*Cynodon dactylon*	Bermuda grass	FACU
Cyperaceae	*Cyperus eragrostis*	Tall cyperus	FACW
Apiaceae	*Daucus pusillus*	Wild carrot	UPL
Poaceae	*Deschampsia danthonioides*	Annual hair grass	FACW
Poaceae	*Deschampsia elongata*	Slender hair grass	FACW
Themidaceae	*Dichelostemma capitatum* ssp. *capitatum*	Wild hyacinth	FACU
Asteraceae	*Dittrichia graveolens*	Stinkwort	--
Campanulaceae	*Downingia* spp.	Downingia	OBL
Cyperaceae	*Eleocharis acicularis*	Needle spikerush	OBL
Cyperaceae	*Eleocharis macrostachya*	Pale spikerush	OBL
Poaceae	*Elymus caput-medusae*	Medusahead	--
Onagraceae	*Epilobium brachycarpum*	annual willowherb	FAC
Onagraceae	*Epilobium* cf. *ciliatum*	Fringed willowherb	FACW
Onagraceae	*Epilobium densiflorum*	Denseflower willowherb	FACW
Geraniaceae	*Erodium botrys*	Big heron bill	FACU
Geraniaceae	*Erodium cicutarium*	Coastal heron's bill	--
Apiaceae	*Eryngium castrense*	Great Valley button-celery	OBL
Phrymaceae	*Erythranthe guttata* (*Mimulus guttatus*)	Yellow monkey flower	OBL
Poaceae	*Festuca microstachys*	Small fescue	--
Poaceae	*Festuca myuros*	Rattail sixweeks grass	FACU
Poaceae	*Festuca perennis*	Italian rye grass	FAC
Moraceae	*Ficus carica*	Edible fig	FACU
Rhamnaceae	*Frangula californica* ssp. *tomentella*	Hoary coffeeberry	--
Poaceae	*Gastridium phleoides*	Nit grass	FACU
Geraniaceae	*Geranium dissectum*	Cutleaf geranium	--
Geraniaceae	*Geranium molle*	Crane's bill geranium	--
Poaceae	*Glyceria declinata*	Low manna grass	FACW
Asteraceae	*Helminthotheca echioides*	Bristly ox-tongue	--
Asteraceae	*Holocarpha virgata* ssp. *virgata*	Narrow tarplant	--

Family	Scientific Name	Common Name	Indicator Status*
Poaceae	*Hordeum marinum*	Barley	FAC
Hypericaceae	*Hypericum perforatum* ssp. *perforatum*	Klamathweed	FACU
Asteraceae	*Hypochaeris glabra*	Smooth cat's-ear	--
Juncaceae	*Juncus bufonius*	Toad rush	FACW
Juncaceae	*Juncus effusus*	Common bog rush	FACW
Juncaceae	*Juncus capitatus*	Leafy bracted dwarf rush	FACU
Juncaceae	*Juncus* cf. *mexicanus*	Mexican rush	FACW
Juncaceae	*Juncus* cf. *tenuis*	Slender rush	FACW
Juncaceae	*Juncus xiphioides*	Iris leaved rush	OBL
Asteraceae	*Lactuca serriola*	Prickly lettuce	FACU
Asteraceae	*Lasthenia fremontii*	Vernal pool goldfields	OBL
Asteraceae	*Leontodon saxatilis*	Hairy hawkbit	FACU
Linaceae	*Linum usitatissimum*	Common flax	--
Lunulariaceae	*Lunularia cruciata*	Crescent-cup liverwort	--
Lythraceae	*Lythrum hyssopifolia*	Hyssop loosestrife	OBL
Lamiaceae	*Mentha pulegium*	Pennyroyal	OBL
Poaceae	*Muhlenbergia rigens*	Deer grass	FAC
Haloragaceae	*Myriophyllum aquaticum*	Parrot feather watermilfoil	OBL
Polemoniaceae	*Navarretia intertexta*	Interwoven navarretia	FACW
Poaceae	*Paspalum dilatatum*	Dallis grass	FAC
Polygonaceae	*Persicaria* sp.	Smartweed	OBL
Boraginaceae	*Plagiobothrys stipitatus*	Stalked popcorn-flower	FACW
Poaceae	*Pleuropogon californicus*	Semaphore grass	OBL
Poaceae	*Poa annua*	Annual blue grass	FAC
Lamiaceae	*Pogogyne zizyphoroides*	Sacramento Mesa-mint	OBL
Poaceae	*Polypogon monspeliensis*	Rabbitsfoot grass	FACW
Salicaceae	*Populus fremontii*	Fremont's cottonwood	FAC
Rosaceae	*Prunus* sp.	Cherry tree	FACU
Fagaceae	*Quercus douglasii*	Blue oak	--
Fagaceae	*Quercus lobata*	Valley oak	FACU
Fagaceae	*Quercus wislizeni*	Interior live oak	--
Ranunculaceae	*Ranunculus bonariensis* var. *trisepalus*	Vernal pool buttercup	OBL
Ranunculaceae	*Ranunculus muricatus*	Spiny buttercup	FACW
Brassicaceae	*Rorippa curvisiliqua*	Curvepod yellow cress	OBL
Rosaceae	*Rubus armeniacus*	Himalayan blackberry	FAC
Polygonaceae	*Rumex crispus*	Curly dock	FAC
Polygonaceae	*Rumex pulcher*	Fiddle dock	FAC
Salicaceae	*Salix exigua*	Narrow leaved willow	FACW
Salicaceae	*Salix* cf. *lasiolepis*	Arroyo willow	FACW
Viburnaceae	*Sambucus mexicana*	Elderberry	--
Cyperaceae	*Schoenoplectus californicus*	California bulrush	OBL
Asteraceae	*Senecio vulgaris*	Common groundsel	FACU
Asteraceae	*Sonchus asper*	Prickly sow thistle	FAC
Poaceae	*Stipa pulchra*	Purple needle grass	--
Lamiaceae	*Trichostema lanceolata*	Vinegar weed	FACU
Fabaceae	*Trifolium variegatum*	Variegated clover	FAC
Typhaceae	*Typha latifolia*	Narrow leaved cattail	OBL
Scrophulariaceae	*Verbascum blattaria*	Moth mullein	UPL

Family	Scientific Name	Common Name	Indicator Status*
Plantaginaceae	*Veronica* cf. *americana*	American brooklime	OBL
Fabaceae	*Vicia sativa*	Spring vetch	FACU
Gentianaceae	*Zeltnera muehlenbergii*	Muehlenberg's centaury	FAC

Scientific and common names from:

Baldwin, B.G.. D.H. Goldman, D.J. Keil, R. Patterson, T.J. Rosatti, D.H. Wilken, editors. 2012. The Jepson Manual: Vascular Plants of California, second edition. University of California Press, Berkley

or

U.S. Army Corps of Engineers Cold Regions Research and Engineering Laboratory, *Arid West 2022 Regional Wetland Plant List*

* Acronyms: FAC – facultative, FACU – facultative upland, FACW – facultative wetland, OBL – obligate, UPL – upland; -- Not Listed (considered upland) (USACE 2018)

Appendix D

Data Sheets

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: El Dorado Hills 52 City/County: El Dorado County Sampling Date: Dec. 15, 2015

Applicant/Owner: EDH 52, GP State: CA Sampling Point: 1B

Investigator(s): Kelly Bayne and Charlotte Marks Section, Township, Range: Township 9 North, Range 8 East, Section 1

Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): concave Slope (%): <1

Subregion (LRR): C Lat: 38 39 44.15"N Long: 121 03 22.66"W Datum: NAD 83

Soil Map Unit Name: Auburn Silt Loam, 2 to 30 Percent Slopes NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✓	No _____	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes _____	No ✓	
Wetland Hydrology Present?	Yes ✓	No _____	

Remarks:

Ephemeral drainage; although the soils do not meet the definition of a wetland, the feature has an OHWM. Therefore, it is considered an ephemeral drainage.

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: _____)	Absolute % Cover	Dominant Species?	Indicator Status
1.

% Bare Ground in Herb Stratum 95 % Cover of Biotic Crust _____

Dominance Test worksheet:

Number of Dominant Species That Are OBL, FACW, or FAC: 1 (A)

Total Number of Dominant Species Across All Strata: 1 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

Prevalence Index worksheet:

Total % Cover of:	Multiply by:
OBL species _____	x 1 = _____
FACW species _____	x 2 = _____
FAC species _____	x 3 = _____
FACU species _____	x 4 = _____
UPL species _____	x 5 = _____
Column Totals: _____ (A)	_____ (B)

Prevalence Index = B/A = _____

Hydrophytic Vegetation Indicators:

✓ Dominance Test is >50%

___ Prevalence Index is ≤3.0[1]

___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ✓ No _____

Remarks:

SOIL

Sampling Point: 1B

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	Matrix %	Redox Features Color (moist)	Redox Features %	Type[1]	Loc[2]	Texture	Remarks
0-8	7.5YR 3/2	100	None				Loam	

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)
- ___ 1 cm Muck (A9) (**LRR D**)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ___ **No** ✓

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ✓ Water Marks (B1) (**Riverine**)
- ✓ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No ✓ Depth (inches): _____

Water Table Present? Yes ___ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes ___ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes ✓ **No** ___

- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ✓ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✓ Depth (inches): _____

Water Table Present? Yes _____ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes ✓ **No** _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: El Dorado Hills 52 City/County: El Dorado County Sampling Date: Oct. 13, 2020

Applicant/Owner: EDH 52, GP State: CA Sampling Point: 7B

Investigator(s): Patrick Martin, Halie Goeman Section, Township, Range: Township 9 North, Range 8 East, Section 1

Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): concave Slope (%): <1

Subregion (LRR): C Lat: 38 39 37.64"N Long: 121 03 25.63"W Datum: NAD 83

Soil Map Unit Name: Auburn Silt Loam, 2 to 30 Percent Slopes NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation ✓, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____	No ✓	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes _____	No ✓	
Wetland Hydrology Present?	Yes _____	No ✓	

Remarks:

Low area along ephemeral stream with hydrophytes, but supports a dominance of upland vegetation and lacks other wetland criteria. This is likely a floodplain in uplands that rarely floods.

VEGETATION – Use scientific names of plants.

- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ✓ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ✓ **No** _____

Remarks:

Prominent redoximorphic features in the matrix and pore linings on a dark surface support the hydric soil indicator Redox Dark Surface (F6).

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ✓ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ✓ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✓ Depth (inches): _____

Water Table Present? Yes _____ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes ✓ **No** _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Seep spring dominated by obligate wetland plants likely has a high water table during the growing season.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: El Dorado Hills 52 City/County: El Dorado County Sampling Date: Oct. 13, 2020

Remarks:

No wetland hydrology detected.

U.S. Army Corps of Engineers (USACE)

RAPID ORDINARY HIGH WATER MARK (OHWM) FIELD IDENTIFICATION DATA SHEET

The proponent agency is Headquarters USACE CECW-COR.

Form Approved -
OMB No. 0710-0024
Expires: 2027-09-30

The Agency Disclosure Notice (ADN)

The Public reporting burden for this collection of information, 0710-0024, is estimated to average 30 minutes per response, including time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding the burden estimate or burden reduction suggestions to the Department of Defense, Washington Headquarters Services, at whs.mc-alex.esd.mbx.dd-dod-information-collections@mail.mil. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to any penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.

Project ID #: 03605.00005.001	Site Name: Costco El Dorado Hills	Date and Time: 1/9/25; 0900
Location (lat/long): 38.659489, -121.058405	Investigator(s): C. Gonzalez	

Step 1 Site overview from remote and online resources.
Check boxes for online resources used to evaluate site:

- [ ] gage data
- [X] LiDAR
- [X] geologic maps
- [X] climatic data
- [X] satellite imagery
- [ ] land use maps
- [X] aerial photos
- [X] topographic maps
- [ ] Other: _____

Describe land use and flow conditions from online resources.
Were there any recent extreme events (floods or drought)?

The site is currently an undeveloped annual grassland with several aquatic resources that have previously been delineated. No recent extreme weather events prior to the survey.

Step 2 Site conditions during field assessment. First look for changes in channel shape, depositional and erosional features, and changes in vegetation and sediment type, size, density, and distribution. Make note of natural or human-made disturbances that would affect flow and channel form, such as bridges, riprap, landslides, rockfalls, etc.

Evidence of high flows observed along the perennial drainage (bent vegetation and wracking) and secondary high-flow channels contained some flowing water. The width and depth of the main branch of the drainage is slightly varied. No human-made disturbances observed along branch of the drainage in the Study Area.

Step 3 Mark the boxes next to the indicators used to help identify the location of the OHWM.

OHWM is at a transition point, therefore some indicators used to identify the location of the OHWM may be just below or above the OHWM. Make a slash in boxes next to indicators that are helpful in identifying the OHWM. After the initial assessment, those indicators identified at the OHWM elevation should be changed from slashes to x's. Note, it is not necessary to mark indicators that are present but do not help inform identification of the OHWM.

Go to page 2 to describe overall rationale for location of OHWM, write any additional observations, and attach a photo log.

Geomorphic indicators

- [X] **Break in slope**
  - [X] *on the bank*
  - [ ] *undercut bank*
  - [ ] *valley bottom*
  - [ ] Other: _____
- [X] **Shelving**
  - [X] *shelf at top of bank*
  - [ ] *natural levee*
  - [ ] *human-made berms or levees*
  - [ ] *other berms:* _____
- [X] **Secondary channels**
- [X] **Channel bar**
  - *shelving (berms) on bar*
  - *unvegetated*
  - [X] *vegetation transition (go to veg. indicators)*
  - *sediment transition (go to sed. indicators)*
  - *upper limit of deposition on bar*
- [X] **Instream bedforms and other bedload transport evidence**
  - *deposition bedload indicators (e.g., imbricated clasts, gravel sheets, etc.)*
  - [X] *bedforms (e.g., pools, riffles, steps, etc.)*
  - *Weathered clasts or bedrock*
  - *erosional bedload indicators (e.g., obstacle marks, scour, smoothing, etc.)*

Sediment indicators

- [X] **Soil development**
- **Changes in character of soil**
- **Mudcracks**
- **Changes in particle-sized distribution**
  - *transition from* _____ to _____
  - *upper limit of sand-sized particles*
  - [X] *silt deposits*

Vegetation indicators (*Consider the vegetation transition looking from the middle of the channel, up the banks, and into the floodplain*)

- [X] **Change in vegetation type from** h **to** u
- [X] **Change in density of vegetation**
- **Exposed roots below intact soil layer**
- [X] **Vegetation matted down and/or bent**
- **Other vegetation observations**

Other physical indicators

- [X] **Sediment deposited on vegetation or structures**
- [X] **Wracking/presence of organic litter**
- [X] **Presence of large wood**
- [X] **Leaf litter disturbed or washed away**
- [X] **Water staining**

Other observed indicators? Describe:

Main branch of drainage is devoid of vegetation within the channel. The high-flow channels contain emergent wetland vegetation in the channel and at the OHWM. Vegetation here was bent and matted down.

Project ID #: 03605.00005.001

Step 4 Was additional information used to support identification of the OHWM? Yes [X] No

If yes, describe and attach information to data sheet:

Step 5 Is an OHWM present at this site? [X] Yes No

Describe rationale for location of OHWM or lack thereof by describing any observed indicators (at, above, and/or below the OHWM location).

The OHWM was delineated through observations in vegetation changes, soil/sediment changes, and active hydrology. The main branch and high-flow channels of the drainage contained flowing water and some evidence of recent high flows were observed. The OHWM appears as a prominent line along this drainage.

Additional observations or notes

Unknown minnows observed in the drainage.

Attach an imagery log of the site.

Imagery log attached? [X] Yes No If no, explain why not: _____

List photographs, or other imagery/sketches, and include descriptions in the table below.

Number photographs in the order that they are taken. Attach imagery and include annotations of features.

Imagery Number	Imagery description

OHWM Field Identification Data Sheet Instructions and Field Procedure

Step 1 Site overview from remote and online resources (Chapter 5) **Complete Step 1 prior to site visit.**

Online Resources: Identify what information is available for the site. Check boxes on data sheet next to the resources used to assess this site.

a. gage data
b. aerial photos
c. satellite imagery
d. LiDAR
e. topographic maps
f. geologic maps
g. land use maps
h. climatic data (precipitation and temperature)

Landscape context: Use the online resources to put the site in the context of the surrounding landscape. (Chapter 4)

a. **Note on the data sheet under Step 1:**
   i. Overall land use and change if known
   ii. Recent extreme events if known (e.g., flood, drought, landslides, debris flows, wildfires)
   iii. Erosional and depositional environments
b. Consider the following to inform weighting of evidence observed during field visit.
   i. What physical characteristics are likely to be observed in specific environments?
   ii. Was there a recent flood or drought? Are you expecting to see recently formed or obscured indicators?
   iii. How will land use affect specific stream characteristics? How natural is the hydrologic regime? How stable has the landscape been over the last year, decade, century?

Step 2 Site conditions during the field assessment (assemble evidence) (Chapter 1 and 3)

a. Identify the assessment area.
b. Walk up and down the assessment area noting all the potential OHWM indicators.
c. Note broad trends in channel shape, vegetation, and sediment characteristics.
   i. Is this a single thread or multi-thread system? Is this a stream-wetland complex?
   ii. Are there any secondary and/or floodplain channels?
   iii. Are there obvious human-made alterations to the system?
   iv. Are there man-made (e.g., bridges, dams, culverts) or natural structures (e.g., bedrock outcrops, Large Wood jams) that will influence or control flow?
d. Look for signs of recurring fluvial action.
   i. Where does the flow converge on the landscape?
   ii. Are there signs of fluvial action (sediment sorting, bedforms, etc.) at the convergence zone?
e. Look for indicators on both banks. If the opposite bank is not accessible, then look across the channel at the bank.
f. **In Step 2 of the data sheet,** describe any adjacent land use or flow conditions that may influence interpretation of each line of evidence.
   i. What land use and flow conditions may be affecting your ability to observe indicators at the site?
   ii. What recent extreme events may have caused changes to the site and affected your ability to observe indicators?

Step 3a List evidence (Chapter 2 and 3)

Assemble evidence by marking each box with a slash next to each line of evidence.

If using fillable form, then follow the instructions for filling in the fillable form.

Context is important when assembling evidence. For instance, pool development may be an indicator of interest on the bed of a dry stream, but may not be a useful indicator to take note of in a flowing stream. On the other hand, if the pool is found in a secondary channel adjacent to the main channel, it could provide a line of evidence for a minimum elevation of high flows. Therefore, consider the site context when deciding which indicators provide evidence for identifying the OHWM. Explain reasoning in Step 5.

Questions to consider while making observations and listing evidence at a site:

Geomorphic indicators	**Sediment and soil indicators**	**Vegetation indicators**	**Other physical indicators**
Where are the breaks in slope?	Where does evidence of soil formation appear?	Where are the significant transitions in vegetation species, density, and age?	Is there organic litter present?
Are there identifiable banks?		Is there vegetation growing on the channel bed?	
Is there an easily identifiable top of bank?	Are there mudcracks present?	If no, how long does it take for the non-tolerant vegetation to establish relative to how often flows occur in the channel?	Is there any leaf litter disturbed or washed away?
Are the banks actively eroding?			
Are the banks undercut?	Is there evidence of sediment sorting by grain size?	Where are the significant transitions in vegetation?	Is there large wood deposition?
Are the banks armored?			
Is the channel confined by the surrounding hillslopes?		Is the vegetation tolerant of flowing water?	
Are there natural or man-made berms and levees?		Has any vegetation been flattened by flowing water?	Is there evidence of water staining?
Are there fluvial terraces?			
Are there channel bars?			

Are the following features of fluvial transport present?

Evidence of erosion: obstacle marks, scour, armoring
Bedforms; riffles, pools, steps, knickpoints/headcuts
Evidence of deposition: imbricated clasts, gravel sheets, etc.

In some cases, it may be helpful to explain why an indicator was NOT at the OHWM elevation, but found above or below. It can also be useful to note if specific indicators (e.g., vegetation) are NOT present. For instance, note if the site has no clear vegetation zonation.

OHWM Field Identification Data Sheet Instructions and Field Procedure

Step 3b Weight each line of evidence (Chapter 1 and 3)

Consider importance of each indicator by assessing the following:

a. Relevance:

i. Is this indicator left by low, high, or extreme flows? Did recent extreme events and/or land use affect this indicator?

ii. Consider the elevation of the indicator relative to the channel bed. What is the current flow level based on season or nearby gages?

iii. Consider the elevation of the indicator relative to the current flow. If the stream is currently at baseflow and indicator is adjacent to that, then it is likely a low-flow indicator. The difference between high-and extreme-flow indicators can sometimes be difficult to determine.

***Landscape context from Step 1 (Chapter 4) can help determine the relevance, strength, and reliability of the indicators observed in the field.**

***In Chapter 2 of the OHWM field manual provides information on specific indicators that can assist in putting these in context and determining relevance, strength, and reliability.**

iv. Recent floods may have left many extreme-flow indicators, or temporarily altered channel form. Other resources will likely be needed to support any OHWM identification at this site. Field evidence of the OHWM may have to wait for the site to recover from the recent flood.

v. Droughts may cause field evidence of OHWM to be obscured because there has been an extended time since the last high-flow event. There can be overgrowth of vegetation or deposition of material from surrounding landscape that can obscure indicators.

vi. Both human-made (e.g., dams, construction, mining activities, urbanization, agriculture, grazing) and natural (e.g., fires, floods, debris flows, beaver dams) disturbances can alter how indicators are expected to appear at a site. Chapter 6 and Chapter 7 of the OHWM field manual provide specific case-studies that can help in interpreting evidence at these sites.

b. Strength:

i. Is this indicator persistent across the landscape?

1. Look up and downstream and across the channel to see if you see the same indicator at multiple locations.
2. Does the indicator occur at the same elevation as other indicators?

c. Reliability:

i. Is this indicator persistent on the landscape over time? Will this indicator still persist across seasons?

1. This can be difficult to determine for some indicators and may be specific to climatic region (in terms of persistence of vegetation) and history of land use or other natural disturbances.
2. Chapter 2, Chapter 6, and Chapter 7 of the OHWM field manual describe each indicator in detail and provide examples of areas where indicators are difficult to interpret.

Step 4 Was additional information used to support identification of the OHWM? Are other resources used to support the lines of evidence observed in the field?

a. If additional resources are needed, then repeat steps 3a and 3b for the resources selected in Step 1 of assembling and weighting evidence collected from online resources. Chapter 5 of the OHWM field manual provides information on using online resources.

b. Any data collected from online tools have strengths and weaknesses. Make sure these are clear when determining relevance, strength, and reliability of the remotely collected data. Clearly describe why other resources were used to support the lines of evidence observed in the field, as well as the relevance, strength, and reliability of the supporting data and/or resources.

c. Attach any remote data and data analysis to the data sheet.

Step 5 Describe rationale for location of OHWM: (Chapter 1 and Chapter 3)

a. Weigh body of evidence:

Combine information from Step 3b: Why do the combination of indicators represent the OHWM?

i. Integrate the lines of evidence (relevance, strength, and reliability) of each indicator.

ii. Consider which indicators are high value indicators that co-occur along the stream reach. Which indicators are most relevant to identifying high flow elevations, which are most persistent across the landscape, and which are most persistent over time?

iii. Which indicators that are found above and below the location of the OHWM were helpful in identifying the elevation of the OHWM?

b. If there is more than one possible location, explain why, Include any relevant discussion on why specific indicators were not included in the final decision.

c. If needed, add additional site notes on page 2 of the data sheet under Step 5 or attach additional sketches and field observations to the data sheet.

d. Take photographs of indicators and attach an imagery log using page 2 of data sheet or another method of logging images.

i. Annotate images with descriptions of indicators.

Subject: Costco El Dorado Hills Oak Resources Technical Report

Dear Mr. Okuma:

This report presents the results of an updated survey of oak resources on the Costco El Dorado Hills Study Area (Study Area), assesses estimated impacts to oak woodland canopy and oak trees, identifies proposed mitigation measures, and provides recommendations for tree protection measures for trees to be preserved onsite.

BACKGROUND

Oak Resources Management Plan

The County of El Dorado (County) adopted the *El Dorado County Oak Resources Management Plan* (ORMP) on October 24, 2017, and the ORMP went into effect on November 24, 2017. The ORMP designates three classes of protected oak resources: oak woodlands that have at least 10 percent oak canopy; Heritage Trees, defined as native oaks with a total trunk diameter at breast height of 36 inches or greater; and individual oak trees, defined as native oak trees with a trunk diameter at breast height of six inches or greater that are not located in oak woodlands. An oak woodland removal permit is required prior to removal of oak trees that are part of an oak woodland, and an oak tree removal permit is required prior to removal of Heritage Trees and individual oak trees. Mitigation for impacts to oak woodlands is based on the total area impacted ranging from 1:1 mitigation for zero to 50 percent removal to 2:1 mitigation for more than 75 percent removal. Mitigation may be completed with a combination of the following options: acquisition of an off-site conservation easement, payment of in-lieu fees, or either on- or off-site replacement planting of up to 50 percent of the required mitigation area. Mitigation for removal of Heritage or individual oak trees requires on- or off-site replacement planting or payment of in-lieu fees at a 3:1 or 1:1 ratio, respectively, to the number of trunk inches removed. Any oak woodland preserved on site and all mitigation planting areas must be protected in perpetuity through deed restrictions or a conservation easement.

PROPOSED PROJECT

The approximately 36.94-acre Study Area is located northeast of the intersection of old Tong Road and Silva Valley Parkway, just north of U.S. Highway 50. The Study Area is bifurcated by Silva Valley Parkway. The 20.34-acre project site is contained within the Study Area. The proposed project would include the construction of a Costco Wholesale Warehouse and Costco Fuel Station including associated parking, utilities, and storm water management facilities, as well as multiple points of access and a new traffic signal on Silva Valley Parkway. The fuel station will be situated within a portion of the north site. The remainder of the north site is not currently proposed for development. A site and vicinity map is shown in Figure 1. Representative photos can be found in Attachment A.

METHODOLOGY

Oak trees within the Study Area were originally surveyed by International Society of Arboriculture (ISA)-Certified Arborist Meredith Branstad (WE-5727A) on December 16, 2013, and re-inspected on January 12, 2015. An additional extension of the Study Area in the northwest corner was inspected by ISA-Certified Arborist Zachary Neider (WE-11615A) on October 15, 2020. The entire study area and an additional extension of the Study Area in the western area were re-surveyed by ISA-Certified Arborist Dena Elimelech (WE-15122A) on January 9, 2025. A diameter tape or calipers were used to verify each trunk diameter at breast height (DBH), defined as 4.5 feet above grade. The measurement from the trunk to the end of the longest lateral limb was used as the drip line radius (DLR). A majority of the trees had already been tagged with a pre-printed aluminum tags, which corresponds to the numbering in Table 2 and Figure 2. Trees that were inaccessible to the arborist were left untagged and assigned an arbitrary number (1, 2, and 5).

The health and structural condition of all inventoried trees were rated according to Table 1, *Tree Rating Guidelines*. The health rating considers factors such as the size, color, and density of the foliage; the amount of deadwood within the canopy; bud viability; evidence of wound closure; and the presence or evidence of stress, disease, nutrient deficiency, and/or insect infestation. The structural rating reflects the trunk and branch configuration, canopy balance, the presence of included bark and other structural defects such as decay, and the potential for structural failure. In cases where conditions fall between the Good, Fair, and Poor ratings, intermediate ratings Fair-Good and Poor-Fair were used.

For trees within an oak woodland that were not classified as heritage trees, the oak canopy was mapped using field data and aerial photography.

Table 1
TREE RATING GUIDELINES

Rating	Tree Health
Good	There is an average or below-average amount of deadwood/dieback with respect to the tree's size and growing environment; leaf size, color, and density are typical for the species; buds are normal size, viable, abundant, and uniform throughout the canopy; current and past growth increments are generally average or better; any callusing is vigorous. This health rating indicates that there is very little, if any, evidence of stress, disease, nutrient deficiency, and/or insect infestation.

Rating	Tree Health
Fair	There is an above-average amount of deadwood/dieback with respect to the tree's size and growing environment; leaf size, color, and density may be below what is typically expected for the species; buds are normal size and viable, but slightly sparse throughout the canopy; current and past growth increments may be below average; tree may be slow to callus around old wounds. This health rating indicates that there is moderate evidence of stress, disease, nutrient deficiency, and/or insect infestation.
Poor	There is an extreme amount of deadwood/dieback with respect to the tree's size and growing environment; leaf size, color, and density are clearly compromised; very few viable buds are present throughout the canopy; current and past growth increments are meager; no evidence of callusing around old wounds. This health rating indicates that there is widespread evidence of stress, disease, nutrient deficiency, and/or insect infestation.
	Tree Structure and Form
Good	No wounds, cavities, decay, or indication of hollowness are evident in the root crown, trunk, or primary and secondary limbs; no anchor roots are exposed; no codominant branching or multiple trunk attachments are present; very little included bark at branch attachments exists; no dead primary or secondary limbs are present in canopy; there have been no major limb failures; limbs are not overburdened; branching structure is appropriate for species; any decay is limited to small dead branches/stubs. This structure rating represents a low potential for failure.
Fair	With respect to the size of the tree, small to moderate wounds, cavities, decay, and indication of hollowness may be evident in the root crown, trunk, and/or primary and secondary limbs; some anchor roots may be exposed; codominant branching or multiple trunk attachments may be present, but included bark does not exist or is not well developed; minor to moderate amounts of included bark at branch attachments may exist; there may be small to moderate amounts of large dead limbs in canopy, but there is no evidence of large limb failures; limbs may be slightly overburdened; branching structure and/or canopy balance may be moderately altered by the tree's growing environment. This structure rating represents a moderate potential for failure.
Poor	With respect to the size of the tree, significant wounds, cavities, decay, and/or indication of hollowness may be evident in the root crown, trunk, and/or primary and secondary limbs; anchor roots may be exposed and/or the tree may have lost anchorage; codominant branching or multiple trunk attachments may be present; significant amounts of included bark may exist in trunk and branch attachments; there may be significant amounts of large dead limbs in the canopy; there may be evidence of trunk or large limb failures; limbs may be severely overburdened; branching structure and/or canopy balance may be drastically altered by the tree's growing environment. This structure rating represents a high potential for failure.

EXISTING CONDITIONS

In total, there are 1.45 acres of valley oak woodland located in the Study Area (Figure 2). The majority of the valley oak woodland is located on the western boundary of the Study Area, west of Clarksville Crossing, on either side of a perennial stream. A 0.35-acre portion of valley oak woodland is located along a small perennial drainage bordering the eastern side of Clarksville Crossing. The understory is composed of willows (*Salix sp.*), broadleaf cattail (*Typha latifolia*), spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), and Himalayan blackberry (*Rubus armeniacus*).

Five heritage trees were mapped and assessed throughout the Study Area. The remainder of the oak resources within the Study Area is composed of protected valley oak woodland canopy and five individual oaks.

A total of 10 protected individual oak trees consisting of seven valley oaks (*Quercus lobata*), two interior live oaks (*Quercus wislizeni*), and one blue oak (*Quercus douglasii*) are present within the Study Area outside of oak woodland canopy. Five trees (5, 3378, 3385, 1390, and 3386) are Heritage Trees. Tree data is shown in Table 2 and tree locations are shown in Figure 2.

Table 2
TREE DATA

Tree #	Species	DBH (in)	DLR (ft)	Approximate Height (ft)	Health	Structure	Comments
1	Valley oak	9, 8	15	40	Fair	Fair	No tag, heavy blackberry, codominant stems.
2	Interior live oak	9, 8, 8	15	30	Fair	Fair	No tag, heavy blackberry, codominant stems.
5	Interior live oak	38.3	40	40	Poor	Poor	Heavy dieback, insect activity, dead branches, growing across the ephemeral drainage on the bank. Epicormic growth, dead wood on a main lead. Multi-stem at six feet.
3378	Valley oak	40.4	35	40	Good-Fair	Good-Fair	Some dieback, good structure, decent canopy. Galls, dead branches.
3384	Valley oak	13.5	15	20	Fair	Fair	Codominant stems at eight feet, epicormic growth, decent canopy.
3383	Valley oak	27.9	20	35	Fair	Fair	Uneven canopy, dieback, and snarled growth.
3385	Blue oak	50.1	40	60	Good-Fair	Fair	Lean, cavity on trunk with CODIT, decent canopy, and strong branch attachments.
1390	Valley oak	49.3	20	35	Poor	Poor	Potential nesting habitat, granary, epicormic growth, dead leads, and fallen old branches.
3386	Valley oak	44.2	40	40	Good-Fair	Good-Fair	Codominant stems at 15 feet, dieback, dead branches, old CODIT, nesting cavities present.
1393	Valley oak	25.2	20	50	Good-Fair	Good-Fair	Dieback, decent structure.

Note: Tree numbers in **bold** are Heritage Trees.
CODIT = compartmentalization of decay in trees

IMPACT ASSESSMENT

The proposed project will remove 0.35 acre of valley oak woodland, which is 24 percent of the total oak woodland in the Study Area. Additionally, five individual trees outside of oak woodland canopy, including four heritage trees, are planned for removal. A total of 292.6 trunk inches, composed of 108.6 inches of individual trees and 184 inches of Heritage Trees, will be removed. Estimated impacts are shown in Figure 3.

OAK RESOURCE PRESERVATION RECOMMENDATIONS

The oak canopy located west of Clarksville Crossing may or may not be impacted by construction. Mitigation will be required for any oak canopy removal in this area according to County requirements should it occur. As of the date of this document, no oak canopy impacts are known for the oak canopy to the west of Clarksville Crossing. Oaks to remain should be adequately protected by following the protection measures listed below. At present, none of the trees surveyed in the area east of Clarksville Crossing will be preserved. However, in the case that any trees are planned for preservation, the following protection measures should be integrated into the project construction documents as applicable to the preserved tree:

- Tree protection fencing, consisting of four-foot-tall, high-visibility plastic fencing, shall be placed around the perimeter of the tree protection zone (TPZ) (dripline radius plus one foot). The TPZ is the minimum distance for placing protective fencing. Tree protection fencing should be placed as far outside of the TPZ as possible. Two-foot square signs shall be placed along the fence denoting this as a Tree Protection Zone that shall not be moved until construction is complete. In cases where proposed work infringes on the TPZ, fencing shall be placed at edge of work.

- Whenever possible, fence multiple trees together in a single TPZ.

- Tree protection fencing shall not be moved without prior authorization from the County of El Dorado.

- No parking, portable toilets, dumping or storage of any construction materials, grading, excavation, trenching, or other infringement by workers or domesticated animals is allowed in the TPZ.

- No signs, ropes, cables, or any other item shall be attached to a protected tree, unless recommended by an ISA-Certified Arborist.

- Underground utilities should be avoided in the TPZ but, if necessary, shall be bored or drilled. If boring is impossible, all trenching will be done by hand under the supervision of an ISA-Certified Arborist.

- No cut or fill within the dripline of protected trees is permitted. If cut or fill within the dripline is unavoidable, any mitigation requirements shall be determined by the County of El Dorado.

- Pruning of living limbs or roots over two inches in diameter shall be done under the supervision of an ISA-Certified Arborist.

- All wood plant material less than six inches in diameter shall be mulched on site. Resulting mulch shall be spread in a layer four to six inches deep in the TPZ of preserved trees. Mulch shall not be placed touching the trunk of preserved trees.

- At the discretion of the Project Proponent and Project Arborist, indirectly impacted trees should be deep watered once per month in July, August, September, and October to a soil saturation depth of 16 to 18 inches.

- Appropriate fire prevention techniques shall be employed around all protected trees to be preserved. This includes cutting tall grass, removing flammable debris within the TPZ, and prohibiting the use of tools that may cause sparks, such as metal-bladed trimmers or mowers.

MITIGATION

As previously discussed, mitigation may be implemented through payment of in-lieu fees, on- or off-site planting, or acquisition of an off-site conservation easement. The project proponent is responsible for all oak resource mitigation requirements.

Currently, mitigation is expected to be fulfilled through the payment of in-lieu fees. Table 3 summarizes the mitigation fees based on the ORMP.

Oak tree #1390 does not require mitigation due to its poor health and structure. The valley oak has old fallen branches and dead major leads with no signs of new growth. Although the tree provides good nesting habitat and is a granary, it is dead/dying and does not need to be considered in the mitigation fees.

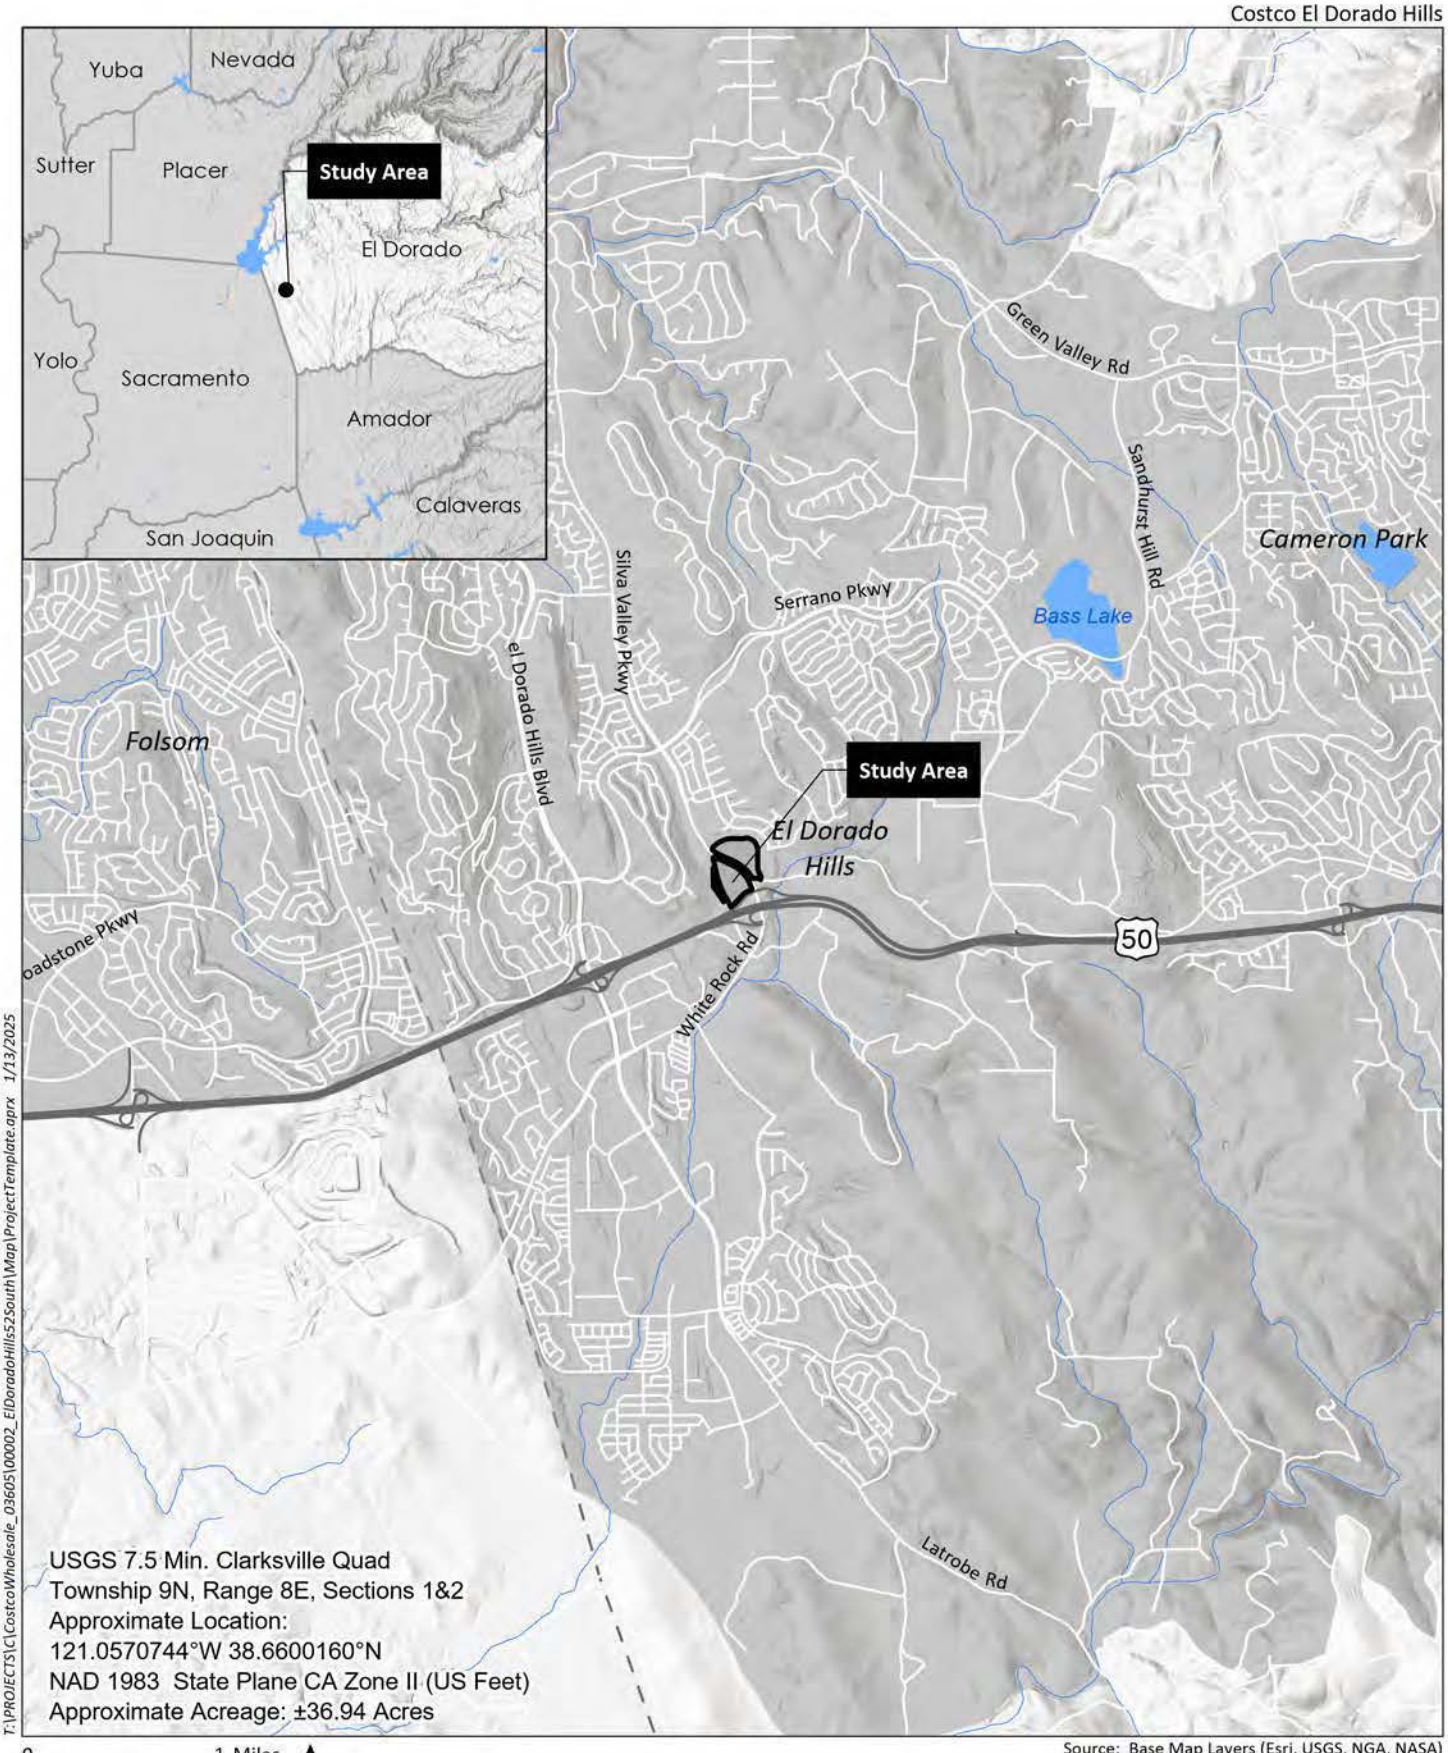
Table 3
MITIGATION FEES

Oak Resource	Impact	Mitigation Ratio	ORMP Fee	Total Fee
Oak Woodland	0.35 acre	1:1	$8,285/acre	$2,900
Individual Oak Trees	108.6 cumulative trunk inches	1:1	$153	$16,616
Heritage Trees	134.7 cumulative inches	3:1	$459 ($459 includes 3:1 ratio)	$61,827
			TOTAL	**$81,343**

If onsite planting will be used to mitigate for any portion of oak tree and oak canopy impacts, then a planting, maintenance, and monitoring plan and conservation easement or deed restriction should be prepared in accordance with the ORMP. Oak trees and canopy to remain onsite will be required to be placed in a conservation easement or deed restriction to prevent future impacts.

If you have any questions, please do not hesitate to contact me at (818) 568-8400 or email DenaE@helixepi.com regarding this report.

Sincerely,



Dena Elimelech
Biologist and ISA-Certified Arborist (WE-15122A)

VOC	volatile organic compound

1. INTRODUCTION

Ramboll Americas Engineering Solutions, Inc. (Ramboll) was retained to prepare a Technical Report on the air quality (AQ), greenhouse gas (GHG), and energy impacts for potential future development in the North Site Remainder Area ("Remainder Area Development"), in addition to the AQ, GHG, and Energy technical reports for the proposed El Dorado Hills (EDH) Costco Project located north of the Silva Valley Parkway/US 50 interchange in the El Dorado Hills community area of the unincorporated El Dorado County in California. For simplicity, the North Site Remainder Area and the proposed EDH Costco Project are collectively referred to hereafter as the proposed Project.

This Technical Report analyzes the AQ, GHG, and energy impacts of the potential Remainder Area Development at a program/plan level. Specifically, it describes the maximum development assumptions for the Remainder Area Development and estimates criteria air pollutant emissions, GHG emissions, and energy use associated with the construction and operations of this development. Additionally, this report evaluates the potential aggregate AQ, GHG, and energy impacts of the proposed Project (both the North Site Remainder Area and the EDH Costco Project).

1.1 Existing Conditions

The Project site is currently vacant grassland with scattered oak trees and seasonal drainage features. There are no permanent structures on the site. The southern edge of the property directly abuts the US 50 right-of-way, while the western boundary is adjacent to Clarksville Crossing. An approximate 7.75-acre portion of the northern site is reserved for a planned future extension of Country Club Drive, which is not part of the proposed Project.

Surrounding land uses include:

- North: Single-family residential uses and Oak Meadow Elementary School
- East: Vacant land, Tong Road, and single-family residential uses
- South: U.S. Highway 50 and Tong Road
- West: Clarksville Crossing roadway, open space, and undeveloped land

1.2 Potential Development in the North Site Remainder Area

An approximately 13.79-acre out-parcel on the North Site would remain undeveloped at this time (North Site Remainder Area). The EDH Costco Project proposes no development for the North Site Remainder Area. However, future development of the North Site Remainder Area would be made more reasonably foreseeable by the proposed annexation of the entire North Site into the El Dorado Irrigation District and the El Dorado Hills Fire Department service areas. Since such annexations are assumed to facilitate possible future development of the North Site Remainder Area, even though there is not even a conceptual or contemplated plan for build out of that land, this analysis conservatively assumes that such land would be developed consistent with the General Plan and zoning designations and density. The assumed potential commercial development of the North Site Remainder Area is approximately 138,000 square feet and 316 employees. The future extension of Country Club Drive (County Capital Improvement Project No. 36105008), when constructed by the County, would occupy a portion of the North Site near its northern edge, though the future extension is an independent project proposed by, and to be undertaken by, the County and is not analyzed as a part of the proposed Project.

2. SIGNIFICANCE THRESHOLDS

The Remainder Area Development would be adjacent to the EDH Costco Project and is subject to the identical regulatory settings and significance thresholds previously described for the EDH Costco Project in the technical reports.[1,2,3] The analysis provided in this technical memorandum evaluates whether the Project would result in any potentially significant impacts regarding the following questions:

Threshold AQ-1. Would the Project conflict with or obstruct implementation of the applicable air quality plan?

Threshold AQ-2. Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard?

Threshold AQ-3. Would the Project expose sensitive receptors to substantial pollutant concentrations?

Threshold AQ-4. Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

Threshold GHG-1. Would the Project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

Threshold GHG-2. Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

Threshold ENE-1. Would the Project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation?

Threshold ENE-2. Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

2.1 Approach to Significance

As described in Section 3.2 of the EDH Costco Project Air Quality Technical Report, the El Dorado County Air Quality Management District (EDCAQMD) has established significance thresholds to assess the impacts of project-related construction and operational emissions, in its California Environmental Quality Act (CEQA) Guide. Table 3-1 in the EDH Costco Project Air Quality Technical Report shows the quantitative mass daily thresholds for construction and operation as adopted by the EDCAQMD reactive organic gases (ROG) and nitrogen oxides (NO_X) emissions. The analysis summarized in this report estimates program/plan level construction and operational mass emissions for the proposed Project and compares the emissions to these significance thresholds.

EDCAQMD has also established significance thresholds for other criteria air pollutants (CAPs) including carbon monoxide (CO), particulate matter less than 10 microns in diameter (PM_{10}), sulfur dioxide (SO_2), nitrogen dioxide, sulfates, lead, hydrogen sulfide (H_2S), and visibility-reducing particles. Project-related emissions of these pollutants are considered to

[1] Ramboll. 2025. EDH Costco Project Air Quality Technical Report.

[2] Ramboll. 2025. EDH Costco Project Greenhouse Gas Technical Report.

[3] Ramboll. 2025. EDH Costco Project Energy Technical Report.

have significant impacts if these emissions will cause or contribute to a violation of the applicable national or state ambient air quality standard. The EDCAQMD provides screening techniques to evaluate if a project's CAP emissions would have a less-than-significant impact in Chapters 4 and 6 of the EDCAQMD CEQA Guide.[4] This analysis in this report estimates the program/plan level construction and operational mass emissions of CO, PM_{10}, sulfur oxides (SO_X), and NO_X for the proposed Project and evaluates the significance of their impacts using these screening techniques established in the EDCAQMD CEQA Guide.[5]

The EDCAQMD has also established significance thresholds to assess health risk impacts of TACs from project-related emission sources on nearby sensitive receptors including residents and other human populations, which are applicable to the program-level impact analysis in this report.[6] These include a maximum incremental cancer risk of one-in-a-million (or ten-in-a-million if best available control technology for toxics (T-BACT) is applied), and incremental chronic and acute hazard indices (HIs) of 1. The analysis summarized in this report evaluates the human health risk impacts from on-site construction and operational emissions against these significance thresholds established by EDCAQMD.

This Technical Report also performs a qualitative assessment of odors from the proposed Project to evaluate if they would have the potential to generate odorous emissions that would meet the statutory definition for nuisance, in accordance with the EDCAQMD CEQA Guide.[7]

This report, relative to Threshold AQ-1, evaluates whether the proposed Project would conflict with applicable plans related to emissions, including the regional air quality attainment plans. This report, relative to Threshold AQ-2, quantifies the proposed Project's emissions during construction and operations and compares those results to the applicable EDCAQMD thresholds. Relative to Threshold AQ-3, this report includes a CO hotspots analysis and a semi-quantitative assessment of the potential health risk impacts to sensitive receptors. This report, relative to Threshold AQ-4, evaluates the potential for odor-generating activities from the proposed Project.

As discussed in Section 3.2 of the EDH Costco Greenhouse Gas Technical Report, El Dorado County provides some basic information on climate change including an overview of GHG regulations and local, state, and national efforts to address climate change; however, it has not established a quantitative or qualitative guidance to evaluate GHG emission impacts of development projects under CEQA.[8] Additionally, EDCAQMD has also not set quantitative GHG significance thresholds. In the absence of a quantitative GHG threshold from El Dorado County and EDCAQMD, this Technical Report assessed significance of GHG impacts for Threshold GHG-1 against the Placer County Air Pollution Control District (PCAPCD) GHG significance thresholds (Table 3-1 of the EDH Costco Greenhouse Gas Technical Report), in consultation with EDCAQMD and El Dorado County.

[4] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

[6] Ibid.

[7] Ibid.

[8] Ibid.

PCAPCD's GHG significance thresholds are reasonable to assess significance in the absence of a quantitative threshold from EDCAQMD because Placer County is similar to El Dorado County demographically, geographically, and meteorologically. Both Placer County and El Dorado County have similar land use patterns (i.e., they are both heavily made up of rural and suburban areas), with similar rates of population growth. Additionally, both counties have similar terrain and lie within the same air basin. Because of this, PCAPCD's quantitative GHG thresholds were used to assess significance against the Project relative to Threshold GHG-1.

Relative to Threshold GHG-2, this report evaluates whether the Project would conflict with the 2022 Scoping Plan Update,[9] Sacramento Area Council of Governments' (SACOG's) 2020 future Metropolitan Transportation Plan & Sustainable Communities Strategy (MTP/SCS),[10] and the El Dorado County Regional Transportation Plan (RTP) 2020-2040.[11]

This report evaluates the proposed Project's energy consumption against the six categories of potential energy-related environmental impacts from Appendix F of the CEQA Guidelines:

1. The Project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the Project including construction, operation, maintenance and/or removal. If appropriate the energy intensiveness of materials may be discussed.
2. The effects of the Project on local and regional energy supplies and on requirements for additional capacity.
3. The effects of the Project on peak and base period demands for electricity and other forms of energy.
4. The degree to which the Project complies with existing energy standards.
5. The effects of the Project on energy resources.
6. The Project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

This report, relative to Threshold ENE-1, assesses the proposed Project's electricity, natural gas, and fossil fuel consumption during construction and operation by way of the six questions above. This report, relative to Threshold ENE-2, evaluates whether the proposed Project would conflict with applicable plans related to renewable energy and energy efficiency.

3. EMISSIONS INVENTORIES AND ENERGY PROJECTIONS

This section provides a brief description of the methodology that Ramboll used to develop CAP, GHG, and energy inventories associated with the Remainder Area Development, which include one-time emissions from construction and long-term operational emissions. This section also presents the CAP, GHG, and energy inventories of the North Site Remainder Area and the proposed Project.

The analysis in this report utilized the California Emissions Estimator Model (CalEEMod) version 2022.1 methodology to quantify CAP and GHG emissions for the Remainder Area Development (**Appendix A**). This report presents assumptions only when they differ from the analysis for the EDH Costco Project, detailed in the EDH Costco Project's technical reports. Unless otherwise stated, CalEEMod default parameters were used to estimate the emission inventories.

As presented in **Section 1**, the Remainder Area Development would, at a maximum, develop 138,000 square feet of commercial/retail land uses, categorized as regional shopping center in CalEEMod. The remaining area of the parcel is conservatively assumed to be developed into asphalt-paved parking lots, totaling approximately 10.6 acres. The land use assumptions used to generate CalEEMod default construction and operational activities are included in **Appendix A**.

Construction of the North Site Remainder Area is assumed to start as early as May 2027, immediately after the EDH Costco Project construction concludes. Operation of the North Site Remainder Area is assumed to start as soon as the construction concludes.

3.1 Construction Emission Inventories and Energy Projection

Construction schedule, off-road equipment activities and on-road vehicle trip assumptions are provided in **Appendix B**. Because the material movement volumes required to construct in the Remainder Area are currently unknown, they are conservatively assumed to be the same as EDH Costco Project's Construction Scenario 2.

Criteria Air Pollutant Inventory

Average daily construction emissions for each quarter of the North Site Remainder Area construction are calculated based on CalEEMod outputs and are included in **Appendix C**.

Table 3-1 summarizes the average daily criteria pollutant emissions from construction of the North Site Remainder Area as compared to the applicable EDCAQMD thresholds. As shown in this table, the average daily unmitigated emissions of ROG and NO_X from the construction of the Remainder Area Development are below EDCAQMD's thresholds for construction. While EDCAQMD has not adopted mass daily numerical thresholds for other CAP emissions from construction, the EDCAQMD CEQA Guide[12] states that if ROG and NO_X exhaust emissions from construction are deemed not significant, then exhaust emissions of CO and PM_{10} may also be deemed not significant. Hence, air quality impacts of all CAPs (ROG, NO_X, CO, and

[12] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

PM_{10}) from the exhaust of construction equipment and on-road vehicles associated with the construction of the North Site Remainder Area are less than significant.

The EDCAQMD CEQA Guide[13] states that fugitive dust PM_{10} emissions may be assumed to be not significant, if the project complies with EDCAQMD Rule 223 and Rule 223-1 for fugitive dust control by implementing control measures that will prevent visible dust beyond the project property lines. The proposed Project will comply with these fugitive dust control rules. Hence, the air quality impacts of fugitive dust emissions from the construction North Site Remainder Area are less than significant.

North Site Remainder Area construction activities are expected to generate negligible emissions of SO_2, sulfates, lead, and H_2S. Therefore, the air quality impacts of these emissions from the construction of the North Site Remainder Area are also less than significant.

Although EDCAQMD has established separate daily mass significance thresholds for short-term construction and long-term operational phases of development projects, this analysis conservatively compares the combined average daily emissions from the construction of the Remainder Area land and the EDH Costco Project operation to EDCAQMD's mass daily construction thresholds. As shown in **Table 3-2**, these combined unmitigated average daily emissions exceed EDCAQMD's construction threshold for ROG but remain below the threshold for NO_X.

Mitigated Criteria Air Pollutant Inventory

In order to ensure that the combined average daily ROG emissions from the construction of the Remainder Area Development and the EDH Costco Project operation are below the EDCAQMD's mass daily construction thresholds, the following mitigation measure will be implemented during the construction of the Remainder Area.

- **Mitigation Measure 3.2-2: Architectural Coating Volatile Organic Compound (VOC) Limits for Development of the North Site Remainder Area**

  Future building construction of the North Site Remainder Area shall only use architectural coatings with a VOC content not exceeding 100 grams per liter during construction for all interior and exterior spaces. This requirement shall be included in plans submitted for review by the County prior to the issuance of building permits.

Additionally, the following mitigation measures that will be implemented during the construction of the EDH Costco Project to address health risk impacts and asbestos dust will also apply to the construction of the Remainder Area Development:

- **Mitigation Measure 3.2-4a: Apply Tier-4 Emission Standards to Diesel-Powered Off-Road Equipment**

  Construction equipment greater than 50 horsepower (hp) used at the site shall meet Environmental Protection Agency (EPA) Tier 4 Final emission standards for PM_{10} and particulate matter less than 2.5 microns in diameter ($PM_{2.5}$), if available. If Tier 4 Final equipment is not available, all construction equipment larger than 50 hp used at the site shall meet EPA emission standards for Tier 3 engines and include particulate matter emissions control equivalent to California Air Resources Board (CARB) Level 3 verifiable

[13] Ibid.

diesel emission control devices. This requirement shall apply to the construction of the Costco project and construction of the North Site Remainder Area.

- **Mitigation Measure 3.2-4b: Implement Asbestos Dust Mitigation Consistent with EDCAQMD Rule 223-1**

  An Asbestos Dust Mitigation Plan shall be prepared and submitted to the EDCAQMD and the County for review and approval by EDCAQMD for implementation during construction on the Costco project, future development of the North Site Remainder Area, and for off-site roadway improvements (if the presence of naturally occurring asbestos (NOA) is confirmed). The Asbestos Dust Mitigation Plan shall comply with the El Dorado County Code Chapter 8.44 (Asbestos and Dust Protection) and EDCAQMD Rule 223-2, which provides performance standards for ensuring that adverse impacts do not result from asbestos dust during construction.

Table 3-3 summarizes the average daily mitigated criteria pollutant emissions from construction of the North Site Remainder Area as compared to the applicable EDCAQMD thresholds. As shown in this table, the average daily unmitigated emissions of ROG and NO_X from the construction of the Remainder Area Development are below EDCAQMD's thresholds for construction. While EDCAQMD has not adopted mass daily numerical thresholds for other CAP emissions from construction, the EDCAQMD CEQA Guide[14] states that if ROG and NO_X exhaust emissions from construction are deemed not significant, then exhaust emissions of CO and PM_{10} may also be deemed not significant. Hence, air quality impacts of all CAPs (ROG, NO_X, CO, and PM_{10}) from the exhaust of construction equipment and on-road vehicles associated with the construction of the North Site Remainder Area are less than significant.

The EDCAQMD CEQA Guide[15] states that fugitive dust PM_{10} emissions may be assumed to be not significant, if the project complies with EDCAQMD Rule 223 and Rule 223-1 for fugitive dust control by implementing control measures that will prevent visible dust beyond the project property lines. The proposed Project will comply with these fugitive dust control rules. Hence, the air quality impacts of fugitive dust emissions from the construction North Site Remainder Area are less than significant.

North Site Remainder Area construction activities are expected to generate negligible emissions of SO_2, sulfates, lead, and H_2S. Therefore, the air quality impacts of these emissions from the construction of the North Site Remainder Area are also less than significant.

Although EDCAQMD has established separate daily mass significance thresholds for short-term construction and long-term operational phases of development projects, this analysis conservatively compares the combined average daily mitigated emissions from the construction of the Remainder Area land and the EDH Costco Project operation to EDCAQMD's mass daily construction thresholds. As shown in **Table 3-4,** with the inclusion of **Mitigation Measure 3.2-2**, which involves using low VOC paints during construction of the Remainder Area land uses, the combined average daily construction and operation emissions are below EDCAQMD's construction mass daily significance thresholds for both ROG and NO_X.

[14] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

[15] Ibid.

Greenhouse Gas Emissions Inventory

GHG emissions associated with the construction of the North Site Remainder Area are estimated using CalEEMod (**Appendix A**) and summarized in **Table 3-5**. As shown in **Table 3-5**, the annual GHG emissions associated with the construction of the North Site Remainder Area are less than the PCAPCD's GHG significance threshold for construction.[16]

Energy Projection

Energy consumption associated with the construction of the North Site Remainder Area are estimated using methodologies described in Section 4.1 of the EDH Costco Energy Technical Report and summarized in **Table 3-6**. Additional details on the fuel consumption of off-road construction equipment and on-road vehicle use during the North Site Remainder Area construction are provided in **Appendix D**.

3.2 Operational Emission Inventories and Energy Projection

A summary of the key assumptions associated with the operation of the North Site Remainder Area including mobile source activity, County-specific consumer product emission factors, and GHG emission factors for electricity are provided in **Appendix E**. These assumptions were incorporated into the CalEEMod model run in **Appendix A**.

Criteria Air Pollutant Inventory

Table 3-7 summarizes the maximum daily criteria air pollutant emissions associated with the operation of the North Site Remainder Area and the EDH Costco Project. As shown in this table, the maximum daily ROG and NO_X emissions associated with proposed Project (North Site Remainder Area and EDH Costco Project) operation are below EDCAQMD's mass daily significance thresholds for operation.

While EDCAQMD has not adopted mass daily numerical thresholds for other CAP emissions, it considers a project to have a significant impact on air quality if it will cause or contribute significantly to a violation of the National Ambient Air Quality Standards or California Ambient Air Quality Standards for CO, PM_{10}, SO_2, sulfates, lead, H_2S.

The EDCAQMD CEQA Guide[17] states that development projects, with land use types similar to the proposed Project, that are deemed less than significant for ROG and NO_X emissions based on land use size screening criteria, can also be considered less than significant for CO emissions. Using this screening approach, we can consider the air quality impacts of CO emissions from the proposed Project operation to be less than significant because the proposed Project's ROG and NO_X emissions are less than EDCAQMD's mass daily significance thresholds. Hence, the air quality impacts of operational CO emissions from the proposed Project are less than significant.

The EDCAQMD CEQA Guide[18] states that PM_{10} emissions from land development projects primarily associated with gasoline-powered vehicles may be assumed to be insignificant if the projects do not generate heavy-duty diesel vehicle trips in greater proportion than the

[16] PCAPCD CEQA Handbook. 2017. Chapter 2 Thresholds of Significance. Available at: https://www.placerair.org/DocumentCenter/View/2047/Chapter-2-Thresholds-of-Significance-PDF. Accessed: October 2025.

[17] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

[18] Ibid.

general mix of such trips in public roadways. The proposed Project is not expected to generate heavy-duty diesel vehicle trips in greater proportion than the general mix of such trips in public roadways in the vicinity of the Project site and the air quality impacts of operational PM_{10} emissions from the proposed Project are less than significant.[19]

The EDCAQMD CEQA Guide[20] states that emissions associated with project operations that are less than 10 pounds per day of a pollutant may be presumed to have impacts that are not significant for that pollutant. Since SO_X emissions associated with the proposed Project operation are less than 10 pounds per day (**Table 3-7**), emissions of these pollutants are less than significant.

The proposed Project is a development project that is not a significant source of lead, sulfates, and H_2S. Hence, the emissions of these pollutants are less than significant.

Finally, according to the EDCAQMD CEQA Guide,[21] visibility impacts from development projects can be considered less than significant. Therefore, the proposed Project impacts on visibility are less then significant.

Greenhouse Gas Emissions Inventory

Table 3-8 summarizes the annual operational GHG emissions associated with the operation of the proposed Project (3,954 metric tonnes of carbon dioxide equivalent emissions per year (MT CO_2e per year) for the North Site Remainder Area and the EDH Costco Project). Because the exact energy efficiency and sustainability features of the North Site Remainder Area are not known at the time of preparation of this report, GHG reduction features of EDH Costco Project were not assumed for the Remainder Area Development.

PCAPCD CEQA Guidelines[22] have a three-tiered approach for assessing GHG emissions from land use projects. For projects with annual operational GHG emissions between 1,100 and 10,000 MT CO_2e per year, PCAPCD recommends applying its GHG Efficiency Matrix to determine significance.

As shown in **Table 3-8**, the proposed Project's estimated annual operational emissions fall within this range. Based on a total building square footage of 303,200 square feet (138,000 square feet for the North Site Remainder Area and 165,200 square feet for the EDH Costco Project), the calculated GHG efficiency for the proposed Project is 13.04 MT CO_2e per 1,000 square feet.[23] This is below the applicable conservative threshold of 26.5 MT CO_2e per 1,000 square feet for nonresidential projects located in urban areas, as defined by PCAPCD.

[19] As noted in Section 4.3.6 of the Air Quality Technical Report, the heavy-duty diesel vehicle trips generated by the EDH Costco Project are less than 0.25% of the total Project trips. Additionally, for purposes of this analysis the heavy-duty diesel vehicle trips generated by the Remainder Area as assumed to be similar to the general fleet mix in El Dorado County, based on the default fleet mix in CalEEMod. Hence, the fraction of heavy-duty diesel vehicle trips generated by the proposed Project (EDH Costco and North Site Remainder Area) will be lower than the approximately 6% of heavy-duty diesel trucks operating on the roads in El Dorado County.

[20] Ibid.

[21] Ibid.

[22] PCAPCD CEQA Handbook. 2017. Chapter 2 Thresholds of Significance. Available at: https://www.placerair.org/DocumentCenter/View/2047/Chapter-2-Thresholds-of-Significance-PDF. Accessed: October 2025.

[23] Note, the Proposed Project GHG efficiency would be 16.94 MT CO_2e per 1,000 square feet if the analysis accounted for the greenhouse gas emission benefits associated with only the mandatory electric vehicle charging requirements (1,097 kW total power) in the 2025 California Green Building Standards Code. This value is also below the applicable conservative threshold of 26.5 MT CO_2e per 1,000 square feet for non-residential projects located in urban areas, as defined by PCAPCD.

Therefore, the proposed Project's operational GHG emissions are considered to be less than significant.

Energy Projection

Energy consumption associated with the operation of the North Site Remainder Area are estimated using methodologies described in Section 4.2 of the EDH Costco Energy Technical Report and summarized in **Table 3-9**. Additional details on the operational electricity, natural gas, diesel and gasoline consumption are provided in **Appendix F**.

4. PROGRAM-LEVEL AIR QUALITY IMPACT ANALYSIS

This section assesses the significance of the proposed Project's air pollutant emissions for purposes of CEQA.

4.1 Threshold AQ-1: Would the Project conflict with or obstruct implementation of the applicable air quality plan?

According to the EDCAQMD CEQA Guide,[24] development projects in the Mountain Counties Air Basin portion of the County are considered consistent with the applicable air quality plan if:

1. The Project does not require a change in the existing land use designation (e.g., a general plan amendment or rezone), and projected emissions of ROG and NO_X from the Project are equal or less than the emissions anticipated for the site if developed under the existing land use designation;
2. The Project does not exceed the "project alone" significance criteria;
3. The lead agency for the Project requires the Project to implement any applicable emission reduction measures contained in and/or derived from the air quality attainment plan; and
4. The Project complies with all applicable district rules and regulations.

El Dorado County's General Plan designates the Project site as Commercial (C). Zoning includes Commercial Regional–Planned Development (CR-PD), with smaller areas of Commercial Limited and Transportation Corridor. Once operational, the proposed Project would be a regional commercial center, which is consistent with the existing designation of the County's General Plan and zoning. Hence, the anticipated growth associated with the Project is generally accounted for in the 2023 Ozone Plan[25] and would be accounted for in forthcoming attainment plans.

As described in **Section 3.1** and **Section 3.2**, the air quality impacts of CAPs associated with the proposed Project construction and operation are less than significant. Therefore, the proposed Project does not exceed the "project alone" significance criteria.

The applicable air quality attainment plans for the Project area are the Sacramento Regional 8-hour Ozone Attainment and Reasonable Further Progress Plan[26] and $PM_{2.5}$ Maintenance Plan and Redesignation Request.[27] As such the proposed Project would not result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under these plans (see **Section 4.2** below for further details). Hence, the

[24] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

[25] Sacramento Region Air Quality Plans. Available at: https://ww2.arb.ca.gov/our-work/programs/california-state-implementation-plans/nonattainment-area-plans/sacramento-region. Accessed: October 2025.

[26] Ibid.

[27] EDCAQMD, Placer County Air Pollution Control District, SMAQMD, and Yolo-Solano Air Quality Management District. $PM_{2.5}$ Implementation/Maintenance Plan and Redesignation Request for Sacramento $PM_{2.5}$ Nonattainment Area. October 24. Available at: http://www.airquality.org/ProgramCoordination/Documents/PM2.5%20Imp%20and%20Redesignation%202013.pdf. Accessed: October 2025.

proposed Project is not required to implement any additional mitigation measures contained in these plans.

As described in **Section 3.1** of this report and Sections 4.2.3 and 5.1.1 of the EDH Costco Project Air Quality Technical Report the proposed Project would comply with EDCAQMD Rules 223-1 and 223-2 for fugitive dust control[28] and asbestos hazard mitigation[29] during construction. The proposed Project is located in an area where NOA could be present.[30] Although the proposed Project's Geotechnical Study[31] concluded that the potential for NOA to be encountered at levels at or exceeding regulatory threshold level is considered low, the proposed Project would implement asbestos dust mitigation measures consistent with EDCAQMD Rule 223-1 through the implementation of **Mitigation Measure 3.2-4b**. The proposed Project would also comply with all other applicable EDCAQMD rules.

Therefore, the proposed Project would not conflict with or obstruct implementation of the applicable air quality plans for the Project region.

4.2 Threshold AQ-2: Would the Project result in a cumulatively considerable net increase of any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard?

As discussed in the EDH Costco Project Air Quality Technical Report, the Project region is currently designated as non-attainment for the State 1-hour ozone (O_3) standard, the federal and the State 8-hour O_3 standard, the State PM_{10} standards, and the federal 24-hour $PM_{2.5}$ standard.

The two primary precursors for O_3 formation are ROG and NO_X. Table 4-12 of the EDH Costco Air Quality Report, and **Table 3-1** and **Table 3-7** of this report present the average daily and maximum daily ROG and NO_X emissions associated with the proposed Project construction and operation. Emissions of these O_3 precursors (ROG and NO_X) are below the EDCAQMD mass daily significance thresholds. Additionally, as described in Section 4.2.6 of the EDH Costco Air Quality Report and **Section 3** of this report, impacts of particulate matter emissions from the proposed Project construction and operation are less than significant. Hence, the proposed Project would not result in a cumulatively considerable net increase in any criteria pollutant for which the Project region is non-attainment under an applicable federal or state ambient air quality standard.

[31] Kleinfelder, 2024. Geotechnical Study, Proposed Costco Fuel Facility, Silva Valley Parkway, El Dorado Hills, California, CW# 18-0487. December 2024.

4.3 Threshold AQ-3: Would the Project expose sensitive receptors to substantial pollutant concentrations?

4.3.1 CO Hotspots

As discussed in Section 6.2 of the AQ Technical Report, according to the PCAPCD guidance, the CO emissions from a proposed Project's operations would be less than significant if CO emissions from vehicle operations are less than 550 pounds per day (lbs/day). As shown in **Table 3-7**, the CO emissions from mobile sources associated with the proposed Project are less than 550 lbs/day. Thus, the increase in CO emissions from the project-related increased traffic volumes at affected intersections and the on-site gasoline fueling station are less than significant and the proposed Project would not expose sensitive receptors to substantial concentrations of localized CO.

4.3.2 Health Risk Thresholds

As described in Section 7.3.1 of the EDH Costco Project Air Quality Technical Report, the cancer risk, non-cancer chronic and acute HIs at the maximally impacted residential and other sensitive receptors associated with the mitigated toxic air contaminant (TAC) emissions from the EDH Costco Project construction and operation are below EDCAQMD significance thresholds. Specifically, the maximum incremental cancer risk, non-cancer chronic and acute HIs for the Costco EDH Project are estimated to be 4.13 in a million, 0.02, and 0.50 respectively (Refer to Table 5-5 in the EDH Costco Project Air Quality Technical Report).

The primary sources of TAC emissions associated with the North Site Remainder Parcel are diesel particulate matter (DPM) emissions from construction equipment, construction trucks, and operational trucks. The construction equipment, construction truck activity, and operational truck activity associated with the development of the North Site Remainder Parcel are generally expected to be similar/lower than that of the EDH Costco Project as maximum square footage of the of commercial/retail land uses that would be developed on the North Site Remainder Area (138,000 square feet) is lower than the square footage of the warehouse that would be developed by the EDH Costco Project (165,000 square foot). Hence, the DPM emissions from the North Site Remainder Parcel and its associated cancer and chronic impacts will be similar or less than that associated with the EDH Costco Project. As a result, the maximum cancer risk and chronic HI associated with the proposed Project (North Site Remainder Area and EDH Costco Project) are expected to be less than 8.5 in a million and 0.05 respectively which are below EDCAQMD significance thresholds.

Additionally, since the North Site Remainder Parcel is expected to be developed as general retail land uses, we do not expect it to be a significant source of TACs that have acute impacts. Therefore, the acute HI for the proposed Project (North Site Remainder Area and EDH Costco Project) is expected to be similar to that of the EDH Costco Project which is below EDCAQMD significance threshold.

Therefore, the Project is not expected to expose sensitive receptors to substantial TAC concentrations.

4.4 Threshold AQ-4: Would the Project result in other emissions (such as those leading to odors) adversely affecting a substantial number of people?

According to the EDCAQMD CEQA Guide,[32] common types of facilities known to produce odors include wastewater treatment plants, landfills and composting facilities, petroleum refineries, manufacturing plants such as asphalt batch plants and chemical/fiberglass manufacturing, painting and coating operations, food processing plants, rendering plants, and coffee roasters. The proposed Project would not include any of these land uses that have been identified by the EDCAQMD as being associated with odor generation and thus would not result in odors adversely affecting a substantial number of people. In addition, the proposed Project does not propose to locate any sensitive receptors near an existing source of objectional odors.

4.4.1 Construction Odors

Construction activities associated with potential odor include equipment exhaust (i.e., from off-road construction equipment), paving, and architectural coating. There are no unusual Project characteristics or construction processes that would require the use of equipment that would be more fuel intensive than is used for comparable construction activities, nor equipment that would not conform to current emission standards. It is expected that these impacts would be short-term in duration and typical of comparable activities, therefore the impacts would not adversely affect a substantial number of people and would be less than significant.

4.4.2 Operational Odors

As discussed above, the proposed Project is a commercial and retail development and does not propose any odor-generating facilities identified by the EDCAQMD. However, the proposed Project does include a gasoline fueling station. During the operation of the Project, VOCs released at the gasoline station due to refueling, spillage, and hose permeation would be controlled to minimize odors (i.e., nozzles equipped with Phase II Enhanced Vapor Recovery systems). Therefore, odor impact from the gasoline fueling station would not affect a substantial number of people and would be less than significant.

There may be some potential for other small-scale, localized odor issues to emerge around some of the proposed Project sources, such as solid waste collection, wastewater or stormwater collection/conveyance, or food preparation. However, these localized short-term odors would not affect a substantial number of people. Therefore, the proposed Project's operational odor impact is considered less than significant.

[32] EDCAQMD. 2002. Guide to Air Quality Assessment. February. Available at: https://www.eldoradocounty.ca.gov/files/assets/county/v/1/documents/government/air-quality/guide-to-air-quality-assessment.pdf. Accessed: October 2025.

5. PROGRAM-LEVEL GREENHOUSE GAS EMISSIONS IMPACT ANALYSIS

This section discusses the assessment of the proposed Project's GHG emissions against the CEQA significance thresholds outlined in **Section 2**.

5.1 Threshold GHG-1: Would the Project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

As noted in **Section 2.1**, in the absence of a quantitative GHG threshold from El Dorado County and EDCAQMD, this Technical Report assesses significance of the proposed Project's GHG impacts for Threshold 1 against the PCAPCD's GHG significance thresholds.

Total GHG emissions for each year of the proposed Project construction are summarized in Table 4-13 of the EDH Costco Project Greenhouse Gas Technical Report and **Table 3-5** of this report. As shown in these tables, the annual GHG emissions associated with the construction of the proposed Project (1,708 MT CO_2e in 2026, 1,866 MT CO_2e in 2027, and 197 MT CO_2e in 2028) are less than the PCAPCD's bright-line GHG significance threshold of 10,000 MT CO_2e/year for construction.

The proposed Project's annual operational GHG emissions were estimated to be 3,954 MT CO_2e per year (**Table 3-8**). These emissions are between PCAPCD's de minimis GHG emissions level (1,100 MT CO_2e/yr) and bright-line GHG significance threshold (10,000 MT CO_2e/yr) for project operation. Therefore, to evaluate the GHG impacts we estimated the proposed Project's efficiency metric in accordance with the PCAPCD's Air Quality Handbook.[33] This calculated efficiency metric (13.04 MT CO_2e per 1,000 square feet) shown in **Table 3-8**, is less than the lower of the two applicable efficiency matrix thresholds in PCAPCD's Air Quality Handbook for the operational phase of land use projects:

1. 26.5 MT CO2e/1,000 square feet for a project in an urban land use setting; and
2. 27.3 MT CO2e/1,000 square feet for a project in rural land use setting.

Therefore, the GHG emissions associated with the construction and operation of the proposed Project would not have a significant impact on the environment.

5.2 Threshold GHG-2: Would the Project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

As noted in **Section 2.1**, this Technical Report assesses the significance of the proposed Project's GHG impacts for Threshold 2 based on whether it would conflict with the 2022 Scoping Plan Update,[34] SACOG's 2020 MTP/SCS,[35] and El Dorado County RTP 2020-2040.[36]

[35] SACOG. 2020. 2020 SACOG MTP/SCS. Available at: https://www.sacog.org/home/showpublisheddocument/76/638212804736270000. Accessed: October 2025.

[36] El Dorado County Transportation Commission. 2020. El Dorado County Regional Transportation Plan 2020-2040. November 5. Available at: https://www.edctc.org/files/2859e4e3f/RTP+2040.pdf. Accessed: October 2025.

5.2.1 2022 Scoping Plan Update

The 2022 Scoping Plan Update has a table of priority GHG reduction strategies that can be utilized by local governments. The three main priority areas addressed in this table are "Transportation Electrification", "vehicle miles travelled (VMT) Reduction", and "Building Decarbonization".[37] These measures represent the core strategies that local jurisdictions in California can implement to reduce GHGs in alignment with State goals.

The proposed Project would not conflict with the implementation of the 2022 Scoping Plan Update and Statewide Emission Reduction Targets and includes the several features and mitigation measures that support the three main priority areas for GHG reduction as described below.

While project-level design features and details are not available for the potential developments in the North Site Remainder Area at the time of preparation of this program-level analysis, the North Site Remainder Area would introduce retail/commercial land uses that are consistent with the zoning designation in a highway hub. Hence, the proposed Project, i.e., the North Site Remainder Area and the Costco EDH Project, would create new employment opportunities. Additionally, the Project site is an infill development located near an El Dorado Transit bus route (50 Express) and bus stop (El Dorado Transit Park & Ride), therefore placing jobs that are accessible via public transit. The El Dorado bus route connects to the larger Sacramento Metropolitan transit network and encourages use of local transit and rail to commute to the proposed Project. Furthermore, the proposed Project is located adjacent to homes, therefore the proposed Project would provide retail and jobs near a housing-rich area served by El Dorado Transit. Lastly, the proposed Project will implement **Mitigation Measure 3.14-2c: Develop a Transportation Demand Management (TDM) Program and Implement VMT Reduction Measures for Subsequent Developments in the North Site Remainder Area** which requires each project applicant of future proposed projects located within the North Site Remainder Area to either demonstrate through a technical analysis that its project would not exceed County VMT thresholds or implement VMT-reducing infrastructure and/or strategies within the commercial facility to mitigate those impacts. If VMT thresholds are exceeded, the applicant shall prepare and submit a TDM Plan to the County for approval, which shall include a series of measures to reduce project-related VMT. Measures may include strategies such as ridesharing initiatives (e.g., carpooling), subsidizing employee use of public transit, and promoting bicycling, walking, and the use of public transit. As noted in Section 5.2.1 of the GHG Technical Report, the EDH Costco Project will meet the Voluntary Tier 1 Electric Vehicle Charging Standards as defined in the 2025 California Green Building Standards Code[38] by installing ten direct current fast chargers that provide a total power of 1,800 kW. Additionally, these chargers will be powered by 100% renewable electrical power supplied by Pacific Gas & Electric (PG&E), as Costco has a Clean Energy Contract with PG&E. Furthermore, the Remainder Area will be required to meet the Mandatory Electric Vehicle Charging Standards as defined in the California Green Building Standards Code.

[37] CARB. 2022. Final 2022 Scoping Plan Update and Appendices. December. Available at: https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents. Accessed: October 2025.

[38] 2025 California Green Building Standards Code, Title 24, Part 11. Available online at: https://codes.iccsafe.org/content/CAGBC2025P1. Accessed: October 2025.

Additionally, as noted in Section 5.2.1 of the GHG Technical Report, the EDH Costco Project will incorporate several sustainability and energy efficiency measures including green building practices as required by the 2025 California Green Building Standards Code.[39] Refer to Section 1.2 of the GHG Technical Report for a detailed listing of these measures. Notably, the EDH Costco Project operations will be powered 100% renewable electrical power supplied by PG&E, as Costco has a Clean Energy Contract with PG&E. Furthermore, the Remainder Area will be required to meet the California Green Building Standards Code, which includes a number of energy-saving requirements for new developments.

Based on the proposed Project elements described above, the Project would not interfere with the implementation of the 2022 Scoping Plan Update and would include elements that support the goals of the plan.

5.2.2 SACOG 2020 MTP/SCS

The proposed Project would not conflict with the State's GHG reduction goals and strategies as discussed in the SACOG's 2020 MTP/SCS,[40] which fall into four priority policy areas:

1. Build vibrant places for today's and tomorrow's residents;
2. Foster the next generation of mobility solutions;
3. Modernize the way we pay for transportation infrastructure; and
4. Build and maintain a safe, reliable, and multimodal transportation system.

The proposed Project would not conflict with the implementation of the SACOG's 2020 MTP/SCS and has several elements that are expected to support the main priority policy in SACOG's 2020 MTP/SCS. As noted in **Section 5.2.1**, the Project is an infill development that would create new employment opportunities and is located near an El Dorado Transit bus route (50 Express) and bus stop (El Dorado Transit Park & Ride), therefore placing jobs that are accessible via public transit. The El Dorado bus route connects to the larger Sacramento Metropolitan transit network and encourages use of local transit and rail to commute to the Project. Furthermore, the Project is located adjacent to homes, therefore the Project would provide retail and jobs near a housing-rich area served by El Dorado Transit.

Moreover, as noted in **Section 5.2.1**, the proposed Project will implement **Mitigation Measure 3.14-2c: Develop a TDM Program and Implement VMT Reduction Measures for Subsequent Developments in the North Site Remainder Area** which requires each project applicant of future proposed projects located within the North Site Remainder Area to either demonstrate through a technical analysis that its project would not exceed County VMT thresholds or implement VMT-reducing infrastructure and/or strategies within the commercial facility to mitigate those impacts. If VMT thresholds are exceeded, the applicant shall prepare and submit a TDM Plan to the County for approval, which shall include a series of measures to reduce project-related VMT. Measures may include strategies such as ridesharing initiatives (e.g., carpooling), subsidizing employee use of public transit, and promoting bicycling, walking, and the use of public transit.

[39] 2025 California Green Building Standards Code, Title 24, Part 11. Available online at: https://codes.iccsafe.org/content/CAGBC2025P1. Accessed: October 2025.

[40] SACOG. 2020. Metropolitan Transportation Plan/Sustainable Communities Strategy. Available at: https://www.sacog.org/home/showpublisheddocument/76/638212804736270000. Accessed: October 2025.

Additionally, as noted in Section 5.2.2 of the GHG Technical Report, the EDH Costco Project would implement pedestrian network improvements as part of **Mitigation Measure 3.14-2b**, and would implement several off-site transportation improvements in coordination with the County to address the existing and future needs of the region in the immediate vicinity of the Project site.

Based on the proposed Project elements described above, the Project would not interfere with the implementation of the SACOG's 2020 MTP/SCS and would include elements that support the goals of the plan.

5.2.3 El Dorado County RTP 2020-2040

The proposed Project would not conflict with the El Dorado County 2020-2040 RTP,[41] which includes the following main goals: to improve highways, streets, and regional/inter-regional roadways, public transit, aviation, freight movement, non-motorized transportation, transportation systems management, integrated land use, air quality, and transportation planning, and funding.

The Project supports the objectives of the El Dorado County Regional Transportation Plan by providing sidewalks, bike lanes, and pedestrian connections. As noted in **Section 5.2.1**, the Project is an infill development that would create new employment opportunities and is located near an El Dorado Transit bus route (50 Express) and bus stop (El Dorado Transit Park & Ride), thereby creating jobs that are accessible via public transit. The El Dorado bus route connects to the larger Sacramento Metropolitan transit network and encourages use of local transit and rail to commute to the Project. Furthermore, the Project is located adjacent to homes, therefore the Project would provide retail and jobs near a housing-rich area served by El Dorado Transit.

Additionally, as noted in **Section 5.2.1**, the proposed Project will implement **Mitigation Measure 3.14-2c: Develop a TDM Program and Implement VMT Reduction Measures for Subsequent Developments in the North Site Remainder Area** which requires each project applicant of future proposed projects located within the North Site Remainder Area to either demonstrate through a technical analysis that its project would not exceed County VMT thresholds or implement VMT-reducing infrastructure and/or strategies within the commercial facility to mitigate those impacts. If VMT thresholds are exceeded, the applicant shall prepare and submit a TDM Plan to the County for approval, which shall include a series of measures to reduce project-related VMT. Measures may include strategies such as ridesharing initiatives (e.g., carpooling), subsidizing employee use of public transit, and promoting bicycling, walking, and the use of public transit.

Further, as described in Section 5.2.2 of the GHG Technical Report, the Project would include pedestrian network improvements as part of **Mitigation Measure 3.14-2b**, and would implement several off-site transportation improvements in coordination with the County to address the existing and future needs of the region in the immediate vicinity of the Project site.

Based on the proposed Project elements described above, the proposed Project would not interfere with the implementation of the El Dorado County 2020-2040 RTP and would include elements that support the goals of the plan.

[41] El Dorado County Transportation Commission. 2020. El Dorado County Regional Transportation Plan 2020-2040. November 5. Available at: https://www.edctc.org/files/2859e4e3f/RTP+2040.pdf. Accessed: October 2025.

5.3 Summary

As discussed in **Section 5.1**, the proposed Project is expected to result in GHG emissions that are below PCAPCD GHG thresholds for operation and construction. Additionally, as described in **Section 5.2**, the proposed Project would not conflict with the 2022 Scoping Plan Update, SACOG's 2020 MTP/SCS, or the El Dorado County RTP 2020-2040. Therefore, the proposed Project's GHG emissions will be less than significant in the context of Threshold 1 and Threshold 2. Based on the analysis above, the proposed Project's GHG emissions are not cumulatively considerable, and the proposed Project is less than significant for cumulative GHG impacts.

6. PROGRAM-LEVEL ENERGY IMPACT ANALYSIS

This section discusses the assessment of the Project's energy demand against the CEQA significance thresholds outlined in **Section 2**.

6.1 Threshold ENE-1: Would the Project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation?

6.1.1 Energy Requirements and Energy Use Efficiencies

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project including construction, operation, maintenance and/or removal. If appropriate the energy intensiveness of materials may be discussed.*

Construction of the proposed Project (North Site Remainder Area and the EDH Costco Project) would result in one-time energy consumption in the form of gasoline and diesel, shown in **Table 3-6**. There are no unusual characteristics that would require the use of equipment that would be more energy intensive than is used for comparable activities, or equipment that would not conform to the current emissions standards (and related fuel efficiencies).

The operational energy use of the proposed Project is summarized in **Table 3-7**. As expected, the program-level energy use would be greater than the energy use from the EDH Costco Project. However, neither the EDH Costco Project nor the Remainder Area Development would have unusual project characteristics that would require electricity, gasoline, natural gas, and diesel consumption that would be more energy intensive than is used for comparable activities, or equipment that would not conform to current emissions standards (and related fuel efficiencies). For example, CARB has adopted an approach to passenger vehicles that combines the control of smog-causing pollutants and GHG emissions into a single coordinated package of standards. The approach also includes efforts to support and accelerate the numbers of plug-in hybrids and zero-emissions vehicles in California. As such, operation of the proposed Project is expected to use decreasing amounts of fuel over time, due to advances in fuel economy.

6.1.2 Local and Regional Energy Supplies

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The effects of the project on local and regional energy supplies and on requirements for additional capacity.*

The off-road construction equipment used during Project construction are primarily diesel-fueled. (see **Table D-1** for additional details on construction of the North Site Remainder Area and Table 4-2 of the EDH Costco Project Energy Technical Report for construction of the EDH Costco Project). Additionally, the fleet mix for construction mobile sources is expected to be gasoline-powered and diesel-powered, based on the CalEEMod default fleet mix for worker, vendor, and hauling vehicles (see **Table D-2** for additional

details on the construction of the North Site Remainder Area and Table 4-4 of the EDH Costco Project Energy Technical Report for construction of the EDH Costco Project). Hence, the proposed Project is not expected to use any natural gas during construction.

As shown in **Table 3-6**, relative to annual countywide fuel usage projections, the proposed Project construction would use up to 0.02% of gasoline, 1.23% of diesel, and 0.000004% of electricity in the year when the most construction would occur (2027). Relative to annual statewide fuel usage projections, the proposed Project construction would use up to 0.00010% of gasoline, 0.00405% of diesel, and 0.00000002% of electricity in the year when the most construction would occur (2027). Because construction of the proposed Project is expected to occur in three years, fuel use during construction would also be temporary and negligible.

Table 3-9 summarizes the proposed Project's operational energy use compared to countywide and statewide fuel usage projections. The estimated electricity usage for the proposed Project operations are anticipated to be approximately 0.57% of the projected countywide demand in 2028, and 0.00272% of the statewide energy demand. The natural gas usage of the proposed Project operations are estimated to be 0.08% of the total countywide natural gas consumption and 0.00024% of the total statewide natural gas consumption. The proposed Project's anticipated gasoline usage is anticipated to be 0.68% of the countywide consumption and 0.00323% of the statewide consumption. As far as the proposed Project's diesel consumption goes, it is estimated to be 1.39% of the projected countywide consumption and 0.0045% of the statewide consumption. Based on these relative percentages, the proposed Project's operational energy usage would not have a substantial impact on the local or regional energy supplies or capacity.

6.1.3 Peak and Base Period Demands

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The effects of the project on peak and base period demands for electricity and other forms of energy.*

The proposed Project construction would only include minor pieces of electric-powered equipment and hence would not impact the peak and base period demands for electricity.

The proposed Project operation will not have a substantial impact on the peak and base period demands for electricity or other forms of energy. Further details and reasoning on the peak demand are described below.

In 2023, California's peak grid demand was 44,534 megawatts (MW).[42] PG&E recorded a peak demand of 19,995 MW in 2023.[43] In comparison, the Project's maximum demand is

[42] California ISO. California ISO Peak Load History 1998 through 2024. Available at: https://www.caiso.com/documents/californiaisopeakloadhistory.pdf. Accessed: October 2025.

[43] California Energy Commission. 2023. Electricity and Gas Demand Forecast. Available at: https://efiling.energy.ca.gov/GetDocument.aspx?tn=253660&DocumentContentId=88907. Accessed: October 2025.

expected to be approximately 1.9 MW in 2028,[44] Therefore, the proposed Project's operations will have a relatively negligible effect on statewide and PG&E peak demands.

6.1.4 Existing Energy Standards

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

The degree to which the project complies with existing energy standards.

The proposed Project construction requires use of on-road trucks for soil hauling and deliveries, and off-road equipment such as excavators, tractors/loaders/backhoes, forklifts, and graders. The construction activities would comply with the five-minute idling limit in the Commercial Motor Vehicle Idling Regulation[45] and the Off-Road Regulation.[46] Additionally, on-road trucks used during Project construction would be compliant with the requirements of the Tractor-Trailer Greenhouse Gas Regulation.[47]

The proposed Project's anticipated operational energy use is summarized in **Table 3-9**. There are no unusual project characteristics that would require the use of gasoline, diesel, natural gas, or electricity that would be more energy intensive than is used for comparable activities, equipment, or vehicles that would not conform to current emissions standards (and related fuel efficiencies). Additionally, as described in Section 5.1.4.2 of the EDH Costco Project Energy Technical Report, the proposed Project would meet or exceed the Title 24 energy efficiency standards in effect at the time of building permit application. Any passenger vehicles and trucks trips generated by the proposed Project would comply with existing and new state-wide vehicle efficiency regulations discussed further in **Section 6.1.6**. Furthermore, the proposed delivery trucks accessing the site would comply with the State's Commercial Motor Vehicle Idling Regulation, similar to the construction vehicles discussed above.

Therefore, the proposed Project will comply with all applicable energy standards and its energy impacts are less than significant.

6.1.5 Energy Resources

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

The effects of the project on energy resources.

As discussed in **Sections 6.1.2** and **6.1.3**, the proposed Project's use of energy will not have a substantial effect on statewide or regional energy resources. Hence, the proposed Project will not significantly impact energy resources, and its energy impacts are less than significant.

---

[44] This is a conservative estimate since it was derived by dividing the total electricity energy required for the proposed Project operation by the annual operating hours for the proposed Costco warehouse, though some sources of electricity would operate 24 hours per day for every day of the year.

[47] CARB. Tractor-Trailer Greenhouse Gas Regulation. Available here: https://ww2.arb.ca.gov/our work/programs/ttghg-regulation/regulatory-and-guidance-documents. Accessed: October 2025.

6.1.6 Transportation Energy Use

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.*

Conventional gasoline, diesel, and natural gas vehicles consume gasoline, diesel, or natural gas, whereas electric vehicles (EVs) consume electricity that can be sourced by fossil fuels or renewables. EVs, including battery-electric vehicles and plug-in hybrid electric vehicles, comprise a growing fraction of the passenger vehicles on the roads in California. EV adoption is expected to increase over the upcoming decades due in part to improvements in battery technology and public initiatives and goals. This increase in EV adoption will decrease the fuel requirements due to transportation. New statewide regulations have been instated which will reduce emissions and fuel requirements from cars and trucks. Gasoline, diesel, and natural gas usage for the mobile sources associated with the proposed Project operation are expected to decrease over time as fleets become more fuel-efficient and switch to more electric-powered vehicles. Overall, the proposed Project would not result in wasteful, inefficient, or unnecessary consumption of transportation energy.

6.1.7 Summary

Based on the above analysis of each of the environmental impact factors identified in CEQA Guidelines Appendix F, the potential for the proposed Project to result in wasteful, inefficient, or unnecessary consumption of fuel or energy, and conversely to fail to incorporate energy efficiency measures into equipment use, transportation or other project features is less than significant.

6.2 Threshold ENE-2: Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

The proposed Project would comply with any applicable local and state plans, regulations, and policies for renewable energy or energy efficiency to the extent required by law. However, because project-level design features and details are not available for the potential developments in the North Site Remainder Area at the time of preparation of this program-level analysis, specific energy efficiency features for the Remainder Area Development will be described in any future applications filed with the County and the associated project-level review of potential environmental impacts under CEQA.

Furthermore, as show in Appendix A of the EDH Costco Project Energy Technical Report, the EDH Costco Project will commit to specific energy efficiency and renewable energy features, including but not limited to, meeting the Voluntary Tier 1 Electric Vehicle Charging Standards as defined in the 2025 California Green Building Standards Code,[48] installation of efficient irrigation systems and high-efficiency restroom fixtures, use of LED lamps, and use of building surface materials with greater solar reflectivity. Therefore, considered as a whole, the proposed Project would not conflict with or obstruct a state or local Plan for renewable energy or energy efficiency.

8. User Changes to Default Data

1. Basic Project Information

1.1. Basic Project Information

Data Field	Value
Project Name	North Site Remainder Area
Construction Start Date	5/18/2027
Operational Year	2028
Lead Agency	—
Land Use Scale	Project/site
Analysis Level for Defaults	County
Windspeed (m/s)	2.70
Precipitation (days)	9.40
Location	38.659852, -121.056799
County	El Dorado-Mountain County
City	Unincorporated
Air District	El Dorado County AQMD
Air Basin	Mountain Counties
TAZ	406
EDFZ	4
Electric Utility	Pacific Gas & Electric Company
Gas Utility	Pacific Gas & Electric
App Version	2022.1.1.29

1.2. Land Use Types

Land Use Subtype	Size	Unit	Lot Acreage	Building Area (sq ft)	Landscape Area (sq ft)	Special Landscape Area (sq ft)	Population	Description
Regional Shopping Center	138	1000sqft	3.17	138,000	0.00	—	—	—

Parking Lot	10.6	Acre	10.6	0.00	0.00	—	—	—

1.3. User-Selected Emission Reduction Measures by Emissions Sector

Sector	#	Measure Title
Construction	C-5	Use Advanced Engine Tiers
Construction	C-6	Use Diesel Particulate Filters
Construction	C-13	Use Low-VOC Paints for Construction

2. Emissions Summary

2.1. Construction Emissions Compared Against Thresholds

4. Operations Emissions Details

4.1. Mobile Emissions by Land Use

4.1.1. Unmitigated

Mobile source emissions results are presented in Sections 2.6. No further detailed breakdown of emissions is available.

4.1.2. Mitigated

Mobile source emissions results are presented in Sections 2.5. No further detailed breakdown of emissions is available.

4.2. Energy

4.2.1. Electricity Emissions By Land Use - Unmitigated

5.4. Vehicles

5.4.1. Construction Vehicle Control Strategies

Non-applicable. No control strategies activated by user.

5.5. Architectural Coatings

Phase Name	Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
Architectural Coating	0.00	0.00	207,000	69,000	27,756

5.6. Dust Mitigation

5.6.1. Construction Earthmoving Activities

Phase Name	Material Imported (cy)	Material Exported (cy)	Acres Graded (acres)	Material Demolished (sq. ft.)	Acres Paved (acres)
Site Preparation	—	—	15.0	0.00	—
Grading	107,000	53,000	90.0	0.00	—
Paving	0.00	0.00	0.00	0.00	10.6

5.6.2. Construction Earthmoving Control Strategies

Control Strategies Applied	Frequency (per day)	PM10 Reduction	PM2.5 Reduction

Water Exposed Area	2	61%	61%

5.7. Construction Paving

Land Use	Area Paved (acres)	% Asphalt
Regional Shopping Center	0.00	0%
Parking Lot	10.6	100%

5.8. Construction Electricity Consumption and Emissions Factors

kWh per Year and Emission Factor (lb/MWh)

Year	kWh per Year	CO2	CH4	N2O
2027	0.00	204	0.03	< 0.005
2028	0.00	204	0.03	< 0.005

5.9. Operational Mobile Sources

5.9.1. Unmitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Total all Land Uses	2,536	2,536	2,536	925,640	11,462	11,462	11,462	4,183,630

5.9.2. Mitigated

Land Use Type	Trips/Weekday	Trips/Saturday	Trips/Sunday	Trips/Year	VMT/Weekday	VMT/Saturday	VMT/Sunday	VMT/Year
Total all Land Uses	2,536	2,536	2,536	925,640	11,462	11,462	11,462	4,183,630

5.10. Operational Area Sources

5.10.1. Hearths

5.10.1.1. Unmitigated

5.10.1.2. Mitigated

5.10.2. Architectural Coatings

Residential Interior Area Coated (sq ft)	Residential Exterior Area Coated (sq ft)	Non-Residential Interior Area Coated (sq ft)	Non-Residential Exterior Area Coated (sq ft)	Parking Area Coated (sq ft)
0	0.00	207,000	69,000	27,756

5.10.3. Landscape Equipment

Season	Unit	Value
Snow Days	day/yr	0.00
Summer Days	day/yr	180

5.10.4. Landscape Equipment - Mitigated

Season	Unit	Value
Snow Days	day/yr	0.00
Summer Days	day/yr	180

5.11. Operational Energy Consumption

5.11.1. Unmitigated

Electricity (kWh/yr) and CO2 and CH4 and N2O and Natural Gas (kBTU/yr)

Land Use	Electricity (kWh/yr)	CO2	CH4	N2O	Natural Gas (kBTU/yr)
Regional Shopping Center	1,202,266	79.7	0.0330	0.0040	1,190,333
Parking Lot	405,244	79.7	0.0330	0.0040	0.00

5.11.2. Mitigated

Electricity (kWh/yr) and CO2 and CH4 and N2O and Natural Gas (kBTU/yr)

Land Use	Electricity (kWh/yr)	CO2	CH4	N2O	Natural Gas (kBTU/yr)
Regional Shopping Center	1,202,266	79.7	0.0330	0.0040	1,190,333
Parking Lot	405,244	79.7	0.0330	0.0040	0.00

5.12. Operational Water and Wastewater Consumption

5.12.1. Unmitigated

Land Use	Indoor Water (gal/year)	Outdoor Water (gal/year)
Regional Shopping Center	10,222,008	0.00
Parking Lot	0.00	0.00

5.12.2. Mitigated

Notes:

[1] Based on CalEEMod default values.

[2] The mitigation measure requires that construction equipment greater than 50 hp used at the site shall be mitigated to meet USEPA Tier 4 Final emission standards for PM_{10} and $PM_{2.5}$. If Tier 4 Final equipment is viable but not available, all construction equipment larger than 50 horsepower used at the site shall meet USEPA emission standards for Tier 3 engines and include particulate matter emissions control equivalent to CARB Level 3 verifiable diesel emission control devices. To be conservative, this analysis assumed that off-road construction equipment larger than 50 horsepower are equipped with Tier 3 engines and DPFs for the mitigated emissions.

Abbreviations:

CalEEMod - California Emissions Estimator Model
CARB - California Air Resources Board
DPF - Diesel Particulate Filter
hp - horsepower
N/A - not available
PM_{10} - particulate matter less than 10 microns in diameter
$PM_{2.5}$ - particulate matter less than 2.5 microns in diameter
USEPA - United States Environmental Protection Agency

Table B-3. Construction Trip Assumptions - North Site Remainder Area
El Dorado Hills Costco Project
El Dorado Hills, California

Construction Phase Name	Worker Trips per Day [1,2]	Vendor Trips per Day [1,2]	Hauling Trips per Day [1,2]
Site Preparation	18	0	0
Grading	20	0	667
Building Construction	44	23	0
Paving	15	0	0
Architectural Coating	9	0	0

Notes:

[1] Trips are presented as one-way trips per day.

[2] Worker, vendor, and hauling trips are based on CalEEMod defaults. The one-way trip lengths for worker, vendor, and hauling trips are assumed to be the CalEEMod default values of 14.3 miles, 8.8 miles, and 20.0 miles, respectively.

Notes:

[1] Construction phases and duration are based on CalEEMod defaults. Refer to **Appendix B** for further details.

[2] Based on CalEEMod defaults.

[3] Estimated by summing up the maximum daily emissions for the construction phase. Maximum daily emissions for the Site Preparation; Grading; Building Construction; Paving; and Architectural Coating phases are obtained from **Appendix A**.

[4] For purposes of this analysis SO_X emissions are assumed to be equal to SO_2.

[5] Particulate matter emissions include exhaust emissions from off-road construction equipment, fugitive dust emissions from on-site construction activities, and exhaust/tire wear/brake wear/entrained road dust emissions from on-road vehicles associated with project construction. As noted in Section 4.2.3 of the Air Quality Technical Report, fugitive dust emissions will be controlled by watering the construction site twice daily in accordance with the EDCAQMD Rule 223-1. Particulate matter emissions presented here account for these control measures for fugitive dust emissions.

[6] Estimated by multiplying the maximum daily emissions by the number of construction days for each construction phase.

APPENDIX D
CONSTRUCTION ENERGY CALCULATIONS

List of Tables

Table D-1: Off-Road Equipment Fuel Consumption During Construction - North Site Remainder Area
Table D-2: On-Road Vehicle Fuel Consumption During Construction - North Site Remainder Area

Table D-1. Off-Road Equipment Fuel Consumption During Construction - North Site Remainder Area
El Dorado Hills Costco Project
El Dorado Hills, California

Construction Phase Name	CO_2 Emissions [1] (MT/yr)	Diesel Consumption [2] (gallons/yr)
Site Preparation (2027)	24.0	2,354
Grading (2027)	89.8	8,794
Building Construction (2027)	204.4	20,021
Building Construction (2028)	121.8	11,929
Paving (2028)	13.7	1,343
Architectural Coating (2028)	1.2	119

Constants:

10.21 kg CO_2/gallon diesel consumed in combustion engines [3]

1,000 kg CO_2/MT CO_2

Notes:

[1] Exhaust CO_2 emissions from off-road construction equipment used during the Site Preparation; Grading; Building Construction; Paving; and Architectural Coating construction phases that occur during remainder area development construction are obtained from the CalEEMod model run shown in **Appendix A**.

[2] Diesel consumption of off-road construction equipment during each construction phase is estimated as a ratio of the CO_2 emissions from these equipment to the CO_2 emission factor per gallon of diesel consumed.

[3] Obtained from the USEPA GHG Emission Factors Hub. Available at: https://www.epa.gov/system/files/documents/2025-01/ghg-emission-factors-hub-2025.pdf. Accessed: June 2025.

Architectural Coating (2028)	20	8.83	-	-	14.3	-	-	2,526	-	-	94	-	-

Notes:

[1] Construction phases and duration (**Table B-1**) are based on CalEEMod defaults. Refer to **Section 3** of the report for further details.

[2] The number of worker and vendor trips represent CalEEMod defaults based on the construction equipment used in each construction phase. The number of hauling trips were estimated by CalEEMod based on volume of soil that would be imported/exported during construction. Refer to **Appendix B** for further details.

[3] The trip lengths for on-road vehicles used during construction are CalEEMod default values.

[4] Estimated based on trip rates, trip length, and phase duration.

[5] Fuel consumption of on-road vehicles used during each construction phase are estimated as a product of the vehicle miles traveled by each vehicle type and its fuel consumption rate in gallons per mile.

[6] Fuel consumption rates for on-road vehicles are calculated using vehicle class-specific fuel consumption data from EMFAC2021 (see the supporting table below, which presents EMFAC2021 outputs for 2027 and 2028 in El Dorado-Mountain County), the fleet mix for each trip type (worker, vendor, and hauling), and vehicle miles traveled. The fleet mix for the worker, vendor, and hauling trucks are based on CalEEMod defaults. Worker vehicles are assumed to be gasoline fueled and include light duty automobiles and trucks (25% LDA, 50% LDT1, 25% LDT2). Vendor vehicles are assumed to be diesel fueled and include heavy heavy-duty trucks and medium heavy duty trucks (50% HHDT and 50% MHDT). Hauling vehicles are assumed to be diesel fueled and include heavy heavy-duty trucks (100% HHDT).

Fuel Consumption Rates by Vehicle Type: [6]

Worker Vehicles in 2027:	0.0378 gallons/mile
Worker Vehicles in 2028:	0.0371 gallons/mile
Vendor Vehicles in 2027:	0.2019 gallons/mile
Vendor Vehicles in 2028:	0.2001 gallons/mile
Haul Trucks in 2027:	0.1998 gallons/mile

Abbreviations:

CalEEMod - California Emissions Estimator Model
EMFAC - EMission FACtors model
HHDT - heavy heavy-duty trucks
LDA - light-duty automobile
LDT - light-duty truck
MHDT - medium heavy-duty trucks

Daily VMT [1,2]	11,463	miles/day

Notes:

[1] Obtained from the July 2025 El Dorado Costco CEQA Analysis report prepared by Kittelson & Associates, Inc.

[2] For purposes of this analysis the daily trip and VMT assumptions were used for both weekdays and weekends.

Abbreviations:

CEQA - California Environmental Quality Act

VMT - vehicle miles travelled

Table E-2. Reactive Organic Gas Emission Factor for Consumer Product Usage in El Dorado County for Calendar Year 2028

El Dorado Hills Costco Project
El Dorado Hills, California

Countywide ROG Inventory for Consumer Product Usage [1] (tons/day)	County Population [2]	Total Building Square Footage in the County [3] (sqft)	ROG Emission Factors for Consumer Product Usage [4] (lb/sqft/day)
1.354	188,380	220,388,409	1.23E-05

Notes:

[1] ROG consumer products inventory for El Dorado County in calendar year 2028 was obtained from the California Emissions Projection Analysis Model, CEPAM2019v1.04. Available at: https://ww2.arb.ca.gov/applications/cepam2019v1-04-standard-emission-tool. Accessed: May 2025.

[2] Population estimates for El Dorado County in 2020 and 2028 were obtained from the State of California Department of Finance website. Available at: https://dof.ca.gov/forecasting/demographics/projections/. Accessed: May 2025.

[3] Total building square footage in 2028 was estimated as the product of the countywide building square footage per person in 2020 multiplied by the population projection for El Dorado County in calendar Year 2028.

[4] The consumer product ROG emission factor for consumer product usage is calculated as the ratio of the countywide ROG inventory for consumer product usage to the total building square footage in the county.

[5] Total building square footage in El Dorado County for 2020 was obtained from FEMA HAZUS-MH software (version 7.0). Available at: https://msc.fema.gov/portal/resources/hazus. Accessed: May 2025.

Constants:

El Dorado County Population [2] in Calendar Year 2020:	191,522
Total Building Square Footage [5] in El Dorado County in 2020:	224,064,279

Conversion Factor:

2000 lb/ton

Abbreviations:

FEMA - Federal Emergency Management Agency
lb - pound
ROG - reactive organic compounds
sqft - square foot

Table E-3. Utility GHG Emission Factor Associated with Renewable Portfolio Standard
El Dorado Hills Costco Project
El Dorado Hills, California

Energy Generated (MWh)

	2020	2021	2022	Average	Units
CO_2 Intensity Factor per Total Energy Generated [1]	160	98	56	105	lbs CO_2/MWh generated
% of Total Energy From Renewables [2]	35.1%	47.7%	38.5%	40.4%	
CO_2 Intensity Factor per Total Non-Renewable Energy [3]	247	187	91	176	lbs CO_2/MWh generated

Calculated Intensity Factors for Total Energy Delivered [4]

2027 RPS (52% Renewable Energy)	118.3	89.9	43.7	84.3	lbs CO_2/MWh generated
2028	111.8	84.9	41.3	79.7	lbs CO_2/MWh generated
2030 RPS (60% Renewable Energy)	98.6	75.0	36.4	70.3	lbs CO_2/MWh generated

Notes:

[1] Obtained from PG&E's 2024 Corporate Sustainability Reports. Note that 2023 values are not provided because they are subject to regulatory approval and verification at the time of this report preparation.

[2] Obtained from PG&E's 2021, 2022, and 2023 Corporate Sustainability Reports.

[3] The emissions metric presented here is calculated based on the total CO_2 emissions for total energy generated divided by the energy generated from non-renewable sources.

[4] The intensity factors for default RPS assumption are estimated multiplying the maximum allowable percentage of non-renewable energy per RPS and the CO_2 intensity factor per total non-renewable energy calculated above. The RPS minimum targets for renewable energy delivered are 52% for 2027 and 60% for 2030 per Senate Bill 100. The estimate provided here assumes that renewable energy sources do not result in any CO_2 emissions.

Abbreviations:

CO_2 - carbon dioxide

GHG - greenhouse gases

lbs - pounds

MWh - megawatt-hour

PG&E - Pacific Gas and Electric

RPS - Renewable Portfolio Standards

1. INTRODUCTION

Ramboll Americas Engineering Solutions, Inc. (Ramboll) was retained to prepare an Energy Technical Report for the proposed El Dorado Hills (EDH) Costco Project (Project) located north of the Silva Valley Parkway/US 50 interchange in the El Dorado Hills community area of the unincorporated El Dorado County in California. This Energy Technical Report analyzes the energy impacts of the Project's construction and operation activities. In particular, this report describes the existing setting of the Project site, describes the relevant regulatory setting, discusses the methodology used to evaluate energy consumption of the Project, and evaluates potential impacts related to energy that would be affected as a result of implementation of the Project.

1.1 Existing Conditions

The Project site is currently vacant grassland with scattered oak trees and seasonal drainage features. There are no permanent structures on the Project site. The southern edge of the property directly abuts the US 50 right-of-way, while the western boundary is adjacent to Clarksville Crossing. An approximate 7.75-acre portion of the northern site is reserved for a planned future extension of Country Club Drive, which is not part of the proposed Project.

Surrounding land uses include:

- North: Single-family residential uses and Oak Meadow Elementary School
- East: Vacant land, Tong Road, and single-family residential uses
- South: U.S. Highway 50 and Tong Road
- West: Clarksville Crossing roadway, open space, and undeveloped land

1.2 Proposed Project

The 43.26-acre Project site is separated into two components: the North Site of approximately 24.83 acres and the South Site of approximately 18.43 acres. A membership-only Costco fuel facility and employee parking would occupy part of the North Site, while the South Site would accommodate the main Costco warehouse retail building and a partially below-grade parking structure. The majority of the North Site is not proposed to include any development as part of the Project.

1.2.1 North Site

On the North Site, approximately 3.29 acres would be developed with a Costco members-only fuel facility and an employee parking area. The remainder of the North Site would include an approximately 13.79-acre out-parcel that would remain undeveloped at this time (North Site Remainder Area). The Costco Project proposes no development for the North Site Remainder Area. The future extension of Country Club Drive (County Capital Improvement Project No. 36105008), when constructed by the County, would occupy a portion of the North Site near its northern edge, though the future extension is an independent project proposed by, and to be undertaken by, the County and is not analyzed as a part of the project.

The fuel facility would occupy a generally rectangular footprint near Silva Valley Parkway, and the employee parking would be situated immediately west of the canopy, separated by drive aisles and landscaping.

Site Access and Roadway Improvements

Primary access to the North Site would be provided via a new signalized intersection on Silva Valley Parkway, shared with the South Site's main driveway. A secondary right-in/right-out driveway north of that intersection would separate fueling operations from primary traffic flows. Fuel delivery trucks would enter the northern driveway and exit at the signal to allow safe left turns. Sidewalks, bike lanes, and pedestrian connections would be provided along the North Site's frontage, north of the signalized intersection.

Architecture

The proposed fuel facility includes a steel canopy structure of up to 13,000 square feet, covering four fueling bays with four two-sided dispensers each (32 fueling positions total). A small, up to 200-square-foot controller enclosure would house operational equipment. The canopy design features neutral colors with corporate striping to align with Costco's brand, and recessed LED lighting directing illumination downward.

Construction

Construction for the North Site is anticipated to last approximately 11 months once construction begins, which is currently estimated to be July of 2026. Construction would occur 7 days per week, with construction occurring 7:00 a.m. to 7:00 p.m. on weekdays and 8:00 a.m. to 5:00 p.m. on weekends.

Operations

Fuel facility hours would generally be from 5:00 a.m. to 10:00 p.m. The facility is expected to receive approximately four to five fuel truck deliveries per day. These deliveries would be staged in a striped area north of the canopy. Approximately 70 employee parking spaces would serve Costco employees; circulation is designed to keep fuel facility traffic and employee parking separate.

1.2.2 South Site

The South Site would include up to approximately 165,000 square feet of building area planned to be constructed as a Costco Wholesale Member Warehouse retail store. Within the store, Costco would offer, among other product and services, optical exams and optical sales, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and tire sales and installation. Temporary outdoor sales may occur within the portion of the parking area adjacent to the warehouse retail building for seasonal sales, such as Christmas tree sales during the months of November and December. The warehouse retail building is proposed to include one customer entrance to the main Costco store, which would be located at the northwest corner of the building. The tire center would have bay doors accessible from outside of the warehouse retail building, though the tire center sales area would be accessible through the building. A promotional vehicle may be on display near the customer entrance to the building. This vehicle would be used to promote online or offsite vehicle sales; no vehicles are proposed to be sold onsite. The South Site would also include a parking structure and surface parking, which are further described below. Development on the South Site would exclude the 1.38-acre area located west of Clarksville Crossing where no development is proposed.

The South Site has been designed to use the existing slope of the site by locating the Costco warehouse retail building in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. Parking would be provided in two at-grade parking lots and one subterranean (below-grade) parking lot structure beneath one of the at-grade lots. Vehicle access to this lower-level parking structure would be provided by a ramp on the north side of the structure from Clarksville Crossing and a ramp on the south side of the structure from the above at-grade parking lot. The below-grade parking structure would include approximately 200 to 230 spaces. A pedestrian ramp and elevators would provide pedestrian access from the below-grade level up to the at-grade parking and entry to the warehouse retail building. The below-grade parking structure and at-grade parking lots together would include approximately 750 to 780 spaces in total parking to serve the South Site.

Site Access and Roadway Improvements

The primary entrance to the South Site would be from the new signalized intersection with Silva Valley Parkway (shared with the North Site). Northbound traffic on Silva Valley Parkway would have a left-turn pocket into Clarksville Crossing, and three driveways off Clarksville Crossing would provide direct access to the South Site. A partial traffic signal would be installed at the intersection of Silva Valley Parkway and Clarksville Crossing. In the future, when Country Club Drive is extended by the County, Clarksville Crossing's connection to Silva Valley Parkway and the traffic signal would be removed. A public access road would be developed on the South Site within the remainder parcel that was taken by the County in connection with the development of Tong Road. A maintenance agreement between the County and Costco would be created to address the maintenance of the new public access road.

Delivery truck access would be allowed at all driveway locations depending on the size of the delivery truck and direction of travel for both the North Site and South Site. Most trucks delivering to the warehouse retail building would access the site at the southwest driveway on Clarksville Crossing near the receiving docks.

Architecture

The warehouse retail building design for the South Site is proposed to be contemporary and would include a variety of massing and appropriate materials for the building. By combining concrete masonry block and architectural metal panels, Costco intends to create a scale and architectural interest to minimize the visual impact of a large retail warehouse retail building. By use of design techniques such as the location of building materials, landscaping, and the incorporation of varying parapet cap heights, Costco proposes to break the long elevations both horizontally and vertically at the appropriate height to conceal roof top mounted mechanical equipment. The proposed colors are warm natural earth tones, which would relate to the proposed surrounding development by utilizing similar building materials and architectural detailing. The tire center would be integrated into the main building, with exterior bay doors and interior retail access for sales and service. Pedestrian entries (main and employee) would be oriented to the northwest for customer convenience and the tire center from the other warehouse retail building operational areas.

The South Site truck loading dock is proposed to be located at the southwest corner of the building adjacent to US 50. The bay doors would be equipped with sealed gaskets to limit noise impacts. A smaller on-grade door would also be located on the south side of the

building. This door is to receive bread deliveries and small delivery vans/trucks. A transformer and two trash compactors would also be located along the south edge of the building proposed for the South Site. Landscape material would provide screening of this area

Parking, Circulation, and Loading

Two at-grade lots and one below-grade lot together provide approximately 750 to 780 parking stalls. Access to the South Site would consist of a signalized intersection on Silva Valley Parkway, as well as driveways provided along Clarksville Road. These driveways would provide customer access to both at-grade and below-grade parking stalls. Delivery trucks would access sealed loading docks at the building's southwest corner.

Construction

As with the North Site, construction for the South Site is anticipated to last approximately 11 months once construction begins, which is currently estimated to be July of 2026. Construction would occur 7 days per week, with construction occurring 7:00 a.m. to 7:00 p.m. on weekdays and 8:00 a.m. to 5:00 p.m. on weekends. In addition to these construction hours, it is anticipated that there would be up to 8 days of nighttime construction activities involving concrete pours for the building foundation.

Operations

The warehouse retail building is proposed to include one member entrance to the main Costco store, which would be located at the northwest corner. The EDH Costco is expected to include, among other features, a bakery and sales of baked goods, meat preparation and sales, alcohol sales, food service preparation and sales, pharmacy, optical center with optical exams and retail optical sales, hearing aid testing center, and food court, along with the sales of approximately 4,000 products. The warehouse retail building would include a five-bay tire center with member access via the inside of the main Costco building, which would include tire sales and a tire installation facility.

It is anticipated that the EDH Costco Project (warehouse retail building and fuel facility) would employ approximately 250 to 300 employees combined. The warehouse retail building would in general be open from 9:00 a.m. to 8:30 p.m. on weekdays and 9:00 a.m. to 7:00 p.m. on weekends. Costco anticipates an average of about 10 to 12 trucks delivering goods per day. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers. Receiving time would be from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before 10:00 a.m. Deliveries to the warehouse retail building are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from eastbound US 50. Truck travel routes would use Silva Valley Parkway (from US 50 to Clarksville Road), Clarksville Road (from White Rock Road to Silva Valley Parkway), future Country Club Drive extension west of the South Site to access Clarksville Road, and White Rock Road (from Clarksville Road to US 50).

The tire center receives shipments of tires once or twice a week, with old tires transported offsite for recycling. Seasonal outdoor sales of items such as Christmas trees may occur in the parking area. In addition, promotional vehicle displays may appear outside, but no on-site vehicle sales would occur.

Energy Efficiency Features

As noted above, the South Site would obtain electrical and natural gas services from Pacific Gas & Electric (PG&E). The development would comply with energy efficiency standards under California Code of Regulations Title 24. Additional energy efficiency and sustainability measures incorporated into the Costco Project are noted below.

- Parking lot light standards would be designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps can provide a higher level of perceived brightness with less energy than other lamps such as high-pressure sodium.
- New and renewable building materials would typically be extracted and manufactured within the region. When masonry and concrete are used, the materials purchased would be local to the Project, minimizing the transportation distances and impact to local road networks.
- The use of pre-manufactured building components, including structural framing and metal panels, would help to minimize waste during construction.
- Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other materials. Building heat absorption would be further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall.
- A substantial amount of the proposed landscaping material for the North Site and South Site is climate adapted to the region and would use less water than other common landscape species.
- The irrigation system proposes to include the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas.
- Storm water management plans are designed to maintain water quality, minimize erosion, and manage storm water discharge rates based on the County requirements.
- High-efficiency restroom fixtures would be installed.
- Commissioning of mechanical systems would occur to ensure that the heating, ventilation, and air conditioning (HVAC) systems are performing as designed. HVAC comfort systems would be controlled by a computerized building management system to maximize efficiency.
- HVAC units planned for the South Site are high-efficiency direct ducted units, which have phased out the use of hydrochlorofluorocarbons completely.
- Parking lot and exterior lights would be controlled by a photo sensor and time clock.
- 10 electric vehicle (EV) chargers with direct current (DC) fast chargers would be installed.
- Lighting would be controlled by the overall Project energy management system.
- Energy efficient Transformers (i.e., Square D Type EE transformers) would be used.
- Variable speed motors would be used on make-up air units and booster pumps.

- Gas water heaters would be direct vent and 94 percent efficient or greater.
- Reclaim tanks would be used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.
- The building structure would be a pre-engineered system that uses 100 percent recycled steel materials and would be designed to minimize the amount of material used.
- Construction waste would be recycled whenever possible.
- Floor sealant would be No-volatile organic compound and would represent over 80 percent of the floor area.
- Carbon dioxide (CO_2) would be monitored throughout the warehouse.
- Extensive recycling/reuse program would be implemented including tires, cardboard, grease, plastics, and electronic waste.
- Use of plastic shopping bags would be avoided.
- Suppliers would be required to reduce packaging and consider alternative packaging solutions.
- Distribution facilities would be strategically located to minimize miles traveled for delivery.
- Deliveries would be made in full trucks.
- All Costco trucks would be equipped with an engine idle shut off timers.
- 100 percent renewable electrical power will be supplied by PG&E, as Costco has a Clean Energy Contract with PG&E.

2. ENERGY ENVIRONMENTAL OVERVIEW

2.1 Energy Production and Distribution

Among the states, California ranks eighth in the nation in production of crude oil, fifteenth in production of natural gas, second in generation of conventional hydroelectric power, second in the production of electricity from biomass, and first in the production of electricity from geothermal and solar energy.[1] California produces approximately 10% of the natural gas used in the State and imports approximately 90% from Canada, the Southwest, and the Rocky Mountains region of the United States.[2] Approximately two-thirds of the crude oil refined in California is from foreign countries, including Iraq, Brazil, Guyana, and Ecuador.[3] Additional crude oil is imported from Alaska.[4] One-fifth to one-third of California's electricity supply is from outside the state.[5]

Electricity Supply

The production of electricity requires the combustion, consumption, or conversion of other energy resources, including water, wind, oil, natural gas, coal, solar, geothermal, and nuclear. Of the electricity that was generated within the State in 2024, 40% was generated by natural gas-fired power plants, 23.4% by solar, 13.5% by hydroelectric, 8.5% by nuclear power plants, 7.3% by wind, 4.8% by geothermal, 2.2% by biomass, and a remaining 0.3% by other sources.[6]

For the El Dorado County area, PG&E is the primary supplier of electricity to businesses and residents of the area. PG&E's 70,000-square-mile service area covers central and Northern California. In 2024, approximately 23% of PG&E's electricity provided to its customers came from renewable sources and about 98% came from greenhouse gas (GHG)-free resources.[7]

Transportation Fuels Supply

Most petroleum fuel refined in California is for use in on-road motor vehicles and is refined within California to meet state-specific formulations required by the California Air Resources Board (CARB). The major categories of petroleum fuels are gasoline and diesel for passenger vehicles, transit, and rail vehicles and fuel oil for industry and emergency electrical power generation. Other liquid fuels include kerosene, jet fuel, and residual fuel oil for marine vessels.

California's oil fields make it the eight-largest petroleum-producing state in the United States, after Texas, New Mexico, North Dakota, Colorado, Alaska, Oklahoma, and Wyoming.[8] Crude oil is transported within California through a network of pipelines that carry it from both onshore and offshore oil wells to the refineries that are located in the San Francisco Bay Area, the Los Angeles area, and the Central Valley. Currently, 13 petroleum refineries operate in California, processing approximately 1.6 million barrels per day of crude oil.[9]

Other transportation fuel sources are alternative fuels, such as methanol and denatured ethanol (alcohol mixtures that contain no less than 70% alcohol), natural gas (compressed or liquefied), liquefied petroleum gas, hydrogen, and fuels derived from biological materials (i.e., biomass).

2.2 Energy Consumption

Electricity Consumption

Californians consumed 282,783 gigawatt hours (GWh) of electricity in 2024.[10,11] Of this total, El Dorado County consumed 1,339 GWh.[12]

Transportation Sector Fuels Consumption

The transportation sector is a major end use of energy in California, accounting for approximately 44.5% of total state-wide energy consumption in 2023, the most recent year for which data is available.[13] In addition, there is energy consumption associated with construction and maintenance of transportation infrastructure, such as streets, highways, freeways, rail lines, and airport runways.

[10] A watt hour is a unit of energy equivalent to one watt of power expended for one hour. For example, a typical light bulb is 60 watts, meaning that if it is left on for one hour, 60-watt hours have been used. One kilowatt equals 1,000 watts. The consumption of electrical energy by homes and businesses is usually measured in kilowatt hours (kWh). Some large businesses and institutions also use megawatt hours (MWh), where one MWh equals 1,000 kWh. One gigawatt equals one thousand (1,000) megawatts, or one million (1,000,000) kilowatts. The energy output of large power plants over long periods of time, or the energy consumption of jurisdictions, can be expressed in GWh.

[11] Electricity data for El Dorado County and the State of California in 2024 are obtained from the California Energy Commission, Energy Consumption Data Files. Available at: https://www.energy.ca.gov/files/energy-consumption-data-files. Accessed: October 2025.

3. SIGNIFICANCE THRESHOLDS

The analysis provided in this report evaluates whether the Project's energy impacts would be potentially significant. The significance of the Project's energy is assessed relative to the following questions from Section VI, Energy, of Appendix G of the California Environmental Quality Act (CEQA) Guidelines as stated below.

Threshold 1. Would the Project result in a potentially significant environmental impact due to wasteful, inefficient, or unnecessary consumption of energy resources, during Project construction or operation?

Threshold 2. Would the Project conflict with or obstruct a state or local plan for renewable energy or energy efficiency?

While no quantitative thresholds related to energy are included in the CEQA Guidelines, Part I of Appendix F of the CEQA Guidelines states as follows:

> "The goal of conserving energy implies the wise and efficient use of energy. The means of achieving this goal include:
>
> 1. decreasing overall per capita energy consumption;
> 2. decreasing reliance on fossil fuels such as coal, natural gas and oil; and
> 3. increasing reliance on renewable energy resources."

Appendix F of the CEQA Guidelines states that an Environmental Impact Report should include a discussion of the potential energy impacts of a project, with particular emphasis on avoiding or reducing inefficient, wasteful, and unnecessary consumption of energy.

For purposes of this analysis, impacts to energy resources will be considered to be significant if the project would result in the wasteful, inefficient or unnecessary consumption of fuel or energy, and conversely if the project would not incorporate renewable energy or energy efficiency measures into building design, equipment use, transportation or other project features.

To determine whether a project would result in the wasteful, inefficient or unnecessary consumption of fuel or energy, and conversely whether the project would fail to incorporate renewable energy or energy efficiency measures into building design, equipment use, transportation or other project features, Appendix F of the CEQA Guidelines identifies six categories of potential energy-related environmental impacts:

1. The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project including construction, operation, maintenance and/or removal. If appropriate the energy intensiveness of materials may be discussed.
2. The effects of the project on local and regional energy supplies and on requirements for additional capacity.
3. The effects of the project on peak and base period demands for electricity and other forms of energy.
4. The degree to which the project complies with existing energy standards.
5. The effects of the project on energy resources.

6. The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.

This report, relative to Threshold 1, assesses the Project's electricity, natural gas, and fossil fuel consumption during construction and operation by way of the six questions above. This report, relative to Threshold 2, evaluates whether the Project would conflict with applicable plans related to renewable energy and energy efficiency (see **Appendix A**, Project Evaluation Against State and Local Plans).

4. METHODOLOGY FOR DEVELOPMENT OF ENERGY PROJECTIONS

This section describes the methodology that Ramboll used to estimate energy consumption associated with the proposed Project, which includes one-time demand from construction and annual operational demand. This section also summarizes the proposed Project's energy consumption based on compliance with applicable regulatory requirements.

Additional information regarding methodology can be found in the Greenhouse Gas Technical Report for the proposed Project;[14] only the methodology specific to energy usage is discussed in this report. California Emissions Estimator Model (CalEEMod) outputs can be found in the appendices of the GHG Technical Report for the proposed Project.

4.1 Construction Equipment & Activities

Project construction is planned to begin in July 2026 and would continue for 11 months.[15] Note, two scenarios are considered for the construction of the proposed Project that have different material movement amounts in the grading phase. Scenario 1 assumes that the excavated material from portions of the Project site will be used as fill during grading. Scenario 2 conservatively assumes that all the excavated material will be exported offsite and soil will be imported for fill during grading.

Construction of the proposed Project requires the use of transportation fuel, including gasoline, and diesel use in construction equipment, material transport and delivery via vendor/hauling trucks, and construction worker vehicles. Fuel consumed by off-road construction equipment would be the primary energy resource expended over the course of construction, while vehicle miles traveled (VMT) associated with the transportation of construction materials and construction worker commutes would also result in fuel consumption. All off-road construction equipment associated with construction activities would use diesel fuel except for signal boards. Construction workers would travel to and from the Project site throughout the duration of construction; this analysis assumed that construction workers would primarily use gasoline-powered passenger vehicles.

Off-road construction equipment of various types would be used during each phase of construction.

Methodology consistent with CalEEMod was used to estimate construction equipment usage, and results are included in the appendices to the GHG Technical Report for the proposed Project. Fuel consumption from off-road construction equipment were estimated by converting the exhaust CO_2 emissions from these equipment in each construction phase to gallons of diesel fuel using United States Environmental Protection Agency's (USEPA's) CO_2 emission factor for diesel engines.[16] While the Project has committed to a construction mitigation measure to mitigate the significant impact of the maximum estimated cancer

[14] Ramboll. 2025. EDH Costco Project Greenhouse Gas Technical Report.

[15] Refer to Section 4.2 of the Greenhouse Gas Technical Report for further details on the construction schedule and activity.

[16] USEPA. 2025. GHG Emission Factors Hub. Available at: https://www.epa.gov/system/files/documents/2025-01/ghg-emission-factors-hub-2025.pdf. Accessed: October 2025.

risk,[17] this mitigation measure does not impact greenhouse gas emissions or the fuel consumption of the construction equipment. The estimated diesel fuel usage from off-road construction equipment for construction Scenario 1 and Scenario 2 are shown in **Table 4-1** and **Table 4-2** respectively.

Fuel consumption from worker, vendor, concrete truck, and hauling trips are estimated by multiplying the trip rate by the trip length to obtain total VMT for each trip type, and then applying the average fuel consumption rate for vehicles used for each trip type to this VMT. Consistent with CalEEMod defaults, worker vehicles are assumed to include light-duty automobiles and trucks, vendor vehicles are assumed to include an equal mix of medium-heavy-duty trucks and heavy-heavy-duty trucks, and hauling vehicles are assumed to include heavy-heavy-duty trucks. Concrete trucks are assumed to be heavy-heavy duty trucks. Estimated on-road fuel usage for construction Scenario 1 and Scenario 2 are shown in **Table 4-3** and **Table 4-4** respectively.

4.2 Operational Energy Requirements

Energy requirements are evaluated for the first year of the proposed Project operations, which would be 2027. The proposed Project's energy consumption was estimated using CalEEMod default methodologies for non-mobile sources, including building energy use, which is assumed to include both natural gas and electricity consumption.

4.2.1 Electricity

Operation of the proposed Project will result in electricity demand for the warehouse, gasoline dispensing facility, parking lot, and on-site EV chargers. The annual electricity usage for each land use is presented in **Table 4-5**. The total electricity use for the Project incorporates 2019 Title 24 standards. Please note that the proposed Project would meet or exceed the Title 24 energy efficiency standards in effect at the time of building permit application, therefore it is conservative to use the 2019 Title 24 standards because newer requirements will be more stringent, leading to greater energy reductions. Additionally, the proposed Project will also meet the California Green Building Code requirements which includes a number of green building practices to reduce energy use. Additionally, the Costco Project will be powered by 100% renewable energy, as Costco has a Clean Energy Contract with PG&E. For additional details on how the electricity consumption for the proposed Project was estimated, refer to Sections 4.3.4 and 4.3.9 of the GHG Technical Report.

4.2.2 Natural Gas

Based on CalEEMod default methodologies, operation of the proposed Project will result in natural gas demand for the warehouse. The CalEEMod default annual natural gas usage for the warehouse is presented in **Table 4-6.**

4.2.3 Mobile Source Fuel Usage

Gasoline, diesel, and electricity consumption for all mobile sources associated with the proposed Project operation are shown in **Table 4-7**, **Table 4-8**, and **Table 4-9** respectively. The following mobile sources are associated with the proposed Project operation: passenger vehicle trips visiting the proposed gasoline dispensing facility and warehouse including employee vehicles, fuel delivery trucks, warehouse and tire center delivery trucks, and Transport Refrigeration Units (TRUs) that are mounted on the trailers of some warehouse

[17] Refer to Section 6 of the EDH Costco Project Air Quality Technical Report for further details on Mitigation Measure 3.2-4a: Apply Tier 4 Emission Standards to Diesel-Powered Off-Road Equipment.

delivery trucks. Refer to Section 4.3.2 of the GHG Technical Report of the proposed Project for a description of the methodology used to develop activity data for these mobile sources.[18] On-road vehicle fuel consumption for the proposed Project operation is calculated by dividing the VMT by each vehicle type with the respective average fuel efficiency of these vehicle types operating in El Dorado-Mountain County in calendar year 2027. TRU fuel consumption is calculated based on the hours of TRU operation and the average fuel consumption rate of TRU trailers operating in El Dorado County in calendar year 2027.

4.2.4 Landscape Equipment Fuel Usage

The proposed Project will result in gasoline usage from landscape equipment used on-site during Project operation. As shown in **Table 4-10**, the proposed Project's landscape equipment fuel consumption was estimated by converting the CO_2 emissions from these equipment to gallons of gasoline using USEPA's CO_2 emission factor for gasoline engines.[19]

4.2.5 Stationary Source Fuel Usage

The proposed Project includes two diesel-powered emergency generators, each rated at 250 horsepower, to support warehouse operations. Testing and maintenance of each generator is not expected to exceed 50 hours per year or 1 hour on any given day. As shown in **Table 4-11**, the proposed Project's emergency generator fuel consumption was estimated by converting the exhaust CO_2 emissions from these emergency generators to gallons of diesel using USEPA's CO_2 emission factor for diesel engines.[20]

[18] As noted in Section 4.3.2 of the GHG Technical Report, this analysis is not affected by Public Laws 119-15 and 119-16 which disapprove the Clean Air Act waivers granted by USEPA for the Advanced Clean Trucks and Advanced Clean Cars II regulations and the fuel consumption reductions associated with these regulations are not included in this analysis.

[19] USEPA. 2025. GHG Emission Factors Hub. Available at: https://www.epa.gov/system/files/documents/2025-01/ghg-emission-factors-hub-2025.pdf. Accessed: October 2025.

[20] Ibid.

5. PROJECT INVENTORY IN CONTEXT

This section discusses the assessment of the proposed Project's energy demand against the CEQA significance thresholds outlined in **Section 3**.

5.1 Threshold 1

Would the Project Result in a Potentially Significant Environmental Impact Due to Wasteful, Inefficient, or Unnecessary Consumption of Energy Resources, During Project Construction or Operation?

5.1.1 Energy Requirements and Energy Use Efficiencies

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The project's energy requirements and its energy use efficiencies by amount and fuel type for each stage of the project including construction, operation, maintenance and/or removal. If appropriate the energy intensiveness of materials may be discussed.*

5.1.1.1 Construction

Construction of the proposed Project would result in fuel usage as shown in **Table 5-1** and **Table 5-2**. There are no unusual project characteristics or construction processes that would require the use of equipment that would be more energy intensive than is used for comparable activities, or equipment that would not conform to current emissions standards (and related fuel efficiencies).

5.1.1.2 Operations

Operation of the proposed Project would result in electricity, gasoline, natural gas, and diesel fuel usage, as shown in **Table 5-3**. There are no unusual project characteristics that would require electricity, gasoline, natural gas, and diesel consumption that would be more energy intensive than is used for comparable activities, or equipment that would not conform to current emissions standards (and related fuel efficiencies).

Over the lifetime of the proposed Project, the fuel efficiency of the vehicles being used for Project operation is expected to improve. The amount of fuel consumption from vehicular trips to and from the Project site during operation would correspondingly decrease over time as vehicles become more efficient. Numerous regulations have been adopted that encourage, and require, increased fuel efficiency. For example, CARB has adopted an approach to passenger vehicles that combines the control of smog-causing pollutants and GHG emissions into a single coordinated package of standards. The approach also includes efforts to support and accelerate the numbers of plug-in hybrids and zero-emissions vehicles in California. As such, operation of the proposed Project is expected to use decreasing amounts of fuel over time, due to advances in fuel economy.

5.1.2 Local and Regional Energy Supplies

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The effects of the project on local and regional energy supplies and on requirements for additional capacity.*

5.1.2.1 Construction

The proposed Project's fuel consumption during construction is discussed in **Section 4.1**. The off-road construction equipment used during Project construction are primarily diesel-fueled (**Table 4-1** and **Table 4-2**), with the exception of signal boards that would be powered by electricity. Additionally, the fleet mix for construction mobile sources is expected to be gasoline-powered and diesel-powered, based on the CalEEMod default fleet mix for worker, vendor, and hauling vehicles (see **Table 4-3** and **Table 4-4** for additional details). Hence, the Project is not expected to use any natural gas during construction.

Countywide, the proposed Project construction in 2026 would use up to 0.02% of gasoline, 1.1% of diesel, and 0.00001% of electricity fuel. For 2027, it would use up to 0.014% of gasoline, 0.40% of diesel, and 0.000004% of electricity fuel during construction (**Table 5-1** and **Table 5-2**).

Compared to state-wide annual usage projections, the proposed Project construction would use up to 0.000078% of gasoline, 0.0037% of diesel, and 0.00000003% of electricity fuel in 2026. For 2027, it would use up to 0.000067% of gasoline, 0.0013% of diesel, and 0.00000002% of electricity fuel (**Table 5-1** and **Table 5-2**).

Therefore, fuel use during construction would be temporary and negligible. Fuel consumption was estimated using CalEEMod, which utilizes EMFAC2021 for on-road mobile source emissions, and OFFROAD2021 for off-road mobile source emissions for El Dorado County.

5.1.2.2 Operations

Electricity

The Project's electricity demand during operation is discussed in **Section 4.2.1** and **Section 4.2.3**. For comparison, based on 2024 consumption, operation of the proposed Project would equate to 0.45% of the total electricity demand countywide and 0.00213% of the total electricity demand state-wide (**Table 5-3**). Therefore, the Project is not expected to have an impact on the local utility.

In 2024, total in-state electricity consumption was 282,783 GWh.[21] The California Energy Commission (CEC) estimates that state-wide energy demand will increase to 395,870 GWh in 2040.[22] The proposed Project's anticipated electricity usage of 6,026,405 kilowatt hours (kWh)/year is 0.00213% of the state-wide demand in 2024.[23] Given that the State is growing annually, the anticipated state-wide energy demand for the proposed Project's

[21] Electricity data for the El Dorado County and the State of California in 2024 are obtained from the California Energy Commission, Energy Consumption Data Files. Available at: https://www.energy.ca.gov/files/energy-consumption-data-files. Accessed: October 2025.

[22] California Energy Commission. 2024. CEDU 2024 Baseline Forecast – Total State. Available at: https://efiling.energy.ca.gov/GetDocument.aspx?tn=260931. Accessed: October 2025.

[23] Electricity data for the El Dorado County and the State of California in 2024 are obtained from the California Energy Commission, Energy Consumption Data Files. Available at: https://www.energy.ca.gov/files/energy-consumption-data-files. Accessed: October 2025.

operational buildout year of 2027 will likely be greater than that in 2022, and thus the proposed Project's relative percentage contribution to the state-wide energy demand would be even less.

The proposed Project's electricity use projections also represent a small percentage of regional estimates for PG&E. The CEC estimates that PG&E energy demand will increase to about 117,758 GWh in 2027.[24] The proposed Project's anticipated electricity usage of 6,026,405 kWh/year is approximately 0.005% of the projected PG&E planning area demand in 2027.

Overall, the proposed Project's projected electricity demand is consistent with, and a small percentage of, State and regional projections. Therefore, the Project will not require additional generation capacity beyond the general state-wide expansion.

Natural Gas Usage

As described in **Section 4.2.2**, the only natural gas consumption during Project operation is from the warehouse operation, which is approximately 1,423,224 kilo-British thermal units per year. For comparison, based on 2024 consumption, operation of the proposed Project would equate to 0.045% of the total natural gas consumption countywide and 0.00013% of the total natural gas consumption state-wide (**Table 5-3**).[25]

Gasoline Usage

The proposed Project's gasoline usage during operation is discussed in **Section 4.2.3** and **Section 4.2.4**. The proposed Project is expected to result in approximately 285,366 gallons of gasoline consumption per year, which is 0.44% of the countywide consumption and 0.0021% of the state-wide consumption in 2027 (**Table 5-3**).

Diesel Usage

The proposed Project's diesel usage during operation is discussed in **Section 4.2.3** and **Section 4.2.5**. Project operational diesel consumption is approximately 169,371 gallons/year, which is 1.19% of the total diesel that would be used countywide and 0.0039% of the total diesel that would be use state-wide in 2027 (**Table 5-3**).

5.1.2.3 Summary

The proposed Project will not have a substantial impact on the local or regional energy supplies or require additional capacity to be constructed. Hence, the proposed Project's energy impacts on energy supplies and capacity are less than significant.

5.1.3 Peak and Base Period Demands

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The effects of the project on peak and base period demands for electricity and other forms of energy.*

[24] California Energy Commission. 2024. CEDU 2024 Baseline Forecast - PGE. Available at: https://efiling.energy.ca.gov/GetDocument.aspx?tn=260927. Accessed: October 2025.

[25] Electricity data for the El Dorado County and the State of California in 2024 are obtained from the California Energy Commission, Energy Consumption Data Files. Available at: https://www.energy.ca.gov/files/energy-consumption-data-files. Accessed: October 2025.

5.1.3.1 Construction

The Project does not include any electric-powered equipment, hence, there is no electricity use during project construction.

5.1.3.2 Operation

The proposed Project operation will not have a substantial impact on the peak and base period demands for electricity or other forms of energy. The proposed Project's base energy consumption compared to regional and state-wide energy consumption is discussed above in **Section 5.1.2**. Further details and reasoning on the peak demand are described below.

In 2023, California's peak grid demand was 48,323 megawatts (MW).[26] PG&E recorded a peak demand of 19,995 MW in 2023.[27] In comparison, the Project's maximum demand is expected to be approximately 1.5 MW in 2027.[28] Thus, the proposed Project will have a relatively negligible effect on state-wide and PG&E peak demands.

5.1.3.3 Summary

As described above, the Project will not have a substantial impact on peak and base period demands for electricity and other forms of energy. Hence, the proposed Project's impacts are less than significant.

5.1.4 Existing Energy Standards

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

The degree to which the project complies with existing energy standards.

5.1.4.1 Construction

Project construction requires use of on-road trucks for soil hauling and deliveries, and off-road equipment such as excavators, tractors/loaders/backhoes, forklifts, and graders. The construction activities would comply with the five-minute idling limit in the Commercial Motor Vehicle Idling Regulation[29] and the Off-Road Regulation.[30] Additionally, on-road trucks used during Project construction would be compliant with the requirements of the Tractor-Trailer Greenhouse Gas Regulation.[31]

[28] This is a conservative estimate since it was derived by dividing the total electricity energy required for Project operation by the annual operating hours for the proposed Costco warehouse, though some sources of electricity would operate 24 hours per day for every day of the year.

[31] CARB. Tractor-Trailer Greenhouse Gas Regulation. Available at: https://ww2.arb.ca.gov/our-work/programs/ttghg-regulation/regulatory-and-guidance-documents. Accessed: October 2025.

5.1.4.2 Operation

The proposed Project's anticipated operational energy use is discussed in **Section 4.2**. There are no unusual project characteristics that would require the use of gasoline, diesel, natural gas, or electricity that would be more energy intensive than is used for comparable activities, equipment, or vehicles that would not conform to current emissions standards (and related fuel efficiencies). Additionally, the proposed Project would meet or exceed the Title 24 energy efficiency standards in effect at the time of building permit application. The proposed Project will include pre-manufactured metal wall panels with insulation which carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other materials. Building heat absorption is further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall. These features align with the El Dorado County General Plan Policy 5.6.2.2. The proposed Project will also incorporate energy conserving landscaping plans, in accordance with the El Dorado County General Plan Policy 5.6.2.1. This includes an irrigation system that uses drip rings to efficiently water the rootball while minimizing water usage and ensuring that water goes directly to the intended planting areas. A substantial amount of the proposed plant material are climate adapted to the region and would use less water than other common landscaping species. Furthermore, the proposed Project will be located in a central location and will serve local customers efficiently, which would result in less transportation energy consumption compared to warehouse locations further away from the populations they serve. Any passenger vehicles and trucks trips generated by the proposed Project would comply with existing and new state-wide vehicle efficiency regulations, such as the Advanced Clean Cars II regulation, discussed further in **Section 5.1.6**. Furthermore, the proposed delivery trucks accessing the site would comply with the State's Commercial Motor Vehicle Idling Regulation, similar to the construction vehicles discussed above. Additional detail on the proposed Project's compliance with existing State and local energy standards and policies is provided in **Appendix A**.

5.1.4.3 Summary

As described above, the proposed Project will comply with all applicable energy standards and its impacts are less than significant.

5.1.5 Energy Resources

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The effects of the project on energy resources.*

The proposed Project's energy use is discussed in **Section 4** above, including electricity, gasoline, natural gas, and diesel consumption associated with on-site equipment, mobile operations, and construction activities. The proposed Project's use of energy will not have a substantial effect on state-wide or regional energy resources. Total operational energy use requirements for the proposed Project are summarized in **Table 5-3**. Programs and measures relevant to energy resources are discussed in detail above.

The proposed Project will not significantly impact energy resources and its impacts are less than significant.

5.1.6 Transportation Energy Use

This section addresses the following category of environmental impact described in Appendix F of the CEQA Guidelines:

> *The project's projected transportation energy use requirements and its overall use of efficient transportation alternatives.*

Conventional gasoline and diesel vehicles consume gasoline or diesel fuel, whereas EVs consume electricity that can be sourced by fossil fuels or renewables. EVs, including battery-electric vehicles and plug-in hybrid electric vehicles, comprise a growing fraction of the passenger vehicles on the roads in California. EV adoption is expected to increase over the upcoming decades due in part to improvements in battery technology and public initiatives and goals. This increase in EV adoption will decrease the fuel requirements due to transportation.

Gasoline and diesel fuel usage for the Project is expected to decrease over time as fleets become more fuel-efficient and switch to more electric-powered vehicles.

5.1.7 Summary

Based on the above analysis of each of the environmental impact factors identified in CEQA Guidelines Appendix F, the potential for the proposed Project to result in wasteful, inefficient, or unnecessary consumption of fuel or energy, and conversely to fail to incorporate energy efficiency measures into equipment use, transportation or other project features is less than significant.

5.2 Threshold 2

Would the Project Conflict with or Obstruct a State or Local Plan for Renewable Energy or Energy Efficiency?

The proposed Project would comply with any applicable local and State plans, regulations, and policies for renewable energy or energy efficiency to the extent required by law. The proposed Project will also meet the 2025 California Green Building Standards Code Voluntary Tier 1 EV charging requirements[32] by installing ten DC fast chargers that provide a total power of 1,800 kilowatts. Additionally, these chargers will be powered by 100% renewable electrical power supplied by PG&E, as Costco has a Clean Energy Contract with PG&E. Specifically, the proposed Project would not conflict with the goals set forth in the energy efficiency objectives in the El Dorado County General Plan (**Section 2.2.3.1**).[33] The Project's evaluation with the plan is provided in **Table A-1** of **Appendix A** and discussed in **Section 5.1.4.2**. Additionally, the Project would not conflict with State regulations and policies as shown in the evaluation presented in **Table A-2** in **Appendix A**. As such, Project impacts are less than significant.

TABLES

Table 4-1. Off-Road Equipment Fuel Consumption During Construction Scenario 1
El Dorado Hills Costco Project
El Dorado Hills, California

Construction Phase Name	CO_2 Emissions [1,2] (MT/yr)	Diesel Consumption [3] (gallons/yr)
Site Improvements - Linear, Grubbing & Land Clearing (2026)	7.5	730
Scenario 1 - Site Preparation (2026)	89	8,709
Site Improvements - Linear, Grading & Excavation (2026)	30	2,948
Scenario 1 - Grading (2026)	440	43,093
Scenario 1 - Building Construction (2026)	160	15,656
Site Improvements - Linear, Drainage, Utilities, & Sub-Grade (2026)	61	5,995
Scenario 1 - Grading (2027)	81	7,914
Site Improvements - Linear, Drainage, Utilities, & Sub-Grade (2027)	45	4,410
Scenario 1 - Building Construction (2027)	149	14,590
Scenario 1 - Paving (2027)	54	5,304
Site Improvements - Linear, Paving (2027)	11	1,064
Scenario 1 - Architectural Coating (2027)	3.8	368

Constants:

10.21 kg CO_2/gallon diesel consumed in combustion engines [4]

1,000 kg CO_2/MT CO_2

Notes:

[1] Exhaust CO_2 emissions from off-road construction equipment used during Site Preparation; Grading; Building Construction; Paving; and Architectural Coating construction phases that occur during construction scenario 1 are obtained from the CalEEMod model run shown in Appendix A-1 in the EDH Costco Project Greenhouse Gas Technical Report.

[2] Exhaust CO_2 emissions from off-road construction equipment used during Linear, Grubbing & Land Clearing; Linear, Grading & Excavation; Linear, Drainage, Utilities, & Sub-Grade; and Linear, Paving construction phases that occur during the site access and roadway improvement (site improvements) construction are obtained from the CalEEMod model run Appendix A-4 in the EDH Costco Project Greenhouse Gas Technical Report.

[3] Diesel consumption of off-road construction equipment during each construction phase is estimated as a ratio of the CO_2 emissions from these equipment to the CO_2 emission factor per gallon of diesel consumed.

Notes:

[1] Construction phases and duration are based on Project-specific information. Refer to Section 4.2 in the EDH Costco Project Greenhouse Gas Technical Report for further details.

[2] The number of worker and vendor trips represent CalEEMod defaults based on the construction equipment used in each construction phase. The number of hauling trips were estimated by CalEEMod based on volume of soil that would be imported/exported during construction and the amount of demolition debris generated. The number of concrete truck trips are based on Project-specific information. Refer to Section 4.2.2 of the EDH Costco Project Greenhouse Gas Technical Report for further details.

[3] The trip lengths for on-road vehicles used during construction are CalEEMod default values.

[4] Estimated based on trip rates, trip length, and phase duration.

[5] Fuel consumption of on-road vehicles used during each construction phase are estimated as a product of the vehicle miles traveled by each vehicle type and its fuel consumption rate in gallons per mile.

[6] Fuel consumption rates for on-road vehicles are calculated using vehicle class-specific fuel consumption data from EMFAC2021 (see the supporting table below, which presents EMFAC2021 outputs for 2026 and 2027 in El Dorado-Mountain County), the fleet mix for each trip type (worker, vendor, and hauling), and vehicle miles traveled. The fleet mix for the worker, vendor, and hauling trucks are based on CalEEMod defaults. Worker vehicles are assumed to be gasoline fueled and include light duty automobiles and trucks (25% LDA, 50% LDT1, 25% LDT2). Vendor vehicles are assumed to be diesel fueled and include heavy heavy-duty trucks and medium heavy duty trucks (50% HHDT and 50% MHDT), except for concrete trucks which are all heavy heavy duty-trucks (100% HHDT). Hauling vehicles are assumed to be diesel fueled and include heavy heavy-duty trucks (100% HHDT).

Abbreviations:

CalEEMod - California Emissions Estimator Model
EDH - El Dorado Hills
EMFAC - EMission FACtors model
HHDT - heavy heavy-duty trucks
LDA - light-duty automobile
LDT - light-duty truck
MHDT - medium heavy-duty trucks

Fuel Consumption Rates by Vehicle Type [6]:

Worker Vehicles in 2026:	0.0385 gallons/mile
Worker Vehicles in 2027:	0.0378 gallons/mile
Vendor Vehicles in 2026:	0.2038 gallons/mile
Vendor Vehicles in 2027:	0.2019 gallons/mile
Haul Trucks in 2026:	0.2017 gallons/mile
Haul Trucks in 2027:	0.1998 gallons/mile
Concrete Trucks in 2026:	0.2017 gallons/mile

Table 4-7. Operational Mobile Source Gasoline Consumption
El Dorado Hills Costco Project
El Dorado Hills, California

Mobile Source Category	Mobile Source Activity [1] (miles/yr)	Mobile Source Activity Associated with Gasoline Combustion [2] (miles/yr)	Gasoline Consumption [3] (gallons/yr)
GDF Customer Vehicles (Passenger Vehicles) - Gasoline	1,076,311	1,076,311	40,774
GDF Customer Vehicles (Passenger Vehicles) - Plug-in Hybrid [3]	26,211	11,967	427
Warehouse and Employee Vehicles (Passenger Vehicles) - Gasoline	6,368,290	6,368,290	241,248
Warehouse and Employee Vehicles (Passenger Vehicles) - Plug-in Hybrid	151,896	69,347	2,474

Constants:

Average fuel efficiency of gasoline vehicles in 2027 [4]	26 miles per gallon
Average fuel efficiency of plug-in hybrid electric vehicles in 2027 [4]	28 miles per gallon

Notes:

[1] The total miles traveled by gasoline passenger vehicles per year was obtained from Table B-1 of the EDH Costco Project Greenhouse Gas Technical Report. The value was apportioned into gasoline and plug-in-hybrid vehicle technology categories based on the Project-specific fleet mix shown in Table B-3 of the EDH Costco Project Greenhouse Gas Technical Report.

[2] The vehicle miles traveled by passenger vehicles that is associated with gasoline combustion for each vehicle technology category was estimated based on EMFAC default assumptions for gasoline and plug-in hybrid vehicles operating in El Dorado (MC) sub-area in calendar year 2027.

[3] Gasoline consumption of passenger vehicles are estimated as a ratio of the vehicle miles traveled associated with gasoline combustion for each vehicle technology category and its average fuel efficiency in miles per gallon.

[4] The average fuel efficiency for each gasoline vehicle technology category operating in for El Dorado (MC) sub-area in calendar year 2027 is obtained from EMFAC2021.

Abbreviations:

EDH - El Dorado Hills	MC - Mountain County

Table 4-8. Operational Mobile Source Diesel Consumption
El Dorado Hills Costco Project
El Dorado Hills, California

Mobile Source Category	Mobile Source Activity [1]	Diesel Consumption [2] (gallons/yr)
Transport Refrigeration Units	6,888 hours per year	4,803
Delivery Trucks	440,060 miles per year	162,002
Warehouse and Employee Passenger Vehicles - Diesel	47,306 miles per year	1,634

Constants:

TRU fuel consumption rate [3]	0.70	gallons per hour
Average fuel efficiency of diesel trucks [4]	5.00	miles per gallon
Average fuel efficiency of passenger vehicles [5]	28.95	miles per gallon

Notes:

[1] Obtained from Table B-1 of the EDH Costco Project Greenhouse Gas Technical Report.

[2] Diesel consumption for TRUs is estimated as a product of the TRU activity and its fuel consumption rate in gallons per hour. Diesel consumption for delivery trucks is estimated as a ratio of vehicle miles traveled to the average fuel efficiency of diesel trucks in miles per gallon. Diesel consumption for diesel warehouse and employee passenger vehicles is estimated as a ratio of vehicle miles traveled to the average fuel efficiency of diesel passenger vehicles in miles per gallon.

[3] Fuel consumption rate for TRUs on trailers operating in El Dorado (MC) sub-area in calendar year 2027 is obtained from OFFROAD2021.

[4] The average fuel efficiency for diesel trucks operating in El Dorado (MC) sub-area in calendar year 2027 is obtained from EMFAC2021.

[5] The average fuel efficiency for diesel passenger vehicles operating in El Dorado (MC) sub-area in calendar year 2027 is obtained from EMFAC2021.

APPENDIX A
PROJECT EVALUATION AGAINST STATE AND LOCAL PLANS

List of Tables

Table A-1: Project Evaluation Against Applicable County of El Dorado General Plan Energy Efficiency Strategies

Table A-2: Project Evaluation Against Applicable State Renewable Energy and Energy Efficiency Strategies

Table A-1. Project Evaluation Against Applicable County of El Dorado General Plan Energy Efficiency Strategies
El Dorado Hills Costco Project
El Dorado Hills, California

Objective [1]	Policy [1]	Does it Conflict?
Objective 5.6.2 - Encourage Energy-Efficient Development: Encourage development of energy-efficient buildings, subdivisions, development, and landscape designs.	**Policy 5.6.2.1** Require energy conserving landscaping plans for all projects requiring design review or other discretionary approval.	**Does Not Conflict.** As described in **Section 1.2** of the **Costco EDH Project Energy Technical Report**, the proposed Project's irrigation system will include the use of drip rings to efficiently water the rootball while minimizing water usage and ensuring that water goes directly to the intended planting areas. Additionally, a substantial amount of the proposed plant material will be climate adapted to the region and would use less water than other common landscaping species. Finally, the Project's storm water management plans are designed to treat all runoff from new impervious surfaces and maintain storm water discharge rates based on County requirements.

Notes:
[1] The applicable goals are obtained from the 2004 County of El Dorado General Plan. Available at: https://www.eldoradocounty.ca.gov/Land-Use/Planning-and-Building/Planning-Division/Adopted-General-Plan. Accessed: September 2025.

Table A-2. Project Evaluation Against Applicable State Renewable Energy and Energy Efficiency Strategies
El Dorado Hills Costco Project
El Dorado Hills, California

#	Plan	Category Description	Does it Conflict?
1	California Renewables Portfolio Standard (RPS) and SB 100	As most recently amended by SB 100 (2018), California's RPS increases the proportion of electricity from renewable sources to 33 percent renewable power by 2020; 50 percent renewable power by 2026; and, 60 percent renewable power by 2030. SB 350 (2015) also requires the State Energy Resources Conservation and Development Commission to double (by 2030) the energy efficiency savings in electricity and natural gas final end uses of retail customers through energy efficiency and conservation.	**Does Not Conflict.** The Project would not conflict with implementation of the state's RPS. The electricity for the operation of the Project would be supplied by Pacific Gas & Electric (PG&E) and powered by 100% renewable energy, as Costco has a Clean Energy Contract with PG&E.
2	California Code of Regulations, Title 24, Part 6	Title 24, Part 6 of the California Code of Regulations establishes energy and water efficiency requirements for residential and non-residential new construction, additions to existing buildings, and alterations to existing buildings. Standards include requirements for water heating, HVAC, lighting, electrical systems, and solar design.	**Consistent.** The Project would meet or exceed the Title 24 energy efficiency standards in effect at the time of building permit application. As noted in **Section 1.2** and listed below, the Project will include a number of energy and water efficiency features: • Parking lot light standards would be designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps can provide a higher level of perceived brightness with less energy than other lamps such as high-pressure sodium. • Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other materials. Building heat absorption would be further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall. • A substantial amount of the proposed landscaping material for the North Site and South Site is climate adapted to the region and would use less water than other common landscape species. • The irrigation system proposes to include the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas. • High-efficiency restroom fixtures would be installed. • Commissioning of mechanical systems would occur to ensure that the HVAC systems are performing as designed. HVAC comfort systems would be controlled by a computerized building management system to maximize efficiency. • HVAC units planned for the South Site are high-efficiency direct ducted units, which have phased out the use of hydrochlorofluorocarbons completely. • Parking lot and exterior lights would be controlled by a photo sensor and time clock. • Lighting would be controlled by the overall project energy management system. • Energy efficient Transformers (i.e., Square D Type EE transformers) would be used. • Variable speed motors would be used on make-up air units and booster pumps. • Gas water heaters would be direct vent and 94 percent efficient or greater. • Reclaim tanks would be used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.
3	Assembly Bill 1109	The Lighting Efficiency And Toxics Reduction Act (AB 1109) requires a reduction in average statewide electrical energy consumption by not less than 50 percent from the 2007 levels for indoor residential lighting and not less than 25 percent from the 2007 levels for indoor commercial and outdoor lighting by 2018.	**Does Not Conflict.** The Project would not conflict with the implementation of AB 1109. Additionally, the proposed Project will incorporate several sustainability and energy efficiency measures including green building practices as required by the 2025 California Green Building Standards Code. Refer to **Section 1.2** for a detailed listing of these measures.
4	California Green (CalGreen) Building Standards Code Requirements	CalGreen establishes green building standards to meet the goals of AB 32. CalGreen includes standards for residential and nonresidential structures such as new buildings or portions of new buildings, additions and alterations, and all occupancies where no other state agency has the authority to adopt green building standards applicable to those occupancies. Standards include requirements for site development, indoor and outdoor water use, construction waste reduction, disposal and recycling and building maintenance and operation.	**Consistent.** The Project will comply with the CalGreen Building Standards Code that is in effect at the time of the building permit application, as applicable. Furthermore, the proposed Project will include several sustainability and energy efficiency measures, including those mandated by California Green Building Standards Code. For a detailed list of these measures, please refer to **Section 1.2**.

Table A-2. Project Evaluation Against Applicable State Renewable Energy and Energy Efficiency Strategies
El Dorado Hills Costco Project
El Dorado Hills, California

#	Plan	Category Description	Does it Conflict?
Mobile Sources			
5	AB 1493 (Pavley Regulations)	Reduces GHG emissions in new passenger vehicles from model years 2012-2016 (Phase I) and model years 2017–2025 (Phase II). Also reduces gasoline consumption to a rate of 31 percent of 1990 gasoline consumption (and associated GHG emissions) by 2020.	**Does Not Conflict.** The Project would not conflict with the implementation of the AB 1493 regulations.
6	Low Carbon Fuel Standard (LCFS)	Establishes protocols for measuring and reducing the life-cycle carbon intensity of transportation fuels and helps to establish use of alternative fuels.	**Does Not Conflict.** The Project would not conflict with implementation of the LCFS.
7	Advanced Clean Cars (ACC) Program	In 2012, the California Air Resources Board (CARB) adopted the ACC program to reduce criteria pollutant emissions and GHG emissions for model year vehicles 2015 through 2025. ACC includes the Low-Emission Vehicle (LEV) regulations that reduce criteria pollutants and GHG emissions from light- and medium-duty vehicles, and the Zero-Emission Vehicle (ZEV) regulations that require manufacturers to produce an increasing number of pure ZEVs (meaning battery electric and fuel cell electric vehicles), with provisions to also produce plug-in hybrid electric vehicles (PHEV) in the 2018 through 2025 model years. In 2022, CARB developed the ACC II regulations which seeks to reduce criteria and greenhouse gas emissions from new light- and medium-duty vehicles beyond the 2025 model year, and increase the number of ZEVs for sale. On December 18, 2024, the U.S. EPA granted a waiver for California's ACC II regulation	**Does Not Conflict.** The Project would not conflict with implementation of the ACC program. Public Law 119-16, enacted on June 12, 2025, is a House joint resolution that disapproves the Clean Air Act waiver granted by USEPA for the ACC II regulation. In response to this action, CARB stated that they "will pursue every remedy available to challenge these actions".
8	Advanced Clean Trucks (ACT)	In 2021, the CARB adopted the ACT regulation to accelerate the market for on-road zero-emission vehicles and to reduce emissions of oxides of nitrogen (NOx), fine particulate matter (PM), other criteria pollutants, toxic air contaminants, and GHG from medium- and heavy-duty on-road vehicles. ACT applies to any manufacturer that certifies on-road vehicles over 8,500 lbs. gross vehicle weight rating for sale in California unless specified as exempt.	**Does Not Conflict.** The Project would not conflict with implementation of the ACT regulation. Public Law 119-15, enacted on June 12, 2025, is a House joint resolution that disapproves the Clean Air Act waiver granted by USEPA for the ACT Regulation. In response to this action, CARB stated that they "will pursue every remedy available to challenge these actions".
9	Advanced Clean Fleets (ACF)	In October 2022, CARB approved the Advanced Clean Fleets (ACF) regulation, which has requirements for fleets to phase in the use of ZEVs from 2024 to 2042 and beyond. The fleets required to comply with the regulation include State and local government agency fleets, high priority and federal fleets, and drayage fleets. The regulation also includes a requirement for manufacturers to only sell zero-emission trucks starting in 2036. The ACF regulation is meant to complement the ACT regulation and will contribute to meeting the goals set out in Governor Newsom's Executive Order N-79-20.	**Does Not Conflict.** The Project would not conflict with implementation of the ACF regulation. In January 2025, CARB withdrew its request for authorization of this rule from the USEPA.
10	Transport Refrigeration Unit (TRU) Air Toxic Control Measure (ATCM)	CARB adopted the ATCM for TRUs, TRU generator sets, and facilities where TRUs and TRU generator sets operate in 2004 (amendments in 2010, 2011, and 2022) to reduce diesel particulate matter emissions from diesel-powered TRUs and TRU generator sets.	**Consistent.** The Project would comply with all applicable requirements of the TRU ATCM. In January 2025, CARB withdrew its request to the USEPA for authorization of parts of this rule that require TRU owners to turnover at least 15 percent of their diesel-fueled truck TRU fleet to ZE TRU by December 31, 2023, and each year thereafter.
11	SB 375	SB 375 establishes mechanisms for the development of regional targets for reducing passenger vehicle GHG emissions. Under SB 375, CARB is required, in consultation with the State's Metropolitan Planning Organizations, to set regional GHG reduction targets for the passenger vehicle and light-duty truck sector for 2020 and 2035.	**Does Not Conflict.** The Project would not conflict with the implementation of SB 375.

Geotechnical Study (December 10, 2024)
and Draft Geotechnical Study
(November 5, 2019)

Geotechnical Study
(December 10, 2024)

December 10, 2024
Kleinfelder Project No. 20193141.002A

Costco Wholesale
9 Corporate Park, Suite 230
Irvine, California 92606

Attention: Mr. Michael Okuma
Director of Real Estate Development

SUBJECT: Geotechnical Study
Proposed Costco Fuel Facility
Silva Valley Parkway
El Dorado Hills, California
CW# 18-0487

Dear Mr. Okuma:

Kleinfelder is pleased to present this report summarizing our geotechnical study for the proposed fuel facility located at Silva Valley Parkway (APN 122-720-019) in El Dorado Hills, California. The purpose of our geotechnical study was to evaluate subsurface soil and groundwater conditions at the project site to provide geotechnical recommendations for design and construction. The conclusions and recommendations presented in this report are subject to the limitations presented in Section 7.

We appreciate the opportunity to provide geotechnical engineering services to you on this project. If you have any questions regarding this report or if we can be of further service, please do not hesitate to contact Andrea Traum at 408.595.3275, or Andy Franks, Kleinfelder's Client Account Manager for Costco, at 480.650.4905.

Sincerely,

KLEINFELDER, INC.

EXECUTIVE SUMMARY

This report presents the results of our geotechnical study for the proposed Costco fuel facility at Silva Valley Parkway (APN 122-720-019) in El Dorado Hills, California. The purpose of our study was to evaluate subsurface soil/bedrock and groundwater conditions to provide geotechnical recommendations for design and construction. We understand Costco had originally planned to have the fuel facility on the same property as the proposed warehouse on parcel (APN 122-720-018) on the west side of Silva Valley Parkway. However, the fuel facility has been relocated east of Silva Valley Parkway onto parcel (APN 122-720-019). Kleinfelder had performed field investigations on this eastern parcel in 2019 for the new warehouse (Kleinfelder, 2019), but the project was moved to the western parcel prior to the completion of fieldwork.

The new fueling facility will consist of four gasoline refueling islands with four pumps at each island, three underground storage tanks (UST), a fuel additive UST, a controller enclosure, and a canopy structure. In addition, asphalt concrete and Portland cement concrete pavements will also be constructed. Our geotechnical study was based generally on the Costco Wholesale Development Requirements (CWDRs), Version 2022, dated October 28, 2022.

The proposed fuel facility site is located northeast side of the Silva Valley Parkway, in El Dorado Hills as shown on Figure 2. The land is zoned as commercial and is located around ¼ mile south of Oak Meadow Elementary school and the Serrano residential development. This site located directly east across Silva Valley Parkway from the proposed warehouse site location. Costco is proposing this site as an alternative to allow additional parking on the warehouse property side.

At the time of our field exploration, the site was an undeveloped field with rolling hills generally sloping from east to west with ground surface elevations ranging from approximately 739 to 770 feet. The majority of the project site is characterized by slope gradients of 5:1 (horizontal to vertical) and shallower (less steep). At the time of our field exploration, much of the site was covered by low-lying vegetation (weeds and shrubs) and animal burrows as well as some native trees. Rock outcrops were also visible throughout the site. Additionally, a seasonal creek runs through the property from east to west. This creek was dry during our July 2024 investigation but was observed to be flowing during our initial field exploration of the property in Spring 2019. Finally, a ditch runs the property boundary along Silva Valley Parkway. The ditch is approximately 5 feet deep and is filled with large angular boulders.

Subsurface conditions at the site were recently explored by excavating 9 test pits across the proposed site. Test pits were excavated by Gulf Shore Excavation of Rancho Cordova, California

© 2024 Kleinfelder

with a John Deere 310 G track excavator to depths ranging from approximately 1½ and 9 feet bgs within the fuel facility area. Kleinfelder also subcontracted a Geophysics company (Gasch Geophysical Services) to perform a seismic refraction survey across the proposed site. The survey was used to evaluate the excavatability (rippability) of the bedrock within the proposed area.

Subsurface materials encountered during the explorations consisted of colluvium/residual soil overlying bedrock. The colluvium/residual soil consisted primarily of sandy silts and lean clays with variable amount of sand and gravel and varied in depth from approximately 1½ to 5 feet bgs. Below the colluvium/residual soil lies bedrock comprised of highly weathered and fractured metavolcanic rock (Vp = 3,000 to 6,000 ft/s) underlain by slightly weathered, intact rock (Vp > 6,000 ft/s). The highly weathered rock was observed to be approximately 10 feet thick. The rock increased in strength and decreased in weathering and fracture amount with depth, as shown in the seismic refraction survey report (Appendix C). Test pits were dug until practical rock refusal was encountered.

Groundwater was not encountered in our explorations to the maximum depth explored of approximately 9 feet. During Kleinfelder's investigation of the adjacent property in 2019, the seasonal creek across the property had been flowing rapidly and all excavated test pits encountered perched water near bedrock contact. Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, perched groundwater will likely be present at or near subgrade level across the entire site during and after rainfall events.

Based on the results of our prior field exploration, laboratory testing, and geotechnical analyses, it is our professional opinion that the proposed project is geotechnically feasible, provided the recommendations presented in this geotechnical report are incorporated into the project design and construction. The following key items were developed from our study.

- Based on the results of the seismic refraction lines, the near surface soils are comprised of a thin colluvium/residual soil layer varying in thickness from approximately 1½ to 5 feet thick. Below the colluvium/residual soil lies bedrock comprised of highly weathered and fractured metavolcanic rock (Vp = 3,000 to 6,000 ft/s). The strength of this highly weathered rock layer increases in depth and is approximately 10 feet thick. The highly weather rock layer is underlain by slightly weathered, intact rock (Vp > 6,000 ft/s). The depth to the bottom of this layer varies from approximately 10 to 20 feet bgs.

© 2024 Kleinfelder

- Soils and rock with velocities of less than 3,000 fps can usually be excavated with conventional earth moving equipment. The intermediate material (velocities between 3,000 fps and 6,000 fps) would likely require heavy equipment and possibly localized use of jackhammers, ram-hoes, or selective blasting to provide cost-effective excavation. Where materials with velocities in excess of 6,000 fps are found, blasting would normally be required for efficient fragmentation. However, if the rock is thinly bedded, jointed, or fractured, it may be possible to break the rock with heavy ripping using a single shank ripper or large ram-hoe. The resulting fragments will be of a size consistent with the fracture spacing and the progress of excavation would be very slow.
- Based on the preliminary grading plans provided by Kier and Wright (project civil engineer), the fuel facility area including the canopy, tanks, and queuing aisles will receive fills of approximately 13 to 18 feet across the site to achieve desired grades. The entrance roadway on the north side will have fills of approximately 4 to 5 feet and on the southern roadway cuts of approximately 5 to 6 feet are planned. In discussions with Costco and the project civil engineer, it has not been decided if fills will be achieved using import soils or balancing the site with rock fill. Fuel facility canopy foundations are anticipated to be founded in structural fill and underground storage tanks will likely tip into the highly weathered rock layer (Vp = 3,000 to 6,000 ft/s).
- Due to the composition of the bedrock, it will not reduce to a soil-like material when excavated and will not be suitable for re-use as structural fill. It is anticipated that crushing and processing the harder rock layers will prove challenging and may require soil to be imported onsite. Import materials, if required, should have a Plasticity Index of less than 10 with no less than 70 percent passing the No. 4 sieve, no more than 30 percent of the particles passing the No. 200 sieve, and no particles greater than 3 inches in maximum dimension. The maximum Plasticity Index for imported soils may be modified upon approval by Costco depending on its proposed use. The contractor should provide documentation to Costco that imported fill is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals prior to its transportation and use on site.
- Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Other than plant roots, organic matter in the topsoil is minimal based on our laboratory testing (between one and three percent). The topsoil can be re-used on site in fills.

© 2024 Kleinfelder

- A seasonal creek runs through the property from east to west toward Silva Valley Parkway. Soft and wet soils found at the base of seasonal creeks should be removed and replaced to the satisfaction of Kleinfelder's geotechnical representative during construction. Prior to filling in the seasonal creek, subdrains should be installed within the creek bottom. This creek was observed to be flowing rapidly in April 2019.
- Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, perched groundwater will likely be present at or near bedrock contact elevation across the site. Temporary dewatering provisions will likely be required during construction, as discussed in Section 5.2.4.
- The proposed fuel facility canopy may be supported on a conventional shallow foundation system founded on structural fill. Light poles may be supported on short drilled piles.
- For areas with new pavements, we recommend that the exposed subgrade be proof-rolled with heavy construction equipment (e.g., loader or smooth-drum roller) to disclose areas of soft and yielding material after the area has been stripped of soft earth materials and debris. Where soft or yielding material are observed, the material should be overexcavated and replaced with structural fill. The proof-rolling should extend beyond the proposed improvements a horizontal distance of at least 2 feet, if practicable.
- After proof-rolling and/or prior to placement of fill, the subgrade should be scarified to a depth of 6 to 8 inches, moisture conditioned, and compacted in accordance with the compaction criteria presented in section 5.2.6. The proof-rolling should extend beyond the proposed improvements a horizontal distance of at least 2 feet, if practicable.
- Due to poor draining subgrade conditions, we recommend drainage inlets and catch basins include pavement underdrains as shown in Detail 1 6_16 of the CWDRs.
- Resistivity values below 1,000 ohm-cm are considered extremely corrosive to buried ferrous metals (NACE, 2006). The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318-19 Table 19.3.1.1 (ACI, 2019). Therefore, in accordance with ACI Building Code 318-19, no special provisions for selection of cement type are required.

The findings, conclusions, and recommendations presented in this executive summary should not be relied upon without consulting our geotechnical report for more detailed description of the

geotechnical evaluation performed by Kleinfelder. The conclusions and recommendations presented in this report are subject to the limitations presented in Section 7.

© 2024 Kleinfelder

1 INTRODUCTION

This report presents the results of our geotechnical study for the proposed Costco fuel facility at Silva Valley Parkway (APN 122-720-019) in El Dorado Hills, California. The location of the project site is presented on Figure 1, Site Vicinity Map. The purpose of our study is to evaluate subsurface soil/bedrock and groundwater conditions at the project site to provide geotechnical recommendations for design and construction. The scope of our services was presented in our proposal titled, “Contract Amendment Request No. 2, Geotechnical Study – Relocated Fuel Facility, Proposal Costco Wholesale Warehouse and Fuel Facility, Silva Valley Parkway, El Dorado Hills, California, CW# 18-0487”, dated June 6, 2024.

This report includes a description of the work performed, a discussion of the geotechnical conditions observed at the site, and recommendations developed from our engineering analyses of field and laboratory data.

1.1 PROJECT DESCRIPTION

Kleinfelder understands Costco plans to construct a new fueling facility consisting of four gasoline refueling islands with four pumps at each island, three 40,000-gallon underground storage tanks (UST), a fuel additive UST, a controller enclosure, and a canopy structure. In addition, asphalt concrete and Portland cement concrete pavements will also be constructed. Kleinfelder understands Costco had originally planned to have the fuel facility on the same property as the proposed warehouse on parcel (APN 122-720-018) on the west side of Silva Valley Parkway. However, the fuel facility has been relocated east of Silva Valley Parkway onto parcel (APN 122-720-019). Kleinfelder had performed field investigations on this parcel in 2019 for the new warehouse (Kleinfelder, 2019), but the project was moved to the western parcel prior to the completion of fieldwork. The location of the project site is presented on Figure 1, Site Vicinity Map.

Based on our experience with fuel facilities, the canopy for the service islands is typically founded on spread footings and the design is typically governed by overturning moments from wind and seismic loading. Typical column dead loads are anticipated to be approximately 4 kips and typical live loads are up to approximately 30 kips, which result in bearing pressures of less than 1,000 pounds per square foot (psf).

The tank excavation is anticipated to be approximately 16 to 18 feet deep. The tanks are planned to be placed on gravel bedding and anchored with “deadmen” to resist potential buoyant forces. Based on the preliminary grading plans provided by Kier and Wright (project civil engineer), the fuel facility area including the canopy, tanks, and queuing aisles will receive fills of approximately

© 2024 Kleinfelder

13 to 18 feet across the site to achieve desired grades. The entrance roadway on the north side will have fills of approximately 4 to 5 feet and on the southern roadway cuts of approximately 5 to 6 feet are planned. In discussions with Costco and the project civil engineer, it has not been decided if fills will be achieved via import soils or balancing the site with rock fill. Based on fill volumes, the fuel facility canopy foundations will be founded in structural fill and underground storage tanks will likely tip into bedrock.

1.2 SCOPE OF SERVICES

The scope of our geotechnical study consisted of a literature review, subsurface excavations, seismic refraction lines, geotechnical laboratory testing, engineering evaluation and analysis, and preparation of this report. Studies to assess environmental hazards that may affect the soil and groundwater at the site were beyond our geotechnical scope of work. A description of our scope of services performed for the geotechnical portion of the project follows.

1.2.1 Task 1 – Background Data Review

We reviewed readily available published and unpublished geologic literature in our files and the files of public agencies, including selected publications prepared by the California Geological Survey (formerly known as the California Division of Mines and Geology) and the U.S. Geological Survey (USGS). We also reviewed readily available seismic and faulting information, including data for designated earthquake fault zones as well as our in-house database of faulting in the general site vicinity.

In addition, we reviewed our 2019 geotechnical report for a prior iteration of the Costco development (Kleinfelder, 2019). Data from the previous and current study were used in our geotechnical analysis. Pertinent logs from the previous explorations are noted on Figure 2 and presented in Appendix A.

1.2.2 Task 2 – Field Exploration

Subsurface conditions at the site were recently explored by excavating 9 test pits across the proposed site. Test pits were excavated by Gulf Shore Excavation of Rancho Cordova, California with a John Deere 310 G track excavator to depths ranging from approximately 1½ and 9 feet bgs within the fuel facility area. Kleinfelder also subcontracted a Geophysics company (Gasch Geophysical Services) to perform a seismic refraction survey across the proposed site. The survey was used to evaluate the excavatability (rippability) of the subsurface conditions within the proposed area.

© 2024 Kleinfelder

Prior to commencement of the fieldwork, Underground Service Alert (USA) was notified, and various geophysical techniques were used at the boring and test pit locations to identify potential conflicts with subsurface structures. A Kleinfelder staff engineer supervised the field operations and logged the explorations. Selected samples were retrieved, placed in plastic bags or sealed, and transported to our Sacramento laboratory for evaluation. Descriptions used on the logs result from field observations and data, as well as from laboratory test data. Stratification lines on the logs represent the approximate boundary between soil types, and the actual transition may vary and can be gradual. Appendix A presents a description of the field exploration program, test pit logs and a legend of terms and symbols used on the logs. Appendix C presents the seismic refraction survey.

1.2.3 Task 4 – Laboratory Testing

Laboratory testing was performed on selected samples to evaluate the physical and engineering characteristics of the subsurface soils. Laboratory testing consisted of in-situ moisture content and dry density, wash sieve, Atterberg limits, Modified proctor, and R-Value. In addition, testing for Naturally Occurring Asbestos (NOA) was conducted by ATEM Laboratories. A summary of the laboratory testing and results are presented in Appendix B. Results for the NOA testing will be published separately in Kleinfelder's Phase 2 environmental report (Kleinfelder, 2024). In summary, no NOA was detected during the investigation.

Previous lab results for soil corrosion testing and plant suitability from our previous investigation of this property (Kleinfelder, 2019) are also included in Appendix B.

1.2.4 Task 5 – Geotechnical Analyses and Report Preparation

We analyzed field and laboratory data in conjunction with the finished grades, facility layout, and assumed structural loads to provide geotechnical recommendations for the design and construction. We evaluated feasible foundation systems, including constructability and compatibility constraints, floor slab support, and earthwork. Seismic design parameters based on the 2022 California Building Code (CBC) are also presented.

This report summarizes the work performed, data acquired, and our findings, conclusions, and geotechnical recommendations for the design and construction. Our report includes the following items:

- Site Vicinity Map (Figure 1) and Field Exploration Map (Figure 2) showing the approximate field exploration locations;

© 2024 Kleinfelder

- Cross Section Figures (Figure 3);
- Logs of test pits (Appendix A);
- Results of laboratory tests (Appendix B);
- Results of the seismic refraction survey (Appendix C);
- Discussion of general site conditions;
- Discussion of general subsurface conditions as encountered in our field exploration, including the depth to groundwater (if encountered);
- Discussion of regional and local geology;
- Recommendations for seismic design parameters in accordance 2022 CBC;
- Recommendations for site preparation, earthwork, temporary slope inclinations, fill placement, and compaction specifications;
- Recommendations for foundation design (shallow foundation) under various loading conditions, including allowable bearing pressures, embedment depths, and settlement estimates;
- Recommendations for flexible and ridged pavement structural sections for light and heavy-duty pavement based on the Equivalent Single Axle Loading (ESALs), as stated in the Costco Wholesale Development Requirements (CWDR); and
- Preliminary evaluation of the corrosion potential of the on-site soils.

© 2024 Kleinfelder

2 SITE CONDITIONS

2.1 SITE DESCRIPTION

The proposed fuel facility site is located northeast side of the Silva Valley Parkway in El Dorado Hills, as shown on Figure 2. The land is zoned as commercial and is located around ¼ mile south of Oak Meadow Elementary school and the Serrano residential development. The proposed site is located directly east across Silva Valley Parkway from the proposed warehouse site location. Costco is proposing this site as an alternative to allow additional parking on the warehouse property side.

At the time of our field exploration, the site was an undeveloped field with rolling hills generally sloping from east to west with ground surface elevations ranging from approximately 739 to 760 feet. The majority of the project site is characterized by slope gradients of 5:1 (horizontal to vertical) and shallower (less steep). At the time of our field exploration, much of the site was covered by low-lying vegetation (weeds and shrubs) and animal burrows as well as some native trees. Rock outcrops were also visible throughout the site. Additionally, a seasonal creek runs through the property from east to west. This creek was dry during our July 2024 investigation but was observed to be flowing during our initial field exploration of the adjacent property in Spring 2019. A ditch also runs the property boundary along Silva Valley Parkway. The ditch is approximately 5 feet deep and is filled with large angular boulders. An unfinished portion (~100 feet long) of Tong Road resides on the southwest corner of the property.

© 2024 Kleinfelder

3 GEOLOGY

3.1 GEOLOGIC SETTING

3.1.1 Regional Geology

The subject site is situated in the gently rolling topography that forms the western foothills of the Sierra Nevada Mountains. The western foothills are broadly tilted, dipping westward, and uplifted increasingly to the east, due to maximum uplift of the Sierra Nevada at its eastern edge. The Sierra Nevada is comprised mostly of large, north-south elongated blocks of Mesozoic granitic terrain forming the backbone of California. The foothills in the project vicinity consist of a northwest-trending belt of metamorphosed volcanic and sedimentary rock that separate the Sierran crystalline basement rock (granites) from the Central Valley sediments. These rocks are distributed within three major north-south trending, fault-bounded lithologic terrains that extend along the length of the metamorphic belt. Rocks within these terrains have been isoclinally folded and metamorphosed on a regional scale and represent a “collage” of tectonically accreted blocks emplaced during convergent plate tectonism that occurred during the Early Paleozoic and Late Jurassic. Bedding, foliation, and major faults throughout the metamorphic belt normally trend northwest and dip steeply to the east.

3.1.2 Site Geology

The project area is mapped by Loyd (1983 and 1984) as being underlain by Jurassic and Triassic age metavolcanic rocks (map symbol Kgv). This formation is almost entirely of marine origin and consist mostly of basaltic to andesitic breccias, flows, and tuffs that have been metamorphosed, but with primary volcanic features generally recognizable. The formation also contains minor associated sandstone and conglomerate, although none were encountered during our field investigation. Foliation that developed from regional metamorphism is often evident in the rock structure and typically has a north-trending direction. Locally, schistose fabric may be evident. The rock strength of the in less weathered portions of the formation is typically very high and can result in difficult excavation conditions.

3.2 SUBSURFACE CONDITIONS

Subsurface materials encountered during the explorations consisted of colluvium/residual soil overlying bedrock. The colluvium/residual soil consisted primarily of sandy silts and lean clays with variable amount of sand and gravel and varied in depth from approximately 1½ to 5 feet bgs. Below the colluvium/residual soil, bedrock comprised of highly weathered and fractured metavolcanic rock (Vp = 3,000 to 6,000 ft/s) underlain by slightly weathered, intact rock (Vp >

© 2024 Kleinfelder

6,000 ft/s). The highly weathered rock was observed to be approximately 10 feet thick. The rock increased in strength and decreased in weathering and fracture amount with depth, as shown in the seismic refraction survey report (Appendix C). Test pits were dug until practical rock refusal was encountered. Table 1 below shows rock depths observed and practical refusal depths in the field in relation to approximate elevation.

TABLE 1
OBSERVED FIELD ROCK CONDITIONS

TEST PIT LOCATION	APPROXIMATE SURFACE ELEVATION	APPROXIMATE DEPTH TO ROCK (FT BGS)	PRACTICAL REFUSAL DEPTH (FT BGS)
TP-1	754	1.5	1.91
TP-2	760	1.0	1.3
TP-3	747	1.5	3.25
TP-4	739	2.75	5.0
TP-5	743	2.5	6.0
TP-6	740	2.0	4.0
TP-7	743	1.5	2.25
TP-8	746	2.5	4.25
TP-9	741	5.0	9.0

3.3 GROUNDWATER

Groundwater was not encountered in our explorations to the maximum depth explored of approximately 9 feet. During Kleinfelder's investigation of the property in 2019, the seasonal creek across the property had been flowing rapidly and all excavated test pits encountered perched water near bedrock contact. Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, perched groundwater will likely be present at or near bedrock contact elevation across the site.

Localized zones of perched water, increased soil moisture content and fluctuations of the groundwater level, should be anticipated during and following the rainy season. Irrigation of landscaped areas on or adjacent to the site can also cause a fluctuation of local groundwater levels.

© 2024 Kleinfelder

3.4 ASSESSMENT OF POTENTIAL GEOLOGIC HAZARDS

3.4.1 Localized Faulting

According to the California Geological Survey (CGS, 2024), the site is not located within an Alquist-Priolo Earthquake Fault Zone and no mapped active or potentially active fault traces are known to traverse the site. The project area is situated within a region traditionally characterized by few active faults, numerous inactive faults, and low to moderate seismic activity.

An active fault is a fault that has experienced seismic activity during historic time (since roughly 1800) or exhibits evidence of surface displacement during Holocene time (Hart and Bryant, 1997). The definition of "potentially active" varies. A generally accepted definition of "potentially active" is a fault showing evidence of displacement that is older than 11,000 years (Holocene age) and younger than 1.7 million years (Pleistocene age). However, "potentially active" is no longer used as criteria for zoning by the California Geologic Survey (CGS), formerly known as the Division of Mines and Geology. The terms "sufficiently active" and "well-defined" are now used by the CGS as criteria for zoning faults under the Alquist-Priolo Earthquake Fault Act. A "sufficiently active fault" is a fault that shows evidence of Holocene surface displacement along one or more of its segments and branches, while a "well-defined fault" is a fault whose trace is clearly detectable by a trained geologist as a physical feature at or just below the ground surface. The definition "inactive" generally implies that a fault has not been active since the beginning of the Pleistocene Epoch (older than 1.7 million years old).

The nearest well-defined faults to the project are the Genoa and Cordelia faults. Both faults are located over 50 miles from the project site. A major seismic event on either of these faults is anticipated to cause weak ground shaking at the project site.

The nearest fault to the project site is the west trace of the Bear Mountain Fault Zone that strikes northwest-southeast for approximately 84 miles along the Sierra Foothill region. A fault trace within this zone is located approximately 650 feet west of the project and forms a major contact between the metavolcanics rock that underly the project and the younger Copper Hills Volcanics Formation to the west of the fault. Seismically, the mapped fault near the project is mapped as Pre-Quaternary (CGS, 2010). However, current seismic data (ANSS, 2011) shows micro-earthquakes (magnitude less than 2 or 3) are generated along the northern portion of the fault zone and UCEF3 includes the Swain Ravine – Spenceville segment of the Bear Mountains Fault Zone in their probability model (USGS, 2013). This low seismic activity is not expected to impact the project.

© 2024 Kleinfelder

3.4.2 Landsliding

Landslides and other forms of mass wasting, including mud flows, debris flows, soil slips, and rock falls occur as soil or rock moves down slope under the influence of gravity. Landslides are frequently triggered by intense rainfall or seismic shaking. Debris flows are known to travel great distances from their source based on the gradients, channel geometry and amount of fluid within the slide mass.

The majority of the project site is characterized by slope gradients of 5:1 (horizontal to vertical) and shallower (less steep). Given the elevation differential and shallow gradients the potential for slope instability is considered low.

3.4.3 Liquefaction and Seismic Compression

The term liquefaction describes a phenomenon in which saturated, cohesionless soils temporarily lose shear strength (liquefy) due to increased pore water pressures induced by strong, cyclic ground motions during an earthquake. Structures founded on or above potentially liquefiable soils may experience bearing capacity failures due to the temporary loss of foundation support, vertical settlements (both total and differential), and/or undergo lateral spreading. The factors known to influence liquefaction potential include soil type, relative density, grain size, confining pressure, depth to groundwater, and the intensity and duration of the seismic ground shaking. Liquefaction is most prevalent in loose to medium dense, silty, sandy, and gravelly soils below the groundwater table. No groundwater was observed during our field investigation. Based on our review of available groundwater well data, it is our opinion that the regional groundwater is deep. Therefore, based on the results of the subsurface explorations and review data, the potential for liquefaction and its adverse effects (i.e., seismic settlement and lateral spreading) is not considered a hazard at the site.

Seismic compression results from the accumulation of contractive volumetric strains in unsaturated soil during earthquake shaking. Loose to medium dense granular material with no fines or with low plasticity fines are most susceptible to seismic compression. Based on the density and soil composition of the underlying soils, the potential for seismic compression is considered low. We estimate dry seismic settlement potential at this site will be low.

3.4.4 Expansive Soils

Expansive soils are characterized by their ability to undergo significant volume changes (shrink or swell) due to variations in moisture content. Changes in soil moisture content can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought,

© 2024 Kleinfelder

or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. The surficial soils are generally sandy lean clays and sandy silts with gravel overlying rock, the observed expansion potential of these soils are low to moderate.

3.4.5 Collapsible Soils

Collapsible soils are characterized by their ability to undergo significant shrinkage (collapse) during inundation. Inundation in soils can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. Based on the results of laboratory testing, the soil encountered are not expected to collapse during inundation, so the impact of collapsible soils for this site is considered low.

3.4.6 Subsidence

The site is not located in an area of known significant ground subsidence due to the withdrawal of subsurface fluids. Subsidence may be present but adverse impacts have not been recorded. Therefore, the potential for subsidence occurring at the site due to the withdrawal of oil, gas, or water is considered low.

3.4.7 Flooding

The Flood Insurance Rate Map prepared by the Federal Emergency Management Agency (FEMA) was reviewed to identify the potential flood hazard for the project. This map indicates the site is within Zone X which is defined as being an area with a 0.2-percent-annual-chance-flood and an area of 1-percent-annual-chance flood with average depths of less than 1 foot. Based on this information the potential for the project site to be impacted by regional flooding is considered low. However, the accuracy of this information should be confirmed by a qualified civil engineer/hydrologist. The need and/or method for mitigation of potential flooding should also be addressed.

3.4.8 Oil and Gas Fields

Upon review of the California Division of Oil, Gas & Geothermal Resources (2016) interactive well-finder map accessed at https://maps.conservation.ca.gov/doggr/wellfinder, the El Dorado Hills region does not contain any known abandoned oil wells. Additionally, no active wells are known to exist within the project boundary.

© 2024 Kleinfelder

3.4.9 Naturally Occurring Asbestos

Naturally occurring asbestos (NOA) has been identified as a source of potentially hazardous airborne asbestos fibers when disturbed by mining or earthwork activities, if present (Clinkenbeard et al., 2002). NOA generally occurs within mafic or ultramafic metamorphic rock units in which one of the asbestiform minerals defined by the California Air Resources Board (CARB, 2002) are present. These NOA minerals have unique flexibility and strength characteristics and include asbestiform varieties of the six minerals chrysotile, amosite, crocidolite, tremolite actinolite, and anthophyllite. Kleinfelder gathered asbestos samples within the project alignment and the results were negative for the presence of NOA minerals upon testing. Full results and discussion is published in Kleinfelder's Phase 2 environmental report for this project.

In addition, based on numerous NOA studies Kleinfelder has performed in the project area, typical NOA concentration level ranges (measured as a percent volume using the polarized light microscopy identification method [PLM]) can be identified for the rock types/geologic units present along the project alignment. These typical values can be compared to the threshold limits established by CARB's Airborne Toxic Control Measures (ATCM) for Construction Grading, Quarrying, and Surface Mining Operation (CARB, 2002) to identify whether mitigative measurements need to be implemented during excavation of the foundation towers and how the excavation spoils are to be handled relative to disposal and off-haul. Generally, the metavolcanic rock has concentration levels at or below the threshold level of 0.25 percent. Where NOA levels are at or above 0.25 percent, contractors are required to implement mitigation practices to protect workers and the public from airborne NOA particles generated during earthwork operations. NOA levels at or above 1 percent is considered a hazardous material and will require special handling during transportation and will need to be disposed of at an approved site. The Asbestos Review Areas map (Churchill, 2000) indicates the project site is in an area that has been removed as mappable NOA bearing unit based on geologic evaluation. Based on this data the potential for NOA to be encountered at levels at or exceeding regulatory threshold levels is considered low. However, testing by Costco could be performed to further define NOA concentrations across the project area in order to assist Costco with identifying their risk associated with this hazard. Should levels be equal to or exceed regulatory threshold levels mitigation procedures will need to be implemented. Mitigation alternatives will need to be consistent with guidelines outlined in the CARB's current ATCM and Occupational Safety and Health Administration (OSHA) standards for the handling of NOA.

© 2024 Kleinfelder

4 CONCLUSIONS AND RECOMMENDATIONS

4.1 GENERAL

Based on the results of our field exploration, laboratory testing and engineering analyses conducted during this study, it is our professional opinion that the proposed project is geotechnically feasible, provided the design and construction recommendations presented in this report are incorporated into the project. We identify the following key geotechnical considerations during our study.

- Based on the results of the seismic refraction lines, the near surface soils are comprised of a thin colluvium/residual soil layer varying in thickness from approximately 1½ to 5 feet thick. Below the colluvium/residual soil lies bedrock comprised of highly weathered and fractured metavolcanic rock (Vp = 3,000 to 6,000 ft/s). The strength of this highly weathered rock layer increases in depth and is approximately 10 feet thick. The highly weather rock layer is underlain by slightly weathered, intact rock (Vp > 6,000 ft/s). The depth to the bottom of this layer varies from approximately 10 to 20 feet bgs.
- Soils and rock with velocities of less than 3,000 fps can usually be excavated with conventional earth moving equipment. The intermediate material (velocities between 3,000 fps and 6,000 fps) would likely require heavy equipment and possibly localized use of jackhammers, ram-hoes, or selective blasting to provide cost-effective excavation. Where materials with velocities in excess of 6,000 fps are found, blasting would normally be required for efficient fragmentation. However, if the rock is thinly bedded, jointed, or fractured, it may be possible to break the rock with heavy ripping using a single shank ripper or large ram-hoe. The resulting fragments will be of a size consistent with the fracture spacing and the progress of excavation would be very slow.
- Based on the preliminary grading plans provided by Kier and Wright (project civil engineer), the fuel facility area including the canopy, tanks, and queuing aisles will receive fills of approximately 13 to 18 feet across the site to achieve desired grades. The entrance roadway on the north side will have fills of approximately 4 to 5 feet and on the southern roadway cuts of approximately 5 to 6 feet are planned. In discussions with Costco and the project civil engineer, it has not been decided if fills will be achieved via import soils or balancing the site with rock fill. Fuel facility canopy foundations are anticipated to be founded in structural fill and underground storage tanks will likely tip into the highly weathered rock layer (Vp = 3,000 to 6,000 ft/s).
- Due to the composition of the bedrock, it will not reduce to a soil-like material when excavated and will not be suitable for re-use as structural fill. It is anticipated that crushing

© 2024 Kleinfelder

and processing the harder rock layers will prove challenging and may require soil to be imported onsite. Import materials, if required, should have a Plasticity Index of less than 10 with no less than 70 percent passing the No. 4 sieve, no more than 30 percent of the particles passing the No. 200 sieve, and no particles greater than 3 inches in maximum dimension. The maximum Plasticity Index for imported soils may be modified upon approval by Costco depending on its proposed use. The contractor should provide documentation to Costco that imported fill is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals prior to its transportation and use on site.

- Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Other than plant roots, organic matter in the topsoil is minimal based on our laboratory testing (between one and three percent). The topsoil can be re-used on site in fills.
- A seasonal creek runs through the property from east to west toward Silva Valley Parkway. Soft and wet soils found at the base of seasonal creeks should be removed and replaced to the satisfaction of Kleinfelder's geotechnical representative during construction. Prior to filling in the seasonal creek, subdrains should be installed within the creek bottom. This creek was observed to be flowing rapidly in April 2019.
- Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, perched groundwater will likely be present at or near bedrock contact elevation across the site. Temporary dewatering provisions will likely be required during construction, as discussed in Section 5.2.4.
- The proposed fuel facility canopy may be supported on a conventional shallow foundation system founded on structural fill. Light poles may be supported on short drilled piles.
- For areas with new pavements, we recommend that the exposed subgrade be proof-rolled with heavy construction equipment (e.g., loader or smooth-drum roller) to disclose areas of soft and yielding material after the area has been stripped of soft earth materials and debris. Where soft or yielding material are observed, the material should be overexcavated and replaced with structural fill. The proof-rolling should extend beyond the proposed improvements a horizontal distance of at least 2 feet, if practicable.
- After proof-rolling and/or prior to placement of fill, the subgrade should be scarified to a depth of 6 to 8 inches, moisture conditioned, and compacted in accordance with the

© 2024 Kleinfelder

compaction criteria presented in section 5.2.6. The proof-rolling should extend beyond the proposed improvements a horizontal distance of at least 2 feet, if practicable.

- Due to poor draining subgrade conditions, we recommend drainage inlets and catch basins include pavement underdrains as shown in Detail 1 6_16 of the CWDRs.
- Resistivity values below 1,000 ohm-cm are considered extremely corrosive to buried ferrous metals (NACE, 2006). The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318-19 Table 19.3.1.1 (ACI, 2019). Therefore, in accordance with ACI Building Code 318-19, no special provisions for selection of cement type are required.

The following opinions, conclusions, and recommendations are based on the properties of the materials encountered in the borings, the results of the laboratory-testing program, and our engineering analyses performed. Our recommendations regarding the geotechnical aspects of the design and construction of the project are presented in the following sections.

4.2 2022 CBC SEISMIC DESIGN PARAMETERS

According to the 2022 California Building Codes (CBC), every structure, and portion thereof, including non-structural components that are permanently attached to structures and their supports and attachments, shall be designed and constructed to resist the effects of earthquake motions in accordance with ASCE 7-16. The Seismic Design Category for a structure may be determined in accordance with Section 1613 of the 2022 CBC.

Based on information obtained from the investigation, published geologic literature and maps, and on our interpretation of the ASCE 7-16 criteria, it is our opinion that the project site may be classified as Site Class C, Soft Rock. Approximate coordinates for the site are noted below.

Latitude: 38.66208°N
Longitude: 121.05749°W

The Risk-Targeted Maximum Considered Earthquake (MCE_R) mapped spectral accelerations for 0.2 seconds and 1 second periods (S_s and S_1) were estimated using Section 1613 of the 2022 CBC and the Structural Engineering Association (SEA) web based application (available at http:// https://www.seismicmaps.org/). The mapped acceleration values and associated soil amplification factors (F_a and F_v) based on the 2022 CBC and corresponding site modified spectral accelerations (S_{MS} and S_{M1}) and design spectral accelerations (S_{DS} and S_{D1}) are presented in Table 2.

© 2024 Kleinfelder

F_v	1.500
S_{MS} (g)	0.526
S_{M1} (g)	0.311
S_{DS} (g)	0.351
S_{D1} (g)	0.207
PGA_M (g)	0.172

4.3 FOUNDATIONS

4.3.1 General

Based on the results of our field exploration, laboratory testing, and geotechnical analyses, the proposed fueling facility canopy may be supported on a conventional shallow foundation system founded on structural fill. New light poles may be supported on short, drilled piles. Recommendations for the design and construction of spread footings and drilled piles are presented below.

4.3.2 Conventional Shallow Foundations

Allowable Soil Bearing Pressure

We understand that new spread footing foundations for the canopies will be embedded approximately 6 to 7 feet below the finished grade. Spread footings founded on structural fill may be designed for a net allowable soil bearing pressure of 3,000 psf for dead plus sustained live loads. A one-third increase in the above bearing pressures can be used for short term load conditions for wind or seismic loads. The footing dimension and reinforcement should be designed by the structural engineer; however, continuous footings should have minimum widths of 18 inches.

© 2024 Kleinfelder

Estimated Settlement

We estimate total static settlement for foundations designed and constructed in accordance with the recommendations presented above to be ½ inch or less. Differential static settlement between similarly loaded footings is estimated to be less than ½ inch over 50 feet. Differential seismic settlement is also estimated to be less than ½ inch over 50 feet.

Lateral Resistance

Lateral load resistance may be derived from passive resistance along the vertical sides of the footings, friction acting at the base of the footing, or a combination of the two. An allowable passive resistance of 250 psf per foot of depth may be used for design. Allowable passive resistance values should not exceed 2,500 psf. An allowable coefficient of friction value of 0.3 between the base of the footings and the engineered fill soils can be used for sliding resistance using the dead load forces. Friction and passive resistance may be combined without reduction. We recommend that the first foot of soil cover be neglected in the passive resistance calculations if the ground surface is not protected from erosion or disturbance by a slab, pavement or in a similar manner.

4.3.3 Drilled Pile Foundations

Axial Capacity

The compressive axial capacity of drilled piles may be estimated based on an allowable skin friction capacity of 200 pounds per square foot. The upper one foot of the skin friction capacity should be ignored. The uplift capacity may be estimated as 70 percent of the allowable compressive axial capacity. A one-third increase in the allowable capacities may be used for transient loading conditions such as wind or seismic loads.

Settlement

Settlement of the proposed canopy supported on drilled piles, as recommended, is estimated to be less than ½ inch.

Lateral Resistance

The drilled pile foundations lateral resistance can be designed in general accordance with Section 1807.3 of the CBC. We recommend a lateral soil bearing pressure of 250 psf per foot of depth below grade. The total lateral soil bearing pressure should not exceed 2,500 psf per pile. Since drilled piles will act as isolated pole foundations, the allowable lateral soil bearing pressure may be increased by

© 2024 Kleinfelder

a factor of 2 for short-term lateral loads provided the structure will not be adversely affected by ½ inch of lateral movement at the ground surface.

4.4 EXTERIOR FLATWORK

Prior to casting exterior flatwork, the subgrade soils should be scarified, moisture conditioned, and recompacted or overexcavated, as recommended in Section 5.2.2. Exterior concrete slabs for pedestrian traffic or landscape should be at least four inches thick. Weakened plane joints should be located at intervals of about 6 feet. Careful control of the water/cement ratio should be performed to avoid shrinkage cracking due to excess water or poor concrete finishing or curing. Unreinforced slabs should not be built in areas where further saturation may occur following construction.

4.5 SITE DRAINAGE

Foundation and slab performance depend greatly on proper irrigation and how well runoff water drains from the site. As such, we recommend that good drainage be provided away from structures and other improvements as discussed below. Drainage should be maintained both during construction and over the entire life of the project. The ground surface around structures should be graded such that water drains rapidly away from structures without ponding. The surface gradient needed to do this depends on the surface type and should follow CWDRs (Costco, 2022).

A seasonal creek is present on the site running east to west, this creek was observed to be flowing rapidly during a previous investigation in 2019. After stripping the site and prior to filling in the creek, subdrains should be installed within the creek bottom.

Due to the presence of shallow rock and because the upper soils are predominately clayey, poor draining subgrade conditions may be present. Accordingly, we recommend drainage inlets and catch basins include pavement underdrains as shown in Detail 16_16 of the CWDRs. Drains should be designed and constructed per Costco's standard details and laterals should extend at least 10 feet from the catch basins. Foundation drains are not necessary.

We recommend that landscape planters either not be located adjacent to buildings and pavement areas or be isolated and properly drained to area drains such that cycles of wetting and drying do not impact pavements, flatwork, and other structures. Drought resistant plants and minimum watering are recommended for planters, if used. No planters should be installed immediately adjacent to structures unless they are water-proofed and have a drainpipe connected to an area drain outlet. Planters should be built such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement. Roof water should be directed to fall on hardscape

© 2024 Kleinfelder

areas sloping to an area drain, or roof gutters and downspouts should be installed and routed to area drains. Roof downspouts and their associated drains should be isolated from other subdrain systems, where used, to avoid flooding. In any event, maintenance personnel should be instructed to keep areas uniformly moist throughout the life of the project (e.g., limit or eliminate cycles of wetting and drying) as cycles of wetting and drying will cause distress in surrounding improvements. Should excessive irrigation, waterline breaks, or unusually high rainfall occur, saturated zones and "perched" groundwater may develop. Consequently, the site should be graded so that water drains away readily without saturating the foundation or landscaped areas. Potential sources of water such as water pipes, drains, and the like should be frequently examined for signs of leakage or damage. Any such leakage or damage should be promptly repaired. Wet utilities should also be designed to be watertight and should be inspected and repaired as needed.

4.6 PAVEMENTS

The required pavement structural sections will depend on the expected wheel loads, volume of traffic, and subgrade soils. We have provided asphalt concrete pavement sections for traffic indices provided in the CWDRs (Costco, 2022). Positive drainage of the paved areas should be provided since moisture infiltration into the subgrade may decrease the life of pavements. Curbing located adjacent to paved areas should be founded in the subgrade, not the aggregate base, in order to provide a cutoff, which reduces water infiltration into the base course.

The following pavement sections are based on the soil conditions encountered during our field investigation, our assumptions regarding final site grades, and limited laboratory testing.

4.6.1 Costco Design Parameters

We developed pavement design recommendations using traffic loading parameters provided in the Costco Wholesale Development Requirements and the following test data:

- A 20-year pavement design life;
- Light-duty pavements subject to 6,600 passenger vehicle trips per year (Traffic Index of 5.0);
- Heavy-duty pavements subject to 30 tractor-trailer truck trips per day (Traffic Index of 7.0);
- For asphalt concrete pavements: an R-value of 15 based on previous laboratory testing results; and
- For Portland cement concrete (PCC) Pavements: a 28-day flexural strength (modulus of rupture determined by the third-point method) of at least 550 pounds per square inch (psi)

© 2024 Kleinfelder

(approximate compressive strength of 4,000 psi); a modulus of subgrade reaction (k value) of 125 pounds per square inch per inch (pci); and interlock at the control joints.

4.6.2 Asphalt Concrete Pavement

We have developed new asphalt concrete pavement, also referred to as Hot Mix Asphalt (HMA) pavements sections in accordance the Caltrans Highway Design Manual in lieu of the Asphalt Institute Manual Series (MS-1) so that the pavement structural sections are somewhat comparable to the existing sections. HMA should conform to requirements of the Costco Wholesale Specification Section 321216, Asphalt Paving. Table 3 presents recommended HMA pavement sections. The designer should select the appropriate pavement sections based on project requirements. Prior to placement of aggregate base, pavement subgrade should be prepared in accordance with Section 5.2.2.

TABLE 3
ASPHALT CONCRETE PAVEMENT SECTIONS

TRAFFIC USE	TRAFFIC INDEX, TI	ASPHALT CONCRETE (INCHES)*	AGGREGATE BASE (INCHES)*
Light-Duty Pavement	5.0	4.0	6.0
Heavy-Duty Pavement	7.0	5.0	10.0

*Rounded to the nearest ½ inch

4.6.3 Asphalt Performance Grade Binder

An asphalt performance grade (PG) binder of 64-10 should be used for the project and is locally available. This recommendation was developed in accordance with Costco Wholesale Asphalt Paving Specification Section 321216. Air temperature data near the project site was used with the MERRA Climate Data option and the PG binder was selected using the FHWA program LTTPBind Online web-based tool based on the AASHTO M323-13 standard. The high-end and low-end temperature rating was selected to provide a reliability of at least 98 and 90 percent, respectively.

4.6.4 Portland Cement Concrete Pavement

We designed PCC pavement in accordance with the Portland Cement Association (PCA) Thickness Design for Concrete Pavements (PCA, 1984) using the design parameters stated above. For heavy-duty pavements, we recommend that PCC pavement should be comprised of

© 2024 Kleinfelder

7.5 inches of PCC with 6.0 inches of aggregate base. Prior to placement of aggregate base, pavement subgrade should be prepared in accordance with Section 5.2.2.

Longitudinal and transverse joint spacing should not exceed 12 feet and 15 feet, respectively. Joint details should conform to PCA guidelines. Expansion joints in concrete slabs should be sealed with petroleum resistant sealant to prevent minor releases from impacting subsurface soil.

4.6.5 Aggregate Base

Aggregate base materials should meet current Caltrans specifications for Class 2 aggregate base and be compacted to at least 95 percent relative compaction (ASTM D1557).

4.7 SOIL CORROSION

A preliminary evaluation of the corrosion potential of the on-site soils to steel and buried concrete was completed during our initial site investigation of the property in 2019. Laboratory testing was performed on two soil samples to evaluate pH, minimum resistivity, chloride, and soluble sulfate content. Results from our samples gathered in 2019 are provided in Table 3 below.

TABLE 4
CORROSION TEST RESULTS

Location	Depth (ft)	Minimum Resistivity (ohm-cm)	pH	Soluble Sulfate Content (ppm)	Soluble Chloride Content (ppm)
TP-1 (2019)	0.5	3,255	6.4	33	34
TP-2 (2019)	0	769	6.6	185	204

These tests are only an indicator of soil corrosivity for the samples tested. Other soils found on site may be more, less, or of a similar corrosive nature. Imported fill materials should be tested to confirm that their corrosion potential is not more severe than those noted.

Resistivity values less than 1,000 ohm-cm are considered extremely corrosive to buried ferrous metals (NACE, 2006). The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318-19 Table 19.3.1.1 (ACI, 2019). Therefore, in accordance with ACI Building Code 318-19, no special provisions for selection of cement type are required.

© 2024 Kleinfelder

Kleinfelder's scope of services does not include corrosion engineering and, therefore, a detailed analysis of the corrosion test results is not included. We understand gasoline station equipment is constructed of corrosion resistant synthetic materials. We recommend the gasoline station designer review these results and consult a corrosion expert for further evaluation, if necessary.

4.8 STORM WATER MANAGEMENT

We have assessed the potential for storm water infiltration into the subgrade soils at the subject project site based on soil type and laboratory testing. Pursuant to the current standard of practice, an infiltration evaluation is a two-step process. The first step is to characterize the site to assess whether infiltration is feasible. If infiltration is feasible, then infiltration testing is needed to provide a design infiltration rate (step two).

Based on visual soil classification and laboratory testing of the soil samples collected during our field exploration, the onsite soils in the upper 5 feet below the existing ground surface at the site are comprised primarily colluvium/residual soil consisted primarily of sandy silts and lean clays underlain by bedrock. Seasonal perched groundwater was also observed within these soils above the bedrock. Given the low infiltration capacity of the on-site soils and observed perched groundwater, we recommend alternatives to infiltration Best Management Practices (BMPs), such as bio filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the project site.

If bio-filtration/bio-retention systems are employed, we recommend that the BMPs be built such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement. If planters are located within 10 feet of the structures, or adjacent to slabs and pavements, then some means of diverting water away from the building, building foundation soils, or soils that support slabs and pavements would be required, such as lining the planters.

© 2024 Kleinfelder

5 CONSTRUCTION RECOMMENDATIONS

5.1 GENERAL

The following recommendations should be used by the contractor for construction of the project.

5.2 EARTHWORK

5.2.1 General

Site preparation and earthwork operations should be performed in accordance with applicable codes, safety regulations and other local, state, or federal specifications, and the recommendations included in this report. References to maximum dry unit weights are established in accordance with the latest version of ASTM Standard Test Method D1557 (modified Proctor). The earthwork operations should be observed and tested by a representative of Kleinfelder.

5.2.2 Site Preparation

Abandoned utilities, existing pavements, foundations, and other existing improvements within the proposed fuel facility area should be removed and the excavation(s) backfilled with engineered fill. Debris produced by demolition operations, including wood, steel, piping, plastics, etc., should be separated and disposed of off-site. Existing utility pipelines or conduits that extend beyond the limits of the proposed construction and are to be abandoned in place, should be plugged with non-shrinking cement grout to prevent migration of soil and/or water. Demolition, disposal, and grading operations should be observed and tested by a representative of Kleinfelder. Areas to receive fill should be stripped of all dry or soft earth materials and unsuitable fill materials to the satisfaction of a representative of Kleinfelder. In addition, a seasonal creek runs through the property from east to west, soft and wet soils at the base of creeks must be removed and replaced with structural fill to the satisfaction of Kleinfelder's Geotechnical representative during construction. Prior to filling in the seasonal creek, subdrains should be installed within the creek bottom.

After the area has been stripped/grubbed of organic material and soft earth materials and debris have been removed and prior to fill placement, we recommend that the exposed subgrade be proof-rolled with heavy construction equipment (e.g., loader or smooth-drum roller) to disclose areas of soft and yielding material. Where soft and yielding material is observed, it should be over excavated and replaced as structural fill. After proof-rolling and/or prior to placement of fill, the subgrade should be scarified to a depth of 8 to 12 inches, moisture conditioned, and compacted

© 2024 Kleinfelder

in accordance with the compaction criteria presented in section 5.2.4. The proof-rolling should extend beyond the proposed improvements a horizontal distance of at least 2 feet, if practicable.

Per our previous investigation in Spring of 2019, perched groundwater may be present at bedrock contact (as shallow as 1-2 feet bgs). The contractor should anticipate that pumping subgrade conditions may be encountered during site grading activities due to shallow perched groundwater, and the subgrade may need to be stabilized with geotextiles and crushed rock. Recommendations to stabilize pumping subgrade are provided in Section 5.3.

5.2.3 Permanent Slopes

Permanent slopes should be constructed at 2:1 (horizontal to vertical) or flatter. Slopes will be subject to erosion and should be planted as soon as practicable. Where new fill slopes are to be constructed on hillsides or existing slopes, the topsoil, colluvial soils, and other materials considered unsuitable should be removed. Where the exposed slope is steeper than 5:1, or where recommended by personnel by our firm, the original ground on which fill is to be placed should be keyed and benched. The benches should extend in the underlying bedrock. Key should be at least 8 feet wide and sloped a minimum of 2 percent towards the slope. Benches should be at least 4 feet wide and not exceed 4 feet in height. Fill slopes should be overbuilt by 2 feet then cut back to facilitate compaction at the face. Fill and cut slopes should be observed by our firm during grading to evaluate the anticipated geologic conditions and make any necessary modifications.

5.2.4 Groundwater Impacts

Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Perched groundwater above the bedrock was encountered in test pits excavated in Spring 2019 that were advanced following a period of heavy rainfall and may be encountered during construction. This is most likely to occur following periods of rainfall and in the winter and spring months. If encountered, excavations which encounter perched groundwater will need to be temporarily dewatered. In our opinion, dewatering of narrow trench excavations, which penetrate less than a few feet below the groundwater level and do not encounter loose and/or cohesionless soils, may be possible by directing inflow to a sump where water can be removed by a pump. Temporary dewatering of wider, deeper, and/or more extensive excavations may require well points, deep wells, and/or deep sumps. To help maintain bottom stability of wider, deeper, and/or more extensive excavations, groundwater levels should be drawn-down a minimum of 2 feet below the lowest portion of the excavation. Since temporary dewatering will impact and be dependent on construction methods and scheduling, we recommend the contractor be solely

© 2024 Kleinfelder

responsible for the design, installation, maintenance, and performance of all temporary dewatering systems.

Depending on the depth of excavation below perched groundwater, soil conditions encountered along the excavation face, and slope inclination, caving or sloughing of excavation slopes is likely within the vicinity of a sump dewatering system. Sloughing or caving of excavation slopes could endanger personnel working within or adjacent to the excavation as well as nearby equipment, structures, or other existing improvements. The contractor should be aware of the potential for caving and take appropriate precautions to ensure the safety of site personnel as well as the integrity of the excavation slopes and any existing, nearby structures or other improvements.

5.2.5 Foundation Excavations

Shallow Foundations

Following excavation to the foundation subgrade elevations, the exposed subgrade should be observed by a representative of the geotechnical engineer to evaluate the presence of satisfactory materials at design elevations. If unsatisfactory material, such as soft or disturbed soil, debris or otherwise unsuitable soil is present at the base of footing excavations, then unsuitable materials should be overexcavated and replaced (e.g., with structural concrete, 2-sack sand-cement slurry, structural fill) to the depth and extent determined by the geotechnical engineer. As a minimum, the contractor should be prepared to scarify, moisture condition, and re-compact the upper 12 inches of footing subgrade.

Drilled Pile Foundations

The performance and capacities of piles can be influenced significantly by the selected construction methods and procedures used. Construction methods that create large zones of disturbance around the drilled shafts can lead to lower-than-expected skin friction due to excessive stress relief around the shaft length. Drilling of the pile shafts should be accomplished using conventional heavy-duty excavation equipment maintained in good condition. It should be noted that shallow bedrock may be encountered in cut areas and difficult excavation conditions may be encountered. The foundation drilling contractor should select equipment and tooling that is capable of reaching the planned foundation depths in such material.

Concrete should be placed immediately after drilling of the hole is complete. The concrete should be pumped to the bottom of the drilled shaft using a down-hole tremie. If steel casing is used, the

© 2024 Kleinfelder

casing should be removed as the concrete is placed, but the bottom of the casing should be kept at least 5 feet below the top of the concrete.

5.2.6 Fill Material and Compaction Criteria

Materials placed below pavement or structures should be structural fill. The on-site soils, minus any debris, organic matter, or other deleterious materials may be used as structural fill. Rock or other soil fragments greater than 6 inches in size should not be used in the fills and disposed off-site.

We recommend granular (sandy) fill soils and imported material should be compacted to at least 95 percent of the maximum dry unit weight (ASTM D1557) in accordance with the CWDRs. Due to compaction difficulties, we do not recommend compacting the onsite clayey soils to 95 percent relative compaction in accordance with the CWDRs. Clayey fill soils should be compacted to between 92 percent of the soil's maximum dry unit weight (ASTM D1557). Compacting the onsite clayey soils to at least 92 percent relative compaction will achieve the necessary strength assumed in our design recommendations.

Fill should be placed in loose horizontal lifts not more than 8 inches thick (loose measurement). The moisture content of the fill should be maintained at -2 to +2 percent of optimum for sandy soils and +2 percent above of optimum for clayey soils during compaction. The moisture content of the clayey fill is considered very important, and therefore, both relative compaction and moisture content should be used to evaluate compaction acceptance. If both criteria are not within the specified tolerances, the fill should not be accepted, and the contractor should rework the material until the fill is placed within the specified tolerances.

Moisture reduction processing of on-site soil maybe required prior to placement as structural fill. Processing may require ripping the material, disking to break up clumps, and blending to attain uniform moisture contents necessary for compaction. Compaction of mass graded areas should be accomplished with a sheep's foot type roller compactor to aid in moisture conditioning. Utility trench backfill should be mechanically compacted. Flooding should not be permitted.

Import soils, if required, should have no particles greater than 3 inches in maximum dimension, no less than 70 percent of the particles passing the No. 4 sieve, no more than 30 percent of particles passing the No. 200 sieve, and a Plasticity Index (PI) less than 10. The contractor should provide documentation that all imported soil is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals. Test results with the geotechnical and

© 2024 Kleinfelder

analytical properties of the proposed import material should be provided to Costco for approval prior to transportation and use on site.

5.2.7 Excavation Characteristics

Due to the relatively deep site fills anticipated (about 13 to 18 feet), the excavations for the USTs and foundations should be excavatable with conventional heavy-duty construction equipment maintained in good condition. However, if onsite excavations and grading operations extend into the highly weathered bedrock layer, the contractor should expect the following excavation conditions.

Based on the results of the seismic refraction lines, the near surface soils are comprised of a colluvium/residual soil layer varying in thickness from approximately 1½ to 5 feet thick. Below the colluvium/residual soil, bedrock comprised of highly weathered and fractured metavolcanic rock (Vp = 3,000 to 6,000 ft/s). The strength of this highly weathered rock increases in depth and is approximately 10 feet thick. The highly weather rock layer is underlain by slightly weathered, intact rock (Vp > 6,000 ft/s). The depth to the bottom of this layer varies as well but is approximately 10 to 20 feet bgs based on seismic refraction lines SL-1 through SL-3 across the entire site. The results of the seismic refraction survey are presented in Appendix C.

Soils and rock with velocities of less than 3,000 fps can usually be excavated with conventional earth moving equipment. Where materials with velocities in excess of 6,000 fps are found, blasting would normally be required for efficient fragmentation. However, if the rock is thinly bedded, jointed, or fractured, it may be possible to break the rock with heavy ripping using a single shank ripper or large ram-hoe. The resulting fragments will be of a size consistent with the fracture spacing and the progress of excavation would be very slow. The intermediate material (velocities between 3,000 fps and 6,000 fps) would likely require heavy equipment and possibly localized use of jackhammers, ram-hoes, or selective blasting to provide cost-effective excavation. If encountered, locally massive (unfractured) or resistant zones of rock may decrease production and require the use of a rock drill, hydraulic hammer, or other specialized rock excavating attachments. The presence of oversized materials, such as cobbles and boulders, should also be anticipated.

A representative of Kleinfelder should be present during excavation in this area to observe the soil conditions. If soft, loose, or deleterious materials are encountered in the base of the excavation then the materials should be removed and replaced as compacted fill or otherwise remediated to provide competent bearing material under site improvements.

© 2024 Kleinfelder

5.2.8 Temporary Excavations

All excavations must comply with applicable local, state, and federal safety regulations, including OSHA requirements. The responsibility for excavation safety and stability of temporary construction slopes lies solely with the contractor. We are providing this information below solely as a service to our client. Under no circumstances should this information provided be interpreted to mean that Kleinfelder is assuming responsibility for final engineering of excavations or shoring, construction site safety, or the contractors' activities; such responsibility is not being implied and should not be inferred.

Minor sloughing and/or raveling of slopes should be anticipated as they dry out. Where space for sloped embankments is not available, shoring will be necessary. In addition, excavations within a 1:1 plane extending downward from a horizontal distance of 2 feet beyond the bottom outer edge of existing improvements should not be attempted without bracing and/or underpinning the footings, as discussed above. The geotechnical engineer or their field representative should observe the excavations so that modifications can be made to the excavations, as necessary, based on variations in the encountered soil conditions. All applicable excavation safety requirements and regulations, including OSHA requirements, should be met.

All trench excavations should be braced and shored in accordance with good construction practice and all applicable safety ordinances and codes. Stockpiled (excavated) materials should be placed no closer to the edge of an excavation than a distance equal to the depth of the excavation, but no closer than 4 feet.

5.2.9 Trench Backfill

Pipe zone backfill (i.e., material beneath and in the immediate vicinity of the pipe) should consist of imported soil less than ¾-inch in maximum dimension. Trench zone backfill (i.e., material placed between the pipe zone backfill and finished subgrade) may consist of onsite soil or imported fill that meets the requirements for engineered fill provided above.

If imported material is used for trench zone backfill, we recommend it consist of silty sand. In general, gravel and cobble should not be used for trench zone backfill due to the potential for soil migration into the relatively large void spaces present in this type of material and water seepage along trenches backfilled with coarse-grained sand and/or gravel.

Recommendations provided above for pipe zone backfill are minimum requirements only. More stringent material specifications may be required to fulfill local building requirements and/or

© 2024 Kleinfelder

bedding requirements for specific types of pipes. We recommend the project civil engineer develop these material specifications based on planned pipe types, bedding conditions, and other factors beyond the scope of this study.

Trench backfill should be placed and compacted in accordance with recommendations provided for structural fill in Section 5.2.6. Mechanical compaction is recommended; ponding or jetting should be avoided, especially in areas supporting structural loads or beneath concrete slabs supported on grade, pavements, or other improvements.

5.3 UNSTABLE SUBGRADE CONDITIONS

It is common to encounter wet, unstable soils upon removal of site pavements or flatwork as a result of subsurface moisture becoming trapped beneath relatively impervious asphalt concrete or Portland cement concrete surfaces. Pumping subgrade conditions may be encountered during site grading activities, and the subgrade may need to be stabilized with geotextiles and crushed rock or chemical treatment. Additionally, should grading be performed during or following periods of rainfall, the moisture content of the near-surface soils will also be significantly above the optimum moisture content. These conditions could seriously impede grading by causing an unstable subgrade condition. Typical remedial measures include the following:

- Drying: Drying unstable subgrade involves disking or ripping wet subgrade to a depth of approximately 18 to 24 inches and allowing the exposed soil to dry. Multiple passes of the equipment (likely on a daily basis) will be needed because as the surface of the soil dries, a crust forms that reduces further evaporation. Frequent disking will help prevent the formation of a crust and will promote drying. This process could take several days to several weeks depending on the depth of ripping, the number of passes, and the weather.
- Removal and Replacement with Crushed Rock and Geotextile Fabric: Unstable subgrade could be over-excavated 12 to 24 inches below existing grade and replaced with ¾- or 1-inch crushed rock underlain by geotextile fabric. The geotextile fabric should consist of a woven geotextile, such as Mirafi 600HP series or equivalent. The final depth of removal will depend upon the conditions observed in the field once over-excavation begins. The geotextile fabric should be placed in accordance with the manufacturer's recommendations.
- Chemical Treatment: Unstable subgrade could be stabilized by mixing the upper 12 to 18 inches of the subgrade with Portland cement, Class C flyash or lime. For estimating purposes, an application rate of 10 to 12 percent Class C flyash, 3 to 5 percent high

© 2024 Kleinfelder

calcium quick lime, or 4 to 5 percent Portland cement may be used. Final application rates should be determined in the field at the time of construction in consultation with the geotechnical engineer. Chemical treatment should be performed by a specialty contractor experienced in this work. Since soil treatment uses the on-site soil, the expense of importing material can be avoided.

5.4 EXTERIOR FLATWORK

Prior to casting exterior flatwork, the subgrade soils should be moisture conditioned and recompacted or overexcavated, as recommended in Section 5.2.2. The moisture content of the subgrade soils should be maintained at least optimum prior to the placement of any flatwork. In the event that these subgrade soils are allowed to dry out, the exposed subgrade should be re-moisture conditioned.

Exterior concrete slabs for pedestrian traffic or landscape should be at least four inches thick. Weakened plane joints should be located at intervals of about 6 feet. Careful control of the water/cement ratio should be performed to avoid shrinkage cracking due to excess water or poor concrete finishing or curing. Unreinforced slabs should not be built in areas where further saturation may occur following construction.

5.5 PAVEMENTS

5.5.1 HMA Design

Hot Mix Asphalt (HMA) should conform to requirements of the Costco Wholesale Specification Section 321216, Asphalt Paving. Section 1.3.C of the HMA specification requires that the HMA section be placed in at least two lifts. The HMA specification allows the use of ½- or ¾-inch Nominal Maximum Aggregate Size (NMAS) mixes for the base course and ⅜- or ½-inch NMAS mixes for surface course. Maximum and minimum HMA compacted lift thicknesses are provided in Table 3.1 in Section 3.3.B of the HMA specification.

5.5.2 Construction Considerations

The pavement sections provided in Section 4.6 are contingent on the following recommendations being implemented during construction.

- Pavement subgrade should be prepared as recommended in Section 5.2.2.
- Subgrade soils should be in a stable, non-pumping condition at the time the aggregate base materials are placed and compacted.

© 2024 Kleinfelder

- Aggregate base materials should be moisture conditioned to at least the optimum moisture content and compacted to at least 95 percent relative compaction (ASTM D1557).
- Asphalt paving materials and placement methods should meet current Costco Wholesale Specifications Section 321216.
- Adequate drainage (both surface and subsurface) should be provided such that the subgrade soils and aggregate base materials are not allowed to become wet.

Note that pavement materials and construction must be completed in strict accordance with the Costco's specifications that contain very specific pavement material (asphalt, aggregate and concrete) criteria and construction practices to be used (compaction and material sampling). The general contractor and pavement construction subcontractor should be aware that asphalt and concrete mix designs must be submitted to the design architect and Kleinfelder at least 45 days prior to the scheduled production and laydown for review and approval.

© 2024 Kleinfelder

6 ADDITIONAL SERVICES

6.1 PLANS AND SPECIFICATIONS REVIEW

We recommend that Kleinfelder perform a general review of the project plans and specifications before they are finalized to verify that our geotechnical recommendations have been properly interpreted and implemented during design. If we are not accorded the privilege of performing this review, we can assume no responsibility for misinterpretation of our recommendations.

6.2 CONSTRUCTION OBSERVATION AND TESTING

The construction process is an integral design component with respect to the geotechnical aspects of a project. Because geotechnical engineering is an inexact science due to the variability of natural processes, and because we sample only a limited portion of the soils affecting the performance of the proposed structure, unanticipated or changed conditions can be encountered during grading. Proper geotechnical observation and testing during construction are imperative to allow the geotechnical engineer the opportunity to verify assumptions made during the design process. Therefore, we recommend that Kleinfelder be retained during the construction of the proposed improvements to observe compliance with the design concepts and geotechnical recommendations, and to allow design changes in the event that subsurface conditions or methods of construction differ from those assumed while completing this study.

Our services are typically needed at the following stages of grading.

- During grading;
- During the installation of temporary construction shoring;
- After the overexcavation, but prior to scarification;
- During utility trench backfill;
- During base placement and site paving; and
- After excavation for foundations.

© 2024 Kleinfelder

7 LIMITATIONS

This geotechnical study has been prepared for the exclusive use of Costco Wholesale and their agents for specific application to the proposed fuel facility located at Silva Valley Parkway (APN 122-720-019) in El Dorado Hills, California. The findings, conclusions and recommendations presented in this report were prepared in accordance with generally accepted geotechnical engineering practice. No other warranty, express or implied, is made.

The scope of services was limited to a background data review and the field exploration described in Section 1.2. It should be recognized that definition and evaluation of subsurface conditions are difficult. Judgments leading to conclusions and recommendations are generally made with incomplete knowledge of the subsurface conditions present due to the limitations of data from field studies. The conclusions of this assessment are based on our field exploration and laboratory testing programs, and engineering analyses.

Kleinfelder offers various levels of investigative and engineering services to suit the varying needs of different clients. Although risk can never be eliminated, more detailed and extensive studies yield more information, which may help understand and manage the level of risk. Since detailed study and analysis involves greater expense, our clients participate in determining levels of service, which provide information for their purposes at acceptable levels of risk. The client and key members of the design team should discuss the issues covered in this report with Kleinfelder, so that the issues are understood and applied in a manner consistent with the owner's budget, tolerance of risk and expectations for future performance and maintenance.

Recommendations contained in this report are based on our field observations and subsurface explorations, limited laboratory tests, and our present knowledge of the proposed construction. It is possible that soil or groundwater conditions could vary between or beyond the points explored. If soil or groundwater conditions are encountered during construction that differ from those described herein, the client is responsible for ensuring that Kleinfelder is notified immediately so that we may reevaluate the recommendations of this report. If the scope of the proposed construction, including the estimated Traffic Index or locations of the improvements, changes from that described in this report, the conclusions and recommendations contained in this report are not considered valid until the changes are reviewed, and the conclusions of this report are modified or approved in writing, by Kleinfelder.

© 2024 Kleinfelder

The scope of services for this subsurface exploration and geotechnical report did not include environmental assessments or evaluations regarding the presence or absence of wetlands or hazardous substances in the soil, surface water, or groundwater at this site.

Kleinfelder cannot be responsible for interpretation by others of this report or the conditions encountered in the field. Kleinfelder must be retained so that all geotechnical aspects of construction will be monitored on a full-time basis by a representative from Kleinfelder, including site preparation, preparation of foundations, and placement of engineered fill and trench backfill. These services provide Kleinfelder the opportunity to observe the actual soil and groundwater conditions encountered during construction and to evaluate the applicability of the recommendations presented in this report to the site conditions. If Kleinfelder is not retained to provide these services, we will cease to be the engineer of record for this project and will assume no responsibility for any potential claim during or after construction on this project. If changed site conditions affect the recommendations presented herein, Kleinfelder must also be retained to perform a supplemental evaluation and to issue a revision to our original report.

This report, and any future addenda or reports regarding this site, may be made available to bidders to supply them with only the data contained in the report regarding subsurface conditions and laboratory test results at the point and time noted. Bidders may not rely on interpretations, opinion, recommendations, or conclusions contained in the report. Because of the limited nature of any subsurface study, the contractor may encounter conditions during construction which differ from those presented in this report. In such event, the contractor should promptly notify the owner so that Kleinfelder's geotechnical engineer can be contacted to confirm those conditions. We recommend the contractor describe the nature and extent of the differing conditions in writing and that the construction contract include provisions for dealing with differing conditions. Contingency funds should be reserved for potential problems during earthwork and foundation construction.

This report may be used only by the client and only for the purposes stated, within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land use, site conditions (both on site and off site) or other factors may change over time, and additional work may be required with the passage of time. Any party, other than the client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of this report and the nature of the new project, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party and the client agrees to defend, indemnify, and hold harmless Kleinfelder from any claims or liability associated with such unauthorized use or non-compliance.

EXPLANATION

QC Colluvial/Residual Soils comprised of sandy silts and lean clays with variable amount of sand and gravel. Observed to be approximately 1 to 5 feet thick.

Kgv Metavolcanic Rock - Highly Weathered within upper 10 feet (Vp = 3,000 to 6,000 ft/s), Slightly Weather intact rock below 10 to 15 feet bgs (Vp > 6,000 ft/s)

**UST excavation location and depth estimated as it was not depicted on grading plans provided by Kier and Wright.

Appendix A

APPENDIX A
FIELD EXPLORATIONS

GENERAL

Our field exploration program consisted of excavating nine test pits. The test pits were excavated on July 9, 2024. Prior to commencement of the fieldwork, the test pit locations were cleared for buried utilities through Underground Service Alert (USA).

Nine test pits were excavated by Gulf Shore Exploration of Rancho Cordova, California using a John Deere 50G track-mounted excavator to excavate to depths ranging from 1½ to 9 feet bgs. The logs of the test pits are attached to this appendix. The approximate locations of the test pits are presented on Figure 2.

An explanation to the log is presented as Figure A-1 and A-2. The logs of the test pits are presented on Figures A-3 through A-11. The test pits describe the earth materials encountered, samples obtained and show field and laboratory tests performed. The log also shows the location, test pit number, excavation date and the name of the excavation subcontractor. The test pits were logged by a Kleinfelder engineer using the Unified Soil Classification System (ASTM 2487/2488). The boundaries between soil types shown on the log are approximate where indicated with a dashed line because the transition between different soil layers may be gradual or location of the transition may be unknown. In a few cases the transition was captured within samples obtained from the subsurface exploration or other information enable us to define an approximately exact location as depicted by a solid line on the logs.

Bulk and grab samples of the near-surface soils were directly retrieved from the auger cuttings from the borings and the excavated material in the test pits.

Current Test Pit Logs (Kleinfelder, 2024)

DRILLING METHOD/SAMPLER TYPE GRAPHICS

BULK SAMPLE

GROUND WATER GRAPHICS

- WATER LEVEL (level where first observed)
- WATER LEVEL (level after stabilizing period)
- WATER LEVEL (additional levels after exploration)
- OBSERVED SEEPAGE

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Solid lines separating strata on the logs represent approximate boundaries only, dashed lines are inferred or extrapolated boundaries. Actual transitions may be gradual or differ from those represented.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System (ASTM D2488/D2487) designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., CL-ML, GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

ABBREVIATIONS

WOH - Weight of Hammer
WOR - Weight of Rod

GRAIN SIZE[1]

DESCRIPTION		SIEVE SIZE	GRAIN SIZE
Boulders		>12 in.	>12 in. (304.8 mm.)
Cobbles		3 - 12 in.	3 - 12 in. (76.2 - 304.8 mm.)
Gravel	coarse	3/4 -3 in.	3/4 -3 in. (19 - 76.2 mm.)
	fine	#4 - 3/4 in.	0.19 - 0.75 in. (4.8 - 19 mm.)
Sand	coarse	#10 - #4	0.079 - 0.19 in. (2 - 4.9 mm.)
	medium	#40 - #10	0.017 - 0.079 in. (0.43 - 2 mm.)
	fine	#200 - #40	0.0029 - 0.017 in. (0.07 - 0.43 mm.)
Fines		Passing #200	<0.0029 in. (<0.07 mm.)

SECONDARY CONSTITUENT[1]

Term of Use	AMOUNT	
	Secondary Constituent is Fine Grained	Secondary Constituent is Coarse Grained
Trace	<5%	<15%
With	≥5 to <15%	≥15 to <30%
Modifier	≥15%	≥30%

PLASTICITY[1]

DESCRIPTION	CRITERIA
Non-Plastic	A 1/8 in. (3 mm) thread cannot be rolled at any water content.
Low	The thread can barely be rolled and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

MOISTURE CONTENT[1]

DESCRIPTION	FIELD TEST
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

CONSISTENCY - FINE-GRAINED SOIL[2, 3]

CONSISTENCY	SPT - N (# blows / ft)	Pocket Pen (tsf)	UNCONFINED COMPRESSIVE STRENGTH (Q_u)(psf)	VISUAL / MANUAL CRITERIA
Very Soft	<2	PP < 0.25	<500	Easily penetrated several inches by fist
Soft	2 - 4	0.25 ≤ PP <0.5	500 - 1,000	Easily penetrated several inches by thumb
Medium Stiff	4 - 8	0.5 ≤ PP <1	1,000 - 2,000	Can be penetrated several inches by thumb with moderate effort
Stiff	8 - 15	1 ≤ PP <2	2,000 - 4,000	Readily indented by thumb but penetrated only with great effort
Very Stiff	15 - 30	2 ≤ PP <4	4,000 - 8,000	Readily indented by thumbnail
Hard	>30	4 ≤ PP	>8,000	Indented by thumbnail with difficulty

APPARENT DENSITY - COARSE-GRAINED SOIL[2]

APPARENT DENSITY	SPT-N (# blows / ft)
Very Loose	<4
Loose	4 - 10
Medium Dense	10 - 30
Dense	30 - 50
Very Dense	>50

STRUCTURE[1]

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. (6mm) thick, note thickness.
Laminated	Alternating layers of varying material or color with the layers less than 1/4-in. (6 mm) thick, note thickness.
Fissured	Breaks along definite planes of fracture with little resistance to fracturing.
Slickensided	Fracture planes appear polished or glossy, sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness.
Homogeneous	Same color and appearance throughout

ANGULARITY[1]

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces.
Subangular	Particles are similar to angular description but have rounded edges.
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges.
Rounded	Particles have smoothly curved sides and no edges.

REACTION WITH HYDROCHLORIC ACID[1]

DESCRIPTION	FIELD TEST
None	No visible reaction
Weak	Some reaction, with bubbles forming slowly
Strong	Violent reaction, with bubbles forming immediately

CEMENTATION[1]

DESCRIPTION	FIELD TEST
Weakly	Crumbles or breaks with handling or little finger pressure
Moderately	Crumbles or breaks with considerable finger pressure
Strongly	Will not crumble or break with finger pressure

Appendix B

APPENDIX B
LABORATORY TESTING

GENERAL

Laboratory tests were performed on selected samples as an aid in classifying the soils and to evaluate physical properties of the soils that may affect foundation design and construction procedures. The tests were performed in general conformance with the current ASTM standards. Laboratory testing was performed by Kleinfelder's laboratory in Sacramento, California. Corrosion testing was performed by Cerco Analytical located in Concord, California. A description of the laboratory-testing program is presented below.

MOISTURE AND UNIT WEIGHT

Moisture content and dry unit weight testing was performed on select samples recovered from our borings. Moisture contents were determined in general accordance with ASTM Test Method D2216; dry unit weight was calculated using the entire weight of the samples collected in general accordance with ASTM Test Method D7263. The test results are presented on the boring log in Appendix A and as an attachment in this appendix.

SIEVE ANALYSES

Sieve analyses were performed on selected samples of the materials encountered at the site to evaluate the grain size distribution characteristics of the soils and to aid in their classification. Sieve analysis was performed in accordance with ASTM Standard Test Method D6913. The results of these tests are presented on the boring logs in Appendix A and as an attachment to this appendix.

WASH SIEVE

Selected soil samples were tested for the percent passing the No. 200 sieve, which was performed by wash sieving in accordance with ASTM Standard Test Method D1140. The test results are presented on the boring logs.

ATTERBERG LIMITS

Atterberg limits testing was performed on a selected soil samples to assist in classification. Testing was performed in general accordance with ASTM D4318. Results of these tests are presented on the boring logs and attached to this appendix.

© 2024 Kleinfelder

MAXIMUM DENSITY AND OPTIMUM MOISTURE

Maximum density and optimum moisture content testing was performed on one bulk sample of the near surface soils to evaluate the compaction characteristics of the onsite soils. Maximum density and optimum moisture content testing was performed in general accordance with ASTM Standard Test Method D1557, Method B. The test result is attached.

R-VALUE TESTS

One resistance value (R-value) test was performed on a bulk soil sample obtained within the proposed fuel facility area to evaluate pavement support characteristics of the near-surface onsite soils. R-value tests were performed in accordance with ASTM Standard Test Method D2844. Results of the testing are attached to this appendix.

SOIL CORROSIVITY TESTS

A series of chemical tests were performed on selected samples of the near-surface soils to estimate pH, resistivity and sulfate and chloride contents. The samples were taken during our 2019 investigation of the property and are provided in this report. The samples were tested for pH and minimum resistivity, soluble chlorides, and soluble sulfates, respectively. Test results may be used by a qualified corrosion engineer to evaluate the general corrosion potential with respect to construction materials. The results of the tests are presented in the body of the report and attached to this appendix.

TOPSOIL ANALYTICAL TESTS

Topsoil analytical testing was performed on one composite sample of the near-surface soils by Waypoint Analytical of Anaheim, California. The composite sample was taken during our 2019 investigation of the property. The composite topsoil sample was tested for percentages of organic matter, percentages of deleterious material, pH, mineral content, micro and macro nutrient content, and herbicide presence in the soil. The test results are presented in the Waypoint Analytical report attached to this appendix.

RE: Costco El Dorado Hills New Warehouse, Job # 20192984.001A

Background

One sample was processed on February 18, 2019 identified as sample TP-1 from an area where new landscaping is scheduled for installation. Fertilizer and amendment recommendations were requested. The sample was analyzed for horticultural suitability, fertility, and physical characteristics including organic matter content. The results of the analyses are attached. Heavy metals testing is in process and this data will be sent separately.

Analytical Results and Comments

The reaction of the sample is slightly alkaline at a pH of 7.1 with qualitative lime favorably low. This is within the preferred range for most plants. Salinity (ECe), sodium, chloride and boron are safely low. The sodium adsorption ratio (SAR) indicates that sodium is adequately balanced by soluble calcium and magnesium; this balance is important for soil structure quality, which relates to the rate at which water infiltrates the soil.

According to the USDA Soil Classification system, the texture of the less than 2mm fraction of the soil is classified as sandy clay loam. Organic content is low at 0.3% dry weight. Based on this information, the estimated infiltration rate is a moderate 0.26 inch per hour. Infiltration rates may vary due to potential differences in compaction across the site.

In terms of soil fertility, nitrogen, phosphorus, potassium and sulfate are low and calcium is moderately supplied. Magnesium is abundant but not problematically so and will not require supplementing for some time. Of the micronutrients; copper, zinc, manganese and iron are low.

Recommendations

Incorporation of nitrogen, phosphorus, potassium, calcium and sulfate fertilizers is recommended at the time of planting. Incorporation of a nitrogen stabilized organic amendment or composted greenwaste product is also recommended in order to help improve the soil nutrient holding capacity and porosity. If a composted greenwaste amendment is chosen, that would provide additional phosphorus and potassium as well as supplemental micronutrients.

Boron is safely low for general ornamental plants and may be below optimum levels for plant nutritional purposes. Irrigation water often supplies sufficient boron to meet plant nutritional requirements. However, if boron is low in the irrigation water and/or plants show symptoms of boron deficiency after they are well established, you may consider an application of a product containing boron at the manufacturer's label rate. Boron deficiency symptoms often include stunted or deformed younger growth and tight internodes. Tissue testing can be performed to identify a boron deficiency if it is suspected.

Incorporation of a composted greenwaste amendment may be sufficient to negate this deficiency, product depending.

The primary symptom of zinc, manganese and iron deficiencies is a general yellowing of leaves with veins remaining green. In severe cases, leaves may become pale yellow or whitish, but veins remain green. Brown spots may develop between veins and leaf margins may turn brown. Zinc deficiencies typically appear first on older, interior leaves. Manganese deficiency symptoms appear first on younger leaves. Iron deficiency shows first and more severely on the newer growth at branch tips. If these symptoms are present after plant installation they may be treated with an application of a chelated micronutrient product at the manufacturer's recommended rate. Incorporation of a composted greenwaste amendment would also provide additional micronutrients and may be sufficient to negate any deficiency, product depending.

To Prepare For Mass Planting:
Drainage of the root zone should be improved by first loosening the top 10 inches of any undisturbed or compacted soil. The following materials should then be evenly spread and thoroughly blended with the top 6 inches of soil to form a homogenous layer:

Amount per 1000 Square Feet	
5 cubic yards	Nitrogen Stabilized Organic Amendment*
7 pounds	Ammonium Phosphate (16-20-0)*
14 pounds	Potassium Sulfate (0-0-50)*
50 pounds	Gypsum (Calcium Sulfate)

*The rate may change based on the analysis of the chosen organic amendment. This rate is based on 270 pounds of dry weight of organic matter per cubic yard of amendment. If a composted greenwaste amendment is selected that contains a significant amount of phosphorus or potassium, the ammonium phosphate should be replaced with ammonium sulfate (21-0-0) at a 7 pound rate and the potassium sulfate should be reduced or omitted accordingly.

To Prepare Backfill For Trees and Shrubs:

- Excavate planting pits at least twice as wide as the diameter of the root ball.
- Soil immediately below the root ball should be left undisturbed to provide support but the sides and the bottom around the side should be cultivated to improve porosity.
- The top of the root ball should be at or slightly above final grade.
- The top 12 inches of backfill around the sides of the root ball of trees and shrubs may consist of the above amended soil or may be prepared as follows:

3 parts	Soil Sample
1 part	Nitrogen Stabilized Organic Amendment*

Uniformly blended with:

Amount per Cubic Yard of Backfill	
1/3 pound	Ammonium Phosphate (16-20-0)*
3/4 pound	Potassium Sulfate (0-0-50)*
2 2/3 pounds	Gypsum (Calcium Sulfate)

- Backfill below 12 inches required for 24 inch box or larger material should not contain the organic amendment or ammonium phosphate but should still contain the potassium sulfate and gypsum

at the recommended rates. In order to improve phosphorus levels below 12 inches in depth, triple superphosphate (0-45-0) should be incorporated at a 1/4 pound rate.

- Ideally a weed and turf free zone should be maintained just beyond the diameter of the planting hole. A 2-4 inch deep layer of coarse mulch can be placed around the tree or shrub. Mulch should be kept a minimum 4 inches from the trunk.
- Irrigation of new plantings should take into consideration the differing texture of the rootball substrate and surrounding soil matrix to maintain adequate moisture during this critical period of establishment.

Maintenance

Maintenance fertilization should rely primarily on a nitrogen only program supplemented with a complete fertilizer in the fall and spring. Beginning 45-60 days after planting, ammonium sulfate (21-0-0) should be applied at a rate of 5 pounds per 1000 square feet with reapplication every 45-60 days. Alternatively, slow release Sulfur Coated Urea (43-0-0) may be applied at 6 pounds per 1000 square feet every 90 days. Once plants are performing satisfactorily, the frequency of fertilization may be decreased depending on color and rate of growth desired. In the winter for a quick greening effect, calcium nitrate (15.5-0-0) may be applied at a 6 pound rate if applicable. Early fall and spring, substitute a complete fertilizer such as 15-15-15 to help insure continuing adequate phosphorus and potassium.

Alternatively, Blood Meal (12-0-0) provides available nitrogen fairly rapidly while materials such as Feather Meal (12-0-0), Soybean or Cotton Seed Meal (7-1-1) are slower to provide available nitrogen, but they extend the length of time they make this contribution. In order to provide a good supply of nitrogen for a 3-4 month time frame a good combination would be 6 pounds Blood Meal and 14 pounds Feather Meal per 1000 square feet. In the fall and spring, substitute a complete organic fertilizer such as 5-5-5 applied at the manufacturer's label rate. Or, nutrient rich composted greenwaste may be spread in a 1 to 2 inch layer, which generally carries enough nutrition to boost complete nutrition though a source of nitrogen might also be added at a half rate to assure adequate nitrogen availability.

If we can be of any further assistance, please feel free to contact us.

Re: Refraction Seismic Investigation at the Costco El Dorado Hills Fuel Project Site in El Dorado Hills, El Dorado County, California
GGSI Project No. 2024-30.01
Kleinfelder Project No. 20193141.002A, Task 01-0002

Dear Mr. Dockendorf:

At your request and authorization, Gasch Geophysical Services, Inc. (GGSI) has completed a refraction seismic investigation at Costco El Dorado Hills Fuel Project Site in El Dorado Hills, El Dorado County, California (Figure 1).

Purpose

The purpose of this investigation was to determine the depth to higher velocity material and also define the rippability (excavatability) characteristics of the sub-surface materials at the Costco El Dorado Hills Fuel Project Site.

Method, Instrumentation and Software

The refraction seismic (RS) method was used to evaluate the rock velocities on site, as seismic primary-wave travel times are used to quantify the rock velocities and, as a result, can determine the general competency/rippability in areas of various rock types. The RS method measures the velocity at which a seismic wave propagates through a soil or rock medium. In this case, the primary (i.e. p-wave or compressional) seismic waves were measured. Higher seismic p-wave velocities (measured in feet per second, ft/s) indicate material of higher density, thus quantifying the competency or strength of the soil or rock medium and providing an estimation of the rippability and/or excavatability of the sub-surface materials.

The seismic data acquisition system used for this project by GGSI was a Seistronix EX-6 Explorer, which is a distributed, 24-bit digital instrument with data output to electronic media for subsequent processing. Geophones were single, 28-Hz, digital grade units manufactured by OYO Geospace Corporation. Spread cables were manufactured by Pro-Seismic Services. The energy source for this project was a sixteen-pound sledge hammer with a hardwire connection for system triggering. All data were processed in house, on our data reduction and plotting workstation.

Refraction seismic data processing was carried out using Rayfract® version 4.06. This refraction seismic processing software utilizes Wavepath Eikonal Traveltime (WET) tomography, which models multiple signal propagation paths contributing to one first break (the Fresnel volume approach). Conventional ray tracing tomography is limited to the modeling of just one ray path per first break. The WET inversion method is founded upon a back-projection formula for inverting velocities from travel times computed by a finite-difference solution to the Eikonal equation (Qin, et al. 1992). An Eikonal solver is used for traveltime field computation, which models diffraction in addition to refraction and transmission of acoustic waves. As a result, the velocity anomaly imaging capability is enhanced with the WET tomographic inversion method compared to conventional ray tomography. This software is developed by Intelligent Resources, Inc. of Vancouver, British Colombia, Canada.

A color-coded seismic velocity cross-section of the subsurface has been generated for each RS line, where cool colors (blues) indicate lower seismic velocities and warm colors (reds, purple) indicate higher velocities. Color scaling of these seismic velocity sections is based on the range of seismic velocity values calculated. Velocity scaling has been normalized on all RS velocity sections.

Data Acquisition Parameters

A total of three RS lines were acquired during this investigation. RS Line locations were suggested by Kleinfelder personnel and slightly adjusted in the field to allow for safe and efficient data acquisition. All RS lines were acquired with geophone stations spaced at 20-foot intervals with energy source points located between every third or every other geophone station as well as off the ends of each line. RS Lines 1 & 2 were acquired with 24 active geophone stations for a total of 500 lineal feet each. RS Line was acquired using 12 active geophone stations for a total length of 260 lineal feet. A total of 1,260 lineal feet of data were collected for this investigation. Collection of the field data was carried out on July 16th, 2024. The field crew consisted of Professional Geophysicist Kent Gasch and Professional Engineer Josh Summers. The locations of the RS lines are presented on Figure 2.

Rippability

Rippability is dependent on the physical condition of the rock masses to be excavated. In addition to rock type and degree of weathering, structural features in the rock such as bedding planes, cleavage planes, joints, fractures, consolidation and shear zones also influence rippability. Rock masses tend to be more easily ripped if they have well defined, closely spaced fractures, joints, or other planes of weakness. Massive rock bodies which lack discontinuities may allow for slow and difficult ripping or refusal, even where partially weathered, and may require blasting to break the rock for efficient removal.

The association between the seismic velocity of any given earth material and its rippability varies greatly from one type of earth-moving equipment to another. For example, although a large track laying dozer with a single ripper tooth can sometimes rip material with seismic velocities in excess of 10,000 ft/s. GGSI has experienced a limiting (refusal) velocity for large excavators to range from 3,500 ft/s to 4,500 ft/s, and a standard backhoe may meet refusal at seismic velocities as low as 2,000 to 2,500 ft/s. Ultimately, the relationship between seismic velocity and rippability is dependent on both: site conditions and equipment and/or operator ability.

Seismic p-wave velocities are related to both rock hardness and fracture density. Rippability has been empirically correlated to refraction seismic velocities by Caterpillar Inc., as displayed on Figure 6 for a CAT D8R/D8T (Caterpillar Performance Handbook, Edition 49, September, 2019). According to this chart, metamorphic/sedimentary rock, in this case slates and shales, becomes marginally rippable around 6,000 to 6,300 ft/s and non-rippable around 8,200 ft/s for a D8R/D8T dozer with multiple or single shank No. 8 ripper. These estimations are based on the published values for igneous rocks on the CAT chart; however, site geology and topography may cause some variations of these values.

The Caterpillar Chart of Ripper Performance should be considered as being only one indicator of rippability. Ripper tooth penetration is the key to successful ripping, regardless of seismic velocity. This criterion is particularly true in finer-grained, homogeneous materials and in tightly cemented formations. Ripping success may ultimately be determined by the operator finding the proper combination of factors, such as: number of shanks used, length and depth of shank, tooth angle, direction of travel, and use of throttle. Although low seismic velocities in any rock type indicate probable rippability, it is possible that, if the fractures, bedding and/or joints do not allow tooth penetration, the material still may not be ripped efficiently. In some cases, drilling and blasting may be required to induce sufficient fracturing to allow for excavation.

Seismic Velocities

Generally, seismic p-wave velocities less than 3,000 ft/s indicate native soil, fill material, sand and gravel or highly weathered and/or decomposed rock, while velocities in excess of 10,000 ft/s indicate fresh (essentially non-weathered) rock. Seismic velocities between these two values typically indicate rock with varying degrees of weathering and/or fracturing. Consolidation and cementation, as well as fracture spacing and density, also affect the measured seismic velocities. Moderate velocities may indicate compacted soil, moderately weathered rock or loosely consolidated sediment such as gravel, sand and silt. Saturated sediment below the water table characteristically displays seismic velocities near or slightly above 5,000 ft/s.

Extremes in seismic velocities may range from below 1,000 ft/s to over 20,000 ft/s. Very low seismic velocities usually indicate highly weathered or poorly compacted material, either natural or man-made. Extremely high velocities are rare in the near-

surface, and only possible in certain types of rock. Rock velocities are dependent on the physical condition of the rock masses evaluated, as a result, seismic p-wave velocities are related to rock hardness, fracture density and sediment consolidation, saturation and cementation.

Findings

The results of this refraction seismic investigation are summarized by Figures 3 through 5. These seismic velocity sections, which were created through the inversion process, have very low error and provide a high degree of lateral definition of the seismic velocity horizons found beneath each line. The seismic velocity sections have been scaled from 1,500 ft/s to 20,000 ft/s for the velocity window. Horizontal and vertical axes have been scaled to 40 feet per inch in the horizontal and 20 feet per inch in the vertical.

Test pits performed by Kleinfelder prior to our arrival are shown on the RS Line Location Map (Figure 2) and on the seismic velocity sections when located near a RS Line. Locations are only approximate and based on information provided.

RS Line 1 (Figure 3)

RS Line 1 is located in the northern portion of the project area (see Figure 2). This line is oriented approximately northwest to southeast and located near test pits 2, 3 and 5 and crosses Line 3 near distance station 426 feet. Measured seismic velocities beneath this line grade at a fast rate from low velocities (1,500 ft/s) at the surface to marginally rippable velocities (≈6,200 ft/s) at depths ranging from approximately 10 to 15 feet below ground surface (bgs).

Velocities less than the ≈6,200 ft/s horizon suggest materials that will be rippable with a CAT D8R/D8T or equivalent. Below this horizon, in the areas of moderate-high to high velocities (6,000 to 8,000+ ft/s), ripping will likely become slower or more difficult as higher velocity material is encountered and depending on the maximum depth of excavation in this area.

RS Line 2 (Figure 4)

RS Line 2 is located in the southern portion of the project area and is located near test pits 4, 6 and 7(see Figure 2). This line is also oriented approximately northwest to southeast and crosses Line 3 near distance station 416 feet. Measured seismic velocities at this location grade at a fast rate from low velocities (1,500 ft/s) at the surface to marginally rippable velocities (≈6,200 ft/s) at approximate depths ranging from 8 to 15 feet bgs.

Seismic velocities less than the ≈6,200 ft/s horizon suggest materials that will be rippable with a CAT D8R/D8T or equivalent. Below this horizon, in the areas of moderate-high to high velocities (6,000 to 8,000+ ft/s), ripping will likely become slower

or more difficult as higher velocity material is encountered and depending on the maximum depth of excavation in this area.

RS Line 3 (Figure 5)

RS Line 3 is located in the eastern portion of the project site (see Figure 2). This line is oriented approximately northeast to southwest (see Figure 2). Test pits 1 and 2 are near to this line. Line 3 crosses Line 1 and 2 at distance stations 36 feet and 96 feet, respectively. Measured seismic velocities at this location grade at a moderate rate from low velocities (1,500 ft/s) at the surface to marginally rippable velocities (≈6,200 ft/s) at depths ranging from approximately 11 feet to near 20 feet bgs on the southwestern end of the line.

Velocities less than the ≈6,200 ft/s horizon suggest materials that will be rippable with a CAT D8R/D8T or equivalent. Below this horizon, in the areas of moderate-high to high velocities (6,000 to 8,000+ ft/s), ripping will likely become slower or more difficult as higher velocity material is encountered and depending on the maximum depth of excavation in this area.

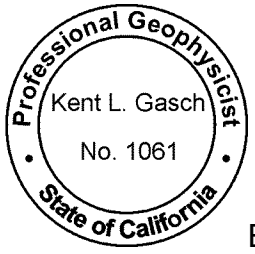
Summary

This refraction seismic investigation to provides a good sampling of the subsurface conditions at the Costco El Dorado Hills Fuel Project Site. All three RS Lines show variable gradation of seismic velocities from ground surface to the maximum depth of exploration beneath each line. Velocity correlation between lines was very good and indicates the consistency of the subsurface materials at the site.

This investigation revealed a high degree of variation in the calculated seismic velocities of the subsurface materials, with the highest seismic velocity of greater than 18,000 ft/s measured at the maximum depth of exploration on all three RS Lines. Low velocity material was measured in the near surface material, which suggests highly weathered/fractured rock and soil or fill. The moderate velocity range of 3,000 ft/s to approximately 5,000 ft/s, suggests compacted soil/fill, moderately weathered/fractured rock, or moderately consolidated sediment. The RS Lines show this low to moderate velocity section of material from the surface to varying depths and higher velocity material at the maximum depth of exploration.

In general, rippability with a CAT D8R/D8T (or equivalent) should not be problematic to the depths noted above for each RS Line; however, depending on the maximum depth of excavation, progress may be slower or difficult as zones of higher velocity material are encountered. Should this be the case, drilling and blasting may be the most effective method to fracture the rock for further excavation.

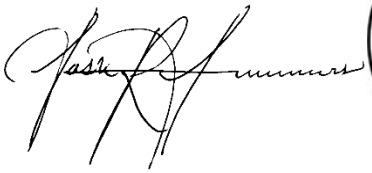
Warranty and Limitations



Gasch Geophysical Services, Inc. has performed these services in a manner which is consistent with standards of the profession. Site conditions can cause some variations of the calculated seismic velocities. Refraction seismic velocities assume that velocities increase with depth; therefore, a lower seismic velocity layer beneath a higher seismic velocity layer will not be resolved. No guarantee, with respect to the results and performance of services or products delivered for this project, is express or implied by Gasch Geophysical Services, Inc.

We trust that this is the information you require; however, should you have comments or questions, please contact our Rancho Cordova office at your convenience. Thank you for this opportunity to be of service.

Sincerely,



GASCH GEOPHYSICAL SERVICES, INC.

Attention: Mr. Michael Okuma
Director of Real Estate Development

SUBJECT: **DRAFT Geotechnical Study**
Proposed Costco Wholesale Warehouse and Fuel Facility
Silva Valley Parkway
El Dorado Hills, California
CW# 18-0487

Dear Mr. Okuma

Kleinfelder is pleased to present this report summarizing our draft geotechnical study for the proposed Costco Wholesale warehouse and fuel facility located on Silva Valley Parkway in El Dorado Hills, California. The conclusions and recommendations presented in this report are subject to the limitations presented in Section 7.

We appreciate the opportunity to provide geotechnical engineering services to you on this project. If you have any questions regarding this report or if we can be of further service, please do not hesitate to contact Andrea Traum at 408.595.3275, or Andy Franks, Kleinfelder's Client Account Manager for Costco at 480.650.4905.

Sincerely,

KLEINFELDER, INC.

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, you can benefit from a lowered exposure to problems associated with subsurface conditions at project sites and development of them that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed herein, contact your GBA-member geotechnical engineer. Active engagement in GBA exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.

Understand the Geotechnical-Engineering Services Provided for this Report

Geotechnical-engineering services typically include the planning, collection, interpretation, and analysis of exploratory data from widely spaced borings and/or test pits. Field data are combined with results from laboratory tests of soil and rock samples obtained from field exploration (if applicable), observations made during site reconnaissance, and historical information to form one or more models of the expected subsurface conditions beneath the site. Local geology and alterations of the site surface and subsurface by previous and proposed construction are also important considerations. Geotechnical engineers apply their engineering training, experience, and judgment to adapt the requirements of the prospective project to the subsurface model(s). Estimates are made of the subsurface conditions that will likely be exposed during construction as well as the expected performance of foundations and other structures being planned and/or affected by construction activities.

The culmination of these geotechnical-engineering services is typically a geotechnical-engineering report providing the data obtained, a discussion of the subsurface model(s), the engineering and geologic engineering assessments and analyses made, and the recommendations developed to satisfy the given requirements of the project. These reports may be titled investigations, explorations, studies, assessments, or evaluations. Regardless of the title used, the geotechnical-engineering report is an engineering interpretation of the subsurface conditions within the context of the project and does not represent a close examination, systematic inquiry, or thorough investigation of all site and subsurface conditions.

Geotechnical-Engineering Services are Performed for Specific Purposes, Persons, and Projects, and At Specific Times

Geotechnical engineers structure their services to meet the specific needs, goals, and risk management preferences of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client.

Likewise, geotechnical-engineering services are performed for a specific project and purpose. For example, it is unlikely that a geotechnical-engineering study for a refrigerated warehouse will be the same as one prepared for a parking garage; and a few borings drilled during a preliminary study to evaluate site feasibility will not be adequate to develop geotechnical design recommendations for the project.

Do not rely on this report if your geotechnical engineer prepared it:

- for a different client;
- for a different project or purpose;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, the reliability of a geotechnical-engineering report can be affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying the recommendations in it. A minor amount of additional testing or analysis after the passage of time – if any is required at all – could prevent major problems.

Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read the report in its entirety. Do not rely on an executive summary. Do not read selective elements only. *Read and refer to the report in full.*

You Need to Inform Your Geotechnical Engineer About Change

Your geotechnical engineer considered unique, project-specific factors when developing the scope of study behind this report and developing the confirmation-dependent recommendations the report conveys. Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the elevation, configuration, location, orientation, function or weight of the proposed structure and the desired performance criteria;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project or site changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept*

responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.

Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface using various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing is performed.* The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgement to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team through project completion to obtain informed guidance quickly, whenever needed.

This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, they are not final, because the geotechnical engineer who developed them relied heavily on judgement and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* exposed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a continuing member of the design team, to:

- confer with other design-team members;
- help develop specifications;
- review pertinent elements of other design professionals' plans and specifications; and
- be available whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction-phase observations.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for information purposes only.* To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. This happens in part because soil and rock on project sites are typically heterogeneous and not manufactured materials with well-defined engineering properties like steel and concrete. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely.* Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually provide environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures.* If you have not obtained your own environmental information about the project site, ask your geotechnical consultant for a recommendation on how to find environmental risk-management guidance.

Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, the engineer's services were not designed, conducted, or intended to prevent migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration. Confront the risk of moisture infiltration*** by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

EXECUTIVE SUMMARY

This report presents the results of Kleinfelder's geotechnical study for proposed Costco Wholesale warehouse and fuel facility (CW# 18-0487) located on Silva Valley Parkway in El Dorado Hills, California. The purpose of our geotechnical study was to evaluate soil/bedrock and groundwater conditions at the site and provide geotechnical recommendations for project design and construction. We based our study on the Costco Wholesale Development Requirements (CWDRs), Version 2018, revised October 26, 2018.

Kleinfelder understands Costco plans to purchase an approximately 17-acre, commercially-zoned site on the southwest side of Silva Valley Parkway north of Highway 50 in El Dorado Hills, California and construct an approximately 152,000-square foot warehouse and fuel facility. The building will be a single-story, steel-framed structure (30 feet in height) with concrete-masonry-unit and metal walls. Based on the CWDRs, we understand maximum column loads will be on the order of 120 kips for non-snow regions, typical wall loads will be approximately 4.5 kips per lineal foot, and the total slab load (dead plus live loads) will be approximately 500 psf.

In addition, immediately west of the warehouse facility, a two-level parking structure will be constructed, which will service the majority of the parking at the site. Structural loading is not currently available; however, based on past experience, maximum column loads for the parking structure is anticipated to be on the order of 250 kips for interior columns and 125 kips for exterior columns, respectively. Additional surface parking and landscape islands are also planned around the new fuel facility located on the northern portion of the property. Parking and drive areas will be paved with either Portland cement concrete or asphalt concrete pavement.

The site is located between Silva Valley Parkway and US Highway 50 in El Dorado Hills, California. The site is currently bounded by Silva Valley Parkway to the north and east, the southbound US Highway 50 on-ramp to the south, and Clarksville Crossing to the west. The site is undeveloped with rolling hills running from east to west with ground surface elevations between approximately 705 to 755 feet. At the time of our field exploration, much of the site was covered by low-lying vegetation (weeds and shrubs) and animal burrows. Additionally, a seasonal creek runs through the property from east to west.

Based on preliminary grading plans provided by Kier and Wright (Civil Engineer), we understand that the finished floor elevation for the warehouse building slab will be established at Elevation

© 2019 Kleinfelder

729 feet. The upper level of the parking structure will match the surface grades surrounding the warehouse building at elevations ranging between 724 and 729 feet. The lower level of the parking structure will be set about 12 feet below the upper level. The warehouse building footprint is situated on a cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. Conversely, the proposed parking structure on the western side of the site is located mostly in fills of approximately 5 to 10 feet in depth. The preliminary grading plans show this site to be balanced. Retaining walls will be constructed on the southern and eastern sides of the warehouse building and west of the fuel facility. Retaining wall types have not been determined at this time; however, rockeries are being considered.

Subsurface conditions at the site were explored by drilling 3 borings/rock cores, excavating 26 test pits and performing a seismic refraction survey. The seismic refraction survey was used to evaluate the excavatability (rippability) of the bedrock rock material. A total of 2 boring/rock cores and 15 test pits were drilled/excavated in the warehouse building area; 1 boring/rock core and 2 test pits were excavated within the fuel facility area, 5 test pits were excavated within the future parking structure; and 4 test pits were excavated in the proposed parking lot areas. The borings were drilled using track-mounted hollow-stem-auger drilling equipment with rock coring abilities to depths of between approximately 8½ to 25 feet below the existing ground surface (bgs). The proposed exploration plan also included a fourth rock coring location (KB-2) at the northeastern corner of the new warehouse location. This location was not drilled due to very hard drilling conditions throughout the course of the field exploration.

Subsurface materials encountered during the explorations consisted of colluvium/residual soil overlying bedrock. The colluvium/residual soil consisted primarily of clayey soils with varying amounts of silt and gravel and varied in depth from approximately 1 to 5½ feet bgs. Below the colluvium/residual soil, bedrock comprised of weathered and fractured metavolcanic rock underlain by little-weathered, intact rock. The rock increased in strength and decreased in weathering and fracture amount with depth, as shown on Figures 5 through 10 and the seismic refraction survey report (Appendix C). Localized deposits of artificial fill were encountered in a few test pits. The fill consisted of sandy lean clays with variable amounts of gravel and cobbles. Perched groundwater was encountered in Test Pits TP-4 and TP-6 at depths of approximately 7 to 8 feet bgs. These test pits were located near a seasonal creek, which runs through the property. During Kleinfelder's investigation of the adjacent property in April of 2019, this creek

© 2019 Kleinfelder

had been flowing rapidly and all excavated test pits encountered perched water near bedrock contact.

Based on the results of our prior field exploration, and observations during this exploration, it is our professional opinion that the proposed project is geotechnically feasible, provided the recommendations presented in the geotechnical report are incorporated into the project design and construction. We identified the following key geotechnical considerations during our study.

- The primary geotechnical consideration for site development is the excavatability of the rock and the construction of fills to achieve the finished grades. The seismic refraction survey results (Appendix C) indicate the initial weathered rock layer with compression wave velocities (Vp) ranging between 3,985 to 6,030 feet per second is located approximately 1 to 3 below existing grades and extends as deep as 30 feet below grade within the warehouse building cut. Based on Caterpillar's Handbook of Ripping (2000), rock exhibiting seismic velocities in this range are marginally rippable using a D9R dozer equipped with multi or single shank ripper(s). Underlying this layer is a less weathered rock zone with compression wave velocities ranging between 12,210 to 18,530 feet per second and is located as shallow as 5 to 10 feet below grade within eastern cut for the warehouse building and the fuel facility cut area on the northern portion of the site. Localized blasting will likely be needed to excavate less weathered rock. In addition, crushing and screening operations will likely be required to produce efficient rock fragmentation of the rock (both weathered and less weathered rock) for re-use onsite as structural fill.
- Based on the preliminary grading plan, the warehouse building footprint is situated on a bedrock cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. To provide uniform support for the proposed warehouse building and to reduce the adverse effects of abrupt differential settlement due the cut/fill transition and variability in fill thickness across the building pad, we recommend the bedrock should be undercut by at least 6 feet below the finished floor elevation and backfilled with structural fill. In addition, cut/fill transitions are situated below small areas of the parking structure's lower level. Beneath the parking structure, we recommend the bedrock should be undercut by at least 4 feet below the finished floor elevation and backfilled with structural fill.

© 2019 Kleinfelder

- The residual soil/colluvial layer should excavated to underlying weathered rock contact and stockpiled on site for reuse as structural fill. An estimate of the residual soil/colluvial layer thickness is shown on the cross sections (Figures 5 through 10).
- Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Other than plant roots, organic matter in the topsoil is minimal based on our laboratory testing (between one and three percent). The topsoil can be re-used on site in fills.
- Due to the composition of the bedrock, it will not reduce to a soil-like material when excavated and will not be suitable for re-use as structural fill. However, the bedrock material may be crushed, processed and re-used onsite as structural fill as described below. Rock fragments up to 12 inches in size may be used in structural fills 10 or more feet below finished subgrade elevation, but not within 10 feet of a slope face. Rock fragments greater than 6 inches in size should not be used in the upper 10 feet of site fills. Rock fragments greater than 3 inches in size should not be used in the upper 3 feet of fills below the Costco warehouse building. There may be an opportunity for larger sized rocks and boulders between 12 and 24 inches in size to be re-used at the base of slopes or in landscape areas. A rock that cannot be crushed or screened to above size criteria should be removed off site.
- Rocks up to 12 inches in size may be placed in the deeper portions of structural fills as noted above provided they are thoroughly mixed with soils to avoid excessive concentrations of rock fragments. Over-sized materials (between 6 and 12 inches) should be placed in windrows or otherwise be placed under the observation of the geotechnical engineer's representative in a manner to avoid nesting or voids. Fills should be placed in lifts slightly thicker than the largest particle size and proof-rolled with a D-9 or larger Caterpillar dozer making at least 5 complete passes over each lift. Periodic test pits should be excavated into each compacted lift to confirm the rock fill is being placed in a uniform, dense manner with no nesting or voids.
- After stripping the site and prior to filling in the seasonal creek, which runs from east to west through the site, subdrains should be installed within the creek bottom. This creek was observed to be flowing rapidly during our initial investigation of the adjacent site in April 2019.

© 2019 Kleinfelder

- Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, perched groundwater will likely be present at or near subgrade level across the entire site during and after rainfall events.
- Although preliminary grading plans show that this site will be balanced, it is anticipated that crushing and processing the harder rock layers will prove challenging and may require soil to be imported onsite. Import materials, if required, should have a Plasticity Index of less than 10 with no less than 70 percent passing the No. 4 sieve, no more than 30 percent of the particles passing the No. 200 sieve, and no particles greater than 3 inches in maximum dimension. The maximum Plasticity Index for imported soils may be modified upon approval by Costco depending on its proposed use. The contractor should provide documentation to Costco that imported fill is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals prior to its transportation and use on site.
- Permanent slopes should be constructed at an inclination of 2:1 (horizontal to vertical) or flatter.
- Retaining wall types have not been determined at this time; however, we understand rockeries are being considered. Kleinfelder has provided recommendations for cantilever retaining walls. Rockeries are designed and constructed by a design-build specialty contractor.
- The proposed Costco warehouse building, fuel facility canopy, and parking structure foundations may be supported on a conventional shallow foundation system. Proposed light poles located in the parking lot may be supported on short drilled pile foundations.
- Pursuant to current Costco Wholesale standard construction design practices, we have evaluated whether steel reinforcement is needed within the floor slab. Based on the geotechnical characteristics of the site, the proposed warehouse can be built with a non-reinforced slab.
- Kleinfelder typically recommends installation of a vapor barrier beneath the slab to mitigate potential moisture issues such as flooring performance and mold. However, we understand that Costco Wholesale has determined that moisture barriers are not to be used in construction of Costco Wholesale warehouses due to adverse effects on concrete curing and performance. Therefore, we have provided construction recommendations that do not include installation of a moisture barrier, with the understanding that there will be an increased risk for adverse moisture issues.

© 2019 Kleinfelder

- The residual soil/colluvium is anticipated to be used near the finished subgrade levels around the site. Because this material drains poorly, we recommend radial finger drains below new pavement sections. Additionally, planters should be detailed such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement.
- Based on the current grading plan and understanding of the regional geology, we classify the site as Seismic Site Class C.
- Performance grade (PG) binder oil of 64-10 should be used asphalt concrete pavements and is locally available.
- The minimum resistivity of the samples tested indicate that the soil may be corrosive towards ferrous metals. The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318-14 Table 19.3.1.1 (ACI, 2014). Therefore, in accordance with ACI Building Code 318-14, no special provisions for selection of cement type are required.
- Based on visual soil classification and laboratory testing of the soil samples collected during our field exploration, the upper approximately 1 to 5 feet of the subsurface soils consist predominantly lean sandy clays underlain with highly fractured highly weathered metavolcanic rock. Based on the soil classification, and gradation tests, water infiltration is expected to be very low. We recommend alternatives to infiltration BMPs, such as bio-filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the Costco site.

The findings, conclusions, and recommendations presented in this executive summary should not be relied upon without consulting our geotechnical report for more information. The conclusions and recommendations presented in this report are subject to the limitations presented in Section 7.

1 INTRODUCTION

This report presents the results of Kleinfelder's geotechnical study for proposed Costco Wholesale warehouse and fuel facility (CW# 18-0487) located at Silva Valley Parkway in El Dorado Hills, California. The location of the project site is presented on Figure 1, Site Location Map. The purpose of our geotechnical study was to evaluate soil/bedrock and groundwater conditions at the site and provide geotechnical recommendations for project design and construction. The scope of our services was presented in our change order and revised proposal titled, "Proposal for Geotechnical Study – New Site, Proposed Costco Wholesale Warehouse and Fuel Facility Silva Valley Parkway, El Dorado Hills, California 95762, CW#18-0487," dated August 19, 2019. We based our study on the Costco Wholesale Development Requirements (CWDRs), Version 2018, revised October 26, 2018.

This report presents a description of the services performed, a discussion of the geotechnical conditions observed at the site, and recommendations developed from our engineering analyses of field and laboratory data. Individuals using this report should read the limitations presented in Section 7.

1.1 PROJECT DESCRIPTION

Kleinfelder understands Costco plans to purchase an approximately 17-acre, commercially-zoned site on the southwest side of Silva Valley Parkway north of Highway 50 in El Dorado Hills, California and construct an approximately 152,000-square foot warehouse and fuel facility. The building will be a single-story, steel-framed structure (30 feet in height) with concrete-masonry-unit and metal walls. Based on the CWDRs, we understand maximum column loads will be on the order of 120 kips for non-snow regions, typical wall loads will be approximately 4.5 kips per lineal foot, and the total slab load (dead plus live loads) will be approximately 500 psf.

In addition, immediately west of the warehouse facility, a two-level parking structure will be constructed, which will service the majority of the parking at the site. Structural loading is not currently available; however, based on past experience, maximum column loads for the parking structure is anticipated to be on the order of 250 kips for interior columns and 125 kips for exterior columns, respectively. Additional surface parking and landscape islands are also planned around the new fuel facility located on the northern portion of the property. Parking and drive areas will be paved with either Portland cement concrete or asphalt concrete pavement.

© 2019 Kleinfelder

Based on preliminary grading plans provided by Kier and Wright (Civil Engineer), we understand that the finished floor elevation for the warehouse building slab will be established at Elevation 729 feet. The upper level of the parking structure will match the surface grades surrounding the warehouse building at elevations ranging between 724 and 728 feet. The lower level of the parking structure will be set about 12 feet below the upper level. The warehouse building footprint is situated on a cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. Conversely, the proposed parking structure on the western side of the site is located mostly in fills of approximately 5 to 10 feet in depth. The preliminary grading plans show this site to be balanced. Retaining walls will be constructed on the southern and eastern sides of the warehouse building and west of the fuel facility. Retaining wall types have not been determined at this time; however, rockeries are being considered.

1.2 SCOPE OF SERVICES

The scope of our geotechnical study consisted of a literature review, subsurface explorations, geotechnical laboratory testing, engineering evaluation and analysis, and preparation of this report. Studies to assess environmental hazards that may affect the soil and groundwater at the site were beyond our geotechnical scope of services. The following paragraphs present a description of our services.

1.2.1 Task 1 – Background Data Review

We reviewed readily-available published and unpublished geologic literature in our files and the files of public agencies, including selected publications prepared by the California Geological Survey and the U.S. Geological Survey. Readily-available on-line photos were reviewed for past site development and use. We also reviewed readily available seismic and faulting information, including data for designated earthquake fault zones as well as our in-house database of faulting in the general site vicinity.

1.2.2 Task 2 – Field Exploration

Subsurface conditions at the site were explored by drilling 3 borings/rock cores, excavating 26 test pits and performing a seismic refraction survey. The seismic refraction survey was used to evaluate the excavatability (rippability) of the bedrock rock material. A total of 2 boring/rock cores and 15 test pits were drilled/excavated in the warehouse building area; 1 boring/rock core

© 2019 Kleinfelder

and 2 test pits were excavated within the fuel facility area, 5 test pits were excavated within the future parking structure; and 4 test pits were excavated in the proposed parking lot areas. The borings were drilled using track-mounted hollow-stem-auger drilling equipment with rock coring abilities to depths of between approximately 8½ to 25 feet below the existing ground surface (bgs). The proposed exploration plan also included a fourth rock coring location (KB-2) at the northeastern corner of the new warehouse location. This location was not drilled due to very hard drilling conditions throughout the course of the field exploration. Test pits were excavated with a John Deere 50G track excavator to depths ranging from 2 to 10 feet bgs. The explorations are shown graphically on Figure 2, Exploration Location Map.

Prior to commencement of the fieldwork, Underground Service Alert (USA) was notified and various geophysical techniques were used at the boring and test pit locations to identify potential conflicts with subsurface structures. A Kleinfelder staff engineer supervised the field operations and logged the explorations. Selected samples were retrieved, placed in plastic bags or sealed, and transported to our laboratory for further evaluation. Descriptions used on the logs result from field observations and data, as well as from laboratory test data. Stratification lines on the logs represent the approximate boundary between soil and/or rock types, and the actual transition may vary and can be gradual. Appendix A presents a description of the field exploration program, exploration logs, test pit logs and a legend of terms and symbols used on the logs.

1.2.3 Task 3 – Laboratory Testing

Laboratory testing was performed on representative bulk and relatively undisturbed samples to assist in soil classification and development of engineering parameters for geotechnical design. Laboratory testing comprised moisture content, Atterberg limits, R-value, and unconfined compressive strength tests and were performed by our in-house laboratory. Corrosivity testing was performed by AP Engineering & Testing, Inc. of Pomona, California.

Analytical testing was performed on a composite topsoil sample for essential elements in accordance with CWDRs topsoil samples were tested for organic content. The topsoil analysis and organic content testing was performed by Waypoint Analytical of Anaheim, California to assess soil fertility, localized concentrations of various metals and organic content. All in-house and subcontracted laboratory test results are shown in Appendix B of this report.

© 2019 Kleinfelder

1.2.4 Task 4 – Geotechnical Analyses

We analyzed field and laboratory data in conjunction with the finished grades, warehouse layout, and structural loads to provide geotechnical recommendations for design and construction. We evaluated feasible foundation systems, concrete slab support, pavement design, and earthwork. Seismic design parameters in accordance with the 2019 California Building Code (CBC) are also presented.

1.2.5 Task 5 – Report Preparation

This report summarizes the services performed, data acquired, and our findings, conclusions, and geotechnical recommendations for the design and construction of the proposed improvements. Our report includes the following items:

- Vicinity map and field exploration location map showing the approximate boring and test pit locations;
- Boring and test pit logs (Appendix A);
- Results of laboratory testing including topsoil analytical testing (Appendix B);
- Seismic refraction survey performed by Advanced Geological Services (Appendix C);
- Cross section figures detailing subsurface soils encountered and recommended overexcavation amounts across the building pad and parking lot areas;
- Discussion of general site conditions;
- Discussion of general subsurface conditions as encountered in our field exploration;
- Discussion of regional and local geology;
- Recommendations for seismic design parameters in accordance with Chapter 16 of the 2019 CBC;
- Recommendations for foundation design, allowable bearing pressures, embedment depths, and compatibility constraints under various loading conditions;
- Anticipated total and differential static settlements;
- Recommendations for site preparation, earthwork, temporary slope inclinations, fill placement, and compaction specifications, including the excavation characteristics of bedrock;
- Recommendations for support of floor slabs and slabs-on-grade;

© 2019 Kleinfelder

- Recommendations for flexible and rigid pavement structural sections for light- and heavy-duty pavement based on Equivalent Single Axle loading presented in the CWDRs;
- Recommendations for design of retaining structures, including active and at-rest lateral earth pressures, passive and frictional resistance, and applicable surcharge loads; and
- Preliminary evaluation of the corrosion potential of the on-site soils

© 2019 Kleinfelder

2 SITE CONDITIONS

2.1 SITE DESCRIPTION

The proposed Costco site is located between Silva Valley Parkway and US Highway 50 in El Dorado Hills, California, as presented on Figure 1. The site is currently bounded by Silva Valley Parkway to the north and east, the southbound US Highway 50 on-ramp to the south, and Clarksville Crossing to the west. The land is zoned as commercial and is located around ¼ mile south of Oak Meadow Elementary school and the Serrano residential development.

At the time of our field exploration, the site was an undeveloped field with rolling hills generally sloping from east to west with ground surface elevations ranging from approximately 705 to 755 feet. Much of the site was covered by low-lying vegetation (weeds and shrubs) and animal burrows as well as some native trees. Outcropping rocks were also visible throughout the site. Additionally, a seasonal creek separating the proposed warehouse and parking structure locations from the proposed fuel facility runs through the property from east to west. This creek was dry during our September 2019 investigation but was observed to be flowing during our initial field exploration of the adjacent property in April of 2019.

An unfinished portion (~100 feet long) of Tong Road resides on the southwest corner of the property. Based on site reconnaissance, no existing structures sat on this land prior to the investigation with no utility company easements running through the property.

© 2019 Kleinfelder

3 GEOLOGY

3.1 GEOLOGIC SETTING

3.1.1 Regional Geology

The subject site is situated in the gently rolling topography that forms the western foothills of the Sierra Nevada Mountains. The western foothills are broadly tilted, dipping westward, and uplifted increasingly to the east, due to maximum uplift of the Sierra Nevada at its eastern edge. The Sierra Nevada is comprised mostly of large, north-south elongated blocks of Mesozoic granitic terrain forming the backbone of California. The foothills in the project vicinity consist of a northwest-trending belt of metamorphosed volcanic and sedimentary rock that separate the Sierran crystalline basement rock (granites) from the Central Valley sediments. These rocks are distributed within three major north-south trending, fault-bounded lithologic terrains that extend along the length of the metamorphic belt. Rocks within these terrains have been isoclinally folded and metamorphosed on a regional scale and represent a “collage” of tectonically accreted blocks emplaced during convergent plate tectonism that occurred during the Early Paleozoic and Late Jurassic. Bedding, foliation, and major faults throughout the metamorphic belt normally trend northwest and dip steeply to the east. A map of the regional geology is provided in Figure 3 of this report.

3.1.2 Site Geology

The project area is mapped by Loyd (1983 and 1984) as being underlain by Jurassic and Triassic age metavolcanic rocks (map symbol mv). This formation is almost entirely of marine origin and consist mostly of basaltic to andesitic breccias, flows, and tuffs that have been metamorphosed, but with primary volcanic features generally recognizable. The formation also contains minor associated sandstone and conglomerate, although none were encountered during our field investigation. Foliation that developed from regional metamorphism is often evident in the rock structure and typically has a north-trending direction. Locally, schistose fabric may be evident. The rock strength of the in less weathered portions of the formation is typically very high and can result in difficult excavation conditions.

3.2 SUBSURFACE CONDITIONS

Subsurface materials encountered during the explorations consisted of colluvium/residual soil overlying bedrock. The colluvium/residual soil consisted primarily of clayey soils with varying amounts of silt and gravel and varied in depth from approximately 1 to 5½ feet bgs. Below the

© 2019 Kleinfelder

colluvium/residual soil, bedrock comprised of weathered and fractured metavolcanic rock underlain by little-weathered, intact rock. The rock increased in strength and decreased in weathering and fracture amount with depth, as shown on the attached figure and seismic refraction survey report. Localized deposits of artificial fill were encountered in a few test pits. The fill consisted of sandy lean clays with variable amounts of gravel and cobbles.

3.3 GROUNDWATER

Groundwater as not encountered in our explorations to the maximum depth explored of approximately 25 feet. However, perched groundwater was encountered in Test Pits TP-4 and TP-6 at depths of approximately 7 to 8 feet bgs. These test pits were located near a seasonal creek, which runs through the property. During Kleinfelder's investigation of the adjacent property in April of 2019, this creek had been flowing rapidly and all excavated test pits encountered perched water near bedrock contact.

Localized zones of perched water, increased soil moisture content and fluctuations of the groundwater level, should be anticipated during and following the rainy season. Irrigation of landscaped areas on or adjacent to the site can also cause a fluctuation of local groundwater levels.

3.4 ASSESSMENT OF POTENTIAL GEOLOGIC HAZARDS

3.4.1 Localized Faulting

According to CGS (2018), the site is not located within an Alquist-Priolo Earthquake Fault Zone and no mapped active or potentially active fault traces are known to traverse the site. The project area is situated within a region traditionally characterized by few active faults, numerous inactive faults, and low to moderate seismic activity.

An active fault is a fault that has experienced seismic activity during historic time (since roughly 1800) or exhibits evidence of surface displacement during Holocene time (Hart and Bryant 1997). The definition of "potentially active" varies. A generally accepted definition of "potentially active" is a fault showing evidence of displacement that is older than 11,000 years (Holocene age) and younger than 1.7 million years (Pleistocene age). However, "potentially active" is no longer used as criteria for zoning by the California Geologic Survey (CGS), formerly known as the Division of Mines and Geology. The terms "sufficiently active" and "well-defined" are now used by the CGS as criteria for zoning faults under the Alquist-Priolo Earthquake Fault Act. A

© 2019 Kleinfelder

"sufficiently active fault" is a fault that shows evidence of Holocene surface displacement along one or more of its segments and branches, while a "well-defined fault" is a fault whose trace is clearly detectable by a trained geologist as a physical feature at or just below the ground surface. The definition "inactive" generally implies that a fault has not been active since the beginning of the Pleistocene Epoch (older than 1.7 million years old).

The nearest well-defined faults to the project are the Genoa and Cordelia faults. Both faults are located over 50 miles from the project site. A major seismic event on either of these faults is anticipated to cause weak ground shaking at the project site.

The nearest fault to the project site is the west trace of the Bear Mountain Fault Zone that strikes northwest-southeast for approximately 84 miles along the Sierra Foothill region. A fault trace within this zone is located approximately 650 feet west of the project and forms a major contact between the metavolcanics rock that underly the project and the younger Copper Hills Volcanics Formation to the west of the fault. Seismically, the mapped fault near the project is mapped as Pre-Quaternary (CGS, 2010). However, current seismic data (ANSS, 2011) shows micro-earthquakes (magnitude less than 2 or 3) are generated along the northern portion of the fault zone and UCEF3 includes the Swain Ravine – Spenceville segment of the Bear Mountains Fault Zone in their probability model (USGS, 2013). This low seismic activity is not expected to impact the project.

3.4.2 Landsliding

The majority of the project site is characterized by slope gradients of 5:1 (horizontal to vertical) and shallower (less steep). Given the elevation differential and shallow gradients the potential for slope instability is considered low. However, it should be noted that the exception to this condition are the approximately 2:1 permanent cut slopes for the roadways that form the northern and southern portions of the site. These slopes were excavated into highly weathered rock that historically can develop shallow debris flows and slumps during wet weather. Given the height of the slopes and extent of exposed rock, the potential for shallow slope instability events in this area is considered moderate.

3.4.3 Liquefaction and Seismic Compression

The term liquefaction describes a phenomenon in which saturated, cohesionless soils temporarily lose shear strength (liquefy) due to increased pore water pressures induced by strong, cyclic

© 2019 Kleinfelder

ground motions during an earthquake. Structures founded on or above potentially liquefiable soils may experience bearing capacity failures due to the temporary loss of foundation support, vertical settlements (both total and differential), and/or undergo lateral spreading. The factors known to influence liquefaction potential include soil type, relative density, grain size, confining pressure, depth to groundwater, and the intensity and duration of the seismic ground shaking. Liquefaction is most prevalent in loose to medium dense, silty, sandy, and gravelly soils below the groundwater table. Based on our review of available groundwater well data, it is our opinion that the regional groundwater is deep. Therefore, based on the results of the subsurface explorations and review data, the potential for liquefaction and its adverse effects (i.e., seismic settlement and lateral spreading) is not considered a hazard at the site.

Seismic compression results from the accumulation of contractive volumetric strains in unsaturated soil during earthquake shaking. Loose to medium dense granular material with no fines or with low plasticity fines are most susceptible to seismic compression. Based on the density and composition of the underlying soil/bedrock, seismic compression (dynamic dry settlement) is considered a hazard at the site.

3.4.4 Expansive Soils

Expansive soils are characterized by their ability to undergo significant volume changes (shrink or swell) due to variations in moisture content. Changes in soil moisture content can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. The surficial soils are generally low-medium plastic fines; therefore, the expansion potential is considered low.

3.4.5 Collapsible Soils

Collapsible soils are characterized by their ability to undergo significant shrinkage (collapse) during inundation. Inundation in soils can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. Based on the results of laboratory testing, the soil encountered are not expected to collapse during inundation, so the impact of collapsible soils for this site is considered low.

© 2019 Kleinfelder

3.4.6 Subsidence

The site is not located in an area of known significant ground subsidence due to the withdrawal of subsurface fluids. Subsidence may be present but adverse impacts have not been recorded. Therefore, the potential for subsidence occurring at the site due to the withdrawal of oil, gas, or water is considered low.

3.4.7 Flooding

The Flood Insurance Rate Map prepared by the Federal Emergency Management Agency (FEMA) was reviewed to identify the potential flood hazard for the project. This map indicates the site is within Zone X which is defined as being an area with a 0.2-percent-annual-chance-flood and an area of 1-percent-annual-chance flood with average depths of less than 1 foot. Based on this information the potential for the project site to be impacted by regional flooding is considered low. However, the accuracy of this information should be confirmed by a qualified civil engineer/hydrologist. The need and/or method for mitigation of potential flooding should also be addressed.

3.4.8 Oil and Gas Fields

Upon review of the California Division of Oil, Gas & Geothermal Resources (2016) interactive well-finder map accessed at https://maps.conservation.ca.gov/doggr/wellfinder, the El Dorado Hills region does not contain any known abandoned oil wells. Additionally, no active wells are known to exist within the project boundary.

3.4.9 Naturally Occurring Asbestos

Naturally occurring asbestos (NOA) has been identified as a source of potentially hazardous airborne asbestos fibers when disturbed by mining or earthwork activities, if present (Clinkenbeard et al. 2002). NOA generally occurs within mafic or ultramafic metamorphic rock units in which one of the asbestiform minerals defined by the California Air Resources Board (CARB 2002) are present. These NOA minerals have unique flexibility and strength characteristics and include asbestiform varieties of the six minerals chrysotile, amosite, crocidolite, tremolite actinolite, and anthophyllite. It was not part of this project's scope to quantitatively evaluate NOA concentrations along the project alignment. However, review of existing NOA maps produced by the CGS (Churchill 2000 and Higgins 2006) and presented on

© 2019 Kleinfelder

Figure 4 provides general guidelines as to the likelihood of encountering NOA for both El Dorado and Sacramento counties.

In addition, based on numerous NOA studies Kleinfelder has performed in the project area, typical NOA concentration level ranges (measured as a percent volume using the polarized light microscopy identification method [PLM]) can be identified for the rock types / geologic units present along the project alignment. These typical values can be compared to the threshold limits established by CARB's Airborne Toxic Control Measures (ATCM) for Construction Grading, Quarrying, and Surface Mining Operation (CARB 2002) to identify whether mitigative measurements need to be implemented during excavation of the foundation towers and how the excavation spoils are to be handled relative to disposal and off-haul. Generally, the metavolcanic rock has concentration levels at or below the threshold level of 0.25 percent. Where NOA levels are at or above 0.25 percent, contractors are required to implement mitigation practices to protect workers and the public from airborne NOA particles generated during earthwork operations. NOA levels at or above 1 percent is considered a hazardous material and will require special handling during transportation and will need to be disposed of at an approved site. The Asbestos Review Areas map (Churchill, 2000) indicates the project site is in an area that has been removed as mappable NOA bearing unit based on geologic evaluation. Based on this data the potential for NOA to be encountered at levels at or exceeding regulatory threshold levels is considered low. However, testing by Costco could be performed to further define NOA concentrations across the project area in order to assist Costco with identifying their risk associated with this hazard. Should levels be equal to or exceed regulatory threshold levels mitigation procedures will need to be implemented. Mitigation alternatives will need to be consistent with guidelines outlined in the CARB's current ATCM and Occupational Safety and Health Administration (OSHA) standards for the handling of NOA.

© 2019 Kleinfelder

4 GEOTECHNICAL DESIGN RECOMMENDATIONS

4.1 GENERAL

Based on the results of our field exploration, laboratory testing and engineering analyses conducted during this study, it is our professional opinion the proposed project is geotechnically feasible, provided the design and construction recommendations presented in this report are incorporated into the project. We identified the following key geotechnical considerations during our study.

- The primary geotechnical consideration for site development is the excavatability of the rock and the construction of fills to achieve the finished grades. The seismic refraction survey results (Appendix C) indicate the initial weathered rock layer with compression wave velocities (Vp) ranging between 3,985 to 6,030 feet per second is located approximately 1 to 3 below existing grades and extends as deep as 30 feet below grade within the warehouse building cut. Based on Caterpillar's Handbook of Ripping (2000), rock exhibiting seismic velocities in this range are marginally rippable using a D9R dozer equipped with multi or single shank ripper(s). Underlying this layer is a less weathered rock zone with compression wave velocities ranging between 12,210 to 18,530 feet per second and is located as shallow as 5 to 10 feet below grade within eastern cut for the warehouse building and the fuel facility cut area on the northern portion of the site. Localized blasting will likely be needed to excavate less weathered rock. In addition, crushing and screening operations will likely be required to produce efficient rock fragmentation of the rock (both weathered and less weathered rock) for re-use onsite as structural fill.
- Based on the preliminary grading plan, the warehouse building footprint is situated on a bedrock cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. To provide uniform support for the proposed warehouse building and to reduce the adverse effects of abrupt differential settlement due the cut/fill transition and variability in fill thickness across the building pad, we recommend the bedrock should be undercut by at least 6 feet below the finished floor elevation and backfilled with structural fill. In addition, cut/fill transitions are situated below small areas of the parking structure's lower level. Beneath the parking structure, we recommend the bedrock should be undercut by at least 4 feet below the finished floor elevation and backfilled with structural fill.

© 2019 Kleinfelder

- The residual soil/colluvial layer should excavated to underlying weathered rock contact and stockpiled on site for reuse as structural fill. An estimate of the residual soil/colluvial layer thickness is shown on the cross sections (Figures 5 through 10).
- Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Other than plant roots, organic matter in the topsoil is minimal based on our laboratory testing (between one and three percent). The topsoil can be re-used on site in fills.
- Due to the composition of the bedrock, it will not reduce to a soil-like material when excavated and will not be suitable for re-use as structural fill. However, the bedrock material may be crushed, processed and re-used onsite as structural fill as described below. Rock fragments up to 12 inches in size may be used in structural fills 10 or more feet below finished subgrade elevation, but not within 10 feet of a slope face. Rock fragments greater than 6 inches in size should not be used in the upper 10 feet of site fills. Rock fragments greater than 3 inches in size should not be used in the upper 3 feet of fills below the Costco warehouse building. There may be an opportunity for larger sized rocks and boulders between 12 and 24 inches in size to be re-used at the base of slopes or in landscape areas. A rock that cannot be crushed or screened to above size criteria should be removed off site.
- Rocks up to 12 inches in size may be placed in the deeper portions of structural fills as noted above provided they are thoroughly mixed with soils to avoid excessive concentrations of rock fragments. Over-sized materials (between 6 and 12 inches) should be placed in windrows or otherwise be placed under the observation of the geotechnical engineer's representative in a manner to avoid nesting or voids. Fills should be placed in lifts slightly thicker than the largest particle size and proof-rolled with a D-9 or larger Caterpillar dozer making at least 5 complete passes over each lift. Periodic test pits should be excavated into each compacted lift to confirm the rock fill is being placed in a uniform, dense manner with no nesting or voids.
- After stripping the site and prior to filling in the seasonal creek, which runs from east to west through the site, subdrains should be installed within the creek bottom. This creek was observed to be flowing rapidly during our initial investigation of the adjacent site in April 2019.

© 2019 Kleinfelder

- Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, perched groundwater will likely be present at or near subgrade level across the entire site during and after rainfall events.
- Although preliminary grading plans show that this site will be balanced, it is anticipated that crushing and processing the harder rock layers will prove challenging and may require soil to be imported onsite. Import materials, if required, should have a Plasticity Index of less than 10 with no less than 70 percent passing the No. 4 sieve, no more than 30 percent of the particles passing the No. 200 sieve, and no particles greater than 3 inches in maximum dimension. The maximum Plasticity Index for imported soils may be modified upon approval by Costco depending on its proposed use. The contractor should provide documentation to Costco that imported fill is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals prior to its transportation and use on site.
- Permanent slopes should be constructed at an inclination of 2:1 (horizontal to vertical) or flatter.
- Retaining wall types have not been determined at this time; however, we understand rockeries are being considered. Kleinfelder has provided recommendations for cantilever retaining walls. Rockeries are designed and constructed by a design-build specialty contractor.
- The proposed Costco warehouse building, fuel facility canopy, and parking structure foundations may be supported on a conventional shallow foundation system. Proposed light poles located in the parking lot may be supported on short drilled pile foundations.
- The residual soil/colluvium is anticipated to be used near the finished subgrade levels around the site. Because this material drains poorly, we recommend radial finger drains below new pavement sections. Additionally, planters should be detailed such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement.
- The minimum resistivity of the sample indicates that the soil may be moderately corrosive to corrosive to ferrous metals. The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318-14 Table 19.3.1.1 (ACI, 2014). Therefore, in accordance with ACI Building Code 318-14, no special provisions for selection of cement type are required.
- Based on visual soil classification and laboratory testing of the soil samples collected during our field exploration, the upper approximately 1 to 5 feet of the subsurface soils consist

© 2019 Kleinfelder

predominantly lean sandy clays underlain with highly fractured highly weathered metavolcanic rock. Based on the soil classification, and gradation tests, water infiltration is expected to be very low. We recommend alternatives to infiltration BMPs, such as bio-filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the Costco site.

The following opinions, conclusions, and recommendations are based on the properties of the materials encountered in the borings and test pits, the results of the laboratory-testing program, and our engineering analyses performed, and should be incorporated into project design and construction.

4.2 2019 CALIFORNIA BUILDING CODE

We have also provided the seismic design parameters for ASCE 7-16, as the project will be designed after adoption of the 2019 California Building Code (CBC) on January 1, 2020. Based on the current grading plan and understanding of the regional geology and on our interpretation of the CBC criteria, we classify the site as Seismic Site Class C. Approximate coordinates for the site are noted below.

- Latitude: 38.66020 °N
- Longitude: 121.05699 °W

In accordance with Section 11.4.8 of ASCE 7-16, a site-specific ground motion analysis may be required for Site Class D sites with an S1 greater than 0.2g. However, a site-specific ground motion analysis is not required if the seismic response coefficient (Cs) is determined in accordance with requirements of Chapter 12 and the exceptions noted in Section 11.4.8. The assumption that Cs will be determined in accordance with the requirements of Chapter 12 and the exceptions noted in Section 11.4.8 should be verified by the project structural engineer during final design. The 2019 CBC (non site-specific) for these structures are summarized in Table 1.

© 2019 Kleinfelder

TABLE 1
2019 CBC SEISMIC DESIGN PARAMETERS

Design Parameter	Recommended Value
Site Class	C
S_s (g)	0.404
S_1 (g)	0.207
F_a	1.300
F_v	1.500
S_{MS} (g)	0.525
S_{M1} (g)	0.311
S_{DS} (g)	0.350
S_{D1} (g)	0.207
PGA_M (g)	0.211

4.3 FOUNDATIONS

4.3.1 General

Based on the results of our field exploration, laboratory testing, and geotechnical analyses, the proposed warehouse building and parking structure may be supported on conventional shallow spread footing foundations founded on subgrade prepared in accordance with Section 5.2.2. We understand that new spread footing foundations for the fuel facility canopy will be embedded approximately 6 to 7 feet below the finished grade. Spread footings may be founded entirely on bedrock or on structural fill.

Proposed light poles in the parking lot may be supported on short drilled pile foundations. Recommendations for the design and construction of shallow foundations and drilled pile foundations are presented below.

4.3.2 Shallow Foundations

Allowable Soil Bearing Pressure

Footings may be designed for a net allowable soil bearing pressure of 3,000 pounds per square foot (psf) for dead plus sustained live loads. Footings should be embedded at least 24 inches below the lowest adjacent exterior grade. The footing dimension and reinforcement should be designed by the structural engineer; however, continuous and isolated spread footings

© 2019 Kleinfelder

should have minimum widths of 18 and 24 inches, respectively. A one-third increase in the above bearing pressures can be used for transient wind or seismic loads.

Estimated Settlements

We estimate total static settlement for foundations designed and constructed in accordance with the recommendations presented above to be less than 1 inch. Differential static settlement between similarly loaded footings is estimated to be less than ½ inches over 50 feet.

Lateral Resistance

Lateral load resistance may be derived from passive resistance along the vertical sides of the footings, friction acting at the base of the footing, or a combination of the two. An allowable passive resistance of 300 psf per foot of depth may be used for design. Allowable passive resistance values should not exceed 3,000 psf. An allowable coefficient of friction of 0.4 between the base of the footings and the structural fill soils can be used for sliding resistance using the dead load normal stresses. Friction and passive resistance may be combined without reduction. We recommend that the first foot of soil cover be neglected in the passive resistance calculations if the ground surface is not protected from erosion or disturbance by a slab, pavement or in a similar manner. Where passive soil resistance is used for design of retaining walls, the area within 5 feet of the front of the wall footing should not be disturbed by excavation or other means.

4.3.3 Drilled Pile Foundations (Light Pole Foundations)

Axial Capacity

The compressive axial capacity of drilled piles may be estimated based on an allowable skin friction capacity of 200 pounds per square foot. The upper one foot of the skin friction capacity should be ignored. The uplift capacity may be estimated as 70 percent of the allowable compressive axial capacity. A one-third increase in the allowable capacities may be used for transient loading conditions such as wind or seismic loads.

Settlement

Settlement of the proposed canopy supported on drilled piles, as recommended, is estimated to be less than ½ inch.

© 2019 Kleinfelder

Lateral Resistance

The drilled pile foundations lateral resistance can be designed in general accordance with Section 1807.3 of the 2016 CBC. We recommend a lateral soil bearing pressure of 300 psf per foot of depth below grade. The lateral soil bearing pressure should not exceed 3,000 psf. Since drilled piles will act as isolated pole foundations, the allowable lateral soil bearing pressure may be increased by a factor of two for short-term lateral loads provided the structure will not be adversely affected by ½ inch of lateral movement at the ground surface.

4.4 BUILDING SLAB-ON-GRADE

Concrete slab-on-grade floors are appropriate for the proposed warehouse, provided subgrade is prepared in accordance with Section 5.2.2. In accordance with the CWDRs, we recommend the slab be a minimum nominal thickness of 6 inches and underlain by at least 6 inches of aggregate base material. Aggregate base materials should meet current Caltrans specifications for Class 2 aggregate base. Please note that Caltrans Class 2 aggregate base may utilize recycled materials. Costco typically does not allow the use of recycled materials within the building pad.

A modulus of subgrade reaction of 150 pounds per cubic inch may be used for design of slabs underlain 6 inches of aggregate base material. Pursuant to current Costco Wholesale standard construction design practices, we have evaluated whether steel reinforcement is needed in the floor slab. Based on the geotechnical characteristics of the site, the proposed warehouse can be built with a non-reinforced slab.

Floor slab control joints should be used to reduce damage due to shrinkage cracking. Control joint spacing is a function of slab thickness, aggregate size, slump and curing conditions. The requirements for concrete slab thickness, joint spacing, and reinforcement should be established by the designer, based on experience, recognized design guidelines and the intended slab use. Placement and curing conditions will have a strong impact on the final concrete slab integrity.

Kleinfelder typically recommends installation of a vapor barrier beneath the slab to mitigate potential moisture issues such as flooring performance and mold. However, we understand that Costco Wholesale has determined that moisture barriers are not to be used in construction of Costco Wholesale warehouses due to adverse effects on concrete curing and performance. Therefore, we have provided construction recommendations that do not include installation of a

© 2019 Kleinfelder

moisture barrier, with the understanding that there will be an increased risk for adverse moisture issues.

4.5 EXTERIOR FLATWORK

Exterior concrete slabs for pedestrian traffic or landscape outside of the building pad limits should be at least four inches thick. Weakened plane joints in sidewalks should be located at intervals of about 6 feet. Careful control of the water/cement ratio should be performed to avoid shrinkage cracking due to excess water or poor concrete finishing or curing. Unreinforced slabs should not be built in areas where further saturation may occur following construction. The subgrade should be prepared in accordance with Section 5.2.2.

4.6 SITE DRAINAGE

Foundation and slab performance depends greatly on proper irrigation and how well runoff water drains from the site. This drainage should be maintained both during construction and over the entire life of the project. The ground surface around structures should be graded such that water drains away from structures without ponding. The surface gradient needed to do this depends on the landscaping type. Surface gradients should conform to current Costco Wholesale standards and the 2019 CBC.

After the initial excavation of the residual/colluvial soils onsite. It is recommended that a perforated subdrain be installed within the creek bottom running from east to west through the project site. The drain may be “burrito wrapped” with filter fabric and surrounded by permeable drain rock prior to rock backfill operations onsite. Slope drains should also be installed within the fill slopes as discussed in Section 4.8. Figures 11 and 12 show typical details for slope and canyon drains.

The residual soil/colluvium is anticipated to be used near the finished subgrade levels around the site. Because this material drains poorly, we recommend radial finger drains below new pavement sections as shown in Detail 16_16 of the CWDRs. Drains should be designed and constructed per Costco’s standard details and laterals should extend at least 15 feet from the catch basins. Planters should be detailed such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement. We recommend that perimeter foundation drains be implemented in accordance with Costco’s development requirements in areas adjacent to landscaping planters.

© 2019 Kleinfelder

Where slabs or pavement areas abut landscaped areas, the aggregate base and subgrade soil should be protected against saturation. Vertical cut off structures are recommended to reduce lateral seepage under slabs from adjacent landscaped areas. Vertical cut-off structures may consist of deepened concrete perimeters, or equivalent, extending at least three inches below the base/subgrade interface. Vertical cut-off structures should be poured neat against undisturbed native soil or compacted fill. The cut-off structures should be continuous.

Operations personnel should be instructed to limit irrigation to the minimum level necessary to properly sustain landscaping plants. Should excessive irrigation, waterline breaks or unusually high rainfall occur, saturated zones and “perched” groundwater may develop, which could soften subgrade and reduce pavement life, and could also create potholes. We also recommend that the downspouts from roof drains be connected to a designed subsurface drainage system such as a storm sewer, etc. to avoid discharging water onto pavement areas as well as backfill zones around the warehouse.

Potential sources of water such as water pipes, drains, and the like should be frequently examined for signs of leakage or damage. Any such leakage or damage should be promptly repaired. Sewer lines beneath the warehouse should have a sufficient slope (at least 1 percent). Plumbing and utility lines should be provided with flexible joints or oversized sleeves where they penetrate floor slabs to prevent breakage caused by different slab movement.

4.7 RETAINING STRUCTURES

Retaining wall types have not been determined at this time; however, we understand rockeries are being considered. Recommendations for cantilever retaining walls are provided below. Rockeries are designed and constructed by a design-build specialty contractor.

Design earth pressures for retaining structures depend primarily on the allowable wall movement, wall inclination, type of backfill materials, backfill slopes, surcharges, and drainage. Earth pressures provided assume that granular (sandy) soils will used as backfill. The on-site residual soil/colluvium should not be used as retaining wall backfill. The granular backfill, which should meet the requirements for imported fill as defined in Section 5.2.6, should extend behind walls a horizontal distance of at least one-half the height of the wall. Determination of whether the active or at-rest condition is appropriate for design will depend on the flexibility of the walls. Walls that are free to rotate at least 0.002 radians (deflection at the top of the wall of at least 0.002 x H,

© 2019 Kleinfelder

where H is the unbalanced wall height) may be designed for the active condition. Walls that are not capable of this movement should be assumed rigid and designed for the at-rest condition. Walls that are not capable of this movement should be assumed rigid and designed for the at-rest condition. The recommended active and at-rest earth pressures and passive resistance values are provided in Table 2.

TABLE 2
LATERAL EARTH PRESSURES FOR RETAINING STRUCTURES
(GRANULAR BACKFILL)

Wall Movement	Backfill Condition	Equivalent Fluid Pressure (pcf)	Seismic Increment (pcf)
Free to Deflect (active condition)	Level	40	5H*
Restrained (at-rest condition)		60	N/A**

*Note: * Walls supporting more than 6 feet of backfill should be designed to support an incremental seismic lateral pressure, which is applied as a triangular pressure distribution with a maximum pressure at the bottom of the wall, not inverted, and H is the height of the wall.*

*** for restrained wall, use the static active earth pressure and seismic increment to check the seismic condition; use at-rest earth pressure only to check the static condition; the larger loading of both cases should be used for the design of restrained wall.*

The above lateral earth pressures do not include the effects of surcharges (e.g., traffic, footings), compaction, or truck-induced wall pressures. Any surcharge (live, including traffic, or dead load) located within a 1:1 (horizontal to vertical) plane drawn upward from the base of the excavation should be added to the lateral earth pressures. The lateral contribution of a uniform surcharge load located immediately behind walls may be calculated by multiplying the surcharge by 0.33 for cantilevered walls under active conditions and 0.50 for restrained walls under at-rest conditions. Walls immediately adjacent to areas subject to vehicular traffic should be designed for a 2-foot equivalent soil surcharge (250 psf). Lateral load contributions from other surcharges located behind walls may be provided once the load configurations and layouts are known.

Walls should be properly drained or designed to resist hydrostatic pressures. Adequate drainage is essential to provide a free-drained backfill condition so that there is no hydrostatic buildup behind the wall. Walls should also be appropriately waterproofed to reduce the potential for staining. Drainage behind loading dock walls can consist of weep holes placed along the base of the wall. Weep holes should be spaced 10 to 15 feet apart and connected with a gravel drain consisting of approximately 2 cubic feet of clean gravel per foot of wall length wrapped with filter fabric. Other types of retaining walls should have a continuous back drain as described below.

© 2019 Kleinfelder

For backfill of walls with a continuous back drain, except for the upper 2 feet, the backfill immediately behind retaining walls (minimum horizontal distance of 2 feet measured perpendicular to the wall) should consist of free-draining ¾-inch crushed rock wrapped with filter fabric. The upper 2 feet of cover backfill should consist of relatively impervious material. A 4-inch-diameter perforated PVC pipe, placed perforations down at the bottom of the rock layer leading to a suitable gravity outlet, should be installed at the base of the walls.

As an alternative to the gravel drain noted above, a manufactured drain panel may be utilized behind retaining walls in addition to normal waterproofing. This system generally consists of a prefabricated drain panel lined with filter fabric. At the wall base, we recommend that a gravel drain be installed to collect and discharge drainage to a suitable outlet. The drain should consist of a 4-inch-diameter perforated PVC pipe, placed perforations down at the bottom of approximately 2 cubic feet of clean gravel per foot of wall length. The gravel drain should be wrapped in filter fabric (Mirafi 140N or equivalent). The pipe should be sloped to drain to a suitable outlet and cleanouts should be provided at appropriate intervals.

If drainage behind the wall is omitted, the wall should be designed for full hydrostatic pressure. The design of any drain system should be submitted to Kleinfelder for review to check that our recommendations have been properly incorporated into the design. Installation of the drainage system should be reviewed and documented by a Kleinfelder representative.

4.8 PERMANENT SLOPES

Preliminary grading plans from the civil engineer have been provided show cut and fill slopes between 2:1 and 6:1 (horizontal to vertical) around the project site. Permanent slopes should be constructed at an inclination of 2:1 or flatter. Slopes will be subject to erosion and should be planted as soon as practicable.

For areas above slopes, positive drainage should be established away from the top of slopes. This may be accomplished utilizing a brow ditch placed at the top of cut slopes to redirect surface runoff away from the slope face where drainage devices are not otherwise available. Site runoff should not be permitted to flow over the tops of slopes. Slope drains should also be installed within the fill slopes. Figures 11 and 12 show typical details for slope and canyon drains.

© 2019 Kleinfelder

4.9 PAVEMENT SECTIONS

The required pavement structural sections will depend on the expected wheel loads, volume of traffic, and subgrade soils. We have provided asphalt concrete pavement sections for traffic indices provided in the CWDRs (Costco, 2018). Positive drainage of the paved areas should be provided since moisture infiltration into the subgrade may decrease the life of pavements. Curbing located adjacent to paved areas should be founded in the subgrade, not the aggregate base, in order to provide a cutoff, which reduces water infiltration into the base course.

The following pavement sections provided above are based on the soil conditions encountered during our field exploration, our assumptions regarding final site grades, and limited laboratory testing.

4.9.1 Costco Pavement Design Parameters

We developed pavement design recommendations using traffic loading parameters provided in the Costco Wholesale Development Requirements and the following test data:

- A 20-year pavement design life;
- Light-duty pavements subject to 6,600 passenger vehicle trips per day (Traffic Index of 5.0);
- Heavy-duty pavements subject to 30 tractor-trailer truck tips per day (Traffic Index of 7.0);
- For asphalt concrete pavements, a design R-value of 50; and
- For Portland cement concrete (PCC) Pavements, a 28-day flexural strength (modulus of rupture determined by the third-point method) of at least 550 pounds per square inch (psi) (approximate compressive strength of 4,000 psi); a modulus of subgrade reaction (k value) of 200 pounds per cubic inch (pci) for native subgrade; and interlock at the control joints.

4.9.2 Asphalt Concrete Pavement

We designed asphalt concrete pavement, also referred to as Hot Mix Asphalt (HMA), in accordance with the Caltrans Highway Design Manual. Prior to placement of aggregate base, pavement subgrade should be prepared in accordance with Section 5.2.2.

© 2019 Kleinfelder

TABLE 3
RECOMMENDED MINIMUM ASPHALT CONCRETE PAVEMENT SECTIONS

TRAFFIC USE	TRAFFIC INDEX, TI	DESIGN METHOD	ASPHALT CONCRETE * (INCHES)	AGGREGATE BASE (INCHES)
Light-Duty Pavement	5.0	CALTRANS	3.0	4.0
Heavy-Duty Pavement	7.0	CALTRANS	4.0	5.0

* Rounded to the closest ½ inch.

4.9.3 Asphalt Performance Grade Binder

An asphalt performance grade (PG) binder of 64-10 should be used for the project and is locally available. This recommendation was developed in accordance with Costco Wholesale Asphalt Paving Specification Section 321216. Air temperature data nearest the project site was used with the MERRA Climate Data option and the PG binder was selected using the FHWA program LTTPBind Online web-based tool based on the AASHTO M323-13 standard. The high-end and low-end temperature rating was selected to provide a reliability of at least 98 and 90 percent, respectively.

4.9.4 Portland Cement Concrete Pavement

We designed PCC pavement in accordance with the Portland Cement Association (PCA) Thickness Design for Concrete Pavements (PCA, 1984) using the design parameters stated above. For heavy-duty pavements, we recommend that PCC pavement section should be comprised of 7.0 inches of PCC with 4.0 inches of aggregate base. We understand that Costco is considering paving the American Disability Act (ADA) access area in front of the main entry with PCC pavement. For ADA access area, we recommend that PCC pavement section should be comprised of 6.0 inches of PCC over 6.0 inches of aggregate base.

Longitudinal and transverse joint spacing should not exceed 12 feet and 15 feet, respectively. Joint details should conform to PCA guidelines. Expansion joints in concrete slabs should be sealed with petroleum resistant sealant to prevent minor releases from impacting subsurface soil.

© 2019 Kleinfelder

4.9.5 Aggregate Base

Aggregate base materials should meet current Caltrans specifications for Class 2 aggregate base and be compacted to at least 95 percent relative compaction (ASTM D1557). Caltrans Class 2 aggregate base utilizes recycled materials and require Costco's approval prior to use.

4.9.6 Pavement Maintenance

Pavements may undergo movement due to changes in subgrade moisture content. This movement tends to accelerate pavement deterioration. A crack sealing program should be performed annually to slow pavement deterioration. Any areas where surface water stands on the surface should be remediated. Over time as cracking becomes more pronounced, a slurry seal coat should be applied.

4.10 SOIL CORROSIVITY

We performed laboratory testing for parameters commonly used to evaluate corrosivity of soils, including pH, minimum resistivity, chloride and soluble sulfate content. Table 4 presents the results.

TABLE 4
CORROSION TEST RESULTS

Location	Depth (ft)	Minimum Resistivity (ohm-cm)	pH	Soluble Sulfate Content (ppm)	Soluble Chloride Content (ppm)
TP-1	0-2	3,848	5.2	36	35
TP-10	0-2	5,324	6.1	38	39
TP-14	0-2	6,453	6.0	34	34
TP-21	0-1.5	5,012	5.7	41	55

These tests are a generalized indicator of soil corrosivity for the sample tested. Other soils on site may be more, less, or similarly corrosive in nature. Imported fill materials should be tested to confirm that their corrosion potential is not more severe than those noted.

Although Kleinfelder does not practice corrosion engineering, resistivity values between 3,000 and 5,000 ohm-cm are considered corrosive to buried ferrous metals (NACE, 2006). The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0

© 2019 Kleinfelder

exposure to sulfate attack on concrete in contact with the soil based on ACI 318-14 Table 19.3.1.1 (ACI, 2014). Therefore, in accordance with ACI Building Code 318-14, no special provisions for selection of cement type are required.

Concrete and the reinforcing steel within it are at risk of corrosion when exposed to water-soluble chloride in the soil or groundwater. The project structural engineer should review this data to determine if remedial measures are necessary for the concrete reinforcing steel.

4.11 STORMWATER MANAGEMENT

We have assessed the potential for storm water infiltration into the subgrade soils at the subject project site. Our assessment is based on the data collected during our field exploration (borings and test pits) and laboratory testing.

Based on visual soil classification and laboratory testing of the soil samples collected during our field exploration, the upper approximately 1 to 5 feet of the subsurface soils consist predominantly lean sandy clays underlain with highly fractured highly weathered metavolcanic rock. Based on the soil classification, and gradation tests, water infiltration is expected to be very low.

We recommend alternatives to infiltration BMPs, such as bio-filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the Costco site. If bio-filtration/bio-retention systems are employed, we recommend that the BMPs be built such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement. If planters are located within 10 feet of the building or building foundations, or adjacent to slabs and pavements, then some means of diverting water away from the building, building foundation soils, or soils that support slabs and pavements would be required, such as lining the planters.

© 2019 Kleinfelder

5 CONSTRUCTION RECOMMENDATIONS

5.1 GENERAL

The following recommendations should be used by the contractor for construction of the project attention to excavatability and perched groundwater should be noted.

5.2 EARTHWORK

5.2.1 General

Site preparation and earthwork operations should be performed in accordance with applicable codes, safety regulations and other local, state or federal specifications, and the recommendations included in this report. References to maximum dry unit weights are established in accordance with the latest version of ASTM Test Method D1557 (modified Proctor). The earthwork operations should be observed and tested by a representative of Kleinfelder.

5.2.2 Site Preparation

Abandoned utilities and other existing features within the proposed development areas (if any are encountered) should be removed and the excavation(s) backfilled with structural fill. Debris produced by demolition operations, including wood, steel, piping, plastics, etc., should be separated and disposed of off-site. Existing utility pipelines or conduits that extend beyond the limits of the proposed construction and are to be abandoned in place, should be plugged with non-shrinking cement grout to prevent migration of soil and/or water. Demolition, disposal and grading operations should be observed and tested by a representative of Kleinfelder.

Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Other than plant roots, organic matter in the topsoil is minimal based on our laboratory testing (between one and three percent). The topsoil can be re-used in site fills. The residual soil/colluvial layer should excavated to underlying weathered rock contact and stockpiled on site for reuse as structural fill. An estimate of the residual soil/colluvial layer thickness is shown on the attached cross sections (Figures 5 through 10.

Based on the preliminary grading plan, the warehouse building footprint is situated on a bedrock cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. To provide

© 2019 Kleinfelder

uniform support for the proposed warehouse building and to reduce the adverse effects of abrupt differential settlement due the cut/fill transition and variability in fill thickness across the building pad, we recommend the bedrock should be undercut by at least 6 feet below the finished floor elevation and backfilled with structural fill. In addition, cut/fill transitions are situated below small area of the parking structure's lower level. Beneath the parking structure, we recommend the bedrock should be undercut by at least 4 feet below the finished floor elevation and backfilled with structural fill.

5.2.3 Permanent Slopes

Permanent slopes should be constructed at 2:1 (horizontal to vertical) or flatter. Slopes will be subject to erosion and should be planted as soon as practicable. Where new fill slopes are to be constructed on hillsides or existing slopes, the topsoil, colluvial soils, and other materials considered unsuitable should be removed. Where the exposed slope is steeper than 5:1, or where recommended by personnel by our firm, the original ground on which fill is to be placed should be keyed and benched. The benches should extend in the underlying bedrock. Key should be at least 8 feet wide and sloped a minimum of 2% towards the slope. Benches should be at least 4 feet wide and not exceed 4 feet in height. Fill slopes should be overbuilt by 2 feet then cut back to facilitate compaction at the face. Fill and cut slopes should be observed by our firm during grading to evaluate the anticipated geologic conditions and make any necessary modifications. Slope drains should also be installed within the fill slopes to prevent building up hydrostatic pressures behind slopes, especially in areas of observed seepage. Figures 11 and 12 show typical details for slope and canyon drains.

5.2.4 Temporary Excavations

All excavations must comply with applicable local, state, and federal safety regulations, including OSHA requirements. The responsibility for excavation safety and stability of temporary construction slopes lies solely with the contractor. We are providing this information below solely as a service to our client. Under no circumstances should this information provided be interpreted to mean that Kleinfelder is assuming responsibility for final engineering of excavations or shoring, construction site safety, or the contractors' activities; such responsibility is not being implied and should not be inferred.

Minor sloughing and/or raveling of slopes should be anticipated as they dry out. Where space for sloped embankments is not available, shoring will be necessary. In addition, excavations within a

© 2019 Kleinfelder

1:1 plane extending downward from a horizontal distance of 2 feet beyond the bottom outer edge of existing improvements should not be attempted without bracing and/or underpinning the footings, as discussed above. The geotechnical engineer or their field representative should observe the excavations so that modifications can be made to the excavations, as necessary, based on variations in the encountered soil conditions. All applicable excavation safety requirements and regulations, including OSHA requirements, should be met.

All trench excavations should be braced and shored in accordance with good construction practice and all applicable safety ordinances and codes. Stockpiled (excavated) materials should be placed no closer to the edge of an excavation than a distance equal to the depth of the excavation, but no closer than 4 feet.

5.2.5 Excavation Characteristics

The seismic refraction survey results indicate the initial weathered rock layer with compression wave velocities (Vp) ranging between 3,985 to 6,030 feet per second is located approximately 1 to 3 below existing grades and extends as deep as 30 feet below grade within the warehouse building cut. Based on Caterpillar's Handbook of Ripping (2000), rock exhibiting seismic velocities in this range are marginally rippable using a D9R dozer equipped with multi or single shank ripper(s). Underlying this layer is a less weathered rock zone with compression wave velocities ranging between 12,210 to 18,530 feet per second and is located as shallow as 5 to 10 feet below grade within eastern cut for the warehouse building and the fuel facility cut area on the northern portion of the site. Localized blasting will likely be needed to excavate less weathered rock. In addition, crushing and screening operations will likely be required to produce efficient rock fragmentation of the rock (both weathered and less weathered rock) for re-use onsite as structural fill. The results of the seismic refraction survey are presented in Appendix C of this report.

5.2.6 Foundation Excavations

Shallow Foundations

Following excavation to the foundation subgrade elevations, the exposed subgrade should be observed by a representative of the geotechnical engineer to evaluate the presence of satisfactory materials at design elevations. If unsatisfactory material, such as soft or disturbed soil, debris or otherwise unsuitable soil is present at the base of footing excavations, it should be overexcavated

© 2019 Kleinfelder

and replaced with structural concrete, 2-sack sand-cement slurry, or structural fill to the depth determined by the geotechnical engineer.

We understand that new spread footing foundations for the fuel facility canopy will be embedded approximately 6 to 7 feet below the finished grade. If a bedrock cut/fill transition is encountered at the footing bottom for the canopy, the bedrock should be undercut by at least 3 feet and backfilled with structural fill to provide uniform support. It should be noted that fuel facility canopy spread foundation excavation may encounter the harder, less weathered bedrock layer and may require blasting to achieve proper foundation depth.

Drilled Pile Foundations

The performance and capacities of piles can be influenced significantly by the selected construction methods and procedures used. Construction methods that create large zones of disturbance around the drilled shafts can lead to lower than expected skin friction due to excessive stress relief around the shaft length. At grade parking lots are planned north of the warehouse footprint. Per Kleinfelder's seismic refraction survey, these drilled piers will encounter the weathered bedrock layer during drilling. Drilling should be completed with heavy-duty equipment with rock coring capabilities.

Concrete should be placed immediately after drilling of the hole is complete. The concrete should be pumped to the bottom of the drilled shaft using a down-hole tremie. If the tremie method is used to place concrete below the polymer slurry level, we recommend it have a slump of at least 8 inches. If steel casing is used, the casing should be removed as the concrete is placed but the bottom of the casing should be kept at least 5 feet below the top of the concrete.

5.2.7 Fill Material and Compaction Criteria

The on-site soils, minus debris, organic matter, or other deleterious materials may be used as structural fill. Due to the composition of the bedrock, it will not reduce to a soil-like material when excavated. The bedrock material may be crushed, processed and re-used onsite as structural fill. Rock fragments up to 12 inches in size may be used in structural fills 10 or more feet below finished subgrade elevation, but not within 10 feet of a slope face. Rock fragments greater than 6 inches in size should not be used in the upper 10 feet of site fills. Rock fragments greater than 3 inches in size should not be used in the upper 3 feet of fills below the Costco warehouse building. There may be an opportunity for larger sized rocks and boulders between 12 and 24 inches in

© 2019 Kleinfelder

size to be re-used at the base of slopes or in landscape areas. A rock that cannot be crushed or screened to above size criteria should be removed off site.

Rocks up to 12 inches in size may be placed in the deeper portions of structural fills as noted above provided they are thoroughly mixed with soils to avoid excessive concentrations of rock fragments. Over-sized materials (between 6 and 12 inches) should be placed in windrows or otherwise be placed under the observation of the geotechnical engineer's representative in a manner to avoid nesting or voids. Fills should be placed in lifts slightly thicker than the largest particle size and proof-rolled with a D-9 or larger Caterpillar dozer making at least 5 complete passes over each lift. Periodic test pits should be excavated into each compacted lift to confirm the rock fill is being placed in a uniform, dense manner with no nesting or voids.

Compaction of rocky fill should be performed by at least 8 to 10 passes of either a self-propelled, vibratory roller applying at least 20 tons force (dynamic) or a sheepsfoot roller weighing at least 30 tons (static) where at least 90 percent relative compaction is specified. Verification of consolidated material by pot holing during fill/backfill activities should be performed for each lift of compacted rocky fill to confirm a dense fill with no void is being achieved. Additional fill lifts should not be placed if the previous fill lift did not meet the minimum required relative compaction or if fill conditions are not stable. Disking, cross ripping, and/or blending may be required to uniformly moisture-condition soils used for engineered fill.

Although preliminary grading plans show that this site will be balanced, it is anticipated that crushing and processing the harder rock layers will prove challenging and may require soil to be imported onsite. Import materials, if required, should have a Plasticity Index of less than 10 with no less than 70 percent passing the No. 4 sieve, no more than 30 percent of the particles passing the No. 200 sieve, and no particles greater than 3 inches in maximum dimension. The maximum Plasticity Index for imported soils may be modified upon approval by Costco depending on its proposed use. The contractor should provide documentation to Costco that imported fill is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals prior to its transportation and use on site

We recommend soils compacted to at least 95 percent of the maximum dry unit weight (ASTM D1557) in accordance with the CWDRs. Fill should be placed in loose horizontal lifts not more than 8 inches thick (loose measurement). The moisture content of the fill should be maintained at

© 2019 Kleinfelder

around optimum for sandy soils and at least above optimum for clayey soils during compaction. Table 5 presents structural fill placement and compaction criteria.

© 2019 Kleinfelder

TABLE 5
STRUCTURAL FILL PLACEMENT AND COMPACTION CRITERIA

Fill Location/Use	Material Type	Relative Compaction[1] (ASTM D1557)	Moisture Content Range	Minimum Compaction Testing Frequency Per Lift
Aggregate base for pavements and concrete slabs	Aggregate Base	95 percent	-2 to +2% of optimum	10,000 Square Feet
Structural Areas (Warehouse Building Pad)	On-site Fill or Imported Material	95 percent	-2 to +2% of optimum for granular soil 0 to +2% of optimum for on-site clayey soils	10,000 Square Feet
Subgrade for Pavements, Sidewalks and Other Flatwork Areas	On-site Fill or Imported Material	95 percent	-2 to +2% of optimum for granular soil 0 to +2% of optimum for on-site clayey soils	15,000 Square Feet
Retaining Wall backfill	Granular Backfill	95 percent	-2 to +2% of optimum	1,000 Square Feet
Utility trenches backfill	On-site Rock Fill or Imported Material	95 percent	-2 to +2% of optimum for granular soil 0 to +2% of optimum for on-site clayey soils	150 Linear Feet
Lawns or Unimproved areas	Imported Material	At least 90 percent	-2 to +2% of optimum for granular soil 0 to +2% of optimum for on-site clayey soils	20,000 Square Feet

5.2.8 Groundwater Impacts

Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Perched groundwater above the bedrock was encountered in the test pits that were may be encountered during construction. This is most likely to occur following periods of rainfall and in the winter and spring months. If encountered, excavations which extend below the perched

© 2019 Kleinfelder

groundwater level (currently estimated to be at approximately 2 to 5 feet below existing site grade) will need to be dewatered. In our opinion, dewatering of narrow trench excavations, which penetrate less than a few feet below the groundwater level and do not encounter loose and/or cohesionless soils, may be possible by directing inflow to a sump where water can be removed by a pump. Temporary dewatering of wider, deeper, and/or more extensive excavations may require well points, deep wells, and/or deep sumps. To help maintain bottom stability of wider, deeper, and/or more extensive excavations, groundwater levels should be drawn-down a minimum of 2 feet below the lowest portion of the excavation. Since temporary dewatering will impact and be dependent on construction methods and scheduling, the contractor will be solely responsible for the design, installation, maintenance, and performance of all temporary dewatering systems.

Perched groundwater levels can fluctuate depending on rainfall, runoff conditions, or other factors. Therefore, water levels presented in this report may not be representative of those encountered at the time of construction. We recommend the contractor verify perched groundwater conditions and evaluate dewatering requirements prior to bidding and/or construction.

Depending on the depth of excavation below perched groundwater, soil conditions encountered along the excavation face, and slope inclination, caving or sloughing of excavation slopes is likely within the vicinity of a sump dewatering system. Sloughing or caving of excavation slopes could endanger personnel working within or adjacent to the excavation as well as nearby equipment, structures, or other existing improvements. The Contractor should be aware of the potential for caving and take appropriate precautions to ensure the safety of site personnel as well as the integrity of the excavation slopes and any existing, nearby structures or other improvements.

5.2.9 Trench Backfill

Pipe zone backfill (i.e. material beneath and in the immediate vicinity of the pipe) should consist of imported soil less than ¾-inch in maximum dimension. Trench zone backfill (i.e., material placed between the pipe zone backfill and finished subgrade) may consist of onsite soil or imported fill that meets the requirements for structural fill provided above.

If imported material is used for trench zone backfill, we recommend it consist of silty sand. In general, gravel should not be used for trench zone backfill due to the potential for soil migration

© 2019 Kleinfelder

into the relatively large void spaces present in this type of material and water seepage along trenches backfilled with coarse-grained sand and/or gravel.

Recommendations provided above for pipe zone backfill are minimum requirements only. More stringent material specifications may be required to fulfill local building requirements and/or bedding requirements for specific types of pipes. We recommend the project civil engineer develop these material specifications based on planned pipe types, bedding conditions, and other factors beyond the scope of this study.

Trench backfill should be placed and compacted in accordance with recommendations provided for structural fill in Section 5.2.7. Mechanical compaction is recommended; ponding or jetting should be avoided, especially in areas supporting structural loads or beneath concrete slabs supported on grade, pavements, or other improvements.

5.3 UNSTABLE SUBGRADE CONDITIONS

Pumping subgrade conditions may be encountered during site grading activities in the residual/colluvium soils, and the subgrade may need to be stabilized. Should grading be performed during or following extended periods of rainfall, the moisture content of the near-surface soils will also be significantly above the optimum moisture content. These conditions could seriously impede grading by causing an unstable subgrade condition. Typical remedial measures include the following:

- Drying: Drying unstable subgrade involves disking or ripping wet subgrade to a depth of approximately 18 to 24 inches and allowing the exposed soil to dry. Multiple passes of the equipment (likely on a daily basis) will be needed because as the surface of the soil dries, a crust forms that reduces further evaporation. Frequent disking will help prevent the formation of a crust and will promote drying. This process could take several days to several weeks depending on the material, the depth of ripping, the number of passes, and the weather.
- Removal and Replacement with Crushed Rock and Geotextile Fabric: Unstable subgrade could be overexcavated 12 to 24 inches below existing grade and replaced with ¾- or 1-inch crushed rock underlain by geotextile fabric. The geotextile fabric should consist of a woven geotextile, such as Mirafi HP series or equivalent. The final depth of removal will depend upon the conditions observed in the field once overexcavation begins. The

© 2019 Kleinfelder

geotextile fabric should be placed in accordance with the manufacturer's recommendations.

- Chemical Treatment: Unstable subgrade could be stabilized by mixing the upper 12 to 18 inches of the subgrade with Portland cement, Class C fly ash or lime. For estimating purposes, an application rate of 10 to 12 percent Class C fly ash, 3 to 4 percent for high calcium quick lime, or 4 to 5 percent Portland cement may be used. Final application rates should be determined in the field at the time of construction in consultation with the geotechnical engineer. Chemical treatment should be performed by a specialty contractor experienced in this work and should be performed in accordance with Caltrans Standard Specifications. Since lime treatment uses the on-site soil, the expense of importing material can be avoided. Chemically treated areas will have a high pH level (pH over 10) that will need to be removed from landscape areas.

5.4 EXTERIOR FLATWORK

Prior to casting exterior flatwork, the subgrade soils should be moisture conditioned and recompacted or over-excavated, as recommended in Section 5.2.2. If encountered, the moisture content of the clayey subgrade soils should be maintained at least above optimum prior to the placement of any flatwork. In the event that these subgrade soils are allowed to dry out, the exposed subgrade should be re-moisture conditioned. Careful control of the water/cement ratio should be performed to avoid shrinkage cracking due to excess water or poor concrete finishing or curing.

5.5 PAVEMENTS

5.5.1 HMA Design

Hot Mix Asphalt (HMA) should conform to requirements of the Costco Wholesale Specification Section 321216, Asphalt Paving. Section 1.3.C of the HMA specification requires that the HMA section be placed in at least two lifts. The HMA specification allows the use of ½- or ¾-inch Nominal Maximum Aggregate Size (NMAS) mixes for the base course and ⅜- or ½-inch NMAS mixes for surface course. Maximum and minimum HMA compacted lift thicknesses are provided in Table 3.1 in Section 3.3.B of the HMA specification.

© 2019 Kleinfelder

5.5.2 Construction Considerations

The pavement sections provided above are contingent on the following recommendations being implemented during construction.

- Pavement subgrade should be prepared as recommended in Section 5.2.2.
- Subgrade soils should be in a stable, non-pumping condition at the time the aggregate base materials are placed and compacted.
- Aggregate base materials should be compacted to at least 95 percent relative compaction (ASTM D1557).
- Asphalt paving materials and placement methods should meet current Costco Wholesale Specifications Section 321216.
- Adequate drainage (both surface and subsurface) should be provided such that the subgrade soils and aggregate base materials are not allowed to become wet.

Note that pavement materials and construction must be completed in strict accordance with the Costco's specifications that contain very specific pavement material (asphalt, aggregate and concrete) criteria and construction practices to be used (compaction and material sampling). The general contractor and pavement construction subcontractor should be aware that asphalt and concrete mix designs must be submitted to the design architect and Kleinfelder at least 45 days prior to the scheduled production and laydown for review and approval.

© 2019 Kleinfelder

6 ADDITIONAL SERVICES

6.1 PLANS AND SPECIFICATIONS REVIEW

We recommend Kleinfelder perform a review of geotechnical related portions of the project plans and specifications before they are finalized to see that geotechnical recommendations have been properly interpreted and implemented during design. If we are not accorded the privilege of performing this review, we can assume no responsibility for misinterpretation of our recommendations.

6.2 CONSTRUCTION OBSERVATION AND TESTING

The construction process is an integral design component with respect to the geotechnical aspects of a project. Because geotechnical engineering is an inexact science due to the variability of natural processes, and because we sample only a limited portion of the soils affecting the performance of the proposed structure, unanticipated or changed conditions can be encountered during grading. Proper geotechnical observation and testing during construction are imperative to allow the geotechnical engineer the opportunity to verify assumptions made during the design process. Therefore, we recommend that Kleinfelder be retained during the construction of the proposed improvements to observe compliance with the design concepts and geotechnical recommendations, and to allow design changes in the event that subsurface conditions or methods of construction differ from those assumed while completing this study.

Our services are typically needed at the following stages of grading:

- After demolition and grubbing;
- During grading;
- After the overexcavation, but prior to subgrade preparation;
- During utility trench backfill;
- During base placement and site paving; and
- After excavation for foundations.

© 2019 Kleinfelder

7 LIMITATIONS

This geotechnical study has been prepared for the exclusive use of Costco Wholesale and their agents for specific application to the proposed Costco Wholesale warehouse and fuel facility located on Silva Valley Parkway in El Dorado Hills, California. The findings, conclusions and recommendations presented in this report were prepared in accordance with generally accepted geotechnical engineering practice. No other warranty, express or implied, is made.

The scope of services was limited to a background data review and the field exploration described in Section 1.2. It should be recognized that definition and evaluation of subsurface conditions are difficult. Judgments leading to conclusions and recommendations are generally made with incomplete knowledge of the subsurface conditions present due to the limitations of data from field studies. The conclusions of this assessment are based on our field exploration and laboratory testing programs, and engineering analyses.

Kleinfelder offers various levels of investigative and engineering services to suit the varying needs of different clients. Although risk can never be eliminated, more detailed and extensive studies yield more information, which may help understand and manage the level of risk. Since detailed study and analysis involves greater expense, our clients participate in determining levels of service, which provide information for their purposes at acceptable levels of risk. The client and key members of the design team should discuss the issues covered in this report with Kleinfelder, so that the issues are understood and applied in a manner consistent with the owner's budget, tolerance of risk and expectations for future performance and maintenance.

Recommendations contained in this report are based on our field observations and subsurface explorations, limited laboratory tests, and our present knowledge of the proposed construction. It is possible that soil or groundwater conditions could vary between or beyond the points explored. If soil or groundwater conditions are encountered during construction that differ from those described herein, the client is responsible for ensuring that Kleinfelder is notified immediately so that we may reevaluate the recommendations of this report. If the scope of the proposed construction, including the estimated Traffic Index or locations of the improvements, changes from that described in this report, the conclusions and recommendations contained in this report are not considered valid until the changes are reviewed, and the conclusions of this report are modified or approved in writing, by Kleinfelder.

© 2019 Kleinfelder

The scope of services for this subsurface exploration and geotechnical report did not include environmental assessments or evaluations regarding the presence or absence of wetlands or hazardous substances in the soil, surface water, or groundwater at this site.

Kleinfelder cannot be responsible for interpretation by others of this report or the conditions encountered in the field. Kleinfelder must be retained so that all geotechnical aspects of construction will be monitored on a full-time basis by a representative from Kleinfelder, including site preparation, preparation of foundations, and placement of structural fill and trench backfill. These services provide Kleinfelder the opportunity to observe the actual soil and groundwater conditions encountered during construction and to evaluate the applicability of the recommendations presented in this report to the site conditions. If Kleinfelder is not retained to provide these services, we will cease to be the engineer of record for this project and will assume no responsibility for any potential claim during or after construction on this project. If changed site conditions affect the recommendations presented herein, Kleinfelder must also be retained to perform a supplemental evaluation and to issue a revision to our original report.

This report, and any future addenda or reports regarding this site, may be made available to bidders to supply them with only the data contained in the report regarding subsurface conditions and laboratory test results at the point and time noted. Bidders may not rely on interpretations, opinion, recommendations, or conclusions contained in the report. Because of the limited nature of any subsurface study, the contractor may encounter conditions during construction which differ from those presented in this report. In such event, the contractor should promptly notify the owner so that Kleinfelder's geotechnical engineer can be contacted to confirm those conditions. We recommend the contractor describe the nature and extent of the differing conditions in writing and that the construction contract include provisions for dealing with differing conditions. Contingency funds should be reserved for potential problems during earthwork and foundation construction.

This report may be used only by the client and only for the purposes stated, within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land use, site conditions (both on site and off site) or other factors may change over time, and additional work may be required with the passage of time. Any party, other than the client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of this report and the nature of the new project, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the

© 2019 Kleinfelder

client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party and the client agrees to defend, indemnify, and hold harmless Kleinfelder from any claims or liability associated with such unauthorized use or non-compliance.

Appendix A

APPENDIX A
FIELD EXPLORATIONS

GENERAL

We explored subsurface conditions at the site by drilling 3 borings and excavating 26 test pits. The borings were drilled by Gulf Shore Drilling of Sacramento, California using track-mounted, hollow-stem auger drilling equipment with rock coring abilities to depths of between approximately 8½ to 25 feet below the existing ground surface (bgs). The proposed exploration plan also included a fourth rock coring location (KB-2) on the northeastern corner of the new warehouse location. This location was not drilled due to very hard drilling conditions throughout the course of the field exploration.

The test pits were excavated by Iron Works Excavation of Sacramento, California using a John Deere 50G track-mounted excavator to excavate to depths ranging from 2 to 10 feet bgs. The approximate locations of the borings and test pits are presented on Figure 2.

Prior to commencement of the fieldwork, Underground Service Alert (USA) was notified and various geophysical techniques were used at the boring locations to identify potential conflicts with subsurface structures.

The boring and test pit logs are presented as Figures A-4 through A-32. An explanation to the log is presented as Figures A-1 through A-3. The Boring/Test Pit Log describes the earth materials encountered, samples obtained and show field and laboratory tests performed. The log also shows the location, boring/test pit number, drilling/excavation date and the name of the drilling/excavation subcontractor. The borings and test pits were logged by a Kleinfelder engineer using the Unified Soil Classification System. The boundaries between soil types shown on the logs are approximate because the transition between different soil layers may be gradual. Bulk and drive samples of selected earth materials were obtained from the borings and test pits.

Bulk and grab samples of the near-surface soils were directly retrieved from the auger cuttings from the borings and the excavated material in the test pits.

SAMPLER AND DRILLING METHOD GRAPHICS

- BULK / GRAB / BAG SAMPLE
- MODIFIED CALIFORNIA SAMPLER (2 or 2-1/2 in. (50.8 or 63.5 mm.) outer diameter)
- CALIFORNIA SAMPLER (3 in. (76.2 mm.) outer diameter)
- STANDARD PENETRATION SPLIT SPOON SAMPLER (2 in. (50.8 mm.) outer diameter and 1-3/8 in. (34.9 mm.) inner diameter)
- HQ CORE SAMPLE (2.500 in. (63.5 mm.) core diameter)
- SHELBY TUBE SAMPLER
- PUSH TYPE SAMPLER
- SONIC CONTINUOUS SAMPLER
- HAND AUGER
- AUGER CUTTINGS

GROUND WATER GRAPHICS

- WATER LEVEL (level where first observed)
- WATER LEVEL (level after exploration completion)
- WATER LEVEL (additional levels after exploration)
- OBSERVED SEEPAGE

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

ABBREVIATIONS
WOH - Weight of Hammer
WOR - Weight of Rod

MOISTURE CONTENT

DESCRIPTION	FIELD TEST
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

CEMENTATION

DESCRIPTION	FIELD TEST
Weakly	Crumbles or breaks with handling or slight finger pressure
Moderately	Crumbles or breaks with considerable finger pressure
Strongly	Will not crumble or break with finger pressure

CONSISTENCY - FINE-GRAINED SOIL

CONSISTENCY	SPT - N_{60} (# blows / ft)	Pocket Pen (tsf)	UNCONFINED COMPRESSIVE STRENGTH (Q_u)(psf)	VISUAL / MANUAL CRITERIA
Very Soft	<2	PP < 0.25	<500	Thumb will penetrate more than 1 inch (25 mm). Extrudes between fingers when squeezed.
Soft	2 - 4	0.25 ≤ PP <0.5	500 - 1000	Thumb will penetrate soil about 1 inch (25 mm). Remolded by light finger pressure.
Medium Stiff	4 - 8	0.5 ≤ PP <1	1000 - 2000	Thumb will penetrate soil about 1/4 inch (6 mm). Remolded by strong finger pressure.
Stiff	8 - 15	1 ≤ PP <2	2000 - 4000	Can be imprinted with considerable pressure from thumb.
Very Stiff	15 - 30	2 ≤ PP <4	4000 - 8000	Thumb will not indent soil but readily indented with thumbnail.
Hard	>30	4 ≤ PP	>8000	Thumbnail will not indent soil.

FROM TERZAGHI AND PECK, 1948; LAMBE AND WHITMAN, 1969; FHWA, 2002; AND ASTM D2488

REACTION WITH HYDROCHLORIC ACID

DESCRIPTION	FIELD TEST
None	No visible reaction
Weak	Some reaction, with bubbles forming slowly
Strong	Violent reaction, with bubbles forming immediately

APPARENT / RELATIVE DENSITY - COARSE-GRAINED SOIL

APPARENT DENSITY	SPT-N_{60} (# blows/ft)	MODIFIED CA SAMPLER (# blows/ft)	CALIFORNIA SAMPLER (# blows/ft)	RELATIVE DENSITY (%)
Very Loose	<4	<4	<5	0 - 15
Loose	4 - 10	5 - 12	5 - 15	15 - 35

Dense	30 - 50	35 - 60	40 - 70	65 - 85
Very Dense	>50	>60	>70	85 - 100

FROM TERZAGHI AND PECK, 1948

PLASTICITY

DESCRIPTION	LL	FIELD TEST
Non-plastic	NP	A 1/8-in. (3 mm.) thread cannot be rolled at any water content.
Low (L)	< 30	The thread can barely be rolled and the lump or thread cannot be formed when drier than the plastic limit.
Medium (M)	30 - 50	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump or thread crumbles when drier than the plastic limit.
High (H)	> 50	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump or thread can be formed without crumbling when drier than the plastic limit.

STRUCTURE

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. thick, note thickness.
Laminated	Alternating layers of varying material or color with the layer less than 1/4-in. thick, note thickness.
Fissured	Breaks along definite planes of fracture with little resistance to fracturing.
Slickensided	Fracture planes appear polished or glossy, sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness.

ANGULARITY

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces.
Subangular	Particles are similar to angular description but have rounded edges.
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges.
Rounded	Particles have smoothly curved sides and no edges.

INFILLING TYPE

NAME	ABBR	NAME	ABBR
Albite	Al	Muscovite	Mus
Apatite	Ap	None	No
Biotite	Bi	Pyrite	Py
Clay	Cl	Quartz	Qz
Calcite	Ca	Sand	Sd
Chlorite	Ch	Sericite	Ser
Epidote	Ep	Silt	Si
Iron Oxide	Fe	Talc	Ta
Manganese	Mn	Unknown	Uk

DENSITY/SPACING OF DISCONTINUITIES

DESCRIPTION	SPACING CRITERIA
Unfractured	>6 ft. (>1.83 meters)
Slightly Fractured	2 - 6 ft. (0.061 - 1.83 meters)
Moderately Fractured	8 in - 2 ft. (203.20 - 609.60 mm)
Highly Fractured	2 - 8 in (50.80 - 203.30 mm)
Intensely Fractured	<2 in (<50.80 mm)

ADDITIONAL TEXTURAL ADJECTIVES

DESCRIPTION	RECOGNITION
Pit (Pitted)	Pinhole to 0.03 ft. (3/8 in.) (>1 to 10 mm.) openings
Vug (Vuggy)	Small openings (usually lined with crystals) ranging in diameter from 0.03 ft. (3/8 in.) to 0.33 ft. (4 in.) (10 to 100 mm.)
Cavity	An opening larger than 0.33 ft. (4 in.) (100 mm.), size descriptions are required, and adjectives such as small, large, etc., may be used
Honeycombed	If numerous enough that only thin walls separate individual pits or vugs, this term further describes the preceding nomenclature to indicate cell-like form.
Vesicle (Vesicular)	Small openings in volcanic rocks of variable shape and size formed by entrapped gas bubbles during solidification.

ADDITIONAL TEXTURAL ADJECTIVES

DESCRIPTION	CRITERIA
Unweathered	No evidence of chemical / mechanical alternation; rings with hammer blow.
Slightly Weathered	Slight discoloration on surface; slight alteration along discontinuities; <10% rock volume altered.
Moderately Weathered	Discoloring evident; surface pitted and alteration penetration well below surface; Weathering "halos" evident; 10-50% rock altered.
Highly Weathered	Entire mass discolored; Alteration pervading most rock, some slight weathering pockets; some minerals may be leached out.
Decomposed	Rock reduced to soil with relic rock texture/structure; Generally molded and crumbled by hand.

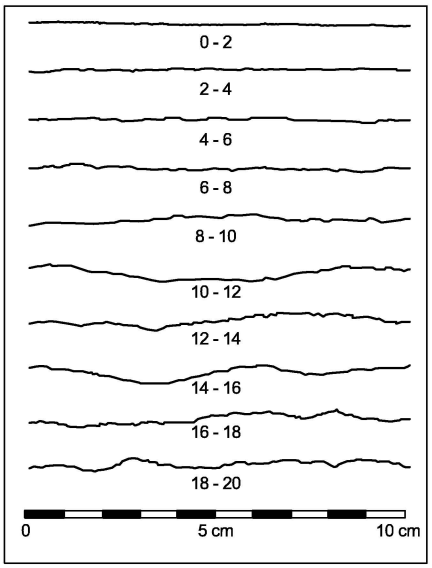
RELATIVE HARDNESS / STRENGTH DESCRIPTIONS

GRADE		UCS (Mpa)	FIELD TEST
R0	Extremely Weak	0.25 - 1.0	Indented by thumbnail
R1	Very Weak	1.0 - 5.0	Crumbles under firm blows of geological hammer, can be peeled by a pocket knife.
R2	Weak	5.0 - 25	Can be peeled by a pocket knife with difficulty, shallow indentations made by firm blow with point of geological hammer.
R3	Medium Strong	25 - 50	Cannot be scraped or peeled with a pocket knife, specimen can be fractured with a single firm blow of a geological hammer.
R4	Strong	50 - 100	Specimen requires more than one blow of geological hammer to fracture it.
R5	Very Strong	100 - 250	Specimen requires many blows of geological hammer to fracture it.
R6	Extremely Strong	> 250	Specimen can only be chipped with a geological hammer.

ROCK QUALITY DESIGNATION (RQD)

DESCRIPTION	RQD (%)
Very Poor	0 - 25
Poor	25 - 50
Fair	50 - 75
Good	75 - 90
Excellent	90 - 100

APERTURE



DESCRIPTION	CRITERIA [in (mm)]
Tight	<0.04 (<1)
Open	0.04 - 0.20 (1 - 5)
Wide	>0.20 (>5)

BEDDING CHARACTERISTICS

DESCRIPTION	Thickness [in (mm)]
Very Thick Bedded	>36 (>915)
Thick Bedded	12 - 36 (305 - 915)
Moderately Bedded	4 - 12 (102 - 305)
Thin Bedded	1 - 4 (25 - 102)
Very Thin Bedded	0.4 - 1 (10 - 25)
Laminated	0.1 - 0.4 (2.5 - 10)
Thinly Laminated	<0.1 (<2.5)

Bedding Planes	Planes dividing the individual layers, beds, or stratigraphy of rocks.
Joint	Fracture in rock, generally more or less vertical or traverse to bedding.
Seam	Applies to bedding plane with unspecified degree of weather.

JOINT ROUGHNESS COEFFICIENT (JRC)

From Barton and Choubey, 1977

RQD Rock-quality designation (RQD) Rough measure of the degree of jointing or fracture in a rock mass, measured as a percentage of the drill core in lengths of 10 cm. or more.

Appendix B

APPENDIX B
LABORATORY TESTING

GENERAL

Laboratory tests were performed on selected samples as an aid in classifying the soils and to evaluate physical properties of the soils that may affect foundation design and construction procedures. The tests were performed in general conformance with the current ASTM or Caltrans standards. A description of the laboratory-testing program is presented below.

MOISTURE CONTENT

Moisture content testing was performed on a selected sample recovered from our borings. Moisture contents were determined in general accordance with ASTM Test Method D2216. Results of the testing are presented on the boring logs in Appendix A and as an attachment in this appendix.

ATTERBERG LIMITS

Atterberg limits testing was performed on selected soil samples to assist in classification. Testing was performed in general accordance with ASTM D4318. Results are presented attached to this appendix.

R-VALUE

Resistance value (R-value) tests were performed on selected bulk soil samples obtained to evaluate pavement support characteristics of the near-surface onsite soils. R-value tests were performed in accordance with Caltrans Standard Test Method 301. The test results are attached in this appendix.

ROCK STRENGTH (UNCONFINED COMPRESSIVE STRENGTH)

Unconfined compressive strength tests were performed on select samples of intact rock from our rock core samples. These tests were performed in accordance with ASTM D7012 and are included in this appendix.

PRELIMINARY SOIL CORROSIVITY

A series of chemical tests were performed on a selected sample of the near-surface soils to estimate pH, resistivity and sulfate and chloride contents. The sample was tested in general accordance with California Test Methods 643, 422, and 417 for pH and minimum resistivity,

© 2019 Kleinfelder

soluble chlorides, and soluble sulfates, respectively. Test results may be used by a qualified corrosion engineer to evaluate the general corrosion potential with respect to construction materials. The tests were performed by AP Engineering and Laboratory, Inc. of Pomona, California. The results of the tests are presented in Table 4 of Section 4.10 of the report and attached to this appendix.

TOPSOIL ANALYTICAL TESTS

Topsoil analytical testing was performed on one representative sample of the near-surface soils by Waypoint Analytical of Anaheim, California. The topsoil was tested for percentages of organic matter, percentages of deleterious material, pH, mineral content, micro and macro nutrient content, and herbicide presence in the soil. The test results are presented in the Waypoint Analytical report attached to this appendix.

RE: Costco El Dorado Hills, Updated New Warehouse

Background

One composite sample was processed on September 10, 2019 identified as soil from areas where new landscaping is scheduled for installation. Fertilizer and amendment recommendations were requested. The sample was analyzed for horticultural suitability, fertility, and physical characteristics. The results of the analyses are attached. Organic matter testing was run separately on individual subsamples and these results are also attached.

Analytical Results and Comments

The reaction of the sample is moderately acidic at a pH of 6.0. This is within the range preferred for most plants. Salinity (ECe), sodium, chloride and boron are safely low. The sodium adsorption ratio (SAR) indicates that sodium is adequately balanced by soluble calcium and magnesium; this balance is important for soil structure quality, which relates to the rate at which water infiltrates the soil.

According to the USDA Soil Classification system, the texture of the less than 2mm fraction of the soil is classified as loam. Organic matter content is low at 2.3% dry weight. Based on this information the estimated infiltration rate is moderate at 0.25 inch per hour. Infiltration rates may vary due to differences in compaction across the site. The over 50% silt plus clay present indicates that this soil will have some potential for issues with slow drainage and high water holding capacity and irrigation timing should take this into account. Additional subdrainage may be beneficial for larger specimens being installed in flat areas in this soil.

In terms of soil fertility, nitrogen, phosphorus and sulfate are low and calcium is fair. All of the other major nutrients are sufficient for proper plant nutrition at this time. Of the micronutrients; copper and manganese are abundant while zinc and iron are sufficient.

Boron is safely low for general ornamental plants and may be below optimum levels for plant nutritional purposes. Irrigation water often supplies sufficient boron to meet plant nutritional requirements. However, if boron is low in the irrigation water and/or plants show symptoms of boron deficiency after they are well established, you may consider an application of a product containing boron at the manufacturer's label rate. Boron deficiency symptoms often include stunted or deformed younger growth and tight internodes. Tissue testing can be performed to identify a boron deficiency if it is suspected. Incorporation of a composted greenwaste amendment may be sufficient to negate this deficiency, product depending.

Recommendations

Nitrogen, phosphorus and calcium fertilizers are recommended at the time of planting. Incorporation of a nitrogen stabilized organic amendment or composted greenwaste product is recommended in order to improve soil nutrient holding capacity and porosity. If a composted greenwaste amendment is chosen, that would provide additional phosphorus and potassium as well as supplemental micronutrients, product depending.

To Prepare for Mass Planting:
Drainage of the root zone should be improved by first loosening the top 10 inches of any undisturbed or compacted soil. The following materials should then be evenly spread and thoroughly blended with the top 6 inches of soil to form a homogenous layer:

Amount per 1000 Square Feet	
5 cubic yards	Nitrogen Stabilized Organic Amendment*
8 pounds	Ammonium Phosphate (16-20-0)*
25 pounds	Gypsum (Calcium Sulfate)

*The rate may change based on the analysis of the chosen organic amendment. This rate is based on 270 lbs. of dry weight of organic matter per cubic yard of amendment. If a composted greenwaste amendment is chosen that provides a substantial amount of phosphorus, the ammonium phosphate should be replaced with ammonium sulfate (21-0-0) at a 7 pound rate.

To Prepare Backfill For Trees and Shrubs:

- Excavate planting pits at least twice as wide as the diameter of the rootball.
- Soil immediately below the root ball should be left undisturbed to provide support but the sides and the bottom around the side should be cultivated to improve porosity.
- The top of the rootball should be at or slightly above final grade.
- The top 12 inches of backfill around the sides of the rootball of trees and shrubs may consist of the above amended soil or may be prepared as follows:

3 parts	Site Soil
1 part	Nitrogen Stabilized Organic Amendment*

Uniformly blended with:

Amount / Cubic Yard of Backfill	
1/2 pound	Ammonium Phosphate (16-20-0)*
1 1/3 pounds	Gypsum (Calcium Sulfate)

- Backfill below 12 inches required for 24 inch box or larger material should not contain the organic amendment or ammonium phosphate, but should still contain the gypsum at the recommended rate. In order to improve phosphorus levels below 12 inches in depth, triple superphosphate should be incorporated at a 1/4 pound rate.
- Ideally a weed and turf free zone should be maintained just beyond the diameter of the planting hole. A 2-4 inch deep layer of coarse mulch can be placed around the tree or shrub. Mulch should be kept a minimum 4 inches from the trunk.
- Irrigation of new plantings should take into consideration the differing texture of the rootball substrate and surrounding soil matrix to maintain adequate moisture during this critical period of establishment.

Maintenance

Maintenance fertilization should rely primarily on a nitrogen only program supplemented with a complete fertilizer in the fall and spring. Beginning 45-60 days after planting, ammonium sulfate (21-0-0) should be applied at a rate of 5 pounds per 1000 square feet with reapplication every 45-60 days. Alternatively, slow release Sulfur Coated Urea (43-0-0) may be applied at 6 pounds per 1000 square feet every 90 days. Once plants are performing satisfactorily, the frequency of fertilization may be decreased depending on color and rate of growth desired. In the winter for a quick greening effect, calcium nitrate (15.5-0-0) may be applied at a 6 pound rate if applicable. Early fall and spring, substitute a complete fertilizer such as 15-15-15 to help insure continuing adequate phosphorus and potassium.

Alternatively, Blood Meal (12-0-0) provides available nitrogen fairly rapidly while materials such as Feather Meal (12-0-0), Soybean or Cotton Seed Meal (7-1-1) are slower to provide available nitrogen, but they extend the length of time they make this contribution. In order to provide a good supply of nitrogen for a 3-4 month time frame a good combination would be 6 pounds Blood Meal and 14 pounds Feather Meal per 1000 square feet. In the fall and spring, substitute a complete organic fertilizer such as 5-5-5 applied at the manufacturer's label rate. Or, nutrient rich composted greenwaste may be spread in a 1 to 2 inch layer, which generally carries enough nutrition to boost complete nutrition though a source of nitrogen might also be added at a half rate to assure adequate nitrogen availability.

If we can be of any further assistance, please feel free to contact us.

Subject: Report
Phase II Seismic Refraction Survey
Silva Valley Parkway Development
El Dorado Hills, California

Dear Mr. Dockendorf:

1.0 INTRODUCTION

This letter presents the results of Advanced Geological Services, Inc. (AGS) seismic refraction survey in support of grading work at a 16-acre site north of Tong Road and west of Silva Valley Parkway in El Dorado Hills, California (Figure 1). The survey objective was to assess the depth and excavation characteristics (rippability) of bedrock. The survey was performed on August 7 and 8, 2019 by AGS senior geophysicist Roark W. Smith and his assistant. Field oversight was provided by Mr. Jordan Annand of Kleinfelder, who showed AGS the seismic line locations, which were marked in the field with wood stakes labeled with the seismic line number. The survey comprised seven seismic lines of varying lengths and orientations distributed across the site (Figure 2).

Figure 1- Phase II Site Location in El Dorado Hills CA

2.0 SUMMARY OF FINDINGS

- Three velocity layers were detected— Layer V_1 is the uppermost approximately1- to 7-foot thick low-velocity layer representing surficial soil. Layer V_2 is a medium-velocity (from about 3,985 to 6,000 fps) layer representing deeply-weathered bedrock. Layer V_3 is a high-velocity layer (12,200 to over 18,500 fps) representing little-weathered, ”hard” bedrock.

- On the basis of the Caterpillar Performance Handbook “rip chart”, the Layer V_3 “hard” bedrock at this site is classified as non-rippable. This non-rippable “hard” bedrock mostly occurs at depths ranging from 7 to 15 feet, but was found as shallow as one (1)

foot bgs along SL-4 in the western-central portion of the site and as deep as 42 feet along SL-6 in the eastern portion of the site. The refraction survey showed V_3 velocities ranging between 12,200 to over 18,500 fps, and the "rip chart" classifies metamorphic rock exhibiting P-wave velocities greater than 9,200 fps and "non-rippable" with a D9R tractor.

3.0 SITE DESCRIPTION

The survey consisted of seven seismic lines ranging from 230 to 600 feet in length; the lines were distributed across a 16-acre triangular-shaped area of gently rolling, grass-covered hills (Figure 2). It is worth noting that the site was seismically "noisy" at times due to vehicle traffic along the nearby Parkway.

4.0 SEISMIC REFRACTION METHOD OVERVIEW

The seismic refraction method uses compressional (P-) wave energy to delineate seismic velocity layers within the subsurface. Interpretation entails correlating the velocity layers to geologic features such as soil and various types of bedrock. To perform a refraction survey, an elastic wave (compressional, or P-wave) is generated at certain locations (shotpoints) along a survey line. The P-wave energy is usually produced by striking the ground with a sledgehammer. As the P-wave propagates through the ground it is refracted along boundaries between geologic layers with different seismic velocities.

Part of the refracted P-wave energy returns to the ground surface where it is detected by vibration-sensitive devices called geophones, which are placed in a co-linear array along the seismic survey line. The geophone data are fed to a seismograph, where they are recorded, and then to a computer, where they are analyzed to determine the depth and velocities of subsurface seismic layers. Key data for refraction analysis are the positions of the geophones and shotpoints along a seismic line, and the amount of time it takes for the refracted wave to travel from the shotpoint to each geophone location. Because the P-wave is the fastest traveling of all types of seismic waves, it can be readily identified as the first deflection ("first break") on a seismic trace.

Additional discussion of the refraction method, its limitations, and the relationship between seismic velocity and geologic materials is presented in Appendix A.

5.0 FIELD PROCEDURES

Due to the lack of vehicle access, AGS hand-carried the seismic gear to each line location. For each seismic line, AGS laid out a fiberglass tape measure and placed an array of 24 geophones on the ground at 10-foot to 20-foot intervals to form a seismic "spread" that measured from 230 to 300 feet long. For seismic lines longer than 300 feet (e.g., SL-7), AGS laid out a second spread to achieve the required line length. The geophones were coupled to the ground by means of 3-inch metal spikes attached to the geophone base. Three shotpoints were used along each spread, with shotpoints located five feet beyond each end of the geophone array and at the array midpoint. AGS produced P-waves through multiple impacts with a 16-lb sledge hammer against a metal plate placed on the ground surface at each shotpoint location. In general, 10 hammer blows were used ("stacked") at the end shotpoints and 5 blows were used at the center shotpoint.

The P-waves produced by the hammer impacts were detected using Mark Products 14-Hz geophones. The detected seismic signals were recorded using a DAQLink II seismic system connected to a laptop computer.

After the seismic data were obtained along each line, AGS performed a hand-level survey to measure the relative elevation changes along the line so that the ground surface topography could be incorporated into the data analysis. After the seismic survey was completed AGS used a Trimble Pro-XR Global Positioning System (GPS) to record the seismic line locations.

6.0 DATA PROCESSING AND ANALYSIS

In general, the refraction data quality is "good"; however, due to traffic noise from the nearby roadway the quality of some of the refraction data is only "fair". Regardless, for the most part the "first beaks" could be readily identified and picked on the seismic records. Data quality was enhanced by "stacking," which entailed using multiple hammer blows at each shotpoint location to improve the signal-to-noise ratio. The additive affect of stacking of multiple hammer blows at the same location enhances or increases the amplitude of the signal (i.e., the P-wave arrival) while amplitude of the background noise, which, being random in nature, tends to cancel itself on successive hammer blows and remains largely unchanged.

Seismic data were transferred from the seismograph to a desktop computer where they were processed using the *SeisImager* software package by Geometrics, Inc. Briefly, *SeisImager* is a computer inversion program that generates an initial velocity layer model, produces synthetic data from the model, and then adjusts the model so that the synthetic data better matches the observed field data. The agreement between the synthetic and observed data provides an indication of how well the model represents the true subsurface conditions.

First, AGS used the *SeisImager* module *PickWin* to interpret ("pick") the P-wave arrivals ("first breaks") for each of the shotpoint data sets ("shot gathers") per line. *PickWin* was also used to check (against the geophysicist's field log) that the proper locations were assigned to the geophones and shotpoints. Next, the first break files were fed to the SeisImager module *PlotRefra*, which was used review time-distance (TD) plots for the seismic lines and assign a seismic layer to each arrival time. For the refraction analysis, each P-wave arrival is considered to have refracted from a distinct seismic layer. The number of layers resolved by the seismic survey, and their thickness and average velocity, is indicated by straight line segments on the TD plot; because these straight-line segments represent a constant velocity condition within the subsurface, the tend to represent a distinct geologic layer. The topographic elevation files were incorporated into the analysis at this point. Next, a time-term inversion was performed to produce layered velocity models presented on Figures 3 through 7. Time-term inversion is a linear least-squares technique that uses the layer assignments and the distances and travel times between the shotpoints and the geophones to develop a velocity layer model that best fits the observed data.

7.0 RESULTS

The results of the seismic refraction survey are summarized on Table 1, below, and presented on Figures 2 through 7, which show the seismic line locations and the subsurface velocity layer

models that were calculated from the refraction data.

Overall, three velocity layers were detected— Layer V_1 is the uppermost approximately1- to 7-foot thick low-velocity layer representing surficial soil. Layer V_2 is a medium-velocity (from about 3,985 to 6,000 fps) layer representing deeply-weathered bedrock. Layer V_3 is a high-velocity layer (12,200 to over 18,500 fps) representing little-weathered, "hard" bedrock. Layer V_3 generally occurs at depths ranging between 7 to 15 feet bgs, but it is found as shallow as one (1) foot bgs to as deep as 42 feet bgs in places. The shallowest bedrock was detected in the northern portion of the site, along SL-1 and SL-2; the deepest along SL-6 in the eastern portion of the site.

On the basis of the Caterpillar Performance Handbook "rip chart", the Layer V_3 "hard" bedrock at this site is non-rippable. This non-rippable "hard" bedrock mostly occurs at depths ranging from 7 to 15 feet, but was found as shallow as one (1) foot bgs in the western-central portion of the site along SL-4 and as deep as 42 feet in the eastern portion of the site along SL-6. The refraction survey showed V_3 velocities ranging between 12,200 to over 18,500 fps, and the "rip chart" classifies metamorphic rock exhibiting P-wave velocities greater than 9,200 fps and "non-rippable" with a D9R tractor.

Velocity information from the seismic survey is summarized in Table 1; rippability information is summarized in Table 2.

Table 1 Velocity Summary (feet per second) from Layer Models

Seismic Line	Line Length (ft)	Layer V_1 (topsoil)	Layer V_2 (weathered bedrock)	Layer V_3 (little-weathered bedrock)	Approx depth to V_3 (feet)
SL-1	230	1,310	3,985	13,680	6 – 12
SL-2	230	1,305	6,030	13,820	8 – 15
SL-3	390	1,250	4,970	14,960	3 – 16
SL-4	250	1,100	4,210	16,225	1 – 5
SL-5	300	1,270	5,380	16,260	5 – 15
SL-6	600	1,790	5,995	12,210	17 – 42
SL-7	400	1,390	5,350	18,530	7 – 17

8.0 EXCAVATION CHARACTERISTICS (RIPPABILITY)

Seismic velocity charts relating seismic velocity and excavation characteristics have been developed from field tests by others. These charts list the seismic velocity of various types of bedrock materials and their relative ease of excavation using different types of rippers. Caterpillar Tractor Company publishes a performance manual that lists ripper performance charts for various size tractors and types of rippers.

The range of rippability obtained from the ripper performance chart from the Caterpillar Performance Handbook, 12th Edition (2000) is as follows (in feet per second):

Table 2 Rip Chart for Metamorphic Rock (from The Caterpillar Performance Handbook)

Ripper	Rippable	Marginally Rippable	Non-Rippable
D9R	less than 7,200	7,200 to 9,200	greater than 9,200

This information should only be used as a general guide, however, as many other factors should also be considered. These factors include the rock jointing and fracture patterns, the experience of the equipment operator, and the equipment and excavation methods selected. Based on the observed velocities, it appears that the subsurface bedrock beneath the seismic refraction lines is rippable for a D9R to the top of Layer V_3; however, this information should be combined with a complete and thorough analysis of geotechnical boring data, as well as local ripping experience (if available) to make a final assessment.

9.0 CLOSING

All geophysical data and field notes collected as a part of this investigation will be archived at the AGS office. The data collection and interpretation methods used in this investigation are consistent with standard practices applied to similar geophysical investigations. The correlation of geophysical responses with probable subsurface features is based on the past results of similar surveys although it is possible that some variation could exist at this site. Due to the nature of geophysical data, no guarantees can be made or implied regarding the targets identified or the presence or absence of additional objects or targets.

AGS appreciates working for you. We enjoyed this project and we look forward to working with you again.

Sincerely,

Roark W. Smith
Senior Geophysicist
Advanced Geological Services, Inc.

FIGURE 7

APPENDIX A

SEISMIC VELOCITY AND LIMITATIONS OF THE REFRACTION METHOD

The physical properties of earth materials (fill, sediment, rock) such as compaction, density, hardness, and induration dictate the corresponding seismic velocity of the material. Additionally, other factors such as bedding, fracturing, weathering, and saturation can also affect seismic velocity. In general, low velocities indicate loose soil, poorly compacted fill material, poorly to semi-consolidated sediments, deeply weathered, and highly fractured rock. Conversely, high velocities are indicative of competent rock or dense and highly compacted sediments and fill. The highest velocities are measured in unweathered and little fractured rock.

There are certain limitations associated with the seismic refraction method as applied for this investigation. These limitations are primarily based on assumptions that are made by the data analysis routine. The data analysis routine assumes that the velocities along the length of each spread are uniform. If there are localized zones within each layer where the velocities are higher or lower than indicated, the analysis routine will interpret these zones as changes in the surface topography of the underlying layer. A zone of higher velocity material would be interpreted as a low in the surface of the underlying layer. Zones of lower velocity material would be interpreted as a high in the underlying layer. The data analysis routine also assumes that the velocity of subsurface materials increase with depth. Therefore, if a layer exhibits velocities that are slower than those of the material above it, the slower layer will not be resolved. Also, a velocity layer may simply be too thin to be detected.

The quality of the field data is critical to the construction of an accurate depth and velocity profile. Strong, clear “first-break” information from refracted interfaces will make the data processing, analysis, and interpretation much more accurate and meaningful. Vibrational noise or poor subsurface conditions can decrease the ability to accurately locate and pick seismic waves from the interfaces.

Due to these and other limitations inherent to the seismic refraction method, resultant velocity cross-sections should be considered only as approximations of the subsurface conditions. The actual conditions may vary locally.

1. INTRODUCTION

Ramboll Americas Engineering Solutions, Inc. (Ramboll) was retained to prepare a Greenhouse Gas (GHG) Technical Report for the proposed El Dorado Hills (EDH) Costco Project (Project) located north of the Silva Valley Parkway/US 50 interchange in the El Dorado Hills community area of the unincorporated El Dorado County in California. This GHG Technical Report analyzes the GHG impacts of Proposed Project's construction and operational activities. In particular, this report describes the existing setting of the Project site, describes the relevant regulatory setting, discusses the methodology used to evaluate GHG emissions related to the Project, and evaluates potential impacts related to GHG that would be affected as a result of implementation of the Proposed Project.

1.1 Existing Conditions

The Project site is currently vacant grassland with scattered oak trees and seasonal drainage features. There are no permanent structures on the Project site. The southern edge of the property directly abuts the US 50 right-of-way, while the western boundary is adjacent to Clarksville Crossing. An approximate 7.75-acre portion of the northern site is reserved for a planned future extension of Country Club Drive, which is not part of the Proposed Project.

Surrounding land uses include:

- North: Single-family residential uses and Oak Meadow Elementary School
- East: Vacant land, Tong Road, and single-family residential uses
- South: U.S. Highway 50 and Tong Road
- West: Clarksville Crossing roadway, open space, and undeveloped land

1.2 Proposed Project

The 43.26-acre project site is separated into two components: the North Site of approximately 24.83 acres and the South Site of approximately 18.43 acres. A membership-only Costco fuel facility and employee parking would occupy part of the North Site, while the South Site would accommodate the main Costco warehouse retail building and a partially below-grade parking structure. The majority of the North Site is not proposed to include any development as part of the Project.

1.2.1 North Site

On the North Site, approximately 3.29 acres would be developed with a Costco members-only fuel facility and an employee parking area. The remainder of the North Site would include an approximately 13.79-acre out-parcel that would remain undeveloped at this time (North Site Remainder Area). The Costco project proposes no development for the North Site Remainder Area. The future extension of Country Club Drive (County Capital Improvement Project No. 36105008), when constructed by the County, would occupy a portion of the North Site near its northern edge, though the future extension is an independent project proposed by, and to be undertaken by, the County and is not analyzed as a part of the project.

The fuel facility would occupy a generally rectangular footprint near Silva Valley Parkway, and the employee parking would be situated immediately west of the canopy, separated by drive aisles and landscaping.

Site Access and Roadway Improvements

Primary access to the North Site would be provided via a new signalized intersection on Silva Valley Parkway, shared with the South Site's main driveway. A secondary right-in/right-out driveway north of that intersection would separate fueling operations from primary traffic flows. Fuel delivery trucks would enter the northern driveway and exit at the signal to allow safe left turns. Sidewalks, bike lanes, and pedestrian connections would be provided along the North Site's frontage, north of the signalized intersection.

Architecture

The proposed fuel facility includes a steel canopy structure of up to 13,000 square feet, covering four fueling bays with four two-sided dispensers each (32 fueling positions total). A small, up to 200-square-foot controller enclosure would house operational equipment. The canopy design features neutral colors with corporate striping to align with Costco's brand, and recessed LED lighting directing illumination downward.

Construction

Construction for the North Site is anticipated to last approximately 11 months once construction begins, which is currently estimated to be July of 2026. Construction would occur 7 days per week, with construction occurring 7:00 a.m. to 7:00 p.m. on weekdays and 8:00 a.m. to 5:00 p.m. on weekends.

Operations

Fuel facility hours would generally be from 5:00 a.m. to 10:00 p.m. The facility is expected to receive approximately four to five fuel truck deliveries per day. These deliveries would be staged in a striped area north of the canopy. Approximately 70 employee parking spaces would serve Costco employees; circulation is designed to keep fuel facility traffic and employee parking separate.

1.2.2 South Site

The South Site would include up to approximately 165,000 square feet of building area planned to be constructed as a Costco Wholesale Member Warehouse retail store. Within the store, Costco would offer, among other product and services, optical exams and optical sales, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and tire sales and installation. Temporary outdoor sales may occur within the portion of the parking area adjacent to the warehouse retail building for seasonal sales, such as Christmas tree sales during the months of November and December. The warehouse retail building is proposed to include one customer entrance to the main Costco store, which would be located at the northwest corner of the building. The tire center would have bay doors accessible from outside of the warehouse retail building, though the tire center sales area would be accessible through the building. A promotional vehicle may be on display near the customer entrance to the building. This vehicle would be used to promote online or off-site vehicle sales; no vehicles are proposed to be sold onsite. The South Site would also include a parking structure and surface parking, which are further described below. Development on the South Site would exclude the 1.38-acre area located west of Clarksville Crossing where no development is proposed.

The South Site has been designed to use the existing slope of the site by locating the Costco warehouse retail building in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. Parking would be provided in two at-grade parking lots and one subterranean (below-grade) parking lot structure beneath one of the at-grade lots. Vehicle access to this lower-level parking structure would be provided by a ramp on the north side of the structure from Clarksville Crossing and a ramp on the south side of the structure from the above at-grade parking lot. The below-grade parking structure would include approximately 200 to 230 spaces. A pedestrian ramp and elevators would provide pedestrian access from the below-grade level up to the at-grade parking and entry to the warehouse retail building. The below-grade parking structure and at-grade parking lots together would include approximately 750 to 780 spaces in total parking to serve the South Site.

Site Access and Roadway Improvements

The primary entrance to the South Site would be from the new signalized intersection with Silva Valley Parkway (shared with the North Site). Northbound traffic on Silva Valley Parkway would have a left-turn pocket into Clarksville Crossing, and three driveways off Clarksville Crossing would provide direct access to the South Site. A partial traffic signal would be installed at the intersection of Silva Valley Parkway and Clarksville Crossing. In the future, when Country Club Drive is extended by the County, Clarksville Crossing's connection to Silva Valley Parkway and the traffic signal would be removed. A public access road would be developed on the South Site within the remainder parcel that was taken by the County in connection with the development of Tong Road. A maintenance agreement between the County and Costco would be created to address the maintenance of the new public access road.

Delivery truck access would be allowed at all driveway locations depending on the size of the delivery truck and direction of travel for both the North Site and South Site. Most trucks delivering to the warehouse retail building would access the site at the southwest driveway on Clarksville Crossing near the receiving docks.

Architecture

The warehouse retail building design for the South Site is proposed to be contemporary and would include a variety of massing and appropriate materials for the building. By combining concrete masonry block and architectural metal panels, Costco intends to create a scale and architectural interest to minimize the visual impact of a large retail warehouse retail building. By use of design techniques such as the location of building materials, landscaping, and the incorporation of varying parapet cap heights, Costco proposes to break the long elevations both horizontally and vertically at the appropriate height to conceal roof top mounted mechanical equipment. The proposed colors are warm natural earth tones, which would relate to the proposed surrounding development by utilizing similar building materials and architectural detailing. The tire center would be integrated into the main building, with exterior bay doors and interior retail access for sales and service. Pedestrian entries (main and employee) would be oriented to the northwest for customer convenience and the tire center from the other warehouse retail building operational areas.

The South Site truck loading dock is proposed to be located at the southwest corner of the building adjacent to US 50. The bay doors would be equipped with sealed gaskets to limit noise impacts. A smaller on-grade door would also be located on the south side of the building. This door is to receive bread deliveries and small delivery vans/trucks.

A transformer and two trash compactors would also be located along the south edge of the building proposed for the South Site. Landscape material would provide screening of this area.

Parking, Circulation, and Loading

Two at-grade lots and one below-grade lot together provide approximately 750 to 780 parking stalls. Access to the South Site would consist of a signalized intersection on Silva Valley Parkway, as well as driveways provided along Clarksville Road. These driveways would provide customer access to both at-grade and below-grade parking stalls. Delivery trucks would access sealed loading docks at the building's southwest corner.

Construction

As with the North Site, construction for the South Site is anticipated to last approximately 11 months once construction begins, which is currently estimated to be July of 2026. Construction would occur 7 days per week, with construction occurring 7:00 a.m. to 7:00 p.m. on weekdays and 8:00 a.m. to 5:00 p.m. on weekends. In addition to these construction hours, it is anticipated that there would be up to 8 days of nighttime construction activities involving concrete pours for the building foundation.

Operations

The warehouse retail building is proposed to include one member entrance to the main Costco store, which would be located at the northwest corner. The EDH Costco is expected to include, among other features, a bakery and sales of baked goods, meat preparation and sales, alcohol sales, food service preparation and sales, pharmacy, optical center with optical exams and retail optical sales, hearing aid testing center, and food court, along with the sales of approximately 4,000 products. The warehouse retail building would include a five-bay tire center with member access via the inside of the main Costco building, which would include tire sales and a tire installation facility.

It is anticipated that the El Dorado Hills Costco project (warehouse retail building and fuel facility) would employ approximately 250 to 300 employees combined. The warehouse retail building would in general be open from 9:00 a.m. to 8:30 p.m. on weekdays and 9:00 a.m. to 7:00 p.m. on weekends. Costco anticipates an average of about 10 to 12 trucks delivering goods per day. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers. Receiving time would be from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before 10:00 a.m. Deliveries to the warehouse retail building are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from eastbound US 50. Truck travel routes would use Silva Valley Parkway (from US 50 to Clarksville Road), Clarksville Road (from White Rock Road to Silva Valley Parkway), future Country Club Drive extension west of the South Site to access Clarksville Road, and White Rock Road (from Clarksville Road to US 50).

The tire center receives shipments of tires once or twice a week, with old tires transported offsite for recycling. Seasonal outdoor sales of items such as Christmas trees may occur in the parking area. In addition, promotional vehicle displays may appear outside, but no on-site vehicle sales would occur.

Energy Efficiency Features

As noted above, the South Site would obtain electrical and natural gas services from Pacific Gas & Electric (PG&E). The development would comply with energy efficiency standards under California Code of Regulations Title 24. Additional energy efficiency and sustainability measures incorporated into the Costco project are noted below.

- Parking lot light standards would be designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps can provide a higher level of perceived brightness with less energy than other lamps such as high-pressure sodium.
- New and renewable building materials would typically be extracted and manufactured within the region. When masonry and concrete are used, the materials purchased would be local to the Project, minimizing the transportation distances and impact to local road networks.
- The use of pre-manufactured building components, including structural framing and metal panels, would help to minimize waste during construction.
- Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other materials. Building heat absorption would be further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall.
- A substantial amount of the proposed landscaping material for the North Site and South Site is climate adapted to the region and would use less water than other common landscape species.
- The irrigation system proposes to include the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas.
- Storm water management plans are designed to maintain water quality, minimize erosion, and manage storm water discharge rates based on the County requirements.
- High-efficiency restroom fixtures would be installed.
- Commissioning of mechanical systems would occur to ensure that the heating, ventilation, and air conditioning (HVAC) systems are performing as designed. HVAC comfort systems would be controlled by a computerized building management system to maximize efficiency.
- HVAC units planned for the South Site are high-efficiency direct ducted units, which have phased out the use of hydrochlorofluorocarbons completely.
- Parking lot and exterior lights would be controlled by a photo sensor and time clock.
- 10 electric vehicle (EV) chargers with direct current (DC) fast chargers would be installed.
- Lighting would be controlled by the overall project energy management system.
- Energy efficient Transformers (i.e., Square D Type EE transformers) would be used.
- Variable speed motors would be used on make-up air units and booster pumps.

- Gas water heaters would be direct vent and 94 percent efficient or greater.
- Reclaim tanks would be used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.
- The building structure would be a pre-engineered system that uses 100 percent recycled steel materials and would be designed to minimize the amount of material used.
- Construction waste would be recycled whenever possible.
- Floor sealant would be No-volatile organic compound and would represent over 80 percent of the floor area.
- Carbon dioxide (CO_2) would be monitored throughout the warehouse.
- Extensive recycling/reuse program would be implemented including tires, cardboard, grease, plastics, and electronic waste.
- Use of plastic shopping bags would be avoided.
- Suppliers would be required to reduce packaging and consider alternative packaging solutions.
- Distribution facilities would be strategically located to minimize miles traveled for delivery.
- Deliveries would be made in full trucks.
- All Costco trucks would be equipped with an engine idle shut off timers.
- 100 percent renewable electrical power will be supplied by PG&E, as Costco has a Clean Energy Contract with PG&E.

2. SCIENTIFIC BACKGROUND

2.1 Science of Global Climate Change

There is a general scientific consensus that global climate change is occurring, caused in whole or in part by increased emissions of GHGs that keep the Earth's surface warm by trapping heat in the Earth's atmosphere, in much the same way as glass traps heat in a greenhouse. The Earth's climate is changing because human activities, primarily the combustion of fossil fuels, are altering the chemical composition of the atmosphere through the buildup of GHGs. GHGs allow the sun's radiation to penetrate the atmosphere and warm the Earth's surface, but do not let the infrared radiation emitted from the Earth escape back into outer space. As a result, global temperatures are predicted to increase over the century. In particular, if climate change remains unabated, surface temperatures in California are expected to increase anywhere from 4.1 to 8.6 degrees Fahrenheit by the end of the century. Not only would higher temperatures directly affect the health of individuals through greater risk of dehydration, heat stroke, and respiratory distress, the higher temperatures may increase ozone formation, thereby worsening air quality. Rising temperatures could also reduce the snowpack, which would increase the risk of water shortages. Higher temperatures along with reduced water supplies could reduce the quantity and quality of agricultural products. In addition, there could be an increase in wildfires and a shift in distribution of natural vegetation throughout the State. Global warming could also increase sea levels and coastal storms resulting in greater risk of flooding.

Emissions of CO_2 are the leading cause of global warming, with other pollutants such as methane (CH_4), nitrous oxide (N_2O), hydrofluorocarbons (HFCs), perfluorocarbons, and sulfur hexafluoride also contributing. The magnitude of the impact on global warming differs among the GHGs. For example, HFCs, perfluorocarbons, and sulfur hexafluoride have a greater "global warming potential" than CO_2. In other words, these other GHGs have a greater contribution to global warming than CO_2 on a per mass basis. The effect each GHG has on climate change is measured as a combination of the volume of its emissions and its global warming potential (GWP) and is expressed as a function of how much warming would be caused by the same mass of CO_2. Thus, GHG emissions are typically measured in terms of megagrams or metric tonnes (MT) of carbon dioxide equivalent (CO_2e). CO_2 has the greatest impact on global warming because of the relatively large quantities of CO_2 emitted into the atmosphere.

Globally, CO_2 concentrations, which ranged from 265 parts per million (ppm) to 280 ppm over the last 10,000 years, only began rising in the last 200 years to current levels of 410 ppm,[1] a 46 percent increase.

In 2022, the United States emitted about 6.3 billion MT of CO_2e or about 19 MT/person/year, calculated by dividing the emissions total by the U.S. Census Bureau population estimate for

[1] Intergovernmental Panel on Climate Change (IPCC). Climate Change 2021, The Physical Science Basis. 2021. Available at: https://www.ipcc.ch/report/ar6/wg1/downloads/report/IPCC_AR6_WGI_Full_Report.pdf. Accessed: October 2025.

2022.[2,3] This represents a reduction below 2005 total emission levels of approximately 17 percent. Of the five major sectors nationwide – residential, commercial, industrial, electric power generation, and transportation – transportation accounts for the highest fraction of GHG emissions (approximately 37 percent of emissions from these five sectors). These emissions are entirely generated from direct fossil fuel combustion. Approximately 57 percent of these transportation emissions resulted from passenger car and light-duty truck use. The remaining emissions came from other transportation activities, including the combustion of diesel fuel in medium- and heavy-duty vehicles, and jet fuel in aircraft. According to the Inventory of U.S. Greenhouse Gas Emissions and Sinks,[4] from 1990 to 2022 as a whole, transportation emissions from fossil fuel combustion increased by approximately 19 percent.

In 2022, California emitted approximately 371.1 million tonnes of CO_2e, or about 6 percent of the U.S. emissions.[5] California's percentage contribution is due primarily to the sheer size of California, as compared to other states. For example, in 2022 (the most recent year of state rankings for energy-related CO_2 emissions per capita), California had the third lowest per capita energy-related CO_2 emission rates in the country (including Washington D.C.),[6] due to the success of its energy efficiency and renewable energy programs and commitments that have lowered the State's GHG emissions rate of emissions growth.[7] Another factor that has reduced California's fuel use and GHG emissions is its mild climate compared to that of many other states.

California Air Resources Board (CARB) found that transportation is the source of approximately 38 percent of the State's GHG emissions, followed by industrial sources at 20 percent, and electricity generation (both in-state and out-of-state) at 16 percent. Residential and commercial activities comprised approximately 11 percent of the inventory. Agriculture is the source of approximately 8 percent of the State's GHG emissions.[8]

2.2 Potential Effects of Human Activity on Global Climate Change

Globally, climate change has the potential to impact numerous environmental resources through anticipated, though uncertain, impacts related to future air temperatures and precipitation patterns. Scientific modeling predicts that continued GHG emissions at or above current rates would induce more extreme climate changes during the 21st century than were observed during the 20th century. At the end of the 21st century, global surface temperature change is likely to exceed 1.5°C (relative to 1850-1900 levels) in all four assessed climate model projections but one.[9]

The understanding of GHG emissions, particulate matter, and aerosols on global climate trends is complex and involves varying uncertainties and a balance of different effects. In addition to uncertainties about the extent to which human activity rather than solar or volcanic activity is responsible for increasing warming, there is also evidence that some human activity has cooling, rather than warming, effects, as discussed in detail in numerous publications by the Intergovernmental Panel on Climate Change (IPCC), such as the Sixth Assessment Report (AR6) Synthesis Report.[10,11] Nonetheless, when all effects and uncertainties are considered together, there is a strong scientific consensus that human activity has contributed significantly to global warming. As stated in AR6, "Human activities, principally through emissions of greenhouse gases, have unequivocally caused global warming, with global surface temperature reaching 1.1°C above 1850–1900 in 2011-2020."[12]

Acknowledging uncertainties regarding the rate at which anthropogenic GHG emissions would continue to increase (based upon various factors under human control, such as future population growth and the locations of that growth; the amount, type, and locations of economic development; the amount, type, and locations of technological advancement; adoption of alternative energy sources; legislative and public initiatives to curb emissions; and public awareness and acceptance of methods for reducing emissions), and the impact of such emissions on climate change, the IPCC devises emission scenarios which utilize various assumptions about the rates of economic development, population growth, and technological advancement over the course of the next century. For the Fifth Assessment Report (AR5), Representative Concentration Pathways (RCPs) were developed to describe four different 21st century scenarios of greenhouse gas emissions, atmospheric concentrations, air pollutant emissions, and land use. The RCPs summarized for the AR5 were used for the five climate change scenarios provided in the AR6.[13] RCPs are based on a combination of

[9] IPCC. Intergovernmental Panel on Climate Change (IPCC) Fifth Assessment Report. Climate Change 2014: Synthesis Report. 2014. SPM.2.2. Available at: https://www.ipcc.ch/site/assets/uploads/2018/02/SYR_AR5_FINAL_full.pdf. Accessed: October 2025.

[10] The IPCC was established in 1988 by the World Meteorological Organization and the United Nations Environment Programme to assess scientific, technical, and socio-economic information relevant for the understanding of climate change, its potential impacts, and options for adaptation and mitigation. The IPCC has produced a series of Assessment Reports comprised of full scientific and technical assessments of climate change. The first assessment report was developed in 1990. The Sixth Assessment Report was completed in August 2021 with the most current Synthesis Report completed in March 2023.

[12] Ibid.

[13] IPCC. 2021. Climate Change 2021, The Physical Science Basis. Available at: https://www.ipcc.ch/report/ar6/wg1/downloads/report/IPCC_AR6_WGI_FullReport_small.pdf. Accessed: October 2025.

integrated assessment models, simple climate models, atmospheric chemistry, and global carbon cycle models.

- The projected effects of global warming are assessed under each of the five scenarios.[14]
- It is, at a minimum, more likely than not a 1.5°C increase in globally averaged surface area temperature will occur between 2021-2045 relative to the average over the period of 1850-1900.
- It is virtually certain that global mean sea level will continue to rise through the 21st century.
- It is likely the Arctic Ocean in September, the month of annual minimum sea ice area, will become practically ice free averaged over 2081-2100 and all available simulations.
- It is very likely that the cumulative uptake of carbon by the ocean and by land will increase through the end of the 21st century.

Potential secondary effects from global warming include impacts to agriculture, changes in disease vectors, and changes in habitat and biodiversity.

However, AR6 states, "The uncertainty range on assessed future changes in global surface temperature is narrower than in the AR5" and "For a given level of warming, many climate-related risks are assessed to be higher than in AR5 (high confidence). Levels of risk for all Reasons for Concern are assessed to become high to very high at lower global warming levels compared to what was assessed in AR5 (high confidence). This is based upon recent evidence of observed impacts, improved process understanding, and new knowledge on exposure and vulnerability of human and natural systems, including limits to adaptation".[15]

The IPCC began its seventh assessment cycle in July 2023. The initial Scoping Meeting to prepare the draft outline of the three Working Groups that will contribute to the Seventh Assessment Report took place in December 2024. The Synthesis Report is planned to be released by late 2029.[16]

2.3 Potential Effects of Climate Change on the State of California

According to the CARB, some of the potential impacts in California of global warming may include loss in snowpack, sea level rise, more extreme heat days per year, more high ozone days, more large forest fires, and more drought years.[17] The California Climate Change Center (CCCC) has released four assessment reports on climate change in California, the most recent in 2018. California's Fourth Climate Change Assessment projects an increase by

5.6-8.8°F from 2070 to 2100 depending on greenhouse gas emission reductions (at a moderate rate or continuing at current rates).[18]

Below is a summary of some of the potential effects reported in an array of studies that could be experienced in California as a result of global warming and climate change.

2.3.1 Air Quality

Higher temperatures, conducive to air pollution formation, could worsen air quality in California. Climate change may increase the concentration of ground-level ozone, but the magnitude of the effect, and therefore its indirect effects, are uncertain. For other pollutants, the effects of climate change and/or weather are less well studied, and even less well understood.

If higher temperatures are accompanied by drier conditions, the potential for large wildfires could increase, which, in turn, would further worsen air quality. Studies have been conducted to evaluate the potential impacts of climate change on wildfire frequency based on lower and higher emissions scenarios. Per California's Fourth Climate Change Assessment, under a higher emissions scenario, the average area burned statewide could increase by 77 percent above historic levels by 2100.[19] However, if higher temperatures are accompanied by wetter, rather than drier conditions, the rains would tend to temporarily clear the air of particulate pollution and reduce the incidence of large wildfires, thus ameliorating the pollution associated with wildfires. Additionally, projected increases in average ambient temperatures could increase annual heat-related deaths by as much as 11,300 in 2050.[20]

It is estimated that over the next decade, higher temperatures could increase the peak demand for electricity during summer months, which could require additional electrical generating capacity in California to meet the State's peak electricity demand.[21] During periods of extreme heat, efficiency of electricity generation is reduced at natural gas plants; hydropower generation is reduced; and increased losses occur at substations; all while electricity demands are increased. California's Third Climate Change Assessment provides projected statewide impacts of elevated ambient temperatures on electricity generation. Specifically, these factors are projected to result in the need for more than 17 gigawatts, or 38 percent of additional capacity, needed by 2100. Additionally, transmission lines lose 7 to 8 percent of transmitting capacity in higher temperatures, which also results in a need for increased power generation.[22]

2.3.2 Water Supply

Uncertainty remains with respect to the overall impact of global climate change on future water supplies in California. For example, models that predict drier conditions suggest decreased reservoir inflows and storage, and decreased river flows, relative to current

conditions. By comparison, models that predict wetter conditions project increased reservoir inflows and storage, and increased river flows.[23]

The Climate Change Vulnerability Assessment prepared by the California Department of Water Resources (DWR) in 2019 addresses the impacts of climate change on California. Regarding water supply, the assessment states that "As well, the already-stressed Delta ecosystem will be affected simultaneously by changing hydrology that further limits water supply for protected species at key times of year while rising sea level will push saline water further into the Delta."[24] The assessment also notes that efforts are underway to integrate modeling of water supply and flood management systems, but such integrated analysis tools were not available at the time the assessment was prepared.

California's Fourth Climate Change Assessment outlines the State's urgent water management challenges brought on as a result of climate change. These include increasing demand from a growing population as temperatures rise, earlier snowmelt and runoff, and faster-than-historical sea level rise threatening aging coastal water infrastructure and levees in the Sacramento-San Joaquin Delta.[25] Additionally, they predict that competition between urban and agriculture water users and environmental needs will increase due to effects on water supply and stream flows. The Fourth Climate Change Assessment concludes that by 2100, water supply from snowpack is projected to decline by two-thirds, and that by 2050, California's agricultural production could face climate-related water shortages of up to 16 percent in certain regions.[26]

2.3.3 Hydrology

As discussed above, climate change could potentially affect the following: the amount of snowfall, rainfall, and snowpack; the intensity and frequency of storms; flood hydrographs (flash floods, rain or snow events, coincidental high tide, and high runoff events); sea level rise and coastal flooding; coastal erosion; and the potential for saltwater intrusion. Sea level rise can be a product of global warming through two main processes – expansion of sea water as the oceans warm and melting of ice over land. A rise in sea levels could result in coastal flooding and erosion and could also jeopardize California's water supply. In particular, saltwater intrusion would threaten the quality and reliability of the State's major fresh water supply that is pumped from the southern portion of the Sacramento/San Joaquin River Delta. Increased storm intensity and frequency could affect the ability of flood-control facilities, including levees, to handle storm events. California's Third Climate Change Assessment provides statewide estimates on sea level rise. Specifically, assuming the rate of sea level rise continues to follow global trends, sea level along California's coastline in 2050 could be 10-18 inches higher than in 2000, and 31-55 inches higher by the end of this century.[27] Based on these current projections, the current 100-year storm could occur once every year. California's Fourth Climate Change Assessment projects that without implementation of

[23] Brekke, L.D., et al, 2004. – Climate Change Impacts Uncertainty for Water Resources in the San Joaquin River Basin, California. Journal of the American Water Resources Association. 40(2): 149–164. Malden, MA, Blackwell Synergy for AWRA.

protective measures, airports in major urban areas will be susceptible to major flooding from a combination of sea level rise and storm surge by 2040 to 2080 and that the miles of highways susceptible to coastal flooding from a 100-year storm will triple from current levels by 2100.[28]

2.3.4 Agriculture

California has a $30 billion agricultural industry that produces half the country's fruits and vegetables. The CCCC notes that higher CO_2 levels can stimulate plant production and increase plant water use efficiency. However, if temperatures rise and drier conditions prevail, water demand could increase, crop-yield could be threatened by a less reliable water supply, and greater pest and disease outbreaks. In addition, temperature increases could change the time of year that certain crops bloom and harvest, and thus affect their quality.[29]

2.3.5 Ecosystems and Wildfire

Increases in global temperatures and the potential resulting changes in weather patterns could have ecological effects on a global and local scale. In 2019, the California DWR released an assessment examining the possible impacts of climate change on ecosystems and wildlife.[30] The assessment outlines ways in which it is thought that climate change is already affecting and will continue to affect plants and animals: (1) impacts to important life-cycle events (changes in reproduction and migration patterns), (2) decline in some species populations, (3) habitat fragmentation, and (4) invasive species.

On June 12, 2025, President Trump signed into law House Joint Resolution 87, which provides congressional disapproval of the rule submitted by the Environmental Protection Agency (EPA) relating to "California State Motor Vehicle and Engine Pollution Control Standards; Heavy-Duty Vehicle and Engine Emission Warranty and Maintenance Provisions; Advanced Clean Trucks; Zero Emission Airport Shuttle; Zero-Emission Power Train Certification; Waiver of Preemption; Notice of Decision".[31] On the same day the President signed into law House Joint Resolution 88, which provides congressional disapproval of the rule submitted by the EPA relating to "California State Motor Vehicle and Engine Pollution Control Standards; Advanced Clean Cars II; Waiver of Preemption; Notice of Decision".[32]

3. SIGNIFICANCE THRESHOLDS

3.1 CEQA Guidelines on GHG Emissions

Adopted amendments to the California Environmental Quality Act (CEQA) Guidelines do not provide a mandatory, quantitative rubric for GHG emissions analysis, but instead provide general guidance and recognize long-standing CEQA principles regarding the discretion afforded to lead agencies where supported by substantial evidence. More specifically, CEQA Guidelines Section 15064.4(a) recognizes that the "determination of the significance" of GHG emissions "calls for careful judgment by the lead agency" in accordance with the more general provisions of CEQA Guidelines Section 15064; each agency "shall have discretion to determine" whether to conduct quantitative or qualitative analysis, provided its determination is supported by substantial evidence. Section 15064.4 was most recently amended by the Office of Planning and Research and the California Natural Resources Agency in December 2018.

The analysis provided in this report evaluates the significance of the Proposed Project's GHG emissions by reference to the following questions from Section VIII, Greenhouse Gases, of Appendix G of the CEQA Guidelines:

Threshold 1. Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

Threshold 2. Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

3.2 Project Approach to Significance

This Greenhouse Gas Technical Report assesses significance of GHG impacts based on Section VIII, Greenhouse Gases, of Appendix G of the CEQA Guidelines.

While El Dorado County provides some basic information on climate change including an overview of GHG regulations and local, state, and national efforts to address climate change, it has not established a quantitative or qualitative guidance to evaluate GHG emission impacts of development projects under CEQA.[33] Additionally, El Dorado County Air Quality Management District (EDCAQMD) has also not set quantitative GHG significance thresholds. In the absence of a quantitative GHG threshold from El Dorado County and EDCAQMD, this Technical Report assessed significance of GHG impacts for Threshold 1 against the Placer County Air Pollution Control District (PCAPCD) GHG significance thresholds (**Table 3-1**), in consultation with EDCAQMD and El Dorado County.

PCAPCD's GHG significance thresholds are reasonable to assess significance in the absence of a quantitative threshold from El Dorado County Air Pollution Control District because Placer County is similar to El Dorado County demographically, geographically, and meteorologically. Both Placer County and El Dorado County have similar land use patterns (i.e., they are both heavily made up of rural and suburban areas), with similar rates of population growth. Additionally, both counties have similar terrain and lie within the same air basin. Because of this, PCAPCD's quantitative GHG thresholds were used to assess significance against the Project relative to Threshold 1.

[33] El Dorado County. Air Quality Planning and Information – Climate Change. Available at: https://www.eldoradocounty.ca.gov/Land-Use/Air-Quality-Management-District/Air-Quality-Planning-and-Information/Climate-Change. Accessed: October 2025.

Relative to Threshold 2, this report evaluates whether the Project would conflict with the 2022 Scoping Plan Update, Sacramento Area Council of Governments' (SACOG's) 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS), and El Dorado County Regional Transportation Plan (RTP) 2020-2040.

4. PROJECT GHG EMISSIONS INVENTORY

This section describes the methodology that Ramboll used to develop the GHG emission inventories associated with the Proposed Project, which include construction emissions and operational emissions. Sub-categories of GHG operational emissions include the following: area sources, energy use, mobile sources, water supply and wastewater, solid waste, refrigerant, ongoing vegetation sequestration changes, and emergency generators.

4.1 Measurement, Resources and Baseline Condition

4.1.1 Units of Measurement: Tonnes of CO_2 and CO_2e

In this report, the term "GHGs" includes gases that contribute to the natural greenhouse effect, such as CO_2, CH_4, N_2O, and water, as well as gases that are only man-made and that are emitted through the use of modern industrial products, such as HFCs and chlorofluorocarbons. GHG emissions are typically measured in terms of mass of CO_2e. CO_2e is calculated as the product of the mass of a given GHG and its specific GWP, as described in **Section 2.1**. GWPs of 25 and 298 were used for CH_4 and N_2O, respectively, for this analysis. In many sections of this report, including the final summary sections, emissions are presented in units of CO_2e either because the GWPs of CH_4 and N_2O were accounted for explicitly, or the CH_4 and N_2O are assumed to contribute a negligible amount of GWP when compared to the GWP of CO_2 emissions.

In this report, a tonne refers to MT (1,000 kilograms). Additionally, exact totals presented in all tables and report sections may not equal the sum of components due to independent rounding of numbers.

4.1.2 Resources

4.1.2.1 CalEEMod Methodology

Ramboll primarily utilized the California Emissions Estimator Model (CalEEMod) version 2022.1[34] methodology to assist in quantifying the GHG emissions in the inventories presented in this report for the Proposed Project. CalEEMod provides methodologies to calculate both construction emissions and operational emissions from a land use development project. It calculates total or annual GHG emissions. Specifically, the model methodology aids the user in the following calculations:

- One-time short-term construction emissions from off-road construction equipment, and on-road worker, vendor, and hauling vehicles during the construction of the project and site access and roadway improvements.
- Operational emissions from direct and indirect GHG sources associated with the Proposed Project built-out condition including on-road vehicles, landscaping equipment, emergency generators, natural gas and electricity use in the buildings, water use, solid waste disposal, refrigerant use, and vegetation sequestration changes.

CalEEMod is a statewide program designed to calculate both criteria air pollutant (CAP) and GHG emissions from development projects in California developed under the auspices of the South Coast Air Quality Management District, with input from other California air districts, and is currently supported by numerous lead agencies for use in quantifying the emissions associated with development projects undergoing environmental review. CalEEMod utilizes

[34] California Air Pollution Control Officers Association (CAPCOA). 2022. California Emissions Estimator Model. Available at: https://caleemod.com/. Accessed: October 2025.

widely accepted models for emission estimates combined with appropriate default data that can be used if site-specific information is not available. These models and default estimates use sources such as the United States Environmental Protection Agency (USEPA) AP-42 emission factors,[35] CARB's on-road and off-road equipment emission models such as the EMission FACtors model (EMFAC) and the Off-road Emissions Inventory Program model (OFFROAD), and studies commissioned by California agencies such as the California Energy Commission and California Department of Resources Recycling and Recovery (CalRecycle).

As mentioned above, CalEEMod is based upon the CARB-approved OFFROAD and EMFAC models. OFFROAD[36] is an emission factor model used to calculate emission rates from off-road mobile sources (e.g., construction equipment, agricultural equipment). The off-road diesel emission factors used by CalEEMod are based on the CARB OFFROAD2017 program. EMFAC is an emission factor model used to calculate emissions rates from on-road vehicles (including passenger cars to delivery trucks). CalEEMod 2022.1 contains EMFAC2021 emission factors.[37] These emissions factors were then used to estimate mobile source operational emissions based on CalEEMod methodology and defaults along with Project-specific values where available.

In addition, CalEEMod contains default values and existing regulation methodologies to use in each specific local air district region. Appropriate statewide default values can be utilized if regional default values are not defined. Ramboll used default factors for the El Dorado-Mountain County area for the emissions inventory, unless otherwise noted in the methodology descriptions below.

Details regarding the specific methodologies used by CalEEMod can be found in the CalEEMod User's Guide and associated appendices.[38]

4.1.2.2 Other Resources

Ramboll directly or indirectly relied on emissions estimation guidance from government-sponsored organizations, government-commissioned studies of energy use patterns, Project-specific studies (e.g., Kittelson & Associates, Inc's Transportation Analysis[39]), and emission estimation software as described above. In cases noted below, third-party studies were also relied upon to support analyses and assumptions made outside of the approach described above.

[35] The USEPA maintains a compilation of Air Pollutant Emission Factors and process information for several air pollution source categories. The data is based on source test data, material balance studies, and engineering estimates. Available at: https://www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emissions-factors. Accessed: October 2025.

[39] Kittelson & Associates. 2025. El Dorado Costco CEQA Analysis. July 23.

4.1.3 Indirect GHG Emissions from Electricity Use

Project-related electricity use results in indirect emissions, due to electricity generation activities occurring at off-site power plant locations. For the Proposed Project, 100% renewable electrical power will be supplied by PG&E, as Costco has a Clean Energy Contract with PG&E. Hence, there will be zero indirect GHG emissions generated by Project-related electricity use.

4.2 Construction Emissions

This section describes the estimation of GHG emissions from construction activities at the Proposed Project site. While the exact construction schedule and equipment mix may vary from the current analysis, the GHG emissions are not expected to be higher than that calculated given the conservative assumptions included in this analysis.

This analysis includes estimation of GHG emissions from the following major construction phases for the Proposed Project:

- Site Preparation involves clearing vegetation (grubbing and tree/stump removal) and removing stones and other unwanted material or debris prior to grading.
- Grading involves the cut-and-fill of land to ensure the proper base and slope for the construction foundation.
- Building Construction involves the construction of structures and buildings.
- Paving involves the laying of concrete or asphalt such as in parking lots or roads.
- Architectural Coating involves the application of coatings to both the interior and exterior of buildings or structures, and the painting of parking lot striping, associated signage and curbs.

Note, two scenarios are considered for the construction of the Proposed Project that have different material movement amounts in the grading phase. Scenario 1 assumes that the excavated material from portions of the Project site will be used as fill during grading. Scenario 2 conservatively assumes that all the excavated material will be exported offsite and soil will be imported for fill during grading.

The analysis also includes an estimation of the CAP emissions associated with the following construction phases for the site access and roadway improvements:

- Linear, Grubbing & Land Clearing involves removing vegetation, trees, stumps (grubbing), and clearing stones or other debris from roads, in preparation for grading and excavation.
- Linear, Grading & Excavation involves demolition of existing surfaces and cut-and-fill activities to ensure the proper base and slope for road construction.
- Linear, Drainage, Utilities, & Sub-Grade involves the road construction activities including installation of drainage systems, utility lines, and preparing and compacting the sub-grade to support the road pavement.
- Linear, Paving involves the laying of concrete or asphalt for road surfaces.

The proposed schedule for constructing the Project and the site access and roadway improvements are shown in **Table 4-1** and **Table 4-2** respectively. CalEEMod was used to estimate the annual GHG emissions associated with construction sources including off-road construction equipment and on-road construction vehicle trips.

The off-road construction equipment list and specifications are based on the Project-specific information and supplemented with CalEEMod model defaults, as shown in **Table 4-3** and **Table 4-4**. The Project-specific worker, vendor, and hauling trips, supplemented with CalEEMod defaults are displayed in **Table 4-5**, **Table 4-6**, and **Table 4-7**. **Table 4-8**, **Table 4-9**, and **Table 4-10**, present material volumes which are anticipated to be imported and exported for Project construction Scenario 1, Project construction Scenario 2, and site access and roadway improvements, respectively. Additionally, **Table 4-11** presents an estimate of the demolition debris that would be generated and shipped offsite during the Linear, Grubbing & Land Clearing construction phase for the site access and roadway improvements.

4.2.1 Emissions from Construction Equipment

The emissions associated with construction equipment are from off-road equipment engine use based on the equipment list and phase length, and on-road vehicle trips and phase length.

Since the majority of the off-road construction equipment used for construction projects are diesel-fueled, CalEEMod methodology assumes all of the equipment operates on diesel fuel. These calculations include the running exhaust emissions from off-road equipment. Since the equipment is assumed to be diesel, there are no starting emissions associated with the equipment, as these are *de minimis* for diesel-fueled equipment. CalEEMod calculates the exhaust emissions based on default values for horsepower and load factor from CARB's OFFROAD2017 methodology using the equation presented below.[40]

$$Emissions_{Diesel} = \sum_{i} (EF_i \times Pop_i \times AvgHP_i \times Load_i \times Activity_i)$$

Where:

EF	=	Emission factor in grams per horsepower-hour (g/bhp-hr) as processed from OFFROAD2017
Pop	=	Population, or the number of pieces of equipment
AvgHp	=	Maximum rated average horsepower
Load	=	Load factor
Activity	=	Hours of operation
i	=	equipment type

The construction-related equipment assumptions based on the Project-specific information and supplemented with CalEEMod model defaults are shown in **Table 4-3** and **Table 4-4**. The combustion emissions from the equipment were calculated using CalEEMod, as shown in **Appendix A**.

[40] CAPCOA. 2022. California Emissions Estimator Model User's Guide, Appendix C. Available at: https://caleemod.com/documents/user-guide/04_Appendix%20C.pdf. Accessed: October 2025.

4.2.2 Emissions from On-Road Construction Trips

Construction generates on-road vehicle GHG emissions from worker and vendor commuting, concrete trucks, and trucks used for construction debris and soil/material hauling.

These emissions are calculated in CalEEMod based on the number of trips and vehicle miles traveled (VMT) (**Table 4-5**, **Table 4-6**, and **Table 4-7**) along with emission factors from EMFAC2021. The numbers of worker and vendor trips represent defaults from CalEEMod based on the construction equipment to be used. The number of haul trips was estimated by CalEEMod based on the volume of soil to be imported/exported (**Table 4-8**, **Table 4-9**, and **Table 4-10**) and the amount of demolition debris generated (**Table 4-11**). The number of concrete truck trips were based on Project-specific information.

Additionally, the emissions associated with on-site idling of concrete trucks during the building construction phase were estimated using concrete truck trip rates, idling duration per trip, and emission factors from EMFAC2021. Refer to **Table A-1** and **Table A-2** in **Appendix A** for further details.

4.2.3 Total Construction Emissions

Total GHG emissions for each year of Proposed Project and the site access and roadway improvements construction (2026 and 2027) are summarized in **Table 4-12** and **Table 4-13**, for Project construction Scenario 1 and Scenario 2, respectively. As noted previously under **Section 4.2**, Project construction Scenario 1 assumes that the excavated material from portions of the Project site will be used as fill during grading, while Project construction Scenario 2 conservatively assumes that all the excavated material will be exported offsite, and soil will be imported for fill during grading. Additionally, while the Project has committed to a construction mitigation measure to mitigate the significant impact of the maximum estimated cancer risk,[41] this mitigation measure does not impact the greenhouse gas emissions of the construction equipment. As shown in **Table 4-12** and **Table 4-13**, the annual GHG emissions associated with the construction of the Proposed Project under both scenarios are less than the PCAPCD's GHG significance threshold for construction.[42]

4.3 Operational Emissions

This section describes the estimation of GHG emissions from operational activities at the Project site. The operational emissions were calculated primarily utilizing CalEEMod. Operational GHG emissions are calculated for area sources, mobile sources, water use, energy use, solid waste disposal, refrigerant use, stationary sources, and vegetation sequestration changes. Operational emissions are evaluated for the first year of Proposed Project operation, i.e., calendar year 2027.

4.3.1 Area Sources

Area sources are direct sources of GHG emissions, such as emissions from landscaping activities. The area source GHG emissions included in this analysis are landscaping-related

[41] Refer to Section 6 of the EDH Costco Project Air Quality Technical Report for further details on Mitigation Measure 3.2-4a: Apply Tier 4 Emission Standards to Diesel-Powered Off-Road Equipment.

[42] PCAPCD CEQA Handbook. 2017. Chapter 2 Thresholds of Significance. Available at: https://www.placerair.org/DocumentCenter/View/2047/Chapter-2-Thresholds-of-Significance-PDF. Accessed: June 2025.

fuel combustion sources, such as lawn mowers. These emissions are estimated in the CalEEMod output for the Proposed Project in **Appendix B-1**.

4.3.2 Mobile Sources

The GHG emissions associated with on-road mobile sources are generated from customer and employee vehicles, delivery trucks (i.e., fuel delivery trucks and warehouse/tire center delivery trucks), and transport refrigeration units (TRUs) that are mounted on the trailers of some on warehouse delivery trucks traveling to and from the Project site. The GHG emissions associated with on-road mobile sources include running and starting exhaust emissions. Running exhaust emissions are dependent on VMT. Starting emissions are associated with the number of starts or time between vehicle uses and the assumptions used in determining these values are described below. Ramboll calculated mobile source emissions using trip rates based on analyses conducted by Kittelson[43] and Project-specific information for fuel delivery trucks and warehouse/tire center delivery trucks.

The analysis includes the benefit of reductions from adopted regulatory programs that are accounted for within EMFAC2021 including Assembly Bill 1493 ("the Pavley Standard"), the Advanced Clean Cars (ACC) program, the USEPA/National Highway Traffic Safety Administration Advanced Fuel Economy, and the Heavy-Duty Omnibus regulation.

Public Law 119-17, enacted on June 12, 2025, is a House joint resolution that disapproves the Clean Air Act (CAA) waiver granted by USEPA for the Heavy-Duty Omnibus regulation under the Congressional Review Act.[44] As noted above, this analysis uses EMFAC2021 which incorporates the CAP benefits of Heavy-Duty Omnibus regulation. However, this regulation does not impact the GHG emissions from heavy-duty trucks; therefore this analysis remains unaffected by Public Law 119-17.

Public Law 119-15, enacted on June 12, 2025, is a House joint resolution that disapproves the CAA waiver granted by USEPA for the Advanced Clean Trucks (ACT) Regulation, which is a zero-emission vehicle (ZEV) sales mandate for truck manufacturers.[45] While EMFAC2021 incorporates reductions associated with the ACT regulation, this analysis assumes that all Project-related delivery trucks are diesel-fueled. Hence, Public Law 119-15's disapproval of California's CAA waiver for ACT regulation does not impact this analysis.

Public Law 119-15 - Joint resolution providing congressional disapproval under chapter 8 of title 5, United States Code, of the rule submitted by the Environmental Protection Agency relating to "California State Motor Vehicle and Engine Pollution Control Standards; Heavy-Duty Vehicle and Engine Emission Warranty and Maintenance Provisions; Advanced Clean Trucks; Zero Emission Airport Shuttle; Zero-Emission Power Train Certification; Waiver of Preemption; Notice of Decision". Available at: https://www.govinfo.gov/app/details/PLAW-119publ15. Accessed: October 2025.

Public Law 119-16, enacted on June 12, 2025, is a House joint resolution that disapproves the CAA waiver granted by USEPA for the ACC II regulation, which is a ZEV sales mandate for passenger vehicle manufacturers.[46] Additionally, on January 13, 2025, CARB withdrew its waiver request for the Advanced Clean Fleets (ACF) regulation, which requires fleet owners to reduce emissions by increasing the use of zero emissions trucks in their fleets by replacing existing diesel/gasoline trucks.[47] EMFAC2021 does not incorporate the benefits of the ACC II and ACF regulations; therefore, GHG reductions associated with these regulations are not included in this analysis.

4.3.2.1 Estimating Mobile Source Emissions

Mobile source emissions calculation requires trip rates, trip lengths, and idle time for each on-road vehicle trip type associated with the Proposed Project (e.g., passenger vehicles and delivery trucks). Additionally, the operational time for TRU engines that are mounted on some of the trailers delivered to the warehouse is required to estimate exhaust emissions from TRUs. The following sections describe the methodology to derive the necessary inputs for these calculations.

a) On-Road Vehicle Trip Generation Rates

The total trip generation rates for passenger vehicles (customer and employees) visiting the Proposed Project were provided by Kittelson. The number of TRU equipped trailers that are brought onsite by warehouse delivery trucks and the trip generation rates for fuel and warehouse/tire center delivery trucks are based on Project-specific estimates. The annual average trips were estimated using the daily weekday and weekend trip rates. These are summarized in **Table B-1** in **Appendix B**.

b) Vehicle Miles Traveled

The VMT of passenger vehicles (customer and employees) was provided by Kittelson. The VMT of delivery trucks was calculated as the product of trip rates and trip lengths as shown in **Table B-1** in **Appendix B**. The trip length for delivery trucks is based on Project-specific estimates.

c) On-road Vehicle Idle Duration

The passenger vehicle (customer and employees) idling durations for vehicles queuing at the gasoline dispensing facility (GDF) were provided by Kittelson (**Table B-1** in **Appendix B**). The idle duration for delivery trucks is assumed to be 15 minutes for each round trip (maximum of 5 minutes at Project site entry, 5 minutes at the loading area, and 5 minutes

[46] United States Code. 2025. Public Law 119-16 - Joint resolution providing congressional disapproval under chapter 8 of title 5, United States Code, of the rule submitted by the Environmental Protection Agency relating to "California State Motor Vehicle and Engine Pollution Control Standards; Advanced Clean Cars II; Waiver of Preemption; Notice of Decision". Available at: https://www.govinfo.gov/app/details/PLAW-119publ16. Accessed: October 2025.

[47] California Air Resources Board. 2025. Withdrawal of California's Request for a Waiver, Pursuant to Clean Air Act Section 209(b), and Request for Authorization, Pursuant to Clean Air Act Section 209(e)(2), for the Advanced Clean Fleets (ACF) Regulation, Docket ID EPA-HQ-OAR-2023-0589. January 13. Available at: https://www.epa.gov/system/files/documents/2025-01/ca-acf-carb-withdrawal-ltr-2025-1-13.pdf. Accessed: October 2025.

at Project site exit), consistent with CARB's Air Toxic Control to Limit Diesel-Fueled Commercial Motor Vehicle Idling.[48]

d) TRU Operational Time

The total operational time for each TRU equipped trailer that is brought onsite by a warehouse delivery truck is estimated as the sum of the on-site truck idling time and the travel time for the truck round trip (**Table B-1** in **Appendix B**). As noted above, the on-site truck idling time is assumed to be 15 minutes. The truck travel time for each warehouse delivery truck round trip is estimated as the ratio of the round trip length to the average vehicle speed. For purposes of this analysis, the average vehicle speed was assumed to be 30 miles per hour for off-site travel and 5 miles per hour for on-site travel consistent with CARB's assumptions in Appendix I of the Proposed Amendments to the Airborne Toxic Control Measure for In-Use Diesel-Fueled TRU and TRU Generator Sets, and Facilities Where TRUs Operate.[49] Annual operational duration of TRUs was estimated based on total operational time per transport refrigeration unit and the total number of TRUs visiting the Project site on an annual basis. Refer to **Table B-1** in **Appendix B** for further details.

e) Fleet Mix

The CalEEMod default fleet mix for passenger vehicles in El Dorado-Mountain County (**Table B-2** in **Appendix B**) was adjusted using the default VMT distribution for passenger vehicle technology/fuel categories in EMFAC2021 to determine the Project-specific fleet mix of the passenger vehicles visiting the Project (**Table B-3** in **Appendix B**). Passenger vehicles visiting the GDF represent vehicles used by patrons of the fuel facility and are conservatively assumed to only include plug-in hybrids and gasoline-fueled vehicles. Warehouse and employee passenger vehicles represent the vehicles used by patrons and employees of the warehouse and include gasoline, plug-in hybrid, electricity, and diesel-fueled vehicles. All delivery trucks were assumed to be heavy heavy-duty diesel trucks.

f) Mobile Source Emission Factors

Running, starting, and idling exhaust emission factors for passenger vehicles and delivery trucks visiting the Proposed Project were estimated using the Project-specific fleet mix and EMFAC2021 mobile source emission factor data for El Dorado County. These calculations are presented in **Tables B-4 through Table B-10** in **Appendix B**.

Exhaust emission factors for TRUs were calculated using OFFROAD2021 outputs for in-State and out-of-State trailer TRUs operating in El Dorado-Mountain County as shown in **Table B-11** in **Appendix B**.

[48] CARB Air Toxic Control Measure to Limit Diesel-Fueled Commercial Motor Vehicle Idling. Available at: https://ww2.arb.ca.gov/our-work/programs/atcm-to-limit-vehicle-idling/about. Accessed: June 2025.

[49] CARB. 2021. Appendix I of the Proposed Amendments to the Airborne Toxic Control Measure for In-Sue Diesel-Fueled Transport Refrigeration Units (TRU) and TRU Generator Sets, and Facilities where TRUs operate. July 17. Available at: https://ww2.arb.ca.gov/sites/default/files/barcu/board/rulemaking/tru2021/appi.pdf. Accessed: June 2025.

4.3.2.2 Mobile Source Emissions

The annual GHG emissions from mobile sources associated with the Proposed Project operation are presented in **Table B-12** in **Appendix B**. This includes emissions from passenger vehicles, delivery trucks, and TRUs.

As shown in **Table B-12** in **Appendix B**, the GHG emissions from passenger vehicles and delivery trucks for the Proposed Project are estimated using Project-specific trip rates, VMT, idle time (**Table B-1** in **Appendix B**) and running exhaust, starting exhaust, and idling emission factors for these vehicle types that were calculated using EMFAC2021 data (**Table B-4 through Table B-10** in **Appendix B**).

GHG emissions from TRUs are also estimated in **Table B-12** in **Appendix B** using the Project-specific TRU operational time (**Table B-1** in **Appendix B**) and TRU exhaust emission factors from OFFROAD2021 (**Table B-11** in **Appendix B**).

4.3.3 Water Supply, Treatment and Distribution

Indirect GHG emissions result from the production of electricity used to convey, treat, and distribute the Proposed Project's water and wastewater. The amount of electricity required to convey, treat, and distribute water depends on the volume of water as well as the sources of the water. Additionally, direct CH_4 and N_2O emissions result from the treatment of wastewater.

Water usage associated with the Proposed Project is based on default values in CalEEMod, adjusted to reflect Project-specific features, including:

- Low-Flow Water Fixtures: High-efficiency restroom fixtures designed to reduce water consumption by approximately 40% compared to U.S. baseline standards.
- Water-Efficient Landscaping: The irrigation system incorporates drip rings for parking lot trees to efficiently water the root ball, minimizing water use and ensuring delivery directly to the intended planting areas.

The water usage and associated GHG emissions for the Proposed Project are provided in the CalEEMod output files in **Appendix B-1.**

4.3.4 Energy Use

Energy usage within buildings (e.g., electricity and natural gas) contribute to the Proposed Project's GHG inventory. Combustion of any type of fuel emits CO_2 and other GHGs directly into the atmosphere; these emissions are considered direct emissions associated with a building. GHGs are also emitted during the generation of electricity from fossil fuels; these emissions are considered as indirect emissions.

To estimate GHG emissions from the natural gas and electricity usage for the Proposed Project, Ramboll utilized CalEEMod default assumptions, which incorporate 2019 Title 24 Standards.

The proposed GDF does not have natural gas usage associated with its daily operation. To account for the GDF's energy use, CalEEMod default natural gas usages were converted into equivalent electricity usages by applying the ratio of efficiencies between natural gas and equivalent electric appliances. **Table 4-14** summarizes the operational energy assumptions of the Proposed Project by land use type.

The annual natural gas and electricity use and corresponding GHG emissions for the Proposed Project are shown in the CalEEMod output files in **Appendix B-1**. As noted in **Section 4.1.3**, the Proposed Project will be powered by 100% renewable electricity, as Costco has a Clean Energy Contract with PG&E; hence GHG emissions associated with electricity use are zero.

4.3.5 Solid Waste

Municipal solid waste (MSW) is the amount of material that is disposed of by landfilling, recycling, or composting. CalEEMod calculates the indirect GHG emissions associated with waste that is disposed of at a landfill. The program uses annual waste disposal rates from the CalRecycle data for individual land uses. CalEEMod uses the overall California Waste Stream composition to generate the necessary types of different waste disposed into landfills. The program quantifies the GHG emissions associated with the decomposition of the waste, which generates methane based on the total amount of degradable organic carbon. The program quantifies the CO_2 emissions associated with the combustion of methane, if applicable. Default landfill gas concentrations were used as reported in Section 2.4 of AP-42. The IPCC has a similar method to calculate GHG emissions from MSW in its 2006 Guidelines for National Greenhouse Gas Inventories.

Solid waste generation associated with the Proposed Project is based on default values for waste generation in CalEEMod. The waste generation and associated GHG emissions can be found in the CalEEMod output files in **Appendix B-1**.

4.3.6 Refrigerant Use

The Proposed Project includes refrigerant use for warehouse operations, based on default values in CalEEMod. The resulting GHG emissions are provided in the CalEEMod output file in **Appendix B-1**.

4.3.7 Stationary Sources

The Proposed Project includes two diesel-powered emergency generators, each rated at 250 horsepower, to support warehouse operations. Testing and maintenance of each generator is not expected to exceed 50 hours per year or 1 hour on any given day. Emissions from emergency generator operation were estimated using default assumptions in CalEEMod. The resulting GHG emissions estimates are provided in the CalEEMod output file in **Appendix B-1**.

4.3.8 Vegetation Changes

Vegetation changes that occur as a result of land use development constitute a change in the carbon sequestration capacity of a project site. The site is expected to initially have 14.97 acres that is pervious, and 0 acres of impervious land. Once the Proposed Project is built, it is expected that 7.31 acres would be pervious (landscaped area) and 7.66 acres would be impervious. The changes in vegetation are presented in **Table 4-15**. GHG emissions associated with vegetation changes are estimated in the CalEEMod output for the Proposed Project operation in **Appendix B-1**.

4.3.9 On-Site Electric Vehicle Chargers

As noted in **Section 1.2.2**, the Proposed Project includes the installation of 10 DC fast chargers with a combined power output of 1,800 kilowatts (kW). **Table 4-16** provides an estimate of the GHG emissions reductions attributed to the use of these EV chargers. As shown in this table, it is anticipated that the chargers will be used for approximately 5.6 hours per day, based on recent usage data for public DC fast chargers in California.[50] Given this usage assumption, Ramboll calculated the reduction in gasoline VMT and the associated decrease in GHG emissions, resulting from the substitution of gasoline VMT with electric VMT.

4.4 Total Annual Operational Emissions

Table 4-17 summarizes the annual operational GHG emissions for the Proposed Project (2,167 MT CO_2e per year).

PCAPCD CEQA Guidelines[51] have a three-tiered approach for assessing GHG emissions from land use projects. For projects with annual operational GHG emissions between 1,100 and 10,000 MT CO_2e per year, PCAPCD recommends applying its GHG Efficiency Matrix to determine significance.

As shown in **Table 4-17**, the Project's estimated annual operational emissions fall within this range. Based on a total building square footage of 165,200 square feet (165,000 square foot warehouse and 200 square foot controller enclosure for the GDF), the calculated GHG efficiency for the Proposed Project is 13.1 MT CO_2e per 1,000 square feet.[52] This is below the applicable threshold of 26.5 MT CO_2e per 1,000 square feet for non-residential projects located in urban areas, as defined by PCAPCD. Therefore, the Project's operational GHG emissions are considered to be less than significant.

[50] Based on the Q1 2025 and Q2 2025 Paren Reports titled "State of the Industry Report: US EV Fast Charging". Available at: https://www.paren.app/. Accessed: October 2025.

[51] PCAPCD CEQA Handbook. 2017. Chapter 2 Thresholds of Significance. Available at: https://www.placerair.org/DocumentCenter/View/2047/Chapter-2-Thresholds-of-Significance-PDF. Accessed: October 2025.

[52] Note, the Proposed Project GHG efficiency would be 20.3 MT CO_2e per 1,000 square feet if the analysis accounted for the greenhouse gas emission benefits associated with only the mandatory electric vehicle charging requirements (1,097 kW total power) in the 2025 California Green Building Standards Code. This value is also below the applicable threshold of 26.5 MT CO_2e per 1,000 square feet for non-residential projects located in urban areas, as defined by PCAPCD.

5. PROJECT IMPACTS IN CONTEXT

This section assesses the significance of the Proposed Project's emissions for purposes of CEQA.

5.1 Threshold 1: Would the project generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment?

As noted in **Section 3.2**, in the absence of a quantitative GHG threshold from El Dorado County and EDCAQMD, this Technical Report assesses significance of the Proposed Project's GHG impacts for Threshold 1 against the PCAPCD's GHG significance thresholds (**Table 3-1**).

Total GHG emissions for each year of Proposed Project construction (2026 and 2027) are summarized in **Table 4-12** and **Table 4-13**, for Project construction Scenario 1 and Scenario 2, respectively. The annual GHG emissions associated with the construction of the Proposed Project under both scenarios are less than the PCAPCD's bright-line GHG significance threshold of 10,000 MT CO_2e/year (yr) for construction.

The Proposed Project's annual operational GHG emissions were estimated to be 2,167 MT CO_2e per year (**Table 4-17**). These emissions are between PCAPCD's de minimis GHG emissions level (1,100 MT CO_2e/yr) and bright-line GHG significance threshold (10,000 MT CO_2e/yr) for project operation. Therefore, to evaluate the GHG impacts we estimated the Proposed Project's efficiency metric in accordance with the PCAPCD's Air Quality Handbook.[53] This calculated efficiency metric (13.1 MT CO_2e per 1,000 square feet) shown in **Table 4-17**, is less than PCAPCD's threshold (26.5 MT CO_2e/1,000 square feet) for the operational phase of land use projects in urban settings.

Therefore, the GHG emissions associated with the construction and operation of the Proposed Project would not have a significant impact on the environment.

5.2 Threshold 2: Would the project conflict with an applicable plan, policy or regulation adopted for the purpose of reducing the emissions of GHGs?

As noted in **Section 3.2**, this Technical Report assesses the significance of the Proposed Project's GHG impacts for Threshold 2 based on whether it would conflict with the 2022 Scoping Plan Update,[54] SACOG's 2020 MTP/SCS,[55] and El Dorado County RTP 2020-2040.[56,57]

[53] PCAPCD. 2017. 2017 CEQA Handbook Chapters. Available at: https://www.placerair.org/1801/CEQA-Handbook. Accessed: October 2025.

5.2.1 2022 Scoping Plan Update

The 2022 Scoping Plan Update has a table of priority GHG reduction strategies that can be utilized by local governments. The three main priority areas addressed in this table are "Transportation Electrification", "VMT Reduction", and "Building Decarbonization".[58] These measures represent the core strategies that local jurisdictions in California can implement to reduce GHGs in alignment with State goals.

The Proposed Project would not conflict with the implementation of the 2022 Scooping Plan Update and Statewide Emission Reduction Targets and includes the following features and mitigation measures that support the three main priority areas for GHG reduction:

- The Proposed Project will meet the Voluntary Tier 1 Electric Vehicle Charging Standards as defined in the 2025 California Green Building Standards Code[59] by installing ten DC fast chargers that provide a total power of 1,800 kW. Additionally, these chargers will be powered by 100% renewable electrical power supplied by PG&E, as Costco has a Clean Energy Contract with PG&E. These chargers
- The Proposed Project will implement **Mitigation Measure 3.14-2a: Provide a Mandatory Commute Reduction Program for Costco Employees** to reduce vehicle miles traveled by employees. This would include implementation of the following measures:
  - **Commute Trip Reduction Marketing**: Costco shall develop and implement a marketing strategy to promote a commute reduction program. The following features (or similar alternatives) shall be provided:
    - On-site or online commuter information services;
    - Employee transportation coordinators; and
    - Guaranteed ride home service.
  - **Provide Ridesharing Program**: Costco shall develop and implement a ridesharing program. The following strategies provide examples of a multifaceted approach for promoting a rideshare program:
    - Designating a certain percentage of desirable parking spaces for ridesharing vehicles;
    - Designating adequate passenger loading and unloading and waiting areas for ridesharing vehicles; and
    - Providing an app or website for coordinating rides.
  - **Provide End-of-Trip Bicycle Facilities**: Costco shall install and maintain end-of-trip bicycle facilities for employee use. End-of-trip facilities include bike parking, bike lockers, showers, and personal lockers.

[58] CARB. 2022. Final 2022 Scoping Plan Update and Appendices. December. Available at: https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan/2022-scoping-plan-documents. Accessed: October 2025.

[59] 2025 California Green Building Standards Code, Title 24, Part 11. Available online at: https://codes.iccsafe.org/content/CAGBC2025P1. Accessed: October 2025.

- The Proposed Project will include **Mitigation Measure 3.14-2b: Implement Pedestrian Network Improvements** as well, which is described below:
  - Costco shall provide pedestrian network improvements near the site, constructing sidewalks along the Project frontage on Clarksville Crossing and Silva Valley Parkway. In addition, Costco shall construct sidewalks north of the Project frontage on the east side of Silva Valley Parkway to connect to existing sidewalk near Oak Meadow Elementary School, thereby providing connectivity with the surrounding neighborhood.
- The Project site is an infill development located near an El Dorado Transit bus route (50 Express) and bus stop (El Dorado Transit Park & Ride), therefore placing jobs that are accessible via public transit. Additionally the Project is located adjacent to homes, thereby providing retail and jobs near a housing-rich area served by El Dorado Transit.
- While the Project does generate an increase in VMT,[60] the VMT analysis does not take into account the Costco trips "replacing" existing trips currently going to other retailers. Furthermore, the Project is expected to serve the existing population of the area by providing more convenient access to Costco services. The Project will allow customers to have multiple needs served in one trip, including but not limited to: eye exams, purchase of household goods and groceries, furniture store, appliance store, liquor store, and refueling at a GDF. The VMT modeling does not measure the benefit of one Costco trip replacing multiple trips, and given these factors, it is likely that Costco members make fewer total retail shopping trips in a month or a year when they have the option of shopping at Costco than they would make if they did not have a Costco nearby.
- The Proposed Project will incorporate several sustainability and energy efficiency measures including green building practices as required by the 2025 California Green Building Standards Code.[61] Refer to **Section 1.2** of this report for a detailed listing of these measures. Notably, the Proposed Project operations will be powered 100% renewable electrical power supplied by PG&E, as Costco has a Clean Energy Contract with PG&E.

For further details on the Project evaluation against the 2022 Scoping Plan Update, refer to **Table C-1** in **Appendix C**.

5.2.2 SACOG 2020 MTP/SCS

The Proposed Project would not conflict with the State's GHG reduction goals and strategies as discussed in the SACOG's 2020 MTP/SCS,[62] which fall into four priority policy areas:

1. Build vibrant places for today's and tomorrow's residents;
2. Foster the next generation of mobility solutions;
3. Modernize the way we pay for transportation infrastructure; and
4. Build and maintain a safe, reliable, and multimodal transportation system.

[60] Kittelson & Associates. 2025. El Dorado Costco CEQA Analysis. July 23.

[61] 2025 California Green Building Standards Code, Title 24, Part 11. Available online at: https://codes.iccsafe.org/content/CAGBC2025P1. Accessed: October 2025.

[62] SACOG. 2020. Metropolitan Transportation Plan/Sustainable Communities Strategy. Available at: https://www.sacog.org/home/showpublisheddocument/76/638212804736270000. Accessed: October 2025.

The Proposed Project would not conflict with the implementation of the SACOG's 2020 MTP/SCS and has several elements that are expected to support the priority policy areas in SACOG's 2020 MTP/SCS. As noted in **Section 5.2.1**, the Project is an infill development that would create new employment opportunities, and is located near an El Dorado Transit bus route (50 Express) and bus stop (El Dorado Transit Park & Ride), therefore placing jobs that are accessible via public transit. The El Dorado bus route connects to the larger Sacramento Metropolitan transit network and encourages use of local transit and rail to commute to the Project. Additionally, the Project is located adjacent to homes, therefore the Project would provide retail and jobs near a housing-rich area served by El Dorado Transit.

The Proposed Project will also meet the Voluntary Tier 1 Electric Vehicle Charging Standards as defined in the 2025 California Green Building Standards Code by installing ten DC fast chargers that provide a total power of 1,800 kW, as noted in **Section 5.2.1**. These chargers will be powered by 100% renewable electrical power supplied by PG&E, as Costco has a Clean Energy Contract with PG&E. This will reduce the greenhouse gas emissions from on-road vehicles traveling in the County.

Additionally, the Proposed Project will implement **Mitigation Measure 3.14-2a: Provide a Mandatory Commute Reduction Program for Costco Employees** which would reduce vehicle miles traveled by employees by developing and implementing the following measures:

- Commute trip reduction marketing;
- A ridesharing program for employees; and
- On-site end-of-trip bicycle facilities.

The Project will also include **Mitigation Measure 3.14-2b: Implement Pedestrian Network Improvements**. These are further described in **Section 5.2.1**. Note, the pedestrian network improvements include

- Constructing sidewalks along the Project frontage on Clarksville Crossing and Silva Valley Parkway and
- Constructing sidewalks north of the Project frontage on the east side of Silva Valley Parkway to connect to the existing sidewalk near Oak Meadow Elementary School and providing connectivity with the surrounding neighborhood.

Finally, the Proposed Project will implement off-site transportation improvements in coordination with the County to address compliance with the El Dorado County Transportation and Circulation Element policies. This would include

- The addition of a new signalized intersection on Silva Valley Parkway, shared with the South Site's main driveway;
- The addition of a new signalized intersection with Silva Valley Parkway shared with the North Site;
- Installation of a partial traffic signal at the intersection of Silva Valley Parkway and Clarksville Crossing;

- Installation of 150-foot dual northbound left turn lanes at the proposed signalized intersection of Silva Valley Parkway and the Project driveway; and
- The addition of a northbound right turn lane, change in the right turn phase to be permissive and overlap, and increase of the westbound left turn storage length at the intersection of White Rock Road and Valley View Parkway-Vine Street.

These improvements to the transportation infrastructure would help meet the existing and future transportation needs of the area in the vicinity of Project site.

Based on the Project elements described above, the Project would not interfere with the implementation of the SACOG's 2020 MTP/SCS and would include elements that support the goals of the plan. Refer to **Table C-2** in **Appendix C** for further details on the Project evaluation against SACOG's 2020 MTP/SCS.

5.2.3 El Dorado County RTP 2020-2040

The Proposed Project would not conflict with the El Dorado County 2020-2040 RTP,[63] which includes the following main goals: to improve highways, streets, and regional/inter-regional roadways, public transit, aviation, freight movement, non-motorized transportation, transportation systems management, integrated land use, air quality, and transportation planning, and funding.

The Project supports the objectives of the El Dorado County Regional Transportation Plan by providing sidewalks, bike lanes, and pedestrian connections. As noted in **Section 5.2.1**, the Project is an infill development that would create new employment opportunities and is located near an El Dorado Transit bus route (50 Express) and bus stop (El Dorado Transit Park & Ride), thereby creating jobs that are accessible via public transit. The El Dorado bus route connects to the larger Sacramento Metropolitan transit network and encourages use of local transit and rail to commute to the Project. Additionally, the Project is located adjacent to homes, therefore the Project would provide retail and jobs near a housing-rich area served by El Dorado Transit.

Further, as described in **Section 5.2.1** and **Section 5.2.2**, the Project would include pedestrian network improvements as part of **Mitigation Measure 3.14-2b**, and would implement several off-site transportation improvements in coordination with the County to address the existing and future needs of the region in the immediate vicinity of the Project site.

Based on the Project elements described above, the Project would not interfere with the implementation of the El Dorado County 2020-2040 RTP and would include elements that support the goals of the plan. Refer to **Table C-3** in **Appendix C** for further details on Project evaluation against the County's RTP.

[63] El Dorado County Transportation Commission. 2020. El Dorado County Regional Transportation Plan 2020-2040. November 5. Available at: https://www.edctc.org/files/2859e4e3f/RTP+2040.pdf. Accessed: October 2025.

5.3 Summary

As discussed in **Section 5.1**, the Proposed Project is expected to result in emissions that are below PCAPCD GHG thresholds for operation and construction. Additionally, as described in **Section 5.2**, the Proposed Project would not conflict with the 2022 Scoping Plan Update, SACOG's 2020 MTP/SCS, or the El Dorado County RTP 2020-2040. Therefore, the Proposed Project's GHG emissions will be less than significant in the context of Threshold 1 and Threshold 2. Based on the analysis above, the Proposed Project's GHG emissions are not cumulatively considerable, and the Proposed Project is less than significant for cumulative GHG impacts.

TABLES

Table 3-1. Placer County Air Pollution Control District's Greenhouse Gas Significance Thresholds
El Dorado Hills Costco Project
El Dorado Hills, California

Category	Greenhouse Gas Significance Thresholds [1]
Bright-Line Threshold for Project Construction	10,000 MT CO_2e/year
De Minimis Level for Project Operations	1,100 MT CO_2e/year
Bright-Line Threshold for Project Operations	10,000 MT CO_2e/year
Efficiency Matrix Threshold for Non-Residential Urban Projects	26.5 MT CO2e/1,000 sf
Efficiency Matrix Threshold for Non-Residential Rural Projects	27.3 MT CO_2e/1,000 sf

El Dorado Hills Costco Project
El Dorado Hills, California

Construction Phase Name [1]	CalEEMod Phase Type [1]	Start Date [1]	End Date [1]	Phase Duration [2] (days)
Linear, Grubbing & Land Clearing	Linear, Grubbing & Land Clearing	7/1/2026	7/26/2026	26
Linear, Grading & Excavation	Linear, Grading & Excavation	7/27/2026	11/8/2026	105
Linear, Drainage, Utilities, & Sub-Grade	Linear, Drainage, Utilities, & Sub-Grade	11/9/2026	2/8/2027	92
Linear, Paving	Linear, Paving	2/9/2027	3/19/2027	39

Notes:

[1] Construction phases and duration are based on Project-specific information.

[2] The construction work week was assumed to be 7 days per week.

Abbreviations:

CalEEMod - California Emissions Estimator Model

Table 4-3. Construction Equipment Assumptions - Project
El Dorado Hills Costco Project

Construction Phase Name	Offroad Equipment Type [1]	Number of Equipment [1]	Usage Hours [1] (hours/day)	Equipment Horsepower [1] (hp)	Equipment Load Factor [1]	Fuel Type [1]	Engine Tier for Unmitigated Project [1]	DPF Level for Unmitigated Project [1]	Engine Tier for Mitigated Project [2]	DPF Level for Mitigated Project [2]
Site Preparation	Rubber Tired Dozers	3	8	367	0.40	Diesel	Average	N/A	Tier 3	Level 3
Site Preparation	Tractors/Loaders/Backhoes	4	8	84	0.37	Diesel	Average	N/A	Tier 3	Level 3
Grading	Excavators	2	8	36	0.38	Diesel	Average	N/A	Average	N/A
Grading	Graders	1	8	148	0.41	Diesel	Average	N/A	Tier 3	Level 3
Grading	Rubber Tired Dozers	1	8	367	0.40	Diesel	Average	N/A	Tier 3	Level 3
Grading	Scrapers	2	8	423	0.48	Diesel	Average	N/A	Tier 3	Level 3
Grading	Tractors/Loaders/Backhoes	2	8	84	0.37	Diesel	Average	N/A	Tier 3	Level 3
Building Construction	Cranes	1	7	367	0.29	Diesel	Average	N/A	Tier 3	Level 3
Building Construction	Forklifts	3	8	82	0.20	Diesel	Average	N/A	Tier 3	Level 3
Building Construction	Generator Sets	1	8	14	0.74	Diesel	Average	N/A	Average	N/A
Building Construction	Tractors/Loaders/Backhoes	3	7	84	0.37	Diesel	Average	N/A	Tier 3	Level 3
Building Construction	Welders	1	8	46	0.45	Diesel	Average	N/A	Average	N/A
Paving	Pavers	2	8	81	0.42	Diesel	Average	N/A	Tier 3	Level 3
Paving	Paving Equipment	2	8	89	0.36	Diesel	Average	N/A	Tier 3	Level 3
Paving	Rollers	2	8	36	0.38	Diesel	Average	N/A	Average	N/A
Architectural Coating	Air Compressors	1	6	37	0.48	Diesel	Average	N/A	Average	N/A
