As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

RCRA: Resource Conservation and Recovery Act Information

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data

Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

GEOCHECK®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

SILVA VALLEY PARKWAY IC
SR 50
EL DORADO HILLS, CA 95762

TARGET PROPERTY COORDINATES

Latitude (North):	38.657700 - 38° 39' 27.7"
Longitude (West):	121.055199 - 121° 3' 18.7"
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	669223.6
UTM Y (Meters):	4280379.5
Elevation:	721 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

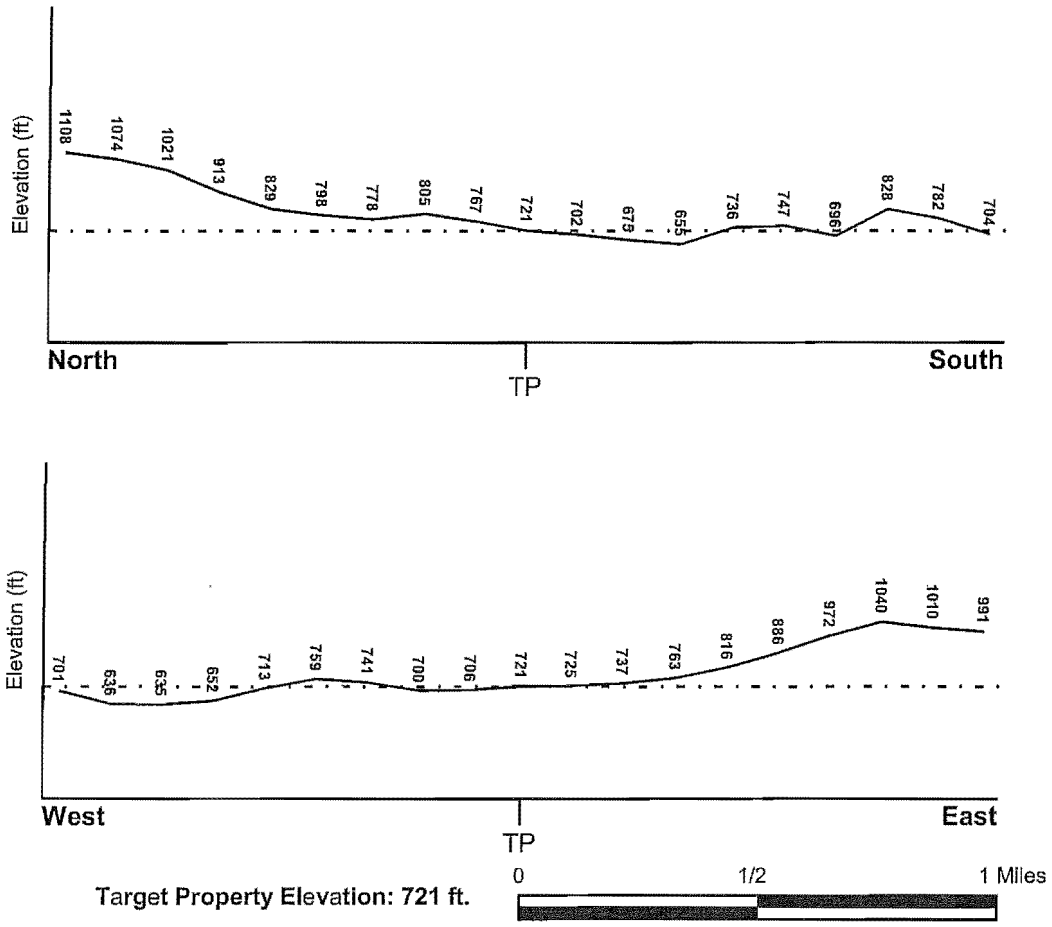
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map:	38121-F1 CLARKSVILLE, CA
General Topographic Gradient:	General South
Source:	USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 721 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
EL DORADO, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 0600400700C

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CLARKSVILLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site-specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT **GEOLOGIC AGE IDENTIFICATION**

Era:	Mesozoic	Category:	Eugeosynclinal Deposits
System:	Lower Jurassic and Upper Triassic		
Series:	Lower Mesozoic		
Code:	IMze *(decoded above as Era, System & Series)*		

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	AUBURN
Soil Surface Texture:	loam
Hydrologic Group:	Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.
Soil Drainage Class:	Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: MODERATE

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 28 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	14 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 2.00 Min: 0.60	Max: 7.30 Min: 5.60
2	14 inches	18 inches	unweathered bedrock	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: silt loam
unweathered bedrock
gravelly - loam
gravelly - silt loam

Surficial Soil Types: silt loam
unweathered bedrock
gravelly - loam
gravelly - silt loam

Shallow Soil Types: clay loam
gravelly - loam
gravelly - clay loam
gravelly - sandy clay loam
sandy clay loam

Deeper Soil Types: weathered bedrock
stratified

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

STATE RECORDS

California Drinking Water Quality Database
Source: Department of Health Services
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations for District 2, 3, 5 and 6
Source: Department of Conservation
Telephone: 916-323-1779

RADON

State Database: CA Radon
Source: Department of Health Services
Telephone: 916-324-2208
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

THE EDR AERIAL PHOTO DECADE PACKAGE

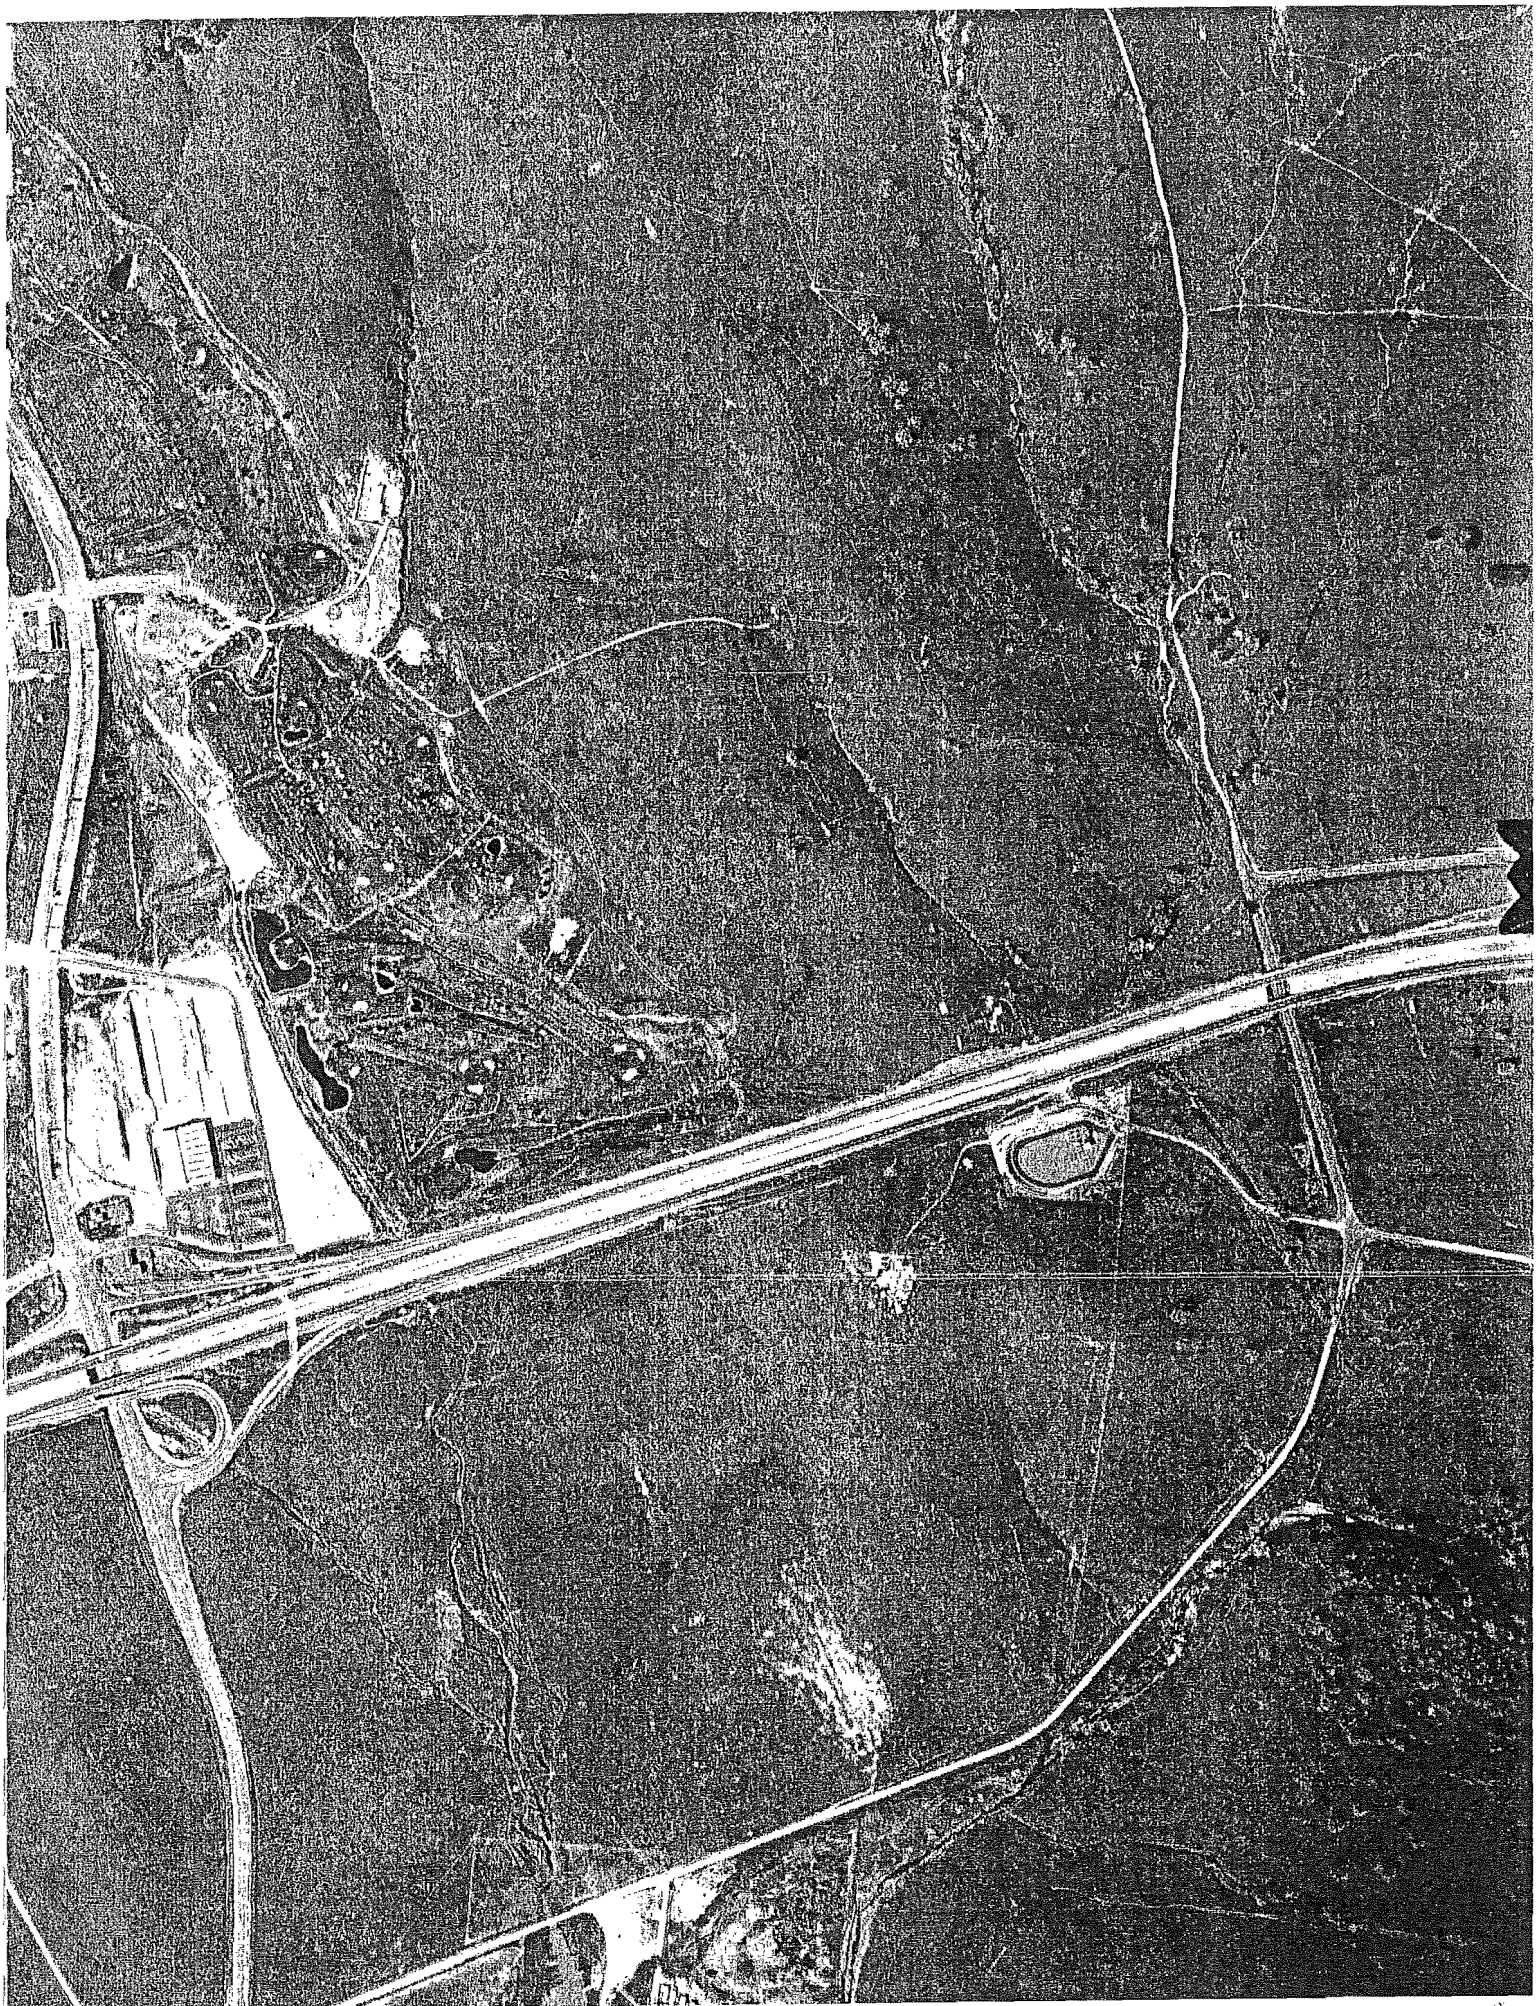
Environmental Data Resources, Inc.s (EDR) Aerial Photography Print Service is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDRs professional researchers provide digitally reproduced historical aerial photographs at one photo per decade.

References
EPAs Standards and Practices for All Appropriate Inquiries (AAI), section 312.24, identifies the historical sources of information necessary to achieve the objectives and performance factors of section 312.20. According to AAI, *"historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."*

To meet the prior use requirements of ASTM E 1527-05, Section 8.3.2, the following standard *historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-05, Section 8.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. ASTM E 1527-05 requires *"All obvious uses of the property shall be identified from the present, back to the property's first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historcal sources as are necessary and both reasonably ascertainable and likely to be useful."* (ASTM E 1527-05, Section 8.3.2) *Reasonably ascertainable means information that is publicly available, obtainable from a source within reasonable time and cost constraints, and practically reviewable.*

Data Gaps
In order to address *data gaps*, additional sources of information may be consulted. According the AAI, Section 312.20 (g), *"to the extent there are data gaps (as defined in section 312.10) in the information developed...that affect the ability of persons (including the environmental professional) conducting the all appropriate inquiries to identify conditions indicative of releases or threatened releases...such persons should identify such data gaps, identify the sources of information consulted to address such data gaps, and comment upon the significance of such data gaps."* According to ASTM E 1527-05, Section 8.3.2.3, *"historical research is complete when either: (1) the objectives in 8.3.1 through 8.3.2.2 are achieved; or (2) data failure is encountered. Data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met....If data failure is encountered, the report shall document the failure and, if any of the standard historical sources were excluded, give the reasons for their exclusion."*

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account executive.



Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR Historical Topographic Map Report

Environmental Data Resources, Inc.'s (EDR) Historical Topographic Map Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR Historical Topographic Map Report includes a search of available public and private color historical topographic map collections. For more than a century, the USGS has been creating and revising topographic maps for the entire country at a variety of scales. There are about 60,000 U.S. Geological Survey (USGS) produced topographic maps covering the United States.

References

To meet the prior use requirements of ASTM E 1527-05, Section 8.3.2, the following *standard historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-05, Section 8.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. ASTM E 1527-05 requires *"All obvious uses of the property shall be identified from the present, back to the property's first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historcal sources as are necessary and both reasonably ascertainable and likely to be useful."* (ASTM E 1527-05, Section 8.3.2) *Reasonably ascertainable means information that is publicly available, obtainable from a source within reasonable time and cost constraints,and practically reviewable.*

EPA's Standards and Practices for All Appropriate Inquiries (AAI), Section § 312.24, identifies the historical sourcesof information necessary to achieve the objectives and performance factors of § 312.20. According to AAI,*"historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps,building department records, chain of title documents, and land use records."*

Data Gaps

In order to address data gaps, additional sources of information may be consulted. According the AAI, Section § 312.20 (g), *"to the extent there are data gaps (as defined in § 312.10) in the information developed...that affect the ability of persons (including the environmental professional) conducting the all appropriate inquiries to identify conditions indicative of releases or threatened releases...such persons should identify such data gaps, identify the sources of information consulted to address such data gaps, and comment upon the significance of such data gaps."* According to ASTM E 1527-05, Section 8.3.2.3, "historical research is complete when either: (1) the objectives in 8.3.1 through 8.3.2.2 are achieved; or (2) data failure is encountered. Data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met....If data failure is encountered, the report shall document the failure and, if any of the standard historical sources were excluded, give the reasons for their exclusion."

BCI File No. 556.1
February 23, 2010

Mr. Derek Minnema
Mark Thomas & Company, Inc.
7300 Folsom Boulevard, Suite 203
Sacramento, CA 95826

Subject: **UPDATED INITIAL SITE ASSESSMENT (ISA)**
Silva Valley Parkway/State Route 50 Interchange (03-ED-50, KP 3.1, PM 1.7)
El Dorado County, California

Dear Mr. Minnema,

Blackburn Consulting (BCI) has prepared this Update of the Initial Site Assessment dated April 2007 for the Silva Valley Parkway/Route 50 Interchange (03-ED-50, KP 3.1, PM 1.7) Project in El Dorado County, California. BCI prepared this update per your request and includes the following:

- Current Database Search. Environmental Data Resources, Inc. (EDR), a commercial data base search firm performed a radius search for the study area on February 16, 2010.
- Review of BCI's Initial Site Assessment for US 50/El Dorado Hills Boulevard Interchange (EA 03-2E5100) and Pedestrian Overcrossing Project (EA 03-2E4700) El Dorado Hills, CA, BCI File No. 1072.5 dated May 2009.
- Review of Geocon's Aerially Deposited Lead, Naturally Occurring Asbestos, and Lead Containing Paint Site Investigation and Bridge Survey/Highway 50 Report, dated March 10, 2008.
- Site Visit conducted on February 18, 2010.

The purpose of this update is to identify and discuss significant changes in site use and/or facilities that may indicate the potential for hazardous materials and/or petroleum hydrocarbon contamination within or adjacent to the project area. It is understood that the project scope includes the original thirty-four (34) parcels as identified in the 2007 Initial Site Assessment.

Based on this review, no significant changes in site use were identified. Supplemental information for several parcels was obtained and is presented below:

Parcel 25, *Wilmington Trust/Tosco Trust (Union 76) – APN 107-120-0410, El Dorado Hills Union 76, 1020 Saratoga Way*

Our recommendations regarding risks associated with this active petroleum fuel service station have not changed. Records review, however, provided the following updated information:

This service station appears to have been operating since 1971. A leaking underground storage tank (LUST) was discovered in 1987 during tank closure. The release is estimated at five hundred (500) gallons of gasoline. Following tank removal, contaminated soil was excavated and disposed of at an approved facility. Contamination was reported as "soil only" and the case was closed in 1991. Currently, four registered Underground Fuel Storage Tanks (USTs) installed in 1993 exist at the site.

Parcel 31, "*Syers Properties, LLC" (Valero Service Station) – APN 107-130-5010*

Our recommendations regarding the exiting Valero service station have not changed. Site reconnaissance, however, identified a second service station, El Dorado Hills Chevron at this parcel. We found no records of suspected soil and/or ground water contamination from the searched database. Service stations are a principal concern for subsurface contamination. If acquisition is to occur at this site we recommend further review and investigation of potential petroleum hydrocarbon impacts including an in depth records review, site inspection, and interviews with the property owner and county environmental health department.

Parcel 32 *(Adjacent) "Shell" - APN 121-180-08, 1021 Saratoga Way*

Our recommendations regarding the existing Shell service station have not changed; however, the records review (1985 City Directory) identified a dry cleaning facility (Swanson Cleaners Store 67) at this parcel where the Shell service station is now located. The records search did not indicate if underground product storage tanks were utilized for material storage, or if any releases were indicated. Dry cleaners have been associated with releases of hazardous materials, such as perchloroethylene (PCE). If acquisition occurs on this property we recommend further review and investigation of potential contaminant impacts.

AERIALLY DEPOSITED LEAD

Geocon Consultants performed ADL Testing along US 50 (PM 0.16/2.90) for the California Department of Transportation (Caltrans). In their report, titled Aerially Deposited Lead, Naturally Occurring Asbestos, and Lead Containing Paint Site Investigation and Bridge Survey Report, dated March 10, 2008, Geocon concluded that soil generated from excavations to depths between 0.0 and 3.0 feet would not be classified as California hazardous waste. Sampling, however, was conducted in the center median and not the shoulder area, therefore we recommend that Caltrans verify that the Geocon Report results are valid for this project.

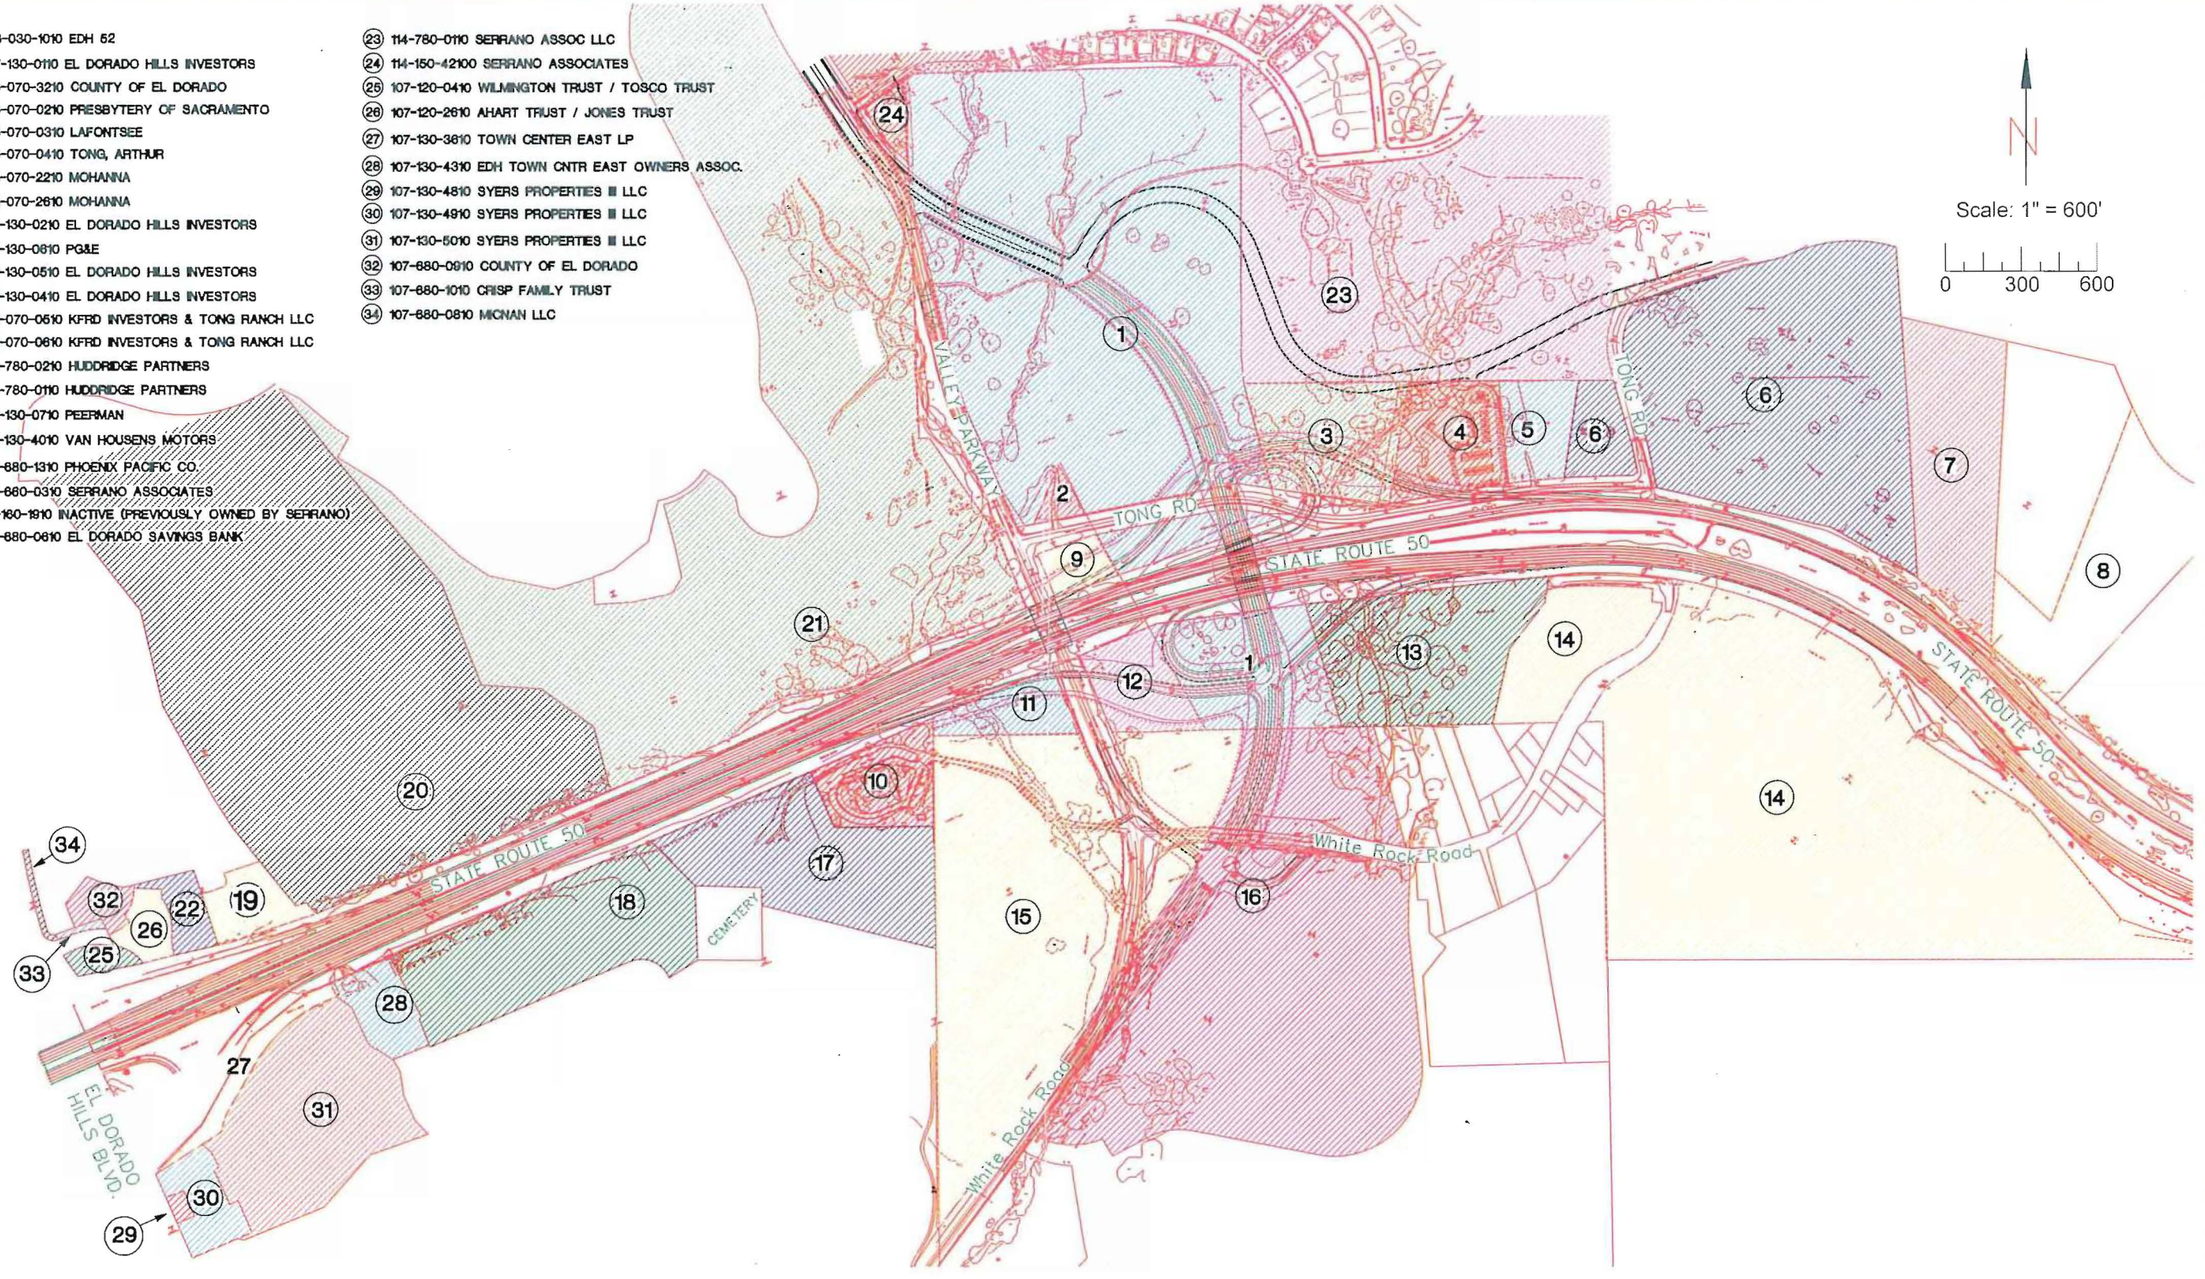
NATURALLY OCCURRING ASBESTOS

Our recommendations regarding naturally occurring asbestos (NOA) have not changed. Additional supporting information is provided in Geocon's Aerially Deposited Lead, Naturally Occurring Asbestos, and Lead Containing Paint Site Investigation and Bridge Survey Report, dated March 10, 2008.

ASBESTOS CONTAINING MATERIALS (ACM)

In Geocon's Aerially Deposited Lead, Naturally Occurring Asbestos, and Lead Containing Paint Site Investigation and Bridge Survey Report, dated March 10, 2008, Geocon concluded that ACM is present in the Clarkesville Road bridge guardrail shim. The guardrail shims are classified as Category I ACM (nonfriable/nonhazardous material). National Emissions Standards for Hazardous Air Pollutants regulations do not require that the Category I material be removed prior to demolition or treated as hazardous waste; however, the disturbance of the material is still covered by the Cal-OSHA asbestos standard.

Please contact us if you have any questions concerning this report update or if we may be of further service.



Sincerely,

BLACKBURN CONSULTING

Dear Mr. Verrios,

Blackburn Consulting (BCI) prepared this Geotechnical Report for the EDH 52 site rough grading in accordance with our proposal dated January 15, 2013. Below, we present a summary of site conditions and recommendations for rough site grading and preliminary foundation design.

Thank you for selecting us to be on the design team. Please call if you have questions.

Sincerely,

INTRODUCTION

Purpose

This report is for rough grading and preliminary foundation design, pavement, and utility installation considerations; final geotechnical design recommendations will be necessary following rough grading and determination of actual improvements. Do not rely upon this report for different locations or improvements without the written consent of BCI.

Scope of Services

To prepare this report, BCI:

- Reviewed our previously obtained subsurface data and analyses for the Silva Valley Parkway Interchange project
- Drilled, sampled, and logged four borings
- Excavated, sampled, and logged 11 test pits
- Performed a site review and reconnaissance
- Performed laboratory tests including a compaction curve, direct shear, moisture density, and rock compression testing
- Compiled existing and new subsurface data
- Performed engineering analyses.

PROJECT LOCATION AND DESCRIPTION

Project Location

The EDH 52 site is a roughly rectangular parcel of land located at the northeast corner of the intersection of Silva Valley Parkway and Tong Road (just north of Highway 50), in El Dorado Hills, California. Figure 1 (attached) shows the approximate site location.

Project Description

Based on the rough grading plans dated January 2013, the EDH 52 site will be split diagonally by the new Silva Valley Parkway which will be constructed as part of the new interchange. Two large commercial lots, Area 1 in the southwest portion and Area 2 in the northeast portion, will be created by the split. The Site Map, attached as Figure 2, shows the general site layout.

Rough grading will create a flat building pad along the south side of Area 1 that will then slope gently up to the north. A flat building pad will also be created along the east side of Area 2 that will then slope gently down to the west. Significant cut and fill are proposed for rough grading in each area.

In Area 1, cuts will generally occur along the east and north sides and fills along the west side. Rough Grading Plans provided by RSC Engineering (1/23/2013) show planned cuts along the east side are up to a maximum of approximately 28 feet in height and fills along the west side are up to approximately 30 feet deep. In general, cut slopes will be created along the east side of Area 1 (below the new Silva Valley Parkway) and fill slopes along the south and west sides (along the existing Silva Valley Parkway). Cut slopes are proposed at gradients of 2:1 to 4:1 (horizontal to vertical) and fill slopes at 2:1 or flatter with most slopes at a gradient of 2:1. Drainages cross the central portion and north end of Area 1 in a southwesterly direction; the central drainage will likely be filled and the other may be filled depending on the final rough grading alternative selected.

In Area 2, cuts will generally occur along the east side and fills in the central and west side. Planned cuts along the east side are up to a maximum of approximately 35 feet in height and fills are up to approximately 25 feet deep. Cut slopes will be created along the south, east, and north sides of Area 2 and fill slopes along the south and west sides. Cut and fill slopes are proposed at a gradient of 2:1. Drainages cross the central and western portion of Area 2 in a southwesterly direction; the central drainage may be filled depending on the final rough grading alternative selected and the western drainage will not be filled.

Structure and foundation details are not known at this time but we assume conventional slab-on-grade commercial/retail structures, likely concrete tilt-up, with light to moderate loads on shallow spread and strip footing foundations.

GEOLOGIC CONDITIONS

General Geology

The project site is located within the foothills of the Sierra Nevada Geomorphic Province of California. The Sierra Nevada has a general northwest topographic/structural trend and is on the order of 430 miles long and 40 to 80 miles wide. The mountain ranges of the Sierra Nevada were created roughly 120 to 130 million years ago when sediments as thick as 30,000 feet along with volcanic rocks were buckled and warped resulting in a series of low mountain ranges. The roots of these mountain ranges were then intruded by granitic rock.

The Sierra Nevada was tilted upward along faulting at the eastern edge. In the higher elevations, much of the younger sedimentary material and older metamorphic rock has been eroded and exposes the granitic rock. In the lower foothills of the Sierra Nevada, the older metamorphic rocks remain and are exposed at the surface.

Much of El Dorado County is underlain by Mesozoic-age metavolcanic and metasedimentary rocks and metavolcanic rock occurs at relatively shallow depths throughout the project site. Published geologic mapping by Wagner[1] and Busch[2] shows Jurassic-age metavolcanic rock at the project site. Our site review and subsurface work confirm the presence of shallow, metavolcanic rock. The Geologic Map, attached as Figure 3, shows the local site geology.

Regional rock structure is dominated by northwest trending foliation and northwest trending faults and fault zones that mark the boundaries of major rock types. Rock structure that we mapped within the project area has a predominant foliation with a general strike of north, 35° to 40° west, and a steep dip of 70°-90° to the northeast.

Rock is exposed intermittently on the surface of the site. We did not observe indications of slope instability on the natural slopes in the area.

Faulting

Active or potentially active faults have not been mapped on or near the site. In general, faults with Historic or Holocene (last 10,000 to 11,000 years) rupture are often considered "active." Late Quaternary or Quaternary age faults are often referred to as "potentially active."

Our review of published geologic mapping and site review did not reveal the presence of Late Quaternary (displacement within the last 700,000 years) or younger faults within or adjacent to the project site.

The site does not lie within or adjacent to an Alquist–Priolo Earthquake Fault Zone for fault rupture hazard (Bryant and Hart, 2007)[3], and no known active faults are mapped with the project area. Busch (2001) shows the main trace of the West Bear Mountains Fault crossing US 50 approximately 3,100 feet west of the existing Silva Valley Parkway and a north-south trending splay associated with this fault crossing US 50 approximately 1,200 feet to the west. Jennings (2010)[4] shows the West Bear Mountains Fault as Pre-Quaternary in age and is not considered as an active seismic source. We consider the potential for fault rupture at the site to be low.

Naturally Occurring Asbestos Minerals

Published mapping and our site review does not indicate that the project is within an ultramafic rock area which is typical host rock for naturally occurring asbestos (NOA) minerals; however, ultramafic rock and faulting are mapped nearby and NOA can potentially occur in the area.

Geologic mapping by Churchill[5] shows an "area more likely to contain naturally occurring asbestos" (NOA) about one mile north of the existing Silva Valley Parkway and also east of Bass Lake Road (over 1 mile east of the site). The map shows the project area to be within an area "that probably does not contain asbestos." Mapping by Bruyn[6], shows the western third of Area 1 (along the existing Silva Valley Parkway) as within an Asbestos Review Area identified as "Quarter Mile Buffer for More Likely to Contain Asbestos or Fault Line".

FIELD INVESTIGATION AND LABORATORY TESTING

To characterize the subsurface soil and rock conditions at the site, BCI observed and logged four borings (B1-B4) and 11 test pits (TP1-TP11). We field located exploration locations by taping and pacing from features shown on the topographic map; therefore, consider exploration locations and elevations shown as approximate.

Exploratory Borings

Taber Drilling drilled and sampled four exploratory borings in February 2013. Boring depths range from 24.2 to 40 feet below ground surface (bgs). BCI planned the general location of the borings based on existing data, planned rough grade, and site accessibility. The depth of the borings is based on the proposed rough grade elevation (excavation depths). Figure 2 shows the approximate boring locations and Appendix A has a discussion of drilling and sampling procedures, logs of the borings, and photographs of rock core.

Exploratory Test Pits

Burke Backhoe excavated 11 test pits with a Caterpillar 430D backhoe equipped with a 2-foot wide bucket in February 2013. The backhoe weighs approximately 14,500 pounds. Typical trenches were 2 to 3 feet wide, 8 to 12 feet long, and 3 to 8 feet deep. Figure 2 shows the approximate test pit locations and Appendix A has a discussion of excavation details and logs and photographs of the test pits.

[5] Churchill, 2000, Areas More Likely to Contain Natural Occurrences of Asbestos in Western El Dorado County, California; California Geological Survey, OFR 2000-002.
[6] Bruyn, 2005, Asbestos Review Areas, Western Slope, County of El Dorado, State of California; El Dorado County, Environmental Management

Laboratory Tests

In addition to the field penetration tests and pocket penetrometer field testing, we completed the following laboratory tests on representative soil samples from our borings and test pits:

- Moisture Content (ASTM D 2216) and Unit Weight (ASTM D 2937) for soil classification and in-place soil characteristics.
- Direct Shear (ASTM D 3080) for soil strength.
- Unconfined Compression (ASTM D 2938) for rock strength.
- Liquid and Plastic (Atterberg) Limits (ASTM D 4318) for soil classification and characteristics
- Maximum Dry Density (ASTM D 1557) for compaction characteristics.

Moisture and density tests indicate that the dry density of the shallow soils and weathered rock generally range from 100 to 108 pounds per cubic foot (pcf) with moisture contents generally in the range of 18% to 22%.

A direct shear test on a mix of soil and weathered rock (clayey sand with gravel) indicates an internal friction angle of 36 degrees and cohesion of 219 pounds per square foot (psf) at normal loads of 1000, 2000, and 3000 psf.

Unconfined compressive strength tests on rock resulted in values that range from 3,200 pounds per square inch (psi) to 17,370 psi. The unit weight of the rock varies from 174 pcf to 184 pcf.

Liquid and Plastic Limit tests confirm the presence of low plasticity silts, with a Plasticity Index of 3, in the upper 1 to 2 feet of soil.

Maximum dry density tests on mixed surface soils and weathered rock is 134.1 to 135.4 pcf at an optimum moisture content of 8.7% and 8.0%.

We attach complete laboratory test results in Appendix B and show selected results on the boring logs in Appendix A.

Seismic Refraction Survey

Seismic refraction profiling is the process by which seismic waves are produced, recorded and analyzed to determine the seismic velocity of subsurface materials. The seismic velocity of the subsurface materials can be correlated to soil and rock types, and rock weathering and competency.

We performed our seismic refraction fieldwork in January 2013. Refraction work consisted of 5 survey lines (SR1 to SR5), each 110 feet in length. The location of our refraction work is based on the rough grading plan and where significant cuts are proposed.

Our Professional Geologist led the field exercises, monitored the data acquisition, and used the computer program SeisImager by Geometrics, Inc. to analyze the acquired data. Figure 2 shows the approximate location of each seismic refraction survey. Appendix C contains a discussion of data retrieval procedures and the interpreted seismic profiles.

Existing Subsurface Information

BCI completed subsurface exploration (borings and test pits) in the project area for the planned Silva Valley Parkway Interchange[7]. Some of this information was collected within or adjacent to the EDH 52 project site. We use the information from these additional exploration points to supplement this evaluation. Figure 2 shows the location of these additional borings and test pits and we include the logs in Appendix D.

SITE CONDITIONS

Surface Conditions

In general, the site is located along the westerly flank of a northwest trending ridge with south-southwest flowing drainages. Natural slope gradients range from a low of approximately 3% (within the drainage areas) to as steep as 25% (4:1, horizontal to vertical) in the northeastern portion of the site. Elevations across the site range from a low of approximately 695 feet in the southwestern portion of the site to a high of approximately 793 feet in the northeast. Figure 1 shows the regional topography and Figure 2, Site Map, shows site details.

The site is covered with moderately dense grasses with scattered oak on knoll tops. Oak and other brush occurs along the drainages particularly in the northwest corner of the site. A thin (1 to 3 inch) layer of organic debris typically covers the ground surface.

Two well-defined drainages are present along the western half of the site (in Area 1 and Area 2, see Figure 2). The drainages flow south-southwest and across Silva Valley Parkway. At the time of our fieldwork, only the more westerly drainage had water in it (several inches with low flow). Flow in this drainage appears to emanate from piping (covered in dense vegetation) below an off-site fill at the north end.

Other surface features of significance include the following (see Figure 2 for approximate locations):

- Soil stockpile in the east-central portion of the site (southeast corner of Area 2)
- Old excavated wells or cisterns. One in the northwestern corner of the site (west end of Area 2 along the drainage) that is approximately 5.5 ft in diameter, and one in the north-central portion of the site (center of Area 2) that is approximately 4 ft in diameter. Depths are unknown.
- Structure remnants on the knoll top in the west-central portion (north end of Area 1)
- Old dam in the drainage at the west central portion (central portion of Area 1)

[7] BCI, 2012, Geotechnical Design Report, US50, Silva Valley Parkway Interchange, Phase 1, El Dorado County, California, 03-ED-50, PM 1.07/R2.40, EA 03-1E2901; Consultants Report to Mark Thomas & Co., Inc.

Tong Road, which will be realigned with the interchange project, traverses the southwest corner of the site. Minor cut slopes exist along Tong Road and along Silva Valley Parkway at the south end of the site. The soil and rock exposed in these slopes stands without significant sloughing or erosion issues (except where water has been directed down a dirt road).

In general, most of the site is undisturbed and we did not observe significant amounts of existing fill or cut area on site. We did observe some existing fill where the new Silva Valley Parkway will cross the most westerly drainage (primarily within the road right-of-way). Also, areas of disturbed ground (minor excavated areas and mounds of soil) occur in and adjacent to the drainage located east of the remnant structures in Area 1.

Subsurface Soil and Rock Conditions

Soil and rock conditions are relatively uniform across the site. In general, we observed 1 to 3 feet of stiff, sandy silt (ML) over weathered metavolcanic rock. We briefly describe the soil and rock conditions below. Refer to the Boring and Test Pit Logs in Appendix A for more specific subsurface conditions in each area.

In Area 1(southwest portion of the site) we typically encountered the following profile:

- 1 to 2 feet of soil that consists of brown, stiff sandy silt with gravel, over
- 1.5 to 5 feet of decomposed to intensely weathered, metavolcanic rock, over
- Intensely to moderately weathered rock to depths of 5.5 to 8 feet where refusal to excavation with the backhoe was encountered. Our borings and seismic refraction work show that rock below this depth becomes progressively less weathered and harder with depth.

In Area 2(northeast portion of the site) we typically encountered the following profile:

- 0.5 to 2 feet of soil that consists of brown to reddish brown, stiff sandy silt, over
- 0 to 7 feet of decomposed to intensely weathered, metavolcanic rock, over
- Intensely to moderately weathered rock to depths of 2 to 15 feet. Refusal to excavation with the backhoe was encountered at depths of 2.5 to 7.5 feet. Our borings and seismic refraction work show that rock below these depths becomes progressively less weathered and harder with depth.

We observed the rock to be intensely to moderately fractured with a predominant/pervasive foliation fracture that has a north-northwest strike and steep dip to the east. Other fracturing we observed appears to be mostly random (no preferred or repeated orientation observed).

Probing of the drainages with a rod indicates that generally 1 to 3 feet of soft or loose soil is present at the surface. Saturated soil conditions can (and do) occur within the drainages.

Groundwater

We did not encounter groundwater in any of our borings or test pits. The borings were cored below augerable depths and the presence of groundwater could not be confirmed at core depths because water is used in the coring process. We did not observe active springs or seeps within the site; however, water was standing in the drainage in the northwest corner of the site at the time of our field investigation.

Based on our experience in the area, groundwater can occur at isolated locations within the fractured rock, and an accumulation of water often occurs near the soil rock interface during and for several months following the rainy season.

Seismic Refraction Profiling

We completed seismic refraction surveys at 5 locations across the site and recorded seismic velocities from ±2,000 to over ±20,000 feet per second (fps). Based on mapped ground conditions and the materials encountered in our borings, we estimate that residual soils have a seismic velocity of 2,000 to 3,000 fps, or less. The underlying metavolcanic rock has velocities ranging from 3,000 to 20,000 fps or higher, depending on the depth, general weathering conditions, and rock fracturing. In general, the less weathered and less fractured the underlying rock, the greater the seismic velocity.

For profiles at each seismic refraction location, refer to the Seismic Refraction Profiles in Appendix C. The refraction surveys reflect average rock conditions; harder or softer rock can occur at depths different than that shown on the profiles.

CONCLUSIONS AND RECOMMENDATIONS

General Site Suitability

We did not observe areas of significant ground instability or unsuitable soil conditions at the site. The site should be suitable for the planned improvements when graded in accordance with the project plans, industry standards, and our geotechnical recommendations. Significant geotechnical challenges for site development include the following:

- Hard rock excavation especially below depths of 10 to 15 feet below existing grade
- Generation of rocky fill material from deeper cuts
- Presence of perched groundwater and/or saturated surface soil conditions during the winter and spring and at low drainage areas throughout the year
- Construction of utilities and foundations in areas cut down to hard rock

Slope Stability and Slope Construction

Fill slopes

Fill slopes are proposed at gradients of 2:1 (horizontal to vertical) or flatter. Maximum fill slope heights are 25 to 30 feet. Fill slopes constructed at a gradient of 2:1 or flatter will be stable when constructed in accordance with our grading recommendations.

Cut Slopes

Cut slopes are proposed at gradients of 2:1 or flatter. Cuts will expose surficial soils and rock that is weathered/fractured to varying degrees. Rock slope stability is commonly controlled by failure along discontinuities within the rock mass; however, weak rock masses can also fail through general shear. At the proposed slope gradients, we do not expect potential for failure through general shear.

We recorded prominent/pervasive discontinuities within test pits and at rock outcrop and reviewed the potential for failure at the proposed cut slopes. In general, most pervasive discontinuities are foliation fracture that has a steep dip (greater than 70° to the northeast) and, therefore, do not create planes or wedges out of proposed slopes with a gradient of 2:1 or flatter. We consider the proposed cut slopes to be stable.

Retain BCI to review cut slopes upon completion to confirm anticipated conditions and evaluate potential for rockfall (and mitigation methods if necessary). Some removal of loose rock blocks may be necessary upon completion of slope cuts. While slopes at a gradient of 2:1 or flatter do not typically present a rockfall hazard, it is possible that some rockfall protection (such as fencing at the base of slope) may be necessary in some areas where the rock has been disturbed. The west facing slopes are more likely to have rock pieces that can roll downslope due to foliation fracture that approximately parallels the slope and the potential for some intersecting fractures that can create larger loose rock pieces following grading (particularly in the upper 10 feet where weathering and fracture is more intense).

Grading

Soil and Rock Excavatability

Our trenching and drilling work can provide insight into rock excavation characteristics. Refer to the logs of the Borings and Test Pits in Appendix A for auger drilling and excavation results.

Based on the soil and rock conditions in our test pits, borings, and existing cuts in the vicinity, the soil and rock should be excavatable with conventional grading equipment such as scrapers, dozers, backhoes and excavators to the depth of refusal encountered in our test pits. This typically occurred at a depth of approximately 5.5 to 8 feet below existing grade in Area 1 and 2.5 to 7 feet in Area 2.

We drilled borings to auger refusal prior to coring. Generally, when auger refusal is encountered using a small diameter auger and a moderate sized drill rig, it's an indication that conventional excavation can be difficult below those depths. Table 1 summarizes the depth of auger refusal at each boring location. At depths greater than these (auger refusal depths), we expect difficult excavation when using equipment such as a D8 to D11 and blasting may be required to facilitate excavation at some locations.

TABLE 1

AUGER REFUSAL DEPTH		
Boring No.	**General Location (see Figure 2)**	**Auger Refusal Depth (bgs)**
B1	Area 1, southeast corner	10 feet
B2	Area 2, southeast corner	20 feet
B3	Area 2, northeast corner	13 feet
B4	Area 2, north side, central	4.5 feet

To further evaluate rock conditions and excavation characteristics, BCI completed seismic refraction surveys. The seismic refraction survey provides an estimate of rock rippability based on compression wave velocities in the underlying soil and rock.

Based on our review of cuts and the results of our seismic refraction survey, we present an estimate of general material rippability in Table 2.

TABLE 2

GENERAL RIPPABILITY		
Seismic Velocity (feet per second, fps)	**Material Type**	**Estimated Rippability**
$\leq 3{,}000$	Soil and decomposed to intensely weathered rock	Rippable with common construction equipment
3,000 to 8,000	Intensely to moderately weathered rock, with local less weathered blocks	Rippable, with local resistant blocks that may require blasting or alternative excavation methods
$\geq 8{,}000$	Slightly weathered to fresh rock	Blasting or alternative excavation methods, with local blocks rippable along natural discontinuities

Seismic velocities we interpret within the site range from ±2,000 to greater than ±20,000 fps. In general, we find a velocity of approximately 4,000 fps or higher indicate material (rock) that is expected to present difficulty to conventional trenching equipment (large backhoe to moderate size excavator). Additionally, Caterpillar publishes the "Caterpillar Performance Handbook (2009)," which relates the performance of various tractors to the seismic velocity of various rock types. According to the handbook, metamorphic rock with seismic velocities less than ±6,000 fps should be rippable using a D8 with a multi or single shank No. 8 ripper. Rock with velocities greater than ±8,000 fps are likely non-rippable with a D8. For a D10, these values are about ±8,000 and ±10,000 fps. Table 3 shows the approximate depth to the 4,000 fps and 8,000 fps horizon at each of our survey locations.

TABLE 3

SEISMIC REFRACTION SUMMARY			
Seismic Profile No.	**General Location (see Figure 2)**	**Approx. Depth to 4000 fps horizon (ft bgs)[1]**	**Approx. Depth to 8000 fps horizon (ft bgs)[2]**
SR1	Area 2, southeast corner	3 to 5	10 to 15
SR2	Area 2, northeast corner	3 to 5	12 to 15
SR3	Area 1, east side	4 to 7	> 25*
SR4	Area 1, southeast corner	4 to 6	8 to 28
SR5	Area 2, north side	3 to 5	12 to 18

[1]Approximate seismic velocity expected to present difficulty to conventional trenching equipment
[2]Approximate seismic velocity expected to present difficulty to conventional excavation equipment (D8)
*Possible more deeply weathered zone

In general, it appears blasting may be required to facilitate excavation at depths greater than approximately 15 to 20 feet. The refraction surveys reflect average rock conditions; harder or softer rock can occur at depths different than that shown on the profiles. For profiles at each seismic refraction location, refer to the Seismic Refraction Profiles in Appendix C.

Competent rock and large boulders may also be present at shallower depths at other locations within the project, which may require alternative excavation methods and/or localized controlled blasting.

To facilitate foundation and utility trench excavation, consider overexcavation of hard rock where building pads will be cut down to this material.

Site Clearing and Original Ground Preparation

Prior to making cuts and fills complete the following:

1. Remove any debris and boulders from the surface of the site.
2. Completely remove all structures and associated foundations, pits, and piping. Structure remnants occur on the knoll top in the west-central portion of Area 1.
3. Remove the dam and accumulated loose/soft soils behind the dam where located in the drainage at the west central portion of Area 1.
4. Remove pavement at Tong Road where new fill will be placed across the old road.
5. Strip vegetation to a minimum depth of 2 inches below the ground surface, and remove brush and trees including the roots. Do not use strippings within engineered fill. Remove strippings from the site or place in landscape areas if approved by the landscape architect. As an alternative to stripping, if vegetation is thin at the time of grading based on review and approval of BCI, thin vegetation may be disced to mix with the upper soils.
6. Widen excavations resulting from tree, foundation, and other buried features to provide access for self-propelled compaction equipment.
7. Remove concentrations of organic material and loose/soft soils from the two drainages located in the western portion of the site. In general, we expect 1 to 3 feet of overexcavation within the drainages.
8. Two open wells or cisterns are present in Area 2. Probe these features to determine depth, completely remove any backfill materials, and backfill with concrete slurry or other approved backfill based on the conditions exposed.
9. Completely remove the soil stockpile in the east-central portion of the site (southeast corner of Area 2). This stockpile is expected to be completely removed when the area is cut down to planned grade.

Prior to placing fill on stripped or cut ground surfaces, scarify the ground surface to a minimum depth of 8 inches. Moisture condition the scarified soil to within 2% of optimum and compact it to a minimum of 90% relative compaction based on ASTM D 1557 test procedure. Scarification and recompaction may not be necessary if fresh to moderately weathered rock is present as determined by a BCI representative.

Subdrainage

Drainages tend to accumulate water even after they have been filled. To reduce the potential for detrimental accumulations of subsurface water along buried drainage locations, install subdrains where the existing drainages will be filled with more than 6 feet of cover (to avoid interference with utilities). We expect this to occur at the southwest trending drainage that crosses the central portion of Area 1 and Area 2, and possibly the drainage crossing the northwest corner of Area 2 (if filled).

Excavate subdrains into the prepared ground surface (surface following removal of organics and loose/soft soils). Refer to the subdrain detail on Figure 4 and construct as follows:

- Minimum depth of 3 feet below the prepared surface
- Minimum width of 2 feet
- Fill the trench with ¾-inch washed, crushed drain rock wrapped with a non-woven filtration geotextile (Mirafi 180N or equivalent)
- Place 6-inch diameter perforated plastic pipe 4 to 6 inches above the trench base (pipe strength must be adequate to support the load of the overlying drain rock and fill)
- Use a minimum gradient of 1% for trench base and pipe
- Provide cleanouts at regular intervals (200 to 300 feet)

Taper off drain rock and filter fabric approximately 15 feet upstream of the subdrain outlet to collect water within the trench. Use solid drain pipe for the last 15 feet and outlet to suitable drainage facilities at the toe of the fill slope or into the storm drain system. Accurately record subdrain and cleanout locations so that future underground installations do not damage them.

Fill Placement and Compaction

On-site soil and weathered rock excavated from proposed cut areas may be used as fill. Fill must be free of debris and concentrations of organic material.

Based on our exploratory work and experience in the area, fill material generated from cuts will predominantly consist of a mixture of sandy silt with gravel and rock fragments up to about 8 inches in greatest dimension. Fill material generated from cuts deeper than about 15 to 20 feet will likely have a relatively small amount of soil or decomposed rock mixed with the rock fragments, and may require mixing with less rocky material to generate suitable fill material. Large rock, several feet in diameter, will be generated at isolated locations during general excavation.

Unless otherwise approved by BCI and the project engineer, limit rock dimensions as follows:

- Upper 4 feet of fill in pavement and structural areas should not contain rock larger than 4 inches in greatest dimension
- Upper 10 feet of fill should not contain rock larger than 12 inches in greatest dimension
- Place rock greater than 12 inches but less than 36 inches in greatest dimension in fills deeper than 10 feet below finish grade. Disperse the large rock throughout the fill and compact soil around the rocks as necessary to prevent voids and nesting.
- Rock larger than 36 inches should be broken down or disposed of at pre-designated locations. Large rock may be placed at the toe of slopes or other locations specifically designated for rock disposal if approved by BCI and the project engineer.

Thoroughly mix soil and rock to prevent nesting and voids.

To reduce the potential for damaging differential settlement, where structures will be located across a cut/fill transition, maintain a maximum fill depth differential of 10 feet within a horizontal length of 50 feet (average fill depth gradient of 1ft of depth over 5ft horizontally). It appears that this condition may need to be addressed at the west central and southwest sides of the Area 2 pad. Overexcavation and recompaction on the cut side of the building pad will reduce fill depth differential.

Construct fill as follows:

- Place fill in maximum 8-inch-thick loose lifts (excluding large rock placement).
- Moisture condition to within 2% of optimum moisture content.
- Compact all fill below planned structure areas and 10 feet beyond to a minimum of 95% relative compaction up to subgrade elevation.
- Compact areas outside of structure locations to a minimum 90% relative compaction within 5 feet of finish subgrade, and a minimum 95% relative compaction when deeper than 5 feet below finish subgrade.
- Fill placed on or against existing slopes with a gradient steeper than 6H:1V must be benched into the existing slope a minimum of 2 feet (or into competent soil/weathered rock as determined by BCI's field representative) so that surficial soils are removed and stepped benches are created.
- Base relative compaction and optimum moisture content on the current ASTM D 1557 test procedure.
- Restrict maximum rock size as indicated above.

If the fill is untestable because of the quantity of rock; moisture condition thoroughly as recommended by BCI, and compact each 8-inch lift with 5 to 7 passes of a Caterpillar 825 sheepsfoot compactor or the equivalent. BCI may modify the number of passes and lift thickness during construction based on the compaction equipment used and material types.

Fill Slope Construction

Where fill slopes will be more than 5 feet high, construct a key at the base of the slope prior to fill placement. The base key excavation must be a minimum of 8 feet wide and extend a minimum of 2 feet below the ground surface or to weathered rock as determined by a BCI representative. Backfill the base key excavation and place fill as recommended above. Construct fill slopes at gradients no steeper than those indicated in the "Slope Stability and Slope Construction" section of this report.

Grading Factors

It is very difficult to assess overall shrink and swell for grading volume in rocky materials due to variation in soil cover, rock weathering and presence of bouldery materials; only rough estimates for general guidance are possible. We expect very little shrinkage (cut to compacted fill) for materials in the upper 10 to 15 feet (say approximately 0% to 5%). Excavations below that depth will likely result in swell (bulking) on the order of 10% to 20% (considering some loss due to oversize material).

The amount of oversize material (large boulders) generated from deeper cuts could significantly reduce the amount of useable fill. Other considerations in shrink/swell estimates include material loss during transport and site work, potential for variability within the weathered/fractured rock, survey errors, and import used for pavement construction and trench backfill.

FOUNDATIONS

Shallow, continuous strip and spread footings will be suitable for structure foundations when the ground surface is prepped and fills are placed in accordance with our recommendations. Structure plans are not available at this time but wood frame, masonry, or concrete tilt-up structures are anticipated. We expect light to moderate loads on the order of 75 to 85 kips for columns and 2 to 6 kips per lineal foot for strip footings.

Bearing Capacity

When building pads are prepared in accordance with these recommendations, the site will be suitable for conventional foundations (i.e., continuously reinforced perimeter wall footings and isolated interior column footings) and slab-on-grade floors.

For preliminary foundation sizing considerations, embed foundations a minimum of 18 inches into the prepared subgrade. Footings must be a minimum of 24 inches wide for continuous and 36 inches for isolated columns, and sized not to exceed an allowable bearing capacity of 5,000 psf. The allowable bearing capacity may be increased by one-third if transient loads are included.

To resist lateral movement, use a coefficient of friction of 0.45 and passive earth pressure of 300 psf per foot of embedment depth or up to 440 psf per foot of embedment if lateral movements of up to 2% of the foundation embedment depth can be tolerated.

Settlement

If the design and construction team follow the recommendations in this report, we expect that total settlement at foundation locations will not exceed 1-inch. Differential settlement between column loads and along strip footings (over a distance of approximately 50 feet) are expected to be less than ½ -inch.

Foundations and slabs-on-grade underlain by fill can experience greater magnitudes of total and differential settlement when the underlying fill thickness is significant (greater than 5 feet) even when properly compacted. Modified fill placement and compaction recommendations are provided in the "Grading Recommendations" section of this report to minimize differential settlement in areas of deep fill.

Seismic Design

The building pads will be underlain by weathered rock to fresh rock that would be classified as Site Class "B" (California Building Code (CBC), 2010). Based on the rough grading plan, portions of the building pad in Area 1 (west side of pad) will have fill and soil in excess of 10 feet deep between the foundations and the underlying rock; therefore, the Site Class must be adjusted to "C" for that location. For design in accordance with current California Building Code (CBC) procedures, we provide parameters in Table 4a and 4b below.

TABLE 4a

Seismic Design Parameters (CBC 2010) EDH 52 (Area 1) – Site Class C

CONCRETE SLABS-ON-GRADE

Design Recommendations for Geotechnical Support

Provided the contractor(s) prepares the building pads in accordance with our grading recommendations and any addendums by BCI, slab-on-grade floors may be used to support normal floor loads. Underlay the concrete slabs with a minimum of 4 inches of washed, crushed, and compacted rock to provide uniform support. Crushed rock used beneath floor slabs should be graded so that 100% passes the ¾ inch sieve and less than 5% passes the No. 4 sieve. Compact crushed rock with at least two passes of a vibratory type compactor.

For building pads Concrete floor slabs with crushed rock underlayment may be designed using a Modulus of Subgrade Reaction, k, of 200 psi per inch in cut or fill locations.

Exterior flatwork such as sidewalks, etc. may be placed directly on the prepared subgrade without the use of rock underlayment. The subgrade should be free of debris, uniformly compacted, and thoroughly wetted before the concrete is placed.

Design Considerations for Moisture

Construction of the building pads will require deep cuts into intensely to slightly weathered rock. BCI did not observe seepage in our exploratory borings or test pits. However, after development, irrigation and rainwater may access deep excavations in rock via seepage and/or from the ground surface. While we don't expect this seepage to be significant enough to require underfloor drainage systems, water will travel on relatively impermeable rock surfaces and could be enough to cause higher than normal moisture vapor to pass through the concrete floor slabs. Excessive vapor can cause floor covering damage and mold.

The designer must consider the potential for excessive water vapor and design the slabs and underlayment accordingly. References providing guidelines for vapor mitigation and slab underlayment include ASTM E 1643, ACI 302.1R, PCA, and flooring manufacturer requirements for the intended use.

No matter how extensive the vapor mitigation design, some vapor will pass through the slabs and, the slabs themselves will absorb and release some moisture. Therefore, consult with floor covering and mold specialists, and include a contingency to replace some floor coverings and mitigate some mold growth.

PRELIMINARY PAVEMENT DESIGN

For this report, we provide preliminary pavement design recommendations based on the anticipated soil conditions in subgrade areas and Resistance (R) values we obtained during our work on the Silva Valley Parkway Interchange project. Base final pavement design on the subgrade conditions present after rough grading.

Preliminary Structural Sections

In general, we find that shallow soils in the area have R-Values on the order of 20 to 30, and mixtures of soil and rock have R-Values on the order of 40 to 60. In-place rock that has been ripped and prepped for subgrade is expected to have an R-Value in excess of 50.

The site has a relatively thin soil horizon that overlies weathered rock. We expect pavement subgrade to be composed of either fill that consists of a mixture of minor amounts of silt soil with excavated rock, or cut locations where the rock is exposed at subgrade elevation. For preliminary pavement considerations, an R-Value of 40 is applicable.

Based on an R-value of 40 and the Caltrans Flexible Pavement Design method, we recommend the preliminary asphalt concrete pavement sections in Table 5 for the Traffic Index (TI) shown. The TI is a measure of wheel load, frequency, and intensity. Our experience is that TI's of 4.0–5.0 are often used for automobile parking, and TI's of 6.0-7.0 are often used for fire truck access, channelized flow, and bus traffic. Use of the proper TI should be confirmed by the project designers.

TABLE 5

Preliminary Pavement Structural Sections (Based on an R-Value = 40)					
Material	**TI = 4**	**TI = 5**	**TI = 6**	**TI = 7**	**TI= 8**
Asphalt Concrete (ft)	0.20	0.20	0.25	0.30	0.40
Class 2 Agg. Baserock* (ft)	0.35	0.40	0.50	0.65	0.65

* ¾–inch or 1½-inch maximum

To develop these pavement sections we assume that the native subgrade soil (minimum of upper 1 foot) is uniformly compacted to 95% or higher relative compaction and that the baserock is uniformly compacted to 95% or higher relative compaction. BCI should provide design R-Value testing prior to final design.

Pavement Subgrade Preparation

Prior to placing aggregate base, check for subgrade stability by running a loaded water truck over the subgrade. Mitigate unstable areas as recommended by BCI.

Design the pavement areas to allow for positive surface drainage. Adequate surface slope, subgrade crown, and uniform compaction contribute to long-term pavement performance.

It is important to design the drainage of pavement areas so that water is not allowed under the paved areas. If water is trapped under paving the water can saturate the base course and soil subgrade, which results in premature pavement failures.

To reduce the amount of water that can seep beneath the pavement, install cutoff curbs where pavement abuts landscaped areas. Extend cutoff curbs a minimum depth of 4 inches below the pavement subgrade or to in-place rock, whichever depth is less. Where cutoff curbs are undesirable, subgrade drains can be constructed to remove excess water from landscape areas or an impermeable barrier, such as 20 mil HDPE, could be placed at the back of curb to a depth of approximately 1 foot below subgrade.

UNDERGROUND UTILITY CONSTRUCTION

Excavation of the exploratory trenches was difficult when we encountered moderately weathered rock. Trenching in moderately weathered to fresh rock will require heavy trenching equipment and or excavation facilitated by chiseling, pre-drilling, and/or blasting. The depth to moderately weathered rock varies throughout the site but it generally occurs at depths of 5 to 15 feet below the existing ground surface.

Trenches should be sloped or braced in accordance with current Cal/OSHA requirements.

With the exception of trenches that cross the existing drainages, we do not anticipate the need for significant dewatering during installation of utility lines (assuming construction takes place in the drier months of the year when the surface soil is not saturated and there is no surface water on the site).

Backfill utility trenches with approved on site soil and/or broken down rock mixed with soil. Use a maximum material size of 4 inches. Some excavated materials will have to be crushed and/or screened to a maximum size of 4 inches for use as trench backfill. Trench backfill materials should be approved by the geotechnical engineer prior to use. Due to the potentially rocky nature of trench backfill on the site, extend bedding materials at least 6-12 inches above the pipe before general trench backfill proceeds to reduce the potential for pipe damage.

Compact trench backfill as follows:

- Maximum uncompacted lift thickness of 1 foot unless field performance testing can demonstrate adequate compaction of thicker lifts
- Base compaction on ASTM D 1557 test specifications
- Minimum of 95% relative compaction in structural areas and 10 feet beyond
- Minimum of 90% relative compaction in pavement areas
- Minimum of 95% relative compaction where trench backfill exceeds a depth of 10 feet
- Minimum of 85% relative compaction in landscape areas
- Use mechanical methods of compaction
- Jetting is not an acceptable means of compaction
- Base compaction of untestable (rocky fill) on performance specifications determined to be adequate by the project geotechnical engineer at the time of backfilling

PRELIMINARY SOIL CORROSIVITY

For the adjacent Silva Valley Parkway Interchange project (BCI, 2012), we completed corrosion tests (pH, resistivity, chlorides, and sulfates) on soil and weathered rock samples retrieved from exploratory borings and trenches. Tests indicate maximum chloride and sulfate concentrations of 24 and 68 part per million (ppm), respectively. The soil pH ranged from 5.3 to 7.6 and the minimum resistivity ranged from 1,420 to 10,724 ohm-cm (most greater than 2,000 ohm-cm). In general, our tests indicate that the surface soils have a relatively low pH ranging from 5.3 to 6.1 and the underlying, weathered rock has a relatively neutral pH ranging from 7.1 to 7.6.

Based on our tests in the area and site conditions, we expect mild to moderate corrosion potential for iron pipe along the alignment and a generally non-corrosive environment for concrete. To further define site specific potential for corrosive soil and rock, additional testing should be completed.

NATURALLY OCCURRING ASBESTOS

We did not observe rock likely to contain NOA (serpentinite or ultramafic rock) within the site and our rock cores show no indication of fibrous minerals. However, the western third of Area 1 (along the existing Silva Valley Parkway) falls within area identified by El Dorado County Environmental Management as being within an "Asbestos Review Area".

El Dorado County Air Quality Management rule 223-2 requires that an Asbestos Dust Mitigation Plan be prepared, submitted, approved and implemented when more than 20 cubic yards of earth will be moved at sites identified as being in an "Asbestos Review Area". If desired, it is possible that an exemption to the rule may be obtained with further geologic evaluation for NOA. Since preliminary rough grading plans indicate that the portion of the site that falls within the "Asbestos Review Area" will only be filled above, discussion with the County regarding exemption on this basis could be considered.

RISK MANAGEMENT

Our experience and that of our profession clearly indicates that the risks of costly design, construction, and maintenance problems can be significantly lowered by retaining the geotechnical engineer of record to provide additional services during design and construction. For this project, BCI should be retained to:

- Review and provide comments on the civil plans, foundation plans, and specifications prior to construction.
- Monitor construction to check and document our report assumptions. At a minimum, BCI should monitor/test grading, cut slope excavation, foundation excavation, pavement subgrade, aggregate baserock and asphalt compaction.
- Update this report if design changes occur, 2 years or more lapses between this report and construction, and/or site conditions have changed.

If we are not retained to perform the above applicable services, we are not responsible for any other party's interpretation of our report, and subsequent addendums, letters, and discussions.

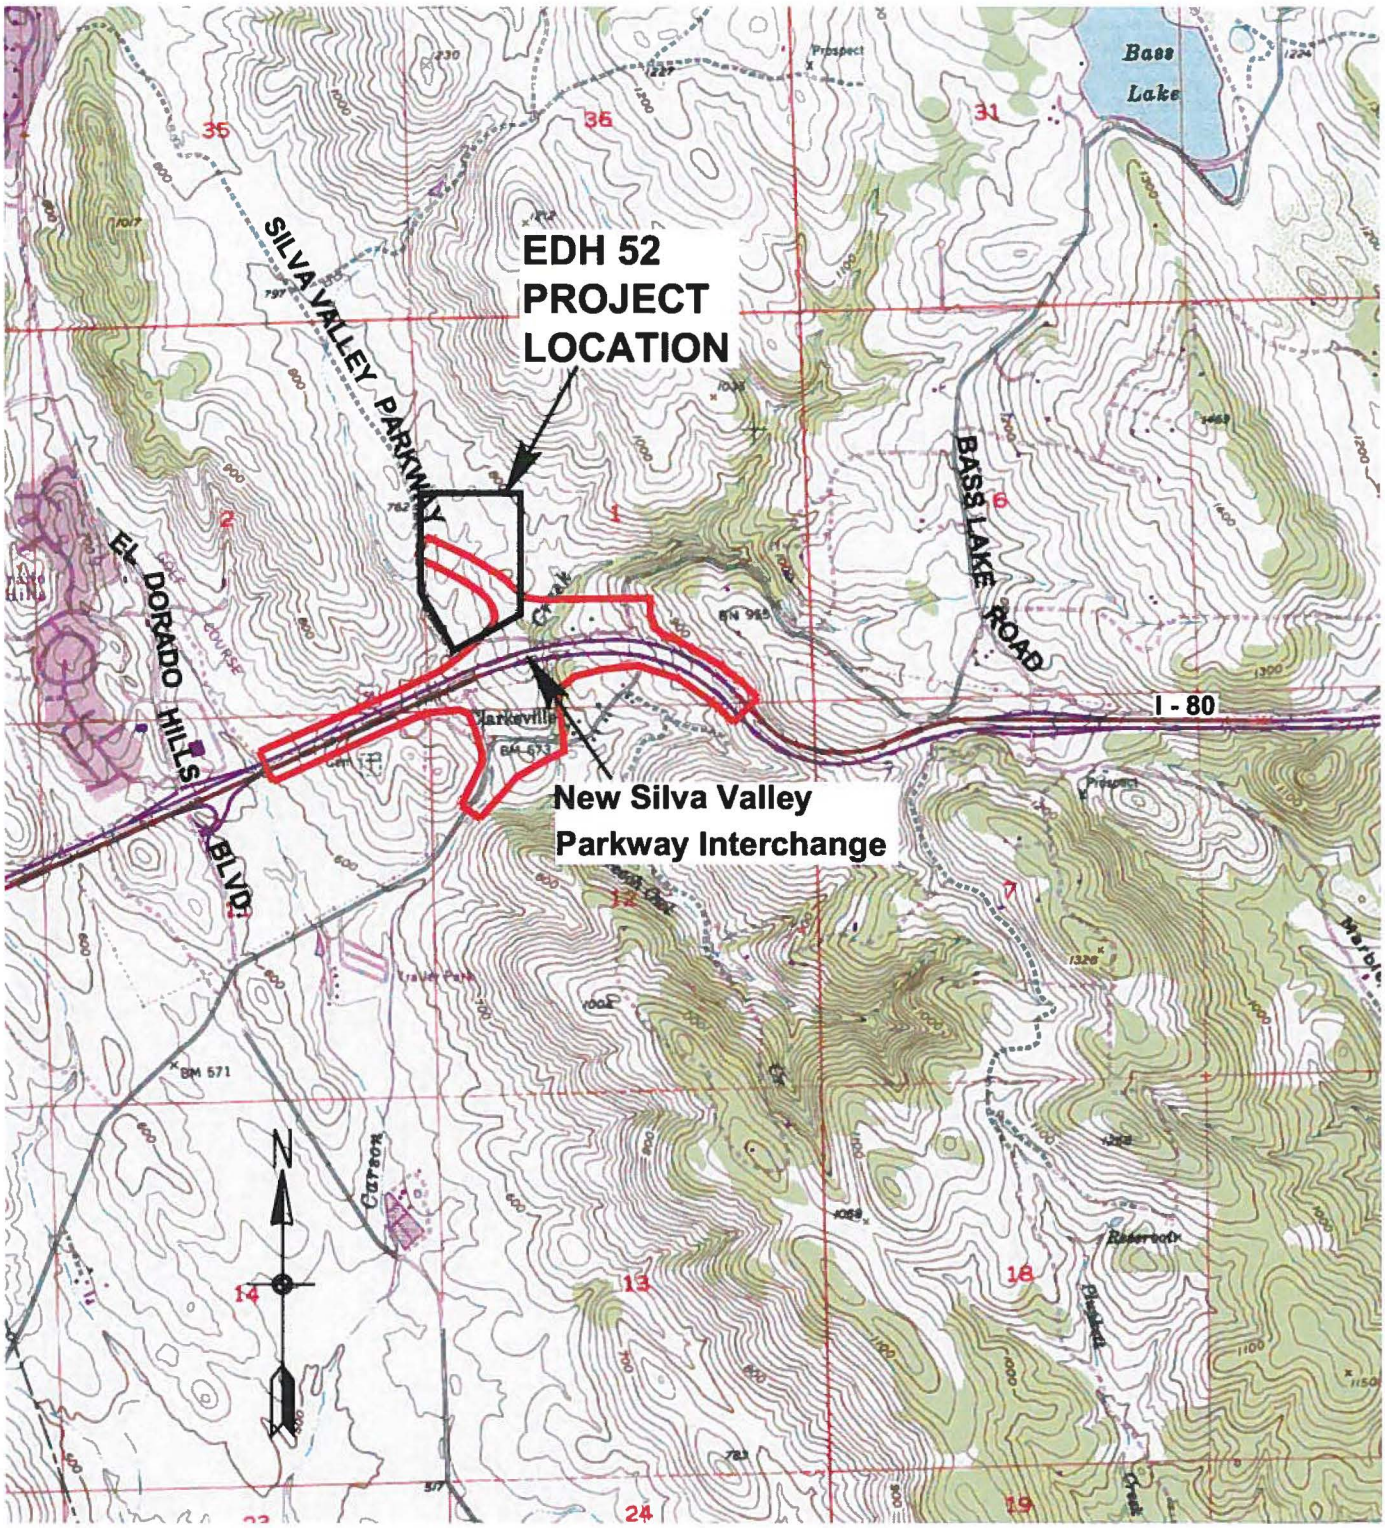
LIMITATIONS

BCI performed services in accordance with generally accepted geotechnical engineering principles and practices currently used in this area. We do not warranty our services.

This is report and preliminary foundation recommendations are based on rough grading plans. Final geotechnical recommendations will be necessary for final improvements.

BCI based this report on the current site conditions. We assumed the soil, rock and groundwater conditions are representative of the subsurface conditions on the site. Actual conditions between probes could be different.

Our scope did not include evaluation of on-site hazardous materials, soil corrosion potential, or flooding.



Modern design and construction are complex, with many regulatory sources/restrictions, involved parties, construction alternatives, etc. It is common to experience changes and delays. The owner should set aside a reasonable contingency fund based on complexities and cost estimates to cover changes and delays.

Logs of our borings and test pits are presented in Appendix A. The lines designating the interface between soil and rock types are approximate. The transition between soil types may be abrupt or gradual. Our recommendations are based on the final logs, which represent our interpretation of the field logs and general knowledge of the site and geological conditions.

Boring, test pit, and seismic refraction survey locations and elevations are approximate (locations were not surveyed).

APPENDIX A

Exploration Notes
Boring and Test Pit Logs
Rock Core and Test Pit Photographs

APPENDIX A – Logs of Borings and Test Pits

Field Exploration Notes

BCI drilled and sampled 4 exploratory borings and excavated 11 test pits in February 2013. The Site Map, Figure 2, shows boring and test pit locations. Logs of the borings and test pits are attached.

Our drilling subcontractor (Taber Drilling) drilled the borings using a CME 55 crawler and solid-stem (4-inch diameter) auger techniques in soil and weathered/fractured, penetrable rock. Harder, more competent rock was drilled and sampled using HQ wire-line coring techniques. Boring depths range from 24.2 to 40 feet below the ground surface (bgs). We obtained soil samples at various intervals using a 3.0-inch O.D. Modified California (MC) sampler (equipped with 2.4-inch diameter brass liners) and a Standard Penetration Test (SPT) sampler driven with an automatic hammer, weighing 140-pounds and falling approximately 30 inches.

Burke Backhoe excavated the test pits with a Caterpillar 430D backhoe equipped with a 2-foot wide bucket. The backhoe weighs approximately 14,500 pounds. Typical trenches were 2 to 3 feet wide, 8 to 12 feet long, and 3 to 8 feet deep. We obtained both hand-driven and bulk soil samples at various intervals.

BCI's project engineer logged the borings and test pits, retrieved samples for laboratory testing, and used plastic caps to seal and label the 2.4-inch diameter, 6-inch long brass tubes retrieved from MC sampling and hand-driven samples. We also retrieved bulk soil samples from soil/rock cuttings, placed this material in large cloth bags, and labeled for laboratory identification. We placed continuous core samples (rock) in labeled core boxes.

During drilling and trench excavation, BCI performed field strength testing with a pocket penetrometer on select cohesive and/or cemented soil samples. The logs include field test results.

BORING RECORD LEGEND

COUNTY	ROUTE	POSTMILE
El Dorado		

PROJECT NAME
El Dorado Hills EDH 52

File No.	PREPARED BY	DATE	SHEET
556.6	**RCP**		**1 of 3**

CONSISTENCY OF COHESIVE SOILS				
Descriptor	**Unconfined Compressive Strength (tsf)**	**Pocket Penetrometer (tsf)**	**Torvane (tsf)**	**Field Approximation**
Very Soft	< 0.25	< 0.25	< 0.12	Easily penetrated several inches by fist
Soft	0.25 - 0.50	0.25 - 0.50	0.12 - 0.25	Easily penetrated several inches by thumb
Medium Stiff	0.50 - 1.0	0.50 - 1.0	0.25 - 0.50	Can be penetrated several inches by thumb with moderate effort
Stiff	1.0 - 2.0	1.0 - 2.0	0.50 - 1.0	Readily indented by thumb but penetrated only with great effort
Very Stiff	2.0 - 4.0	2.0 - 4.0	1.0 - 2.0	Readily indented by thumbnail
Hard	> 4.0	> 4.0	> 2.0	Indented by thumbnail with difficulty

APPARENT DENSITY OF COHESIONLESS SOILS	
Descriptor	**SPT N_{60} - Value (blows / foot)**
Very Loose	0 - 4
Loose	5 - 10
Medium Dense	11 - 30
Dense	31 - 50
Very Dense	> 50

MOISTURE	
Descriptor	**Criteria**
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

PERCENT OR PROPORTION OF SOILS	
Descriptor	**Criteria**
Trace	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

SOIL PARTICLE SIZE		
Descriptor		**Size**
Boulder		> 12 inches
Cobble		3 to 12 inches
Gravel	Coarse	3/4 inch to 3 inches
	Fine	No. 4 Sieve to 3/4 inch
Sand	Coarse	No. 10 Sieve to No. 4 Sieve
	Medium	No. 40 Sieve to No. 10 Sieve
	Fine	No. 200 Sieve to No. 40 Sieve
Silt and Clay		Passing No. 200 Sieve

PLASTICITY OF FINE-GRAINED SOILS	
Descriptor	**Criteria**
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

CEMENTATION	
Descriptor	**Criteria**
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

NOTE: This legend sheet provides descriptors and associated criteria for required soil description components only. Refer to Caltrans Soil and Rock Logging, Classification, and Presentation Manual (July 2007), Section 2, for tables of additional soil description components and discussion of soil description and identification.

ROCK GRAPHIC SYMBOLS

IGNEOUS ROCK

SEDIMENTARY ROCK

METAMORPHIC ROCK

BEDDING SPACING

Descriptor	Thickness or Spacing
Massive	> 10 ft
Very thickly bedded	3 to 10 ft
Thickly bedded	1 to 3 ft
Moderately bedded	3-5/8 inches to 1 ft
Thinly bedded	1-1/4 to 3-5/8 inches
Very thinly bedded	3/8 inch to 1-1/4 inches
Laminated	< 3/8 inch

WEATHERING DESCRIPTORS FOR INTACT ROCK

	Diagnostic Features					
	Chemical Weathering-Discoloration-Oxidation		Mechanical Weathering and Grain Boundary Conditions	Texture and Solutioning		
Descriptor	Body of Rock	Fracture Surfaces		Texture	Solutioning	General Characteristics
Fresh	No discoloration, not oxidized	No discoloration or oxidation	No separation, intact (tight)	No change	No solutioning	Hammer rings when crystalline rocks are struck.
Slightly Weathered	Discoloration or oxidation is limited to surface of, or short distance from, fractures; some feldspar crystals are dull	Minor to complete discoloration or oxidation of most surfaces	No visible separation, intact (tight)	Preserved	Minor leaching of some soluble minerals may be noted	Hammer rings when crystalline rocks are struck. Body of rock not weakened.
Moderately Weathered	Discoloration or oxidation extends from fractures usually throughout; Fe-Mg minerals are "rusty"; feldspar crystals are "cloudy"	All fracture surfaces are discolored or oxidized	Partial separation of boundaries visible	Generally preserved	Soluble minerals may be mostly leached	Hammer does not ring when rock is struck. Body of rock is slightly weakened.
Intensely Weathered	Discoloration or oxidation throughout; all feldspars and Fe-Mg minerals are altered to clay to some extent; or chemical alteration produces in situ disaggregation (refer to grain boundary conditions)	All fracture surfaces are discolored or oxidized; surfaces are friable	Partial separation, rock is friable; in semi-arid conditions, granitics are disaggregated	Altered by chemical disintegration such as via hydration or argillation	Leaching of soluble minerals may be complete	Dull sound when struck with hammer; usually can be broken with moderate to heavy manual pressure or by light hammer blow without reference to planes of weakness such as incipient or hairline fractures or veinlets. Rock is significantly weakened.
Decomposed	Discolored of oxidized throughout, but resistant minerals such as quartz may be unaltered; all feldspars and Fe-Mg minerals are completely altered to clay		Complete separation of grain boundaries (disaggregated)	Resembles a soil; partial or complete remnant rock structure may be preserved; leaching of soluble minerals usually complete		Can be granulated by hand. Resistant minerals such as quartz may be present as "stringers" or "dikes".

Note: Combination descriptors (such as "slightly weathered to fresh") are used where equal distribution of both weathering characteristics is present over significant intervals or where characteristics present are "in between" the diagnostic feature. However, combination descriptors should not be used where significant identifiable zones can be delineated. Only two adjacent descriptors shall be combined. "Very intensely weathered" is the combination descriptor for "decomposed to intensely weathered".

RELATIVE STRENGTH OF INTACT ROCK

Descriptor	Uniaxial Compressive Strength (psi)
Extremely Strong	> 30,000
Very Strong	14,500 - 30,000
Strong	7,000 - 14,500
Medium Strong	3,500 - 7,000
Weak	700 - 3,500
Very Weak	150 - 700
Extremely Weak	< 150

ROCK HARDNESS

Descriptor	Criteria
Extremely Hard	Specimen cannot be scratched with pocket knife or sharp pick; can only be chipped with repeated heavy hammer blows
Very hard	Specimen cannot be scratched with pocket knife or sharp pick; breaks with repeated heavy hammer blows
Hard	Specimen can be scratched with pocket knife or sharp pick with heavy pressure; heavy hammer blows required to break specimen
Moderately Hard	Specimen can be scratched with pocket knife or sharp pick with light or moderate pressure; breaks with moderate hammer blows
Moderately Soft	Specimen can be grooved 1/6 in. with pocket knife or sharp pick with moderate or heavy pressure; breaks with light hammer blow or heavy hand pressure
Soft	Specimen can be grooved or gouged with pocket knife or sharp pick with light pressure, breaks with light to moderate hand pressure
Very Soft	Specimen can be readily indented, grooved, or gouged with fingernail, or carved with pocket knife; breaks with light hand pressure

CORE RECOVERY CALCULATION (%)

$$\frac{\Sigma \text{ Length of the recovered core pieces (in.)}}{\text{Total length of core run (in.)}} \times 100$$

RQD CALCULATION (%)

$$\frac{\Sigma \text{ Length of intact core pieces} > 4 \text{ in.}}{\text{Total length of core run (in.)}} \times 100$$

FRACTURE DENSITY

Descriptor	Criteria
Unfractured	No fractures
Very Slightly Fractured	Lengths greater 3 ft
Slightly Fractured	Lengths from 1 to 3 ft, few lengths outside that range
Moderately Fractured	Lengths mostly in range of 4 in. to 1 ft, with most lengths about 8 in.
Intensely Fractured	Lengths average from 1 in. to 4 in. with scattered fragmented intervals with lengths less than 4 in.
Very Intensely Fractured	Mostly chips and fragments with few scattered short core lengths

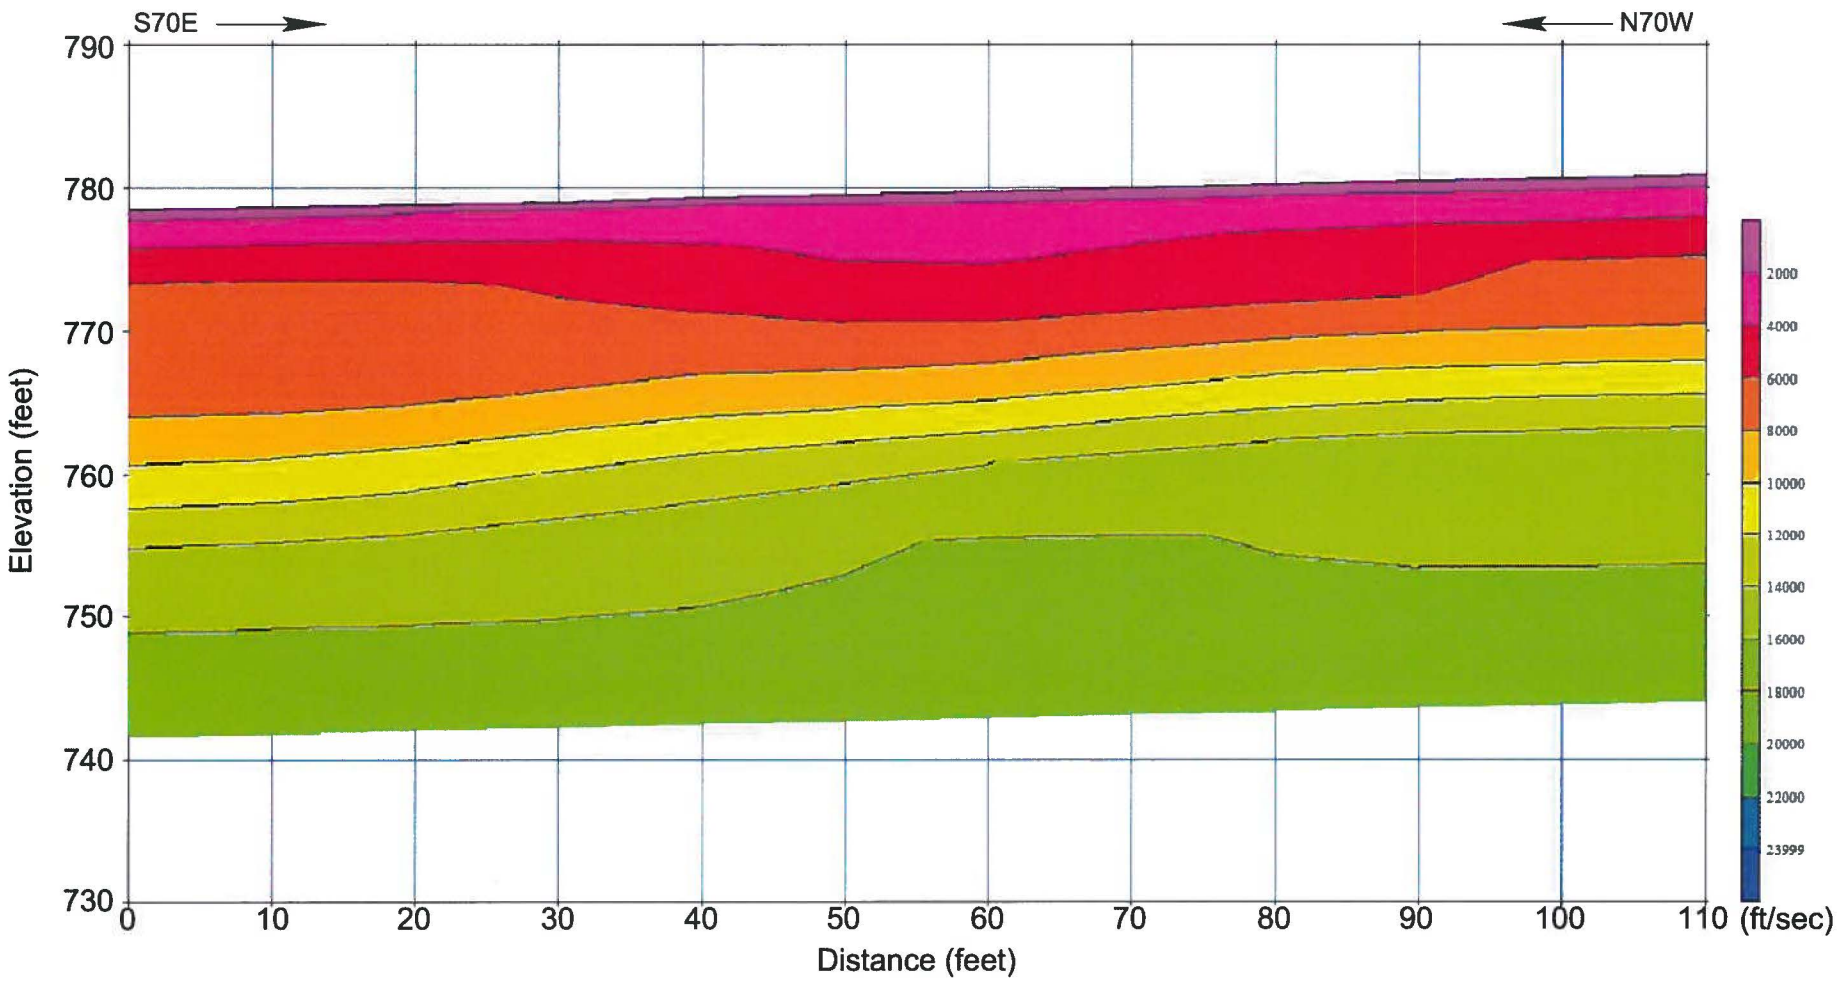
APPENDIX C – Seismic Refraction Survey Notes and Profiles



Seismic Refraction Survey Notes

Seismic refraction profiling is the process by which seismic waves are produced, recorded and analyzed to determine the seismic velocity of subsurface materials. In general terms, the seismic velocity of the subsurface is derived from the travel time of compressional wave (P-wave) energy over the distance from the source to recording devices. P-wave energy is generated at the surface by an impulsive source. The P-wave energy propagates into the subsurface and is refracted along subsurface interfaces (likely layers) representing an increase in velocity. P-wave energy returns to the surface where it is detected by an array of geophones and recorded by a seismograph. Analysis of this data produces the theoretical depth, thickness, and seismic velocity of the subsurface layers. The seismic velocity of the subsurface materials can be correlated to soil and rock types, and rock weathering and competency.

We performed our seismic refraction fieldwork in January 2013. Refraction work consisted of 5 survey lines, each 110 feet in length. Location of the refraction work is based on the proposed rough grade elevations and location of significant cuts. Our Professional Geologist led the field exercises and monitored the data acquisition. Figure 2 shows the approximate location of each seismic survey. Seismic line locations are based on measurement from features shown on the project base map and are considered approximate.

Each seismic refraction line consists of 5 shot points distributed along a linear array of 12 geophones placed at 10-foot intervals along the array. A multi-channel receiver (seismograph) is located at one end of the array to collect the data. Compressional wave energy (P-wave) is generated at each shot point using multiple impacts with a 20-pound sledge hammer striking a steel and/or aluminum plate placed on the ground surface. A Strataview R48 Seismograph is used to detect, digitize, and record the P-waves.

BCI used the computer program SeisImager by Geometrics, Inc. to analyze the acquired data. The profile of the ground surface at each seismic line location, as seen in the Seismic Profiles, is based on our interpretation of the topography shown on the project topography. Interpreted seismic profiles (subsurface) are attached.

BORING RECORD LEGEND

COUNTY	ROUTE	POSTMILE
El Dorado	50	1.1/R2.4

PROJECT OR BRIDGE NAME: **Silva Valley Parkway Interchange**

PREPARED BY	DATE	SHEET
RCP		1 of 3

CONSISTENCY OF COHESIVE SOILS				
Descriptor	**Unconfined Compressive Strength (tsf)**	**Pocket Penetrometer (tsf)**	**Torvane (tsf)**	**Field Approximation**
Very Soft	< 0.25	< 0.25	< 0.12	Easily penetrated several inches by fist
Soft	0.25 - 0.50	0.25 - 0.50	0.12 - 0.25	Easily penetrated several inches by thumb
Medium Stiff	0.50 - 1.0	0.50 - 1.0	0.25 - 0.50	Can be penetrated several inches by thumb with moderate effort
Stiff	1.0 - 2.0	1.0 - 2.0	0.50 - 1.0	Readily indented by thumb but penetrated only with great effort
Very Stiff	2.0 - 4.0	2.0 - 4.0	1.0 - 2.0	Readily indented by thumbnail
Hard	> 4.0	> 4.0	> 2.0	Indented by thumbnail with difficulty

APPARENT DENSITY OF COHESIONLESS SOILS	
Descriptor	**SPT N_{60} - Value (blows / foot)**
Very Loose	0 - 4
Loose	5 - 10
Medium Dense	11 - 30
Dense	31 - 50
Very Dense	> 50

MOISTURE	
Descriptor	**Criteria**
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

PERCENT OR PROPORTION OF SOILS	
Descriptor	**Criteria**
Trace	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

SOIL PARTICLE SIZE		
Descriptor		**Size**
Boulder		> 12 inches
Cobble		3 to 12 inches
Gravel	Coarse	3/4 inch to 3 inches
	Fine	No. 4 Sieve to 3/4 inch
Sand	Coarse	No. 10 Sieve to No. 4 Sieve
	Medium	No. 40 Sieve to No. 10 Sieve
	Fine	No. 200 Sieve to No. 40 Sieve
Silt and Clay		Passing No. 200 Sieve

PLASTICITY OF FINE-GRAINED SOILS	
Descriptor	**Criteria**
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

CEMENTATION	
Descriptor	**Criteria**
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

ROCK GRAPHIC SYMBOLS

IGNEOUS ROCK

SEDIMENTARY ROCK

METAMORPHIC ROCK

BEDDING SPACING

Descriptor	Thickness or Spacing
Massive	> 10 ft
Very thickly bedded	3 to 10 ft
Thickly bedded	1 to 3 ft
Moderately bedded	3-5/8 inches to 1 ft
Thinly bedded	1-1/4 to 3-5/8 inches
Very thinly bedded	3/8 inch to 1-1/4 inches
Laminated	< 3/8 inch

WEATHERING DESCRIPTORS FOR INTACT ROCK

	Diagnostic Features					
	Chemical Weathering-Discoloration-Oxidation		Mechanical Weathering and Grain Boundary Conditions	Texture and Solutioning		
Descriptor	Body of Rock	Fracture Surfaces		Texture	Solutioning	General Characteristics
Fresh	No discoloration, not oxidized	No discoloration or oxidation	No separation, intact (tight)	No change	No solutioning	Hammer rings when crystalline rocks are struck.
Slightly Weathered	Discoloration or oxidation is limited to surface of, or short distance from, fractures; some feldspar crystals are dull	Minor to complete discoloration or oxidation of most surfaces	No visible separation, intact (tight)	Preserved	Minor leaching of some soluble minerals may be noted	Hammer rings when crystalline rocks are struck. Body of rock not weakened.
Moderately Weathered	Discoloration or oxidation extends from fractures usually throughout; Fe-Mg minerals are "rusty"; feldspar crystals are "cloudy"	All fracture surfaces are discolored or oxidized	Partial separation of boundaries visible	Generally preserved	Soluble minerals may be mostly leached	Hammer does not ring when rock is struck. Body of rock is slightly weakened.
Intensely Weathered	Discoloration or oxidation throughout; all feldspars and Fe-Mg minerals are altered to clay to some extent; or chemical alteration produces in situ disaggregation (refer to grain boundary conditions)	All fracture surfaces are discolored or oxidized; surfaces are friable	Partial separation, rock is friable; in semi-arid conditions, granitics are disaggregated	Altered by chemical disintegration such as via hydration or argillation	Leaching of soluble minerals may be complete	Dull sound when struck with hammer; usually can be broken with moderate to heavy manual pressure or by light hammer blow without reference to planes of weakness such as incipient or hairline fractures or veinlets. Rock is significantly weakened.
Decomposed	Discolored of oxidized throughout, but resistant minerals such as quartz may be unaltered; all feldspars and Fe-Mg minerals are completely altered to clay		Complete separation of grain boundaries (disaggregated)	Resembles a soil; partial or complete remnant rock structure may be preserved; leaching of soluble minerals usually complete		Can be granulated by hand. Resistant minerals such as quartz may be present as "stringers" or "dikes".

Note: Combination descriptors (such as "slightly weathered to fresh") are used where equal distribution of both weathering characteristics is present over significant intervals or where characteristics present are "in between" the diagnostic feature. However, combination descriptors should not be used where significant identifiable zones can be delineated. Only two adjacent descriptors shall be combined. "Very intensely weathered" is the combination descriptor for "decomposed to intensely weathered".

RELATIVE STRENGTH OF INTACT ROCK

Descriptor	Uniaxial Compressive Strength (psi)
Extremely Strong	> 30,000
Very Strong	14,500 - 30,000
Strong	7,000 - 14,500
Medium Strong	3,500 - 7,000
Weak	700 - 3,500
Very Weak	150 - 700
Extremely Weak	< 150

ROCK HARDNESS

Descriptor	Criteria
Extremely Hard	Specimen cannot be scratched with pocket knife or sharp pick; can only be chipped with repeated heavy hammer blows
Very hard	Specimen cannot be scratched with pocket knife or sharp pick; breaks with repeated heavy hammer blows
Hard	Specimen can be scratched with pocket knife or sharp pick with heavy pressure; heavy hammer blows required to break specimen
Moderately Hard	Specimen can be scratched with pocket knife or sharp pick with light or moderate pressure; breaks with moderate hammer blows
Moderately Soft	Specimen can be grooved 1/6 in. with pocket knife or sharp pick with moderate or heavy pressure; breaks with light hammer blow or heavy hand pressure
Soft	Specimen can be grooved or gouged with pocket knife or sharp pick with light pressure, breaks with light to moderate hand pressure
Very Soft	Specimen can be readily indented, grooved, or gouged with fingernail, or carved with pocket knife; breaks with light hand pressure

CORE RECOVERY CALCULATION (%)

$$\frac{\Sigma \text{ Length of the recovered core pieces (in.)}}{\text{Total length of core run (in.)}} \times 100$$

RQD CALCULATION (%)

$$\frac{\Sigma \text{ Length of intact core pieces} > 4 \text{ in.}}{\text{Total length of core run (in.)}} \times 100$$

FRACTURE DENSITY

Descriptor	Criteria
Unfractured	No fractures
Very Slightly Fractured	Lengths greater 3 ft
Slightly Fractured	Lengths from 1 to 3 ft, few lengths outside that range
Moderately Fractured	Lengths mostly in range of 4 in. to 1 ft, with most lengths about 8 in.
Intensely Fractured	Lengths average from 1 in. to 4 in. with scattered fragmented intervals with lengths less than 4 in.
Very Intensely Fractured	Mostly chips and fragments with few scattered short core lengths

ASTM E1527-13
Phase I Environmental Site Assessment
User Questionnaire

INTRODUCTION

In order to qualify for one of the *Landowner Liability Protections (LLPs)*[1] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"),[2] the *user* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The *user* should provide the following information to the *environmental professional*. Failure to conduct these inquiries could result in a determination that "*all appropriate inquiries*" is not complete.

(1.) Environmental liens that are filed or recorded against the *property* (40 CFR 312.25).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* below) identify any environmental liens filed or recorded against the *property* under federal, tribal, state or local law?

No

Note 1—In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

(2.) Activity and use limitations that are in place on the *property* or that have been filed or recorded against the *property* (40 CFR 312.26(a)(1)(v) and vi)).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* above) identify any AULs, such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the *property* and/or have been filed or recorded against the *property* under federal, tribal, state or local law?

No

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an *adjoining property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No

---

[1] *Landowner Liability Protections*, or *LLPs*, is the term used to describe the three types of potential defenses to Superfund liability in EPA's *Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability* ("*Common Elements*" Guide) issued on March 6, 2003.

[2] P.L. 107-118.

(4.) Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?

Yes

(5.) Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30).

Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases?

No

For example,

(a.) Do you know the past uses of the *property*?

No

(b.) Do you know of specific chemicals that are present or once were present at the *property*?

No

(c.) Do you know of spills or other chemical releases that have taken place at the *property*?

No

(d.) Do you know of any environmental cleanups that have taken place at the *property*?

No

(6.) The degree of obviousness of the presence or likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

Based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of releases at the *property*?

No

In addition, certain information should be collected, if available, and provided to the *environmental professional* conducting the *Phase I Environmental Site Assessment*. This information is intended to assist the *environmental professional*, but is not necessarily required to qualify for one of the *LLPs*. The information includes:

(a) the reason why the Phase I is being performed,

(b) the type of *property* and type of *property* transaction, for example, sale, purchase, exchange, etc.,

(c) the complete and correct address for the *property* (a map or other documentation showing *property* location and boundaries is helpful),

(d) the scope of services desired for the Phase I ESA (including whether any parties to the *property* transaction may have a required standard scope of services or whether any considerations beyond the requirements of Practice E1527 are to be considered),

(e) identification of all parties who will rely on the Phase I *report* ,

(f) identification of the site contact and how the contact can be reached,

(g) any special terms and conditions which must be agreed upon by the *environmental professional*, and

(h) any other knowledge or experience with the *property* that may be pertinent to the *environmental professional* (for example, copies of any available prior *environmental site assessment reports*, documents, correspondence, etc., concerning the *property* and its environmental condition).

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Kleinfelder, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

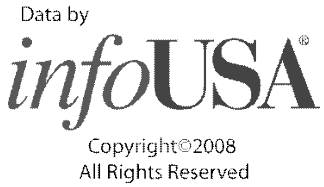
EXECUTIVE SUMMARY



DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

ASTM and EPA Requirements

ASTM E 1527-13 lists building department records as a "standard historical source," as detailed in § 8.3.4.7: "Building Department Records - The term building department records means those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property." ASTM also states that "Uses in the area surrounding the property shall be identified in the report, but this task is required only to the extent that this information is revealed in the course of researching the property itself."

EPA's Standards and Practices for All Appropriate Inquires (AAI) states: "§312.24: Reviews of historical sources of information. (a) Historical documents and records must be reviewed for the purposes of achieving the objectives and performance factors of §312.20(e) and (f). Historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

GLOSSARY

General Building Department concepts

- **ICC:** The International Code Council. The governing body for the building/development codes used by all jurisdictions who've adopted the ICC guidelines. MOST of the US has done this. Canada, Mexico, and other countries use ICC codes books and guides as well. There are a few states who have added guidelines to the ICC codes to better fit their needs. For example, California has added seismic retrofit requirements for most commercial structures.
- **Building Department (Permitting Authority, Building Codes, Inspections Department, Building and Inspections):** This is the department in a jurisdiction where an owner or contractor goes to obtain permits and inspections for building, tearing down, remodeling, adding to, re-roofing, moving or otherwise making changes to any structure, Residential or Commercial.
- **Jurisdiction:** This is the geographic area representing the properties over which a Permitting Authority has responsibility.
- **GC:** General Contractor. Usually the primary contractor hired for any Residential or Commercial construction work.
- **Sub:** Subordinate contracting companies or subcontractors. Usually a "trades" contractor working for the GC. These contractors generally have an area of expertise in which they are licensed like Plumbing, Electrical, Heating and Air systems, Gas Systems, Pools etc. (called "trades").
- **Journeymen:** Sub contractors who have their own personal licenses in one or more trades and work for different contracting companies, wherever they are needed or there is work.
- **HVAC (Mechanical, Heating & Air companies):** HVAC = Heating, Ventilation, and Air Conditioning.
- **ELEC (Electrical, TempPole, TPole, TPower, Temporary Power, Panel, AMP Change, Power Release):** Electrical permits can be pulled for many reasons. The most common reason is to increase the AMPs of power in an electrical power panel. This requires a permit in almost every jurisdiction. Other commons reason for Electrical permits is to insert a temporary power pole at a new construction site. Construction requires electricity, and in a new development, power has yet to be run to the lot. The temporary power pole is usually the very first permit pulled for new development. The power is released to the home owner when construction is complete and this sometimes takes the form of a Power Release permit or inspection.
- **"Pull" a permit:** To obtain and pay for a building permit.
- **CBO:** Chief Building Official
- **Planning Department:** The department in the development process where the building /structural plans are reviewed for their completeness and compliance with building codes
- **Zoning Department:** The department in the development process where the site plans are reviewed for their compliance with the regulations associated with the zoning district in which they are situated.
- **Zoning District:** A pre-determined geographic boundary within a jurisdiction where certain types of structures are permitted / prohibited. Examples are Residential structure, Commercial/Retail structures, Industrial/Manufacturing structures etc. Each zoning district has regulations associated with it like the sizes of the lots, the density of the structures on the lots, the number of parking spaces required for certain types of structures on the lots etc.
- **PIN (TMS, GIS ID, Parcel#):** Property Identification Number and Tax Map System number.
- **State Card (Business license):** A license card issued to a contractor to conduct business.
- **Building Inspector (Inspector):** The inspector is a building department employee that inspects building construction for compliance to codes.
- **C.O.:** Certificate of Occupancy. This is the end of the construction process and designates that the owners now have permission to occupy a structure after its building is complete. Sometimes also referred to as a Certificate of Compliance.

GLOSSARY

Permit Content Definitions

- Permit Number: The alphanumerical designation assigned to a permit for tracking within the building department system. Sometimes the permit number gives clues to its role, e.g. a "PL" prefix may designate a plumbing permit.
- Description: A field on the permit form that allows the building department to give a brief description of the work being done. More often than not, this is the most important field for EP's to find clues to the prior use(s) of the property.
- Permit Type: Generally a brief designation of the type of job being done. For example BLDG-RES, BLDG-COM, ELEC, MECH etc.

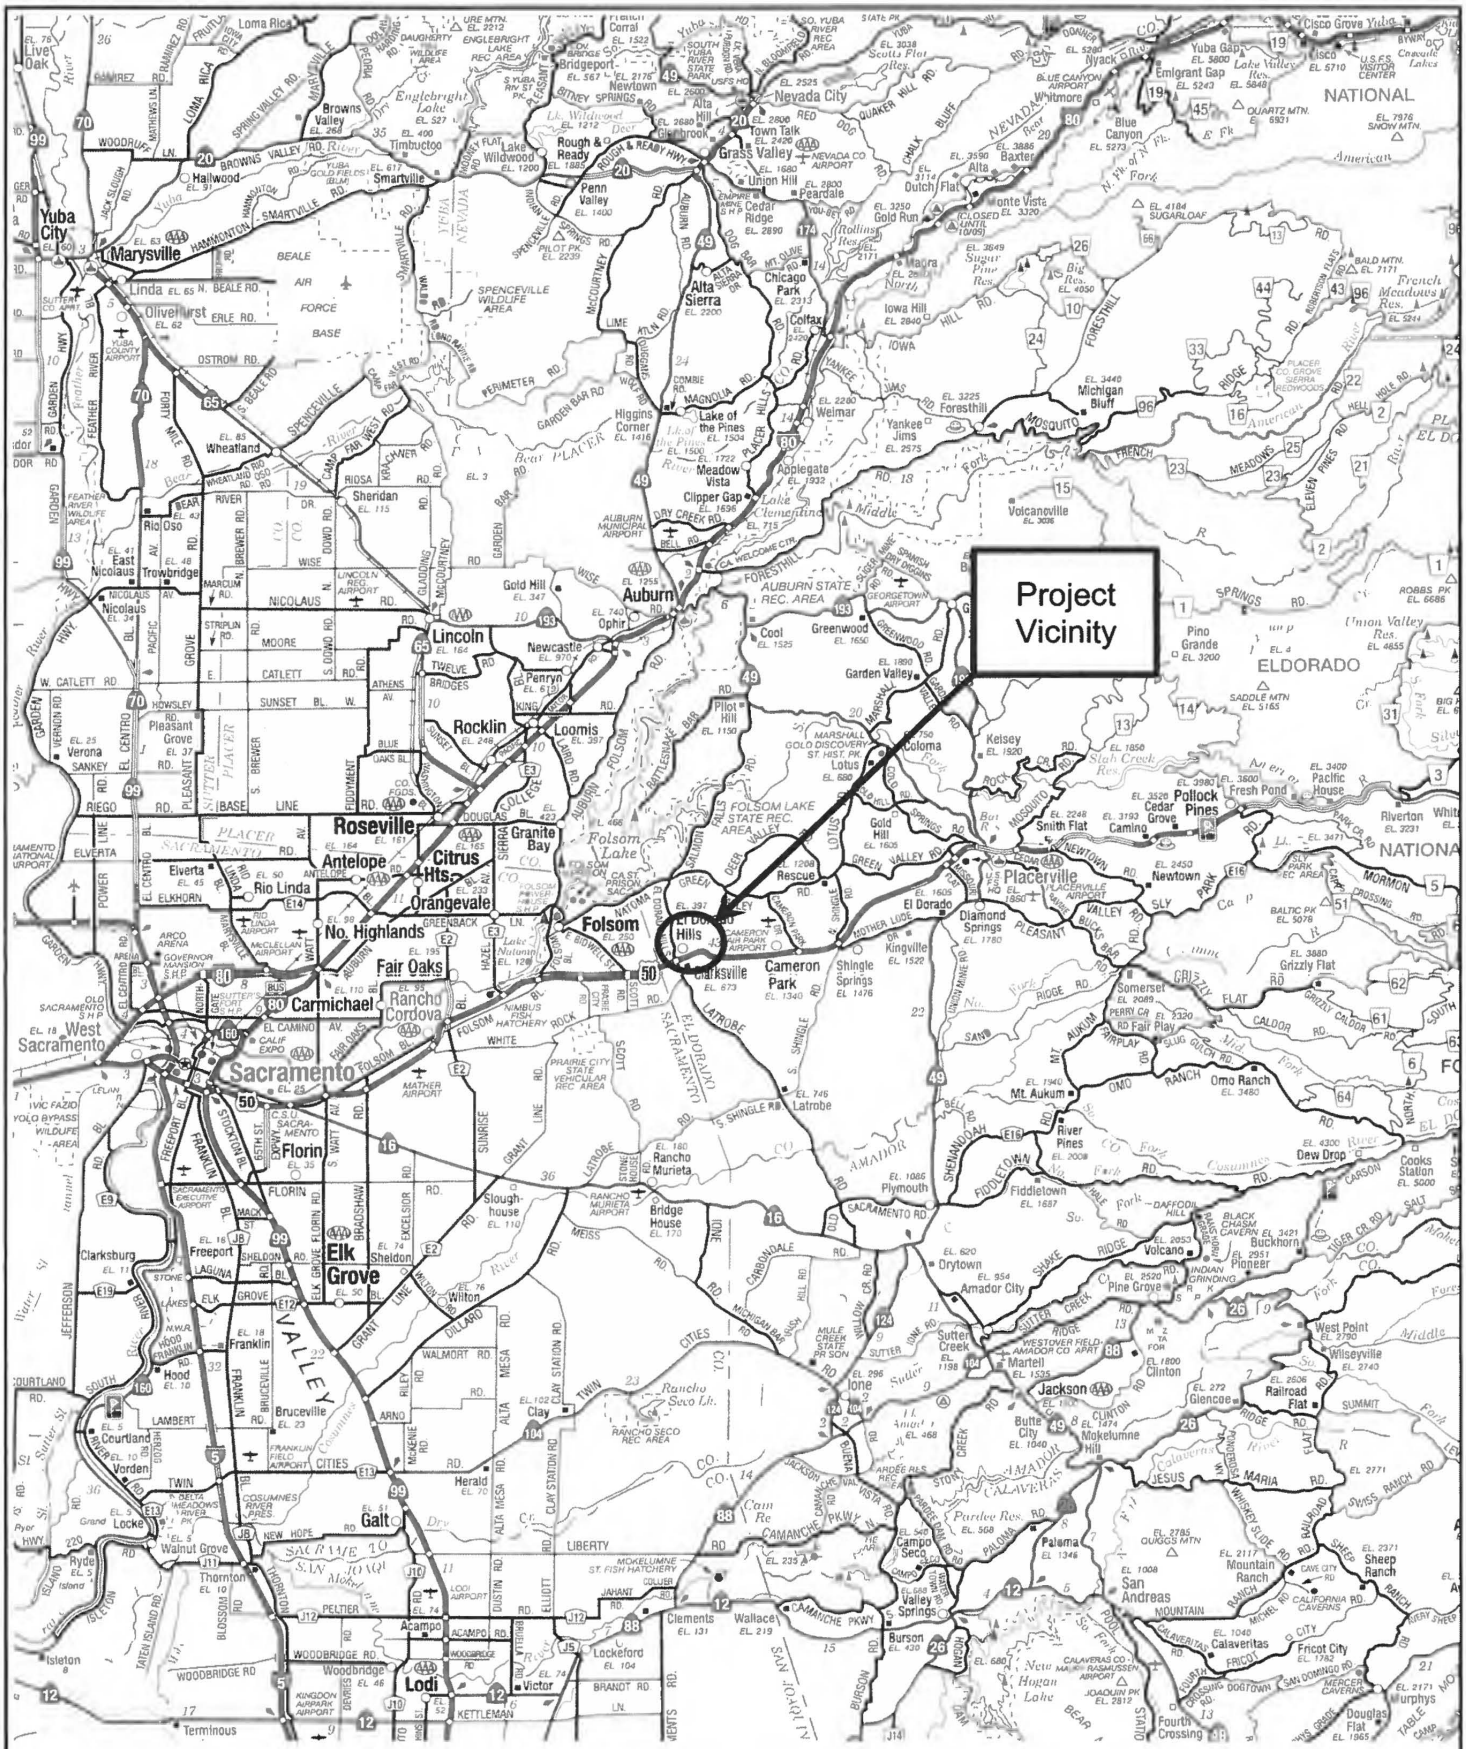
Subject: 17+/- ACRE COSTCO SITE, EL DORADO HILLS, CALIFORNIA: BIOLOGICAL ASSESSMENT



Dear Lindsey:

Thank you for asking Moore Biological Consultants to assist with this approximately 17+/- acre site in El Dorado Hills, El Dorado County, California (Figures 1 and 2 and Maps in Attachment A). The purpose of this assessment is to describe existing biological resources in the site, identify potentially significant impacts to biological resources from commercial development, and provide recommendations for how to reduce those impacts to a less-than-significant level. The work involved reviewing databases and aerial photographs, and conducting field surveys to document vegetation communities, potentially jurisdictional Waters of the U.S. and/or wetlands, and potentially suitable habitat for or presence of special-status species. This report details the methodology and results of our investigation.

Methods

Prior to the field surveys, we conducted a search of California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB, 2019). The CNDDB search included the USGS 7.5-minute Clarksville and Folsom SE topographic quadrangles, which encompass approximately 120 square miles surrounding the project site. The United States Fish and Wildlife Service

(USFWS) IPaC Trust Report of Federally Threatened and Endangered species that may occur in or be affected by projects in the project vicinity was also reviewed (Attachment B). This information was used to identify wildlife and plant species that have been previously documented in the project vicinity or have the potential to occur based on suitable habitat and geographical distribution. Additionally, the CNDDB depicts locations of sensitive habitats. The USFWS on-line maps of designated critical habitat were also downloaded.

Field surveys were conducted on July 26 and 29, 2019. The surveys consisted of walking throughout the site making observations of habitat conditions and noting surrounding land uses, vegetation types, and plant and wildlife species. The surveys included an assessment of the site for potentially jurisdictional Waters of the U.S. (a term that includes wetlands) as defined by the U.S. Army Corps of Engineers (ACOE, 1987; 2008), special-status species, and potentially suitable habitat for special-status species (e.g., blue elderberry shrubs, vernal pools). Additionally, trees in and near the site were assessed for the potential use by nesting raptors and the site was also searched for burrowing owls (*Athene cunicularia*) or ground squirrel burrows that could be utilized by burrowing owls.

Results

GENERAL SETTING: The 17+/- acre site is in El Dorado Hills, El Dorado County, California (Figure 1). The site is in within Section 1 in Township 9 North, Range 8 East of the USGS 7.5-minute Clarksville topographic quadrangle (Figure 2). The site consists of gently rolling hills and slopes down generally from the northeast to the southwest. Site elevations range from approximately 700 to 730 feet above mean sea level.

The site primarily consists of open hillsides supporting annual grassland vegetation (Figure 3 and photographs in Attachment C). The grasslands are

El Dorado Hills, El Dorado County, CA

moderately to highly disturbed from historic mining, prior development, grazing, grading related to construction of adjacent roads and on adjacent parcels, and periodic disking for weed abatement.

Silva Valley Parkway runs along the east side of the site and “Clarksville Crossing” (also named “Silva Valley Parkway” on some maps and signs) bounds the west edge of the site. An open grassland field bounds the south edge of the site, with Interstate 50+/- feet further to the south. There are residential areas further north and west of the site beyond strips of grassland and woodland areas. The site is surrounded by gently rolling hills of oak woodlands intermixed with annual grassland, similar to habitats in the site.

There are two intermittent creeks in the site that receive water via culverts under Silva Valley Parkway and flow generally southwest into culverts along Clarksville Crossing. These creeks convey water via their culverts into a tributary to Carson Creek, which is just off-site and to the west side of Clarksville Crossing. There are seepy areas within the larger creek where water was flowing out of the ground transitions into an area best described as a seasonal wetland swale. The smaller creek in the north part of the site was trickling with water flowing out of the culvert under Silva Valley Parkway.

There are some old concrete foundations and structural remains of what appears to have been a residence in the north part of the site (see photographs in Attachment C). There are remnant structures that appear to have been related to historic farming of the land in the site, including a concrete dam across one of the intermittent creeks.

VEGETATION: California annual grassland series (Sawyer and Keeler-Wolf, 1995) best describe vegetation found throughout the body of the site (Figure 3 and photographs in Attachment C). The grasslands are vegetated with native and non-native annual and perennial grassland species. Dominant grasses in the

site include oats (*Avena fatua*), foxtail barley (*Hordeum murinum*), soft chess brome (*Bromus hordeaceus*), ripgut brome (*Bromus diandrus*), and perennial ryegrass (*Lolium perenne*). Other grassland species such as black mustard (*Brassica nigra*), annual fireweed (*Epilobium brachycarpum*), Italian thistle (*Carduus pycnocephalus*), rose clover (*Trifolium hirtum*), prickly lettuce (*Lactuca serriola*), yellow star thistle (*Centaurea solstitialis*) and filaree (*Erodium botrys*) are intermixed with the grasses. There are also some widely scattered coyote bush (*Baccharis pilularis*) shrubs in the on-site grasslands. Plant species observed in the site are listed in Table 1.

There are a few trees and shrubs growing along the intermittent creek that northeast to southwest through the body of the site. Dominant trees along the creek corridors include valley oak (*Quercus lobata*), blue oak (*Quercus douglasii*), willows (*Salix* sp.), and California black walnut (*Juglans californica*) (see photographs in Attachment C). Patches of coyote bush and Himalayan blackberry (*Rubus discolor*) are found near the edges of the creek. Vegetation in the bed of the larger intermittent creek includes cattails (*Typha* sp.), tules (*Scirpus acutus*), tall flat sedge (*Cyperus eragrostis*), annual rabbit's-foot grass (*Polypogon monspeliensis*), curly dock (*Rumex crispus*), and other hydrophytes. The smaller small creek in the north tip of the site supports a similar assemblage vegetation along its bed and banks.

No blue elderberry (*Sambucus mexicana*) shrubs were observed in or adjacent to the site.

WILDLIFE: only a few bird species typical to foothill annual grasslands were observed during the field surveys. Turkey vulture (*Cathartes aura*), American crow (*Corvus brachyrhynchos*), California scrub jay (*Aphelocoma californica*), Northern flicker (*Colaptes auratus*), and Brewer's blackbird (*Euphagus cyanocephalus*) were the only birds observed in the site.

TABLE 1

PLANT SPECIES OBSERVED IN THE SITE

Amsinckia menziesii	common fiddleneck
Avena sp.	oat
Baccharis pilularis	coyote brush
Brassica nigra	black mustard
Bromus diandrus	ripgut brome
Bromus hordeaceus	soft chess brome
Bromus madritensis	compact brome
Carduus pycnocephalus	Italian thistle
Centaurea solstitialis	yellow star-thistle
Cerastium glomeratum	mouse-eared chickweed
Cirsium vulgare	bull thistle
Cyperus eragrostis	tall flat-sedge
Epilobium brachycarpum	annual fireweed
Eremocarpus setigerus	turkey mullein
Erigeron canadensis	Canadian horseweed
Erodium botrys	long beak stork's bill
Erodium cicutarium	red stemmed filaree
Holocarpha virgata	tarweed
Hordeum murinum	wall barley
Juglans californica	California black walnut
Lactuca serriola	prickly lettuce
Leotondon taraxacoides	lesser hawkbit
Mentha pulegium	European pennyroyal
Phalaris aquatica	harding grass
Polypogon monspeliensis	annual rabbit's-foot grass
Quercus lobata	valley oak

TABLE 1 (continued)
PLANT SPECIES OBSERVED IN THE SITE

Quercus wislizenii	interior live oak
Rubus discolor	Himalayan blackberry
Rumex crispus	curly dock
Salix sp.	willow
Salsola iberica	Russian thistle
Scirpus acutus	tule
Sonchus asper	spiny-leaf sow-thistle
Taeniatherum caput-medusae	medusahead grass
Torilis arvensis	field hedge parsley
Trifolium hirtum	rose clover
Triteleia laxa	Ithuriel's spear
Typha sp.	cattail
Vicia sativa	common vetch

There are several large trees along the intermittent creek in the northwest part of the site and large trees in the open grasslands and developed areas surrounding the site that are suitable for nesting raptors. Given the presence of large trees near the site and raptor foraging habitat (i.e., open fields) in and near the site, it is possible raptors nest near the site. Smaller birds, such as songbirds, could potentially nest in shrubs, grasslands, and particularly in the riparian vegetation along the edges of the intermittent creek in the site.

While no mammals were observed in the site during the surveys, a few common mammals have potential to occur in the site. Coyote (*Canis latrans*), striped skunk (*Mephitis mephitis*), black-tailed hare (*Lepus californicus*), desert cottontail (*Sylvilagus audubonii*), and Virginia opossum (*Didelphis virginiana*) may occur in

the project site on occasion. A few California ground squirrel (*Spermophilus beecheyi*) burrows and Botta's pocket gopher (*Thomomys bottae*) burrows were observed in annual grasslands in the site. A number of species of small rodents including mice (*Mus musculus, Reithrodontomys megalotis,* and *Peromyscus maniculatus*) and voles (*Microtus californicus*) also likely occur in the site.

Based on habitats, only a few amphibians and reptiles have potential to occur in the site and only western fence lizard (*Sceloporus occidentalis*) was observed during the recent surveys. The site is within the range of Pacific chorus frog (*Pseudacris regilla*), bullfrog (*Rana catesbeiana*), western fence lizard (*Sceloporus occidentalis*), western terrestrial garter snake (*Thamnophis elegans*), and gopher snake (*Pituophis melanoleucus*); these and other common amphibian and reptile species may occur in the site.

WATERS OF THE U.S. AND WETLANDS: Waters of the U.S., including wetlands, are broadly defined under 33 Code of Federal Regulations (CFR) 328 to include navigable waterways, their tributaries, and adjacent wetlands. State and federal agencies regulate these habitats and Section 404 of the Clean Water Act requires that a permit be secured prior to the discharge of dredged or fill materials into any waters of the U.S., including wetlands. Both CDFW and ACOE have jurisdiction over modifications to riverbanks, lakes, stream channels and other wetland features.

"Waters of the U.S.", as defined in 33 CFR 328.4, encompasses Territorial Seas, Tidal Waters, and Non-Tidal Waters; Non-Tidal Waters includes interstate and intrastate rivers and streams, as well as their tributaries. The limit of federal jurisdiction of Non-Tidal Waters of the U.S. extends to the "ordinary high water mark". The ordinary high water mark is established by physical characteristics such as a natural water line impressed on the bank, presence of shelves, destruction of terrestrial vegetation, or the presence of litter and debris.

Jurisdictional wetlands are vegetated areas that meet specific vegetation, soil, and hydrologic criteria defined by the ACOE *Wetlands Delineation Manual* and Regional Supplement (ACOE, 1987; 2008). Jurisdictional wetlands are usually adjacent to or hydrologically associated with Waters of the U.S; isolated wetlands are outside federal jurisdiction.

Jurisdictional wetlands and Waters of the U.S. include, but are not limited to, perennial and intermittent creeks and drainages, lakes, seeps, and springs; emergent marshes; riparian wetlands; and seasonal wetlands. Wetlands and Waters of the U.S. provide critical habitat components, such as nest sites and a reliable source of water, for a wide variety of wildlife species.

On February 14, 2019, the Environmental Protection Agency (EPA) and ACOE proposed a new definition of "Waters of the United States" that is intended to clarify the limits of jurisdiction under the Clean Water Act; the Proposed Rule is currently out for public comment. The Proposed Rule proposes as a baseline concept that ''Waters of the U.S.'' are waters within the ordinary meaning of the term, such as oceans, rivers, streams, lakes, ponds, and wetlands. The Proposed Rule clarifies that "Waters of the U.S." encompass traditional navigable waters, including the territorial seas; tributaries that contribute perennial or intermittent flow to such waters; certain ditches; certain lakes and ponds; impoundments of otherwise jurisdictional waters; and wetlands adjacent to other jurisdictional waters. Under the Proposed Rule, not all waters are "Waters of the U.S.". For example, many ditches, constructed features (excavated basins), isolated waters and wetlands, and ephemeral tributaries would no longer meet the definition of "Waters of the U.S.".

WATERS OF THE STATE: Under the Porter-Cologne Water Quality Control Act, "Waters of the State" fall under the jurisdiction of the State Water Resource Control Board (SWRCB) and California Regional Water Quality Control Boards (RWQCBs). The RWQCBs are required to prepare and periodically update water

quality control basin plans, which set forth water quality standards for surface water and groundwater, as well as actions to control non-point and point sources of pollution to achieve and maintain these standards.

Projects that affect Waters of the State may also be required to meet waste discharge requirements (WDRs) of the RWQCBs. SWRCB's Resolution 2008-0026 identified a need to protect Waters of the State that are not subject to CWA Section 404 permitting and associated CWA Section 401 Water Quality Certification. In April 2019, the SWRCB adopted the *State Wetland Definition and Procedures for Discharges of Dredged or Fill Materials to Waters of the State*. When the program is implemented, the Central Valley Regional Water Quality Board is expected to require WDRs for the fill of isolated wetlands that not subject to CWA Section 404 that authorize the impacts by issuing WDRs or in some cases, a WDR waiver.

There are two potentially jurisdictional Waters of the U.S. including wetlands in the site consisting of two intermittent creeks, and a seasonal wetland swale feature (Figure 4 and photographs in Attachment C). None of these features are mapped on the USGS topographic map (Figure 2) as "blue-line" streams, nor are they depicted on the National Wetland Inventory (Attachment D). While a formal wetland delineation would be need to prepared to map jurisdictional boundaries and calculate precise acreages, it is estimated the jurisdictional areas encompass approximately 0.2 acres.

The larger intermittent creek in the site flows from generally northeast to southwest and extends through the approximate center of the site. There is a culvert at the north end of the creek that receives water under Silva Valley Parkway. The upper section of the creek has a mean width of approximately 10 feet, and then it transitions further downstream into more of a seasonal wetland swale feature in the center of the site (Figure 4 and photographs in Attachment C). Groundwater seeping out of the ground supports the swale in this area where

El Dorado Hills, El Dorado County, CA

it is noticeably boggy and was trickling water during the recent survey; other portions of the creek are completely dry. There is an historic stone dam a bit further downstream of the wetland swale portion of the creek that does not contain a culvert, however, the creek continues on the other side of the dam, presumably by water seeping under and/or flowing around the ends of the rock dam. Downstream of the dam, the creek winds southwest through the site under oak woodland habitat until reaching the culvert. Downstream of the dam, the creek has a mean width of approximately 5 feet.

Although the intermittent creek in the north part of the site is much smaller, it shares similar characteristics to the larger creek, and supports the same assortment of trees, shrubs, and emergent wetland vegetation (Figure 4 and photographs in Attachment C). This creek has a mean width of approximately 5 feet and was trickling water via its culvert under Silva Valley Parkway during the survey.

The two creeks convey water during and after rain events. Additionally, the creeks convey water that seeps out of the ground in various places on the site, as well as from off-site areas to the northeast. The beds and banks of the creeks are moderately to well defined, and the limit of jurisdiction is the ordinary high water mark (OHWM) along the banks of the creeks. In the wetland swale portion of the larger intermittent creek, the limit of jurisdiction is the wetland edge, which is defined by the presence of the combination of wetland vegetation, hydric soils, and wetland hydrology.

Both of the creeks are tributaries to an un-named tributary to Carson Creek, which eventually flows in to the Cosumnes River. The Cosumnes River is a jurisdictional water of the U. S. and the tributary relationship of the on-site creeks to the Cosumnes River forms the basis for them being potentially jurisdictional Waters of the U.S. and under the jurisdiction of agencies including ACOE, CDFW, and the RWQCB.

SPECIAL-STATUS SPECIES: Special-status species are plants and animals that are legally protected under the state and/or federal Endangered Species Act or other regulations. The Federal Endangered Species Act (FESA) of 1973 declares that all federal departments and agencies shall utilize their authority to conserve endangered and threatened plant and animal species. The California Endangered Species Act (CESA) of 1984 parallels the policies of FESA and pertains to native California species.

Special-status species also include other species that are considered rare enough by the scientific community and trustee agencies to warrant special consideration, particularly with regard to protection of isolated populations, nesting or denning locations, communal roosts, and other essential habitat. The presence of species with legal protection under the Endangered Species Act often represents a major constraint to development, particularly when the species are wide-ranging or highly sensitive to habitat disturbance and where proposed development would result in a take of these species.

Special-status plants are those which are designated rare, threatened, or endangered and candidate species for listing by the USFWS. Special-status plants also include species considered rare or endangered under the conditions of Section 15380 of the California Environmental Quality Act Guidelines, such as those plant species identified on Lists 1A, 1B and 2 in the Inventory of Rare and Endangered Vascular Plants of California (CNPS, 2019). Finally, special-status plants may include other species that are considered sensitive or of special concern due to limited distribution or lack of adequate information to permit listing or rejection for state or federal status, such as those included on CNPS List 3.

The likelihood of occurrence of listed, candidate, and other special-status species in the site is generally low. Table 3 provides a summary of the listing status and habitat requirements of special-status species that have been documented in the greater project vicinity or for which there is potentially suitable habitat in the

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
PLANTS						
Stebbin's morning-glory	*Calystegia stebbinsii*	E	E	1B	Chaparral or cismontane woodland; red clay soils of the Pine Hill formation, or gabbroic or serpentine soils.	Unlikely: the annual grassland in the site does not provide suitable habitat for Stebbin's morning-glory; no gabbroic or serpentine soils were observed and the site is not in the Pine Hill formation. There are no recorded occurrences of this species in the CNDDB (2019) search area.
Pine Hill ceanothus	*Ceanothus roderickii*	E	R	1B	Chaparral or cismontane woodland; in gabbroic soils.	Unlikely: the annual grassland in the site does not provide suitable habitat for Pine Hill ceanothus; no gabbroic soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 5 miles northeast of the site.
Red Hills soaproot	*Chlorogalum grandiflorum*	None	None	1B	Chaparral, cismontane woodland, or lower montane coniferous forest; in serpentine or gabbroic soils.	Unlikely: there is no suitable habitat within the site for Red Hills soaproot; no serpentine or gabbroic habitats were observed in or near the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 4.5 miles northeast of the site.
Brandegee's clarkia	*Clarkia biloba ssp. brandegeeae*	None	None	1B	Chaparral, cismontane woodland, and lower montane coniferous forest; often on road cuts.	Unlikely: the annual grassland in the site does not provide suitable habitat for Brandegee's clarkia. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 3.5 miles northwest of the site.
Tuolumne button celery	*Eryngium pinnatisectum*	None	None	1B	Vernal pools and other mesic habitats within cismontane woodland and lower montane coniferous forest; at elevations between 70 and 900 meters.	Unlikely: the annual grassland in the site does not provide suitable habitat for Tuolumne button celery. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 11 miles southeast of the site.

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
Pine Hill flannelbush	*Fremontodendron decumbens*	E	R	1B	Chaparral, cismontane woodland, or openings in lower montane coniferous forest; in serpentine or gabbroic soils.	Unlikely: annual grassland in the site does not provide suitable habitat for Pine Hill flannelbush; no serpentine or gabbroic soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 5 miles northeast of the site.
El Dorado bedstraw	*Galium californicum ssp. sierrae*	E	R	1B	Chaparral, cismontane woodland, or lower montane coniferous forest; gabbroic soils.	Unlikely: the annual grassland habitats in the site are not suitable for El Dorado bedstraw; no gabbroic soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 6 miles northeast of the site.
Bisbee Peak rush-rose	*Helianthemum suffrutescens*	None	None	3	Serpentine, gabbroic, or Ione formation soils in Chaparral.	Unlikely: there is no chaparral habitat in the site and no areas of serpentine, gabbroic, or Ione formation soils were observed within the site. The nearest occurrence of Bisbee Peak rush-rose in the CNDDB (2019) search area is approximately 3.5 miles northeast of the site.
Layne's ragwort	*Packera layneae*	T	R	1B	Chaparral or cismontane woodland; serpentine or gabbroic soils	Unlikely the annual grassland habitats in the site are not suitable for Layne's ragwort; no serpentine or gabbroic soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 3.5 miles northeast of the site.
Sanford's arrowhead	*Sagittaria sanfordii*	None	None	1B	Standing or slow moving freshwater ponds, marshes, and ditches.	Unlikely: the site does not provide suitable habitat for Sanford's arrowhead. The nearest occurrence of Sanford's arrowhead in the CNDDB (2019) search area is approximately 3.5 miles southwest of the site.
El Dorado County mule ears	*Wyethia reticulata*	None	None	1B	Chaparral, cismontane woodland, or lower montane coniferous forest; clay or gabbroic soils.	Unlikely: the ruderal grassland habitats in the site are not suitable for El Dorado County mule ears; no gabbroic or clay soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 4 miles northeast of the site.

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
WILDLIFE						
BIRDS						
Swainson's hawk	*Buteo swainsoni*	None	T	N/A	Nesting: large trees, usually within riparian corridors. Foraging: agricultural fields and annual grasslands.	Unlikely: the open, annual grassland vegetation in the site provides marginally suitable foraging habitat for Swainson's hawks. There are several large trees in and in close proximity to the site that may be used for nesting. However, the site is on east edge of the nesting range of this species. There are only two records of nesting Swainson's hawks in the CNDDB (2019) search area; the nearest occurrence is approximately 4 miles southwest of the site.
Burrowing owl	*Athene cunicularia*	None	None	N/A	Open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation.	Unlikely: the annual grassland in the site provides limited burrow habitat for burrowing owls. No ground squirrels were observed in the site, but a few ground squirrel burrows were observed. The nearest occurrence of burrowing owl in the CNDDB (2019) search area is approximately 2 miles southwest of the site.
Tricolored blackbird	*Agelaius tricolor*	None	CE	N/A	Nests in dense brambles and emergent wetland vegetation associated with open water habitat.	Unlikely: the intermittent creeks in the site are very small and provide poor quality and only marginally suitable nesting habitat for tricolored blackbird. The nearest occurrence of tricolored blackbird in the CNDDB (2019) search area is approximately 3 miles southeast of the site.
Golden eagle	*Aquila chrysaetos*	None	FP	N/A	Nesting areas are associated with cliff-walled canyons and large trees. Forages in rolling hills and mountain areas	Unlikely: the large trees within and in close proximity to the site provide low quality nesting habitat for golden eagle, as they prefer ledges on cliff walls or very large trees isolated from any type of disturbance for nesting. The rolling hills in the site provides potential foraging habitat for this species. The nearest occurrence of golden eagle in the CNDDB (2019) search area is approximately 2 miles northwest of the site.

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
Bald eagle	*Haliaeetus leucocephalus*	None	E	N/A	Nests in large trees along rivers, ocean shores, and lake margins.	Unlikely: although there are large trees within and in close proximity to the site, bald eagles are known to nest near large bodies of water. Bald eagles could fly over or forage in the site on occasion. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 2.5 miles northeast of the site.
California black rail	*Laterallus jamaicensis coturniculus*	None	T	N/A	Mainly inhabits salt marshes bordering larger bays.	Unlikely: the site does not provide suitable habitat for California black rail. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 2 miles south of the site.
White-tailed kite	*Elanus leucurus*	None	FP	N/A	Herbaceous lowlands with variable tree growth and dense population of voles.	Unlikely: the site provides potentially suitable foraging habitat for white-tailed kite, and there are suitable nest trees in and near the site. The nearest occurrence of white-tailed kite in the CNDDB (2019) search area is approximately 2.5 miles northwest of the site.
Grasshopper sparrow	*Ammodramus savannum*	None	SC	N/A	Dense grasslands, lowland plains, and lower mountain slopes; prefers native grasses with scattered shrubs.	Unlikely: the site provide poor quality habitat for grasshopper sparrow. This species may occasionally fly over or forage in the area. The nearest occurrence of grasshopper sparrow in the CNDDB (2019) search area is approximately 9 miles southwest of the site.
REPTILES & AMPHIBIANS						
California red-legged frog	*Rana aurora draytonii*	T	SC	N/A	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation.	Unlikely: there is no suitable aquatic habitat for California red-legged frog in the project site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 5.5 miles northwest of the site. The site is not within designated critical habitat for California red-legged frog (USFWS, 2006).

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
Foothill yellow-legged frog	*Rana boylii*	None	SC	N/A	Perennial water bodies (i.e., streams and ponds) with abundant riparian vegetation; not found on Central Valley floor.	Unlikely: the site does not contain suitable aquatic habitat for foothill yellow-legged frog. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 3.5 miles northwest of the site.
California tiger salamander	*Ambystoma californiense*	T	T	N/A	Breeds in seasonal water bodies such as deep vernal pools or stock ponds. Requires small mammal burrows for summer refugia.	Unlikely: there are no potentially suitable breeding ponds for California tiger salamander in or near the site. There are no occurrences of this species recorded in the CNDDB (2019) within the search area. The site is not within an area designated critical habitat for California tiger salamander (USFWS, 2005a).
Giant garter snake	*Thamnophis gigas*	T	T	N/A	Freshwater marsh and low gradient streams; uses drainage canals and irrigation ditches, primarily for dispersal or migration.	Unlikely: the site does not provide suitable habitat for giant garter snake. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 11 miles southeast of the site.
Western pond turtle	*Emys marmorata*	None	SC	N/A	Permanent or semi-permanent water bodies; require basking sites such as logs.	Unlikely: the site does not provide suitable habitat for western pond turtle. The nearest occurrence of western pond turtle in the CNDDB (2019) search area is approximately 2 miles south of the site.
Western spadefoot	*Spea hammondii*	None	SC	N/A	Breeds and lays eggs in seasonal water bodies such as deep vernal pools or stock ponds	Unlikely: the intermittent creeks in the site are shallow and do not provide suitable habitat for western spadefoot. The nearest occurrence of western spadefoot in the CNDDB (2019) search area is approximately 4 miles northwest of the site.

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
Fish						
Delta smelt	*Hypomesus transpacificus*	T	T	N/A	Shallow lower delta waterways with submersed aquatic plants and other suitable refugia.	None: there is no suitable aquatic habitat for fish in the site. There are no occurrences of delta smelt recorded in the CNDDB (2019) within the search area. The site is not within designated critical habitat for delta smelt (USFWS, 1994).
Central Valley steelhead	*Oncorhynchus mykiss*	T	None	N/A	Riffle and pool complexes with adequate spawning substrates within Central Valley drainages.	None: there is no suitable aquatic habitat for fish in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 11 miles south of the site. The site is not within designated critical habitat for Central Valley steelhead (NOAA, 2005).
INVERTEBRATES						
Vernal pool fairy shrimp	*Branchinecta lynchi*	T	None	N/A	Vernal pools and seasonally inundated depressions in the Central Valley.	Unlikely: there are no vernal pools in the project site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 3.5 miles northwest of the site. The site is not within designated critical habitat for vernal pool fairy shrimp (USFWS, 2005b).
Vernal pool tadpole shrimp	Lepidurus packardi	E	None	N/A	Vernal pools	Unlikely: there are no vernal pools in the project site. There are no occurrences of vernal pool tadpole shrimp recorded in the CNDDB (2019) within the search area. The site is not within designated critical habitat for vernal pool tadpole shrimp (USFWS, 2005b).
Valley elderberry longhorn beetle	*Desmocerus californicus dimorphus*	T	None	N/A	Elderberry shrubs in the Central Valley and surrounding foothills	Unlikely: there are no blue elderberry shrubs in the project site. The nearest occurrence of valley elderberry longhorn beetle in the CNDDB (2019) search area is approximately 3.5 miles northwest of the site.

Notes:

1 T = Threatened; E = Endangered; R = Rare; CE = Candidate for Endangered Status; SC=State of California Species of Special Concern; FP = Fully Protected Species.

2 CNPS List 1B includes species that are rare, threatened, or endangered in California and elsewhere; List 3 includes plants about which more information is needed.

greater project vicinity. This table also includes an assessment of the likelihood of occurrence of each of these species in the site. The evaluation of the potential for occurrence of each species is based on the distribution of regional occurrences (if any), habitat suitability, and field observations.

SPECIAL-STATUS PLANTS: Ten (10) species of special-status plants were identified in the CNDDB (2019) search: Pine Hill ceanothus (*Ceanothus roderickii*), Red Hills soaproot (*Chlorogalum grandiflorum*), Brandegee's clarkia (*Clarkia biloba ssp. brandegeeae*), Tuolumne button celery (*Eryngium pinnatisectum*), Pine Hill flannelbush (*Fremontodendron decumbens*), El Dorado bedstraw (*Galium californicum ssp. sierrae*), Bisbee Peak rush-rose (*Helianthemum suffrutescens*), Layne's ragwort (*Packera layneae*), Sanford's arrowhead (*Sagittaria sanfordii*), and El Dorado County mule ears (*Wyethia reticulata*) (Table 3 and Attachment B). Stebbin's morning-glory (*Calystegia stebbinsii*) is not recorded in the CNDDB within the search area, but is on the USFWS IPaC Trust Report (Attachment B).

Special-status plants generally occur in relatively undisturbed areas in vegetation communities such as vernal pools, marshes and swamps, chenopod scrub, seasonal wetlands, riparian scrub, and areas with unusual soils. The grasslands in the site have been highly disturbed by historic mining, prior development, grazing, grading related to construction of adjacent roads and on adjacent parcels, and periodic disking for weed abatement, and off-road vehicle trespass. Due to lack of even moderately suitable habitat for special-status plants, it is unlikely special-status plants occur in the site.

SPECIAL-STATUS WILDLIFE: The potential for intensive use of the site by special-status wildlife species is also low. Fifteen (16) special-status wildlife species were recorded in project area in the CNDDB (2019) query: Swainson's hawk (*Buteo swainsonii*), burrowing owl, tricolored blackbird (*Agelaius tricolor*), golden eagle (*Aquila chrysaetos*), bald eagle (*Haliaeetus leucocephalus*), California black rail (*Laterallus jamaicensis coturniculus*), white-tailed kite (*Elanus leucurus*),

grasshopper sparrow (*Ammodramus savannum*), California red-legged frog (*Rana aurora draytonii*), foothill yellow-legged frog (*Rana boylii*), giant garter snake (*Thamnophis gigas*), western pond turtle (*Emys marmorata*), western spadefoot (*Spea hammondii*), Central Valley steelhead (*Oncorhynchus mykiss*), vernal pool fairy shrimp (*Branchinecta lynchi*) and valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*). California tiger salamander (*Ambystoma californiense*), Delta smelt (*Hypomesus transpacificus*), and vernal pool tadpole shrimp (*Lepidurus packardi*) are not recorded in the CNDDB within the search area, but are on the USFWS IPaC Trust Report (Attachment B).

While the project site may have provided habitat for special-status wildlife species at some time in the past, agriculture, mining, and development have substantially modified natural habitats in the greater project vicinity, including those within the site. Of the species in Table 3, Swainson's hawk and burrowing owl are the only species with more than a very low potential to occur in the project site on more than a transitory or very occasional basis and are discussed further below. Other special-status birds may fly over or forage in the area on occasion, but would not be expected to nest in or adjacent to the project site, primarily due to poor habitat quality.

SWAINSON'S HAWK: The Swainson's hawk is a migratory hawk listed by the State of California as a Threatened species. The Migratory Bird Treaty Act and Fish and Game Code of California protect Swainson's hawks year-round, as well as their nests during the nesting season (March 1 through September 15). Swainson's hawk are found in the Central Valley primarily during their breeding season, a population is known to winter in the San Joaquin Valley.

Swainson's hawks prefer nesting sites that provide sweeping views of nearby foraging grounds consisting of grasslands, irrigated pasture, hay, and wheat crops. Most Swainson's hawks are migratory, wintering in Mexico and breeding in California and elsewhere in the western United States. This raptor generally

arrives in the Central Valley in mid-March, and begins courtship and nest construction immediately upon arrival at the breeding sites. The young fledge in early July, and most Swainson's hawks leave their breeding territories by late August.

The site is within the nesting range of Swainson's hawks and the CNDDB (2019) contains a few records of nesting Swainson's hawks in the greater project vicinity (Attachment B). The nearest occurrence of Swainson's hawk in the CNDDB (2019) search area is approximately 4 miles southwest of the site.

The open, annual grasslands in the site provide marginal, yet potentially suitable Swainson's hawk foraging habitat. The large trees along the intermittent creek in the site and relatively large trees near the site could be used by nesting Swainson's hawks. No large stick nests were observed in any of the trees within the site and no Swainson's hawks were observed during the surveys. Due to the location of the site along the extreme east edge of the nesting range of this species, it is unlikely Swainson's hawks nest in or near the site, or forage in the site intensively, if at all.

BURROWING OWL: The Migratory Bird Treaty Act and Fish and Game Code of California protect burrowing owls year-round, as well as their nests during the nesting season (February 1 through August 31). Burrowing owls are a year-long resident in a variety of grasslands as well as scrub lands that have a low density of trees and shrubs with low growing vegetation; burrowing owls that nest in the Central Valley may winter elsewhere.

The primary habitat requirement of the burrowing owl is small mammal burrows for nesting. The owl usually nests in abandoned ground squirrel burrows, although they have been known to dig their own burrows in softer soils. In urban areas, burrowing owls often utilize artificial burrows including pipes, culverts, and piles of concrete pieces. This semi-colonial owl breeds from March through

August, and is most active while hunting during dawn and dusk. The nearest record of burrowing owls in the CNDDB (2019) is approximately 2 miles southwest of the site.

The absence of extensive burrow habitat, periodic disking and/or mowing of the on-site grasslands for weed abatement, and development in parcels surrounding the site reduces the likelihood of burrowing owls using the site for nesting. No burrowing owls were observed in the project site and only a few ground squirrel burrows were observed in the site. None of the burrows had any evidence of past or current use by owls. In its current condition, the site provides very limited potential nesting habitat for nesting burrowing owls. However, the site is within the species range and burrowing owls may fly over the site on an occasional basis, and may nest in the site in the future if burrow habitat becomes available.

OTHER SPECIAL-STATUS WILDLIFE SPECIES: The site does not provide highly suitable habitat for other special-status wildlife species. Special-status birds and may fly over the area on occasion, but few, if any, would be expected to use on-site habitats on more than an occasional or transitory basis. While there are shrubby willows and small amounts of emergent wetland vegetation in the intermittent creeks that are potentially suitable for nesting tricolored blackbirds, this vegetation is not near a large body of open water and the vegetation is not dense or extensive. There are no elderberry shrubs in the site, precluding the potential occurrence of valley elderberry longhorn beetle.

The site does not provide suitable aquatic habitat for any species of fish, California red-legged frog, California tiger salamander, giant garter snake, foothill yellow-legged frog, western spadefoot, or western pond turtle. There are no vernal pools or seasonal wetlands in the site for vernal pool branchiopods (i.e., fairy and tadpole shrimp).

CRITICAL HABITAT: The site is not in designated critical habitat of California red-legged frog (USFWS, 2006a), California tiger salamander (USFWS, 2005b), federally listed vernal pool shrimp or plants, such as Sacramento Orcutt grass (USFWS, 2005a), delta smelt (USFWS, 1994) Central Valley steelhead (NOAA, 2005) valley elderberry longhorn beetle (USFWS, 1980a) (Attachment E).

Conclusions and Recommendations

- The body of the site is an open field vegetated in upland grasses and weeds that has is routinely disked. The annual grassland habitats in the site are biologically unremarkable.

- Potentially jurisdictional Waters of the U.S. and wetlands in the site include, two ephemeral creeks, and a seasonal wetland swale; it is estimated these areas encompass approximately 0.2+/- acres. A formal wetland delineation would be need to prepared to map jurisdictional boundaries and calculate precise acreages.

- Avoidance of jurisdictional Waters of the U.S. and wetlands is recommended, if possible. If complete avoidance is infeasible (which appears likely), impacts should be minimized to the maximum extent practicable, and permits from ACOE, CDFW, RWQCB will be then be needed prior to the placement of any fill material (e.g., culverts, fill dirt, rock) within jurisdictional Waters of the U.S. As the acreage is under 0.5 acres, it is expected ACOE would authorize any fills under a Nationwide Permit. Securing permits for the fill of jurisdictional Waters of the U.S. and wetlands is usually time consuming, and it is expected it will take approximately 9 to 12 months to secure all of the needed permits.

- Due to a lack of suitable habitat, it is unlikely that special-status plants occur in the site.

- Swainson's hawk and burrowing owl are the only species with more than a very low potential to occur in the project site on more than a transitory or very occasional basis. Conversion of 17+/- acres of upland grassland habitat to development in the east part of the species' ranges is a less than significant reduction in potential foraging habitat for Swainson's hawk, burrowing owl, and other wildlife.

- A pre-construction survey for burrowing owls within 250 feet of the site are recommended if construction commences between February 1 and August 31. If occupied burrows are found, a qualified biologist should determine the need (if any) for temporal restrictions on construction. The determination should be pursuant to criteria set forth by CDFW (CDFG, 2012).

- A pre-construction survey for nesting Swainson's hawks within 0.25 miles of the project site is recommended if construction commences between March 1 and September 15. If active nests are found, a qualified biologist should determine the need (if any) for temporal restrictions on construction. The determination should utilize criteria set forth by CDFW (CDFG, 1994).

- The site is not within designated critical habitat for any federally listed species.

- Trees, shrubs, and grasslands in the site could be used by other birds protected by the Migratory Bird Treaty Act of 1918. If tree removal is scheduled during the nesting season of raptors (January 1 through July 31), a pre-construction survey for nesting raptors is recommended. If other vegetation removal or construction commences during the general avian nesting season (March 1 through July 31), a pre-construction survey for all species of nesting birds is recommended. If active nests are found, work in the vicinity of the nests should be delayed until the young fledge.

We hope this information is useful. Please call me at (209) 745-1159 with any questions.

Sincerely,

Diane S. Moore, M.S.
Principal Biologist

IPaC **U.S. Fish & Wildlife Service**

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

El Dorado County, California

Local office

Sacramento Fish And Wildlife Office

(916) 414-6600
(916) 414-6713

Federal Building
2800 Cottage Way, Room W-2605
Sacramento, CA 95825-1846

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population, even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

NOT FOR CONSULTATION

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information.
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Reptiles

NAME	STATUS

Giant Garter Snake Thamnophis gigas — Threatened
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/4482

Amphibians

NAME	STATUS

California Red-legged Frog Rana draytonii — Threatened
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/2891

California Tiger Salamander Ambystoma californiense — Threatened
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/2076

Fishes

NAME	STATUS

Delta Smelt Hypomesus transpacificus — Threatened
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/321

Insects

NAME	STATUS

Valley Elderberry Longhorn Beetle Desmocerus californicus dimorphus — Threatened
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/7850

Crustaceans

NAME	STATUS

Vernal Pool Fairy Shrimp Branchinecta lynchi — Threatened
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/498

Vernal Pool Tadpole Shrimp Lepidurus packardi — Endangered
There is **final** critical habitat for this species. Your location is outside the critical habitat.
https://ecos.fws.gov/ecp/species/2246

NOT FOR CONSULTATION

Flowering Plants

NAME	STATUS
El Dorado Bedstraw Galium californicum ssp. sierrae No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/5209	Endangered
Layne's Butterweed Senecio layneae No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/4062	Threatened
Pine Hill Ceanothus Ceanothus roderickii No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/3293	Endangered
Pine Hill Flannelbush Fremontodendron californicum ssp. decumbens No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/4818	Endangered
Stebbins' Morning-glory Calystegia stebbinsii No critical habitat has been designated for this species. https://ecos.fws.gov/ecp/species/3991	Endangered

NOT FOR CONSULTATION

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php
- Measures for avoiding and minimizing impacts to birds http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/conservation-measures.php
- Nationwide conservation measures for birds http://www.fws.gov/migratorybirds/pdf/management/nationwidestandardconservationmeasures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NOT FOR CONSULTATION

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
Bald Eagle Haliaeetus leucocephalus This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Jan 1 to Aug 31
California Thrasher Toxostoma redivivum This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Jan 1 to Jul 31

Clark's Grebe Aechmophorus clarkii — Breeds Jan 1 to Dec 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Lawrence's Goldfinch Carduelis lawrencei — Breeds Mar 20 to Sep 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Lewis's Woodpecker Melanerpes lewis — Breeds Apr 20 to Sep 30
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9408

Nuttall's Woodpecker Picoides nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

Oak Titmouse Baeolophus inornatus — Breeds Mar 15 to Jul 15
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9656

Rufous Hummingbird selasphorus rufus — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/8002

Song Sparrow Melospiza melodia — Breeds Feb 20 to Sep 5
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA

Spotted Towhee Pipilo maculatus clementae — Breeds Apr 15 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/4243

NOT FOR CONSULTATION

Wrentit Chamaea fasciata — Breeds Mar 15 to Aug 10
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Yellow-billed Magpie Pica nuttalli — Breeds Apr 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9726

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

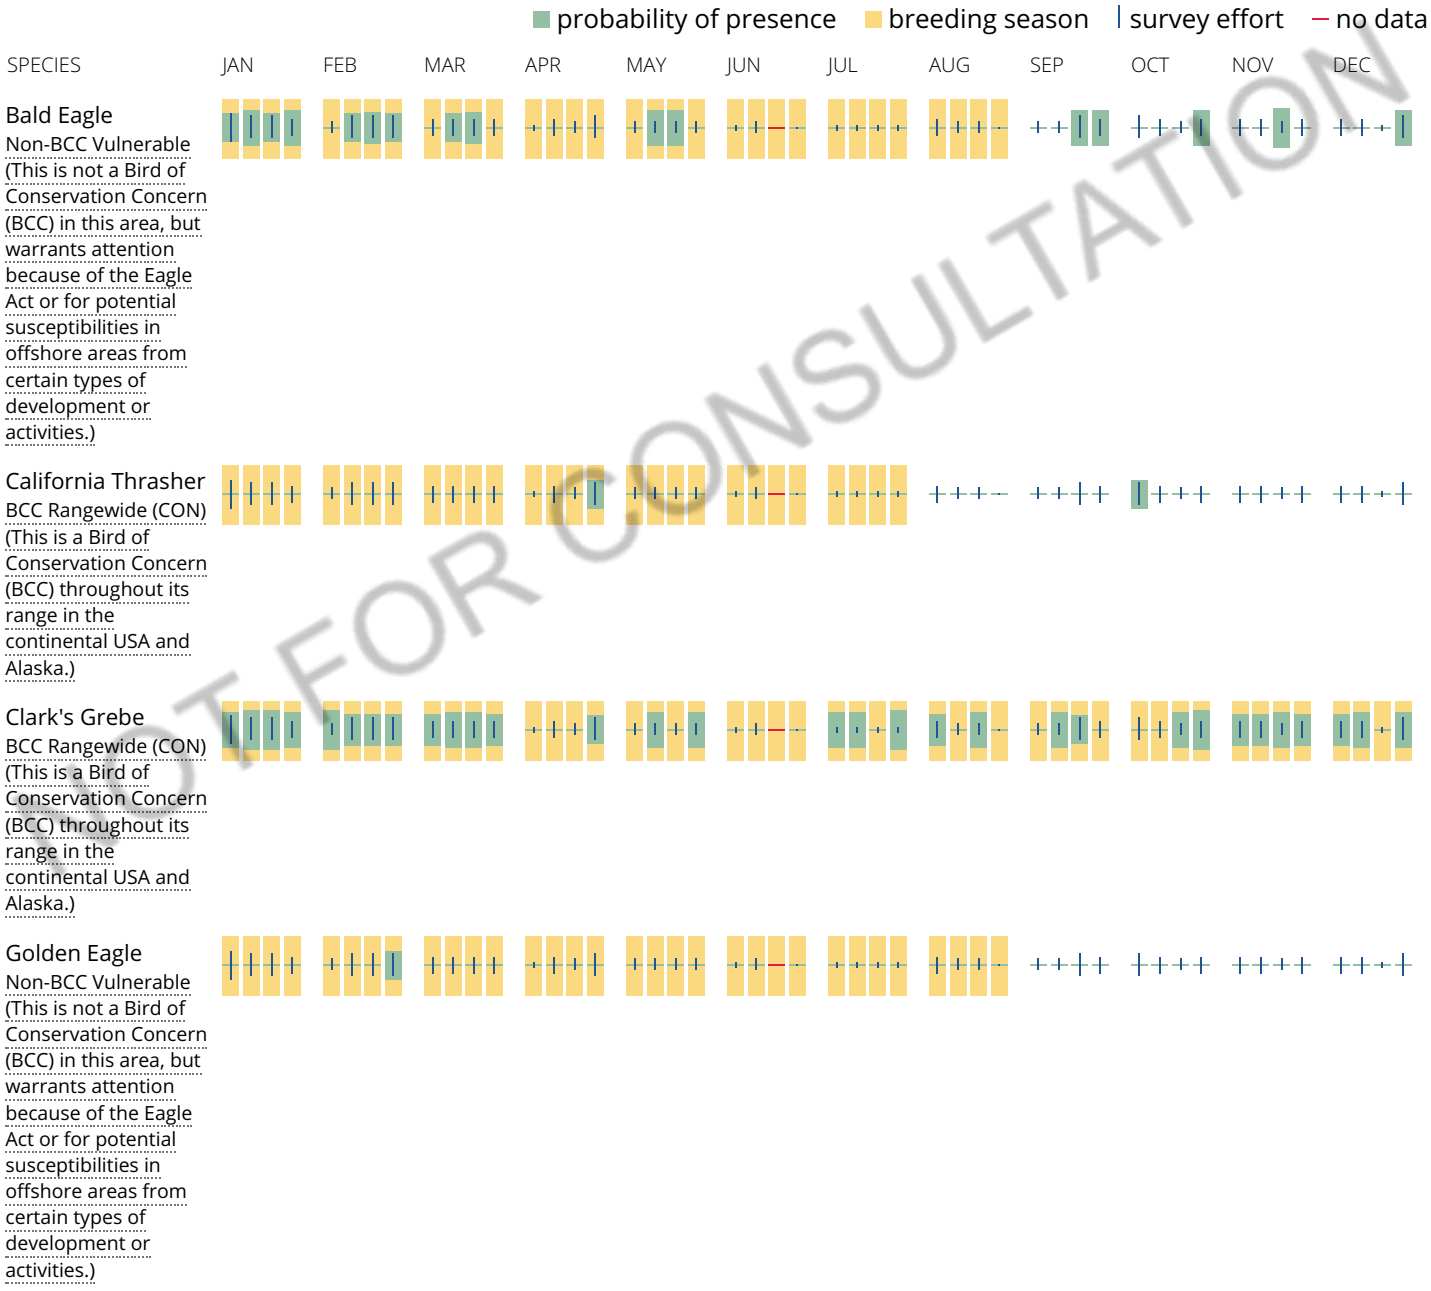
How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (■)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.

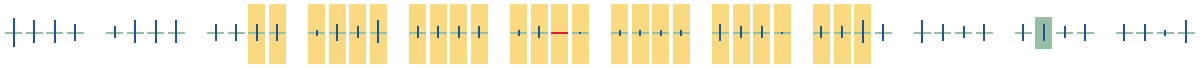
Survey Effort (|)



NOT FOR CONSULTATION

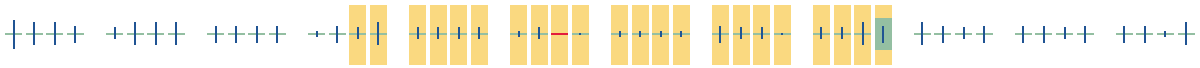
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.

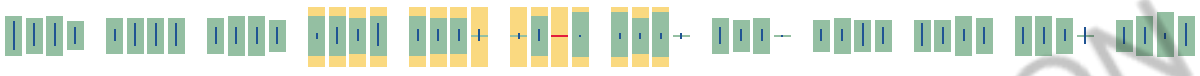


No Data (–)
A week is marked as having no data if there were no survey events for that week.

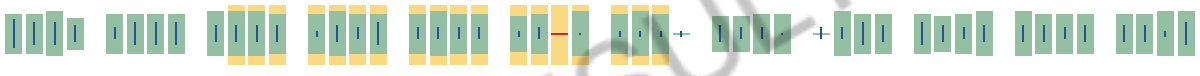
Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.



DRAFT FOR CONSULTATION



Lawrence's Goldfinch
BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)

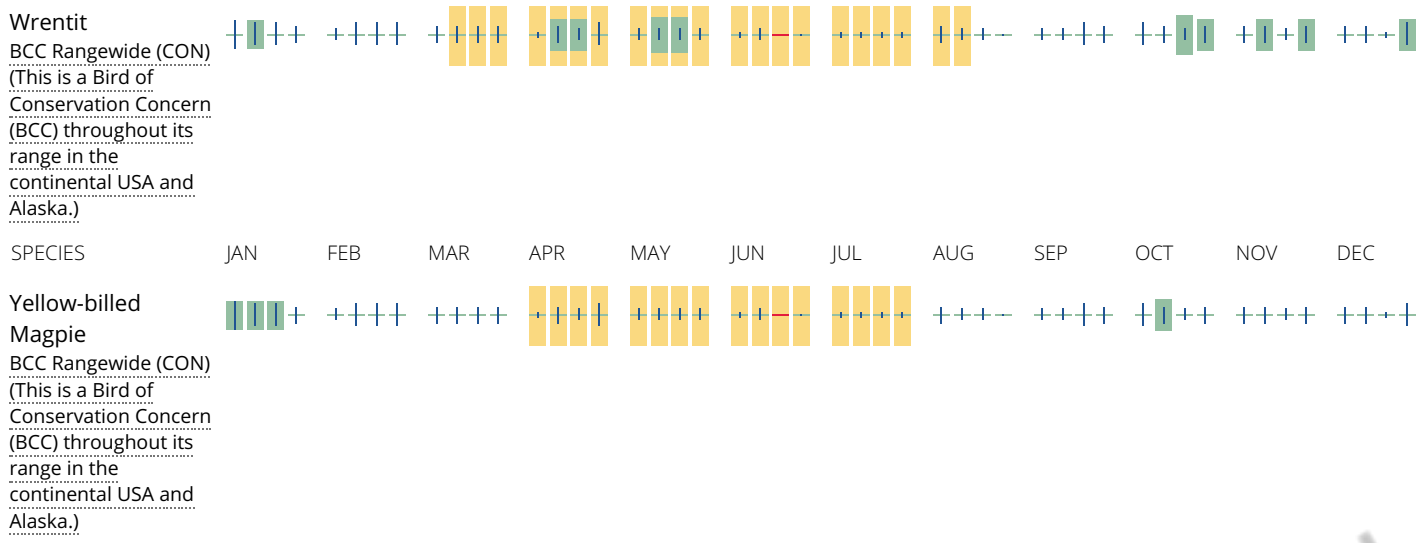


Lewis's Woodpecker
BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)

Nuttall's Woodpecker
BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)

Oak Titmouse
BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)

Rufous Hummingbird
BCC Rangewide (CON) (This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.)



Song Sparrow
BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)

Spotted Towhee
BCC - BCR (This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA)

NOT FOR CONSULTATION

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures and/or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the AKN Phenology Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

NOT FOR CONSULTATION

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there), the Cornell Lab of Ornithology Neotropical Birds guide. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ “What does IPaC use to generate the migratory birds potentially occurring in my specified location”. Please be aware this report provides the “probability of presence” of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the “no data” indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential

NOT FOR CONSULTATION

impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

This location overlaps the following wetlands:

FRESHWATER EMERGENT WETLAND

- PEM1A
- PEM1Ch

RIVERINE

- R4SBC

A full description for each wetland code can be found at the National Wetlands Inventory website

Data limitations

NOT FOR CONSULTATION

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

Typical upland vegetation found throughout the majority of the site, looking north from the south edge of the site; 07/26/19.

West edge of the site, looking northwest along Clarksville Crossing; 07/26/19.

East edge of the site, looking northwest along Silva Valley Parkway; 07/26/19.

Former home site in the north part of the site, looking north 07/29/19. There is several pieces of large concrete debris likely associated with the former home site in the north part of the site.

South edge of the site, looking west from the southeast corner of the site; 07/26/19.

Large concrete structure in the north part of the site, looking north; 07/29/19. The purpose of this structure is not known, but is believed to be associated with a former residence just north of this location.

North end of the concrete structure mentioned above, looking southwest 07/29/19.

Cluster of trees around the smaller creek in the north tip of the site, looking southeast; 07/26/19.

Culvert associated with the small creek mentioned above, looking southwest; 07/26/19. This creek receives water from the adjacent parcel through a culvert under Silva Valley Parkway.

Roadside ditch along the east edge of the site, looking southeast along Silva Valley Parkway; 07/26/19. Further south this ditch connects with the culvert inlet into the main creek in the site.

Area where the main creek in the site receives water from the adjacent parcel under Silva Valley Parkway, looking south; 07/26/19. Although the creek was flowing further southwest, this area was dry.

East panhandle of the seasonal wetland swale within the body of the site, looking northwest from the north part of the swale; 07/29/19.

Another fork off of the seasonal wetland swale within the body of the site, looking southwest from the north part of the swale; 07/29/19.

Main seasonal wetland swale channel that extends through the body of the site, looking southwest from the north part of the swale. A little further south, the wetland swale branches off in two areas before a large blackberry stand.

Historic stone dam across the seasonal wetland swale, looking south from the center part of the swale; 07/29/19. The seasonal wetland swale bumps into this the dam, which does not contain a culvert.

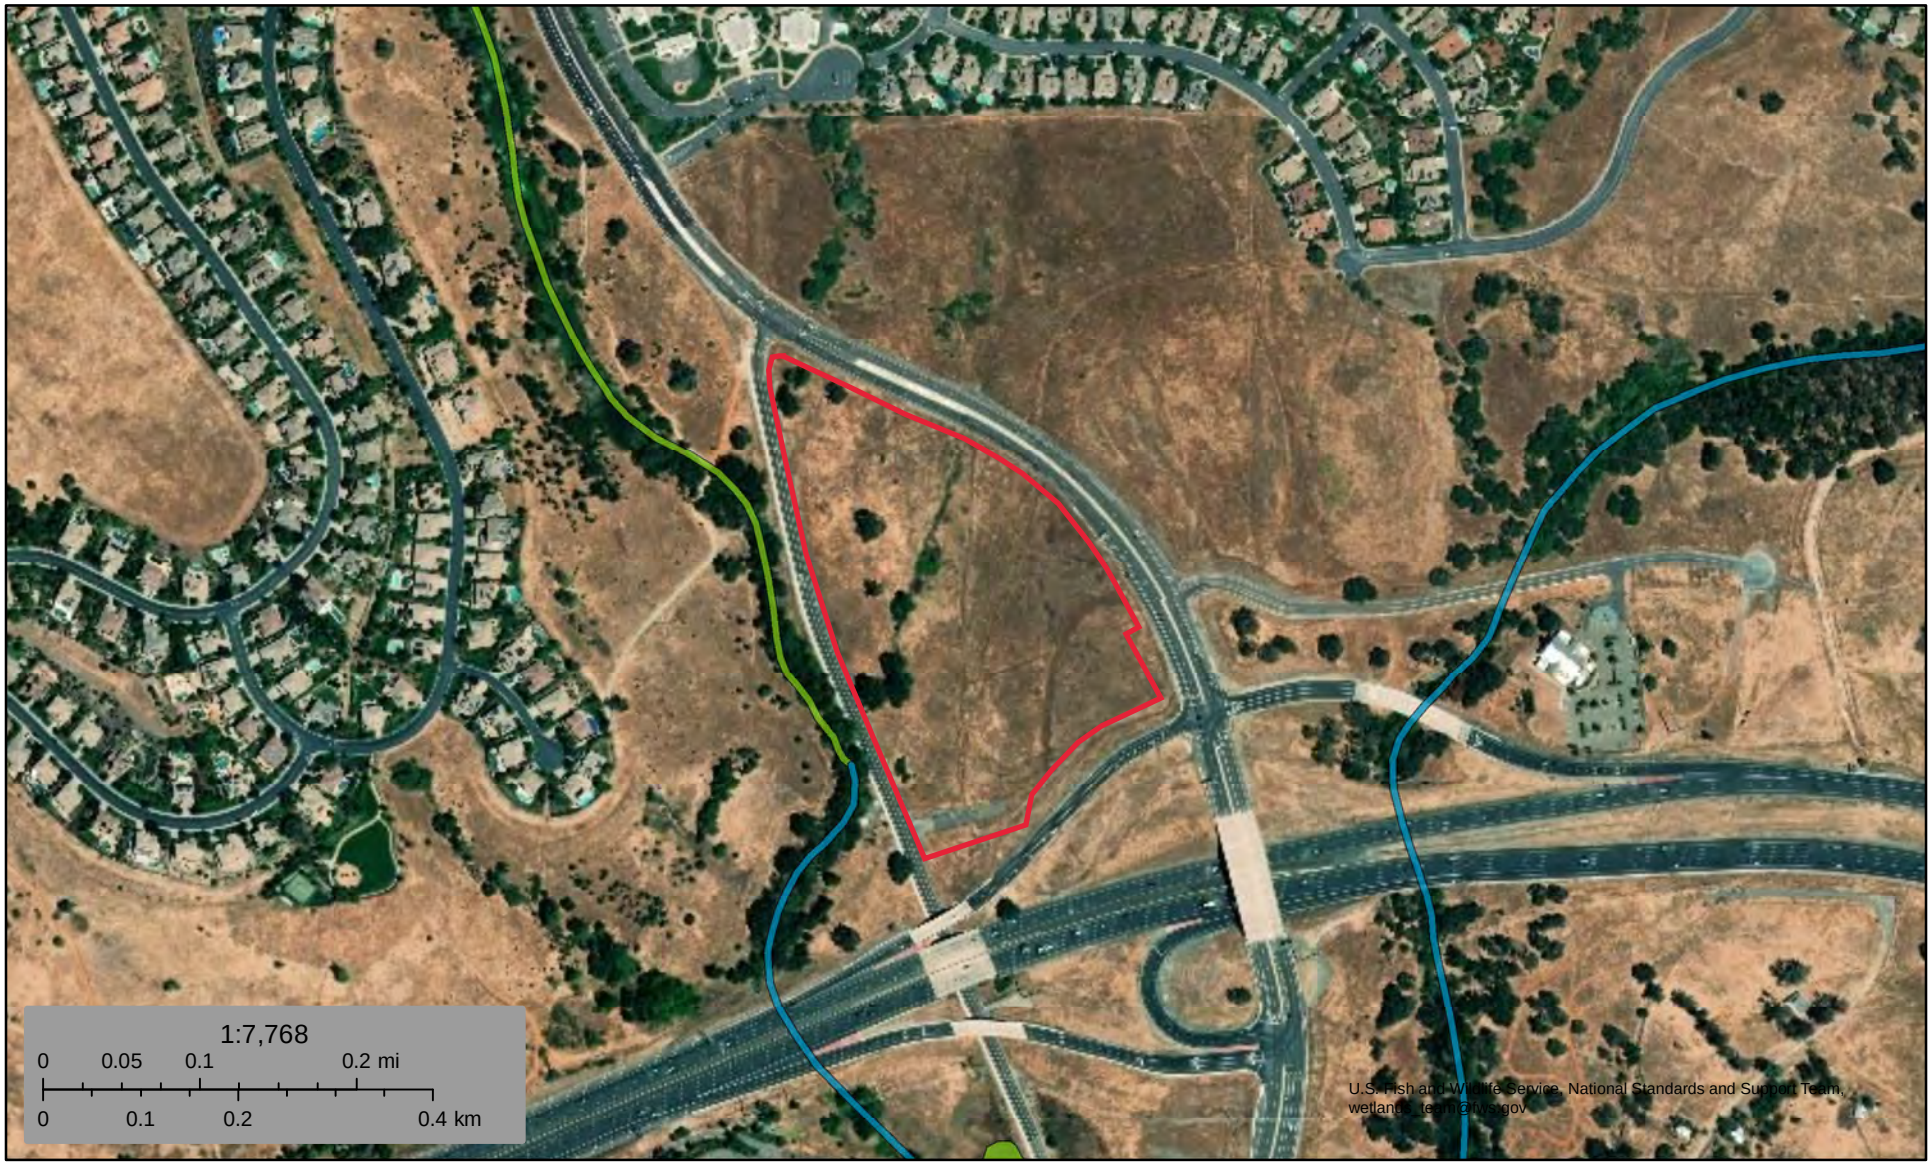
Close-up of the historic dam, looking southwest (downstream); 07/29/19.

Close-up of the historic dam, looking northeast (upstream); 07/29/19. There is wetland vegetation on either side of the dam.

The west end of the small creek that runs northeast to southwest in the body of the site, looking north (upstream); 07/26/19.

Culvert inlet to the creek mentioned above, looking northwest along Crarksville Crossing; 07/26/19.

Riparian corridor along the west side of Clarksville Crossing; 07/26/19. The on-site creeks drain in to this relatively larger off-site creek.



Intermittent creek just west of the site, looking south; 07/26/19.

Attention: Ms. Michael Okuma, NCARB
Director of Real Estate Development

SUBJECT: Phase I Environmental Site Assessment
Proposed Costco Warehouse and Gas Station
Silva Valley Parkway
El Dorado Hills, El Dorado County, California
CW: 18-0487

Dear Mr. Okuma:

Enclosed is the Phase I Environmental Site Assessment (ESA) report for the above referenced property. We trust the information presented in this report meets your needs at this time.

An executive summary is provided. However, we recommend that the report be read in its entirety for a comprehensive understanding of the items contained therein.

We appreciate the opportunity to provide these services to Costco Wholesale Corporation. If you have questions regarding this report or if we can be of further service, please do not hesitate to contact Paolo Dizon at 949.727.4466 or Andy Franks, Kleinfelder's Client Account Manager for Costco, at 480.650.4905.

Sincerely,

KLEINFELDER

1 EXECUTIVE SUMMARY

This report documents a Phase I Environmental Site Assessment (ESA) performed by Kleinfelder for Costco Wholesale Corporation (Costco / Client), of the location of a proposed Costco warehouse and gas station (Site) in the unincorporated El Dorado Hills community of El Dorado County, California (the Site). Kleinfelder understands the Client intends to purchase the Site.

This report was prepared using the ASTM International Designation E 1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (the "ASTM Standard Practice"), the All Appropriate Inquiry (AAI) section of the Small Business Liability Relief and Revitalization Act (the Federal Brownfields Law), and Costco's Development Requirements, Version 2018, dated October 26, 2018. The Phase I ESA findings include the following:

- The Site is located on vacant land east of Silva Valley Parkway and north of the intersection of Silva Valley Parkway and Tong Road, approximately 725 feet north of Highway 50 in the unincorporated El Dorado Hills community of El Dorado County, California (see Figure 1). It consists of approximately 25 acres of land, which is a portion of a larger parcel of land identified as El Dorado County Assessor's Parcel Number (APN) 122-720-15. This larger parcel consists of land on both the north and south sides of Silva Valley Parkway. The Site consists of the portion of the larger parcel located on the north side of Silva Valley Parkway.
- The Site was historically undeveloped, though some earthwork appears to have occurred in the southern portion of the Site between 2012 and 2016, based on aerial photographs from those years. This earthwork appears to be related to Highway 50 construction activities, and realignment of Silva Valley Parkway and Tong Road in 2012 and 2013 (see next bullet).
- Two Asbestos Dust Mitigation Plan Applications were approved by the El Dorado County Air Quality Management District (AQMD) in 2012 and 2013 for grading/excavation activities associated with construction of a Highway 50 off-ramp, south of the Site. A March 2008 Caltrans report, entitled *Aerially Deposited Lead, Naturally Occurring Asbestos and Lead Containing Paint Site Investigation and Bridge Survey Report*, prepared for the Highway 50 Site Investigation project, was included with one of the Asbestos Dust Mitigation Plan Applications. This report indicated that 30 composite soil samples collected from the median and proposed sound wall areas (sample locations were not identified)

Copyright 2019 Kleinfelder

were analyzed for the presence of naturally-occurring asbestos (NOA), total lead and chromium. One out of 24 composite soil samples contained 0.25 percent (%) chrysotile asbestos; remaining samples did not contain detectable NOA. Total lead and chromium were detected in soil samples analyzed, but at concentrations reported below California hazardous waste threshold levels. A figure presented in this report indicates that the southern portion of the Site was used to temporarily stockpile soil that was to be covered with plastic and surrounded by fiber rolls. Hydroseed was to be planted at the end of the project. A Rough Grading Plan dated August 2013 indicates that 20,000 cubic yards of existing stockpiled soil and an additional 100,000 cubic yards of soil from a "Borrow Area" would be used as part of the construction of a future Highway 50 off-ramp, and future alignments of Tong Road and Silva Valley Parkway. The "Borrow Area" was shown to be on the southern portion of the Site with a 10-foot wide maintenance access road to the area.

- A quarter-mile buffer zone pursuant to an *Asbestos Review Areas, Western Slope, County of El Dorado, State of California* map, dated August 22, 2018, is located adjacent to and extends into the westernmost portion of the Site. This buffer zone is considered "more likely to contain asbestos" in soil. Soil with asbestos greater than or equal to 0.25% asbestos would require approval of an Asbestos Dust Mitigation Plan through the AQMD prior to construction.

- The Site was vacant land at the time of the Site reconnaissance. Two streams were observed on the western half of the Site. A concrete structure with a basin in the middle (probably to provide water for grazing livestock) was observed in the north-central portion of the Site. A revetted pipe and an earthen embankment were observed in the north-central portion of the Site, possibly associated with drainage control on Site. An empty container of diesel exhaust fluid was observed along Silva Valley Parkway, and pet waste bags were observed in the northern portion of the Site adjoining the residential community located north of the Site.

- No off-Site facilities are considered likely to have affected soil, soil vapor or groundwater beneath the Site.

Kleinfelder's scope of services included Standard Practice non-scope evaluations of wetlands and surface water; and threatened, endangered, and other protected species that may be required for a Phase I ESA pursuant to Costco's Development Requirements, Version 2018,

Copyright 2019 Kleinfelder

dated October 26, 2018. Kleinfelder's subcontractor, Moore Biological Consultants (Moore), performed these Standard Practice non-scope evaluations. The findings include the following:

- During Moore's Site reconnaissance, an intermittent creek and ephemeral creek were observed flowing from north to south across the Site. Two seasonal wetland areas were observed near the southern ends of these waterways.

- No special status wildlife or plant species were observed during the Site reconnaissance. Ten special status plants were identified during database research as potentially occurring at the Site. Due to lack of habitat, it is unlikely these special status plants would occur at the Site. Fifteen special status species were documented in the Site vicinity; however, upon review of the available habitat and distribution of regional occurrences, in Moore's opinion, most of the species are unlikely to occur at the Site.

- A blue elderberry shrub was observed near the northern boundary of the Site. This shrub can be home to the blue elderberry beetle; however, no sign of the beetle was observed on this shrub and due to the elevation of the location of the shrub it is unlikely the beetle will occur at this location. However, presence of the blue elderberry shrub may require that one mitigation credit be purchased from the United States Fish and Wildlife Service (USFWS), and the shrub relocated. Based on the Site observations, in Moore's opinion, it is unlikely the beetle will occur at the Site.

- Burrowing owls, Swainson's Hawk, and migratory birds have the potential to occur on Site.

Further discussion of the non-scope evaluations is provided in Section 8.3.

This assessment has revealed no evidence of recognized environmental conditions (RECs), historical RECs (HRECs) or controlled RECs (CRECs) associated with the Site. Although not considered RECs pursuant to the Standard Practice, the following environmental conditions were noted because of potential impact to construction activity at the Site.

- NOA has been identified in the vicinity of the Site. Limited NOA soil sampling was performed for the construction of Highway 50 and roadways adjacent to the Site; however, since specific locations of those samples are not known, the collection and analysis of additional NOA samples is recommended if Costco desires a greater level of certainty of the potential presence of NOA in shallow soil at the Site. Additionally, preparation of an Asbestos Dust Mitigation Plan for AQMD is recommended prior to construction at the Site.

Copyright 2019 Kleinfelder

- A concrete structure (probably to provide water for grazing livestock) was observed on the Site. There is the potential for dumping in this structure, and though the former use is assumed to be associated with grazing livestock, that has not been confirmed. Therefore, Kleinfelder recommends environmental monitoring and observation of the removal of this structure and, if contamination is suspected, collection of soil samples from beneath this structure.

- Two seasonal wetlands were observed on the Site. Kleinfelder recommends that a wetland delineation be performed in the spring.
- Burrowing owls, Swainson's hawk, and migratory birds have the potential to occur on Site, therefore, pre-construction surveys for these species are recommended.
- A blue elderberry shrub, which can be home to the blue elderberry beetle, was observed near the northern boundary of the Site. A mitigation credit may need to be acquired to move the blue elderberry shrub in the northern portion of the Site.

Deviations, HRECs, and *de minimis* findings are discussed in Section 8 of this report. This report is subject to the limitations in Section 2.5.

Copyright 2019 Kleinfelder

2 INTRODUCTION

This report is a summary of work performed using the guidelines set forth in the Standard Practice, the AAI section of the Federal Brownfields Law, and Costco's Development Requirements, Version 2018, dated October 26, 2018. This report also generally conforms to the Standard Practice's suggested table of contents. Minor format modifications have been made to the Standard Practice's suggested table of contents to assist in better reading and understanding the report findings.

2.1 PURPOSE

The purpose of this Phase I ESA is to identify, to the extent feasible pursuant to the scope of services defined in our Proposal No. MPCOSTCO.001C/IRV19P89535, dated January 14, 2019, and limitations discussed in this report, RECs and other environmental issues related to the Site.

As defined in the Standard Practice, a REC is:

> *"The presence or likely presence of any hazardous substances or petroleum products in, on or at a property: (1) due to a release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions."*

As defined in the Standard Practice, a *de minimis* condition is:

> *"A condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."*

The 2013 Standard Practice also introduced the designation of CREC. As defined in the Standard Practice, a CREC is:

> *"… a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the*

Copyright 2019 Kleinfelder

implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).”

The 2013 Standard Practice defines an HREC as:

“…a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to environmental controls.”

The final decision regarding whether a past release is an HREC rests with the environmental professional (EP) and will be influenced by the current impact (if any) of the past release to the Site.

This report describes Kleinfelder’s assessment methodology and documents its findings, subject to the limitations presented in Section 2.5 of this report.

2.2 DETAILED SCOPE OF SERVICES

The following sections describe Kleinfelder’s work scope:

- Section 2, **Introduction**, includes a discussion of the purpose/reason for performing the Phase I ESA, additional services requested by the Client (e.g., an evaluation of business environmental risk factors associated with the Site), significant assumptions (e.g., property boundaries if not marked in the field), limitations, exceptions, special terms and conditions (e.g., contractual), and user reliance parameters.
- Section 3, **Site Description**, is a compilation of information concerning the Site location, legal description (if provided by the Client), current and proposed use of the Site, a description of structures and improvements on the Site at the time of Kleinfelder’s assessment, and adjoining property use.
- Section 4, **Records Review**, is a compilation of Kleinfelder’s review of several databases available from Federal, State, and local regulatory agencies regarding hazardous substance use, storage, or disposal at the Site; and for off-Site facilities within the search distances specified by the Standard Practice. Records provided by the Client are summarized, and copies of relevant documents are included in the appendices of this report. Physical setting sources (including topography and soil and groundwater

Copyright 2019 Kleinfelder

conditions) and typical Client-provided information (e.g., title records, environmental liens, specialized knowledge, valuation reduction for environmental issues, and owner, property manager, and occupant information) are also summarized. Other interviews with people knowledgeable about the Site (including the Client) are included in Section 7.

- Section 5, **History of the Site**, summarizes the history of the Site and adjoining properties. This Site history is based on various sources, which may include a review of historical aerial photographs, Sanborn Fire Insurance Maps, city or suburban directories, historical topographic maps, building department records, and results of previous Site assessments (if any and reasonably ascertainable).
- Section 6, **Site Reconnaissance**, describes Kleinfelder's observations during the Site reconnaissance. The methodology used and limiting conditions are also described.
- Section 7, **Interviews**, is a summary of telephone and personal interviews performed with "Key Site Managers" that may include the Site owner/manager, occupants/tenants, local government officials, and the Client. Additional interview sources may be contacted if Key Site Managers were not available prior to production of this report, and may include adjoining landowners and people with historical knowledge of the area.
- Section 8, **Evaluation**, is a presentation of findings and opinions regarding the information provided in Sections 3 through 7, and presents the conclusions regarding the presence of RECs connected with the Site, and Kleinfelder's recommendations.
- Section 9, **References**, is a summary listing of the resources used to compile this report.

A statement of qualifications of the signatories of this report is provided in Appendix A, and pertinent documentation regarding the Site is included in Appendices B through D.

2.3 ADDITIONAL SERVICES

Kleinfelder's scope of services as part of this Phase I ESA did not include Standard Practice non-scope evaluations of cultural, historic, and archaeological resources; and environmental regulatory compliance that may be required for a Phase I ESA pursuant to Costco's Development Requirements publication (revised October 26, 2018). In addition, the Phase I ESA did not include an assessment for asbestos-containing materials (ACMs), radon, lead-based paint (LBP), lead in drinking water, molds and mildews, indoor air quality, industrial hygiene, health and safety, and other Standard Practice non-scope considerations not described herein.

Copyright 2019 Kleinfelder

The Phase I ESA did, however, include evaluations of wetlands and surface water; and threatened, endangered, and other protected species that are required for a Phase I ESA pursuant to Costco's Development Requirements. No other additional services were provided by Kleinfelder for this Phase I ESA.

2.4 SIGNIFICANT ASSUMPTIONS

Kleinfelder does not guarantee the accuracy of information supplied by its sources, but reserves the right to rely on the information in forming a professional opinion regarding the potential for contamination at the Site. It is assumed the Client provided Kleinfelder all applicable and available environmental records and specialized knowledge in its possession regarding the Site. Kleinfelder has not made other significant assumptions during the performance of this Phase I ESA.

2.5 LIMITATIONS AND EXCEPTIONS

Phase I ESAs are non-comprehensive by nature and may not identify all environmental problems and will not eliminate all risk. This report is a qualitative assessment. Kleinfelder offers a range of investigative and engineering services to suit the needs of its clients, including more quantitative investigations. Although risk can never be eliminated, more detailed and extensive investigations yield more information, which may help the Client understand and better manage risks. Since such detailed services involve greater expense, Kleinfelder asks its clients to participate in identifying the level of service that will provide them with an acceptable level of risk. Please contact the signatories of this report if you would like to discuss this issue of risk further.

Kleinfelder performed this Phase I ESA consistent with the guidelines set forth in the Standard Practice; Costco's Development Requirements, Version 2018 publication (dated October 26, 2018); and the proposed scope of services subsequently approved by Costco. No other warranty, either express or implied, is made. Environmental issues not specifically addressed in this report were beyond the scope of Kleinfelder's services and not included in the evaluation.

This report may be used only by Costco and only for the purposes stated within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land or facility use, on- and off-Site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Since Site activities and regulations beyond Kleinfelder's control may change at any time after the completion of this report, the observations, findings, and opinions provided herein are considered valid only as of the date of the Site visit. Pursuant to Section 4.6 of the Standard Practice, this report should not be relied upon after 180

Copyright 2019 Kleinfelder

days from the date of its oldest component. Any party other than the Client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the Client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party, but only to the extent of any such non-compliance by the Client.

The Phase I ESA has been conducted in accordance with, and conforms to the Costco Wholesale Development Requirements Document and the latest edition of ASTM E 1527. This assessment has been prepared for the sole use of Costco Wholesale Corporation. Its contents should not be relied upon by other parties without the express written consent of Costco Wholesale Corporation.

2.6 SPECIAL TERMS AND CONDITIONS

No special terms and conditions were agreed to by the Client and Kleinfelder.

Copyright 2019 Kleinfelder

3 SITE DESCRIPTION

The Site description is presented in this section and describes the condition of the Site at the time of the Phase I ESA. The Site location is shown on Figure 1. Tables 3-1 through 3-4 summarize the physical characteristics of the Site and adjoining properties.

3.1 LOCATION AND LEGAL DESCRIPTION

The information presented in Table 3-1 denotes the physical location and legal description of the Site. This information was obtained from review of various maps (such as topographic maps and tax assessor maps), aerial photographs, public records at City and/or County offices, interviews, and/or information provided by the Client.

TABLE 3-1

Location and Legal Description

PARAMETER	INFORMATION/COMMENTS
LOCATION	The Site is located east-northeast of Silva Valley Parkway, and north of Tong Road, in the unincorporated El Dorado Hills community of El Dorado County, California (see Figure 1).
LEGAL DESCRIPTION	A legal description for the larger Site parcel is presented in the *EDR Environmental Lien and AUL Search* report (EDR, 2019a) provided in Appendix C.
ASSESSOR'S PARCEL NUMBER	The Site is situated on the northeastern portion of a larger parcel of land identified as El Dorado County APN 122-720-15.
ADDRESS(ES)	No address is associated with the Site.
SECTION, TOWNSHIP, AND RANGE	Township 9 North, Range 8 East, Section 1, Mt. Diablo Meridian and Baseline.
ZONING	Based on zoning information provided by Costco, the Site is zoned "PD-CR", which indicates Planned Development Regional Commercial.

3.2 CURRENT / PROPOSED USE OF THE PROPERTY

Land use in the general vicinity appeared to be either residential or undeveloped at the time of Kleinfelder's assessment. Current and proposed Site uses are described in Table 3-2.

Copyright 2019 Kleinfelder

TABLE 3-2

Current and Proposed Uses

PARAMETER	GENERAL OBSERVATIONS
CURRENT USE	The Site is vacant land.
PROPOSED USE	Costco warehouse and gas station.

3.3 DESCRIPTION OF STRUCTURES / IMPROVEMENTS

Structures and/or improvements observed on the Site at the time of Kleinfelder's reconnaissance are described in Table 3-3.

TABLE 3-3

Structures and Improvements

PARAMETER	GENERAL OBSERVATIONS
STRUCTURES	No structures were present on Site.
IMPROVEMENTS	No improvements were present on Site.

3.4 CURRENT USES OF ADJOINING PROPERTIES

Kleinfelder performed a brief drive-by survey of the properties immediately adjoining to the Site on January 16, 2019. A summary of the observations regarding the surrounding properties is presented in Table 3-4 and shown on Figure 2, Site Vicinity Map.

TABLE 3-4

Adjoining Properties

DIRECTION	LAND USE DESCRIPTION
NORTH; NORTHWEST	The property north of the Site was mostly residential. Oak Meadow Elementary School was located north of the northwest portion of the Site.
NORTHEAST; EAST	The property east-northeast of the northeast portion of the Site was developed with residential housing. The property east of the Site was vacant.
SOUTH	Tong Road forms the southern border of the Site, beyond which is vacant land.
WEST; SOUTHWEST	Silva Valley Parkway forms most of the west-southwest boundary of the Site, beyond which is vacant land. Vacant land adjoins to the west of the northwest portion of the Site.

Hazardous materials and petroleum products were not directly observed to be stored on the properties adjoining the Site. No other environmental conditions were apparent on the adjoining properties at the time of Kleinfelder's Site reconnaissance.

Copyright 2019 Kleinfelder

4 RECORDS REVIEW

4.1 STANDARD ENVIRONMENTAL RECORD SOURCES

The purpose of the records review is to obtain and review records that would help to evaluate RECs in connection with the Site and bordering properties. Federal, State, and local regulatory agencies publish databases or “lists” of businesses and properties that handle hazardous materials or hazardous waste or are the known location of a release of hazardous substances to soil and/or groundwater. These databases are available for review and/or purchase at the regulatory agencies, or the information may be obtained through a commercial database service. Kleinfelder contracted a commercial database service, EDR, of Shelton, Connecticut, to perform the government database search for listings within the appropriate Standard Practice minimum search distance of the Site, and the distances set forth in Costco’s Development Requirements, Version 2018, dated October 26, 2018. Included in the EDR Radius Map™ Report with GeoCheck® (EDR, 2019b) is a listing of specific databases outlined by the Standard Practice. A listing of the search distances, databases evaluated, dates the databases were last updated, and types of information contained in each database are included in the regulatory database search report provided in Appendix B of this report.

EDR utilizes a geographical information system to plot the locations of reported spills, leaks, incidents, etc. Kleinfelder reviews this information to help establish if the Site or nearby properties are listed in the databases and lists. Each of the listings was reviewed by Kleinfelder to assess whether the corresponding property details included in EDR’s report revealed a potential environmental impact to the Site. Many listings in the report were concluded not to have the potential to impact the Site based on the following, or a combination thereof:

- The listed property is located at a distance where the facility is unlikely to impact the Site based on Kleinfelder’s evaluation of the relevant data in EDR’s report and knowledge of the Site vicinity.
- The listed property is located in a down-gradient or cross-gradient direction from the Site, based on the anticipated direction of groundwater flow at the property being evaluated, and is located at a distance such that it is unlikely to impact the Site. Judgements as to down- or cross-gradient direction are best made if groundwater flow direction information is available for a specific property.

Copyright 2019 Kleinfelder

- The listed property is identified in the underground storage tank (UST) or small quantity generator (SQG) databases and does not immediately adjoin the Site. The property is furthermore not listed in other databases that report a release of a hazardous substance or petroleum product and/or is not listed as having environmental violations. The listing of a facility in these databases alone is not indicative of an unauthorized release.
- The listing for the facility suggested a short-term release occurred (e.g., from incidental traffic accidents or involving limited quantities of chemicals from illegal drug labs found at residences), with associated response actions completed.
- The quantity of the hazardous substances or petroleum product released from an off-Site, non-adjoining facility was not judged to have resulted in contamination above the most stringent criteria requiring regulatory action. Therefore, no impact to the Site is anticipated.
- The listed property record indicates that the property was characterized, the reported release affected soil only, the listed property was not on or adjacent to the Site, and the release was not recognized as indicative of area-wide conditions or was characterized as a soil removal action only.
- The listed property record indicates that contamination on the property is limited to relatively non-mobile contaminants, including polyaromatic hydrocarbons (PAHs) and metals, in soil only, on a non-adjacent property.
- The listed property record indicates that the case for the property has been closed to the satisfaction of the designated lead regulatory agency, and residual contamination, if present, is not considered likely to affect the Site based on one or more of the criteria mentioned in the bulleted items above (a condition referred to by the Standard Practice as an HREC).

Based on these criteria indicating no material threat of a release that affected the Site and/or no release that could require future regulatory agency oversight, the listings concluded not to have the potential to impact the Site were not evaluated further and are not discussed in the following sections.

4.2 RESULTS OF DATABASE SEARCH

The remaining property listings, if applicable, were reviewed to assess whether these properties had environmental releases that may have resulted in RECs in connection with the Site. Listed

Copyright 2019 Kleinfelder

properties for which a reported release may have resulted in a REC in connection with the Site were further assessed by performing a review of agency files available through the GeoTracker™ website (https://geotracker.waterboards.ca.gov/) operated by the State Water Resources Control Board (SWRCB), and/or review of other relevant regulatory agency websites, to evaluate whether the listed release represents a potential impact to the Site.

4.2.1 Site Listings

The Site was not listed in local, state or federal databases searched by EDR.

4.2.2 Off-Site Listings

Five facilities in the Site vicinity are listed in various databases searched by EDR. Two of the five listings were further reviewed as to the potential to impact the Site as summarized below.

“Serrano Elementary School” (Serrano Parkway/Silva Valley Parkway) – The school is located approximately 1,640 north-northwest of the Site. This facility was listed in the Department of Toxic Substance Control’s (DTSC’s) Site Mitigation and Brownfields Reuse Program’s EnviroStor database. The listing indicates that there was the potential for naturally-occurring asbestos, arsenic and lead in soil, and that the former property use was agricultural (livestock). The status of the case was listed as requiring “No Further Action”. As no releases to soil or groundwater were reported and the case is closed; this facility is not considered a REC.

“Silver Dove Elementary School” (Silver Dove Way/Bass Lake Road) – This school is located approximately 4,675 east of the Site. This facility was listed in the DTSC EnviroStor database. The listing indicates that there was the potential for naturally-occurring asbestos in soil. The status of the case was listed as requiring “No Further Action”. As no releases to soil or groundwater were reported and the case is closed, this facility is not considered a REC.

4.2.3 Orphan List

Facilities not plotted by EDR due to poor or inadequate address information are referred to as orphan facilities. No orphan facilities were listed in the EDR database report.

4.3 OTHER RECORDS REVIEWED / AGENCIES CONTACTED

The following additional sources of environmental records were reviewed during this Phase I ESA for the purposes of meeting the Standard Practice. Local regulatory agencies were contacted for

Copyright 2019 Kleinfelder

reasonably ascertainable and practically reviewable documentation regarding RECs present at the Site and adjoining facilities. Summaries of interviews with local regulatory agency representatives, when performed, are included in Section 7 of this report (with interview documentation included in Appendix C). Information was obtained or reviewed from the following agencies:

☒ ..... Pipeline and Hazardous Materials Safety Administration (PHMSA), National Pipeline Mapping System (NPMS)
☒ ..... State of California, Division of Oil, Gas and Geothermal Resources (DOGGR)
☒ ..... El Dorado County Building Services
☒ ..... El Dorado County Air Quality Management District
☒ ..... El Dorado County Environmental Management (EDCEM)
☒ ..... State Water Resources Control Board, GeoTracker™ Database
☒ ..... State of California, Department of Toxic Substances Control, EnviroStor Database

Information/responses from the agencies contacted and agency databases reviewed is presented below:

4.3.1 Pipeline and Hazardous Materials Safety Administration, National Pipeline Mapping System

Pipeline information is available at the PHMSA's online NPMS website (https://www.npms.phmsa.dot.gov). Kleinfelder researched pipeline information on the website on January 25, 2019 for the Site and vicinity. Based on Kleinfelder's review of the NPMS website, no mapped natural gas transmission pipelines or hazardous liquid pipelines are located on Site or in the Site vicinity. A copy of the NPMS map is included in Appendix C.

4.3.2 State of California Division of Oil, Gas and Geothermal Resources

Kleinfelder searched the State of California DOGGR website (http://www.conservation.ca.gov/dog) for oil and gas wells at the Site or in the Site vicinity. No oil or gas wells are depicted in the immediate vicinity of the Site. A copy of the DOGGR map results is presented in Appendix C.

4.3.3 El Dorado County Planning and Building Services

Kleinfelder submitted a records request on January 22, 2019 to El Dorado County Planning and Building for current or historical records pertaining to the Site. El Dorado County responded in an

Copyright 2019 Kleinfelder

email on January 28, 2019 that there are no building permits available for the Site parcel. A copy of the El Dorado County response is presented in Appendix C.

4.3.4 El Dorado County Air Quality Management District

Kleinfelder submitted a records request to the AQMD on January 22, 2019 for available information pertaining to the Site. Tod from the AQMD responded via telephone on January 22, 2019. He indicated that the parcel appears to be in the process of being subdivided and was not listed. He indicated that Caltrans Asbestos Dust Control Plan Applications and a Caltrans soil sampling report from 2008 were available for Highway 50 just south of the Site. The available Asbestos Dust Control Plan Applications were uploaded to the El Dorado County Public Records Center for Kleinfelder to download. Based on Kleinfelder's review, an Asbestos Dust Control Plan for a permanent stockpile was issued in 2012 to "AKT, EDH 52 Partnership"; a 2008 Caltrans report entitled, *Aerially Deposited Lead, Naturally Occurring Asbestos and Lead Containing Paint Site Investigation and Bridge Survey Report, Highway 50 Site Investigation Post Mile 2.90 to 8.79, El Dorado County, California*, was attached to this plan. The Caltrans report showed the stockpile locations on the Site and summarized asbestos results for composite soil samples collected from medians and sound wall areas within the Silva Valley Parkway Interchange project area. The sample locations were not shown. Asbestos was not detected in samples collected except for one composite sample, which contained 0.25% chrysotile asbestos. A second Asbestos Dust Control Plan Application indicated that a 20,000 cubic yard soil stockpile, and approximately 120,000 cubic yards of soil to be excavated from a 5-acre section ("Borrow Area") on the Site, would be used as fill material for the highway interchange in 2013.

The AQMD regulates NOA in El Dorado County. Based on Kleinfelder's review of an El Dorado County *Asbestos Review Areas* Map dated August 22, 2018, a quarter mile buffer zone for areas more likely to contain asbestos is located adjacent to, and extends into the westernmost portion of the Site. The closest buffer is near a fault zone extending parallel to Silva Valley Parkway through the hills west of the Site. Based on the quarter-mile buffer zone extending onto the Site, and because at least one composite sample associated with nearby construction contained a 0.25% chrysotile asbestos concentration, the potential exists for NOA to be present in soil at the Site. Copies of the AQMD documents are included in Appendix C.

4.3.5 El Dorado County Environmental Management

Kleinfelder submitted a records request to the El Dorado County Environmental Management on January 22, 2019 for well, UST, aboveground storage tank (AST), hazardous materials, and site

Copyright 2019 Kleinfelder

mitigation documents pertaining to the Site. El Dorado County Environmental Management responded in an email on January 25, 2019 that no records exist for the provided parcel number. A copy of the email response is included in Appendix C.

4.3.6 State Water Resources Control Board

Kleinfelder reviewed the SWRCB GeoTracker™ database (http://geotracker.waterboards.ca.gov/) on January 21, 2019 for information pertaining to the Site and adjoining properties. The Site and adjoining properties are not listed in the GeoTracker™ database. A copy of the GeoTracker™ search results map is presented in Appendix C.

4.3.7 Department of Toxic Substances Control

Kleinfelder reviewed the DTSC's EnviroStor website (https://www.envirostor.dtsc.ca.gov/public/) on January 21, 2019, for available files pertaining to the Site and adjoining properties. The Site and adjoining properties are not listed. A copy of the EnviroStor search results is presented in Appendix C.

4.4 PHYSICAL SETTING SOURCE(S)

Table 4-1 presents information concerning the physical setting of the Site. The information was primarily obtained from published maps.

TABLE 4-1

Physical Setting

DATA	GENERAL INFORMATION
USGS TOPOGRAPHIC QUADRANGLE	Based on the United States Geological Survey (USGS) Clarksville Quadrangle 7.5-Minute Series (Topographic) Map, dated 2012, the Site elevation is between approximately 740 and 800 feet above mean sea level (msl). The Site has a general topographical slope towards the southwest. An elevated area (a hill) is located in the southeast corner of the Site.
SOIL TYPE	According to the soil composition information provided in the physical setting section of The EDR Radius Map™ Report with GeoCheck®, the soil components beneath the Site are identified as Auburn silt loam, which is underlain by unweathered bedrock at approximately 14 to 18 inches (EDR, 2019b).
OIL AND GAS WELLS	Information concerning oil and gas fields was obtained by Kleinfelder on January 18, 2019 from the DOGGR Well Finder online database (http://www.conservation.ca.gov/dog). Based on Kleinfelder's review, no oil or gas wells are located within the immediate vicinity of the Site. A copy of the Well Finder search results is presented in Appendix C.

Table 4-2 presents information concerning regional geology and hydrogeology. The information was obtained from published maps and other sources.

Copyright 2019 Kleinfelder

TABLE 4-2

Regional Geology and Hydrogeology

PHYSICAL PARAMETER	INFORMATION/COMMENTS
REGIONAL PHYSIOGRAPHY AND GEOLOGY	The Site is situated between the Great Valley and Sierra Nevada Geomorphic Provinces of California. The Great Valley Geomorphic Province is an alluvial plain about 50 miles wide and 400 miles long that includes the Sacramento Valley as its northern portion, and the San Joaquin Valley as its central and southern portion. The Great Valley is a trough in which sediments have been deposited almost continuously since the Jurassic. The Sierra Nevada Geomorphic Province is a tilted fault block characterized as a high multiple scarp mountain range that slopes gently to the west, and dips under the Great Valley (California Geological Survey [CGS], 2002). The Sierras are characterized by deep cut valleys that drain into the Great Valley. The high Sierras are granitic with the surrounding bedrock being metamorphic. The Site is located on Jurassic-Triassic metavolcanics rocks, which consist of basaltic and andesitic volcanic rocks, tuff, and volcanic breccia. The Bear Mountain Fault Zone is located approximately 1-mile west of the Site and extends northwest to southeast from Folsom Lake along the Sierra Nevada foothills (Strand and Koenig, 1965).
REGIONAL HYDROGEOLOGY	The Site is not located within a groundwater basin or subbasin recognized by the California Department of Water Resources (CDWR) Bulletin 118, last updated in July 2017. The closest groundwater basin is the Sacramento Valley-South American groundwater basin, located approximately 3 miles to the west-northwest of the Site (CDWR, https://gis.water.ca.gov/app/gicima/).
DEPTH TO GROUNDWATER DIRECTION OF ANTICIPATED FLOW [1]	Groundwater information was not available for the Site or Site vicinity.
REGIONAL GROUNDWATER QUALITY PROBLEMS	Groundwater information was not available for the Site or Site vicinity.
WATER SUPPLY	The Site is currently not connected to the municipal water system.
FLOOD ZONE DESIGNATION	According to *The EDR Radius Map™ Report with GeoCheck®*, the Site is not located within a 100-year or a 500-year flood zone (EDR, 2019b).

[1] Groundwater flow direction is based on regional information sources. Site-specific conditions may vary due to a variety of factors including geologic anomalies, utilities, nearby pumping wells (if present), and others.

4.5 USER PROVIDED INFORMATION

Kleinfelder understands that the Client intends to purchase the Site and develop it as a Costco Warehouse and gas station. Information regarding the current owners/occupants of the Site is summarized in Table 4-3.

Copyright 2019 Kleinfelder

TABLE 4-3

Owner and Occupant Information

ENTITY	NAME
OWNER	According to the *EDR Environmental Lien and AUL Search* report (EDR, 2019a), the current owner of the Site parcel (APN 122-720-015) is "EDH 52, a California General Partnership".
OCCUPANT(S)	The Site is currently vacant land.

Summaries of interviews of key individuals with knowledge of the Site ("Key Site Managers") are provided in Section 7. The following sections present information provided to Kleinfelder by the Client.

4.6 TITLE RECORDS

Chain-of-title information for the Site was not provided by the Client. Therefore, a review of a chain-of-title report was not reviewed as part of this Phase I ESA.

4.7 ENVIRONMENTAL LIENS AND USAGE LIMITATIONS

According to information provided in EDR's regulatory agency database search report (EDR, 2019b), no known recorded land-use environmental deed restrictions pertaining to the Site are listed in the State Liens Database. Kleinfelder's review of the *EDR Environmental Lien and AUL Search* report (EDR, 2019a) indicated no environmental liens or activity and use limitations (AULs) are associated with the Site (Appendix C).

4.8 VALUE REDUCTION

As part of the Standard Practice process, information is to be gathered regarding the prospective purchase price of the Site relative to its fair market value. If there appears to be a value reduction, that reduction must be identified with respect to whether the difference may be attributed to environmental degradation of the property. According to a questionnaire completed by Mr. Michael Okuma of Costco on February 5, 2019, the purchase price of the Site reflects the fair market value. A copy of the questionnaire is provided in Appendix C.

4.9 OTHER INFORMATION / DOCUMENTS PROVIDED

Other information and documents pertaining to the Site were not provided to Kleinfelder for review.

Copyright 2019 Kleinfelder

5 SITE HISTORY

The history of the Site was researched to identify obvious uses. Historical land use was researched to the first developed use, or back to 1940, whichever was earlier or readily available. Table 5-1 summarizes the availability of information reviewed during this assessment.

TABLE 5-1

Historical Information Sources

SOURCE	YEARS REVIEWED	SOURCE / AVAILABILITY
SANBORN FIRE INSURANCE MAPS	Not available	EDR, 2019c
AERIAL PHOTOGRAPHS	1940, 1952, 1962, 1966, 1972, 1984, 1993, 2006, 2009, 2012, and 2016	EDR, 2019d
CITY DIRECTORIES	1970 through 2014 (select years)	EDR, 2019e
HISTORICAL TOPOGRAPHIC MAP REPORT	1891, 1892, 1893, 1941, 1944, 1953, 1973, 1980, and 2012	EDR, 2019f
BUILDING DEPARTMENT	1980 - 2018	EDR, 2019g
PREVIOUS ASSESSMENT(S)	Not available	Not available

5.1 SANBORN FIRE INSURANCE MAPS

Sanborn Fire Insurance Maps provide historical land use information for some metropolitan areas and small, established towns. Kleinfelder requested EDR to search its library of Sanborn Fire Insurance Maps for maps of the Site. EDR responded that Sanborn Fire Insurance Maps were not available for the Site (EDR, 2019c) (Appendix D).

5.2 AERIAL PHOTOGRAPHS

A review of historical aerial photography may indicate past activities at a property that may not be documented by other means or observed during a reconnaissance visit. The effectiveness of this technique depends on the scale and quality of the photographs and the available coverage. Aerial photographs were obtained from several historical photograph collections through EDR (2019d) and span a period of 76 years. A tabulation of the aerial photographs reviewed by Kleinfelder is presented in Table 5-2. Copies of the aerial photographs provided by EDR are included in Appendix D.

Copyright 2019 Kleinfelder

TABLE 5-2

Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1940	1" = 500'	**Site:** The Site appears to be vacant grazing land. Two creeks appear to extend north to south across the western half of the Site and three trees are present on the southeastern portion of the Site. Dirt tracks extend across the Site, with one dirt track extending along the northern Site boundary. A possible haystack or stockpile appears to be present west of the southernmost tree. A dark area in the middle of Site may be a ponding area. **Surrounding Area:** The adjoining properties appear to also be grazing land. Dirt roads are present throughout the Site vicinity. Farm-type structures (or residential) are present southwest (not adjoining) and southeast (also not adjoining) of the Site.
1952 1962 1966	1" = 500' 1" = 500' 1" = 500'	**Site:** The Site appears generally the same. **Surrounding Area:** The adjoining properties appear generally the same. There appears to be a possible structure adjoining the northwest corner of the Site.
1972 1984	1" = 500' 1" = 500'	**Site:** The Site appears generally the same. **Surrounding Area:** The adjoining properties to the north, west, south, and east appear generally the same. The structure southwest of the Site is no longer clearly present, though there may be some smaller structures remaining.
1993	1" = 500'	**Site:** The Site appears generally the same. More developed dirt roads appear to extend along the northern, northwestern, and eastern Site boundaries. **Surrounding Area:** The adjoining properties appear generally the same, though there appears to be some grading northwest of the Site.
2006 2009	1" = 500' 1" = 500'	**Site:** The Site appears generally the same with a dirt track extending east to west across the Site. **Surrounding Area:** The properties adjoining to the north and northwest appear to match their existing configuration with residential housing present north and northeast of the Site, and Oak Meadow Elementary School present north-northwest of the Site. The properties to the west, southwest, south, and east-southeast remain vacant and undeveloped. The structures to the southwest of the Site appear to have been removed. The structure southeast of the Site appears to have been re-developed as a church and associated parking lot.

Copyright 2019 Kleinfelder

TABLE 5-2 (Continued)

Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
2012	1" = 500'	**Site:** The Site appears generally the same, except that there appears to be a graded, raised (or cut) half-circle section in the southeastern portion of the Site. Dirt roads extend to this area from the south, northeast, and west. **Surrounding Area:** The adjoining properties to the north, west, and south remain generally the same.
2016	1" = 500'	**Site:** The Site appears generally the same, except that the trees are no longer present in the southeast portion of the Site, and the raised or cut section appears to have been graded. **Surrounding Area:** The adjoining properties to the north, northwest, east, and southeast remain generally the same. Silva Valley Parkway is now present along the west-southwest boundary of the Site, and Tong Road is now present along the southern Site boundary.
Note: Aerial photographs only provide information concerning indications of land use, and no conclusions regarding the release of hazardous substances or petroleum products can be drawn from the review of photographs alone.		

5.3 CITY DIRECTORIES

City directories provide information regarding property occupants by address. EDR provided a city directory image report (EDR, 2019e), which included a review of city directories for properties along Silva Valley Parkway for select years between 1970 and 2014. There were no listings reported for the Site. The adjoining property, 7701 Silva Valley Parkway located north of the Site, was listed as being occupied by Buckeye Union School District (2005, 2010, 2014) and PTA CA Congress of Parents OAK (2010, 2014). No other adjoining properties were listed. No RECs were identified based on the city directories listings review.

5.4 HISTORICAL TOPOGRAPHIC MAP REVIEW

Kleinfelder obtained information regarding historical topographic maps of the Site vicinity from EDR (2019f). The topographic maps reviewed for this assessment are listed in Table 5-3 and copies of the maps are included in Appendix D.

Copyright 2019 Kleinfelder

TABLE 5-3

Historical Topographic Maps Reviewed

YEAR	SCALE	SUMMARY
1891 1892 1893	1:125,000 1:125,000 1:125,000	**Site:** The Site is shown as undeveloped land consisting of a hill peaking in the northeast corner of the Site. **Surrounding Area:** The immediate Site vicinity is shown as undeveloped land.
1941 1944	1:62,500 1:62,500	**Site:** The Site remains as undeveloped land. An unimproved road is present along the western Site boundary. **Surrounding Area:** The adjoining properties to the Site remain as undeveloped land. A residential structure is shown southwest of the Site. A creek, with an additional residential structure beyond it, is shown southeast of the Site.
1953 1973	1:24,000 1:24,000	**Site:** The Site remains as undeveloped land with the unimproved road adjoining the western Site boundary. **Surrounding Area:** The adjoining properties to the Site remain as undeveloped land. The structure southwest of the Site appears to have changed from residential to a barn or equipment storage structure (unoccupied), as shown by the change in the topographic symbol.
1980	1:24,000	**Site:** The Site remains as undeveloped land with the unimproved road adjoining the western Site boundary. **Surrounding Area:** The adjoining properties to the Site remain as undeveloped land. The structure formerly southwest of the Site is no longer present.
2012	1:24,000	**Site:** The 2012 topographic map is similar in appearance and shows physical features (e.g., roads and surface water) with no structures. Therefore, no structures are shown on the Site. **Surrounding Area:** Off-Site roads (Silva Valley Parkway to the west, Tong Road to the south, and the residential roads to the north) are shown. However, Silva Valley Parkway and Tong Road do not match their current configurations.

No RECs were identified based on the historical topographic map review.

5.5 BUILDING PERMITS

EDR provided a Building Permit Report, included in Appendix D, (EDR, 2019g). No building permits were found for the Site. Permits for adjoining properties were listed in the EDR Building Permit Report. These permits included building and pool permits for the adjoining residential properties. No RECs were identified based on the EDR Building Permit Report review.

5.6 PREVIOUS ASSESSMENTS

No previous environmental assessments were available for the Site.

Copyright 2019 Kleinfelder

6 SITE RECONNAISSANCE

Kleinfelder's Phase I ESA activities included a Site reconnaissance. This section summarizes the findings from the Site reconnaissance.

6.1 METHODOLOGY AND LIMITING CONDITIONS

Mr. Anthony Wohletz of Kleinfelder performed a reconnaissance of the Site and vicinity on January 16, 2019. The Site reconnaissance included a visual inspection of the Site to assist in identifying the presence or likely presence of hazardous substances or petroleum hydrocarbons under conditions that indicate an existing release, a past release, or threat of release into structures, soil, groundwater, or surface water at the Site (i.e., RECs). Observations of readily-apparent environmental conditions are summarized in Table 6-1, and color photographs of the Site are presented on Figures 3 through 15. The approximate Site boundaries are shown on Figure 2.

6.2 GENERAL SITE SETTING

The Site is generally located east of Silva Valley Parkway and north of Tong Road in the unincorporated El Dorado Hills community of El Dorado County, California.

6.3 SITE OBSERVATIONS

Kleinfelder's Site observations are summarized in Table 6-1.

TABLE 6-1

Site Observations

6.4 RESULTS OF SITE RECONNAISSANCE

The Site currently consists of vacant, undeveloped land. The Site was hilly, with the highest point located in the southern portion of the Site. Two streams flowed southward from the northern Site boundary through the western half of the Site. A square, concrete structure with an 8-foot deep basin in the middle was located on the north-central portion of the Site. This structure may be a guzzler to provide water for grazing stock animals. A revetted pipe was present in the central portion of the Site in one of the streams. An earthern embankment was also located in the north-central portion of the Site. Both the revetted pipe and the earthern embankment appear to have been associated with controlling drainage, but have since been breached. A second revetted drainage pipe was located along Silva Valley Parkway, adjoining the Site. An empty container of exhaust fluid was present along Silva Valley Parkway. No staining or signs of a spill were visible. Little plastic bags likely containing pet waste were present along the northern border of the Site, which adjoins a residential community and elementary school. Surface water and ponding were observed on the Site, likely due to the recent rains. With the exception of the residential community and school to the north, and the adjoining roads (Silva Valley Parkway and Tong Road), the adjoining properties are vacant and similar to the Site. Evidence of stained soil, discolored water, stressed vegetation, USTs, wells, pits, ponds, or lagoons was not observed on the Site during the reconnaissance.

Copyright 2019 Kleinfelder

7 INTERVIEWS

Key Site Managers are contacted to obtain current and historical environmental information concerning the Site. The following sections highlight information revealed during the interviews.

7.1 INTERVIEW WITH CLIENT/OWNER/MANAGER

A questionnaire completed by Mr. Michael Okuma of Costco on February 5, 2019 indicated the following:

- He is unaware of environmental liens that are filed or recorded against the property.
- He is unaware of AULs that are in place on the property or that have been filed or recorded against the property.
- He has no specialized knowledge or experience related to the property or nearby properties unrelated to the Costco warehouse.
- He indicated that the purchase price of the property reasonably reflects the fair market value of the property.
- He is not aware of commonly known or reasonably ascertainable information about the property that would help Kleinfelder identify conditions indicative of releases or threatened releases.
- He is unaware of obvious indicators that point to the presence or likely presence of releases at the property. He indicated that this Phase I ESA was being performed for due diligence.

The completed questionnaire is included in Appendix C.

7.2 INTERVIEW WITH OWNER/MANAGER

Kleinfelder provided Costco an interview questionnaire to be delivered to the property owner for completion. A completed questionnaire from the property owner has not been received to date.

7.3 INTERVIEW WITH OCCUPANT(S)

The Site is vacant land with no occupants present. Therefore, interviews with occupants were not performed as part of this Phase I ESA.

Copyright 2019 Kleinfelder

7.4 INTERVIEWS WITH LOCAL GOVERNMENT OFFICIALS

Kleinfelder contacted the El Dorado County AQMD for records associated with the Site. Tod from the AQMD responded via telephone on January 22, 2019 that the parcel appears to be in the process of being subdivided and the parcel number is no longer listed in his database. He looked up the area after the Site location was described and he indicated that a Caltrans asbestos dust control plan with a soil sampling report from 2008 was available for Highway 50 just south of the Site. Tod uploaded the available dust control plans to the El Dorado County Public Records Center for Kleinfelder to download. A summary of Kleinfelder's review of the documents was included in Section 4.3.4.

Copyright 2019 Kleinfelder

8 EVALUATION

Kleinfelder performed this Phase I ESA of the Site in conformance with the scope and limitations of the Standard Practice, the scope of services in our Proposal No. MPCOSTCO.001C/IRV19P89535, dated January 14, 2019, and in accordance with Costco's Development Requirements, Version 2018, dated October 26, 2018. The following sections describe Kleinfelder's findings and provide general background information about the Site. Findings address RECs, HRECs, CRECs, and notation of *de minimis* quantities, as applicable to the Site. In summary, Kleinfelder's assessment revealed the following information concerning the Site:

8.1 BACKGROUND

The following is a summary of the Site background information:

- The Site is located on vacant land east of Silva Valley Parkway, and north of the intersection of Silva Valley Parkway and Tong Road, approximately 725 feet north of Highway 50 in the unincorporated El Dorado Hills community of El Dorado County, California. It consists of approximately 25 acres of land, which is a portion of a larger parcel of land identified as El Dorado County APN 122-720-15. This larger parcel consists of land on both the north and south sides of Silva Valley Parkway. The Site consists of the portion of the larger parcel located on the north side of Silva Valley Parkway.
- The Site was historically undeveloped, though some earthwork appears to have occurred in the southern portion of the Site between 2012 and 2016 based on aerial photographs from those years. This earthwork appears to be related to Highway 50 construction activities, and realignment of Silva Valley Parkway and Tong Road in 2012 and 2013.

8.2 FINDINGS AND OPINIONS

The following is a summary of findings and opinions for the Site:

- The Site was vacant land at the time of the Site reconnaissance. Two streams were observed on the western half of the Site. A concrete structure with a basin in the middle (probably to provide water for grazing livestock) was observed in the north-central portion of the Site. A revetted pipe and an earthen embankment were observed in the north-central portion of the Site, possibly associated with drainage control on Site. An empty container of exhaust fluid was observed along Silva Valley Parkway, and pet waste bags

Copyright 2019 Kleinfelder

were observed in the northern portion of the Site adjoining the residential community located north of the Site. No RECs were identified during the Site reconnaissance.

- Two Asbestos Dust Mitigation Plan Applications were approved by the El Dorado County AQMD in 2012 and 2013 for grading/excavation activities associated with construction of a Highway 50 off-ramp, south of the Site. A March 2008 Caltrans report, entitled *Aerially Deposited Lead, Naturally Occurring Asbestos and Lead Containing Paint Site Investigation and Bridge Survey Report*, prepared for the Highway 50 Site Investigation project, was included with one of the Asbestos Dust Mitigation Plan Applications. This report indicated that 30 composite soil samples collected from the median and proposed sound wall areas (sample locations were not identified) were analyzed for the presence of NOA, total lead and chromium. One out of 24 composite soil samples contained 0.25% chrysotile asbestos; remaining samples did not contain detectable NOA. Total lead and chromium were detected in soil samples analyzed, but at concentrations reported below California hazardous waste threshold levels. A figure presented in this report indicates that the southern portion of the Site was used to temporarily stockpile soil that was to be covered with plastic and surrounded by fiber rolls. Hydroseed was to be planted at the end of the project. A Rough Grading Plan dated August 2013 indicates that 20,000 cubic yards of existing stockpiled soil and an additional 100,000 cubic yards of soil from a "Borrow Area" would be used as part of the construction of a future Highway 50 off-ramp, and future alignments of Tong Road and Silva Valley Parkway. The "Borrow Area" was shown to be on the southern portion of the Site with a 10-inch wide maintenance access road to the area.
- A quarter-mile buffer zone pursuant to an *Asbestos Review Areas, Western Slope, County of El Dorado, State of California* map, dated August 22, 2018, is located adjacent to and extends into the westernmost portion of the Site. This buffer zone is considered "more likely to contain asbestos" in soil. Soil with asbestos greater than or equal to 0.25% asbestos would require approval of an Asbestos Dust Mitigation Plan through the AQMD prior to construction.
- No off-Site facilities are considered likely to have affected soil, soil vapor or groundwater beneath the Site.

Copyright 2019 Kleinfelder

8.3 DEVIATIONS AND ADDITIONAL SERVICES

Kleinfelder's scope of services did not include Standard Practice non-scope evaluations of cultural, historic, and archaeological resources and environmental regulatory compliance that may be required for a Phase I ESA pursuant to Costco's Development Requirements publication (revised October 26, 2018). In addition, the Phase I ESA did not include an assessment for ACMs, radon, LBP, lead in drinking water, molds and mildews, indoor air quality, industrial hygiene, health and safety, and other Standard Practice non-scope considerations not described herein.

Kleinfelder's scope of services included evaluations of wetlands and threatened, endangered, and other protected species pursuant to Development Requirements, Version 2018, revised October 26, 2018. Kleinfelder contracted with Moore to perform these evaluations. A copy of Moore's report is provided in Appendix E. A summary of the results of these evaluations is provided in Sections 8.3.1 and 8.3.2 below.

8.3.1 Protected Plant/Wildlife Assessment

Moore queried relevant agency databases to determine the potential biological constraints that could be imposed on the Site. Additionally, Moore performed visited the Site on December 18 and 29, 2018 to document existing biological conditions at the Site.

At the time of Moore's site visits, the Site was open hillsides supporting grassland vegetation. A notable hill and soil stockpile were present in the southern portion of the Site. The grassland appeared to be moderately to highly disturbed from historic mining, grazing, grading, and construction of adjoining parcels, discing for weed abatement, and off-road vehicle use. A riparian corridor is present along an intermittent stream in the western portion of the Site. Trees and shrubs are present in this area. One blue elderberry shrub was observed along the north edge of the Site, east of the riparian corridor. Several bird species were observed. The several large trees in the riparian corridor are suitable for nesting birds. The habitat is suitable for raptors and song birds. No mammals were observed, but the habitat is suitable for coyotes, black-tailed hares, desert cottontails, and Virginia opossum. Several ground squirrel burrows and gophers were observed in the grasslands. Mice and voles are also likely to occur in the grasslands. No amphibians or reptiles were observed, though there is the potential for the Pacific chorus frog, bullfrog, western fence lizard, western terrestrial garter snake, and gopher snake to occur.

Moore searched the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CBDDB, 2019) and the USFWS Information, Planning, and Consultation System (IPAC) Trust Report of Federally Threatened and Endangered species for plant and

Copyright 2019 Kleinfelder

wildlife species that have been documented in the Site vicinity, or have the potential to occur based on suitable habitat. Ten special status plants were identified as potentially occurring at the Site. Due to lack of habitat, it is unlikely these special status plants would occur at the Site. Fifteen special status species were documented in the Site vicinity; however, upon review of the available habitat and distribution of regional occurrences, in Moore's opinion, most of the species are unlikely to occur at the Site. The only species with a more than low potential to occur are Swainson's hawk and burrowing owls. Other special status species may forage or migrate through the area.

A preconstruction survey for burrowing owls within 250 feet of the Site is recommended if construction is scheduled between February 1 and August 31. A preconstruction survey for Swainson's hawk within 0.25-mile of the Site is recommended if construction is scheduled between March 1 and September 15.

Migratory birds are protected under the Migratory Bird Treaty Act (MBTA). If tree removal is scheduled between January 1 and July 31, a preconstruction survey for nesting raptors is recommended. If other vegetation is removed between March 1 and July 31, a pre-construction for any nesting birds is recommended. If active nests are observed, they are to be avoided until the young birds have been fledged.

The Valley elderberry longhorn beetle is listed as a federally threatened species and its hots is the blue elderberry shrub. The USFWS (2017) *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle* indicates that ground disturbance should be set back 165 feet from the shrub. Mitigation can be in the form of purchasing credits at the USFWS-approved mitigation bank and transplantation of the shrub to the bank. The Site has one elderberry shrub present along the northern boundary. The Framework recommends that, in the case of the presence of a single shrub, 2 credits be purchased, and the shrub transplanted. No evidence of the beetle on the shrub on Site was observed. The shrub is also at an elevation higher than the typically elevation where the beetle occurs. Based on the Site observations, in Moore's opinion it is unlikely the beetle will occur at the Site.

8.3.2 Wetland Assessment

During Moore's Site visits, an intermittent creek, two ephemeral creeks, and two seasonal wetlands were observed. These features were not mapped on the USGS topographic map or the National Wetland Inventory, but are potentially jurisdictional Waters of the United States and wetlands. Moore recommends a wetlands delineation later in the spring to when plants are in

Copyright 2019 Kleinfelder

bloom to confirm the actual wetland boundaries. The intermittent stream flows north to south in the western portion of the Site. The intermittent stream carries water during and after rain and is lined with trees and riparian vegetation. Wetland vegetation is present in the flat area near Silva Valley Parkway. The ephemeral creeks also flow north to south. These carry water only during and shortly after heavy rains. The seasonal wetlands include a historic stock pond and boggy area near the south end of one of the ephemeral creeks. The stock pond is approximately 2 feet deep and is fed by the creek and possibly a spring.

8.4 CONCLUSIONS

Kleinfelder has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-13 of the location of a proposed Costco warehouse and gas station (Site) in the unincorporated El Dorado Hills community of El Dorado County, California. Any exceptions to, or deletions from, this practice are described in Section 8.3 of this report. This assessment has revealed no evidence of RECs or CRECs in connection with the Site.

8.5 RECOMMENDATIONS

Based on the findings and conclusions of this Phase I ESA, Kleinfelder has the following recommendations for further assessment.

- The Site is within the quarter-mile buffer zone for the likely presence of NOA extending into at least the westernmost portion of the Site, and at least one composite sample associated with nearby construction contained a 0.25% chrysotile asbestos concentration. Since specific locations of those samples are not known, the collection and analysis of NOA samples is recommended if Costco desires a greater level of certainty of the potential presence of NOA in shallow soil at the Site. Additionally, an Asbestos Dust Mitigation Plan for AQMD is recommended prior to construction at the Site.
- A wetland delineation in the spring is recommended.
- Pre-construction surveys for burrowing owls, Swainson’s hawk, and migratory birds is recommended.
- A mitigation credit may need to be acquired to move the blue elderberry shrub in the northern portion of the Site.

Copyright 2019 Kleinfelder

8.6 DATA GAPS

Data gaps, which may affect the identification of hazardous substances or petroleum products for the evaluation of RECs at the Site, include the following:

- A completed questionnaire from the current owner of the Site has not been received to date.

The absence of information from the property owner is not considered a significant data gap based on other information obtained as part of this Phase I ESA.

STATEMENT OF QUALIFICATIONS

We declare that to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in Section 312.10 of 40 CFR 312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all-appropriate inquiries in conformance with the standards and practices set forth in CFR Part 312.

Lindsey Dandridge-Perry
Project Professional

Lizanne Simmons, PG
Senior Principal Geologist

The resumes of above-listed environmental professionals performing this Phase I ESA are on file at the Kleinfelder office and are available upon request.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

RGA LF ---- Recovered Government Archive Solid Waste Facilities List

EXECUTIVE SUMMARY

RGA LUST---------- Recovered Government Archive Leaking Underground Storage Tank

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 10/29/2018 has revealed that there are 2 ENVIROSTOR sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SERRANO ELEMENTARY S Facility Id: 9020004 Status: No Further Action	***SERRANO PARKWAY/SILV***	***NNW 1/4 - 1/2 (0.311 mi.)***	***1***	***8***
SILVER DOVE ELEMENTA Facility Id: 9000003 Status: No Further Action	***SILVER DOVE WAY/BASS***	***E 1/2 - 1 (0.886 mi.)***	***5***	***13***

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

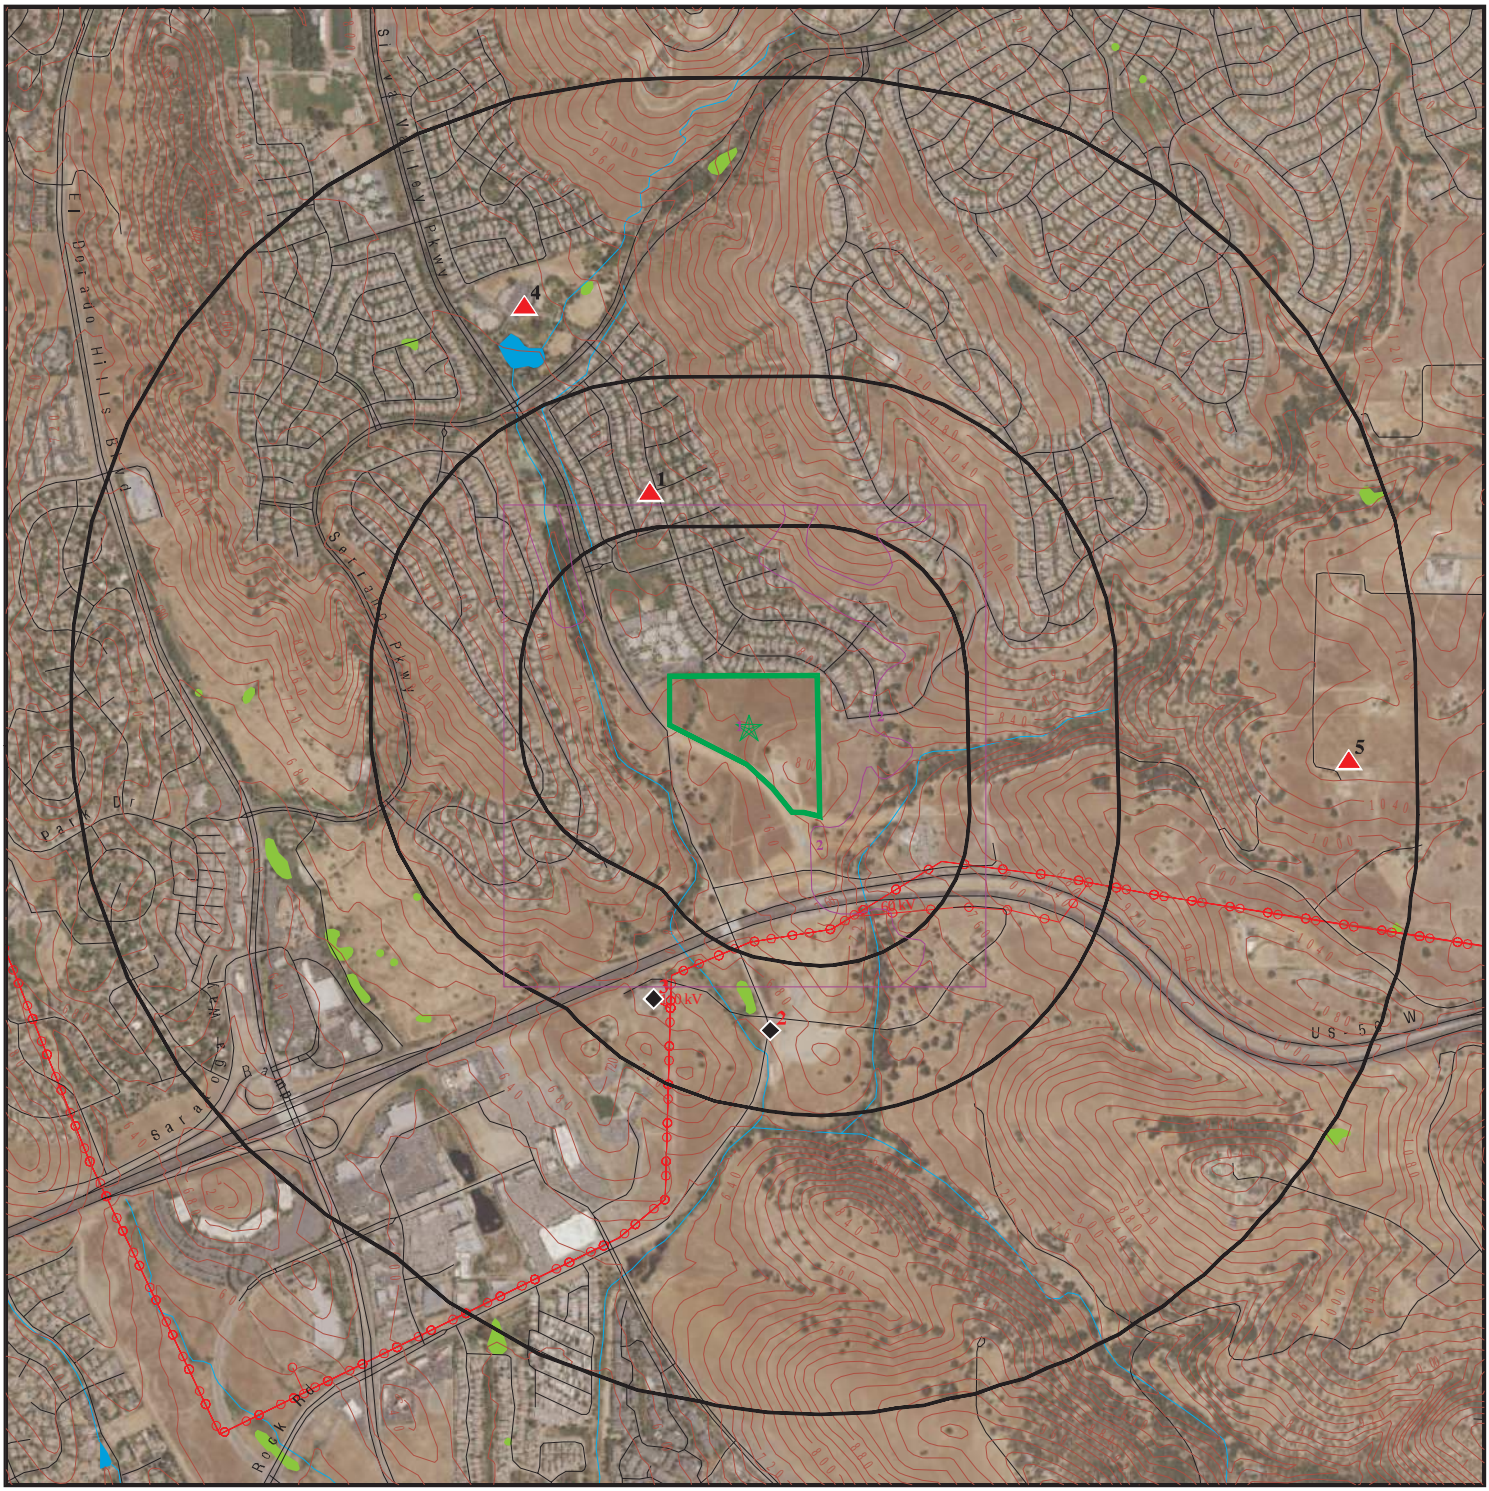
CUPA Listings: A listing of sites included in the county's Certified Unified Program Agency database. California's Secretary for Environmental Protection established the unified hazardous materials and hazardous

waste regulatory program as required by chapter 6.11 of the California Health and Safety Code. The Unified Program consolidates the administration, permits, inspections, and enforcement activities.

A review of the CUPA Listings list, as provided by EDR, has revealed that there are 2 CUPA Listings sites within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
NEHEMIAH CONSTRUCTIO	1400 WHITE ROCK RD	S 1/4 - 1/2 (0.366 mi.)	2	9
Database: CUPA EL DORADO, Date of Government Version: 12/13/2018 Status: Inactive, non-billable				
PG&E: CLARKSVILLE SU	JOERGER RD	SSW 1/4 - 1/2 (0.388 mi.)	3	10
Database: CUPA EL DORADO, Date of Government Version: 12/13/2018 Status: Active, billable				

ENF: A listing of Water Board Enforcement Actions. Formal is everything except Oral/Verbal Communication, Notice of Violation, Expedited Payment Letter, and Staff Enforcement Letter.



A review of the ENF list, as provided by EDR, and dated 11/01/2018 has revealed that there is 1 ENF site within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/1991

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

FEDERAL FACILITY: Federal Facility Site Information listing

A listing of National Priority List (NPL) and Base Realignment and Closure (BRAC) sites found in the Comprehensive Environmental Response, Compensation and Liability Information System (CERCLIS) Database where EPA Federal Facilities Restoration and Reuse Office is involved in cleanup activities.

Date of Government Version: 11/07/2016

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

RCRA-CESQG: RCRA - Conditionally Exempt Small Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Date of Government Version: 04/17/1995
Date Data Arrived at EDR: 07/03/1995
Date Made Active in Reports: 08/07/1995

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

CERS: CalEPA Regulated Site Portal Data

The CalEPA Regulated Site Portal database combines data about environmentally regulated sites and facilities in California into a single database. It combines data from a variety of state and federal databases, and provides an overview of regulated activities across the spectrum of environmental programs for any given location in California. These activities include hazardous materials and waste, state and federal cleanups, impacted ground and surface waters, and toxic materials

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data

Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Longitude (West):	121.056446 - 121° 3' 23.21''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	669104.5
UTM Y (Meters):	4280878.5
Elevation:	758 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5629046 CLARKSVILLE, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

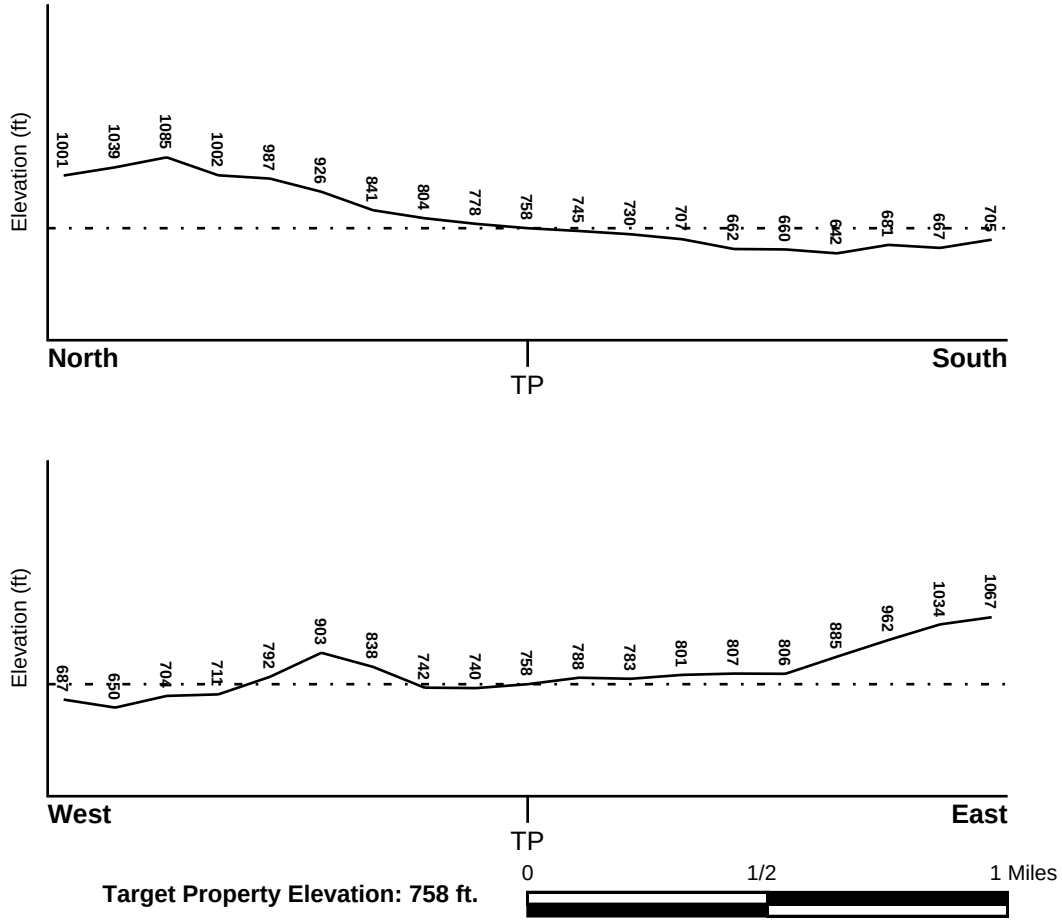
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06017C0725E	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06067C0140H	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CLARKSVILLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: AUBURN

Soil Surface Texture: silt loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 48 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

STATE RECORDS

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

OTHER STATE DATABASE INFORMATION

California Oil and Gas Well Locations
Source: Department of Conservation
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

RADON

State Database: CA Radon
Source: Department of Public Health
Telephone: 916-210-8558
Radon Database for California

Area Radon Information
Source: USGS
Telephone: 703-356-4020
The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

PHYSICAL SETTING SOURCE RECORDS SEARCHED

EPA Radon Zones
Source: EPA
Telephone: 703-356-4020
Sections 307 & 309 of IRAA directed EPA to list and identify areas of U.S. with the potential for elevated indoor radon levels.

OTHER

Airport Landing Facilities: Private and public use landing facilities
Source: Federal Aviation Administration, 800-457-6656

Epicenters: World earthquake epicenters, Richter 5 or greater
Source: Department of Commerce, National Oceanic and Atmospheric Administration

California Earthquake Fault Lines: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

EDR Environmental Lien and AUL Search

The EDR Environmental LienSearch Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Asbestos Dust Mitigation Plan (ADMP) Application

(For projects greater than 20 yd³ and located in NOA(*) designated areas, or where NOA had been discovered)

Please complete every section and initial each page – incomplete applications will be returned.

1. ADMINISTRATIVE INFORMATION

Size of Project

Estimated Size of DISTURBED area (acres) *(Round up to nearest acre)*: 2

NOTE: If size of DISTURBED area exceeds 50 acres, the project is designated as a "Large Operation" and additional requirements apply.

Estimated VOLUME (cubic yards) of graded Material: 20,000

NOTE: If VOLUME of graded material exceeds 20 cubic yards, ADMP must be prepared and submitted.

Will Export Soils be Generated? ☐ YES ☑ NO

If "YES": (1) Exported soil management MUST comply with Rule 223-2.6.D.3. (2) Address of the receiving site MUST be provided in Section 16.

Fees and Checklist

Fees due:

$363.00 ADMP Review Fee

+ 48.00 $24 x DISTURBED Acres (minimum = $24)

$ 411.00 **Total Fees Due**

Checklist:

☑ Fees submitted with ADMP Application

☑ Application signed and initialed by a Responsible Party

☑ Project Map (must be included)

☑ NOA(*) Sampling Reports (if applicable)

8. LARGE OPERATIONS (> 50 acres of DISTURBED surface) ☑ N/A

Additional requirements (Rule 223-2.7):

- Large Operations must include Dust Controls Measures specified in Tables 5-6 of Rule 223-2.
  - ☐ Maintain daily records to document the specific dust control actions taken
  - ☐ Onsite Dust Control Supervisor (available within 30 minutes during working hours):

Name: _____ Phone/Mobile Number: _____

9. POTENTIAL SOURCES OF FUGITIVE DUST EMISSIONS

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Asbestos Warning Signs must be posted at main entrances to the project (Rule 223-2.4.D)

Activity: (Check all that apply)

- ☑ Disturbing Soil
- ☐ Clearing and Grubbing
- ☐ Grading
- ☐ Backfilling
- ☐ Clearing Forms, Foundations and Slabs
- ☐ Demolition – Mechanical/Manual
- ✓ Large Earth-moving Equipment Operations
- ✓ Importing/Exporting of Bulk Materials
- ☐ Landscaping
- ✓ Road Construction / Maintenance
- ✓ Stockpiles/Bulk Material Handling
- ☐ Traffic Areas for Construction Activities
- ☐ Trenching
- ☐ Truck Loading
- ☐ Unpaved Road/Parking Lots
- ☐ Blasting
- ☐ Other: _____

Initial: MD
Responsible Person

ASBESTOS DUST MITIGATION PLAN APPLICATION

EL DORADO COUNTY AIR QUALITY MANAGEMENT DISTRICT

10. SOIL DISTURBANCE ACTIVITIES

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend soil disturbing activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures

Controls for soil distrurbing activities: (Check all that apply)

- ☑ Application of water, as necessary, prior and during earthmoving or land clearing activities (maintain live perennial vegetation where possible)
- ☐ Pre-wetting the ground to the depth of the anticipated cuts
- ☑ Stabilize soils once soils disturbing activities are complete
- ☑ Any other measure(s) as effective as the measures listed above (please describe)

Permanent erosion control measures.

11. ACTIVE STORAGE PILES ☐ N/A

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

The following control measure MUST be addressed:

- ☑ Keep active storage piles adequately wetted or covered with tarps (please describe):

Stockpile will be watered to control dust

- ☑ When handling bulk material apply water or chemical/organic stabilizers/suppressants
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

Initial: MB

Responsible Person

*: NOA(*) – Naturally Occurring Asbestos (see "Western El Dorado County Asbestos Review Areas" Map)

ASBESTOS DUST MITIGATION PLAN APPLICATION

EL DORADO COUNTY AIR QUALITY MANAGEMENT DISTRICT

12. INACTIVE STORAGE PILES ☐ N/A

(not disturbed for more than 7 consecutive days)

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

Control for disturbed surface areas and storage piles that will remain inactive for more than seven (7) days shall include one or more of the following: (Check all that apply)

- ☑ Keep the surface adequately wetted
- ☐ Establish and maintenance of surface crusting sufficient to satisfy the test in Rule 223-2.10.C or Title 14 subsection §93105(h)(6)
- ☐ Application of chemical dust suppressants or chemical stabilizers according to the manufacturer's recommendations
- ☑ Covering with tarp(s) or vegetative cover
- ☐ Installation of wind barriers of fifty (50) percent porosity around three (3) sides of a storage pile
- ☐ Installation of wind barriers across open areas
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

13. TRACK-OUT PREVENTION

- Any visible track-out on a paved public road where vehicles enter and exit the work area must be **IMMEDIATELY** removed from paved public roads. Removal shall be accomplished by using wet sweeping or a HEPA filter equipped vacuum device or flushing with water (if not in violation of any National Pollutant Discharge Elimination System permit program). Applicable Best Management Practices included in Table 3 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A. ***Note: The use blower devices, or dry rotary brushes, is expressly prohibited!***

Other control measures: (Check all that apply)

- ☑ A gravel pad designed using good engineering practices to clean the tires of exiting vehicles
- ☐ Grizzlies, or similar devices designed to remove mud/dirt from tires
- ☐ A tire shaker
- ☐ A wheel wash system (mechanical or manual)
- ☐ Paving of interior roads
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

14. BLASTING ACTIVITIES ☑ N/A

Must notify AQMD two (2) hours prior to blast!

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend blasting activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures. Consider wind direction with respect to property line and nearby residences

Controls for blasting activities: (Check all that apply)

- ☐ Pre-wetting blast area
- ☐ Place blast mats or soil mounds over charges
- ☐ Stabilize soils once blasting activities are complete
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

15. TRAFFIC CONTROL ON ON-SITE UNPAVED ROADS, PARKING LOTS AND STAGING AREAS ☐ N/A

The following control measure MUST be addressed:

- A maximum speed limit of fifteen (15) miles per hour (mph) or less

Additional control measures: (Check all that apply)

- ☑ Water every two hours of active operation or sufficiently often to keep the area adequately wetted
- ☐ Apply chemical dust suppressants consistent with manufacturer's directions
- ☐ Maintain a gravel cover with a silt content that is less than five (5) percent and asbestos content that is less than 0.25 percent, as determined using an approved asbestos bulk test method, to a depth of three (3) inches on the surface being used for travel
- ☑ Direct construction traffic over established haul routes
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

16. MANAGEMENT OF EXCAVATED SOILS

The owner and/or operator MUST ensure that procedures and documentation per Rule 223-2.6.D. are obtained and retained.

☑ **On-Site Disposition**. Where feasible, excavated soils should be placed into fills elsewhere on the project.

- **Location**(s) of removal and placement quantities and location(s) of fills must be documented **and records retained for a period of ten (10) years.**
- Fills, with a NOA(*) content ≥ 1.0% or when visually evident fibrous materials likely to be NOA(*) are present, located in residential landscaping areas shall be covered by at least two feet (24 inches) of non-asbestiform cover soil material, or by concrete or asphalt paving.

☐ **Off-Site Disposition**. For any **soils** transported off-site the following information must be documented and retained for a period of at least 3 years (Rule 223-2.6.D.3).

- Originating project information (name, address, location)
- Laboratory results/report for NOA(*) soil testing done at the project location
- Date(s) of off-site transport(s) of excavated soils
- Location(s) where excavated soils were transported to
- Total quantity transported to each location
- Intended usage (fill, surface application), if the final destination is other than Class II or Class III landfill disposal
- **Location to receive exported soils**: _____

_____

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

17. OFF-SITE TRANSPORT ☑ N/A

The owner and/or operator must ensure that no trucks are allowed to transport excavated material off-site unless:

- Trucks are maintained such that no spillage can occur from holes or other openings in cargo compartments
- Loads are adequately wetted

☑ Water applied, if necessary, to the top of load

AND either: (Check all that apply)

☐ Covered with tarps or other suitable cover

☐ Trucks loaded such that the freeboard is not less than six (6) inches (material does not touch the front, back or sides of the cargo compartment at any point less than six inches from the top)

☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

18. POST CONSTRUCTION STABLIZATION OF DISTURBED AREAS

■ Upon completion of all phases of the project, but **no later than 30 days following the end of soil disturbing activities**, all disturbed surfaces with naturally occurring asbestos content of equal to or greater than 0.25% shall be stabilized using one or more of the following methods:

- [x] Establish a vegetative cover (less than 30% of disturbed ground exposed within 90 days of planting, and at all times thereafter):
- [ ] Placement of at least three (3.0) inches of non-asbestos containing material on disturbed soil areas in residential and nonresidential areas;
- [ ] Placement of a total of at least twelve (12) inches or the maximum depth of irrigation improvements, whichever is higher, of non-asbestos containing material on disturbed soil areas in residential landscaping areas with NOA(*) content greater than 0.25% or when visually evident fibrous materials likely to be asbestos are present;
- [ ] Paving, decking, building foundations, swimming pool structure, flatwork or retaining walls;
- [ ] Other measures approved by the APCO: _____

19. STATEMENT OF PROJECT'S RESPONSIBLE PERSON (Owner or Licensed Contractor acting on behalf of the Owner)

"I am familiar with the Rules and Regulations of the El Dorado County AQMD that are applicable to my project and I certify that the information and the data submitted with the application are true with regards to the project activities and/or equipment which are the subjects of this application". **A copy of this plan must be provided to all contractors and be available on site at all times.**
NOTE: Any changes to this plan MUST be pre-approved by the AQMD.

2.0 to 3.0	7.0	7.8	4.0	0.5	56

Sample Population B
(Borings B46 through B49 and B187 through B194 – Soundwall)

SAMPLE INTERVAL (feet)	90% TOTAL LEAD UCL * (mg/kg)	95% TOTAL LEAD UCL * (mg/kg)	TOTAL LEAD MEAN (mg/kg)	MINIMUM VALUE (mg/kg)	MAXIMUM VALUE (mg/kg)
0.0 to 3.0	35.6	38.7	21.7	0.9	95

* UCLs could not be calculated for each sample interval due to insufficient number of data, thus UCLs were calculated using all samples collected from this area.

5.4 NOA Results

Thirty composite soil samples were analyzed by EMSL for asbestos by the PLM method using the CARB 435 sample preparation method. An additional rock chip sample was analyzed by the PLM method and CARB 435 sample preparation. A summary of asbestos analytical results is presented in Table 4. Laboratory reports and COC documentation are presented in Appendix B.

One sample (NOA24) was reported to contain asbestos below the CARB regulatory action limit of 0.25% and the rest were reported as non-detect. TEM analysis was not performed on sample NOA24 because of the low percentage of asbestos reported. Additionally, TEM analysis is primarily used to determine the type of asbestos present and was not deemed necessary for this study.

5.5 Lead-containing Paint Sample Analytical Results

Five paint-chip samples were collected from the yellow median traffic stripe within the project boundaries. Paint-chip samples were analyzed for total lead and chromium. The analytical results of the LCP samples are summarized in Table 5. Laboratory reports and COC documentation are presented in Appendix B.

Total lead and chromium were detected in each sample submitted for analysis. Total lead was reported to range from 290 to 1,000 mg/kg, at or less than the California hazardous waste threshold (TTLC) for lead of 1,000 mg/kg. Total chromium was reported to range from 90 to 240 mg/kg, less than the California hazardous waste threshold (TTLC) for chromium of 2,500 mg/kg. Since the samples were only collected for screening purposes, WET analysis was not performed.

Asbestos Dust Mitigation Plan (ADMP) Application

(For projects greater than 20 yd³ and located in Naturally Occurring Asbestos (NOA) designated areas as shown on the Western El Dorado County Asbestos Review Map, or where NOA had been discovered)

Please complete every section and initial each page – incomplete applications will be returned.

1. ADMINISTRATIVE INFORMATION

Size of Project

Estimated Size of DISTURBED area (acres) *(Round up to nearest acre)*: 5.0 ACRES

NOTE: If size of DISTURBED area exceeds 50 acres, the project is designated as a "Large Operation" and additional requirements apply.

Estimated VOLUME (cubic yards) of graded Material: 120,000 CY

NOTE: If VOLUME of graded material exceeds 20 cubic yards, ADMP must be prepared and submitted.

Will Export Soils be Generated? ☒ YES ☐ NO

If "YES": (1) Exported soil management MUST comply with Rule 223-2.6.D.3.
(2) Address of the receiving site MUST be provided in Section 16.

Fees and Checklist

Fees due:

$380.00 (5) ADMP Review Fee

+ 130.00 $26 x DISTURBED Acres (minimum = $26)

$510.00 **Total Fees Due**

Checklist:

- ☒ Fees submitted with ADMP Application
- ☒ Application signed and initialed by a Responsible Party
- ☒ Project Map (must be included)
- ☐ NOA Sampling Reports (if applicable)

10. SOIL DISTURBANCE ACTIVITIES

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend soil disturbing activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures

Controls for soil distrurbing activities: (Check all that apply)

- [☑] Application of water, as necessary, prior and during earthmoving or land clearing activities (maintain live perennial vegetation where possible)
- [ ] Pre-wetting the ground to the depth of the anticipated cuts
- [x] Stabilize soils once soils disturbing activities are complete
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

11. ACTIVE STORAGE PILES ☐ N/A

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

The following control measure MUST be addressed:

- [X] Keep active storage piles adequately wetted or covered with tarps (please describe):

_____

_____

- [ ] When handling bulk material apply water or chemical/organic stabilizers/suppressants
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

12. INACTIVE STORAGE PILES ☐ N/A

(not disturbed for more than 7 consecutive days)

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

Control for disturbed surface areas and storage piles that will remain inactive for more than seven (7) days shall include one or more of the following: (Check all that apply)

- [X] Keep the surface adequately wetted OR
- [X] Establish and maintenance of surface crusting sufficient to satisfy the test in Rule 223-2.10.C or Title 14 subsection §93105(h)(6) OR
- [X] Application of chemical dust suppressants or chemical stabilizers according to the manufacturer's recommendations OR
- [X] Covering with tarp(s) or vegetative cover
- [ ] Installation of wind barriers of fifty (50) percent porosity around three (3) sides of a storage pile
- [ ] Installation of wind barriers across open areas
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

13. TRACK-OUT PREVENTION

- Any visible track-out on a paved public road where vehicles enter and exit the work area must be **IMMEDIATELY** removed from paved public roads. Removal shall be accomplished by using wet sweeping or a HEPA filter equipped vacuum device or flushing with water (if not in violation of any National Pollutant Discharge Elimination System permit program). Applicable Best Management Practices included in Table 3 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A. ***Note: The use of blower devices, or dry rotary brushes, is expressly prohibited!***

Other control measures: (Check all that apply)

- [X] A gravel pad designed using good engineering practices to clean the tires of exiting vehicles OR
- [X] Grizzlies, or similar devices designed to remove mud/dirt from tires OR
- [X] A tire shaker OR
- [X] A wheel wash system (mechanical or manual)
- [ ] Paving of interior roads
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

14. BLASTING ACTIVITIES ☐ N/A

Must notify AQMD two (2) hours prior to blast!

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend blasting activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures. Consider wind direction with respect to property line and nearby residences

Controls for blasting activities: (Check all that apply)

- [x] Pre-wetting blast area
- [x] Place blast mats or soil mounds over charges
- [ ] Stabilize soils once blasting activities are complete
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

15. TRAFFIC CONTROL OF ON-SITE UNPAVED ROADS, PARKING LOTS AND STAGING AREAS ☐ N/A

The following control measure MUST be addressed:

- A maximum speed limit of fifteen (15) miles per hour (mph) or less

Additional control measures: (Check all that apply)

- [x] Water every two hours of active operation or sufficiently often to keep the area adequately wetted OR
- [x] Apply chemical dust suppressants consistent with manufacturer's directions OR
- [ ] Maintain a gravel cover with a silt content that is less than five (5) percent and asbestos content that is less than 0.25 percent, as determined using an approved asbestos bulk test method, to a depth of three (3) inches on the surface being used for travel
- [x] Direct construction traffic over established haul routes
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

16. MANAGEMENT OF EXCAVATED SOILS

The owner and/or operator MUST ensure that procedures and documentation per Rule 223-2.6.D. are obtained and retained.

☒ **On-Site Disposition**. Where feasible, excavated soils should be placed into fills elsewhere on the project.

- **Location**(s) of removal and placement quantities and location(s) of fills must be documented **and records retained for a period of ten (10) years.**
- Fills, with a NOA content ≥ 1.0% or when visually evident fibrous materials likely to be NOA are present, located in residential landscaping areas shall be covered by at least two feet (24 inches) of non-asbestiform cover soil material, or by concrete or asphalt paving.

☒ **Off-Site Disposition**. For any **soils** transported off-site the following information must be documented and retained for a period of at least 3 years (Rule 223-2.6.D.3).

- Originating project information (name, address, location)
- Laboratory results/report for NOA soil testing done at the project location
- Date(s) of off-site transport(s) of excavated soils
- Location(s) of transported soil
- Total quantity transported to each location
- Intended usage (fill, surface application), if the final destination is other than Class II or Class III landfill disposal
- **Location to receive exported soils**: HIGHWAY 50 INTERCHANGE AT SILVA VALLEY PARKWAY AREA POTENTIALLY AREAS WITHIN 122-720-09 & 118-170-01,13,14,16,17 & 121-280-01, 24

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

17. OFF-SITE TRANSPORT ☐ N/A

The owner and/or operator must ensure that no trucks are allowed to transport excavated material off-site unless:

- Trucks are maintained such that no spillage can occur from holes or other openings in cargo compartments
- Loads are adequately wetted

☑ Water applied, if necessary, to the top of load

AND either: (Check all that apply)

☐ Covered with tarps or other suitable cover

☐ Trucks loaded such that the freeboard is not less than six (6) inches (material does not touch the front, back or sides of the cargo compartment at any point less than six inches from the top)

☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

ASBESTOS DUST MITIGATION PLAN APPLICATION

COUNTY OF EL DORADO AIR QUALITY MANAGEMENT DISTRICT

18. POST CONSTRUCTION STABLIZATION OF DISTURBED AREAS

- Upon completion of all phases of the project, but **no later than 30 days following the end of soil disturbing activities**, all disturbed surfaces with naturally occurring asbestos content of equal to or greater than 0.25% shall be stabilized using one or more of the following methods:

  - [X] Establish a vegetative cover (less than 30% of disturbed ground exposed within 90 days of planting, and at all times thereafter):
  - [ ] Placement of at least three (3.0) inches of non-asbestos containing material on disturbed soil areas in residential and nonresidential areas;
  - [ ] Placement of a total of at least twelve (12) inches or the maximum depth of irrigation improvements, whichever is higher, of non-asbestos containing material on disturbed soil areas in residential landscaping areas with NOA content greater than 0.25% or when visually evident fibrous materials likely to be asbestos are present;
  - [ ] Paving, decking, building foundations, swimming pool structure, flatwork or retaining walls;
  - [ ] Other measures approved by the APCO: _____

19. STATEMENT OF PROJECT'S RESPONSIBLE PARTY
(Owner or Licensed Contractor acting on behalf of the Owner)

"I am familiar with the Rules and Regulations of the County of El Dorado AQMD that are applicable to my project and I certify that the information and the data submitted with the application are true with regards to the project activities and/or equipment which are the subjects of this application". **A copy of this plan must be provided to all contractors and be available on site at all times.**
NOTE: Any changes to this plan MUST be pre-approved by the AQMD.

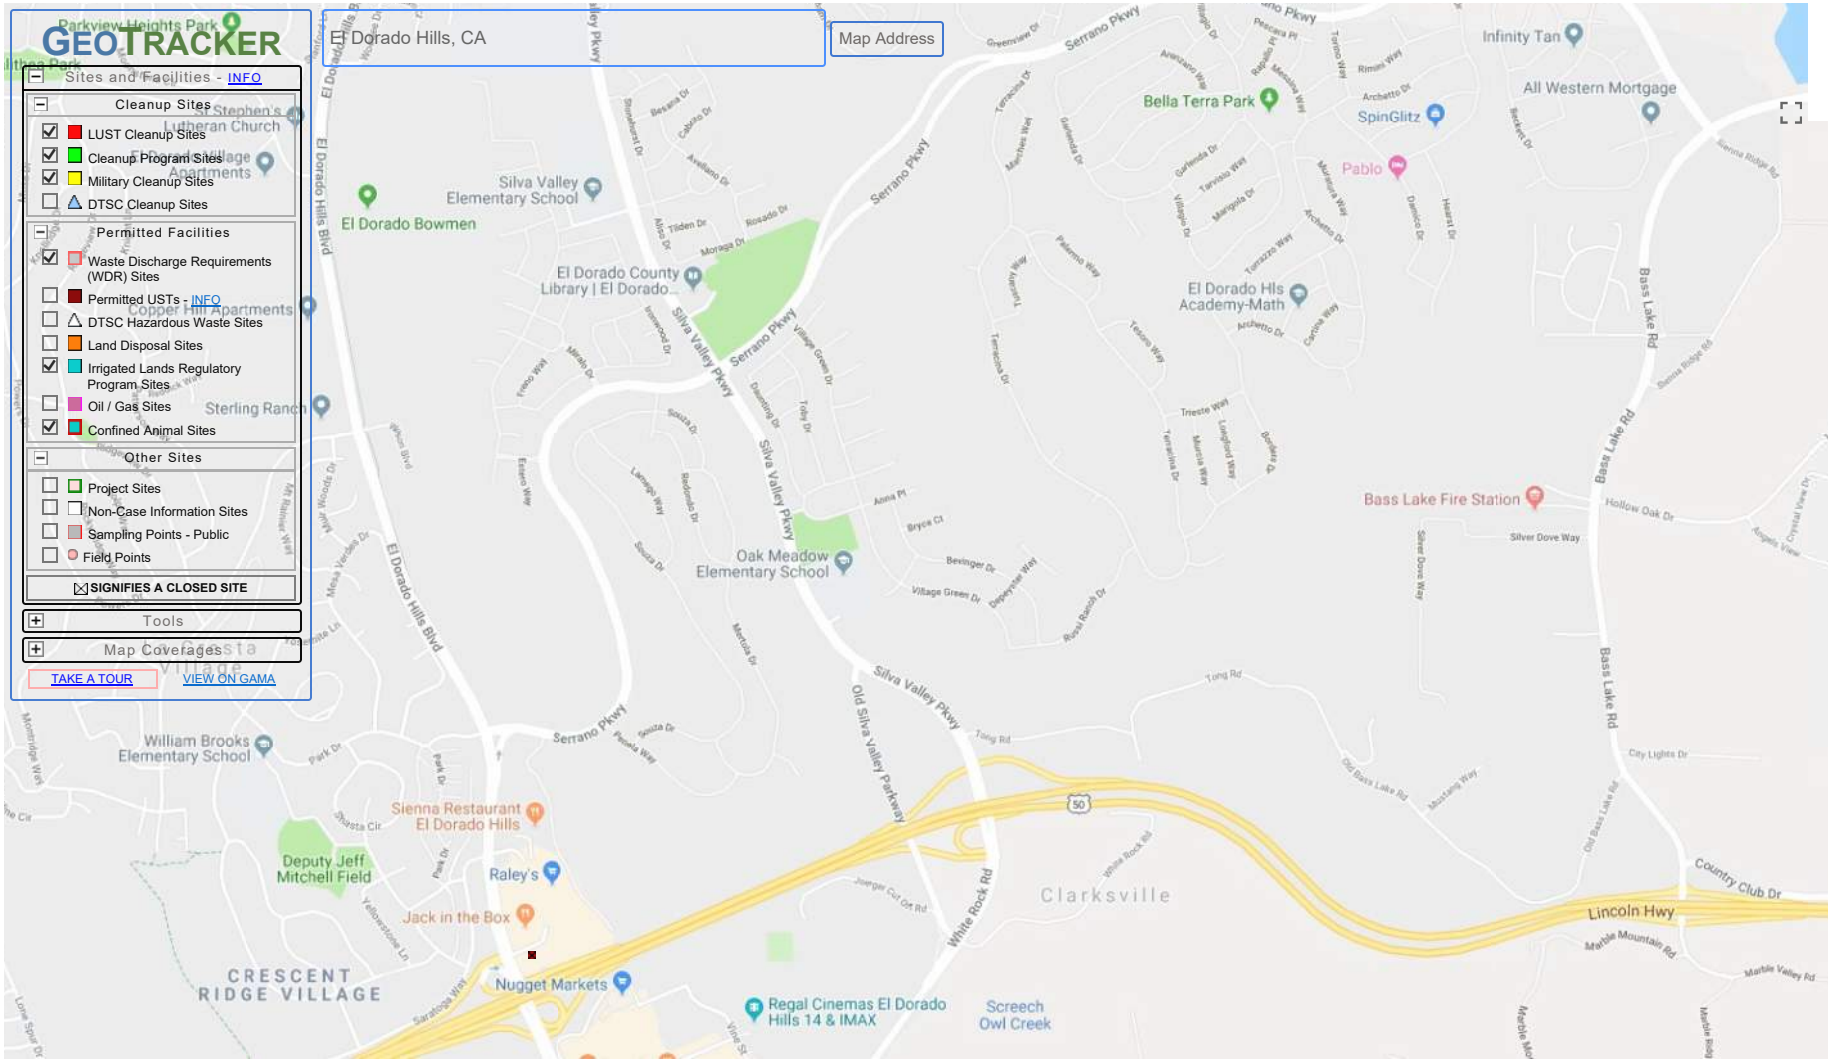
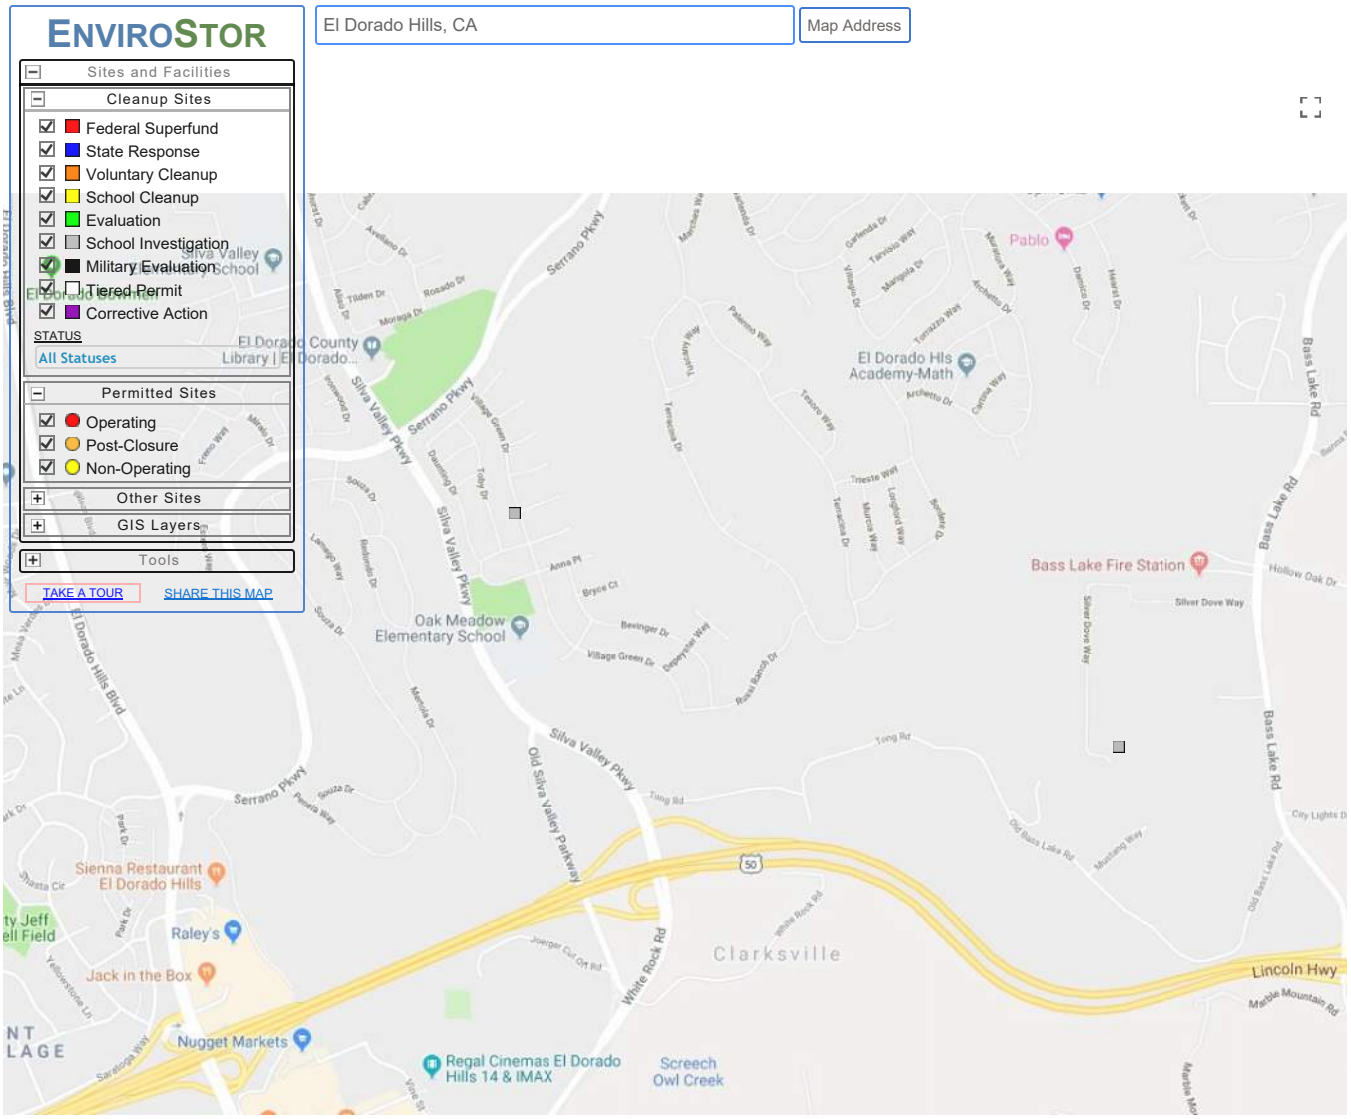
The Gold Standard in Public Service

Public Records

Dear Ms. Dandridge-Perry,



The Community Development Services, Environmental Management Department, has concluded its search and has determined that there are no records available responsive to your public records request for the property identified as APN 122-720-09 in El Dorado Hills.



This email confirms closure of your request. Thank you for using the WebQA system.

Regards,

Tom Meyer
Administrative Analyst
Environmental Management Department

To monitor the progress or update this request please log into the El Dorado County Public Records Center.

ASTM E1527-13
Phase I Environmental Site Assessment
User Questionnaire

INTRODUCTION

In order to qualify for one of the *Landowner Liability Protections (LLPs)*[1] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"),[2] the *user* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The *user* should provide the following information to the *environmental professional*. Failure to conduct these inquiries could result in a determination that "*all appropriate inquiries*" is not complete.

(1.) Environmental liens that are filed or recorded against the *property* (40 CFR 312.25).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* below) identify any environmental liens filed or recorded against the *property* under federal, tribal, state or local law?

No

Note 1—In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

(2.) Activity and use limitations that are in place on the *property* or that have been filed or recorded against the *property* (40 CFR 312.26(a)(1)(v) and vi)).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* above) identify any AULs, such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the *property* and/or have been filed or recorded against the *property* under federal, tribal, state or local law?

No

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an *adjoining property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No

[1] *Landowner Liability Protections*, or *LLPs*, is the term used to describe the three types of potential defenses to Superfund liability in EPA's *Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability* ("*Common Elements*" Guide) issued on March 6, 2003.
[2] P.L. 107-118.

(4.) Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?

Yes

(5.) Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30).

Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases?

No

For example,

(a.) Do you know the past uses of the *property*?

No

(b.) Do you know of specific chemicals that are present or once were present at the *property*?

No

(c.) Do you know of spills or other chemical releases that have taken place at the *property*?

No

(d.) Do you know of any environmental cleanups that have taken place at the *property*?

No

(6.) The degree of obviousness of the presence or likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

Based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of releases at the *property*?

No

In addition, certain information should be collected, if available, and provided to the *environmental professional* conducting the *Phase I Environmental Site Assessment*. This information is intended to assist the *environmental professional*, but is not necessarily required to qualify for one of the *LLPs*. The information includes:

(a) the reason why the Phase I is being performed,

(b) the type of *property* and type of *property* transaction, for example, sale, purchase, exchange, etc.,

(c) the complete and correct address for the *property* (a map or other documentation showing *property* location and boundaries is helpful),

(d) the scope of services desired for the Phase I ESA (including whether any parties to the *property* transaction may have a required standard scope of services or whether any considerations beyond the requirements of Practice E1527 are to be considered),

(e) identification of all parties who will rely on the Phase I *report* ,

(f) identification of the site contact and how the contact can be reached,

(g) any special terms and conditions which must be agreed upon by the *environmental professional*, and

(h) any other knowledge or experience with the *property* that may be pertinent to the *environmental professional* (for example, copies of any available prior *environmental site assessment reports*, documents, correspondence, etc., concerning the *property* and its environmental condition).

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Kleinfelder, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

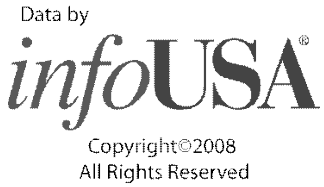
EXECUTIVE SUMMARY



DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available city directory data at 5 year intervals.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

ASTM and EPA Requirements

ASTM E 1527-13 lists building department records as a "standard historical source," as detailed in § 8.3.4.7: "Building Department Records - The term building department records means those records of the local government in which the property is located indicating permission of the local government to construct, alter, or demolish improvements on the property." ASTM also states that "Uses in the area surrounding the property shall be identified in the report, but this task is required only to the extent that this information is revealed in the course of researching the property itself."

EPA's Standards and Practices for All Appropriate Inquires (AAI) states: "§312.24: Reviews of historical sources of information. (a) Historical documents and records must be reviewed for the purposes of achieving the objectives and performance factors of §312.20(e) and (f). Historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

BUILD FAX PROPERTY HISTORY

EXECUTIVE SUMMARY: SEARCH DOCUMENTATION

A search of building department records was conducted by Environmental Data Resources, Inc (EDR) on behalf of Kleinfelder, Inc. on Jan 17, 2019.

TARGET PROPERTY

Not Reported
El Dorado Hills, CA 95762

SEARCH METHODS

EDR searches available lists for both the Target Property and Surrounding Properties.

RESEARCH SUMMARY

Building permits identified: **YES**

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

GLOSSARY

General Building Department concepts

- **ICC:** The International Code Council. The governing body for the building/development codes used by all jurisdictions who've adopted the ICC guidelines. MOST of the US has done this. Canada, Mexico, and other countries use ICC codes books and guides as well. There are a few states who have added guidelines to the ICC codes to better fit their needs. For example, California has added seismic retrofit requirements for most commercial structures.
- **Building Department (Permitting Authority, Building Codes, Inspections Department, Building and Inspections):** This is the department in a jurisdiction where an owner or contractor goes to obtain permits and inspections for building, tearing down, remodeling, adding to, re-roofing, moving or otherwise making changes to any structure, Residential or Commercial.
- **Jurisdiction:** This is the geographic area representing the properties over which a Permitting Authority has responsibility.
- **GC:** General Contractor. Usually the primary contractor hired for any Residential or Commercial construction work.
- **Sub:** Subordinate contracting companies or subcontractors. Usually a "trades" contractor working for the GC. These contractors generally have an area of expertise in which they are licensed like Plumbing, Electrical, Heating and Air systems, Gas Systems, Pools etc. (called "trades").
- **Journeymen:** Sub contractors who have their own personal licenses in one or more trades and work for different contracting companies, wherever they are needed or there is work.
- **HVAC (Mechanical, Heating & Air companies):** HVAC = Heating, Ventilation, and Air Conditioning.
- **ELEC (Electrical, TempPole, TPole, TPower, Temporary Power, Panel, AMP Change, Power Release):** Electrical permits can be pulled for many reasons. The most common reason is to increase the AMPs of power in an electrical power panel. This requires a permit in almost every jurisdiction. Other commons reason for Electrical permits is to insert a temporary power pole at a new construction site. Construction requires electricity, and in a new development, power has yet to be run to the lot. The temporary power pole is usually the very first permit pulled for new development. The power is released to the home owner when construction is complete and this sometimes takes the form of a Power Release permit or inspection.
- **"Pull" a permit:** To obtain and pay for a building permit.
- **CBO:** Chief Building Official
- **Planning Department:** The department in the development process where the building /structural plans are reviewed for their completeness and compliance with building codes
- **Zoning Department:** The department in the development process where the site plans are reviewed for their compliance with the regulations associated with the zoning district in which they are situated.
- **Zoning District:** A pre-determined geographic boundary within a jurisdiction where certain types of structures are permitted / prohibited. Examples are Residential structure, Commercial/Retail structures, Industrial/Manufacturing structures etc. Each zoning district has regulations associated with it like the sizes of the lots, the density of the structures on the lots, the number of parking spaces required for certain types of structures on the lots etc.
- **PIN (TMS, GIS ID, Parcel#):** Property Identification Number and Tax Map System number.
- **State Card (Business license):** A license card issued to a contractor to conduct business.
- **Building Inspector (Inspector):** The inspector is a building department employee that inspects building construction for compliance to codes.
- **C.O.:** Certificate of Occupancy. This is the end of the construction process and designates that the owners now have permission to occupy a structure after its building is complete. Sometimes also referred to as a Certificate of Compliance.

GLOSSARY

Permit Content Definitions

- Permit Number: The alphanumerical designation assigned to a permit for tracking within the building department system. Sometimes the permit number gives clues to its role, e.g. a "PL" prefix may designate a plumbing permit.
- Description: A field on the permit form that allows the building department to give a brief description of the work being done. More often than not, this is the most important field for EP's to find clues to the prior use(s) of the property.
- Permit Type: Generally a brief designation of the type of job being done. For example BLDG-RES, BLDG-COM, ELEC, MECH etc.

Sample Building Permit Data

Date: Nov 09, 2000
Permit Type: Bldg -
New Permit Number: 101000000405
Status: Valuation: $1,000,000.00
Contractor Company: OWNER-BUILDER
Contractor Name:

Description: New one store retail (SAV-ON) with drive-thru pharmacy. Certificate of Occupancy.

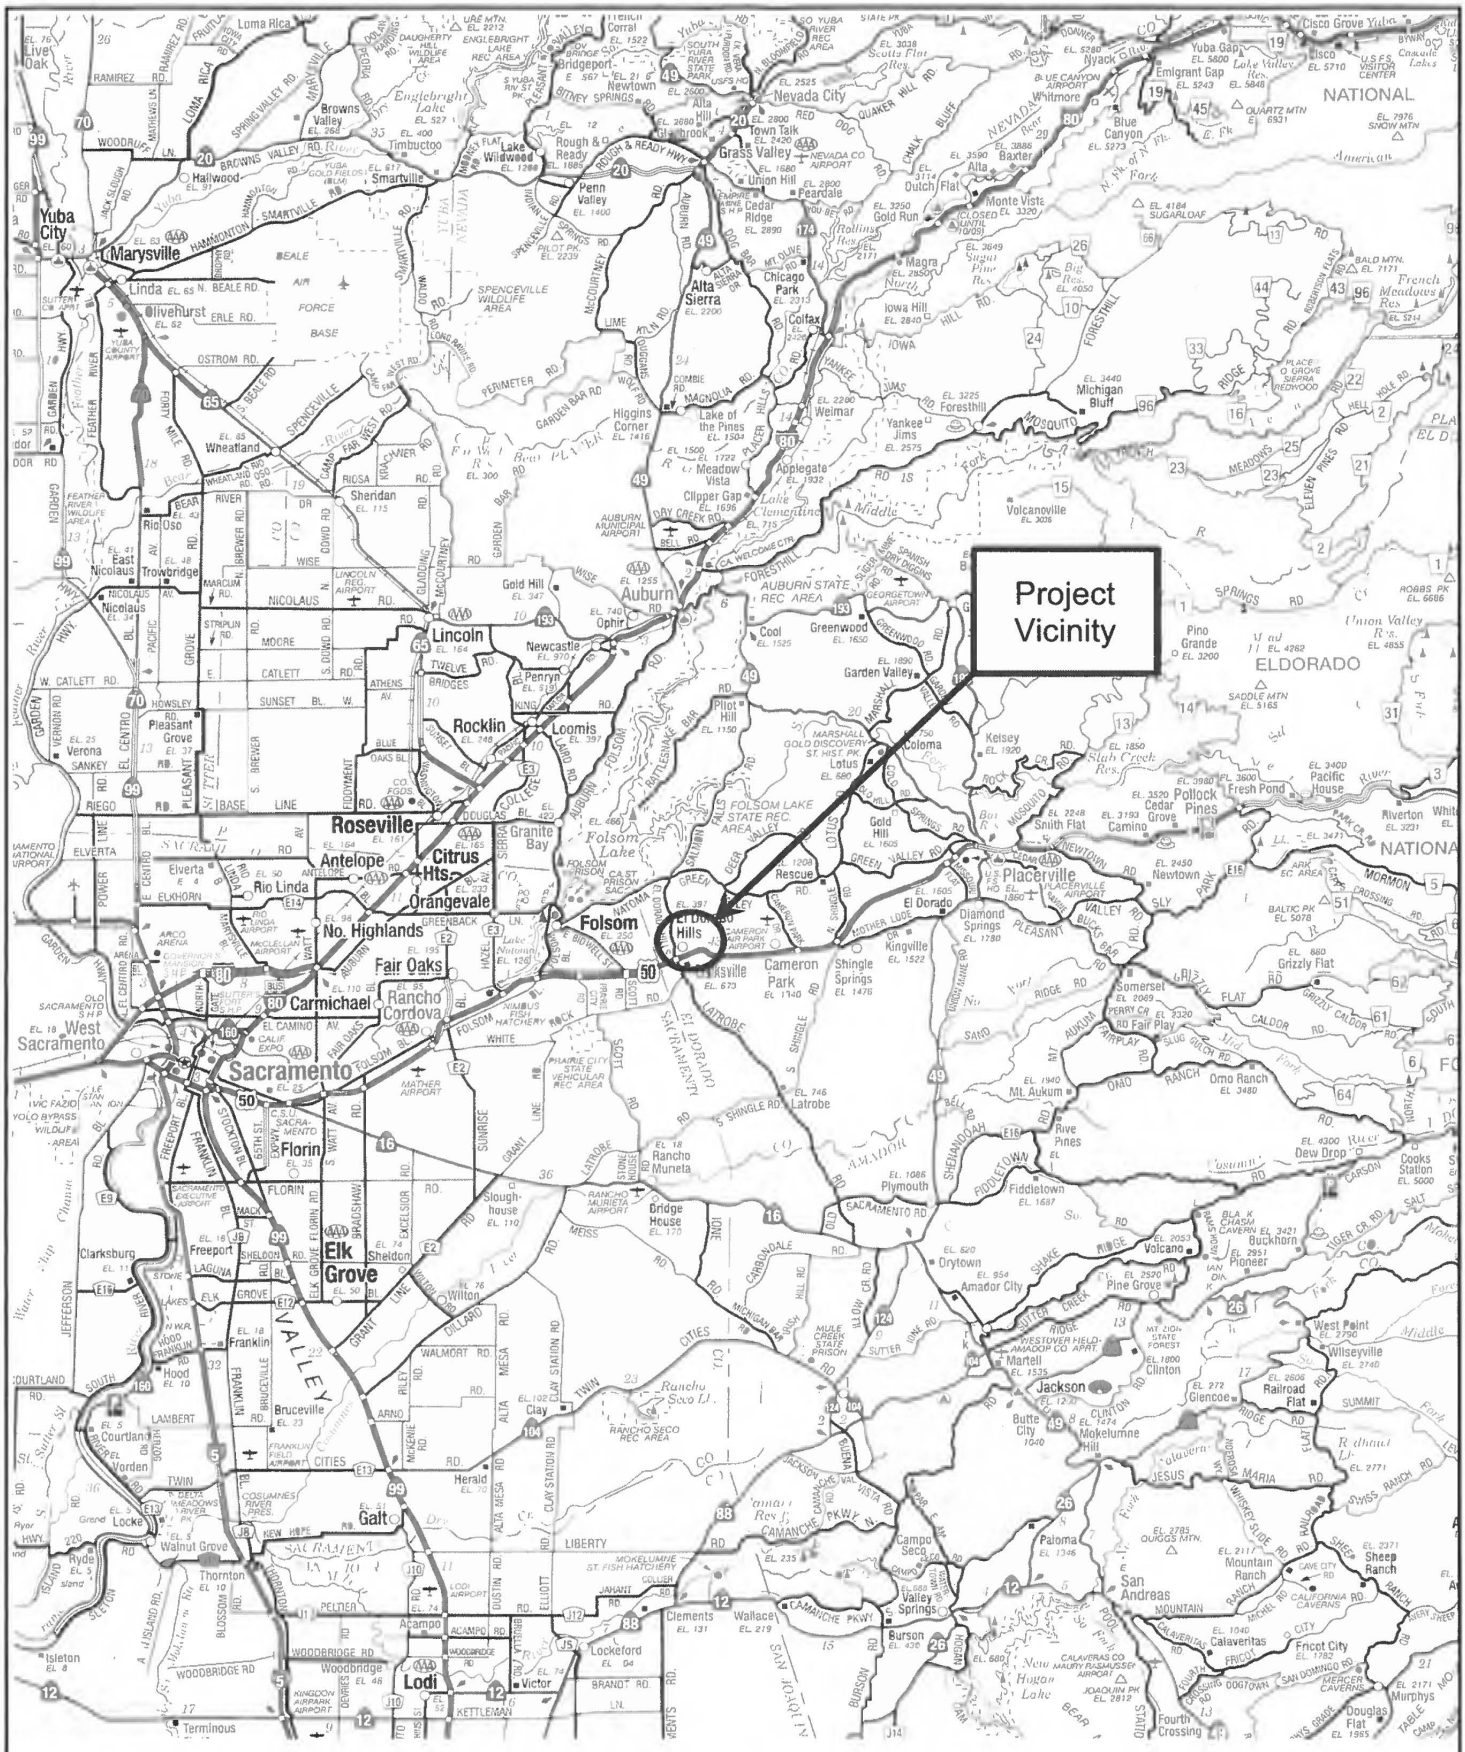
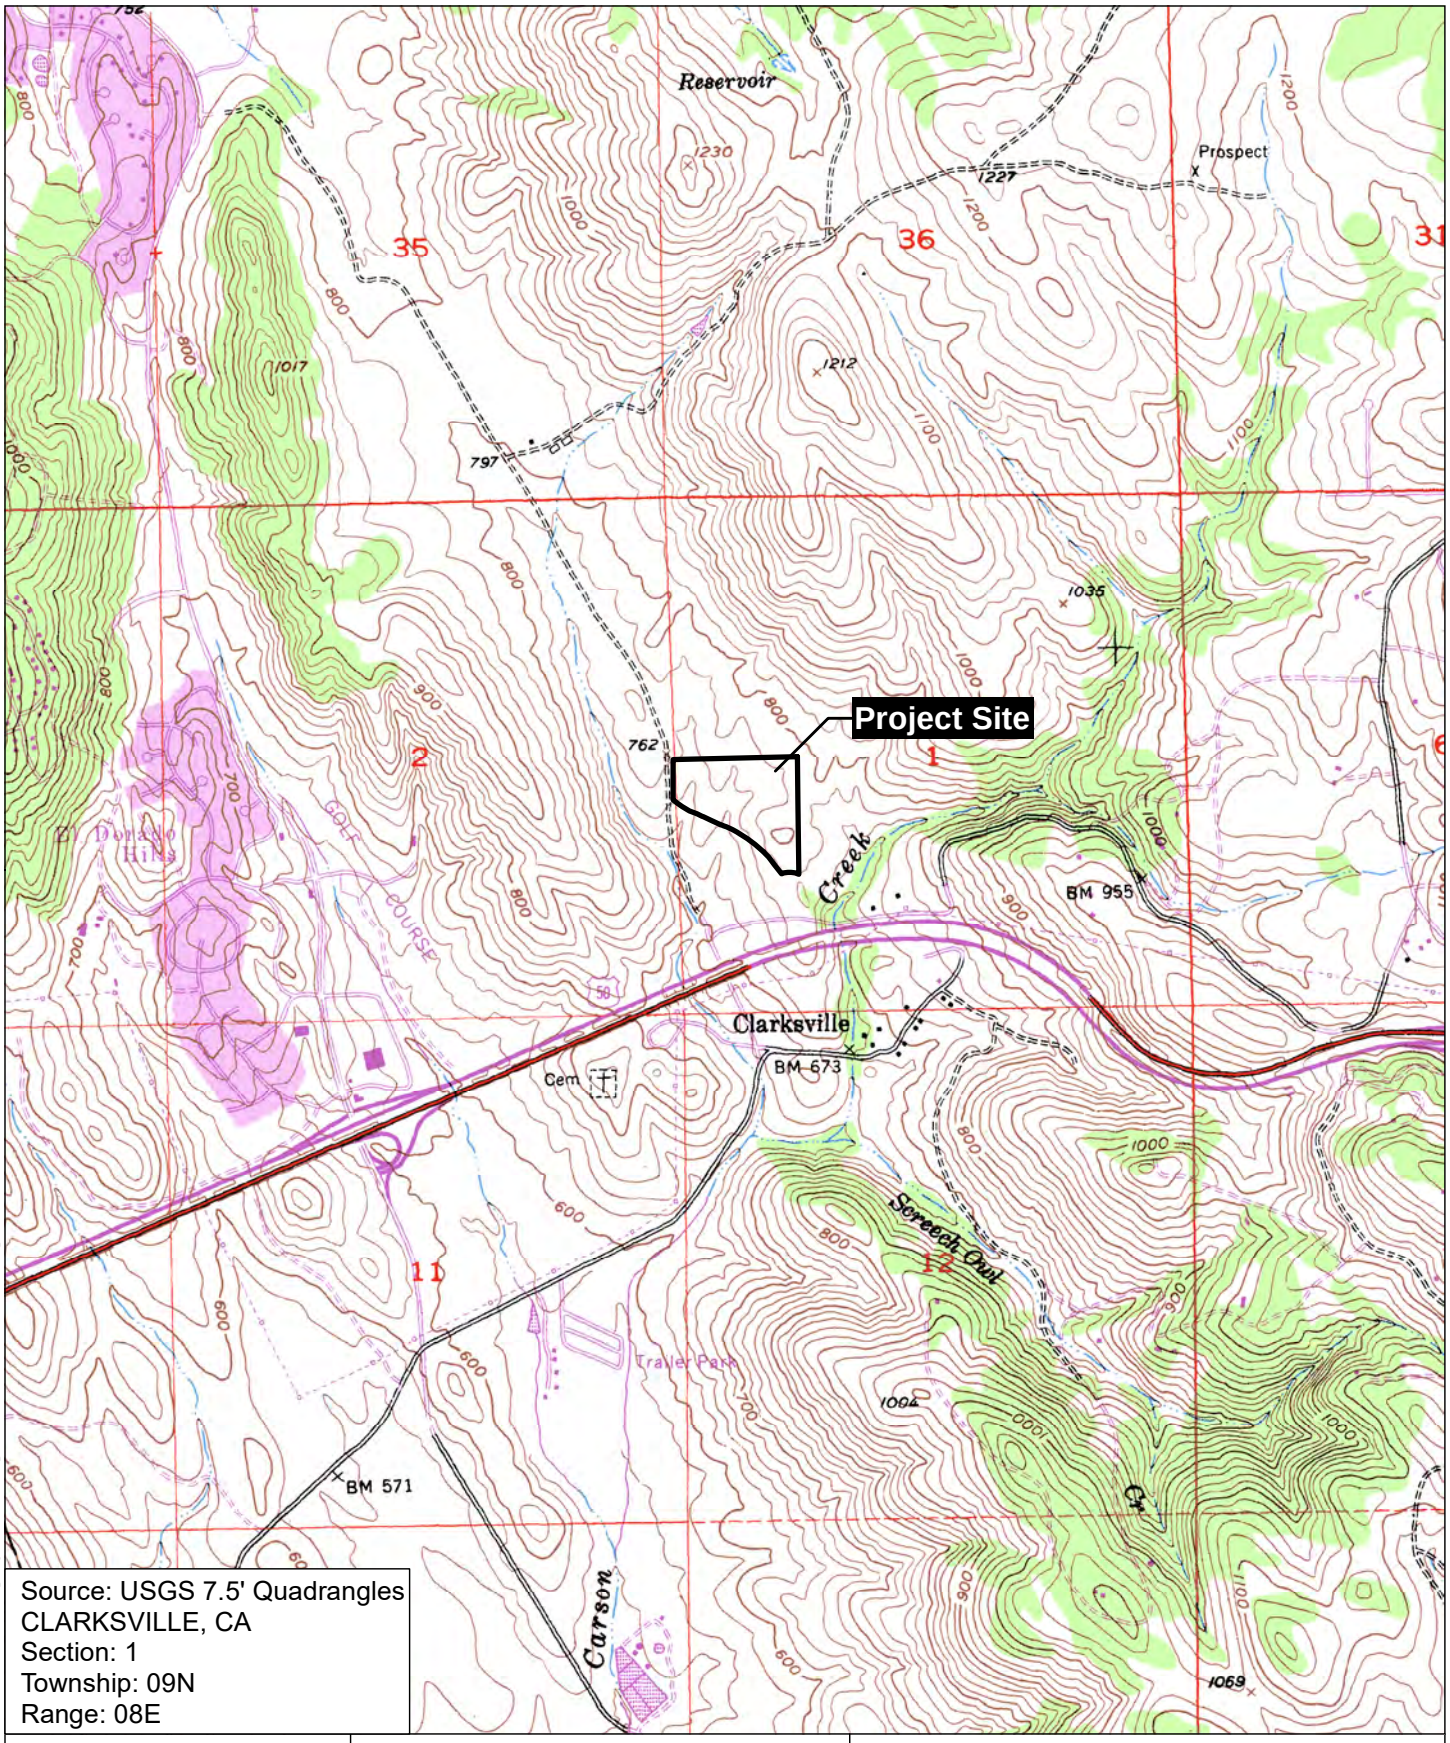
Laguna Hills, CA 92653

Subject: 25+/- ACRE "SILVA PARKWAY" SITE, EL DORADO HILLS, CALIFORNIA: BIOLOGICAL ASSESSMENT



Dear Lindsey:



Thank you for asking Moore Biological Consultants to assist with this approximately 25+/- acre site in El Dorado Hills, El Dorado County, California (Figures 1 and 2 and Parcel Map in Attachment A). The purpose of this assessment is to describe existing biological resources in the site, identify potentially significant impacts to biological resources from commercial development, and provide recommendations for how to reduce those impacts to a less-than-significant level. The work involved reviewing databases and aerial photographs, and conducting field surveys to document vegetation communities, potentially jurisdictional Waters of the U.S. and/or wetlands, and potentially suitable habitat for or presence of special-status species. This report details the methodology and results of our investigation.

Methods

Prior to the field surveys, we conducted a search of California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CNDDB, 2019). The CNDDB search included the USGS 7.5-minute Clarksville and Folsom SE topographic quadrangles, which encompass approximately 120 square miles

surrounding the project site. The United States Fish and Wildlife Service (USFWS) IPaC Trust Report of Federally Threatened and Endangered species that may occur in or be affected by projects in the project vicinity was also reviewed (Attachment B). This information was used to identify wildlife and plant species that have been previously documented in the project vicinity or have the potential to occur based on suitable habitat and geographical distribution. Additionally, the CNDDB depicts locations of sensitive habitats. The USFWS on-line maps of designated critical habitat were also downloaded.

Field surveys were conducted on December 18 and 29, 2018. The surveys consisted of walking throughout the site making observations of habitat conditions and noting surrounding land uses, vegetation types, and plant and wildlife species. The surveys included an assessment of the site for potentially jurisdictional Waters of the U.S. (a term that includes wetlands) as defined by the U.S. Army Corps of Engineers (ACOE, 1987; 2008), special-status species, and suitable habitat for special-status species (e.g., blue elderberry shrubs, vernal pools). Additionally, trees in and near the site were assessed for the potential use by nesting raptors and the site was also searched for burrowing owls (*Athene cunicularia*) or ground squirrel burrows that could be utilized by burrowing owls.

Results

GENERAL SETTING: The 25+/- acre site is in El Dorado Hills, El Dorado County, California (Figure 1). The site is in within Section 1, in Township 9 North, Range 8 East of the USGS 7.5-minute Clarksville topographic quadrangle (Figure 2). The site consists of gently rolling hills and slopes down generally from the northeast to the southwest. Site elevations range from approximately 720 to 800 feet above mean sea level. There is a notable hill and a notable soil stockpile in the south part of the site.

The site primarily consists of open hillsides supporting annual grassland vegetation (Figure 3 and photographs in Attachment C). The grasslands are moderately to highly disturbed from historic mining, grazing, grading, construction of adjacent parcels, disking for weed abatement, and off-road vehicle trespass.

Silva Valley Parkway runs along the west side of the site and Tong Road bounds the south edge of the site. Areas to the north and northeast of the site are primarily residential; there is also a school just north and northwest of the site (Figure 3). Areas to the west, south, and east of the site are similar habitats to those found in the site consisting of gently rolling hills of oak woodlands intermixed with annual grassland.

VEGETATION: California annual grassland series (Sawyer and Keeler-Wolf, 1995) best describe vegetation found throughout the body of the site (Figure 3 and photographs in Attachment C). The grasslands are vegetated with native and non-native annual and perennial grassland species. Dominant grasses in the site include oats (*Avena fatua*), foxtail barley (*Hordeum murinum*), soft chess brome (*Bromus hordeaceus*), ripgut brome (*Bromus diandrus*), and perennial ryegrass (*Lolium perenne*). Other grassland species such as black mustard (*Brassica nigra*), annual fireweed (*Epilobium brachycarpum*), Italian thistle (*Carduus pycnocephalus*), rose clover (*Trifolium hirtum*), prickly lettuce (*Lactuca serriola*), yellow star thistle (*Centaurea solstitialis*) and filaree (*Erodium botrys*) are intermixed with the grasses. There are also some widely scattered coyote bush (*Baccharis pilularis*) shrubs in the on-site grasslands. Plant species observed in the site are listed in Table 1.

A riparian corridor along an intermittent creek in the west part of the site supports trees and shrubs. Dominant trees in the riparian corridor include valley oak (*Quercus lobata*), blue oak (*Quercus douglasii*), Fremont cottonwood (*Populus fremontii*), and Pacific willow (*Salix lasiandra*) (see photographs in Attachment C). Coyote bush, Himalayan blackberry (*Rubus discolor*), and California wild

AERIAL

Costco - El Dorado Hills

El Dorado County, CA

C:\Users\owner\Documents\Fremont Environmental Consulting\Projects\Moore Biological\Costco_ED\HVM\Costco_edh_figure_3.mxd

TABLE 1

PLANT SPECIES OBSERVED IN THE SITE

Avena sp.	oat
Baccharis pilularis	coyote brush
Brassica nigra	black mustard
Bromus diandrus	ripgut brome
Bromus hordeaceus	soft chess brome
Carduus pycnocephalus	Italian thistle
Centaurea solstitialis	yellow star-thistle
Cerastium glomeratum	mouse-eared chickweed
Chlorogalum angustifolium	narrow-leaved soap plant
Cirsium vulgare	bull thistle
Conium maculatum	poison hemlock
Cyperus eragrostis	tall flat-sedge
Epilobium brachycarpum	annual fireweed
Eremocarpus setigerus	turkey mullein
Erodium botrys	long beak stork's bill
Erodium cicutarium	red stemmed filaree
Ficus carica	common fig
Geranium dissectum	dissected geranium
Holocarpha virgata	tarweed
Hordeum murinum	wall barley
Lactuca serriola	prickly lettuce
Montia perfoliata	miner's lettuce
Pinus sp.	ornamental pine
Populus fremontii	Fremont cottonwood
Quercus douglasii	blue oak
Quercus lobata	valley oak

TABLE 1 (continued)
PLANT SPECIES OBSERVED IN THE SITE

Quercus wislizeni	interior live oak
Rosa californica	California wild rose
Rubus discolor	Himalayan blackberry
Rumex crispus	curly dock
Salix lasiandra	Pacific willow
Sambucus mexicana	blue elderberry
Salsola iberica	Russian thistle
Scirpus acutus	tule
Sonchus asper	spiny-leaf sow-thistle
Taeniatherum caput-medusae	medusahead grass
Torilis arvensis	field hedge parsley
Trifolium hirtum	rose clover
Triteleia laxa	Ithuriel's spear
Typha sp.	cattail
Vicia sativa	common vetch

rose (*Rosa californica*) are the dominant shrubs and vines (see photographs in Attachment C). Vegetation in the bed of creek and a small stock pond near Silva Valley Parkway includes cattails (*Typha* sp.), tules (*Scirpus acutus*), tall flat sedge (*Cyperus eragrostis*), and other hydrophytes.

One blue elderberry (*Sambucus mexicana*) shrub was observed in the project site. This shrub is along the north edge of the site, along the east side of the riparian corridor along the intermittent creek (Figure 4 and photograph in Attachment C).

Sensitive Habitats

Costco - El Dorado Hills

El Dorado County, CA

C:\Users\owner\Documents\Fremont Environmental Consulting\Projects\Moore Biological\Costco_ED\HVMD\costco_edh_figure_4.mxd

WILDLIFE: Several bird species typical to foothill annual grasslands were observed during the field surveys. Representative species include red-tailed hawk (*Buteo jamaicensis*), American crow (*Corvus brachyrhynchos*), California scrub jay (*Aphelocoma californica*), Nuttall's woodpecker (*Picoides nuttallii*), and red-winged black bird (*Agelaius phoeniceus*). A complete list of wildlife species are listed below in Table 2.

There are several large trees along the intermittent creek in the northwest part of the site and large trees in the open grasslands and developed areas surrounding the site that are suitable for nesting raptors. Given the presence of large trees near the site and raptor foraging habitat (i.e., open fields) in and near the site, it is possible raptors nest near the site. Smaller birds, such as songbirds, could potentially nest in shrubs, grasslands, and particularly in the riparian vegetation along the edges of the intermittent creek in the site.

While no mammals were observed in the site during the survey, a few common mammals have potential to occur in the site. Coyote (*Canis latrans*), striped skunk (*Mephitis mephitis*), black-tailed hare (*Lepus californicus*), desert cottontail (*Sylvilagus audubonii*), and Virginia opossum (*Didelphis virginiana*) may occur in the project site on occasion. A few California ground squirrel (*Spermophilus beecheyi*) burrows and several Botta's pocket gopher (*Thomomys bottae*) were observed in annual grasslands in the site. A number of species of small rodents including mice (*Mus musculus, Reithrodontomys megalotis,* and *Peromyscus maniculatus*) and voles (*Microtus californicus*) also likely occur in the site.

Based on habitats, only a few amphibians and reptiles have potential to occur in the site and none were observed during the recent surveys. The site is within the range of Pacific chorus frog (*Pseudacris regilla*), bullfrog (*Rana catesbeiana*), western fence lizard (*Sceloporus occidentalis*), western terrestrial garter snake (*Thamnophis elegans*), and gopher snake (*Pituophis melanoleucus*); these and other common amphibian and reptile species may occur in the site.

TABLE 2

WILDLIFE SPECIES DOCUMENTED IN THE SITE

Birds

Canada goose	*Branta canadensis*
Turkey vulture	*Cathartes aura*
Red-tailed hawk	*Buteo jamaicensis*
Killdeer	*Charadrius vociferous*
California gull	*Larus californicus*
Anna's hummingbird	*Calypte anna*
Nuttall's woodpecker	*Picoides nuttallii*
Northern flicker	*Colaptes auratus*
Black phoebe	*Sayornis nigricans*
Say's phoebe	*Sayornis saya*
California scrub jay	*Aphelocoma californica*
American crow	*Corvus brachyrhynchos*
European starling	*Sturnus vulgaris*
Yellow-rumped warbler	*Setophaga coronata*
White-crowned sparrow	*Zonotrichia leucophrys*
Red-winged blackbird	*Agelaius phoeniceus*
Brewer's blackbird	*Euphagus cyanocephalus*
House finch	*Haemorhous mexicanus*

Mammals

Botta's pocket gopher	*Thomomys bottae*
California ground squirrel	*Otospermophilus beecheyi*

WATERS OF THE U.S. AND WETLANDS: Waters of the U.S., including wetlands, are broadly defined under 33 Code of Federal Regulations (CFR) 328 to include navigable waterways, their tributaries, and adjacent wetlands. State and federal agencies regulate these habitats and Section 404 of the Clean Water Act requires that a permit be secured prior to the discharge of dredged or fill materials into any waters of the U.S., including wetlands. Both CDFW and ACOE have jurisdiction over modifications to riverbanks, lakes, stream channels and other wetland features.

"Waters of the U.S.", as defined in 33 CFR 328.4, encompasses Territorial Seas, Tidal Waters, and Non-Tidal Waters; Non-Tidal Waters includes interstate and intrastate rivers and streams, as well as their tributaries. The limit of federal jurisdiction of Non-Tidal Waters of the U.S. extends to the "ordinary high water mark". The ordinary high water mark is established by physical characteristics such as a natural water line impressed on the bank, presence of shelves, destruction of terrestrial vegetation, or the presence of litter and debris.

Jurisdictional wetlands are vegetated areas that meet specific vegetation, soil, and hydrologic criteria defined by the ACOE *Wetlands Delineation Manual* and Regional Supplement (ACOE, 1987; 2008). Jurisdictional wetlands are usually adjacent to or hydrologically associated with Waters of the U.S; isolated wetlands are outside federal jurisdiction.

Jurisdictional wetlands and Waters of the U.S. include, but are not limited to, perennial and intermittent creeks and drainages, lakes, seeps, and springs; emergent marshes; riparian wetlands; and seasonal wetlands. Wetlands and Waters of the U.S. provide critical habitat components, such as nest sites and a reliable source of water, for a wide variety of wildlife species.

The most notable potentially jurisdictional Waters of the U.S. and wetlands in the site include an intermittent creek, two ephemeral creeks, and two seasonal

wetlands (Figure 4 and photographs in Attachment C). None of these features are mapped on the USGS topographic map (Figure 2) or the National Wetland Inventory (Attachment D). While a wetland delineation would be need to confirm boundaries, it is estimated these areas encompass approximately 0.4+/- acres. There are also a few relatively small areas that were either very saturated or had flowing water during the field surveys. If these additional areas are in fact wetlands, they are estimated to encompass 0.1+/- acre. A wetland delineation later this spring when plants are blooming and recognizable is recommended.

The intermittent creek in the site flows from generally north to south. The intermittent creek carries water during and after rain events, has moderately to well-defined beds and banks, and the limit of jurisdiction is the ordinary high water mark (OHWM) along the banks. As described above, the banks of the intermittent creek are lined with willows, cottonwoods, and other woody riparian vegetation. The bed of the creek supports emergent wetland vegetation, especially in a flat area near the culvert under Silva Valley Parkway. This creek contained surface flows during the surveys.

The ephemeral creeks also flow from generally north to south. The ephemeral creeks carry water only during and shortly after heavy rain events and have poorly to well-defined beds and banks. The ephemeral creeks vary in width and depth along their lengths, with some sections narrow and the limit of jurisdiction being the OHWM. In other areas, the creeks are broader and more like seasonal wetland swales; in these areas, the limit of jurisdiction is the wetland edge.

Seasonal wetlands in the site include a historic stock pond and a boggy area near the south end of the longer ephemeral creek (see photographs in Attachment C). The historic stock pond holds water approximately 2 feet deep and supports cattails and a small willow. This seasonal wetland is adjacent to an ephemeral creek, and appears to be fed by a combination of creek flows and possibly a seep or spring.

SPECIAL-STATUS SPECIES: Special-status species are plants and animals that are legally protected under the state and/or federal Endangered Species Act or other regulations. The Federal Endangered Species Act (FESA) of 1973 declares that all federal departments and agencies shall utilize their authority to conserve endangered and threatened plant and animal species. The California Endangered Species Act (CESA) of 1984 parallels the policies of FESA and pertains to native California species.

Special-status species also include other species that are considered rare enough by the scientific community and trustee agencies to warrant special consideration, particularly with regard to protection of isolated populations, nesting or denning locations, communal roosts, and other essential habitat. The presence of species with legal protection under the Endangered Species Act often represents a major constraint to development, particularly when the species are wide-ranging or highly sensitive to habitat disturbance and where proposed development would result in a take of these species.

Special-status plants are those which are designated rare, threatened, or endangered and candidate species for listing by the USFWS. Special-status plants also include species considered rare or endangered under the conditions of Section 15380 of the California Environmental Quality Act Guidelines, such as those plant species identified on Lists 1A, 1B and 2 in the Inventory of Rare and Endangered Vascular Plants of California (CNPS, 2019). Finally, special-status plants may include other species that are considered sensitive or of special concern due to limited distribution or lack of adequate information to permit listing or rejection for state or federal status, such as those included on CNPS List 3.

The likelihood of occurrence of listed, candidate, and other special-status species in the site is generally low. Table 3 provides a summary of the listing status and habitat requirements of special-status species that have been documented in the greater project vicinity or for which there is potentially suitable habitat in the

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
PLANTS						
Stebbin's morning-glory	*Calystegia stebbinsii*	E	E	1B	Chaparral or cismontane woodland; red clay soils of the Pine Hill formation, or gabbroic or serpentine soils.	Unlikely: the annual grassland in the site does not provide suitable habitat for Stebbin's morning-glory; no gabbroic or serpentine soils were observed and the site is not in the Pine Hill formation. There are no recorded occurrences of this species in the CNDDB (2019) search area.
Pine Hill ceanothus	*Ceanothus roderickii*	E	R	1B	Chaparral or cismontane woodland; in gabbroic soils.	Unlikely: the annual grassland in the site does not provide suitable habitat for Pine Hill ceanothus; no gabbroic soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 5 miles north of the site.
Red Hills soaproot	*Chlorogalum grandiflorum*	None	None	1B	Chaparral, cismontane woodland, or lower montane coniferous forest; in serpentine or gabbroic soils.	Unlikely: there is no suitable habitat within the site for Red Hills soaproot; no serpentine or gabbroic habitats were observed in or near the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 4.5 miles northeast of the site.
Brandegee's clarkia	*Clarkia biloba ssp. brandegeeae*	None	None	1B	Chaparral, cismontane woodland, and lower montane coniferous forest; often on road cuts.	Unlikely: the annual grassland in the site does not provide suitable habitat for Brandegee's clarkia. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 3.5 miles northwest of the site.
Tuolumne button celery	*Eryngium pinnatisectum*	None	None	1B	Vernal pools and other mesic habitats within cismontane woodland and lower montane coniferous forest; at elevations between 70 and 900 meters.	Unlikely: the annual grassland in the site does not provide suitable habitat for Tuolumne button celery. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 11 miles south of the site.

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
Pine Hill flannelbush	*Fremontodendron decumbens*	E	R	1B	Chaparral, cismontane woodland, or openings in lower montane coniferous forest; in serpentine or gabbroic soils.	Unlikely: annual grassland in the site does not provide suitable habitat for Pine Hill flannelbush; no serpentine or gabbroic soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 4.5 miles northeast of the site.
El Dorado bedstraw	*Galium californicum ssp. sierrae*	E	R	1B	Chaparral, cismontane woodland, or lower montane coniferous forest; gabbroic soils.	Unlikely: the annual grassland habitats in the site are not suitable for El Dorado bedstraw; no gabbroic soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 6 miles northeast of the site.
Bisbee Peak rush-rose	*Helianthemum suffrutescens*	None	None	3	Serpentine, gabbroic, or Ione formation soils in Chaparral.	Unlikely: there is no developed chaparral habitat in the site and no areas of serpentine, gabbroic, or Ione formation soils were observed within the site. The nearest occurrence of Bisbee Peak rush-rose in the CNDDB (2019) search area is approximately 3 miles northeast of the site.
Layne's ragwort	*Packera layneae*	T	R	1B	Chaparral or cismontane woodland; serpentine or gabbroic soils	Unlikely the annual grassland habitats in the site are not suitable for Layne's ragwort; no serpentine or gabbroic soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 3 miles northeast of the site.
Sanford's arrowhead	*Sagittaria sanfordii*	None	None	1B	Standing or slow moving freshwater ponds, marshes, and ditches.	Unlikely: the intermittent creeks and stock pond in the site provides marginal, yet potentially suitable habitat for Sanford's arrowhead. The nearest occurrence of Sanford's arrowhead in the CNDDB (2019) search area is approximately 4 miles southwest of the site.

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
El Dorado County mule ears	*Wyethia reticulata*	None	None	1B	Chaparral, cismontane woodland, or lower montane coniferous forest; clay or gabbroic soils.	Unlikely: the ruderal grassland habitats in the site are not suitable for El Dorado County mule ears; no gabbroic or clay soils were observed in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 3.5 miles northeast of the site.
WILDLIFE						
BIRDS						
Swainson's hawk	*Buteo swainsoni*	None	T	N/A	Nesting: large trees, usually within riparian corridors. Foraging: agricultural fields and annual grasslands.	Unlikely: the open, annual grassland vegetation in the site provides marginally suitable foraging habitat for Swainson's hawks. There are several large trees in and in close proximity to the site that may be used for nesting. However, the site is on east edge of the nesting range of this species. There are only two records of nesting Swainson's hawks in the CNDDB (2019) search area; the nearest occurrence is approximately 4 miles southwest of the site.
Burrowing owl	*Athene cunicularia*	None	None	N/A	Open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation.	Unlikely: the annual grassland in the site provides marginally suitable burrow habitat for burrowing owls. No ground squirrels were observed in the site during the survey, but a few ground squirrel burrows were observed. The nearest occurrence of burrowing owl in the CNDDB (2019) search area is approximately 2 miles southwest of the site.
Tricolored blackbird	*Agelaius tricolor*	None	SC	N/A	Nests in dense brambles and emergent wetland vegetation associated with open water habitat.	Unlikely: the intermittent creek is very small and provides marginally suitable nesting habitat for tricolored blackbird. This species may occasionally fly over or forage in the area, and may nest in the greater project vicinity. The nearest occurrence of tricolored blackbird in the CNDDB (2019) search area is approximately 3 miles southeast of the site.

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
Golden eagle	*Aquila chrysaetos*	None	FP	N/A	Nesting areas are associated with cliff-walled canyons and large trees. Forages in rolling hills and mountain areas	Unlikely: the large trees within and in close proximity to the site provide low quality nesting habitat for golden eagle, as they prefer ledges on cliff walls or very large trees isolated from any type of disturbance for nesting. The rolling hills in the site provides potential foraging habitat for this species. The nearest occurrence of golden eagle in the CNDDB (2019) search area is approximately 2 miles northwest of the site.
Bald eagle	*Haliaeetus leucocephalus*	None	E	N/A	Nests in large trees along rivers, ocean shores, and lake margins.	Unlikely: although there are large trees within and in close proximity to the site, bald eagles are known to nest near large bodies of water. Bald eagles could fly over or forage in the site on occasion. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 2 miles northeast of the site.
California black rail	*Laterallus jamaicensis coturniculus*	None	T	N/A	Mainly inhabits salt marshes bordering larger bays.	Unlikely: the site does not provide suitable habitat for California black rail. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 2.5 miles south of the site.
White-tailed kite	*Elanus leucurus*	None	FP	N/A	Herbaceous lowlands with variable tree growth and dense population of voles.	Unlikely: the site provides potentially suitable foraging habitat for white-tailed kite, and there are suitable nest trees in and near the site. The nearest occurrence of white-tailed kite in the CNDDB (2019) search area is approximately 2.5 miles northwest of the site.
Grasshopper sparrow	*Ammodramus savannum*	None	SC	N/A	Dense grasslands, lowland plains, and lower mountain slopes; prefers native grasses with scattered shrubs.	Unlikely: the site provide poor quality habitat for grasshopper sparrow. This species may occasionally fly over or forage in the area. The nearest occurrence of grasshopper sparrow in the CNDDB (2019) search area is approximately 9 miles southwest of the site.

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
REPTILES & AMPHIBIANS						
California red-legged frog	*Rana aurora draytonii*	T	SC	N/A	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation.	Unlikely: there is no suitable aquatic habitat for California red-legged frog in the project site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 5 miles northwest of the site. The site is not within designated critical habitat for California red-legged frog (USFWS, 2006).
Foothill yellow-legged frog	*Rana boylii*	None	SC	N/A	Perennial water bodies (i.e., streams and ponds) with abundant riparian vegetation; not found on Central Valley floor.	Unlikely: the site does not contain suitable aquatic habitat for foothill yellow-legged frog. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 3.5 miles northwest of the site.
California tiger salamander	*Ambystoma californiense*	T	T	N/A	Breeds in seasonal water bodies such as deep vernal pools or stock ponds. Requires small mammal burrows for summer refugia.	Unlikely: there are no potentially suitable breeding ponds for California tiger salamander in or near the site. There are no occurrences of this species recorded in the CNDDB (2019) within the search area. The site is not within an area designated critical habitat for California tiger salamander (USFWS, 2005a).
Giant garter snake	*Thamnophis gigas*	T	T	N/A	Freshwater marsh and low gradient streams; uses drainage canals and irrigation ditches, primarily for dispersal or migration.	Unlikely: the site does not provide suitable habitat for giant garter snake. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 11 miles south of the site.
Western pond turtle	*Emys marmorata*	None	SC	N/A	Permanent or semi-permanent water bodies; require basking sites such as logs.	Unlikely: the site does not provide suitable habitat for western pond turtle. The nearest occurrence of western pond turtle in the CNDDB (2019) search area is approximately 2 miles southwest of the site.

TABLE 3

SPECIAL-STATUS PLANT AND WILDLIFE SPECIES DOCUMENTED IN THE GREATER PROJECT VICINITY

Common Name	Scientific Name	Federal Status[1]	State Status[1]	CNPS List[2]	Habitat	Likeliness of Occurrence in the Project Site
Fish						
Delta smelt	*Hypomesus transpacificus*	T	T	N/A	Shallow lower delta waterways with submersed aquatic plants and other suitable refugia.	Unlikely: there is no suitable aquatic habitat for fish in the site. There are no occurrences of delta smelt recorded in the CNDDB (2019) within the search area. The site is not within designated critical habitat for delta smelt (USFWS, 1994).
Central Valley steelhead	*Oncorhynchus mykiss*	T	None	N/A	Riffle and pool complexes with adequate spawning substrates within Central Valley drainages.	Unlikely: there is no suitable aquatic habitat for fish in the site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 11 miles south of the site. The site is not within designated critical habitat for Central Valley steelhead (NOAA, 2005).
INVERTEBRATES						
Vernal pool fairy shrimp	*Branchinecta lynchi*	T	None	N/A	Vernal pools and seasonally inundated depressions in the Central Valley.	Unlikely: there are no vernal pools in the project site. The nearest occurrence of this species in the CNDDB (2019) search area is approximately 3.5 miles northwest of the site. The site is not within designated critical habitat for vernal pool fairy shrimp (USFWS, 2005b).
Vernal pool tadpole shrimp	Lepidurus packardi	E	None	N/A	Vernal pools	Unlikely: there are no vernal pools in the project site. There are no occurrences of vernal pool tadpole shrimp recorded in the CNDDB (2019) within the search area. The site is not within designated critical habitat for vernal pool tadpole shrimp (USFWS, 2005b).
Valley elderberry longhorn beetle	*Desmocerus californicus dimorphus*	T	None	N/A	Elderberry shrubs in the Central Valley and surrounding foothills	Unlikely: while the blue elderberry shrub in the site may support this species, the stems showed no evidence of species' occupancy. The nearest occurrence of valley elderberry longhorn beetle in the CNDDB (2019) search area is approximately 4 miles northwest of the site.

Notes:

1 T= Threatened; E = Endangered; SC = Species of Special Concern per California Department of Fish and Wildlife.

2 CNPS List 1B includes species that are rare, threatened, or endangered in California and elsewhere; List 2 includes plants that are rare, threatened or endangered in California but are more common elsewhere.

greater project vicinity. This table also includes an assessment of the likelihood of occurrence of each of these species in the site. The evaluation of the potential for occurrence of each species is based on the distribution of regional occurrences (if any), habitat suitability, and field observations.

SPECIAL-STATUS PLANTS: Ten (10) species of special-status plants were identified in the CNDDB (2019) search: Pine Hill ceanothus (*Ceanothus roderickii*), Red Hills soaproot (*Chlorogalum grandiflorum*), Brandegee's clarkia (*Clarkia biloba ssp. brandegeeae*), Tuolumne button celery (*Eryngium pinnatisectum*), Pine Hill flannelbush (*Fremontodendron decumbens*), El Dorado bedstraw (*Galium californicum ssp. sierrae*), Bisbee Peak rush-rose (*Helianthemum suffrutescens*), Layne's ragwort (*Packera layneae*), Sanford's arrowhead (*Sagittaria sanfordii*), and El Dorado County mule ears (*Wyethia reticulata*)(Table 1 and Attachment B). Stebbin's morning-glory (*Calystegia stebbinsii*) is not recorded in the CNDDB within the search area, but is on the USFWS IPaC Trust Report (Attachment B).

Special-status plants generally occur in relatively undisturbed areas in vegetation communities such as vernal pools, marshes and swamps, chenopod scrub, seasonal wetlands, riparian scrub, and areas with unusual soils. The grasslands in the site have been highly disturbed by historic mining practices, grazing, construction of adjacent parcels, disking for weed abatement and off-road vehicle trespass. The intermittent creek in the site provides marginal, yet potentially suitable habitat for Sanford's arrowhead; the ephemeral creeks in the site do not provide suitable habitat for any special-status plants. Due to lack of even moderately suitable habitat for special-status plants, it is unlikely special-status plants occur in the site.

SPECIAL-STATUS WILDLIFE: The potential for intensive use of the site by special-status wildlife species is also low. Fifteen (15) special-status wildlife species were recorded in project area in the CNDDB (2019) query: Swainson's hawk (*Buteo swainsonii*), burrowing owl, tricolored blackbird (*Agelaius tricolor*), golden eagle

(*Aquila chrysaetos*), bald eagle (*Haliaeetus leucocephalus*), California black rail (*Laterallus jamaicensis coturniculus*), white-tailed kite (*Elanus leucurus*), grasshopper sparrow (*Ammodramus savannum*), California red-legged frog (*Rana aurora draytonii*), foothill yellow-legged frog (*Rana boylii*), giant garter snake (*Thamnophis gigas*), western pond turtle (*Emys marmorata*), Central Valley steelhead (*Oncorhynchus mykiss*), vernal pool fairy shrimp (*Branchinecta lynchi*) and valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*). California tiger salamander (*Ambystoma californiense*), Delta smelt (*Hypomesus transpacificus*), and vernal pool tadpole shrimp (*Lepidurus packardi*) are not recorded in the CNDDB within the search area, but are on the USFWS IPaC Trust Report (Attachment B).

While the project site may have provided habitat for special-status wildlife species at some time in the past, agriculture and development have substantially modified natural habitats in the greater project vicinity, including those within the site. Of the species in Table 3, Swainson's hawk and burrowing owl are the only species with more than a very low potential to occur in the project site on more than a transitory or very occasional basis and are discussed further below. Other special-status birds may fly over or forage in the area on occasion, but would not be expected to nest in or adjacent to the project site, primarily due to poor habitat quality. Valley elderberry longhorn beetle is not expected to occur in the site, but is discussed below due the presence on an elderberry shrub in the site.

SWAINSON'S HAWK: The Swainson's hawk is a migratory hawk listed by the State of California as a Threatened species. The Migratory Bird Treaty Act and Fish and Game Code of California protect Swainson's hawks year-round, as well as their nests during the nesting season (March 1 through September 15). Swainson's hawk are found in the Central Valley primarily during their breeding season, a population is known to winter in the San Joaquin Valley.

Swainson's hawks prefer nesting sites that provide sweeping views of nearby foraging grounds consisting of grasslands, irrigated pasture, hay, and wheat crops. Most Swainson's hawks are migratory, wintering in Mexico and breeding in California and elsewhere in the western United States. This raptor generally arrives in the Central Valley in mid-March, and begins courtship and nest construction immediately upon arrival at the breeding sites. The young fledge in early July, and most Swainson's hawks leave their breeding territories by late August.

The site is within the nesting range of Swainson's hawks and the CNDDB (2019) contains a few records of nesting Swainson's hawks in the greater project vicinity (Attachment B). The nearest occurrence of Swainson's hawk in the CNDDB (2019) search area is approximately 4 miles southwest of the site.

The open, annual grasslands in the site provide marginal, yet potentially suitable Swainson's hawk foraging habitat. The large trees along the intermittent creek in the site and relatively large trees near the site could be used by nesting Swainson's hawks. However, due to the location of the site along the extreme east edge of the nesting range of this species, it is unlikely Swainson's hawks nest in or near the site, or forage in the site intensively, if at all.

BURROWING OWL: The Migratory Bird Treaty Act and Fish and Game Code of California protect burrowing owls year-round, as well as their nests during the nesting season (February 1 through August 31). Burrowing owls are a year-long resident in a variety of grasslands as well as scrub lands that have a low density of trees and shrubs with low growing vegetation; burrowing owls that nest in the Central Valley may winter elsewhere.

The primary habitat requirement of the burrowing owl is small mammal burrows for nesting. The owl usually nests in abandoned ground squirrel burrows, although they have been known to dig their own burrows in softer soils. In urban

areas, burrowing owls often utilize artificial burrows including pipes, culverts, and piles of concrete pieces. This semi-colonial owl breeds from March through August, and is most active while hunting during dawn and dusk. The nearest record of burrowing owls in the CNDDB (2019) is approximately 2 mile southwest of the site.

The absence of extensive burrow habitat, periodic disking and/or mowing of the on-site grasslands for weed abatement, and development in parcels surrounding the site reduces the likelihood of burrowing owls using the site for nesting. No burrowing owls were observed in the project site and only a few ground squirrels burrows were observed in the site. None of the burrows had any evidence of past or current use by owls. In its current condition, the site provides very limited potential nesting habitat for nesting burrowing owls. However, the site is within the species range and burrowing owls may fly over the site on an occasional basis, and may nest in the site in the future if burrow habitat is available.

VALLEY ELDERBERRY LONGHORN BEETLE: The valley elderberry longhorn beetle (VELB) is listed as a federally threatened species and its host plant is the blue elderberry shrub. Eggs are laid on the leaves or stems of the shrubs and upon hatching, the larvae bore in to the stem where they remain for 2+/- years feeding on the interior portions of the stems. Following several larval instars, the larvae chews an exit hole in the stem, pupates, and emerges after approximately a month as an adult. The adults live only 4 to 5 days, mates, lays eggs, and dies.

The USFWS (2017) *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle* direct that, if possible, elderberry shrubs should be avoided by a ground disturbance set back of at least 165 feet from the drip line of each shrub. A number of measures are also recommended to avoid and minimize project impacts to VELB and/or its habitat including fencing, worker training, and timing of construction, among others. In cases where complete avoidance is not feasible, the Framework recommends compensatory mitigation for the loss of

actual or potential VELB habitat. Mitigation is usually achieved through the purchase of credits at a USFWS-approved mitigation bank, and transplantation of the impacted shrub to the bank, if feasible. In the case of a single shrub in a riparian setting such as at the project site, the Framework recommends the purchase of 2 credits at a USFWS-approved bank and transplantation of the impacted shrub to the bank, if feasible.

The nearest occurrence of valley elderberry longhorn beetle in the CNDDB (2019) search area is approximately 4 miles northwest of the site. There is a single blue elderberry shrub along the north edge of the site, along the east side of the riparian corridor surrounding the intermittent creek. No boreholes indicative of occupancy by VELB were observed on the stems of the shrubs. The shrub is also at an elevation of approximately 750 feet, whereas the species generally found at elevations at or below 500 feet. Due to lack of evidence of species' occupancy and elevation of the shrub, it is unlikely to support VELB.

OTHER SPECIAL-STATUS WILDLIFE SPECIES: The site does not provide highly suitable habitat for other special-status wildlife species. Special-status birds and may fly over the area on occasion, but few, if any, would be expected to use on-site habitats on more than an occasional or transitory basis. While there are shrubby willows and small amounts of emergent wetland vegetation in the intermittent creek that are potentially suitable for nesting tricolored blackbirds, this vegetation is not near a large body of open water.

The site does not provide suitable aquatic habitat for any species of fish, California red-legged frog, California tiger salamander, giant garter snake, foothill yellow-legged frog, or western pond turtle. There are no vernal pools or seasonal wetlands in the site for vernal pool branchiopods (i.e., fairy and tadpole shrimp).

CRITICAL HABITAT: The site is not in designated critical habitat of California red-legged frog (USFWS, 2006a), California tiger salamander (USFWS, 2005b),

federally listed vernal pool shrimp or plants, such as Sacramento Orcutt grass (USFWS, 2005a), delta smelt (USFWS, 1994) Central Valley steelhead (NOAA, 2005) valley elderberry longhorn beetle (USFWS, 1980a)(Attachment E).

Conclusions and Recommendations

- The body of the site is an open field vegetated in upland grasses and weeds that has is routinely disked and/or mowed. The annual grassland habitats in the site are biologically unremarkable.

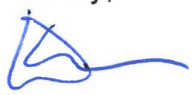
- Potentially jurisdictional Waters of the U.S. and wetlands in the site include an intermittent creek, two ephemeral creeks, and two seasonal wetlands; it is estimated these areas encompass approximately 0.4+/- acres. There are also a few relatively small areas in the site that may be seasonal wetlands; these areas are estimated to encompass 0.1+/- acre. A wetland delineation would be need to confirm boundaries and is recommended for later this spring when plants are blooming and recognizable.

- Avoidance of jurisdictional Waters of the U.S. and wetlands is recommended, if possible. If complete avoidance is infeasible, impacts should be minimized to the maximum extent practicable, and permits from ACOE, CDFW, and the Regional Water Quality Control Board (RWQCB) will be then be needed prior to the placement of any fill material (e.g., culverts, fill dirt, rock) within jurisdictional Waters of the U.S. Securing permits for the fill of jurisdictional Waters of the U.S. and wetlands could be challenging and time consuming, likely taking approximately 12 months to secure.

- Due to a lack of suitable habitat, it is unlikely that special-status plants occur in the site.

- Swainson's hawk and burrowing owl are the only species with more than a very low potential to occur in the project site on more than a transitory or very occasional basis. Conversion of 25+/- acres of upland grassland habitat to development in the east part of the species' ranges is a less than significant reduction in potential foraging habitat for Swainson's hawk, burrowing owl, and other wildlife.

- A pre-construction survey for burrowing owls within 250 feet of the site are recommended if construction commences between February 1 and August 31. If occupied burrows are found, a qualified biologist should determine the need (if any) for temporal restrictions on construction. The determination should be pursuant to criteria set forth by CDFW (CDFG, 2012).



- A pre-construction survey for nesting Swainson's hawks within 0.25 miles of the project site is recommended if construction commences between March 1 and September 15. If active nests are found, a qualified biologist should determine the need (if any) for temporal restrictions on construction. The determination should utilize criteria set forth by CDFW (CDFG, 1994).

- The site is not within designated critical habitat for any federally listed species.

- Trees, shrubs, and grasslands in the site could be used by other birds protected by the Migratory Bird Treaty Act of 1918. If tree removal is scheduled during the nesting season of raptors (January 1 through July 31), a pre-construction survey for nesting raptors is recommended. If other vegetation removal or construction commences during the general avian nesting season (March 1 through July 31), a pre-construction survey for all species of nesting birds is recommended. If active nests are found, work in the vicinity of the nests should be delayed until the young fledge.

We hope this information is useful. Please call me at (209) 745-1159 with any questions.

Sincerely,

Diane S. Moore, M.S.
Principal Biologist

IPaC resource list

This report is an automatically generated list of species and other resources such as critical habitat (collectively referred to as *trust resources*) under the U.S. Fish and Wildlife Service's (USFWS) jurisdiction that are known or expected to be on or near the project area referenced below. The list may also include trust resources that occur outside of the project area, but that could potentially be directly or indirectly affected by activities in the project area. However, determining the likelihood and extent of effects a project may have on trust resources typically requires gathering additional site-specific (e.g., vegetation/species surveys) and project-specific (e.g., magnitude and timing of proposed activities) information.

Below is a summary of the project information you provided and contact information for the USFWS office(s) with jurisdiction in the defined project area. Please read the introduction to each section that follows (Endangered Species, Migratory Birds, USFWS Facilities, and NWI Wetlands) for additional information applicable to the trust resources addressed in that section.

NOT FOR CONSULTATION

Location

El Dorado County, California

Local office

Sacramento Fish And Wildlife Office

Endangered species

This resource list is for informational purposes only and does not constitute an analysis of project level impacts.

The primary information used to generate this list is the known or expected range of each species. Additional areas of influence (AOI) for species are also considered. An AOI includes areas outside of the species range if the species could be indirectly affected by activities in that area (e.g., placing a dam upstream of a fish population, even if that fish does not occur at the dam site, may indirectly impact the species by reducing or eliminating water flow downstream). Because species can move, and site conditions can change, the species on this list are not guaranteed to be found on or near the project area. To fully determine any potential effects to species, additional site-specific and project-specific information is often required.

Section 7 of the Endangered Species Act **requires** Federal agencies to "request of the Secretary information whether any species which is listed or proposed to be listed may be present in the area of such proposed action" for any project that is conducted, permitted, funded, or licensed by any Federal agency. A letter from the local office and a species list which fulfills this requirement can **only** be obtained by requesting an official species list from either the Regulatory Review section in IPaC (see directions below) or from the local field office directly.

For project evaluations that require USFWS concurrence/review, please return to the IPaC website and request an official species list by doing the following:

1. Draw the project location and click CONTINUE.
2. Click DEFINE PROJECT.
3. Log in (if directed to do so).
4. Provide a name and description for your project.
5. Click REQUEST SPECIES LIST.

Listed species[1] and their critical habitats are managed by the Ecological Services Program of the U.S. Fish and Wildlife Service (USFWS) and the fisheries division of the National Oceanic and Atmospheric Administration (NOAA Fisheries[2]).

Species and critical habitats under the sole responsibility of NOAA Fisheries are **not** shown on this list. Please contact NOAA Fisheries for species under their jurisdiction.

NOT FOR CONSULTATION

1. Species listed under the Endangered Species Act are threatened or endangered; IPaC also shows species that are candidates, or proposed, for listing. See the listing status page for more information.
2. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

The following species are potentially affected by activities in this location:

Reptiles

NAME	STATUS

Giant Garter Snake Thamnophis gigas — Threatened
No critical habitat has been designated for this species.
https://ecos.fws.gov/ecp/species/4482

Amphibians

NAME	STATUS

Critical habitats

Potential effects to critical habitat(s) in this location must be analyzed along with the endangered species themselves.

THERE ARE NO CRITICAL HABITATS AT THIS LOCATION.

Migratory birds

Certain birds are protected under the Migratory Bird Treaty Act[1] and the Bald and Golden Eagle Protection Act[2].

Any person or organization who plans or conducts activities that may result in impacts to migratory birds, eagles, and their habitats should follow appropriate regulations and consider implementing appropriate conservation measures, as described below.

1. The Migratory Birds Treaty Act of 1918.
2. The Bald and Golden Eagle Protection Act of 1940.

Additional information can be found using the following links:

- Birds of Conservation Concern http://www.fws.gov/birds/management/managed-species/birds-of-conservation-concern.php
- Measures for avoiding and minimizing impacts to birds http://www.fws.gov/birds/management/project-assessment-tools-and-guidance/conservation-measures.php
- Nationwide conservation measures for birds http://www.fws.gov/migratorybirds/pdf/management/nationwidestandardconservationmeasures.pdf

The birds listed below are birds of particular concern either because they occur on the USFWS Birds of Conservation Concern (BCC) list or warrant special attention in your project location. To learn more about the levels of concern for birds on your list and how this list is generated, see the FAQ below. This is not a list of every bird you may find in this location, nor a guarantee that every bird on this list will be found in your project area. To see exact locations of where birders and the general public have sighted birds in and around your project area, visit the E-bird data mapping tool (Tip: enter your location, desired date range and a species on your list). For projects that occur off the Atlantic Coast, additional maps and models detailing the relative occurrence and abundance of bird species on your list are available. Links to additional information about Atlantic Coast birds, and other important information about your migratory bird list, including how to properly interpret and use your migratory bird report, can be found below.

For guidance on when to schedule activities or implement avoidance and minimization measures to reduce impacts to migratory birds on your list, click on the PROBABILITY OF PRESENCE SUMMARY at the top of your list to see when these birds are most likely to be present and breeding in your project area.

NOT FOR CONSULTATION

NAME	BREEDING SEASON (IF A BREEDING SEASON IS INDICATED FOR A BIRD ON YOUR LIST, THE BIRD MAY BREED IN YOUR PROJECT AREA SOMETIME WITHIN THE TIMEFRAME SPECIFIED, WHICH IS A VERY LIBERAL ESTIMATE OF THE DATES INSIDE WHICH THE BIRD BREEDS ACROSS ITS ENTIRE RANGE. "BREEDS ELSEWHERE" INDICATES THAT THE BIRD DOES NOT LIKELY BREED IN YOUR PROJECT AREA.)
Bald Eagle *Haliaeetus leucocephalus* This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities. https://ecos.fws.gov/ecp/species/1626	Breeds Jan 1 to Aug 31

Burrowing Owl Athene cunicularia — Breeds Mar 15 to Aug 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9737

California Thrasher Toxostoma redivivum — Breeds Jan 1 to Jul 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Clark's Grebe Aechmophorus clarkii — Breeds Jan 1 to Dec 31
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.

Common Yellowthroat Geothlypis trichas sinuosa — Breeds May 20 to Jul 31
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/2084

Golden Eagle Aquila chrysaetos — Breeds Jan 1 to Aug 31
This is not a Bird of Conservation Concern (BCC) in this area, but warrants attention because of the Eagle Act or for potential susceptibilities in offshore areas from certain types of development or activities.
https://ecos.fws.gov/ecp/species/1680

Lawrence's Goldfinch Carduelis lawrencei — Breeds Mar 20 to Sep 20
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9464

Lewis's Woodpecker Melanerpes lewis — Breeds Apr 20 to Sep 30
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9408

Marbled Godwit Limosa fedoa — Breeds elsewhere
This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.
https://ecos.fws.gov/ecp/species/9481

Nuttall's Woodpecker Picoides nuttallii — Breeds Apr 1 to Jul 20
This is a Bird of Conservation Concern (BCC) only in particular Bird Conservation Regions (BCRs) in the continental USA
https://ecos.fws.gov/ecp/species/9410

Wrentit Chamaea fasciata This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska.	Breeds Mar 15 to Aug 10
Yellow-billed Magpie Pica nuttalli This is a Bird of Conservation Concern (BCC) throughout its range in the continental USA and Alaska. https://ecos.fws.gov/ecp/species/9726	Breeds Apr 1 to Jul 31

NOT FOR CONSULTATION

Probability of Presence Summary

The graphs below provide our best understanding of when birds of concern are most likely to be present in your project area. This information can be used to tailor and schedule your project activities to avoid or minimize impacts to birds. Please make sure you read and understand the FAQ "Proper Interpretation and Use of Your Migratory Bird Report" before using or attempting to interpret this report.

Probability of Presence (■)

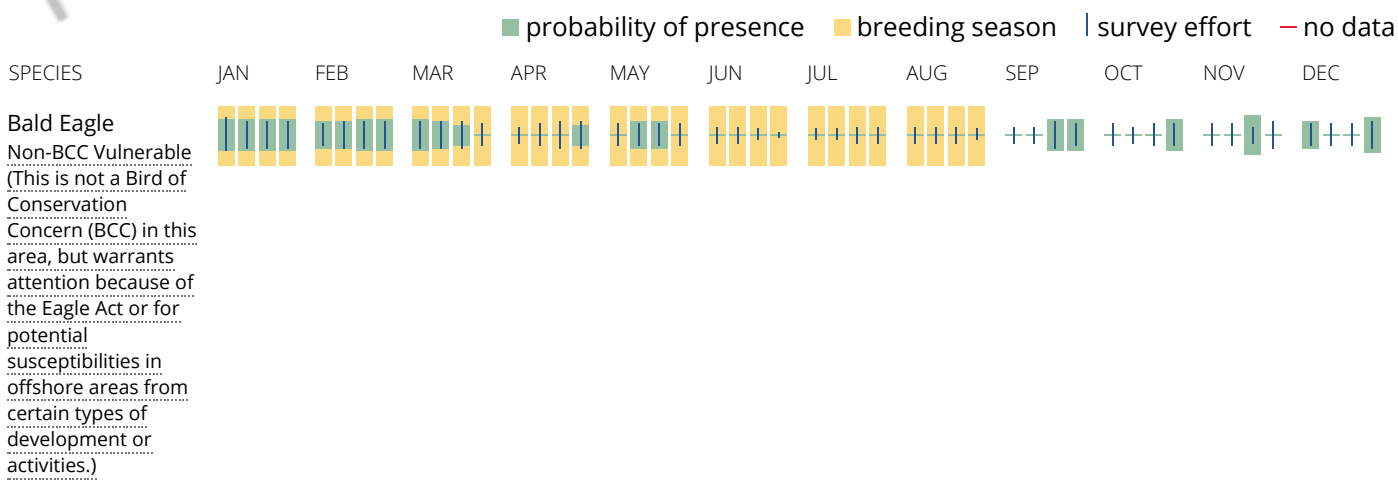
Each green bar represents the bird's relative probability of presence in the 10km grid cell(s) your project overlaps during a particular week of the year. (A year is represented as 12 4-week months.) A taller bar indicates a higher probability of species presence. The survey effort (see below) can be used to establish a level of confidence in the presence score. One can have higher confidence in the presence score if the corresponding survey effort is also high.

How is the probability of presence score calculated? The calculation is done in three steps:

1. The probability of presence for each week is calculated as the number of survey events in the week where the species was detected divided by the total number of survey events for that week. For example, if in week 12 there were 20 survey events and the Spotted Towhee was found in 5 of them, the probability of presence of the Spotted Towhee in week 12 is 0.25.
2. To properly present the pattern of presence across the year, the relative probability of presence is calculated. This is the probability of presence divided by the maximum probability of presence across all weeks. For example, imagine the probability of presence in week 20 for the Spotted Towhee is 0.05, and that the probability of presence at week 12 (0.25) is the maximum of any week of the year. The relative probability of presence on week 12 is 0.25/0.25 = 1; at week 20 it is 0.05/0.25 = 0.2.
3. The relative probability of presence calculated in the previous step undergoes a statistical conversion so that all possible values fall between 0 and 10, inclusive. This is the probability of presence score.

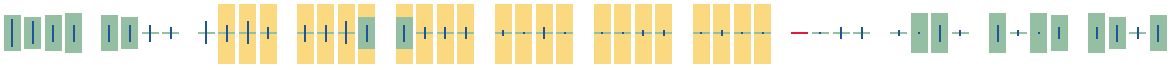
To see a bar's probability of presence score, simply hover your mouse cursor over the bar.

Breeding Season (▪)
Yellow bars denote a very liberal estimate of the time-frame inside which the bird breeds across its entire range. If there are no yellow bars shown for a bird, it does not breed in your project area.



Survey Effort (|)
Vertical black lines superimposed on probability of presence bars indicate the number of surveys performed for that species in the 10km grid cell(s) your project area overlaps. The number of surveys is expressed as a range, for example, 33 to 64 surveys.

To see a bar's survey effort range, simply hover your mouse cursor over the bar.



No Data (–)
A week is marked as having no data if there were no survey events for that week.

Survey Timeframe
Surveys from only the last 10 years are used in order to ensure delivery of currently relevant information. The exception to this is areas off the Atlantic coast, where bird returns are based on all years of available data, since data in these areas is currently much more sparse.

Tell me more about conservation measures I can implement to avoid or minimize impacts to migratory birds.

Nationwide Conservation Measures describes measures that can help avoid and minimize impacts to all birds at any location year round. Implementation of these measures is particularly important when birds are most likely to occur in the project area. When birds may be breeding in the area, identifying the locations of any active nests and avoiding their destruction is a very helpful impact minimization measure. To see when birds are most likely to occur and be breeding in your project area, view the Probability of Presence Summary. Additional measures and/or permits may be advisable depending on the type of activity you are conducting and the type of infrastructure or bird species present on your project site.

What does IPaC use to generate the migratory birds potentially occurring in my specified location?

The Migratory Bird Resource List is comprised of USFWS Birds of Conservation Concern (BCC) and other species that may warrant special attention in your project location.

The migratory bird list generated for your project is derived from data provided by the Avian Knowledge Network (AKN). The AKN data is based on a growing collection of survey, banding, and citizen science datasets and is queried and filtered to return a list of those birds reported as occurring in the 10km grid cell(s) which your project intersects, and that have been identified as warranting special attention because they are a BCC species in that area, an eagle (Eagle Act requirements may apply), or a species that has a particular vulnerability to offshore activities or development.

Again, the Migratory Bird Resource list includes only a subset of birds that may occur in your project area. It is not representative of all birds that may occur in your project area. To get a list of all birds potentially present in your project area, please visit the E-bird Explore Data Tool.

What does IPaC use to generate the probability of presence graphs for the migratory birds potentially occurring in my specified location?

The probability of presence graphs associated with your migratory bird list are based on data provided by the Avian Knowledge Network (AKN). This data is derived from a growing collection of survey, banding, and citizen science datasets .

Probability of presence data is continuously being updated as new and better information becomes available. To learn more about how the probability of presence graphs are produced and how to interpret them, go the Probability of Presence Summary and then click on the "Tell me about these graphs" link.

How do I know if a bird is breeding, wintering, migrating or present year-round in my project area?

NOT FOR CONSULTATION

To see what part of a particular bird's range your project area falls within (i.e. breeding, wintering, migrating or year-round), you may refer to the following resources: The Cornell Lab of Ornithology All About Birds Bird Guide, or (if you are unsuccessful in locating the bird of interest there), the Cornell Lab of Ornithology Neotropical Birds guide. If a bird on your migratory bird species list has a breeding season associated with it, if that bird does occur in your project area, there may be nests present at some point within the timeframe specified. If "Breeds elsewhere" is indicated, then the bird likely does not breed in your project area.

What are the levels of concern for migratory birds?

Migratory birds delivered through IPaC fall into the following distinct categories of concern:

1. "BCC Rangewide" birds are Birds of Conservation Concern (BCC) that are of concern throughout their range anywhere within the USA (including Hawaii, the Pacific Islands, Puerto Rico, and the Virgin Islands);
2. "BCC - BCR" birds are BCCs that are of concern only in particular Bird Conservation Regions (BCRs) in the continental USA; and
3. "Non-BCC - Vulnerable" birds are not BCC species in your project area, but appear on your list either because of the Eagle Act requirements (for eagles) or (for non-eagles) potential susceptibilities in offshore areas from certain types of development or activities (e.g. offshore energy development or longline fishing).

Although it is important to try to avoid and minimize impacts to all birds, efforts should be made, in particular, to avoid and minimize impacts to the birds on this list, especially eagles and BCC species of rangewide concern. For more information on conservation measures you can implement to help avoid and minimize migratory bird impacts and requirements for eagles, please see the FAQs for these topics.

Details about birds that are potentially affected by offshore projects

For additional details about the relative occurrence and abundance of both individual bird species and groups of bird species within your project area off the Atlantic Coast, please visit the Northeast Ocean Data Portal. The Portal also offers data and information about other taxa besides birds that may be helpful to you in your project review. Alternately, you may download the bird model results files underlying the portal maps through the NOAA NCCOS Integrative Statistical Modeling and Predictive Mapping of Marine Bird Distributions and Abundance on the Atlantic Outer Continental Shelf project webpage.

Bird tracking data can also provide additional details about occurrence and habitat use throughout the year, including migration. Models relying on survey data may not include this information. For additional information on marine bird tracking data, see the Diving Bird Study and the nanotag studies or contact Caleb Spiegel or Pam Loring.

What if I have eagles on my list?

If your project has the potential to disturb or kill eagles, you may need to obtain a permit to avoid violating the Eagle Act should such impacts occur.

Proper Interpretation and Use of Your Migratory Bird Report

The migratory bird list generated is not a list of all birds in your project area, only a subset of birds of priority concern. To learn more about how your list is generated, and see options for identifying what other birds may be in your project area, please see the FAQ “What does IPaC use to generate the migratory birds potentially occurring in my specified location”. Please be aware this report provides the “probability of presence” of birds within the 10 km grid cell(s) that overlap your project; not your exact project footprint. On the graphs provided, please also look carefully at the survey effort (indicated by the black vertical bar) and for the existence of the “no data” indicator (a red horizontal bar). A high survey effort is the key component. If the survey effort is high, then the probability of presence score can be viewed as more dependable. In contrast, a low survey effort bar or no data bar means a lack of data and, therefore, a lack of certainty about presence of the species. This list is not perfect; it is simply a starting point for identifying what birds of concern have the potential to be in your project area, when they might be there, and if they might be breeding (which means nests might be present). The list helps you know what to look for to

NOT FOR CONSULTATION

confirm presence, and helps guide you in knowing when to implement conservation measures to avoid or minimize potential impacts from your project activities, should presence be confirmed. To learn more about conservation measures, visit the FAQ "Tell me about conservation measures I can implement to avoid or minimize impacts to migratory birds" at the bottom of your migratory bird trust resources page.

Facilities

National Wildlife Refuge lands

Any activity proposed on lands managed by the National Wildlife Refuge system must undergo a 'Compatibility Determination' conducted by the Refuge. Please contact the individual Refuges to discuss any questions or concerns.

THERE ARE NO REFUGE LANDS AT THIS LOCATION.

Fish hatcheries

THERE ARE NO FISH HATCHERIES AT THIS LOCATION.

Wetlands in the National Wetlands Inventory

Impacts to NWI wetlands and other aquatic habitats may be subject to regulation under Section 404 of the Clean Water Act, or other State/Federal statutes.

For more information please contact the Regulatory Program of the local U.S. Army Corps of Engineers District.

Please note that the NWI data being shown may be out of date. We are currently working to update our NWI data set. We recommend you verify these results with a site visit to determine the actual extent of wetlands on site.

This location overlaps the following wetlands:

FRESHWATER EMERGENT WETLAND

- PEM1A
- PEM1Ch
- PEM1C

FRESHWATER FORESTED/SHRUB WETLAND

- PFOA
- PSSA

R4SBA

A full description for each wetland code can be found at the National Wetlands Inventory website

Data limitations

The Service's objective of mapping wetlands and deepwater habitats is to produce reconnaissance level information on the location, type and size of these resources. The maps are prepared from the analysis of high altitude imagery. Wetlands are identified based on vegetation, visible hydrology and geography. A margin of error is inherent in the use of imagery; thus, detailed on-the-ground inspection of any particular site may result in revision of the wetland boundaries or classification established through image analysis.

The accuracy of image interpretation depends on the quality of the imagery, the experience of the image analysts, the amount and quality of the collateral data and the amount of ground truth verification work conducted. Metadata should be consulted to determine the date of the source imagery used and any mapping problems.

Wetlands or other mapped features may have changed since the date of the imagery or field work. There may be occasional differences in polygon boundaries or classifications between the information depicted on the map and the actual conditions on site.

Data exclusions

Certain wetland habitats are excluded from the National mapping program because of the limitations of aerial imagery as the primary data source used to detect wetlands. These habitats include seagrasses or submerged aquatic vegetation that are found in the intertidal and subtidal zones of estuaries and nearshore coastal waters. Some deepwater reef communities (coral or tuberficid worm reefs) have also been excluded from the inventory. These habitats, because of their depth, go undetected by aerial imagery.

Data precautions

Federal, state, and local regulatory agencies with jurisdiction over wetlands may define and describe wetlands in a different manner than that used in this inventory. There is no attempt, in either the design or products of this inventory, to define the limits of proprietary jurisdiction of any Federal, state, or local government or to establish the geographical scope of the regulatory programs of government agencies. Persons intending to engage in activities involving modifications within or adjacent to wetland areas should seek the advice of appropriate federal, state, or local agencies concerning specified agency regulatory programs and proprietary jurisdictions that may affect such activities.

MEMORANDUM

DATE: October 31, 2019

TO: Mr. Michael Okuma, Costco Wholesale

FROM: Brian E. Crystal, PE, GE, Kleinfelder

CC: Andrea Traum, PE, Kleinfelder
Andy Franks, Kleinfelder

SUBJECT: Preliminary Site Preparation Recommendations
Proposed Costco Wholesale Warehouse and Fuel Facility
Silva Valley Parkway
El Dorado Hills, California
CW# 18-0487

This draft memorandum presents preliminary site preparation recommendations for the subject project in El Dorado Hills, California. Kleinfelder understands Costco plans to purchase an approximately 17-acre, commercially-zoned site on the south side of Silva Valley Parkway north of Highway 50 in El Dorado Hills, California and construct an approximately 152,000-square foot warehouse and fuel facility. The building will be a single-story, steel-framed structure (30 feet in height) with concrete-masonry unit and metal walls. In addition, immediately to the west of the warehouse facility, a two-level parking structure will be constructed, which service the majority of the parking at the site. Additional surface parking and landscape islands are also planned around the new fuel facility located on the northern portion of the property. Parking and drive areas will be paved with either Portland cement concrete or asphalt concrete pavements.

The site is undeveloped with rolling hills running from east to west with elevations between approximately 705 to 755 feet. At the time of our field exploration, much of the site was covered by low-lying vegetation (weeds and shrubs) and animal burrows. Additionally, a seasonal creek runs through the property running from east to west. Based on preliminary grading plans provided by Kier and Wright (Civil Engineer), we understand that the finished floor elevation for the warehouse building slab will be established at Elevation 729 feet. The upper level of the parking structure will match the surface grades surrounding the warehouse building at elevations ranging between 724 and 728 feet. The lower level of the parking structure will be set about 12 feet below the upper level. The warehouse building footprint is situated on a cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. Conversely, the proposed parking structure on the western side of the site is located mostly in fills of approximately 5 to 10 feet in depth. Retaining walls will be constructed on the southern and eastern sides of the warehouse building and west of the fuel facility. Retaining wall types have not been determined at this time; however, rockeries are being considered.

© 2019 Kleinfelder

Subsurface conditions at the site were explored by drilling 3 borings/rock cores, excavating 26 test pits and performing a seismic refraction survey. The seismic refraction survey was used to evaluate the excavatability (rippability) of the bedrock rock material. A total of 2 boring/rock cores and 15 test pits were drilled/excavated in the warehouse building area; 1 boring/rock core and 2 test pits were excavated within the fuel facility area, 5 test pits were excavated within the future parking structure; and 4 test pits were excavated in the proposed parking lot areas. The borings were drilled using track-mounted hollow-stem-auger drilling equipment with rock coring abilities to depths of between approximately 8½ to 30 feet below the existing ground surface (bgs). The proposed exploration plan also included a fourth rock coring location (KB-2) at the northeastern corner of the new warehouse location. This location was not drilled due to very hard drilling conditions throughout the course of the field exploration.

Soil materials encountered during the explorations consisted of colluvium/residual soil overlying bedrock. The colluvium/residual soil consisted primarily of clayey soils with varying amounts of silt and gravel and varied in depth from approximately 1.5 and 5.5 feet bgs. Below the colluvium/residual soil, bedrock comprised of weathered and fractured metavolcanic rock underlain by little-weathered, intact rock. The rock increased in strength and decreased in weathering and fracture amount with depth, as shown on the attached figure and seismic refraction survey report. Localized deposits of artificial fill were encountered in a few test pits. The fill consisted of sandy lean clays with variable amounts of gravel and cobbles. Perched groundwater was encountered in a few test pits between the depths of approximately 7 to 8 feet bgs. These test pits were located near a seasonal creek, which runs through the property. During Kleinfelder's investigation of the adjacent property in April of 2019, this creek had been flowing rapidly and all excavated test pits encountered perched water near bedrock contact.

Based on the results of our prior field exploration, and observations during this exploration, it is our professional opinion that the proposed project is geotechnically feasible, provided the recommendations presented in the geotechnical report are incorporated into the project design and construction. We identified the following key geotechnical considerations during our study.

- The primary geotechnical consideration for site development is the excavatability of the rock and the construction of fills to achieve the finished grades. The seismic refraction survey results (attached) indicate the initial weathered rock layer with compression wave velocities (Vp) ranging between 3,985 to 5,990 feet per second is located approximately 1 to 3 below existing grades and extends as deep as 30 feet below grade within the warehouse building cut. Based on Caterpillar's Handbook of Ripping (2000), rock exhibiting seismic velocities in this range are marginally rippable using a D9R dozer equipped with multi or single shank ripper(s). Underlying this layer is a less weathered rock zone with compression wave velocities ranging between 12,480 to 18,530 feet per second and is located as shallow as 5 to 10 feet below grade within eastern cut for the warehouse building and the fuel facility cut area on the northern portion of the site. Localized blasting will likely be needed to excavate less weathered rock. In addition, crushing and screening operations will likely be required to produce efficient rock fragmentation of the rock (both weathered and less weathered rock) for re-use onsite as structural fill.

© 2019 Kleinfelder

- Based on the preliminary grading plan, the warehouse building footprint is situated on a bedrock cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. To provide uniform support for the proposed warehouse building and to reduce the adverse effects of abrupt differential settlement due the cut/fill transition and variability in fill thickness across the building pad, we recommend the bedrock should be undercut by at least 6 feet below the finished floor elevation and backfilled with structural fill. In addition, cut/fill transitions are situated below small area of the parking structure's lower level. Beneath the parking structure, we recommend the bedrock should be undercut by at least 4 feet below the finished floor elevation and backfilled with structural fill.

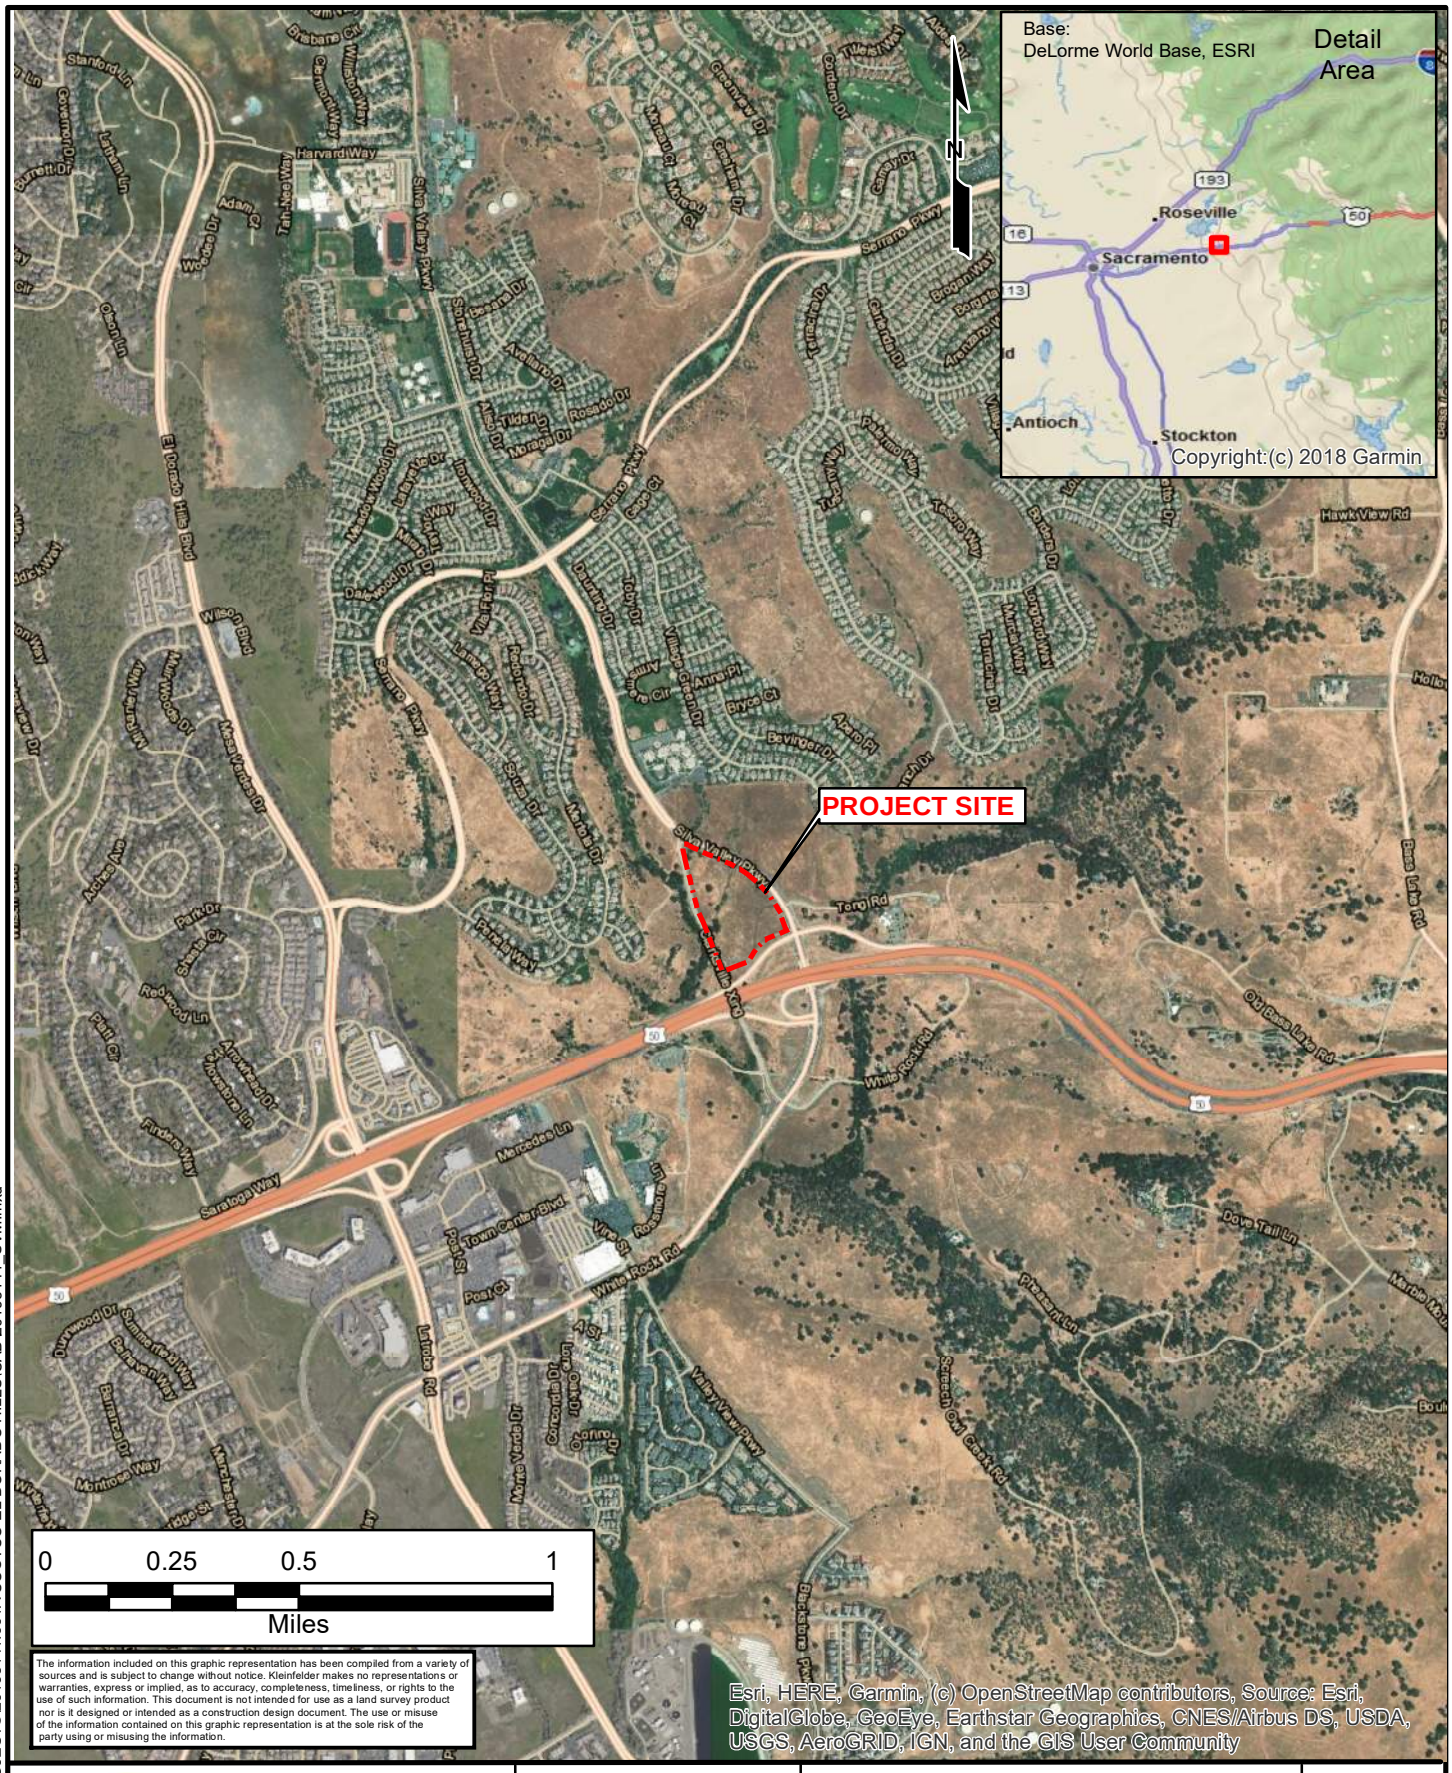
- The residual soil/colluvial layer should excavated to underlying weathered rock contact and stockpiled on site for reuse as structural fill. An estimate of the residual soil/colluvial layer thickness is shown on the attached cross sections (Figures 5 through 10).

- Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Other than plant roots, organic matter in the topsoil is minimal based on our laboratory testing (between one and three percent). The topsoil can be re-used on site in fills.

- Due to the composition of the bedrock, it will not reduce to a soil-like material when excavated. The bedrock material may be crushed, processed and re-used onsite as structural fill. Rock fragments up to 12 inches in size may be used in structural fills 10 or more feet below finished subgrade elevation, but not within 10 feet of a slope face. Rock fragments greater than 6 inches in size should not be used in the upper 10 feet of site fills. Rock fragments greater than 3 inches in size should not be used in the upper 3 feet of fills below the Costco warehouse building. There may be an opportunity for larger sized rocks and boulders between 12 and 24 inches in size to be re-used at the base of slopes or in landscape areas. A rock that cannot be crushed or screened to above size criteria should be removed off site.

- Rocks up to 12 inches in size may be placed in the deeper portions of structural fills as noted above provided they are thoroughly mixed with soils to avoid excessive concentrations of rock fragments. Over-sized materials (between 6 and 12 inches) should be placed in windrows or otherwise be placed under the observation of the geotechnical engineer's representative in a manner to avoid nesting or voids. Fills should be placed in lifts slightly thicker than the largest particle size and proof-rolled with a D-9 or larger Caterpillar dozer making at least 5 complete passes over each lift. Periodic test pits should be excavated into each compacted lift to confirm the rock fill is being placed in a uniform, dense manner with no nesting or voids.

- After stripping the site and prior to filling in the seasonal creek, which runs from east to west through the site, subdrains should be installed within the creek bottom. This creek was observed to be flowing rapidly during our initial investigation of the adjacent site in April 2019.



© 2019 Kleinfelder

- Although preliminary grading plans show that this site will be balanced, it is anticipated that crushing and processing the harder rock layers will prove challenging and may require soil to be imported onsite. Import materials, if required, should have a Plasticity Index of less than 10 with no less than 70 percent passing the No. 4 sieve, no more than 30 percent of the particles passing the No. 200 sieve, and no particles greater than 3 inches in maximum dimension. The maximum Plasticity Index for imported soils may be modified upon approval by Costco depending on its proposed use. The contractor should provide documentation to Costco that imported fill is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals prior to its transportation and use on site.

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

Very Dense	>50	>60	>70	85 - 100

FROM TERZAGHI AND PECK, 1948

PLASTICITY

DESCRIPTION	LL	FIELD TEST
Non-plastic	NP	A 1/8-in. (3 mm.) thread cannot be rolled at any water content.
Low (L)	< 30	The thread can barely be rolled and the lump or thread cannot be formed when drier than the plastic limit.
Medium (M)	30 - 50	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump or thread crumbles when drier than the plastic limit.
High (H)	> 50	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump or thread can be formed without crumbling when drier than the plastic limit.

STRUCTURE

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. thick, note thickness.
Laminated	Alternating layers of varying material or color with the layer less than 1/4-in. thick, note thickness.
Fissured	Breaks along definite planes of fracture with little resistance to fracturing.
Slickensided	Fracture planes appear polished or glossy, sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness.

ANGULARITY

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces.
Subangular	Particles are similar to angular description but have rounded edges.
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges.
Rounded	Particles have smoothly curved sides and no edges.

PROJECT NUMBER: 20193141.001A
gINT FILE: Klf_gint_master_2019
gINT TEMPLATE: E:\KLF_STANDARD_GINT_LIBRARY_2019.GLB [LEGEND 2 (SOIL DESC KEY)]

INFILLING TYPE

NAME	ABBR	NAME	ABBR
Albite	Al	Muscovite	Mus
Apatite	Ap	None	No
Biotite	Bi	Pyrite	Py
Clay	Cl	Quartz	Qz
Calcite	Ca	Sand	Sd
Chlorite	Ch	Sericite	Ser
Epidote	Ep	Silt	Si
Iron Oxide	Fe	Talc	Ta
Manganese	Mn	Unknown	Uk

DENSITY/SPACING OF DISCONTINUITIES

DESCRIPTION	SPACING CRITERIA
Unfractured	>6 ft. (>1.83 meters)
Slightly Fractured	2 - 6 ft. (0.061 - 1.83 meters)
Moderately Fractured	8 in - 2 ft. (203.20 - 609.60 mm)
Highly Fractured	2 - 8 in (50.80 - 203.30 mm)
Intensely Fractured	<2 in (<50.80 mm)

ADDITIONAL TEXTURAL ADJECTIVES

DESCRIPTION	RECOGNITION
Pit (Pitted)	Pinhole to 0.03 ft. (3/8 in.) (>1 to 10 mm.) openings
Vug (Vuggy)	Small openings (usually lined with crystals) ranging in diameter from 0.03 ft. (3/8 in.) to 0.33 ft. (4 in.) (10 to 100 mm.)
Cavity	An opening larger than 0.33 ft. (4 in.) (100 mm.), size descriptions are required, and adjectives such as small, large, etc., may be used
Honeycombed	If numerous enough that only thin walls separate individual pits or vugs, this term further describes the preceding nomenclature to indicate cell-like form.
Vesicle (Vesicular)	Small openings in volcanic rocks of variable shape and size formed by entrapped gas bubbles during solidification.

ADDITIONAL TEXTURAL ADJECTIVES

DESCRIPTION	CRITERIA
Unweathered	No evidence of chemical / mechanical alternation; rings with hammer blow.
Slightly Weathered	Slight discoloration on surface; slight alteration along discontinuities; <10% rock volume altered.
Moderately Weathered	Discoloring evident; surface pitted and alteration penetration well below surface; Weathering "halos" evident; 10-50% rock altered.
Highly Weathered	Entire mass discolored; Alteration pervading most rock, some slight weathering pockets; some minerals may be leached out.
Decomposed	Rock reduced to soil with relic rock texture/structure; Generally molded and crumbled by hand.

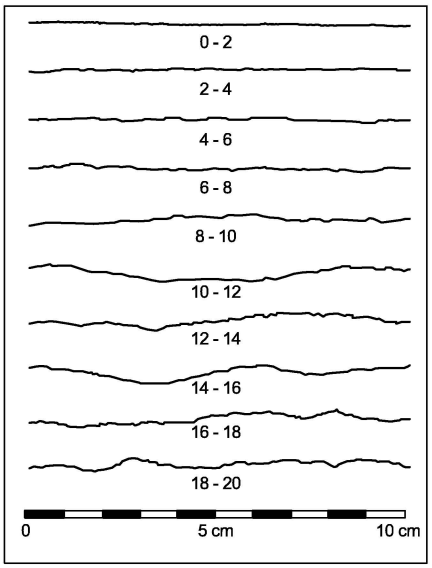
RELATIVE HARDNESS / STRENGTH DESCRIPTIONS

GRADE		UCS (Mpa)	FIELD TEST
R0	Extremely Weak	0.25 - 1.0	Indented by thumbnail
R1	Very Weak	1.0 - 5.0	Crumbles under firm blows of geological hammer, can be peeled by a pocket knife.
R2	Weak	5.0 - 25	Can be peeled by a pocket knife with difficulty, shallow indentations made by firm blow with point of geological hammer.
R3	Medium Strong	25 - 50	Cannot be scraped or peeled with a pocket knife, specimen can be fractured with a single firm blow of a geological hammer.
R4	Strong	50 - 100	Specimen requires more than one blow of geological hammer to fracture it.
R5	Very Strong	100 - 250	Specimen requires many blows of geological hammer to fracture it.
R6	Extremely Strong	> 250	Specimen can only be chipped with a geological hammer.

ROCK QUALITY DESIGNATION (RQD)

DESCRIPTION	RQD (%)
Very Poor	0 - 25
Poor	25 - 50
Fair	50 - 75
Good	75 - 90
Excellent	90 - 100

APERTURE



DESCRIPTION	CRITERIA [in (mm)]
Tight	<0.04 (<1)
Open	0.04 - 0.20 (1 - 5)
Wide	>0.20 (>5)

BEDDING CHARACTERISTICS

DESCRIPTION	Thickness [in (mm)]
Very Thick Bedded	>36 (>915)
Thick Bedded	12 - 36 (305 - 915)
Moderately Bedded	4 - 12 (102 - 305)
Thin Bedded	1 - 4 (25 - 102)
Very Thin Bedded	0.4 - 1 (10 - 25)
Laminated	0.1 - 0.4 (2.5 - 10)
Thinly Laminated	<0.1 (<2.5)

Bedding Planes	Planes dividing the individual layers, beds, or stratigraphy of rocks.
Joint	Fracture in rock, generally more or less vertical or traverse to bedding.
Seam	Applies to bedding plane with unspecified degree of weather.

JOINT ROUGHNESS COEFFICIENT (JRC)

From Barton and Choubey, 1977

RQD Rock-quality designation (RQD) Rough measure of the degree of jointing or fracture in a rock mass, measured as a percentage of the drill core in lengths of 10 cm. or more.

RE: Costco El Dorado Hills, Updated New Warehouse

Background

One composite sample was processed on September 10, 2019 identified as soil from areas where new landscaping is scheduled for installation. Fertilizer and amendment recommendations were requested. The sample was analyzed for horticultural suitability, fertility, and physical characteristics. The results of the analyses are attached. Organic matter testing was run separately on individual subsamples and these results are also attached.

Analytical Results and Comments

The reaction of the sample is moderately acidic at a pH of 6.0. This is within the range preferred for most plants. Salinity (ECe), sodium, chloride and boron are safely low. The sodium adsorption ratio (SAR) indicates that sodium is adequately balanced by soluble calcium and magnesium; this balance is important for soil structure quality, which relates to the rate at which water infiltrates the soil.

According to the USDA Soil Classification system, the texture of the less than 2mm fraction of the soil is classified as loam. Organic matter content is low at 2.3% dry weight. Based on this information the estimated infiltration rate is moderate at 0.25 inch per hour. Infiltration rates may vary due to differences in compaction across the site. The over 50% silt plus clay present indicates that this soil will have some potential for issues with slow drainage and high water holding capacity and irrigation timing should take this into account. Additional subdrainage may be beneficial for larger specimens being installed in flat areas in this soil.

In terms of soil fertility, nitrogen, phosphorus and sulfate are low and calcium is fair. All of the other major nutrients are sufficient for proper plant nutrition at this time. Of the micronutrients; copper and manganese are abundant while zinc and iron are sufficient.

Boron is safely low for general ornamental plants and may be below optimum levels for plant nutritional purposes. Irrigation water often supplies sufficient boron to meet plant nutritional requirements. However, if boron is low in the irrigation water and/or plants show symptoms of boron deficiency after they are well established, you may consider an application of a product containing boron at the manufacturer's label rate. Boron deficiency symptoms often include stunted or deformed younger growth and tight internodes. Tissue testing can be performed to identify a boron deficiency if it is suspected. Incorporation of a composted greenwaste amendment may be sufficient to negate this deficiency, product depending.

Recommendations

Nitrogen, phosphorus and calcium fertilizers are recommended at the time of planting. Incorporation of a nitrogen stabilized organic amendment or composted greenwaste product is recommended in order to improve soil nutrient holding capacity and porosity. If a composted greenwaste amendment is chosen, that would provide additional phosphorus and potassium as well as supplemental micronutrients, product depending.

To Prepare for Mass Planting:
Drainage of the root zone should be improved by first loosening the top 10 inches of any undisturbed or compacted soil. The following materials should then be evenly spread and thoroughly blended with the top 6 inches of soil to form a homogenous layer:

Amount per 1000 Square Feet	
5 cubic yards	Nitrogen Stabilized Organic Amendment*
8 pounds	Ammonium Phosphate (16-20-0)*
25 pounds	Gypsum (Calcium Sulfate)

*The rate may change based on the analysis of the chosen organic amendment. This rate is based on 270 lbs. of dry weight of organic matter per cubic yard of amendment. If a composted greenwaste amendment is chosen that provides a substantial amount of phosphorus, the ammonium phosphate should be replaced with ammonium sulfate (21-0-0) at a 7 pound rate.

To Prepare Backfill For Trees and Shrubs:

- Excavate planting pits at least twice as wide as the diameter of the rootball.
- Soil immediately below the root ball should be left undisturbed to provide support but the sides and the bottom around the side should be cultivated to improve porosity.
- The top of the rootball should be at or slightly above final grade.
- The top 12 inches of backfill around the sides of the rootball of trees and shrubs may consist of the above amended soil or may be prepared as follows:

3 parts	Site Soil
1 part	Nitrogen Stabilized Organic Amendment*

Uniformly blended with:

Amount / Cubic Yard of Backfill	
1/2 pound	Ammonium Phosphate (16-20-0)*
1 1/3 pounds	Gypsum (Calcium Sulfate)

- Backfill below 12 inches required for 24 inch box or larger material should not contain the organic amendment or ammonium phosphate, but should still contain the gypsum at the recommended rate. In order to improve phosphorus levels below 12 inches in depth, triple superphosphate should be incorporated at a 1/4 pound rate.
- Ideally a weed and turf free zone should be maintained just beyond the diameter of the planting hole. A 2-4 inch deep layer of coarse mulch can be placed around the tree or shrub. Mulch should be kept a minimum 4 inches from the trunk.
- Irrigation of new plantings should take into consideration the differing texture of the rootball substrate and surrounding soil matrix to maintain adequate moisture during this critical period of establishment.

Maintenance

Maintenance fertilization should rely primarily on a nitrogen only program supplemented with a complete fertilizer in the fall and spring. Beginning 45-60 days after planting, ammonium sulfate (21-0-0) should be applied at a rate of 5 pounds per 1000 square feet with reapplication every 45-60 days. Alternatively, slow release Sulfur Coated Urea (43-0-0) may be applied at 6 pounds per 1000 square feet every 90 days. Once plants are performing satisfactorily, the frequency of fertilization may be decreased depending on color and rate of growth desired. In the winter for a quick greening effect, calcium nitrate (15.5-0-0) may be applied at a 6 pound rate if applicable. Early fall and spring, substitute a complete fertilizer such as 15-15-15 to help insure continuing adequate phosphorus and potassium.

Alternatively, Blood Meal (12-0-0) provides available nitrogen fairly rapidly while materials such as Feather Meal (12-0-0), Soybean or Cotton Seed Meal (7-1-1) are slower to provide available nitrogen, but they extend the length of time they make this contribution. In order to provide a good supply of nitrogen for a 3-4 month time frame a good combination would be 6 pounds Blood Meal and 14 pounds Feather Meal per 1000 square feet. In the fall and spring, substitute a complete organic fertilizer such as 5-5-5 applied at the manufacturer's label rate. Or, nutrient rich composted greenwaste may be spread in a 1 to 2 inch layer, which generally carries enough nutrition to boost complete nutrition though a source of nitrogen might also be added at a half rate to assure adequate nitrogen availability.

If we can be of any further assistance, please feel free to contact us.

Salinas, California 93901

Subject: Report
Phase II Seismic Refraction Survey
Silva Valley Parkway Development
El Dorado Hills, California

Dear Mr. Dockendorf:

1.0 INTRODUCTION

This letter presents the results of Advanced Geological Services, Inc. (AGS) seismic refraction survey in support of grading work at a 16-acre site north of Tong Road and west of Silva Valley Parkway in El Dorado Hills, California (Figure 1). The survey objective was to assess the depth and excavation characteristics (rippability) of bedrock. The survey was performed on August 7 and 8, 2019 by AGS senior geophysicist Roark W. Smith and his assistant. Field oversight was provided by Mr. Jordan Annand of Kleinfelder, who showed AGS the seismic line locations, which were marked in the field with wood stakes labeled with the seismic line number. The survey comprised seven seismic lines of varying lengths and orientations distributed across the site (Figure 2).

Figure 1- Phase II Site Location in El Dorado Hills CA

2.0 SUMMARY OF FINDINGS

- Three velocity layers were detected— Layer V_1 is the uppermost approximately1- to 7-foot thick low-velocity layer representing surficial soil. Layer V_2 is a medium-velocity (from about 3,985 to 6,000 fps) layer representing deeply-weathered bedrock. Layer V_3 is a high-velocity layer (12,200 to over 18,500 fps) representing little-weathered, ”hard” bedrock.

- On the basis of the Caterpillar Performance Handbook “rip chart”, the Layer V_3 “hard” bedrock at this site is classified as non-rippable. This non-rippable “hard” bedrock mostly occurs at depths ranging from 7 to 15 feet, but was found as shallow as one (1)

foot bgs along SL-4 in the western-central portion of the site and as deep as 42 feet along SL-6 in the eastern portion of the site. The refraction survey showed V_3 velocities ranging between 12,200 to over 18,500 fps, and the "rip chart" classifies metamorphic rock exhibiting P-wave velocities greater than 9,200 fps and "non-rippable" with a D9R tractor.

3.0 SITE DESCRIPTION

The survey consisted of seven seismic lines ranging from 230 to 600 feet in length; the lines were distributed across a 16-acre triangular-shaped area of gently rolling, grass-covered hills (Figure 2). It is worth noting that the site was seismically "noisy" at times due to vehicle traffic along the nearby Parkway.

4.0 SEISMIC REFRACTION METHOD OVERVIEW

The seismic refraction method uses compressional (P-) wave energy to delineate seismic velocity layers within the subsurface. Interpretation entails correlating the velocity layers to geologic features such as soil and various types of bedrock. To perform a refraction survey, an elastic wave (compressional, or P-wave) is generated at certain locations (shotpoints) along a survey line. The P-wave energy is usually produced by striking the ground with a sledgehammer. As the P-wave propagates through the ground it is refracted along boundaries between geologic layers with different seismic velocities.

Part of the refracted P-wave energy returns to the ground surface where it is detected by vibration-sensitive devices called geophones, which are placed in a co-linear array along the seismic survey line. The geophone data are fed to a seismograph, where they are recorded, and then to a computer, where they are analyzed to determine the depth and velocities of subsurface seismic layers. Key data for refraction analysis are the positions of the geophones and shotpoints along a seismic line, and the amount of time it takes for the refracted wave to travel from the shotpoint to each geophone location. Because the P-wave is the fastest traveling of all types of seismic waves, it can be readily identified as the first deflection ("first break") on a seismic trace.

Additional discussion of the refraction method, its limitations, and the relationship between seismic velocity and geologic materials is presented in Appendix A.

5.0 FIELD PROCEDURES

Due to the lack of vehicle access, AGS hand-carried the seismic gear to each line location. For each seismic line, AGS laid out a fiberglass tape measure and placed an array of 24 geophones on the ground at 10-foot to 20-foot intervals to form a seismic "spread" that measured from 230 to 300 feet long. For seismic lines longer than 300 feet (e.g., SL-7), AGS laid out a second spread to achieve the required line length. The geophones were coupled to the ground by means of 3-inch metal spikes attached to the geophone base. Three shotpoints were used along each spread, with shotpoints located five feet beyond each end of the geophone array and at the array midpoint. AGS produced P-waves through multiple impacts with a 16-lb sledge hammer against a metal plate placed on the ground surface at each shotpoint location. In general, 10 hammer blows were used ("stacked") at the end shotpoints and 5 blows were used at the center shotpoint.

The P-waves produced by the hammer impacts were detected using Mark Products 14-Hz geophones. The detected seismic signals were recorded using a DAQLink II seismic system connected to a laptop computer.

After the seismic data were obtained along each line, AGS performed a hand-level survey to measure the relative elevation changes along the line so that the ground surface topography could be incorporated into the data analysis. After the seismic survey was completed AGS used a Trimble Pro-XR Global Positioning System (GPS) to record the seismic line locations.

6.0 DATA PROCESSING AND ANALYSIS

In general, the refraction data quality is "good"; however, due to traffic noise from the nearby roadway the quality of some of the refraction data is only "fair". Regardless, for the most part the "first beaks" could be readily identified and picked on the seismic records. Data quality was enhanced by "stacking," which entailed using multiple hammer blows at each shotpoint location to improve the signal-to-noise ratio. The additive affect of stacking of multiple hammer blows at the same location enhances or increases the amplitude of the signal (i.e., the P-wave arrival) while amplitude of the background noise, which, being random in nature, tends to cancel itself on successive hammer blows and remains largely unchanged.

Seismic data were transferred from the seismograph to a desktop computer where they were processed using the *SeisImager* software package by Geometrics, Inc. Briefly, *SeisImager* is a computer inversion program that generates an initial velocity layer model, produces synthetic data from the model, and then adjusts the model so that the synthetic data better matches the observed field data. The agreement between the synthetic and observed data provides an indication of how well the model represents the true subsurface conditions.

First, AGS used the *SeisImager* module *PickWin* to interpret ("pick") the P-wave arrivals ("first breaks") for each of the shotpoint data sets ("shot gathers") per line. *PickWin* was also used to check (against the geophysicist's field log) that the proper locations were assigned to the geophones and shotpoints. Next, the first break files were fed to the SeisImager module *PlotRefra*, which was used review time-distance (TD) plots for the seismic lines and assign a seismic layer to each arrival time. For the refraction analysis, each P-wave arrival is considered to have refracted from a distinct seismic layer. The number of layers resolved by the seismic survey, and their thickness and average velocity, is indicated by straight line segments on the TD plot; because these straight-line segments represent a constant velocity condition within the subsurface, the tend to represent a distinct geologic layer. The topographic elevation files were incorporated into the analysis at this point. Next, a time-term inversion was performed to produce layered velocity models presented on Figures 3 through 7. Time-term inversion is a linear least-squares technique that uses the layer assignments and the distances and travel times between the shotpoints and the geophones to develop a velocity layer model that best fits the observed data.

7.0 RESULTS

The results of the seismic refraction survey are summarized on Table 1, below, and presented on Figures 2 through 7, which show the seismic line locations and the subsurface velocity layer

models that were calculated from the refraction data.

Overall, three velocity layers were detected— Layer V_1 is the uppermost approximately1- to 7-foot thick low-velocity layer representing surficial soil. Layer V_2 is a medium-velocity (from about 3,985 to 6,000 fps) layer representing deeply-weathered bedrock. Layer V_3 is a high-velocity layer (12,200 to over 18,500 fps) representing little-weathered, "hard" bedrock. Layer V_3 generally occurs at depths ranging between 7 to 15 feet bgs, but it is found as shallow as one (1) foot bgs to as deep as 42 feet bgs in places. The shallowest bedrock was detected in the northern portion of the site, along SL-1 and SL-2; the deepest along SL-6 in the eastern portion of the site.

On the basis of the Caterpillar Performance Handbook "rip chart", the Layer V_3 "hard" bedrock at this site is non-rippable. This non-rippable "hard" bedrock mostly occurs at depths ranging from 7 to 15 feet, but was found as shallow as one (1) foot bgs in the western-central portion of the site along SL-4 and as deep as 42 feet in the eastern portion of the site along SL-6. The refraction survey showed V_3 velocities ranging between 12,200 to over 18,500 fps, and the "rip chart" classifies metamorphic rock exhibiting P-wave velocities greater than 9,200 fps and "non-rippable" with a D9R tractor.

Velocity information from the seismic survey is summarized in Table 1; rippability information is summarized in Table 2.

Table 1 Velocity Summary (feet per second) from Layer Models

Seismic Line	Line Length (ft)	Layer V_1 (topsoil)	Layer V_2 (weathered bedrock)	Layer V_3 (little-weathered bedrock)	Approx depth to V_3 (feet)
SL-1	230	1,310	3,985	13,680	6 – 12
SL-2	230	1,305	6,030	13,820	8 – 15
SL-3	390	1,250	4,970	14,960	3 – 16
SL-4	250	1,100	4,210	16,225	1 – 5
SL-5	300	1,270	5,380	16,260	5 – 15
SL-6	600	1,790	5,995	12,210	17 – 42
SL-7	400	1,390	5,350	18,530	7 – 17

8.0 EXCAVATION CHARACTERISTICS (RIPPABILITY)

Seismic velocity charts relating seismic velocity and excavation characteristics have been developed from field tests by others. These charts list the seismic velocity of various types of bedrock materials and their relative ease of excavation using different types of rippers. Caterpillar Tractor Company publishes a performance manual that lists ripper performance charts for various size tractors and types of rippers.

The range of rippability obtained from the ripper performance chart from the Caterpillar Performance Handbook, 12th Edition (2000) is as follows (in feet per second):

Table 2 Rip Chart for Metamorphic Rock (from The Caterpillar Performance Handbook)

Ripper	Rippable	Marginally Rippable	Non-Rippable
D9R	less than 7,200	7,200 to 9,200	greater than 9,200

This information should only be used as a general guide, however, as many other factors should also be considered. These factors include the rock jointing and fracture patterns, the experience of the equipment operator, and the equipment and excavation methods selected. Based on the observed velocities, it appears that the subsurface bedrock beneath the seismic refraction lines is rippable for a D9R to the top of Layer V_3; however, this information should be combined with a complete and thorough analysis of geotechnical boring data, as well as local ripping experience (if available) to make a final assessment.

9.0 CLOSING

All geophysical data and field notes collected as a part of this investigation will be archived at the AGS office. The data collection and interpretation methods used in this investigation are consistent with standard practices applied to similar geophysical investigations. The correlation of geophysical responses with probable subsurface features is based on the past results of similar surveys although it is possible that some variation could exist at this site. Due to the nature of geophysical data, no guarantees can be made or implied regarding the targets identified or the presence or absence of additional objects or targets.

AGS appreciates working for you. We enjoyed this project and we look forward to working with you again.

Sincerely,

Roark W. Smith
Senior Geophysicist
Advanced Geological Services, Inc.

FIGURE 7

APPENDIX A

SEISMIC VELOCITY AND LIMITATIONS OF THE REFRACTION METHOD

The physical properties of earth materials (fill, sediment, rock) such as compaction, density, hardness, and induration dictate the corresponding seismic velocity of the material. Additionally, other factors such as bedding, fracturing, weathering, and saturation can also affect seismic velocity. In general, low velocities indicate loose soil, poorly compacted fill material, poorly to semi-consolidated sediments, deeply weathered, and highly fractured rock. Conversely, high velocities are indicative of competent rock or dense and highly compacted sediments and fill. The highest velocities are measured in unweathered and little fractured rock.

There are certain limitations associated with the seismic refraction method as applied for this investigation. These limitations are primarily based on assumptions that are made by the data analysis routine. The data analysis routine assumes that the velocities along the length of each spread are uniform. If there are localized zones within each layer where the velocities are higher or lower than indicated, the analysis routine will interpret these zones as changes in the surface topography of the underlying layer. A zone of higher velocity material would be interpreted as a low in the surface of the underlying layer. Zones of lower velocity material would be interpreted as a high in the underlying layer. The data analysis routine also assumes that the velocity of subsurface materials increase with depth. Therefore, if a layer exhibits velocities that are slower than those of the material above it, the slower layer will not be resolved. Also, a velocity layer may simply be too thin to be detected.

The quality of the field data is critical to the construction of an accurate depth and velocity profile. Strong, clear “first-break” information from refracted interfaces will make the data processing, analysis, and interpretation much more accurate and meaningful. Vibrational noise or poor subsurface conditions can decrease the ability to accurately locate and pick seismic waves from the interfaces.

Due to these and other limitations inherent to the seismic refraction method, resultant velocity cross-sections should be considered only as approximations of the subsurface conditions. The actual conditions may vary locally.

SUBJECT: **DRAFT Geotechnical Study**
Proposed Costco Wholesale Warehouse and Fuel Facility
Silva Valley Parkway
El Dorado Hills, California
CW# 18-0487

Dear Mr. Okuma

Kleinfelder is pleased to present this report summarizing our draft geotechnical study for the proposed Costco Wholesale warehouse and fuel facility located on Silva Valley Parkway in El Dorado Hills, California. The conclusions and recommendations presented in this report are subject to the limitations presented in Section 7.

We appreciate the opportunity to provide geotechnical engineering services to you on this project. If you have any questions regarding this report or if we can be of further service, please do not hesitate to contact Andrea Traum at 408.595.3275, or Andy Franks, Kleinfelder's Client Account Manager for Costco at 480.650.4905.

Sincerely,

KLEINFELDER, INC.

Important Information about This

Geotechnical-Engineering Report

Subsurface problems are a principal cause of construction delays, cost overruns, claims, and disputes.

While you cannot eliminate all such risks, you can manage them. The following information is provided to help.

The Geoprofessional Business Association (GBA) has prepared this advisory to help you – assumedly a client representative – interpret and apply this geotechnical-engineering report as effectively as possible. In that way, you can benefit from a lowered exposure to problems associated with subsurface conditions at project sites and development of them that, for decades, have been a principal cause of construction delays, cost overruns, claims, and disputes. If you have questions or want more information about any of the issues discussed herein, contact your GBA-member geotechnical engineer. Active engagement in GBA exposes geotechnical engineers to a wide array of risk-confrontation techniques that can be of genuine benefit for everyone involved with a construction project.

Understand the Geotechnical-Engineering Services Provided for this Report

Geotechnical-engineering services typically include the planning, collection, interpretation, and analysis of exploratory data from widely spaced borings and/or test pits. Field data are combined with results from laboratory tests of soil and rock samples obtained from field exploration (if applicable), observations made during site reconnaissance, and historical information to form one or more models of the expected subsurface conditions beneath the site. Local geology and alterations of the site surface and subsurface by previous and proposed construction are also important considerations. Geotechnical engineers apply their engineering training, experience, and judgment to adapt the requirements of the prospective project to the subsurface model(s). Estimates are made of the subsurface conditions that will likely be exposed during construction as well as the expected performance of foundations and other structures being planned and/or affected by construction activities.

The culmination of these geotechnical-engineering services is typically a geotechnical-engineering report providing the data obtained, a discussion of the subsurface model(s), the engineering and geologic engineering assessments and analyses made, and the recommendations developed to satisfy the given requirements of the project. These reports may be titled investigations, explorations, studies, assessments, or evaluations. Regardless of the title used, the geotechnical-engineering report is an engineering interpretation of the subsurface conditions within the context of the project and does not represent a close examination, systematic inquiry, or thorough investigation of all site and subsurface conditions.

Geotechnical-Engineering Services are Performed for Specific Purposes, Persons, and Projects, and At Specific Times

Geotechnical engineers structure their services to meet the specific needs, goals, and risk management preferences of their clients. A geotechnical-engineering study conducted for a given civil engineer will not likely meet the needs of a civil-works constructor or even a different civil engineer. Because each geotechnical-engineering study is unique, each geotechnical-engineering report is unique, prepared *solely* for the client.

Likewise, geotechnical-engineering services are performed for a specific project and purpose. For example, it is unlikely that a geotechnical-engineering study for a refrigerated warehouse will be the same as one prepared for a parking garage; and a few borings drilled during a preliminary study to evaluate site feasibility will not be adequate to develop geotechnical design recommendations for the project.

Do not rely on this report if your geotechnical engineer prepared it:

- for a different client;
- for a different project or purpose;
- for a different site (that may or may not include all or a portion of the original site); or
- before important events occurred at the site or adjacent to it; e.g., man-made events like construction or environmental remediation, or natural events like floods, droughts, earthquakes, or groundwater fluctuations.

Note, too, the reliability of a geotechnical-engineering report can be affected by the passage of time, because of factors like changed subsurface conditions; new or modified codes, standards, or regulations; or new techniques or tools. *If you are the least bit uncertain* about the continued reliability of this report, contact your geotechnical engineer before applying the recommendations in it. A minor amount of additional testing or analysis after the passage of time – if any is required at all – could prevent major problems.

Read this Report in Full

Costly problems have occurred because those relying on a geotechnical-engineering report did not read the report in its entirety. Do not rely on an executive summary. Do not read selective elements only. *Read and refer to the report in full.*

You Need to Inform Your Geotechnical Engineer About Change

Your geotechnical engineer considered unique, project-specific factors when developing the scope of study behind this report and developing the confirmation-dependent recommendations the report conveys. Typical changes that could erode the reliability of this report include those that affect:

- the site's size or shape;
- the elevation, configuration, location, orientation, function or weight of the proposed structure and the desired performance criteria;
- the composition of the design team; or
- project ownership.

As a general rule, *always* inform your geotechnical engineer of project or site changes – even minor ones – and request an assessment of their impact. *The geotechnical engineer who prepared this report cannot accept*

responsibility or liability for problems that arise because the geotechnical engineer was not informed about developments the engineer otherwise would have considered.

Most of the "Findings" Related in This Report Are Professional Opinions

Before construction begins, geotechnical engineers explore a site's subsurface using various sampling and testing procedures. *Geotechnical engineers can observe actual subsurface conditions only at those specific locations where sampling and testing is performed.* The data derived from that sampling and testing were reviewed by your geotechnical engineer, who then applied professional judgement to form opinions about subsurface conditions throughout the site. Actual sitewide-subsurface conditions may differ – maybe significantly – from those indicated in this report. Confront that risk by retaining your geotechnical engineer to serve on the design team through project completion to obtain informed guidance quickly, whenever needed.

This Report's Recommendations Are Confirmation-Dependent

The recommendations included in this report – including any options or alternatives – are confirmation-dependent. In other words, they are not final, because the geotechnical engineer who developed them relied heavily on judgement and opinion to do so. Your geotechnical engineer can finalize the recommendations *only after observing actual subsurface conditions* exposed during construction. If through observation your geotechnical engineer confirms that the conditions assumed to exist actually do exist, the recommendations can be relied upon, assuming no other changes have occurred. *The geotechnical engineer who prepared this report cannot assume responsibility or liability for confirmation-dependent recommendations if you fail to retain that engineer to perform construction observation.*

This Report Could Be Misinterpreted

Other design professionals' misinterpretation of geotechnical-engineering reports has resulted in costly problems. Confront that risk by having your geotechnical engineer serve as a continuing member of the design team, to:

- confer with other design-team members;
- help develop specifications;
- review pertinent elements of other design professionals' plans and specifications; and
- be available whenever geotechnical-engineering guidance is needed.

You should also confront the risk of constructors misinterpreting this report. Do so by retaining your geotechnical engineer to participate in prebid and preconstruction conferences and to perform construction-phase observations.

Give Constructors a Complete Report and Guidance

Some owners and design professionals mistakenly believe they can shift unanticipated-subsurface-conditions liability to constructors by limiting the information they provide for bid preparation. To help prevent the costly, contentious problems this practice has caused, include the complete geotechnical-engineering report, along with any attachments or appendices, with your contract documents, *but be certain to note conspicuously that you've included the material for information purposes only.* To avoid misunderstanding, you may also want to note that "informational purposes" means constructors have no right to rely on the interpretations, opinions, conclusions, or recommendations in the report. Be certain that constructors know they may learn about specific project requirements, including options selected from the report, *only* from the design drawings and specifications. Remind constructors that they may perform their own studies if they want to, and *be sure to allow enough time* to permit them to do so. Only then might you be in a position to give constructors the information available to you, while requiring them to at least share some of the financial responsibilities stemming from unanticipated conditions. Conducting prebid and preconstruction conferences can also be valuable in this respect.

Read Responsibility Provisions Closely

Some client representatives, design professionals, and constructors do not realize that geotechnical engineering is far less exact than other engineering disciplines. This happens in part because soil and rock on project sites are typically heterogeneous and not manufactured materials with well-defined engineering properties like steel and concrete. That lack of understanding has nurtured unrealistic expectations that have resulted in disappointments, delays, cost overruns, claims, and disputes. To confront that risk, geotechnical engineers commonly include explanatory provisions in their reports. Sometimes labeled "limitations," many of these provisions indicate where geotechnical engineers' responsibilities begin and end, to help others recognize their own responsibilities and risks. *Read these provisions closely.* Ask questions. Your geotechnical engineer should respond fully and frankly.

Geoenvironmental Concerns Are Not Covered

The personnel, equipment, and techniques used to perform an environmental study – e.g., a "phase-one" or "phase-two" environmental site assessment – differ significantly from those used to perform a geotechnical-engineering study. For that reason, a geotechnical-engineering report does not usually provide environmental findings, conclusions, or recommendations; e.g., about the likelihood of encountering underground storage tanks or regulated contaminants. *Unanticipated subsurface environmental problems have led to project failures.* If you have not obtained your own environmental information about the project site, ask your geotechnical consultant for a recommendation on how to find environmental risk-management guidance.

Obtain Professional Assistance to Deal with Moisture Infiltration and Mold

While your geotechnical engineer may have addressed groundwater, water infiltration, or similar issues in this report, the engineer's services were not designed, conducted, or intended to prevent migration of moisture – including water vapor – from the soil through building slabs and walls and into the building interior, where it can cause mold growth and material-performance deficiencies. Accordingly, ***proper implementation of the geotechnical engineer's recommendations will not of itself be sufficient to prevent moisture infiltration. Confront the risk of moisture infiltration*** by including building-envelope or mold specialists on the design team. ***Geotechnical engineers are not building-envelope or mold specialists.***

EXECUTIVE SUMMARY

This report presents the results of Kleinfelder's geotechnical study for proposed Costco Wholesale warehouse and fuel facility (CW# 18-0487) located on Silva Valley Parkway in El Dorado Hills, California. The purpose of our geotechnical study was to evaluate soil/bedrock and groundwater conditions at the site and provide geotechnical recommendations for project design and construction. We based our study on the Costco Wholesale Development Requirements (CWDRs), Version 2018, revised October 26, 2018.

Kleinfelder understands Costco plans to purchase an approximately 17-acre, commercially-zoned site on the southwest side of Silva Valley Parkway north of Highway 50 in El Dorado Hills, California and construct an approximately 152,000-square foot warehouse and fuel facility. The building will be a single-story, steel-framed structure (30 feet in height) with concrete-masonry-unit and metal walls. Based on the CWDRs, we understand maximum column loads will be on the order of 120 kips for non-snow regions, typical wall loads will be approximately 4.5 kips per lineal foot, and the total slab load (dead plus live loads) will be approximately 500 psf.

In addition, immediately west of the warehouse facility, a two-level parking structure will be constructed, which will service the majority of the parking at the site. Structural loading is not currently available; however, based on past experience, maximum column loads for the parking structure is anticipated to be on the order of 250 kips for interior columns and 125 kips for exterior columns, respectively. Additional surface parking and landscape islands are also planned around the new fuel facility located on the northern portion of the property. Parking and drive areas will be paved with either Portland cement concrete or asphalt concrete pavement.

The site is located between Silva Valley Parkway and US Highway 50 in El Dorado Hills, California. The site is currently bounded by Silva Valley Parkway to the north and east, the southbound US Highway 50 on-ramp to the south, and Clarksville Crossing to the west. The site is undeveloped with rolling hills running from east to west with ground surface elevations between approximately 705 to 755 feet. At the time of our field exploration, much of the site was covered by low-lying vegetation (weeds and shrubs) and animal burrows. Additionally, a seasonal creek runs through the property from east to west.

Based on preliminary grading plans provided by Kier and Wright (Civil Engineer), we understand that the finished floor elevation for the warehouse building slab will be established at Elevation

© 2019 Kleinfelder

729 feet. The upper level of the parking structure will match the surface grades surrounding the warehouse building at elevations ranging between 724 and 729 feet. The lower level of the parking structure will be set about 12 feet below the upper level. The warehouse building footprint is situated on a cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. Conversely, the proposed parking structure on the western side of the site is located mostly in fills of approximately 5 to 10 feet in depth. The preliminary grading plans show this site to be balanced. Retaining walls will be constructed on the southern and eastern sides of the warehouse building and west of the fuel facility. Retaining wall types have not been determined at this time; however, rockeries are being considered.

Subsurface conditions at the site were explored by drilling 3 borings/rock cores, excavating 26 test pits and performing a seismic refraction survey. The seismic refraction survey was used to evaluate the excavatability (rippability) of the bedrock rock material. A total of 2 boring/rock cores and 15 test pits were drilled/excavated in the warehouse building area; 1 boring/rock core and 2 test pits were excavated within the fuel facility area, 5 test pits were excavated within the future parking structure; and 4 test pits were excavated in the proposed parking lot areas. The borings were drilled using track-mounted hollow-stem-auger drilling equipment with rock coring abilities to depths of between approximately 8½ to 25 feet below the existing ground surface (bgs). The proposed exploration plan also included a fourth rock coring location (KB-2) at the northeastern corner of the new warehouse location. This location was not drilled due to very hard drilling conditions throughout the course of the field exploration.

Subsurface materials encountered during the explorations consisted of colluvium/residual soil overlying bedrock. The colluvium/residual soil consisted primarily of clayey soils with varying amounts of silt and gravel and varied in depth from approximately 1 to 5½ feet bgs. Below the colluvium/residual soil, bedrock comprised of weathered and fractured metavolcanic rock underlain by little-weathered, intact rock. The rock increased in strength and decreased in weathering and fracture amount with depth, as shown on Figures 5 through 10 and the seismic refraction survey report (Appendix C). Localized deposits of artificial fill were encountered in a few test pits. The fill consisted of sandy lean clays with variable amounts of gravel and cobbles. Perched groundwater was encountered in Test Pits TP-4 and TP-6 at depths of approximately 7 to 8 feet bgs. These test pits were located near a seasonal creek, which runs through the property. During Kleinfelder's investigation of the adjacent property in April of 2019, this creek

© 2019 Kleinfelder

had been flowing rapidly and all excavated test pits encountered perched water near bedrock contact.

Based on the results of our prior field exploration, and observations during this exploration, it is our professional opinion that the proposed project is geotechnically feasible, provided the recommendations presented in the geotechnical report are incorporated into the project design and construction. We identified the following key geotechnical considerations during our study.

- The primary geotechnical consideration for site development is the excavatability of the rock and the construction of fills to achieve the finished grades. The seismic refraction survey results (Appendix C) indicate the initial weathered rock layer with compression wave velocities (Vp) ranging between 3,985 to 6,030 feet per second is located approximately 1 to 3 below existing grades and extends as deep as 30 feet below grade within the warehouse building cut. Based on Caterpillar's Handbook of Ripping (2000), rock exhibiting seismic velocities in this range are marginally rippable using a D9R dozer equipped with multi or single shank ripper(s). Underlying this layer is a less weathered rock zone with compression wave velocities ranging between 12,210 to 18,530 feet per second and is located as shallow as 5 to 10 feet below grade within eastern cut for the warehouse building and the fuel facility cut area on the northern portion of the site. Localized blasting will likely be needed to excavate less weathered rock. In addition, crushing and screening operations will likely be required to produce efficient rock fragmentation of the rock (both weathered and less weathered rock) for re-use onsite as structural fill.
- Based on the preliminary grading plan, the warehouse building footprint is situated on a bedrock cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. To provide uniform support for the proposed warehouse building and to reduce the adverse effects of abrupt differential settlement due the cut/fill transition and variability in fill thickness across the building pad, we recommend the bedrock should be undercut by at least 6 feet below the finished floor elevation and backfilled with structural fill. In addition, cut/fill transitions are situated below small areas of the parking structure's lower level. Beneath the parking structure, we recommend the bedrock should be undercut by at least 4 feet below the finished floor elevation and backfilled with structural fill.

© 2019 Kleinfelder

- The residual soil/colluvial layer should excavated to underlying weathered rock contact and stockpiled on site for reuse as structural fill. An estimate of the residual soil/colluvial layer thickness is shown on the cross sections (Figures 5 through 10).
- Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Other than plant roots, organic matter in the topsoil is minimal based on our laboratory testing (between one and three percent). The topsoil can be re-used on site in fills.
- Due to the composition of the bedrock, it will not reduce to a soil-like material when excavated and will not be suitable for re-use as structural fill. However, the bedrock material may be crushed, processed and re-used onsite as structural fill as described below. Rock fragments up to 12 inches in size may be used in structural fills 10 or more feet below finished subgrade elevation, but not within 10 feet of a slope face. Rock fragments greater than 6 inches in size should not be used in the upper 10 feet of site fills. Rock fragments greater than 3 inches in size should not be used in the upper 3 feet of fills below the Costco warehouse building. There may be an opportunity for larger sized rocks and boulders between 12 and 24 inches in size to be re-used at the base of slopes or in landscape areas. A rock that cannot be crushed or screened to above size criteria should be removed off site.
- Rocks up to 12 inches in size may be placed in the deeper portions of structural fills as noted above provided they are thoroughly mixed with soils to avoid excessive concentrations of rock fragments. Over-sized materials (between 6 and 12 inches) should be placed in windrows or otherwise be placed under the observation of the geotechnical engineer's representative in a manner to avoid nesting or voids. Fills should be placed in lifts slightly thicker than the largest particle size and proof-rolled with a D-9 or larger Caterpillar dozer making at least 5 complete passes over each lift. Periodic test pits should be excavated into each compacted lift to confirm the rock fill is being placed in a uniform, dense manner with no nesting or voids.
- After stripping the site and prior to filling in the seasonal creek, which runs from east to west through the site, subdrains should be installed within the creek bottom. This creek was observed to be flowing rapidly during our initial investigation of the adjacent site in April 2019.

© 2019 Kleinfelder

- Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, perched groundwater will likely be present at or near subgrade level across the entire site during and after rainfall events.
- Although preliminary grading plans show that this site will be balanced, it is anticipated that crushing and processing the harder rock layers will prove challenging and may require soil to be imported onsite. Import materials, if required, should have a Plasticity Index of less than 10 with no less than 70 percent passing the No. 4 sieve, no more than 30 percent of the particles passing the No. 200 sieve, and no particles greater than 3 inches in maximum dimension. The maximum Plasticity Index for imported soils may be modified upon approval by Costco depending on its proposed use. The contractor should provide documentation to Costco that imported fill is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals prior to its transportation and use on site.
- Permanent slopes should be constructed at an inclination of 2:1 (horizontal to vertical) or flatter.
- Retaining wall types have not been determined at this time; however, we understand rockeries are being considered. Kleinfelder has provided recommendations for cantilever retaining walls. Rockeries are designed and constructed by a design-build specialty contractor.
- The proposed Costco warehouse building, fuel facility canopy, and parking structure foundations may be supported on a conventional shallow foundation system. Proposed light poles located in the parking lot may be supported on short drilled pile foundations.
- Pursuant to current Costco Wholesale standard construction design practices, we have evaluated whether steel reinforcement is needed within the floor slab. Based on the geotechnical characteristics of the site, the proposed warehouse can be built with a non-reinforced slab.
- Kleinfelder typically recommends installation of a vapor barrier beneath the slab to mitigate potential moisture issues such as flooring performance and mold. However, we understand that Costco Wholesale has determined that moisture barriers are not to be used in construction of Costco Wholesale warehouses due to adverse effects on concrete curing and performance. Therefore, we have provided construction recommendations that do not include installation of a moisture barrier, with the understanding that there will be an increased risk for adverse moisture issues.

© 2019 Kleinfelder

- The residual soil/colluvium is anticipated to be used near the finished subgrade levels around the site. Because this material drains poorly, we recommend radial finger drains below new pavement sections. Additionally, planters should be detailed such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement.
- Based on the current grading plan and understanding of the regional geology, we classify the site as Seismic Site Class C.
- Performance grade (PG) binder oil of 64-10 should be used asphalt concrete pavements and is locally available.
- The minimum resistivity of the samples tested indicate that the soil may be corrosive towards ferrous metals. The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318-14 Table 19.3.1.1 (ACI, 2014). Therefore, in accordance with ACI Building Code 318-14, no special provisions for selection of cement type are required.
- Based on visual soil classification and laboratory testing of the soil samples collected during our field exploration, the upper approximately 1 to 5 feet of the subsurface soils consist predominantly lean sandy clays underlain with highly fractured highly weathered metavolcanic rock. Based on the soil classification, and gradation tests, water infiltration is expected to be very low. We recommend alternatives to infiltration BMPs, such as bio-filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the Costco site.

The findings, conclusions, and recommendations presented in this executive summary should not be relied upon without consulting our geotechnical report for more information. The conclusions and recommendations presented in this report are subject to the limitations presented in Section 7.

1 INTRODUCTION

This report presents the results of Kleinfelder's geotechnical study for proposed Costco Wholesale warehouse and fuel facility (CW# 18-0487) located at Silva Valley Parkway in El Dorado Hills, California. The location of the project site is presented on Figure 1, Site Location Map. The purpose of our geotechnical study was to evaluate soil/bedrock and groundwater conditions at the site and provide geotechnical recommendations for project design and construction. The scope of our services was presented in our change order and revised proposal titled, "Proposal for Geotechnical Study – New Site, Proposed Costco Wholesale Warehouse and Fuel Facility Silva Valley Parkway, El Dorado Hills, California 95762, CW#18-0487," dated August 19, 2019. We based our study on the Costco Wholesale Development Requirements (CWDRs), Version 2018, revised October 26, 2018.

This report presents a description of the services performed, a discussion of the geotechnical conditions observed at the site, and recommendations developed from our engineering analyses of field and laboratory data. Individuals using this report should read the limitations presented in Section 7.

1.1 PROJECT DESCRIPTION

Kleinfelder understands Costco plans to purchase an approximately 17-acre, commercially-zoned site on the southwest side of Silva Valley Parkway north of Highway 50 in El Dorado Hills, California and construct an approximately 152,000-square foot warehouse and fuel facility. The building will be a single-story, steel-framed structure (30 feet in height) with concrete-masonry-unit and metal walls. Based on the CWDRs, we understand maximum column loads will be on the order of 120 kips for non-snow regions, typical wall loads will be approximately 4.5 kips per lineal foot, and the total slab load (dead plus live loads) will be approximately 500 psf.

In addition, immediately west of the warehouse facility, a two-level parking structure will be constructed, which will service the majority of the parking at the site. Structural loading is not currently available; however, based on past experience, maximum column loads for the parking structure is anticipated to be on the order of 250 kips for interior columns and 125 kips for exterior columns, respectively. Additional surface parking and landscape islands are also planned around the new fuel facility located on the northern portion of the property. Parking and drive areas will be paved with either Portland cement concrete or asphalt concrete pavement.

© 2019 Kleinfelder

Based on preliminary grading plans provided by Kier and Wright (Civil Engineer), we understand that the finished floor elevation for the warehouse building slab will be established at Elevation 729 feet. The upper level of the parking structure will match the surface grades surrounding the warehouse building at elevations ranging between 724 and 728 feet. The lower level of the parking structure will be set about 12 feet below the upper level. The warehouse building footprint is situated on a cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. Conversely, the proposed parking structure on the western side of the site is located mostly in fills of approximately 5 to 10 feet in depth. The preliminary grading plans show this site to be balanced. Retaining walls will be constructed on the southern and eastern sides of the warehouse building and west of the fuel facility. Retaining wall types have not been determined at this time; however, rockeries are being considered.

1.2 SCOPE OF SERVICES

The scope of our geotechnical study consisted of a literature review, subsurface explorations, geotechnical laboratory testing, engineering evaluation and analysis, and preparation of this report. Studies to assess environmental hazards that may affect the soil and groundwater at the site were beyond our geotechnical scope of services. The following paragraphs present a description of our services.

1.2.1 Task 1 – Background Data Review

We reviewed readily-available published and unpublished geologic literature in our files and the files of public agencies, including selected publications prepared by the California Geological Survey and the U.S. Geological Survey. Readily-available on-line photos were reviewed for past site development and use. We also reviewed readily available seismic and faulting information, including data for designated earthquake fault zones as well as our in-house database of faulting in the general site vicinity.

1.2.2 Task 2 – Field Exploration

Subsurface conditions at the site were explored by drilling 3 borings/rock cores, excavating 26 test pits and performing a seismic refraction survey. The seismic refraction survey was used to evaluate the excavatability (rippability) of the bedrock rock material. A total of 2 boring/rock cores and 15 test pits were drilled/excavated in the warehouse building area; 1 boring/rock core

© 2019 Kleinfelder

and 2 test pits were excavated within the fuel facility area, 5 test pits were excavated within the future parking structure; and 4 test pits were excavated in the proposed parking lot areas. The borings were drilled using track-mounted hollow-stem-auger drilling equipment with rock coring abilities to depths of between approximately 8½ to 25 feet below the existing ground surface (bgs). The proposed exploration plan also included a fourth rock coring location (KB-2) at the northeastern corner of the new warehouse location. This location was not drilled due to very hard drilling conditions throughout the course of the field exploration. Test pits were excavated with a John Deere 50G track excavator to depths ranging from 2 to 10 feet bgs. The explorations are shown graphically on Figure 2, Exploration Location Map.

Prior to commencement of the fieldwork, Underground Service Alert (USA) was notified and various geophysical techniques were used at the boring and test pit locations to identify potential conflicts with subsurface structures. A Kleinfelder staff engineer supervised the field operations and logged the explorations. Selected samples were retrieved, placed in plastic bags or sealed, and transported to our laboratory for further evaluation. Descriptions used on the logs result from field observations and data, as well as from laboratory test data. Stratification lines on the logs represent the approximate boundary between soil and/or rock types, and the actual transition may vary and can be gradual. Appendix A presents a description of the field exploration program, exploration logs, test pit logs and a legend of terms and symbols used on the logs.

1.2.3 Task 3 – Laboratory Testing

Laboratory testing was performed on representative bulk and relatively undisturbed samples to assist in soil classification and development of engineering parameters for geotechnical design. Laboratory testing comprised moisture content, Atterberg limits, R-value, and unconfined compressive strength tests and were performed by our in-house laboratory. Corrosivity testing was performed by AP Engineering & Testing, Inc. of Pomona, California.

Analytical testing was performed on a composite topsoil sample for essential elements in accordance with CWDRs topsoil samples were tested for organic content. The topsoil analysis and organic content testing was performed by Waypoint Analytical of Anaheim, California to assess soil fertility, localized concentrations of various metals and organic content. All in-house and subcontracted laboratory test results are shown in Appendix B of this report.

© 2019 Kleinfelder

1.2.4 Task 4 – Geotechnical Analyses

We analyzed field and laboratory data in conjunction with the finished grades, warehouse layout, and structural loads to provide geotechnical recommendations for design and construction. We evaluated feasible foundation systems, concrete slab support, pavement design, and earthwork. Seismic design parameters in accordance with the 2019 California Building Code (CBC) are also presented.

1.2.5 Task 5 – Report Preparation

This report summarizes the services performed, data acquired, and our findings, conclusions, and geotechnical recommendations for the design and construction of the proposed improvements. Our report includes the following items:

- Vicinity map and field exploration location map showing the approximate boring and test pit locations;
- Boring and test pit logs (Appendix A);
- Results of laboratory testing including topsoil analytical testing (Appendix B);
- Seismic refraction survey performed by Advanced Geological Services (Appendix C);
- Cross section figures detailing subsurface soils encountered and recommended overexcavation amounts across the building pad and parking lot areas;
- Discussion of general site conditions;
- Discussion of general subsurface conditions as encountered in our field exploration;
- Discussion of regional and local geology;
- Recommendations for seismic design parameters in accordance with Chapter 16 of the 2019 CBC;
- Recommendations for foundation design, allowable bearing pressures, embedment depths, and compatibility constraints under various loading conditions;
- Anticipated total and differential static settlements;
- Recommendations for site preparation, earthwork, temporary slope inclinations, fill placement, and compaction specifications, including the excavation characteristics of bedrock;
- Recommendations for support of floor slabs and slabs-on-grade;

© 2019 Kleinfelder

- Recommendations for flexible and rigid pavement structural sections for light- and heavy-duty pavement based on Equivalent Single Axle loading presented in the CWDRs;
- Recommendations for design of retaining structures, including active and at-rest lateral earth pressures, passive and frictional resistance, and applicable surcharge loads; and
- Preliminary evaluation of the corrosion potential of the on-site soils

© 2019 Kleinfelder

2 SITE CONDITIONS

2.1 SITE DESCRIPTION

The proposed Costco site is located between Silva Valley Parkway and US Highway 50 in El Dorado Hills, California, as presented on Figure 1. The site is currently bounded by Silva Valley Parkway to the north and east, the southbound US Highway 50 on-ramp to the south, and Clarksville Crossing to the west. The land is zoned as commercial and is located around ¼ mile south of Oak Meadow Elementary school and the Serrano residential development.

At the time of our field exploration, the site was an undeveloped field with rolling hills generally sloping from east to west with ground surface elevations ranging from approximately 705 to 755 feet. Much of the site was covered by low-lying vegetation (weeds and shrubs) and animal burrows as well as some native trees. Outcropping rocks were also visible throughout the site. Additionally, a seasonal creek separating the proposed warehouse and parking structure locations from the proposed fuel facility runs through the property from east to west. This creek was dry during our September 2019 investigation but was observed to be flowing during our initial field exploration of the adjacent property in April of 2019.

An unfinished portion (~100 feet long) of Tong Road resides on the southwest corner of the property. Based on site reconnaissance, no existing structures sat on this land prior to the investigation with no utility company easements running through the property.

© 2019 Kleinfelder

3 GEOLOGY

3.1 GEOLOGIC SETTING

3.1.1 Regional Geology

The subject site is situated in the gently rolling topography that forms the western foothills of the Sierra Nevada Mountains. The western foothills are broadly tilted, dipping westward, and uplifted increasingly to the east, due to maximum uplift of the Sierra Nevada at its eastern edge. The Sierra Nevada is comprised mostly of large, north-south elongated blocks of Mesozoic granitic terrain forming the backbone of California. The foothills in the project vicinity consist of a northwest-trending belt of metamorphosed volcanic and sedimentary rock that separate the Sierran crystalline basement rock (granites) from the Central Valley sediments. These rocks are distributed within three major north-south trending, fault-bounded lithologic terrains that extend along the length of the metamorphic belt. Rocks within these terrains have been isoclinally folded and metamorphosed on a regional scale and represent a “collage” of tectonically accreted blocks emplaced during convergent plate tectonism that occurred during the Early Paleozoic and Late Jurassic. Bedding, foliation, and major faults throughout the metamorphic belt normally trend northwest and dip steeply to the east. A map of the regional geology is provided in Figure 3 of this report.

3.1.2 Site Geology

The project area is mapped by Loyd (1983 and 1984) as being underlain by Jurassic and Triassic age metavolcanic rocks (map symbol mv). This formation is almost entirely of marine origin and consist mostly of basaltic to andesitic breccias, flows, and tuffs that have been metamorphosed, but with primary volcanic features generally recognizable. The formation also contains minor associated sandstone and conglomerate, although none were encountered during our field investigation. Foliation that developed from regional metamorphism is often evident in the rock structure and typically has a north-trending direction. Locally, schistose fabric may be evident. The rock strength of the in less weathered portions of the formation is typically very high and can result in difficult excavation conditions.

3.2 SUBSURFACE CONDITIONS

Subsurface materials encountered during the explorations consisted of colluvium/residual soil overlying bedrock. The colluvium/residual soil consisted primarily of clayey soils with varying amounts of silt and gravel and varied in depth from approximately 1 to 5½ feet bgs. Below the

© 2019 Kleinfelder

colluvium/residual soil, bedrock comprised of weathered and fractured metavolcanic rock underlain by little-weathered, intact rock. The rock increased in strength and decreased in weathering and fracture amount with depth, as shown on the attached figure and seismic refraction survey report. Localized deposits of artificial fill were encountered in a few test pits. The fill consisted of sandy lean clays with variable amounts of gravel and cobbles.

3.3 GROUNDWATER

Groundwater as not encountered in our explorations to the maximum depth explored of approximately 25 feet. However, perched groundwater was encountered in Test Pits TP-4 and TP-6 at depths of approximately 7 to 8 feet bgs. These test pits were located near a seasonal creek, which runs through the property. During Kleinfelder's investigation of the adjacent property in April of 2019, this creek had been flowing rapidly and all excavated test pits encountered perched water near bedrock contact.

Localized zones of perched water, increased soil moisture content and fluctuations of the groundwater level, should be anticipated during and following the rainy season. Irrigation of landscaped areas on or adjacent to the site can also cause a fluctuation of local groundwater levels.

3.4 ASSESSMENT OF POTENTIAL GEOLOGIC HAZARDS

3.4.1 Localized Faulting

According to CGS (2018), the site is not located within an Alquist-Priolo Earthquake Fault Zone and no mapped active or potentially active fault traces are known to traverse the site. The project area is situated within a region traditionally characterized by few active faults, numerous inactive faults, and low to moderate seismic activity.

An active fault is a fault that has experienced seismic activity during historic time (since roughly 1800) or exhibits evidence of surface displacement during Holocene time (Hart and Bryant 1997). The definition of "potentially active" varies. A generally accepted definition of "potentially active" is a fault showing evidence of displacement that is older than 11,000 years (Holocene age) and younger than 1.7 million years (Pleistocene age). However, "potentially active" is no longer used as criteria for zoning by the California Geologic Survey (CGS), formerly known as the Division of Mines and Geology. The terms "sufficiently active" and "well-defined" are now used by the CGS as criteria for zoning faults under the Alquist-Priolo Earthquake Fault Act. A

© 2019 Kleinfelder

"sufficiently active fault" is a fault that shows evidence of Holocene surface displacement along one or more of its segments and branches, while a "well-defined fault" is a fault whose trace is clearly detectable by a trained geologist as a physical feature at or just below the ground surface. The definition "inactive" generally implies that a fault has not been active since the beginning of the Pleistocene Epoch (older than 1.7 million years old).

The nearest well-defined faults to the project are the Genoa and Cordelia faults. Both faults are located over 50 miles from the project site. A major seismic event on either of these faults is anticipated to cause weak ground shaking at the project site.

The nearest fault to the project site is the west trace of the Bear Mountain Fault Zone that strikes northwest-southeast for approximately 84 miles along the Sierra Foothill region. A fault trace within this zone is located approximately 650 feet west of the project and forms a major contact between the metavolcanics rock that underly the project and the younger Copper Hills Volcanics Formation to the west of the fault. Seismically, the mapped fault near the project is mapped as Pre-Quaternary (CGS, 2010). However, current seismic data (ANSS, 2011) shows micro-earthquakes (magnitude less than 2 or 3) are generated along the northern portion of the fault zone and UCEF3 includes the Swain Ravine – Spenceville segment of the Bear Mountains Fault Zone in their probability model (USGS, 2013). This low seismic activity is not expected to impact the project.

3.4.2 Landsliding

The majority of the project site is characterized by slope gradients of 5:1 (horizontal to vertical) and shallower (less steep). Given the elevation differential and shallow gradients the potential for slope instability is considered low. However, it should be noted that the exception to this condition are the approximately 2:1 permanent cut slopes for the roadways that form the northern and southern portions of the site. These slopes were excavated into highly weathered rock that historically can develop shallow debris flows and slumps during wet weather. Given the height of the slopes and extent of exposed rock, the potential for shallow slope instability events in this area is considered moderate.

3.4.3 Liquefaction and Seismic Compression

The term liquefaction describes a phenomenon in which saturated, cohesionless soils temporarily lose shear strength (liquefy) due to increased pore water pressures induced by strong, cyclic

© 2019 Kleinfelder

ground motions during an earthquake. Structures founded on or above potentially liquefiable soils may experience bearing capacity failures due to the temporary loss of foundation support, vertical settlements (both total and differential), and/or undergo lateral spreading. The factors known to influence liquefaction potential include soil type, relative density, grain size, confining pressure, depth to groundwater, and the intensity and duration of the seismic ground shaking. Liquefaction is most prevalent in loose to medium dense, silty, sandy, and gravelly soils below the groundwater table. Based on our review of available groundwater well data, it is our opinion that the regional groundwater is deep. Therefore, based on the results of the subsurface explorations and review data, the potential for liquefaction and its adverse effects (i.e., seismic settlement and lateral spreading) is not considered a hazard at the site.

Seismic compression results from the accumulation of contractive volumetric strains in unsaturated soil during earthquake shaking. Loose to medium dense granular material with no fines or with low plasticity fines are most susceptible to seismic compression. Based on the density and composition of the underlying soil/bedrock, seismic compression (dynamic dry settlement) is considered a hazard at the site.

3.4.4 Expansive Soils

Expansive soils are characterized by their ability to undergo significant volume changes (shrink or swell) due to variations in moisture content. Changes in soil moisture content can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. The surficial soils are generally low-medium plastic fines; therefore, the expansion potential is considered low.

3.4.5 Collapsible Soils

Collapsible soils are characterized by their ability to undergo significant shrinkage (collapse) during inundation. Inundation in soils can result from precipitation, landscape irrigation, utility leakage, roof drainage, perched groundwater, drought, or other factors and may result in unacceptable settlement or heave of structures or concrete slabs supported on grade. Based on the results of laboratory testing, the soil encountered are not expected to collapse during inundation, so the impact of collapsible soils for this site is considered low.

© 2019 Kleinfelder

3.4.6 Subsidence

The site is not located in an area of known significant ground subsidence due to the withdrawal of subsurface fluids. Subsidence may be present but adverse impacts have not been recorded. Therefore, the potential for subsidence occurring at the site due to the withdrawal of oil, gas, or water is considered low.

3.4.7 Flooding

The Flood Insurance Rate Map prepared by the Federal Emergency Management Agency (FEMA) was reviewed to identify the potential flood hazard for the project. This map indicates the site is within Zone X which is defined as being an area with a 0.2-percent-annual-chance-flood and an area of 1-percent-annual-chance flood with average depths of less than 1 foot. Based on this information the potential for the project site to be impacted by regional flooding is considered low. However, the accuracy of this information should be confirmed by a qualified civil engineer/hydrologist. The need and/or method for mitigation of potential flooding should also be addressed.

3.4.8 Oil and Gas Fields

Upon review of the California Division of Oil, Gas & Geothermal Resources (2016) interactive well-finder map accessed at https://maps.conservation.ca.gov/doggr/wellfinder, the El Dorado Hills region does not contain any known abandoned oil wells. Additionally, no active wells are known to exist within the project boundary.

3.4.9 Naturally Occurring Asbestos

Naturally occurring asbestos (NOA) has been identified as a source of potentially hazardous airborne asbestos fibers when disturbed by mining or earthwork activities, if present (Clinkenbeard et al. 2002). NOA generally occurs within mafic or ultramafic metamorphic rock units in which one of the asbestiform minerals defined by the California Air Resources Board (CARB 2002) are present. These NOA minerals have unique flexibility and strength characteristics and include asbestiform varieties of the six minerals chrysotile, amosite, crocidolite, tremolite actinolite, and anthophyllite. It was not part of this project's scope to quantitatively evaluate NOA concentrations along the project alignment. However, review of existing NOA maps produced by the CGS (Churchill 2000 and Higgins 2006) and presented on

© 2019 Kleinfelder

Figure 4 provides general guidelines as to the likelihood of encountering NOA for both El Dorado and Sacramento counties.

In addition, based on numerous NOA studies Kleinfelder has performed in the project area, typical NOA concentration level ranges (measured as a percent volume using the polarized light microscopy identification method [PLM]) can be identified for the rock types / geologic units present along the project alignment. These typical values can be compared to the threshold limits established by CARB's Airborne Toxic Control Measures (ATCM) for Construction Grading, Quarrying, and Surface Mining Operation (CARB 2002) to identify whether mitigative measurements need to be implemented during excavation of the foundation towers and how the excavation spoils are to be handled relative to disposal and off-haul. Generally, the metavolcanic rock has concentration levels at or below the threshold level of 0.25 percent. Where NOA levels are at or above 0.25 percent, contractors are required to implement mitigation practices to protect workers and the public from airborne NOA particles generated during earthwork operations. NOA levels at or above 1 percent is considered a hazardous material and will require special handling during transportation and will need to be disposed of at an approved site. The Asbestos Review Areas map (Churchill, 2000) indicates the project site is in an area that has been removed as mappable NOA bearing unit based on geologic evaluation. Based on this data the potential for NOA to be encountered at levels at or exceeding regulatory threshold levels is considered low. However, testing by Costco could be performed to further define NOA concentrations across the project area in order to assist Costco with identifying their risk associated with this hazard. Should levels be equal to or exceed regulatory threshold levels mitigation procedures will need to be implemented. Mitigation alternatives will need to be consistent with guidelines outlined in the CARB's current ATCM and Occupational Safety and Health Administration (OSHA) standards for the handling of NOA.

© 2019 Kleinfelder

4 GEOTECHNICAL DESIGN RECOMMENDATIONS

4.1 GENERAL

Based on the results of our field exploration, laboratory testing and engineering analyses conducted during this study, it is our professional opinion the proposed project is geotechnically feasible, provided the design and construction recommendations presented in this report are incorporated into the project. We identified the following key geotechnical considerations during our study.

- The primary geotechnical consideration for site development is the excavatability of the rock and the construction of fills to achieve the finished grades. The seismic refraction survey results (Appendix C) indicate the initial weathered rock layer with compression wave velocities (Vp) ranging between 3,985 to 6,030 feet per second is located approximately 1 to 3 below existing grades and extends as deep as 30 feet below grade within the warehouse building cut. Based on Caterpillar's Handbook of Ripping (2000), rock exhibiting seismic velocities in this range are marginally rippable using a D9R dozer equipped with multi or single shank ripper(s). Underlying this layer is a less weathered rock zone with compression wave velocities ranging between 12,210 to 18,530 feet per second and is located as shallow as 5 to 10 feet below grade within eastern cut for the warehouse building and the fuel facility cut area on the northern portion of the site. Localized blasting will likely be needed to excavate less weathered rock. In addition, crushing and screening operations will likely be required to produce efficient rock fragmentation of the rock (both weathered and less weathered rock) for re-use onsite as structural fill.
- Based on the preliminary grading plan, the warehouse building footprint is situated on a bedrock cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. To provide uniform support for the proposed warehouse building and to reduce the adverse effects of abrupt differential settlement due the cut/fill transition and variability in fill thickness across the building pad, we recommend the bedrock should be undercut by at least 6 feet below the finished floor elevation and backfilled with structural fill. In addition, cut/fill transitions are situated below small areas of the parking structure's lower level. Beneath the parking structure, we recommend the bedrock should be undercut by at least 4 feet below the finished floor elevation and backfilled with structural fill.

© 2019 Kleinfelder

- The residual soil/colluvial layer should excavated to underlying weathered rock contact and stockpiled on site for reuse as structural fill. An estimate of the residual soil/colluvial layer thickness is shown on the cross sections (Figures 5 through 10).
- Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Other than plant roots, organic matter in the topsoil is minimal based on our laboratory testing (between one and three percent). The topsoil can be re-used on site in fills.
- Due to the composition of the bedrock, it will not reduce to a soil-like material when excavated and will not be suitable for re-use as structural fill. However, the bedrock material may be crushed, processed and re-used onsite as structural fill as described below. Rock fragments up to 12 inches in size may be used in structural fills 10 or more feet below finished subgrade elevation, but not within 10 feet of a slope face. Rock fragments greater than 6 inches in size should not be used in the upper 10 feet of site fills. Rock fragments greater than 3 inches in size should not be used in the upper 3 feet of fills below the Costco warehouse building. There may be an opportunity for larger sized rocks and boulders between 12 and 24 inches in size to be re-used at the base of slopes or in landscape areas. A rock that cannot be crushed or screened to above size criteria should be removed off site.
- Rocks up to 12 inches in size may be placed in the deeper portions of structural fills as noted above provided they are thoroughly mixed with soils to avoid excessive concentrations of rock fragments. Over-sized materials (between 6 and 12 inches) should be placed in windrows or otherwise be placed under the observation of the geotechnical engineer's representative in a manner to avoid nesting or voids. Fills should be placed in lifts slightly thicker than the largest particle size and proof-rolled with a D-9 or larger Caterpillar dozer making at least 5 complete passes over each lift. Periodic test pits should be excavated into each compacted lift to confirm the rock fill is being placed in a uniform, dense manner with no nesting or voids.
- After stripping the site and prior to filling in the seasonal creek, which runs from east to west through the site, subdrains should be installed within the creek bottom. This creek was observed to be flowing rapidly during our initial investigation of the adjacent site in April 2019.

© 2019 Kleinfelder

- Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Therefore, perched groundwater will likely be present at or near subgrade level across the entire site during and after rainfall events.
- Although preliminary grading plans show that this site will be balanced, it is anticipated that crushing and processing the harder rock layers will prove challenging and may require soil to be imported onsite. Import materials, if required, should have a Plasticity Index of less than 10 with no less than 70 percent passing the No. 4 sieve, no more than 30 percent of the particles passing the No. 200 sieve, and no particles greater than 3 inches in maximum dimension. The maximum Plasticity Index for imported soils may be modified upon approval by Costco depending on its proposed use. The contractor should provide documentation to Costco that imported fill is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals prior to its transportation and use on site.
- Permanent slopes should be constructed at an inclination of 2:1 (horizontal to vertical) or flatter.
- Retaining wall types have not been determined at this time; however, we understand rockeries are being considered. Kleinfelder has provided recommendations for cantilever retaining walls. Rockeries are designed and constructed by a design-build specialty contractor.
- The proposed Costco warehouse building, fuel facility canopy, and parking structure foundations may be supported on a conventional shallow foundation system. Proposed light poles located in the parking lot may be supported on short drilled pile foundations.
- The residual soil/colluvium is anticipated to be used near the finished subgrade levels around the site. Because this material drains poorly, we recommend radial finger drains below new pavement sections. Additionally, planters should be detailed such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement.
- The minimum resistivity of the sample indicates that the soil may be moderately corrosive to corrosive to ferrous metals. The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0 exposure to sulfate attack on concrete in contact with the soil based on ACI 318-14 Table 19.3.1.1 (ACI, 2014). Therefore, in accordance with ACI Building Code 318-14, no special provisions for selection of cement type are required.
- Based on visual soil classification and laboratory testing of the soil samples collected during our field exploration, the upper approximately 1 to 5 feet of the subsurface soils consist

© 2019 Kleinfelder

predominantly lean sandy clays underlain with highly fractured highly weathered metavolcanic rock. Based on the soil classification, and gradation tests, water infiltration is expected to be very low. We recommend alternatives to infiltration BMPs, such as bio-filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the Costco site.

The following opinions, conclusions, and recommendations are based on the properties of the materials encountered in the borings and test pits, the results of the laboratory-testing program, and our engineering analyses performed, and should be incorporated into project design and construction.

4.2 2019 CALIFORNIA BUILDING CODE

We have also provided the seismic design parameters for ASCE 7-16, as the project will be designed after adoption of the 2019 California Building Code (CBC) on January 1, 2020. Based on the current grading plan and understanding of the regional geology and on our interpretation of the CBC criteria, we classify the site as Seismic Site Class C. Approximate coordinates for the site are noted below.

- Latitude: 38.66020 °N
- Longitude: 121.05699 °W

In accordance with Section 11.4.8 of ASCE 7-16, a site-specific ground motion analysis may be required for Site Class D sites with an S1 greater than 0.2g. However, a site-specific ground motion analysis is not required if the seismic response coefficient (Cs) is determined in accordance with requirements of Chapter 12 and the exceptions noted in Section 11.4.8. The assumption that Cs will be determined in accordance with the requirements of Chapter 12 and the exceptions noted in Section 11.4.8 should be verified by the project structural engineer during final design. The 2019 CBC (non site-specific) for these structures are summarized in Table 1.

© 2019 Kleinfelder

TABLE 1
2019 CBC SEISMIC DESIGN PARAMETERS

Design Parameter	Recommended Value
Site Class	C
S_s (g)	0.404
S_1 (g)	0.207
F_a	1.300
F_v	1.500
S_{MS} (g)	0.525
S_{M1} (g)	0.311
S_{DS} (g)	0.350
S_{D1} (g)	0.207
PGA_M (g)	0.211

4.3 FOUNDATIONS

4.3.1 General

Based on the results of our field exploration, laboratory testing, and geotechnical analyses, the proposed warehouse building and parking structure may be supported on conventional shallow spread footing foundations founded on subgrade prepared in accordance with Section 5.2.2. We understand that new spread footing foundations for the fuel facility canopy will be embedded approximately 6 to 7 feet below the finished grade. Spread footings may be founded entirely on bedrock or on structural fill.

Proposed light poles in the parking lot may be supported on short drilled pile foundations. Recommendations for the design and construction of shallow foundations and drilled pile foundations are presented below.

4.3.2 Shallow Foundations

Allowable Soil Bearing Pressure

Footings may be designed for a net allowable soil bearing pressure of 3,000 pounds per square foot (psf) for dead plus sustained live loads. Footings should be embedded at least 24 inches below the lowest adjacent exterior grade. The footing dimension and reinforcement should be designed by the structural engineer; however, continuous and isolated spread footings

© 2019 Kleinfelder

should have minimum widths of 18 and 24 inches, respectively. A one-third increase in the above bearing pressures can be used for transient wind or seismic loads.

Estimated Settlements

We estimate total static settlement for foundations designed and constructed in accordance with the recommendations presented above to be less than 1 inch. Differential static settlement between similarly loaded footings is estimated to be less than ½ inches over 50 feet.

Lateral Resistance

Lateral load resistance may be derived from passive resistance along the vertical sides of the footings, friction acting at the base of the footing, or a combination of the two. An allowable passive resistance of 300 psf per foot of depth may be used for design. Allowable passive resistance values should not exceed 3,000 psf. An allowable coefficient of friction of 0.4 between the base of the footings and the structural fill soils can be used for sliding resistance using the dead load normal stresses. Friction and passive resistance may be combined without reduction. We recommend that the first foot of soil cover be neglected in the passive resistance calculations if the ground surface is not protected from erosion or disturbance by a slab, pavement or in a similar manner. Where passive soil resistance is used for design of retaining walls, the area within 5 feet of the front of the wall footing should not be disturbed by excavation or other means.

4.3.3 Drilled Pile Foundations (Light Pole Foundations)

Axial Capacity

The compressive axial capacity of drilled piles may be estimated based on an allowable skin friction capacity of 200 pounds per square foot. The upper one foot of the skin friction capacity should be ignored. The uplift capacity may be estimated as 70 percent of the allowable compressive axial capacity. A one-third increase in the allowable capacities may be used for transient loading conditions such as wind or seismic loads.

Settlement

Settlement of the proposed canopy supported on drilled piles, as recommended, is estimated to be less than ½ inch.

© 2019 Kleinfelder

Lateral Resistance

The drilled pile foundations lateral resistance can be designed in general accordance with Section 1807.3 of the 2016 CBC. We recommend a lateral soil bearing pressure of 300 psf per foot of depth below grade. The lateral soil bearing pressure should not exceed 3,000 psf. Since drilled piles will act as isolated pole foundations, the allowable lateral soil bearing pressure may be increased by a factor of two for short-term lateral loads provided the structure will not be adversely affected by ½ inch of lateral movement at the ground surface.

4.4 BUILDING SLAB-ON-GRADE

Concrete slab-on-grade floors are appropriate for the proposed warehouse, provided subgrade is prepared in accordance with Section 5.2.2. In accordance with the CWDRs, we recommend the slab be a minimum nominal thickness of 6 inches and underlain by at least 6 inches of aggregate base material. Aggregate base materials should meet current Caltrans specifications for Class 2 aggregate base. Please note that Caltrans Class 2 aggregate base may utilize recycled materials. Costco typically does not allow the use of recycled materials within the building pad.

A modulus of subgrade reaction of 150 pounds per cubic inch may be used for design of slabs underlain 6 inches of aggregate base material. Pursuant to current Costco Wholesale standard construction design practices, we have evaluated whether steel reinforcement is needed in the floor slab. Based on the geotechnical characteristics of the site, the proposed warehouse can be built with a non-reinforced slab.

Floor slab control joints should be used to reduce damage due to shrinkage cracking. Control joint spacing is a function of slab thickness, aggregate size, slump and curing conditions. The requirements for concrete slab thickness, joint spacing, and reinforcement should be established by the designer, based on experience, recognized design guidelines and the intended slab use. Placement and curing conditions will have a strong impact on the final concrete slab integrity.

Kleinfelder typically recommends installation of a vapor barrier beneath the slab to mitigate potential moisture issues such as flooring performance and mold. However, we understand that Costco Wholesale has determined that moisture barriers are not to be used in construction of Costco Wholesale warehouses due to adverse effects on concrete curing and performance. Therefore, we have provided construction recommendations that do not include installation of a

© 2019 Kleinfelder

moisture barrier, with the understanding that there will be an increased risk for adverse moisture issues.

4.5 EXTERIOR FLATWORK

Exterior concrete slabs for pedestrian traffic or landscape outside of the building pad limits should be at least four inches thick. Weakened plane joints in sidewalks should be located at intervals of about 6 feet. Careful control of the water/cement ratio should be performed to avoid shrinkage cracking due to excess water or poor concrete finishing or curing. Unreinforced slabs should not be built in areas where further saturation may occur following construction. The subgrade should be prepared in accordance with Section 5.2.2.

4.6 SITE DRAINAGE

Foundation and slab performance depends greatly on proper irrigation and how well runoff water drains from the site. This drainage should be maintained both during construction and over the entire life of the project. The ground surface around structures should be graded such that water drains away from structures without ponding. The surface gradient needed to do this depends on the landscaping type. Surface gradients should conform to current Costco Wholesale standards and the 2019 CBC.

After the initial excavation of the residual/colluvial soils onsite. It is recommended that a perforated subdrain be installed within the creek bottom running from east to west through the project site. The drain may be “burrito wrapped” with filter fabric and surrounded by permeable drain rock prior to rock backfill operations onsite. Slope drains should also be installed within the fill slopes as discussed in Section 4.8. Figures 11 and 12 show typical details for slope and canyon drains.

The residual soil/colluvium is anticipated to be used near the finished subgrade levels around the site. Because this material drains poorly, we recommend radial finger drains below new pavement sections as shown in Detail 16_16 of the CWDRs. Drains should be designed and constructed per Costco’s standard details and laterals should extend at least 15 feet from the catch basins. Planters should be detailed such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement. We recommend that perimeter foundation drains be implemented in accordance with Costco’s development requirements in areas adjacent to landscaping planters.

© 2019 Kleinfelder

Where slabs or pavement areas abut landscaped areas, the aggregate base and subgrade soil should be protected against saturation. Vertical cut off structures are recommended to reduce lateral seepage under slabs from adjacent landscaped areas. Vertical cut-off structures may consist of deepened concrete perimeters, or equivalent, extending at least three inches below the base/subgrade interface. Vertical cut-off structures should be poured neat against undisturbed native soil or compacted fill. The cut-off structures should be continuous.

Operations personnel should be instructed to limit irrigation to the minimum level necessary to properly sustain landscaping plants. Should excessive irrigation, waterline breaks or unusually high rainfall occur, saturated zones and “perched” groundwater may develop, which could soften subgrade and reduce pavement life, and could also create potholes. We also recommend that the downspouts from roof drains be connected to a designed subsurface drainage system such as a storm sewer, etc. to avoid discharging water onto pavement areas as well as backfill zones around the warehouse.

Potential sources of water such as water pipes, drains, and the like should be frequently examined for signs of leakage or damage. Any such leakage or damage should be promptly repaired. Sewer lines beneath the warehouse should have a sufficient slope (at least 1 percent). Plumbing and utility lines should be provided with flexible joints or oversized sleeves where they penetrate floor slabs to prevent breakage caused by different slab movement.

4.7 RETAINING STRUCTURES

Retaining wall types have not been determined at this time; however, we understand rockeries are being considered. Recommendations for cantilever retaining walls are provided below. Rockeries are designed and constructed by a design-build specialty contractor.

Design earth pressures for retaining structures depend primarily on the allowable wall movement, wall inclination, type of backfill materials, backfill slopes, surcharges, and drainage. Earth pressures provided assume that granular (sandy) soils will used as backfill. The on-site residual soil/colluvium should not be used as retaining wall backfill. The granular backfill, which should meet the requirements for imported fill as defined in Section 5.2.6, should extend behind walls a horizontal distance of at least one-half the height of the wall. Determination of whether the active or at-rest condition is appropriate for design will depend on the flexibility of the walls. Walls that are free to rotate at least 0.002 radians (deflection at the top of the wall of at least 0.002 x H,

© 2019 Kleinfelder

where H is the unbalanced wall height) may be designed for the active condition. Walls that are not capable of this movement should be assumed rigid and designed for the at-rest condition. Walls that are not capable of this movement should be assumed rigid and designed for the at-rest condition. The recommended active and at-rest earth pressures and passive resistance values are provided in Table 2.

TABLE 2
LATERAL EARTH PRESSURES FOR RETAINING STRUCTURES
(GRANULAR BACKFILL)

Wall Movement	Backfill Condition	Equivalent Fluid Pressure (pcf)	Seismic Increment (pcf)
Free to Deflect (active condition)	Level	40	5H*
Restrained (at-rest condition)		60	N/A**

*Note: * Walls supporting more than 6 feet of backfill should be designed to support an incremental seismic lateral pressure, which is applied as a triangular pressure distribution with a maximum pressure at the bottom of the wall, not inverted, and H is the height of the wall.*

*** for restrained wall, use the static active earth pressure and seismic increment to check the seismic condition; use at-rest earth pressure only to check the static condition; the larger loading of both cases should be used for the design of restrained wall.*

The above lateral earth pressures do not include the effects of surcharges (e.g., traffic, footings), compaction, or truck-induced wall pressures. Any surcharge (live, including traffic, or dead load) located within a 1:1 (horizontal to vertical) plane drawn upward from the base of the excavation should be added to the lateral earth pressures. The lateral contribution of a uniform surcharge load located immediately behind walls may be calculated by multiplying the surcharge by 0.33 for cantilevered walls under active conditions and 0.50 for restrained walls under at-rest conditions. Walls immediately adjacent to areas subject to vehicular traffic should be designed for a 2-foot equivalent soil surcharge (250 psf). Lateral load contributions from other surcharges located behind walls may be provided once the load configurations and layouts are known.

Walls should be properly drained or designed to resist hydrostatic pressures. Adequate drainage is essential to provide a free-drained backfill condition so that there is no hydrostatic buildup behind the wall. Walls should also be appropriately waterproofed to reduce the potential for staining. Drainage behind loading dock walls can consist of weep holes placed along the base of the wall. Weep holes should be spaced 10 to 15 feet apart and connected with a gravel drain consisting of approximately 2 cubic feet of clean gravel per foot of wall length wrapped with filter fabric. Other types of retaining walls should have a continuous back drain as described below.

© 2019 Kleinfelder

For backfill of walls with a continuous back drain, except for the upper 2 feet, the backfill immediately behind retaining walls (minimum horizontal distance of 2 feet measured perpendicular to the wall) should consist of free-draining ¾-inch crushed rock wrapped with filter fabric. The upper 2 feet of cover backfill should consist of relatively impervious material. A 4-inch-diameter perforated PVC pipe, placed perforations down at the bottom of the rock layer leading to a suitable gravity outlet, should be installed at the base of the walls.

As an alternative to the gravel drain noted above, a manufactured drain panel may be utilized behind retaining walls in addition to normal waterproofing. This system generally consists of a prefabricated drain panel lined with filter fabric. At the wall base, we recommend that a gravel drain be installed to collect and discharge drainage to a suitable outlet. The drain should consist of a 4-inch-diameter perforated PVC pipe, placed perforations down at the bottom of approximately 2 cubic feet of clean gravel per foot of wall length. The gravel drain should be wrapped in filter fabric (Mirafi 140N or equivalent). The pipe should be sloped to drain to a suitable outlet and cleanouts should be provided at appropriate intervals.

If drainage behind the wall is omitted, the wall should be designed for full hydrostatic pressure. The design of any drain system should be submitted to Kleinfelder for review to check that our recommendations have been properly incorporated into the design. Installation of the drainage system should be reviewed and documented by a Kleinfelder representative.

4.8 PERMANENT SLOPES

Preliminary grading plans from the civil engineer have been provided show cut and fill slopes between 2:1 and 6:1 (horizontal to vertical) around the project site. Permanent slopes should be constructed at an inclination of 2:1 or flatter. Slopes will be subject to erosion and should be planted as soon as practicable.

For areas above slopes, positive drainage should be established away from the top of slopes. This may be accomplished utilizing a brow ditch placed at the top of cut slopes to redirect surface runoff away from the slope face where drainage devices are not otherwise available. Site runoff should not be permitted to flow over the tops of slopes. Slope drains should also be installed within the fill slopes. Figures 11 and 12 show typical details for slope and canyon drains.

© 2019 Kleinfelder

4.9 PAVEMENT SECTIONS

The required pavement structural sections will depend on the expected wheel loads, volume of traffic, and subgrade soils. We have provided asphalt concrete pavement sections for traffic indices provided in the CWDRs (Costco, 2018). Positive drainage of the paved areas should be provided since moisture infiltration into the subgrade may decrease the life of pavements. Curbing located adjacent to paved areas should be founded in the subgrade, not the aggregate base, in order to provide a cutoff, which reduces water infiltration into the base course.

The following pavement sections provided above are based on the soil conditions encountered during our field exploration, our assumptions regarding final site grades, and limited laboratory testing.

4.9.1 Costco Pavement Design Parameters

We developed pavement design recommendations using traffic loading parameters provided in the Costco Wholesale Development Requirements and the following test data:

- A 20-year pavement design life;
- Light-duty pavements subject to 6,600 passenger vehicle trips per day (Traffic Index of 5.0);
- Heavy-duty pavements subject to 30 tractor-trailer truck tips per day (Traffic Index of 7.0);
- For asphalt concrete pavements, a design R-value of 50; and
- For Portland cement concrete (PCC) Pavements, a 28-day flexural strength (modulus of rupture determined by the third-point method) of at least 550 pounds per square inch (psi) (approximate compressive strength of 4,000 psi); a modulus of subgrade reaction (k value) of 200 pounds per cubic inch (pci) for native subgrade; and interlock at the control joints.

4.9.2 Asphalt Concrete Pavement

We designed asphalt concrete pavement, also referred to as Hot Mix Asphalt (HMA), in accordance with the Caltrans Highway Design Manual. Prior to placement of aggregate base, pavement subgrade should be prepared in accordance with Section 5.2.2.

© 2019 Kleinfelder

TABLE 3
RECOMMENDED MINIMUM ASPHALT CONCRETE PAVEMENT SECTIONS

TRAFFIC USE	TRAFFIC INDEX, TI	DESIGN METHOD	ASPHALT CONCRETE * (INCHES)	AGGREGATE BASE (INCHES)
Light-Duty Pavement	5.0	CALTRANS	3.0	4.0
Heavy-Duty Pavement	7.0	CALTRANS	4.0	5.0

* Rounded to the closest ½ inch.

4.9.3 Asphalt Performance Grade Binder

An asphalt performance grade (PG) binder of 64-10 should be used for the project and is locally available. This recommendation was developed in accordance with Costco Wholesale Asphalt Paving Specification Section 321216. Air temperature data nearest the project site was used with the MERRA Climate Data option and the PG binder was selected using the FHWA program LTTPBind Online web-based tool based on the AASHTO M323-13 standard. The high-end and low-end temperature rating was selected to provide a reliability of at least 98 and 90 percent, respectively.

4.9.4 Portland Cement Concrete Pavement

We designed PCC pavement in accordance with the Portland Cement Association (PCA) Thickness Design for Concrete Pavements (PCA, 1984) using the design parameters stated above. For heavy-duty pavements, we recommend that PCC pavement section should be comprised of 7.0 inches of PCC with 4.0 inches of aggregate base. We understand that Costco is considering paving the American Disability Act (ADA) access area in front of the main entry with PCC pavement. For ADA access area, we recommend that PCC pavement section should be comprised of 6.0 inches of PCC over 6.0 inches of aggregate base.

Longitudinal and transverse joint spacing should not exceed 12 feet and 15 feet, respectively. Joint details should conform to PCA guidelines. Expansion joints in concrete slabs should be sealed with petroleum resistant sealant to prevent minor releases from impacting subsurface soil.

© 2019 Kleinfelder

4.9.5 Aggregate Base

Aggregate base materials should meet current Caltrans specifications for Class 2 aggregate base and be compacted to at least 95 percent relative compaction (ASTM D1557). Caltrans Class 2 aggregate base utilizes recycled materials and require Costco's approval prior to use.

4.9.6 Pavement Maintenance

Pavements may undergo movement due to changes in subgrade moisture content. This movement tends to accelerate pavement deterioration. A crack sealing program should be performed annually to slow pavement deterioration. Any areas where surface water stands on the surface should be remediated. Over time as cracking becomes more pronounced, a slurry seal coat should be applied.

4.10 SOIL CORROSIVITY

We performed laboratory testing for parameters commonly used to evaluate corrosivity of soils, including pH, minimum resistivity, chloride and soluble sulfate content. Table 4 presents the results.

TABLE 4
CORROSION TEST RESULTS

Location	Depth (ft)	Minimum Resistivity (ohm-cm)	pH	Soluble Sulfate Content (ppm)	Soluble Chloride Content (ppm)
TP-1	0-2	3,848	5.2	36	35
TP-10	0-2	5,324	6.1	38	39
TP-14	0-2	6,453	6.0	34	34
TP-21	0-1.5	5,012	5.7	41	55

These tests are a generalized indicator of soil corrosivity for the sample tested. Other soils on site may be more, less, or similarly corrosive in nature. Imported fill materials should be tested to confirm that their corrosion potential is not more severe than those noted.

Although Kleinfelder does not practice corrosion engineering, resistivity values between 3,000 and 5,000 ohm-cm are considered corrosive to buried ferrous metals (NACE, 2006). The concentrations of soluble sulfates indicate that the subsurface soils represent a Class S0

© 2019 Kleinfelder

exposure to sulfate attack on concrete in contact with the soil based on ACI 318-14 Table 19.3.1.1 (ACI, 2014). Therefore, in accordance with ACI Building Code 318-14, no special provisions for selection of cement type are required.

Concrete and the reinforcing steel within it are at risk of corrosion when exposed to water-soluble chloride in the soil or groundwater. The project structural engineer should review this data to determine if remedial measures are necessary for the concrete reinforcing steel.

4.11 STORMWATER MANAGEMENT

We have assessed the potential for storm water infiltration into the subgrade soils at the subject project site. Our assessment is based on the data collected during our field exploration (borings and test pits) and laboratory testing.

Based on visual soil classification and laboratory testing of the soil samples collected during our field exploration, the upper approximately 1 to 5 feet of the subsurface soils consist predominantly lean sandy clays underlain with highly fractured highly weathered metavolcanic rock. Based on the soil classification, and gradation tests, water infiltration is expected to be very low.

We recommend alternatives to infiltration BMPs, such as bio-filtration/bio-retention systems (bio-swales and planter boxes), be implemented at the Costco site. If bio-filtration/bio-retention systems are employed, we recommend that the BMPs be built such that water exiting from them will not seep into the foundation areas or beneath slabs and pavement. If planters are located within 10 feet of the building or building foundations, or adjacent to slabs and pavements, then some means of diverting water away from the building, building foundation soils, or soils that support slabs and pavements would be required, such as lining the planters.

© 2019 Kleinfelder

5 CONSTRUCTION RECOMMENDATIONS

5.1 GENERAL

The following recommendations should be used by the contractor for construction of the project attention to excavatability and perched groundwater should be noted.

5.2 EARTHWORK

5.2.1 General

Site preparation and earthwork operations should be performed in accordance with applicable codes, safety regulations and other local, state or federal specifications, and the recommendations included in this report. References to maximum dry unit weights are established in accordance with the latest version of ASTM Test Method D1557 (modified Proctor). The earthwork operations should be observed and tested by a representative of Kleinfelder.

5.2.2 Site Preparation

Abandoned utilities and other existing features within the proposed development areas (if any are encountered) should be removed and the excavation(s) backfilled with structural fill. Debris produced by demolition operations, including wood, steel, piping, plastics, etc., should be separated and disposed of off-site. Existing utility pipelines or conduits that extend beyond the limits of the proposed construction and are to be abandoned in place, should be plugged with non-shrinking cement grout to prevent migration of soil and/or water. Demolition, disposal and grading operations should be observed and tested by a representative of Kleinfelder.

Prior to grading and subgrade preparation, all vegetation should be cut and removed from the site. Roots and vegetative matter in excess of one inch should be removed by screening or raking soils to a minimum depth of 12 inches. Other than plant roots, organic matter in the topsoil is minimal based on our laboratory testing (between one and three percent). The topsoil can be re-used in site fills. The residual soil/colluvial layer should excavated to underlying weathered rock contact and stockpiled on site for reuse as structural fill. An estimate of the residual soil/colluvial layer thickness is shown on the attached cross sections (Figures 5 through 10.

Based on the preliminary grading plan, the warehouse building footprint is situated on a bedrock cut/fill transitional area with cuts up to approximately 20 feet in the eastern side of the building and fills up to approximately 10 to 15 feet along the western side of the building. To provide

© 2019 Kleinfelder

uniform support for the proposed warehouse building and to reduce the adverse effects of abrupt differential settlement due the cut/fill transition and variability in fill thickness across the building pad, we recommend the bedrock should be undercut by at least 6 feet below the finished floor elevation and backfilled with structural fill. In addition, cut/fill transitions are situated below small area of the parking structure's lower level. Beneath the parking structure, we recommend the bedrock should be undercut by at least 4 feet below the finished floor elevation and backfilled with structural fill.

5.2.3 Permanent Slopes

Permanent slopes should be constructed at 2:1 (horizontal to vertical) or flatter. Slopes will be subject to erosion and should be planted as soon as practicable. Where new fill slopes are to be constructed on hillsides or existing slopes, the topsoil, colluvial soils, and other materials considered unsuitable should be removed. Where the exposed slope is steeper than 5:1, or where recommended by personnel by our firm, the original ground on which fill is to be placed should be keyed and benched. The benches should extend in the underlying bedrock. Key should be at least 8 feet wide and sloped a minimum of 2% towards the slope. Benches should be at least 4 feet wide and not exceed 4 feet in height. Fill slopes should be overbuilt by 2 feet then cut back to facilitate compaction at the face. Fill and cut slopes should be observed by our firm during grading to evaluate the anticipated geologic conditions and make any necessary modifications. Slope drains should also be installed within the fill slopes to prevent building up hydrostatic pressures behind slopes, especially in areas of observed seepage. Figures 11 and 12 show typical details for slope and canyon drains.

5.2.4 Temporary Excavations

All excavations must comply with applicable local, state, and federal safety regulations, including OSHA requirements. The responsibility for excavation safety and stability of temporary construction slopes lies solely with the contractor. We are providing this information below solely as a service to our client. Under no circumstances should this information provided be interpreted to mean that Kleinfelder is assuming responsibility for final engineering of excavations or shoring, construction site safety, or the contractors' activities; such responsibility is not being implied and should not be inferred.

Minor sloughing and/or raveling of slopes should be anticipated as they dry out. Where space for sloped embankments is not available, shoring will be necessary. In addition, excavations within a

© 2019 Kleinfelder

1:1 plane extending downward from a horizontal distance of 2 feet beyond the bottom outer edge of existing improvements should not be attempted without bracing and/or underpinning the footings, as discussed above. The geotechnical engineer or their field representative should observe the excavations so that modifications can be made to the excavations, as necessary, based on variations in the encountered soil conditions. All applicable excavation safety requirements and regulations, including OSHA requirements, should be met.

All trench excavations should be braced and shored in accordance with good construction practice and all applicable safety ordinances and codes. Stockpiled (excavated) materials should be placed no closer to the edge of an excavation than a distance equal to the depth of the excavation, but no closer than 4 feet.

5.2.5 Excavation Characteristics

The seismic refraction survey results indicate the initial weathered rock layer with compression wave velocities (Vp) ranging between 3,985 to 6,030 feet per second is located approximately 1 to 3 below existing grades and extends as deep as 30 feet below grade within the warehouse building cut. Based on Caterpillar's Handbook of Ripping (2000), rock exhibiting seismic velocities in this range are marginally rippable using a D9R dozer equipped with multi or single shank ripper(s). Underlying this layer is a less weathered rock zone with compression wave velocities ranging between 12,210 to 18,530 feet per second and is located as shallow as 5 to 10 feet below grade within eastern cut for the warehouse building and the fuel facility cut area on the northern portion of the site. Localized blasting will likely be needed to excavate less weathered rock. In addition, crushing and screening operations will likely be required to produce efficient rock fragmentation of the rock (both weathered and less weathered rock) for re-use onsite as structural fill. The results of the seismic refraction survey are presented in Appendix C of this report.

5.2.6 Foundation Excavations

Shallow Foundations

Following excavation to the foundation subgrade elevations, the exposed subgrade should be observed by a representative of the geotechnical engineer to evaluate the presence of satisfactory materials at design elevations. If unsatisfactory material, such as soft or disturbed soil, debris or otherwise unsuitable soil is present at the base of footing excavations, it should be overexcavated

© 2019 Kleinfelder

and replaced with structural concrete, 2-sack sand-cement slurry, or structural fill to the depth determined by the geotechnical engineer.

We understand that new spread footing foundations for the fuel facility canopy will be embedded approximately 6 to 7 feet below the finished grade. If a bedrock cut/fill transition is encountered at the footing bottom for the canopy, the bedrock should be undercut by at least 3 feet and backfilled with structural fill to provide uniform support. It should be noted that fuel facility canopy spread foundation excavation may encounter the harder, less weathered bedrock layer and may require blasting to achieve proper foundation depth.

Drilled Pile Foundations

The performance and capacities of piles can be influenced significantly by the selected construction methods and procedures used. Construction methods that create large zones of disturbance around the drilled shafts can lead to lower than expected skin friction due to excessive stress relief around the shaft length. At grade parking lots are planned north of the warehouse footprint. Per Kleinfelder's seismic refraction survey, these drilled piers will encounter the weathered bedrock layer during drilling. Drilling should be completed with heavy-duty equipment with rock coring capabilities.

Concrete should be placed immediately after drilling of the hole is complete. The concrete should be pumped to the bottom of the drilled shaft using a down-hole tremie. If the tremie method is used to place concrete below the polymer slurry level, we recommend it have a slump of at least 8 inches. If steel casing is used, the casing should be removed as the concrete is placed but the bottom of the casing should be kept at least 5 feet below the top of the concrete.

5.2.7 Fill Material and Compaction Criteria

The on-site soils, minus debris, organic matter, or other deleterious materials may be used as structural fill. Due to the composition of the bedrock, it will not reduce to a soil-like material when excavated. The bedrock material may be crushed, processed and re-used onsite as structural fill. Rock fragments up to 12 inches in size may be used in structural fills 10 or more feet below finished subgrade elevation, but not within 10 feet of a slope face. Rock fragments greater than 6 inches in size should not be used in the upper 10 feet of site fills. Rock fragments greater than 3 inches in size should not be used in the upper 3 feet of fills below the Costco warehouse building. There may be an opportunity for larger sized rocks and boulders between 12 and 24 inches in

© 2019 Kleinfelder

size to be re-used at the base of slopes or in landscape areas. A rock that cannot be crushed or screened to above size criteria should be removed off site.

Rocks up to 12 inches in size may be placed in the deeper portions of structural fills as noted above provided they are thoroughly mixed with soils to avoid excessive concentrations of rock fragments. Over-sized materials (between 6 and 12 inches) should be placed in windrows or otherwise be placed under the observation of the geotechnical engineer's representative in a manner to avoid nesting or voids. Fills should be placed in lifts slightly thicker than the largest particle size and proof-rolled with a D-9 or larger Caterpillar dozer making at least 5 complete passes over each lift. Periodic test pits should be excavated into each compacted lift to confirm the rock fill is being placed in a uniform, dense manner with no nesting or voids.

Compaction of rocky fill should be performed by at least 8 to 10 passes of either a self-propelled, vibratory roller applying at least 20 tons force (dynamic) or a sheepsfoot roller weighing at least 30 tons (static) where at least 90 percent relative compaction is specified. Verification of consolidated material by pot holing during fill/backfill activities should be performed for each lift of compacted rocky fill to confirm a dense fill with no void is being achieved. Additional fill lifts should not be placed if the previous fill lift did not meet the minimum required relative compaction or if fill conditions are not stable. Disking, cross ripping, and/or blending may be required to uniformly moisture-condition soils used for engineered fill.

Although preliminary grading plans show that this site will be balanced, it is anticipated that crushing and processing the harder rock layers will prove challenging and may require soil to be imported onsite. Import materials, if required, should have a Plasticity Index of less than 10 with no less than 70 percent passing the No. 4 sieve, no more than 30 percent of the particles passing the No. 200 sieve, and no particles greater than 3 inches in maximum dimension. The maximum Plasticity Index for imported soils may be modified upon approval by Costco depending on its proposed use. The contractor should provide documentation to Costco that imported fill is free of hazardous materials, including petroleum or petroleum byproducts, chemicals and harmful minerals prior to its transportation and use on site

We recommend soils compacted to at least 95 percent of the maximum dry unit weight (ASTM D1557) in accordance with the CWDRs. Fill should be placed in loose horizontal lifts not more than 8 inches thick (loose measurement). The moisture content of the fill should be maintained at

© 2019 Kleinfelder

around optimum for sandy soils and at least above optimum for clayey soils during compaction. Table 5 presents structural fill placement and compaction criteria.

© 2019 Kleinfelder

TABLE 5
STRUCTURAL FILL PLACEMENT AND COMPACTION CRITERIA

Fill Location/Use	Material Type	Relative Compaction[1] (ASTM D1557)	Moisture Content Range	Minimum Compaction Testing Frequency Per Lift
Aggregate base for pavements and concrete slabs	Aggregate Base	95 percent	-2 to +2% of optimum	10,000 Square Feet
Structural Areas (Warehouse Building Pad)	On-site Fill or Imported Material	95 percent	-2 to +2% of optimum for granular soil 0 to +2% of optimum for on-site clayey soils	10,000 Square Feet
Subgrade for Pavements, Sidewalks and Other Flatwork Areas	On-site Fill or Imported Material	95 percent	-2 to +2% of optimum for granular soil 0 to +2% of optimum for on-site clayey soils	15,000 Square Feet
Retaining Wall backfill	Granular Backfill	95 percent	-2 to +2% of optimum	1,000 Square Feet
Utility trenches backfill	On-site Rock Fill or Imported Material	95 percent	-2 to +2% of optimum for granular soil 0 to +2% of optimum for on-site clayey soils	150 Linear Feet
Lawns or Unimproved areas	Imported Material	At least 90 percent	-2 to +2% of optimum for granular soil 0 to +2% of optimum for on-site clayey soils	20,000 Square Feet

5.2.8 Groundwater Impacts

Rainfall will infiltrate near surface soils and collect on less permeable soil and rock at shallow depth. Perched groundwater above the bedrock was encountered in the test pits that were may be encountered during construction. This is most likely to occur following periods of rainfall and in the winter and spring months. If encountered, excavations which extend below the perched

© 2019 Kleinfelder

groundwater level (currently estimated to be at approximately 2 to 5 feet below existing site grade) will need to be dewatered. In our opinion, dewatering of narrow trench excavations, which penetrate less than a few feet below the groundwater level and do not encounter loose and/or cohesionless soils, may be possible by directing inflow to a sump where water can be removed by a pump. Temporary dewatering of wider, deeper, and/or more extensive excavations may require well points, deep wells, and/or deep sumps. To help maintain bottom stability of wider, deeper, and/or more extensive excavations, groundwater levels should be drawn-down a minimum of 2 feet below the lowest portion of the excavation. Since temporary dewatering will impact and be dependent on construction methods and scheduling, the contractor will be solely responsible for the design, installation, maintenance, and performance of all temporary dewatering systems.

Perched groundwater levels can fluctuate depending on rainfall, runoff conditions, or other factors. Therefore, water levels presented in this report may not be representative of those encountered at the time of construction. We recommend the contractor verify perched groundwater conditions and evaluate dewatering requirements prior to bidding and/or construction.

Depending on the depth of excavation below perched groundwater, soil conditions encountered along the excavation face, and slope inclination, caving or sloughing of excavation slopes is likely within the vicinity of a sump dewatering system. Sloughing or caving of excavation slopes could endanger personnel working within or adjacent to the excavation as well as nearby equipment, structures, or other existing improvements. The Contractor should be aware of the potential for caving and take appropriate precautions to ensure the safety of site personnel as well as the integrity of the excavation slopes and any existing, nearby structures or other improvements.

5.2.9 Trench Backfill

Pipe zone backfill (i.e. material beneath and in the immediate vicinity of the pipe) should consist of imported soil less than ¾-inch in maximum dimension. Trench zone backfill (i.e., material placed between the pipe zone backfill and finished subgrade) may consist of onsite soil or imported fill that meets the requirements for structural fill provided above.

If imported material is used for trench zone backfill, we recommend it consist of silty sand. In general, gravel should not be used for trench zone backfill due to the potential for soil migration

© 2019 Kleinfelder

into the relatively large void spaces present in this type of material and water seepage along trenches backfilled with coarse-grained sand and/or gravel.

Recommendations provided above for pipe zone backfill are minimum requirements only. More stringent material specifications may be required to fulfill local building requirements and/or bedding requirements for specific types of pipes. We recommend the project civil engineer develop these material specifications based on planned pipe types, bedding conditions, and other factors beyond the scope of this study.

Trench backfill should be placed and compacted in accordance with recommendations provided for structural fill in Section 5.2.7. Mechanical compaction is recommended; ponding or jetting should be avoided, especially in areas supporting structural loads or beneath concrete slabs supported on grade, pavements, or other improvements.

5.3 UNSTABLE SUBGRADE CONDITIONS

Pumping subgrade conditions may be encountered during site grading activities in the residual/colluvium soils, and the subgrade may need to be stabilized. Should grading be performed during or following extended periods of rainfall, the moisture content of the near-surface soils will also be significantly above the optimum moisture content. These conditions could seriously impede grading by causing an unstable subgrade condition. Typical remedial measures include the following:

- Drying: Drying unstable subgrade involves disking or ripping wet subgrade to a depth of approximately 18 to 24 inches and allowing the exposed soil to dry. Multiple passes of the equipment (likely on a daily basis) will be needed because as the surface of the soil dries, a crust forms that reduces further evaporation. Frequent disking will help prevent the formation of a crust and will promote drying. This process could take several days to several weeks depending on the material, the depth of ripping, the number of passes, and the weather.
- Removal and Replacement with Crushed Rock and Geotextile Fabric: Unstable subgrade could be overexcavated 12 to 24 inches below existing grade and replaced with ¾- or 1-inch crushed rock underlain by geotextile fabric. The geotextile fabric should consist of a woven geotextile, such as Mirafi HP series or equivalent. The final depth of removal will depend upon the conditions observed in the field once overexcavation begins. The

© 2019 Kleinfelder

geotextile fabric should be placed in accordance with the manufacturer's recommendations.

- Chemical Treatment: Unstable subgrade could be stabilized by mixing the upper 12 to 18 inches of the subgrade with Portland cement, Class C fly ash or lime. For estimating purposes, an application rate of 10 to 12 percent Class C fly ash, 3 to 4 percent for high calcium quick lime, or 4 to 5 percent Portland cement may be used. Final application rates should be determined in the field at the time of construction in consultation with the geotechnical engineer. Chemical treatment should be performed by a specialty contractor experienced in this work and should be performed in accordance with Caltrans Standard Specifications. Since lime treatment uses the on-site soil, the expense of importing material can be avoided. Chemically treated areas will have a high pH level (pH over 10) that will need to be removed from landscape areas.

5.4 EXTERIOR FLATWORK

Prior to casting exterior flatwork, the subgrade soils should be moisture conditioned and recompacted or over-excavated, as recommended in Section 5.2.2. If encountered, the moisture content of the clayey subgrade soils should be maintained at least above optimum prior to the placement of any flatwork. In the event that these subgrade soils are allowed to dry out, the exposed subgrade should be re-moisture conditioned. Careful control of the water/cement ratio should be performed to avoid shrinkage cracking due to excess water or poor concrete finishing or curing.

5.5 PAVEMENTS

5.5.1 HMA Design

Hot Mix Asphalt (HMA) should conform to requirements of the Costco Wholesale Specification Section 321216, Asphalt Paving. Section 1.3.C of the HMA specification requires that the HMA section be placed in at least two lifts. The HMA specification allows the use of ½- or ¾-inch Nominal Maximum Aggregate Size (NMAS) mixes for the base course and ⅜- or ½-inch NMAS mixes for surface course. Maximum and minimum HMA compacted lift thicknesses are provided in Table 3.1 in Section 3.3.B of the HMA specification.

© 2019 Kleinfelder

5.5.2 Construction Considerations

The pavement sections provided above are contingent on the following recommendations being implemented during construction.

- Pavement subgrade should be prepared as recommended in Section 5.2.2.
- Subgrade soils should be in a stable, non-pumping condition at the time the aggregate base materials are placed and compacted.
- Aggregate base materials should be compacted to at least 95 percent relative compaction (ASTM D1557).
- Asphalt paving materials and placement methods should meet current Costco Wholesale Specifications Section 321216.
- Adequate drainage (both surface and subsurface) should be provided such that the subgrade soils and aggregate base materials are not allowed to become wet.

Note that pavement materials and construction must be completed in strict accordance with the Costco's specifications that contain very specific pavement material (asphalt, aggregate and concrete) criteria and construction practices to be used (compaction and material sampling). The general contractor and pavement construction subcontractor should be aware that asphalt and concrete mix designs must be submitted to the design architect and Kleinfelder at least 45 days prior to the scheduled production and laydown for review and approval.

© 2019 Kleinfelder

6 ADDITIONAL SERVICES

6.1 PLANS AND SPECIFICATIONS REVIEW

We recommend Kleinfelder perform a review of geotechnical related portions of the project plans and specifications before they are finalized to see that geotechnical recommendations have been properly interpreted and implemented during design. If we are not accorded the privilege of performing this review, we can assume no responsibility for misinterpretation of our recommendations.

6.2 CONSTRUCTION OBSERVATION AND TESTING

The construction process is an integral design component with respect to the geotechnical aspects of a project. Because geotechnical engineering is an inexact science due to the variability of natural processes, and because we sample only a limited portion of the soils affecting the performance of the proposed structure, unanticipated or changed conditions can be encountered during grading. Proper geotechnical observation and testing during construction are imperative to allow the geotechnical engineer the opportunity to verify assumptions made during the design process. Therefore, we recommend that Kleinfelder be retained during the construction of the proposed improvements to observe compliance with the design concepts and geotechnical recommendations, and to allow design changes in the event that subsurface conditions or methods of construction differ from those assumed while completing this study.

Our services are typically needed at the following stages of grading:

- After demolition and grubbing;
- During grading;
- After the overexcavation, but prior to subgrade preparation;
- During utility trench backfill;
- During base placement and site paving; and
- After excavation for foundations.

© 2019 Kleinfelder

7 LIMITATIONS

This geotechnical study has been prepared for the exclusive use of Costco Wholesale and their agents for specific application to the proposed Costco Wholesale warehouse and fuel facility located on Silva Valley Parkway in El Dorado Hills, California. The findings, conclusions and recommendations presented in this report were prepared in accordance with generally accepted geotechnical engineering practice. No other warranty, express or implied, is made.

The scope of services was limited to a background data review and the field exploration described in Section 1.2. It should be recognized that definition and evaluation of subsurface conditions are difficult. Judgments leading to conclusions and recommendations are generally made with incomplete knowledge of the subsurface conditions present due to the limitations of data from field studies. The conclusions of this assessment are based on our field exploration and laboratory testing programs, and engineering analyses.

Kleinfelder offers various levels of investigative and engineering services to suit the varying needs of different clients. Although risk can never be eliminated, more detailed and extensive studies yield more information, which may help understand and manage the level of risk. Since detailed study and analysis involves greater expense, our clients participate in determining levels of service, which provide information for their purposes at acceptable levels of risk. The client and key members of the design team should discuss the issues covered in this report with Kleinfelder, so that the issues are understood and applied in a manner consistent with the owner's budget, tolerance of risk and expectations for future performance and maintenance.

Recommendations contained in this report are based on our field observations and subsurface explorations, limited laboratory tests, and our present knowledge of the proposed construction. It is possible that soil or groundwater conditions could vary between or beyond the points explored. If soil or groundwater conditions are encountered during construction that differ from those described herein, the client is responsible for ensuring that Kleinfelder is notified immediately so that we may reevaluate the recommendations of this report. If the scope of the proposed construction, including the estimated Traffic Index or locations of the improvements, changes from that described in this report, the conclusions and recommendations contained in this report are not considered valid until the changes are reviewed, and the conclusions of this report are modified or approved in writing, by Kleinfelder.

© 2019 Kleinfelder

The scope of services for this subsurface exploration and geotechnical report did not include environmental assessments or evaluations regarding the presence or absence of wetlands or hazardous substances in the soil, surface water, or groundwater at this site.

Kleinfelder cannot be responsible for interpretation by others of this report or the conditions encountered in the field. Kleinfelder must be retained so that all geotechnical aspects of construction will be monitored on a full-time basis by a representative from Kleinfelder, including site preparation, preparation of foundations, and placement of structural fill and trench backfill. These services provide Kleinfelder the opportunity to observe the actual soil and groundwater conditions encountered during construction and to evaluate the applicability of the recommendations presented in this report to the site conditions. If Kleinfelder is not retained to provide these services, we will cease to be the engineer of record for this project and will assume no responsibility for any potential claim during or after construction on this project. If changed site conditions affect the recommendations presented herein, Kleinfelder must also be retained to perform a supplemental evaluation and to issue a revision to our original report.

This report, and any future addenda or reports regarding this site, may be made available to bidders to supply them with only the data contained in the report regarding subsurface conditions and laboratory test results at the point and time noted. Bidders may not rely on interpretations, opinion, recommendations, or conclusions contained in the report. Because of the limited nature of any subsurface study, the contractor may encounter conditions during construction which differ from those presented in this report. In such event, the contractor should promptly notify the owner so that Kleinfelder's geotechnical engineer can be contacted to confirm those conditions. We recommend the contractor describe the nature and extent of the differing conditions in writing and that the construction contract include provisions for dealing with differing conditions. Contingency funds should be reserved for potential problems during earthwork and foundation construction.

This report may be used only by the client and only for the purposes stated, within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land use, site conditions (both on site and off site) or other factors may change over time, and additional work may be required with the passage of time. Any party, other than the client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of this report and the nature of the new project, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the

© 2019 Kleinfelder

client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party and the client agrees to defend, indemnify, and hold harmless Kleinfelder from any claims or liability associated with such unauthorized use or non-compliance.

Appendix A

APPENDIX A
FIELD EXPLORATIONS

GENERAL

We explored subsurface conditions at the site by drilling 3 borings and excavating 26 test pits. The borings were drilled by Gulf Shore Drilling of Sacramento, California using track-mounted, hollow-stem auger drilling equipment with rock coring abilities to depths of between approximately 8½ to 25 feet below the existing ground surface (bgs). The proposed exploration plan also included a fourth rock coring location (KB-2) on the northeastern corner of the new warehouse location. This location was not drilled due to very hard drilling conditions throughout the course of the field exploration.

The test pits were excavated by Iron Works Excavation of Sacramento, California using a John Deere 50G track-mounted excavator to excavate to depths ranging from 2 to 10 feet bgs. The approximate locations of the borings and test pits are presented on Figure 2.

Prior to commencement of the fieldwork, Underground Service Alert (USA) was notified and various geophysical techniques were used at the boring locations to identify potential conflicts with subsurface structures.

The boring and test pit logs are presented as Figures A-4 through A-32. An explanation to the log is presented as Figures A-1 through A-3. The Boring/Test Pit Log describes the earth materials encountered, samples obtained and show field and laboratory tests performed. The log also shows the location, boring/test pit number, drilling/excavation date and the name of the drilling/excavation subcontractor. The borings and test pits were logged by a Kleinfelder engineer using the Unified Soil Classification System. The boundaries between soil types shown on the logs are approximate because the transition between different soil layers may be gradual. Bulk and drive samples of selected earth materials were obtained from the borings and test pits.

Bulk and grab samples of the near-surface soils were directly retrieved from the auger cuttings from the borings and the excavated material in the test pits.

SAMPLER AND DRILLING METHOD GRAPHICS

- BULK / GRAB / BAG SAMPLE
- MODIFIED CALIFORNIA SAMPLER (2 or 2-1/2 in. (50.8 or 63.5 mm.) outer diameter)
- CALIFORNIA SAMPLER (3 in. (76.2 mm.) outer diameter)
- STANDARD PENETRATION SPLIT SPOON SAMPLER (2 in. (50.8 mm.) outer diameter and 1-3/8 in. (34.9 mm.) inner diameter)
- HQ CORE SAMPLE (2.500 in. (63.5 mm.) core diameter)
- SHELBY TUBE SAMPLER
- PUSH TYPE SAMPLER
- SONIC CONTINUOUS SAMPLER
- HAND AUGER
- AUGER CUTTINGS

GROUND WATER GRAPHICS

- WATER LEVEL (level where first observed)
- WATER LEVEL (level after exploration completion)
- WATER LEVEL (additional levels after exploration)
- OBSERVED SEEPAGE

NOTES

- The report and graphics key are an integral part of these logs. All data and interpretations in this log are subject to the explanations and limitations stated in the report.
- Lines separating strata on the logs represent approximate boundaries only. Actual transitions may be gradual or differ from those shown.
- No warranty is provided as to the continuity of soil or rock conditions between individual sample locations.
- Logs represent general soil or rock conditions observed at the point of exploration on the date indicated.
- In general, Unified Soil Classification System designations presented on the logs were based on visual classification in the field and were modified where appropriate based on gradation and index property testing.
- Fine grained soils that plot within the hatched area on the Plasticity Chart, and coarse grained soils with between 5% and 12% passing the No. 200 sieve require dual USCS symbols, ie., GW-GM, GP-GM, GW-GC, GP-GC, GC-GM, SW-SM, SP-SM, SW-SC, SP-SC, SC-SM.
- If sampler is not able to be driven at least 6 inches then 50/X indicates number of blows required to drive the identified sampler X inches with a 140 pound hammer falling 30 inches.

MOISTURE CONTENT

DESCRIPTION	FIELD TEST
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

CEMENTATION

DESCRIPTION	FIELD TEST
Weakly	Crumbles or breaks with handling or slight finger pressure
Moderately	Crumbles or breaks with considerable finger pressure
Strongly	Will not crumble or break with finger pressure

CONSISTENCY - FINE-GRAINED SOIL

CONSISTENCY	SPT - N_{60} (# blows / ft)	Pocket Pen (tsf)	UNCONFINED COMPRESSIVE STRENGTH (Q_u)(psf)	VISUAL / MANUAL CRITERIA
Very Soft	<2	PP < 0.25	<500	Thumb will penetrate more than 1 inch (25 mm). Extrudes between fingers when squeezed.
Soft	2 - 4	0.25 ≤ PP <0.5	500 - 1000	Thumb will penetrate soil about 1 inch (25 mm). Remolded by light finger pressure.
Medium Stiff	4 - 8	0.5 ≤ PP <1	1000 - 2000	Thumb will penetrate soil about 1/4 inch (6 mm). Remolded by strong finger pressure.
Stiff	8 - 15	1 ≤ PP <2	2000 - 4000	Can be imprinted with considerable pressure from thumb.
Very Stiff	15 - 30	2 ≤ PP <4	4000 - 8000	Thumb will not indent soil but readily indented with thumbnail.
Hard	>30	4 ≤ PP	>8000	Thumbnail will not indent soil.

Very Dense	>50	>60	>70	85 - 100

FROM TERZAGHI AND PECK, 1948

PLASTICITY

DESCRIPTION	LL	FIELD TEST
Non-plastic	NP	A 1/8-in. (3 mm.) thread cannot be rolled at any water content.
Low (L)	< 30	The thread can barely be rolled and the lump or thread cannot be formed when drier than the plastic limit.
Medium (M)	30 - 50	The thread is easy to roll and not much time is required to reach the plastic limit. The thread cannot be rerolled after reaching the plastic limit. The lump or thread crumbles when drier than the plastic limit.
High (H)	> 50	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump or thread can be formed without crumbling when drier than the plastic limit.

STRUCTURE

DESCRIPTION	CRITERIA
Stratified	Alternating layers of varying material or color with layers at least 1/4-in. thick, note thickness.
Laminated	Alternating layers of varying material or color with the layer less than 1/4-in. thick, note thickness.
Fissured	Breaks along definite planes of fracture with little resistance to fracturing.
Slickensided	Fracture planes appear polished or glossy, sometimes striated.
Blocky	Cohesive soil that can be broken down into small angular lumps which resist further breakdown.
Lensed	Inclusion of small pockets of different soils, such as small lenses of sand scattered through a mass of clay; note thickness.

ANGULARITY

DESCRIPTION	CRITERIA
Angular	Particles have sharp edges and relatively plane sides with unpolished surfaces.
Subangular	Particles are similar to angular description but have rounded edges.
Subrounded	Particles have nearly plane sides but have well-rounded corners and edges.
Rounded	Particles have smoothly curved sides and no edges.

INFILLING TYPE

NAME	ABBR	NAME	ABBR
Albite	Al	Muscovite	Mus
Apatite	Ap	None	No
Biotite	Bi	Pyrite	Py
Clay	Cl	Quartz	Qz
Calcite	Ca	Sand	Sd
Chlorite	Ch	Sericite	Ser
Epidote	Ep	Silt	Si
Iron Oxide	Fe	Talc	Ta
Manganese	Mn	Unknown	Uk

DENSITY/SPACING OF DISCONTINUITIES

DESCRIPTION	SPACING CRITERIA
Unfractured	>6 ft. (>1.83 meters)
Slightly Fractured	2 - 6 ft. (0.061 - 1.83 meters)
Moderately Fractured	8 in - 2 ft. (203.20 - 609.60 mm)
Highly Fractured	2 - 8 in (50.80 - 203.30 mm)
Intensely Fractured	<2 in (<50.80 mm)

ADDITIONAL TEXTURAL ADJECTIVES

DESCRIPTION	RECOGNITION
Pit (Pitted)	Pinhole to 0.03 ft. (3/8 in.) (>1 to 10 mm.) openings
Vug (Vuggy)	Small openings (usually lined with crystals) ranging in diameter from 0.03 ft. (3/8 in.) to 0.33 ft. (4 in.) (10 to 100 mm.)
Cavity	An opening larger than 0.33 ft. (4 in.) (100 mm.), size descriptions are required, and adjectives such as small, large, etc., may be used
Honeycombed	If numerous enough that only thin walls separate individual pits or vugs, this term further describes the preceding nomenclature to indicate cell-like form.
Vesicle (Vesicular)	Small openings in volcanic rocks of variable shape and size formed by entrapped gas bubbles during solidification.

ADDITIONAL TEXTURAL ADJECTIVES

DESCRIPTION	CRITERIA
Unweathered	No evidence of chemical / mechanical alternation; rings with hammer blow.
Slightly Weathered	Slight discoloration on surface; slight alteration along discontinuities; <10% rock volume altered.
Moderately Weathered	Discoloring evident; surface pitted and alteration penetration well below surface; Weathering "halos" evident; 10-50% rock altered.
Highly Weathered	Entire mass discolored; Alteration pervading most rock, some slight weathering pockets; some minerals may be leached out.
Decomposed	Rock reduced to soil with relic rock texture/structure; Generally molded and crumbled by hand.

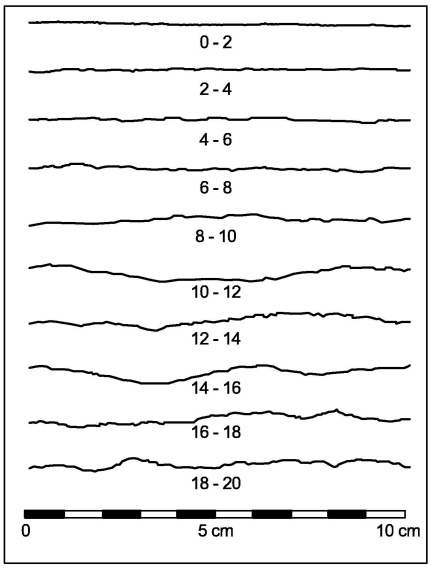
RELATIVE HARDNESS / STRENGTH DESCRIPTIONS

GRADE		UCS (Mpa)	FIELD TEST
R0	Extremely Weak	0.25 - 1.0	Indented by thumbnail
R1	Very Weak	1.0 - 5.0	Crumbles under firm blows of geological hammer, can be peeled by a pocket knife.
R2	Weak	5.0 - 25	Can be peeled by a pocket knife with difficulty, shallow indentations made by firm blow with point of geological hammer.
R3	Medium Strong	25 - 50	Cannot be scraped or peeled with a pocket knife, specimen can be fractured with a single firm blow of a geological hammer.
R4	Strong	50 - 100	Specimen requires more than one blow of geological hammer to fracture it.
R5	Very Strong	100 - 250	Specimen requires many blows of geological hammer to fracture it.
R6	Extremely Strong	> 250	Specimen can only be chipped with a geological hammer.

ROCK QUALITY DESIGNATION (RQD)

DESCRIPTION	RQD (%)
Very Poor	0 - 25
Poor	25 - 50
Fair	50 - 75
Good	75 - 90
Excellent	90 - 100

APERTURE



DESCRIPTION	CRITERIA [in (mm)]
Tight	<0.04 (<1)
Open	0.04 - 0.20 (1 - 5)
Wide	>0.20 (>5)

BEDDING CHARACTERISTICS

DESCRIPTION	Thickness [in (mm)]
Very Thick Bedded	>36 (>915)
Thick Bedded	12 - 36 (305 - 915)
Moderately Bedded	4 - 12 (102 - 305)
Thin Bedded	1 - 4 (25 - 102)
Very Thin Bedded	0.4 - 1 (10 - 25)
Laminated	0.1 - 0.4 (2.5 - 10)
Thinly Laminated	<0.1 (<2.5)

Bedding Planes	Planes dividing the individual layers, beds, or stratigraphy of rocks.
Joint	Fracture in rock, generally more or less vertical or traverse to bedding.
Seam	Applies to bedding plane with unspecified degree of weather.

JOINT ROUGHNESS COEFFICIENT (JRC)

From Barton and Choubey, 1977

RQD Rock-quality designation (RQD) Rough measure of the degree of jointing or fracture in a rock mass, measured as a percentage of the drill core in lengths of 10 cm. or more.

Appendix B

APPENDIX B
LABORATORY TESTING

GENERAL

Laboratory tests were performed on selected samples as an aid in classifying the soils and to evaluate physical properties of the soils that may affect foundation design and construction procedures. The tests were performed in general conformance with the current ASTM or Caltrans standards. A description of the laboratory-testing program is presented below.

MOISTURE CONTENT

Moisture content testing was performed on a selected sample recovered from our borings. Moisture contents were determined in general accordance with ASTM Test Method D2216. Results of the testing are presented on the boring logs in Appendix A and as an attachment in this appendix.

ATTERBERG LIMITS

Atterberg limits testing was performed on selected soil samples to assist in classification. Testing was performed in general accordance with ASTM D4318. Results are presented attached to this appendix.

R-VALUE

Resistance value (R-value) tests were performed on selected bulk soil samples obtained to evaluate pavement support characteristics of the near-surface onsite soils. R-value tests were performed in accordance with Caltrans Standard Test Method 301. The test results are attached in this appendix.

ROCK STRENGTH (UNCONFINED COMPRESSIVE STRENGTH)

Unconfined compressive strength tests were performed on select samples of intact rock from our rock core samples. These tests were performed in accordance with ASTM D7012 and are included in this appendix.

PRELIMINARY SOIL CORROSIVITY

A series of chemical tests were performed on a selected sample of the near-surface soils to estimate pH, resistivity and sulfate and chloride contents. The sample was tested in general accordance with California Test Methods 643, 422, and 417 for pH and minimum resistivity,

© 2019 Kleinfelder

soluble chlorides, and soluble sulfates, respectively. Test results may be used by a qualified corrosion engineer to evaluate the general corrosion potential with respect to construction materials. The tests were performed by AP Engineering and Laboratory, Inc. of Pomona, California. The results of the tests are presented in Table 4 of Section 4.10 of the report and attached to this appendix.

TOPSOIL ANALYTICAL TESTS

Topsoil analytical testing was performed on one representative sample of the near-surface soils by Waypoint Analytical of Anaheim, California. The topsoil was tested for percentages of organic matter, percentages of deleterious material, pH, mineral content, micro and macro nutrient content, and herbicide presence in the soil. The test results are presented in the Waypoint Analytical report attached to this appendix.

RE: Costco El Dorado Hills, Updated New Warehouse

Background

One composite sample was processed on September 10, 2019 identified as soil from areas where new landscaping is scheduled for installation. Fertilizer and amendment recommendations were requested. The sample was analyzed for horticultural suitability, fertility, and physical characteristics. The results of the analyses are attached. Organic matter testing was run separately on individual subsamples and these results are also attached.

Analytical Results and Comments

The reaction of the sample is moderately acidic at a pH of 6.0. This is within the range preferred for most plants. Salinity (ECe), sodium, chloride and boron are safely low. The sodium adsorption ratio (SAR) indicates that sodium is adequately balanced by soluble calcium and magnesium; this balance is important for soil structure quality, which relates to the rate at which water infiltrates the soil.

According to the USDA Soil Classification system, the texture of the less than 2mm fraction of the soil is classified as loam. Organic matter content is low at 2.3% dry weight. Based on this information the estimated infiltration rate is moderate at 0.25 inch per hour. Infiltration rates may vary due to differences in compaction across the site. The over 50% silt plus clay present indicates that this soil will have some potential for issues with slow drainage and high water holding capacity and irrigation timing should take this into account. Additional subdrainage may be beneficial for larger specimens being installed in flat areas in this soil.

In terms of soil fertility, nitrogen, phosphorus and sulfate are low and calcium is fair. All of the other major nutrients are sufficient for proper plant nutrition at this time. Of the micronutrients; copper and manganese are abundant while zinc and iron are sufficient.

Boron is safely low for general ornamental plants and may be below optimum levels for plant nutritional purposes. Irrigation water often supplies sufficient boron to meet plant nutritional requirements. However, if boron is low in the irrigation water and/or plants show symptoms of boron deficiency after they are well established, you may consider an application of a product containing boron at the manufacturer's label rate. Boron deficiency symptoms often include stunted or deformed younger growth and tight internodes. Tissue testing can be performed to identify a boron deficiency if it is suspected. Incorporation of a composted greenwaste amendment may be sufficient to negate this deficiency, product depending.

Recommendations

Nitrogen, phosphorus and calcium fertilizers are recommended at the time of planting. Incorporation of a nitrogen stabilized organic amendment or composted greenwaste product is recommended in order to improve soil nutrient holding capacity and porosity. If a composted greenwaste amendment is chosen, that would provide additional phosphorus and potassium as well as supplemental micronutrients, product depending.

To Prepare for Mass Planting:
Drainage of the root zone should be improved by first loosening the top 10 inches of any undisturbed or compacted soil. The following materials should then be evenly spread and thoroughly blended with the top 6 inches of soil to form a homogenous layer:

Amount per 1000 Square Feet	
5 cubic yards	Nitrogen Stabilized Organic Amendment*
8 pounds	Ammonium Phosphate (16-20-0)*
25 pounds	Gypsum (Calcium Sulfate)

*The rate may change based on the analysis of the chosen organic amendment. This rate is based on 270 lbs. of dry weight of organic matter per cubic yard of amendment. If a composted greenwaste amendment is chosen that provides a substantial amount of phosphorus, the ammonium phosphate should be replaced with ammonium sulfate (21-0-0) at a 7 pound rate.

To Prepare Backfill For Trees and Shrubs:

- Excavate planting pits at least twice as wide as the diameter of the rootball.
- Soil immediately below the root ball should be left undisturbed to provide support but the sides and the bottom around the side should be cultivated to improve porosity.
- The top of the rootball should be at or slightly above final grade.
- The top 12 inches of backfill around the sides of the rootball of trees and shrubs may consist of the above amended soil or may be prepared as follows:

3 parts	Site Soil
1 part	Nitrogen Stabilized Organic Amendment*

Uniformly blended with:

Amount / Cubic Yard of Backfill	
1/2 pound	Ammonium Phosphate (16-20-0)*
1 1/3 pounds	Gypsum (Calcium Sulfate)

- Backfill below 12 inches required for 24 inch box or larger material should not contain the organic amendment or ammonium phosphate, but should still contain the gypsum at the recommended rate. In order to improve phosphorus levels below 12 inches in depth, triple superphosphate should be incorporated at a 1/4 pound rate.
- Ideally a weed and turf free zone should be maintained just beyond the diameter of the planting hole. A 2-4 inch deep layer of coarse mulch can be placed around the tree or shrub. Mulch should be kept a minimum 4 inches from the trunk.
- Irrigation of new plantings should take into consideration the differing texture of the rootball substrate and surrounding soil matrix to maintain adequate moisture during this critical period of establishment.

Maintenance

Maintenance fertilization should rely primarily on a nitrogen only program supplemented with a complete fertilizer in the fall and spring. Beginning 45-60 days after planting, ammonium sulfate (21-0-0) should be applied at a rate of 5 pounds per 1000 square feet with reapplication every 45-60 days. Alternatively, slow release Sulfur Coated Urea (43-0-0) may be applied at 6 pounds per 1000 square feet every 90 days. Once plants are performing satisfactorily, the frequency of fertilization may be decreased depending on color and rate of growth desired. In the winter for a quick greening effect, calcium nitrate (15.5-0-0) may be applied at a 6 pound rate if applicable. Early fall and spring, substitute a complete fertilizer such as 15-15-15 to help insure continuing adequate phosphorus and potassium.

Alternatively, Blood Meal (12-0-0) provides available nitrogen fairly rapidly while materials such as Feather Meal (12-0-0), Soybean or Cotton Seed Meal (7-1-1) are slower to provide available nitrogen, but they extend the length of time they make this contribution. In order to provide a good supply of nitrogen for a 3-4 month time frame a good combination would be 6 pounds Blood Meal and 14 pounds Feather Meal per 1000 square feet. In the fall and spring, substitute a complete organic fertilizer such as 5-5-5 applied at the manufacturer's label rate. Or, nutrient rich composted greenwaste may be spread in a 1 to 2 inch layer, which generally carries enough nutrition to boost complete nutrition though a source of nitrogen might also be added at a half rate to assure adequate nitrogen availability.

If we can be of any further assistance, please feel free to contact us.

Subject: Report
Phase II Seismic Refraction Survey
Silva Valley Parkway Development
El Dorado Hills, California

Dear Mr. Dockendorf:

1.0 INTRODUCTION

This letter presents the results of Advanced Geological Services, Inc. (AGS) seismic refraction survey in support of grading work at a 16-acre site north of Tong Road and west of Silva Valley Parkway in El Dorado Hills, California (Figure 1). The survey objective was to assess the depth and excavation characteristics (rippability) of bedrock. The survey was performed on August 7 and 8, 2019 by AGS senior geophysicist Roark W. Smith and his assistant. Field oversight was provided by Mr. Jordan Annand of Kleinfelder, who showed AGS the seismic line locations, which were marked in the field with wood stakes labeled with the seismic line number. The survey comprised seven seismic lines of varying lengths and orientations distributed across the site (Figure 2).

Figure 1- Phase II Site Location in El Dorado Hills CA

2.0 SUMMARY OF FINDINGS

- Three velocity layers were detected— Layer V_1 is the uppermost approximately1- to 7-foot thick low-velocity layer representing surficial soil. Layer V_2 is a medium-velocity (from about 3,985 to 6,000 fps) layer representing deeply-weathered bedrock. Layer V_3 is a high-velocity layer (12,200 to over 18,500 fps) representing little-weathered, ”hard” bedrock.

- On the basis of the Caterpillar Performance Handbook “rip chart”, the Layer V_3 “hard” bedrock at this site is classified as non-rippable. This non-rippable “hard” bedrock mostly occurs at depths ranging from 7 to 15 feet, but was found as shallow as one (1)

foot bgs along SL-4 in the western-central portion of the site and as deep as 42 feet along SL-6 in the eastern portion of the site. The refraction survey showed V_3 velocities ranging between 12,200 to over 18,500 fps, and the "rip chart" classifies metamorphic rock exhibiting P-wave velocities greater than 9,200 fps and "non-rippable" with a D9R tractor.

3.0 SITE DESCRIPTION

The survey consisted of seven seismic lines ranging from 230 to 600 feet in length; the lines were distributed across a 16-acre triangular-shaped area of gently rolling, grass-covered hills (Figure 2). It is worth noting that the site was seismically "noisy" at times due to vehicle traffic along the nearby Parkway.

4.0 SEISMIC REFRACTION METHOD OVERVIEW

The seismic refraction method uses compressional (P-) wave energy to delineate seismic velocity layers within the subsurface. Interpretation entails correlating the velocity layers to geologic features such as soil and various types of bedrock. To perform a refraction survey, an elastic wave (compressional, or P-wave) is generated at certain locations (shotpoints) along a survey line. The P-wave energy is usually produced by striking the ground with a sledgehammer. As the P-wave propagates through the ground it is refracted along boundaries between geologic layers with different seismic velocities.

Part of the refracted P-wave energy returns to the ground surface where it is detected by vibration-sensitive devices called geophones, which are placed in a co-linear array along the seismic survey line. The geophone data are fed to a seismograph, where they are recorded, and then to a computer, where they are analyzed to determine the depth and velocities of subsurface seismic layers. Key data for refraction analysis are the positions of the geophones and shotpoints along a seismic line, and the amount of time it takes for the refracted wave to travel from the shotpoint to each geophone location. Because the P-wave is the fastest traveling of all types of seismic waves, it can be readily identified as the first deflection ("first break") on a seismic trace.

Additional discussion of the refraction method, its limitations, and the relationship between seismic velocity and geologic materials is presented in Appendix A.

5.0 FIELD PROCEDURES

Due to the lack of vehicle access, AGS hand-carried the seismic gear to each line location. For each seismic line, AGS laid out a fiberglass tape measure and placed an array of 24 geophones on the ground at 10-foot to 20-foot intervals to form a seismic "spread" that measured from 230 to 300 feet long. For seismic lines longer than 300 feet (e.g., SL-7), AGS laid out a second spread to achieve the required line length. The geophones were coupled to the ground by means of 3-inch metal spikes attached to the geophone base. Three shotpoints were used along each spread, with shotpoints located five feet beyond each end of the geophone array and at the array midpoint. AGS produced P-waves through multiple impacts with a 16-lb sledge hammer against a metal plate placed on the ground surface at each shotpoint location. In general, 10 hammer blows were used ("stacked") at the end shotpoints and 5 blows were used at the center shotpoint.

The P-waves produced by the hammer impacts were detected using Mark Products 14-Hz geophones. The detected seismic signals were recorded using a DAQLink II seismic system connected to a laptop computer.

After the seismic data were obtained along each line, AGS performed a hand-level survey to measure the relative elevation changes along the line so that the ground surface topography could be incorporated into the data analysis. After the seismic survey was completed AGS used a Trimble Pro-XR Global Positioning System (GPS) to record the seismic line locations.

6.0 DATA PROCESSING AND ANALYSIS

In general, the refraction data quality is "good"; however, due to traffic noise from the nearby roadway the quality of some of the refraction data is only "fair". Regardless, for the most part the "first beaks" could be readily identified and picked on the seismic records. Data quality was enhanced by "stacking," which entailed using multiple hammer blows at each shotpoint location to improve the signal-to-noise ratio. The additive affect of stacking of multiple hammer blows at the same location enhances or increases the amplitude of the signal (i.e., the P-wave arrival) while amplitude of the background noise, which, being random in nature, tends to cancel itself on successive hammer blows and remains largely unchanged.

Seismic data were transferred from the seismograph to a desktop computer where they were processed using the *SeisImager* software package by Geometrics, Inc. Briefly, *SeisImager* is a computer inversion program that generates an initial velocity layer model, produces synthetic data from the model, and then adjusts the model so that the synthetic data better matches the observed field data. The agreement between the synthetic and observed data provides an indication of how well the model represents the true subsurface conditions.

First, AGS used the *SeisImager* module *PickWin* to interpret ("pick") the P-wave arrivals ("first breaks") for each of the shotpoint data sets ("shot gathers") per line. *PickWin* was also used to check (against the geophysicist's field log) that the proper locations were assigned to the geophones and shotpoints. Next, the first break files were fed to the SeisImager module *PlotRefra*, which was used review time-distance (TD) plots for the seismic lines and assign a seismic layer to each arrival time. For the refraction analysis, each P-wave arrival is considered to have refracted from a distinct seismic layer. The number of layers resolved by the seismic survey, and their thickness and average velocity, is indicated by straight line segments on the TD plot; because these straight-line segments represent a constant velocity condition within the subsurface, the tend to represent a distinct geologic layer. The topographic elevation files were incorporated into the analysis at this point. Next, a time-term inversion was performed to produce layered velocity models presented on Figures 3 through 7. Time-term inversion is a linear least-squares technique that uses the layer assignments and the distances and travel times between the shotpoints and the geophones to develop a velocity layer model that best fits the observed data.

7.0 RESULTS

The results of the seismic refraction survey are summarized on Table 1, below, and presented on Figures 2 through 7, which show the seismic line locations and the subsurface velocity layer

models that were calculated from the refraction data.

Overall, three velocity layers were detected— Layer V_1 is the uppermost approximately1- to 7-foot thick low-velocity layer representing surficial soil. Layer V_2 is a medium-velocity (from about 3,985 to 6,000 fps) layer representing deeply-weathered bedrock. Layer V_3 is a high-velocity layer (12,200 to over 18,500 fps) representing little-weathered, "hard" bedrock. Layer V_3 generally occurs at depths ranging between 7 to 15 feet bgs, but it is found as shallow as one (1) foot bgs to as deep as 42 feet bgs in places. The shallowest bedrock was detected in the northern portion of the site, along SL-1 and SL-2; the deepest along SL-6 in the eastern portion of the site.

On the basis of the Caterpillar Performance Handbook "rip chart", the Layer V_3 "hard" bedrock at this site is non-rippable. This non-rippable "hard" bedrock mostly occurs at depths ranging from 7 to 15 feet, but was found as shallow as one (1) foot bgs in the western-central portion of the site along SL-4 and as deep as 42 feet in the eastern portion of the site along SL-6. The refraction survey showed V_3 velocities ranging between 12,200 to over 18,500 fps, and the "rip chart" classifies metamorphic rock exhibiting P-wave velocities greater than 9,200 fps and "non-rippable" with a D9R tractor.

Velocity information from the seismic survey is summarized in Table 1; rippability information is summarized in Table 2.

Table 1 Velocity Summary (feet per second) from Layer Models

Seismic Line	Line Length (ft)	Layer V_1 (topsoil)	Layer V_2 (weathered bedrock)	Layer V_3 (little-weathered bedrock)	Approx depth to V_3 (feet)
SL-1	230	1,310	3,985	13,680	6 – 12
SL-2	230	1,305	6,030	13,820	8 – 15
SL-3	390	1,250	4,970	14,960	3 – 16
SL-4	250	1,100	4,210	16,225	1 – 5
SL-5	300	1,270	5,380	16,260	5 – 15
SL-6	600	1,790	5,995	12,210	17 – 42
SL-7	400	1,390	5,350	18,530	7 – 17

8.0 EXCAVATION CHARACTERISTICS (RIPPABILITY)

Seismic velocity charts relating seismic velocity and excavation characteristics have been developed from field tests by others. These charts list the seismic velocity of various types of bedrock materials and their relative ease of excavation using different types of rippers. Caterpillar Tractor Company publishes a performance manual that lists ripper performance charts for various size tractors and types of rippers.

The range of rippability obtained from the ripper performance chart from the Caterpillar Performance Handbook, 12th Edition (2000) is as follows (in feet per second):

Table 2 Rip Chart for Metamorphic Rock (from The Caterpillar Performance Handbook)

Ripper	Rippable	Marginally Rippable	Non-Rippable
D9R	less than 7,200	7,200 to 9,200	greater than 9,200

This information should only be used as a general guide, however, as many other factors should also be considered. These factors include the rock jointing and fracture patterns, the experience of the equipment operator, and the equipment and excavation methods selected. Based on the observed velocities, it appears that the subsurface bedrock beneath the seismic refraction lines is rippable for a D9R to the top of Layer V_3; however, this information should be combined with a complete and thorough analysis of geotechnical boring data, as well as local ripping experience (if available) to make a final assessment.

9.0 CLOSING

All geophysical data and field notes collected as a part of this investigation will be archived at the AGS office. The data collection and interpretation methods used in this investigation are consistent with standard practices applied to similar geophysical investigations. The correlation of geophysical responses with probable subsurface features is based on the past results of similar surveys although it is possible that some variation could exist at this site. Due to the nature of geophysical data, no guarantees can be made or implied regarding the targets identified or the presence or absence of additional objects or targets.

AGS appreciates working for you. We enjoyed this project and we look forward to working with you again.

Sincerely,

Roark W. Smith
Senior Geophysicist
Advanced Geological Services, Inc.

APPENDIX A

SEISMIC VELOCITY AND LIMITATIONS OF THE REFRACTION METHOD

The physical properties of earth materials (fill, sediment, rock) such as compaction, density, hardness, and induration dictate the corresponding seismic velocity of the material. Additionally, other factors such as bedding, fracturing, weathering, and saturation can also affect seismic velocity. In general, low velocities indicate loose soil, poorly compacted fill material, poorly to semi-consolidated sediments, deeply weathered, and highly fractured rock. Conversely, high velocities are indicative of competent rock or dense and highly compacted sediments and fill. The highest velocities are measured in unweathered and little fractured rock.

There are certain limitations associated with the seismic refraction method as applied for this investigation. These limitations are primarily based on assumptions that are made by the data analysis routine. The data analysis routine assumes that the velocities along the length of each spread are uniform. If there are localized zones within each layer where the velocities are higher or lower than indicated, the analysis routine will interpret these zones as changes in the surface topography of the underlying layer. A zone of higher velocity material would be interpreted as a low in the surface of the underlying layer. Zones of lower velocity material would be interpreted as a high in the underlying layer. The data analysis routine also assumes that the velocity of subsurface materials increase with depth. Therefore, if a layer exhibits velocities that are slower than those of the material above it, the slower layer will not be resolved. Also, a velocity layer may simply be too thin to be detected.

The quality of the field data is critical to the construction of an accurate depth and velocity profile. Strong, clear “first-break” information from refracted interfaces will make the data processing, analysis, and interpretation much more accurate and meaningful. Vibrational noise or poor subsurface conditions can decrease the ability to accurately locate and pick seismic waves from the interfaces.

Due to these and other limitations inherent to the seismic refraction method, resultant velocity cross-sections should be considered only as approximations of the subsurface conditions. The actual conditions may vary locally.

ASTM E1527-21
Phase I Environmental Site Assessment
User Questionnaire

INTRODUCTION **El Dorado Hills 05/28/24**

In order to qualify for one of the *Landowner Liability Protections (LLPs)*[1] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"),[2] the *user* must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The *user* should provide the following information to the *environmental professional*. Failure to conduct these inquiries could result in a determination that "*all appropriate inquiries*" is not complete.

(1.) Environmental liens that are filed or recorded against the *property* (40 CFR 312.25).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* below) identify any environmental liens filed or recorded against the *property* under federal, tribal, state or local law?

No

Note 1—In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

(2.) Activity and use limitations that are in place on the *property* or that have been filed or recorded against the *property* (40 CFR 312.26(a)(1)(v) and vi)).

Did a search of *recorded land title records* (or judicial records where appropriate, see *Note 1* above) identify any AULs, such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the *property* and/or have been filed or recorded against the *property* under federal, tribal, state or local law?

No

(3.) Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).

Do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former *occupants* of the *property* or an *adjoining property* so that you would have specialized knowledge of the chemicals and processes used by this type of business?

No

---

[1] *Landowner Liability Protections, or LLPs*, is the term used to describe the three types of potential defenses to Superfund liability in EPA's *Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability* ("*Common Elements*" Guide) issued on March 6, 2003.

[2] P.L. 107-118.

(4.) Relationship of the purchase price to the fair market value of the *property* if it were not contaminated (40 CFR 312.29).

Does the purchase price being paid for this *property* reasonably reflect the fair market value of the *property*? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?

Yes

(5.) Commonly known or *reasonably ascertainable* information about the *property* (40 CFR 312.30).

Are you aware of commonly known or *reasonably ascertainable* information about the *property* that would help the *environmental professional* to identify conditions indicative of releases or threatened releases?

For example,

(a.) Do you know the past uses of the *property*?
No

(b.) Do you know of specific chemicals that are present or once were present at the *property*?
No

(c.) Do you know of spills or other chemical releases that have taken place at the *property*?
No

(d.) Do you know of any environmental cleanups that have taken place at the *property*?
No

(6.) The degree of obviousness of the presence or likely presence of contamination at the *property*, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31).

Based on your knowledge and experience related to the *property* are there any *obvious* indicators that point to the presence or likely presence of releases at the *property*?

No

In addition, certain information should be collected, if available, and provided to the *environmental professional* conducting the *Phase I Environmental Site Assessment*. This information is intended to assist the *environmental professional*, but is not necessarily required to qualify for one of the *LLPs*. The information includes:

(a) the reason why the Phase I is being performed,

(b) the type of *property* and type of *property* transaction, for example, sale, purchase, exchange, etc.,

(c) the complete and correct address for the *property* (a map or other documentation showing *property* location and boundaries is helpful),

(d) the scope of services desired for the Phase I ESA (including whether any parties to the *property* transaction may have a required standard scope of services or whether any considerations beyond the requirements of Practice E1527 are to be considered),

(e) identification of all parties who will rely on the Phase I *report*,

(f) identification of the site contact and how the contact can be reached,

(g) any special terms and conditions which must be agreed upon by the *environmental professional*, and

(h) any other knowledge or experience with the *property* that may be pertinent to the *environmental professional* (for example, copies of any available prior *environmental site assessment reports*, documents, correspondence, etc., concerning the *property* and its environmental condition).

The *USER* QUESTIONNAIRE was completed by:

INTERVIEW QUESTIONNAIRE
PHASE I ENVIRONMENTAL SITE ASSESSMENT
Compatible with ASTM Standard E 1527-13

Prepared by Kleinfelder Environmental Site Characterization Practice Group

Site Name: EDH 52

Site Address: Approx. 41 Ac. N. of US 50 + East/West of Silva Valley Parkway
Parcels 122-720-002, 018, 019, 020, 021

Date: 5/28/24

Interviewer: _____

Interviewee: Angelo Christie

Site Association: Project Manager for Owner

Years Associated: 7

Please answer the following questions to the best of your knowledge.

1. Was the property or adjoining property ever used for industrial purposes (e.g. manufacturing) or as a gas station, dry cleaners, waste treatment, processing facility, motor repair facility, photo lab, commercial printing facility, junkyard/disposal/recycling/ landfill? If yes, please list the activity, hazardous substances used, and approximate dates when the activity occurred.

   Prior land use, hazardous substances used, and dates: N/A

   Prior owners, key site managers/operators, occupants and dates:

   Existing or prior structures used for what purposes and duration:

2. Do any of the following documents exist for the site or any portion of the site? If so, can you provide Kleinfelder with a copy? (This question to be asked before site visit).

- ☐ Environmental site assessment reports
- ☐ Environmental compliance audit reports wetland Fill Permits
- ☐ Environmental permits (applications submitted, but permits not issued until 401 cert issued)
- ☐ Underground Storage Tank registration
- ☐ Underground Injection System registration
- ☐ Material Safety Data Sheets
- ☐ Community Right-To-Know Plan
- ☐ Safety plans: preparedness and prevention plans; spill prevention; countermeasure; and control plans, etc.
- ☐ Reports regarding hydrogeologic conditions on the property or surrounding area;
- ☐ Correspondence from any government agency relating to past or current violations of environmental laws with regard to the property or relating to environmental liens encumbering the property
- ☐ Hazardous waste generator notices or reports
- ☒ Geotechnical studies
- ☐ Risk assessments
- ☐ Recorded Activity and Use Limitations (AULs)

3. Have you ever observed evidence of or do you have prior knowledge of any of the following items being used, stored, discarded, dumped above grade, buried, or burned onsite? Circle all that apply and indicate amount and approximate dates.

MATERIAL	QUANTITY	DATE(S) OBSERVED	COMMENTS
Above ground storage tank (AST)*	N/A		Size: Contents: Condition:
Automotive batteries	N/A		
Industrial batteries	N/A		
Pesticides (>5 gallon)	N/A		
Paints (> 5 gallon)	N/A		
Chemicals/Hazardous Substances (> 5 gallon liquid)	N/A		

MATERIAL	QUANTITY	DATE(S) OBSERVED	COMMENTS
Chemicals/Hazardous Substances (dry sacks, containers, etc.)	N/A		
Industrial drums (typically 55 gallons)	N/A		Contents: Condition:
Transformer or other equipment that may contain PCBs (e.g. hydraulic equipment)*	N/A		Installation date:
Underground storage tank*	N/A		Size: Contents: Condition:
Unknown materials you suspect may be hazardous substances	N/A		Describe:

*Please provide records if available.

4. What method(s) is used to contain spills of hazardous waste?

N/A

5. What method(s) is used to dispose of hazardous waste?

N/A

6. Are there any permits for handling, use, storage, or disposal of hazardous waste?

N/A

7. Have you observed evidence of or have prior knowledge of the following onsite?

MATERIAL	QUANTITY	DATE(S) OBSERVED	COMMENTS
Equipment Maintenance Areas	N/A		
Accidental spills or releases of chemicals or petroleum products	N/A		

MATERIAL	QUANTITY	DATE(S) OBSERVED	COMMENTS
Possible asbestos containing materials (e.g. pipe, building, etc.)	N/A		Describe material:
Fill dirt originating from an unknown or contaminated site?	N/A		Source:
Pits, ponds, or lagoons associated with waste treatment or waste disposal?	N/A		Location:
Stained soil or odiferous soil? (e.g. oily black)	N/A		Location:
Sumps or dry wells*	N/A		Size : Contents : Condition :
Vent pipes, fill pipes, access ways to a fill pipe protruding from the ground or adjacent to a structure onsite?	N/A		Location:
Heating and cooling systems (include fuel source)	N/A		Source:
Flooring, drains, walls that are stained or emitting a foul odor (do NOT include water damage)?	N/A		Location:

*Please provide records if available.

8. Is the property served by a private well or non-public water system? If so, please answer the following:

   a. Was the well used for domestic (D), agricultural irrigation (I), or monitoring (M) purposes? Are the wells currently operational and if not, when were they last used? When was the well drilled? How deep is the well? What is the approximate discharge rate?

Well No.	Type	Operating?	Last Used	Date Drilled	Depth	Discharge Rate	Location
1-							
2-							

b. Have the wells been sampled for contaminants that exceed applicable requirements for the designated use (e.g. Drinking Water Standards)? If so, please provide the dates and copies of well records.

c. Has the well or water system been designated by any governmental environmental/health agency as contaminated?

9. Is there an oil/gas well or oil/gas vent located onsite? If so, please indicate the location. Please supply any documents available.

N/A

10. Is the property or has the property to your knowledge been previously served by a septic system? If so, please indicate the location of the tank and leach lines (if applicable) and list any hazardous materials disposed.

Unknown

11. Does the property discharge waste water into a storm water sewer system or a sanitary sewer system onto or adjacent to the property? If so, please describe location, piping flow, quantity discharged, and water quality.

N/A

12. Do you have knowledge of the following with respect to the property? Circle and explain all that apply.

a. Environmental clean-up, ongoing or pending.

b. Environmental liens

c. Governmental notifications regarding any possible past or present violations of environmental laws.

d. Past, threatened, pending lawsuits or administrative proceedings relevant to a release of a hazardous substance or petroleum product, in, on, or from the property.

e. Prior environmental assessment that indicated the presence of hazardous substances, petroleum hydrocarbons, contaminants, or recommended further assessment.

f. Deed Restrictions

g. Citizen complaints regarding activities onsite

AGRICULTURAL SITES:

13. What crops have been grown onsite, currently and in the past? None

CROP	DATE	LOCATION

If crops are present or have been grown, please answer questions 14 through 16 below: N/A

14. Have pesticides been applied to fields or other portions of the site? If so, please answer the following questions:

    a. List the names of pesticides (includes herbicides, fungicides, insecticides, rodenticide) used and dates applied.

PESTICIDE AND BRAND NAME	DATE	CROP OR ANIMAL USE

b. Have you been notified of any violation of environmental law with respect to application or storage of pesticides?

No

c. Location of pesticide mixing areas, if any (past or present)?

N/A

d. Method of pesticide application?

N/A

15. Have fertilizers been applied to the site? What type and method of application?

Never to my knowledge

16. Are there any buried pipelines for irrigation or other purposes onsite? If so, what materials is the piping constructed of? Asbestos containing material, PVC, other? Describe the location of buried piping.

There is a recycled water line @ the Northwest corner of parcel 122-720-018 between Clarksville & Silva Valley Pkwy. There is also a 48" storm drain that daylights in this same area.

P006961-060524 - Public Records Request

Message History (2)

On 6/5/2024 2:34:15 PM, El Dorado County Public Records Center wrote:

Dear Victoria Golston:

The County of El Dorado is dedicated and responsive to our community. Your request has been received and is being processed. Your request was given the reference number P006961-060524 for tracking purposes.

Records Requested: Public Lands - Parks

I am looking to obtain information regarding California Protected Areas Database (CPAD) sites that are identified as regional parks which are maintained by the County of El Dorado:
1. Unit ID: 35646, Super Unit ID: 3446
2. Unit ID: 35695, Super Unit ID: 3446

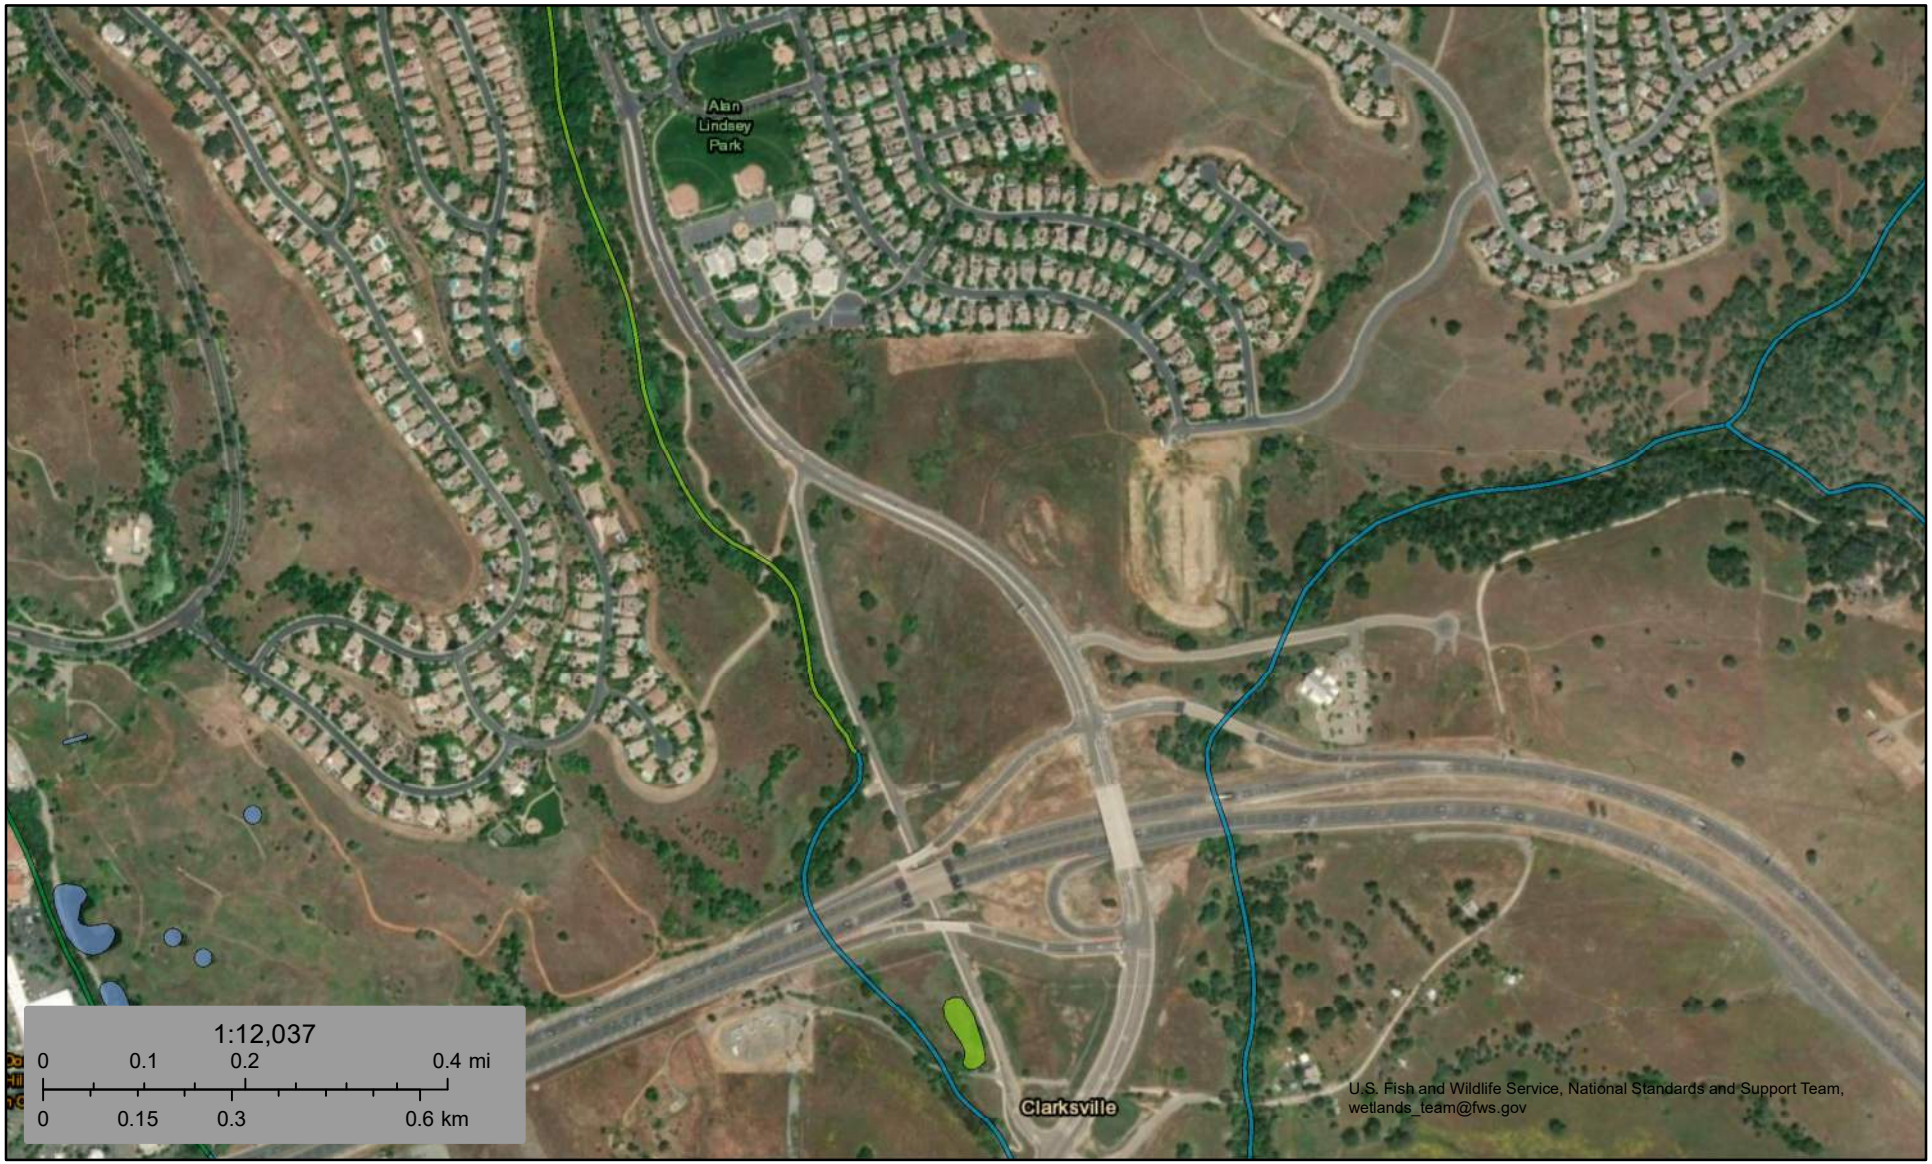
What are the limitations or restrictions for conducting work in these areas? Are there any regulations on grading, stockpiling, or any earth moving activities that need to be of concern? Any issues with constructing on these areas? Any other concerns in terms of environmental, geotechnical, construction, etc. that we should be concerned with?

Your request will be forwarded to the relevant department(s) to locate the information you seek and to determine the volume and any costs associated with satisfying your request. You will be contacted about the availability and/or provided with copies of the records in question.

You can monitor the progress of your request at the link below and you'll receive an email when your request has been completed.

Thank You,

County of El Dorado



To monitor the progress or update this request please log into the El Dorado County Public Records Center.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Report includes a search of available business directory data at approximately five year intervals.

RECORD SOURCES

The EDR City Directory Report accesses a variety of business directory sources, including Haines, InfoUSA, Polk, Cole, Bresser, and Stewart. Listings marked as EDR Digital Archive access Cole and InfoUSA records. The various directory sources enhance and complement each other to provide a more thorough and accurate report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. A check mark indicates where information was identified in the source and provided in this report.

www.edrnet.com

EDR Environmental Lien and AUL Search

The EDR Environmental Lien Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations (AULs), such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel number and/or legal description
- search for ownership information
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.
- search for publicly available environmental encumbering instrument(s) filed on or after the recording of the current deed; between the recording of the current deed and the most current publicly available date
- provide a copy of any environmental encumbrance(s)
- provide a copy of the current deed when available

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR BUILDING PERMIT REPORT

About This Report

The EDR Building Permit Report provides a practical and efficient method to search building department records for indications of environmental conditions. Generated via a search of municipal building permit records gathered from more than 1,600 cities nationwide, this report will assist you in meeting the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527 - 21), or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

Building permit data can be used to identify current and/or former operations and structures/features of environmental concern. The data can provide information on a target property and adjoining properties such as the presence of underground storage tanks, pump islands, sumps, drywells, etc., as well as information regarding water, sewer, natural gas, electrical connection dates, and current/former septic tanks.

Methodology

EDR has developed the EDR Building Permit Report through our partnership with BuildFax, the nation's largest repository of building department records. BuildFax collects, updates, and manages building department records from local municipal governments. The database now includes 30 million permits, on more than 10 million properties across 1,600 cities in the United States.

The EDR Building Permit Report comprises local municipal building permit records, gathered directly from local jurisdictions, including both target property and adjoining properties. Years of coverage vary by municipality. Data reported includes (where available): date of permit, permit type, permit number, status, valuation, contractor company, contractor name, and description.

Incoming permit data is checked at seven stages in a regimented quality control process, from initial data source interview, to data preparation, through final auditing. To ensure the building department is accurate, each of the seven quality control stages contains, on average, 15 additional quality checks, resulting in a process of approximately 105 quality control "touch points."

For more information about the EDR Building Permit Report, please contact your EDR Account Executive at (800) 352-0050.

EDR® Environmental Data Resources Inc

BUILD FAX PROPERTY HISTORY

EXECUTIVE SUMMARY: SEARCH DOCUMENTATION

A search of building department records was conducted by Environmental Data Resources, Inc (EDR) on behalf of Kleinfelder, Inc. on May 22, 2024.

TARGET PROPERTY

Costco El Dorado Hills
El Dorado Hills, CA 95762

SEARCH METHODS

EDR searches available lists for both the Target Property and Surrounding Properties.

RESEARCH SUMMARY

Building permits identified: **NO PERMITS IDENTIFIED**

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.

The following Adjoining Property addresses were researched for this report. Detailed findings are provided for each address.

No Permits Found

GLOSSARY

General Building Department concepts

- **ICC:** The International Code Council. The governing body for the building/development codes used by all jurisdictions who've adopted the ICC guidelines. MOST of the US has done this. Canada, Mexico, and other countries use ICC codes books and guides as well. There are a few states who have added guidelines to the ICC codes to better fit their needs. For example, California has added seismic retrofit requirements for most commercial structures.
- **Building Department (Permitting Authority, Building Codes, Inspections Department, Building and Inspections):** This is the department in a jurisdiction where an owner or contractor goes to obtain permits and inspections for building, tearing down, remodeling, adding to, re-roofing, moving or otherwise making changes to any structure, Residential or Commercial.
- **Jurisdiction:** This is the geographic area representing the properties over which a Permitting Authority has responsibility.
- **GC:** General Contractor. Usually the primary contractor hired for any Residential or Commercial construction work.
- **Sub:** Subordinate contracting companies or subcontractors. Usually a "trades" contractor working for the GC. These contractors generally have an area of expertise in which they are licensed like Plumbing, Electrical, Heating and Air systems, Gas Systems, Pools etc. (called "trades").
- **Journeymen:** Sub contractors who have their own personal licenses in one or more trades and work for different contracting companies, wherever they are needed or there is work.
- **HVAC (Mechanical, Heating & Air companies):** HVAC = Heating, Ventilation, and Air Conditioning.
- **ELEC (Electrical, TempPole, TPole, TPower, Temporary Power, Panel, AMP Change, Power Release):** Electrical permits can be pulled for many reasons. The most common reason is to increase the AMPs of power in an electrical power panel. This requires a permit in almost every jurisdiction. Other commons reason for Electrical permits is to insert a temporary power pole at a new construction site. Construction requires electricity, and in a new development, power has yet to be run to the lot. The temporary power pole is usually the very first permit pulled for new development. The power is released to the home owner when construction is complete and this sometimes takes the form of a Power Release permit or inspection.
- **"Pull" a permit:** To obtain and pay for a building permit.
- **CBO:** Chief Building Official
- **Planning Department:** The department in the development process where the building /structural plans are reviewed for their completeness and compliance with building codes
- **Zoning Department:** The department in the development process where the site plans are reviewed for their compliance with the regulations associated with the zoning district in which they are situated.
- **Zoning District:** A pre-determined geographic boundary within a jurisdiction where certain types of structures are permitted / prohibited. Examples are Residential structure, Commercial/Retail structures, Industrial/Manufacturing structures etc. Each zoning district has regulations associated with it like the sizes of the lots, the density of the structures on the lots, the number of parking spaces required for certain types of structures on the lots etc.
- **PIN (TMS, GIS ID, Parcel#):** Property Identification Number and Tax Map System number.
- **State Card (Business license):** A license card issued to a contractor to conduct business.
- **Building Inspector (Inspector):** The inspector is a building department employee that inspects building construction for compliance to codes.
- **C.O.:** Certificate of Occupancy. This is the end of the construction process and designates that the owners now have permission to occupy a structure after its building is complete. Sometimes also referred to as a Certificate of Compliance.

GLOSSARY

Permit Content Definitions

- Permit Number: The alphanumerical designation assigned to a permit for tracking within the building department system. Sometimes the permit number gives clues to its role, e.g. a "PL" prefix may designate a plumbing permit.
- Description: A field on the permit form that allows the building department to give a brief description of the work being done. More often than not, this is the most important field for EP's to find clues to the prior use (s) of the property.
- Permit Type: Generally a brief designation of the type of job being done. For example BLDG-RES, BLDG-COM, ELEC, MECH etc.

Sample Building Permit Data

Date: Nov 09, 2000
Permit Type: Bldg -
New Permit Number: 101000000405
Status: Valuation: $1,000,000.00
Contractor Company: OWNER-BUILDER
Contractor Name:

Description: New one store retail (SAV-ON) with drive-thru pharmacy. Certificate of Occupancy.

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

EDR NEPASearch DESCRIPTION

The National Environmental Policy Act of 1969 (NEPA) requires that Federal agencies include in their decision-making processes appropriate and careful consideration of all environmental effects and actions, analyze potential environmental effects of proposed actions and their alternatives for public understanding and scrutiny, avoid or minimize adverse effects of proposed actions, and restore and enhance environmental quality as much as possible.

The EDR NEPASearch Map Report provides information which may be used, in conjunction with additional research, to determine whether a proposed site or action will have significant environmental effect.

Scientific Name: Pseudogarypus orpheus
Status: Species of Concern

Common Name: Monterey Dunes scorpion
Scientific Name: Pauroctonus maritimus
Status: Species of Concern

Group:Birds

Common Name: Grasshopper sparrow
Scientific Name: Ammodramus savannarum ssp. perpallidus
Status: Species of Concern

Common Name: Black-backed woodpecker
Scientific Name: picoides arcticus
Status: Under Review

Common Name: Tufted Puffin
Scientific Name: Fratercula cirrhata
Status: Under Review

Common Name: Sharp shinned hawk
Scientific Name: Accipiter striatus
Status: Species of Concern

Common Name: Southern California rufous-crowned sparrow
Scientific Name: Aimophila ruficeps canescens
Status: Species of Concern

Common Name: California spotted Owl
Scientific Name: Strix occidentalis occidentalis
Status: Under Review

Common Name: Tricolored blackbird
Scientific Name: Agelaius tricolor
Status: Under Review

Common Name: San Joaquin LeConte's thrasher
Scientific Name: Toxostoma lecontei macmillanorum
Status: Species of Concern

Common Name: Eagle Mountain scrub jay
Scientific Name: Aphelocoma coerulescens cana
Status: Species of Concern

Common Name: Elegant tern
Scientific Name: Sterna elegans
Status: Species of Concern

Federal Endangered Species from the U.S. Fish and Wildlife for CA State (Continued...)

Common Name: Least bittern
Scientific Name: Ixobrychus exilis hesperis
Status: Species of Concern

Common Name: Song Sparrow
Scientific Name: Melospiza melodia pusillula
Status: Species of Concern

Common Name: Little willow flycatcher
Scientific Name: Empidonax traillii brewsteri
Status: Species of Concern

Common Name: Song Sparrow
Scientific Name: Melospiza melodia samuelis
Status: Species of Concern

Common Name: Yuma clapper rail
Scientific Name: Rallus longirostris yumanensis
Status: Endangered

Common Name: Southwestern willow flycatcher
Scientific Name: Empidonax traillii extimus
Status: Endangered

Common Name: Large-billed savannah sparrow
Scientific Name: Passerculus sandwichensis rostratus
Status: Species of Concern

Common Name: Common Yellowthroat
Scientific Name: Geothlypis trichas sinuosa
Status: Species of Concern

Common Name: Black tern
Scientific Name: Chlidonias niger
Status: Species of Concern

Common Name: Song Sparrow
Scientific Name: Melospiza melodia maxillaris
Status: Species of Concern

Common Name: Fulvous whistling duck
Scientific Name: Dendrocygna bicolor
Status: Species of Concern

Common Name: Belding’s savannah sparrow
Scientific Name: Passerculus sandwichensis beldingi
Status: Species of Concern

Common Name: Spotted Towhee
Scientific Name: Pipilo maculatus clementae
Status: Species of Concern

Common Name: Xantus’sMurrelet
Scientific Name: Synthliboramphus hypoleucus
Status: Candidate

Common Name: Bell’s sage sparrow
Scientific Name: Amphispiza belli belli
Status: Species of Concern

Common Name: Cooper’s hawk
Scientific Name: Accipiter cooperii
Status: Species of Concern

Group:Conifers and Cycads

Common Name: Torrey, Del Mar pine
Scientific Name: Pinus torreyana torreyana
Status: Species of Concern

Common Name: Bolander’s beach pine
Scientific Name: Pinus contorta bolanderi
Status: Species of Concern

Federal Endangered Species from the U.S. Fish and Wildlife for CA State (Continued...)

Common Name: Tecate cypress
Scientific Name: Cupressus forbesii
Status: Species of Concern

Common Name: Monterey pine
Scientific Name: Pinus radiata
Status: Species of Concern

Common Name: Torrey Island pine
Scientific Name: Pinus torreyana insularis
Status: Species of Concern

Common Name: Monterey cypress
Scientific Name: Cupressus macrocarpa
Status: Species of Concern

Common Name: Mendocino cypress
Scientific Name: Cupressus goveniana pigmaea
Status: Species of Concern

Common Name: Yellow cedar
Scientific Name: Calliptropsis nootkatensis
Status: Under Review

Group:Crustaceans

Common Name: Vernal pool tadpole shrimp
Scientific Name: Lepidurus packardi
Status: Endangered

Common Name: Longhorn fairy shrimp
Scientific Name: Branchinecta longiantenna
Status: Endangered

Common Name: Mono Lake brine shrimp
Scientific Name: Artemia monica
Status: Species of Concern

Common Name: Conservancy fairy shrimp
Scientific Name: Branchinecta conservatio
Status: Endangered

Common Name: California freshwater shrimp
Scientific Name: Syncaris pacifica
Status: Endangered

Common Name: [Unnamed] isopod
Scientific Name: Caecidotea tomalensis
Status: Species of Concern

Group:Ferns and Allies

Common Name: No common name
Scientific Name: Botrychium crenulatum
Status: Species of Concern

Common Name: Crater Lake grap fern
Scientific Name: Botrychium pumicola nealleyi
Status: Species of Concern

Group:Fishes

Common Name: Goose Lake redband trout
Scientific Name: Oncorhynchus mykiss ssp.
Status: Species of Concern

Common Name: green sturgeon
Scientific Name: Acipenser medirostris
Status: Threatened

Common Name: Pit roach
Scientific Name: Lavinia symmetricus mitrulus
Status: Species of Concern

Federal Endangered Species from the U.S. Fish and Wildlife for CA State (Continued...)

Common Name: Eagle Lake rainbow Trout
Scientific Name: Oncorhynchus mykiss aquilarum
Status: Under Review

Common Name: Jenny Creek sucker
Scientific Name: Catostomus rimiculus ssp.
Status: Species of Concern

Common Name: Steelhead
Scientific Name: Oncorhynchus (=Salmo) mykiss
Status: Under Review

Common Name: longfin smelt
Scientific Name: Spirinchus thaleichthys
Status: Candidate

Common Name: Owens speckled dace
Scientific Name: Rhinichthys osculus ssp.
Status: Species of Concern

Common Name: Steelhead
Scientific Name: Oncorhynchus (=Salmo) mykiss
Status: Threatened

Common Name: Warner Valley redband trout
Scientific Name: Oncorhynchus mykiss ssp.
Status: Species of Concern

Common Name: Amargosa Canyon speckled dace
Scientific Name: Rhinichthys osculus ssp.
Status: Species of Concern

Common Name: Russian River tule perch
Scientific Name: Hysterocarpus traskii pomo
Status: Species of Concern

Common Name: Benton Valley speckled dace
Scientific Name: Rhinichthys osculus ssp.
Status: Species of Concern

Common Name: Goose Lake lamprey
Scientific Name: Lampetra tridentata ssp.
Status: Species of Concern

Common Name: Gualala roach
Scientific Name: Lavinia symmetricus parvipinnis
Status: Species of Concern

Common Name: Rough sculpin
Scientific Name: Cottus asperrimus
Status: Species of Concern

Common Name: Kern River rainbow trout
Scientific Name: Oncorhynchus mykiss gilberti
Status: Species of Concern

Common Name: Arroyo chub
Scientific Name: Gila orcuttii
Status: Species of Concern

Common Name: Flannelmouth sucker
Scientific Name: Catostomus latipinnis
Status: Species of Concern

Common Name: Steelhead
Scientific Name: Oncorhynchus (=Salmo) mykiss
Status: Endangered

Common Name: Klamath largescale sucker
Scientific Name: Catostomus snyderi
Status: Species of Concern

Common Name: Long Valley speckled dace
Scientific Name: Rhinichthys osculus ssp.
Status: Species of Concern

Federal Endangered Species from the U.S. Fish and Wildlife for CA State (Continued...)

Common Name: Shoshone pupfish
Scientific Name: Cyprinodon nevadensis shoshone
Status: Species of Concern

Common Name: Red Hills roach
Scientific Name: Lavinia symmetricus ssp.
Status: Species of Concern

Common Name: Santa Ana speckled dace
Scientific Name: Rhinichthys osculus ssp.
Status: Species of Concern

Common Name: Goose Lake sucker
Scientific Name: Catostomus occidentalis lacusanserinus
Status: Species of Concern

Common Name: Sacramento perch
Scientific Name: Archoplites interruptus
Status: Species of Concern

Group:Flowering Plants

Common Name: Marin dwarf-flax
Scientific Name: Hesperolinon congestum
Status: Threatened

Common Name: Fleshy owl's-clover
Scientific Name: Castilleja campestris ssp. succulenta
Status: Threatened

Common Name: Pine Hill ceanothus
Scientific Name: Ceanothus roderickii
Status: Endangered

Common Name: Hoover's spurge
Scientific Name: Chamaesyce hooveri
Status: Threatened

Common Name: Suisun thistle
Scientific Name: Cirsium hydrophilum var. hydrophilum
Status: Endangered

Common Name: Vine Hill clarkia
Scientific Name: Clarkia imbricata
Status: Endangered

Common Name: Soft bird's-beak
Scientific Name: Cordylanthus mollis ssp. mollis
Status: Endangered

Common Name: Baker's larkspur
Scientific Name: Delphinium bakeri
Status: Endangered

Common Name: Yellow larkspur
Scientific Name: Delphinium luteum
Status: Endangered

Common Name: Ione (incl. Irish Hill) buckwheat
Scientific Name: Eriogonum apricum (incl. var. prostratum)
Status: Endangered

Common Name: Pine Hill flannelbush
Scientific Name: Fremontodendron californicum ssp. decumbens
Status: Endangered

Common Name: El Dorado bedstraw
Scientific Name: Galium californicum ssp. sierrae
Status: Endangered

Common Name: Sebastopol meadowfoam
Scientific Name: Limnanthes vinculans
Status: Endangered

Federal Endangered Species from the U.S. Fish and Wildlife for CA State (Continued...)

Common Name: San Joaquin Orcutt grass
Scientific Name: Orcuttia inaequalis
Status: Threatened

Common Name: Sacramento Orcutt grass
Scientific Name: Orcuttia viscida
Status: Endangered

Common Name: Pitkin Marsh lily
Scientific Name: Lilium pardalinum ssp. pitkinense
Status: Endangered

Common Name: Few-flowered navarretia
Scientific Name: Navarretia leucocephala ssp. pauciflora (=N. pauciflora)
Status: Endangered

Common Name: Many-flowered navarretia
Scientific Name: Navarretia leucocephala ssp. plieantha
Status: Endangered

Common Name: Colusa grass
Scientific Name: Neostapfia colusana
Status: Threatened

Common Name: Hairy Orcutt grass
Scientific Name: Orcuttia pilosa
Status: Endangered

Common Name: Lake County stonecrop
Scientific Name: Parvisedum leiocarpum
Status: Endangered

Common Name: Calistoga allocarya
Scientific Name: Plagiobothrys strictus
Status: Endangered

Common Name: Napa bluegrass
Scientific Name: Poa napensis
Status: Endangered

Common Name: Hartweg's golden sunburst
Scientific Name: Pseudobahia bahiifolia
Status: Endangered

Common Name: San Joaquin adobe sunburst
Scientific Name: Pseudobahia peirsonii
Status: Threatened

Common Name: Layne's butterweed
Scientific Name: Senecio layneae
Status: Threatened

Common Name: Keck's Checker-mallow
Scientific Name: Sidalcea keckii
Status: Endangered

Common Name: Kenwood Marsh checker-mallow
Scientific Name: Sidalcea oregana ssp. valida
Status: Endangered

Common Name: Metcalf Canyon jewelflower
Scientific Name: Streptanthus albidus ssp. albidus
Status: Endangered

Common Name: Presidio Manzanita
Scientific Name: Arctostaphylos hookeri var. ravenii
Status: Endangered

Common Name: Sonoma sunshine
Scientific Name: Blennosperma bakeri
Status: Endangered

Common Name: Tiburon mariposa lily
Scientific Name: Calochortus tiburonensis

Federal Endangered Species from the U.S. Fish and Wildlife for CA State (Continued...)

Status: Threatened

Common Name: Coyote ceanothus
Scientific Name: Ceanothus ferrisae
Status: Endangered

Status: Species of Concern

Common Name: San Bernardino mountain king snake
Scientific Name: Lampropeltis zonata parvirubra
Status: Species of Concern

Common Name: Coastal rosy boa
Scientific Name: Charina trivirgata roseofusca
Status: Species of Concern

Common Name: Sierra night lizard
Scientific Name: Xantusia vigilis sierrae
Status: Species of Concern

Common Name: Coastal western whiptail
Scientific Name: Cnemidophorus tigris multiscutatus
Status: Species of Concern

Common Name: Orange-throated whiptail
Scientific Name: Cnemidophorus hyperythrus
Status: Species of Concern

Federal Endangered Species from the U.S. Fish and Wildlife for CA State (Continued...)

Common Name: San Diego horned lizard
Scientific Name: Phrynosoma coronatum blainvillii
Status: Species of Concern

Common Name: Coast patch-nosed snake
Scientific Name: Salvadora hexalepis virgultea
Status: Species of Concern

Common Name: San Joaquin whipsnake
Scientific Name: Masticophis flagellum ruddocki
Status: Species of Concern

Common Name: Mojave fringe-toed Lizard
Scientific Name: Uma scoparia
Status: Status Undefined

Common Name: San Diego ringneck snake
Scientific Name: Diadophis punctatus similis
Status: Species of Concern

Common Name: Barefoot gecko
Scientific Name: Coleonyx switaki
Status: Species of Concern

Common Name: Coronado skink
Scientific Name: Eumeces skiltonianus interparietalis
Status: Species of Concern

Common Name: Rosy boa
Scientific Name: Charina trivirgata
Status: Species of Concern

Common Name: California horned lizard
Scientific Name: Phrynosoma coronatum frontale
Status: Species of Concern

Common Name: San Diego banded gecko
Scientific Name: Coleonyx variegatus abbotti
Status: Species of Concern

Common Name: San Bernardino ringneck snake
Scientific Name: Diadophis punctatus modestus
Status: Species of Concern

Common Name: Banded gila monster
Scientific Name: Heloderma suspectum cinctum
Status: Species of Concern

Common Name: San Diego Mountain king snake
Scientific Name: Lampropeltis zonata pulchra
Status: Species of Concern

Common Name: Panamint alligator lizard
Scientific Name: Elgaria panamintina
Status: Under Review

Common Name: Two-striped garter snake
Scientific Name: Thamnophis hammondii
Status: Species of Concern

Common Name: Santa Cruz Island gopher snake
Scientific Name: Pituophis melanoleucus pumilis
Status: Species of Concern

Common Name: Northern red diamond rattlesnake
Scientific Name: Crotalus ruber ruber
Status: Species of Concern

Group:Snails

Common Name: Keeled sideband
Scientific Name: Monadenia circumcarinata
Status: Species of Concern

Federal Endangered Species from the U.S. Fish and Wildlife for CA State (Continued...)

Common Name: California McCoy snail islandsnail — Scientific Name: Micrarionta rowelli mccoiana
Status: Species of Concern

Common Name: Mimic tryonia — Scientific Name: Tryonia imitator
Status: Species of Concern

Common Name: San Nicolas islandsnail — Scientific Name: Micrarionta feralis
Status: Species of Concern

Common Name: Santa Barbara shelled slug — Scientific Name: Binneya notabilis
Status: Species of Concern

Common Name: Williams' bronze shoulderband — Scientific Name: Helminthoglypta arrosa williamsi
Status: Species of Concern

Common Name: Santa Barbara islandsnail — Scientific Name: Micrarionta facta
Status: Species of Concern

Common Name: Hirsute sierra sideband — Scientific Name: Monadenia mormonum hirsuta
Status: Species of Concern

Common Name: Yosemite mariposa sideband — Scientific Name: Monadenia hillebrandi yosemitensis
Status: Species of Concern

Common Name: Thousand Palms desertsnail — Scientific Name: Eremarionta millepalmarum
Status: Species of Concern

Common Name: Button's Sierra sideband — Scientific Name: Monadenia mormonum buttoni
Status: Species of Concern

Common Name: White Abalone — Scientific Name: Haliotis sorenseni
Status: Endangered

Common Name: Shasta sideband — Scientific Name: Monadenia troglodytes troglodytes
Status: Under Review

Common Name: Grapevine Springs elongate tryonia — Scientific Name: Tryonia margae
Status: Species of Concern

Common Name: Robust tryonia — Scientific Name: Tryonia robusta
Status: Species of Concern

Common Name: Redwood shoulderband — Scientific Name: Helminthoglypta sequoicola consors
Status: Species of Concern

Common Name: Merced Canyon shoulderband — Scientific Name: Helminthoglypta allynsmithi
Status: Species of Concern

Common Name: Wintu sideband — Scientific Name: Monadenia troglodytes ssp. wintu
Status: Under Review

Common Name: Globular pebblesnail — Scientific Name: Fluminicola sph
Status: Under Review

Common Name: Peninsula Coast Range shoulderband — Scientific Name: Helminthoglypta nickliniana awania
Status: Species of Concern

Federal Endangered Species from the U.S. Fish and Wildlife for CA State (Continued...)

Common Name: Pricklypear islandsnail — Scientific Name: Micrarionta opuntia
Status: Species of Concern

NATURAL AREAS MAP FINDINGS

Group: Other Federal Lands
Level: Federal

Endangered Species Codes

Global Imperilment Rank Codes - GRANK: Priority rank (1-5) based on number of occurrences through element's range.

G1 - Critically imperiled globally because of extreme rarity (5 or fewer occurrences or very few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extinction.

G2 - Imperiled globally because of rarity (6-20 occurrences or few remaining individuals or acres) or because of some factor(s) making it especially vulnerable to extinction.

G3 - Vulnerable. Either very rare and local throughout its range or found locally (even abundantly at some of its locations) in a restricted range. (e.g., a single western state, a physiographic region in the East) or because of other factors making it vulnerable to extinction throughout its range; in terms of occurrences, in the range of 21 - 100.

G4 - Apparently secure globally, though it may be quite rare in parts of its range, especially at the periphery.

G5 - Demonstrably secure globally, though it may be quite rare in parts of its range, especially at the periphery.

GH - Possibly extinct or eliminated. Of historical occurrence throughout its range, i.e., formerly part of the established biota, with the expectation that it may be rediscovered (e.g., Bachman's Warbler). For historic and ecological communities, no likelihood for rediscovery, but possibility of restoration (e.g., American Chestnut Forest).

GNA - Not applicable to the element at a global level. Includes Hybrids, Invasive species, species of Domestic Origin, Cultural communities, and communities that have been managed.

GNR - Rank not assigned.

GU - Unrankable. Possibly in peril range-wide but status uncertain; more information is needed.

GX - Believed to be extinct throughout range (e.g., Passenger Pigeon) with virtually no likelihood that it will be rediscovered. For an ecological community, no restoration potential.

G#G# - Rank with a range. Used to show the range of uncertainty, will not skip more than 1 rank.

T-RANKS - T subranks are given to global ranks when a subspecies, variety, or race is considered at the state level. The subrank is made up of a "T" plus a number or letter (1, 2, 3, 4, 5, H, U, X) with the same ranking rules as a full species.

State Rank Codes - SRANK: Priority rank (1-5) based on number of occurrences through element's range.

S1 - Critically imperiled, Extremely rare. Typically 5 or fewer estimated occurrences in the state, or only a few remaining individuals, may be especially vulnerable to extirpation.

S2 - Imperiled, very rare. Typically between 5 and 20 estimated occurrences or with many individuals in fewer occurrences, often susceptible to becoming extirpated.

S3 - Vulnerable, rare to uncommon. Typically between 21 and 100 estimated occurrences, may have fewer occurrences but with large number of individuals in some populations, may be susceptible to large-scale disturbances.

S4 - Common, apparently secure under present conditions. Typically 100 or more estimated occurrences, but may be fewer with many large populations, may be restricted to only a portion of the state, usually not susceptible to immediate threats.

S5 - Demonstrably widespread, common, and secure in the state and essentially ineradicable under present conditions.

SA - Accidental.

SH - Historically known from the state, but not verified for an extended period, usually 15 years.

SU - Unrankable, not assessed. Possibly in peril in the state, but status uncertain, more information is needed. When possible, the most likely rank is assigned and a question mark is added to show uncertainty.

SX - Apparently extirpated from state.

SNR - Unranked. The state rank not yet assessed.

SRF - Reported falsely in the state.

SE - Exotic for local area.

SZ - Birds that migrate through the state but have no identifiable location.

S#S# - State level of G#G#.

Endangered Species Codes, (Continued...)

General Ranking Notes

Q - A "Q" in the global rank indicates the element’s taxonomic classification as a species is a matter of conjecture among scientists.

A - Accidental - far outside usual range

C - Captive or Cultivated only

HYB - Element represents an interspecific hybrid, not a species

R - Reported but not confirmed

Z - Zero Occurrences

Breeding Status Qualifiers (animals only)

B - Breeding population of the element

N - Nonbreeding population of the element

M - Migrant population

Site #: NO. 699
County: El Dorado
Description: At this site on the old Clarksville-White Rock Emigrant Road was Mormon Tavern. Constructed in 1849, this popular stage stop was enlarged and operated by Franklin Winchell in 1851. It became a remount station of the Central Overland Pony Express and on April 4, 1860, pony rider Sam (Bill) Hamilton changed horses here on the first eastbound trip.

WETLANDS CLASSIFICATION SYSTEM

National Wetland Inventory Maps are produced by the U.S. Fish and Wildlife Service, a sub-department of the U.S. Department of the Interior. In 1974, the U.S. Fish and Wildlife Service developed a criteria for wetland classification with four long range objectives:

- to describe ecological units that have certain homogeneous natural attributes,
- to arrange these units in a system that will aid decisions about resource management,
- to furnish units for inventory and mapping, and
- to provide uniformity in concepts and terminology throughout the U.S.

High altitude infrared photographs, soil maps, topographic maps and site visits are the methods used to gather data for the productions of these maps. In the infrared photos, wetlands appear as different colors and these wetlands are then classified by type. Using a hierarchical classification, the maps identify wetland and deepwater habitats according to:

- system
- subsystem
- class
- subclass
- modifiers

(as defined by Cowardin, et al. U.S. Fish and Wildlife Service FWS/OBS 79/31. 1979.)

The classification system consists of five systems:

1. marine
2. estuarine
3. riverine
4. lacustrine
5. palustrine

The marine system consists of deep water tidal habitats and adjacent tidal wetlands. The riverine system consists of all wetlands contained within a channel. The lacustrine systems includes all nontidal wetlands related to swamps, bogs & marshes. The estuarine system consists of deepwater tidal habitats and where ocean water is diluted by fresh water. The palustrine system includes nontidal wetlands dominated by trees and shrubs and where salinity is below .5% in tidal areas. All of these systems are divided in subsystems and then further divided into class.

National Wetland Inventory Maps are produced by transferring gathered data on a standard 7.5 minute U.S.G.S. topographic map. Approximately 52 square miles are covered on a National Wetland Inventory map at a scale of 1:24,000. Electronic data is compiled by digitizing these National Wetland Inventory Maps.

KEY CONTACTS & GOVERNMENT RECORDS SEARCHED

Various Federal laws and executive orders address specific environmental concerns. NEPA requires the responsible offices to integrate to the greatest practical extent the applicable procedures required by these laws and executive orders. EDR provides key contacts at agencies charged with implementing these laws and executive orders to supplement the information contained in this report.

National Register of Historic Places:
The National Register of Historic Places is the official federal list of districts, sites, buildings, structures, and objects significant in American history, architecture, archeology, engineering, and culture. These contribute to an understanding of the historical and cultural foundations of the nation.
The National Register includes:
- All prehistoric and historic units of the National Park System;
- National Historic Landmarks, which are properties recognized by the Secretary of the Interior as possessing national significance; and
- Properties significant in American, state, or local prehistory and history that have been nominated by State Historic Preservation Officers, federal agencies, and others, and have been approved for listing by the National Park Service.

Date of Government Version: 07/19/2015

Drainage Study

DATE: April 14, 2025

TO: Kier+Wright and Costco Wholesale

FROM: Patrick Stiehr, PE

RE: Drainage Study for Costco El Dorado Hills at Highway 50 and Silva Valley Parkway

OVERVIEW

The project consists of two hydraulically connected parcels covering about 45 acres that include a Costco gas station on the northeast side of Silva Valley Parkway and a Costco warehouse on the southwest side. Both are located just north of the Highway 50 interchange. See **Figure 1**, **Vicinity Map**.

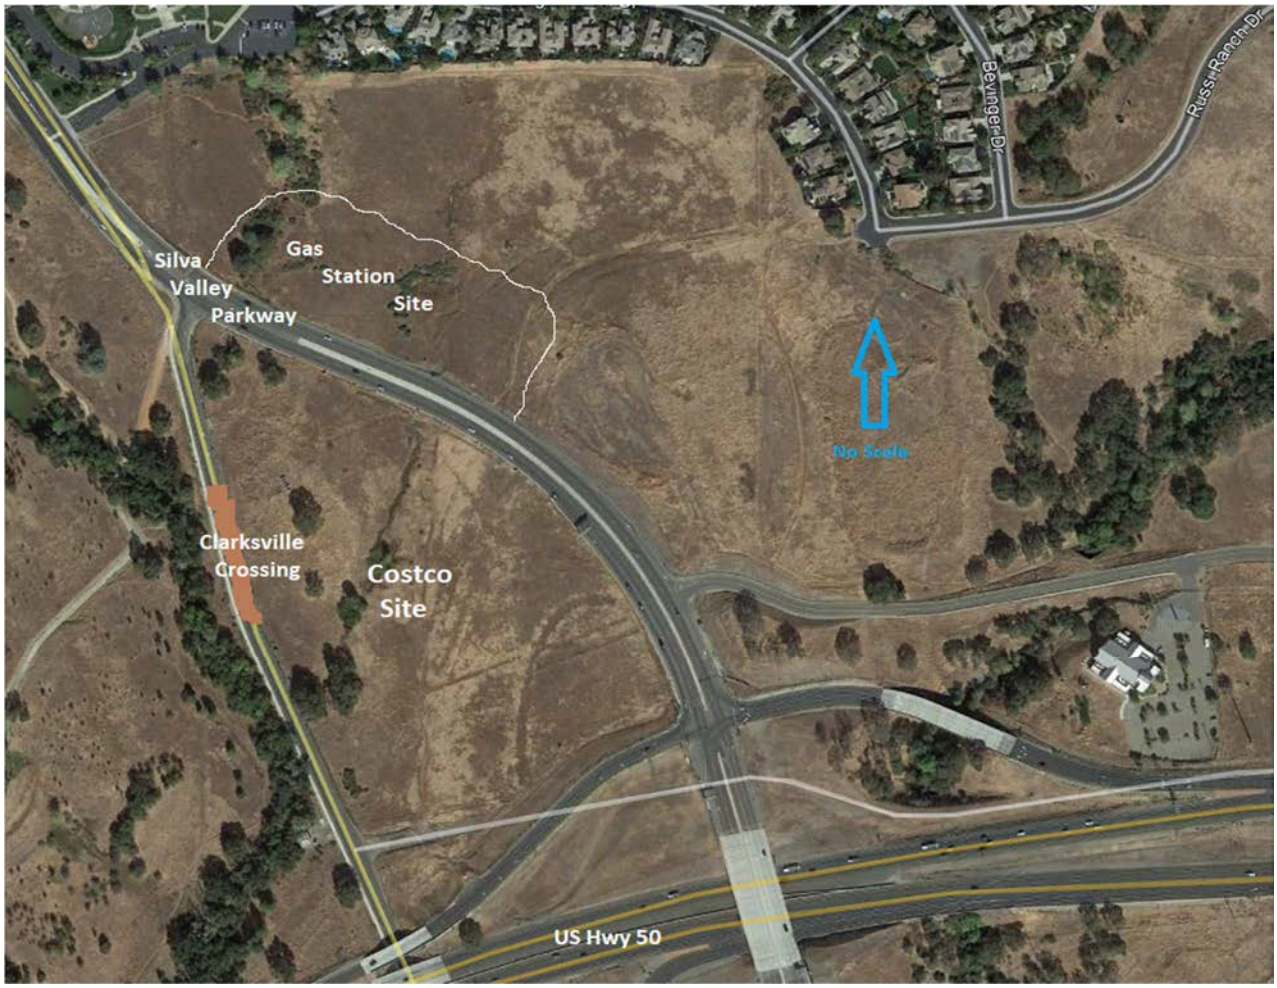

Figure 1. Vicinity Map

3153 Jenna Court
Roseville, CA 95747

Phone: 916- 774- 1111, Fax: 916- 774- 1181
Mobile: 916- 715- 1167, email: pstiehr@wtrmark.com

This study provides evaluation of the proposed onsite facilities to demonstrate adequate capacity of the proposed drainage facilities but does not address downstream conditions. A consideration is that the proposed Costco development is located at the lower end of the 763-acre watershed the passes under Highway 50. Per Caltrans requirement, the drainage facilities will include attenuation storage to reduce the estimated peak 100-year flow to existing conditions. The peak flow from this development area will enter the watercourse and pass under Highway 50 at least 15 minutes before the main stem peak arrives, meaning the likelihood of the proposed development increasing the main stem peak flow is minimal.

HYDROLOGY

The hydrology was based on the SCS methodology embedded within the XP-SWMM software.

Soils

The soils within the project area are classified by the NRCS as Auburn Silt Loam and falls within Hydrologic Group D, low infiltration. The published hydraulic conductivity for the Auburn Silt Loam is 7.09 micrometers per second, or one inch per hour in US units.

Shed Definition

The gas station was divided into five subsheds, DMAs 8-12. There are five offsite sheds, A B, C1, C2, and D. The Costco site was divided into seven sheds, DMAs 1-7. All of the site generally drains to the southwest.

The Drainage Management Areas (DMAs) are shown on the 'Storm Water Quality Control Plan prepared by Kier+Wright and are shown on **Figure 2**. Offsite flows from the northeast will be piped through both the gas station and warehouse sites.

SCS Parameters

The idealized rainfall distribution for the 10-year, 24-hour storm was developed from the El Dorado County Table A2.2.3, depth-duration-frequency, developed by Jim Goodridge in 2008. A screen shot of the hyetograph is shown in **Figure 3**. The mean annual rainfall was estimated at 26 inches per year.

An assumed time-of-concentration of five minutes and a Curve Number of 98 were used for all nodes within the project areas. **Table 1** provides a summary of the shed areas and peak flows from the 10-year and 100-year, 24-hour storms. The 100-year storm has the same general shape as the 10-year storm, but with greater intensities and storm volume.

HYDRAULICS

The XP-SWMM software was used for the backwater analysis. Drainage facilities information for the modeling was based on the Preliminary Grading Plan Drainage Exhibit prepared by Kier+Wright for the Costco site.

Figure 4 provides a schematic modeling map for the two development area projects. The "Existing" node was used to generate existing conditions hydrographs for the 10- and 100-year storms without additional routing.

Table 2 provides a summary of the design flows and the hydraulic parameters and characteristics of the drainage facilities.

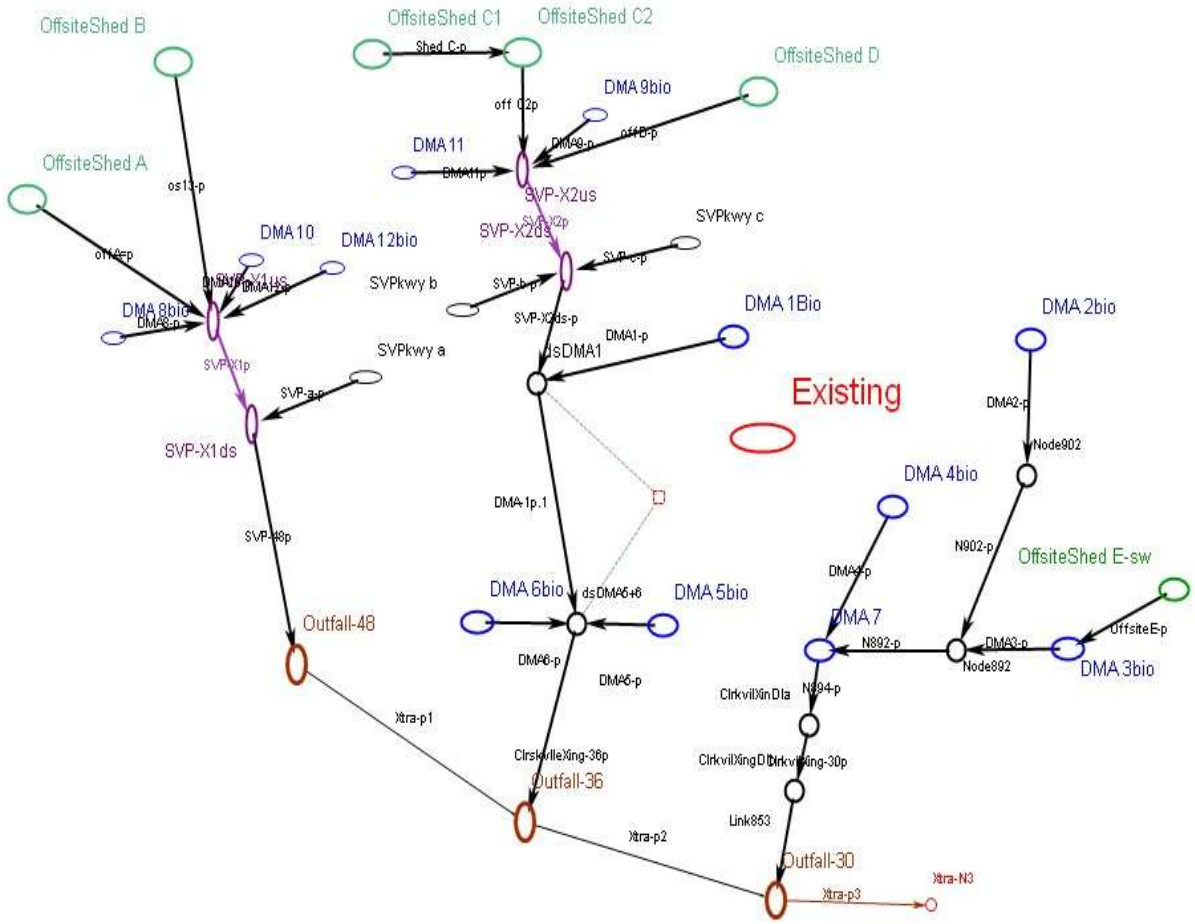

Figure 4 Modeling Map

The modeling results indicate that the proposed storm drain pipes have adequate capacity to convey the 10-year, 24-hour storm. Note that the bio-retention areas were not modeled as storage areas. If the bio-retention areas were added, there may be a decreased peak flow because of the attenuation throughout the development. They were not added because it seemed unnecessary.

Attachments 1, 2 and 3 provide screen shots of a highlighted reach of storm drain pipe within the project with the 10-year, 24-hr storm water surface profiles. This information is available in Table 2 but is also provided graphically to aid the reader.

ATTENUATION OF 100-YR FLOW

The facilities to attenuate the 100-year flow down to existing conditions are preliminary at this time but consist of an oversized pipe within the middle storm drain within the parking lot. An orifice or smaller pipe will then be used to meter the flow as necessary.

The preliminary design includes 220 lineal feet of 48-inch storm drain with a downstream 15-inch storm drain. The XP model was then configured to compare the flow along the normal 36-inch storm drain to the attenuated flow within the combined large and small pipes.

The bottom part of the model map shows that all the flows were combined as part of this evaluation. Note that the three outfalls are not and will not be connected and the configuration is for modeling and comparison purposes only.

Figure 5 shows the 100-year runoff hydrograph for existing conditions (102 cfs). Figure 6 shows the computed flows for the 10-yr, 100-yr and 100-yr attenuated flow (99) cfs for developed conditions. The red value in Figure 6 is the 100-year flow without attenuation.

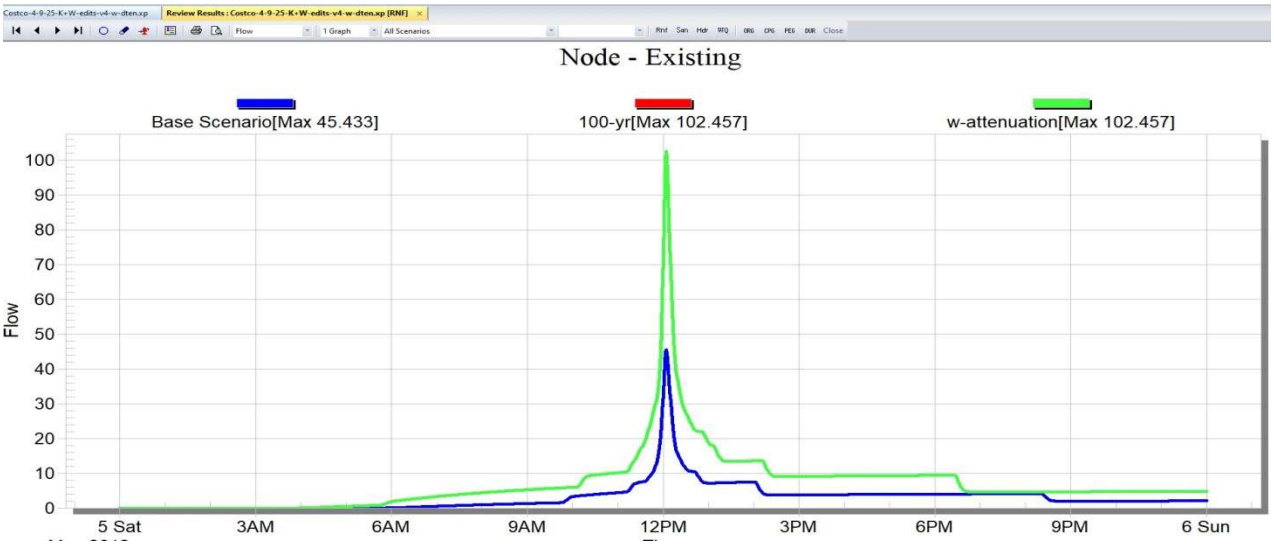

FIGURE 5. PLOT OF EXISTING CONDITIONS HYDROGRAPHS

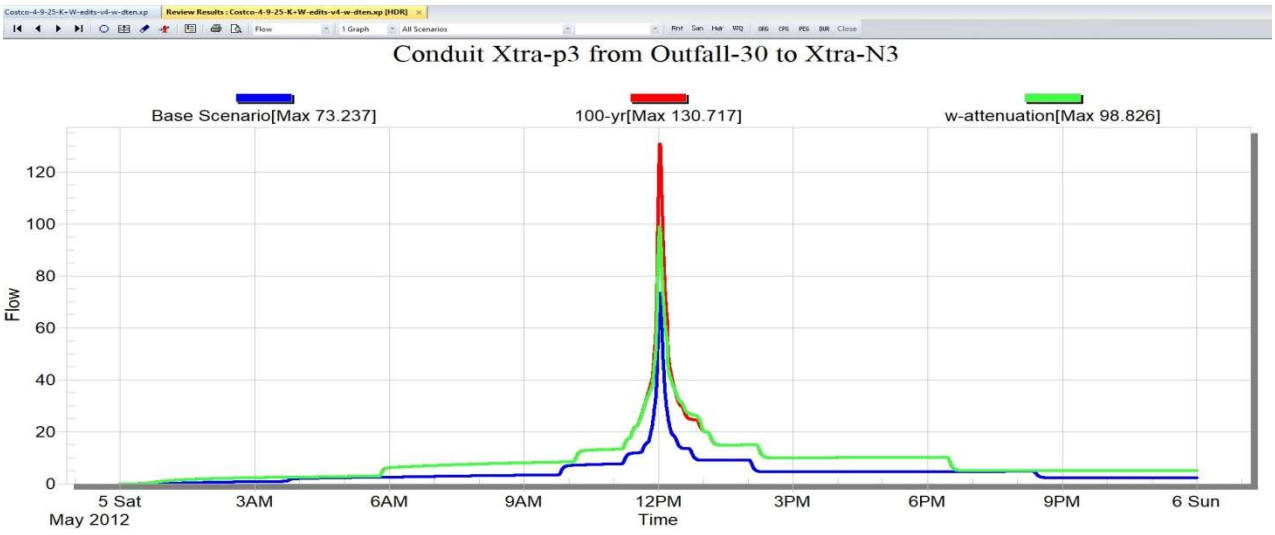

FIGURE 6. PLOT OF OUTFLOWS FROM DEVELOPMENT SITE

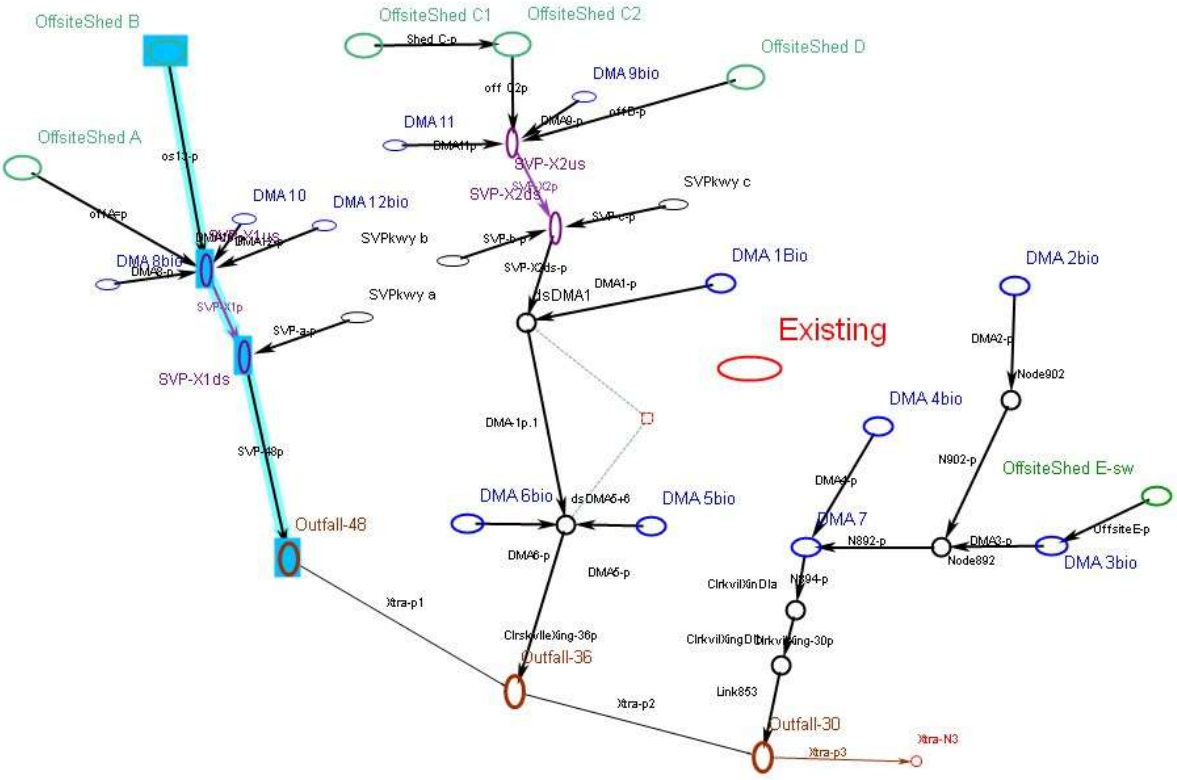
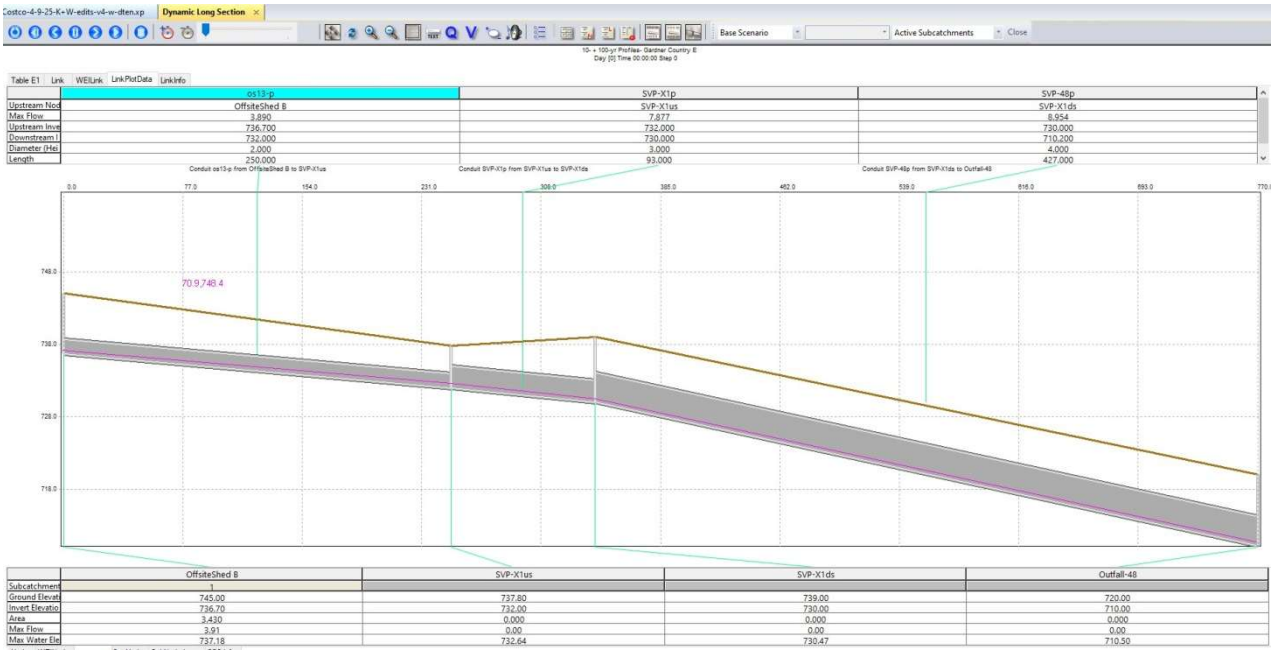
SUMMARY AND COMMENTS



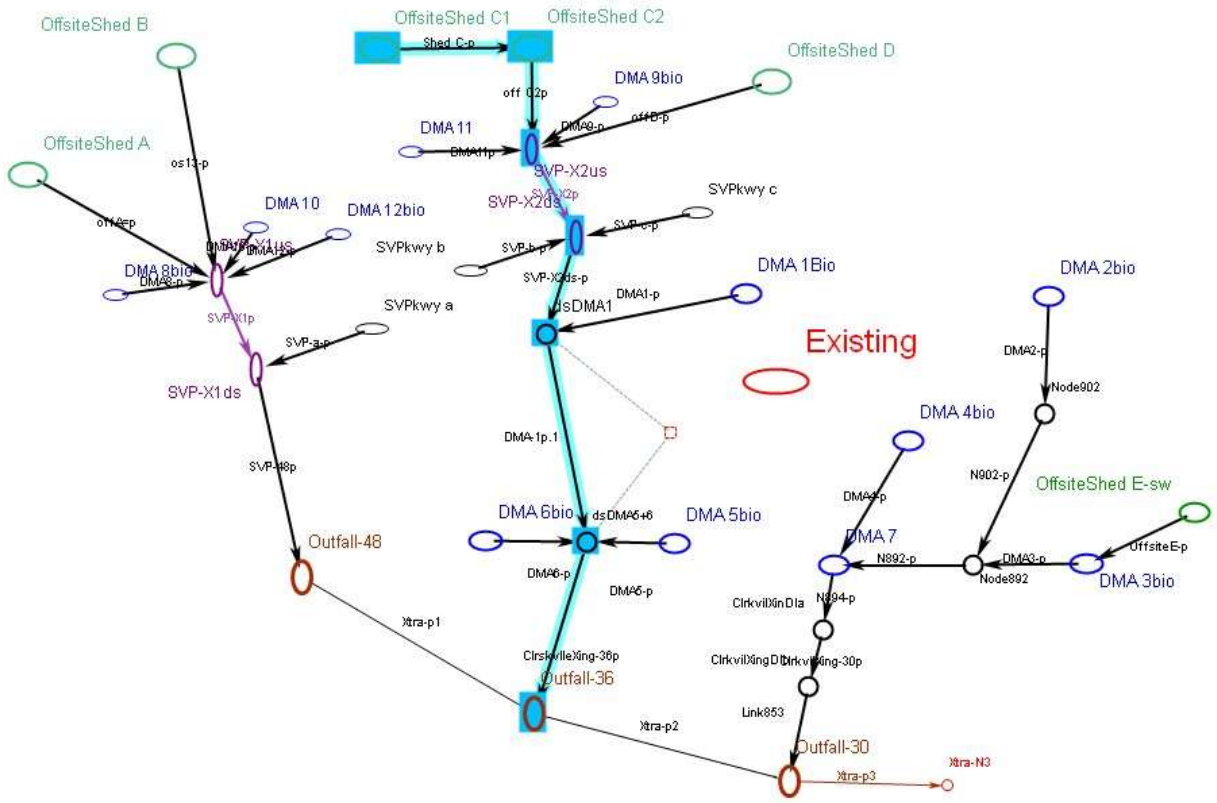
The modeling shows that the proposed piping network for the two projects has adequate capacity to convey the 10-year storm.

The modeling also shows that the 100-year peak flow can be attenuated on-site with a length of over-sized pipe connected to a smaller pipe, or with an orifice to reduce peak flow.



Additional information is available upon request including the XP-SWMM model and the rainfall 5-minute distribution depicted in Figure 2.

Water quality for the two projects is accomplished via the bio-retention area planters scattered within the project. No additional information has been provided within this document.



The offsite drainage northwest of the gas station is included in the analysis, but is considered as pass-through flow.

Long-Term Noise Measurement Calculations

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

Measurement Site: LT1
Measurement Date: February 25, 12:00 p.m. to February 26, 12:00 p.m.
Project Name: El Dorado County - Costco

		24		
L_{dn}	65.1	**CNEL**	65.2	

Notes:
[1] Computation of Sound Power are based on equation 7-1 on pg. 7-9 of Caltrans 2013
[2] Computation of the L_{dn} based on 1-hour L_{eq} measurements for each hour of a day are based on equation 2-23 on pg. 2-52 of Caltrans 2013.
[3] Computation of the CNEL based on 1-hour L_{eq} measurements for each hour of a day are based on equation 2-24 on pg. 2-53 of Caltrans 2013.
[4] Log factors for the L_{dn} and CNEL penalties are provided in Table 2-11 on pg. 2-48 of Caltrans 2013.
[5] Average noise level descriptors were logarithmicly averaged over the total number of hours

L_{dn}	58.7	**CNEL**	58.9	

Notes:
[1] Computation of Sound Power are based on equation 7-1 on pg. 7-9 of Caltrans 2013
[2] Computation of the L_{dn} based on 1-hour L_{eq} measurements for each hour of a day are based on equation 2-23 on pg. 2-52 of Caltrans 2013.
[3] Computation of the CNEL based on 1-hour L_{eq} measurements for each hour of a day are based on equation 2-24 on pg. 2-53 of Caltrans 2013.
[4] Log factors for the L_{dn} and CNEL penalties are provided in Table 2-11 on pg. 2-48 of Caltrans 2013.
[5] Average noise level descriptors were logarithmicly averaged over the total number of hours

[2] Based on Figure 6-5 from the Federal Transit Noise and Vibration Impact Assessment, 2006 (pg 6-23).

[3] Based on the following from the Federal Transit Noise and Vibration Impact Assessment, 2006 (pg 12-3).

$L_{eq}(equip) = E.L.+10*\log(U.F.) - 20*\log(D/50) - 10*G*\log(D/50)$

Where: E.L. = Emission Level;

U.F.= Usage Factor;

G = Constant that accounts for topography and ground effects (FTA 2006: pg 6-23); and

D = Distance from source to receiver.

Attenuation Calculations for Stationary Noise Sources

KEY:
Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

STEP 1: Identify the noise source and enter the reference noise level (dBA and distance).

STEP 2: Select the ground type (hard or soft), and enter the source and receiver heights.

STEP 3: Select the distance to the receiver.

Noise Source/ID	Reference Noise Level			Attenuation Characteristics				Attenuated Noise Level at Receptor		
	noise level (dBA)	@	distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	noise level (dBA)	@	distance (ft)
Loading Dock Activity (daytime: 55 dBA Leq)	59.3	@	100	hard	8	5	0.00	55.0	@	165
Loading Dock Activity (evening: 50 dBA Leq)	59.3	@	100	hard	8	5	0.00	49.8	@	300

Notes:

Estimates of attenuated noise levels do not account for reductions from intervening barriers, including walls, trees, vegetation, or structures of any type.

Computation of the attenuated noise level is based on the equation presented on pg. 176 and 177 of FTA 2018.

Computation of the ground factor is based on the equation presentd in Table 4-26 on pg. 86 of FTA 2018, where the distance of the reference noise leve can be adjusted and the usage factor is not applied (i.e., the usage factor is equal to 1).

Available: <http://www.transit.dot.gov/sites/fta.dot.gov/files/docs/research-innovation/118131/transit-noise-and-vibration-impact-assessment-manual-fta-report-no-0123_0.pdf>Accessed: March 5,

Addition of Noise Levels from Multiple Sources at a Discrete Receptor

OBJECTIVE: This work sheet is designed to estiamte the combined level of noise exposure at a single discrete receptor from multiple point sources.

KEY: Orange cells are for input.
Grey cells are intermediate calculations performed by the model.
Green cells are data to present in a written analysis (output).

Receptor Name: **Sensitive Receptors near El Dorado Hills Costco Project**

STEP 1: Identify the noise sources and enter the reference noise levels (dBA and distance).
Hour of Day (24-HR time)
STEP 3: Select the distance to the receptor and the reduction provided by any intervening barrier.

Step 1. Step 2. Step 3.

Noise Source	**Reference Noise Level**			**Attenuation Characteristics**				**Attenuated Noise Level at Receptor (SR 5)**			
	Reference Noise Level (dBA)	@	Reference Distance (ft)	Ground Type (soft/hard)	Source Height (ft)	Receiver Height (ft)	Ground Factor	Noise Level (dBA)	@	Distance to Receptor (ft)	Reduction Provided by Barrier, if any (dBA)
HVAC Unit	75.0	@	3	hard	35	5	0.00	25.8	@	870	0

Distance Propagation Calculations for Stationary Sources of Ground Vibration

KEY: Orange cells are for input.

Grey cells are intermediate calculations performed by the model.

Green cells are data to present in a written analysis (output).

STEP 1: Determine units in which to perform calculation.

— If vibration decibels (VdB), then use Table A and proceed to Steps 2A and 3A.

— If peak particle velocity (PPV), then use Table B and proceed to Steps 2B and 3B.

STEP 2A: Identify the vibration source and enter the reference vibration level (VdB) and distance.

STEP 3A: Select the distance to the receiver.

Table A. Propagation of vibration decibels (VdB) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (VdB)	@	distance (ft)	vibration level (VdB)	@	distance (ft)
Hoe Ram	87	@	25	79.9	@	43
Vibratory Roller	87	@	25	79.9	@	43
Large Bulldozer	87	@	25	79.9	@	43
Loaded Trucks	70	@	25	79.9	@	12
Small Bulldozer	58	@	25	78.8	@	5

The Lv metric (VdB) is used to assess the likelihood for vibration to result in human annoyance.

STEP 2B: Identify the vibration source and enter the reference peak particle velocity (PPV) and distance.

STEP 3B: Select the distance to the receiver.

Table B. Propagation of peak particle velocity (PPV) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noise Level at Receptor		
	vibration level (PPV)	@	distance (ft)	vibration level (PPV)	@	distance (ft)
Hoe Ram	0.089	@	25	0.237		13
Vibratory Roller	0.089	@	25	0.237		13
Large Bulldozer	0.089	@	25	0.237		13

The PPV metric (in/sec) is used for assessing the likelihood for the potential of structural damage.

Notes:

Computation of propagated vibration levels is based on the equations presented on pg. 185 of FTA 2018. Estimates of attenuated vibration levels do not account for reductions from intervening underground barriers or other underground structures of any type, or changes in soil type.

Introduction

Costco Wholesale (Costco) has proposed to construct an approximately 155,700 square foot warehouse retail facility and 30-fueling position fuel station (Project) in El Dorado County, CA along Silva Valley Parkway and just north of US 50. Silva Valley Parkway bifurcates the development with the warehouse retail building on the south side of the road and adjacent to Clarksville Crossing (South Site), and the fuel facility on the north side of the road (North Site). This report evaluates this Project under the California Environmental Quality Act (CEQA) to determine whether the Project would result in potentially significant impacts. Figure 1 presents the proposed Project site plan.

On the North Site, approximately 3.29 acres would be developed with a Costco members-only fuel facility and an employee parking area. The remainder of the North Site would include a 13.79 acre out-parcel that would remain undeveloped at this time (Remainder Area). Figure 1 presents the Remainder Area.

The Costco project proposes no development for the Remainder Area. However, development of the remainder area would be made more reasonably foreseeable by the proposed annexation of the entire North Site to the El Dorado Irrigation District and the El Dorado Fire District. Since such annexations are assumed to facilitate possible future development of the Remainder Area, even though there is not even a conceptual or contemplated plan for build out of that land, the analysis in this report conservatively assumes that such land would be developed consistent with the General Plan and zoning designations and density. The assumed total potential commercial development of the Remainder Area is approximately 138,000 square feet. This analysis programmatically studies development of the Remainder Area with 138,000 square feet of commercial uses.

Figure 1. Proposed Site Plan

CEQA Background & Significance Criteria

In January 2016, the California Office of Planning and Research (OPR), now the Governor's Office of Land Use and Climate Innovation (OLCI), published for public review and comment a Revised Proposal on Updates to the CEQA Guidelines on Evaluating Transportation Impacts in CEQA, recommending that transportation impacts for projects be measured using a vehicle miles traveled (VMT) metric. In December 2018, the California Natural Resources Agency certified and adopted the CEQA Guidelines update package, including the section implementing Senate Bill (SB) 743 (section 15064.3). OPR developed a Technical Advisory on Evaluating Transportation Impacts in CEQA, which contains OPR's technical recommendations regarding assessment of VMT, thresholds of significance, and mitigation measures. The Board of Supervisors of the County of El Dorado adopted its own VMT significance thresholds for analyzing transportation impacts under CEQA, consistent with OPR's guidance, in October 2020 (Resolution 141-2020).[1]

The Project's impact is not considered to be significant unless it would:

a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle, and pedestrian facilities.
b) Conflict or be inconsistent with CEQA Guideline section 15064.3, subdivision (b).
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment).
d) Result in inadequate emergency access.

Significance criterion "b" is related to the implementation of VMT as the primary performance metric. OPR recommends using a project's total VMT (as opposed to per-capita or per employee VMT) for retail projects because "… retail projects typically re-route travel from other retail destinations. A retail project might lead to increases or decreases in VMT, depending on previously existing retail travel patterns." Therefore, a project is considered to have a significant impact if it results in a net increase in existing regional VMT.

1. Consistency with Plans and Programs

The County of El Dorado (County) has jurisdiction over County streets and County-operated traffic signals. Caltrans has jurisdiction over State facilities and on- and off-ramp intersections with County streets. Kittelson reviewed the applicable programs, plans, ordinances, and policies that pertain to the Project's potential impacts on the transportation system.

FEDERAL

No federal plans, policies, regulations, or laws related to transportation and circulation were identified as applicable to the Project.

STATE

Senate Bill 743 (2020)

Senate Bill (SB) 743, passed in 2013, required the Governor's Office of Planning and Research (OPR) to develop new CEQA guidelines that address transportation metrics under CEQA. As stated in the legislation, upon adoption of the new guidelines, "automobile delay, as described solely by LOS or similar measures of vehicular capacity or traffic congestion shall not be considered a significant impact on the environment pursuant to this division, except in locations specifically identified in the guidelines, if any."

OPR published its proposal for the comprehensive updates to the CEQA Guidelines in November 2017 which included proposed updates related to analyzing transportation impacts pursuant to Senate Bill 743. These updates indicated that vehicle miles traveled (VMT) be the primary metric used to identify transportation impacts. In December of 2018, OPR published the most recent version of the Technical Advisory on Evaluating Transportation Impacts (December 2018) which provides guidance for VMT analysis.

The updated CEQA Guidelines were adopted on December 28, 2018. According to the new CEQA Guidelines (Section 15064.3), VMT replaces congestion as the metric for determining transportation impacts. The guidelines state, "Beginning July 1, 2020, the provisions of this section shall apply statewide."

State of California General Plan Guidelines (Governor's Office of Planning and Research 2017)

The State of California General Plan Guidelines, published in 2017, assists local governments in preparing general plans by providing detailed guidelines which streamline the process of updating general plans. The document provides free online tools and resources, promotes increased use of online data, and includes templates, sample policies and links to more information. The transportation section of this document notes objectives including designing with complete streets, improving safety for all modes, and improving air quality and health.

REGIONAL

2021-24 Metropolitan Transportation Improvement Program (Sacramento Area Council of Governments 2021)

The Metropolitan Transportation Improvement Program (MTIP) is a comprehensive listing of transportation projects that receive federal funds, require federal action, or are regionally significant. The MTIP includes transit, highway, local roadway, bicycle, and pedestrian investments. Projects in the MTIP are included in the federal TIP and the state TIP. Some features of the MTIP are that it: Addresses the federal requirements as identified in the Fixing America's Surface Transportation Act (FAST Act); covers four years of programming; includes approximately 520 projects total; programs over $2.4 billion of the over $3.9 billion of reasonably available federal, state, and local funding during the four-year period.

2020 Metropolitan Transportation Plan/Sustainable Communities Strategy (Sacramento Area Council of Governments 2020)

The 2020 Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) lays out a transportation investment and land use strategy to support a prosperous region, with access to jobs and economic opportunity, transportation options, and affordable housing that works for all residents. The plan also lays out a path for improving air quality, preserving open space and natural resources, and helping California achieve its goal to reduce greenhouse gas emissions that contribute to climate change. The Plan has four priority policy areas: build vibrant places for today's and tomorrow's residents; foster the next generation of mobility solutions; modernize the way we pay for transportation infrastructure; build and maintain a safe, reliable and multimodal transportation system.

COUNTY

El Dorado County Active Transportation Plan (El Dorado County Transportation Commission 2020)

The Active Transportation Plan establishes a long-term vision for improving walking and bicycling in El Dorado County. The plan provides a set of recommended infrastructure improvements and studies paired with education, encouragement, enforcement, and evaluation programs. This document also provides a strategy to ensure implementation of these projects and programs is manageable and fundable.

County of El Dorado General Plan (County of El Dorado 2019)

The El Dorado County General Plan policies and strategic actions that are relevant to the transportation and circulation impacts analyzed in this Project are listed below.

- Goal TC-X: To coordinate planning and implementation of roadway improvements with new development to maintain adequate levels of service on County roads.
    - Policy TC-Xg: Each development project shall dedicate right-of-way, design and construct or fund any improvements necessary to mitigate the effects of traffic from the project. The County shall require an analysis of impacts of traffic from the development project, including impacts from truck traffic, and require dedication of needed right-of-way and construction of road facilities as a condition of the development. This policy shall remain in effect indefinitely unless amended by voters.

- Goal TC-3: To reduce travel demand on the County's road system and maximize the operating efficiency of transportation facilities, thereby reducing the quantity of motor vehicle emissions and the amount of investment required in new or expanded facilities.
    - Policy TC-3c: The County shall encourage new development within Community Regions and Rural Centers to provide appropriate on-site facilities that encourage employees to use alternative transportation modes. The type of facilities may include bicycle parking, shower and locker facilities, and convenient access to transit, depending on the development size and location.

- Goal TC-5: to provide safe, continuous and accessible sidewalks and pedestrian facilities as a viable alternative transportation mode.
    - Policy TC-5b: In commercial and research and development subdivisions, curbs and sidewalks shall be required on all roads. Sidewalks in industrial subdivisions may be required as appropriate.

Western El Dorado County Short- and Long-Range Transit Plan (El Dorado County Transportation Commission 2019)

The Western El Dorado County Short- and Long-Range Transit Plan focuses on improving and enhancing public transit services in the coming years. The plan presents detailed, financially constrained improvements for future services and provides a more generalized long-range plan for El Dorado County. The plan includes short- and long-range transit service and capital improvements. Key points in the short-range service plan include establishing a 50 Express service, an El Dorado Hills Wednesday Activity Bus, and extended hours. Key points in the long-range plan include hourly service on the 50 Express Route and greater frequency of local routes.

El Dorado County Traffic Impact Mitigation Fee Program (County of El Dorado 2016)

The County utilizes its Capital Improvement Program (CIP) to identify and prioritize future transportation investments to meet the County's existing and future transportation needs. CIP projects can include roadways, intersections, sidewalks, bicycle lanes, traffic calming treatments, transit service improvement projects, and ongoing administrative costs for transportation monitoring programs, including traffic model update costs, traffic study guideline updates, and updates to the Circulation Element to the County's General Plan. Funding from most CIP projects is provided from a variety of sources including state and/or federal grants, and the County's Traffic Impact Mitigation (TIM) Fee Program. This program is required by General Plan Policy TC-Xb.

The TIM Fee Program is used to fund needed improvements including roadway widening, new roadways, roadway intersection improvements, and transit to deal with future growth during a defined period of time. Major updates to the CIP and TIM Fee Program are made by the County every five years as required by State law and General Plan policies. The most recent update to the Western Slope Roadway CIP and TIM Fee Program was completed and certified by the County Board of Supervisors in 2016, with amendments adopted as recently as June 2018. The current TIM Fee Program is based on 20 years of growth and TIM Fee Program-funded improvements are part of the CIP.

El Dorado County Regional Transportation Plan 2035 (El Dorado County Transportation Commission 2015)

The El Dorado County Transportation Commission is the Regional Transportation Planning Agency (RTPA) for El Dorado County (excluding the Tahoe Basin) and is responsible for the preparation of the El Dorado County Regional Transportation Plan (RTP). The current El Dorado County Regional Transportation Plan 2015 – 2035 was developed to guide the systematic development of a balanced, comprehensive, multi-modal transportation system. The RTP was developed to provide a clear vision of the regional transportation goals, objectives, and policies, complemented by short-term and long-term strategies for implementation. The El Dorado County RTP also serves as the El Dorado County portion of the Sacramento Area Council of Governments (SACOG) MTP.

IMPACT FINDING

Project Impact. The Project will develop a warehouse retail facility on an undeveloped parcel within El Dorado County with direct access to existing transportation facilities, including regional routes such as US-50. The proposed Costco facility will provide nearby members with a more convenient option and would benefit the local economy.

The Project will not require substantial modifications to the transportation network and would not explicitly conflict with any program, plan, ordinance, or policy addressing the circulation system, including those relating to transit, bicycle, or pedestrian facilities. Furthermore, the development of the Project will entail development review by the County and compliance with County land development and site access standards and policies. Therefore, the Project impact due to a conflict with existing plans, ordinances, or policies will be less than significant.

Remainder Area Impact. The Project proposes no development for the North Site Remainder Area. There are existing Class II bicycle facilities along Silva Valley Parkway. Like the Project, the development of the Remainder Area will entail development review by the County and compliance with County land development and site access standards and policies. Therefore, the Remainder Area impact due to a conflict with existing plans, ordinances, or policies is anticipated to be less than significant.

2. Impact to Regional VMT

The potential for an impact due to regional vehicle miles traveled (VMT) is evaluated by comparing the expected future condition (members traveling to/from the new facility) to the existing condition (members traveling to/from other existing facilities). Consistent with OPR's recommendations, this analysis considers a project to have a significant impact if it results in a net increase in existing regional VMT.

VMT DATA

This section provides an overview of the proprietary Costco membership data, transaction data, and member trip data that were used in this analysis.

Trip Generation Estimates

Trip generation estimates for each trip type were developed for the warehouse and fuel facility using trip rates from a database of proprietary Costco traffic data and travel characteristics maintained by Kittelson & Associates, Inc. (Kittelson).

COSTCO TRIP DATABASE

For more than 20 years, Kittelson has maintained a database of trip data and travel characteristics for Costco Wholesale. The database contains transportation information such as trip rates and trip type percentages for Costco locations throughout the United States as well as Canada and Mexico. The database is updated periodically when new Costco traffic counts or other such information become available to Kittelson. To best evaluate the anticipated transportation characteristics of the proposed warehouse in El Dorado County, Kittelson used the Costco trip database to develop a trip generation estimate as it provides use-specific data that most accurately represents the anticipated transportation characteristics of this unique development type.

The warehouse trip rates summarized herein rely on data collection conducted at Costco sites located across the western region of the United States. The trip studies were completed using industry standard engineering practices consistent with guidance within the Institute of Transportation Engineers (ITE) standard reference, Trip Generation Manual, 11th Edition. These cordon surveys were conducted between 2011 and 2024 and include 24 surveys of Costco warehouses with fuel stations in California, Arizona, Oregon, Utah, and Washington. The Costco buildings surveyed range in size between 115,707 square feet and 235,298 square feet, with an average size of 156,293 square feet. The existing Costco locations all included fuel stations, ranging from 20 to 32 fueling positions. Most Costco warehouses have an attached tire center for tire sales and installation, including the Project. The tire center is an ancillary use to the warehouse, and trips associated with the tire center are captured in the overall trip generation of a site. The data used for analysis of the Project includes trip data for warehouses with tire centers.

Internal (or shared) trip percentages, or the percentage of trips to the site that visit more than one Costco facility (e.g. warehouse *and* fuel facility,) are derived from Costco member transaction data – a trip is considered an internal trip if a member completed a transaction at two Costco facilities on site within one 90-minute window. Primary, pass-by, and diverted trip percentages were derived from member surveys

taken at existing Costco warehouses and fuel facilities. These trip types are described in more detail below.

Table 1 summarizes trip characteristics for weekday AM and PM peak hours, Saturday midday peak hour, and weekday daily. This VMT analysis only considers the weekday daily trip generation.

Table 1. Costco Warehouse Trip Characteristics

Land Use / Trip Type	Weekday Daily Trip Rate (per KSF)	Weekday AM Peak Rate			Weekday PM Peak Rate			Saturday Midday Peak Rate		
		Total	In	Out	Total	In	Out	Total	In	Out
Costco Warehouse	94.6	3	55%	45%	8.2	47%	53%	10.9	49%	51%
Internal Trips	14%	14%			13%			14%		
Primary Trips	38%*	10%			38%			46%		
Pass-by Trips	23%*	36%			23%			19%		
Diverted Trips	26%*	40%			26%			21%		

Source: Kittelson & Associates, Inc., 2025

*No data available for weekday daily primary, pass-by, and diverted trip percentages. Weekday PM peak values are assumed.

TRIP TYPES

Since travel behaviors and average trip distances (and therefore VMT) may differ between trips made to the warehouse versus trips made to the fuel facility, this analysis separates these trip types and evaluates the contribution of each trip type toward a potential impact to regional VMT. Trip types evaluated in the VMT analysis are described below.

- A **warehouse trip** is a member trip to the Costco *warehouse* facility. These trips may also include a shared trip to another facility within the development (e.g., fuel facility) but are assumed to be driven to the development by the warehouse (*warehouse-only trips* + *shared warehouse/fuel trips*).
    - A **primary warehouse trip** is a trip that motivates travel in the first place with a destination (i.e., the warehouse) that terminates the travel session. These are trips made to the warehouse or warehouse *and* fuel facility that are assumed to return to their previous location once all purchase transactions are complete. For this Project, these trips may be existing trips that are expected to shift from nearby Costco locations or new trips on the transportation network. The assumption that any trip not shifting from another Costco location is a new trip on the network is a conservative assumption since the analysis intentional avoids attempting to assume trips to existing non-Costco, large format retail facilities would shift to the Project.
    - A **pass-by warehouse trip** is a trip made during the course of an existing primary trip that does not require deviating from the primary trip route and already is passing by the Project site. Since these trips are assumed to have a trip distance of zero miles, they do not affect regional VMT, and thus pass-by trip VMT is not measured in this analysis.
    - A **diverted warehouse trip** is a trip made during the course of a primary trip that requires deviating from the primary trip route. For this analysis, these trips are assumed to originate from primary trips along US-50, from which members deviate from their original path to visit the warehouse or warehouse and fuel facility. They consist of both existing trips that

are expected to shift from nearby Costco locations and new trips on the transportation network.

- A **gas trip** is a member trip made to the Costco *fuel* facility that does not include a visit to the warehouse. These trips are considered separate from warehouse trips since they have unique characteristics that affect VMT *(Gas-only trips)*.
    - A **primary gas trip** is a trip that motivates travel in the first place with a destination (i.e., the fuel facility) that terminates the travel session. These are trips made to the fuel facility that are assumed to return to their previous location once the purchase transaction is complete. For this Project, these trips are assumed to be existing trips on the transportation network that would otherwise be made at other Costco fuel facilities or existing non-Costco gas stations and would shift to the new facility. None of these trips are assumed to be new on the roadway network as gas purchasing is motivated by a household's driving behaviors and is not motivated by the mere presence of a gas station (i.e., people who would buy gas at the Costco fuel station already are buying gas somewhere today).
    - A **pass-by gas trip** is a trip made during the course of a primary trip that does not require deviating from the primary trip route. Since these trips are assumed to have a trip distance of zero miles, they do not affect regional VMT, and thus pass-by trip VMT is not measured in this analysis.
    - A **diverted gas trip** is a trip made during the course of a primary trip that requires deviating from the primary trip route. For this analysis, these trips are assumed to originate from primary trips along US-50, from which members deviate from their original path to visit the warehouse or warehouse and fuel facility. They are assumed to be existing trips on the transportation network that would otherwise divert to nearby Costco fuel facilities or non-Costco gas stations.

- An **employee trip** is a trip made by an employee to or from the new facility. These trips are assumed to be new primary trips on the transportation network.

Table 2 shows the anticipated weekday daily trip generation for the Project. These values are used to calculate VMT associated with Costco members and employees in subsequent sections of this report. As shown in the table, the Project is expected to generate 14,729 weekday trips, which includes 8,350 total warehouse trips, 5,779 gas-only trips, and 600 employee trips.

Table 3 shows the estimated weekday daily trip generation for the nearby Folsom Costco, since a portion of Project trips are expected to shift from this location. The estimate was developed using driveway counts and fuel facility counts at the Folsom location, as well as member surveys and member transaction data.

Table 2. Project Daily Trip Generation

Trip Type	Weekday Daily Trip Ends
Total Trips	**14,729**
Total Warehouse Trips[1]	**8,350**
Primary Warehouse Trips	5,538
Pass-by Warehouse Trips	1,454
Diverted Warehouse Trips	1,358
Total Gas Trips[2]	**5,779**
Primary Gas Trips	1,667
Pass-by Gas Trips	1,796
Diverted Gas Trips	2,316
Total Employee Trips	**600**
Primary Employee Trips	600
Pass-by Employee Trips	0
Diverted Employee Trips	0

Source: Kittelson & Associates, Inc., 2025

[1] Shared warehouse/gas trips are included in this value since the warehouse is the primary use of the site and is expected draw these shared trips; these trips share characteristics in terms of travel time and distance that influence VMT

[2] Gas-Only trips

Table 3. Folsom Costco Daily Trip Generation

Trip Type	Weekday Daily Trip Ends
Total Trips	**15,476**
Total Warehouse Trips[1]	**8,624**
Primary Warehouse Trips	5,784
Pass-by Warehouse Trips	1,478
Diverted Warehouse Trips	1,362
Total Gas Trips[2]	**6,252**
Primary Gas Trips	1,803
Pass-by Gas Trips	1,943
Diverted Gas Trips	2,506
Total Employee Trips	**600**
Primary Employee Trips	600
Pass-by Employee Trips	0
Diverted Employee Trips	0

Source: Kittelson & Associates, Inc., 2025

[1] Shared warehouse/gas trips are included in this value since the warehouse is the primary use of the site and is expected draw these shared trips; these trips share characteristics in terms of travel time and distance that influence VMT

[2] Gas-Only trips

Costco Member/Transaction Data

To understand how Costco member VMT in the region may change with the addition of the Project, the following data regarding Costco members, market areas, and transactions were compiled.

- Aggregated home locations of Costco members who shopped at an existing Costco facility in the Project area during September 2024, grouped into 1-square-mile zones.
    - Folsom Costco – located approximately 4 miles southwest of the Project at 1800 Cavitt Drive in Folsom, CA
- Number of visits to the existing Folsom Costco in September 2024 made by members in each 1-square-mile zone, separated into warehouse-only visits, gas-only visits, and shared warehouse/gas visits. A member visit was assumed to be a shared warehouse/gas visit if transactions were made at both the warehouse and the fuel facility within a 90-minute period.
- Market areas of the existing Folsom Costco and proposed El Dorado Costco locations

VMT ASSESSMENT

This section presents the VMT analysis methodology and findings for each trip type provided in Table 2.

Warehouse Trip VMT

Warehouse trip VMT refers to the daily miles traveled by members to and from the warehouse. Warehouse trip VMT includes trips made to the warehouse *only* as well as trips made to both the warehouse and on-site fuel facility and includes both primary and diverted trips.

PRIMARY WAREHOUSE TRIPS

Primary warehouse trips made by members to the Project site are expected to either 1) replace existing warehouse trips to the Folsom Costco or 2) be new trips made on the transportation network. This section assesses VMT associated with primary warehouse trips.

SHIFT FROM EXISTING COSTCO LOCATIONS

The first component of the VMT analysis evaluates how the VMT associated with Costco members making primary trips to an existing Costco warehouse may change with the addition of a new location in El Dorado County. The new location provides another option for existing Costco members and results in lower average trip lengths for members who choose to shift their existing trip to a more convenient location.

A spatial analysis was conducted to determine which Costco members would likely shift their existing trips and to derive the associated effect to regional VMT. ArcGIS Online software was used to calculate average trip distances to the existing Folsom Costco and the proposed new facility for two scenarios: without and with the new facility. The software determined the most convenient routes between each 1-square-mile zone and the existing Folsom Costco. Average trip distances were calculated using proprietary Costco transaction data from September 2024. This analysis was then conducted assuming the presence of the new El Dorado facility and assuming members would visit the Costco location most convenient to them

(i.e., the one located within the shortest travel time from their homes). The following provides more details regarding the methodology and assumptions of this analysis:

- The center of each 1-square-mile zone was used for the starting/ending point of member trips (see Figure 2).

- The data provided by Costco includes information regarding warehouse-only and shared warehouse/gas visits at the existing Folsom Costco in September 2024. The member transactions were limited to those made by members who live within Costco's pre-defined market areas for the Folsom and El Dorado locations. This subset is used as a proxy for primary trips; transactions made by members whose homes are far from the site and were likely associated with pass-by or diverted trips (instead of primary trips beginning and ending at members' homes) are eliminated from the dataset.

- Each transaction is assumed to correspond to two one-way trips between the members' homes and the Costco facility (i.e., one roundtrip).

- To calculate the average primary trip lengths to the existing Folsom Costco, trip distances between each 1-square-mile zone and the existing facility were determined using ArcGIS online software. Trips were routed based on minimum travel time (as opposed to shortest distance recognizing shorter distances along low-speed streets can result in longer travel times). These distances were then multiplied by the number of transactions made at facility by members within each 1-square-mile zone to calculate the total one-way miles traveled by members to the Folsom Costco. This value divided by the average daily visits provides the average one-way trip length. Table 4 shows the average existing trip lengths.

- To calculate the average primary trip length when the new warehouse opens in El Dorado County, first it was determined which existing Costco members would shift their trips to the new facility. For this analysis, it was assumed that if the travel time from a 1-square mile zone to the new location was less than the travel time to the existing Folsom location, all members within that zone would choose to shop at the new location. In other words, all trips currently made from that zone to an existing Costco location are assumed to shift to the new location. For zones that are closer (by travel time) to the Folsom Costco, no shift was made, and trips by members in those zones were assumed to remain as they are today. Figure 2 shows the approximate home locations of existing Costco members whose primary warehouse trips are assumed to shift from the Folsom Costco to the El Dorado Costco.

- The proprietary transaction data is used to calculate 1) the average trips lengths for the existing and proposed conditions and 2) the percentage of existing trips expected to shift to the new facility. The transaction data is *not* used to estimate trip generation; a separate trip generation estimate based on trip generation data collected at other Costco warehouse retail facilities with fuel stations (as previously described) is used to compute VMT.

Table 4 provides the average primary warehouse trip distances for the existing and Project conditions (8.90 miles and 7.20 miles, respectively), as well as the portion of existing primary warehouse trips expected to shift from the Folsom warehouse (55%). Table 5 shows how these values are used in combination with the trip generation estimates presented in Table 2 and Table 3 to determine how the shifting of primary warehouse trips affects regional VMT.

Table 4. Average Primary Warehouse Trip Distances - Existing vs. Proposed

Costco Location	Existing			Proposed (after El Dorado location opens)		
	Daily Transactions	Total One-Way Distance (vehicle miles)	Average One-Way Trip Distance (mi)	Daily Transactions	Total One-Way Distance (vehicle miles)	Average One-Way Trip Distance (mi)
Folsom	3,828	34,071	8.90	1,733	6,748	3.89
El Dorado	-	-	-	2,095	20,817	9.94
Total	**3,828**	**34,071**	**8.90**	**3,828**	**27,565**	**7.20**

Source: Kittelson & Associates, Inc., 2025

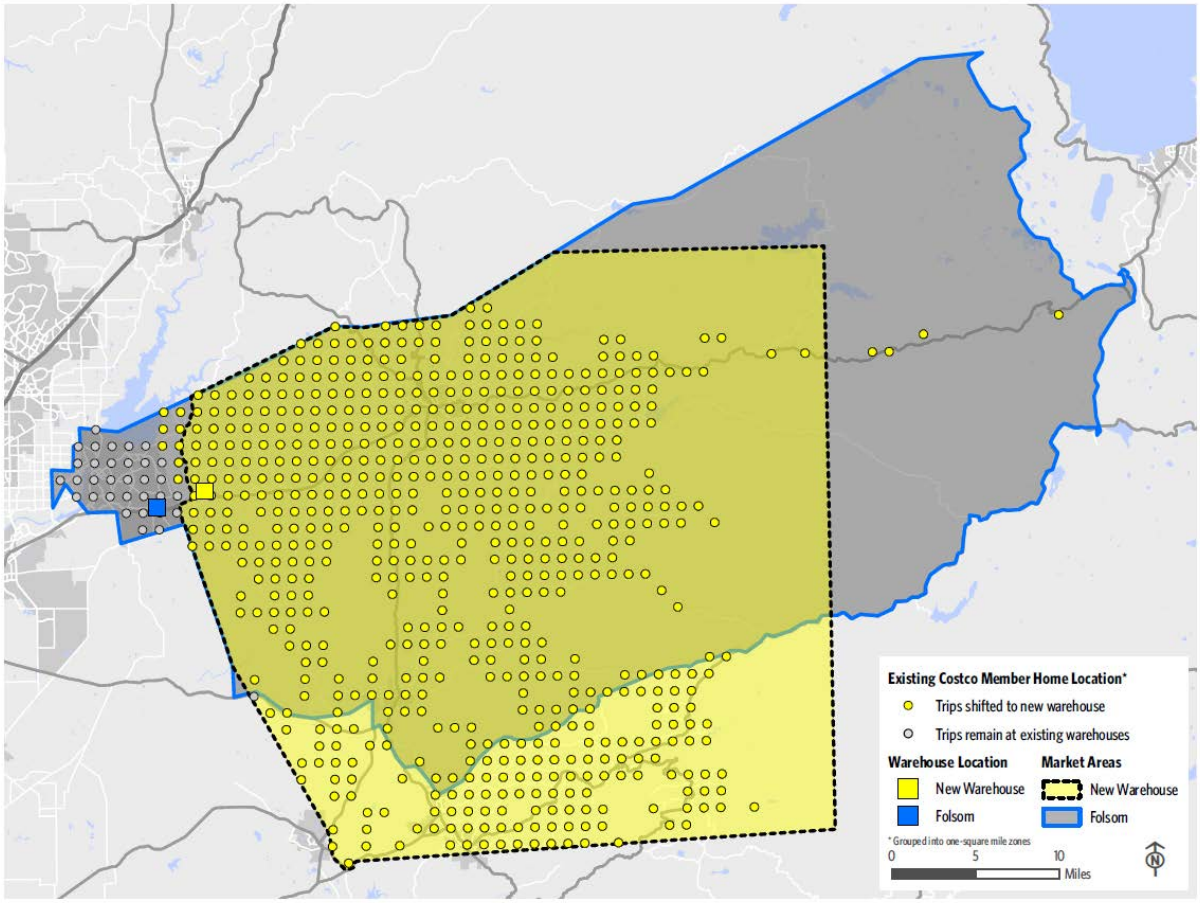

Table 5. Primary Warehouse Trip VMT – Shifting Existing Trips from Folsom Costco

Scenario / Location	Primary Warehouse Trip Length (mi)	Primary Warehouse Trips	Primary Warehouse Trip VMT
Existing Conditions	**8.90**	**5,784**	**51,478**
Folsom	8.90	5,784	51,478
Future Conditions	**7.20**	**5,784**	**41,648**
Folsom	3.89	2,619	10,188
El Dorado	9.94	3,165	31,460
		Change in Regional VMT	**-9,830**

Source: Kittelson & Associates, Inc., 2025

As shown in Table 5, the opening of the new warehouse in El Dorado County is expected to result in 3,165 daily existing primary warehouse trips to the Folsom Costco to shift to the new facility. This shift will result in a decrease in regional VMT of 9,830 miles.

Figure 2. VMT Analysis – Existing Primary Warehouse Trips Shifted to New Warehouse

NEW PRIMARY WAREHOUSE TRIPS

As shown in Table 5, 3,165 of the estimated 5,538 primary warehouse trips are expected to shift from the nearby Folsom Costco. The remaining 2,373 trips are assumed to be new trips on the network, made by existing or new members who previously would not have made a trip to a Costco location.

Table 6 presents the VMT associated with new primary warehouse trips. Assuming a trip length of 9.94 (developed through the previous analysis and presented in Tables 3 and 4), new primary warehouse trips are expected to generate approximately 23,588 daily vehicle miles.

Table 6. Primary Warehouse Trip VMT - New Trips

Primary Warehouse Trip Length (mi)	New Primary Warehouse Trips	New Primary Warehouse Trip VMT
9.94	2,373	**+23,588**

Source: Kittelson & Associates, Inc., 2025

DIVERTED WAREHOUSE TRIPS

The Project is expected to generate 1,358 daily diverted warehouse trips, which are assumed to originate from US-50. Since the Folsom Costco is located in close proximity to the Project (about 4 miles to the west) and currently generates diverted trips off US-50, a portion of the Project's diverted warehouse trips are expected to replace existing trips to the Folsom Costco. The remaining trips are assumed to be new diversions made on the transportation network. This section assesses VMT associated with diverted warehouse trips.

SHIFT FROM EXISTING COSTCO LOCATIONS

Based on the GIS exercise completed for the primary warehouse trip VMT assessment, approximately 55% of Folsom Costco's diverted warehouse trips are expected to shift to the new location in El Dorado County. To determine how this shift will affect the VMT associated with these trips, average diversion distances were calculated for both the existing Folsom and proposed El Dorado warehouses. Trip distances reflect the average distance traveled to divert from the original path (US-50) to visit the facility (inbound) and to return to the original path, minus any progress made toward the original trip (outbound). Table 7 presents the diverted warehouse trip distances for the Folsom and El Dorado warehouses.

Table 7. Diverted Warehouse Trip Distances

Diversion Route	Trip Distance to Folsom Warehouse (mi)	Trip Distance to El Dorado Warehouse (mi)
US-50 Westbound	0.33	0.13
US-50 Eastbound	0.43	0.23
Average	**0.38**	**0.18**

Source: Kittelson & Associates, Inc., 2025

Table 8 presents the VMT associated with shifting existing diverted warehouse trips from the Folsom Costco. As shown in the table, Project trips are expected to replace 745 of the existing trips to Folsom, resulting in a decrease in regional VMT of 150 miles.

Table 8. Diverted Warehouse Trip VMT – Shifting Existing Trips from Folsom Costco

Scenario / Location	Diverted Warehouse Trip Length (mi)	Diverted Warehouse Trips	Diverted Warehouse Trip VMT
Existing Conditions	**0.38**	**1,362**	**518**
Folsom	0.38	1,362	518
Future Conditions	**0.27**	**1,362**	**368**
Folsom	0.38	617	234
El Dorado	0.18	745	134
		Change in Regional VMT	**-150**

NEW DIVERTED WAREHOUSE TRIPS

As shown in Table 8, 745 of the estimated 1,358 diverted warehouse Project trips are expected to shift from the nearby Folsom Costco. The remaining 613 trips are assumed to be new trips on the network, made by existing or new members who previously would not have made a diverted trip to a Costco location.

Table 9 presents the VMT associated with new diverted warehouse trips. Assuming a trip length of 0.18 (presented in Table 7), new diverted warehouse trips are expected to generate approximately 110 daily vehicle miles.

Gas Trip VMT

Gas Trip VMT refers to the daily miles traveled by members to and from the fuel facility. Gas Trip VMT includes primary and diverted trips made to the fuel facility *only* and does not include trips made to both the warehouse and fuel facility[2]. All Project gas trips are assumed to be existing trips on the transportation network that are currently being made at nearby Costco fuel facilities or non-Costco gas stations since people's demand for gas is based on household driving trends and not on the mere presence of gas stations.

PRIMARY GAS TRIPS

Primary gas trips made by members to the Project site are expected to 1) replace existing primary gas trips to the Folsom Costco or 2) replace existing primary gas trips to non-Costco gas stations. This section assesses VMT associated with primary gas trips.

[2] Shared trips are accounted for in the "Warehouse Trip VMT" analysis

SHIFT FROM EXISTING COSTCO LOCATIONS

The same spatial analysis conducted for the primary warehouse trips was conducted using data regarding gas trips to determine which Costco members would likely shift their existing trips from the Folsom Costco to the new location. ArcGIS Online software was used to calculate average trip distances to the existing and proposed fuel facilities, without and with the new facility. The data provided by Costco and used in this analysis includes information regarding gas-only visits at the existing Folsom Costco in September 2024.

The methodology and assumptions described in the "Primary Warehouse Trips" section of this report also apply to this analysis with one key difference: for warehouse trips, the pre-defined Costco market areas served as boundaries to determine which member transactions were assumed to be associated with primary trips to the warehouse. However, since gas-only trips are assumed to be relatively short trips of convenience, member gas transactions were limited to those made by member households within a 10-minute drive of each site. This eliminates transactions made by members whose homes are farther from the site and were likely associated with pass-by or diverted trips (instead of primary trips beginning and ending from members' homes). Figure 3 shows the approximate home locations of members expected to shift their existing gas trips from the Folsom location to the new location in El Dorado County.

Table 10 provides the average trip distances for the existing and proposed conditions (2.30 miles and 2.18 miles, respectively), as well as the portion of existing primary gas trips expected to shift from the Folsom warehouse (8%). Table 11 shows how these values are used (with the trip generation estimates presented in Table 2 and Table 3) to determine how the shifting of primary gas trips affects regional VMT.

Table 10. Average Primary Gas Trip Distances – Existing vs. Proposed

Costco Location	Existing			Proposed (after El Dorado location opens)		
	Daily Transactions	Total One-Way Distance (vehicle miles)	Average One-Way Trip Distance (mi)	Daily Transactions	Total One-Way Distance (vehicle miles)	Average One-Way Trip Distance (mi)
Folsom	419	963	2.30	384	827	2.15
El Dorado	-	-	-	35	88	2.50
Total	**419**	**963**	**2.30**	**419**	**915**	**2.18**

Table 11. Primary Gas Trip VMT – Shifting Existing Trips from Folsom Costco

Scenario / Location	Primary Gas Trip Length (mi)	Primary Gas Trips	Primary Gas Trip VMT
Existing Conditions	**2.30**	**1,803**	**4,147**
Folsom	2.30	1,803	4,147
Future Conditions	**2.18**	**1,803**	**3,929**
Folsom	2.15	1,652	3,552
El Dorado	2.50	151	378
		Change in Regional VMT	**-218**

Source: Kittelson & Associates, Inc., 2025

As shown in Table 11, the opening of the new warehouse in El Dorado County is expected to result in 151 daily existing primary gas trips to the Folsom Costco to shift to the new facility. This shift will result in a decrease in regional VMT of 218 miles.

Figure 3. VMT Analysis – Existing Primary Gas Trips Shifted to New Warehouse

SHIFT FROM EXISTING NON-COSTCO GAS STATIONS

As shown in Table 11, 151 of the estimated 1,667 primary gas trips are expected to shift from the nearby Folsom Costco. The remaining 1,516 trips are assumed to be existing trips shifted from non-Costco as stations in the vicinity of the Project.

To determine how these trips will affect regional VMT, a similar GIS exercise to the one previously described was completed to understand the difference in average trip lengths between 1) members' homes and the new Costco fuel facility and 2) members' homes and the closest non-Costco gas station.

- For all member households within 10 minutes of the new facility, the average distance to the new Costco fuel facility (when accounting for minimal travel time) is 3.76 miles.
- For these same households, the average distance to their nearest non-Costco gas station is 1.92 miles. This value was determined using ArcGIS online to route each member household 1-square-mile zone to the nearest gas station, using a shapefile consisting of all gas stations in California provided by the California Energy Commission[3].

Table 12 shows the change in VMT associated with 1,516 existing primary gas trips shifting from non-Costco gas stations to the new facility. As shown in the table, the average trip distance for these trips is expected to increase from 1.92 miles to 3.76 miles, increasing regional VMT by about 2,789 miles.

Table 12. Primary Gas Trip VMT - Shifting Existing Trips from Non-Costco Gas Stations

	Primary Gas Trips	Average Trip Distance (mi)	VMT
Existing Conditions *Non-Costco Gas Stations*	1,516	1.92	2,911
Future Conditions *Costco Fuel Facility*	1,516	3.76	5,700
		Change in Regional VMT	**+2,789**

Source: Kittelson & Associates, Inc., 2025

DIVERTED GAS TRIPS

Of the 5,779 daily gas trips anticipated at the El Dorado Costco fuel facility, 2,316 are expected to be diverted trips. Similar to primary gas trips, all diverted gas trips are assumed to replace existing trips on the network, shifting from either the nearby Folsom Costco or a non-Costco gas station. This section assesses VMT associated with diverted gas trips.

SHIFT FROM EXISTING COSTCO LOCATIONS

Based on the GIS exercise completed for the primary gas trip VMT assessment, approximately 8% of Folsom Costco's diverted gas trips are expected to shift to the new location in El Dorado County. The diverted trip distances calculated for warehouse trips (presented in Table 7) remain valid for gas trips, since both trip types are expected to divert from/to the same location (US-50).

[3] https://hub.arcgis.com/datasets/ec575b2693f64199866bc18744d232fe/explore

Table 13 presents the VMT associated with shifting existing diverted gas trips from the Folsom Costco. As shown in the table, Project trips are expected to replace 209 of the existing trips to Folsom, resulting in a decrease in regional VMT of 41 miles.

Table 13. Diverted Gas Trip VMT – Shifting Existing Trips from Folsom Costco

Scenario / Location	Diverted Gas Trip Length (mi)	Diverted Gas Trips	Diverted Gas Trip VMT
Existing Conditions	**-**	**2,506**	**952**
Folsom	0.38	2,506	952
Future Conditions	**-**	**2,506**	**911**
Folsom	0.38	2,297	873
El Dorado	0.18	209	38
		Change in Regional VMT	**-41**

Source: Kittelson & Associates, Inc., 2025

SHIFT FROM NON-COSTCO GAS STATIONS

The remaining 2,107 daily diverted gas trips that are not expected to shift from the Folsom Costco are assumed to be existing trips that would shift from nearby non-Costco gas stations. Given the numerous non-Costco gas stations present near US-50 off-ramps and the minimal trip distances associated with these trips, this analysis conservatively assumes a length of zero miles.

Table 14 presents the change in regional VMT associated with these 2,107 diverted gas trips. As shown in the table, they are anticipated to increase regional VMT by about 379 miles.

Table 14. Diverted Gas Trip VMT – Shifting Existing Trips from Non-Costco Gas Stations

	Diverted Gas Trips	Average Diverted Gas Trip Distance (mi)	VMT
Existing Conditions *Non-Costco Gas Stations*	2,107	0	0
Future Conditions *Costco Fuel Facility*	2,107	0.18	379
		Change in Regional VMT	**+379**

Source: Kittelson & Associates, Inc., 2025

Employee Trip VMT

Employee Trip VMT was estimated using the 2018 countywide home-based work VMT per employee of 12.75, provided on El Dorado County's map server[4]. This VMT rate was multiplied by the estimated number of employees for the new facility (300) to calculate total daily employee VMT. As presented in Table 15, the expected daily employee VMT for the new Costco facility is 3,825 miles.

[4] https://www.arcgis.com/home/webmap/viewer.html?url=https%3A%2F%2Fsee-eldorado.edcgov.us%2Farcgis%2Frest%2Fservices%2FHosted%2FEDC_TAZs_with_a_Total_VMT_per_Service_Population_below_the_Countywide_Average%2FFeatureServer%2F6&source=sd

Latent Demand VMT

The existing Folsom Costco is expected to become less crowded with the opening of the new warehouse in El Dorado County after some existing members shift their trips to the new warehouse. As Costco has observed at other warehouses when a new location opens in the same market area, this latent demand could result in an increase in trip frequency to existing warehouses by existing members who continue to shop at their same warehouse. To estimate the number of additional trips expected at the Folsom warehouse, Costco transaction data from representative warehouses in California were analyzed.

The analysis demonstrated that existing members tend to purchase more products at existing warehouses (increased sales) after a new warehouse is opened, but the increase in visit frequency (trips) to the existing warehouse is relatively minor. Table 16 shows the average annual change in member trip frequency (4.5%) at three California Costco warehouse locations after another warehouse opened in the same market area. As shown in the table, the existing Costco warehouse locations see an average of 1.5 additional trips per member per year as a result of latent demand.

Table 16. Change in Member Frequency Associated with New Warehouse Opening

Costco Location	New Costco Opening	Average Annual Visit Frequency (Trips per Year)			
		Before	After	Change	% Change
Visalia	New Hanford	34.5	35.5	1	2.9%
Garden Grove	Huntington Beach	44	45.5	1.5	3.4%
South Sacramento	Elk Grove	27.5	29.5	2	7.3%
Average				**1.5**	**4.5%**

Source: Kittelson & Associates, Inc., 2025

Table 17 presents the change in VMT associated with an increase in trip frequency to the existing warehouses after a new warehouse opens (i.e. latent demand trips). As shown in the table, daily regional VMT is expected to increase by 671 miles.

Table 17. Latent Demand VMT

Change in Regional Total VMT

Table 18 presents the change in regional daily VMT associated with the new Costco facility. The change in total regional daily VMT is calculated by comparing the existing VMT by Costco members in the Project area and VMT by members and employees after the new facility is opened. As presented in the table, the change in total regional daily VMT with the new facility is estimated to be a net increase of 21,123 miles.

Table 18. Change in Regional Total VMT, Costco Development

North Site Remainder Area VMT

North Site Remainder Area VMT was estimated using land use, daily trips, and average trip length information for year 2040 in the current approved version of the El Dorado County travel forecast model. The traffic analysis zone (TAZ) in the model encompassing the Project and Remainder Area represents 24 acres, which is approximately the total acreage of the Project site and Remainder Area. The Remainder Area is 13.79 acres or 57% of the acreage assumed for the TAZ in the model. The model generates 4,427 daily trips by commercial uses in the TAZ. For this analysis, it is assumed the Remainder Area when developed with 138,000 SF of commercial uses would generate 57% of the daily trips generated by the TAZ in the model, or 2,536 daily trips. The travel forecast model provides an average trip length of 4.52

miles for all trip types in the model. VMT for the Remainder Area was computed by multiplying daily trips by this average trip length.

Table 19 presents the VMT for the Remainder Area. As shown in the table, the change in total regional daily VMT with development of 138,00 SF of commercial uses in the Remainder Area is estimated to be a net increase of 11,463 miles.

Table 19: North Site Remainder Area VMT

Daily trips	Average Trip Length	VMT
2,536	4.52	**+11,463**

Source: Kittelson & Associates, Inc., 2025

IMPACT FINDING

With operation of the Costco warehouse, regional daily VMT is estimated to increase by 21,123 miles. When the Remainder Area develops, regional daily VMT is estimated to increase by 11,463 miles. Therefore, the Project impact due to VMT will be significant, and the future Remainder Area impact to VMT is anticipated to be significant.

VMT Mitigation

The California Air Pollution Control Officers Association (CAPCOA) first published a handbook in 2010 titled *Quantifying Greenhouse Gas Mitigation Measures Handbook* (GHG Handbook). The GHG Handbook was updated by the Sacramento Metropolitan Air Quality Management District and adopted by CAPCOA in December 2021. The GHG Handbook is provided as a planning resource for agencies and developers. It includes a transportation section that discusses solutions to mitigate VMT by shifting modes of travel from single-occupancy vehicles to shared or active modes of transportation.

Table 20 provides trip reduction programs/measures from the GHG Handbook aimed at reducing VMT associated with the Project. The table provides only measures that could reasonably be considered for the Costco Project, given the implementation scale, nature of the proposed Project, and/or limited jurisdictional authority of Costco to implement particular measures.

Table 20: Trip Reduction Programs for Employees (Project/Site)

#	VMT Mitigation Measure	Percent Reduction	Notes
T-7	Commute Trip Reduction Marketing	Up to 4%	
T-8	Provide Ridesharing Program	Up to 8%	Designated parking spaces for rideshare vehicles; Designated passenger loading and unloading and waiting areas.
T-10	Provide End-of-Trip Bicycle Facilities	Up to 4.4%	
T-18	Provide Pedestrian Network Improvement	Up to 6.4%	

Source: GHG Handbook, 2021

PROPOSED VMT MITIGATION MEASURES

Costco Wholesale's business model involves the sale of large items and the sale of items in bulk. As such, walking or biking to a Costco warehouse typically is not a viable method of travel for members as they would have difficulty transporting their goods home with them. Therefore, VMT mitigation measures that Costco can implement are geared toward reducing employee trips. Employee trips account for 600 daily trips (about 4% of total daily trips) and 3,825 VMT (approximately 18% of daily VMT). Thus, VMT reductions from TDM measures are not expected to fully mitigate the VMT impact and the Project VMT impact will remain significant.

To encourage Costco employees to shift their trips from automobiles to active modes of transportation, Costco intends to provide the following mitigation measures on the Project site and within its immediate vicinity.

- **Commute Trip Reduction Marketing [T-7]** (up to 4% employee VMT reduction): Costco will implement a marketing strategy to promote Costco's commute reduction program. Information sharing and marketing promote and educate employees about their travel choices to the employment location beyond driving such as carpooling, walking, and biking. The following features (or similar alternatives) will be provided: on-site or online commuter information services, employee transportation coordinators, and guaranteed ride home service.

- **Provide Ridesharing Program [T-8]** (up to 8% employee VMT reduction): Costco will develop and implement a ridesharing program. Ridesharing encourages carpooled vehicle trips in place of single-occupied vehicle trips. The following strategies provide examples of a multifaceted approach for promoting a rideshare program:
    - Designating a certain percentage of desirable parking spaces for ridesharing vehicles
    - Designating adequate passenger loading and unloading and waiting areas for ridesharing vehicles
    - Providing an app or website for coordinating rides

- **Provide End-of-Trip Bicycle Facilities [T-10]** (up to 4.4% employee VMT reduction): Costco will install and maintain end-of-trip facilities for employee use. End-of-trip facilities include elements such as bike parking, bike lockers, showers, and personal lockers. The provision and maintenance of secure bike parking and related facilities encourages commuting by bicycle.

- **Provide Pedestrian Network Improvement [T-18]** (up to 6.4% employee VMT reduction): Costco will provide a pedestrian network improvement near the site, constructing sidewalk along the Project frontage on Clarksville Crossing and Silva Valley Parkway. Additionally, the Project will construct sidewalk north of the Project frontage on the east side of Silva Valley Parkway to connect to existing sidewalk near Oak Meadow Elementary School, thereby providing connectivity with the surrounding neighborhood.

Table 21 provides the potential employee VMT reduction associated with these proposed mitigation measures. As shown in the table, employee VMT is anticipated to decrease by 872 miles; however, employee VMT (and regional VMT) is expected to remain a net positive as a result of the Project. Therefore, the Project impact due to VMT would remain significant.

Table 21. Reduction in VMT Associated with Proposed TDM Mitigation Measures

Employee VMT Mitigation Measures	Maximum Reduction	VMT
Employee Trip VMT	-	3,825
Commute Trip Reduction Marketing	*4%*	*(153)*
Ridesharing Program	*8%*	*(306)*
End-of-Trip Bicycle Facilities	*4.4%*	*(168)*
Pedestrian Network Improvement	*6.4%*	*(245)*
Total Employee Trip VMT Reduction	22.8%[1]	(872)
Employee Trip VMT (with mitigation)	**-**	**2,953**

Source: Kittelson & Associates, Inc., 2025

[1] For illustrative purposes only, the maximum reductions were summed to demonstrate that, even with the most generous assumption of VMT reductions, Project VMT would not be reduced to a less-than-significant level with implementation of all feasible mitigation measures.

3. Potential Hazards

The Project is a land development composed of commercial uses and ancillary parking on land zoned for these types of uses. All site accesses and traffic controls will comply with County design standards and policies. Similarly, the Remainder Area as represented in this programmatic analysis comprises 13.59 acres with anticipated future development of 138,000 SF of commercial uses. All proposed developments within the Remainder Area would be subject to County development review and would be required to comply with County standards and policies.

IMPACT FINDING

The Project does not propose any geometric design features or incompatible uses that would substantially increase hazards. Therefore, the Project impact due to hazards will be less than significant. The Remainder Area would be subject to County development review and would be required to comply with County standards and policies. Therefore, the Remainder Area impact due to hazards is anticipated to be less than significant.

4. Emergency Access

Emergency response to the site is accommodated through the Project access points on Silva Valley Parkway and Clarksville Crossing. The Project will comply with all applicable El Dorado County Fire Protection District design standards for emergency access. Adequate emergency access is required per the local fire code, and site plans will be reviewed by local fire officials as part of the site development design review process. Similarly, future development of the Remainder Area would be subject to County development review and would be required to comply with County standards and policies for emergency access.

IMPACT FINDING

The Project will comply with all applicable El Dorado County Fire Protection District design standards for emergency access. Therefore, the Project impact due to emergency access will be less than significant. The Remainder Area would be subject to County development review and would be required to comply with County standards and policies. Therefore, the Remainder Area impact due to emergency access is anticipated to be less than significant.

Conclusion

This CEQA compliance analysis resulted in the following impact findings:

- Consistency with Plans, Policies, and Programs – Neither the Project nor the anticipated Remainder Area development would conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bike, and pedestrian facilities. Therefore, both the Project impact and Remainder Area impact would be **less than significant**.
- Change in Regional VMT – The Project is expected to increase regional daily VMT by 21,123 vehicle miles traveled. The anticipated Remainder Area is expected to increase regional daily VMT by 11,463 miles. Therefore, both the Project impact and Remainder Area impact would be **significant**. Proposed TDM mitigation measures could reduce employee VMT by approximately 872 miles; however, the Project impact would remain significant.
- Potential Hazards – The Project's proposed on-site and off-site improvements would not result in sharp curves, dangerous intersections, or other hazards. The anticipated Remainder Area would be subject to County review and would comply with County standards and policies for land development, thus not resulting in sharp curves, dangerous intersections, or other hazards. Therefore, the Project impact and the anticipated Remainder Area impact would be **less than significant**.
- Emergency Access – The Project provides emergency access to and within the site and is not expected to result in inadequate emergency vehicle access. The anticipated Remainder Area would be subject to County review and would comply with County standards and policies for land development and emergency access. Therefore, the Project impact and the anticipated Remainder Area impact would be **less than significant**.

INTENTIONALLY LEFT BLANK

1 Executive Summary

New developments in moderate, high, and very high fire hazard severity zones (FHSZ) in El Dorado County are required to submit a Wildland Urban Interface Fire Protection Plan, known as a Fire Safe Plan (FSP), to identify the wildfire risks present within the project area and provide recommendations to address these risks. The proposed Costco Wholesale project (project) is located in a moderate fire hazard severity zone (MFHSZ)[1] and is submitting this FSP to the El Dorado Hills Fire Department as part of their building permit application package to the County.

The Costco project is a commercial development located in El Dorado County, California, near the county line between El Dorado and Sacramento counties. The project is located just north of California State Highway 50 and is accessible from the Silva Valley Parkway. The project is located on both the north and south sides of Silva Valley Parkway. The site is currently vacant and covered with California Annual Grasslands with scattered woodland and riparian vegetation along the wet drainages that cross the site. Adjacent properties are a mix of developed and undeveloped areas, with vegetation similar to that of the two project sites. In its current state, the project site and several adjacent properties could sustain the spread of a wildfire due to the continuous fuel bed provided by the annual grasslands.

This Fire Safe plan aims to describe the site conditions that could contribute to the intensity and spread of a wildfire, potentially causing it to transmit to buildings, endanger life, overwhelm fire suppression capabilities, or result in significant property losses. Then, describe the actions the property owner or responsible party is taking to address these conditions, including removing flammable vegetation, using ignition-resistant materials in the project's development, and installing features on the site and in the proposed building that will aid firefighters.

Dudek prepared this Fire Safe Plan by analyzing the following: the physical environmental conditions in the vicinity of the project and the local fire environment, the project's impact on wildfire risk, the project's impact on evacuation and emergency access, and the elements incorporated into the project to mitigate the risk of wildfire.

Dudek concludes that the project, as proposed, will not exacerbate the risk of wildfire in the area.

[1] A discussion of the updates to the FHSZ maps is presented in Section 4.3.4

Plan Signature Page

Preparer:

Jeremy Cawn, Dudek

CAL FIRE – Amador & El Dorado Unit (AEU) Representative:

Authorized Representative for the AHJ:

2 Introduction

This Fire Safe Plan (FSP) has been prepared for the Costco project, located in El Dorado Hills, California, specifically for the El Dorado Hills Costco warehouse project on the South Site of the property, a proposed commercial development in El Dorado County, California. The project is located in an area designated as a moderate fire hazard severity zone by CAL FIRE, with existing site conditions that can sustain the growth of a wildfire due to the continuous fuel bed provided by the annual grasslands that cover the site.

The El Dorado Hills Fire Department requires that new development in moderate, high, and very high fire hazard severity zones create a Fire Safety Plan (FSP). The specific requirements for the FSP are described in the El Dorado Hills Fire Department (EDHFD) standard #W-002.

The purpose of this FSP is to meet the requirements of the EDHFD standards, to identify the wildfire risks present at the site and the project's impact on those risks, and to provide recommendations to address these risks through vegetation management, ignition-resistant construction, providing adequate water supply, and fire department access. Appendix A contains a list of the EDHFD Fire Safe Plan requirements.

This FSP has assessed the property's location, topography, surrounding combustible vegetation (including fuel types), climatic conditions, and fire history. The plan addresses water supply, access, structural ignitability, and fire-resistant building features, as well as fire protection systems and equipment, impacts on existing emergency services, community evacuation routes, defensible space, and vegetation management. The following tasks were performed toward the completion of this plan:

- Gather site-specific climate, terrain, and fuel data;
- Collect site photographs;
- Process and analyze the data using the latest GIS technology;
- Predict fire behavior using scientifically based fire behavior models, comparisons with actual wildfires in similar terrain and fuels, and experienced judgment;
- Analyze and guide the design of proposed infrastructure;
- Analyze the existing emergency response capabilities;
- Analyze the existing site access and community evacuation routes;
- Assess the risk associated with the Proposed Project and the project site; and
- Prepare this FSP detailing how fire risk will be mitigated through a system of fuel modification, structural ignition resistance enhancements, and fire protection delivery system upgrades.

3 Regulatory Setting

The Project site and the surrounding area are within a CAL FIRE-designated Fire Hazard Severity Zone (FHSZ). They are required to meet local and state regulations that provide for a minimum level of wildfire safety and ignition risk reduction. Appendix B contains a detailed list of the applicable fire prevention regulations that apply to new development in the Project area. The requirement to prepare this Fire Safe Plan is authorized by the El Dorado County General Plan Public Health, Safety, and Noise Element, *Policy 6.2.2.2.* El Dorado Hills Fire Department standard #W-002 communicates the minimum fire safe regulations of the State of California, County of El Dorado (EDC), and the local Fire Code Official for the formation, implementation, and ongoing use of a Wildland Urban Interface Fire Protection Plan (Fire Safe Plan) for new developments and special use permits.

According to EDHFD standard #W-002, Fire Safe Plans (FSPs) are required for the following types of development projects:

A. The creation of a Specific Plan or similar large-scale project.

B. The creation of five (5) or more parcels as part of a parcel or subdivision map.

C. A change in zoning or issuance of a discretionary permit that proposes to increase intensity or density.

D. New commercial or industrial uses located in High or Very-High Fire Hazard Severity Zones.

E. Where, in the opinion of either CAL FIRE or the local Fire Code Official, it is deemed necessary due to the fire risk or fire hazard associated with the property.

The preparation of this FSP is required under condition E. This FSP demonstrates compliance with the requirements for an FSP in standard #W-002 shown in Appendix A and with the codes, laws, and regulations listed in Appendix B.

4 Site Description

4.1 Project Location

The Project site is located north of US 50 and Tong Road, east of Clarksville Crossing. It is bisected by the Silva Valley Parkway in El Dorado County, California.

The northern portion of the property (North Site) is approximately 24.83 acres and includes APNs: 122-720-0019, 20, and 21. All the parcels are undeveloped, and 122-720-21 (6.57 of 7.75 acres) is primarily reserved for the future extension of County Club Drive to Silva Valley Parkway, which is not part of the project. The southern portion of the property (South Site) is approximately 18.42 acres and includes APNs: 122- 720- 018, 02, and 03. A portion of 122-720-003 and a portion of the unused former Tong Road right-of-way between Silva Valley Parkway and Clarksville Crossing are proposed for use as site access. The 1.38-acre portion of 122-720-018, located west of Clarksville Crossing on the South Site, will not be developed as part of the project site, resulting in a net development site of 17.05 acres. Figure 1 shows the Project site and the surrounding area.

4.2 Project Description

The Project includes a new Costco Member Warehouse, Fuel Facility, and associated site improvements. The North Site contains the Fuel Facility and Costco employee parking lot, while the South Site contains the Costco Member Warehouse. The remainder of the North Site would include an out parcel that is not planned for development at this time. The maximum building area for the Member Warehouse on the South Site will be approximately 165,000 square feet and includes, without limitation, a Costco warehouse retail center, tire sales and installation, optical exams and optical sales, hearing aid testing and sales, food service preparation and sales, a pharmacy, meat preparation and sales, bakery and sales of baked goods, and alcohol sales. Temporary outdoor sales may occur within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December. The members-only Fuel Facility on the North Site will include a maximum of 13,000 square feet of open canopy and a 200-square-foot controller enclosure. Figure 2 contains the site layout plans for the Project.

4.3 Site Conditions

The following sections discuss the project site characteristics, including the local climate and fire history within and surrounding the site. Evaluating conditions at the project scale is intended to understand the local fire environment, which is helpful for predicting how a wildfire may spread across the site and for estimating wildfire risk for the project site. Appendix C includes photos of the project site showing the conditions of the local fire environment.

4.3.1 Adjacent Properties

Adjacent to the project site are residential communities on the east and west, composed of single-family dwellings, an elementary school to the north, and the Highway to the south. Between these developed areas and the project site is vacant, undeveloped land.

4.3.2 Fuels (Vegetation)

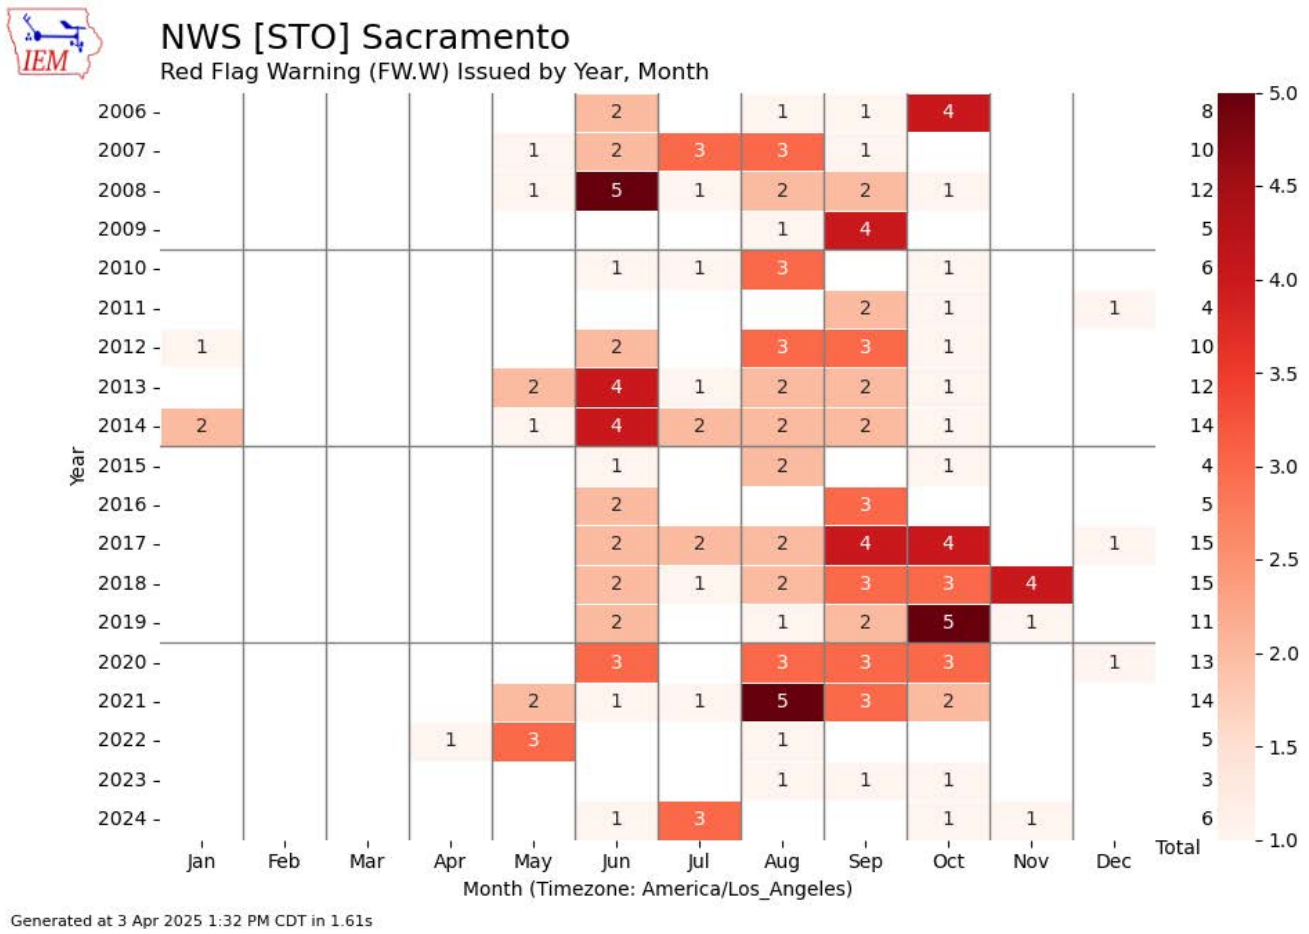
The Costco South site is predominantly covered with California Annual Grasslands. The grasslands extend continuously across both developments, north and south of Silva Valley Parkway. This fuel continuity continues onto adjacent properties and is only interrupted by the roads that border the project boundaries (e.g., Tong Road, Clarksville Road). Fuel heights in these grasslands are between two and three feet. Vegetation cover transitions to riparian woodlands surrounding the drainage near the intersection of Clarksville Road and Silva Valley Parkway, as well as in the small drainage that runs from Oak Meadow Elementary School to Silva Valley Parkway. Valley Oak woodlands are present in the drainage that crosses the Costco South development from north to south. Annual grass continues to be a significant part of the surface fuels, even in areas where vegetation cover changes. This grass is anticipated to be the primary carrier of any wildfire spreading through the project site. The exception to this is the perennially wet area near the storm drain.

4.3.3 Terrain

The general terrain of the Costco South Site is composed of a southwest-facing slope with an average slope of 6% and slopes that range from 0 to 37 degrees. Elevations range from 693 feet at the southwest corner of the Costco South development near Clarksville Road to 791 feet above mean sea level (AMSL) along the north boundary of the North Site. The general terrain on the site is broken up by a north-to-south-oriented drainage that crosses through the center of the project and a depression for a storm drain at the northern tip of the project site.

In the absence of strong winds, a terrain-driven wildfire is expected to move upslope following the general terrain of the two units. The drainages are not deep enough to create or funnel winds that would be significantly different from the prevailing wind conditions expected across the rest of the project site. There are no terrain features present on either side that would be expected to significantly increase fire intensity or rate of spread.

4.3.4 Weather



The climate in the El Dorado Hills community is Mediterranean, characterized by wet, cool winters and dry, hot summers. Weather data from the nearest remote automated weather station (RAWS) at Ben Bolt describes the following weather conditions for the area. Average temperatures range from 40°F to 58°F in the winter months and 60°F to 98°F in the summer. The hottest months, May through October, can have maximum daily temperatures over 100 degrees Fahrenheit. The driest months coincide with the hottest months; precipitation during an average year is minimal from May to October, and the average minimum relative humidity from May to October is less than 10%.

Prevailing winds in the community vary based on the time of year; from December to February, prevailing winds are, on average, out of the east-northeast. From March to November, prevailing winds are on average from the west-northwest. Throughout the year, winds averaged 0 to 5 miles per hour (mph), but the maximum wind gusts occurred on average from November to April, with maximum wind speeds of 40 mph and greater. From May to October, average maximum wind gusts range between 20 and 30 mph. It is important to note that the prevailing winds for most of the year and during the hottest and driest time of year are aligned with the general terrain of the two project sites (e.g., prevailing winds would push a fire upslope).

The National Weather Service (NWS) issues wildfire forecast warnings when conditions are ideal for wildfire combustion and high rates of fire spread. The NWS issues two types of these forecasts, Red Flag Warnings (RFW) and Fire Weather Watches. Both indicate that dangerous fire weather conditions will occur in the forecast area.

Based on historical records from the NWS, Red Flag Warnings and Fire Weather Watches can occur from May to November, with these warnings being issued most frequently between August and October (NWS Sacramento 2025). Exhibit 1 shows the historical occurrence of RFWs in the project area (IEMS 2025).

Exhibit 1: Red Flag Warnings Issued by Year, Month

4.3.5 Fire History and Fire Severity Zones

Fire Hazard Severity Zones

The project is located in the CAL FIRE state responsibility area (SRA), which has been designated as a Moderate Fire Hazard Severity zone (MFHSZ). The CAL FIRE adopted updated SRA Fire Hazard Severity Zone maps in April 2024, and the designated fire hazard severity zone for the project site was unchanged. Adjacent lands to the north are within the Local Responsibility Area (LRA) and are designated as a Moderate Fire Hazard Severity Zone. The SRA Moderate Fire Hazard Severity Zone continues to the east. To the south, the SRA transitions to the High Fire Hazard Severity Zone south of Highway 50. To the west is the LRA Moderate Fire Hazard Severity Zone. Figure 3 contains the CAL FIRE Fire Hazard Severity Zone map for the project area.

Fire History

Fire history represented in this FSP uses the Fire and Resource Assessment Program (FRAP) database. FRAP summarizes fire perimeter data dating back to the late 1800s; however, it is incomplete due to the fact that it only includes fires over 10 acres in size and has incomplete perimeter data, especially for the first half of the 20th century (Syphard and Keeley 2016). However, the data does provide a summary of recorded fires and can be used to show whether large fires have occurred in the Project area, which indicates whether they may be possible in the future.

Figure 3, Project Fire History Map, presents a graphical view of the project area's recorded fire history. As presented in the exhibit, there have been 28 fires recorded since 1935 by CALFIRE in their FRAP database (FRAP 2024)[2] Within 5 miles of the project site. Three of these fires occurred within 1 mile of the project. Based on the fire perimeters mapped in Figure 4, many of the recorded wildfires in the vicinity of the project were primarily slope-driven (uphill) and wind-driven by the prevailing winds.

Based on an analysis of the CAL FIRE FRAP fire history data set, specifically the years in which the fires burned, the average interval between wildfires in the five-mile radius area was calculated to be 3 years, with intervals ranging between zero and 18 years. Based on this analysis, it is expected that a wildfire that could burn in available unmaintained landscapes may occur, if weather conditions coincide, possibly every two to three years, with the realistic possibility of longer interval occurrences, as observed in the fire history records, and considering the recent past and ongoing development of the region.

2 Based on polygon GIS data from CAL FIRE's FRAP, which includes data from CAL FIRE, USDA Forest Service Region 5, BLM, NPS, Contract Counties and other agencies. The data set is a comprehensive fire perimeter GIS layer for public and private lands throughout the state and covers fires 10 acres and greater between 1878–2018.

5 Adjoining Property Conditions

The following sections discuss the site characteristics for the properties adjacent to the project site. The Costco Project is similar in terms of topography, vegetative cover, and access to adjacent residential areas, but it differs in planned use and proximity to buildings. The following sections discuss the characteristics of the project area at the community scale. The intent of evaluating conditions at this macro-scale is to provide a better understanding of the regional fire environment, which is not constrained by property boundary delineations.

5.1 Current Land Uses

North

To the north of the project site is Silva Valley Parkway, a 4-lane divided road. North of the road is a vacant lot that covers the lower portion of the hillside, between Silva Valley Parkway and the residential community, and Oak Meadow Elementary School, further up the slope. The vacant lot is predominantly covered with annual grasslands except for a strip of riparian woodland along the drainage that ends at the intersection of Silva Valley Parkway and Clarksville Road. The residential community to the north consists of single-family homes on approximately 0.25-acre lots, with approximately 20 feet of space between homes. This community is accessed by a circuit of residential streets connected to Silva Valley Parkway. Oak Meadow Elementary School is located to the north of the project site on the uphill side of the vacant lot. The school consists of a cluster of nine buildings in the center of the property and two separate buildings along the east border of the school property. The north, south, and west sides of the school property contain a large, paved driveway and parking lot. The school is accessed from Silva Valley Parkway.

East

The Silva Valley Parkway continues along the east side of the project, and on the other side of the road, vacant land on the hillside north of the project site continues to the east of the project site. Annual grassland remains the dominant vegetation cover type, transitioning to woodlands only in the wetter drainages. There is little development east of the project site. Tong Road connects to Silva Valley Parkway near the westbound Highway 50 off-ramp and runs east. Along Tong Road is a church and several widely spaced home sites (>400 feet). The church and home sites are accessible from Tong Road/Old Bass Road. Approximately 600 feet east of the Capital Korean Presbyterian Church on Tong Road, the road narrows and is no longer compliant with fire code regulations.

South

Immediately south of the project site is Highway 50, a six-lane divided freeway. The westbound on-ramp and eastbound on and off-ramps are also located south of the project site. Between the freeway and the ramps are areas of maintained grasslands. South of the freeway are several roads: White Rock Road, Clarksville Road, Joerger Cut-off Road, and Old White Rock Road. There is little development south of the project site, with most of the land covered with continuous grasslands on the drier sites or riparian woodlands on the wetter sites. The nearest development to the south is an electrical substation approximately 1300 feet to the southwest, and then another 700 feet beyond the substation until the outskirts of the developed areas off Latrobe Road.

West

Clarksville Road, a 2-lane road, is located immediately west of the project site. Across the road is a vacant, undeveloped creek and hillside. The creek bottom is perennially wet and covered with riparian vegetation. Slopes immediately adjacent to the creek bed are covered with a mix of riparian forest that transitions to oak woodland. Further from the creek, the tree cover thins out and transitions to annual grasslands with scattered trees. The property across Clarksville Road from the project site is not entirely vacant. Near the southwest corner of the project site, there is a single utility building on a concrete pad. West of the undeveloped creek and hillside is a residential community. This community consists of single-family homes on 0.25-acre lots with approximately 20 feet between homes on the same street. Homes situated between streets are separated by more than 100 feet, and a strip of undeveloped hillside that lies between them. This residential community is accessible by a circuit of residential streets connected to Serrano Parkway.

5.2 Planned Construction

There are no projects under review with the El Dorado Hills Area Planning Advisory Committee (EDHAPAC 2025) or the El Dorado County Planning Division (El Dorado County 2025) on the lands immediately adjoining the project site. The nearest projects under review are located 1.1 miles southeast of the project site on Latrobe Road (Montano De El Dorado), 1.34 miles east of the project site on Bass Lake Road (Town and Country Village), 1.7 miles east of the project site, south of Highway 50 (Village of Marble Valley), and 1.7 miles south of the project site on Latrobe Road (Gateway El Dorado). To the north of the Project site is the Serrano Village residential community, an approved project comprising several phases of construction, some of which have been completed. Phase A14 is located south of the intersection between Village Green Drive and Russi Ranch Drive, approximately 1,200 feet east of Silva Valley Parkway, on the hilltop/ridgeline on the adjacent property to the north (El Dorado County 2025). At the time of Dudek's site visit for this FSP, grading work was underway.

At the time of the site visit, a vacant property near the corner of Silva Valley Parkway and Tong Road was being graded. No other planned construction was identified.

5.3 Vegetation (Fuels)

Adjoining properties contain a mix of vegetation covers depending on location and land use.

Developed areas are predominantly covered with maintained landscaping, including ornamental ground covers, shrubs, and shade trees. Within the boundaries of the developed areas, both single-family homes and the elementary school, there is very little natural and unmanaged vegetation. Typical vegetation cover consists of turfgrass and low-growing ornamental plants, with scattered individual or clusters of shade trees. Generally, there is adequate separation between the tree crowns and the surface vegetation.

Undeveloped, vacant properties are covered predominantly with annual grasslands on the drier upland and hillside areas. Annual grasslands are generally continuous with fuel heights of 2 to 3 feet. Wetter areas in drainages and along creeks are covered with oak woodland on the slopes adjacent to the creek or drainage that transitions to riparian woodlands and riparian vegetation at the drainage bottom or creek bed. Vegetation in woodland areas is generally dense, with small trees and shrubs in the understory and no separation between the tree crowns and the

tops of the understory vegetation. In the wettest areas, year-round standing water, tree cover is scattered, and vegetation is limited to riparian vegetation.

5.4 Environmental Restoration Plans

There are no known environmental restoration plans for the properties adjoining the project.

6 Recommendations for Reducing Wildfire Risk

The project will incorporate a series of complementary fire protection features that will reduce the risk of a wildfire igniting on the project site and the risk that a wildfire spreading on the adjacent properties can spread onto the Project site. This section of the FSP summarizes all fire risk reduction recommendations for the Project, including building construction and fire protection features, signage, access, water supply, and vegetation management.

6.1.1 Building Construction

The Project's structures and facilities will be similar in layout, building materials, and appearance to those of other nearby Costco facilities in Elk Grove and Folsom, California. The Costco Warehouse on the Costco South site will be built to meet Type V B construction. It will incorporate non-combustible materials throughout the structure, including steel for the main building structure, metal panels, concrete and masonry on the building exterior walls, and metal studs and structural steel for interior elements. The roof covering on both the Costco Warehouse and the fuel facility will have flat Class A roof coverings composed of a metal joist system for structure and a standing seam metal roof on vapor barrier/batt insulation for the roof coverings.

These building materials comply with the ignition-resistant building requirements in Chapter 7a of the California Building Code.

No accessory structures are proposed for construction on the Costco South site.

6.1.2 Fire Protection and Life Safety Systems

The Costco Warehouse building and the fueling facility will incorporate CFC-required fire detection, notification, and protection systems. The Costco Warehouse contains a bakery and food preparation area, a tire center, and a floor shopping area. To meet CFC and local fire code requirements and protect occupants, the Costco Warehouse will have the following fire protection systems installed.

- An automatic fire sprinkler system will be installed to provide coverage throughout the occupiable portions of the structure. Pipe layout, size, and composition, as well as the type and number of sprinkler heads, will comply with the requirements of the 2022 El Dorado Hills Fire Code, the 2022 California Fire Code, and NFPA 13. The building's fire flow is 3,000 gallons per minute for a duration of two hours. Sprinkler head K-factor and activation temperatures will be customized to match the use or materials stored throughout the building.

- A Fire Alarm System installed that meets the requirements of the 2022 El Dorado Hills Fire Code and the 2022 California Fire Code, as well as the provisions in the National Fire Protection Association 72 standard. The fire alarm system will be connected directly through and monitored by a UL. approved central station service, which gives audible and visual signals at a constantly attended location.

- A Type 1 Commercial Cooking Exhaust Hood that meets the requirements of the 2022 California Fire Code, California Mechanical Code, and the provisions of Underwriters Laboratories 610 standard. The commercial cooking exhaust hood will contain the required ventilation and fire suppression systems.

- The layout of the Tire Center will meet Fire Protection requirements in CFC Chapter 32, 34, and NFPA 13. Adequate water supply to meet these requirements would be provided by the building's fire sprinkler system and on-site fire hydrants.

The fire sprinkler riser(s) and the Fire Alarm Control Panel (FACP) will be located in a fire control room that is accessible from the exterior of the building and used only for fire protection systems. The room will be clearly labeled on the door “FIRE CONTROL ROOM.”

The Costco fueling facility will install the following fire protection systems to meet CFC Chapter 23 and local fire code requirements and protect occupants.

- Vehicle impact protection for the fuel dispensing devices for each of the four fueling bays.

- An emergency disconnect switch within 20 feet of the fuel pumps.

- Portable fire extinguishers meeting CFC Section 906 requirements and having a minimum rating of 2-A:20-B: C would be provided so that one fire extinguisher is within 75 feet of any pumps, dispensers, or storage tank fill pipe opening.

- The underground fuel storage tank for the fueling facility will comply with CFC Chapter 57.

- Dispenser equipment, including pumps, hoses, and nozzles, will be composed of UL-listed equipment.

Both the Costco warehouse and the fuel facility will incorporate CFC-compliant fire and life safety features that minimize the risk of explosion, fire, and accidental spill of flammable liquids. While these features are intended to protect occupants and minimize the risk of a structure fire, they also address the Project’s wildfire risk by reducing the likelihood of a fire occurring on the property that can spread onto the adjacent wildlands and by reducing the risk that the Project structures will ignite during a wildfire.

6.1.3 Access

The Costco South site is accessible from four driveways; three are connected to Clarksville Road on the west side of the south project site, and one is connected to Silva Valley Parkway on the east side of the south project site. Access to the south side of the building is from the road connecting the southwest corner of the building to Clarksville Road. Access to the north side of the building is from two roads, one connecting to Clarksville Road and the other to Silva Valley Parkway. The exterior of the building is accessible on all sides. The Warehouse is surrounded by a road on three sides of the building and is connected to the driveways that lead to the adjacent public streets. A walkway is located on the east side of the building.

Both the North Site and the South Site will be accessible by two or more connections to the adjacent public streets. The North Site is accessible from two connections to the adjacent public streets. Both are connected to Silva Valley Parkway on the west side of the North Site. The two driveways are located on the northwest and southeast boundaries of the fueling facility.

The internal access system consists of roads and driveways that surround both the fueling facility on the North Site and the Costco Warehouse on the South Site. For the North site, the internal road system consists of a loop that begins at Silva Valley Parkway, wraps around the north side of the fueling facility, and reconnects to Silva Valley Parkway on the other side of the fueling facility. Access to the fueling bays, fueling facility attendant structure, and the Costco employee parking lot is from driveways connected to the internal access loop. Traffic flow for the internal road system for the North Site will be one-way starting at the Silva Valley Parkways connection on the northwest side of the fueling facility. For the South Site, the internal road system consists of one access road that traverses the north half of the site from Silva Valley Parkway to Clarksville Road. This access road is connected to multiple driveways that allow access to the parking lot, the Costco warehouse store front, the parking garage, and the tire center. A more direct access to the parking garage is provided by a short internal road section that connects to Clarksville Road along the west side of the site. At the southwest corner of the Costco South site, an access road provides direct access to the rear of the Costco warehouse building, the tire center, and the south side of the parking garage. The internal access roads for both sites are interconnected; it is possible to drive around both sites using any access point.

For the South Site, the access point and access road at the southwest corner are the designated truck routes for delivery trucks. This access road provides the shortest path to the loading docks at the southwest corner of the Costco warehouse. There is a hammerhead ‘T’ at the rear of the Costco warehouse for fire trucks to turn around.

The access road connections and the internal access roads will meet the fire department access requirements in Chapter 5 of the 2022 CFC and the CCR Title 14 minimum fire-safe regulations. Internal access roads, not including driveways and parking lot alleys, will exceed 20 feet in width (approximately 30 feet in width), with the exception of the access on the east side of the structure, which is reduced to 15’ because of topographical constraints. Driveways and parking lot alleys will be a minimum of 15 feet wide. Internal access roads will be designed and maintained to support the weight of a fully loaded fire apparatus and surfaced to provide all-weather driving conditions. No traffic calming features will be installed on interior access roads that will impact emergency vehicle access. Designated Fire Apparatus Access Roads will be marked appropriately and have signage that contains the words “NO PARKING-FIRE LANE”. Designated Fire Apparatus Access Roads include the main access road loop around the fueling facility on the North Site, the access road that traverses the Costco South Site from Silva Valley Parkway to Clarksville Road, and the truck route at the southwest corner of the South Site.

There are no dead ends or gates at either the North Site or South Site.

6.1.4 Water Supply

The project site is located within the El Dorado Irrigation District (EID) service territory; however, the EID is not currently servicing the property. As part of the Project approval, the Project will apply for annexation into the EID and will connect to the 18-inch water line located along the west side of the project in Clarksville Crossing. The project proposes to install a looped water line extension to the EID water line for water service, including water for firefighting purposes, to both the North Site and the South Site. According to the project's Facility Improvement

Letter, the existing water system can deliver the required 3000 gallons per minute fire flow demand to the project site (El Dorado Irrigation District 2022).

Dry barrel fire hydrants will be installed on the project site to provide water for fire protection. The nearest hydrant, according to EID maps, is located approximately 75 feet from the southwest corner of the project site in front of the utility building on the west side of Clarksville Crossing. The project would install at least five fire hydrants for the Costco South site, with no more than 450 feet on average between fire hydrants. These fire hydrants will be spaced out evenly around the Costco warehouse opposite the structure in parking lot islands on the north and west sides, and in the landscape areas across the access roads around the east and south sides. No new fire hydrants will be installed at the North Site fueling facility.

All fire hydrants will be painted with safety white enamel and marked with a blue reflective marker on the adjacent public street or access road.

6.1.5 Signage

Both the North Site and the South Sites would be appropriately signed to meet address identification requirements in the 2022 CFC, the CCR Title 14 Minimum Fire Safe Standards, and local fire codes. Address identification will be provided either on the structure or on a sign near each structure.

In addition to address signage, fire protection features such as Fire Department Connections, Fire Alarm Control Panels, Fire Sprinkler Rooms, Emergency Disconnects, and Electrical rooms will be signed as required by the 2022 CFC. Fire hydrants would be identified with a reflective blue marker in the middle of the street adjacent to the hydrant.

6.1.6 Housekeeping

The Costco project would, as a part of everyday business, generate and store combustible materials on-site, including cardboard boxes and rubbish containers or dumpsters. Stored outside, these materials can be ignited by an approaching wildfire or embers cast ahead of the main body of the fire. Combustible waste generated during the operations of the Costco Warehouse and the Fueling Facility will be disposed of on a regular basis. Combustible waste materials (such as stacks of cardboard boxes) and rubbish bins will not be stored within five feet of the exterior of the Costco Warehouse, Fueling Facility Attendant Station, or within 30 feet of the fueling bays. Costco utilizes an all-metal trash compactor for handling cardboard and solid, non-hazardous trash generated by the store. Combustible materials and debris will be placed in the compactor, compacted, and then stored until picked up by a trash disposal service. Inside the metal compactor, the combustible material and debris will be protected from direct flame contact and embers from a nearby fire.

6.1.7 Other

Electrical lines and utility connections servicing the project will be installed underground. Above-ground transformers and pull boxes (located on the south side of the Costco Warehouse) will be constructed of non-combustible materials and placed more than 10 feet away from combustible vegetation.

6.2 Vegetation Management

The Fuel Facility on the North Site does not occupy the entire North Site. To the north, east, and south, the North Project Site will be enveloped by a 30-foot-wide non-combustible surface service road. Silva Valley Parkway is a 100-foot-wide non-combustible surface bordering the North Site Project to the west.

The development footprint, including structures, access roads, and other built non-combustible facilities of the Costco project, occupies a portion of both sites. The remainder of both sites will be covered with landscaping or a mix of landscaping and natural vegetation (California Annual Grasslands). The development footprint for the Fuel Facility on the North Site covers less than ½ of the north site parcel. Outside of the development footprint, the site would remain covered in continuous annual grasslands. Within the development footprint and the area immediately around it, vegetation cover will be composed entirely of maintained landscaping. The development footprint for the Costco warehouse on the South site covers the entire parcel, and there will be no areas of natural vegetation.

For both sites, vegetation maintenance and careful landscaping layout and installation are necessary to minimize the risk of wildfire spreading onto the property and extreme fire behavior igniting the structures, thereby placing occupants at risk. Based on the anticipated post-development conditions, vegetation management for the Project to minimize wildfire will be divided into two activities: defensible space and fire-resistant landscaping.

6.2.1 Defensible Space

Defensible space refers to the design and maintenance of natural and/or landscaped areas around structures to mitigate the danger from an approaching wildfire. Defensible space is intended to reduce the threat of wildfire spreading from the wildland to adjacent structures. It is also intended to provide firefighters with access for fire suppression actions and a safe zone for them to work. State and local agencies generally define the defensible space area as a 100-foot-wide area that begins at the structure exterior (including an appendage such as a combustible deck or covering). The 100-foot-wide defensible space area is divided into three zones. EDHFD defines the three zones as:

- Zone 0 – 0 feet to 5 feet; Ember Resistant Zone
- Zone 1 – 5 feet to 30 feet; Lean, Clean and Green Zone
- Zone2 – 30 feet to 100 feet; Reduced Fuel Zone

The defensible space zone for the fueling facility on the North Site encompasses the areas within the development footprint around the fueling bays, the adjacent parking lot to the northwest, the landscaping surrounding the fueling bays, and a portion of the undeveloped hillside to the northeast of the fueling facility. The defensible space zone for the Costco Warehouse on the Costco South site encompasses the parking lots and access roads on the northwest, southwest, and southeast sides of the structure. On the northeast side of the Costco warehouse, the defensible space zone includes the landscaped area on the grounds between the building and Silva Valley Parkway. A portion of the defensible space area for both sites overlaps with Silva Valley Parkways, which is outside of the project boundaries. For both the Fueling Facility and the Costco Warehouse, Zone 0 and Zone 1 of the defensible space area are generally covered with roads, walkways, and other non-combustible surfaces. Vegetation in these two zones for both the Fueling Facility and the Costco Warehouse is limited to irrigated landscaping. A portion of Zone 2 for the Fueling Facility on the northeast side of the fuel bays extends onto the undeveloped hillside. The

remainder of Zone 2 for the Fueling Facility and all of Zone 2 for the Costco Warehouse is covered with either non-combustible surfaces (e.g., roads, walkways, parking lots, etc.) or irrigated landscaping. Figure 5 shows the 100-foot defensible space zone around both sites and includes the boundaries of Zones 0, 1, and 2.

6.2.2 Defensible Space Standards

Zone 0– Immediate Zone (0 to 5 feet from the structure)

Zone 0 reduces the likelihood of structure ignition by reducing the potential for direct ignition of the structure from flame contact, embers that accumulate at the base of a wall, and/or indirect ignitions when embers ignite vegetation, vegetation debris, or other combustible materials located close to the structure, resulting in either radiant heat and/or direct flame contact exposure to the structure.

Zone 0 is the horizontal area within the first five feet around the structure, garage, any outbuildings, attached decks, and stairs. Zone 0 is measured from the edge of a structure, attached decks, patio covers, balconies, and floor projections above grade. The zone also includes the area under attached decks and stair landings.

The Immediate Zone is the most vulnerable and should be the most aggressively maintained for fire resistance through the following practices:

- Clean roofs and gutters of dead leaves, debris, and pine needles that could catch embers.
- Replace or repair any loose or missing shingles or roof tiles to prevent ember penetration.
- Clean debris from exterior attic vents and install 1/8 inch metal mesh screening to block embers.
- Repair or replace damaged or loose window screens and any broken windows.
- Remove combustible materials from beneath decks or porches. Screen or box-in areas below patios and decks with wire mesh to prevent debris and combustible materials from accumulating.
- Move any flammable material away from wall exteriors – lumber, cardboard, and combustible debris.
- Leaf litter should be cleaned up and disposed of regularly. Dead plants should be removed promptly.
- Trim back tree and large shrub branches that grow into the Immediate Zone to a minimum of 5 feet from the structure and 10 feet from a chimney.
- Minimize vegetation in this Zone. Do not plant trees or woody shrubs in this Zone.
- No annual grasses or plants are permitted in this zone.
- Irrigate and maintain the existing landscape so that plants are healthy with minimal dead material.
- Minimize the use of combustible mulches.
- Maintain shrubs to 18 inches in height or less and with 10 feet of horizontal separation between shrubs.

Note: As required by State Law, regulations for the Immediate Zone are under development by the State Board of Forestry and were initially scheduled to take effect January 1, 2023, for all new buildings and January 1, 2024, for all existing buildings; however, as stated, these regulations are still under development with no set date of enforcement. Any State regulation more restrictive than this standard will apply.

Zone 1 - Intermediate Zone (5 to 30 feet from the structure)

Zone 1 reduces the likelihood of fire burning directly to the structure. This is accomplished by modifying fuels and creating a discontinuity between planting groups that limits the pathways for fire to burn to the structure and reduces the potential for near-to-building ember generation and radiant heat exposures. This zone shall consist of planting low-growth, drought-tolerant, and fire-resistant plant species. An additional purpose of this zone is to provide a defendable area for fire personnel to stage and take direct action.

Zone 1 is an area within 5 to 30 feet of structures. The vegetation within the Intermediate Zone will be maintained to break up fuel pathways to structures and to minimize fire behavior through the following practices:

- Remove all dead plants, grass, and weeds (vegetation).
- Remove dead or dry leaves and pine needles from your yard, roof, and rain gutters.
- Trees and shrubs will be maintained to create 10 feet of horizontal space between tree or shrub crowns.
- Lower branches will be removed from trees to create a minimum of 6 feet of clearance between the lowest branches and the surface vegetation (or 1/3 of the tree height for trees less than 10 feet in height).
- Do not install woody shrubs beneath trees. Remove existing shrubs and small trees growing beneath mature trees.
- Remove branches that hang over your roof and keep dead branches 10 feet away from your chimney.
- Irrigate and maintain landscaping in this Zone to keep plants healthy with minimal dead material.

Landscaping installed in this zone will be based on the characteristics of the plants found on the fire-resistant plant species in the Project landscape plans.

Zone 2 – Extended Zone (30 to 100 feet from the structure)

The Extended Zone is designed to interrupt the fire's path to the structures and minimize fire behavior by keeping flame heights low and minimizing the risk of extreme fire behavior. The vegetation within the Extended Zone will be maintained to minimize fire behavior through the following practices:

- Cut or mow annual grass down to a maximum height of 4 inches.
- Remove all dead plants, grass, and weeds.
- Landscaping installed in this zone will be based on the characteristics of the plants found on the fire-resistant plant species in the Project landscape plans.

- Trees and shrubs will be maintained to create 15 feet of horizontal space between tree or shrub crowns.
- Lower branches will be removed from trees to create a minimum of 6 feet of clearance between the lowest branches and the surface vegetation (or 1/3 of the tree height for trees less than 10 feet in height).
- Do not install woody shrubs beneath trees. Remove existing shrubs and small trees growing beneath mature trees.

6.2.3 Fire Resistant Landscaping

The landscaping on the project site will be composed of shade trees with ground cover beneath. No natural areas of unmanaged vegetation will be present. The species composition, planting density, continuity, and plant life form type will be varied across the property and will be dependent on the primary function of the landscaping. Shade trees will be planted individually or in open clusters throughout the project site, with the exception of the very steep slopes between the Costco and the Silva Valley Parkway. For the ground cover, a mix of shrub and herbaceous plants will be installed throughout the project site. Shrubs will compose a more significant portion of the species installed on the steepest slopes to stabilize the slope and minimize erosion. In the bioretention basins, ground cover will consist of grass and perennial herbaceous plants only.

Landscaping will comply with each standard defensible space zone, based on distance from structures. There will be no dead plants, grass, or weeds within the landscaped area. There will be no flammable material on the wall exteriors. Trees and shrubs will not be planted within 5 feet of structures, and trees and shrubs will be trimmed to have 5 5-foot spacing with structures. Needle and leaf litter will be cleaned up on a regular basis. Tree branches will be removed to create 6 feet of clearance between the tree's lowest branch and ground vegetation or a clearance of 1/3 the height of the tree if the tree is less than 10 feet in height. Woody shrubs and volunteer trees will not occupy the space below a mature tree's crown. Within Zone 1, trees and shrubs will maintain a minimum of 10 feet of horizontal space between their crowns. Landscaped area will be irrigated, and the vegetation within the landscaped areas will maintain a higher level of fuel moisture than the undeveloped areas on the surrounding hillsides, even in dry conditions.

These actions in landscaping surrounding structures will significantly tame fire behavior approaching structures, making structures safer and easier to defend in potential wildfire conditions.

Table 1 below contains a list of the shade trees and ground cover proposed for installation on the project site by the project's conceptual landscape plan.

Table 1 Proposed Plants for Landscape Areas and Defensible Space Zone[3]

Species	Expected Height at Maturity (in feet)	Expected Width at Maturity (in feet)
Trees		
Acer platanoides 'Crimson King' /Crimson King Norway Maple	45	40
Acer rubrum 'Redpointe' / Redpointe Red Maple	45	35
Cedrus deodora / Deodar Cedar	80	40
Lagerstroemia hyb. 'Muskogee'/Muskogee (Lavender) Crape Myrtle	25	15
Lagerstroemia hyb. 'Tuscarora' /Pink/Red Flowering Crape Myrtle	25	15
Zelkova serrata 'Green Vase' /Green Vase Zelkova	65	65
Quercus ilex /Holly Oak	60	60
Quercus lobata /Valley Oak	70	70
Quercus virginiana 'Sky Climber' / Sky Climber Live Oak	80	80
Shrubs/Perennials/Grasses/Ground Covers/Vine		
Arbutus unedo 'Compacta' /Compact Strawberry Tree	8	8
Ceanothus 'Concha' /Concha Ceanothus	8	8

[3] Plant characteristic information obtained from San Marco Growers, Monrovia Nursery Company, Gardenia.net, Urban Forest Ecosystem Institute (UFEI), and USDA PLANTS database

Species	Expected Height at Maturity (in feet)	Expected Width at Maturity (in feet)
Cotoneaster dammeri 'Lowfast' /Lowfast Bearberry Cotoneaster	1	10
Dietes grandiflora 'Variegata' /Striped Fortnight Lily	4	3
Dianella revolute 'Little Rev' /Little Rev Dianella	4	2
Eleagnus x ebbingei 'Gilt Edge' /Gilt Edge Silver Berry	5	5
Juniperus chinensis 'Mint Julep' /Mint Julep Juniper	6	8
Juniperus horizontalis 'Blue Chip' /Blue Chip Juniper	1	8
Phlomis fruticosa /Jerusalem Sage	4	4
Rosa 'Meidrifora' /Coral Drift Rose	2	2
Rosa banksiae 'Lutea' /Yellow Lady Banks Climbing Rose	Climbing Vine	Climbing Vine
Salvia leucantha 'Santa Barbara' /Santa Barbara Sage	4	6
Rosmarinus o. 'Huntington Blue' /Huntington Blue Rosemary	2	8
Juncus patens 'Elk Blue' /Elk Blue Gray Rush	2	2
Muhlenbergia rigens /Deer Grass	5	4
Nepeta racemosa 'Walker's Low' /Walker's Low Catmint	2	3

Species	Expected Height at Maturity (in feet)	Expected Width at Maturity (in feet)
Chondropetalum tectorum /Cape Rush	3	4
Festuca mairei /Atlas Fescue	3	3
Muhlenbergia capillaris 'Regal Mist' /Regal Mist Muhly Grass	3	3
Pennisetum orientale /Oriental Fountain Grass	2	3
Verbena lilacina 'De la Mina' / Purple Cedros Island Verbena	3	3

Figure 6 contains the Project landscape plans with an overlay of the defensible space zones.

6.3 Fire Prevention During Construction

During the development of the Project, the site will transition from an open grassland to a developed commercial property on a portion of the North Site and all of the South Site. During this period, the wildfire risk will vary. Dropping as the existing land is cleared, including the removal of natural vegetation, is completed. Then, when combustible building materials are transported to the site and activities with ignition potential, such as hot work, are performed, the risk of fire increases. Fire risk, including the risk that construction activities ignite a wildfire, can be mitigated by adhering to CFC and local fire prevention requirements during construction and by modifying construction activities when there is a high risk of wildfire occurrence. This section describes the 2022 CFC Chapter 33 and the El Dorado Hills Fire Department's requirements for fire safety during construction. Adhering to the CFC and the El Dorado Hills Fire Department's requirements reduces the risk that construction activities will result in a new wildfire. It minimizes the risk that a fire spreading onto the Project site from an adjacent property will ignite the structures or building materials.

6.3.1 Precautions Against Fire

Smoking

- Smoking will be prohibited except in approved areas. A designated smoking area where smoking is permitted will be signed.

Combustible Debris, Rubbish, and Waste

- Combustible debris will not be left in structures.
- Combustible Debris, Rubbish, and Waste will be removed from buildings at the end of each work shift.

- Rubbish containers will be constructed of noncombustible materials or materials that meet a peak rate of heat release not exceeding 300 kW/m^2 when tested in accordance with ASTM E1354.
- Combustible Debris, Rubbish, and Waste will not be disposed of by burning on the site.

Electrical

- Temporary wiring for electrical power and lighting will comply with the California Electrical Code.

Storage of Flammable and Combustible Liquids and Gases

- Storage of flammable and combustible liquids and gases will be in accordance with CFC Section 5704 and Chapter 58.
- Flammable and combustible liquids and materials storage areas will be maintained clear of combustible vegetation and waste materials.
- Sources of ignition and smoking will be prohibited in flammable and combustible liquid and gas storage areas.

Vehicles and Equipment

- When not in use, Project vehicles and equipment will be parked in a designated parking or storage area with at least 30 feet of separation between the parking area and any unmanaged flammable vegetation.
- Vehicle and equipment fueling will be conducted in designated locations and at least 10 feet from combustible debris or building material storage areas.
- Vehicle and equipment fueling and servicing areas will be located at least 30 feet from any hot work areas.

6.3.2 Access For Firefighting

- Fire Apparatus access for firefighting will be provided to all construction and demolition sites.
- Fire Apparatus access for firefighting will be provided within 100 feet of temporary or permanent fire department connections, including fire hydrants.
- Fire Apparatus access must be maintained until fire apparatus access roads are available.
- Fire Apparatus access roads will be a minimum of 20 feet wide and have a vertical clearance of 13 feet 6 inches.
- Fire Apparatus access roads will be of an all-weather surface capable of supporting a minimum of 75,000 lbs. gross vehicle weight (minimum of 3 inches of AC over 8 inches of Compacted AB rock).
- Fire Apparatus access roads will be designed to meet the turning radius requirements of forty (40) feet inside and fifty-six (56) feet outside.

- Any dead-end roadway in excess of 150 feet in length will be provided with not less than a fifty-six (56) foot outside turning radius.
- Key boxes will be provided as required by CFC Chapter 5.

As soon as construction begins, Fire Department access roads will be provided for both the North Site and the South Site.

6.3.3 Water Supply

An approved water supply, either temporary or permanent, will be available for firefighting as soon as combustible building materials arrive on-site. The water supply during the Project construction will provide a minimum flow rate of 500 gallons per minute. The fire hydrant that provides this fire flow will be within 500 feet of the combustible materials and adjacent to a fire apparatus access road.

6.3.4 Fire Protection Features

- Automatic fire sprinkler systems will be tested and approved prior to occupancy of the Costco Warehouse.
- Fire extinguishers will be installed and ready for use at both the North Site and South Site near combustible material storage, flammable liquids and gases, and areas where hot work is occurring.

6.3.5 Hot Work

These requirements are primarily from California Fire Code (CFC) Chapter 35, Welding and other Hot Work, and NFPA 51B, Fire Prevention During Welding, Cutting and other Hot Work. Hot work is defined in the CFC as operations involving cutting, welding, thermit welding, brazing, soldering, grinding, thermal spraying, thawing pipe, or other similar operations. Hot work areas are defined as the areas exposed to sparks, hot slag, radiant heat, or convective heat because of the hot work.

Hot work will only be done in designated fire-safe areas and will comply with the following:

- All personnel involved in Hot Work shall be trained in the safe operation of the equipment. This will include providing training at "tailgate safety meetings." They shall also be made aware of the risks involved and emergency procedures, such as how to transmit an alarm and who is responsible for calling 9-1-1.
- Signage required in areas where workers may enter, indicating "Caution; Hot Work in progress; Stay Clear" would be posted on site.
- Hot work would not be done on any containers containing or having contained flammable liquids, gases, or solids until they have been thoroughly cleaned, purged, or inerted.
- A dry chemical fire extinguisher with a minimum rating of 4A:80BC, a 5-gallon backpack pump or water fire extinguisher, and a 46-inch round point shovel shall be readily accessible within 25 feet of the hot work area.
- The safety manager shall inspect the hot work area before issuing a permit and shall then make daily inspections.
- Welding and cutting would comply with 2022 CFC Chapter 35- Welding and Hot Work.
- Electric arc hot work would comply with CFC Chapter 35.

- Piping manifolds and Hose Systems for Fuel Gases and Oxygen would comply with CFC Section 3509.
- Cylinder use and storage shall comply with 2022 CFC Chapter 53, "Compressed Gases."
- Personal Protective Clothing would be selected to minimize the potential for ignition, burning, trapping hot sparks, and electric shock.
- A fire watch will be in place for a minimum of 30 minutes, or longer as considered necessary.
- Any ignitions would be immediately extinguished (as much as possible) by site personnel, and the fire department would be notified of the incident.

6.3.6 Fuel Modification

Prior to the start of construction, both the North Site and South Site development footprints would be cleared of all existing vegetation. This will result in the removal of all of the vegetation on the South Ste and the North Site, except for a strip along the northeast side of the development footprint. During construction, the CFC chapter 49 and PRC 4291 required a 100-foot defensible space area to be maintained around each structure. Fuel modification would also be performed within 20 feet of a site access road and along Silva Valley Parkway and Clarksville Crossing.

Within the development footprint for both sites, fuel modification would include removing or mowing to a height of less than four inches any vegetation that grows in the graded areas. For the North site, a 50— to 70-foot-wide strip of the annual grasslands on the hillsides northeast of the development footprint will be mowed to a height of four inches or less prior to May 1st.

Prior to the start of any vegetation management activities, it is recommended that the developer have a certified biologist survey the project site to identify any areas containing protected species or habitats, and have the biologist mark the areas with sensitive species and habitats so vegetation management crews can avoid those areas. If sensitive species or habitats are identified, the California Department of Fish and Wildlife (CDFW) should be contacted at least ten days prior to beginning work.

6.3.7 Red Flag Warning Protocol

The National Weather Service issues Red Flag Warnings, indicating that conditions are such that wildfire ignitions and spread are likely to occur (e.g., low humidity, high winds). The Red Flag Warning protocol is intended to raise on-site construction crews' awareness of the fire danger and limit activities that pose a high risk of igniting a wildfire.

During Red Flag Warning or Watch periods, no hot work or open flames will be performed unless the El Dorado Hills Fire Department has been consulted to discuss the type of hot work activity and the precautions that will be taken. Other construction, operation, maintenance, and decommissioning activities may proceed during these periods under heightened awareness conditions.

To ensure compliance with Red Flag Warning restrictions, the National Weather Service website will be monitored daily during normal conditions or 2 to 3 times a day during Red Flag Warnings at the Project site during construction and decommissioning (National Weather Service 2024).

6.4 Timing and Responsible Parties

Table 2 below summarizes all project recommendations, including the timing for implementation and the responsible party for completion.

Table 2. Summary of Project Fire Risk Mitigation Recommendations

Recommendation	Responsible Party	Timing
Construction Fire Safety		
Fire Apparatus Access	Project Manager	After the Completion of grading and site clearing
Permanent or Temporary Water Supply	Project Manager	Prior to the delivery of combustible materials
Hot Work	Project Manager, Staff performing Hot Work	During hot work operations
Fire Extinguishers	Project Manager	Prior to the delivery of combustible materials
Precautions Against Fire	Project Manager	Set up at the beginning of construction and maintained throughout the entire project.
Fire Protection Features	Project Manager	Prior to occupation
Fuel Modification	Project Manager	Completed prior to May 1st
Red Flag Warning (RFW) Protocol	Project Manager	When NWS issues RFW
Fire and Life Safety Features		
Fire Apparatus Access Roads	On-site Costco Manager	Inspect annually, repair or replace as needed.
Water Supply	On-site Costco Manager	Inspect and certify every 12 months
Fire and Life Safety Systems (Fire Alarm, Fire Sprinklers, etc.)	On-site Costco Manager	Inspect and certify every 12 months
Fire Alarm	On-site Costco Manager	Inspect and certify every 12 months
Fire Extinguishers	On-site Costco Manager	Inspect and certify every 12 months
Housekeeping	On-site Costco Manager, all staff	Daily
Signage	On-site Costco Manager	Inspect annually, repair or replace as needed.
Defensible Space		

Recommendation	Responsible Party	Timing
Landscaping, installation	Project Manager	Inspect and confirm the functioning of the irrigation system and the proper plant layout prior to project completion.
Landscaping, maintenance	On-site Costco Manager	Weekly inspections of the vegetation for maintenance needs should be conducted, and the irrigation system should be inspected annually.
Hillside Vegetation Management	On-site Costco Manager	Completed prior to May 1st

7 Project Impacts to Adopted Emergency Response Plans or Emergency Evacuation Plans

All development proposed for the Project would be designed, constructed, and maintained to comply with applicable local, regional, state, and/or federal requirements related to emergency access, fire protection, and evacuation. The El Dorado Hills Fire Department and CAL FIRE would perform a fire and life safety review, respectively, prior to approval of the Project plans and documents.

An emergency plan describes a comprehensive emergency management system that provides for the planned response to disaster situations associated with natural disasters, technological incidents, terrorism, and nuclear-related incidents. The County of El Dorado and the community of El Dorado Hills utilize the following documents to respond to major emergencies and disasters.

- 2024 El Dorado County Multi-Jurisdictional Hazard Mitigation Plan.
- El Dorado County - Emergency Operations Plan
- El Dorado County - Local Hazard Mitigation Plan

The El Dorado County Emergency Operations Plan identifies a broad range of potential hazards and a general response plan (County of El Dorado 2023). While evacuation routes for the Project area are not identified in the Emergency Operations Plan, typically, evacuation routes consist of the major interstates, highways, and prime arterials. Nearby potential evacuation routes nearest to the Project area include the Silva Valley Parkway, which is immediately adjacent to the Project, and State Highway 50, with the nearest on ramp several hundred feet south of the Project., However, specific evacuation routes would be determined based on the location and extent of the incident.

The El Dorado County Emergency Operations Plan establishes the emergency organization, assigns tasks, specifies policies and general procedures, and provides for the coordination of planning efforts of the various emergency staff and service elements of the county. The El Dorado County Emergency Operations Plan is an all-hazards plan that establishes a comprehensive framework for the management of emergency events that occur in the county or can have a significant impact on the county. The plan is designed to integrate with the plans of El Dorado County's response partners. It is consistent with the mandates of the Federal Emergency Management Agency and the California Office of Emergency Services. While the El Dorado County Emergency Operations Plan and the El Dorado County Multi-Jurisdictional Hazard Mitigation Plan address evacuation, they do not provide specific guidance on establishing evacuation routes, trigger points, or other details that describe how an evacuation would be conducted in the Project area. No officially adopted emergency evacuation plan in El Dorado County applies to the Project area.

Appendix D, El Dorado Hills Costco Warehouse- Evacuation Analysis, May 2025, details the Evacuation Analysis of the project site, which is also discussed thoroughly in Section 12, Project Impact to Community Evacuation Routes.

Overall, the Project would not impair implementation of or physically interfere with the El Dorado County Emergency Operations Plan or the county hazard mitigation plans, as it would not have any effect on the framework or procedural guidance in these plans or otherwise affect plans for wildfire mitigation or preparedness.. Therefore, the Project Plan would not interfere with adopted emergency response plans, and the impact would be **less than significant.**

8 Project Impacts to Wildfire Risk

The Project is located entirely within a CAL FIRE-designated Moderate Fire Hazard Severity Zone. Figure 3 shows the CAL FIRE Fire Hazard Severity Zone map for the Project area. The Project site and surrounding areas contain fuels (annual grasslands and woodlands) and terrain (southwest-facing hillsides) that can sustain the spread of a wildfire when weather conditions permit fire growth (May to October) and a suitable ignition source is present. Wildfires have historically happened in the area due to a variety of ignition sources, including equipment use and electrical equipment.

Construction

As noted, the Project area is partially located within a Moderate Fire Hazard Severity Zone. Heat or sparks from construction equipment or vehicles, as well as the use of flammable materials, have the potential to ignite adjacent vegetation and start a fire, especially during weather events that include low humidity and high wind speeds that are typically experienced in the fall, but can occur from May to October in the region. The following construction-related equipment and practices have the potential to generate heat or sparks that could result in wildfire ignition:

- Earthmoving and excavating equipment, chainsaws, and other small gas-powered equipment and tools can cause sparks that serve as a source of fire ignition.
- Tractors, graders, mowers, bulldozers, backhoes, cranes, excavators, trucks, and vehicles may result in heated exhaust, which, if they come into contact with vegetation, may result in fire ignition.
- Welders consist of an open heat source that may result in metallic sparks, which could ignite vegetation.

The risk of potential ignitions resulting from construction activities is very low for the vast majority of the Project development footprint. Both the North Site and the South Site will be cleared and graded during the first phases of construction. This work would remove combustible vegetation from the area where there is a risk of construction-related ignition. All of the Costco South site will be cleared and graded, so it is anticipated that there will be no combustible vegetation on site to be ignited. The development footprint of the Fuel Facility on the North Site only covers a portion of the site, and during construction, the annual grasslands on the adjacent hillside will remain intact. There is an increased ignition potential resulting from construction equipment and related activities at the North Site due to the proximity of native vegetation communities to construction activities. Therefore, the construction impacts of the proposed Master Plan related to wildfire risks would be **potentially significant.** Implementation of the Construction Fire Prevention measures in Section 6.3 would avoid significant wildfire risks associated with the construction of the project.

Operation

After the completion of the project, the area within the development footprint on both the North Site and South Site would be converted to a mix of non-combustible surfaces, ignition-resistant buildings, and maintained landscaping. Project structures, infrastructure, and landscaping would comply with the requirements in the CBC for ignition-resistant construction, and the CFC and Title 14 Minimum Fire Safe Regulations for access, water supply, and vegetation management. Structural hardening requirements address roofs, eaves, exterior walls, vents, appendages, windows, and doors, and result in hardened structures that have been proven to perform at high levels

(resist ignition) during the typically short duration of exposure to burning vegetation from wildfires. There are two primary concerns for structure ignition: 1) radiant and/or convective heat and 2) burning embers (NFPA 1144, 2008; IBHS, 2008). Burning embers have been a focus of building code updates for at least the last decade, and structures built to these codes have proven to be very ignition-resistant. Likewise, radiant and convective heat impacts on structures have been minimized through the exterior fire ratings for walls, windows, and doors. Additionally, provisions for defensible space (described below) separating wildland fuels from structures and requirements for interior sprinklers have proven to reduce the number of structure losses in WUI areas. Project structures would be required to maintain a defensible area around the entire structure and be consistent with state and local level 100-foot defensible space standards (California Public Resources Code Section 4291, EDH #W-002), As shown on Figure 5, the Project is able to achieve a 100 foot defensible space area around structures at both sites through a combination of non-combustible surfaces, fire smart landscaping, and maintenance of the adjacent annual grasslands. Therefore, with adherence to the CBC and CFC, the impacts of the Project post-development related to wildfire risks would be **less than significant.**

9 Installation or maintenance of associated infrastructure that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment.

As described in Section 6.2, it would maintain defensible space around the structures at both the North Site and South Site, consistent with California Public Resources Code 4291 and El Dorado Hills Fire Department standards (#W-001 and # W—002), given its location within the CAL FIRE designated Moderate Fire Hazard Severity Zone. The Project structures and infrastructure would comply with the CBC and CFC requirements for development in an SRA Fire Hazard Severity, including adequate fire department road access and suitable water supply, given the structure's construction and size. Project components, including structures, infrastructure, and vegetation, would also comply with the CCR Title 14 Minimum Fire Safe Standards. The Project improvements, including access road construction and the installation of on-site fire hydrants and automatic fire sprinklers, would facilitate site access for responding fire agency personnel and reduce the risk of structure ignition. None of the Project components, including the Fueling Facility, is expected to exacerbate wildfire risk or result in additional temporary or permanent impacts beyond those identified in this FSP. Finally, the Project proposes to convert all of the South Site and all of the development footprint of the North Site from a hillside covered with combustible vegetation (annual grasslands) to a combination of maintained landscaping, non-combustible surfaces, and ignition-resistant structures. For these reasons, impacts to the environment resulting from the installation and maintenance of infrastructure would be **less than significant.**

Development of the Project and the resulting conversion of the lands within the development footprint from combustible vegetation to maintained vegetation, ignition-resistant construction, and non-combustible surfaces would reduce the overall wildfire risk on the Project site. A portion of both the North Site and South Site is adjacent to Silva Valley Parkway, an important transportation corridor between Highway 50 and the residential areas to the north. The development of the Project site would protect the portions of Silva Valley Parkway within the Project boundaries from being overrun during a wildfire. Fire smart landscaping, annual vegetation management, and regular irrigation as described in Section 6.2 would ensure that the emergency access roads within the Project site, as well as the important adjacent public streets, would remain open during a fire and would not likely be impacted by extreme fire behavior anticipated in unmanaged fuels.

10 Project Influence on the Risk of Post-Fire Downslope or Downstream Flooding as a Result of Run-off, Slope Instability, or Drainage Changes

Slope failures, mudflows, and landslides are common in areas with steep hillsides and embankments, and such conditions would be exacerbated in a post-fire environment where vegetative cover has been removed. The project site is located in a valley bottom at the lower end of a watershed that passes under Highway 50 (Stier PE 2021). There is minimal development downslope to or downstream from the project site. Slopes exceed 20% on the steepest parts of the Project site, but these occur on short sections of the hillside. The average slope across the Project site is approximately 4%, and therefore, it is not at a high risk for slope failures, mudflows, or landslides. Further, the entire Costco South site will be developed, and post-development will be unlikely to sustain a wildfire that could remove all of the vegetation on the site and lead to post-fire soil instability.

Increases in surface runoff and erosion are also possible in a post-fire environment where surface vegetation has been removed, and steep slopes can lead to increased runoff flow velocity. As presented in Section 4.10, Hydrology and Water Quality, all near-term project development and redevelopment that introduces new impervious surfaces or replaces existing impervious surfaces would be required to include stormwater control features to reduce the potential for increased runoff and associated erosion. Finally, the irrigated and maintained landscaping in Voorhis Ecological Reserve and the Agricultural Field Laboratories are not expected to be burned (removed) entirely should a fire occur on the near-term project sites, unlike post-fire conditions in native vegetation, where complete removal is common. Considering these near-term project site features and characteristics, post-fire conditions are not expected to increase risks associated with runoff and erosion. Therefore, potential impacts associated with runoff, post-fire slope instability, or drainage changes due to the near-term projects would be **less than significant**.

11 Local Fire Protection Capability and Water Supply for Fire Suppression

The El Dorado Hills Costco project is located within the jurisdiction of the El Dorado Hills Fire Department (EDHFD); however, the project does not have agreement with the EDHFD yet to provide emergency services to site and the property is still described on CAL FIRE Fire Hazard Severity Maps as being located in the State Responsibility Area (SRA) with CAL FIRE having the responsibility to provide emergency services to the project site (CAL FIRE 2024). Water service in the area of the project site is provided by the El Dorado Irrigation District (EID), but the site is not currently in EID's service area.

At this time, the project does not have 'Will-Serve' agreements with either agency; however, will serve agreements are a condition of project approval, and for this report, it is assumed that both agencies will annex the project into their service territories.

11.1 Fire Protection Capability

The El Dorado Hills Fire Department is an ISO rated Class 3/3x Fire Department with seven fire stations serving the communities of El Dorado Hills, Latrobe, and Rescue. The project site is located at approximately equal distances and travel times to three EDHFD fire stations. Station 86 is located east of the project site on Bass Lake Road, approximately 2.8 road miles from the project site, with a projected travel time of 5 minutes. Station 85 is located west of the project site on El Dorado Hills Boulevard, approximately 2.7 road miles from the project site, with a projected travel time of 6.5 minutes. Station 87 is located south of the project on Golden Foothill Parkway, approximately 2.8 miles from the project site, with a projected travel time of 6.5 minutes.

The EDHFD has sufficient staffing and equipment to provide emergency fire protection services to the project site and meets the requirements for fire protection response and capacity described in Chapters 5 and 6 of the El Dorado County General Plan [Policies 5.7.1.1, 5.7.4.1, 5.7.4.2, and 6.2.3.1].

Table 3 lists the three closest El Dorado Hills Fire stations, along with their respective travel distances and travel times to the Project site.

Table 3 Location and Response Times for the Nearest Fire Stations to the Project

Station Name	Fire Station Address	Maximum Travel Distance[4]	Maximum Travel Time**
El Dorado Hills Fire Station 85	1050 Wilson Blvd, El Dorado Hills, CA 95762	2.7 mi.	6 minutes and 20 seconds
El Dorado Hills Fire Station 86	3670 Bass Lake Rd, El Dorado Hills, CA 95762	2.8 mi.	6 minutes and 35 seconds
El Dorado Hills Fire Station 87	4680 Golden Foothill Pkwy, El Dorado Hills, CA 95762	2.8 mi.	6 minutes and 35 seconds

[4] Maximum Travel Distance from the fire station to the Costco Warehouse entrance on Silva Valley Parkway

Travel distances are derived from Google road data. In contrast, travel times are calculated using response speeds of 35 mph, consistent with the nationally recognized National Fire Protection Association (NFPA) 1710 and Insurance Services Office (ISO) Public Protection Classification Program's Response Time Standard formula (Time=0.65 + 1.7(Distance). The ISO response travel time formula discounts speed for intersections, vehicle deceleration, and acceleration, and does not include turnout time.

11.2 Water Supply

The El Dorado Irrigation District (EID) will provide water service to the project. There is an existing EID water main located in Clarksville Crossing that the Project's new water mains would connect to. Based on the requirements in Chapter 5, Appendix B, and Appendix C of the 2022 CFC, it meets the requirements for fire protection response and capacity described in Chapters 5 and 6 of the El Dorado County General Plan [Policies 5.7.1.1 and 6.2.3.1]. The project would be required to meet a minimum fire flow rate of 3000 gallons per minute for a duration of two hours and install a minimum of five fire hydrants around the Costco Warehouse.

12 Project Impact on Community Evacuation Routes

12.1 Background

Appendix D, Evacuation Analysis, a technical memorandum prepared by Kittelson and Associates, created in May 2025, provides an evacuation transport analysis and is summarized in this section. The Evacuation Analysis provides estimates of roadway capacity constraints during wildfire evacuations, potential impacts to the roadway network under wildfire evacuation scenarios, and changes in travel times associated with the proposed Project. The Evacuation Analysis describes two different wildfire event scenarios for both existing and near-term (2034) conditions at the Project site and the surrounding residential communities. The two different wildfire event scenarios include one fire igniting in the northeast of the Project site and one fire igniting southwest of the Project site.

12.2 Analysis

12.2.1 Scenarios

The Evacuation Analysis evaluates the transportation-related impacts of the Project during the two wildfire evacuation scenarios, which are summarized in Table 4. To maintain consistency with the Traffic Impact Analysis (TIA), the Evacuation Analysis examines potential evacuation effects under the Existing and Near-Term (2034) conditions. To account for the worst-case scenario, all the scenarios are analyzed during the afternoon peak hour, which represents the peak traffic volume during a typical week: the sum of background traffic in the area plus traffic from the Project development, assuming Costco members and employees are in the warehouse and residents in the evacuation area are at home. Accordingly, this study evaluates transportation-related impacts during the afternoon peak hour for the two wildfire scenarios under the following conditions: existing no project, existing plus project, near-term (2034) no project, and near-term (2034) plus project. The near-term (2034) no project and plus project conditions include the projected land use development and trip generation for the remainder area, which is the approximately 13.79-acre portion of the Project site that is not proposed for development. Thus, the remainder area is not considered in the existing plus project conditions.

Table 4. Evacuation Analysis Wildfire Scenarios

	Wildfire Scenario #1	Wildfire Scenario #2
Ignition Location	Northeast of the Project site	Southwest of the Project site
Wind Direction	North-northeast	Southwest
Direction of Fire Spread	Southwest towards the Project site	Northeast towards the Project site
Time to reach the Project site	~143 minutes (2 hours 23 minutes)	Does not reach the Project site due to fire breaks, including riparian vegetation and a paved roadway west of the Project site

12.2.2 Evacuation Assumptions

Transportation activity was modeled for the worst-case scenario under which people in the surrounding areas would evacuate. This period is assumed to be the afternoon peak hour when the sum of background traffic in the area plus traffic from the Project development is greatest during a typical week.

Baseline travel represents normal travel patterns during the afternoon peak hour, as included in the El Dorado County travel demand model. Evacuation travel represents the estimated number of evacuation trips and the travel time from each evacuating Traffic Analysis Zone (TAZ) to an evacuation destination. TAZs are assigned a combination of Baseline travel and Evacuation travel (25% and 75%, respectively), based on their presence in the designated evacuation area.

For each of the two wildfire evacuation scenarios analyzed in this study, the following are the evacuation area boundaries: For wildfire Scenario #1, the evacuation area is assumed to be bounded by Serrano Parkway on the north, US 50/Old White Rock Road on the south, Silva Valley Parkway on the west, and Bass Lake Road on the east. For wildfire scenario #2, the evacuation area is assumed to be bounded by Serrano Parkway on the north, US 50/White Rock Road on the south, El Dorado Hills Boulevard on the west, and areas surrounding Tong Road between Silva Valley Parkway and Bass Lane Road.

The El Dorado County auto ownership information by Census Tract is obtained from the American Community Survey (ACS) 2023 five-year estimates. Based on this data, there are an average of 2.03 vehicles per household in El Dorado County. Therefore, the number of evacuating households is multiplied by two (rounded) to estimate the number of evacuating residential vehicles. Each evacuating employee is assumed to use one vehicle.

The evacuation analysis conservatively assumes that 75 percent of residents and 75 percent of employees would need to evacuate during a wildfire event. This is due to most residents being at home during the night and fewer being at home during the day, while most employees will be at work during the day and are much less likely to be at work at night.

65% of Costco members and employees will evacuate eastward towards Placerville, while 35% will evacuate westward towards Folsom. 80% of residents and employees outside the project area will evacuate westward towards Folsom, while twenty percent will evacuate eastward towards Placerville. Those evacuating will use US 50 to evacuate to the east or west. All Costco employees and members will evacuate during the peak hour for both scenarios. Additionally, 65% of residents and employees outside the project area will evacuate during the peak hour when under an evacuation order, and 25% will evacuate under an evacuation warning.

12.3 Results

The El Dorado County travel demand model was used to estimate travel times and volume-to-capacity ratios (V/C) ratios for each analysis scenario to understand how the Project would impact residents, employees, and Costco members in the evacuation area for each wildfire scenario. The following sections present the congestion locations and comparison of travel times for baseline conditions (no evacuation), existing conditions, and near-term (2034) conditions in No Project and Plus Project conditions for the two wildfire scenarios. The analysis is run assuming no manual traffic control is in place during the evacuation. The congestion on a roadway segment is determined based on the V/C ratio of the segment derived from the El Dorado County travel demand model. Congestion locations are classified as shown in Table 5.

Table 5. Congestion Classification based on Volume-to-Capacity (V/C) ratio

Volume to Capacity Ratio	Congestion Classification
≤ 0.9	Under Capacity
0.9 to 1.0	Near Capacity
≥ 1.0	Over Capacity

12.3.1 Scenario #1, Existing Conditions

The Project will increase travel time in traffic with a variation between 0.1 and 1.0 minutes (0-5% increase). Although the volume-to-capacity ratio increases along US 50 towards Folsom and Placerville, the volume-to-capacity ratio changes with the addition of Project traffic are minimal. The overall roadway capacity is expected to remain under full capacity (v/c < 1.0).

12.3.2 Scenario #1, Near Term (2034) Conditions

The Project will increase travel time in traffic with a variation between 0.1 and 0.8 minutes (1-4% increase). Volume-to-capacity ratio increases along US 50 towards Folsom and Placerville, and along Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard. The overall roadway capacity is expected to remain under full capacity (v/c < 1.0). The change in roadway capacity is estimated to be minimal.

12.3.3 Scenario #2, Existing Conditions

The Project will increase travel time in traffic with a variation between 0 and 1.2 minutes (0-6% increase). Although volume-to-capacity ratio increases along US 50 towards Folsom and Placerville, and along Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard, the volume-to-capacity ratio changes with the addition of Project traffic are minimal. The Overall roadway capacity is expected to remain under full capacity (v/c < 1.0) for most of US-50 near the project site, but some segments are estimated to have a roadway capacity over capacity (v/c > 1.0).

12.3.4 Scenario #2, Near Term (2034) Conditions

The Project will increase travel time in traffic with a variation between 0.1 and 0.6 minutes (0-3% increase). Overall roadway capacity is expected to remain under full capacity (v/c < 1.0) for most US-50 near the project site, but some segments are estimated to have a roadway capacity over capacity (v/c > 1.0). Although the volume-to-capacity ratio increases along US 50 towards Folsom and Placerville, and along Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard. The change in roadway capacity is estimated to be minimal.

13 Conclusion

The El Dorado Hills Costco project proposes to construct a Costco retail center, parking facilities, and a fuel facility on a vacant site in the El Dorado Hills community. The project site is located just north of Highway 50 and next to Silva Valley Parkway. The project site and surrounding area have been designated as a Moderate Fire Hazard Severity Zone. Since 1935, the project's general area has experienced 20 large wildfires. Current conditions on the site and on the adjacent properties would sustain the spread of a wildfire. Because of this risk, the El Dorado Hills Fire Department has required the developer of this project to create a Fire Safe Plan as a condition of approval for the project. This Fire Safe Plan is intended to document the conditions present on the site that could contribute to the ignition or spread of a wildfire and the elements of the project that help mitigate this risk of a new wildfire igniting or spreading on the project site.

This Fire Safe Plan describes the current wildfire environment for the project site, including the elements required for a wildfire to grow, such as fuels, terrain, and weather. Also described is the existing road system and the adjacent land uses. The report then describes the elements that the developer intends to incorporate into the Costco building, the parking lot, and the surrounding landscaping that will reduce the risk of a new fire starting on the site, limit the ability of a wildfire to spread on the site, and allow firefighters to engage a nearby wildfire safely.

Upon completion of the proposed project, the site will lack terrain and fuels that can sustain the rapid growth of a wildfire. The Costco building, located on a large bench in the middle of the site, will have an exterior constructed out of ignition-resistant and non-combustible materials, so it would not be at an increased risk of ignition. The entire site will be easily accessible for fire apparatus from multiple points. In addition to not increasing the risk of starting or spreading a wildfire, the project can be served by the existing roads, water supply, and fire department without requiring an upgrade to public facilities. Finally, the project would not substantially impact the evacuation of the surrounding residential communities.

This plan concludes that the project does not exacerbate the wildfire risk in the project area.

IRRIGATION DESIGN STATEMENT:

The irrigation system will be a water efficient low flow, point source system designed to provide adequate watering to support plant growth and insure deeply rooted plant material while avoiding excess water application. The system will be programmable, allowing operation during late night and or early morning hours, with multiple start times and cycles. The system will interface with a weather based sensor that will adjust the amount of water applied to the plant material based on daily weather conditions. Irrigation materials specified for the site will be selected on the basis of durability and ease of maintenance. Landscape irrigation will comply with the California Department of Water Resources Model Water Efficient Landscape Ordinance (MWELO).

Note: All landscape areas will be irrigated.

EDHFD Fire Safe Plan Requirements (From #W-002)

EL DORADO HILLS FIRE DEPARTMENT
FIRE PROTECTION STANDARD

Wildland Urban Interface Fire Protection Plans
STANDARD #W-002 EFFECTIVE 6-6-2022 REVISED 6-6-22

I. PURPOSE:

The purpose of this standard is to communicate the minimum fire safe regulations of the State of California, County of El Dorado (EDC) and the local Fire Code Official for the formation, implementation and on-going use of a *Wildland Urban Interface Fire Protection Plan* (Fire Safe Plan) for new developments and special use permits hereafter created.

II. BACKGROUND:

The California Fire Code (CFC) Section 4903.1 (Where Required), amended by ordinance in EDC by each local fire authority, states: *The fire code official of the fire district may require development projects located in Moderate, High and Very-High Fire Hazard Severity Zones to submit a fire protection plan. This plan shall be approved by both the fire code official and the authorized representative for the local CAL FIRE Unit Chief, if located in the State Responsibility Area (SRA), prior to the recording of the final map for the project by the County of El Dorado.*

III. SCOPE:

This standard identifies when a Fire Safe Plan is required, common definitions associated with the plan creation, who is qualified to prepare plans, the framework for a plan, and how the plan is to be implemented by the property owner or responsible party to mitigate conditions that might cause a wildfire to transmit fire to buildings, threaten to destroy life, overwhelm fire suppression capabilities, or result in large property losses. This standard does not supersede the

fire code official's authority to require more restrictive requirements than those described in this document.

IV. WHERE REQUIRED:

An approved Fire Safe Plan shall be prepared for the following types of development projects:

A. The creation of a Specific Plan or similar large-scale project.

B. The creation of five (5) or more parcels as part of a parcel or subdivision map.

C. A change in zoning or issuance of a discretionary permit which proposes to increase intensity or density.

D. New commercial or industrial uses located in High or Very-High Fire Hazard Severity Zones.

E. Where in the opinion of either CAL FIRE or the local Fire Code Official it is deemed necessary due to the fire risk or fire hazard associated with the property.

EXCEPTIONS:

1. Accessory and junior accessory dwelling units.
2. Roads used solely for agricultural, mining, or the management and harvesting of wood products.

V. AUTHORITY CITED:

A. County of El Dorado General Plan 6.2.2.2 (Limitations to Development).

B. 2019 California Fire Code (CFC), Chapter 4, Chapter 4 (Emergency Planning & Preparedness).

C. 2020 Local Fire District Ordinance, Chapter 49, Section 4903.1 (WUI Fire Protection Plans).

D. 2021 Title 14 of the California Code of Regulations, Division 1.5, Chapter 7, Subchapter 2, Articles 1-5 (Fire Safe Regulations).

E. 2019 California Building Code (CBC) Chapter 7A (Materials & Construction Methods for Exterior Wildfire Exposure)

F. Fire Hazard Planning Technical Advisory Guide (2020) – Governor's Office of Planning & Research

VI. DEFINITIONS:

A. **Access –** The roads on a route from a building to the nearest collector road.

B. **Authority Having Jurisdiction (AHJ) -** A fire department, agency, division, district, or other governmental body responsible for regulating and/or enforcing minimum fire safety standards.

C. **Building –** Any structure utilized or intended for supporting or sheltering any occupancy.

D. **Biomass** – Refers to "green waste" materials generated during the defensible space clearing project. This includes grass, weeds, and tree trimming materials.

E. **CAL FIRE** – Refers to the California Department of Forestry and Fire Protection.

F. **CWPP –** Refers to the El Dorado County Community Wildfire Protection Plan.

G. **Defensible Space** – Is the design and maintenance of natural and/or landscaped areas around a structure to reduce the danger from an approaching wildfire. Defensible space is intended to reduce the threat of wildfire spread from the wildland threat area to adjacent structures. It is also intended to provide access to firefighters for fire suppression actions and to provide a safe zone for them to work. Defensible space is based on three general concepts:

1. Zone 0 - 0-5'; Ember Resistant Zone
2. Zone 1 – 5'-30'; Lean, Clean and Green Zone
3. Zone 2 – 30'-100'; Reduced Fuel Zone
4. Fuel removal or reduction within 100' of structures in all directions
5. Thinning, pruning and removal of dead vegetation and continuous dense uninterrupted layers of vegetation
6. Removal of ladder fuels within 6'-10' to prevent fire spread from surface fuels into tree canopies.

H. **Development –** means the uses to which the land which is the subject of a map shall be put, the buildings to be constructed on it, and all alterations of the land and construction incident thereto.

I. **Emergency Vehicle/Evacuation Access Road (EVA)** - A road or other connection designed to connect directly to a through road and used to comply with 14CCR §1273.08 (Maximum Length of New Dead-end Roads). The road shall serve as a secondary means of emergency vehicle access and civilian evacuation for the project.

J. **Fire Code Official –** The fire chief or other designated authority charged with the administration and enforcement of the code, or a duly authorized representative.

K. **Firefighting Water Supply –** Water supply that is dedicated to the use of the fire department for the suppression of any type of fire.

L. **Fire Hazard –** Is the dangerous accumulation of flammable fuels in open space areas and other wildland urban interface areas. It is typically described at the landscape (area) level. Usually referring to the density of live or dead vegetation that may be ignited by the various fire risks or causes that can increase a fires intensity or rate of spread. Fire hazard is based on the vegetation types likely to be present over the next 50 years that contribute to fire severity and ember production, the topography of the area and the average fire weather conditions present in the area.

M. **Fire Resistant Vegetation** – Plants, shrubs, trees, and other vegetation which exhibit properties, such as high moisture content, little accumulation of dead vegetation, and low sap or resin content, that make them less likely to ignite or contribute heat or spread flame in a fire than native vegetation typically found in the region. **Note**: The following sources contain examples of vegetation that can be considered fire resistant vegetation. (Fire Resistant Plants for Home Landscapes, A Pacific Northwest Extension publication; Home Landscaping for Fire, University of California Division of Agriculture and Natural Resources; Sunset Western Garden Book).

N. **Fire Risk** – Is the potential damage a fire can cause to buildings, critical assets/infrastructure and other values at risk in individual open space areas and other

wildland urban interface areas. Fire risk does consider modification that may affect susceptibility of property to damage such as defensible space, fire sprinkler systems and building construction that can reduce the risk of burning embers igniting buildings. Fire hazard does not equal fire risk but is an important factor in determining fire risk.

O. **Fuel Break** – A strategically located area where the volume and arrangement of vegetation has been managed to limit fire intensity, fire severity, rate of spread, crown fire potential and/or ember production.

P. **Greenbelts** – Agricultural lands, open space, parks, wildlands, or a combination thereof, as designated by a local jurisdiction, which surround or are adjacent to a city or urbanized area, and restrict or prohibit development.

Q. **Greenways** – Linear open spaces or corridors that link parks and neighborhoods within a community through natural or manmade trails and paths.

R. **Local Responsibility Area (LRA)** – Those areas of land not classified by the State Board of Forestry where the financial responsibility of preventing and suppressing wildfires is that of the State or Federal government, PRC §4125.

S. **Public Temporary Refuge Area** – A gathering point for residents if they are temporarily evacuated from their residence, or when evacuation routes are obstructed by smoke, incoming emergency equipment, or directly threatened by fire as a last resort.

T. **Shaded Fuel Break** – Is a strategy used whereby a strip of land containing fuel (for example, living trees and brush, and dead branches, needles, or downed logs) has been modified to reduce the amount of combustible materials to act as a "strategic landscape" to limit the fire's ability to spread rapidly. Constructing a shaded fuel break is the process of selectively thinning and removing more flammable understory vegetation while leaving the majority of larger tree species in place. Along roadways, shaded fuel breaks create safer ingress and egress routes for fire personnel and citizens.

U. **Shelter in Place**[i] – Is a community approach to protecting neighborhood and individual homes from the imminent threat of a wildfire when residents are unable to evacuate. The communities are built to specific fire safety standards adopted by the AHJ that may allow

the residents who are unable to evacuate to remain inside their ignition-resistant home until the immediate emergency is over.

V. **State Responsibility Area (SRA)** – Areas of the State in which the financial responsibility of preventing and suppressing fires has been determined by the State Board of Forestry and Fire Protection, to be primarily the responsibility of the State, PRC §4102.

W. **Wildfire** – Any uncontrolled fire spreading through vegetative fuels that threatens to destroy life, property, or resources, PRC §4103 and 4104.

X. **Wildland-Urban Interface (WUI)** – A geographical area identified by the State as a "Fire Hazard Severity Zone" in accordance with the PRC §4201 through 4204 and Government Code §51175 through 51189, or through the Healthy Forest Restoration Act of 2003 (Public Law 108-148), as an area within or adjacent to an at-risk community that is identified to be at a significant risk from wildfires.

VII. REQUIRED PERMITS:

A. Concurrent with the submission of an application for a Parcel Map or Tentative Subdivision Map that would result in a total of five (5) or more parcels, or other entitlement application for projects described in Section IV, to the County of El Dorado, the project applicant shall submit the required Fire Safe Plan to the AHJ and CAL FIRE - Amador-El Dorado- Unit (AEU) for approval.

B. Prior to the approval of a certificate of occupancy for a building the project shall demonstrate to the satisfaction of the AHJ and CAL FIRE that the project complies with all applicable provisions found in the Fire Safe Plan.

C. Prior to the recording of a Parcel Map or approval of a Final Subdivision Map, or other entitlement for projects described in Section IV, by the County of El Dorado, the project shall adequately demonstrate that all provisions of the Fire Safe Plan, including the maintenance of green belts, greenways, fuel breaks, shaded fuel breaks and other vegetation management requirements, have either [1] been met to the satisfaction of the

AHJ and CAL FIRE; or [2] that a development agreement or bonding of the required infrastructure has been agreed to by the AHJ and CAL FIRE.

D. Prior to June 1st each year the property owner or their representative shall demonstrate to the satisfaction of the AHJ and CAL FIRE that the project [1] complies with all relevant provisions of the Fire Safe Plan; and [2] that all fire hazards in the development have been mitigated.

E. Fire Safe Plans shall be reviewed and updated by the property owner no less than once every five calendar years after its original approval to ensure that the project complies with all current regulations and requirements for existing developments. The AHJ and CAL FIRE shall review and approve this plan update prior to its use.

VIII. QUALIFICATIONS & LICENSES REQUIRED FOR PLAN DEVELOPMENT:

The following persons and / or concerns are qualified to prepare and submit Fire Safe Plans on behalf of the development projects described in Section IV.

A. California licensed foresters, landscape architects and arborists with fire behavior experience.

B. Certified Wildfire Mitigation Specialists.

C. Subject matter experts deemed qualified by the fire code official and CAL FIRE.

D. A AHJ or other approved federal, state or local agency.

IX. FIRE SAFE PLAN REQUIREMENTS:

A. Fire Safe Plans shall be based on a site-specific wildfire risk assessment that includes considerations of location, topography, aspect, flammable vegetation, climatic conditions, and fire history. The plan shall address water supply, emergency vehicle access, building ignition and fire-resistance factors, fire protection systems and equipment, defensible space, fuel breaks, buffer zones and vegetation management to

reduce hazard severity and risk. Fire Safe Plans shall be formatted in the following areas to ensure consistency:

1. A cover sheet that identifies the name of the project, the County of El Dorado Planning Permit Number (if applicable), the date prepared and the name of the concern that prepared the plan.
2. A plan signature page that includes the name and organization of the plan preparer, CAL FIRE – Amador & El Dorado Unit (AEU) representative and the authorized representative for the AHJ.
3. A section of the plan shall identify the following features of the project:
   a. Total size of the project
   b. Information on the adjoining properties on all sides, including current land uses, and, if known, existing structures and densities, planned construction, natural vegetation, environmental restoration plans, roads and parks.
   c. A map with all project boundary lines, slope contour lines, proposed structure foundation footprints, and proposed roads and driveways. The map shall also identify fuel modification zones and methods of identifying the fuel modification zone boundaries.

4. A section of the plan shall summarize all recommendations for the project, the timing in which the recommendations are to be implemented, and who the responsible party is to complete these recommendations.

B. The plan shall evaluate whether the project will substantially impair an adopted emergency response plan or emergency evacuation plan. The plan shall identify potential mitigation measures that can be adequately employed to reduce the impacts caused to the existing response or evacuation plan.

C. The plan shall evaluate whether the project exacerbates the wildfire risk due to slope, prevailing winds and other factors. The plan shall identify potential mitigation measures that can be adequately employed to reduce the overall wildfire risk due to the factors identified.

D. The plan shall identify the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or on-going impacts to the environment. The plan shall identify potential mitigation measures for vegetation reduction around emergency access, evacuation routes and associated infrastructure that can be implemented to ensure that this infrastructure is installed and maintained by the project and successor parties.

E. The plan shall identify whether the project will expose people or structures to significant risks, including downslope or downstream flooding or landscape, as a result of runoff, post-fire slope instability, or drainage changes.

F. The plan shall evaluate [1] the local fire protection capabilities; and [2] fire suppression water supply capabilities to adequately serve the project and make recommendations to improve or mitigate deficiencies identified during the analysis of the project.

G. The plan shall evaluate community wildfire evacuation routes required for the project for their capacity, safety, and viability under a range of scenarios and to ensure consistency with CAL FIRE, CAL OES and AHJ requirements.

H. The plan shall provide legally binding statements regarding community responsibility for the maintenance of fuel modification zones. The legally binding statements shall be

incorporated into the project covenants, conditions, and restriction regarding property owner responsibilities for vegetation maintenance.

I. The plan shall include a map identifying all proposed plants in the fuel modification zones with a legend that includes a symbol for each proposed plant species. The plan shall include specific information on each species proposed, including but not limited to:

1. The plant life-form
2. Scientific and common name; and
3. Expected height and width of mature growth

The map shall identify irrigated and non-irrigated zones. The map shall identify all points of access for equipment and personnel to maintain vegetation in common areas.

J. The cost of fire safe plan preparation and review shall be the responsibility of the project applicant.

K. The use of alternative materials, designs and methods of construction and equipment proposed within a FSP shall be approved by the AHJ in accordance with CFC §104.9.

L. Applications for appeal of provisions found in a FSP shall be heard by the AJH Board of Appeals in accordance with CFC §109.

M. The approved fire safe plan shall be retained by both the AHJ and CAL FIRE for future use. The plan shall also be provided to the project applicant and successor parties for use in implementing the plan provisions.

Approved By:

Ronald A. Phillips, Project Management Specialist

Maurice Johnson, Fire Chief

HOW TO DISTINGUISH CHANGES TO THIS STANDARD FROM PRIOR STANDARD PROVISIONS

Indicates a new standard section has been added.

RED indicates language changes have been made since the previous version of this standard.

[i] The shelter in place concept is normally associated with new communities and developments where fire protection features such as defensible space, home hardening, Class A roofs, automatic fire sprinkler systems, etc.... are present.

Appendix B
Regulatory Environment: Wildfire Prevention Codes, Laws, and Regulations Relevant to the Costco Project

The Costco project will be consistent with the following codes and regulations:

- **2019 California Building Code, Ch. 7A** – Materials and Construction Methods for Exterior Wildfire Exposure: minimum standards for a new building located in a WUI area to resist the intrusion of flame or burning embers projected by a vegetation fire.
- **2019 California Fire Code, Chapter 49** – Requirements for Wildland-Urban Interface Fire Areas: minimum standards to increase the ability of a building to resist the intrusion of flame or burning embers being projected by a vegetation fire.
- **2019 California Code of Regulations, Title 14, Div. 1.5, Ch. 7, Sub-Ch. 2** – SRA/VHFHSZ Fire Safe Regulations: minimum wildfire protection standards in conjunction with building, construction, and development in the SRA and VHFHSZ.
- **California Public Resources Code, Div. 4, Part 2, Ch. 3, Sec. 4290**: minimum fire safety standards related to defensible space in Hazardous Fire Areas; **Sec. 4291**: Defensible space maintenance on Mountainous, Forest-, Brush- and Grass-Covered Lands.
- **California Government Code, Title 5, Div. 1, Part 1, Ch. 6.8, Sec. 51175-51189**: Very High Fire Hazard Severity Zones.
- **California Government Code, Title 7, Div. 2, Ch. 4, Sec. 66474.02**: requirements for tentative map approval in a very high fire hazard severity zone.

- **El Dorado County General Plan, Public Health, Safety, and Noise Element, Policy 6.2.3.1:** The project proponent and the responsible fire protection district must provide the County with evidence of adequate emergency water flow, fire access, and firefighting personnel and equipment in accordance with applicable State and local fire district standards.

- **El Dorado County General Plan, Public Health, Safety, and Noise Element, Policy 6.2.3.2:** The project proponent must demonstrate to the County that adequate emergency access exists at the site and private vehicles can safely evacuate the area.

- **El Dorado County General Plan, Public Services and Utilities Element, Policy 5.2.1.2:** An adequate quantity and quality of water for all uses, including fire, shall be provided for with discretionary development.

- **El Dorado County General Plan, Public Health, Safety, and Noise Element, Policy 5.7.2.1:** The responsible fire protection district shall be requested to determine the ability of the district to provide protection at acceptable levels because of the new development.

TECHNICAL MEMORANDUM

August 20, 2025 Project# 26783

To: Ande Flower & Cameron Welch, County of El Dorado Planning

From: Grace Carsky, Sravya Kamalapuram, Amy Lopez

CC: Lt. Troy Morton, El Dorado County Office of Emergency Services; Chief Chrishana Fields, El Dorado Hills Fire; Chief Jeff Hoag, CAL FIRE

RE: El Dorado Hills Costco Warehouse - Evacuation Analysis

Introduction

Kittelson & Associates, Inc. (Kittelson) is providing an evacuation transportation analysis for the environmental impact report (EIR) of the proposed El Dorado Hills Costco warehouse development (Project) at the Silva Valley Parkway, El Dorado Hills site. This assessment provides estimates of roadway capacity constraints during wildfire evacuations, potential impacts to the roadway network under wildfire evacuation scenarios, and changes in travel times associated with the proposed Project. The assessment will cover two different wildfire event scenarios for both existing and near-term (2034) conditions. This memorandum presents the evacuation analysis methodology, results, and considerations for the County of El Dorado (County) and emergency responders including Cal FIRE, El Dorado Hills Fire Department, and El Dorado County Office of Emergency Services.

PROJECT DESCRIPTION

The proposed Project is a commercial development in El Dorado County north of US 50 along Silva Valley Parkway. It is bordered by existing residences and vacant land to the north, vacant land to the east, Clarksville Crossing to the west, and Tong Road and the US 50 westbound ramps to the south. The Project site currently is vacant. Figure 1 presents the Project location.

The Project consists of two sites on either side of Silva Valley Parkway: the North Site and South Site. The North Site will contain a fuel facility with 32 fueling positions. The South Site entails a Costco Warehouse retail center of approximately 165,000 cumulative square feet. Figure 1 presents the location of the proposed Project. Adjacent to the North Site fuel facility, future commercial development is anticipated for the surrounding vacant land (herein referred to as the "Remainder Area").

The Project is expected to generate 442 trips (221 vehicles) in the AM peak hour, 1,277 trips (638 to 639 vehicles) in the PM peak hour, and 1,697 trips (848 to 849 veicles) in the Saturday midday peak hour. During operating hours of the Costco warehouse and gas station, as many as 200 employees are expected to be on-site at any given time.

Wildfire Scenarios

To evaluate how the proposed development may affect congestion and travel times in the vicinity of the Project during wildfire evacuation scenarios, fire progression and fire behavior modeling was conducted by Dudek for the Project area. This modeling considered wildfire history, ignition sources, fuels/vegetation, and historical weather patterns for the Project site and the surrounding area. The detailed Wildfire Modeling methodology report prepared by Dudek is provided in Appendix A.

While the modeling identified three potential wildfire scenarios impacting the Project site, discussions with El Dorado County, El Dorado County Office of Emergency Services (OES), El Dorado Hills Fire Department, and the California Department of Forestry and Fire Protection (Cal FIRE) (hereby referred as the advisory group) led to the selection of two primary wildfire evacuation scenarios for further analysis. These scenarios assess wildfire behavior and evacuation strategies for area residents and Costco employees and members in the Project vicinity and nearby communities.

The details of the wildfire scenarios analyzed in this study are outlined in Table 1. Figure 2 and Figure 3 show the fire progression and fire spread for wildfire scenarios #1 and #2.

Table 1. Wildfire Scenarios

	Wildfire Scenario #1	Wildfire Scenario #2
Ignition Location	Northeast of the Project site	Southwest of the Project site
Wind Direction[1]	North/Northeast	Southwest
Fire Spread	Southwest towards the Project site	Northeast towards the Project site
Time to reach the Project Site	~143 minutes (2 hours 23 minutes)	Does not reach the Project site due to natural fire breaks including riparian vegetation and a paved roadway west of the Project site

Analysis Scenarios

This study evaluates the transportation related impacts of the Project during the two wildfire evacuation scenarios discussed in Table 1. To maintain consistency with the Traffic Impact Analysis (TIA) conducted by Kittleson & Associates, Inc. for the Project,[1] this study examines potential evacuation effects under the Existing and Near-Term (2034) conditions. To account for the worst-case scenario, all the scenarios are analyzed during the PM peak hour, which represents the peak traffic volume during a typical week: the sum of background traffic in the area plus traffic from the Project development, assuming Costco members and employees are in the warehouse and residents in the evacuation area are at home.

Accordingly, this study evaluates transportation related impacts during the PM peak hour for the two wildfire scenarios under the following conditions:

- Existing No Project
- Existing Plus Project
- Near-Term (2034) No Project
- Near-Term (2034) Plus Project

The Near-Term (2034) No Project and Plus Project conditions include the projected land use development and trip generation for the Remainder Area. The Remainder Area is approximately 13.79 acres and is not proposed for development as part of the current project. Thus, the Remainder Area is not considered in the Existing Plus Project conditions.

Travel Modeling Tools

The evacuation analysis uses the El Dorado County travel demand model to estimate roadway congestion and travel times in an evacuation under No Project and Plus Project conditions. The current travel model is calibrated and validated for a 2018 base year and includes a 2040 future scenario with 2040 land use forecasts and transportation improvement assumptions. Kittelson estimated land use conditions for Near-Term (2034) conditions by a linear interpolation of 2018 and 2040 land use assumptions and assuming the 2040 transportation improvements in the Project vicinity.

Evacuation Assumptions

This section outlines the assumptions made on when the residents, employees, and Costco members in the evacuation area would need to evacuate and the conditions under which they would evacuate.

[1] *EDH Costco TIA – DRAFT, February 2025*

TIME PERIOD

Kittelson modeled transportation activity for the worst-case scenario under which people in surrounding areas would evacuate. This period is assumed to be the PM peak hour when the sum of background traffic in the area plus traffic from the Project development is greatest during a typical week.

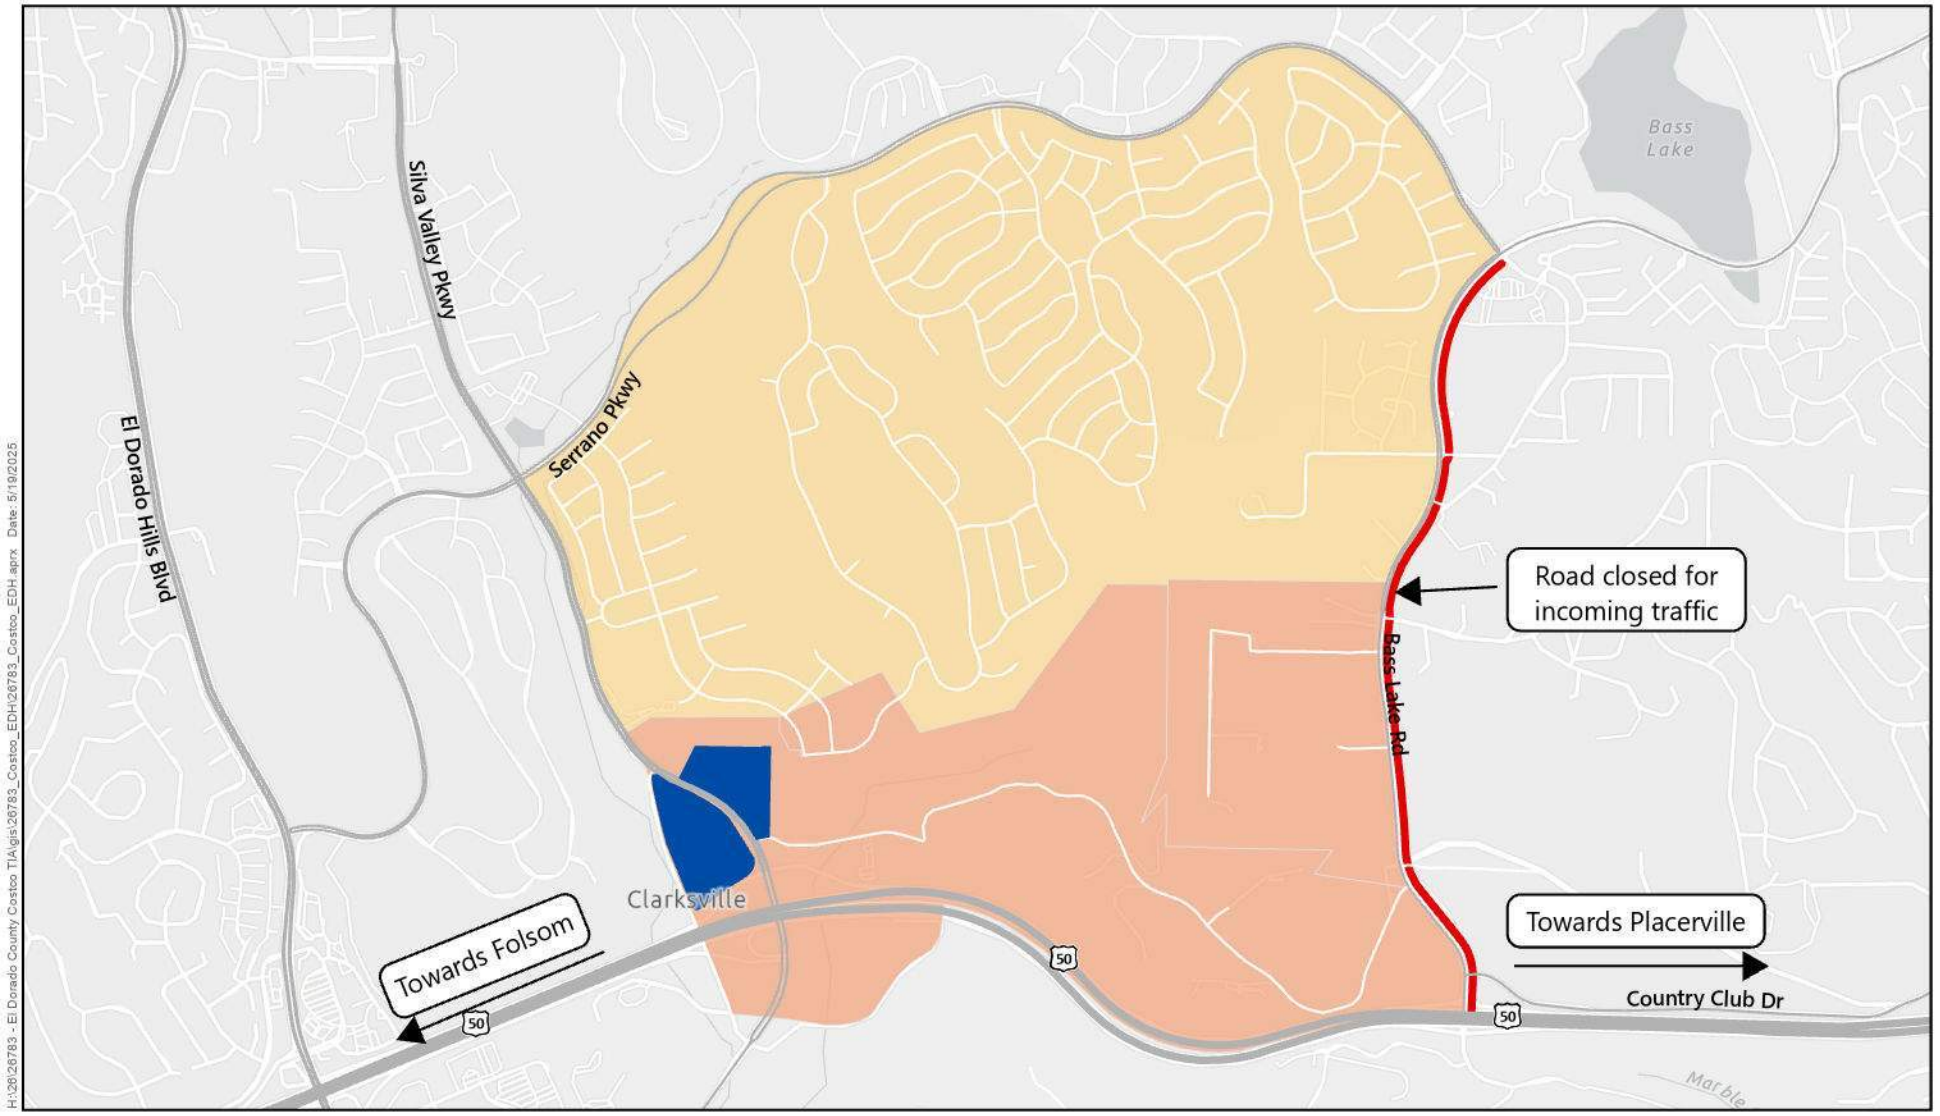
TRAVEL TYPE

Baseline travel represents normal travel patterns during the PM peak hour as included in the El Dorado County travel demand model. Evacuation travel represents estimated evacuation trips and travel time from each evacuating Traffic Analysis Zone (TAZ) to an evacuation destination. Kittelson reviewed the model's TAZs and assigned each TAZ a combination of Baseline travel and Evacuation travel (25% and 75%, respectively), based on its presence in the designated evacuation area.

EVACUATION AREA BOUNDARIES

For each of the two wildfire evacuation scenarios analyzed in this study, evacuation area boundaries were determined based on discussions with the advisory group. Accordingly, the following are the evacuation area boundaries assumed in this study.

- **Wildfire Scenario #1:** Evacuation area is assumed to be bounded by Serrano Parkway on the north, US 50/Old White Rock Road on the south, Silva Valley Parkway on the west, and Bass Lake Road on the east.
- **Wildfire Scenario #2:** Evacuation area is assumed to be bounded by Serrano Parkway on the north, US 50/White Rock Road on the south, El Dorado Hills Boulevard on the west, and areas surrounding Tong Road between Silva Valley Parkway and Bass Lane Road.



The evacuation areas are overlaid with the El Dorado County travel demand model's Traffic Analysis Zone (TAZ) map to identify the numbers of people that would need to be evacuated.

NUMBER OF EVACUATING TRIPS

Modeled trips are a function of the interactions between geographic patterns, including the land uses in an area, the socio-economic characteristics of the population in the area (e.g., auto ownership, income, and household size), and the type and extent of transportation facilities in an area. Kittelson obtained countywide land use information by TAZ (including households, population, and employment information) from the El Dorado County travel demand model for the Existing and Near-Term (2034) conditions. The land use information for Near-Term (2034) conditions also includes the projected land use for the Reminder Area, based on the County's General Plan.

The El Dorado County auto ownership information by Census Tract is obtained from the American Community Survey (ACS) 2023 five-year estimates. Based on this data, there are an average of 2.03 vehicles per household in El Dorado County. Therefore, the number of evacuating households is multiplied by two (rounded) to estimate the number of evacuating residential vehicles. Each evacuating employee is assumed to use one vehicle.

Kittelson estimated total evacuation trips by calculating the trips generated at household uses and trips generated by employees at non-residential land uses. If a fire occurs during the night, most residents would be home, but most employees would not be at their workplace. If a fire occurs during the workday, most employees would be at their workplace, but many residents would not be at their homes. The evacuation analysis conservatively assumes that 75 percent of residents and 75 percent of employees would need to evacuate during a wildfire event.

TRIP DISTRIBUTION

Kittelson considered separate trip distribution for the Costco members and employees and other residents and employees in the evacuation area outside of the Project site. The assumptions are as follows.

- **Costco Members and Employees**: Trip distribution assumptions were based on Costco member transaction data and a market area analysis conducted as part of the Project TIA. The analysis showed that most Costco members are expected to travel from areas east of the Project site, surrounding the City of Placerville and other parts of El Dorado County (Figure 6). Accordingly, the following evacuation trip distribution was assumed for Costco members and employees:
    - 65% evacuate eastward toward Placerville
    - 35% evacuate westward toward Folsom
- **Residents and Employees Outside the Project Site**: For residents and employees in the evacuation area outside of the Project site, trip distribution assumptions were based on existing land use, the location of evacuation destinations, and their relative proximity to the evacuation area. Accordingly, the following evacuation trip distribution was assumed for residents and employees in the evacuation area outside of the Project site:
    - 80% evacuate westward toward Folsom
    - 20% evacuate eastward toward Placerville

The trips were distributed from each of the evacuating TAZs to the evacuation destinations, as appropriate. The trip distribution is not intended to reflect a precise distribution of the routes that would be taken during an evacuation.

ROADWAY CAPACITY AND ROADWAY CLOSURES

Kittelson modeled trip patterns using the typical capacities for each roadway within and outside the evacuation area for roadways otherwise identified for road closures by the advisory group. The scenarios represent conditions without implementation of any evacuation strategies, such as manual traffic control or contraflow lanes, which could increase roadway capacity in one direction versus the other. The roadways identified for roadway closures for each of the scenarios include:

- **Wildfire Scenario #1:** Bass Lake Road is assumed to be restricted to outbound/evacuating traffic only, with no access allowed for inbound traffic.
- **Wildfire Scenario #2:** It is assumed that residential streets in the communities north of the Project site will be closed to incoming traffic and will only remain open for evacuating vehicles.

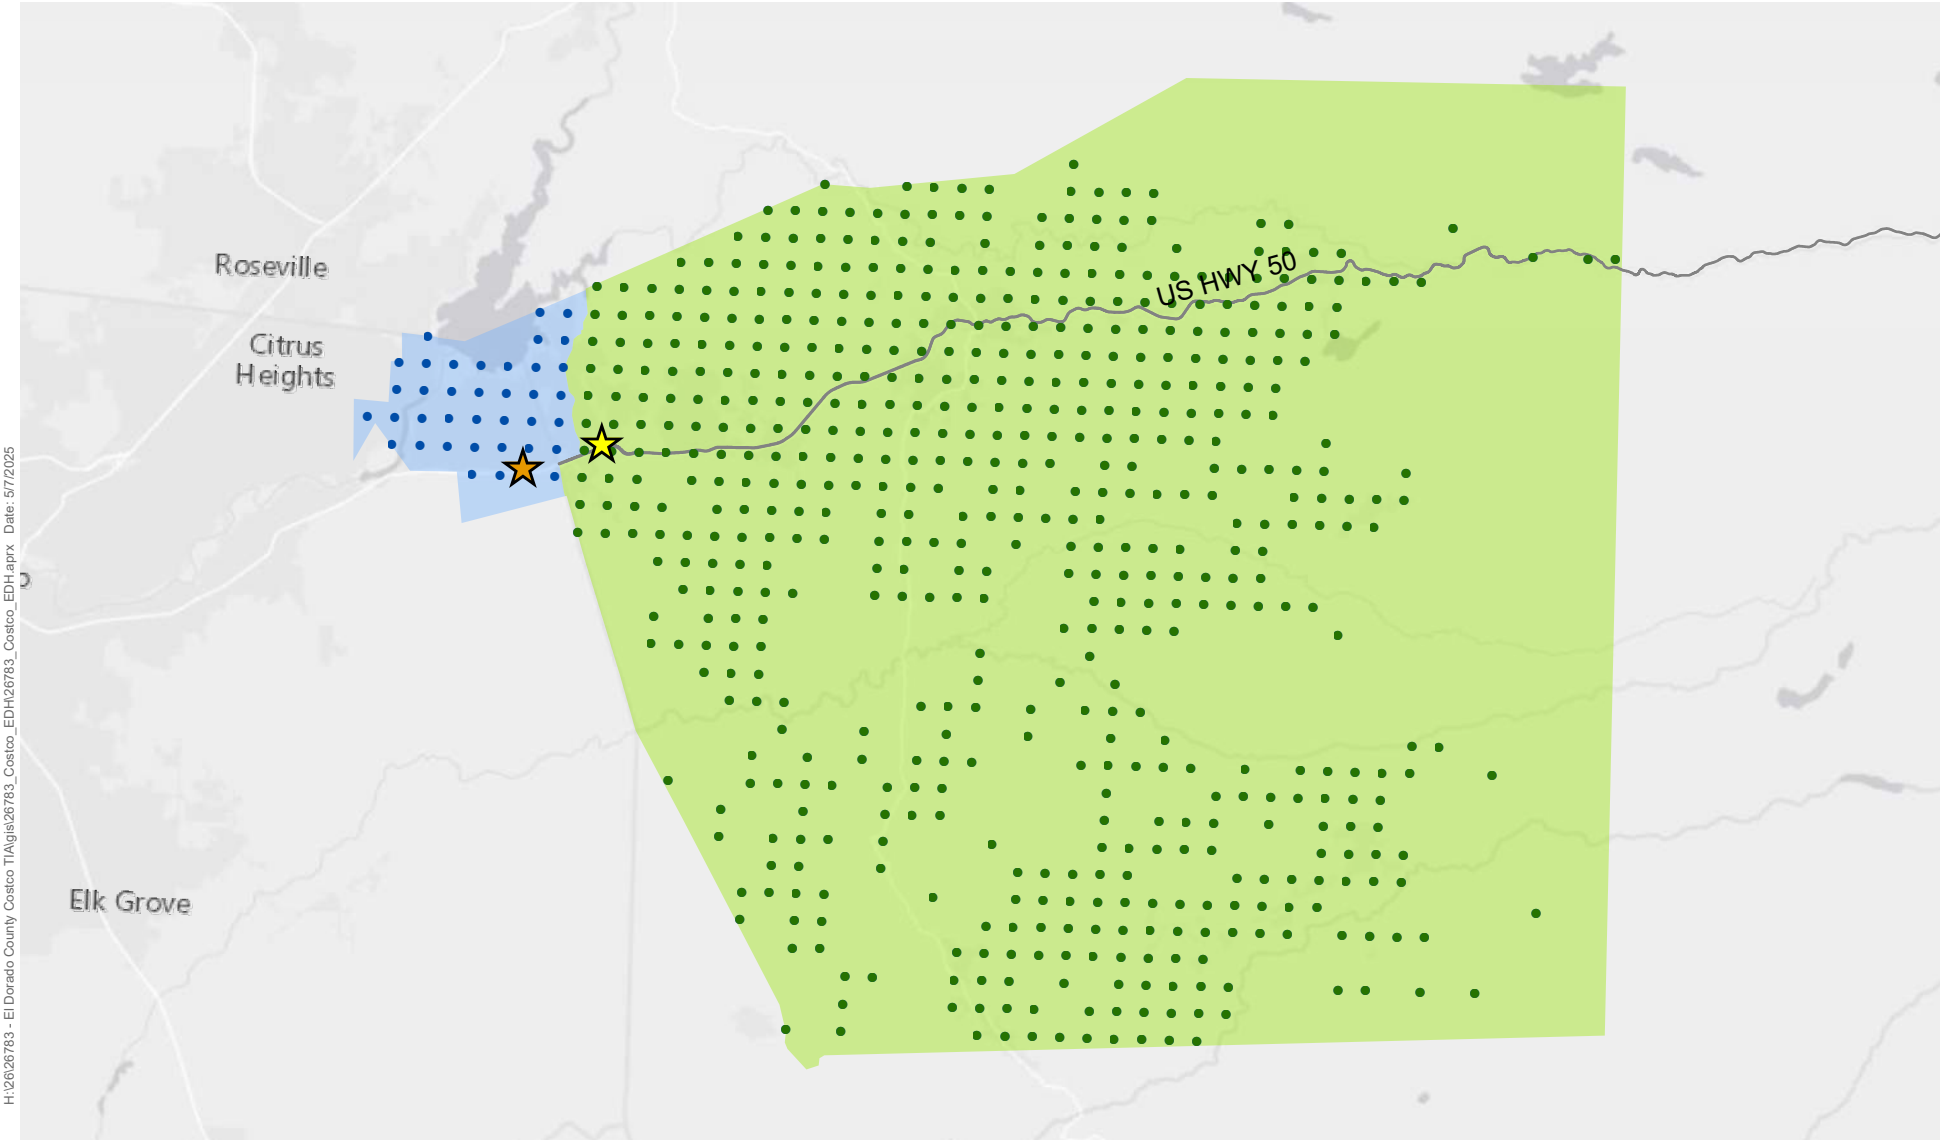

Figure 6

Future Market Areas
El Dorado Hills Costco

KITTELSON & ASSOCIATES

EVACUATION DESTINATION AND ROUTE CHOICE

Based on the conversations with the advisory group, Kittelson modeled evacuating vehicles to use US 50 to evacuate towards Folsom to the west or Placerville to the east.

The number of trips to each evacuation destination was assigned based on the location and direction of the evacuation based on the trip distribution described above. These destinations were selected for each of the evacuation scenarios with a goal of identifying evacuation travel patterns and congestion in the evacuation area and in the region.

EVACUATION ASSIGNMENT

During an evacuation event, residents and employees will receive one of three evacuation assignment orders:

- **No Action** – residents and employees do not need to evacuate or prepare for an evacuation.
- **Evacuation Warning** – residents and employees in a specific evacuation zone are ordered to prepare for an evacuation but do not need to evacuate immediately.
- **Evacuation Order** – residents and employees in a specific evacuation zone are ordered to evacuate immediately.

The peak hour for evacuation, when most vehicles evacuate, is defined differently depending on the wildfire scenario. For both wildfire scenarios, the peak hour is assumed to be the first hour of the evacuation.

The percentage of residents and employees evacuating is considered in two separate groups.

- **Costco Members and Employees:** To account for the worst-case scenario, it is assumed that all Costco members and employees will receive an evacuation order and evacuate during the peak hour in both wildfire scenarios.
- **Residents and Employees Outside the Project Site**: When an area is assigned an evacuation order or warning, it is assumed that 90 percent of residents and employees will evacuate over the duration of an evacuation and approximately 10 percent will remain behind. The estimated factors are based on survey results from people impacted by prior fires in California in UC Berkeley's Review of California Wildfire Evacuations from 2017 to 2019.[2] Based on Kittelson's conversations with the advisory group, it is assumed that evacuation will occur in phases, with different portions of the evacuation area receiving either an evacuation order or an evacuation warning.
    - Areas under an evacuation order are expected to have 65 percent of vehicles evacuating during the peak hour.
    - Areas under an evacuation warning are expected to have 25 percent of vehicles evacuating during the peak hour.

[2] *Wong, S., Broader, J. and Shaheen, P., 2022. Review of California Wildfire Evacuations from 2017 to 2019. [online] Escholarship.org. Available at:* <https://escholarship.org/uc/item/5w85z07g>

Evacuation Results

The El Dorado County travel demand model was used to estimate travel times and volume-to-capacity (V/C) ratios for each analysis scenario to understand how the Project would impact residents, employees, and Costco members in the evacuation area for each wildfire scenario. The following sections present the congestion locations and comparison of travel times for baseline conditions (no evacuation), existing conditions, and near-term (2034) conditions in No Project and Plus Project conditions for the two wildfire scenarios. The analysis is run assuming no manual traffic control is in place during the evacuation.

The congestion on a roadway segment is determined based on the V/C ratio of the segment derived from the El Dorado County travel demand model. Congestion locations are classified as shown in Table 2.

Table 2. Congestion Classification based on Volume-to-Capacity (V/C) ratio

Volume-to-Capacity (V/C) ratio	Congestion Classification
≤ 0.9	Under Capacity
0.9 to 1.0	Near Capacity
≥ 1.0	Over Capacity

Wildfire Scenario #1

This section presents the congestion location and travel times analysis under wildfire scenario #1 for all the analysis scenarios. The origin and destination location are identified based on the evacuation area boundaries identified for this wildfire scenario and likely evacuation destinations in the City of Folsom and City of Placerville. However, evacuation destinations are subject to change during an actual evacuation event based on direction from the Office of Emergency Services or evacuating persons' personal preferences.

EXISTING CONDITIONS

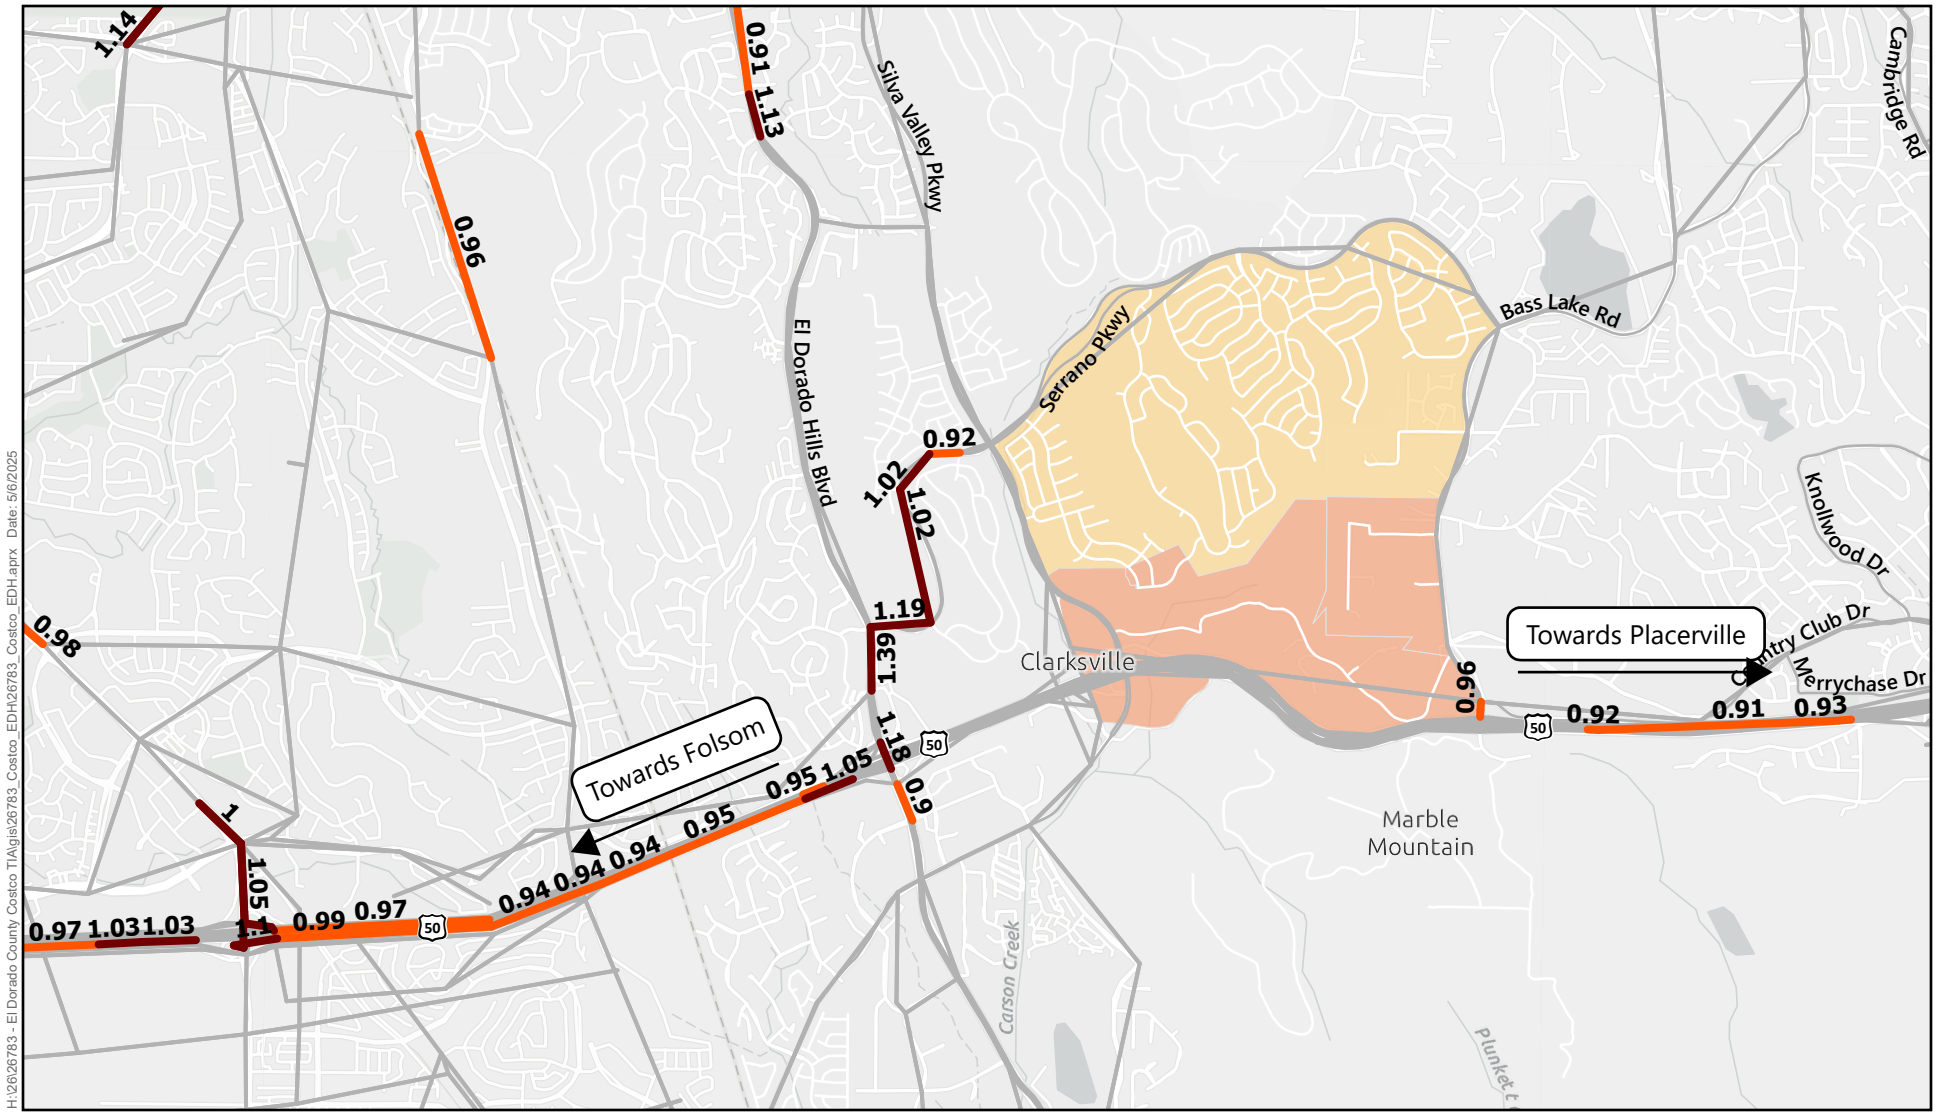
Figure 7 and Figure 8 show the congestion locations during wildfire scenario #1 for Existing Conditions under Evacuation No Project and Evacuation Plus Project scenarios. The following are the locations operating near or over capacity in the Existing Conditions No Project and Plus Project scenarios.

No Project

- Eastbound US 50 toward Placerville
- Eastbound and Westbound US 50 toward Folsom
- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50

Plus Project

- Eastbound US 50 toward Placerville including sections adjacent to the evacuation area.
- Eastbound and Westbound US 50 toward Folsom
- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50



With the addition of Project traffic, volume-to-capacity ratio increases along US 50 towards Folsom and Placerville. Roadway capacity along Serrano Parkway between Silva Valley Parkway and El Dorado Hills operates over capacity under the No Project and Plus Project scenarios, though the volume-to-capacity ratio changes with the addition of Project traffic are minimal.

Table 3 shows the travel times (in minutes) during wildfire scenario #1 for existing conditions under No Evacuation, Evacuation No Project, and Evacuation Plus Project scenarios. As seen in the table below, the increase in travel time with Project traffic varies between 0.1 to 1.0 minutes (0-5% increase).

NEAR-TERM (2034) CONDITIONS

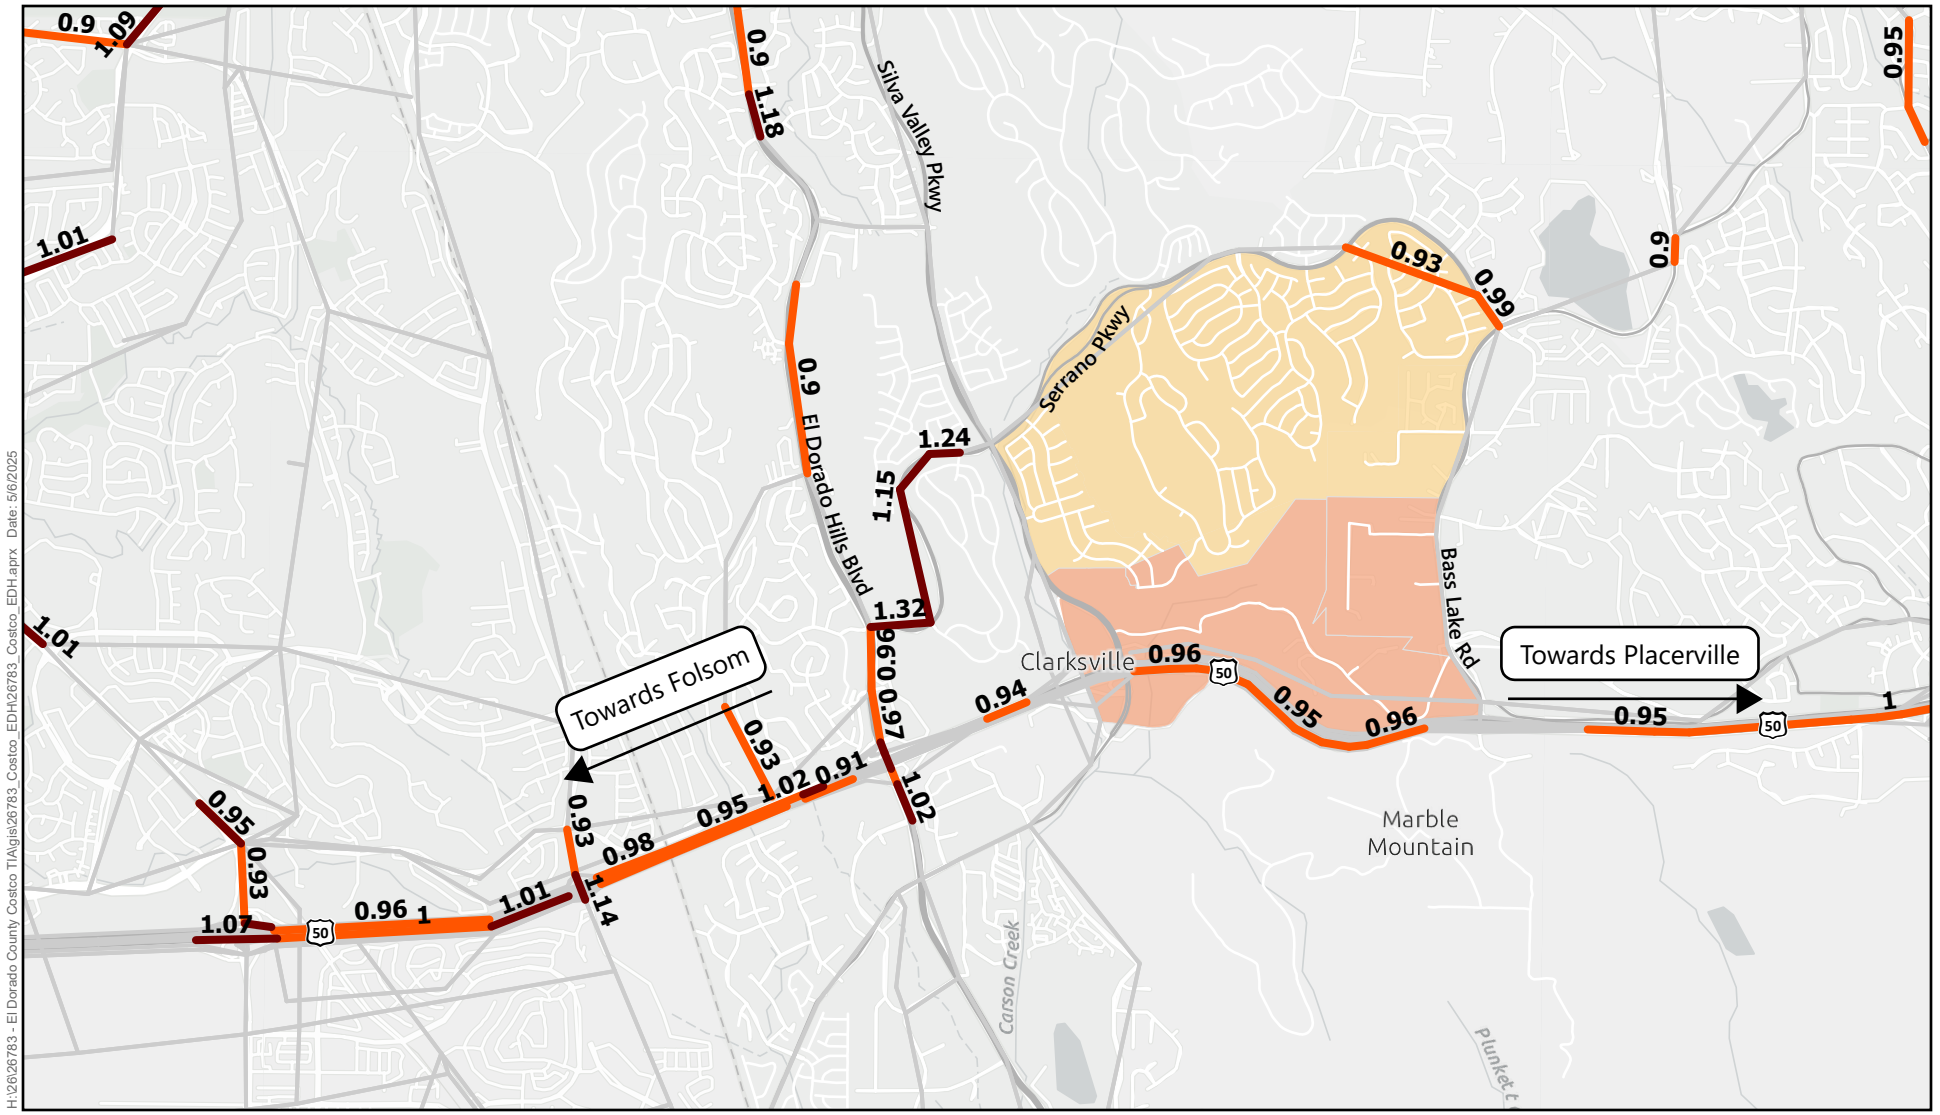
Figure 9 and Figure 10 show the congestion locations during wildfire scenario #1 for Near Term (2034) Conditions under Evacuation No Project and Evacuation Plus Project scenarios. In the No Project and Plus Project scenarios, roadways operating near or over capacity are as follows:

No Project

- Eastbound US 50 toward Placerville
- Eastbound and Westbound US 50 toward Folsom
- Serrano Parkway connecting evacuation area to Bass Lake Road
- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50

Plus Project

- Eastbound US 50 toward Placerville
- Eastbound and Westbound US 50 toward Folsom
- Serrano Parkway connecting evacuation area to Bass Lake Road
- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50



With the addition of Project traffic, volume-to-capacity ratio increases along US 50, towards Folsom and Placerville, including sections adjacent to the Project Site, and along Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard.

Table 4 shows the travel times (in minutes) during wildfire scenario #1 for Existing Conditions under No Evacuation, Evacuation No Project, and Evacuation Plus Project scenarios. As seen in the table below, the increase in travel time with Project traffic varies between 0.1 to 0.8 minutes (1-4% increase) with the addition of the Project.

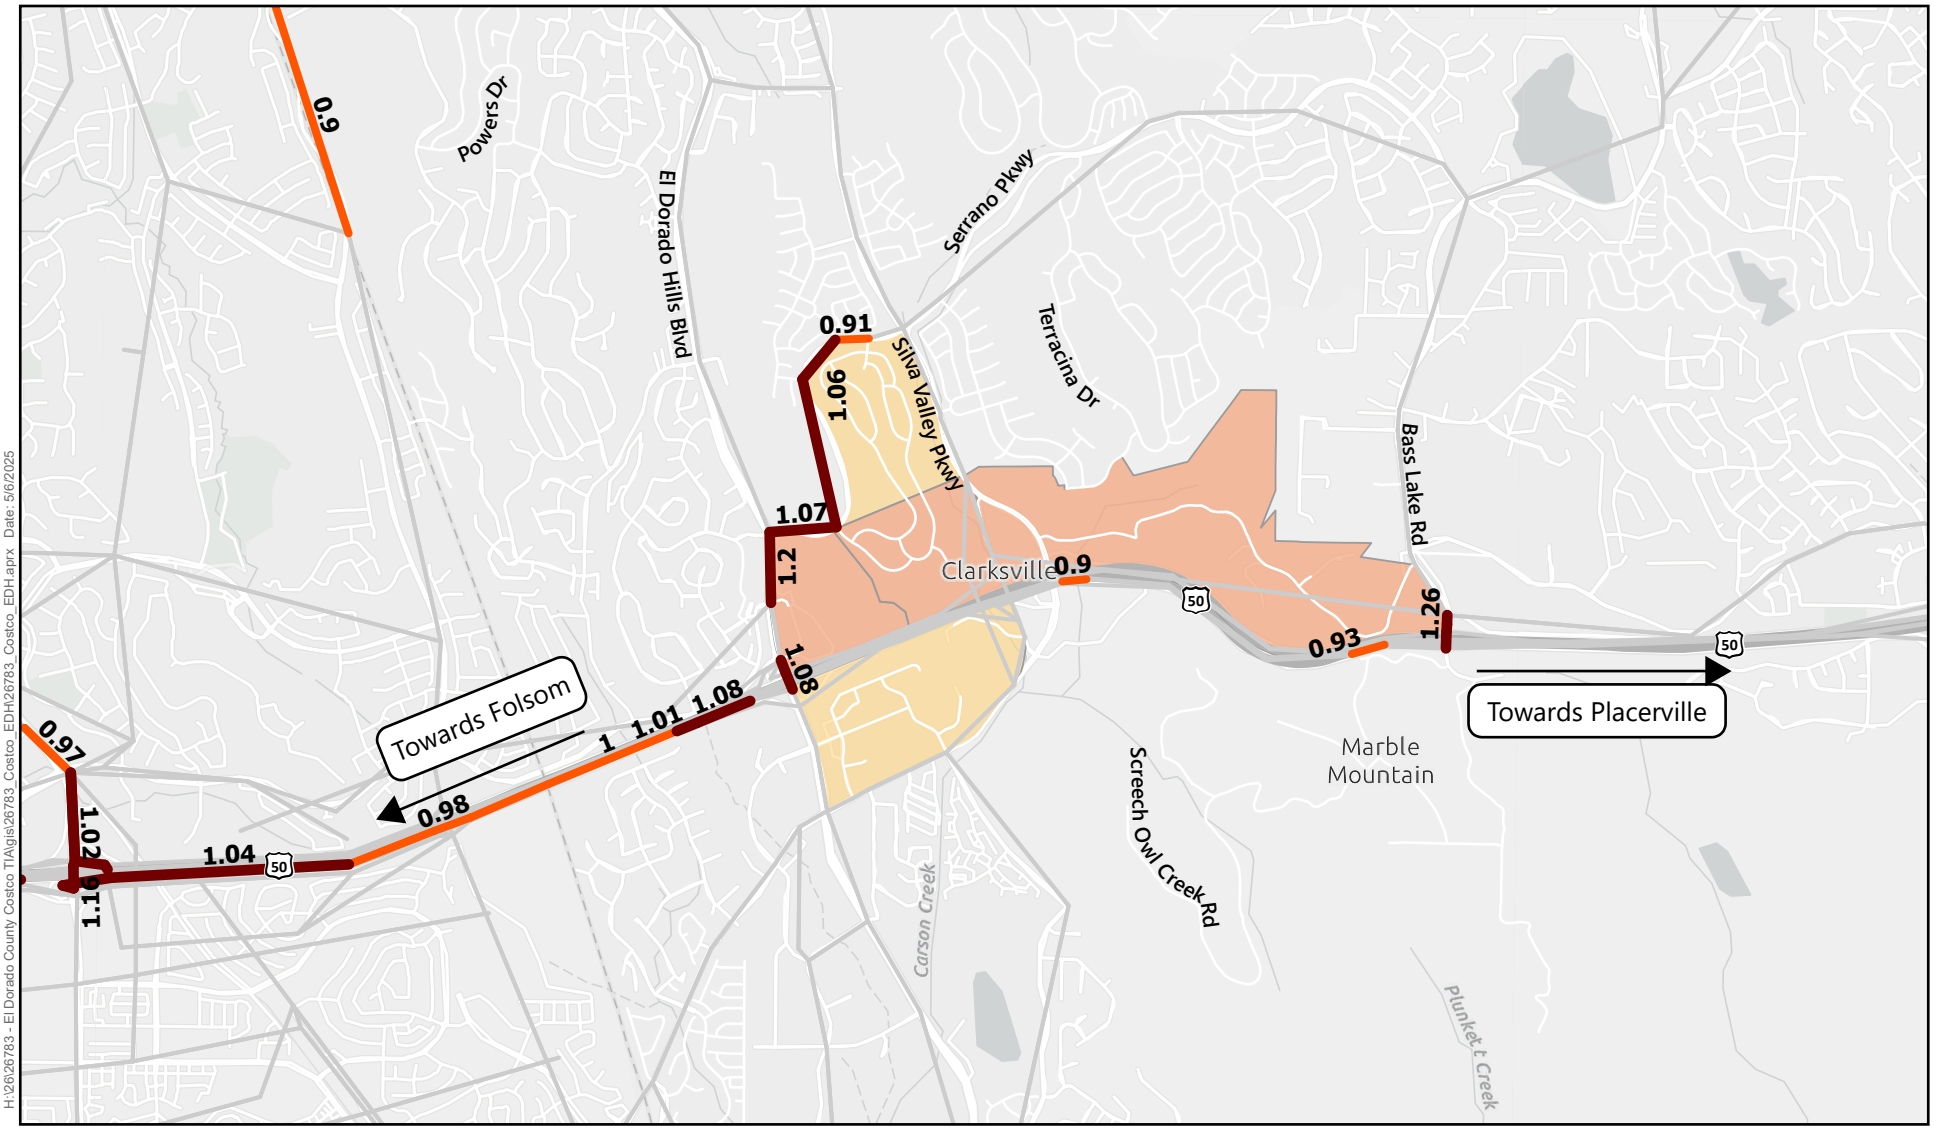
Wildfire Scenario #2

This section presents the travel times and congestion analysis under wildfire scenario #2 for all the analysis scenarios. The origin and destination locations are identified based on the evacuation area boundaries identified for this wildfire scenario and likely evacuation destinations in Folsom and Placerville. However, evacuation destinations are subject to change during an actual evacuation event based on direction from the Office of Emergency Services or evacuating persons' personal preferences.

EXISTING CONDITIONS

Figure 11 and Figure 12 show the congestion locations during the wildfire scenario #2 for Existing Conditions under Evacuation No Project and Evacuation Plus Project scenarios. The following are the locations operating near or over capacity in the Existing No Project and Plus Project scenarios.

No Project



- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50
- Eastbound US 50 between Folsom and El Dorado Hills

Plus Project

- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50
- A few sections of Eastbound US 50 between Folsom and Placerville including those adjacent to the Project site.

With the addition of Project traffic, volume-to-capacity ratio increases along US 50, towards Folsom and Placerville, including sections adjacent to the Project site. Roadway capacity on Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard operates over capacity in the No Project and Plus Project scenarios, though the volume-to-capacity ratio changes with the addition of the Project are minimal.

Table 5 shows the travel times (in minutes) during wildfire scenario #2 for Existing Conditions under No Evacuation, Evacuation No Project, and Evacuation Plus Project scenarios. As seen in the table, the increase in travel time with Project traffic varies between 0 to 1.2 minutes (0-6% increase).

Evacuation Planning Considerations

This section describes evacuation projects and strategies that may be considered to improve the capacity and resilience of the evacuation area and surrounding region's roadway network to support future evacuation events. The projects and strategies were identified based on previous congestion and evacuation studies, review of recent evacuation efforts, and effective evacuation planning practices identified by US Department of Transportation (USDOT) and Federal Highway Administration (FHWA). The strategies are organized into five categories:

1. Roadway Management
2. Communications
3. Vulnerable Populations
4. Public Education
5. Resource Management

ROADWAY MANAGEMENT

This section includes infrastructure-related strategies that may aid in improving the capacity of the evacuation roadway network, which can present constraints or limitations to a successful evacuation. For each infrastructure-related treatment, it is necessary to consider downstream capacity limitations and identify if those limits nullify the potential benefits of the treatment as well as other competing roadway design needs to serve other functions and goals. Table 7 outlines each of these strategies and provides a brief description of the strategy and desired outcomes.

Of these strategies, the most effective for increasing evacuation capacity would be those that involve manual control of traffic combined with contra flow operations that allow evacuation on both inbound and outbound lanes of streets, combined with maintaining clear passages for emergency vehicles.

Table 7: Roadway and Intersection Capacity and Resilience Related Strategies

Strategy	Action Items
Limited contra flow on highways	Reverse one or more lanes of highway to accommodate an increased flow of traffic in one direction.
Unlimited contra flow on highways	Redirect all lanes of a designated evacuation route to accommodate rapid evacuation from a city or region.
Limited/unlimited contra flow on unlimited access arterials	Temporarily close inbound travel lanes on selected unlimited access arterials (such as parkways and boulevards) to allow outbound traffic to utilize these lanes during evacuation.
Closure of inbound lanes on selected roads and highways	Close inbound lanes on highways utilized for evacuation routes to prevent drivers on these routes from entering the evacuation area while evacuation is underway.
Restrict left-turn movements	Minimize left-turn movements along evacuation routes and on roads leading to evacuation routes.

Strategy	Action Items
Stage tow trucks	Consider how to stage tow trucks at bottleneck locations along evacuation routes to help detect and clear minor crashes and maintain traffic flows.
Adjust signal timing	Increase the green time and/or progression band for through movements leading out of an evacuation zone.
Signal operation during power outage	Install signal battery backups in case signal operations need to be maintained during a power outage. Consider using channeling devices, static signs, and coning strategies to manage intersection flow during power outage if signals lack power.
Additional access routes	Identify and communicate with communities that have at least two access points. Prioritize adding additional access to communities that are currently served by only one or two access points.
Public transit	Develop transportation solutions such as the use of a bus system for evacuating individuals with special needs (such as those with mobility limitations) and/or evacuating larger groups of people in fewer vehicles.
Traffic control points	Establish traffic control points (i.e., locations along designated evacuation routes with emergency management personnel) to maintain a greater degree of evacuation management. These locations could enhance the efficiency of an evacuation, reduce public confusion, and allow increased operational flexibility during an evacuation.
Vegetation clearing/management	Maintain evacuation roadways and shoulders, keeping them clear of trees, vegetation, and debris that would block travel lanes and shoulders for people evacuating and for emergency operation vehicles.

COMMUNICATIONS

This section describes communication strategies that address how information may be shared among agencies, organizations, and the general public for evacuations. During an emergency evacuation event, two types of communication take place: (1) communication among entities involved in the management of response, and (2) communication between the County and the general public. Table 8 outlines each of these strategies and provides a brief description of the strategy and desired outcomes.

Table 8. Communication Strategies for Evacuations

Strategy	Description and Outcome
Establish and maintain communications	Strengthen and maintain communication among coordinating emergency event agencies. This could be achieved through systems such as the Public Information Emergency System and Emergency Satellite Communications.

Strategy	Description and Outcome
Variable/Dynamic Message Signage	Use variable message board equipment and targeted installation of permanent dynamic message signs on evacuation routes to improve communication and reduce public confusion.
Traffic Control Center	Implement a traffic control center that would have up-to-the-minute reports on traffic patterns and could communicate directly with emergency officers via broadcast media, social media, and other emergency communications channels (e.g., County Telephone Emergency Notification System) to let drivers know about roadway congestion conditions and direct them to alternate routes.
Traffic counters/CCTV cameras	Install traffic counters and/or CCTV cameras on freeways, which can help assess traffic flow, volume of vehicles evacuating, and monitor incidents during emergency evacuation events.
Highway Advisory Radio	Implement highway advisory radio to provide information regarding primary and secondary evacuation routes and incidents to the public.
Pre-defined evacuation zones	The County could consider implementing a system of pre-defined evacuation zones. Pre-defined evacuation zones can provide a common reference system for first responders and the community.

VULNERABLE POPULATIONS

This section identifies strategies specifically for evacuation of vulnerable populations. The County can use demographic data and U.S. Census data to identify vulnerable population locations and communities. County staff and emergency response teams may work with specialized organizations such as hospitals, medical associations, public service organizations, public health staff, and other providers or community groups to identify and locate relevant population segments and the types of assistance needed. Table 9 outlines considerations by need.

Table 9: Additional Steps for Evacuation of Vulnerable Populations

Special Need	Action Items/Considerations
Visually impaired	May be reluctant to leave familiar surroundings when the request for evacuation comes from a stranger. People who are blind or partially sighted may have to depend on their guide dogs and/or others to lead them to safety.
Hearing impaired	May need to make special arrangements to receive evacuation warnings. Include visual aids such as pictures or maps to reinforce key messages.

Special Need	Action Items/Considerations
Mobility impaired	May need special assistance such as paratransit. Partner with neighboring jurisdictions and/or private/non-profit organizations to provide adequate paratransit services.
People without vehicles	Emphasize the importance of carpooling with neighbors or other community members. Provide information on transit routes and transit stops.
Non-English-speaking persons	Provide bilingual or multilingual materials to support communication with non-English speaking populations during evacuation.
People with medical conditions	Communicate in advance the location and availability of hospitals or facilities with emergency/life-sustaining medical equipment, such as dialysis machines.
Unhoused population	Arrange for food, shelter, and transportation for unhoused population. Offer age-appropriate emergency and evacuation information to unhoused children.

PUBLIC EDUCATION

Sharing information is a critical element to help educate the general public on how to prepare in advance for an evacuation. The public education strategies the County may consider include:

- Defining the meaning of different types of evacuation orders
- Sharing how evacuation orders are declared and communicated to the public
- Providing information on preparations to carry out in advance (such as emergency "go" kits or family evacuation plans)
- Conducting a public affair campaign(s) to distribute easy-to-read evacuation maps with alternate routes
- Providing information on available transportation options, including for vulnerable populations
- Providing information on evacuation shelters and support services offered during evacuation
- Providing regular emergency preparedness trainings in multiple languages at convenient, accessible locations
- Building capacity of resilience hubs, community-based organizations, and other community groups to support community-based disaster preparedness efforts through direct or passthrough funding, grant writing support, information sharing, etc.

RESOURCE MANAGEMENT

Evacuations are resource-intensive events that require significant personnel, facilities, and equipment to implement successfully. The County should determine what resources are available as well as what resources will be needed for staff to perform their responsibilities during an evacuation successfully, which may include the following:

- Clarity on staff roles and expertise available
- Facilities available (e.g., traffic operations center, shelters, etc.)

- Available information systems to support the evacuation (e.g., intelligent transportation systems, computer networks, road sensor loops, ancillary hardware such as cameras, etc.)
- Communication systems (e.g., landline, mobile phones, radio system, email, sirens)
- Vehicles/transports (e.g., staff transport, tow trucks, transit vehicles, heavy equipment)
- Miscellaneous materials to support implementation of evacuation strategies (e.g., traffic cones, channeling devices, static/dynamic message signs)

If critical resource gaps are identified, the County may look to work with other evacuation entities to determine additional resources and needs. The County may also work with private sector entities to expand the resource base. For example, utilities companies may keep cell and internet services running in vulnerable communities during public safety power shutoffs. Private service companies such as ambulance operators and towing companies can provide additional assets during evacuation. These companies can clarify what is expected of them during a potential evacuation event to ensure their services are available, when needed.

Conclusion

This memorandum documents the methodology and results of the evacuation analysis for two wildfire scenarios under Existing and Near-Term Conditions: No Project and Plus Project scenarios. The El Dorado County travel demand model was used to estimate roadway capacity and travel times during evacuations in No Project and Plus Project conditions.

EXISTING CONDITIONS

Under Existing conditions, roadway capacity is estimated to increase along US-50 in the westbound and eastbound directions. Though the roadway capacity is estimated to increase, overall roadway capacity is expected to remain under full capacity (v/c < 1.0).

Roadways near the project site, such as Silva Valley Parkway and Serrano Parkway, are estimated to see an increase in roadway capacity as residents, customers, and employees evacuate. The change in roadway capacity is estimated to be minimal.

NEAR-TERM (2034) CONDITIONS

Under Near-Term (2034) conditions, which include land uses and traffic for the Remainder Area, roadway capacity is estimated to increase along US-50 in the westbound and eastbound directions. Overall roadway capacity is expected to remain under full capacity (v/c < 1.0) for most of US-50 near the project site, but some segments are estimated to have a roadway capacity over capacity (v/c > 1.0).

Roadways adjacent to the project site, such as Silva Valley Parkway and Serrano Parkway, are estimated to see an increase in roadway capacity as residents, customers, and employees evacuate. The change in roadway capacity is estimated to be minimal.

The evacuation planning considerations and strategies identified in this memorandum can help enhance the capacity and resilience of the County's roadway network to support future evacuation events.

A Fire Progression Model Outputs

B Landscape Fire Behavior Model Outputs

1 Introduction

This report summarizes fire behavior modeling efforts conducted for the El Dorado Hills 52 North and Costco South Project (Project), a proposed commercial development located in El Dorado County, California. Fire progression and fire behavior modeling was conducted for the Project area to evaluate potential fire behavior characteristics and fire spread potential toward the Project site. The following tasks were performed:

- Evaluation of wildfire history, wildfire ignition, and fuels/vegetation mapping data for the Project site and surrounding area.
- A field evaluation of the Project site and surrounding area to better understand fuel (vegetation) conditions and confirm observations made during mapping data review and to refine the fuel model(s) to be used in the wildfire behavior and progression modeling efforts.
- Analysis and processing of local historical weather data to determine appropriate fuel moisture, wind speed, and wind direction inputs for the wildfire behavior and progression modeling runs.
- Creation of a base landscape data set (GIS-based terrain and fuels data) to be used for wildfire behavior and progression modeling efforts.
- Modeling of wildfire behavior (flame length, spread rate, and fireline intensity) and three (3) wildfire progression scenarios to understand the effect of a fire approaching the proposed Project site. Modeling was conducted using FlamMap. A GID-based fire behavior modeling application.
- Preparation of this Wildfire Modeling Summary Report that summarizes our methods, data sources, assumptions, and modeling results.
- Coordination and communication with the California Department of Forestry and Fire Protection (CAL FIRE) and the Project team.

1.1 Location

The Project site is located in El Dorado County, north of US 50 and Tong Road, east of Clarksville Crossing, and is bisected by Silva Valley Parkway. The northern portion of the Project site is approximately 24.83 acres (EDH 52 – North Site) and includes APNs: 122-720-0019, 20, and 21. All the parcels are undeveloped, and 122-720-21 (6.57 of 7.75 acres) is primarily reserved for the future extension of County Club Drive to Silva Valley Parkway, which is not part of the Project. The southern portion of the Project site is approximately 18.42 acres (EDH 52 – South Site) and includes APNs:122-720-018, 02, and 03. A portion of 122-720-003 and a portion of the unused former Tong Road right-of-way between Silva Valley Parkway and Clarksville Crossing are proposed to be utilized for site access. The 1.38-acre portion of 122-720-018 west of Clarksville Crossing on the South Site will not be developed as part of the Project, resulting in a net development site of 20.34 acres.

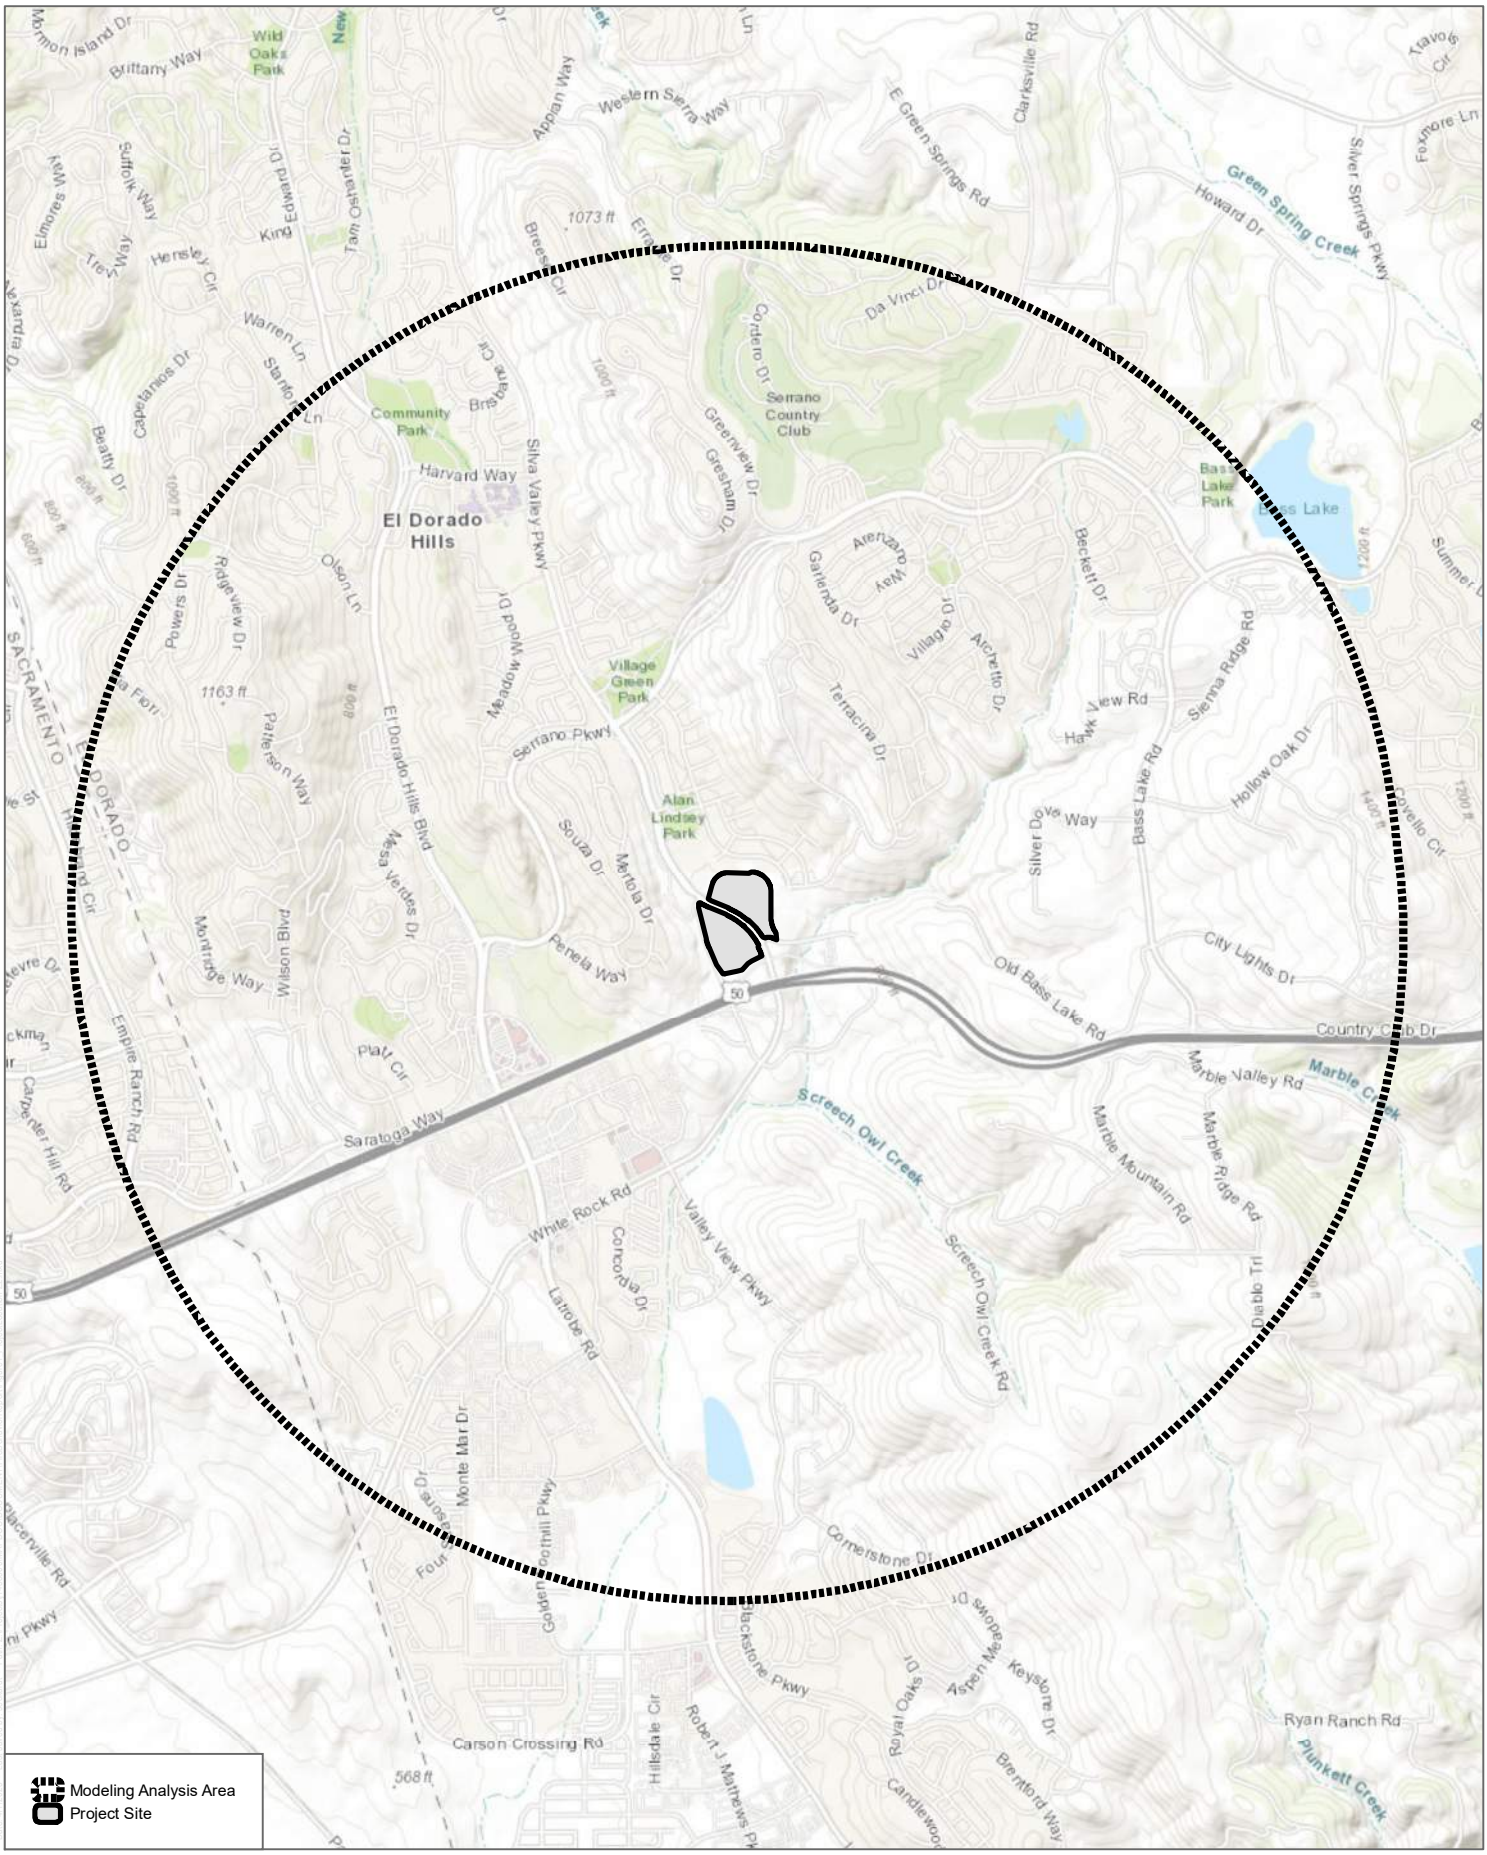
The modeling analysis area discussed in this report includes the Project site plus the area within 2 miles of the Project site. The Project site and modeling analysis area are presented in Figure 1.

1.2 Project Description

The Project proposes to develop the site as a Costco retail center with the Costco building at the center of the south portion of the site and a fuel facility on the north portion of the site. The maximum building area for the Costco South Site will be approximately 165,000 square feet. Development of this portion of the site includes the main Costco building, site access, and a parking area, including a subterranean parking structure. The fuel facility on the North Site will include a maximum 13,000 square foot open canopy and a 200 square foot controller enclosure. The remainder of the North Site will include Costco employee parking.

1.3 FlamMap Fire Behavior Modeling

The FlamMap software package was used to model potential fire behavior and fire spread in the modeling analysis area. FlamMap utilizes the same fire spread equations built into the BehavePlus software package but allows for a geographical presentation of fire behavior outputs as it applies the calculations to each pixel in an associated geographic information system (GIS) landscape (Finney 2002). The FlamMap software package is a publicly available resource available through the Fire, Fuel, and Smoke Science Program of the U.S. Forest Service. FlamMap is a GIS-based software package that models potential fire behavior and fire spread where weather conditions (wind and fuel moisture) are held constant. FlamMap generates map files of potential fire behavior characteristics (e.g., flame length, spread rate, fireline intensity) and fire progression data (fire growth perimeters, fire flow paths). Model outputs represent fire behavior calculated for each pixel within the analysis area independently and do not calculate fire spread across a landscape. The software requires a minimum of five input variables, including elevation, slope, aspect, fuel model, and canopy cover. Wind and weather data are also critical components to FlamMap modeling efforts. The following section presents a background on fire behavior modeling and this report presents the methods and data sources used in performing the FlamMap fire behavior modeling analysis.



1.4 Fire Behavior Modeling Background

Predicting wildland fire behavior is not an exact science due to the many variables that must be considered. As such, the movement of a fire will likely never be fully predictable, especially considering the variations in weather, the limits of weather forecasting, and the weather that is often created by firestorms. Nevertheless, practiced and experienced judgment, coupled with a validated fire behavior modeling system, results in useful and accurate fire information (Rothermel 1993). To be used effectively, the basic assumptions and limitations of fire behavior modeling applications must be understood.

- First, it must be realized that the fire model describes fire behavior only in the flaming front. The primary driving force in the predictive calculations is dead fuel less than 0.25 inches in diameter. These are the fine fuels that carry fire. Fuels greater than 1 inch in diameter have little effect, while fuels greater than 3 inches in diameter have no effect on fire behavior.
- Second, the model bases surface fire calculations and descriptions on a wildfire spreading through fuels that are within 6 feet of the ground and contiguous to the ground. Surface fuels are classified as grass, grass/shrub, shrub, timber litter, timber understory, or slash.

- Third, the software assumes that weather is uniform. However, because wildfires almost always burn under non-uniform conditions, creating their own weather, length of projection period and choice of fuel model must be carefully considered to obtain useful predictions.
- Fourth, fire behavior computer modeling systems are not intended for determining sufficient fuel modification zone/defensible space widths. However, results can provide the average length of the flames, which is a key element for determining defensible space distances for minimizing structure ignition.
- Fifth, FlamMap is designed to simulate wildland fire behavior in vegetative fuels (such as grasses, shrubs, and trees), not structures.
- Sixth, FlamMap does not predict ember spotting from non-timber fuel types (e.g., shrubs, grasses).
- Seventh, fire spread modeling does not account for fire suppression efforts and therefore represents a worst-case scenario.

FlamMap can provide valuable fire behavior predictions, which can be used as a tool in the decision-making process. In order to make reliable estimates of fire behavior, one must understand the relationship of fuels to the fire environment and be able to recognize the variations in these fuels. Fuels are made up of the various components of vegetation, both live and dead, that occur in a particular landscape. The type and quantity will depend upon soil, climate, terrain, and management and disturbance (e.g., fire) history. The major fuel groups of grass, grass/shrub, shrub, trees, tree litter, and slash are defined by their constituent types and quantities of litter and duff layers, dead woody material, grasses and forbs, shrubs, regeneration, and trees. Fire behavior can be predicted largely by analyzing the characteristics of these fuels. Fire behavior is affected by seven principal fuel characteristics: fuel loading, size and shape, compactness, horizontal continuity, vertical arrangement, moisture content, and chemical properties.

2 Modeling Approach Summary

Three scenarios were evaluated for fire progression modeling, as defined below:

- **Scenario 1:** This scenario represented a fire burning under late summer/early fall north-northwest wind conditions (represented by 97th percentile fire weather conditions). The ignition point for this scenario was located to the northeast of the Project site.
- **Scenario 2:** This scenario represented a fire burning under summer southwest wind conditions (represented by 50th percentile fire weather conditions). The ignition point for this scenario was located to the southwest of the Project site.
- **Scenario 3:** Similar to Scenario 2, this scenario represented a fire burning under summer southwest wind conditions (represented by 50th percentile fire weather conditions). The ignition point for this scenario was located to the southwest of the Project site, though further east than that for Scenario 2.

Additionally, fire behavior modeling was used to evaluate potential fire behavior characteristics in the modeling analysis area. The results of this modeling effort are static outputs representing fire behavior characteristic at a site, given fuel, terrain, and weather inputs. The following fire behavior characteristics were modeled:

- Flame Length
- Spread Rate
- Fireline Intensity

3 Modeling Inputs

3.1 Model Inputs

3.1.1 Elevation

Elevation data were derived from a 1/3 arc-second (10m) resolution National Elevation Dataset (NED), acquired from the U.S. Geological Survey (USGS) National Oceanic and Atmospheric Administration (NOAA) Coastal Services Center and projected in the NAD 1983, California State Plane, Zone 2 coordinate system, with units in meters (USGS, 2024a). Elevation values in the modeling area range from 492 feet to 1,460 feet above mean sea level (AMSL). This data was utilized to create an elevation grid file, using units of feet AMSL. Elevation is a required input file for FlamMap runs and are necessary for adiabatic adjustment of temperature and humidity and for conversion of fire spread between horizontal and slope distances.

3.1.2 Slope

Using ArcGIS Spatial Analyst tools, a slope grid file was generated from the elevation grid file described above. Slope measurements utilized values in percent of inclination from horizontal. Slope values in the analysis area range from 0-37 degrees. The slope input file is necessary for computing slope effects on fire spread and solar radiance.

3.1.3 Aspect

Using ArcGIS Spatial Analyst tools, an aspect grid file was generated from the elevation grid file described above. The aspect values utilized were azimuth degrees. Aspect values are important in determining the solar exposure of grid cells.

3.1.4 Fuel Model

Fire Behavior Fuel Models (FBFMs) are standardized classifications used to describe the types of vegetation and other combustible materials that influence wildfire behavior. These models help predict fire spread, intensity, and flame length under various conditions. Fuel model data was created utilizing the 2023 National Land Cover Database (USGS 2024b). This database is a comprehensive dataset that provides detailed land cover and land use information for the United States. It is produced by the United States Geological Survey (USGS) and the Multi-Resolution Land Characteristics Consortium (MRLC) and is used for a wide range of applications in environmental monitoring, land planning, resource management, and research. Land cover data is provided at a 30-meter resolution and classifies landcover into the categories provided in **Exhibit 1**. Fuel model data was further refined to account for roadways and other non-burnable areas not accounted for within the NLCD Land Cover data.

Exhibit: 1: NLCD Land Cover Classifications (USGS 2024b)

This dataset was clipped to the modeling analysis area to derive fuel models in wildlands surrounding the Project site at a 10-meter resolution. A crosswalk was created to assign land cover classifications into unique FBFMs using the Scott and Burgan 2005 40 FBFMs (Scott and Burgan, 2005). Crosswalk values were determined through field observations and through comparison with regional FBFM classification standards as mapped by LANDFIRE. The land cover to FBFM crosswalk is provided in Table 1. As presented, fuels in the analysis area are comprised mainly of developed areas and annual grassland vegetation.

Table 1. Land Cover to Fire Behavior Fuel Model Crosswalk

NLCD Land Cover Classification	Fuel Model Classification	Acres
21-24 Developed 11 Open water	NB1 – Non-burnable/Developed	4,460

Table 1. Land Cover to Fire Behavior Fuel Model Crosswalk

NLCD Land Cover Classification	Fuel Model Classification	Acres
71 Grassland/Herbaceous	GR2 - Low Load, Dry Climate Grass	2,858
52 Shrub/Scrub	SH5 - High Load, Dry Climate Shrub	527
41 Deciduous Forest	TL2 - Low Load Broadleaf Litter	353
42 Evergreen Forest 43 Mixed Forest	TL6 – Moderate Load Broadleaf Litter	146
	Total:	**8,306**

Source: USGS 2024b, LANDFIRE 2023

3.1.5 Canopy Cover

Canopy cover is a required raster file for FlamMap operations. It is necessary for computing shading and wind reduction factors for all fuel models. Canopy cover is measured as the horizontal fraction of the ground that is covered directly overhead by tree canopy. Crown closure refers to the ecological condition of relative tree crown density. Stands can be said to be "closed" to recruitment of canopy trees but still only have 40% or 50% canopy cover. Coverage units are represented as percentage values (0–100).

Canopy cover for the analysis area was derived from NLCD 2023 Canopy Cover Database (MRLC 2023). The 2023 NLCD Canopy Cover dataset quantifies the percentage of forest canopy cover in 10% increments. It provides a spatial representation of canopy cover at a 30-meter resolution ranging from 0% (no canopy) to 100% (complete canopy coverage).

3.1.6 Weather

Historical weather data for the modeling area was utilized in determining appropriate fire behavior modeling inputs. For this analysis, 97th percentile fuel moisture, wind speed, and wind direction values were derived from Remote Automated Weather Station (RAWS) data and utilized in fire behavior and progression modeling efforts. Data from the Ben Bolt RAWS was utilized for modeling fire behavior and progression (approximately 250 feet north of the City-owned Grizzly Peak Open Space parcels). Table 2 summarizes location information and available data ranges for the Ben Bolt RAWS.

Table 2. Ben Bolt Remote Automated Weather Station Characteristics

Station Characteristics	Value
Station ID	42612
Latitude	38.59084
Longitude	-120.93362
Elevation	905 feet
Data Years	2005-2024

To determine weather-related modeling inputs, RAWS data were downloaded, processed, and analyzed using the FireFamily Plus software package (v. 5.0) to determine 97th percentile (Scenario 1) and 5th percentile (Scenarios 2 and 3) fire weather conditions. The RAWS data was evaluated from August 1 through October 15 for each year between 2005 and 2024 (extent of available data record) for the 97th percentile (Scenario 1) and from June 1

through August 31 for each year between 2005 and 2024 (extent of available data record) for the 50th percentile (Scenarios 2 and 3). Data derived from this analysis included values for 1-hour, 10-hour, and 100-hour fuel moistures, live herbaceous moisture, live woody moisture, 20-foot sustained wind speed, and wind direction. The weather data was also evaluated to determine the maximum sustained wind speed.

These weather values were incorporated into the Initial Fuel Moisture file used as an input in FlamMap. Wind direction and wind speed values for the FlamMap run were manually entered during the data input phase. Table 3 presents the wind and weather values used in the FlamMap fire behavior and progression modeling runs.

Table 3. Weather Variables used for Fire Behavior and Progression Modeling

Model Variable	Value Scenario 1 (97th Percentile Fire Weather)	Value Scenarios 2 and 3 (50th Percentile Fire Weather)
20-foot Wind Speed (mph)	10	8
Maximum Wind Speed (mph)	23	19
Wind Azimuth (degrees)	23	225
1-hour Fuel Moisture (%)	3	6
10-hour Fuel Moisture (%)	6	10
100-hour Fuel Moisture (%)	8	11
Live Herbaceous Fuel Moisture (%)	30	30
Live Woody Fuel Moisture (%)	59	59

Note: * Live herbaceous moisture values were lower than 30% so the herbaceous fuels are considered fully cured (Scott and Burgan 2005).

Wind direction (azimuth) for each Scenario was determined by evaluating wind rose outputs for sustained wind speeds, as presented in Exhibits 2 and 3.

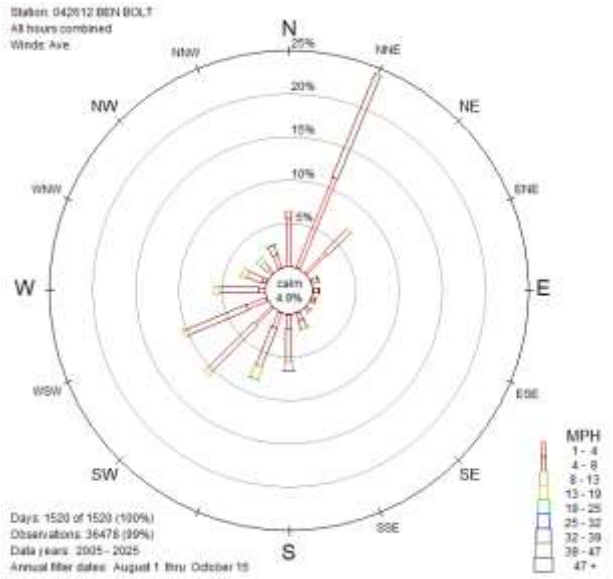

Exhibit 2. Wind rose for 97th percentile wind direction.

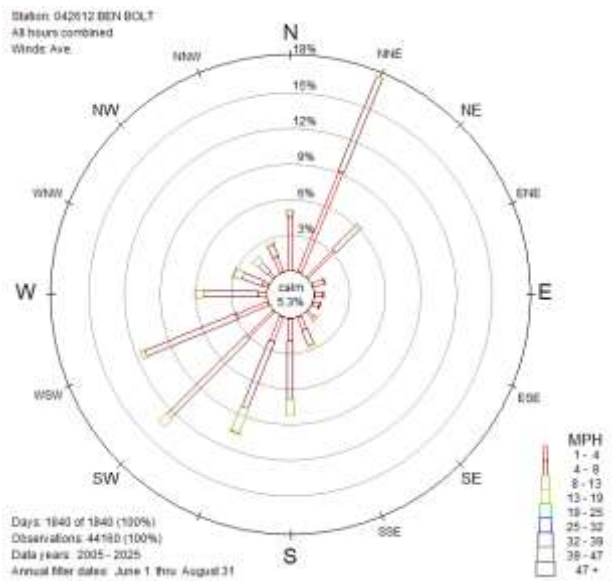

Exhibit 3. Wind rose for 50th percentile wind direction.

Finally, wind vectors were modeled within the FlamMap runs using the WindNinja tool embedded in the FlamMap software. WindNinja models the effect of topography on wind speed and direction and generates wind vector files for use in the modeling runs. The grid resolution for the WindNinja analysis was set at 30 meters.

3.1.7 Ignition Locations

We evaluated historic wildfire ignition point data in GIS format (NIFC 2025) to understand where historic ignitions have occurred and where it is likely that they could occur again. This data, coupled with an evaluation of wildfire history data (CAL FIRE 2024) and vegetation mapping data (USGS 2024b), informed the selection of ignition locations for the fire progression modeling effort. These locations were also evaluated in the field and ignition locations were reviewed with CAL FIRE prior to conducting the modeling runs. The following summarizes each of the ignition locations used for the fire progression modeling runs:

Exhibit 4. Photograph of field conditions located at the ignition point used for Scenario 1 (southwest corner of the intersection of Bass Lake Road and Hawk View Road).

Scenario 1: The ignition point for this scenario represents a roadside ignition occurring along the west side of Bass Lake Road near its intersection with Hawk View Road. This location contains ample roadside grasses that could potentially be ignited from human causes associated with roadways (e.g., cigarettes, dragging chains, molten catalyst material from vehicles, etc.) According to historic ignition data, multiple ignitions have occurred along Bass Lake Road.

Scenario 2: The ignition point for this scenario represents a roadside ignition occurring along the north side of Highway-50 approximately 1,200 feet east of El Dorado Hills Boulevard. An ignition in this location is possible from a vehicle or other human causes. According to historic ignition data, multiple ignitions have occurred along Highway-50 in this region.

Exhibit 5. Photograph of field conditions located near the ignition points used for Scenarios 2 and 3 (north of Highway 50 and east of El Dorado Hills Boulevard).

Scenario 3: The ignition point for this scenario represents a similar roadside ignition to Scenario 2 yet occurring approximately 2,000 feet further to the east and closer to the Project site. According to historic ignition data, multiple ignitions have occurred along Highway 50 in this region.

3.2 Model Outputs

Model outputs for this analysis include three fire progression maps (one for each of the three scenarios) and six landscape fire behavior characteristic maps, which include measurements of flame length, fireline intensity, and rate of spread for 50th and 97th percentile weather conditions. While wildfire progression maps present fire behavior and spread from a unique ignition point, landscape fire behavior models are static and represent wildfire behavior in all vegetated pixels present within the landscape.

Fire progression runs utilized the Minimum Travel Time (MTT) tool in FlamMap. The MTT tool is a two-dimensional fire growth model which calculates fire growth based on calculated fire spread rates from an ignition source (point, line, or polygon). The MTT tool uses fire spread rates to find minimum travel paths between data cells in the GIS landscape, with an output data file representing the number of minutes for a wildfire to reach a particular location from the ignition source. As FlamMap provides a static representation of fire behavior, modeling using the MTT tool holds wind and weather inputs constant over the modeling period. Each MTT simulation was assigned a burn period of 6 hours (360 minutes).

3.2.1 Fire Progression

The output files generated for the three progression runs included one arrival time grid and one line file representing major fire spread paths, considering modeling inputs and ignition location (output maps are presented in Appendix A). Major paths identify the most significant pathways for fire spread. The arrival time data presents time (in minutes) for a modeled fire to reach a specific location. This data was analyzed to determine the time necessary for a fire to burn from its ignition point to the Project site and surrounding communities. For some runs (Scenarios 2 and 3), the modeled fire did not reach the Project. This is due to the classification of non-burnable fuel models associated with roadways that function as barriers to grassland fire spread.

Scenario 1: A wildfire in this scenario spreads in a southwest direction driven by strong 23 mph winds from the north/northeast. Wildfire spreads quickly through herbaceous vegetation in a downslope direction through the Carson Creek drainage. Exiting roadways such as Silver Dove Way and Tong Road function as fuel breaks and prevent the fire from burning away from the drainage to the south. While the main fire front spreads in a southwest direction, the fire's flanks spread towards existing communities along Borders Drive and Archetto Drive. After about 1 hour, the modeled fire reaches riparian woodland vegetation which significantly slows fire spread. This alters the path of the fire front and results in fire spread across the north slope of Carson Creek. The fire front continues to spread southwest and eventually reaches the eastern edge of the Project site in 143 minutes (2 hours, 23 minutes).

Scenario 2: A wildfire in this scenario spreads in a northeast direction through grassland fuels. Fire spread is driven by 19 mph winds from the southwest and follows a slight uphill slope. The fire's northern perimeter is modeled to reach the edge of existing communities along Panela Way within 52 minutes. Spread along the fire's northeastern perimeter is halted by an existing dirt service road (roughly 16 feet wide) which travels across the open space and functions as a fuel break. This feature is modeled to prevent fire from continuing towards the Project site from this ignition location.

Exhibit 6: Aerial image of service road which functions as a fuel break and limits fire spread towards the Project site in Scenario 2.

Scenario 3: In this scenario, similar to Scenario 2, a wildfire spreads northeast across grasslands, driven by 19 mph winds from the southwest. The fire follows a slight uphill path and reaches the western edge of Old Silva Valley Parkway in 36 minutes. However, riparian vegetation and the paved roadway to the west of the Project site act as a natural fire break, preventing the fire from reaching the Project site.

3.2.2 Fire Behavior

Three output grid files for each weather scenario (50th and 97th percentile) were generated for the FlamMap run and represent flame length (feet), fireline intensity (BTU/ft/s), and rate of spread (mph). Flame length, the length of the flame of a spreading surface fire within the flaming front, is measured from midway in the active flaming combustion zone to the average tip of the flames (Andrews et al. 2008). It is a somewhat subjective and non-scientific measure of fire behavior but is extremely important to fireline personnel in evaluating fireline intensity and is worth considering as an important fire variable (Rothermel 1993). Flame length values in the resulting grid file are in feet. Table 4 below presents an interpretation of flame length and its relationship to fireline intensity. Fireline intensity is a measure of heat output from the flaming front and affects the potential for a surface fire to transition to a crown fire. Rate of spread measures the horizontal movement of fire spread across the landscape and is useful to determine a fire's behavior and how many resources will be needed to contain the fire, as a faster-moving fire requires more immediate and significant resources. Maps depicting fire behavior in the modeling analysis area are presented in Appendix B (B1-B6).

As presented in B-1 under 50th percentile weather summer conditions, flame lengths within grass fuels (Fuel Model GS2) range from roughly 6-8 feet depending on slope and wind exposure. During peak 97th percentile weather conditions (B-2), flame lengths in grass fuels are modeled to reach upwards of 9-12 feet under sustained wind speeds of 23 miles per hour.

Under extreme weather and wind conditions (B-4), fireline intensity values may exceed 1,000 Btu/foot/second with spread rates greater than 2 miles per hour in grass fuels. While at high risk of ignition, grass fuels are generally less hazardous compared to other fuel types such as shrub and timber. This is largely to lower fuel loads and rapid burn-out times. Grass fuels are typically light, fine fuels, meaning they are composed of thin, dry material that ignites and burns quickly. While wildfires in grass fuels may produce large flame lengths and spread rapidly, these conditions are often sustained for short periods of time. Because of this, grass fires provide more opportunities for direct fire suppression from responding personnel.

Table 4. Fire Behavior Interpretation

Flame Length	Fireline Intensity	Interpretation
Under 4 feet	Under 100 BTU/ft/s	Fires can generally be attacked at the head or flanks by persons using hand tools. Hand line should hold the fire.
4 feet to 8 feet	100–500 BTU/ft/s	Fires are too intense for a direct attack on the head by persons using hand tools. Hand line cannot be relied on to hold the fire. Equipment such as dozers, pumpers, and retardant aircraft can be effective.
8 feet to 11 feet	500–1,000 BTU/ft/s	Fires may present serious control problems—torching out, crowning, and spotting. Control efforts at the fire head will probably be ineffective.
Over 11 feet	Over 1,000 BTU/ft/s	Crowning, spotting, and major fire runs are probable. Control efforts at the head of fire are ineffective.

Source: Roussopoulos and Johnson 1975.
Note: BTU/ft/s = British thermal units per foot per second.

TECHNICAL MEMORANDUM

August 20, 2025 Project# 26783

To: Ande Flower & Cameron Welch, County of El Dorado Planning

From: Grace Carsky, Sravya Kamalapuram, Amy Lopez

CC: Lt. Troy Morton, El Dorado County Office of Emergency Services; Chief Chrishana Fields, El Dorado Hills Fire; Chief Jeff Hoag, CAL FIRE

RE: El Dorado Hills Costco Warehouse - Evacuation Analysis

Introduction

Kittelson & Associates, Inc. (Kittelson) is providing an evacuation transportation analysis for the environmental impact report (EIR) of the proposed El Dorado Hills Costco warehouse development (Project) at the Silva Valley Parkway, El Dorado Hills site. This assessment provides estimates of roadway capacity constraints during wildfire evacuations, potential impacts to the roadway network under wildfire evacuation scenarios, and changes in travel times associated with the proposed Project. The assessment will cover two different wildfire event scenarios for both existing and near-term (2034) conditions. This memorandum presents the evacuation analysis methodology, results, and considerations for the County of El Dorado (County) and emergency responders including Cal FIRE, El Dorado Hills Fire Department, and El Dorado County Office of Emergency Services.

PROJECT DESCRIPTION

The proposed Project is a commercial development in El Dorado County north of US 50 along Silva Valley Parkway. It is bordered by existing residences and vacant land to the north, vacant land to the east, Clarksville Crossing to the west, and Tong Road and the US 50 westbound ramps to the south. The Project site currently is vacant. Figure 1 presents the Project location.

The Project consists of two sites on either side of Silva Valley Parkway: the North Site and South Site. The North Site will contain a fuel facility with 32 fueling positions. The South Site entails a Costco Warehouse retail center of approximately 165,000 cumulative square feet. Figure 1 presents the location of the proposed Project. Adjacent to the North Site fuel facility, future commercial development is anticipated for the surrounding vacant land (herein referred to as the "Remainder Area").

The Project is expected to generate 442 trips (221 vehicles) in the AM peak hour, 1,277 trips (638 to 639 vehicles) in the PM peak hour, and 1,697 trips (848 to 849 veicles) in the Saturday midday peak hour. During operating hours of the Costco warehouse and gas station, as many as 200 employees are expected to be on-site at any given time.

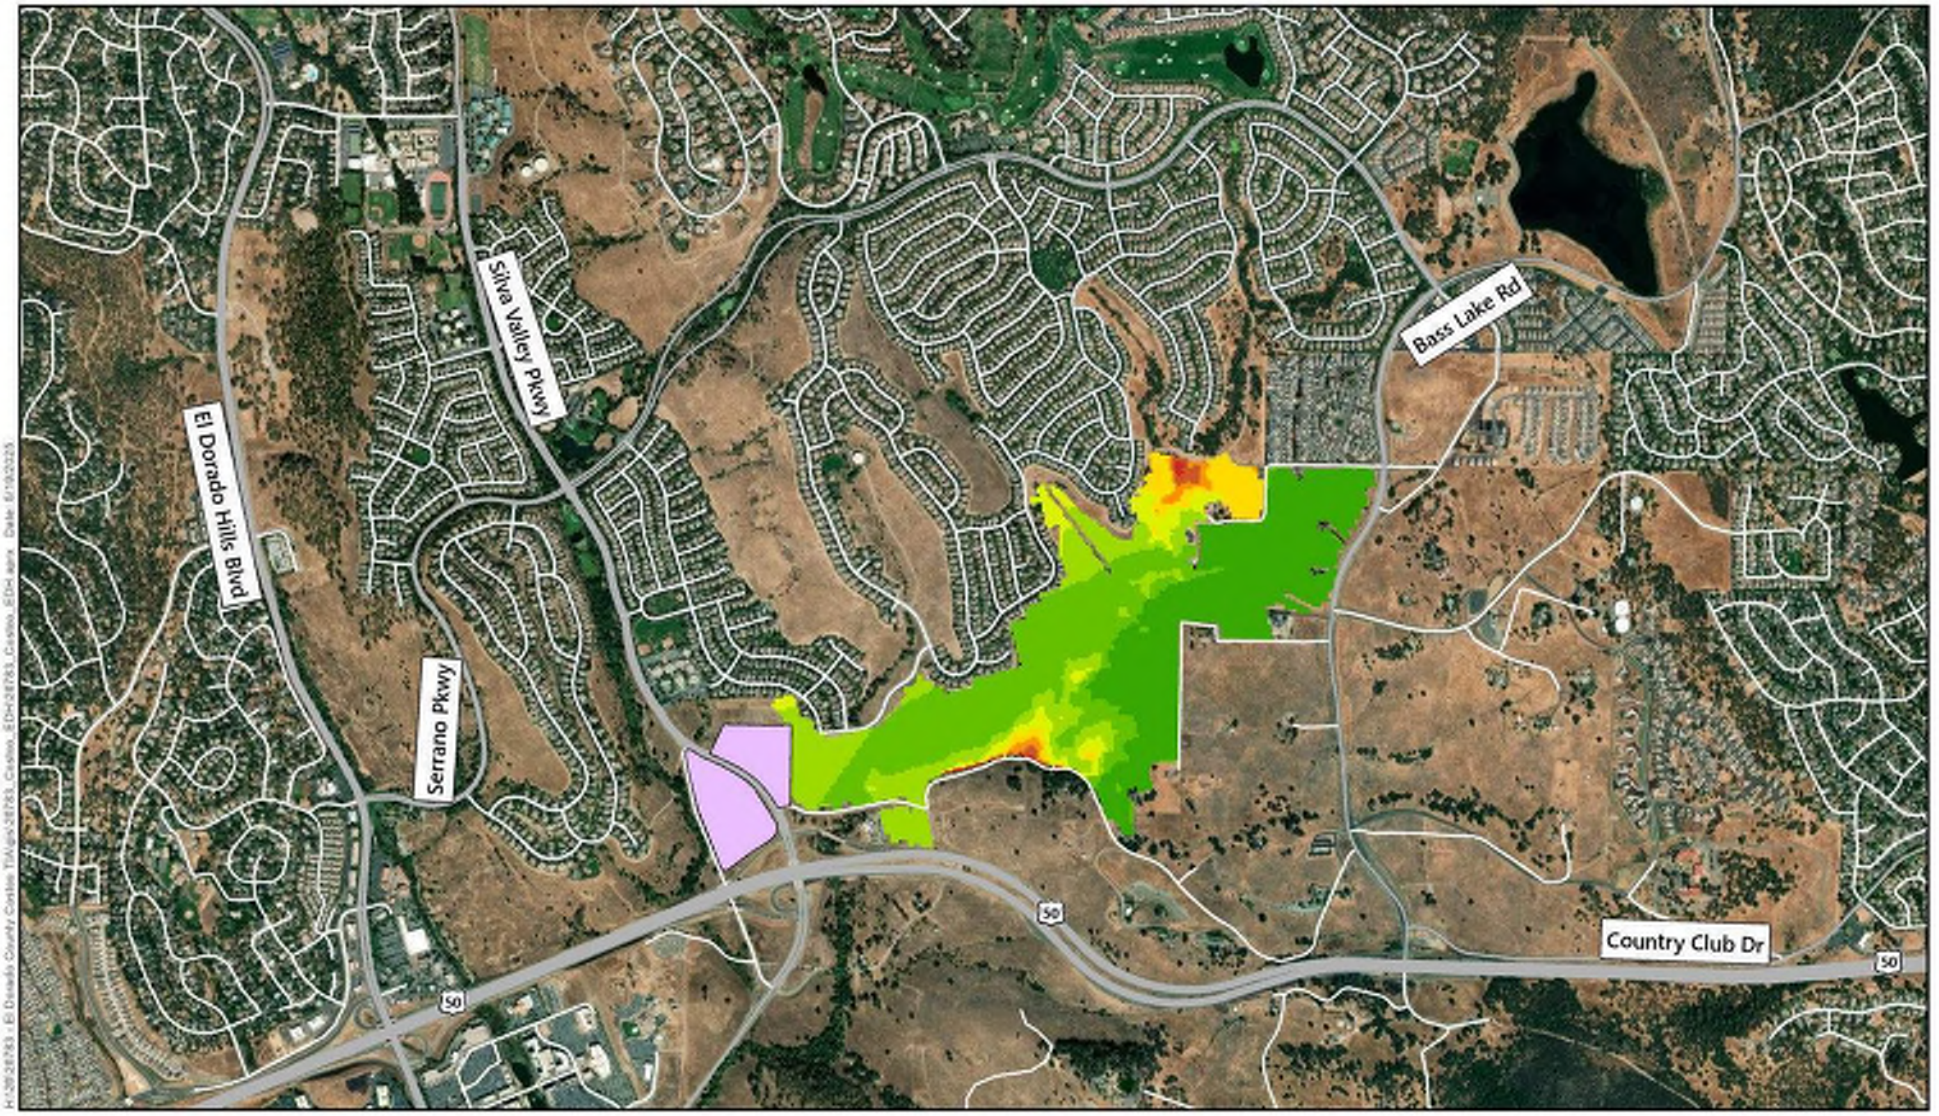
KITTELSON & ASSOCIATES

Wildfire Scenarios

To evaluate how the proposed development may affect congestion and travel times in the vicinity of the Project during wildfire evacuation scenarios, fire progression and fire behavior modeling was conducted by Dudek for the Project area. This modeling considered wildfire history, ignition sources, fuels/vegetation, and historical weather patterns for the Project site and the surrounding area. The detailed Wildfire Modeling methodology report prepared by Dudek is provided in Appendix A.



While the modeling identified three potential wildfire scenarios impacting the Project site, discussions with El Dorado County, El Dorado County Office of Emergency Services (OES), El Dorado Hills Fire Department, and the California Department of Forestry and Fire Protection (Cal FIRE) (hereby referred as the advisory group) led to the selection of two primary wildfire evacuation scenarios for further analysis. These scenarios assess wildfire behavior and evacuation strategies for area residents and Costco employees and members in the Project vicinity and nearby communities.

The details of the wildfire scenarios analyzed in this study are outlined in Table 1. Figure 2 and Figure 3 show the fire progression and fire spread for wildfire scenarios #1 and #2.

Table 1. Wildfire Scenarios

Analysis Scenarios

This study evaluates the transportation related impacts of the Project during the two wildfire evacuation scenarios discussed in Table 1. To maintain consistency with the Traffic Impact Analysis (TIA) conducted by Kittleson & Associates, Inc. for the Project,[1] this study examines potential evacuation effects under the Existing and Near-Term (2034) conditions. To account for the worst-case scenario, all the scenarios are analyzed during the PM peak hour, which represents the peak traffic volume during a typical week: the sum of background traffic in the area plus traffic from the Project development, assuming Costco members and employees are in the warehouse and residents in the evacuation area are at home.

Accordingly, this study evaluates transportation related impacts during the PM peak hour for the two wildfire scenarios under the following conditions:

- Existing No Project
- Existing Plus Project
- Near-Term (2034) No Project
- Near-Term (2034) Plus Project

The Near-Term (2034) No Project and Plus Project conditions include the projected land use development and trip generation for the Remainder Area. The Remainder Area is approximately 13.79 acres and is not proposed for development as part of the current project. Thus, the Remainder Area is not considered in the Existing Plus Project conditions.

Travel Modeling Tools

The evacuation analysis uses the El Dorado County travel demand model to estimate roadway congestion and travel times in an evacuation under No Project and Plus Project conditions. The current travel model is calibrated and validated for a 2018 base year and includes a 2040 future scenario with 2040 land use forecasts and transportation improvement assumptions. Kittelson estimated land use conditions for Near-Term (2034) conditions by a linear interpolation of 2018 and 2040 land use assumptions and assuming the 2040 transportation improvements in the Project vicinity.

Evacuation Assumptions

This section outlines the assumptions made on when the residents, employees, and Costco members in the evacuation area would need to evacuate and the conditions under which they would evacuate.

[1] *EDH Costco TIA – DRAFT, February 2025*

TIME PERIOD

Kittelson modeled transportation activity for the worst-case scenario under which people in surrounding areas would evacuate. This period is assumed to be the PM peak hour when the sum of background traffic in the area plus traffic from the Project development is greatest during a typical week.

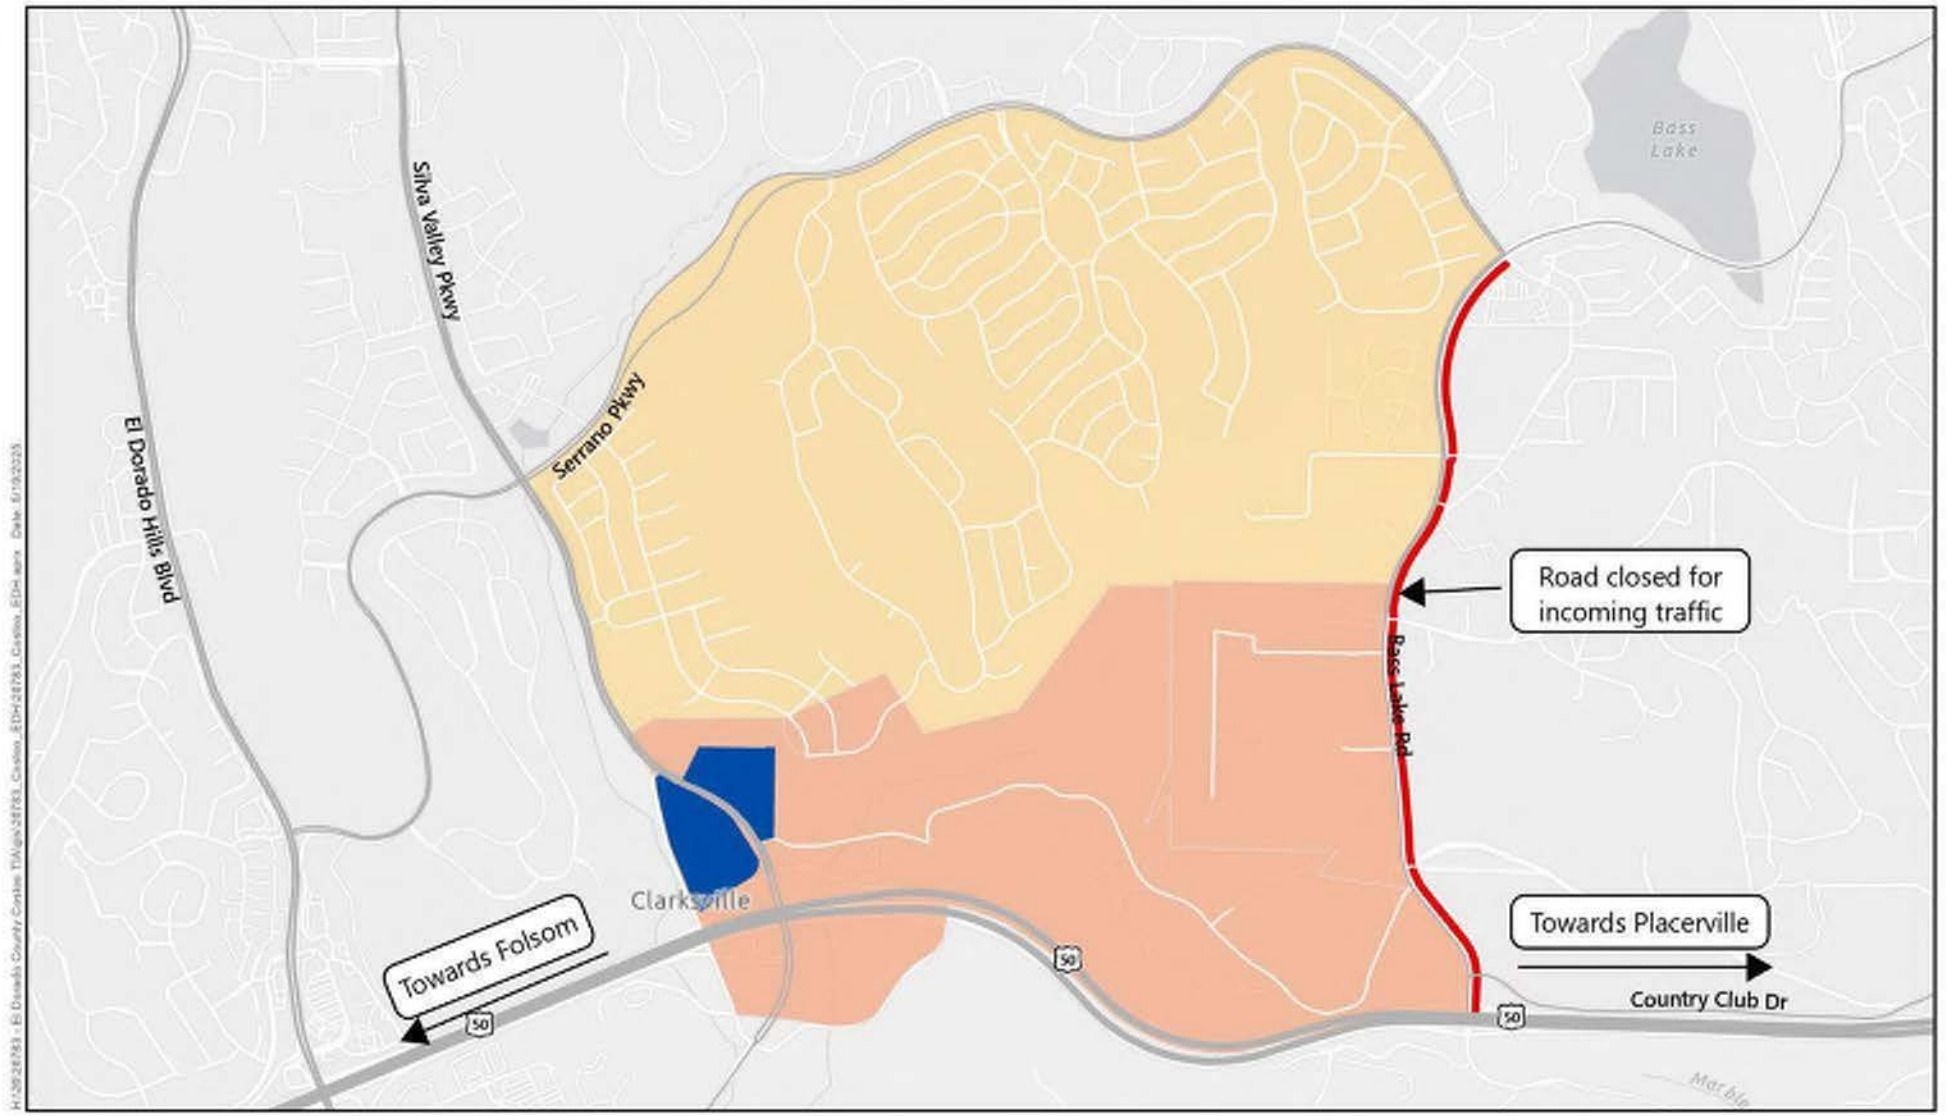
TRAVEL TYPE

Baseline travel represents normal travel patterns during the PM peak hour as included in the El Dorado County travel demand model. Evacuation travel represents estimated evacuation trips and travel time from each evacuating Traffic Analysis Zone (TAZ) to an evacuation destination. Kittelson reviewed the model's TAZs and assigned each TAZ a combination of Baseline travel and Evacuation travel (25% and 75%, respectively), based on its presence in the designated evacuation area.

EVACUATION AREA BOUNDARIES

For each of the two wildfire evacuation scenarios analyzed in this study, evacuation area boundaries were determined based on discussions with the advisory group. Accordingly, the following are the evacuation area boundaries assumed in this study.

- **Wildfire Scenario #1:** Evacuation area is assumed to be bounded by Serrano Parkway on the north, US 50/Old White Rock Road on the south, Silva Valley Parkway on the west, and Bass Lake Road on the east.
- **Wildfire Scenario #2:** Evacuation area is assumed to be bounded by Serrano Parkway on the north, US 50/White Rock Road on the south, El Dorado Hills Boulevard on the west, and areas surrounding Tong Road between Silva Valley Parkway and Bass Lane Road.



The evacuation areas are overlaid with the El Dorado County travel demand model's Traffic Analysis Zone (TAZ) map to identify the numbers of people that would need to be evacuated.

NUMBER OF EVACUATING TRIPS

Modeled trips are a function of the interactions between geographic patterns, including the land uses in an area, the socio-economic characteristics of the population in the area (e.g., auto ownership, income, and household size), and the type and extent of transportation facilities in an area. Kittelson obtained countywide land use information by TAZ (including households, population, and employment information) from the El Dorado County travel demand model for the Existing and Near-Term (2034) conditions. The land use information for Near-Term (2034) conditions also includes the projected land use for the Reminder Area, based on the County's General Plan.

The El Dorado County auto ownership information by Census Tract is obtained from the American Community Survey (ACS) 2023 five-year estimates. Based on this data, there are an average of 2.03 vehicles per household in El Dorado County. Therefore, the number of evacuating households is multiplied by two (rounded) to estimate the number of evacuating residential vehicles. Each evacuating employee is assumed to use one vehicle.

Kittelson estimated total evacuation trips by calculating the trips generated at household uses and trips generated by employees at non-residential land uses. If a fire occurs during the night, most residents would be home, but most employees would not be at their workplace. If a fire occurs during the workday, most employees would be at their workplace, but many residents would not be at their homes. The evacuation analysis conservatively assumes that 75 percent of residents and 75 percent of employees would need to evacuate during a wildfire event.

KITTELSON & ASSOCIATES

TRIP DISTRIBUTION

Kittelson considered separate trip distribution for the Costco members and employees and other residents and employees in the evacuation area outside of the Project site. The assumptions are as follows.

- **Costco Members and Employees**: Trip distribution assumptions were based on Costco member transaction data and a market area analysis conducted as part of the Project TIA. The analysis showed that most Costco members are expected to travel from areas east of the Project site, surrounding the City of Placerville and other parts of El Dorado County (Figure 6). Accordingly, the following evacuation trip distribution was assumed for Costco members and employees:
    - 65% evacuate eastward toward Placerville
    - 35% evacuate westward toward Folsom
- **Residents and Employees Outside the Project Site**: For residents and employees in the evacuation area outside of the Project site, trip distribution assumptions were based on existing land use, the location of evacuation destinations, and their relative proximity to the evacuation area. Accordingly, the following evacuation trip distribution was assumed for residents and employees in the evacuation area outside of the Project site:
    - 80% evacuate westward toward Folsom
    - 20% evacuate eastward toward Placerville

The trips were distributed from each of the evacuating TAZs to the evacuation destinations, as appropriate. The trip distribution is not intended to reflect a precise distribution of the routes that would be taken during an evacuation.

ROADWAY CAPACITY AND ROADWAY CLOSURES

Kittelson modeled trip patterns using the typical capacities for each roadway within and outside the evacuation area for roadways otherwise identified for road closures by the advisory group. The scenarios represent conditions without implementation of any evacuation strategies, such as manual traffic control or contraflow lanes, which could increase roadway capacity in one direction versus the other. The roadways identified for roadway closures for each of the scenarios include:

- **Wildfire Scenario #1:** Bass Lake Road is assumed to be restricted to outbound/evacuating traffic only, with no access allowed for inbound traffic.
- **Wildfire Scenario #2:** It is assumed that residential streets in the communities north of the Project site will be closed to incoming traffic and will only remain open for evacuating vehicles.

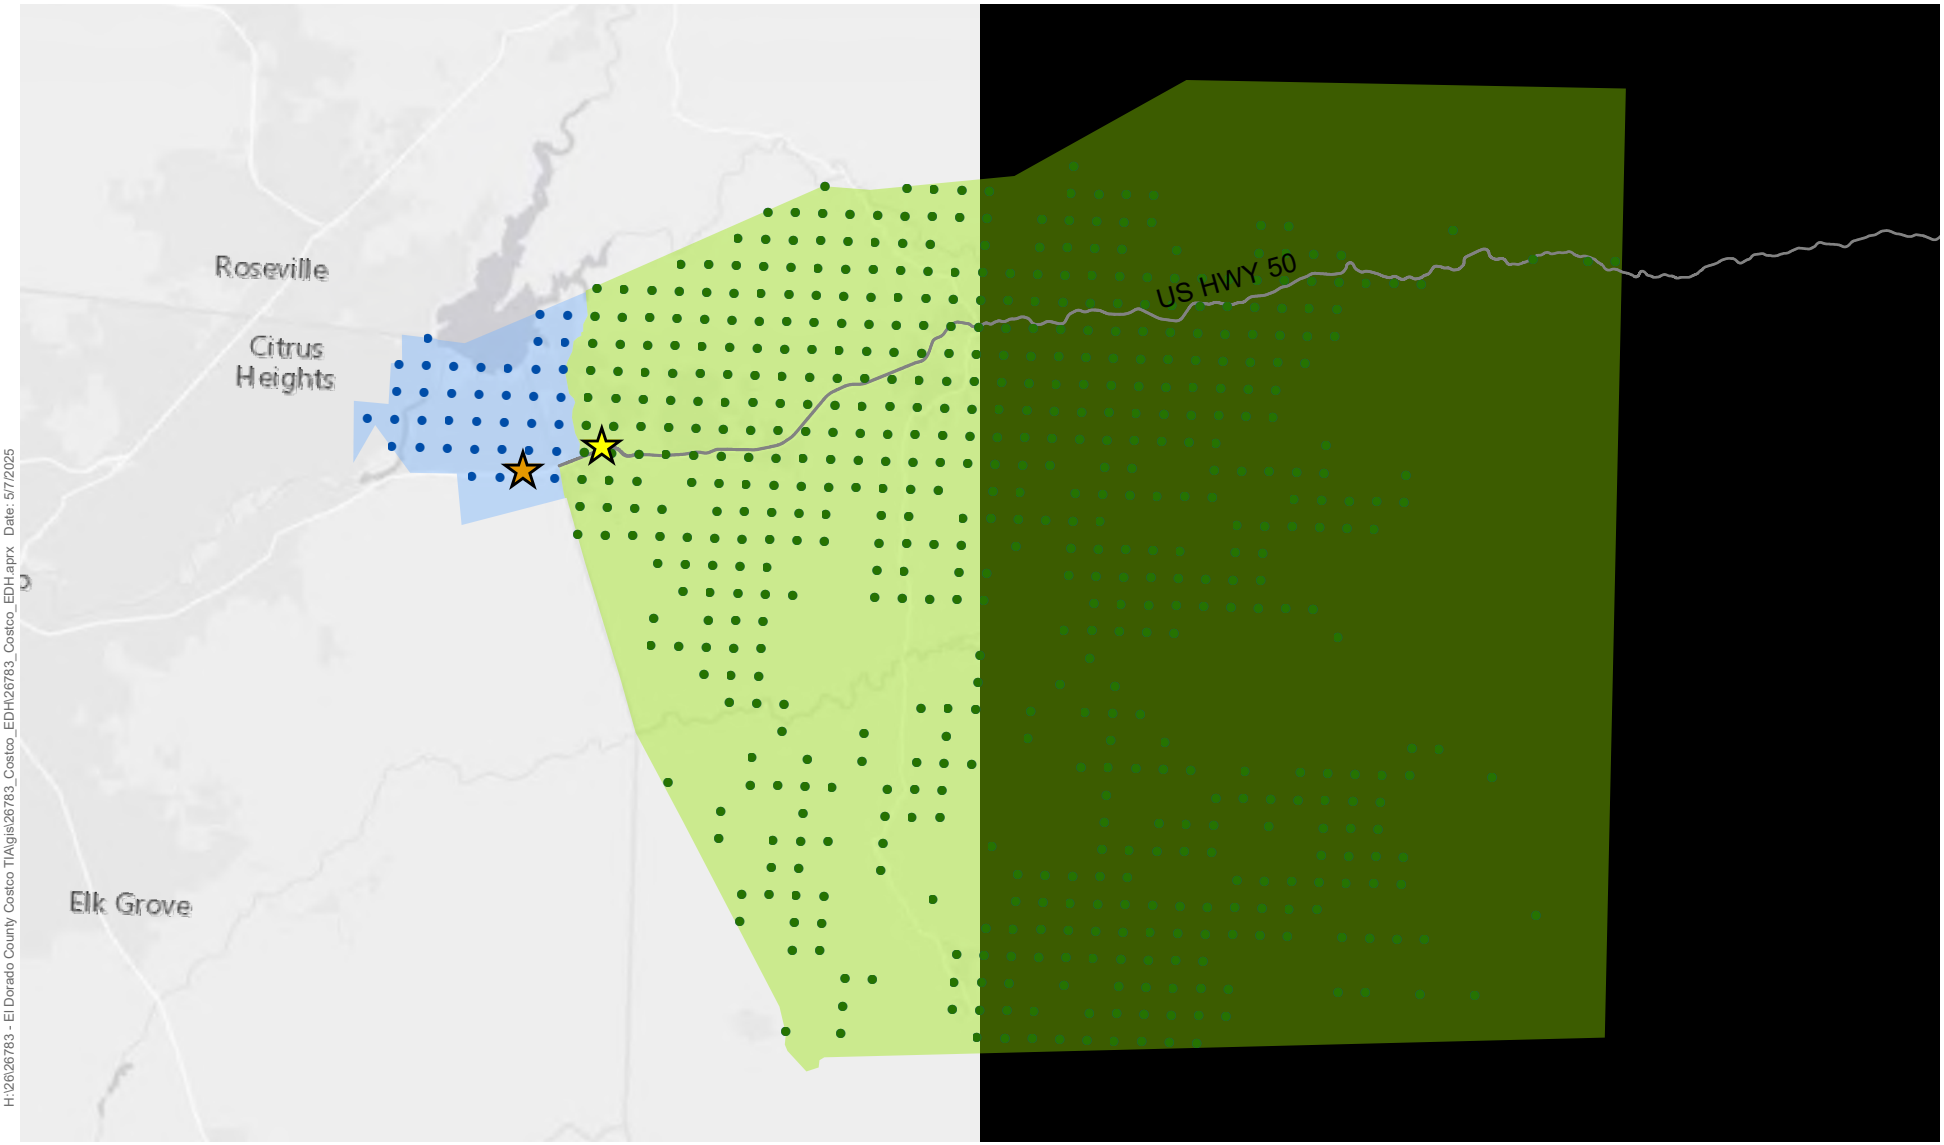

Figure 6

Future Market Areas
El Dorado Hills Costco

KITTELSON & ASSOCIATES

EVACUATION DESTINATION AND ROUTE CHOICE

Based on the conversations with the advisory group, Kittelson modeled evacuating vehicles to use US 50 to evacuate towards Folsom to the west or Placerville to the east.

The number of trips to each evacuation destination was assigned based on the location and direction of the evacuation based on the trip distribution described above. These destinations were selected for each of the evacuation scenarios with a goal of identifying evacuation travel patterns and congestion in the evacuation area and in the region.

EVACUATION ASSIGNMENT

During an evacuation event, residents and employees will receive one of three evacuation assignment orders:

- **No Action** – residents and employees do not need to evacuate or prepare for an evacuation.
- **Evacuation Warning** – residents and employees in a specific evacuation zone are ordered to prepare for an evacuation but do not need to evacuate immediately.
- **Evacuation Order** – residents and employees in a specific evacuation zone are ordered to evacuate immediately.

The peak hour for evacuation, when most vehicles evacuate, is defined differently depending on the wildfire scenario. For both wildfire scenarios, the peak hour is assumed to be the first hour of the evacuation.

The percentage of residents and employees evacuating is considered in two separate groups.

- **Costco Members and Employees:** To account for the worst-case scenario, it is assumed that all Costco members and employees will receive an evacuation order and evacuate during the peak hour in both wildfire scenarios.
- **Residents and Employees Outside the Project Site**: When an area is assigned an evacuation order or warning, it is assumed that 90 percent of residents and employees will evacuate over the duration of an evacuation and approximately 10 percent will remain behind. The estimated factors are based on survey results from people impacted by prior fires in California in UC Berkeley's Review of California Wildfire Evacuations from 2017 to 2019.[2] Based on Kittelson's conversations with the advisory group, it is assumed that evacuation will occur in phases, with different portions of the evacuation area receiving either an evacuation order or an evacuation warning.
    - Areas under an evacuation order are expected to have 65 percent of vehicles evacuating during the peak hour.
    - Areas under an evacuation warning are expected to have 25 percent of vehicles evacuating during the peak hour.

[2] *Wong, S., Broader, J. and Shaheen, P., 2022. Review of California Wildfire Evacuations from 2017 to 2019. [online] Escholarship.org. Available at:* <https://escholarship.org/uc/item/5w85z07g>

Evacuation Results

The El Dorado County travel demand model was used to estimate travel times and volume-to-capacity (V/C) ratios for each analysis scenario to understand how the Project would impact residents, employees, and Costco members in the evacuation area for each wildfire scenario. The following sections present the congestion locations and comparison of travel times for baseline conditions (no evacuation), existing conditions, and near-term (2034) conditions in No Project and Plus Project conditions for the two wildfire scenarios. The analysis is run assuming no manual traffic control is in place during the evacuation.

The congestion on a roadway segment is determined based on the V/C ratio of the segment derived from the El Dorado County travel demand model. Congestion locations are classified as shown in Table 2.

Table 2. Congestion Classification based on Volume-to-Capacity (V/C) ratio

Volume-to-Capacity (V/C) ratio	Congestion Classification
≤ 0.9	Under Capacity
0.9 to 1.0	Near Capacity
≥ 1.0	Over Capacity

Wildfire Scenario #1

This section presents the congestion location and travel times analysis under wildfire scenario #1 for all the analysis scenarios. The origin and destination location are identified based on the evacuation area boundaries identified for this wildfire scenario and likely evacuation destinations in the City of Folsom and City of Placerville. However, evacuation destinations are subject to change during an actual evacuation event based on direction from the Office of Emergency Services or evacuating persons' personal preferences.

EXISTING CONDITIONS

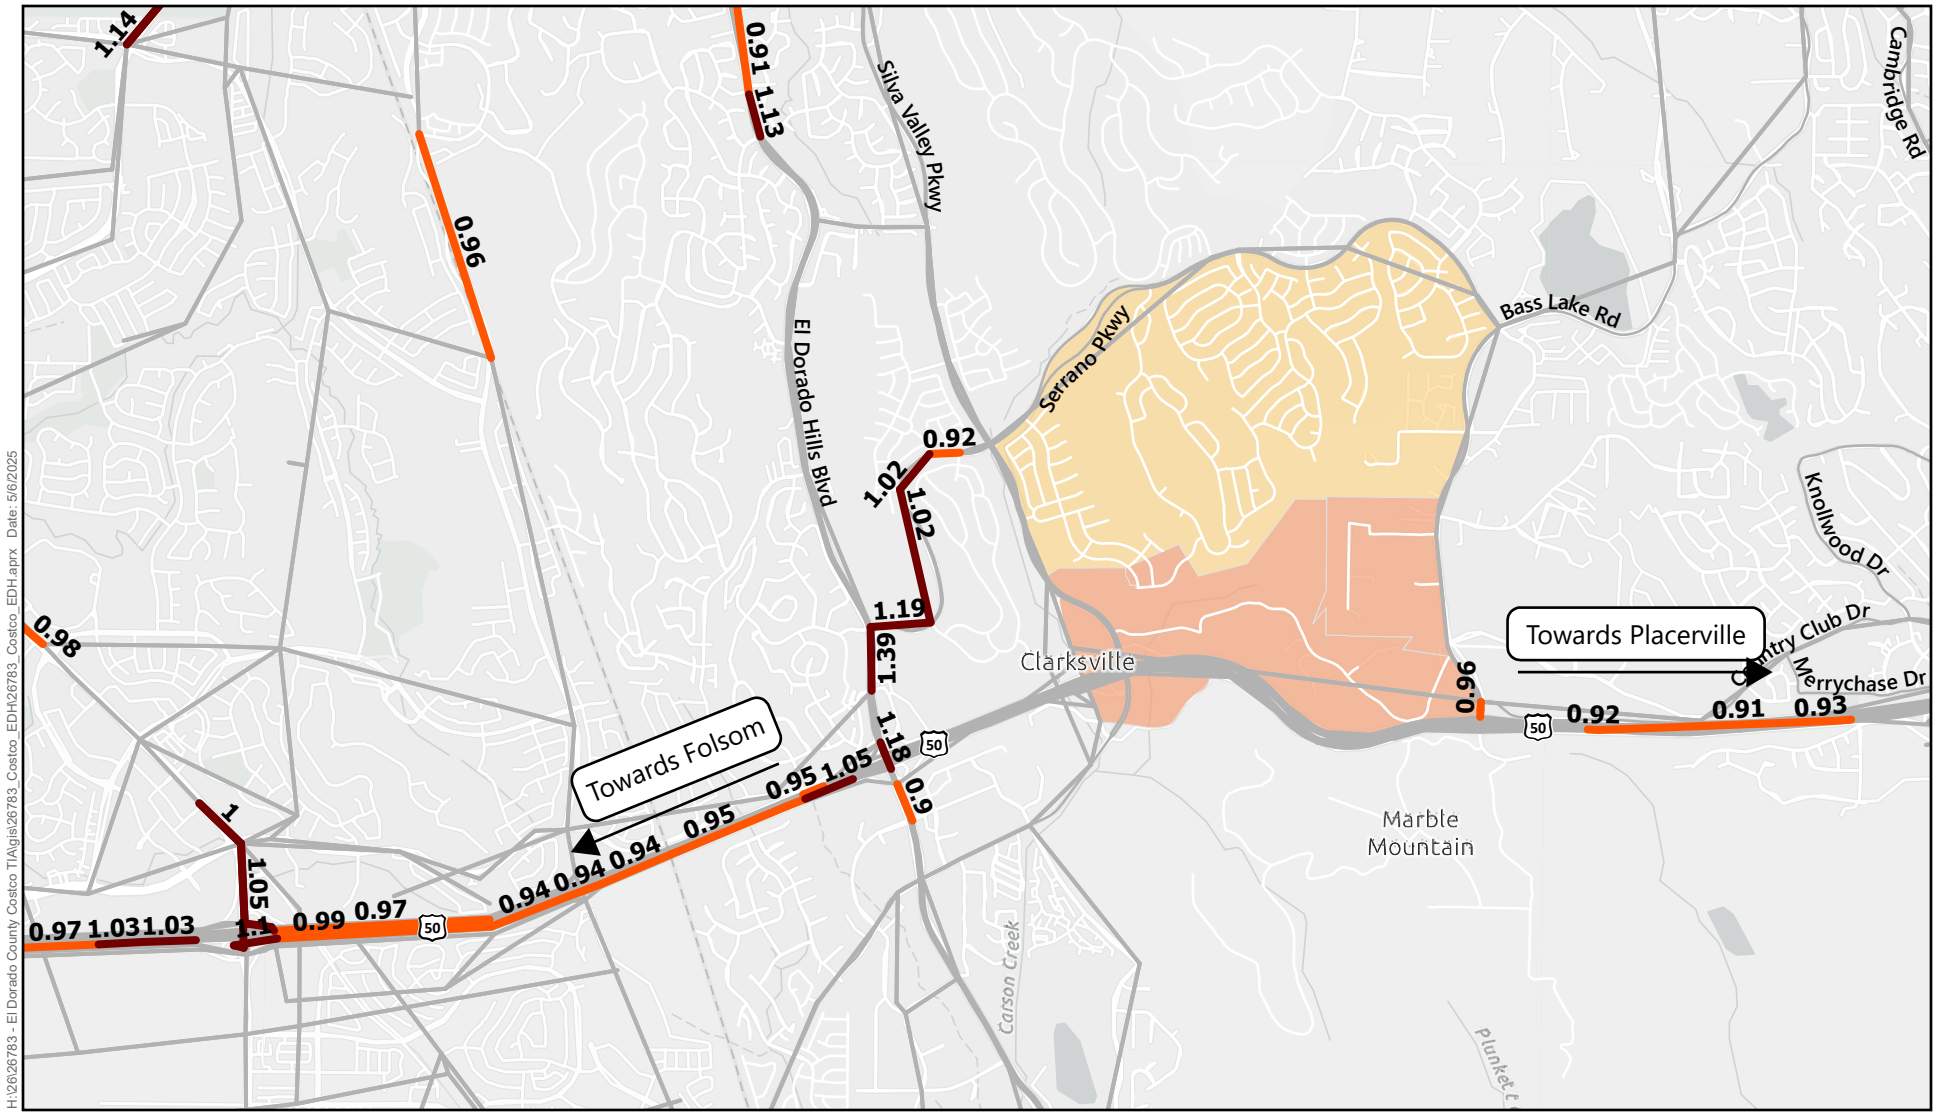
Figure 7 and Figure 8 show the congestion locations during wildfire scenario #1 for Existing Conditions under Evacuation No Project and Evacuation Plus Project scenarios. The following are the locations operating near or over capacity in the Existing Conditions No Project and Plus Project scenarios.

No Project

- Eastbound US 50 toward Placerville
- Eastbound and Westbound US 50 toward Folsom
- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50

Plus Project

- Eastbound US 50 toward Placerville including sections adjacent to the evacuation area.
- Eastbound and Westbound US 50 toward Folsom
- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50



With the addition of Project traffic, volume-to-capacity ratio increases along US 50 towards Folsom and Placerville. Roadway capacity along Serrano Parkway between Silva Valley Parkway and El Dorado Hills operates over capacity under the No Project and Plus Project scenarios, though the volume-to-capacity ratio changes with the addition of Project traffic are minimal.

Table 3 shows the travel times (in minutes) during wildfire scenario #1 for existing conditions under No Evacuation, Evacuation No Project, and Evacuation Plus Project scenarios. As seen in the table below, the increase in travel time with Project traffic varies between 0.1 to 1.0 minutes (0-5% increase).

Table 3. Travel Time (minutes), Wildfire Scenario #1 - Existing Conditions

Origin	Destination	No Evacuation Travel Time (mins)	Evacuation			
			No Project Travel Time (mins)	Plus Project Travel Time (mins)	Difference (mins)	Difference (percent)
S. of Serrano Pkwy.	Folsom	9.5	10.1	10.2	0.1	1%

NEAR-TERM (2034) CONDITIONS

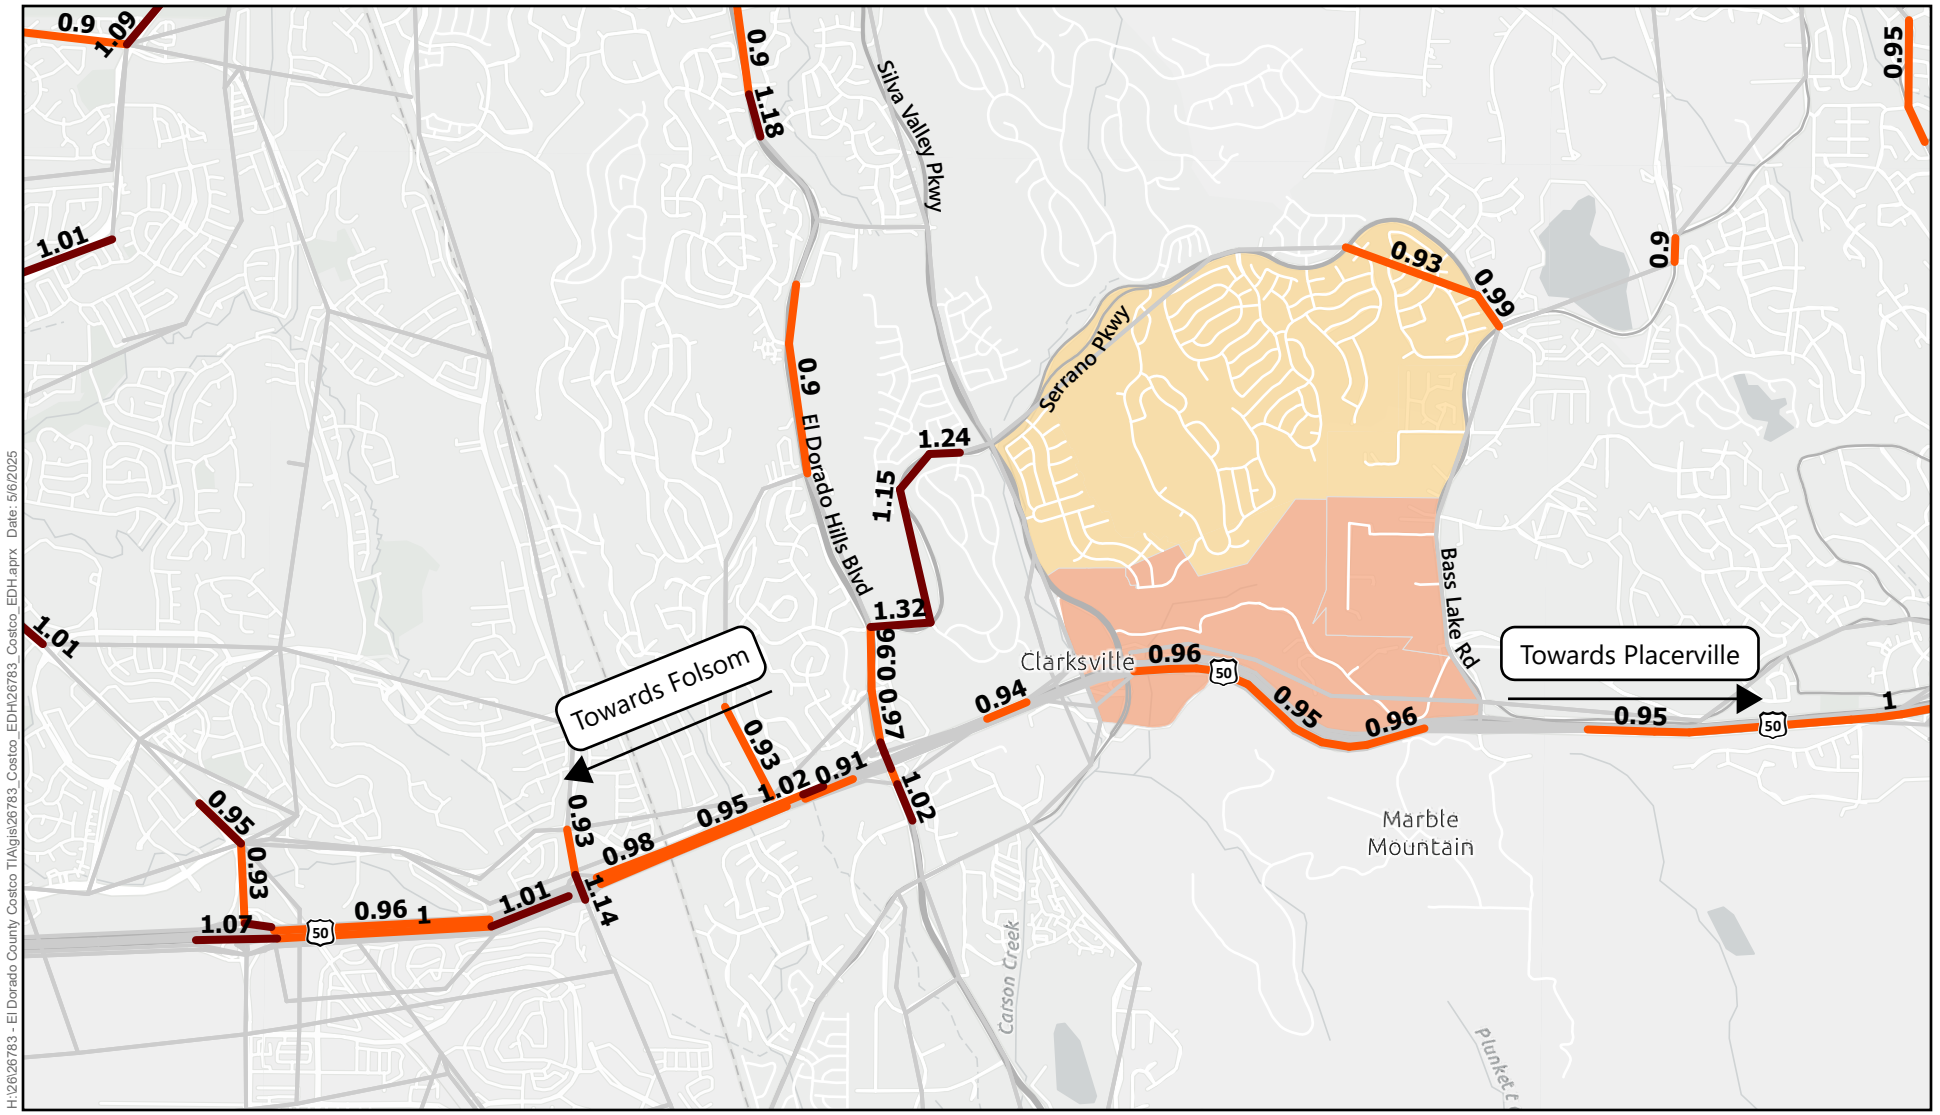
Figure 9 and Figure 10 show the congestion locations during wildfire scenario #1 for Near Term (2034) Conditions under Evacuation No Project and Evacuation Plus Project scenarios. In the No Project and Plus Project scenarios, roadways operating near or over capacity are as follows:

No Project

- Eastbound US 50 toward Placerville
- Eastbound and Westbound US 50 toward Folsom
- Serrano Parkway connecting evacuation area to Bass Lake Road
- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50

Plus Project

- Eastbound US 50 toward Placerville
- Eastbound and Westbound US 50 toward Folsom
- Serrano Parkway connecting evacuation area to Bass Lake Road
- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50



With the addition of Project traffic, volume-to-capacity ratio increases along US 50, towards Folsom and Placerville, including sections adjacent to the Project Site, and along Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard.

Table 4 shows the travel times (in minutes) during wildfire scenario #1 for Existing Conditions under No Evacuation, Evacuation No Project, and Evacuation Plus Project scenarios. As seen in the table below, the increase in travel time with Project traffic varies between 0.1 to 0.8 minutes (1-4% increase) with the addition of the Project.

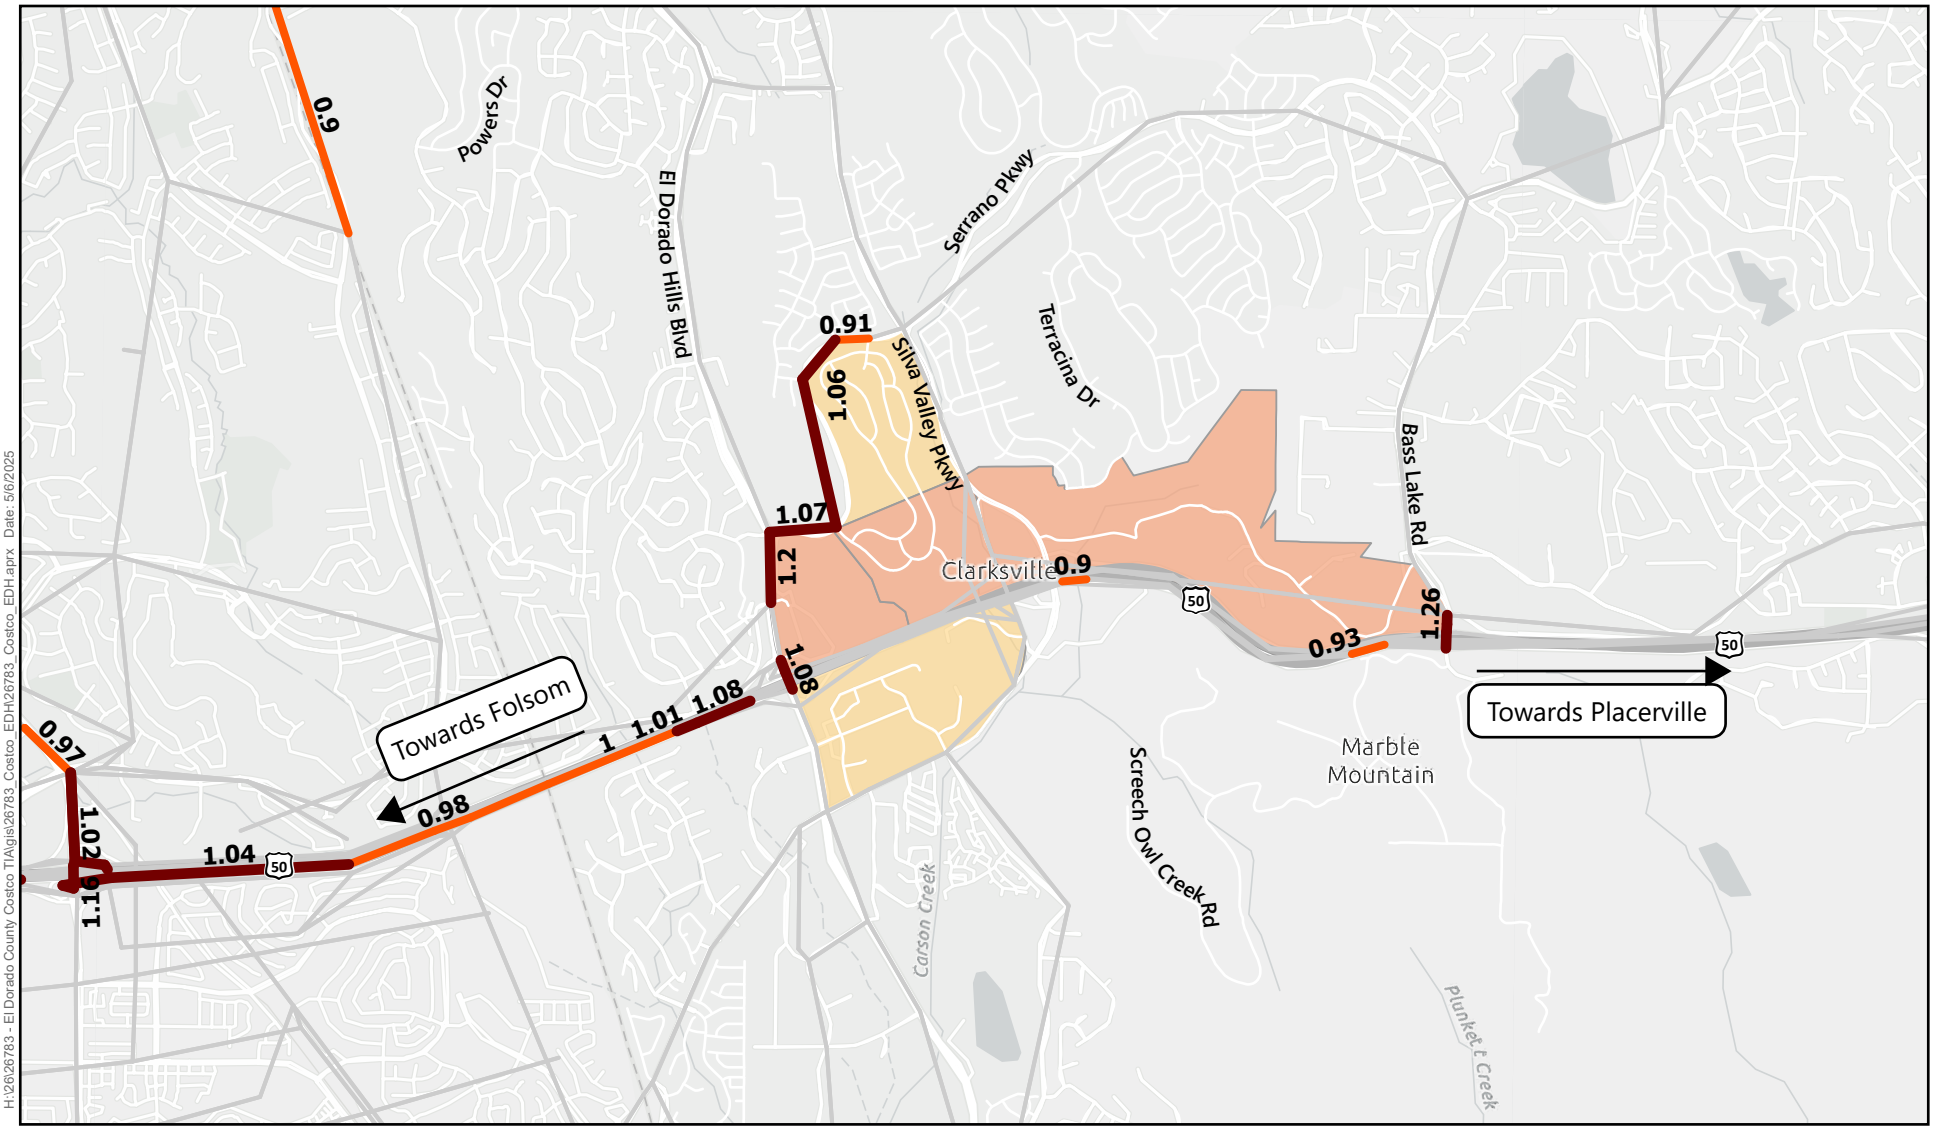
Wildfire Scenario #2

This section presents the travel times and congestion analysis under wildfire scenario #2 for all the analysis scenarios. The origin and destination locations are identified based on the evacuation area boundaries identified for this wildfire scenario and likely evacuation destinations in Folsom and Placerville. However, evacuation destinations are subject to change during an actual evacuation event based on direction from the Office of Emergency Services or evacuating persons' personal preferences.

EXISTING CONDITIONS

Figure 11 and Figure 12 show the congestion locations during the wildfire scenario #2 for Existing Conditions under Evacuation No Project and Evacuation Plus Project scenarios. The following are the locations operating near or over capacity in the Existing No Project and Plus Project scenarios.

No Project



- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50
- Eastbound US 50 between Folsom and El Dorado Hills

Plus Project

- Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard
- El Dorado Hills Boulevard between Serrano Parkway and US 50
- A few sections of Eastbound US 50 between Folsom and Placerville including those adjacent to the Project site.

With the addition of Project traffic, volume-to-capacity ratio increases along US 50, towards Folsom and Placerville, including sections adjacent to the Project site. Roadway capacity on Serrano Parkway between Silva Valley Parkway and El Dorado Hills Boulevard operates over capacity in the No Project and Plus Project scenarios, though the volume-to-capacity ratio changes with the addition of the Project are minimal.

Table 5 shows the travel times (in minutes) during wildfire scenario #2 for Existing Conditions under No Evacuation, Evacuation No Project, and Evacuation Plus Project scenarios. As seen in the table, the increase in travel time with Project traffic varies between 0 to 1.2 minutes (0-6% increase).

Evacuation Planning Considerations

This section describes evacuation projects and strategies that may be considered to improve the capacity and resilience of the evacuation area and surrounding region's roadway network to support future evacuation events. The projects and strategies were identified based on previous congestion and evacuation studies, review of recent evacuation efforts, and effective evacuation planning practices identified by US Department of Transportation (USDOT) and Federal Highway Administration (FHWA). The strategies are organized into five categories:

1. Roadway Management
2. Communications
3. Vulnerable Populations
4. Public Education
5. Resource Management

ROADWAY MANAGEMENT

This section includes infrastructure-related strategies that may aid in improving the capacity of the evacuation roadway network, which can present constraints or limitations to a successful evacuation. For each infrastructure-related treatment, it is necessary to consider downstream capacity limitations and identify if those limits nullify the potential benefits of the treatment as well as other competing roadway design needs to serve other functions and goals. Table 7 outlines each of these strategies and provides a brief description of the strategy and desired outcomes.

Of these strategies, the most effective for increasing evacuation capacity would be those that involve manual control of traffic combined with contra flow operations that allow evacuation on both inbound and outbound lanes of streets, combined with maintaining clear passages for emergency vehicles.

Table 7: Roadway and Intersection Capacity and Resilience Related Strategies

Strategy	Action Items
Limited contra flow on highways	Reverse one or more lanes of highway to accommodate an increased flow of traffic in one direction.
Unlimited contra flow on highways	Redirect all lanes of a designated evacuation route to accommodate rapid evacuation from a city or region.
Limited/unlimited contra flow on unlimited access arterials	Temporarily close inbound travel lanes on selected unlimited access arterials (such as parkways and boulevards) to allow outbound traffic to utilize these lanes during evacuation.
Closure of inbound lanes on selected roads and highways	Close inbound lanes on highways utilized for evacuation routes to prevent drivers on these routes from entering the evacuation area while evacuation is underway.
Restrict left-turn movements	Minimize left-turn movements along evacuation routes and on roads leading to evacuation routes.

Strategy	Action Items
Stage tow trucks	Consider how to stage tow trucks at bottleneck locations along evacuation routes to help detect and clear minor crashes and maintain traffic flows.
Adjust signal timing	Increase the green time and/or progression band for through movements leading out of an evacuation zone.
Signal operation during power outage	Install signal battery backups in case signal operations need to be maintained during a power outage. Consider using channeling devices, static signs, and coning strategies to manage intersection flow during power outage if signals lack power.
Additional access routes	Identify and communicate with communities that have at least two access points. Prioritize adding additional access to communities that are currently served by only one or two access points.
Public transit	Develop transportation solutions such as the use of a bus system for evacuating individuals with special needs (such as those with mobility limitations) and/or evacuating larger groups of people in fewer vehicles.
Traffic control points	Establish traffic control points (i.e., locations along designated evacuation routes with emergency management personnel) to maintain a greater degree of evacuation management. These locations could enhance the efficiency of an evacuation, reduce public confusion, and allow increased operational flexibility during an evacuation.
Vegetation clearing/management	Maintain evacuation roadways and shoulders, keeping them clear of trees, vegetation, and debris that would block travel lanes and shoulders for people evacuating and for emergency operation vehicles.

COMMUNICATIONS

This section describes communication strategies that address how information may be shared among agencies, organizations, and the general public for evacuations. During an emergency evacuation event, two types of communication take place: (1) communication among entities involved in the management of response, and (2) communication between the County and the general public. Table 8 outlines each of these strategies and provides a brief description of the strategy and desired outcomes.

Table 8. Communication Strategies for Evacuations

Strategy	Description and Outcome
Establish and maintain communications	Strengthen and maintain communication among coordinating emergency event agencies. This could be achieved through systems such as the Public Information Emergency System and Emergency Satellite Communications.

Strategy	Description and Outcome
Variable/Dynamic Message Signage	Use variable message board equipment and targeted installation of permanent dynamic message signs on evacuation routes to improve communication and reduce public confusion.
Traffic Control Center	Implement a traffic control center that would have up-to-the-minute reports on traffic patterns and could communicate directly with emergency officers via broadcast media, social media, and other emergency communications channels (e.g., County Telephone Emergency Notification System) to let drivers know about roadway congestion conditions and direct them to alternate routes.
Traffic counters/CCTV cameras	Install traffic counters and/or CCTV cameras on freeways, which can help assess traffic flow, volume of vehicles evacuating, and monitor incidents during emergency evacuation events.
Highway Advisory Radio	Implement highway advisory radio to provide information regarding primary and secondary evacuation routes and incidents to the public.
Pre-defined evacuation zones	The County could consider implementing a system of pre-defined evacuation zones. Pre-defined evacuation zones can provide a common reference system for first responders and the community.

VULNERABLE POPULATIONS

This section identifies strategies specifically for evacuation of vulnerable populations. The County can use demographic data and U.S. Census data to identify vulnerable population locations and communities. County staff and emergency response teams may work with specialized organizations such as hospitals, medical associations, public service organizations, public health staff, and other providers or community groups to identify and locate relevant population segments and the types of assistance needed. Table 9 outlines considerations by need.

Table 9: Additional Steps for Evacuation of Vulnerable Populations

Special Need	Action Items/Considerations
Visually impaired	May be reluctant to leave familiar surroundings when the request for evacuation comes from a stranger. People who are blind or partially sighted may have to depend on their guide dogs and/or others to lead them to safety.
Hearing impaired	May need to make special arrangements to receive evacuation warnings. Include visual aids such as pictures or maps to reinforce key messages.

Special Need	Action Items/Considerations
Mobility impaired	May need special assistance such as paratransit. Partner with neighboring jurisdictions and/or private/non-profit organizations to provide adequate paratransit services.
People without vehicles	Emphasize the importance of carpooling with neighbors or other community members. Provide information on transit routes and transit stops.
Non-English-speaking persons	Provide bilingual or multilingual materials to support communication with non-English speaking populations during evacuation.
People with medical conditions	Communicate in advance the location and availability of hospitals or facilities with emergency/life-sustaining medical equipment, such as dialysis machines.
Unhoused population	Arrange for food, shelter, and transportation for unhoused population. Offer age-appropriate emergency and evacuation information to unhoused children.

PUBLIC EDUCATION

Sharing information is a critical element to help educate the general public on how to prepare in advance for an evacuation. The public education strategies the County may consider include:

- Defining the meaning of different types of evacuation orders
- Sharing how evacuation orders are declared and communicated to the public
- Providing information on preparations to carry out in advance (such as emergency "go" kits or family evacuation plans)
- Conducting a public affair campaign(s) to distribute easy-to-read evacuation maps with alternate routes
- Providing information on available transportation options, including for vulnerable populations
- Providing information on evacuation shelters and support services offered during evacuation
- Providing regular emergency preparedness trainings in multiple languages at convenient, accessible locations
- Building capacity of resilience hubs, community-based organizations, and other community groups to support community-based disaster preparedness efforts through direct or passthrough funding, grant writing support, information sharing, etc.

RESOURCE MANAGEMENT

Evacuations are resource-intensive events that require significant personnel, facilities, and equipment to implement successfully. The County should determine what resources are available as well as what resources will be needed for staff to perform their responsibilities during an evacuation successfully, which may include the following:

- Clarity on staff roles and expertise available
- Facilities available (e.g., traffic operations center, shelters, etc.)

- Available information systems to support the evacuation (e.g., intelligent transportation systems, computer networks, road sensor loops, ancillary hardware such as cameras, etc.)
- Communication systems (e.g., landline, mobile phones, radio system, email, sirens)
- Vehicles/transports (e.g., staff transport, tow trucks, transit vehicles, heavy equipment)
- Miscellaneous materials to support implementation of evacuation strategies (e.g., traffic cones, channeling devices, static/dynamic message signs)

If critical resource gaps are identified, the County may look to work with other evacuation entities to determine additional resources and needs. The County may also work with private sector entities to expand the resource base. For example, utilities companies may keep cell and internet services running in vulnerable communities during public safety power shutoffs. Private service companies such as ambulance operators and towing companies can provide additional assets during evacuation. These companies can clarify what is expected of them during a potential evacuation event to ensure their services are available, when needed.

Conclusion

This memorandum documents the methodology and results of the evacuation analysis for two wildfire scenarios under Existing and Near-Term Conditions: No Project and Plus Project scenarios. The El Dorado County travel demand model was used to estimate roadway capacity and travel times during evacuations in No Project and Plus Project conditions.

EXISTING CONDITIONS

Under Existing conditions, roadway capacity is estimated to increase along US-50 in the westbound and eastbound directions. Though the roadway capacity is estimated to increase, overall roadway capacity is expected to remain under full capacity (v/c < 1.0).

Roadways near the project site, such as Silva Valley Parkway and Serrano Parkway, are estimated to see an increase in roadway capacity as residents, customers, and employees evacuate. The change in roadway capacity is estimated to be minimal.

NEAR-TERM (2034) CONDITIONS

Under Near-Term (2034) conditions, which include land uses and traffic for the Remainder Area, roadway capacity is estimated to increase along US-50 in the westbound and eastbound directions. Overall roadway capacity is expected to remain under full capacity (v/c < 1.0) for most of US-50 near the project site, but some segments are estimated to have a roadway capacity over capacity (v/c > 1.0).

Roadways adjacent to the project site, such as Silva Valley Parkway and Serrano Parkway, are estimated to see an increase in roadway capacity as residents, customers, and employees evacuate. The change in roadway capacity is estimated to be minimal.

The evacuation planning considerations and strategies identified in this memorandum can help enhance the capacity and resilience of the County's roadway network to support future evacuation events.

1 Introduction

This report summarizes fire behavior modeling efforts conducted for the Costco Wholesale Project (Project), a proposed commercial development located in El Dorado County, California. Fire progression and fire behavior modeling was conducted for the Project area to evaluate potential fire behavior characteristics and fire spread potential toward the Project site. The following tasks were performed:

- Evaluation of wildfire history, wildfire ignition, and fuels/vegetation mapping data for the Project site and surrounding area.
- A field evaluation of the Project site and surrounding area to better understand fuel (vegetation) conditions and confirm observations made during mapping data review and to refine the fuel model(s) to be used in the wildfire behavior and progression modeling efforts.
- Analysis and processing of local historical weather data to determine appropriate fuel moisture, wind speed, and wind direction inputs for the wildfire behavior and progression modeling runs.
- Creation of a base landscape data set (GIS-based terrain and fuels data) to be used for wildfire behavior and progression modeling efforts.
- Modeling of wildfire behavior (flame length, spread rate, and fireline intensity) and three (3) wildfire progression scenarios to understand the effect of a fire approaching the proposed Project site. Modeling was conducted using FlamMap. A GID-based fire behavior modeling application.
- Preparation of this Wildfire Modeling Summary Report that summarizes our methods, data sources, assumptions, and modeling results.
- Coordination and communication with the California Department of Forestry and Fire Protection (CAL FIRE) and the Project team.

1.1 Location

The Project site is located in El Dorado County, north of US 50 and Tong Road, east of Clarksville Crossing, and is bisected by Silva Valley Parkway. The northern portion of the Project site is approximately 24.83 acres (North Site) and includes APNs: 122-720-0019, 20, and 21. All the parcels are undeveloped, and 122-720-21 (6.57 of 7.75 acres) is primarily reserved for the future extension of County Club Drive to Silva Valley Parkway, which is not part of the Project. The southern portion of the Project site is approximately 18.42 acres (South Site) and includes APNs:122-720-018, 02, and 03. A portion of 122-720-003 and a portion of the unused former Tong Road right-of-way between Silva Valley Parkway and Clarksville Crossing are proposed to be utilized for site access. The 1.38-acre portion of 122-720-018 west of Clarksville Crossing on the South Site will not be developed as part of the Project, resulting in a net development site of 17.05 acres.

The modeling analysis area discussed in this report includes the Project site plus the area within 2 miles of the Project site. The Project site and modeling analysis area are presented in Figure 1.

Project and Modeling Area Location

1.2 Project Description

The Project proposes to develop the site as a Costco retail center with the Costco building at the center of the south portion of the site and a fuel facility on the north portion of the site. The maximum building area for the Costco South Site will be approximately 165,000 square feet. Development of this portion of the site includes the main Costco building, site access, and a parking area, including a subterranean parking structure. The fuel facility on the North Site will include a maximum 13,000 square foot open canopy and a 200 square foot controller enclosure. The remainder of the North Site will include Costco employee parking.

1.3 FlamMap Fire Behavior Modeling

The FlamMap software package was used to model potential fire behavior and fire spread in the modeling analysis area. FlamMap utilizes the same fire spread equations built into the BehavePlus software package but allows for a geographical presentation of fire behavior outputs as it applies the calculations to each pixel in an associated geographic information system (GIS) landscape (Finney 2002). The FlamMap software package is a publicly available resource available through the Fire, Fuel, and Smoke Science Program of the U.S. Forest Service. FlamMap is a GIS-based software package that models potential fire behavior and fire spread where weather conditions (wind and fuel moisture) are held constant. FlamMap generates map files of potential fire behavior characteristics (e.g., flame length, spread rate, fireline intensity) and fire progression data (fire growth perimeters, fire flow paths). Model outputs represent fire behavior calculated for each pixel within the analysis area independently and do not calculate fire spread across a landscape. The software requires a minimum of five input variables, including elevation, slope, aspect, fuel model, and canopy cover. Wind and weather data are also critical components to FlamMap modeling efforts. The following section presents a background on fire behavior modeling and this report presents the methods and data sources used in performing the FlamMap fire behavior modeling analysis.

1.4 Fire Behavior Modeling Background

Predicting wildland fire behavior is not an exact science due to the many variables that must be considered. As such, the movement of a fire will likely never be fully predictable, especially considering the variations in weather, the limits of weather forecasting, and the weather that is often created by firestorms. Nevertheless, practiced and experienced judgment, coupled with a validated fire behavior modeling system, results in useful and accurate fire information (Rothermel 1993). To be used effectively, the basic assumptions and limitations of fire behavior modeling applications must be understood.

- First, it must be realized that the fire model describes fire behavior only in the flaming front. The primary driving force in the predictive calculations is dead fuel less than 0.25 inches in diameter. These are the fine fuels that carry fire. Fuels greater than 1 inch in diameter have little effect, while fuels greater than 3 inches in diameter have no effect on fire behavior.

- Second, the model bases surface fire calculations and descriptions on a wildfire spreading through fuels that are within 6 feet of the ground and contiguous to the ground. Surface fuels are classified as grass, grass/shrub, shrub, timber litter, timber understory, or slash.

- Third, the software assumes that weather is uniform. However, because wildfires almost always burn under non-uniform conditions, creating their own weather, length of projection period and choice of fuel model must be carefully considered to obtain useful predictions.
- Fourth, fire behavior computer modeling systems are not intended for determining sufficient fuel modification zone/defensible space widths. However, results can provide the average length of the flames, which is a key element for determining defensible space distances for minimizing structure ignition.
- Fifth, FlamMap is designed to simulate wildland fire behavior in vegetative fuels (such as grasses, shrubs, and trees), not structures.
- Sixth, FlamMap does not predict ember spotting from non-timber fuel types (e.g., shrubs, grasses).
- Seventh, fire spread modeling does not account for fire suppression efforts and therefore represents a worst-case scenario.

FlamMap can provide valuable fire behavior predictions, which can be used as a tool in the decision-making process. In order to make reliable estimates of fire behavior, one must understand the relationship of fuels to the fire environment and be able to recognize the variations in these fuels. Fuels are made up of the various components of vegetation, both live and dead, that occur in a particular landscape. The type and quantity will depend upon soil, climate, terrain, and management and disturbance (e.g., fire) history. The major fuel groups of grass, grass/shrub, shrub, trees, tree litter, and slash are defined by their constituent types and quantities of litter and duff layers, dead woody material, grasses and forbs, shrubs, regeneration, and trees. Fire behavior can be predicted largely by analyzing the characteristics of these fuels. Fire behavior is affected by seven principal fuel characteristics: fuel loading, size and shape, compactness, horizontal continuity, vertical arrangement, moisture content, and chemical properties.

2 Modeling Approach Summary

Three scenarios were evaluated for fire progression modeling, as defined below:

- **Scenario 1:** This scenario represented a fire burning under late summer/early fall north-northwest wind conditions (represented by 97th percentile fire weather conditions). The ignition point for this scenario was located to the northeast of the Project site.
- **Scenario 2:** This scenario represented a fire burning under summer southwest wind conditions (represented by 50th percentile fire weather conditions). The ignition point for this scenario was located to the southwest of the Project site.
- **Scenario 3:** Similar to Scenario 2, this scenario represented a fire burning under summer southwest wind conditions (represented by 50th percentile fire weather conditions). The ignition point for this scenario was located to the southwest of the Project site, though further east than that for Scenario 2.

Additionally, fire behavior modeling was used to evaluate potential fire behavior characteristics in the modeling analysis area. The results of this modeling effort are static outputs representing fire behavior characteristic at a site, given fuel, terrain, and weather inputs. The following fire behavior characteristics were modeled:

- Flame Length
- Spread Rate
- Fireline Intensity

3 Modeling Inputs

3.1 Model Inputs

3.1.1 Elevation

Elevation data were derived from a 1/3 arc-second (10m) resolution National Elevation Dataset (NED), acquired from the U.S. Geological Survey (USGS) National Oceanic and Atmospheric Administration (NOAA) Coastal Services Center and projected in the NAD 1983, California State Plane, Zone 2 coordinate system, with units in meters (USGS, 2024a). Elevation values in the modeling area range from 492 feet to 1,460 feet above mean sea level (AMSL). This data was utilized to create an elevation grid file, using units of feet AMSL. Elevation is a required input file for FlamMap runs and are necessary for adiabatic adjustment of temperature and humidity and for conversion of fire spread between horizontal and slope distances.

3.1.2 Slope

Using ArcGIS Spatial Analyst tools, a slope grid file was generated from the elevation grid file described above. Slope measurements utilized values in percent of inclination from horizontal. Slope values in the analysis area range from 0-37 degrees. The slope input file is necessary for computing slope effects on fire spread and solar radiance.

3.1.3 Aspect

Using ArcGIS Spatial Analyst tools, an aspect grid file was generated from the elevation grid file described above. The aspect values utilized were azimuth degrees. Aspect values are important in determining the solar exposure of grid cells.

3.1.4 Fuel Model

Fire Behavior Fuel Models (FBFMs) are standardized classifications used to describe the types of vegetation and other combustible materials that influence wildfire behavior. These models help predict fire spread, intensity, and flame length under various conditions. Fuel model data was created utilizing the 2023 National Land Cover Database (USGS 2024b). This database is a comprehensive dataset that provides detailed land cover and land use information for the United States. It is produced by the United States Geological Survey (USGS) and the Multi-Resolution Land Characteristics Consortium (MRLC) and is used for a wide range of applications in environmental monitoring, land planning, resource management, and research. Land cover data is provided at a 30-meter resolution and classifies landcover into the categories provided in **Exhibit 1**. Fuel model data was further refined to account for roadways and other non-burnable areas not accounted for within the NLCD Land Cover data.

Exhibit: 1: NLCD Land Cover Classifications (USGS 2024b)

This dataset was clipped to the modeling analysis area to derive fuel models in wildlands surrounding the Project site at a 10-meter resolution. A crosswalk was created to assign land cover classifications into unique FBFMs using the Scott and Burgan 2005 40 FBFMs (Scott and Burgan, 2005). Crosswalk values were determined through field observations and through comparison with regional FBFM classification standards as mapped by LANDFIRE. The land cover to FBFM crosswalk is provided in Table 1. As presented, fuels in the analysis area are comprised mainly of developed areas and annual grassland vegetation.

Table 1. Land Cover to Fire Behavior Fuel Model Crosswalk

NLCD Land Cover Classification	Fuel Model Classification	Acres
21-24 Developed 11 Open water	NB1 – Non-burnable/Developed	4,460

Table 1. Land Cover to Fire Behavior Fuel Model Crosswalk

NLCD Land Cover Classification	Fuel Model Classification	Acres
71 Grassland/Herbaceous	GR2 - Low Load, Dry Climate Grass	2,858
52 Shrub/Scrub	SH5 - High Load, Dry Climate Shrub	527
41 Deciduous Forest	TL2 - Low Load Broadleaf Litter	353
42 Evergreen Forest 43 Mixed Forest	TL6 – Moderate Load Broadleaf Litter	146
	Total:	**8,306**

Source: USGS 2024b, LANDFIRE 2023

3.1.5 Canopy Cover

Canopy cover is a required raster file for FlamMap operations. It is necessary for computing shading and wind reduction factors for all fuel models. Canopy cover is measured as the horizontal fraction of the ground that is covered directly overhead by tree canopy. Crown closure refers to the ecological condition of relative tree crown density. Stands can be said to be "closed" to recruitment of canopy trees but still only have 40% or 50% canopy cover. Coverage units are represented as percentage values (0–100).

Canopy cover for the analysis area was derived from NLCD 2023 Canopy Cover Database (MRLC 2023). The 2023 NLCD Canopy Cover dataset quantifies the percentage of forest canopy cover in 10% increments. It provides a spatial representation of canopy cover at a 30-meter resolution ranging from 0% (no canopy) to 100% (complete canopy coverage).

3.1.6 Weather

Historical weather data for the modeling area was utilized in determining appropriate fire behavior modeling inputs. For this analysis, 97th percentile fuel moisture, wind speed, and wind direction values were derived from Remote Automated Weather Station (RAWS) data and utilized in fire behavior and progression modeling efforts. Data from the Ben Bolt RAWS was utilized for modeling fire behavior and progression (approximately 250 feet north of the City-owned Grizzly Peak Open Space parcels). Table 2 summarizes location information and available data ranges for the Ben Bolt RAWS.

Table 2. Ben Bolt Remote Automated Weather Station Characteristics

Station Characteristics	Value
Station ID	42612
Latitude	38.59084
Longitude	-120.93362
Elevation	905 feet
Data Years	2005-2024

To determine weather-related modeling inputs, RAWS data were downloaded, processed, and analyzed using the FireFamily Plus software package (v. 5.0) to determine 97th percentile (Scenario 1) and 5th percentile (Scenarios 2 and 3) fire weather conditions. The RAWS data was evaluated from August 1 through October 15 for each year between 2005 and 2024 (extent of available data record) for the 97th percentile (Scenario 1) and from June 1

through August 31 for each year between 2005 and 2024 (extent of available data record) for the 50th percentile (Scenarios 2 and 3). Data derived from this analysis included values for 1-hour, 10-hour, and 100-hour fuel moistures, live herbaceous moisture, live woody moisture, 20-foot sustained wind speed, and wind direction. The weather data was also evaluated to determine the maximum sustained wind speed.

These weather values were incorporated into the Initial Fuel Moisture file used as an input in FlamMap. Wind direction and wind speed values for the FlamMap run were manually entered during the data input phase. Table 3 presents the wind and weather values used in the FlamMap fire behavior and progression modeling runs.

Table 3. Weather Variables used for Fire Behavior and Progression Modeling

Model Variable	Value Scenario 1 (97th Percentile Fire Weather)	Value Scenarios 2 and 3 (50th Percentile Fire Weather)
20-foot Wind Speed (mph)	10	8
Maximum Wind Speed (mph)	23	19
Wind Azimuth (degrees)	23	225
1-hour Fuel Moisture (%)	3	6
10-hour Fuel Moisture (%)	6	10
100-hour Fuel Moisture (%)	8	11
Live Herbaceous Fuel Moisture (%)	30	30
Live Woody Fuel Moisture (%)	59	59

Note: * Live herbaceous moisture values were lower than 30% so the herbaceous fuels are considered fully cured (Scott and Burgan 2005).

Wind direction (azimuth) for each Scenario was determined by evaluating wind rose outputs for sustained wind speeds, as presented in Exhibits 2 and 3.

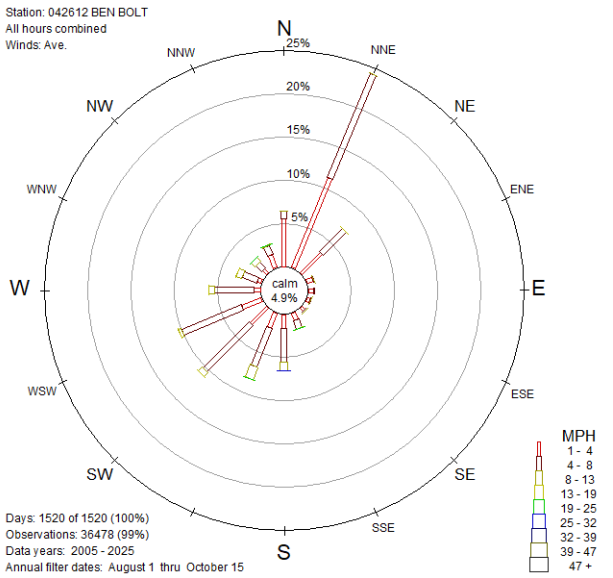

Exhibit 2. Wind rose for 97th percentile wind direction.

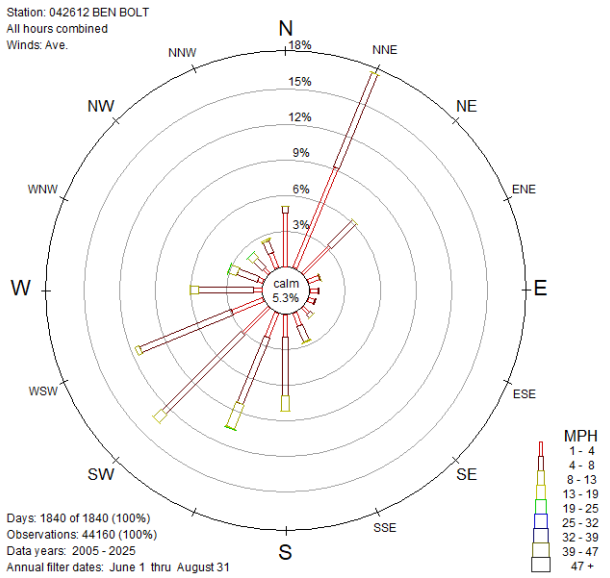

Exhibit 3. Wind rose for 50th percentile wind direction.

Finally, wind vectors were modeled within the FlamMap runs using the WindNinja tool embedded in the FlamMap software. WindNinja models the effect of topography on wind speed and direction and generates wind vector files for use in the modeling runs. The grid resolution for the WindNinja analysis was set at 30 meters.

3.1.7 Ignition Locations

We evaluated historic wildfire ignition point data in GIS format (NIFC 2025) to understand where historic ignitions have occurred and where it is likely that they could occur again. This data, coupled with an evaluation of wildfire history data (CAL FIRE 2024) and vegetation mapping data (USGS 2024b), informed the selection of ignition locations for the fire progression modeling effort. These locations were also evaluated in the field and ignition locations were reviewed with CAL FIRE prior to conducting the modeling runs. The following summarizes each of the ignition locations used for the fire progression modeling runs:

Exhibit 4. Photograph of field conditions located at the ignition point used for Scenario 1 (southwest corner of the intersection of Bass Lake Road and Hawk View Road).

Scenario 1: The ignition point for this scenario represents a roadside ignition occurring along the west side of Bass Lake Road near its intersection with Hawk View Road. This location contains ample roadside grasses that could potentially be ignited from human causes associated with roadways (e.g., cigarettes, dragging chains, molten catalyst material from vehicles, etc.) According to historic ignition data, multiple ignitions have occurred along Bass Lake Road.

Exhibit 5. Photograph of field conditions located near the ignition points used for Scenarios 2 and 3 (north of Highway 50 and east of El Dorado Hills Boulevard).

Scenario 2: The ignition point for this scenario represents a roadside ignition occurring along the north side of Highway-50 approximately 1,200 feet east of El Dorado Hills Boulevard. An ignition in this location is possible from a vehicle or other human causes. According to historic ignition data, multiple ignitions have occurred along Highway-50 in this region.

Scenario 3: The ignition point for this scenario represents a similar roadside ignition to Scenario 2 yet occurring approximately 2,000 feet further to the east and closer to the Project site. According to historic ignition data, multiple ignitions have occurred along Highway 50 in this region.

3.2 Model Outputs

Model outputs for this analysis include three fire progression maps (one for each of the three scenarios) and six landscape fire behavior characteristic maps, which include measurements of flame length, fireline intensity, and rate of spread for 50th and 97th percentile weather conditions. While wildfire progression maps present fire behavior and spread from a unique ignition point, landscape fire behavior models are static and represent wildfire behavior in all vegetated pixels present within the landscape.

Fire progression runs utilized the Minimum Travel Time (MTT) tool in FlamMap. The MTT tool is a two-dimensional fire growth model which calculates fire growth based on calculated fire spread rates from an ignition source (point, line, or polygon). The MTT tool uses fire spread rates to find minimum travel paths between data cells in the GIS landscape, with an output data file representing the number of minutes for a wildfire to reach a particular location from the ignition source. As FlamMap provides a static representation of fire behavior, modeling using the MTT tool holds wind and weather inputs constant over the modeling period. Each MTT simulation was assigned a burn period of 6 hours (360 minutes).

3.2.1 Fire Progression

The output files generated for the three progression runs included one arrival time grid and one line file representing major fire spread paths, considering modeling inputs and ignition location (output maps are presented in Appendix A). Major paths identify the most significant pathways for fire spread. The arrival time data presents time (in minutes) for a modeled fire to reach a specific location. This data was analyzed to determine the time necessary for a fire to burn from its ignition point to the Project site and surrounding communities. For some runs (Scenarios 2 and 3), the modeled fire did not reach the Project. This is due to the classification of non-burnable fuel models associated with roadways that function as barriers to grassland fire spread.

Scenario 1: A wildfire in this scenario spreads in a southwest direction driven by strong 23 mph winds from the north/northeast. Wildfire spreads quickly through herbaceous vegetation in a downslope direction through the Carson Creek drainage. Exiting roadways such as Silver Dove Way and Tong Road function as fuel breaks and prevent the fire from burning away from the drainage to the south. While the main fire front spreads in a southwest direction, the fire's flanks spread towards existing communities along Borders Drive and Archetto Drive. After about 1 hour, the modeled fire reaches riparian woodland vegetation which significantly slows fire spread. This alters the path of the fire front and results in fire spread across the north slope of Carson Creek. The fire front continues to spread southwest and eventually reaches the eastern edge of the Project site in 143 minutes (2 hours, 23 minutes).

Scenario 2: A wildfire in this scenario spreads in a northeast direction through grassland fuels. Fire spread is driven by 19 mph winds from the southwest and follows a slight uphill slope. The fire's northern perimeter is modeled to reach the edge of existing communities along Panela Way within 52 minutes. Spread along the fire's northeastern perimeter is halted by an existing dirt service road (roughly 16 feet wide) which travels across the open space and functions as a fuel break. This feature is modeled to prevent fire from continuing towards the Project site from this ignition location.

Exhibit 6: Aerial image of service road which functions as a fuel break and limits fire spread towards the Project site in Scenario 2.

Scenario 3: In this scenario, similar to Scenario 2, a wildfire spreads northeast across grasslands, driven by 19 mph winds from the southwest. The fire follows a slight uphill path and reaches the western edge of Old Silva Valley Parkway in 36 minutes. However, riparian vegetation and the paved roadway to the west of the Project site act as a natural fire break, preventing the fire from reaching the Project site.

3.2.2 Fire Behavior

Three output grid files for each weather scenario (50th and 97th percentile) were generated for the FlamMap run and represent flame length (feet), fireline intensity (BTU/ft/s), and rate of spread (mph). Flame length, the length of the flame of a spreading surface fire within the flaming front, is measured from midway in the active flaming combustion zone to the average tip of the flames (Andrews et al. 2008). It is a somewhat subjective and non-scientific measure of fire behavior but is extremely important to fireline personnel in evaluating fireline intensity and is worth considering as an important fire variable (Rothermel 1993). Flame length values in the resulting grid file are in feet. Table 4 below presents an interpretation of flame length and its relationship to fireline intensity. Fireline intensity is a measure of heat output from the flaming front and affects the potential for a surface fire to transition to a crown fire. Rate of spread measures the horizontal movement of fire spread across the landscape and is useful to determine a fire's behavior and how many resources will be needed to contain the fire, as a faster-moving fire requires more immediate and significant resources. Maps depicting fire behavior in the modeling analysis area are presented in Appendix B (B1-B6).

As presented in B-1 under 50th percentile weather summer conditions, flame lengths within grass fuels (Fuel Model GS2) range from roughly 6-8 feet depending on slope and wind exposure. During peak 97th percentile weather conditions (B-2), flame lengths in grass fuels are modeled to reach upwards of 9-12 feet under sustained wind speeds of 23 miles per hour.

Under extreme weather and wind conditions (B-4), fireline intensity values may exceed 1,000 Btu/foot/second with spread rates greater than 2 miles per hour in grass fuels. While at high risk of ignition, grass fuels are generally less hazardous compared to other fuel types such as shrub and timber. This is largely to lower fuel loads and rapid burn-out times. Grass fuels are typically light, fine fuels, meaning they are composed of thin, dry material that ignites and burns quickly. While wildfires in grass fuels may produce large flame lengths and spread rapidly, these conditions are often sustained for short periods of time. Because of this, grass fires provide more opportunities for direct fire suppression from responding personnel.

Table 4. Fire Behavior Interpretation

Flame Length	Fireline Intensity	Interpretation
Under 4 feet	Under 100 BTU/ft/s	Fires can generally be attacked at the head or flanks by persons using hand tools. Hand line should hold the fire.
4 feet to 8 feet	100–500 BTU/ft/s	Fires are too intense for a direct attack on the head by persons using hand tools. Hand line cannot be relied on to hold the fire. Equipment such as dozers, pumpers, and retardant aircraft can be effective.
8 feet to 11 feet	500–1,000 BTU/ft/s	Fires may present serious control problems—torching out, crowning, and spotting. Control efforts at the fire head will probably be ineffective.
Over 11 feet	Over 1,000 BTU/ft/s	Crowning, spotting, and major fire runs are probable. Control efforts at the head of fire are ineffective.

Source: Roussopoulos and Johnson 1975.
Note: BTU/ft/s = British thermal units per foot per second.

Policy and Regulation
Consistency Analysis

Project Compliance with Applicable Land Use-Related Plans, Policies, and Regulations that Protect the Environment

Plan/ Policy/Regulation	Project Consistency
El Dorado County General Plan	
Policy 2.3.1.2: The Zoning Ordinance shall include consideration of a standard for parking lot shading and provision of street trees in all new development Projects.	***Consistent.*** As discussed in Section 3.1, "Aesthetics," Section 3.1.3, "Environmental Impacts and Mitigation Measures," Substantial perimeter landscaping would be provided along Silva Valley Parkway and Clarksville Crossing to screen parking areas and soften views of structures. Approximately 36 percent of the site would be landscaped, and 56 percent of the parking area would be shaded by trees after 15 years. Loading and utility areas would be screened with landscaping, walls, and fencing to reduce visual clutter.
Objective 2.5.1: Provision for the visual and physical separation of communities from new development.	***Consistent.*** As discussed in Section 3.1, "Aesthetics," Section 3.1.3, "Environmental Impacts and Mitigation Measures," the Costco project is buffered from single-family residential uses by intervening open space areas and distance.
Policy 2.5.1.1: Low intensity land uses shall be incorporated into new development projects to provide for the physical and visual separation of communities. Low intensity land uses may include any one or a combination of the following: parks and natural open space areas, special setbacks, parkways, landscaped roadway buffers, natural landscape features, and transitional development densities.	***Consistent.*** As discussed in Section 3.1, "Aesthetics," Section 3.1.3, "Environmental Impacts and Mitigation Measures," the Costco project is buffered from single-family residential uses by intervening open space areas and distance. Perimeter landscaping would be provided along Silva Valley Parkway and Clarksville Crossing Road providing addition buffer
Objective 2.8.1: Lighting Standards - Provide standards, consistent with prudent safety practices, for the elimination of high intensity lighting and glare.	***Consistent.*** As discussed in Section 3.1, "Aesthetics," Section 3.1.3, "Environmental Impacts and Mitigation Measures," the proposed project would add new nighttime lighting, which would increase nighttime illumination on the site where none currently exists. It would also contribute to areawide nighttime lighting because this lighting could spillover on adjacent areas and residences north and west of the site, resulting in adverse nighttime lighting impacts. However, the project is designed to comply with Title 130, Chapter 130.34 (Outdoor Lighting) of County Code, which requires that outdoor lighting be located, shielded, and directed such that no direct light falls outside the property line or into the public right-of-way. Additionally, the project would use non-reflective materials and low-glare finishes, such as ribbed metal panels in muted colors, split-face CMU, and natural concrete, to eliminate glare.
Policy 2.8.1.1: Development shall limit excess nighttime light and glare from parking area lighting, signage, and buildings. Consideration will be given to design features, namely directional shielding for street lighting, parking lot lighting, sport field lighting, and other significant light sources, that could reduce effects from nighttime lighting. In addition, consideration will be given to the use of automatic shutoffs or motion sensors for lighting features in rural areas to further reduce excess nighttime light.	**Consistent.** See response to Objective 2.8.1.

Plan/ Policy/Regulation	Project Consistency
Objective 5.1.2: Concurrency: Ensure through consultation with responsible service and utility purveyors that adequate public services and utilities, including fire protection, police protection, and ambulance service are provided concurrent with discretionary development or through other mitigation measures provided, and ensure that adequate school facilities are provided concurrent with discretionary development to the maximum extent permitted by State law. It shall be the policy of the County to cooperate with responsible service and utility purveyors in ensuring the adequate provision of service. Absent evidence beyond a reasonable doubt, the County will rely on the information received from such purveyors and shall not substitute its judgment for that of the responsible purveyors on questions of capacity or levels of service.	***Consistent.*** As discussed in Section 3.13, "Public Services and Recreation," Section 3.13.3, "Environmental Impacts and Mitigation Measures," the El Dorado Hills Fire Department and ECSO have level of service standards that the project would meet. Additionally, as discussed in Section 3.16, "Utilities and Service Systems," Section 3.16.3, "Environmental Impacts and Mitigation Measures," EID and El Dorado Disposal would both be able to serve the projects water supply, wastewater, and solid waste disposal needs, respectively. El Dorado Local Agency Formation Commission approval of project annexation to EID and El Dorado Hills Fire Department service areas would be required.
Policy 5.1.2.1: Prior to the approval of any discretionary development, the approving authority shall make a determination of the adequacy of the public services and utilities to be impacted by that development. Where, according to the purveyor responsible for the service or utility as provided in Table 5-1(Draft EIR Table 3.13-1), demand is determined to exceed capacity, the approval of the development shall be conditioned to require expansion of the impacted facility or service to be available concurrent with the demand, mitigated, or a finding made that a CIP [Capital Improvements Plan] project is funded and authorized which will increase service capacity.	***Consistent.*** As discussed in Section 3.13, "Public Services and Recreation," Section 3.13.3, "Environmental Impacts and Mitigation Measures," public service provision for public services not conflict with this Policy. Additionally, as discussed in Section 3.16, "Utilities and Service Systems," Section 3.16.3, "Environmental Impacts and Mitigation Measures," based on the EID 2022 Water Supply and Demand Report and the EID 2020 UWMP, water supply would be adequate to accommodate the project under normal-, dry-, and multiple-dry-year water conditions. Additionally, the constituents in the wastewater flow from the project to the EDHWWTP would be within the plant's capacity. The solid waste facilities would experience a small increase from the project and would not consume a substantial proportion of the available permitted capacity and would not trigger the need to expand landfill facilities.
Policy 5.1.2.2: Provision of public services to new discretionary development shall not result in a reduction of service below minimum established standards to current users, pursuant to Table 5-1 (Draft EIR Table 3.13-1).	***Consistent.*** See response to Policy 5.1.2.1.
Policy 5.1.2.3: New development shall be required to pay its proportionate share of the costs of infrastructure improvements required to serve the project to the extent permitted by State law. Lack of available public or private services or adequate infrastructure to serve the project which cannot be satisfactorily mitigated shall be grounds for denial of any project or cause for the reduction of size, density, and/or intensity otherwise indicated on the General Plan land use map to the extent allowed by State law.	***Consistent.*** As discussed in Chapter 2, "Project Description," and Section 3.16, "Utilities and Service Systems," Section 3.16.3, "Environmental Impacts and Mitigation Measures," the project proposes to onsite improvements into its design to adequately service water supply and wastewater needs of the project.
Objective 5.2.1: County-Wide Water Resource Program. Establish a county-wide water resources development and management program to include the activities necessary to ensure adequate future water supplies consistent with the General Plan.	***Consistent.*** As discussed in Section 3.16, "Utilities and Service Systems," Section 3.16.3, "Environmental Impacts and Mitigation Measures," adequate water supply is available to accommodate the project consistent with this General Plan Objective.

Plan/ Policy/Regulation	Project Consistency
Policy 5.2.1.2: An adequate quantity and quality of water for all uses, including fire protection, shall be provided for with discretionary development.	***Consistent.*** As discussed in Section 3.16, "Utilities and Service Systems," Section 3.16.3, "Environmental Impacts and Mitigation Measures," the Costco project would require approximately 20.7 EDUs of water supply and the North Site Remainder Area could require approximately 86.3 EDUs of water supply, depending on the types of commercial uses that are proposed for future development. As of January 2022, there were approximately 16,910 EDUs of water supply available in El Dorado Hills Water Supply Region. EID determined in its 2020 UWMP that its water supply portfolio is capable of meeting water demand in its service area in normal, single dry, and consecutive dry years from 2020 through 2045.
Policy 5.2.1.9: In an area served by a public water purveyor or an approved private water system, the applicant for a tentative map or for a building permit on a parcel that has not previously complied with this requirement must provide a Water Supply Assessment that contains the information that would be required if a water supply assessment were prepared pursuant to Water Code section 10910. In order to approve the tentative map or building permit for which the assessment was prepared the County must **(a)** find that by the time the first grading or building permit is issued in connection with the approval, the water supply from existing water supply facilities will be adequate to meet the highest projected demand associated with the approval on the lands in question; and **(b)** require that before the first grading permit or building permit is issued in connection with the approval, the applicant will have received a sufficient water meters or a comparable supply guarantee to provide adequate water supply to meet the projected demand associated with the entire approval. A water supply is adequate if the total entitled water supplies available during normal, single, dry, and multiple-dry years within a 20-year projection will meet the highest projected demand associated with the approval, in addition to existing and 20-year projected future uses within the area served by the water supplier, including but not limited to, fire protection, agricultural, and industrial uses, 95% of the time, with cutbacks calculated not to exceed 20% in the remaining 5% of the time.	***Consistent.*** The project is not subject to Water Code Section 10910. However, a detailed analysis of water supply availability consistent with this policy is provided in Section 3.16, "Utilities and Service Systems," Section 3.16.3, "Environmental Impacts and Mitigation Measures."
Policy 5.2.1.11: The County shall direct new development to areas where public water service already exists. In Community Regions, all new development shall connect to a public water system. In Rural Centers, all new development shall connect either to a public water system or to an approved private water system.	***Consistent.*** The project would obtain public water service from EID. El Dorado Local Agency Formation Commission approval of project annexation to the EID service area would be required.
Objective 5.3.1: Wastewater Capacity. Ensure the availability of wastewater collection and treatment facilities of adequate capacity to meet the needs of multifamily, high-, and medium-density residential areas, and commercial and industrial areas.	***Consistent.*** As discussed in Section 3.16, "Utilities and Service Systems," Section 3.16.3, "Environmental Impacts and Mitigation Measures," the constituents in the wastewater flow from the project to the EDHWWTP would be within the plant's treatment capacity. The project also includes onsite wastewater improvements to obtain service.
Policy 5.3.1.1: High-density and multifamily residential, commercial, and industrial projects may be required to connect to public wastewater collection facilities if reasonably available as a condition of approval. In the Rural Centers of Camino/Cedar Grove/Pollock Pines, the long-term development of public sewer service shall be encouraged.	***Consistent.*** The project would be required to connect to EID's public wastewater collection facilities that would address the wastewater needs for the project.

Plan/ Policy/Regulation	Project Consistency
Policy 5.3.1.7: In Community Regions, all new development shall connect to public wastewater treatment facilities. In Community Regions where public wastewater collection facilities do not exist project applicants must demonstrate that the proposed wastewater disposal system can accommodate the highest possible demand of the project.	***Consistent.*** The project would be required to connect to EID's public wastewater collection facilities that would address the wastewater needs for the project. El Dorado Local Agency Formation Commission approval of project annexation to the EID service area would be required.
Objective 5.4.1: Initiate a County-wide drainage and flood management program to prevent flooding, protect soils from erosion, and minimize impacts on existing drainage facilities.	***Consistent.*** As discussed in Section 3.9, "Hydrology and Water Quality," Section 3.9.1, "Regulatory Setting," The County's Drainage Manual requires that a hydrologic and hydraulic analysis be submitted for all proposed drainage facilities. The analysis must include an introduction/background, location map/description, catchment description/delineation, hydrologic analysis, hydraulic and structural analysis, risk assessment/impacts discussion, unusual or special conditions, conclusions, and technical appendices. A drainage report based on the project design and is provided in Appendix H that documents that proposed drainage improvements would address water quality and offset project increases in drainage flows offsite.
Policy 5.4.1.1. Require storm drainage systems for discretionary development that protect public health and safety, preserve natural resources, prevent erosion of adjacent and downstream lands, prevent the increase in potential for flood hazard or damage on either adjacent, upstream or downstream properties, minimize impacts to existing facilities, meet the National Pollution Discharge Elimination System (NPDES) requirements, and preserve natural resources such as wetlands and riparian areas.	***Consistent.*** See response to Objective 5.4.1.
Policy 5.4.1.2: Discretionary development shall protect natural drainage patterns, minimize erosion, and ensure existing facilities are not adversely impacted while retaining the aesthetic qualities of the drainage way.	***Consistent.*** While the project would modify onsite drainage features, it would retain the overall drainage pattern and includes water quality and detention facilities to avoid adverse impacts to downstream drainage conditions of natural waterways.
Objective 5.5.2: Recycling, Transformation, and Disposal Facilities. Ensure that there is adequate capacity for solid waste processing, recycling, transformation, and disposal to serve existing and future users in the County.	***Consistent.*** As discussed in Section 3.16, "Utilities and Service Systems," Section 3.16.3, "Environmental Impacts and Mitigation Measures," there is capacity for solid waste pick up and removal to serve the project.
Policy 5.5.2.1: Concurrent with the approval of new development, evidence will be required that capacity exists within the solid waste system for the processing, recycling, transformation, and disposal of solid waste.	***Consistent.*** See response to Objective 5.5.2.
Objective 5.6.2: Encourage development of energy-efficient buildings, subdivisions, development, and landscape designs	***Consistent.*** As described in Chapter 2, "Project Description," the project would include multiple design features to improve energy efficiency and prevent the wasteful or inefficient use of energy for building operations, including use of energy-efficient LED lighting, water-efficient landscaping, high-efficiency water fixtures, HVAC systems controlled by a computerized building management system to maximize efficiency, and gas water heaters that would be direct-vent and 94 percent efficient or greater. Additionally, because Costco has a Clean Energy Contract with PG&E, all electricity consumed by the project would be 100 percent renewable electrical power.
Policy 5.6.2.1: Require energy conserving landscaping plans for all projects requiring design review or other discretionary approval.	***Consistent.*** As discussed in Section 3.5, "Energy," the project would be subject to energy efficiency requirements of the California Energy Code.

Plan/ Policy/Regulation	Project Consistency
Objective 5.7.1: Fire Protection (Community Regions): Ensure sufficient emergency water supply, storage, and conveyance facilities are available, and that adequate access is provided for, concurrent with development.	***Consistent.*** As discussed in Section 3.16, "Utilities and System Services," EID Facility Improvement letter identifies project proposed improvements for water supply would provide water flow to meet fire protection needs. Section 3.14, "Transportation," identifies that the project design provides adequate access points for emergency vehicle access.
Policy 5.7.1.1: Prior to approval of new development, the applicant will be required to demonstrate that adequate emergency water supply, storage, conveyance facilities, and access for fire protection either are or will be provided concurrent with development.	***Consistent.*** The project would be required to comply with level of service standards (discussed above) that would address fire protection and water supply standards and be consistent with the General Plan.
Objective 5.7.3: Law Enforcement: An adequate, comprehensive, coordinated law enforcement system consistent with the needs of the community.	***Consistent.*** As discussed in Section 3.13, "Public Services and Recreation," EDSO responded that they had no concerns regarding serving the project.
Policy 5.7.3.1: Prior to approval of new development, the Sheriff's Department shall be requested to review all applications to determine the ability of the department to provide protection services. The ability to provide protection to existing development shall not be reduced below acceptable levels as a consequence of new development. Recommendations such as the need for additional equipment, facilities, and adequate access may be incorporated as conditions of approval.	***Consistent.*** See response to Objective 5.7.3.
Objective 5.7.4: Medical Emergency Services**:** Adequate medical emergency services available to serve existing and new development recognizing that levels of service may differ between Community Regions, and Rural Centers and Regions	***Consistent.*** As discussed in Section 3.13, "Public Services and Recreation," the El Dorado Hills Fire Department identified that they would be able to meet the minimum required response time.
Policy 5.7.4.1: Prior to approval of new development, the applicant shall be required to demonstrate that adequate medical emergency services are available and that adequate emergency vehicle access will be provided concurrent with development.	***Consistent.*** See response to Objective 5.7.4.
Policy 5.7.4.2: Prior to approval of new development, the Emergency Medical Services Agency shall be requested to review all applications to determine the ability of the department to provide protection services. The ability to provide protection to existing development shall not be reduced below acceptable levels as a consequence of new development. Recommendations such as the need for additional equipment, facilities, and adequate access may be incorporated as conditions of approval.	***Consistent.*** See response to Objective 5.7.4.
Objective 6.2.1: Defensible Space: All existing and new development and structures shall meet "defensible space" requirements to minimize wildland fire hazards.	***Consistent.*** As described in Section 3.17, "Wildfire and Evacuation," and the Costco Wholesale Project Fire Safe Plan, the project site would be converted to a mix of non-combustible surfaces, ignition resistant buildings, and maintained landscaping. Project structures, infrastructure, and landscaping would comply with the requirements in the CBC for ignition resistant construction, and the CFC and Title 14 Minimum Fire Safe Regulations for access, water supply, and vegetation management. Structural hardening requirements address roofs, eaves, exterior walls, vents, appendages, windows, and doors and result in hardened structures that have been proven to perform at high levels (resist ignition) during the typically short duration of exposure to burning vegetation from wildfires.

Plan/ Policy/Regulation	Project Consistency
Policy 6.2.1.1: Implement Fire Safe ordinance to attain and maintain defensible space through conditioning of tentative maps and in new development at the final map and/or building permit stage.	***Consistent.*** See response to Objective 6.2.1.
Policy 6.2.1.2: Coordinate with the local Fire Safe Councils, California Department of Forestry and Fire Protection (CAL FIRE), and federal and state agencies having land use jurisdiction in El Dorado County in the development of a countywide fuels management strategy.	***Consistent.*** See response to Objective 6.2.1.
Policy 6.2.1.4: Require consistency with fire code and development standards that ensure adequate defensible space clearance around all existing and new structures in compliance with the California Fire Code, Public Resources Code Section 4291 (ember-resistant zone), Government Code Section 51175-51188, CCR Title 14, Division 1.5, Chapter 7, Subchapter 3, Section 1299.03, and in the County Code of Ordinances Chapter 8.09	***Consistent.*** See response to Objective 6.2.1.
Policy 6.2.1.5: Maintain and enforce the County Defensible Space Ordinance and Fire Prevention Programs and Plans in coordination with local the VHFHSZs and other fire agencies and continue to support related fire prevention programs associated with defensible space inspections as detailed in County Code of Ordinances Chapter 8.09, fire development standards, and public education	***Consistent.*** See response to Objective 6.2.1.
Policy 6.2.2.1: Fire Hazard Severity Zone Maps shall be consulted in the review of all projects so that standards and mitigation measures appropriate to each hazard classification can be applied. Land use densities and intensities shall be determined by mitigation measures in areas designated as high or very high fire hazard.	***Consistent.*** See response to Objective 6.2.2. Draft EIR Figure 3.17-1 provides fire hazard severity zone mapping for the project site and the surrounding area.
Policy 6.2.2.2: The County shall preclude development in areas of high and very high wildland fire hazard or in areas identified as wildland-urban interface (WUI) communities within the vicinity of Federal lands that are a high risk for wildfire, as listed in the Federal Register Executive Order 13728 of May 18, 2016, unless such development can be adequately protected from wildland fire hazard, as demonstrated in a WUI Fire Safe Plan prepared by a qualified professional as approved by the El Dorado County Fire Prevention Officers Association. The WUI Fire Safe Plan shall be approved by the local Fire Protection District having jurisdiction and/or California Department of Forestry and Fire Protection. (Resolution 124- 2019, August 6, 2019)	***Consistent.*** See response to Objective 6.2.2.

Plan/ Policy/Regulation	Project Consistency
Objective 6.2.3: Adequate Fire Protection: Application of uniform fire protection standards to development projects by fire district.	***Consistent.*** As described in Section 3.17, "Wildfire and Evacuation," and the Costco Wholesale Project Fire Safe Plan, both the Costco warehouse retail building and the fuel facility would incorporate CFC-compliant fire and life safety features that minimize the risk of explosion, fire, and accidental spill of flammable liquids. While these features are intended to protect occupants and minimize the risk of a structure fire, they also address the project's wildfire risk by reducing the likelihood of a fire occurring on the property that can spread onto the adjacent wildlands and by reducing the risk that the project structures would ignite during a wildfire. Upon completion, the project site would be converted to a mix of non-combustible surfaces, ignition resistant buildings, and maintained landscaping. Project structures, infrastructure, and landscaping would comply with the requirements in the CBC for ignition resistant construction, and the CFC, Title 14 Minimum Fire Safe Regulations, and El Dorado Hills Fire Department requirements for access, water supply, and vegetation management. Structural hardening requirements address roofs, eaves, exterior walls, vents, appendages, windows, and doors and result in hardened structures that have been proven to perform at high levels (resist ignition) during the typically short duration of exposure to burning vegetation from wildfires. Future development of the North Site Remainder Area would also be subject to these standards.
Policy 6.2.3.1: As a requirement for approving new development, the County must find, based on information provided by the applicant and the responsible FPD that, concurrent with development, adequate emergency and peak load water supply, water flow, fire access, and firefighting personnel and equipment will be available in accordance with applicable State and local fire district standards to support fire suppression efforts.	***Consistent.*** See response to Objective 6.2.3. The Costco project design includes a 15-ft wide fire access easement and associated pathway along the rear of the building to be built to bear a minimum of 75,000 pounds and meet County Department of Transportation standards for roadways and the provision of 3,000 gallons per minute fire flow accompanied with sprinklers sufficient to meet California Fire Code Section 507.3 and Appendix B fire flow requirements as identified in Section 3.13, "Public Services and Recreation."
Policy 6.2.3.2: As a requirement of new development, the applicant must demonstrate that adequate access exists, or can be provided to ensure that emergency vehicles can access the site and private vehicles can evacuate the area.	***Consistent.*** See response to Objective 6.2.3 and Policy 6.2.3.1.
Policy 6.2.3.4: All new development and public works projects shall be consistent with applicable State Wildland Fire Standards and other relevant State and federal fire requirements.	***Consistent.*** See response to Objective 6.2.3.
Policy 6.2.3.5: Identify actions to ensure noncompliant development meets current fire safe standards and road standards as defined in Title 14 CCR, Division 1.5, Chapter 7 Fire Protection, Subchapter 2, Articles 1-5, SRA Fire Safe Regulations through the WUI Fire Safe Plan review process and through collaboration with the FPDs and local fire agencies when reviewing Fire Protection Plans and provisions for new development.	***Consistent.*** See response to Objective 6.2.3.

Plan/ Policy/Regulation	Project Consistency
Policy 6.2.3.6: All new development within an SRA or very high (VHFHSZs) shall prepare a Fire Protection Plan that complies with established fire safety standards. Ingress and egress to the new development will be constructed utilizing the most current State Fire Safe Regulations, Fire Code, and/or County Code that meets these minimum requirements. Key components of a Fire Protection Plan include: 1. risk analysis; 2. fire response capabilities; 3. fire safety requirements – defensible space, infrastructure, and building ignition resistance; 4. mitigation measures and design considerations for non-conforming fuel modification; 5. wildfire education, maintenance, and limitations, and 6. evacuation planning. Existing development within an SRA or VHFHSZ can meet these requirements through retro-fitting and home hardening.	***Consistent.*** See response to Objective 6.2.3.
Policy 6.2.3.7: Enforce the most recent California Uniform Building Code Fire Code to safeguard life and property from the hazards of fires and explosions; dangerous conditions arising from the storage, handling, and use of hazardous materials and devices; and hazardous conditions in the use or occupancy of building or premises.	***Consistent.*** See response to Objective 6.2.3. The FSP demonstrates compliance with applicable State fire requirements.
Objective 6.2.4: Area-Wide Fuel Management Program: Reduce fire hazard through cooperative fuel management activities.	***Consistent.*** As described in Section 3.17, "Wildfire and Evacuation," and the Costco Wholesale Project Fire Safe Plan, the project site would be converted to a mix of non-combustible surfaces, ignition resistant buildings, and maintained landscaping. Project structures, infrastructure, and landscaping would comply with the requirements in the CBC for ignition resistant construction, and the CFC and Title 14 Minimum Fire Safe Regulations for access, water supply, and vegetation management. Structural hardening requirements address roofs, eaves, exterior walls, vents, appendages, windows, and doors and result in hardened structures that have been proven to perform at high levels (resist ignition) during the typically short duration of exposure to burning vegetation from wildfires.
Policy 6.2.4.1: Discretionary development within high and very high fire hazard areas shall be conditioned to designate fuel break zones that comply with fire safe requirements to benefit the new and, where possible, existing development.	***Consistent.*** See response to Objective 6.2.4.
Policy 6.2.4.2: The County shall cooperate with CAL FIRE and local FPDs to identify opportunities for fuel breaks in zones of high and very high fire hazard either prior to or as a component of project review and will support the FPDs in tracking grants to fund fire breaks and their long-term maintenance.	***Consistent.*** See response to Objective 6.2.4.

Plan/ Policy/Regulation	Project Consistency
Objective 6.3.1: Building and Site Standards. Adopt and enforce development regulations, including building and site standards, to protect against seismic and geologic hazards.	***Consistent.*** As discussed in Section 3.6, "Geology, Soils, and Paleontological Resources," Section 3.6.3, "Environmental Impacts and Mitigation Measures," in the General Plan EIR, this particular portion of the Foothills Fault System has a low level of seismic activity. Nevertheless, the project would be required to comply with the CBC regarding Chapter 16, Structural Design, which identifies both general building structural design requirements and specific seismic safety design requirements for projects. These seismic design criteria are also included as recommendations in the Geotechnical Study Update. Standard regulatory compliance with the CBC and incorporation of the Geotechnical Study recommendations would minimize the project's potential to cause direct or indirect adverse effects, including risk of loss, injury, or death, involving strong seismic shaking.
Policy 6.3.1.1: The County shall require that all discretionary projects and all projects requiring a grading permit, or a building permit that would result in earth disturbance, that are located in areas likely to contain naturally occurring asbestos (based on mapping developed by the California Department of Conservation [DOC]) comply with the Air Quality Management District (AQMD) Rules 223, 223-1 and 223-2 requirements. The Department of Transportation and the AQMD shall consider the requirement of posting a warning sign at the work site in areas likely to contain naturally occurring asbestos based on the mapping developed by the DOC.	***Consistent.*** As discussed in Section 3.2, "Air Quality," Section 3.2.3, "Environmental Impacts and Mitigation Measures," NOA may present in the project area. Mitigation Measure 3.2-4b would Implement Asbestos Dust Mitigation Consistent with EDCAQMD Rule 223-1, EDCAQMD Rule 223-2 and County Ordinance 4548 to prepare an Asbestos Dust Mitigation Plan before the start of construction and therefore would ensure compliance with all EDCAQMD rules.
Objective 6.3.2: County-Wide Seismic Hazards. Continue to evaluate seismic related hazards such as liquefaction, landslides, avalanche, and seiche, particularly in the Tahoe Basin.	***Consistent.*** See response to Objective 6.3.1.
Policy 6.3.2.4: Applications for development of habitable structures shall be reviewed for potential hazards associated with steep or unstable slopes, areas susceptible to high erosion, and avalanche risk. Geotechnical studies shall be required when development may be subject to geological hazards. If hazards are identified, applicants shall be required to mitigate or avoid identified hazards as a condition of approval. If no mitigation is feasible, the project will not be approved.	***Consistent.*** See response to Objective 6.3.1.
Objective 6.5.1: Protection of Noise-Sensitive Development: Protect existing noise-sensitive developments (e.g., hospitals, schools, churches and residential) from new uses that would generate noise levels incompatible with those uses and, conversely, discourage noise-sensitive uses from locating near sources of high noise levels	***Consistent.*** As discussed in Section, "Noise and Vibration," Section 3.11.3, "Environmental Impacts and Mitigation Measures," project operational noise would comply with stationary noise standards in General Plan Table HS-4.
Policy 6.5.1.2: Where proposed non-residential land uses are likely to produce noise levels exceeding the performance standards of Table HS-4 (presented as Table 3.11-4 in this section) at existing or planned noise-sensitive uses, an acoustical analysis shall be required as part of the environmental review process so that noise mitigation may be included in the project design.	***Consistent.*** See response to Objective 6.5.1.
Policy 6.5.1.7: Noise created by new proposed non-transportation noise sources shall be mitigated so as not to exceed the noise level standards of Table HS-4 (presented as Table 3.11-4 in this section) for noise-sensitive uses.	***Consistent.*** See response to Objective 6.5.1.

Plan/ Policy/Regulation	Project Consistency
Policy 6.5.1.9: Noise created by new transportation noise sources, excluding airport expansion but including roadway improvement projects, shall be mitigated so as not to exceed the levels specified in Table HS-3 (presented as Table 3.11-3 in this section) at existing noise-sensitive land uses.	***Consistent.*** As discussed in Section, "Noise and Vibration," Section 3.11.3, "Environmental Impacts and Mitigation Measures," the project transportation noise would not exceed noise standards in General Plan Table HS-3.
Policy 6.5.1.11: The standards outlined Table HS-5, Table HS-6, and Table HS-7 shall not apply to those activities associated with actual construction of a project as long as such construction occurs between the hours of 7 a.m. and 7 p.m., Monday through Friday, and 8 a.m. and 5 p.m. on weekends, and on federally-recognized holidays. Further, the standards outlined in Tables HS-5, HS-6, and HS-7 shall not apply to public projects to alleviate traffic congestion and safety hazards.	***Consistent.*** The project would be required to comply with Mitigation Measure 3.11-1a and 3.11-1b that would address construction noise, including nighttime construction noise.
Policy 6.5.1.12: When determining the significance of impacts and appropriate mitigation for new development projects, the following criteria shall be taken into consideration. A. Where existing or projected future traffic noise levels are less than 60 dBA L_{dn} at the outdoor activity areas of residential uses, an increase of more than 5 dBA L_{dn} caused by a new transportation noise source will be considered significant; B. Where existing or projected future traffic noise levels range between 60 and 65 dBA L_{dn} at the outdoor activity areas of residential uses, an increase of more than 3 dBA L_{dn} caused by a new transportation noise source will be considered significant; and C. Where existing or projected future traffic noise levels are greater than 65 dBA L_{dn} at the outdoor activity areas of residential uses, an increase of more than 1.5 dBA L_{dn} caused by a new transportation noise will be considered significant	***Consistent.*** As discussed in Section, "Noise and Vibration," Section 3.11.3, "Environmental Impacts and Mitigation Measures," the project transportation noise would not exceed noise standards in General Plan.
Policy 6.5.1.13: When determining the significance of impacts and appropriate mitigation to reduce those impacts for new development projects, including ministerial development, the following criteria shall be taken into consideration: A. In areas in which ambient noise levels are in accordance with the standards in Table HS-3, increases in ambient noise levels caused by new non transportation noise sources that exceed 5 dBA shall be considered significant; and B. In areas in which ambient noise levels are not in accordance with the standards in Table HS-3, increases in ambient noise levels caused by new non transportation noise sources that exceed 3 dBA shall be considered significant.	***Consistent.*** As discussed in Section 3.11, "Noise and Vibration," Section 3.11.3, "Environmental Impacts and Mitigation Measures," long-term stationary impacts are assessed in conjunction with the County's noise performance standards and General Plan Policy 6.5.1.13.
Objective 6.6.1: Regulation of Hazardous Materials. Regulate the use, storage, manufacture, transport, and disposal of hazardous materials in accordance with State and Federal regulations.	***Consistent.*** As discussed in Section 3.8, "Hazards and Hazardous Materials," Section 3.8.3, "Environmental Impacts and Mitigation Measures," Mitigation Measure 3.8-1 would address the proper removal of potential onsite hazardous materials.

Plan/ Policy/Regulation	Project Consistency
Policy 6.6.1.1: The Hazardous Waste Management Plan shall serve as the implementation program for management of hazardous waste in order to protect the health, safety, property of residents and visitors, and to minimize environmental degradation while maintaining economic viability.	***Consistent.*** See response to Objective 6.6.1.
Policy 6.6.1.2: Prior to the approval of any subdivision of land or issuing of a permit involving ground disturbance, a site investigation, performed by a Registered Environmental Assessor or other person experienced in identifying potential hazardous wastes, shall be submitted to the County for any subdivision or parcel that is located on a known or suspected contaminated site included in a list on file with the Environmental Management Department as provided by the State of California and federal agencies. If contamination is found to exist by the site investigations, it shall be corrected and remediated in compliance with applicable laws, regulations, and standards prior to the issuance of a new land use entitlement or building permit.	***Consistent.*** The project has completed a Phase I Environmental Site Assessment and is provided in Appendix G.
Objective 6.10.1: Encourage Water Efficiency. Promote cost-effective water conservation and water efficiency measures.	***Consistent.*** Upon annexation to EID, the project would be subject to EID's water conservation and efficiency requirements..
Policy 6.10.1.3: Require new development to demonstrate that adequate water is available before project approval and to fund its fair-share costs associated with the provision of water service.	***Consistent.*** See response to Policy 5.2.12.
Objective 6.11.1: Evacuation Route Identification. Identify and analyze emergency evacuation routes and areas without at least two evacuation routes.	***Consistent.*** As identified in Chapter 2, "Project Description," the project proposes multiple access points to both Silva Valley Parkway and Clarksville Crossing Road. Appendix K (El Dorado Hills Costco Warehouse Evacuation Analysis) concludes that the Costco project and future development within the North Site Remainder Area impact to overall roadway capacity and evacuation travel times would be minimal under both wildfire scenarios and are not expected to impair implementation of or physically interfere with evacuation efforts and associated implementation of the El Dorado County Emergency Operations Plan or the county hazard mitigation plans.
Objective 6.11.2: Evacuation Route Maintenance. Ensure viability of future use of evacuation routes.	***Consistent.*** See response to Objective 6.11.1.
Policy 6.11.2.1: Development shall be served by a street system with at least two evacuation routes capable of carrying peak load traffic and have sufficient capacity to meet project needs, or they must provide the necessary capacity to ensure the development has adequate fire protection and safe ingress and egress routes in conformance with the California Fire Safe Regulations (Section 1273 and 1274) of the California Code of Regulations – Title 14, Division 1.5, Chapter 7, Articles 2 and 3).	***Consistent.*** See response to Objective 6.11.1. The Costco project design includes a 15-ft wide fire access easement and associated pathway along the rear of the building to be built to bear a minimum of 75,000 pounds and meet County Department of Transportation standards for roadways and the provision of 3,000 gallons per minute fire flow accompanied with sprinklers sufficient to meet California Fire Code Section 507.3 and Appendix B fire flow requirements as identified in Section 3.13, "Public Services and Recreation."
Policy 6.11.2.2: Construction of new roads, streets, and evacuation routes must be adequate in terms of width, turning radius, and grade to facilitate access by firefighting apparatus. Priorities for road improvements will be based on evacuation accessibility	***Consistent. Consistent.*** See response to Policy 6.11.2.1.

Plan/ Policy/Regulation	Project Consistency
Policy 6.11.2.4: Continue to coordinate with the County Sheriff's Department, CAL FIRE, local FPDs, and other fire agencies to identify, assess, and maintain evacuation routes to support the adequate capacity, safety, and viability of those routes under a range of emergency scenarios. Identify designated evacuation routes that are not compliant with Fire Safe Regulations (14 CCR Section 1270.00) for roadway standards and develop a plan to bring those roads into conformance to promote adequate and safe accessibility in communities	***Consistent.*** See response to Policy 6.11.2.1.
Objective 7.1.2: Erosion/Sedimentation - Minimize soil erosion and sedimentation.	***Consistent***: As discussed in Section 3.9, "Hydrology and Water Quality," Section 3.9, "Environmental Impacts and Mitigation Measures," the project would be required to comply with State and County standards during construction, including the development and implementation of a storm water pollution prevention plan (SWPPP).
Policy 7.1.2.2: Discretionary and ministerial projects that require earthwork and grading, including cut and fill for roads, shall be required to minimize erosion and sedimentation, conform to natural contours, maintain natural drainage patterns, minimize impervious surfaces, and maximize the retention of natural vegetation. Specific standards for minimizing erosion and sedimentation shall be incorporated into the Zoning Ordinance.	***Consistent.*** The project would be required to comply with the County's SWMP and project SWPPP (discussed under Objective 7.1.2) that would address minimizing erosion and sedimentation to be consistent with the General Plan and County standards.
Objective 7.3.2: Water Quality - Maintenance of and, where possible, improvement of the quality of underground and surface water.	***Consistent.*** The project would be required to comply with the County's SWMP and project SWPPP (discussed under Objective 7.1.2) that would address minimizing erosion and sedimentation to be consistent with the General Plan and County Ordinances for project construction and operation.
Policy 7.3.2.2: Projects requiring a grading permit shall have an erosion control program approved, where necessary.	***Consistent.*** The project would be required to comply with the County's SWMP and project SWPPP (discussed under Objective 7.1.2) that would address minimizing erosion and sedimentation to be consistent with the General Plan and County standards.
Objective 7.3.3: Wetlands - Protection of natural and man-made wetlands, vernal pools, wet meadows, and riparian areas from impacts related to development for their importance to wildlife habitat, water purification, scenic values, and unique and sensitive plant life.	***Consistent.*** With the exception of proposed restoration of the existing on-site ponds, the project design retains the on-site drainage features within proposed open space lots. As discussed in Section 3.3, "Biological Resources," Section 3.3.3, "Environmental Impacts and Mitigation Measures," implementation of Mitigation Measures 3.3-3a, 3.3-3b, and 3.4-4 would reduce significant impacts on sensitive natural communities, riparian habitat, and wetlands to a less-than-significant level by requiring compensation for permanent loss of these habitats such that there is no net loss, potentially including a streambed alteration agreement with CDFW.
Policy 7.3.3.1: For projects that would result in the discharge of material to or that may affect the function and value of river, stream, lake, pond, or wetland features, the application shall include a delineation of all such features. For wetlands, the delineation shall be conducted using the US Army Corps of Engineers (USACE) Wetland Delineation Manual.	***Consistent.*** The project would be required to comply with the Mitigation Measures 3.3-4 (discussed above under Objective 7.3.3) that would address impacts on protected wetlands to be consistent with the General Plan and County standards.
Policy 7.3.3.5: Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.	***Consistent.*** Costco project impacts would be limited proposed development areas and would be mitigation with implementation of Mitigation Measure 3.3-4.

Plan/ Policy/Regulation	Project Consistency
Objective 7.3.4: Drainage - Protection and utilization of natural drainage patterns	***Consistent.*** While the project would modify onsite drainage features, it would retain the overall drainage pattern and includes water quality and detention facilities to avoid adverse impacts to downstream drainage conditions of natural waterways. Implementation of Mitigation Measures 3.3-3a, 3.3-3b, and 3.4-4 would reduce significant impacts to onsite sensitive natural communities, riparian habitat, and wetlands.
Policy 7.3.4.1: Natural watercourses shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site without disturbance	***Consistent.*** See response to Objective 7.3.4.
Policy 7.3.4.2: Modification of natural stream beds and flow shall be regulated to ensure that adequate mitigation measures are utilized.	***Consistent.*** See response to Objective 7.3.4.
Objective 7.4.1: Pine Hill Rare Plant Species - The County shall protect Pine Hill rare plant species and their habitats consistent with Federal and State laws.	***Consistent.*** As discussed in Section 3.3, "Biological Resources," Section 3.3.3, "Environmental Impacts and Mitigation Measures," implementation of Mitigation Measure 3.3-1 would reduce the significant impact on special-status plants to a less-than-significant level by requiring protocol-level surveys for special-status plants and implementation of avoidance measures and compensation for impacts on special-status plants if they are present.
Policy 7.4.1.1: The County shall continue to provide for the permanent protection of the eight sensitive plant species known as the Pine Hill endemics and their habitat through the establishment and management of ecological preserves consistent with County Code Chapter 130.71 and the USFWS Gabbro Soil Plants for the Central Sierra Nevada Foothills Recovery Plan (USFWS 2002).	***Consistent.*** The project is located outside of the ecological preserves.
Objective 7.4.2: Identify and Protect Resources - Identification and protection, where feasible, of critical fish and wildlife habitat including deer winter, summer, and fawning ranges; deer migration routes; stream and river riparian habitat; lake shore habitat; fish spawning areas; wetlands; wildlife corridors; and diverse wildlife habitat.	***Consistent.*** Section 3.3, "Biological Resources, Section 3.3.3, "Environmental Impacts and Mitigation Measures," identifies residential development surrounding the project site makes it unlikely that the project site functions as a critical habitat linkage for wildlife.
Policy 7.4.2.8: Conserve contiguous blocks of important habitat to offset the effects of increased habitat loss and fragmentation elsewhere in the County through a Biological Resource Mitigation Program (Program). The Program will result in the conservation of: 1. Habitats that support special status species; 2. Aquatic environments including streams, rivers, and lakes; 3. Wetland and riparian habitat; 4. Important habitat for migratory deer herds; and 5. Large expanses of native vegetation. (see full text in Section 3.4.1, "Regulatory Setting.")	***Consistent.*** While the project site contains natural habitat and may provide some wildlife nursery habitat and function as a movement corridor for some wildlife species, it is surrounded by residential development to the north and west and US 50 (including onramps and offramps) to the south. Silva Valley Parkway, which bisects the north and south portions of the project site, is a busy four-lane road. Implementation of Mitigation Measure 3.3-2a through 3.3-2i would reduce the potential impact on all endangered or threatened species that may occur in the project area. Implementation of Mitigation Measures 3.3-3a, 3.3-3b, and 3.4-4 would reduce significant impacts to onsite sensitive natural communities, riparian habitat, and wetlands.
Policy 7.4.4.4: For all new development projects or actions that result in impacts to oak woodlands and/or individual native oak trees, including Heritage Trees, the County shall require mitigation as outlined in the El Dorado County Oak Resources Management Plan (ORMP). The ORMP functions as the oak resources component of the County's biological resources mitigation program, identified in Policy 7.4.2.8.	***Consistent.*** The project would be required to comply with the County's ORMP for proposed oak tree removal.

Plan/ Policy/Regulation	Project Consistency
Policy 7.5.1.3: Cultural resource studies (historic, prehistoric, and paleontological resources) shall be conducted prior to approval of discretionary projects. Studies may include, but are not limited to, record searches through the North Central Information Center at California State University, Sacramento, the Museum of Paleontology, University of California, Berkeley, field surveys, subsurface testing, and/or salvage excavations. The avoidance and protection of sites shall be encouraged.	***Consistent.*** Section 3.4, "Cultural Resources," identifies that the project was evaluated in the *Costco El Dorado Hills Project Cultural Resources Assessment*. Paleontological resources are addressed in mitigated in Section Geology, Soils, and Paleontological Resources, Section 3.6.3, "Environmental Impacts and Mitigation Measures. " The project would implement Mitigation Measures 3.4-1a, 3.4-1b, and 3.6-4 that would address resource protection consistent with the General Plan.
Policy 7.5.1.6: The County shall treat any significant cultural resources (i.e., those determined California Register of Historical Resources/National Register of Historic Places eligible and unique paleontological resources), documented as a result of a conformity review for ministerial development, in accordance with CEQA standards.	***Consistent.*** See response to Policy 7.5.1.3.
Objective 7.5.2: Visual Integrity - Maintenance of the visual integrity of historic resources.	***Consistent.*** See response to Policy 7.5.1.3. No historic resources were identified on the project site.
Policy 7.5.2.4: The County shall prohibit the modification of all National Register of Historic Places (NRHP)/California Register of Historical Resources (CRHR) listed properties that would alter their integrity, historic setting, and appearance to a degree that would preclude their continued listing on these registers. If avoidance of such modifications on privately owned listed properties is deemed infeasible, mitigation measures commensurate with NRHP/CRHR standards shall be formulated in cooperation with the property owner.	***Consistent.*** See response to Policy 7.5.1.3.
Policy TC-3c: The County shall encourage new development within Community Regions and Rural Centers to provide appropriate on-site facilities that encourage employees to use alternative transportation modes. The type of facilities may include bicycle parking, shower and locker facilities, and convenient access to transit, depending on the development size and location	***Consistent.***
Policy TC-4b: The County shall construct and maintain bikeways in a manner that minimizes conflicts between bicyclists and motorists.	***Consistent.*** As discussed in Section 3.14, "Transportation," Section 3.14.3, "Environmental Impacts and Mitigation Measures," the project would minimize the opportunity for conflicts between vehicles and alternative modes of transportation through design. All intersections and driveways along existing and proposed roadways would be required to provide adequate sight distance in accordance with Section 3(B) of the County DISM (El Dorado County 1990: 23).
Policy TC-5a: Sidewalks and curbs shall be required throughout residential subdivisions, including land divisions created through the parcel map process, where any residential lot or parcel size is 10,000 square feet or less.	***Consistent.*** As discussed in Section 3.14, "Transportation," Section 3.14.3, "Environmental Impacts and Mitigation Measures," the project would include sidewalks along project streets.
Policy TC-5c: Roads adjacent to schools or parks shall have curbs and sidewalks.	***Consistent.*** See response to Policy TC-9a.
El Dorado County Ordinances	
Chapter 130.34.020: Outdoor lighting Ordinance.	***Consistent.*** As discussed in Section 3.1, "Aesthetics," Section 3.1.3, "Environmental Impacts and Mitigation Measures," features to reduce excess nighttime light and glare, such as the use of directional shielding and automatic shutoff or motion sensors, would be incorporated into the project design.

Plan/ Policy/Regulation	Project Consistency
Chapter 110.14: Grading, Erosion, and Sediment Control Ordinance	***Consistent.*** As discussed in Section 3.6, "Geology, Soils, and Paleontological Resources, Section 3.6.3, "Environmental Impacts and Mitigation Measures," the project would be required to comply with the County Code of Ordinances Chapter 110.14, Grading, Erosion, and Sediment Control Ordinance, which requires grading and drainage plans to be developed for major development projects, as well as compliance with Chapter 4 of the County Land Development Manual, which sets forth standards and procedures for grading activities in the county.
Chapter 110.32: On-Site Wastewater Treatment Systems	***Consistent.*** As discussed in Section 3.6, "Geology, Soils, and Paleontological Resources," Section 3.6.3, "Environmental Impacts and Mitigation Measures," the project would be required to comply with Chapter 110.32 in the County Code of Ordinances and OWTS Manual, which would ensure that construction and operation of the project would not have a significant adverse wastewater disposal or sewer system impact on existing conditions. The project has addressed compliance in part with the preparation of the Septic Feasibility Study.
Chapter 120.12: Conditions and Requirements	***Consistent.*** As discussed in Section 3.13, "Public Services and Recreation," Section 3.13.3, "Environmental Impacts and Mitigation Measures," Section 120.12.090 establishes park dedication requirements for new development projects. When a subdivision proposes or creates lots, the Board of Supervisors may require the dedication of land and/or a payment of fees in lieu of park and recreation development as a condition of approval of the tentative subdivision map if the dedicated park land would conform with the goals, objectives, and standards contained in the recreation element of the general plan and any applicable specific plans and the dedicated land would serve park and recreation facilities for the proposed project, in the case of this project the ratio would be required to be 5.0 acres of parks and recreation land per 1,000 residents, as stated in General Plan Policy 9.1.1.1. The project would build a 4.0 acre community park and make up for the additional 0.385 required acres through in-lieu fees.
Chapter 12.08.080: Roach Encroachments	***Consistent.*** The project will obtain encroachment permits from El Dorado County before any work begins within El Dorado County right-of-way.
Chapter 130.37.50: Acoustic Analysis Required	***Consistent.*** An acoustic analysis was prepared for the project as identified in Section 3.11, "Noise and Vibration."
El Dorado LAFCO Policies	
Policy 3.2.16: When evaluating environmental impacts discovered during the Initial Study process, LAFCO will identify such impacts as potentially significant and adverse if: ▶ Build-out of the proposed project may cause service levels to decline below established standards, costs of service provision to rise substantially to the detriment of service levels, or cause those currently receiving service to receive reduced or inadequate services especially when such change may cause adverse health and safety or other physical impacts; ▶ Build-out of the proposed project may cause the infrastructure capacity of a service provider to exceed planned and safe limits especially when such change may cause adverse health and safety or other physical impacts; ▶ The proposed project includes or plans for infrastructure capacity, especially water and sewer lines, that exceed the needs of the proposed project and may be used to serve	***Consistent.*** The project would maintain El Dorado County General Plan level of service standards for public services and utilities. The project includes plans for annexation to the EID service area as well as water supply, sewer, and electrical improvements that would support the project and allow for surrounding existing developments to maintain their current level of service for water, sewer, and electrical services, see Section 3.16, "Utilities and Service Systems," 3.16.3, "Utilities and Service Systems." Public services, such as fire protection services and park and recreation facilities would also be able to serve the project as detailed in Section 3.13, "Public Services and Recreation," Section 3.13.3, "Environmental Impacts and Mitigation Measures." The project is within the EDHCSD Sphere of Influence. The project is not on important agriculture land or open space land that is open to the public. The project plan includes nine open space lots that would preserve 57.58 acres of oak trees, woodland areas, and wetland features. The project is surrounded by residential projects on its western and southern boundaries, and its larger lot properties in the project design are on the exterior of the project site to soften the transition to the more rural lands to the north and east of the project site.

Plan/ Policy/Regulation	Project Consistency
areas not planned for development, especially those containing prime agricultural land, mineral, sensitive plant and wildlife or other important resources (*note – this circumstance does not occur with this project*); ▶ The proposed plan could cause health and safety or other physical impacts because a service provider is incapable of providing service, the proposal has an illogical boundary, or elements needed to provide service (water supply, treatment facilities, equipment, energy) are not available, or stressed beyond capacity. ▶ The proposed project is substantially inconsistent with applicable Sphere of Influence Plans, long range and area service plans, phased land use plans of any city or county, or resource conservation plans of the state or federal government. ▶ In the case of Sphere of Influence and area of service plans, the Environmental Coordinator reviews the appropriate plans and determines whether the level of significance warrants additional review. In the case of public agency land use or resource plans, the affected agency shall provide specific information regarding the nature and substance of the project's potential impacts upon its plans or programs. ▶ The proposed project may induce substantial growth on important agricultural and open space lands because it would: ▪ Permit the extension of, or require, infrastructure such as flood control levees or water diversions, electrical, water or sewer lines, especially trunk lines, roadways or other public facilities that would permit new development in a substantial area currently constrained from development; ▪ Be adversely and substantially inconsistent with the agricultural, open space, resource conservation or preservation, growth management, trip reduction, air quality improvement or other plans, policies or Ordinances of the General, Community, Specific or other Plan of the land use jurisdiction responsible for the project site or vicinity. ▪ Cause significant adverse cumulative impacts when considered in conjunction with other recent, present and reasonably foreseeable projects; ▪ Result in substantial noncontiguous development which, in turn, results in adverse physical impacts; ▪ Have no need for service and the proposed project adversely affects important public resources or the public health and safety; ▪ Adversely impact animal or plant species either listed as, or determined to be, endangered, rare, or threatened as provided in §15380; or ▪ Be identified as potentially significant when completing the Initial Study checklist adopted as Exhibit A of LAFCO's CEQA procedures.	There is the potential for the project to impact special status species, however with the mitigation measures listed in Section 3.4, "Biological Resources," these impacts would be less than significant.

Plan/ Policy/Regulation	Project Consistency
Policy 3.3.2.2: If service cannot be provided without expanding service capacity or constructing infrastructure (other than at parcel connections to service), then the following information shall be provided: ▶ A description of any required facility or infrastructure expansions or other necessary capital improvements; ▶ The likely schedule for completion of the expanded capacity project, the viability of the needed project, and the relation of the subject project to the overall project and project time line; ▶ A list of required administrative and legislated processes, such as CEQA review or State Water Resources Board allocation permits, including assessment of likelihood of approval of any permits and existence of pending or threatened legal or administrative challenges if known; ▶ The planned total additional capacity; ▶ The size and location of needed capital improvements; ▶ The proposed project cost, financing plan and financing mechanisms including a description of the persons or properties who will be expected to bear project costs; and ▶ Any proposed alternative projects if the preferred project cannot be completed (include information in letters "a" through "f" for each proposed alternative).	***Consistent.*** The project has provided specific descriptions of required utility, facility, and infrastructure plans that would be needed to provide services to the project area as identified in Section 3.13, Public Services and Recreation," and Section 3.16, "Utilities and Service Systems." Off-site water and wastewater improvements would be sized to accommodate the project.
Policy 3.4.1: Consistency with General and Specific Plans. For the purposes of this policy, a project is consistent if the type and level of services to be provided are consistent with and appropriate to the applicable General or Specific Plan land use designations and document text, and the applicable General or Specific Plan is legally adequate and internally consistent. The Commission will not approve projects that are inconsistent with the applicable General or Specific Plan unless the following circumstances are shown to exist: ▶ The site is fully developed and located in an existing developed area where district or city facilities are present and found by LAFCO to be sufficient for service and where the Commission determines that the change of organization or reorganization will not induce growth in the area. ▶ The site is fully developed and located in an existing developed area where LAFCO finds that the public interests of health, safety, and welfare would best be served, or that clear and present health or safety hazards could be mitigated, by the proposal. ▶ The site is located in an undeveloped area where disapproval would cause a loss of service to existing service users.	***Consistent.*** While the project is proposing to amend its current General Plan land use designations to allow for more dense residential development, the project is located within the El Dorado Hills Community Region that is designated for urban and suburban development and associated public service and utility provision. Impacts on fire protection services and parks and recreation facilities was discussed in Section 3.13, "Public Services and Recreation," and would be consistent with LAFCO capacity policies through facility improvements and development fees. Impacts of the project on the wastewater system is evaluated in Section 3.16, "Utilities and Service Systems," and the project includes plans for capital improvement projects to the EID wastewater system off-site from the project area to service the project and not exceed the capacity of the existing public wastewater service. Additionally, Section 3.10, "Land Use and Planning, and Agriculture and Forestry Resources" details consistency with the El Dorado County General Plan and El Dorado County Code of Ordinances.

Plan/ Policy/Regulation	Project Consistency
Policy 3.9.3: Lands to be annexed which are within an adopted Sphere of Influence shall be physically contiguous to the boundaries of the annexing agency except under one of the following circumstances (§56119): ▶ Existing developed areas where LAFCO determines that interests of public health, safety, and welfare would best be served by the extension of the service, or which represent clear or present health or safety hazards that could be mitigated by the proposal and city or district facilities are present and sufficient for service. ▶ Existing developed areas where city or district facilities are present and sufficient for service, and where the Commission determines that the annexation will not induce growth.	***Consistent.*** As described in Section 3.13, "Public Service and Recreation," and Section 3.16, "Utility and Service Systems," the project area is within sphere of influences for the El Dorado Hills Fire Department, El Dorado Hills Community Services District, and EID.
Policy 3.9.7: The resulting boundary configuration shall not produce areas that are difficult to serve (§56668, §56001).	***Consistent.*** As described in Section 3.13, "Public Services and Recreation," and Section 3.14, "Transportation," EA roads and access points from Green Valley Road would allow for adequate service to the project site. Additionally, the project site is in a contiguous boundary from agencies that would require annexation, and would not create an area that is difficult to serve.
Policy 6.1.7: Prior to annexation to a city or special district, the petitioners shall demonstrate that the need for governmental services exists, the annexing agency is capable of providing service, that a plan for service exists, and that the annexation is the best alternative to provide service (§56700, §56668)	***Consistent.*** The project would be required to comply with level of service standards and agency requirements to gain annexation (discussed above), which would be consistent with the LAFCO policies. Project-proposed residential development densities would require public services and utility service.

I. EXECUTIVE SUMMARY

INTRODUCTION

The purpose of this study is to assess the economic impacts of a proposed Costco warehouse store and fuel facility in El Dorado Hills, a census designated place in Unincorporated El Dorado County, California (the "Project"). The Project is planned to include a 165,000-square-foot Costco warehouse plus a 16-pump fuel facility with 32 handles. An Environmental Impact Report (EIR) is being prepared for the Project. ALH Urban & Regional Economics ("ALH Economics") is preparing the EIR's urban decay analysis. As such, this study estimates the potential impacts of the Project on existing retailers in the market area pursuant to diverted sales from existing retailers. The study estimates the extent to which the opening of the Costco warehouse and fueling facility and other cumulative retail projects may or may not contribute to urban decay in the market area resulting from potential store closures attributable to existing retailer sales diversions.

SUMMARY OF FINDINGS

Project Sales and Market Area

ALH Economics estimates that stabilized Project sales will total $297 million in pre-tax sales. Of the annual sales amount, 84% is generally estimated to be generated by retail consumers versus 16% generated by wholesale consumers, i.e., businesses that purchase items wholesale from Costco, and then resell the items as part of their business operations. Of the retail consumer amount, 85% is estimated to be generated from within the Project's market area. Development of the El Dorado Hills warehouse and fuel facility is intended by Costco to take pressure off its existing Folsom facilities located east of the Project site and enhance member shopping experiences. Therefore, many of the sales anticipated to be achieved in El Dorado Hills are assumed to be shifted from the Folsom warehouse and fuel facility. Consequently, $111.5 million in consumer retail sales are estimated to be competitive with other retailers in the market area.

Given the broad range of products sold by Costco, these consumer retail sales will occur in numerous retail categories, including motor vehicles & parts, home furnishings & appliances, building materials & garden equipment, food & beverages, gasoline, clothing & accessories, general merchandise, food services & drinking places, and other retail. The other retail category is broad and encompasses a wide range of retailers such as office supply, pet supply, sporting goods, book stores, and jewelry.

The Project's market area includes about 2/3 of El Dorado County extending eastward from the county's western boundary, but short of South Lake Tahoe, and south/southeast to include a major portion of Amador County (excluding Kirkwood and other nearby areas far to the east and Comanche North Shore and Buena Vista in the southern part of the County). This is the geographic area for which the El Dorado Hills Costco Warehouse and Fuel Facility will be the closest Costco operations.

Market Area Sales Base and Retail Leakage

The market area's retail sales base is estimated to total close to $2.9 billion in 2024. The El Dorado County portion of the market area sales base comprises a significant share at $2.3 billion (i.e., 80%). Analysis indicates that the market area portion of El Dorado County is characterized overall by a modest amount of retail leakage, amounting to 8% of the area's demand. This means that across all retail categories, 8% of estimated household spending leaves the county and is spent elsewhere. Thus, almost $237 million in local demand leaves the area. In contrast, Amador County, with a much smaller sales base, is characterized overall by retail attraction, much of which is likely attributable to tourist sales. Overall, when pairing market area retail sales with estimated retail demand generated by market area households, the market area has an aggregate level of 11% retail sales attraction, totaling $325 million. By dollar volume, attraction is greatest in the other retail group category, food & beverage stores category, and gasoline stations. These categories correspond to the categories comprising the greatest amount of the El Dorado Hills Costco sales. Thus, the majority of Costco sales will be in strong market area retail sales categories, with the potential for Costco sales to strengthen these attraction categories. There are additionally four leakage categories in the market area, including home furnishings & appliance stores, motor vehicles & parts dealers, clothing & clothing accessories stores, and food services & drinking places. Costco sales will have the potential to reduce existing leakage in these categories.

Project Sales Achieved Through Retail Sales Recapture

The enhanced shopping opportunities provided by Costco will serve to help recapture existing retail leakage in select retail categories. Given the volume of Costco sales in the four leakage categories, and the amount of estimated leakage, all of the Costco sales in these leakage categories are assumed to comprise recaptured leakage, with no resulting impact on existing market area retailers. Even with this capture a large amount of leakage in the market area's four leakage categories will remain, totaling $367 million.

Sales Impacts

Net of the share of Project sales anticipated to be generated by consumers outside the market area and after consideration of recaptured leakage and some sales fluctuation associated with the normal ebb and flow of economic cycles, the study estimates potential sales impacts will occur among the market area's food stores and gasoline stations. These impacts are estimated as 2.5% to 7.5% of the market area's food & beverage store sales (or $15.9 to $47.9 million) and 2.9% to 7.9% of the market area's gasoline station sales (or $10.3 to $28.2 million). For both retail categories, the minimum sales impacts reflect the idea that there will be some economic cycles and sales fluctuations over time, while the maximum sales impacts reflect the perspective that, in this instance, all of the impacts are related to the new El Dorado Hills Costco.

Food Stores. The market area has at least 28 stores with significant food sales, including conventional grocery stores, discount food stores, general merchandise stores, and niche stores. This does not include relatively smaller convenience-oriented stores as Costco will not compete with a store that satisfies a shopper's need for a quick, convenience item. Costco will also not be directly competitive with any single one of the 28 stores selling food because of the nature of Costco product sales. This includes Costco's merchandising strategy associated with its product mix and depth and checkout procedures. Because Costco carries a relatively small number of products

(4,000 stock keeping units per warehouse across all products, not just food, versus 31,795 for the average grocery store) shoppers making food and food-related purchases at Costco will still need to shop at other stores to purchase the full complement of food supplies needed to equip their household. These Costco retail merchandising factors will likely contribute to the dispersal and lessening of potential food store sales impacts resulting from the Project. Because of the comparatively limited number of products available for purchase, the bulk nature of the products, and the bagging and purchasing procedures implemented at Costco, the potential for sales to be diverted away from any of the existing retailers selling food products to an extent so severe as to cause store closure is highly unlikely.

There are numerous existing food stores distributed across a large geographic area. Because existing and anticipated Costco members are also distributed across a relatively large geographic area, shopping pattern changes away from existing stores will also be widely distributed. For stores that may experience sales impacts attributable to Costco's food sales, adaptation is a hallmark of the retail sector, meaning stores can modify their merchandising mix and customer service strategies to be more resistant to prospective sales impacts. Retailing is highly dynamic, with the nature of competition continuously changing. Thus, retailers regularly modify their strategies to distinguish themselves in the market and to retain market share. The actual performance of the market area grocery stores and other stores selling food products is not available. However, most stores appear to have robust performance with a dedicated customer base. Therefore, ALH Economics concludes that given the potential to implement adaptive strategies, no single store engaged in food sales is likely to experience sales declines sufficient to result in store closure.

Gasoline Stations. There are at least 47 gas stations in the market area, with 116 fueling stations and 232 handles. A same day price comparison with Costco indicated that about 40% of the El Dorado County gas stations had some gas prices equal to or less than Costco's prices. This comparison included only gas stations located 5 or more miles from the Costco Project site.

The market area's existing gas stations have many features that set them apart from Costco, providing a competitive advantage. These include gas availability 24/7 (i.e., open 50% more hours than Costco's Folsom fuel facility, and 40% more than at the planned Costco El Dorado Hills fuel facility),[1] a wider range of gas product availability, the presence of convenience stores to satisfy travel-related shopping needs, restroom availability, and select amenities, such as car wash stations, repair services, and smog checks. Another notable difference between Costco gasoline sales and the market area gas stations is the fact that only Costco members can purchase gas at Costco gas stations. Because of this, the existing gas stations all have access to a broader customer base while also providing more amenities and services.

The estimated gasoline sales impacts will be dispersed throughout the market area. To some extent the impacts could be greatest closest to the Project site, as it would be easier for Costco members to redirect their gasoline purchase trip from stations closer rather than more distant from Costco. However, even gas stations further from Costco are likely to experience sales diversions depending

[1] Per the Project Description on file with El Dorado County Planning and building Department, the Fuel Facility hours will be 5:00 am to 10:00 pm daily. See "EDH 52 North and Costco South Overall Commercial Center CEQA Project Description, March 18, 2022 (revised December 18, 2024)," 12/14/24, page 6.

upon how well consumers can time their purchases coincident with a shopping trip to the Costco warehouse.

The timing of gasoline purchases are often dictated by need, not by choice, and a Costco member who lives or works at the perimeter of the market area will often need to pump gas into their vehicle when in a location distant from the Costco fuel facility. Nevertheless, it is possible that gas stations with higher gas prices in the area near the Costco might encounter a more competitive marketplace, with a disproportionate decline in customer sales. However, Costco gas lines can be long, and time-stressed consumers will choose to purchase gas at other locations rather than go an extra distance to wait in line behind other gasoline customers. In addition, the longer hours at market area gas stations and presence of amenities relative to Costco will comprise comparative market area gas station advantages. Therefore, ALH Economics concludes that the gasoline sales impacts will likely be dispersed to the extent that no single or small set of gas stations will bear the brunt of the sales impacts and risk closure as a result.

Cumulative Project Impacts

ALH Economics identified five potential cumulative development projects in the market area with retail components comprising at least 25,000 square feet of retail space. The five projects have total retail potential of 550,646 to 711,382 square feet, with most also encompassing other land uses, especially residential. One project is requesting a land use change. If this happens, then the cumulative retail space total will drop to 475,330 to 636,066 square feet. The projects are located between 1.7 and 30 miles of the El Dorado Hills Costco site. All but one of the projects is in El Dorado County. One of the cumulative projects is under construction with 132,126 square feet, one project is approved, and three projects are under review.

The El Dorado Hills Costco Project is anticipated to have the greatest impact on the market area's food & beverage and gasoline station retail sectors. Thus, any food store and gasoline station sales generated by cumulative projects would add to these prospective impacts. However, based on the size of cumulative project retail components, and constituent buildings, it is unlikely that any cumulative project will include a food store. Moreover, it is too speculative at present to forecast the retail uses at the three cumulative projects that are under review. In addition, none of the cumulative projects appear at this time to include plans for new gas station development.

This probable lack of food store and gas station development indicates there will likely not be any cumulative project impacts in these retail categories. While El Dorado Hills Costco sales may compete with sales in other retail sectors, those impacts are low enough to likely be absorbed in the normal course of doing business in the market area. The same is likely the case among the cumulative projects, as even with Costco's recapture of existing market area leakage some leakage will still remain. Therefore, the cumulative projects are not anticipated to significantly increase or change the market area impacts associated with the El Dorado Hills Costco Project.

URBAN DECAY DETERMINATION

Definition of Urban Decay

For the purpose of this analysis, urban decay is defined as, among other characteristics, visible symptoms of physical deterioration that invite vandalism, loitering, and graffiti that is caused by a

downward spiral of business closures and long term vacancies. This physical deterioration to properties or structures is so prevalent, substantial, and lasting for a significant period of time that it impairs the proper utilization of the properties and structures, and the health, safety, and welfare of the surrounding community. The manifestations of urban decay include such visible conditions as plywood-boarded doors and windows, parked trucks and long term unauthorized use of the properties and parking lots, extensive gang and other graffiti and offensive words painted on buildings, dumping of refuse on site, overturned dumpsters, broken parking barriers, broken glass littering the site, dead trees and shrubbery together with weeds, lack of building maintenance, homeless encampments, and unsightly and dilapidated fencing.

Urban Decay Conclusion

Based on the above description of urban decay, ALH Economics' analysis examined whether there was sufficient market demand to support the Project without affecting existing retailers so severely as to consequently lead to a downward spiral toward decay. Specifically, the analysis considered whether or not physical deterioration would likely result from the opening of the Project and other cumulative retail developments. ALH Economics' urban decay conclusion is based on consideration of current market conditions, findings regarding diverted sales, the backfilling potential of existing store spaces, and the existence of regulatory controls.

In addition, the urban decay conclusion assumes the existing Folsom Costco warehouse and fuel facility will not close following development and opening of the new El Dorado Hills Costco project. This assumption is based on the expectation that the diversion of sales from Folsom to El Dorado Hills will take pressure off Costco's existing Folsom facilities, providing members at both warehouses with a better shopping experience. Data and information from Costco about comparable experiences in other communities where new Costco facilities were built close to existing facilities supports this expectation.

Overall, field research, market research, and interviews with market participants indicate that current market conditions are relatively strong, except for some older properties with absent and/or lackluster owner interest. The market area's retail inventory is generally in good to excellent condition, with well-located properties garnering market interest and backfilling with new retail tenants. Vacant retail properties in some markets with weak or weakening conditions often transition to alternate uses. Such conversions do not appear to be happening in the market area, demonstrating the presence of a generally healthy retail sector.

The study analysis estimated that market sales impacts are only likely to transpire in the food & beverage stores and gasoline station retail sectors. This is attributable to existing retail sales leakage in other key retail sectors matching Costco merchandising categories. Even with absorption of this leakage yet additional retail sales leakage is anticipated to remain in the market area. Given the large size of the market area and number of competitive food stores and gas stations, the analysis concluded that no single food store or gas station is likely to experience Project-induced sales declines sufficient to trigger store closure. However, even if any existing market area retailers were to close as a consequence of the Project and its sales impacts, retail leakage in other categories could comprise opportunities for new retailers to enter the marketplace focused on satisfying unmet market area retail demand. Moreover, there are existing governmental regulatory controls in the market area's jurisdictions designed to manage or avoid nuisances such as graffiti, broken windows, overgrown vegetation, and dilapidated building exteriors. Enforcement

of these ordinances can help prevent physical deterioration due to any long-term closures of retail spaces. Thus, if any market area retail properties experience prolonged vacancy following the operations of the Project and any cumulative projects, implementation of the existing regulations will likely support abatement of conditions contributing to urban decay and deterioration.

Based upon all these findings in combination, ALH Economics concludes that the Costco Project and the identified cumulative projects will not cause or contribute to urban decay.

II. INTRODUCTION

STUDY BACKGROUND

Costco Wholesale Corporation ("Costco") is seeking to open a Costco Wholesale Member Warehouse retail store (warehouse) and fuel facility in El Dorado Hills, a census designated place in Unincorporated El Dorado County (the "Project"). The warehouse is planned to include 165,000 square feet of building area plus a 16-pump facility with 32 handles, on an approximately 43.26-acre site. The site is located across the north and south sides of Silva Valley Parkway, just north of U.S. Highway 50.

The primary reason Costco is seeking to open a warehouse and fuel facility in El Dorado Hills is to take pressure off Costco's existing Folsom facilities located approximately 5.1 miles east of the Project site. By opening a new nearby warehouse and fuel facility Costco hopes to provide members at both warehouses with a better experience. The Folsom Costco is currently operating over ideal capacity with demand generated by members from Folsom and El Dorado County.[2]

An Environmental Impact Report (EIR) for the Project is being prepared for El Dorado County. To support this effort and comply with the California Environmental Quality Act ("CEQA"), ALH Urban & Regional Economics ("ALH Economics") was asked to prepare findings regarding the potential for the proposed Project to cause urban decay. The decision by the Fifth District Court of Appeal in *Bakersfield Citizens for Local Control v. The City of Bakersfield* indicated that CEQA requires a lead agency to consider and analyze the potential for the introduction of planned retailers to result in adverse physical impacts on the environment by causing a chain reaction of store closures and long-term vacancies, otherwise referred to as a condition of "urban decay."

This study addresses the concerns voiced in the Bakersfield decision by considering the potential impact of the warehouse and fuel facility in conjunction with the introduction of other retail developments in the Project's identified market area. The key indicator from a CEQA perspective is impacts on the existing environment, which in the context of an urban decay analysis includes existing stores and commercial real estate conditions, as measured by the current baseline. The Notice of Preparation (NOP) for the EIR was released in March 2025. This timeframe comprises the baseline reflected by existing conditions discussed in this report.

The field work upon which this study is based was completed in Spring and early Summer 2025. Accordingly, ALH Economics assumes no responsibility for market events pertinent to the market area, more general environs, or the Project site occurring after those dates.

STUDY TASKS

ALH Economics engaged in numerous tasks to complete this assignment. These tasks included the following:

- Identified the Project's market area, i.e., the area from which the majority of Project shoppers are anticipated to originate;

[2] See https://edhapac.org/wp-content/uploads/2019/03/Fact-Sheet-FAQ-Costco-FINAL.pdf.

- Conducted fieldwork to review the Project site and evaluate existing market conditions;
- Estimated the planned Project's sales;
- Estimated market area retail sales;
- Conducted retail sales leakage analyses for the Project's market area and constituent county areas;
- Estimated the Project's impacts on existing relevant retailers;
- Identified planned retail projects in the market area;
- Assessed the cumulative impacts of planned retail projects in the market area and other relevant areas; and
- Assessed the extent to which opening of the Costco wholesale warehouse and the cumulative projects may or may not contribute to urban decay.

The findings pertaining to these tasks are reviewed and summarized in this report, with analytical findings presented in the exhibits in Appendices A and B. Figures referenced in the text are presented on the page following the first reference.

REPORT ORGANIZATION

This report includes eight chapters, as follows:

I. Executive Summary
II. Introduction
III. Projected Costco Sales
IV. Market Area Definition
V. Retail Sales Base Characterization
VI. Project Sales Impacts
VII. Cumulative Projects
VIII. Urban Decay Determination

This report is subject to the appended Assumptions and General Limiting Conditions.

III. PROJECTED COSTCO SALES

A description of the planned Project and ALH Economics' estimates of the total retail sales generated by the Project are presented below, including sales generated by retail category. This estimate is necessary to facilitate analysis of the Project's urban decay impacts.

COSTCO PROJECT DESCRIPTION AND SALES COMPOSITION

The 165,000-square-foot Costco warehouse inclusive of a tire center and fuel facility will be located north of U.S. Highway 50, straddling Silva Parkway. The fuel facility will comprise a 16-pump facility with 32 handles. Close to the site across U.S. Highway 50 there is a significant retail node, with close to 600,000 square feet of retail space in two major shopping centers plus four gas stations. These shopping centers include the 448,256-square-foot El Dorado Hills Town Center, anchored by Target, and the 134,679-square-foot Market Place at Town Center, anchored by Nugget and Ace Hardware.

Costco is a membership warehouse store, where members are required to purchase a membership and renew it annually if they seek to continue shopping at Costco. As such, only members will be able to make purchases at the El Dorado Hills Costco Project. There are different types of memberships, available at different pricing levels. These include the following:

- Gold Star Membership, for $65.00 a year, available for individuals who want to purchase products mainly for personal use;
- Business Membership, for $65.00 a year, available for business owners and managers, which allows the purchase of products for business, personal, and resale use; and
- Executive Membership, for $130.00 a year, includes a 2% reward on purchases up to $1,250 a year as well as additional benefits and greater discounts on select Costco services. This membership level is available to both households and businesses.[3]

In 2024, the national division between household and business membership was 84% and 16%, respectively.[4] All of these memberships include a household card. The household figure is inclusive of the Executive Memberships.

Costco merchandise is not targeted to the average consumer. Many Costco items are only available in bulk. This includes mostly foodstuffs and other items one could purchase at a grocery store, such as two loaves of sliced bread bundled together, a case of kidney bean cans, 15 rolls of paper towels, and a 3 lb. can of ground coffee. It is not possible at Costco to purchase an individual-sized pastry, a quart of milk, a small spice jar, a dozen eggs, or just a pound of butter. Costco food sales are clearly targeted toward large families, restaurants, event organizers, and other consumers with extensive storage capacity. Accordingly, Costco is not the type of store where the average household consumer will stop by once or twice a week to round out the pantry and purchase ingredients for intimate family dinners. Even many non-food items or business-oriented products are also only available in bulk, such as a case of printer paper versus just one ream, a box of 500 business envelopes, or a large package of batteries rather than a two- or four-pack.

[3] Costco.com
[4] Costco Wholesale 2024 Annual Report, Fiscal Year Ended September 1, 2024, page 6.

In addition, Costco typically carries only one brand at a time of certain items, such as canned peaches or tomato sauce. Thus, selection is not the hallmark of Costco. In fact, Costco typically carries less than 4,000 active items per warehouse, or SKUS (stock-keeping units) for sale.[5] This compares to 120,000 for the typical Walmart supercenter[6] and 31,704 on average at a traditional supermarket.[7] To counterbalance the limited variety of merchandise, Costco strives to keep a unique mix of new, limited volume merchandise flowing through the stores, so shoppers can expect to encounter some new merchandise with every visit.

Costco is further distinguished from the average retailer pursuant to its payment options and how it assembles items purchased by customers. Costco warehouses accept cash, checks, debit cards, and only Visa credit cards. No other major credit cards are accepted for the payment of merchandise.[8] These methods of payment may limit Costco's customer base. Once a customer has made purchases, Costco does not provide bags or bagging services. Some items are loaded into packing boxes by Costco cashiers, but the balance of goods are either reloaded back into the shopping cart by the Costco cashiers or can be placed into bags provided by the customer. This approach may further limit Costco's customer base among customers accustomed to merchandise bagging.

Costco presents information in its corporate materials regarding the average distribution of sales at all Costco warehouse stores. This information is presented in categories that conform to categorization by Costco. These categories, and the percent distribution of sales, are summarized in Table 1, below.

Table 1
Costco Warehouse
Costco Retail Categories and Sales Distribution

Costco Sales Category	Percent
Foods and Sundries	40%
Non-Foods	26%
Fresh Foods	14%
Ancillary & Other	20%
Total	100%

Source: Costco Wholesale 2024 Annual Report, Fiscal Year Ended September 1, 2024. Calculated from sales data reported on page 60.

This sales information is presented in Exhibit 1, which develops and expands this information in ways conducive to analyzing the Costco Project's prospective impacts relative to other existing retailers. This is accomplished by matching Costco's categories with categories used by the State of California Department of Tax and Fee Administration (CDTFA) which is the primary public source of taxable retail sales data and trends in California. This is necessary because CDTFA data are the

[5] Ibid, page 5.
[6] http://en.wikipedia.org/wiki/Walmart
[7] http://www.fmi.org/facts_figs/?fuseaction=superfact
[8] https://www.forbes.com/advisor/credit-cards/what-credit-cards-does-costco-accept/

most comprehensive resource available to provide a basis for evaluating the existing retail sales base by geography.

ALH Economics spread the Costco sales percentages presented in Table 1 among the State of California Department of Tax and Fee Administration's reporting categories. This was accomplished through several means, including the following:

- Reviewing Costco's category descriptions included in its most recent and previous Annual Reports and qualitatively matching the referenced types of goods with the appropriate CDTFA category;
- Conducting field work to an existing representative Costco warehouse and assessing the distribution of warehouse products by type of good and CDTFA retail category;
- Reviewing select information presented by Costco regarding the amount or percentage of store sales in key retail categories, such as a Costco reference to 12% of net sales typically comprising gasoline sales;[9] and
- Using the preceding information to quantitatively spread the Costco category sales among the CDTFA retail sales categories.

The results of the distribution of Costco sales into the CDTFA categories are presented in Exhibit 1 and summarized below in Table 2.

Table 2
Costco Warehouse
CDTFA Retail Categories and Sales Distribution

Costco Sales Category	Percent
Motor Vehicle & Parts Dealers	3.1%
Home Furnishings & Appliances	8.6%
Building Materials & Garden Equipment	1.5%
Food & Beverage Stores	49.1%
Gasoline Stations	12.0%
Clothing & Clothing Accessories	3.2%
General Merchandise Stores	8.1%
Food Services & Drinking Places	1.3%
Other Retail Group	13.2%

Source: Exhibit 1.

These sales distribution assumptions were used as a basis for distributing the estimated Costco Project sales among the relevant retail sales categories and by type of consumer. As noted, the largest portion of estimated Costco sales, 49.1%, is in the food & beverage category, which includes all food items and both alcoholic and non-alcoholic beverages. This sales category dominates all estimated sales, with the next largest categories comprising other retail at 13.2% and gasoline sales at 12%. The other retail sales category is a broad category, and includes such goods as pharmacy, health and personal care, gifts, art goods and novelties, sporting goods, florists, photographic supplies, musical instruments, stationary and books, and office and school supplies.

[9] Costco Wholesale 2024 Annual Report, Fiscal Year Ended September 1, 2024, page 5.

COSTCO WAREHOUSE SALES

Total Sales

For the purpose of the study, ALH Economics developed a total Project stabilized sales estimate. This estimate is based on a per square foot sales figure of $1,800. This figure was developed based on analysis of several sources, including Costco Wholesale's Annual Reports and industry internet resources, such as Statista and Gurufocus.com. Applying this sales figure to the total warehouse square footage results in an annual sales estimate of $297 million.

The following analysis, which provides the basis for the urban decay analysis, assumes the Project sales at this $297 million performance level. In the retail industry many stores ramp up to their stabilized sales levels over time, as the retailer becomes more established in the market. This analysis, however, conservatively assumes the maximum sales will be achieved during the Project's first full year of operations rather than several years later after it has become established in the marketplace and solidified a customer following.

Sales by Retail Category

The Project's $297 million sales estimate is distributed in Exhibit 2 among the CDTFA retail categories. This distribution is based upon the estimated distribution of sales calculated in Exhibit 1 and summarized in Table 3, presented in millions of dollars.

Table 3
Costco Warehouse
CDTFA Retail Categories and Sales, in $ millions

Costco Sales Category	Sales
Motor Vehicle & Parts Dealers	$9.2
Home Furnishings & Appliances	$25.5
Building Materials & Garden Equipment	$4.6
Food & Beverage Stores	$145.9
Gasoline Stations	$35.6
Clothing & Clothing Accessories	$9.4
General Merchandise Stores	$23.9
Food Services & Drinking Places	$3.9
Other Retail Group	$39.1
Total	$297.0

Source: Exhibit 2.

This table indicates that approximately $146 million in sales generated by the Project is likely to be for food & beverage items. The next largest categories are other retail at $39.1 million and gasoline at $35.6 million. The other double-digit sales categories include home furnishings & appliances with $25.5 million in sales and general merchandise with $23.9 million in sales.

Store Sales by Type and Location of Consumer

Not all the estimated Project sales will be competitive with existing retail operations, especially retailers within the Costco market area. There are several factors contributing to this competitiveness profile, discussed below.

Sales Redirected from Costco's Folsom Warehouse. The El Dorado Hills Costco is located just 5.1 miles east of Costco's existing Folsom warehouse and fuel facility. There are no other Costco operations anywhere else east of Folsom, since the next closest warehouse to the east is in Carson City, Nevada, approximately 105 miles east of Folsom, and 100 miles east of El Dorado Hills. This means that the new El Dorado Hills location will comprise a more convenient, closer shopping location for many existing Folsom shoppers originating from east of Folsom. Hence there is an expectation that many of the existing Folsom sales will be redirected to El Dorado Hills. While these redirected sales will be new to the El Dorado Hills Costco, they will not comprise new sales to Costco or new expenditures made by Costco shoppers. Costco also anticipates that a small percentage of sales at the Rancho Cordova Costco will also be transferred to El Dorado Hills.

The transportation engineering and planning consulting firm Kittelson & Associates prepared a transportation analysis for the Project that includes analysis of projected vehicle miles traveled (VMT) by Project patrons and number of existing and projected member visits. Their analysis is grounded in proprietary data provided by Costco, including data pertaining to Folsom warehouse and fuel facility shoppers (but not Rancho Cordova). Based on ALH Economics' analysis of Kittelson & Associates' findings, where ALH Economics generally equates demand with the number of warehouse trips, but allocating more weight to primary trips given the expectation these trips will entail higher sales, ALH Economics assumes that 54% of the El Dorado Hills Costco warehouse sales are anticipated to be shifted, or redirected, from the Folsom warehouse.[10] Thus, 46% of projected Project sales are estimated to be net new to Costco. Since gasoline purchases are more convenience-oriented, and locally based, a much lower 7% of gasoline sales are estimated to be shifted, or redirected, also with the same weighted sales approach applied to food sales. This assumption is also derived from the Kittelson & Associates analysis. Both the warehouse and fuel facility estimated shifts are slightly conservative, as they do not take into account the small shift from Rancho Cordova to El Dorado Hills (which Costco estimates at less than 5%).[11]

Application of these estimated sales shifts indicates that $153 million of the estimated $297 million in El Dorado Hills Costco sales are estimated to be net new sales to Costco, and comprise new retail expenditures by consumers (see Exhibit 2).

Costco Business vs. Household Shoppers. Costco's membership includes business and household members. Some business members include businesses that purchase items wholesale from Costco, and then resell the items as part of their business operations. Businesses with resale licenses do not pay sales tax on the purchased items. Thus, sales made under these circumstances are not considered taxable retail sales. As such, these sales are not competitive with the existing retail base, the size of which is estimated based upon taxable retail sales reported by the State of California Department of Tax and Fee Administration (see Chapter V).

[10] Note, primary trips comprise trips planned with Costco as an explicit destination.
[11] This less than 5% sales transfer from Rancho Cordova to El Dorado Hills was provided to ALH Urban & Regional Economics by Costco.

In its annual reports Costco presents information about the composition of its membership base. This includes the aforementioned Gold Star, Business, and Executive Membership categories. Information presented in Costco's 2024 Annual Report indicates that Business Membership totaled 17.9% of total membership in 2022, 17.2% in 2023, and 16.4% in 2024. Costco materials indicate that many business members also shop at Costco for their personal needs, but these materials do not indicate the share of total business member purchases that are personal.

For the sake of the analysis, ALH Economics assumes that the percentage of resale volume will comprise 16%, consistent with the national proportion of Business Membership. Therefore, the analysis assumes that 16% of Project sales will be to wholesale customers, i.e., customers whose typical purchases are not reported as retail purposes, and 84% will be to household and business customers that qualify to pay sales tax on taxable items. The exception to this assumption is gasoline sales, all of which are allocated to retail consumers, as all of these sales are assumed to be taxed, and this is the same as a consumer-based taxable retail sales purchase.

Based upon the assumption split between retail and business customers, Exhibit 2 presents further information about the disaggregation of the estimated net new Costco Project sales. Assuming that 84% of sales are generated by household retail consumers, the Project sales competitive with other retailers totals $131.2 million. The balance of the sales, or $18.8 million, is assumed to be generated by wholesale customers and is not competitive with the retail base. There is actually a strong likelihood that these sales might ultimately be reflected themselves in the retail sales base, as they are resold in the course of the operations conducted by the business members.

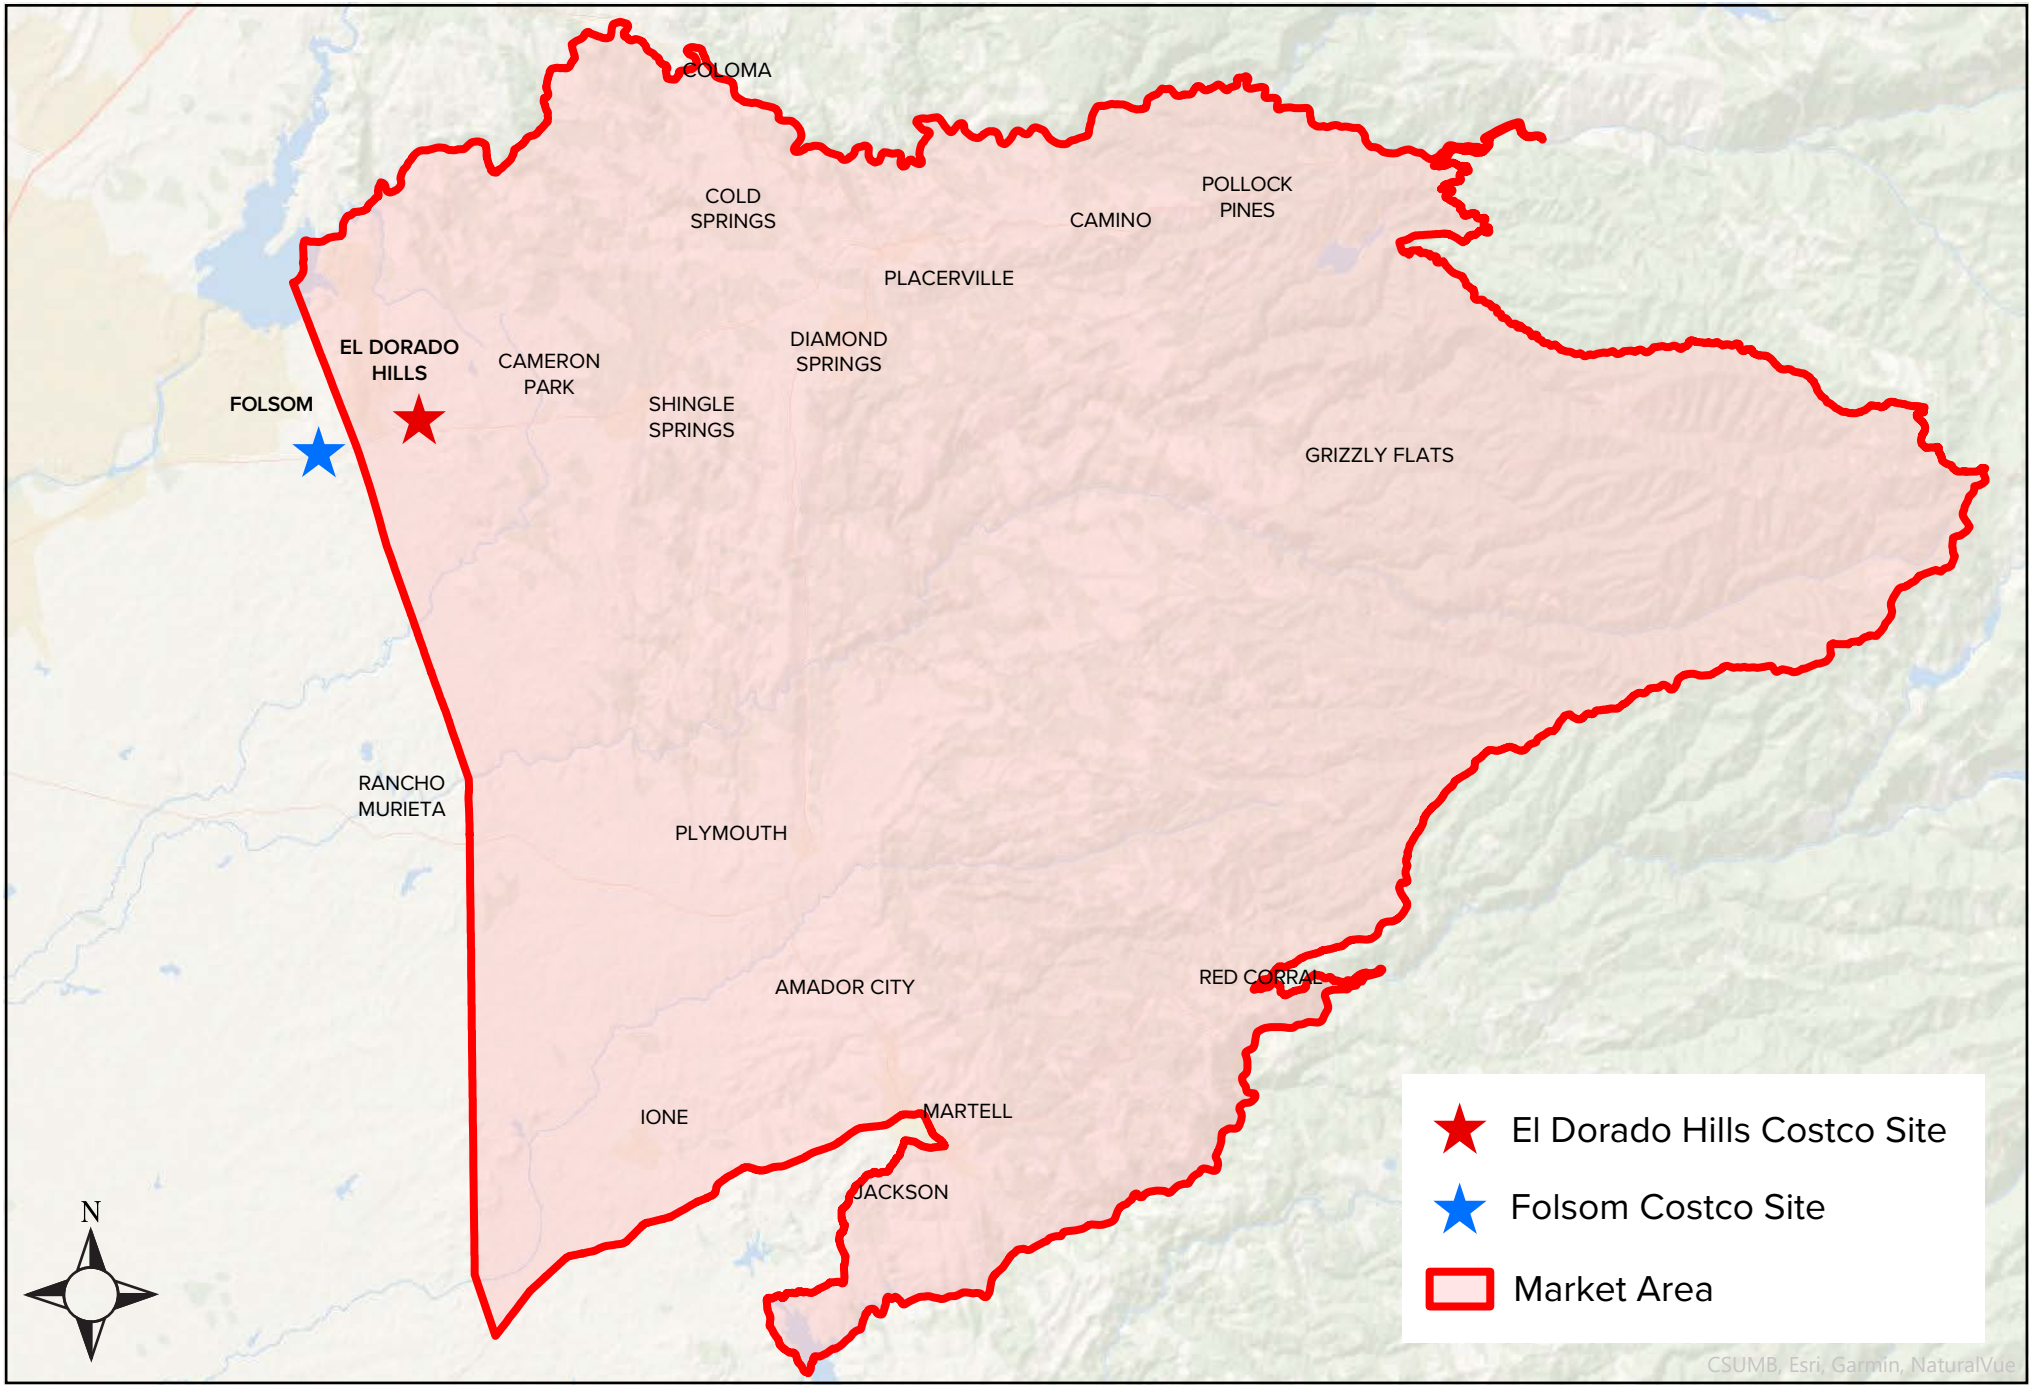
Customer Geographical Origin. The customers that will shop at the El Dorado Hills Costco will come from a large geographical area. The following chapter defines and discusses the market area for the Project. For the purpose of this section it suffices to say that a market area comprises the area from which the majority of shoppers originate. It does not, however, include the area from which ***all*** shoppers originate. Therefore, the portion of sales contributed by shoppers outside the market area are not competitive with sales within the market area since, at worst, they will be diverted away from retailers that would otherwise be frequented by the out-of-market-area shoppers. By definition, these retailers will be located in a variety of locations not within the Costco market area. Consideration of how the outside market area customer shopping affects the Costco sales relevant to the urban decay analysis is discussed in the following chapter.

IV. MARKET AREA DEFINITION

This report chapter discusses the approach to examining the Project's market area, which is the area from which the majority of shoppers is anticipated to originate. This chapter defines the Project's anticipated market area based on this approach and provides general information regarding locations of major retail corridors and nodes within the market area.

PROJECT MARKET AREA DEFINITION

ALH Economics engaged in several activities to define the Project's market area, i.e., the area from which the majority of shoppers will originate. These included fieldwork in the El Dorado Hills area, identification of the location of existing Costco warehouses, and review of VMT Analysis information and graphics prepared for the Project.



Typically, the definition of a market area is based on the principle that most consumers will travel to the shopping destination most convenient to their homes given the type of goods available. In this instance, given Costco's focus on selling heavily discounted, bulk products, the market area definition is premised upon the expectation that Costco will achieve a large consumer draw. One of the main determinants of the market area, therefore, was consideration of the next nearest Costco warehouses, and the geographic area located in closest proximity to the planned El Dorado Hills warehouse. This was accomplished by mapping the locations of the nearest Costco warehouses and then determining travel time and distance from various map locations to the El Dorado Hills site and other Costco warehouses. The four most relevant warehouses for this purpose are located in: Folsom, 5 miles west of the El Dorado Hills site; Loomis, 19 miles northwest of the site; Lodi, 51 miles southwest of the site; and Carson City, Nevada, approximately 100 miles east of the El Dorado Hills site.[12]

Another prominent guide to definition of the market area are projections and analysis of vehicle trips to the new Costco location. These are included in "El Dorado Costco CEQA Analysis [Draft], February 14, 2025, prepared by Kittelson & Associates. Graphic information included in this report, as well as supplemental graphic information provided upon request, were based on information about existing Folsom warehouse and fuel facility shoppers provided by Costco to Kittelson & Associates.

Combining the existing Costco warehouse locational information with the Kittelson & Associates presentation resulted in a market area definition that includes about 2/3 of El Dorado County extending eastward from the county's western boundary, but short of South Lake Tahoe, and south/southeast to include a major portion of Amador County (excluding Kirkwood and other nearby areas to the extreme east and Comanche North Shore and Buena Vista in the southern part of the County). A map of this area is presented in Figure 1. The area reflected in Figure 1 comprises an agglomeration of select El Dorado County and Amador County census tracts. For areas not defined on a geopolitical basis, such as cities or counties, census tracts provide a strong basis for defining a market area. This is because census tracts are defined to capture population nodes but are generally small enough to allow customization of an area. An additional benefit is the greater ability to obtain

[12] For the purposes of measuring distances the El Dorado Hills Costco Project site is the intersection of Silva Valley Parkway and Clarksville Road.

FIGURE 1. EL DORADO HILLS COSTCO PROJECT MARKET AREA

and analyze data at the census tract level while retaining the potential for replication by interested parties. Because of the relatively sparse population base in portions of both counties, some of the census tracts are large, with some encompassing areas inside and outside of the market area. In cases where a census tract was deemed not fully within the market area, the definition includes the census tract if at least one-half or more of the census tract is located in the market area. In most cases these are the largest and least populated census tracts, thus minimizing the potential to overstate the size of the market area population base. This is counter-balanced by the exclusion of census tracts where less than one-half the area overlapped with the market area. A list of the resulting census tracts is located in the Appendix, in Exhibit B-1. In addition, the cities and unincorporated areas per county located in the Market Area are identified in Exhibit 3 for El Dorado County and Exhibit 4 for Amador County. These exhibits demonstrate that South Lake Tahoe in El Dorado County is the largest city or area in the market area counties that is not within the Project's market area.

ESTIMATE OF SALES GENERATED FROM WITHIN THE MARKET AREA

ALH Economics estimates that market area residents will generate 85% of the retail consumer sales for the planned El Dorado Hills Costco warehouse and that consumers traveling from outside the market area (e.g., travelers to and through the region) will generate the remaining 15% of revenues. The estimated percentage of wholesale consumers from within the market area is higher, at 90%, with 10% originating from outside the market area. Thus, of total warehouse sales, $111.5 million are estimated to be generated by household consumers located within the market area, and $16.9 million are estimated by be generated by wholesale business customers within the market area. These sales estimates are delineated in Exhibit 5.

This distribution of sales is consistent with findings published by major research organizations, such as the Urban Land Institute (ULI) and the International Council of Shopping Centers (ICSC), which indicate that a retail store's trade area generally supplies 70% to 90% of the store's sales, while the remaining 10% to 30% of sales are attributed to consumers residing outside of the related market area. For example, ULI states the following in its *Shopping Center Development Handbook, Third Edition*:

> *"A site generally has a primary and a secondary trade area, and it might have a tertiary area. The primary trade area should generally supply 70 to 80 percent of the sales generated by the site. These boundaries are set by geographical and psychological obstacles."*[13]

ULI is a nonprofit research and education organization representing the entire spectrum of land use and real estate development disciplines. Among real estate, retail, and economic development professionals, this organization is considered a preeminent educational forum.

Information published by the International Council of Shopping Centers (ICSC), a trade association for the shopping center industry, also provides background about market area definitions. In the publication *Developing Successful Retail in Secondary & Rural Markets*, the ICSC says:

> *"A trade area is the geographic market that you will be offering to potential retailers as a consumer market. … Defining a retail trade area is an art and a science. In general, a trade area should reflect the geography from which 75-90 percent of retail sales are generated.*

[13] *Shopping Center Development Handbook, Third Edition*, Urban Land Institute, 1999, page 44.

Different stores can have different trade areas based on their individual drawing power and the competitive market context."[14]

El Dorado Hills is along a major transportation route to one of California's most popular tourist destinations – Lake Tahoe. Analysis of countywide tourist spending supports the 15% outside market area support for consumer retail spending. Dean Runyan Associates annually prepares a study for Visit California, a nonprofit organization that partners with the state's travel industry to promote California as a tourist destination, which estimates the economic impact of travel in the state. Many results are presented on a county by county basis, including estimates of the percent of taxable sales that are generated by travel.[15] The most recent study, published in May 2025, indicated that travel-generated taxable sales comprised 17.2% of El Dorado County's taxable sales and 14.5% of Amador County's taxable sales in 2024.[16] The weighted average between the two counties is 16.8%. Thus, the 15% figure for consumer retail sales is a reasonable estimate of outside market area sales support.

MARKET AREA DEMOGRAPHICS

Based on the market area definition, approximately three-quarters of the combined population and household base of El Dorado and Amador counties is within the El Dorado Hills Costco market area. Given the disparity in the relative size of each county's demographic base, the majority of the market area's population is located in El Dorado County. Thus, the market area's average household size, average household income, and median household income is very comparable to the corresponding figures in El Dorado County (see Table 4).

Table 4. Summary Demographic Characteristics, 2025

Demographic Characteristic	El Dorado County	Amador County	Market Area (1)
Population	188,656	41,134	175,676
Households	74,644	15,991	67,688
Average HH Size	2.5	2.3	2.5
Average HH Income	$161,661	$107,536	$161,755
Median HH Income	$112,508	$79,850	$111,311

Sources: Claritas, Demographic Quick Facts, El Dorado County, Amador County, and Select Census Tracts; and ALH Urban & Regional Economics.
(1) The Market Area includes 33/50+ census tracts in El Dorado County and 8/10 census tracts in Amador County. See Exhibit B-1.

Overall, in 2025, the market area is estimated to have a 175,676 population count and 67,688 households. Average market area household income is estimated at $161,755.

Despite recent modest growth in El Dorado and Amador counties (approximately 2% from 2020 to 2024 per the State of California Department of Finance), growth is projected to be limited over the next five years, between 2025 and 2030.[17]

KEY MARKET AREA SHOPPING NODES AND RETAIL SALES

The market area has several existing retail nodes, with El Dorado Hills and Placerville comprising the largest in the El Dorado County portion of the market area. The retail in these areas is generally located close to Highway 50, which stretches from Sacramento to South Lake Tahoe and beyond. El Dorado Hills and Placerville each have general merchandise retailers, with Target in El Dorado Hills and Target and Walmart in Placerville. There are numerous shopping centers in both areas, primarily neighborhood and community shopping centers, with many grocery stores and other complementary retail, such as hardware, mattresses, pharmacy, clothing/shoes, and restaurants. The lion's share of retail in El Dorado Hills was built during the early 2000's while most of Placerville's major retail was built prior to 2000. There are also a couple of retail nodes in Cameron Park, located between El Dorado Hills and Placerville. The retail centers in Cameron Park are also generally older, with most built prior to the 2000's. Retail tenants in Cameron Park include more grocery stores, pharmacies, Petco, and other small shop retailers. This portion of the market area also has other, small pockets of retail, such in Pollack Pines. There are many gas stations distributed throughout El Dorado County's portion of the market area, including in Shingle Springs, east of Cameron Park, and Diamond Springs, further east of Shingle Springs, but west of Placerville.

There is comparatively much less retail in the Amador County portion of the market area. This portion of the market area has many additional grocery stores, a recently remodeled Walmart, and numerous big box and other major retailers, such as Lowes, Petco, Staples, Big 5, Tractor Supply, and Dollar Tree. This retail is generally located along Highway 49, through Plymouth, Amador City, Sutter Creek, Martell, and Jackson. The largest portion of Amador County's market area retail is located in Martell and Jackson. State Route 124 is a relatively short state highway (about 10 miles) that runs through Ione, west of Jackson, where another small amount of retail is located. As with the rest of the market area, the majority of the retail centers are older, with only one significant center (the largest with over 200,000 square feet) built after 2000. There are also gas stations in this portion of the market area, but comparatively less than in El Dorado County.

V. RETAIL SALES BASE CHARACTERIZATION

This chapter analyzes the retail sales leakage and sales base composition of the portion of El Dorado County in the market, Amador County, and the Project's market area. The analysis focuses on the extent to which each area captures resident household spending as well as sales generated from outside the area. This analysis provides a characterization of the sales performance of the relevant retail sales bases, an estimate of the size of the sales bases, and an estimate of existing demand for retail. ALH Economics conducts this analysis as a building block towards determining the extent to which the Project may or may not divert sales away from existing market area retailers.

METHODOLOGY

Approach

ALH Economics uses a retail model that estimates retail spending potential for an area based upon household counts, income, and consumer spending patterns. The model then computes the extent to which the area is or is not capturing this spending potential based upon taxable sales data published by the State of California Department of Tax and Fee Administration (DTFA). This analysis can be most readily conducted for cities, groupings of cities, or counties, consistent with the geographies reported by the DTFA.

For any study area, retail categories in which spending by locals[18] is not fully captured are called "leakage" categories, while retail categories in which more sales are captured than are generated by residents are called "attraction" categories. This type of study is generically called a retail demand, sales attraction, and spending leakage analysis. Generally, attraction categories signal particular strengths of a retail market while leakage categories signal particular weaknesses. ALH Economics' model, as well as variations developed by other urban economic and real estate consultants, compares projected spending to actual sales.

For the purpose of generating a Retail Demand, Sales Attraction, and Spending Leakage Analysis for the Project's market area and other germane areas ALH Economics obtained taxable retail sales data for calendar year 2024 and adjusted the taxable sales to reflect total sales. Sales data were obtained for El Dorado County, Amador County, and select constituent cities. Using these retail sales data, combined with household counts estimated by the State of California and by Claritas Inc., (a national provider of demographic and economic data) and household income estimates provided by Claritas, Inc., ALH Economics conducted Retail Demand, Sales Attraction, and Spending Leakage Analyses. These analyses compared total estimated household spending to actual retail sales in the portion of El Dorado County in the market area, in Amador County, and in the market area. Sales estimates for the market area were assumed to comprise the summation of sales in the portion of El Dorado County in the market area and sales in Amador County. This study assumes that the majority of all Amador County taxable sales are generated by establishments located in the portion of Amador County in the market area.

[18] In this context locals refers to households and businesses. While the model is driven off household counts, they are a proxy for all spending, as the sales base included in the analysis includes all taxable sales, regardless of how they are generated.

Demographic Characteristics

ALH Economics' Retail Demand, Sales Attraction, and Spending Leakage Analysis requires household count and average household income inputs for the area of analysis. Demographic data assumptions for the market area were presented earlier in Table 4. Household counts for El Dorado County, South Lake Tahoe, and Amador County were all obtained from the State of California Department of Finance. Average household incomes for El Dorado and Amador counties were estimated by Claritas, also in Table 4. The relevant average household income estimates are $161,661 for El Dorado County, $107,536 for Amador County, and $161,755 for the market area.

RETAIL SALES BASES

Approach to Estimation

ALH Economics estimated sales for El Dorado County less South Lake Tahoe, Amador County, and the market area by utilizing city and county DTFA data. DTFA publishes taxable sales figures for counties and major cities; its most recent full-year taxable sales figures are for 2024. These are the data points reflected in this report.

Because DTFA presents data corresponding with only taxable sales, ALH Economics included adjustments to gross the estimated sales up to total sales. This involved sales adjustments for non-taxable sales for food, pharmacy, and a portion of general merchandise store sales that include food sales. ALH Economics estimates that 70% of food store sales and 67% of drug store sales are non-taxable based on discussions with the DTFA and other industry research, including U.S. Census publications. In addition, sales of grocery items at non-drug store general merchandise stores are non-taxable and are estimated at 35% of sales for this subset of the retail category based on analysis of the U.S Economic Census for General Merchandise Stores.[19] Finally, the DTFA combines drug stores sales in the "other retail group" sales. Thus, the analysis assumes a portion of this category's sales are pharmaceutical sales, in keeping with the statewide percentage of 5.5%. Consequently, the CDTFA taxable sales figures for the food stores, general merchandise, and other categories are adjusted upward to reflect non-taxable transactions.

Market Area Sales Base

The market area sales base is estimated to comprise the sales base for El Dorado County less South Lake Tahoe and Amador County. The sales estimates for these areas are presented in Exhibits 6 and 7, respectively. The results indicate that the El Dorado County portion of the market area has an estimated $2.3 billion sales base and Amador County has an approximately $570 million sales base. As shown in Table 5, the combined market area sales base is therefore almost $2.9 billion. Of this total, 80% is generated by the El Dorado County portion of the market area, with just 20% contributed by Amador County. The retail categories with the largest sales are food & beverage stores at nearly $640 million and other retail group at about $580 million. Many other sales categories range from $265 to $360 million, with only two below this level, at $72 million for clothing & clothing accessories and $45 million for home furnishings & appliances.

[19] Per the U.S. Economic Census data, General Merchandise stores encompass a mix of department stores, discount department stores, warehouse clubs and Supercenters, variety stores, and other general miscellaneous stores.

Table 5. El Dorado Hills Costco Market Area Sales Base

Type of Retailer	Market Area Sales (1)	Share of Sales by County	
		El Dorado	Amador
Motor Vehicle & Parts Dealers	$328,246,110	94%	6%
Home Furnishings & Appliances	$44,548,860	84%	16%
Building Materials & Garden Equipment	$265,689,745	74%	26%
Food & Beverage Stores	$639,438,217	74%	26%
Gasoline Stations	$357,453,917	82%	18%
Clothing & Clothing Accessories	$71,749,758	87%	13%
General Merchandise Stores	$284,962,168	73%	27%
Food Services & Drinking Places	$292,446,546	80%	20%
Other Retail Group	$580,802,160	83%	17%
Total	$2,865,337,481	80%	20%

(1) Comprises the summation of taxable and non-taxable sales for El Dorado County less South Lake Tahoe and for Amador County, as a proxy for market area sales.

RETAIL LEAKAGE AND ATTRACTION FINDINGS

Market Area Constituent Counties

Retail Demand, Sales Attraction, and Spending Leakage Analyses were prepared for the market area portion of El Dorado County (see Exhibit 8), Amador County (see Exhibit 9), and the market area (see Exhibit 11). As a key component of the market area analysis, market area retail demand was also estimated (see Exhibit 10). The retail demand, sales attraction, and spending leakage findings are all annual estimates.

The analysis for the market area portion of El Dorado County indicates that overall, the area is characterized by a modest amount of retail leakage, amounting to 8% of the area's demand. Thus, almost $237 million in local demand leaves the area. The levels of attraction and leakage for this area vary widely, with most categories characterized by leakage, ranging from -18% to -51% of demand, but a few characterized by attraction, ranging from 15% to 44% of demand. One category, food & beverage stores, is at relative equilibrium between supply and demand, with effectively no attraction or leakage. The categories with the great volume of leakage include food services & drinking places (restaurants) with -$183 million in leakage, motor vehicles & parts dealers with -$112 million in leakage, clothing & clothing accessories with -$100 million in leakage. The general merchandise category, which is one of the categories most relevant to Costco, also has leakage, amounting to -$60 million.

Unlike the El Dorado County portion of the market area, Amador County is overall characterized by retail attraction. But to put this in perspective, the retail base in the El Dorado County portion of the market area is four times the size of Amador County's retail base. Further, as noted earlier, in 2024 an estimated 14.5% of Amador County's retail sales comprised tourist dollars. This compares to Amador County's 20% overall attraction. Thus, much of this county's retail sales attraction is likely due to tourists traveling to and through the county. Attraction in Amador County is most pronounced in food & beverage stores, with $82 million in attraction and the other retail group, with $51 million in attraction. The building materials & garden equipment, general merchandise store, and gasoline

station categories are also attraction categories. Leakage in Amador County is greatest in motor vehicles & parts dealers totaling -$54 million, and somewhat comparable among the other leakage categories of home furnishings & appliance stores, clothing & clothing accessories stores, and food services & drinking places, ranging from -$14 million to -20 million a year.

Market Area

The combined partial El Dorado County and all Amador County sales bases are estimated to comprise the market area sales base. Therefore, to assess how this sales base contributes to the market area's assessment of retail sales attraction and leakage it is necessary to also estimate market area spending, or demand for retail.

Market Area Demand. The retail sales demand generated by the market area is estimated in Exhibit 10. Based on the market area's $161,755 average annual household income, the demand analysis assumes annual retail spending of 26% of income on categories comparable to the ones reported by the CDTFA. This amount totals $41,900 per household. This average spending is allocated by retail category consistent with the sales distribution pattern throughout the State of California, resulting in per category spending estimates ranging from $2,272 on home furnishings & appliances to $7,221 on food and beverage stores. Net of an estimated 10.5% of overall spending on e-commerce, ranging from 0% to 25% of category spending, the market area's 67,688 households are estimated to annually spend just over $2.5 billion on brick & mortar store retail goods.

Retail Leakage and Attraction Findings. The market area demand estimate is paired with the market area sales base in Exhibit 11 to assess the overall state of retail attraction and leakage in the market area. The aggregate findings are summarized below in Table 6.

Table 6. El Dorado Hills Costco Market Area Retail Sales Attraction and Spending Leakage Summary, 2024

	Market Area Retail Sales Attraction/(Leakage)	
Type of Retailer	Amount	Percent
Motor Vehicle & Parts Dealers	($92,512,084)	-22%
Home Furnishings & Appliances	($70,804,734)	-61%
Building Materials & Garden Equipment	$98,595,019	37%
Food & Beverage Stores	$165,300,898	26%
Gasoline Stations	$115,923,095	32%
Clothing & Clothing Accessories	($92,029,122)	-56%
General Merchandise Stores	$16,913,863	6%
Food Services & Drinking Places	($126,887,637)	-30%
Other Retail Group	$310,863,292	54%
Total	**$325,362,591**	**11%**

Source Exhibit 11.

Overall, the market area has an aggregate level of 11% retail sales attraction. By dollar volume, attraction is greatest in the other retail group category, food & beverage stores category, and gasoline stations, each with attraction over $100 million. These categories correspond to the categories comprising the greatest amount of the El Dorado Hills Costco sales, equal to 74% of all sales (see percentages in Table 2). Thus, the majority of Costco sales will be in strong market area retail sales

categories, with the potential for Costco sales to strengthen these attraction categories. There are four retail leakage categories in the market area, i.e., motor vehicle & parts dealers, home furnishings & appliances, clothing & clothing accessories, and food services & drinking places. Another 16% of Costco sales will occur in these existing market area retail leakage categories, with Costco sales having the potential to reduce existing market area leakage.

VI. PROJECT SALES IMPACTS

The following analysis more fully examines the extent to which El Dorado Hills Costco operations would attract new sales to the market area and/or divert sales from existing retailers. If some sales are diverted, the maximum level of impact on existing market area retailers is identified.

APPROACH

ALH Economics has developed an analytic approach that estimates the impact of the Project's incremental sales on existing retailers. For this analysis, the approach assumes that if the Costco Project is adding sales to a category in an amount greater than any potential recaptured market area leakage in the category, ***then at worst***, the amount of sales in that category in excess of any recaptured leakage will be diverted away from existing market area retailers. This is a conservative assumption given that diverted sales could also occur among other retailers beyond the market area boundaries. The analysis referenced in this chapter is presented in Exhibit 12.

RECAPTURED LEAKAGE POTENTIAL

One potential source of demand for new retail space such as the Project is the share of market area residents' shopping that occurs outside of the market area, comprising the estimated retail leakage. In other words, given the identification of retail leakage, market area households clearly spend some proportion of their incomes at retail stores outside the market area. If the addition of the Costco makes the market area a more convenient shopping destination, local and regional demand could increase through the recapture of these sales.

As summarized in Exhibit 11, the market area experiences $382 million in annual retail sales leakage. This is counterbalanced by $708 million in retail attraction, with the net results of $325 million in attraction. Four retail categories contribute to the identified leakage. This leakage is in addition to recaptured leakage and other sales already accounted for in Exhibit 2, which estimated the share of El Dorado Hills Costco sales anticipated to be transferred from the existing Folsom warehouse and fuel facility.

Recaptured Leakage

The enhanced market area shopping opportunities provided by the El Dorado Hills Costco warehouse and fuel facility will serve to help recapture existing retail leakage. The amount of recaptured leakage will depend upon the estimated amount of Costco sales in the associated retail category and the depth of the estimated retail leakage. The analysis assumes that if estimated Project sales are less than 25% of the estimated leakage, then 100% of the Project's sales are anticipated to be absorbed through leakage. If the Project sales are equal to 25% to 50% of the leakage, then 50% of the Project sales are anticipated to be absorbed through leakage. If the Project sales comprise more than 50% of the estimated leakage then only 25% or less of the Project sales are anticipated to be absorbed through leakage. These thresholds were developed because they generally appear reasonable.

For the four retail leakage categories identified in Exhibit 11 the Costco sales are well below the 25% threshold associated with 100% of sales achieved through recapture. The greatest percentage is 12% for the home furnishings & appliance stores category, with 1% to 3% for the other three leakage categories of motor vehicles & parts dealers, clothing & clothing accessories stores, and food services

& drinking places. Thus, as shown in Exhibit 12, all of the Costco sales in these leakage categories are assumed to comprise recaptured leakage, with no resulting impact on existing market area retailers. These sales total $15.4 million, comprising 14% of total Project sales. The $15.4 million in recaptured leakage also comprise only 4% of all existing market area leakage.

Remaining Leakage. Exhibit 12 indicates that after the Project's absorption of retail leakage a large amount of leakage in the market area's four leakage categories will still remain, totaling $367 million. This remaining leakage indicates that when retailers are poised to make new investments, the market area as a whole has the potential to support a greater critical mass of retail than is currently supported. In addition, the potential for yet other retailers to gain support from the market area will be enhanced after the Project opens, due to the greater market visibility and draw achieved by Costco.

ESTIMATED MARKET AREA SALES IMPACTS

Absent the share of Project sales anticipated to be generated by consumers outside the market area and the recaptured leakage, Exhibit 12 indicates the potential for $98 million in sales to be diverted from market area retailers. This sales volume, which comprises 3.4% of the market area's retail sales base, includes all of the Project's anticipated sales in the market area's attraction categories of building materials & garden equipment, food & beverage stores, gasoline stations, general merchandise, and other retail group. For these sales attraction categories the analysis conservatively assumes that any Project sales generated by market area residents absent sales redirected from the Folsom Costco warehouse and fuel facility will occur to the detriment of retailers in the market area.

As shown in Exhibit 12 and summarized in Table 7, the sales base impacts for categories with estimated impacts range from a low of 0.6% in building materials & garden equipment to a high of 7.9% in gasoline stations. Three of the categories have impacts below 3% while only two have greater impacts, i.e., the 7.9% gasoline sales impacts and 7.5% food & beverage store impacts. These would comprise maximum impacts, as are all of the impacts that total $98 million. Alternatively, ALH Economics assumes that in the normal course of doing business some retailers should anticipate the potential need to absorb annual fluctuations in sales, including nominal sales declines or fluctuations up to 3% - 5%. This reflects the type of economic changes retailers should anticipate given the ebb and flow of retail sales and swings in the local economy, comprising minimum impacts. The range of impacts above 5% is summarized in Table 7 and are labeled minimum impacts.

Table 7. El Dorado Hills Costco Market Area Sales Base Impact, 2024 Dollars

	Sales Base Impact Less Leakage		Sales Base Impact Above 5% of Sales Base	
	Maximum Impact		Minimum Impact	
Type of Retailer	Amount	Percent of Sales Base	Amount	Percent of Sales Base
Motor Vehicle & Parts Dealers	$0	0.0%	$0	0.0%
Home Furnishings & Appliances	$0	0.0%	$0	0.0%
Building Materials & Garden Equipment	$1,502,941	0.6%	$0	0.0%
Food & Beverage Stores	$47,911,300	7.5%	$15,939,389	2.5%
Gasoline Stations	$28,173,420	7.9%	$10,300,724	2.9%
Clothing & Clothing Accessories	$0	0.0%	$0	0.0%
General Merchandise Stores	$7,863,724	2.8%	$0	0.0%
Food Services & Drinking Places	$0	0.0%	$0	0.0%
Other Retail Group	$12,829,195	2.2%	$0	0.0%

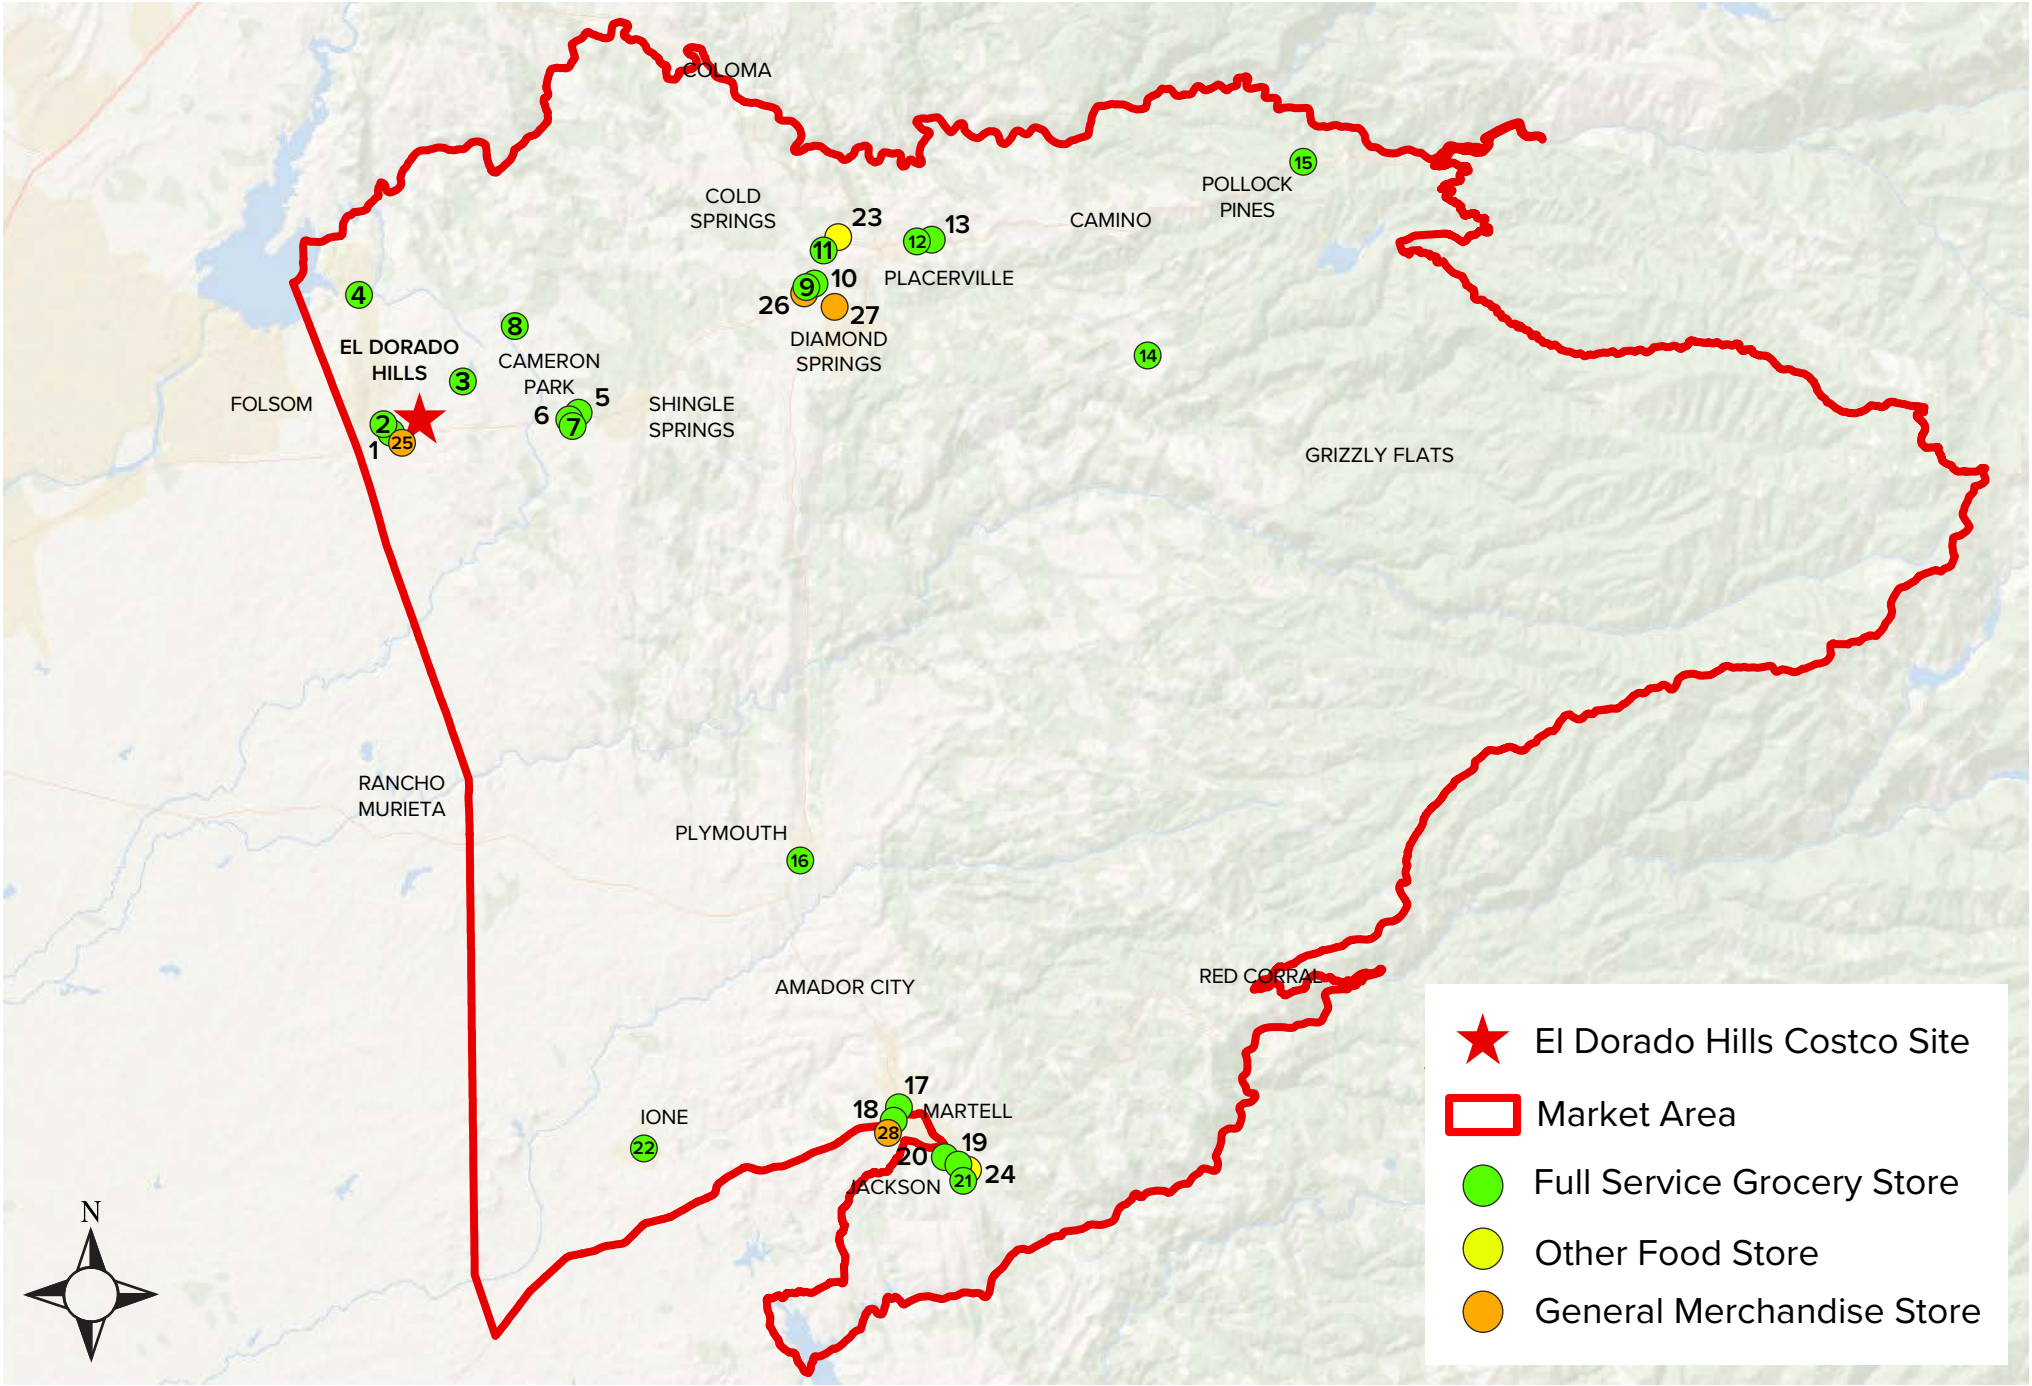
Source Exhibit 12.

Based on the findings summarized in Table 7, two of the retail categories have maximum impacts above 5%. These are food & beverage stores and gasoline stations. Because of the magnitude of these impacts, the following impact analysis focuses on these two retail sectors. For both, the minimum sales impacts reflect the idea that there will be some economic cycles and sales fluctuations over time, while the maximum sales impacts reflect the perspective that, in this instance, all of the impacts are related to the new Costco.

FOOD SALES IMPACTS

Relative to the market area, the almost $48 million sales impact in food & beverage store sales totals 7.5% of the sales base. After assuming 5% of this impact could be absorbed pursuant to average, or typical retail sales fluctuations, the remainder is a 2.5% impact, or just about $16 million. Thus, the range of food stores impacts is approximately $16 million to $48 million.

ALH Economics identified 28 supermarkets, food stores, and general merchandise stores selling food products in the market area. These would be the stores most competitive with the Project's grocery component. The market area's relatively smaller convenience-oriented stores are not included because Costco will not compete with a store that satisfies a shopper's need for a quick, convenience item. The 28 identified stores are referenced in Exhibit 13 and are presented in three categories, by county: full service grocery stores; other food stores; and general merchandise stores. The market area store locations are mapped in Figure 2.



Many of the identified market area stores may experience a share of the estimated food sales impacts following Costco's opening. Given the store formats of these retailers relative to the proposed Project, ALH Economics believes it is most meaningful to classify these retailers by market orientation.

- ***Discount Stores and General Merchandise Stores*** are characterized by lower-than-average price points. Sometimes, these are characterized by bulk items, which allow the customers to get more for their dollar relative to most other grocery stores. In the market area, Grocery Outlet is the primary discount food store by virtue of its pricing levels and store format. Costco's grocery component is most similar to the Discount supermarket format. General Merchandise stores selling significant quantities of food items and other items typically found in a grocery store also have the feel of a discount store. In the market area this includes two Walmart stores and two Target stores.

- ***Conventional Stores*** are full-service grocery stores that offer most or all of the following: a fresh bakery; fresh meat and seafood; frozen foods including frozen meat; fresh produce; a deli counter; and prepared foods. Other specialties sometimes include organic foods, a flower selection, a pharmacy, or a coffee bar. The largest share of the market area food stores are conventional groceries, such as Safeway, Bel Air, Save Mart, and Cost Less Food Company. Some Conventional stores also have a more upscale orientation, such as Nugget Markets and Raley's O-N-E Market.

- ***Niche Stores*** typically have average to higher prices and a unique product orientation. Many brands sold at these stores are not stocked at the more conventional stores. There is usually an emphasis on fresh foods, gourmet products, and locally grown, organic foods. These stores may sell a mix of more unique non-grocery products as well, such as natural home remedies and specialty gift items. In the market area this category includes Placerville Food Co-op and Gold Trail Natural Foods.

FIGURE 2. EL DORADO HILLS COSTCO PROJECT MARKET AREA - **GROCERY STORES**

Factors Offsetting Individual Store Impacts

ALH Economics visited many of the market area grocery stores to ascertain their market orientation and assess the degree to which they might experience sales impacts attributable to Costco. The nature of Costco product sales will serve to minimize the potential for significant sales impacts on any specific store. Factors influencing this include Costco's merchandising strategy, specifically its product mix and depth and checkout procedures.

Product Mix and Depth. Costco's merchandising strategy aims to provide its members with a broad range of high-quality merchandise at consistently low prices. Costco seeks to limit most items to fast-selling models, sizes, and colors. Accordingly, Costco carries less than 4,000 active stock keeping units (SKUs) per warehouse in its core warehouse business. This is significantly less than other broadline retailers,[20] which comprise companies that offer a wide range of products and merchandise categories under one roof. Other brick and mortar examples of broadline retailers include Target, Walmart, Dollar General, and Dollar Tree.[21] Even much smaller Dollar General not long ago carried 11,000 – 12,000 SKUs per store, [22] although recent efforts have involved some SKU reduction to make space for in-demand inventory.[23]

As noted previously, the core merchandise categories in a Costco warehouse are as follows: Foods and Sundries; Non-Foods; Fresh Foods; and Ancillary & Other. Because of Costco's wide range of product offerings, there is very little depth in any one type of product, limiting the potential to draw demand away from any specific retail store or type of retailer. Yet, food and food-related products comprise the largest general category of goods typically sold by Costco. This suggests that if any particular type of store would be impacted by Costco sales, it would be grocery stores. However, there are a number of factors endemic to a Costco food shopping experience that could minimize impacts on existing food and beverage retailers, or especially a specific food store. Many of Costco's consumable products are offered for sale in case, carton, or multiple pack quantities only,[24] including many foodstuffs and other items one could purchase at a grocery store, such as two loaves of sliced bread bundled together, a case of kidney bean cans, 15 rolls of paper towels, and a 33.9-ounce can of ground coffee. It is not possible at Costco to purchase an individual-sized pastry, a quart of milk, a small spice jar, a dozen eggs, or just a pound of butter. Costco food sales are clearly targeted toward large families, restaurants, event organizers, and other consumers with extensive storage capacity. Accordingly, Costco is not the type of store where the average household consumer will stop by once or twice a week to round out the pantry and purchase ingredients for intimate family dinners. Therefore, individual local businesses that do serve the market for more individualized grocery purchases are not likely to be significantly affected by Costco.

In addition, given the very limited number of SKUs, selection is not the hallmark of Costco, as there is often only one brand at a time available of certain items, such as canned peaches or tomato sauce. Product depth is especially limited. For example, only a few varieties of soup may be for sale at a time. In contrast, in 2024 the average grocery store offered 31,795 products.[25] This is nearly 8 times

[20] These statements and information can be found here: Costco Wholesale Corp, 10-K, For the fiscal year ended September 1, 2024, page 5.

[25] https://www.fmi.org/our-research/food-industry-facts

more products available in the entirety of a Costco warehouse, which includes more than just food products. In contrast to Costco's few varieties of soup, a traditional grocery store will have shelves filled with multiple brands and multiple varieties. The same applies to many other products, such as canned beans, canned fish, bread, cookies, etc.

Checkout Procedures. Costco is further distinguished from the average retailer pursuant to its payment options and how it assembles items purchased by customers. Costco warehouses accept cash, checks, certain debit cards, and certain (but not all) credit cards, including Costco cobranded cards.[26] These methods of payment may limit Costco's customer base. Once a customer has made purchases, Costco does not provide bags (to minimize costs and waste) or bagging services. Some items are loaded into packing boxes by Costco cashiers, but the balance of goods are either reloaded back into the shopping cart by the Costco cashiers or can be placed into bags provided by the customer. This approach may further limit Costco's customer base among customers accustomed to merchandise bagging, including by store clerks.

Sales Impact Implications

These Costco retail merchandising factors will likely contribute to the dispersal and lessening of potential food store sales impacts resulting from the Project. Because of the comparatively limited number of products available for purchase, the bulk nature of the products, and the bagging and purchasing procedures implemented at Costco, the potential for sales to be diverted away from any of the existing retailers selling food products to an extent so severe as to cause store closure is highly unlikely, despite the maximum estimated food stores impact of $48 million. Many factors are likely to moderate this maximum impact.

There are a large number of stores distributed across a large geographic area, identified as at least 28. Because existing and anticipated Costco members are also distributed across a relatively large geographic area, shopping pattern changes away from existing stores will also be widely distributed. However, most shoppers will need to continue shopping elsewhere to purchase the full complement of food supplies needed to equip their household. Moreover, existing stores can adapt their merchandising mix and customer service strategies to be more resistant to prospective sales impacts, regardless of the source (e.g., the Project or other major retailer). Retailing is highly dynamic, with the nature of competition continuously changing. Thus, retailers regularly modify their strategies to distinguish themselves in the market and to retain market share.

The estimated $16 million to $48 million in food store sales impact will occur among a wide range of existing stores, as Costco appeals to a wide range of shoppers. Therefore, discount grocery stores as well as conventional grocery stores alike are anticipated to incur some sales losses as shoppers replace some of their regular store shopping trips with Costco shopping trips. The actual performance of the market area grocery stores and other stores selling food products is not available. However, most stores appear to have robust performance with a dedicated customer base.

To approximate a general idea of where food store impacts might be concentrated, ALH Economics prepared an analysis sorting the stores identified in Exhibit 13 into three categories defined by distance from the El Dorado Hills Costco site. The categories were defined by the natural breaks in distance, with the First Tier including stores located 1.5 to 6.0 miles from the Costco site, the Second Tier including stores 13.5 to 17.6 miles from the Costco site, and the Third Tier including stores 22.5

[26] Costco Wholesale Corp, 10-K, Ibid

to 31.2 miles from the Costco site. A Fourth Tier is also identified, as a catchall tier to include other food-selling stores in the market area that were not substantial enough on their own to be included in the Exhibit 13 representative inventory. The First Tier stores include 9 stores in El Dorado Hills and Cameron Park, The Second Tier stores include 8 stores in Placerville, and the Third Tier stores include 11 stores, comprising 9 in Amador County and two relatively distant stores in Placerville and Pollock Pines.

The First through Third Tiers were paired with the size of the market area population closest to each tier and then weighted by proximity. The population estimates are not exact, but they encompass the population counts identified earlier in Exhibits 3 and 4 for communities in El Dorado and Amador counties, respectively. For the First Tier the population counts include El Dorado Hills, Cameron Park, and Shingle Springs. For the Second Tier the population counts include Placerville, Diamond Springs, and the other El Dorado County market area locations except Pollock Pines. Finally, the Third Tier includes the Amador County population within the market area plus Pollock Pines.

As shown in Exhibit 14, the market area's population is distributed 51% in the First Tier, 18% in the Second Tier, and 31% in the Third Tier. The analysis also assumes that 10% of the market area population is served by the generalized Fourth Tier stores (primarily to allocate 10% of the impact to these stores). The population counts in the First through Third Tiers were then weighted based on proximity to the new Costco site, recognizing the likelihood that persons living closer to the Costco site may have a greater propensity to shop at Costco than those living further away. These weights ranged from a high of 2 applied to the First Tier population to a low of 1 applied to the Third Tier population. The resulting weighted populations were then used to calculate estimated shares of diverted sales from each Tier, and then averaged across the number of food-selling stores in each tier. These shares are 64% for the First Tier, 17% for the Second Tier, and 20% for the Third Tier. These are percentage shares of the impacts less the Fourth Tier allocation, or 90% of the minimum and maximum impacts.

The prospective store impact results displayed in Exhibit 14 indicate a per store average impact ranging as follows:[27]

- $1.0 million to $3.1 million among the First Tier stores in El Dorado Hills and Cameron Park;
- $300,000 to just under $900,000 million among the Second Tier stores in Placerville; and
- $200,000 to almost $800,000 among the Third Tier stores in Amador County.[28]

Expressed in this manner, it seems highly unlikely that all 9 stores in El Dorado Hills and Cameron Park would experience a $3.1 million annual sales loss attributable to the economic impacts of the El Dorado Hills Costco. All of the stores in this tier are well-established and appear to be strong performers based on visual observation. The same is generally true for the stores in the Second and Third tiers, such that the respective maximum average impacts of $900,000 and $800,000 per store are unlikely to occur. Individual store impacts may be uneven, but the lower estimates of $300,000 to $1.0 million per store depending upon tier seem more likely given the inherent differences in store merchandising strategies between Costco and the market area's more traditional food stores and general merchandise stores selling food products. Thus, ALH Economics concludes that given the potential to implement adaptive strategies, and the differences in merchandising strategies, no single store engaged in food sales is likely to experience sales declines sufficient to result in store closure.

[27] Results are generally rounded to the nearest $100,000.
[28] With the exception of two El Dorado County stores also located in this tier.

GASOLINE STATION IMPACTS

Prevalence of Market Area Gas Stations

Relative to the market area, the approximately $27.5 million maximum sales impact in gasoline stations totals 7.7% of the sales base. After assuming 5% of this impact is absorbed pursuant to average, or typical retail sales fluctuations (including most likely the price of gasoline given its relative volatility compared to other consumer products), that leaves a minimum 2.7% impact, or $9.7 million (see Exhibit 12).

Exhibits 15 and 16 identify 34 gas stations in the El Dorado County portion of the market area, with a total of 71 fueling stations and 142 handles. Exhibit 17 identifies an additional 13 gas stations in the Amador County portion of the market area, with 45 fueling stations and 90 pumps. Therefore, there are at least 47 gas stations in the market area with 116 fueling stations and 232 pumps.[29] This compares to the 16 fueling stations and 32 handles at the proposed El Dorado Hills Costco fueling facility. Hence the Project will increase the market area's gasoline handle inventory by 14%.

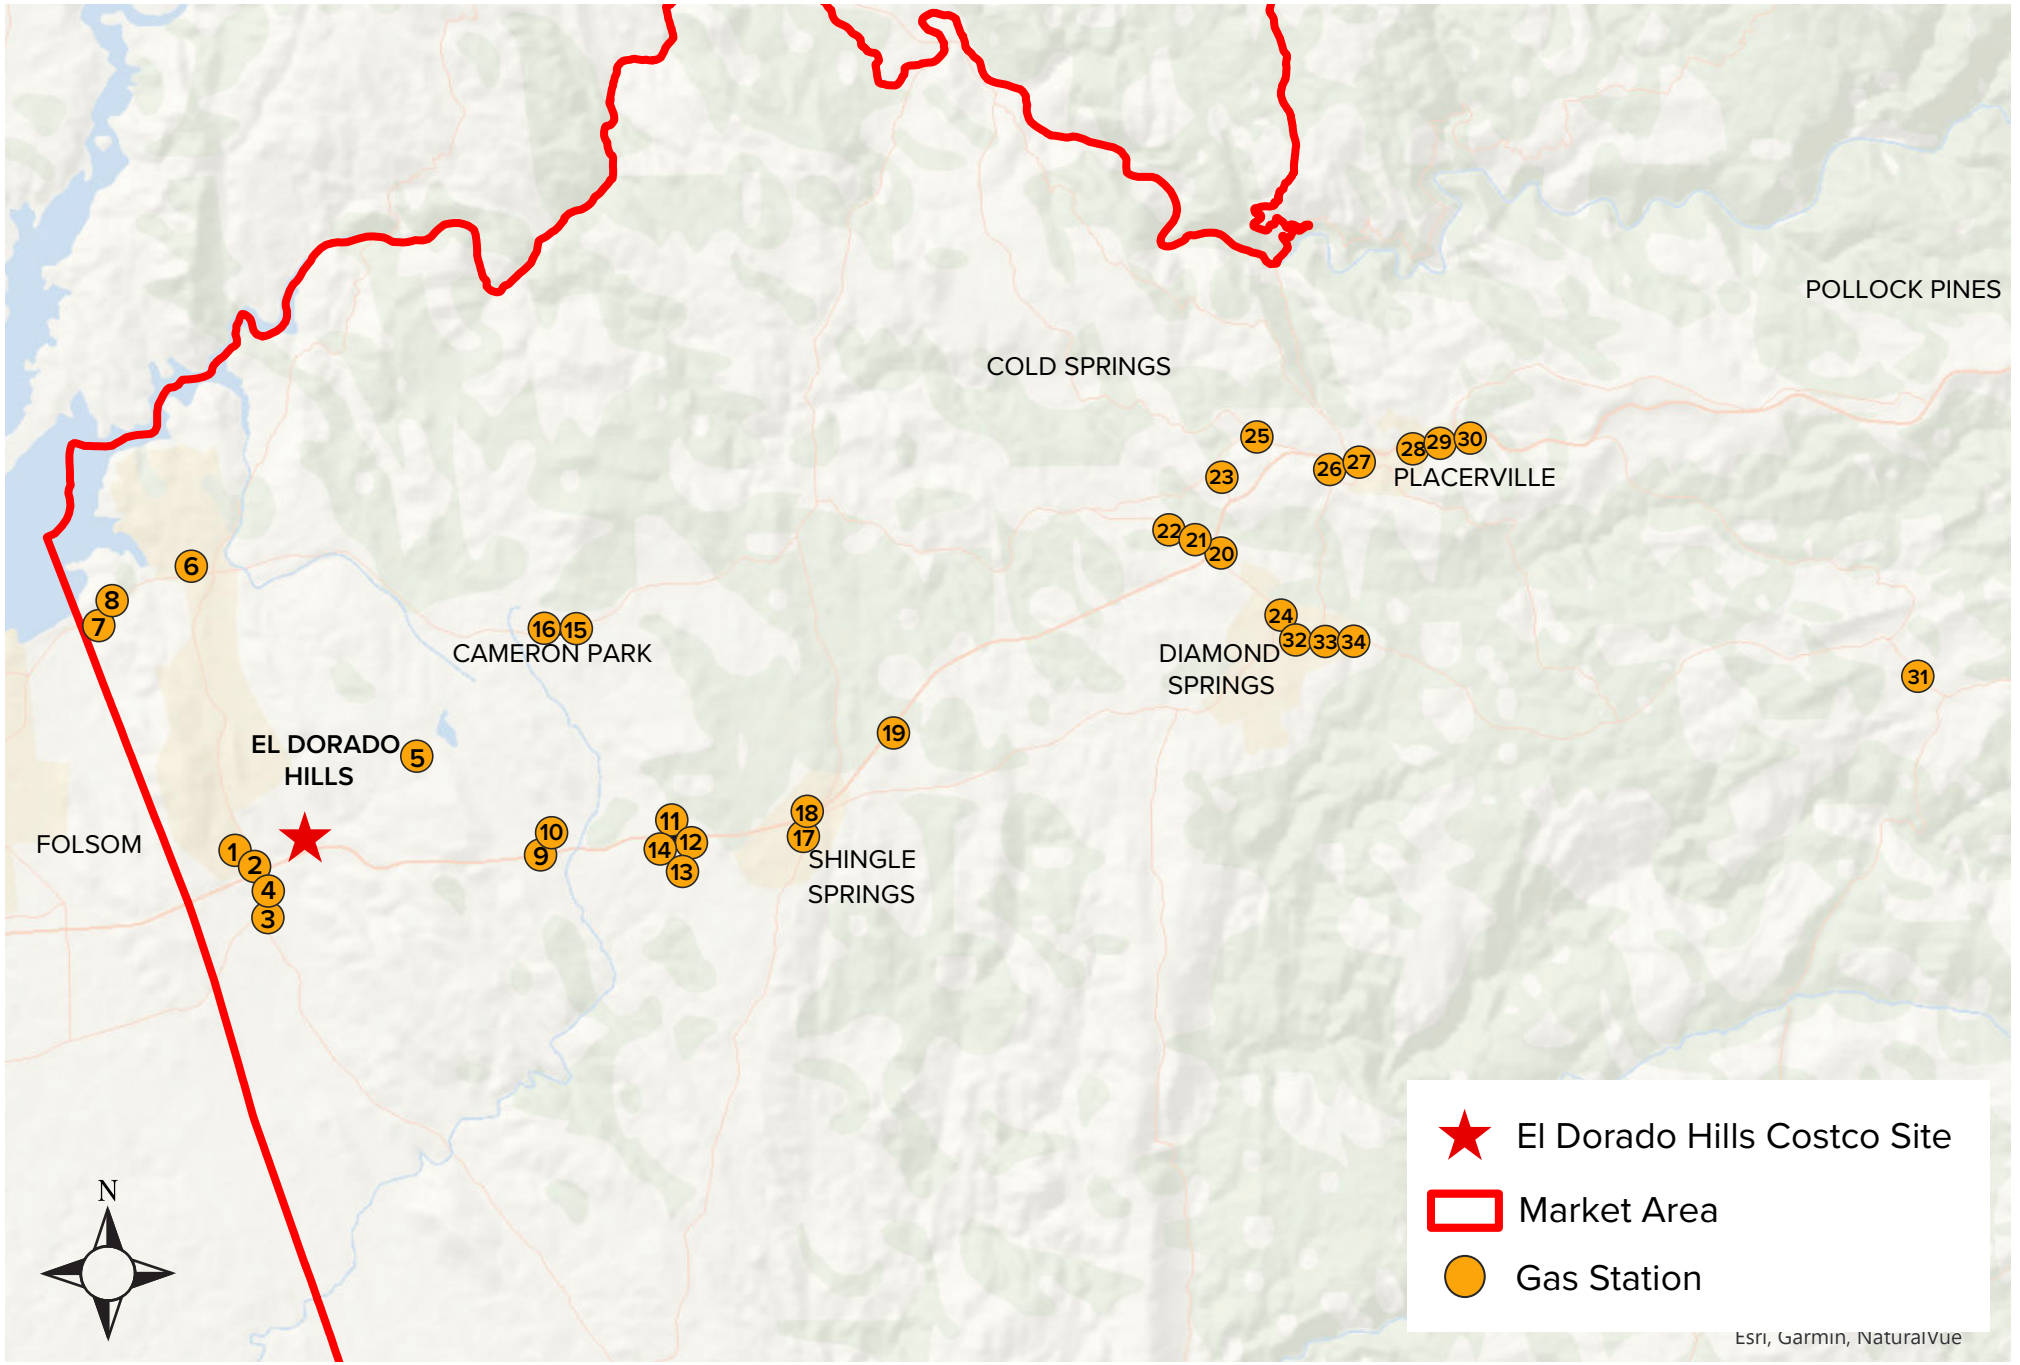
These gas stations are geographically mapped in Figure 3 (El Dorado County) and Figure 4 (Amador County). ALH Economics visited all the gas stations listed in Exhibits 15-17 and gathered key operating information, including number of fueling stations and pumps, price of gasoline, name and relative size of the gas station's convenience store (if any), hours of operation for the gas pumps and store, and unique gas station features. The gas stations were visited over multiple days. For each of those days the gas prices at the Costco in Folsom were also gathered for comparison purposes.

Market Area Gas Station Characteristics

The gasoline price comparison information indicates that in the El Dorado County portion of the market area, 13 of the 34 gas stations had at least some gasoline price equal to or lower than the Costco price on the survey day. These included only gas stations 5 or more miles from the Project site (6 gas stations are less than 5 miles from the Project and 27 are located 5 – 17.3 miles distant, with one outlier around 24.5 miles away). In addition to some selective low gas prices, gas was available for purchase 24/7 at every El Dorado County gas station. This is equivalent to gas availability 168 hours per week. In contrast, Costco fuel facility hours are more limited, with gas available for purchase 108.5 hours per week. Thus, the El Dorado County gas stations are open more than 50% more hours than the Costco fuel facility. This is a significant distinction between Costco and the market area gas stations, with consumers having comparatively more flexibility in when they can purchase gasoline from market area gas stations. Further distinguishing these gas stations from Costco is the presence of a convenience store at every El Dorado County gas station. At 12 of these gas stations, the store hours were also 24/7; hours at the other 22 gas station convenience stores typically extend from 5:00 or 6:00 am to 10:00 or 11:00 pm. Finally, about 40% of the El Dorado County gas stations have yet additional features not present at the planned Project. These primarily include car wash stations with some also offering repair services and smog checks.

[29] These gas stations are representative, and yet additional gas stations may be present in the market area.

FIGURE 3. EL DORADO HILLS COSTCO PROJECT MARKET AREA
EL DORADO COUNTY GAS STATIONS



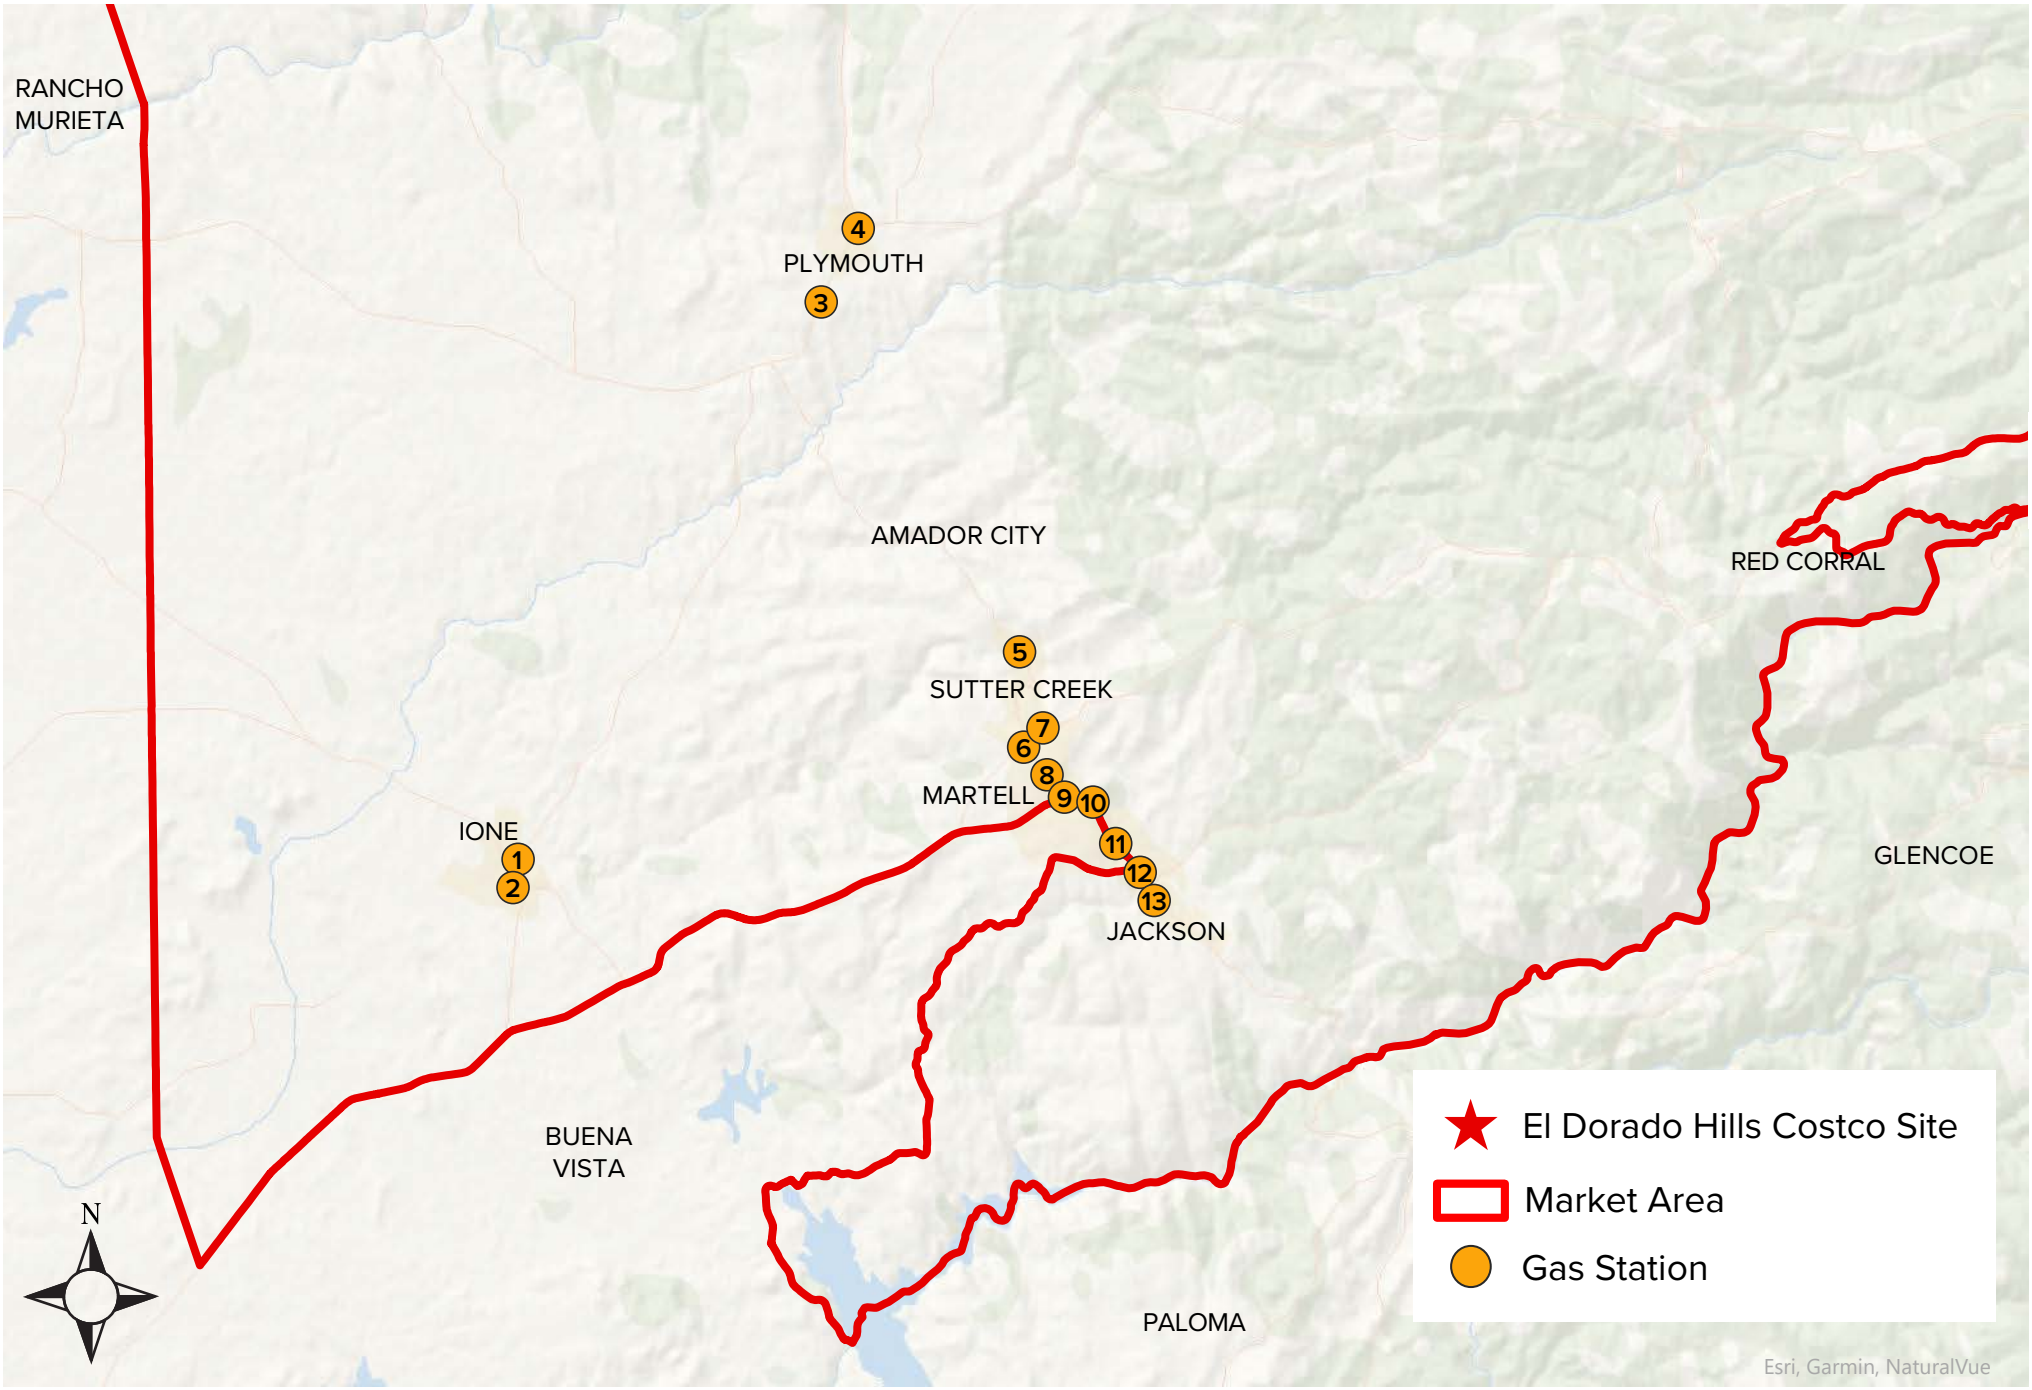


FIGURE 4. EL DORADO HILLS COSTCO PROJECT MARKET AREA
AMADOR COUNTY GAS STATIONS

In the Amador County portion of the market area, none of the 13 gas stations had any gasoline prices lower than Costco. This likely reflects the more rural nature of Amador County, plus the location of all the gas stations 20 – 30 miles from the Project site. All but one of these gas stations has gas available 24/7, hence with greater availability than at Costco. In addition, all but one of the Amador County gas stations has a convenience store of some kind. Unlike in El Dorado County, few of the Amador County gasoline stations have any additional features.

There are some other notable differences between Costco gasoline sales and the market area gas stations. Most notably, only Costco members can purchase gas at Costco gas stations. In contrast, any consumer can purchase gas at the market area's 47 gas stations, which offer the same or a wider range of fuel products, are open longer hours, sell on-site convenience store products (with many of the convenience stores providing customer restrooms, which are not a Costco fueling station feature), and in many cases provide expanded automobile services. All of the existing gas stations have more customer service offerings than Costco and they all have access to a broader customer base because they do not have a customer membership requirement.

Moreover, the market area as a whole, and individually including the El Dorado County and Amador County portions, achieves significant retail sales attraction in gasoline sales. This indicates that the gasoline sales sector is one of the market area's strongest performing retail sectors, clearly satisfying regional demands in excess of local needs.

Sales Impact Implications

The estimated $9.7 million minimum to $27.5 million maximum market area gasoline sales will be dispersed throughout the market area. To some extent the impacts could be greatest closest to the Project site, as it would be easier for Costco members to redirect their gasoline purchase trip from stations closer rather than more distant from Costco. However, even gas stations further from Costco are likely to experience sales diversions depending upon how well consumers can time their purchases coincident with a shopping trip to the Costco warehouse. This is especially the case as current market area Costco members are already likely purchasing gas at Costco in favor of existing market area gas stations when feasible.

The timing of gasoline purchases are often dictated by need, not by choice, and a Costco member who lives or works at the perimeter of the market area will often need to pump gas into their vehicle when in a location distant from the Costco fuel facility. Nevertheless, it is possible that gas stations with higher gas prices in the area near the Costco might encounter a more competitive marketplace, with a disproportionate decline in customer sales. However, Costco gas lines can be long, and time-stressed consumers will choose to purchase gas at other locations rather than go an extra distance to wait in line behind other gasoline customers. In addition, the longer hours at market area gas stations and presence of amenities relative to Costco (e.g., convenience store, restroom, and ancillary services) will comprise comparative market area gas station advantages. Therefore, ALH Economics concludes that the gasoline sales impacts will likely be dispersed to the extent that no single or small set of gas stations will bear the brunt of the sales impacts and risk closure as a result. This is especially the case if the gas station impacts are at the lower end of the estimated range of impacts. Moreover, case study research previously conducted by ALH Economics in communities with new Costco fuel facilities indicated that while revenues at other area gas stations may experience an initial dip after the Costco fuel facility opening, over time, gas station revenues are recouped, and often increase, even adjusting for the volatility of gasoline prices.

VII. CUMULATIVE PROJECTS

This analysis seeks to quantify the impact of the Costco Project taking into consideration other planned competitive retail projects within the market area. The cumulative projects that have been assessed for impacts include retail developments that are in various stages of entitlement or planning.

IDENTIFIED RETAIL DEVELOPMENT PROJECTS

ALH Economics identified five potential cumulative development projects in the market area with retail components. Projects with at least 25,000 square feet of planned retail space are included in the cumulative projects. Information about these projects was primarily derived from review of public documents and interviews with local government sources. These five projects are described in Exhibit 18, and are organized based on their development or public review status, including projects under construction, projects approved but not yet under construction, and projects under review. The five projects have total retail potential of 550,646 to 711,382 square feet, with most also encompassing other land uses, especially residential. The projects are located between 1.7 and 30 miles of the El Dorado Hills Costco site.

The cumulative projects are mostly all located in El Dorado County, with just one in Amador County. The El Dorado County projects are located in Placerville and Unincorporated El Dorado County, including El Dorado Hills. The Amador County project is located in Unincorporated Amador County near Martell.

Only one cumulative project is currently under construction. This project is "Crossings at El Dorado" in Placerville, which is a 132,126-square-foot all retail project located 13.6 miles from the Costco site. This new community shopping center is located adjacent to the existing Prospector's Plaza. As of June 2025, some of this project's pad buildings were complete and operational, but the majority of the space was still under construction. Representative tenants identified for this project include 7-Eleven, Petco, Michael's, and Five Below. Notably, none of the anticipated tenants identified for this project include food sales that would be competitive with the high volume of food sales anticipated to be generated at Costco.

One additional project with a planned retail component is approved, located in El Dorado Hills. This project is situated 1.7 miles from the Costco site, and is named "Montano de El Dorado Phase II. This is a planned mixed-use development project comprising an expansion of the existing Montano de El Dorado boutique lifestyle retail center near El Dorado Hills Town Center. This approved project includes 75,316 square feet of retail divided among 8 buildings. However, since the 2021 approval of this project the applicant has identified plans to alternatively develop the land with multifamily residential housing, so actual development of the approved retail space is uncertain.

The three other cumulative projects are all under review in their respective jurisdictions, which include El Dorado County and Amador County. These projects are "Gateway El Dorado" in El Dorado Hills, "Village of Marble Valley" in Unincorporated El Dorado County, and "Wicklow Way Specific Plan" in Unincorporated Amador County. All three projects include a range of land uses, with retail space comprising just a portion, ranging from 100,000 to 303,940 square feet per project.

CUMULATIVE PROJECT IMPACTS

The cumulative projects total 550,646 to 711,382 square feet of potential new retail space. Only 132,126 square feet of this space is under construction, with all other space either approved or under review. The approved space appears to have the potential to be converted to another land use. If this occurs, then the cumulative retail space total will drop to 475,330 to 636,066 square feet.

As demonstrated earlier, the El Dorado Hills Costco project is anticipated to have the greatest impact on the market area's food & beverage and gasoline station retail sectors. Thus, any food store and gasoline station sales generated by cumulative projects would add to these prospective impacts. However, based on the size of cumulative project retail components, and constituent buildings where identified, it is unlikely that any cumulative project will include a food store. Moreover, it is too speculative at this time to forecast the retail uses at the three cumulative projects that are under review. In addition, none of the cumulative projects appear at this time to include plans for new gas station development.

This probable lack of food store and gas station development indicates there will likely not be any cumulative project impacts in these retail categories. While El Dorado Hills Costco sales may compete with sales in other retail sectors, those impacts are low enough to likely be absorbed in the normal course of doing business in the market area. The same is likely the case among the cumulative projects, as even with Costco's recapture of existing market area leakage some leakage will still remain. This remaining leakage is in these retail categories: motor vehicles & parts dealers, home furnishings & appliance stores, clothing & clothing accessories stores, and food services & drinking places. If the cumulative projects include tenants representative of these retail categories then those tenants will likewise have the potential to recapture existing leakage. This is especially likely in the food services & drinking places retail category, which as shown in Exhibit 12 has the greatest amount of remaining leakage ($125.6 million) while various forms of restaurants are likely to be major cumulative retail project retail uses, including at "Crossings at El Dorado", the one cumulative project most likely to be developed in a timeframe coincident with the Costco Project.

In conclusion, the cumulative projects are not anticipated to significantly increase or change the market area impacts associated with the El Dorado Hills Costco Project.

VIII. URBAN DECAY DETERMINATION

The purpose of this chapter is to assess the degree to which development of the Costco Project will or will not contribute to urban decay. This chapter discusses the definition of urban decay, the study's approach to determining urban decay potential, and ALH Economics' urban decay determination.

STUDY DEFINITION OF URBAN DECAY

For the purpose of this analysis, urban decay is defined as, among other characteristics, visible symptoms of physical deterioration that invite vandalism, loitering, and graffiti that is caused by a downward spiral of business closures and long term vacancies. The outward manifestations of urban decay include, but are not limited to, plywood-boarded doors and windows, parked trucks and long term unauthorized use of the properties and parking lots, extensive gang and other graffiti and offensive words painted on buildings, dumping of refuse on site, overturned dumpsters, broken parking barriers, broken glass littering the site, dead trees and shrubbery together with weeds, lack of building maintenance, homeless encampments, and unsightly and/or dilapidated fencing. A project's economic impacts on a community are only considered significant if they lead to adverse physical changes in the environment.

APPROACH TO DETERMINING URBAN DECAY POTENTIAL

ALH Economics engaged in several tasks to assess the probability of urban decay ensuing from Project development. These tasks revolved around assessing the potential for closed retail store spaces, if any, to either (a) remain vacant for a prolonged period of time such that they contribute to the multitude of causes that could eventually lead to urban decay, or (b) be leased to other retailers within a reasonable marketing period. Part of this research focused on assessing if sufficient retailer demand exists to absorb vacated space in the event existing retailers close due to any negative economic impacts of the Project and the development of other planned retail. ALH Economics conducted field research and contacted real estate brokers and third party resources to determine the commercial health of the market area.

THE CURRENT ENVIRONMENT

ALH Economics conducted fieldwork throughout the more heavily retailed portions of the market area. The purpose of this fieldwork was to examine the physical condition of major shopping centers and shopping corridors, especially ones with stores competitive with Costco, to identify existing retail vacancies, and to assess their condition and appearance. A four point rating system was applied to each center's vacancies as a whole, including Poor, Fair, Good, and Excellent.

Area Commercial Retail Vacancies

All of the commercial shopping centers where competitive stores are located were examined during field research to identify and inventory any existing vacancies. The physical conditions of the vacancies were also reviewed, to assess their current state relative to the characteristics indicative of urban decay. Follow-up research on the vacancies was conducted via internet research and outreach to commercial real estate brokers representing the various vacancies. Additional centers in select areas were also inventoried, despite the lack of a grocery store or general merchandise store anchor tenant. The purpose of this inclusion is to highlight the difference in performance and condition between

centers with and without anchors competitive to Costco. Notably, in general, retail operating within a 5% to 10% vacancy rate is typically considered indicative of a healthy retail market, as some vacancy facilitates strategic repositioning and the attraction of new tenants with higher growth potential, leading to a more vibrant and competitive market.

Some of the commercial centers where competitive stores are located have no apparent or visible vacancies, but the majority of the centers have some degree of vacancy. Many of the relevant centers are identified on Exhibit 13 in association with the identification of representative grocery stores, other food stores, and general merchandise stores. Summary information on this exhibit in the "Adjoining Vacancies" column identifies the number and relative size of existing vacancies. Several centers are also noted as having no vacancies at the time of the field research in late spring and early summer 2025.

The centers with existing vacancy and select information on the vacancies are presented in Exhibits 19 and 20. Where available, the information presented includes center name and address, year built, miles from the Project site, gross leasable area (GLA), anchor tenants, amount of vacant square footage including size and number of vacancies, vacancy rate, condition of the vacancies, and select notes on the vacancies or property. Exhibit 19 pertains to centers located in the El Dorado County portion of the market area and Exhibit 20 pertains to select Amador County retail vacancies. Notes on the vacancies and photos of representative vacancies are maintained in ALH Economics' project files.

El Dorado Hills Vacancies. In El Dorado Hills, ALH Economics identified five shopping centers with tenants included in the competitive store inventory that are operating with some vacancies. These centers range in size from 100,698 square feet at the relatively new Sienna Ridge center (built 2020), located 3.2 miles from the Project site, to 448,256 square feet at El Dorado Hills Town Center, 1.5 miles from the Project site. The Sienna Ridge shopping center, anchored by Safeway, is still experiencing initial build out, with the expected completion of a 1,527-square-foot pad in Summer 2025. An additional 3,559 square feet is unoccupied, but still under lease, so technically not vacant. Nevertheless, there are two parties interested in the space. One small space of 900 vacant square feet is under negotiations.

The vacancies among the older shopping centers in El Dorado Hills, built between 1992 and 2007, are all in good to mostly excellent condition. All four of the centers anchored by a grocery store are operating at well below 5.0% vacancy. Commercial brokers representing the vacant spaces generally indicate there is strong market interest for vacancies. One of these centers, Market Place at Town Center, previously had a long-term vacancy (beginning 2012), comprising 23,435 square feet occupied by CVS prior to its relocation. For many years, CVS continued to hold and pay on this lease, so it was not available for backfilling. Once the CVS lease expired, Ace Hardware took over the space, and appears to be meeting with strong market demand.

Cameron Park Vacancies. The information on the properties located in Cameron Park indicates that almost three quarters of the selected retail centers with existing vacancy were built approximately 20 or more years ago. All but one of the nine Cameron Park centers identified in Exhibit 19 are located 5.5 or more miles from the Costco site. Only two centers have grocery or other stores competitive with Costco. These include the Goldorado Shopping Center anchored by Bel Air and Cameron Park Place anchored by Safeway. Notably, these centers are operating at relatively low vacancy rates of 5.5% and 6.8%, respectively. Of the identified centers with existing vacancy, these are the lowest vacancy rates. The vacancies at these centers appear to be in good or excellent condition. These are likely equilibrium vacancy rates for these two centers, as the Goldorado Shopping Center, with 6.8% vacancy, lacks visibility, which is challenging for existing and prospective retailers. The 5.5% vacancy

rate at Cameron Park Place is attributed by the commercial broker representing the space to the relatively small size of the Cameron Park market.

Two other Cameron Park centers are grocery store adjacent. These include Cameron Park, adjacent to Forklift, and Green Valley Station, adjacent to the market area's newest grocery store, Grocery Outlet (opened October 2023). These two centers have among the second lowest levels of existing vacancy, at 8.3% and 8.4%, respectively. Their vacant spaces appear to be in excellent condition. All the other Cameron Park retail centers have substantially higher vacancy rates, of 30% or greater. One center, which is really a stand-alone retail space, is noted with 100% vacancy. However, this former Rite-Aid, closed in 2022 during the Covid-19 Pandemic, is slated to become a new Dollar Tree store. The other two centers with high vacancy, Cameron Park Plaza and Winery Plaza, appear to be victims of owner disinterest, due to long-distance ownership, and are essentially located adjacent to each other. This appears to be a neglected retail node, although the new Dollar Tree opening in the former CVS space is also located at this node.

Among the two Cameron Park centers with high vacancy rates, the condition of their respective vacancies appear to be in fair (Winery Plaza) to good condition (Cameron Park Plaza). The vacancies at Cameron Park Plaza appear to be in good condition, with no visible signs of decay. There may be plastic sheeting covering some windows from inside, but this is not an indicator of urban decay. At Winery Plaza, the vacancies have been available for several years. The leasing broker for the center indicates interest is expressed from time to time, but is never followed through. These vacancies are in fair condition, with some visible rust and other staining on the façades. Still, this is not an indicator of urban decay, as the center is reasonably well maintained, there is no visible trash, and no windows are boarded up and no graffiti is present. In many rural and country settings, this exterior appearance, especially for an older property, is the norm.

Placerville Vacancies. There are five centers in Placerville included in Exhibit 19. Three of these centers are anchored by a grocery store, with the other two centers located across a road from stand-alone grocery stores. All of these centers are at least 13.5 miles from the Costco Project site, with the furthest located 24-25 miles away. These centers range in size from about 20,000 square feet to over 240,000 square feet. Retail vacancy is highest at 10.6% for the oldest center in Placerville, Apple Farm Place, originally built in 1973 (and renovated in 2022/23). The six vacancies at this center have been vacant for about three years. Nevertheless, the center and vacancies appear to be in good condition. The existing tenants at this center have a discount orientation, including Grocery Outlet and Dollar Tree.

The two other Placerville shopping centers anchored by a grocery store are operating at low vacancy rates of 1.5% and 5.1%. These are also the largest centers, with 243,000 square feet at Prospector's Plaza anchored by Save Mart and Target and 119,928 square feet at Missouri Flat Village, anchored by Safeway. The one vacancy at Prospector's Plaza is in good condition, while the more numerous vacancies at Missouri Flat Village are in excellent condition. The only Placerville center with vacancies deemed to be in fair condition is the relatively small Pleasant Valley Square, located out in the country, 24-25 miles from the Costco Project site and across the road from the stand-alone Holiday Market.

Amador County Vacancies. Exhibit 20 for Amador County includes five properties, four of which are retail centers with vacancy and one of which is a long-term vacant retail building. These properties are all 28-31 miles from the Costco Project site. The long-term vacancy is the former K-Mart space in Martell, across the road from Martell's Walmart store. The K-Mart was closed in 2017 and the space has remained vacant ever since, with the property available for sale or lease. Following recent community efforts to clean up the site and enhance its curb appeal the property appears to be in

generally good condition, although there is one area of the building that is in disrepair (under the eaves along the front).

The two shopping centers with the more conventional grocery stores are both operating at very low vacancy, with 3.7% at Amador Ridge Plaza in Martell with multiple anchor tenants including Safeway, and 1.1% at Jackson Creek Plaza in Jackson anchored by Cost Less Food Co. The limited vacancies at both these centers appear to be in good condition. At the large Amador Ridge Plaza (272,948 square feet), vacancies tend to lease up after about 6 to 12 months, which is a reasonable and respectable time frame.

Jackson's Grocery Outlet is located in a small, out of the way, center, previously paired with a Joann Fabric and Crafts store. Due to the closure of the entire Joann chain, the Joann space was vacated in spring 2025. City of Jackson representatives indicate no interest has yet been expressed in renovating or retenanting the space. Nevertheless, it is in good condition. Prior to occupancy by Grocery Outlet and Joanne, this center was a Safeway store. Hence the current occupancy is an example of retail backfilling of a grocery store in the Costco Project market area.

Finally, the Mother Lode Plaza is a relatively older retail center, dating from 1977-1979. The amount of vacancy is unclear, given recent changes in property management, but appears to be about 25%. This center is a bit run down, with on-site indications of personal vehicle sales. The only relevance of this center to the Costco Project is the tenancy of Gold Trail Natural Foods, a small, specialty food store. However, given the specialized products sold at this store and its distance from the Costco Project site, this store is highly unlikely to be competitive with Costco and is not likely to experience any sales impacts as a result of the Costco warehouse operations.

Vacancy Summary. In summary, this review of representative commercial vacancies in the Costco Project market area indicates that the majority of centers with stores potentially competitive with Costco are operating at healthy vacancy rates (or none at all) with existing vacancies being well-maintained and in good to excellent condition. Some longer term vacancies have recently or will soon be backfilled, although the large vacant K-Mart in Martell remains available. Despite this building's long-term vacancy of about 8 years, efforts were recently made to improve the property's curb appeal. Other vacancies in well-located centers with good visibility appear to attract prospective tenant interest.

Overall, while some market area retail vacancies may be located in older properties not characterized by stringent upkeep, ALH Economics does not consider them indicative of widespread urban decay, as they do not generally exhibit the typical signs of urban decay such as plywood-boarded doors and windows, parked trucks and long term unauthorized use of the properties and parking lots, extensive gang and other graffiti and offensive words painted on buildings, dumping of refuse on site, overturned dumpsters, broken parking barriers, broken glass littering the site, dead trees and shrubbery together with weeds, lack of building maintenance, homeless encampments, and unsightly and/or dilapidated fencing.

IMPACT ON COSTCO'S FOLSOM WAREHOUSE AND FUEL FACILITY[30]

As noted earlier in the analysis, in Chapter III, Projected Costco Sales, 54% of the El Dorado Hills Costco warehouse sales and 7% of the El Dorado Hills Costco fuel facility sales are estimated to be diverted from Costco's existing Folsom warehouse and fuel facility, for a total of $144 million in shifted annual sales. Also as noted earlier, in Section II. Study Background, Costco is developing the new facilities in El Dorado Hills because the Folsom warehouse and fuel facility are operating over ideal capacity. Consequently, some members are deterred from shopping in Folsom because of the high volume of shoppers and congestion.

According to communication from Costco representatives, Folsom sales have increased by nearly 53% over the last 10 years. As a result, the Folsom warehouse is the highest generator of sales in the Sacramento market. Accordingly, this suggests the Folsom facilities are achieving substantially higher sales per square foot than the $1,800 figure estimated for El Dorado Hills. Costco representatives confirm that Folsom sales performance exceeds this more generalized average. Further, Costco has developed its own internal estimates of the share of Folsom sales that will transfer to El Dorado Hills when the latter is fully operational. Based on the 150,000-square-foot size of the Folsom warehouse [31] and the share of sales Costco estimates will transfer to El Dorado Hills, for analytical purposes ALH Economics assumes this warehouse is performing 50% above this study's $1,800 per square foot estimate for El Dorado Hills. If that is the case, which ALH Economics believes is a reasonable estimate given the strong performance of the Folsom warehouse, then sales at Folsom (inclusive of gasoline) are $405 million. The estimated $144 million in sales diverted from Folsom to El Dorado Hills will comprise 36% of Folsom's estimated existing sales. This figure is generally comparable to the estimate provided by Costco.

The impact of this sales loss at Costco's Folsom facilities is not anticipated to be severe enough to cause the Folsom facilities to close, and thus are not anticipated to cause or contribute to urban decay. This finding is based on several factors. One major factor is that Costco is seeking to open in El Dorado Hills to provide a more enjoyable shopping experience for Members who will continue to live closest to Folsom and shop there. Second, for the purpose of this study, Costco provided information about Costco warehouse impacts in other California and Pacific Northwest communities when a new warehouse opened near an existing warehouse.[32] These included the following comparatively new warehouses:

- Hanford in 2016, near an existing Visalia warehouse;
- Redmond, WA in 2016 near an existing Kirkland, WA warehouse;
- San Jose's Great Oaks neighborhood in 2017 near an Almaden neighborhood warehouse;
- Elk Grove in 2018 near an existing South Sacramento warehouse; and
- SW Henderson, Nevada, near an existing Henderson warehouse.

Sales losses at the existing warehouses cited above ranged from 11% to 26%. All these existing warehouses continued operations, and built back their sales within 2 to 7 years, averaging 4.5 years. The growth market deemed by Costco to be most similar to the Folsom/El Dorado Hills area was the

[30] Select information in this section regarding Costco's existing Folsom operations was provided by Costco representatives. Communications pertaining to this information are maintained in ALH Economics' project file.
[31] See https://engageeldorado.us.engagementhq.com/edh-costco/widgets/93259/faqs#question15042.
[32] This information is also maintained in ALH Economics' project file.

last example, in Henderson Nevada. There, a sales loss greater than 20% at the existing store was built back by year 2.

While the estimated sales loss at Folsom is greater than those cited above, the Folsom store is most likely outperforming any of the identified existing warehouses. But the most significant finding represented by these examples is that Costco routinely develops new warehouses close to existing ones without impacting the existing warehouses to such an extent that they cease operations and negatively impact their respective physical environments. This provides support for the expectation that development of the El Dorado Hills warehouse and fuel facility will not negatively impact the existing Folsom warehouse such that it could close and potentially impact Folsom's real estate base.

REGULATORY CONTROLS

Owners of commercial retail properties are generally financially motivated to maintain property in a manner appropriate to retain existing tenants and attract new tenants. This appears to generally be the case in the market area portions of El Dorado and Amador counties, where the competitive retail properties are located. This is evidenced by the overall positive prevailing physical condition of the market area's retail vacancies. If property owners lag, however, and property maintenance begins to show signs of deferred maintenance or other disrepair, the various jurisdictions comprising the bulk of the market area have regulatory controls that can be implemented to avoid the onset of deterioration or decay. This report section reviews some of these regulatory controls.

Relevant Jurisdictions in El Dorado County

El Dorado County and Placerville both have ordinance codes addressing property conditions characteristic of urban decay and blight. El Dorado County's code is especially relevant to these conditions.

El Dorado County. The El Dorado County Code, adopted November 17, 2014 (with the most recent ordinance 5231 adopted June 24, 2025), includes many regulations designed to maintain the physical condition of properties in the unincorporated County areas. These regulations can serve to keep urban decay conditions at bay. The sections of the Code most applicable to urban decay characteristics include ones addressing graffiti, weeds and rubbish, illegal dumping, and nuisance abatement.[33]

The ***Title 9*** portion of the code, addressing ***Public Peace, Morals and Welfare,*** contains the basics regarding maintenance of private property. This includes ***Article II. – Vacant Buildings,*** which has a series of provisions related to the responsibility of property owners to actively maintain and manage their buildings. The Board of Supervisors finds that "When the owner of a vacant building fails to actively maintain and manage the building, the building can become a major cause of blight…vacant buildings that are boarded, substandard, or unkempt discourage economic development." The text explicitly states that it is the property owner's responsibility to maintain their property in order to prevent it from becoming a threat to "public health, safety, or welfare." ***Section 9.02.630. – Maintenance and monitoring of vacant buildings,*** further requires that vacant buildings, along with the associated landscaping, be maintained in good condition with regular trash removal, weed abatement, and the prevention of criminal activity, including illegal occupancy. Furthermore, if a vacant building cannot be secured, then the code requires it to be boarded up with posted signs

[33] See https://library.municode.com/ca/el_dorado_county/codes/code_of_ordinances for all references to El Dorado County's Municipal Code, relevant to the county's Unincorporated areas.

indicating that it is unlawful to enter or occupy the structure. While boarded up buildings can often be perceived as an indicator of urban decay, here the County's code requires this action.

Also included in Title 9 is ***Chapter 9.50. – Graffiti Abatement,*** which is intended to "summarily abate graffiti throughout the unincorporated area of the County" because graffiti "constitutes a nuisance that presents an imminent danger to the public health, safety and welfare of persons in the County and creates a negative impact on the County." Among provisions in the chapter is the requirement that the private property owner paint out graffiti within five calendar days from notice (***Section 9.50.060. – Graffiti removal***). There are also provisions for the County to recover costs associated with graffiti abatement, including liens for minors and persons creating graffiti.

Litter and weeds are specifically addressed in ***Title 8 – Public Health and Safety.*** The section regarding litter is found in **Chapter 8.42. – Solid Waste Management, Article VIII. Prohibited Acts, Nuisances, Violations, Abatement and Penalties, Section 8.42.700. – Littering, accumulation of litter, and illegal dumping prohibited.** Property owners are prohibited from allowing the accumulation of litter, trash, scrap, junk, or garbage so that it is visible to adjacent properties or the right-of-way. ***Section 8.42.800. – Abatement procedures*** under ***Article IX. Abatement and Penalties*** provides details regarding abatement of litter and penalties for violating the chapter.

Weeds and hazardous vegetation are addressed in ***Chapter 8.09 – Hazardous Vegetation and Defensible Space, Section 8.09.060. – Prohibited conduct,*** which states that a responsible person shall not "permit the accumulation of weeds, grasses, hazardous vegetation, refuse, or other combustible material on that responsible person's property or on any other property so as to constitute a fire hazard." Subsequent sections outline the duty to remove and abate hazardous vegetation and the penalties for violations.

City of Placerville. Similarly, the City of Placerville has an Official City Code with provisions to prevent the occurrence of blight, regulating items such as graffiti, litter, weeds or debris accumulation.[34] The prevailing City Code of Placerville contains ordinances up to and including ordinance 1725, passed October 22, 2024.

Under ***Title 7 Health and Sanitation, Chapter 13 Abatement of Graffiti, 7-13-4: Graffiti Prohibited,*** the code indicates that property owners and managers shall not allow any graffiti to remain on property when it is visible from the public right of way or other public or private property. The chapter indicates that property owners who are notified have 10 days to remove the graffiti, or the City will remove the graffiti itself and seek repayment from the property owner. Also under ***Title 7 Health and Sanitation*** **is** ***Chapter 7-1A Solid Waste Regulations, 7-1A-17 Prohibited Acts***, which prohibits the accumulation of "litter, trash, scrap materials, junk parts, garbage or refuse of any kind upon private property." This chapter also provides a complaint procedure to address this issue.

With respect to weeds and debris, ***Title 8 Public Ways and Property, Chapter 4 Weeds, 8-4-1 Accumulation of Weeds Prohibited*** states that property owners are prohibited from allowing "weeds, dry grass, rubbish, or other debris to grow or collect upon his property within thirty feet of any fence, house, or building." The chapter continues with the process of abating such a hazard. If the fire chief determines that a fire hazard exists, the property owner has fourteen days to eliminate the

[34] See https://codelibrary.amlegal.com/codes/placervilleca/latest/placerville_ca/0-0-0-1 for the cited references to the City of Placerville's Municipal Code.

hazard after they receive notice. If no action is taken by the property owner, the City may abate the hazard at the owner's expense.

Relevant Jurisdictions in Amador County

Amador County and the relevant cities of Ione, Jackson, and Plymouth all have ordinances in their respective codes addressing issues such as the accumulation of weeds, debris, refuse, abandoned vehicles, etc. on private properties. These ordinances are usually found in the Health and Safety (or Sanitation) sections of the respective codes. The City of Ione specifically addresses vacant or abandoned buildings in its municipal code (while other jurisdictions do not), while the City of Jackson has a section outlining property maintenance regulations in its code. Two of the jurisdictions specifically mention graffiti abatement for buildings in their codes (Ione and Jackson) while two do not reference graffiti in the context of buildings, although they do relative to signs, fences, and walls (Amador County and Plymouth).

Amador County. Amador County's General Ordinances (the Amador County Code, current through Ordinance 1862, passed April 8, 2025) have some provisions relevant to characteristics or urban decay, but is not as expansive as El Dorado County's Ordinance Code. Some of the key provisions in the General Ordinances of Amador County include the following: ***Title 7: Health and Safety***, which requires abatement of hazardous vegetation; ***Title 9: Public Peace, Morals and Welfare,*** which prohibits unlawful dumping and littering including that on a private property that creates a public health or safety hazard or public nuisance with provisions to abate such hazards; and ***Title 10: Vehicles and Traffic***, which considers abandoned vehicles a nuisance.[35]

City of Ione. In the City of Ione, the March 10, 2025, Ione Municipal Code's ***Title 8: Health and Safety (Section 8.06 Vacant, Abandoned, Distressed or Foreclosed Properties***) very comprehensively addresses conditions relevant to urban decay. This portion of the Code has the following provisions: requires registration of abandoned/vacant properties; requires maintenance, including abatement of weeds, trash, debris, and graffiti; requires security; and includes penalties for failure to comply with the measure.[36]

City of Jackson. In the Jackson Municipal Code (current through Ordinance 732 adopted 3/24/2025), ***Title 8: Health and Sanitation; Weed and Rubbish Abatement*** –requires owners to abate weed growth, refuse, and rubbish that may constitute a hazard and allows city to take corrective action and bill the owner. Title 17: Development Code includes a section regarding property maintenance prohibiting abandoned materials and dangerous conditions, and requiring the removal of trash, debris, dry vegetation, and graffiti.[37]

City of Plymouth. The Plymouth Municipal Code, which includes legislation through Ord. No. 2024-07 adopted January 9, 2025, includes one section with key relevancy to characteristics of urban decay. This section is ***Title 8: Health and Safety; Chapter 8.01 – Weed, Rubble and Rubbish Control,*** which requires property owners to keep their property clear (remove or destroy) of weeds, rubble, and rubbish that may constitute a menace to health or safety or constitute a fire menace. A

separate chapter, ***8.04, Abandoned, Wrecked or Dismantled Vehicles***, regulates abandoned, wrecked or dismantled vehicles.[38]

Regulatory Summary and Implications

During the study fieldwork conducted in spring and early summer 2025, there were very few signs of litter, weeds, or rubbish associated with the identified existing retail properties in the competitive market area. There were no visible signs of graffiti associated with the retail centers, and only a few buildings exhibited signs of structural disrepair, of a very minor nature.

Instead, vacant storefronts in most shopping centers were reasonably well-maintained with no significant signs of decay or deterioration. Thus, ALH Economics concludes that existing measures to maintain private commercial property in good condition in the El Dorado Hills Costco market area are effective and would serve to preclude the potential for urban decay and deterioration in the event any existing market area retail properties experience prolonged vacancy following the operations of the Project and any cumulative projects.

POTENTIAL FOR URBAN DECAY RESULTING FROM THE PROJECT

Definition of Urban Decay

Before considering how the Project and cumulative projects might affect the market and environs, it is useful to focus on what constitutes the *environmental* impact known as urban decay. The leading court case on the subject, *Bakersfield Citizens for Local Control v. City of Bakersfield* (2004) 124 Cal.App.4th 1184, 1204, described the phenomenon as "a chain reaction of store closures and long-term vacancies, ultimately destroying existing neighborhoods and leaving decaying shells in their wake." The court also discussed prior case law that addressed the potential for large retail projects to cause "physical deterioration of [a] downtown area" or "a general deterioration of [a] downtown area." (Id. at pp. 1206, 1207). When looking at the phenomenon of urban decay, it is also helpful to note economic impacts that do not constitute urban decay. For example, a vacant building is not urban decay, even if the building were to be vacant over a relatively long time. Similarly, even a number of empty storefronts will not constitute urban decay.

Urban Decay Conclusion

Based on the above description of urban decay, ALH Economics' analysis examined whether there was sufficient market demand to support the Project without affecting existing retailers so severely as to consequently lead to a downward spiral toward decay. Specifically, the analysis considered whether or not physical deterioration would likely result from the opening of the Project and other cumulative retail developments. ALH Economics' urban decay conclusion is based on consideration of current market conditions, findings regarding diverted sales, the backfilling potential of existing store spaces, and the existence of regulatory controls.

Overall, field research, market research, and interviews with market participants indicate that current market conditions are relatively strong, except for some older properties with absent and/or lackluster owner interest. The market area's retail inventory is generally in good to excellent condition, with well-

[38] See https://ecode360.com/PL4989 for the cited references to the City of Plymouth's Municipal Code.

located properties garnering market interest and backfilling with new retail tenants. Vacant retail properties in some markets with weak or weakening conditions often transition to alternate uses. Such conversions do not appear to be happening in the market area, demonstrating the presence of a generally healthy retail sector.

The preceding analysis estimated that market sales impacts are only likely to transpire in the food & beverage stores and gasoline station retail sectors. This is attributable to existing retail sales leakage in other key retail sectors matching Costco merchandising categories. Even with absorption of this leakage yet additional retail sales leakage is anticipated to remain in the market area. Given the large size of the market area and number of competitive food stores and gas stations, the analysis concluded that no single food store or gas station is likely to experience Project-induced sales declines sufficient to trigger store closure. However, even if any existing market area retailers were to close as a consequence of the Project and its sales impacts, retail leakage in other categories could comprise opportunities for new retailers to enter the marketplace focused on satisfying unmet market area retail demand. Moreover, there are existing governmental regulatory controls in the market area's jurisdictions designed to manage or avoid nuisances such as graffiti, broken windows, overgrown vegetation, and dilapidated building exteriors. Enforcement of these ordinances can help prevent physical deterioration due to any long-term closures of retail spaces. Thus, if any market area retail properties experience prolonged vacancy following the operations of the Project and any cumulative projects, implementation of the existing regulations will likely support abatement of conditions contributing to urban decay and deterioration.

Based upon all these findings in combination, ALH Economics concludes that the Costco Project and the identified cumulative projects will not cause or contribute to urban decay.

ASSUMPTIONS AND GENERAL LIMITING CONDITIONS

ALH Urban & Regional Economics has made extensive efforts to confirm the accuracy and timeliness of the information contained in this study. Such information was compiled from a variety of sources, including interviews with government officials, review of City and County documents, and other third parties deemed to be reliable. Although ALH Urban & Regional Economics believes all information in this study is correct, it does not warrant the accuracy of such information and assumes no responsibility for inaccuracies in the information by third parties. We have no responsibility to update this report for events and circumstances occurring after the date of this report. Further, no guarantee is made as to the possible effect on development of present or future federal, state or local legislation, including any regarding environmental or ecological matters.

The accompanying projections and analyses are based on estimates and assumptions developed in connection with the study. In turn, these assumptions, and their relation to the projections, were developed using currently available economic data and other relevant information. It is the nature of forecasting, however, that some assumptions may not materialize, and unanticipated events and circumstances may occur. Therefore, actual results achieved during the projection period will likely vary from the projections, and some of the variations may be material to the conclusions of the analysis.

Contractual obligations do not include access to or ownership transfer of any electronic data processing files, programs or models completed directly for or as by-products of this research effort, unless explicitly so agreed as part of the contract.

The fieldwork and primary research for this project was completed in August 2025. Hence ALH Urban & Regional Economics is not responsible for any market changes or data updates occurring after this timeframe. The study findings and conclusions are pertinent through August 2025.

(1) This exhibit classifies Costco sales into the major retail categories used for retail sales classification purposes by the State of California Department of Tax and Fee Administration. The Costco category sales distributions are for pre-tax sales.
(2) Category descriptions and percentages are presented in the Costco Wholesale Annual Reports cited in the Sources.
(3) The sales categories reported by Costco Wholesale do not clearly match the State of California Department of Tax and Fee Administration (CDTFA) retail sales categories. ALH Urban & Regional Economics distributed the Costco Wholesale per category sales among the DTFA categories based upon information previously shared by Costco and professional judgment pursuant to select Costco store site visits to examine the mix and array of merchandise.
(4) Sundries includes candy, snack foods, tobacco, alcoholic and nonalcoholic beverages, and cleaning and institutional supplies.
(5) Hardlines includes major appliances, electronics, health and beauty aids, hardware, office supplies, cameras, garden and patio, sporting goods, toys, seasonal items, and automotive supplies.
(6) Food includes dry and institutionally packaged foods.
(7) Fresh food includes meat, bakery, deli, and produce.
(8) Softlines include apparel, domestics, jewelry, housewares, media, home furnishings, and small appliances.
(9) Ancillary and Other includes gas stations, pharmacy, food court, optical, one-hour photo, hearing aid, and travel.

Sources: Costco Wholesale Annual Report, Fiscal Year Ending 9/1/24, pages 6, 20, and 60; Statista; Gurufocus.com; El Dorado Costco CEQA Analysis [DRAFT], El Dorado County, California, February 14, 2025, Kittelson & Associates, pages 12, 15, and 17; and ALH Urban & Regional Economics.

(1) Transportation impact analysis for the Project prepared by Kittelson & Associates includes assumptions regarding shifting of existing trips to the Folsom warehouse and fuel facility to El Dorado Hills. The Kittelson & Associates assumptions are based upon shopper data and information provided by Costco. Based upon analysis presented in a February 14, 2025 Kittelson & Associates report for the Project, ALH Urban & Regional Economics assumes that 54% of warehouse purchases in El Dorado Hills will be shifted from Folsom, and 7% of fuel purchases in El Dorado Hills will be shifted from Folsom. These percentages were derived from Kittelson & Associates estimates of shifted trips by type of trip, with additional weight allocated to trips of a primary nature, i.e., a trip planned with Costco as an explicit destination.
(2) A portion of Costco sales are made by businesses that later engage in resales of the products purchased from Costco. These sales are considered wholesale purchases, and are exempt from sales tax at the time of purchase. They are also not reported by the State of California Department of Tax and Fee Administration in the same manner as other, more commercial purchases. This is relevant because subsequent analysis reflected in this study's series of exhibits is highly dependent on taxable sales data reported by the State of California. For the sake of the analysis, ALH Urban & Regional Economics assumes that 16% of El Dorado Hills Costco warehouse sales will be made by members with resale licenses. Therefore, the analysis assumes that 16% of El Dorado Hills Costco store sales will be to wholesale customers, i.e., customers whose typical purchases are not reported as retail purchases, and 84% will be to household and business customers that qualify to pay sales tax on taxable items. The exception is gasoline sales, all of which are allocated to retail consumers as all of these sales are assumed to be taxed, and this is the same as a consumer-based taxable retail sales purchase. The 16% and 84% assumptions are based on analysis of Costco's Membership base, as presented in Costco's Annual Report for the fiscal year ending 9/1/24 (see page 6).
(3) Total sales, inclusive of gasoline sales, are estimated to total $1,800 per square foot, applied to the warehouse size of 165,000 square feet. The per square foot sales estimate is based on analysis of several sources, including Costco Wholesale's Annual Reports (including pages 20 and 60 in Costco's Annual Report for the fiscal year ending 9/1/24) and industry internet resources, such as Statista and Gurufocus.
(4) See Exhibit 1.
(5) As noted in footnote (1), Costco gasoline sales are assumed to only be made by retail consumers, and not wholesale consumers for resale purposes.

Sources: "The Economic Impact of Travel, California: 2024p Calendar Year; State, Regional, & County Impacts," May 2025, Prepared for Visit California, by Dean Runyan Associates; and ALH Urban & Regional Economics.

(1) See Exhibit 2.
(2) The analysis assumes that the Costco Warehouse and Fuel Facility will draw a share of non-market area shoppers to El Dorado Hills because of tourist spending, such as tourists traveling to Lake Tahoe, a popular vacation location. Based on considerations of the market area's geography and location within the region, 85% of the store's consumer sales are estimated to be generated by market area residents and 90% of wholesale purchases are estimated to be generated by businesses located within the market area. The 85% assumption is based on analysis of the 2024 "The Economic Impact of Travel" study prepared by Dean Runyan Associates in May 2025, which includes figures indicating that in 2024, travel-generated taxable sales comprised 17.2% of El Dorado County's taxable sales and 14.5% of Amador County's taxable sales, with a weighted average between the two counties of 16.8% (see page 25 of the cited study).

Total (7)	**$2,280,383,049**	**$2,880,170,095**	**$437,588,129**	**$586,057,740**	**$1,842,794,920**	**$2,294,112,355**
Percent Taxable	**79%**		**75%**		**80%**	

Sources: California Department of Tax and Fee Administration (CDTFA), "Table 3. Taxable Sales in California Counties, By Type of Business, 2024"; U.S. Economic Census, "Retail Trade: Summary Statistics for the U.S., States, and Selected Geographies: 2022"; and ALH Urban & Regional Economics.

(1) Taxable sales are pursuant to reporting by the State of California Department of Tax and Fee Administration (CDTFA).
(2) For analytical purposes, the taxable retail sales base of the El Dorado County portion of the Project's market area is assumed to comprise all of El Dorado County sales less South Lake Tahoe sales, as the City of Lake Tahoe is not geographically deemed part of the Project's Market Area.
(3) Sales for Food and Beverage Stores have been adjusted to account for non-taxable sales; only 30.0% of all food store sales are estimated to be taxable.
(4) Sales for General Merchandise Stores have been adjusted to account for non-taxable sales, since some General Merchandise Store sales include non-taxable items. ALH Urban & Regional Economics estimates that at least 35% of General Merchandise sales are for grocery, pharmacy, and other non-taxable items. This estimate is based on analysis of the 2022 U.S. Economic Census findings for General Merchandise stores in California.
(5) Sales for Other Retail Group have been adjusted to account for non-taxable drug store sales, since drug store sales are included in the Other Retail Group category. ALH Urban & Regional Economics estimates that 33.0% of drug store sales are taxable, based on discussions with representatives of the California Department of Fee and Tax Administration (when it was formerly called the Board of Equalization and examination of U.S. Census data. In California, drug store sales in 2024 represented approximately 5.5% of all Other Retail Group sales. ALH Urban & Regional Economics applied that percentage and then adjusted upward for non-taxable sales.
(6) The source data from CDTFA do not disclose taxable retail sales in General Merchandise Stores in South Lake Tahoe. Such lack of disclosure typically occurs when one major retailer dominates a retail category, in such a manner that reporting the category sales would identify the store's sales. To maintain confidentiality, the CDTFA in these instances combines the category sales in with the Other Retail Group sales. In order to estimate these sales for South Lake Tahoe, ALH Economics developed an estimate, assuming that General Merchandise Stores sales in South Lake Tahoe are the same percentage as the combined General Merchandise Stores and Other Retail Group sales countywide. In this instance that percentage is 24%, and South Lake Tahoe's combined General Merchandise Stores and Other Retail Group sales total $68,250,032.
(7) Totals may not add up due to rounding.

Sources: Claritas, Demographic Quick Facts, Select El Dorado County and Amador County census tracts; State of California Department of Finance, Table E-5 for 2024; Retail Indicators Branch, U.S. Census Bureau, "Table 1. Supplemental Estimated Quarterly US Retail Trade Sales: Total and E-Commerce, 2022Q4"; ecommercedb (a partner of Statista, see https://ecommercedb.com/insights/ecommerce-shares-in-top-product-categories); "U.S. Retail Market Outlook," March 2021, page 7, Cushman & Wakefield; "California Retail Analytics: Expanding Retailers and Retail Stores Sales Estimate," page 4, HdL ECONSolutions, 2019; emarketer.com (retail sales per square foot); and ALH Urban & Regional Economics.

(1) All figures are expressed in 2024 dollars.
(2) The per household spending estimates for El Dorado County less South Lake Tahoe were generated by ALH Urban & Regional Economics by taking the estimated El Dorado County average 2025 area household income figure of $161,661 from Claritas and multiplying by 26%, utilizing the assumption that 26% of household income is spent on California Department of Tax and Fee Administration (CDTFA) type retail (see Exhibit B-3). El Dorado County average household income is assumed to comprise a proxy for all county households less South Lake Tahoe. This figure was then multiplied by the percentages calculated from the ratio of the CDTFA sales for the State of California. See Exhibit B-2.
(3) Presented for illustrative purposes. Comprises El Dorado County sales less South Lake Tahoe sales divided by the estimated household count of 67,487, from the State of California Department of Finance.
(4) Total Demand represents per household spending multiplied by the 2024 household count for Unincorporated El Dorado County of 67,487, per the State of California Department of Finance (with housing unit count deemed a proxy for households).
(5) Percentages estimated based on review of governmental data sources and various retail and e-commerce industry publications (see Sources).
(6) Comprises the balance of household demand anticipated to be expressed for brick and mortar stores, after deducting the percent of demand assumed to be satisfied by internet sales.
(7) See Exhibit 6.
(8) Comprises sales less demand. Categories with attraction are characterized by positive amounts or percentages, and categories with leakage are characterized by negative amounts or percentages. A positive percentage indicates the share of the sales base that comprises attraction while a negative percentage indicates the share of retail demand that is leaking outside the market area.
(9) Building Materials and Garden Equipment includes hardware stores, plumbing and electrical supplies, paint and wallpaper products, glass stores, lawn and garden equipment, and lumber.
(10) Other Retail Group includes drug stores, health and personal care, pet supplies, gifts, art goods and novelties, sporting goods, florists, musical instruments, stationary and books, office and school supplies, second-hand merchandise, and miscellaneous other retail stores.
(11) Weighted average totals.

Sources: Claritas, Demographic Quick Facts, El Dorado County; State of California Department of Finance, Table E-5 for 2024; Retail Indicators Branch, U.S. Census Bureau, "Table 1. Supplemental Estimated Quarterly US Retail Trade Sales: Total and E-Commerce, 2022Q4"; ecommercedb (a partner of Statista, see https://ecommercedb.com/insights/ecommerce-shares-in-top-product-categories); "U.S. Retail Market Outlook," March 2021, page 7, Cushman & Wakefield; "California Retail Analytics: Expanding Retailers and Retail Stores Sales Estimate," page 4, HdL ECONSolutions, 2019; emarketer.com (retail sales per square foot); and ALH Urban & Regional Economics.

(1) All figures are expressed in 2024 dollars.
(2) The per household spending estimates for Amador County were generated by ALH Urban & Regional Economics by taking the estimated county average 2025 area household income figure of $107,536 from Claritas and multiplying by 30%, utilizing the assumption that 30% of household income is spent on California Department of Tax and Fee Administration (CDTFA) type retail (see Exhibit B-3). This figure was then multiplied by the percentages calculated from the ratio of the CDTFA sales for the State of California (see Exhibit B-2.)
(3) Presented for illustrative purposes. Comprises Amador County sales divided by the estimated household count of 15,993, from the State of California Department of Finance. This estimate is nearly identical to the estimate of 15,991 from Claritas, presented in Table 4.
(4) Total Demand represents per household spending multiplied by the 2024 household count for Amador County of 15,993, per the State of California Department of Finance (with housing unit count deemed a proxy for households).
(5) Percentages estimated based on review of governmental data sources and various retail and e-commerce industry publications (see Sources).
(6) Comprises the balance of household demand anticipated to be expressed for brick and mortar stores, after deducting the percent of demand assumed to be satisfied by internet sales.
(7) See Exhibit 7.
(8) Comprises sales less demand. Categories with attraction are characterized by positive amounts or percentages, and categories with leakage are characterized by negative amounts or percentages. A positive percentage indicates the share of the sales base that comprises attraction while a negative percentage indicates the share of retail demand that is leaking outside the
(9) Building Materials and Garden Equipment includes hardware stores, plumbing and electrical supplies, paint and wallpaper products, glass stores, lawn and garden equipment, and lumber.
(10) Other Retail Group includes drug stores, health and personal care, pet supplies, gifts, art goods and novelties, sporting goods, florists, musical instruments, stationary and books, office and school supplies, second-hand merchandise, and miscellaneous other retail stores.
(11) Weighted average totals.

Supplemental Estimated Quarterly US Retail Trade Sales: Total and E-Commerce, 2022Q4"; ecommercedb (a partner of Statista, see https://ecommercedb.com/insights/ecommerce-shares-in-top-product-categories); "U.S. Retail Market Outlook," March 2021, page 7, Cushman & Wakefield; "California Retail Analytics: Expanding Retailers and Retail Stores Sales Estimate," page 4, HdL ECONSolutions, 2019; emarketer.com (retail sales per square foot); and ALH Urban & Regional Economics.

(1) All figures are expressed in 2025 dollars.
(2) The per household spending estimates for the market area were generated by ALH Urban & Regional Economics by taking the estimated market area average 2025 household income figure of $161,755 from Claritas and multiplying by 26%, utilizing the assumption that 26% of household income is spent on California Department of Tax and Fee Administration (CDTFA) type retail (see Exhibit B-3). This figure was then multiplied by the percentages calculated from the ratio of the CDTFA sales for the State of California. See Exhibit B-2.
(3) Total Demand represents per household spending multiplied by the 2025 household count for the El Dorado Hills Costco Market Area of 67,688, per Claritas (see Table 4).
(4) Percentages estimated based on review of governmental data sources and various retail and e-commerce industry publications (see Sources).
(5) Comprises the balance of household demand anticipated to be expressed for brick and mortar stores, after deducting the percent of demand assumed to be satisfied by internet sales.
(6) Building Materials and Garden Equipment includes hardware stores, plumbing and electrical supplies, paint and wallpaper products, glass stores, lawn and garden equipment, and lumber.
(7) Other Retail Group includes drug stores, health and personal care, pet supplies, gifts, art goods and novelties, sporting goods, florists, musical instruments, stationary and books, office and school supplies, second-hand merchandise, and miscellaneous other
(8) Percentages are weighted average totals.

Source: ALH Urban & Regional Economics.

(1) See Exhibit 5.
(2) See Exhibit 11. Retail categories with $0 leakage are identified as attraction categories in this source exhibit.
(3) For retail categories characterized by retail attraction there are no Project sales in excess of retail leakage. However, for categories with leakage, this calculation assumes the Project will absorb leakage up to the full amount of leakage or the full amount of Project sales, whichever figure is lower. In this case, for categories with leakage, the Project's consumer sales are much greater than the leakage, indicating the Project will be well-positioned to absorb the existing leakage. These are considered the Project's maximum impacts.
(4) See Exhibit 11.
(5) This column comprises "Project Sales in Excess of Retail Leakage" divided by "Market Area Total Retail Sales."
(6) A threshold of 5% sales impact is deemed reasonable, reflecting the type of economic changes retailers should anticipate and be able to withstand given swings in the local economy. These are considered the Project's minimum impacts.

Sources: Exhibits 3, 4, and 13; and ALH Urban & Regional Economics.

(1) See Exhibit 13 for all store information presented herein except for Immediate Area Population.
(3) Weights are assigned each tier (excepting the Fourth Tier) to also take into consideration proximity to the Costco site. These weights are applied to the population counts for each area to acknowledge the likelihood that persons living closer to the Costco site may have a greater propensity to shop at Costco than those living further away.
(4) This column comprises the area population multiplied by the assigned category weight.
(5) This is the share of the sales impact allocated to each respective tier. These shares add to 100%, but are applied to the Total Food Stores Category Impact less the 10% of sales impact assumed to impact various minor stores located throughout the market area, represented as the Fourth Tier, but not inventoried for the purpose of this study.
(6) See Exhibit 12.
(7) Comprises the population counts in Exhibit 3 for El Dorado Hills, Cameron Park, and Shingle Springs.
(8) Comprises the population counts in Exhibit 3 for Placerville, Diamond Springs, and the other El Dorado County market area locations.
(9) Comprises the market area population counts in Exhibit 4 for the Amador County population within the market area plus Pollock Pines in El Dorado County.
(10) This analysis assumes that 10% of the prospective Project sales impact is distributed among various other commercial operations in the market area that also sell food products.
(11) The impact is based on the percentage share of diverted sales multiplied by 90% of the Total Food Stores Category Impact, which excludes the Fourth Tier. These impact figures are a minimum of $14,345,450 and a maximum of $43,120,170.

(1) This exhibit includes representative gas stations within the market area of the proposed El Dorado Hills Costco development site. It is not intended to comprise a full inventory of existing area gas stations. The gas stations closest in proximity to the site of the proposed Costco gasoline station are located within 1.5 miles of the proposed Costco site.
(2) See Figure 3 for gas station locations.
(3) Shopping center names are identified if the gas station is located on a pad in or adjacent to a shopping center.
(4) For distance mapping purposes the intersection of Clarksville Crossing & Silva Valley Parkway is utilized as the future Costco gas station address.
(5) These numbers correspond with the number of fueling pumps and handles, with two handles per gas pump.
(6) Pricing information is based on one day of fieldwork, occurring March 27, 2025. Gas station prices for equivalent grades of gasoline (regular and premium) equal to or lower than Costco's price are in bold and shaded in gray.

Exhibit 18
Identified Planned and Proposed Retail Projects (1)
Project Details and Timing Estimates
El Dorado Hills Costco Competitive Market Area
June 2025

Project Status, Name, and Type	Location	Miles from Costco Site	Potential Retail Sq. Ft.	Project Description
Under Construction				
Crossings at El Dorado All retail project	Placerville Southwest corner Missouri Flat Road and Crossings Lane	13.6	132,126	This new community shopping center is under construction. Of the total space, approximately 55% has been leased to tenants including 7-Eleven, America's Tire, Boot Barn, Burger King, Dutch Bros Coffee, Five Below, Michael's, Petco, and ULTA. As of June 2025, only the pad buildings with 7-Eleven, America's Tire, and Dutch Bros Coffee are open. A second phase of the project is expected to include an RV resort and campground.
Approved				
Montano de El Dorado Phase II Mixed-use development project	El Dorado Hills East side of Latrobe Road, south of White Road	1.7	75,316	The 2021-approved project represents the expansion of Montano de El Dorado, a 2007 boutique lifestyle retail center with 43,200 square feet. The project includes eight retail buildings totaling 75,316 square feet, 13,448 square feet of office, a 55,136-square-foot hotel, and an outdoor amphitheater. The total amount of new building space is 143,900 square feet. However, in 2023 the applicant revealed plans to develop the land with multifamily residential instead. The status of these revised plans is unknown.
Under Review				
Gateway El Dorado Mixed-use development project	El Dorado Hills	3.3	143,204 to 303,940	This is the re-entitlement of 98 acres in an existing business park into a mixed-use multifamily residential, commercial, retained research and development use, and open space. The Specific Plan for the site calls for a range of multifamily units, from 140 to 495 dwelling units, and commercial space from 143,204 to 303,940 square feet. Three sites totaling 14.76 acres have the flexibility to be developed with residential or commercial use. Of the total 98 acres, 30.8 acres would remain research and development, and 26 acres would be parks/open space. The pre-application was filed in July 2024.
Village of Marble Valley Master-planned community	Unincorporated El Dorado County Marble Valley Road, south of U.S. Highway 50	3.5+/-	100,000	This master-planned community encompasses 2,341 acres. Plans call for 3,236 residential units at a variety of densities, 375,000 square feet of office park, 100,000 square feet of village commercial, 1,284 acres of open space, schools, and parks. The partial recirculated draft environmental impact report was available from April 23 to June 23, 2025 for public review.
Wicklow Way Specific Plan Specific Plan area with a mix of land uses	Unincorporated Amador County Wicklow Way, south of State Highway 88	30.0	100,000	This Specific Plan area encompasses 201 acres of County-owned land wrapping the Walmart site. The plan proposes 78 acres of residential development (700 units), 12 acres of community commercial (office/retail) space totaling 100,000 square feet of building space, 12.4 acres of Civic Center space, and nearly 64 acres of open space and parks. The draft environmental impact report was issued in June 2024. The County planning representative indicated that they hope to finish the plan in 2026.
Total			**550,646** *to* **711,382**	

Sources: El Dorado County Planning Department website; City of Placerville "Pending Commercial Projects" revised March 26, 2025; CBRE; Ascent Inc.; Amador County Planning Department; planning departments for Amador County cities (Amador City, Ione, Jackson, Plymouth, and Sutter Creek); and ALH Urban & Regional Economics.

(1) Includes retail development projects 25,000 square feet or larger with development plans in progress. Projects are generally listed in descending order of size.
(2) Driving distance from the proposed El Dorado Hills Costco Development is measured from the intersection of Clarksville Crossing & Silva Valley Parkway.

El Dorado Hills								
El Dorado Hills Town Center 4315-4363 Town Center Blvd	2007	1.5	448,256 office & retail	**Target**	1,682 sq. ft. 1 space	<1.0%	Excellent	Prior tenant, a lingerie store, closed in February 2025; multiple parties are interested in the space. Many times, a new tenant is secured before previous tenant vacates.
Market Place at Town Center 431 Town Center Blvd	2002	1.6	134,679	**Nugget** Ace Hardware	2,467 sq. ft. 1 space - a lease for this space is reportedly out for signature	1.8%	Good	In summer 2022 ACE Hardware opened in a 23,435-square-foot space vacated by CVS in 2012. The long term vacancy was largely attributable to CVS continuing to hold the lease and tenancy restrictions.
Village Square Center 3819-3963 Park Dr	1992	1.9	116,306	**Raley's**	1,476 sq. ft. 1 space	1.3%	Excellent	The vacant space, previously occupied by a real estate office, has been vacant for nearly a year. The space has received a lot of interest.
Sienna Ridge 3375-3383 Bass Lake Rd	2020	3.2	100,698	**Safeway**	900	1.5%	Excellent	Bark Avenue (3,559 sq. ft.) closed at the end of February 2025, but there are still a few more months on the lease. There are two parties interested in the space. The existing 900-sq.-ft. vacant space is in negotiations for lease. A new pad building with 1,527 sq. ft. is under construction expected to be completed Summer 2025.
Green Valley Marketplace 2201 - 2219 Francisco Dr	2005 (4)	4.1	106,332	**Safeway**	2,400 sq. ft. 2 vacancies, with 1,200 sq. ft. each There is strong tenant interest in the spaces	2.3%	Excellent

Cameron Park								
Cambridge Plaza 3950-3960 Cambridge Rd	1988	3.8	21,609	Cambridge Liquor & Mart	1 small vacancy	NA	Poor	Vacancy is the former Hair Cuts (#2). This vacant space is in fair condition, but some significant roof damage is evident at the center.
Goldorado Shopping Center 3440 - 3510 Palmer Drive	1990	5.5	156,592	**Bel Air** Petco CVS	10,584 sq. ft. 7 vacancies, ranging from 1,150 to 2,015 sq. ft., averaging 1,512 sq. ft.	6.8%	Excellent	The center historically has operated at a comparable vacancy rate. The center lacks visibility. Five spaces have been vacant 5 to 7 years. The former Mathnasium space (1,150 sq. ft.) has been vacant 4 years, while the former Goodwill (1,438 sq. ft.) has been vacant one month. Although there is moderate tenant interest, center has too much in-line retail space.
Cameron Park 3275-3317 Coach Lane	approx. 15 yrs ago	5.6	32,187 exc. Applebee's	**Forklift adjacent**	2,665 sq. ft. 1 vacancy (corner space)	8.3%	Excellent	Space has been vacant for about six months. There has been a little interest in the space. Representative Tenants: Companion Animal Hospital (3275), Applebee's (3281), Starbuck's (3291), Matthews Mattresses (3291), Davita (3311), Pizza Guys Pizza (3317), Great Clips (3317).
Cameron Park Place 3326-3352 Coach Lane	approx. 25 yrs ago	5.5	103,414	**Safeway** Dollar Tree O'Reilly Auto Parts	5,673 sq. ft. 4 vacancies, ranging from 960 - 2,313 sq. ft. averaging 1,418 sq. ft.	5.5%	Good	This is generally an equilibrium vacancy rate for this center. The spaces have been available between 1 and 5 years, with the 2,313 sq. ft. space available the longest. Broker reports that Cameron Park has slow retail space demand due to its small market size.
Green Valley Station 3020-3100 Green Valley Rd	2007	6.0	87,075	CVS **Adjacent to Grocery Outlet**	7,321 sq. ft. 4 vacancies, ranging from 1,460 - 2,255 sq. ft., average size 1,830 sq. ft. Plus one space with tenant coming soon	8.4%	Excellent	Spaces have been available between 1 and 6 years, with the 1,606-sq.-ft. space available the longest. Despite the recent opening of the Grocery Outlet, occupancy has not improved due to overall slow demand in small market.
Cameron Park Plaza 2650 Cameron Park Drive	1988	6.3	34,423	Mountain Mike's Pizza	7 vacancies 18 retail spaces total Smallest available space is 1,300 sq. ft.	37.8%	Good	This center is accompanied by a 76 Gas Station and Rocket convenience market. Many of the vacancies are long-term. Ownership is not local and is not investing in the property or tenant improvements. Also, Cameron Park is a small market with too much retail space for its population per commercial broker opinion.
Former Stand-alone Rite Aid 3101 Green Valley Road	2009	6.3	17,272	Vacant	17,272 sq. ft.	100.0%	Excellent	This stand-alone former Rite Aid store, closed in 2022, is located across the street from Cameron Park Plaza. Per the El Dorado County Planning Department, a Dollar Tree store will be opening in this space.
Winery Plaza 2643-2653 Cameron Park Dr	Older	6.3	11,577	Vineyard Liquor Store	4,700 sq. ft. Three spaces, approximately 1,400, 1,600, and 1,700 sq. ft. in size, are available	40.6%	Fair	These are long-term vacancies, vacant since before 2021, when ALH Economics last surveyed the area's retail market. One of the long-term vacancies was previously a bakery. Other past tenants include a pizza restaurant, and a marijuana dispensary. Located next to Valero gas station.
Point Loma 3161 - 3181 Cameron Park Drive	1990	7.0	33,446	Cameron Park Liquor & Deli (small convenience store)	2,798 sq. ft. Two spaces, 1,048 sq. ft. and 1,750 sq. ft.	8.4%	Good	Both spaces are in the 3161 Cameron Park Dr. building. The 1,048 sq. ft. space has been vacant 1-2 months, while the 1,750 sq. ft. space has been vacant over a year. There is some tenant interest.

Representative Retail Vacancies (1)
El Dorado Hills Costco Market Area
El Dorado County Portion of the Market Area
March and April 2025

Location and Address	Year Built/ Renovated	Miles from Costco Site (2)	GLA (Sq. Ft.)	Anchor Tenant(s) (3)	Retail Vacancies	Vacancy Rate	Condition of Vacancies (4)	Comments/Market Interest/Broker Input
Placerville								
Prospector's Plaza 3964 Missouri Flat Rd	1982/ 2021	13.5	243,000	**Save Mart, Target** CVS	No vacancies except for a 3,765 sq. ft. stand alone bank building under separate ownership	1.5%	Good	Management demolished a dated pad building and is constructing a Quick Quack car wash. Another pad building is fenced off. Broker representing bank building reports that it has been available for over two years with limited interest as bank footprints are shrinking.
Missouri Flat Village 3955 Missouri Flat Rd	2004 (5)	13.5	119,928	**Safeway**	6,075 sq. ft. Five spaces, 1,000, 1,035 (former physical therapist), 1,200, 1,240, and 1,600 (former Jamba Juice, closed 3/3/25) sq. ft.	5.1%	Excellent	This center also has a 1.03-acre undeveloped pad available for sale or lease. Tenant interest in the vacant spaces is reported as being moderate due to the more outlying area.
Discovery Plaza 2849-2889 Ray Lawyer Dr Located across Ray Lawyer Dr from Raley's	1983	14.6	40,803	Riebes Auto Parts	3,800 sq. ft. Two spaces, 2,200 sq. ft., former yoga studio, and 1,600 sq. ft., former dance studio	9.3%	Good	This small strip center has about 9 tenants, including Riebes Autoparts, Verizon, State Farm Insurance, nail salon, bakery, a pub, and a chinese restaurant. The 1,600 sq. ft. space has been vacant 5 to 6 months, while the 2,200 sq. ft. space has been vacant about 5 years. Tenant interest in the spaces has picked up recently.
Apple Farm Place 1426 - 1480 Broadway	1973/ 2022-3	17.6	67,693	**Grocery Outlet** Dollar Tree Harbor Freight	7,196 sq. ft. There are six vacant spaces ranging in size from 704 to 1,942 sq. ft.	10.6%	Good	Other tenants include a nail salon, a deli, H&R Block, and a work clothes store. The spaces have been vacant for about 3 years; there is greater interest in the smaller spaces (704 - 1,050 sq. ft.). The spaces are in shell condition.
Pleasant Valley Square 4570 Pleasant Valley Rd Located across a side street from Holiday Market	1989	24-25	19,076	Ace Hardware	740 sq. ft. 1 space, former pet grooming shop	3.9%	Fair	Other tenants include a hair salon, Pizza Factory, Chinese restaurant, Grace Community Church, a dog trainer, karate studio, and smoke shop.

Location and Address	Year Built	Miles from Costco Site (2)	GLA (Sq. Ft.)	Anchor Tenant(s) (3)	Retail Vacancies	Vacancy Rate	Condition of Vacancies (4)	Comments/Market Interest/Broker Input
Martell								
Amador Ridge Plaza Highway 49 @ Industry Way	2006-2007	28.3	272,948	**Safeway** Lowes, Petco, Staples	10,084 sq. ft. Seven spaces, 2,286, 1,316, 1,316, 1,332, 1,300, 1,332, and 1,202 square feet	3.7%	Good	Some of the available spaces were vacated earlier in 2025, while some have been vacant over one year. The center is generally well-occupied and typical time to re-lease a space is 6 to 12 months.
Former K-Mart 10500 Wicklow Way	1990	29.4	86,479	Not Applicable But located across the road from Walmart	K-Mart space, closed in 2017 Property is for sale or for lease	100.0%	Poor to Good	Generally the building and site are in good physical condition, except a portion of the eaves over the entrance walkway has exposed wood beams, and the doors are boarded up. In June 2025 the site was the subject of a major clean-up and revitalization effort to to enhance curb appeal and stimulate commercial interest.
Jackson								
Jackson Creek Plaza	1988	30.0	94,321	**Cost Less Food Co.** CVS	1,000 sq. ft. 1 vacancy	1.1%	Good	The broker representing the property recently took over the property. He indicated that one space at 1,000 square feet, is vacant, although field work observation suggested that other spaces were available.
Grocery Outlet 9-11 N. State Highway 49	1971 (5)	30.5	36,223 (4)	**Grocery Outlet**	Former Joann Fabric and Crafts store, closed in Spring 2025	40% - 50% estimate based on visual observation	Good	There are no signs marketing the former Joann space and City of Jackson representatives indicate that to date no interest has been expressed in renovating or retenanting the space. The building was originally a Safeway store.
Mother Lode Plaza 557-625 State Highway 49	1977 - 1979 (5)	30.9	20,000 estimate provided by broker	None, but tenants include Gold Trail Natural Foods (a very small food store)	5,000 sq. ft., approximate 4 vacancies	25.0% See comment	Fair RV for sale in parking lot	The current property management company just took over management of the center. This is a probate situation and detailed property information is not available. The sizes of the vacant spaces are approximate, as well as the estimated size of the overall center. The management company contact indicated that there was an additional building that was not included in the center size.

(1) These census tracts encompass the geographic area that corresponds with the market area for the El Dorado Hills Costco Warehouse and Fuel Facility identified by Kittelson & Associates. Census tracts are included if the majority of the census tract or its population base is geographically included in the market area.
(2) The market area includes 33 of El Dorado County's 50+ census tracts in 2020.
(3) The market area includes 8 of Amador County's 10 census tracts in 2020.

Exhibit B-2
State of California Department of Tax and Fee Administration Taxable Retail Sales Estimate by Retail Category
2024

Type of Retailer	Total Taxable Sales (1)	State of California Taxable Sales Adjusted to Total Retail	Percent of Total Taxable	Percent of Total All Sales
Motor Vehicle & Parts Dealers	$100,456,368,692	$100,456,368,692	16.2%	15.6%
Home Furnishings & Appliances	$30,996,012,214	$30,996,012,214	5.0%	5.4%
Building Materials & Garden Equipment	$48,326,163,805	$48,326,163,805	7.8%	6.7%
Food & Beverage Stores	$33,462,408,320	$111,541,361,067 (2)	5.4%	17.2%
Gasoline Stations	$59,394,225,286	$59,394,225,286	9.6%	8.5%
Clothing & Clothing Accessories	$48,793,391,406	$48,793,391,406	7.8%	7.2%
General Merchandise Stores	$67,046,736,721	$103,148,825,725 (3)	10.8%	11.8%
Food Services & Drinking Places	$109,695,677,404	$109,695,677,404	17.6%	14.8%
Other Retail Group (4)	$123,439,500,198	$137,156,262,390 (5)	19.9%	12.7%
Total (6)	$621,610,484,046	**$749,508,287,988**	**100.0%**	**100.0%**

Sources: California Department of Tax and Fee Administration (CDTFA), "Statewide Taxable Sales by Type of Business, 2024"; U.S. Economic Census, "Retail Trade: Summary Statistics for the U.S., States, and Selected Geographies: 2022"; and ALH Urban & Regional Economics.

(1) Taxable sales are pursuant to reporting by the California Department of Tax and Fee Administration (CDTFA).
(2) Sales for Food and Beverage Stores have been adjusted to account for non-taxable sales; only 30.0% of all food store sales are estimated to be taxable.
(3) Sales for General Merchandise Stores have been adjusted to account for non-taxable sales, since some General Merchandise Store sales include non-taxable items. ALH Urban & Regional Economics estimates that at least 35% of General Merchandise sales are for grocery, pharmacy, and other non-taxable items. This estimate is based on analysis of the 2022 U.S. Economic Census findings for General Merchandise stores in California.
(4) Other Retail Group includes drug stores, health and personal care, pet supplies, gifts, art goods and novelties, sporting goods, florists, musical instruments, stationary and books, office and school supplies, second-hand merchandise, and miscellaneous other retail stores.
(5) Sales for Other Retail Group have been adjusted to account for non-taxable drug store sales, since drug store sales are included in the Other Retail Group category. ALH Urban & Regional Economics estimates that 33.0% of drug store sales are taxable, based on discussions with representatives of the California Department of Fee and Tax Administration (when it was formerly called the Board of Equalization) and examination of U.S. Census data. In California, drug store sales in 2024 represented approximately 5.5% of all Other Retail Group sales. ALH Urban & Regional Economics applied that percentage and then adjusted upward for non-taxable
(6) Totals may not add up due to rounding.
