1 Introduction

This drainage analysis was conducted for the proposed commercial development on Silva Valley Parkway located just north of Highway 50 on Silva Valley Parkway in El Dorado Hills, California as shown in Figure 1.

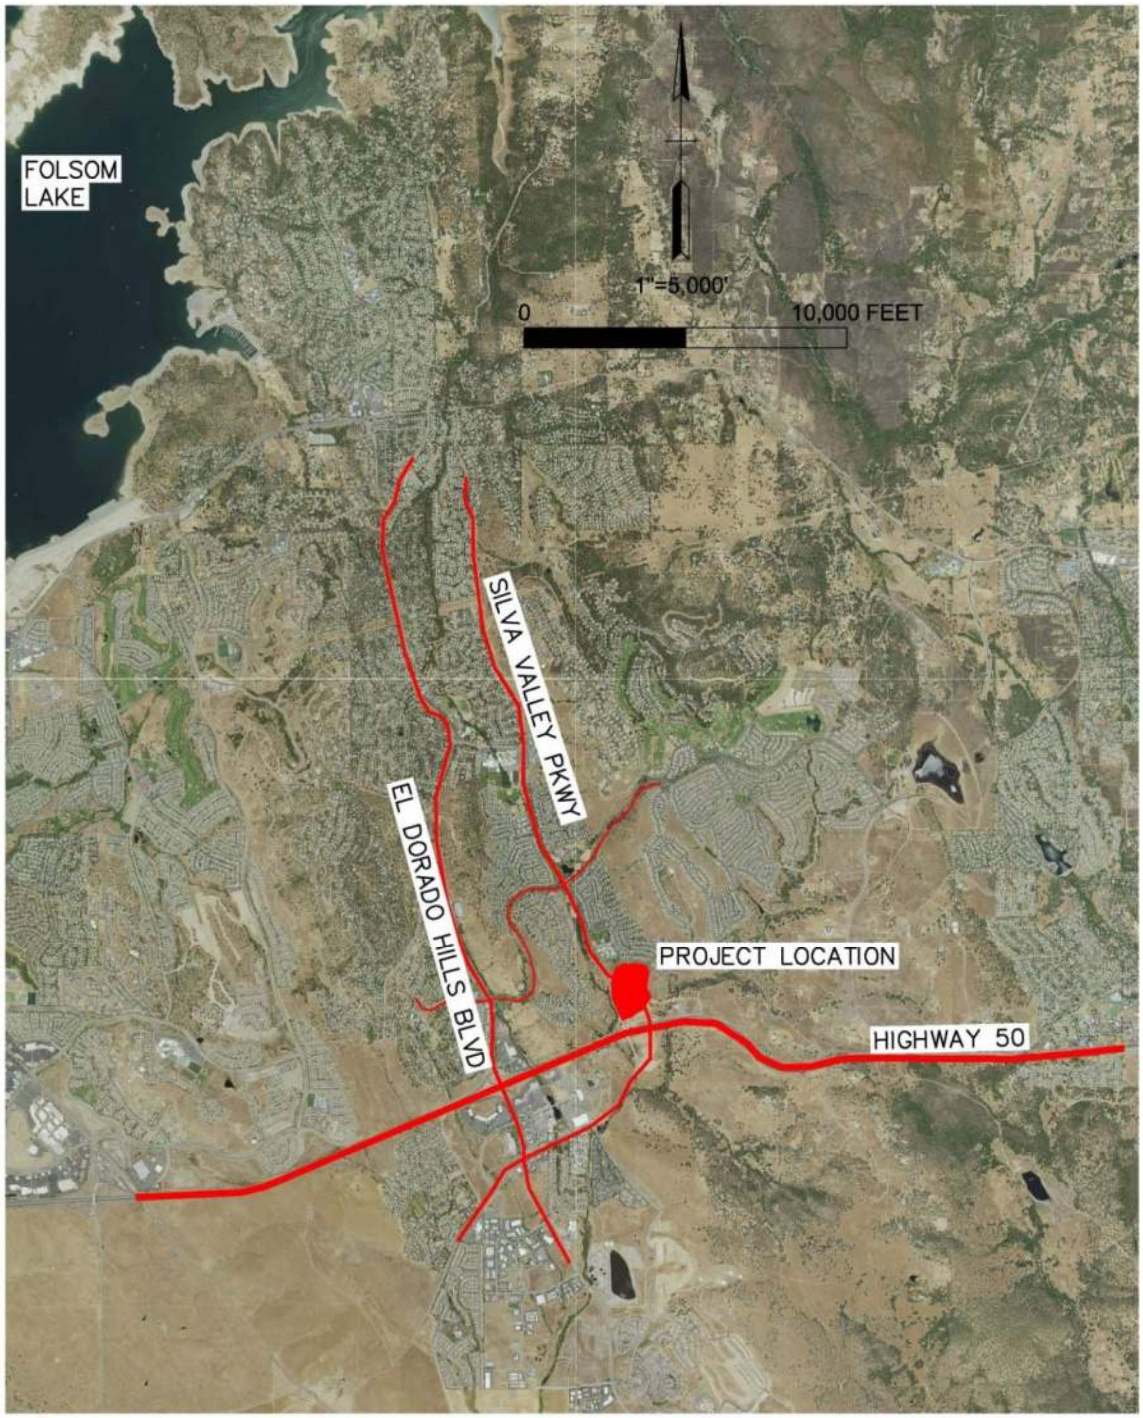

Figure 1 - Vicinity Map

This project location is at the very bottom of a large drainage shed (763 acres) that contributes flows to a culvert under Highway 50. Much of the drainage shed (88%) flows around the project, however, about 50 acres must be conveyed through the site. This report was developed for the following:

1. To determine how much flow must be conveyed through the site
2. Determine downstream impacts due to this development
3. Develop proposed improvements to minimize the downstream impacts

Limited development has occurred downstream of this project site along Carson Creek.

2 Hydrology

The hydrologic conditions were investigated to estimate the 2, 10 and 100-year, 24-hour storm event peak discharge from the contributing drainage area. The peak discharge at the culvert under Highway 50 for the existing and proposed conditions was calculated using the U.S. Corps of Engineers' HEC-HMS rainfall-runoff modeling program. The SCS Unit Hydrograph method was used to model the rainfall-runoff relationships of the corresponding drainage area. The hydrologic model input parameters required for peak discharge calculation are described below.

2.1 Existing Conditions

Drainage Area

The contributing drainage area of 763 acres, as shown on Figure 2, was determined by using USGS HUC-12 boundary lines and USGS Quadrangle maps.

Figure 2 - Existing Drainage Area Map

Rainfall

The 2, 10, and 100-year, 24-hour design storm depths for the project area were obtained from The County of El Dorado Drainage Manual, adopted in March 1995. The storm depths for the 2, 10 and 100-year, 24-hour events are summarized in Table 1 below.

Table 1 - Average Rainfall for the Project Location

Storm Event	Precipitation (in.)
2-year, 24-hour	2.45
10-year, 24-hour	3.61
100-year, 24-hour	5.12

According to the County of El Dorado Drainage Manual, El Dorado County requires use of the Soil Conservation Service (SCS) Type I distribution for catchments with an elevation less than 1,640 feet and use of Type IA distribution for those above 1,640 feet. The elevation of the proposed project area is below 1,640 feet, and therefore the Type I distribution was used.

Time of Concentration

Travel time (T_t) was calculated using the following equations from Technical Release 55 (TR-55):

Sheet Flow:

$$T_t = \frac{0.42(nL)^{0.8}}{(P_2)^{0.5} s^{0.4}}$$

Where:

T_t = travel time (minutes)

n = Manning's roughness coefficient

L = flow length (feet)

P_2 = 2-year, 24-hour rainfall (inches)

s = slope of hydraulic grade line (feet/feet)

Shallow Concentrated Flow and Channel Flow:

$$T_t = \frac{L}{60V}$$

Where:

T_t = travel time (minutes)

L = flow length (feet)

V = average velocity (ft/s)

Velocity for Shallow Concentrated Flow for an Unpaved Channel:

$$V = 16.1345\sqrt{s}$$

Where:

V = average velocity (ft/s)

s = slope of hydraulic grade line (feet/feet)

Velocity for Channel Flow:

$$V = \frac{1.49 r^{2/3} s^{1/2}}{n}$$

Where:

V= average velocity (ft/s)

r = hydraulic radius (ft)

s = slope of hydraulic grade line (feet/feet)

n = Manning's roughness coefficient

Table 2 below summarizes the travel time for each type of flow in the existing drainage area. The time of concentration (T_c) is equal to the total travel time, which is equal to 50 minutes for the existing drainage area.

Table 2 - Summary of Time of Travel and Time of Concentration

Flow Type	Travel Time (min)	Length (ft)
Sheet Flow	20.6	300
Shallow Concentrated Flow	6.5	2,383
Channel Flow (30" Pipe)	7.7	4,469
Channel Flow	15.2	6,620
T_c:	50.0	

Lag Time

According to the SCS, for average conditions the lag time can be estimated at 60% of the time of concentration. Therefore, the lag time for the existing drainage area was calculated to be 30 minutes.

Runoff Curve Number

Runoff curve numbers were developed to determine runoff losses due to infiltration and interception per the NRCS TR-55 manual. The runoff curve numbers were determined by reviewing available land cover and hydrologic soil group data. The existing drainage area consists primarily of herbaceous land and developed residential land. Aerial imagery was reviewed to verify the land cover types within the drainage area. NRCS Web Soil Survey data was used to determine the hydrologic soil group classifications within the drainage area. The area consists of hydrologic soil type D.

A weighted curve number was calculated for the contributing drainage area. Table 3 below summarizes the land cover found within the drainage area and the associated curve number.

Table 3 - Summary of Land Cover

Land Cover Type	Percentage of Total Drainage Area	Curve Number for Soil Type D
Residential (1/4 acre lot)	41.5%	87
Herbaceous – mixture of grass, weeds, and low-growing brush	52.5%	85
Streets and Roads – Paved	4.5%	98
Open Space (lawn) – Good Condition	1.5%	80
Weighted Curve Number:		**86**

Results

A HEC-HMS hydrologic model was developed to estimate the peak discharge for the drainage area for the 2, 10 and 100-year, 24-hour storms. Figure 3 below shows the HEC-HMS schematic of the existing conditions model developed for this analysis.

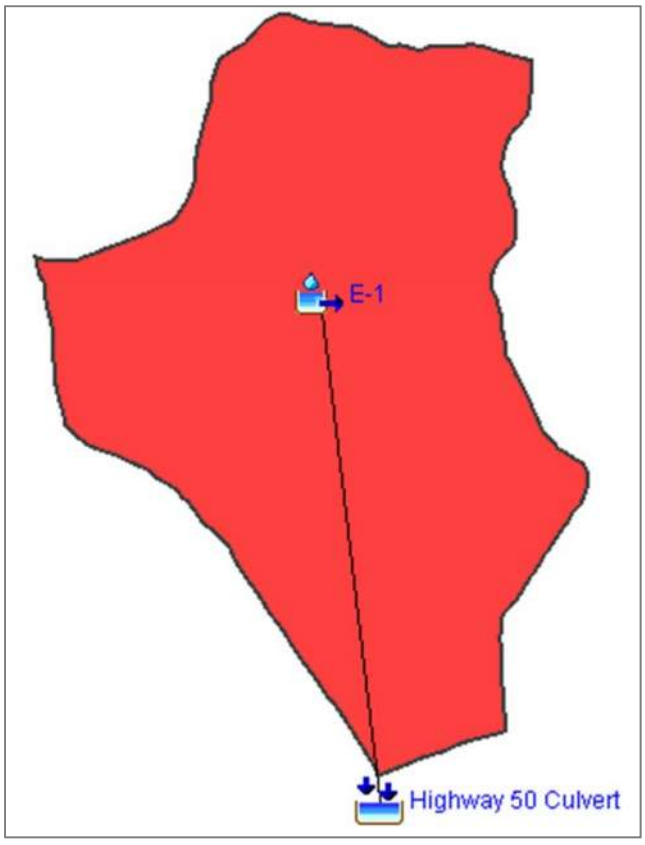

Figure 3 - HEC-HMS Existing Basin Model Schematic

Table 4 below summarizes the HEC-HMS model results.

Table 4 - Summary of Hydrology Results for Existing Conditions

Storm Event	Area (Acres)	24-hour precipitation (inches)	Curve Number	Peak Discharge (cfs)
2-year, 24-hour	763	2.45	86	319
10-year, 24-hour	763	3.61	86	611
100-year, 24-hour	763	5.12	86	1,014

2.2 Proposed Conditions

Drainage Areas

The contributing drainage area consists of the following four watersheds:

Proposed Shed 1 (P-1) consists of 670-acre area of the existing shed, excluding the project area and the residential area north of the project that will drain onto the project site. This is primarily made up of residential and herbaceous land.

Proposed Shed 2 (P-2) consists of the 49-acre residential area north of the project site that will drain onto the project site.

Proposed Shed 3(P-3) consists of the 27-acre commercial project area north of Silva Valley Parkway.

Proposed Shed 4 (P-4) consists of the 18-acre commercial project area south of Silva Valley Parkway.

Figure 4 shows the boundaries of each drainage area.

Figure 4- Proposed Drainage Area Map

Runoff Curve Number

The drainage area for the project site consists of the commercial and business land cover type, while the surrounding drainage areas consist primarily of herbaceous land and developed residential land. Table 5 below summarizes the land cover found within the drainage area and the associated curve number.

Table 5 - Summary of Land Cover

Land Cover Type	Percentage of Total Drainage Area	Curve Number for Soil Type D
Proposed – Shed 1		
Residential (1/4 acre lot)	41.5%	87
Herbaceous – mixture of grass, weeds, and low-growing brush	52.5%	85
Streets and Roads – Paved	4.5%	98
Open Space (lawn) – Good Condition	1.5%	80
	Weighted Curve Number:	86
Proposed – Shed 2		
Residential (1/4 acre lot)	62.1%	87
Herbaceous – mixture of grass, weeds, and low-growing brush	37.9%	85
	Weighted Curve Number:	86
Proposed – Shed 3		
Commercial and Business	100.0%	95
Proposed – Shed 4		
Commercial and Business	100%	95

Time of Concentration

Table 6 below summarizes the travel time for each type of flow in the drainage areas. The time of concentration (T_c) for each drainage area is equal to the total travel time.

Table 6 - Summary of Time of Travel and Time of Concentration

Flow Type	Travel Time (min)	Length (ft)
Proposed – Shed 1		
Sheet Flow	20.6	300
Shallow Concentrated Flow	6.5	2,383
Channel Flow (30" Pipe)	7.7	4,469
Channel Flow	15.2	6,620
T_c:	50.0	
Proposed – Shed 2		
Sheet Flow	27.2	300
Shallow Concentrated Flow	4.5	1,490
Channel Flow (30" Pipe)	3.6	1,352
T_c:	35.3	
Proposed – Shed 3		
Sheet Flow	30.8	300
Shallow Concentrated Flow	0.5	158
Channel Flow (21" Pipe)	3.5	1,508
T_c:	34.8	
Proposed – Shed 3		
Sheet Flow	29.7	300
Shallow Concentrated Flow	0.5	155
Channel Flow (21" Pipe)	2.9	1,440
T_c:	33.1	

Lag Time

The lag time for each drainage area is shown in Table 7 below.

Table 7 - Summary of Lag Times

Drainage Area	Lag Time (minutes)
Proposed – Shed 1	30.0
Proposed – Shed 2	21.2
Proposed – Shed 3	20.9
Proposed – Shed 4	19.9

Hydromodification Requirements

El Dorado County is covered under the West Slope Phase II Municipal Separate Storm Sewer Systems (MS4) NPDES Permit. Hydromodification standards are included in Section E.12 Post Construction Storm Water Management Program. In the geomorphic province that the proposed project is located, the MS4 Permit requires that post-project runoff not exceed the estimated pre-project flow rate for the 2-year, 24-hour storm.

A detention basin, located in the southeast corner of the project site, was designed to comply with the hydromodification requirements. This earthen basin with a capacity of 1.2 acre-feet would have 2:1 side slopes and a depth of 14 feet will detain runoff from the project site. An 18"

outfall pipe will release the runoff into the nearby stream. As required, the peak discharge for the 2-year, 24-hour event at the Highway 50 Culvert was estimated to be 315 cfs with the detention basin which is lower than the estimated 319 cfs under the existing conditions. Flows in excess of the 2-yr, 24-hour event will be discharged over a one-foot deep by 80-feet long concrete weir on the west bank of the basin. Figure 5 shows the proposed pond's location.

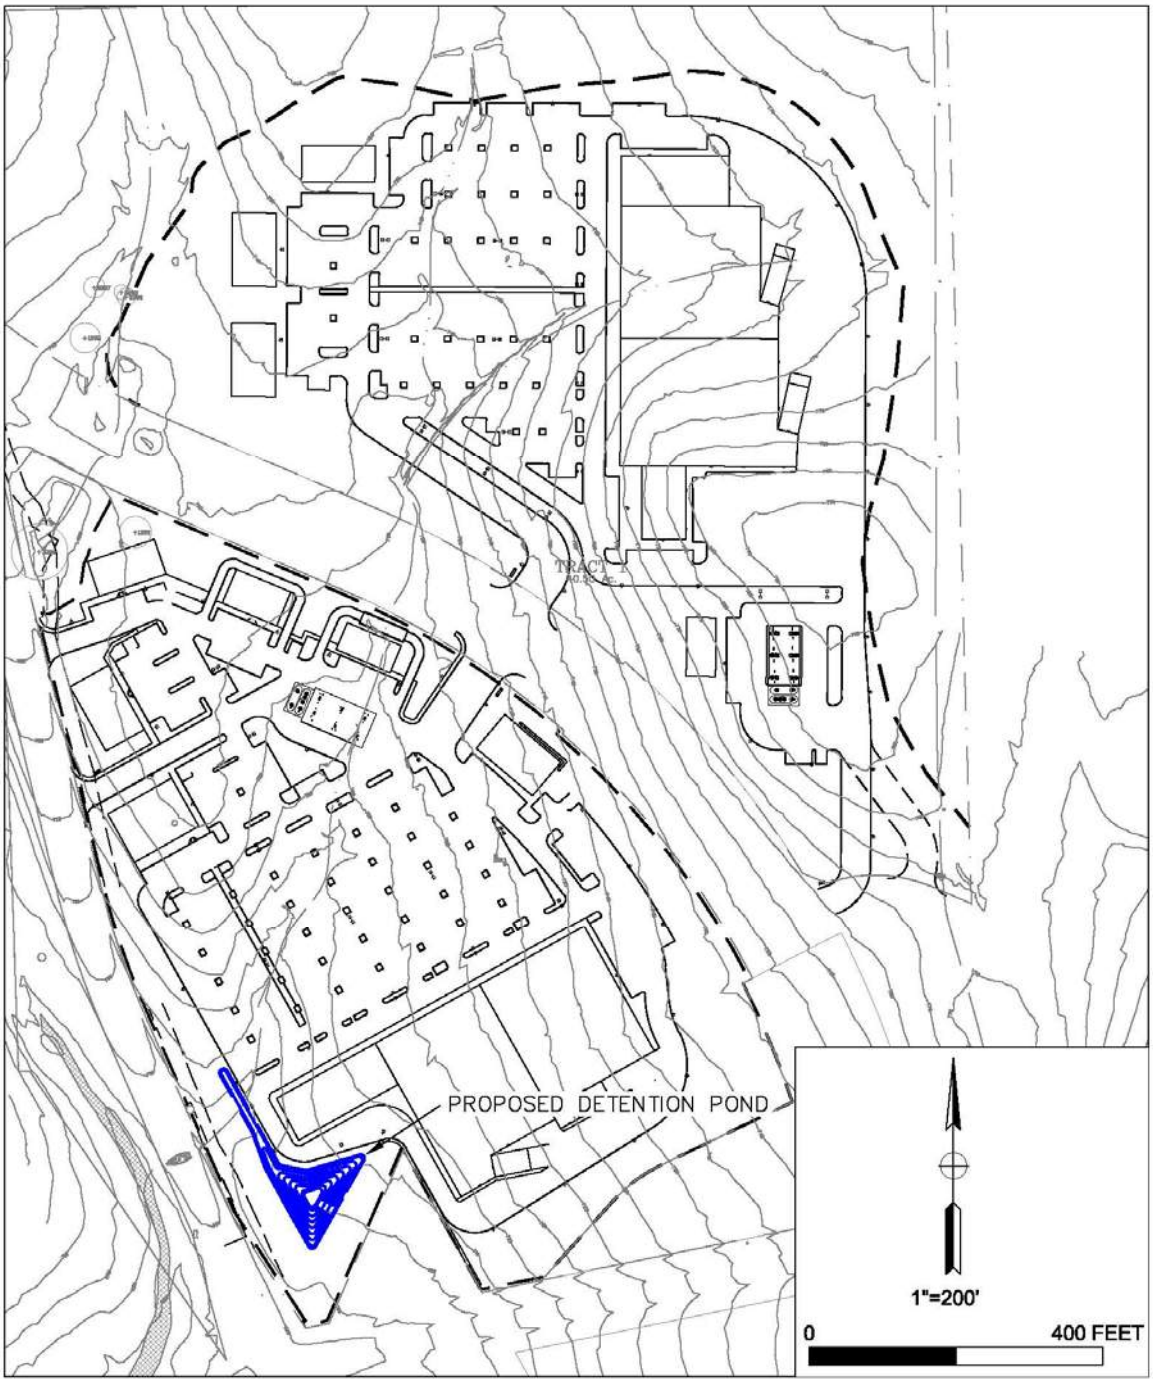

Figure 5- Proposed Detention Pond

HEC-RAS was used to develop the stage-discharge curves shown in for the detention basin drainage pipe and weir. The 18" outfall would be about 170-feet long and was analyzed in HEC-RAs as a culvert. Table 8 shows the stage-storage-discharge input for the pond.

Table 8 - Detention Pond Stage-Storage-Discharge Input

Stage (ft)	Storage Acre-Feet	Discharge (cfs)
711.0	0.00000	0
712.0	0.00720	4
714.0	0.05075	16
716.0	0.12800	24
718.0	0.24749	29
720.0	0.41842	31
722.0	0.65486	32
724.1	1.00705	34
724.2	1.02690	35
724.3	1.04696	40
724.7	1.13199	110
725.0	1.22000	180

Results

The existing HEC-HMS hydrologic model was revised to estimate the peak discharge for the 2, 10 and 100-year, 24-hour storms. Figure 6 below shows the HEC-HMS schematic of the proposed conditions model developed for this analysis.

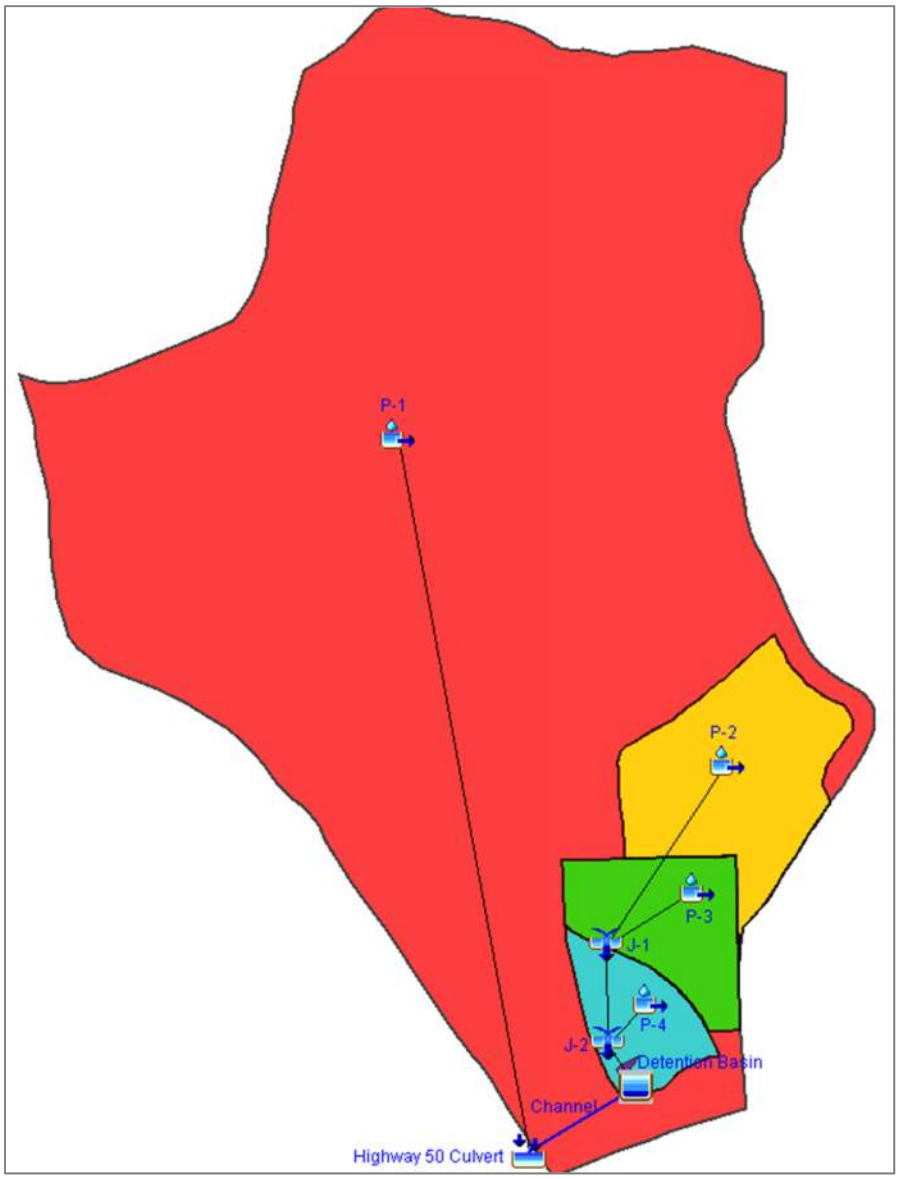

Figure 6 - HEC-HMS Proposed Basin Model Schematic

Table 9 below summarizes the HEC-HMS model results.

Table 9 - Summary of Hydrology Results for Proposed Conditions

			Peak Discharge for Storm Event (cfs)		
Hydrologic Element	**Area (Acres)**	**Curve Number**	**2-yr, 24-hr**	**10-yr, 24-hr**	**100-yr, 24-hr**
Proposed – Shed 1	670.0	86.0	278	532	883
Proposed – Shed 2	49.0	86.0	25	47	78
Proposed – Shed 3	27.0	95.0	24	38	55
Junction 1	-	-	49	85	133
Proposed – Shed 4	18	95	16	25	37
Junction 2	-	-	64	110	170
Detention Basin	-	-	46	110	169
Highway 50 Culvert	-	-	315	633	1,040

2.3 Conclusions

Downstream impacts due to the construction of the project will be minimal. The proposed detention basin limits the peak, 2-year flows to less than existing conditions. 10-year flows would be increased by about 4% and 100-year flows about 3%. With little development downstream the chance of increased damages due to flooding is insignificant.

Jose Crummett, El Dorado County GIS Manager
360 Fair Lane
Placerville, CA 95667

RE: Approval of Administrative Zoning Map Correction for APN: 122-720-15
File references: Z04-0016 and Z16-0008 (EDH 52 Property)

Mr. Crummett:

This letter is to notify you that the Planning Director has approved on this date the Administrative Zoning Map Correction to add the Planned Development (PD) combining zone to APN 122-720-15.

Please amend the County GIS Zoning maps accordingly.

The PD combining zone for APN 122-720-15 (formerly 122-720-09) was erroneously removed during the Zoning Ordinance Update approved on December 15, 2015. The PD combining zone was approved by Board of Supervisors through Ordinance 4975 on March 13, 2012 and implements General Plan Policy 2.2.6.1, specifically requiring that this property have the PD zone.

The approval of this Zoning Map Correction is based on the following Findings of Approval:

FINDINGS FOR APPROVAL

1. The Administrative Zoning Map Correction is authorized by and complies with Zoning Ordinance Section 130.10.030.D.5 (Map Corrections) (Attachment 1). Approval of the zoning map correction is based on historical data, prior zoning maps, and clear legislative intent.

2. The applicant initiated rezone of the property (Z04-0016) was approved by the Board of Supervisors on March 13, 2012 through Ordinance 4975 which rezoned the property from One-Family Residential-Planned Development (R1) to Commercial-Planned Development (C-PD) (Attachment 2).

3. General Plan Policy 2.2.6.1 provides clear legislative intent in that the lot, identified as Village P of the El Dorado Hills Specific Plan, was to be rezoned to include the Planned Development Overlay (-PD): "Those lands within the El Dorado Hills Specific Plan known as Villages P, Q, and V shall be rezoned to include the Planned Development Overlay (-PD) as part of any development application."

4. The Board's adoption of the Zoning Maps on December 15, 2015 did not intend to remove the PD combining zone because:

    a. there was no specific direction to remove the PD combining zone,
    b. Planning staff had no reason for the removal of the zone, and
    c. the removal of the combining zone conflicts with General Plan Policy 2.2.6.1.

5. Approval of the rezone from R1 to C-PD included adoption of a Negative Declaration. It has been determined that pursuant to the California Environmental Quality Act (CEQA) Guidelines Sections 15162 and 15164, there is no substantial evidence requiring the preparation of a Subsequent Negative Declaration or an Addendum to the existing Negative Declaration, adopted by the Board of Supervisors on March 13, 2012.

Sincerely,

Roger Trout

ROGER P. TROUT
Development Services Director

County to correct any such mapping error within 180 days from the date the inconsistency is discovered. The correction of a mapping error shall be exempt from the County's customary application and processing fees. To ensure timely resolution of mapping errors, the County shall schedule hearings for amendments to the Zoning Ordinance at least quarterly.

130.10.030 Responsibility for Administration

A. Responsible Bodies and Individuals. This Title shall be administered by:

1. The El Dorado County Board of Supervisors, hereafter referred to as the Board;
2. The Planning Commission, hereafter referred to as the Commission;
3. The County Zoning Administrator, hereafter referred to as the Zoning Administrator;
4. The County Agricultural Commission, hereafter referred to as the Ag Commission;
5. The Director of the Development Services Department or designee, hereafter referred to as the Director; and
6. The Development Services Department hereafter referred to as the Department.

B. Advisory Committees. The Board may appoint Advisory Committees to review design review applications, or provide input on other issues of concern to the Board or the Commission. These Advisory Committees include, but are not necessarily limited to, the following:

1. Cameron Park Design Review Committee
2. El Dorado Hills Design Review Committee
3. Pollock Pines Design Review Committee
4. The County's Economic Development Advisory Committee ("EDAC")
5. Diamond Springs-El Dorado Community Advisory Committee
6. Meyers Area Plan Advisory Committee

C. Responsibility and Authority of the Director. The duties and responsibilities of the Director are those enumerated in Article 6 (Zoning Ordinance Administration), in this Title and in other Titles of the County Code of Ordinances. Whenever this Title refers to the Director, it is expressly understood to include Department staff acting under the

direction and control of the Director, and whenever this Title refers to the Department it is expressly understood to describe Department staff acting under the direction and control of the Director.

D. Rules of Application. This Title shall be applied in the following manner:

1. **Minimum Requirements.** The provisions of this Title shall be deemed to be the minimum standards unless stated otherwise (for example, maximum building height or maximum density). These standards shall apply to all buildings, structures and uses, except where this Title provides for the exercise of discretion or where a Variance is granted.

2. **Conflicting Provisions.** If conflicts occur between different requirements of this Title, or between provisions of this Title and requirements imposed by other provisions of the County Code of Ordinances or other laws, and regulations adopted by the County, the more stringent development requirement or greater restriction on the use of land or buildings shall apply.

3. **Single Lot Containing Multiple Zones.** Where the boundaries of the zone designation are not coterminous with the property line boundaries, a single lot will contain multiple zones. In that event, the County shall first determine if the zone boundary appears to be the result of a mapping error. In that case, the mapping error shall be resolved as provided in Subsection D.5 (Map Corrections) below.

   Where the County determines that a mapping error has not occurred, the uses of the lot shall be consistent with the zone as shown for the portion of the lot on which the use is proposed. Multiple uses of a lot with multiple zones are expressly allowed consistent with the requirements of each zone. The precise location of the uses may be modified by a planned development or specific plan. Any uncertainty as to the boundaries of each zone within the lot shall be determined pursuant to Subsection D.4 (Map Boundaries) below.

4. **Map Boundaries.** Where the boundaries of any zone shown on the zoning maps are uncertain, the following rules shall apply to resolve the uncertainty:

   a. Where a zone boundary approximately follows a lot line, or road or street, such lot line or the centerline of the road or street shall be construed to be the boundary.

   b. Where a zone boundary approximately follows a stream or river, ridge line or other distinct geographic or topographic feature, such stream or geographic feature shall be construed to be the boundary.

   c. If a zone divides a lot, and the boundary line location is not otherwise designated, the location of the boundary shall be determined by the use of the scale appearing on the zoning map.

5. **Map Corrections.** Where a zone boundary appears to be in error, the Director may make the correction based on historical data, prior zoning maps, clear legislative intent, and other available information. Where the record is unclear, the zoning shall be reviewed by the Commission to determine if the map is in error. If, after review of the record, the Commission finds that the map is in error, they shall direct the Director to correct said error by revising the official maps accordingly within 30 days of the Commission's review.

130.10.040 Applicability of Zoning Ordinance

A. **Area of Applicability.** The provisions of this Title shall apply to all lands within the unincorporated area of the County of El Dorado except as provided in Subsection B (Exemptions from Zone Ordinance Requirements) below.

B. **Exemptions from Zone Ordinance Requirements.** The provisions of this Title do not apply to the following activities, uses, and structures, except where provisions of a memorandum of understanding between the County and another governmental agency provide for County regulatory authority or otherwise provided by law:

1. Activities of the Federal Government on federally owned or leased land.

2. Activities of the State of California or any agency of the state on state owned or leased land.

3. Activities of a local agency, as defined in California Government Code Section 53090, as provided in Section 53091 et seq.

4. The location and construction of facilities for water and electrical energy as provided in California Government Code Section 53091.

5. Tribal lands which are not subject to the jurisdiction of the County.

6. Existing and future preemptions of local land use authority resulting from State Law.

C. **Effect of Zoning Ordinance Changes on Projects in Progress.** The enactment of this Title or amendments hereto may have the effect of imposing different standards on development or new uses from that which previously applied. Following the effective date of this Title the following provisions shall apply:

1. **Pending Applications.** Applications which have been determined by the Department to be complete and in compliance with California Government Code Section 65943 before the effective date of this Title, or any amendment hereto, shall comply with the provisions of this Title in effect on the date that the application is deemed complete.

ORDINANCE NO. 4975

THE BOARD OF SUPERVISORS OF THE COUNTY OF EL DORADO DOES ORDAIN AS FOLLOWS:

RELATED TO REZONING IN THE EL DORADO HILLS AREA
PETITIONED BY EDH 52 PARTNERS

Section 1. The Official Zoning Map for the El Dorado Hills Area is hereby amended to rezone the following described lands from One-Family Residential (R1) zone to Commercial-Planned Development (C-PD) zone:

El Dorado Hills Area

A portion of Assessor's Parcel No. 122-720-09, being described as a portion of Section 1, Township 9 North, Range 8 East, M.D.M., consisting of 57.78 acres (see Exhibit A Attached hereto)

Section 2. This ordinance shall take effect and shall become effective thirty (30) days following the adoption hereof.

PASSED AND ADOPTED by the Board of Supervisors of the County of El Dorado at a regular meeting of said Board, held on the 13 day of MARCH, 2012, by the following vote of said Board:

Ayes: Ron Briggs, Raymond J. Nutting
John R. Knight, James R. Sweeney

EL DORADO COUNTY
COMMUNITY DEVELOPMENT AGENCY

AGREEMENT FOR PAYMENT OF PROCESSING FEES

Business or Name of Financially Responsible Party	Project/Facility Number

the FINANCIALLY RESPONSIBLE PARTY (hereinafter FRP), agrees as follows:

1. This project/facility is subject to time and materials method of billing or raises issues that may require significant staff and/or consultant time which might not be covered by the initial processing deposit/fee detailed in the approved Board of Supervisors Community Development Agency Consolidated Fee Schedule, and other County department fee schedules as applicable, as amended from time to time. Therefore, the FRP for this project will be billed at the approved rate for time and materials for the processing of this project. The fee initially collected will be a deposit toward subsequent billings.

2. Accounting of time spent on the project and/or applicable fees will be detailed in a statement/invoice sent to the FRP.

3. The FRP is responsible for payment of all permit processing costs and/or applicable fees associated with this project/facility. If payment is not received within 90 days of the date of an invoice, the County may elect to stop work and close the file. The County may require a new application and/or new deposit before resuming processing of the project. Projects with an outstanding balance due on their account that are not paid in full by the scheduled appearance on the Planning Commission, Zoning Administrator, or Board of Supervisors agenda will not proceed until after any balance due is paid.

4. If during the course of processing, the FRP changes, the new FRP must complete an Agreement for Payment, which will release the previous FRP from further financial obligations and designate the new FRP.

5. The FRP understands and agrees that if the FRP owes any overdue balance for processing a project/permit of more than 90 days, Community Development Agency will not accept any subsequent applications from the FRP until the outstanding balance due is paid.

6. FRP agrees to pay any and all remaining fees applicable under the approved Board of Supervisors Community Development Agency Consolidated Fee Schedule, and any other fees associated with the processing of the project that may be charged by County Departments outside of the Community Development Agency, prior to map clearance for recordation or clearance for record of survey or issuance of any building or grading permits or any other permits under authority of the Community Development Agency. No clearances or permits will be issued without receipt of full payment of fees applicable under the approved Board of Supervisors Community Development Agency Consolidated Fee Schedule, or any other fees associated with the processing of the project that may be charged by County Departments outside of the Community Development Agency, unless waived or adjusted in accordance with County Board of Supervisors Policy B-2.

7. If the FRP appeals a decision on this project/facility, the costs of processing the appeal will be charged to the FRP pursuant to the fees applicable under the approved Board of Supervisors Community Development Agency Consolidated Fee Schedule, and other County department fee schedules as applicable, at the time of Appeal.

8. If payment is not received within 90 days of said statement/invoice, collection will be initiated. Unpaid balances turned over to County Revenue Recovery will be assessed an additional fourteen percent (14%).

9. A processing fee will be charged for any check returned for insufficient funds, up to the maximum allowed by the State of California.

Design Guidelines

These Guidelines will serve to further define the design theme and its application to the multiple project buildings. The design theme for the project is based on the existing building design theme of the Serrano area which is a California/Mediterranean style, examples of which are contained in this guideline.

Where single tenant types (hotel and retail shops) occur, the guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants will use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as shown in this guideline. No building design for any tenant type shall be repeated.

Each building shall vary in building height to achieve more visual interest and distinct building character, avoiding the monotony of continuous building height. Each building shall combine horizontal and vertical elements to provide variation, interest and rhythm within and among the buildings. In no case shall any roof mounted equipment be higher than the lowest parapet height of the building.

The color and material palette for the project contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the project so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette must be maintained throughout the development.

Within the development all sides of all buildings will be visible from adjacent roadways and properties. The architecture of all sides of all buildings must, therefore, be of equal quality and attention. Screening is required for loading and storage areas, utilities meters and boxes by the use of landscaping, walls, fences in combination.

The use of colored concrete, concrete pavers, accent patterns, etc. shall be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas shall be accomplished by the use of intimate seating areas in near proximity of the building.

ENVIRONMENTAL QUESTIONNAIRE

Project Title EDH 52

Lead Agency EL DORADO COUNTY

Name of Owner EDH 52, GP Telephone (916) 383-2500

Address 7700 COLLEGE TOWN DR., STE. 101 SACRAMENTO, CA 95826

Name of Applicant RSC ENGINEERING, INC. Telephone (916) 788-2884

Address 2250 DOUGLAS BLVD., STE. 150 ROSEVILLE, CA 95661

Project Location NE CORNER OF OLD SILVA VALLEY ROAD & HIGHWAY 50

Assessor's Parcel Number(s) 122-720-15

Acreage 41.87 AC, Zoning PD-CR

Please answer all of the following questions as completely as possible. Subdivisions and other major projects will require a Technical Supplement to be filed together with this form.

1. Type of project and description: _____

2. What is the number of units/parcels proposed? 11

GEOLOGY AND SOILS

3. Identify the percentage of land in the following slope categories:

X 0 to 10% X 11 to 15% X 16 to 20% X 21 to 29% X over 30%

4. Have you observed any building or soil settlement, landslides, rock falls or avalanches on this property or in the nearby surrounding area? No

5. Could the project affect any existing agriculture uses or result in the loss of agricultural land?
No

DRAINAGE AND HYDROLOGY

6. Is the project located within the flood plain of any stream or river? If so, which one?
No

7. What is the distance to the nearest body of water, river, stream or year-round drainage channel?
2/3 miles Name of the water body? Carson Creek

8. Will the project result in the direct or indirect discharge of silt or any other particles in noticeable amount into any lakes, rivers or streams? No

9. Will the project result in the physical alteration of a natural body of water or drainage way?
If so, in what way? No

10. Does the project area contain any wet meadows, marshes or other perennially wet areas?
Yes, wetlands

VEGETATION AND WILDLIFE

11. What is the predominant vegetative cover on the site (trees, brush, grass, etc.)? Estimate percentage of each: 98% grasses, 2% oak woodland

12. How many trees of 6-inch diameter will be removed when this project is implemented?

FIRE PROTECTION

13. In what structural fire protection district (if any) is the project located? El Dorado Hills

14. What is the nearest emergency source of water for fire protection purposes (hydrant, pond, etc.)?
hydrant on Silva Valley Parkway

15. What is the distance to the nearest fire station? 2.25 miles at Bass Lake Station

16. Will the project create any dead-end roads greater than 500 feet in length?
No

17. Will the project involve the burning of any material including brush, trees and construction materials?
No

NOISE QUALITY

18. Is the project near an industrial area, freeway, major highway or airport? If so, how far?
Freeway approximately 150' south

19. What types of noise would be created by the establishment of this land use, both during and after construction? typical construction of a retail center and typical operation noises like truck traffic and HVAC units during operation

AIR QUALITY

20. Would any noticeable amounts of air pollution, such as smoke, dust or odors, be produced by this project? No

WATER QUALITY

21. Is the proposed water source: X public or ___private, X treated or ___untreated?
Name the system: EID

22. What is the water use (residential, agricultural, industrial or commercial)?
Commercial

AESTHETICS

23. Will the project obstruct scenic views from existing residential areas, public lands, public bodies of water or roads? No

ARCHAEOLOGY/HISTORY

24. Do you know of any archaeological or historical areas within the boundaries or adjacent to the project? (e.g., Indian burial grounds, gold mines, etc.) Yes.

SEWAGE

25. What is the proposed method of sewage disposal? ____ septic system X sanitation district
Name of district: EID

26. Would the project require a change in sewage disposal methods from those currently used in the vicinity? No

TRANSPORTATION

27. Will the project create any traffic problems or change any existing roads, highways or existing traffic patterns? None expected. A traffic study will be prepared.

28. Will the project reduce or restrict access to public lands, parks or any public facilities?
No

GROWTH-INDUCING IMPACTS

29. Will the project result in the introduction of activities not currently found within the community?
No

30. Would the project serve to encourage development of presently undeveloped areas, or increases in development intensity of already developed areas (include the introduction of new or expanded public utilities, new industry, commercial facilities or recreation activities)? No

31. Will the project require the extension of existing public utility lines? If so, identify and give distances:
Yes.

GENERAL

32. Does the project involve lands currently protected under the Williamson Act or an Open Space Agreement? No

33. Will the project involve the application, use or disposal of potentially hazardous materials, including pesticides, herbicides, other toxic substances or radioactive material?
No

34. Will the proposed project result in the removal of a natural resource for commercial purposes (including rock, sand, gravel, trees, minerals or top soil)?
No

35. Could the project create new, or aggravate existing health problems (including, but not limited to, flies, mosquitos, rodents and other disease vectors)?
No

36. Will the project displace any community residents? No

DISCUSS ANY YES ANSWERS TO THE PREVIOUS QUESTIONS (attach additional sheets if necessary)

MITIGATION MEASURES (attach additional sheets if necessary)

Proposed mitigation measures for any of the above questions where there will be an adverse impact:

Attention: Mel Pabalinas

Subject: EDH 52 (PD15-0001)

Dear Mel,

As you are aware this project was put on hold for some time until such time that more specific details could be provided regarding the proposed project. We are resubmitting the PD application package based on the incomplete letter dated August 12, 2015. We also have added 3 new entitlements to the project which include a rezone, tentative parcel map, and conditional use permit. We also prepared an annotated response to your letter, which is attached, explaining how each of the items was addressed.

Forms and Maps (F&M) Required

1. Four copies of a tree preservation plan is provided with this submittal.
2. A preliminary drainage report is included with the submittal.
3. We understand a noise analysis will be prepared as part of the EIR document and will not be required to continue moving the project forward.
4. We understand an air quality impact analysis will be prepared as part of the EIR document and will not be required to continue moving the project forward.
5. We understand a traffic analysis will be prepared as part of the EIR document and will not be required to continue moving the project forward.

Site Plan Requirements

1. The entire parcel of land along with perimeter dimensions are shown on the updated site plan detail sheets.
2. A note has been added on the site plan stating that all existing easements have widths that vary. All existing easements are shown on the site plan

RSC Engineering, Inc.
Consulting Engineers

2250 Douglas Blvd.
Suite 150
Roseville, CA 95661
916.788.2884
Fax 916.788.4408
rsc-engr.com

with their purpose. Proposed easements are not known at this time and will be determined during the improvements plan preparation.

3. Typical parking stall and loading stall dimensions are shown on the site plan. Compact stalls and standard stall depths and widths are also noted in the notes section.
4. Retaining walls are proposed along the roadways due to grade differences. The walls are shown on the site plan and grading plan.
5. Monument signs are proposed at each entry. See project description for details on the proposed freestanding signage.
6. Please see the preliminary utility plan for the proposed fire hydrant locations.
7. All adjacent parcels including parcel owners and APN's are shown on the site plan detail sheets.
8. Location of neighboring school is shown on Sheet SP3.

Plan of Building Elevations

1. Typical elevations for all sides of the proposed building types are provided.
2. Proposed highway signs and monument sign locations are shown on the proposed site plan. See project description for details on the proposed freestanding signage.

Advisories

1. This project will mitigate for oak trees removed as part of the project. A preserve area is available for a portion of the mitigation at the northern corner of the south site. An offsite preserve area will be needed for the remaining mitigation oak trees. A total of 1.18 acres of mitigation planting or 236 oak trees will be planted.
2. Deleted.
3. It is our understanding a FIA is not required with this submittal. A modified scope will be coordinated with the County at a late date.
4. The project description has been updated to reflect the comments listed in the letter.
5. The new project description will be the one used by the EIR Consultant when selected.
6. The site plan and landscape plan have been adjusted to have a single overall sheet and subsequent details sheets for better clarity. The grading and utility plans have one sheet for each project site (north and south)

The project is proposing a rezone from PD-CR to PD-CC. A rezone exhibit and application is provided with this submittal. The project will also include a tentative parcel map to subdivide the property into 12 lots. This will include 8 on the south side and 4 on the north side. This tentative parcel map assumes a large lot 4 parcel map has recorded that separates the north and south lots and creates a

lot of the mini-storage use and future Country Club Drive extension roadway. Finally, a conditional use permit is being requested to allow the mini-storage use as a conditional use within the proposed PD-CC zone.

We look forward to your review of our third submittal and moving forward with the EIR. Please call if there are any questions.

Sincerely,

Tiffany Ann Wilson, AICP
Managing Planner

Angelo Christie

EDH 52

OVERALL COMMERCIAL CENTER

PROJECT DESCRIPTION

October 5, 2017

DESCRIPTION AND PURPOSE OF THE REQUEST

The owner is requesting approval to construct two (2) new commercial centers (collectively, the "Project") in El Dorado County on APN 122-720-15. The property is located north of Highway 50 and Tong Road, east of Old Silva Valley Parkway, and is bisected by Silva Valley Parkway. The northern portion of the property is approximately 17.07 acres (North Site) and the southern portion is approximately 15.73 acres (South Site), net of the right of way for roads. There is a 7.69-acre area on the North Site for the right of way associated with the future extension of Country Club Drive. There is a 1.38-acre open space area west of Old Silva Valley Road that will not be developed.

The County is reviewing the owner's request as a single application and project for local entitlement and California Environmental Quality Act purposes. However, the owner views the North Site and the South Site as two distinct projects, and each constitutes a separate "integrated development" pursuant to El Dorado County Code Section 130.16.120. Accordingly, the owner will seek separate wetlands permits from the Army Corps of Engineers for each. The maximum building area for the South Site will be approximately 110,000 square feet and may include the following uses: hotel, drive through uses, gas station with car wash, grocery, pharmacy, retail, food uses, outdoor patio, medical office, surgery center, office, technical school, outdoor storage and outdoor sales. The maximum building area for the North Site will be approximately 180,000 square feet and may include self-storage, grocery, and other commercial uses.

The Project requires a Planned Development application because the property is zoned PD-CR. A rezone is proposed to PD-CC to allow more uses primarily seen in a shopping center setting and to allow a self-storage use with the approval of a conditional use permit. In addition, a design review permit will be required for signage and a tentative parcel map is proposed to subdivide the parcels further for purposes of sale, lease or financing of the property.

PROJECT OBJECTIVES

- Develop two high-quality planned commercial developments on currently vacant and underutilized land adjacent to Highway 50 adequately served by public services and utilities.
- Promote economic growth and diverse new employment and retail/service opportunities for County residents.
- Develop architectural and landscaping designs that soften the scale and mass of the buildings, create a pleasant and attractive appearance, and complement the surrounding area.

- Develop site plans that minimize potential access and circulation conflicts between automobiles and pedestrians, provide adequate off-street parking for store customers and employees, and minimize impacts to the surrounding area.

SITE INFORMATION

Location

The proposed Project is located in El Dorado County. The Project site is on the north side of Highway 50 and is bisected by Silva Valley Parkway. It is bordered by existing residences and an elementary school to the north, vacant land to the east, Old Silva Valley Road to the west, and Highway 50 to the south.

Site Description

The Project site is currently vacant. The site consists of annual grassland with small oak woodlands throughout the Project. Slivers of wetlands and riparian areas are located on site.

DESCRIPTION OF THE PROPOSED PROJECT

The maximum building area for the South Site will be approximately 110,000 square feet and may include the following uses: hotel, drive through uses, gas station with car wash, grocery, pharmacy, retail, food uses, outdoor patio, medical office, surgery center, office, technical school, outdoor storage and outdoor sales. The maximum building area for the North Site will be approximately 180,000 square feet and may include self-storage, grocery, and other community-serving commercial uses.

Design

The design theme for the Project is based on the existing building design theme of the Serrano area which is a California/Mediterranean style, examples of which are included in the design guidelines proposed for this project.

Where single tenant types (hotel and retail shops) occur, the guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants will use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as shown in the guidelines. No building design for any tenant type shall be repeated.

Each building shall vary in building height to achieve more visual interest and distinct building character, avoiding the monotony of continuous building height. Each building shall combine horizontal and vertical elements to provide variation, interest and rhythm within and among the buildings. In no case shall any roof mounted equipment be higher than the lowest parapet height of the building.

The color and material palette for the project contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the project so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette must be maintained throughout the development.

Within the development all sides of all buildings will be visible from adjacent roadways and properties. The architecture of all sides of all buildings must, therefore, be of equal quality and attention. Screening is required for loading and storage areas, utilities meters and boxes by the use of landscaping, walls, fences in combination.

The use of colored concrete, concrete pavers, accent patterns, etc. shall be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas shall be accomplished by the use of intimate seating areas in near proximity of the building.

Sustainability Features

The proposed Project will incorporate sustainability features per the California Title 24 energy requirements.

SIGNAGE

Proposed highway-oriented and monument sign locations are depicted on the proposed site plan.

One highway-oriented sign is proposed on the South Site within 100 feet of the freeway right of way and therefore requires a Design Review Permit. A second highway-oriented sign is proposed on the North Site greater than 100 feet from the freeway right of way. The owner is requesting certain deviations from Chapter 130.16 of the County Code for the proposed highway-oriented signs, including a reduction in the minimum separation between highway-oriented signs, a reduction in the minimum setback from the adjacent residential district (North Site only), an increase in the maximum allowed area, and an increase in the maximum allowed height. Each highway-oriented sign will be a 75 foot tenant pylon sign allowing advertising from either commercial center and will include one (1) major tenant panel, one (1) junior tenant panel, and eight (8) shop tenant panels. The proposed sign area for each highway-oriented sign is 652 square feet. The highway-oriented signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be fabricated aluminum, pan channel construction. Tenant names and logos will be flush mounted to the panel background and internally illuminated with white LED lights. Colors will comply with tenant specifications.

The owner is also requesting certain deviations from Chapter 130.16 of the County Code for the proposed monument signs, including a reduction in the minimum separation between monument signs, an increase in the maximum number of signs allowed per street frontage, an increase in the maximum allowed area, and an increase in the maximum allowed height. The developer is proposing six (6) 28 foot tenant monument signs allowing advertising from either commercial center. Each monument sign will have one (1) featured tenant panel and six (6) shop tenant panels. The proposed area for each monument sign is 242 square feet. The monument signs

will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be routed out with acrylic push-through graphics and vinyl film overlays. Tenant names will be internally illuminated with white LED lights. Colors will comply with tenant specifications.

Building signs will be a part of a separate sign permit and are not proposed at this time.

SITE ACCESS

It is anticipated that the Project site will have multiple points of access. A traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the South Site and the North Site. A right in and right out access driveway is proposed on Silva Valley Parkway north of the signalized driveway and at the old Tong Road location to provide access to the North Site. Two full access driveways are proposed on Old Silva Valley Road to provide additional points of access to the South Site.

LOADING

The North Site includes the potential for a truck dock with up to 4 loading spaces located at the rear of the proposed stores.

PARKING LOT

The North Site proposes a main parking lot area in front of the buildings. The parking lot will provide approximately 204 parking spaces, proposed at 90 degrees to maximize the number of stalls on the site. This number includes 9 accessible parking stalls and 29 compact stalls (14%).

The South Site proposes a main parking lot area in front of the buildings. The parking lot will provide approximately 521 parking spaces, proposed at 90 degrees to maximize the number of stalls on the site. This number includes 16 accessible parking stalls, 24 compact stalls (5%), and 10 RV stalls.

ADA parking will comply with the County Code and Title 24 requirements.

BICYCLE PARKING

The Project will provide bicycle parking spaces (lockers and racks) throughout the site that will meet County and Title 24 requirements.

PEDESTRIAN CIRCULATION

A pedestrian walkway for each portion of the Project will connect the buildings to Silva Valley Parkway.

LANDSCAPING

The Project will include a variety of drought tolerant landscaping options. The landscaping will provide screening along the boundary which will consist of evergreen trees and shrub rows. Shade trees with large canopy coverage will be planted in the parking lot for shade. Planting at the entries will be highlighted and defined by seasonal accented trees and shrubs with the use of colorful plant material. Shrubs will be low growing to maintain line of sight to the street. Along the streets, plantings will incorporate shade trees and mixed species and forms of shrubs to create interest, color, and buffering from the shopping center.

In addition to the proposed shopping center landscaping, this Project will mitigate for oak trees removed as part of the Project. A preserve area is available for a portion of the mitigation oak trees. The preserve area is located at the northwest corner of the southern site. An offsite preserve area will be needed for the remaining mitigation oak trees. Based on the Tree Survey, Preservation, and Replacement Plan dated September 18, 2017 by Foothill Associates, a total of 1.18 acres of mitigation planting or 236 oak trees will be planted. Planting will be according to the planting details provided in the plan.

LIGHTING

The Project will provide various single, two- or four-light fixtures throughout the parking areas and driveways. The overall height of the lighting, including the lighting fixtures and a three foot base, will be 33 feet in the parking lot and 25 feet along the perimeter and main drive aisles. LED luminaires will be used for the parking lot lights.

GRADING

A preliminary grading plan has been prepared for review as part of the application submittals. Each site is designed to balance independently and it is the intent of this application to allow for mass grading of both sites individually.

ON-SITE IMPROVEMENTS

The Project is designed to allow either the North Site or the South Site to develop independent from the other. Mass grading of each site to accommodate future development will occur in the first phase of development, including filling of the permitted wetlands and permitted tree removal. In the event the South Site develops first, utility crossings under Silva Valley Parkway will be constructed as part of the South Site infrastructure work to serve the North Site. In the event the North Site develops first, interim facilities will be constructed on the North Site.

The second phase will include construction of the parking, landscaping, lighting, utility infrastructure, and driveways designed to support the buildings. Site improvements will be constructed in various phases depending on the extent of development occurring at any given time. Buildings can be started once site improvements are sufficiently completed to allow construction and emergency fire access.

As preservation of 90% of the existing oak tree canopy is not feasible, this Project will be requesting relief from General Plan Policy 7.4.4.4 due to topographic constraints and the need to grade the site in relation to Silva Valley Parkway.

OFF-SITE IMPROVEMENTS

A proposed traffic signal and appurtenant facilities will be located on Silva Valley Parkway at the center of the Project to provide a connection to both the South Site and the North Site.

A right in and right out access driveway is proposed on Silva Valley Parkway north of the signalized driveway and at the old Tong Road location to provide access to the North Site. Two full access driveways are proposed on Old Silva Valley Road to provide additional points of access to the South Site. A reservation for 7.65 acres of future right of way is proposed along the outer boundary of the North Site.

UTILITY INFRASTRUCTURE

The property will need to annex into El Dorado Irrigation District (EID) in order to acquire sanitary sewer and water service. EID stated in its August 29, 2014 Facilities Improvement Letter that there should be adequate water supply and sewer capacity available to serve the Project. The Project will tie into the existing 18-inch potable water main and the 21-inch gravity sewer line in Old Silva Valley Road. An updated Facilities Improvement Letter will be requested through EID at the appropriate time.

The property will also annex into the El Dorado Hills County Water District (Fire Protection) prior to building permit issuance.

Sanitary service and potable water for the North Site will be provided by public (EID) sanitary sewer and water lines that cross the South Site. Reclaimed water is available for non-potable irrigation use and will be provided by extending an existing reclaimed line in Silva Valley Parkway north of the Project site.

Dry utilities (electric, gas, telephone and cable TV) will be provided from existing infrastructure located to the north of the Project site in Silva Valley Parkway. Dry utilities will need to be extended along the frontage of both the North Site and the South Site.

STORM DRAINAGE DESCRIPTION

The on-site drainage system will connect to El Dorado County's storm drain infrastructure in Old Silva Valley Road. The Project has typical pollutant sources from parking lot runoff, loading/unloading areas, outdoor storage areas, and a trash compactor. This Project proposes underground water quality vaults as the form of treatment for the site.

A proposed detention basin is located at the southwest corner of the property. It will be sized to serve both the South Site and the North Site. As with sanitary sewer and water, drainage facilities will be constructed on the South Site to transmit storm water runoff from the North Site to the detention basin.

TRUCK CIRCULATION

Truck access will be allowed at all driveway locations depending on the size of the delivery truck and direction of travel.

OTHER GOVERNMENTAL AGENCY APPROVALS

Additional subsequent approvals and permits that may be required from local, regional, state, and federal agencies are identified below.

- El Dorado Irrigation District -Water and Sewer-Annexation and Utility Approval
- El Dorado County Resource Conservation District-Onsite Plan Approval
- El Dorado Hills County Water District (Fire Protection)-Annexation and Fire Approval
- El Dorado County Air Quality Management District-Air Quality Permit
- El Dorado County Department of Transportation -Encroachment Permit/Grading Permit/Onsite Plan Approval
- El Dorado County Building Services-Building Permit/Sign Permit
- Central Valley Regional Water Quality Control Board-NPDES General Permit for Stormwater Discharge
- California Department of Fish and Wildlife-Wetland Approval
- Army Corps-Wetland Approval
- LAFCO-Annexation approval for EID and El Dorado Fire Protection District

Design Guidelines

ARCHITECTURE

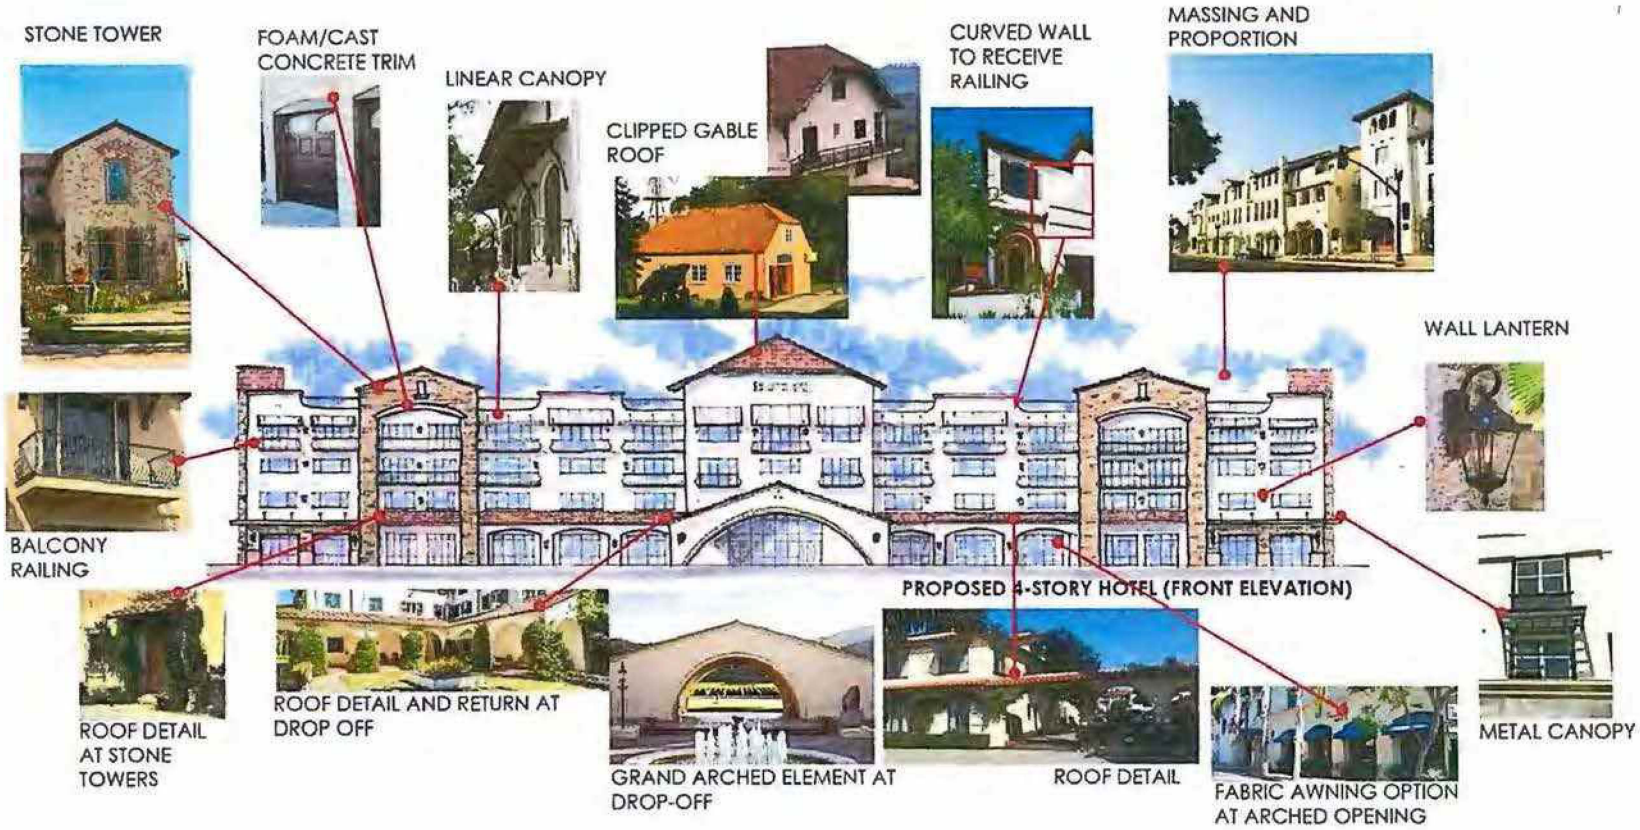
PLANNING

INTERIORS

These Guidelines will serve to further define the design theme and its application to the multiple project buildings. The design theme for the project is based on the existing building design theme of the Serrano area which is a California/Mediterranean style, examples of which are contained in this guideline.

Where single tenant types (hotel and retail shops) occur, the guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants will use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as shown in this guideline. No building design for any tenant type shall be repeated.

Each building shall vary in building height to achieve more visual interest and distinct building character, avoiding the monotony of continuous building height. Each building shall combine horizontal and vertical elements to provide variation, interest and rhythm within and among the buildings. In no case shall any roof mounted equipment be higher than the lowest parapet height of the building.



The color and material palette for the project contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the project so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette must be maintained throughout the development.

Within the development all sides of all buildings will be visible from adjacent roadways and properties. The architecture of all sides of all buildings must, therefore, be of equal quality and attention. Screening is required for loading and storage areas, utilities meters and boxes by the use of landscaping, walls, fences in combination.

The use of colored concrete, concrete pavers, accent patterns, etc. shall be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas shall be accomplished by the use of intimate seating areas in near proximity of the building.

GENERAL PLANTING NOTES

1. ALL PLANTING AREAS SHALL BE IRRIGATED WITH AN AUTOMATIC IRRIGATION SYSTEM.
2. ALL SHRUB AND GROUNDCOVER AREAS SHALL RECEIVE A 2" LAYER OF BARK CHIP MULCH TOP DRESSING.
3. REDWOOD HEADERBOARD SHALL BE INSTALLED BETWEEN LAWN AND SHRUB AREAS.
4. ALL GROUND MOUNTED HVAC UNITS, GAS & ELECTRICAL METERS, AND EQUIPMENT ETC. SHALL RECEIVE SHRUB SCREENING IN SHRUB AND GROUNDCOVER AREAS AROUND BUILDINGS.
5. TRASH ENCLOSURES SHALL BE SCREENED WITH TREES AND SHRUB PLANTING.

SHEET

PL-1

1 OF 4 SHEETS

STREETSCAPE INTENT

AREAS FRONTING THE STREETS WILL INCORPORATE SHADE TREES ALONG WITH MIXED SPECIES AND FORMS OF SHRUBS FOR INTEREST, COLOR, AND BUFFERING OF THE SHOPPING CENTER FROM THE STREETS. SHRUB MASSES WILL UTILIZE DROUGHT TOLERANT SPECIES WHERE APPROPRIATE.

PARKING LOT INTENT

THE PRIMARY TREES WILL PROVIDE A CANOPY OF SHADE. UNDERSTORY PLANTINGS WITHIN THE PARKING LOT WILL CONSIST OF LOW SHRUBS AND/OR GROUNDCOVERS.

SCREENING INTENT

PRIMARY PLANTING ALONG THE PROPERTY BOUNDARIES WILL CONSIST OF EVERGREEN TREES AND SHRUB ROWS TO SCREEN ADJACENT PROPERTIES.

ENTRY TREATMENT INTENT

PLANTING AT THE ENTRIES WILL BE HIGHLIGHTED & DEFINED BY SEASONAL ACCENTED TREES & SHRUBS WITH THE USE OF COLORFUL PLANT MATERIAL. SHRUBS WILL BE LOW TO MAINTAIN SIGHT LINES.

EDH 52 PRELIMINARY PLANT MATERIAL LIST AND LEGEND

TREES

SYMBOL	BOTANICAL NAME / COMMON NAME	SIZE	REMARKS	WATER USE

CANOPY/SHADE TREES
LARGE EVERGREEN OR DECIDUOUS 30' TO 35' DIAMETER TREES USED TO PROVIDE SHADE

CELTIS SINENSIS CHINESE HACKBERRY	15 G	40'H x 30'W	MED
ELAEOCARPUS DECIPIENS JAPANESE BLUEBERRY TREE	15 G	40'H x 28'W	MED
LIRIODENDRON TULIPIFERA TULIP TREE	15 G	60'H x 35'W	MED
MAGNOLIA GRANDIFLORA 'D.D. BLANCHARD' SOUTHERN MAGNOLIA	15 G	45'H x 30'W	MED
PISTACIA CHINENSIS 'KEITH DAVEY' CHINESE PISTACHE	15 G	40'H x 35'W	LOW
PLATANUS ACERIFOLIA 'BLOODGOOD' LONDON PLANE TREE	15 G	40'H x 30'W	MED
TILIA CORDATA 'GREENSPIRE' LITTLE-LEAF LINDEN	15 G	35'H x 25'W	MED
ULMUS PARVIFOLIA 'ALLEE' ALLEE CHINESE EVERGREEN ELM	15 G	50'H x 30'W	MED
ZELKOVA SERRATA 'VILLAGE GREEN' SAWLEAF ZELKOVA	15 G	45'H x 35'W	MED

SCREEN TREES
EVERGREEN TREES USED TO SCREEN THE PROJECT FROM THE SURROUNDING DEVELOPMENTS

ARBUTUS 'MARINA' MARINA STRAWBERRY TREE	15 G	30'H x 25'W	LOW
CEDRUS DEODARA DEODAR CEDAR	15 G	50'H x 25'W	LOW
CUPRESSOCYPARIS LEYLANDII LEYLAND CYPRESS	15 G	60'H x 12'W	MED
CUPRESSUS GLABRA 'BLUE ICE' BLUE ICE ARIZONA CYPRESS	15 G	25'H x 12'W	LOW
LAURUS 'SARATOGA' SARATOGA SWEET BAY	15 G	25'H x 25'W	LOW
PINUS ELDARICA MONDELL PINE	15 G	30'H x 20'W	LOW
PRUNUS CAROLINIANA CAROLINA CHERRY LAUREL	15 G	25'H x 20'W	LOW
QUERCUS SUBER CORK OAK	15 G	45'H x 45'W	LOW
QUERCUS WISLIZENI INTERIOR LIVE OAK	15 G	40'H x 45'	LOW

ACCENT TREES
EVERGREEN OR DECIDUOUS TREES USED TO PROVIDE COLOR, DENOTE ENTRIES AND CREATE PEDESTRIAN SCALE

CARPINUS BETULUS 'FASTIGIATA' EUROPEAN HORNBEAM	15 G	30'H x 20'W	MED
CERCIS CANADENSIS 'FOREST PANSY' FOREST PANSY REDBUD	15 G	20'H x 25'W	MED
CERCIS OCCIDENTALIS WESTERN REDBUD	15 G	15'H x 12'W	LOW
LAGERSTROEMIA INDICA x FAURIEI 'MUSKOGEE' LAVENDER CRAPE MYRTLE	15 G	25'H x 15'W MULTI-TRUNK	LOW
LAGERSTROEMIA INDICA x FAURIEI 'NATCHEZ' WHITE CRAPE MYRTLE	15 G	25'H x 12'W MULTI-TRUNK	LOW
MAGNOLIA GRANDIFLORA 'LITTLE GEM' COMPACT SOUTHERN MAGNOLIA	15 G	25'H x 12'W	MED
NYSSA SYLVATICA TUPELO	15 G	40'H x 15'W	MED
PRUNUS CERASIFERA 'KRAUTER VESUVIUS' PURPLE-LEAF FLOWERING PLUM	15 G	15'H x 15'W	MED
PYRUS CALLERYANA 'RED SPIRE' RED SPIRE PEAR	15 G	30'H x 20'W	MED
VITEX AGNUS-CASTUS BLUE CHASTE TREE	15 G	15'H x 15'W	LOW

SHRUBS & GROUNDCOVERS

SYMBOL	BOTANICAL NAME / COMMON NAME	SIZE	REMARKS	WATER USE

BACKGROUND OR FOUNDATION SHRUBS
LARGE EVERGREEN SHRUBS USED FOR REDUCING BUILDING MASS OR SCREENING

ARBUTUS UNEDO 'COMPACTA' DWARF STRAWBERRY TREE	5 G	8'H x 8'W	LOW
CEANOTHUS SPP. WILD LILAC	5 G	6'H x 6'W	LOW
CHOISYA TERNATA MEXICAN ORANGE	5 G	6'H x 6'W	MED
LEUCOPHYLLUM FRUTESCENS TEXAS RANGER	5 G	7'H x 7'W	LOW
NERIUM OLEANDER 'PETITE' RED OLEANDER	5 G	10'H x 10'W	LOW
PRUNUS CALIFORNICA 'ONE CASE' COFFEEBERRY	5 G	8'H x 8'W	LOW
RHAPHIOLEPIS INDICA SPP. INDIAN HAWTHORN	5 G	5'H x 5'W	MED
XYLOSMA CONGESTUM 'COMPACTA' COMPACT SHINY XYLOSMA	5 G	7'H x 7'W	LOW

FACER SHRUBS
EVERGREEN OR DECIDUOUS SHRUBS USED FOR LAYERING OF PLANT MATERIAL, SEASONAL COLOR AND SOFTENING OF BUILDING EDGE AND FOUNDATION SHRUBS.

AZALEA SPP. AZALEA	5 G	3'H x 3'W	MED
CALLISTEMON VIMINALIS 'LITTLE JOHN' DWARF BOTTLEBRUSH	5 G	3'H x 3'W	LOW
CISTUS SP. ROCKROSE	5 G	3'H x 5'W	LOW
LORIOPETALUM CHINENSIS 'MONRAZ' RAZZLEBERRY FRINGE FLOWER	5 G	5'H x 4'W	MED
LEUCOPHYLLUM ZYGOPHYLLUM BLUE RANGER	5 G	3'H x 3'W	LOW
PITTOSPORUM TOBIRA 'WHEELER'S DWARF' DWARF MOCK ORANGE	5 G	3'H x 4'W	MED
RHAPHIOLEPIS UMBELLATA 'MINOR' DWARF YEDDO HAWTHORN	5 G	3'H x 3'W	LOW
WESTRINGIA ROSMARINIFORMIS 'MORNING LIGHT' VARIEGATED COAST ROSEMARY	5 G	3'H x 3'W	LOW

ACCENT SHRUBS
EVERGREEN OR PERENNIAL SHRUBS USED FOR AESTHETIC VALUE IN LANDSCAPE THROUGH BLOOM, COLOR, OR OVERALL CHARACTER.

AGAVE SPP. AGAVE	5 G	VARIES	LOW
BERBERIS THUNBERGII 'CRIMSON PYGMY' RED DWARF JAPANESE BARBERRY	5 G	1.5'H x 2.5'W	MED
BOUTELOUA GRACILIS 'BLOND AMBITION' BLUE GRAMA GRASS	1 G	3'H x 3'W	LOW
CALAMAGROSTIS x ACUTIFLORA 'KARL FOERSTER' FEATHER REED GRASS	1 G	2.5'H x 2.5'W	LOW
HEMEROCALLIS HYBRIDS EVERGREEN DAYLILY	1 G	VARIES X 2'W	MED
KNEPHOFIA UVARIA RED HOT POKER	1 G	3'H x 3'W	LOW
LAVANDULA SPP. LAVENDER	1 G	VARIES	LOW
MUHLENBERGIA CAPILLARIS PINK MUHLY	5 G	3'H x6'W	LOW
NANDINA DOMESTICA 'COMPACTA' COMPACT HEAVENLY BAMBOO	1 G/5 G	4'H x 3'W	LOW
PHORMIUM HYBRIDS NEW ZEALAND FLAX	1 G/5 G	VARIES	MED/LOW

GROUNDCOVER MATERIAL
EVERGREEN OR PERENNIAL SHRUBS TO 30" HIGH, USED TO BLANKET LARGER AREAS AND AS A FILLER BETWEEN SITE WORK EDGES AND FACER SHRUBS.

BACCHARIS PILULARIS 'PIGEON POINT' DWARF COYOTE BUSH	1 G	2.5'H x 7'W	LOW
COPROSMA KIRKII KIRK'S COPROSMA	1 G	2'H x 5'W	LOW
FESTUCA GLAUCA 'SEASIDE BLUE' BLUE FESCUE	1 G	1'H x 1'W	MED
HYPERICUM CALYCINUM GROWING ST. JOHN'S WORT	1 G	1'H x 3'W	MED
LANTANA MONTEVIDENSIS PURPLE TRAILING LANTANA	1 G	2'H x 6'W	LOW
LONICERA JAPONICA 'HALLIANA' HALL'S HONEYSUCKLE	1 G	1.5'H x 6.5'W	MED
ROSA BANKSIAE 'LUTEA' YELLOW LADY BANKS ROSE	1 G	4'H x 6'W	LOW
ROSA FLOWER CARPET FLOWER CARPET ROSE	1 G/5 G	2'H x 3'W	MED
ROSMARINUS OFFICINALIS 'PROSTRATUS' DWARF ROSEMARY	1 G	2'H x 6'W	LOW
TRACHELOSPERMUM JASMINOIDES STAR JASMINE	1 G	1.5'H x 6'W	MED
VINCA MINOR DWARF PERIWINKLE	1 G	0.5'H x 3'W	MED

BUFFER PLANTING
MIX OF NATIVE PLANT MATERIAL USED AS A NATURAL TRANSITION FROM THE EDGES OF THE SITE TO ADJACENT PROPERTIES. PLANT MATERIAL TO BE USED AS A NATURAL FILLER WILL BE HYDROSEEDED.

ARTEMISIA CALIFORNICA CALIFORNIA SAGEBRUSH	---	---	LOW
CEANOTHUS SPP. CALIFORNIA LILAC	---	---	LOW
FREMONTODENDRON 'DARA GOLD' FLANNEL BUSH	---	---	LOW
ESCHSCHOLZIA CALIFORNICA CALIFORNIA POPPY	---	---	LOW
ROMNEYA COULTERI MATILIJA POPPY	---	---	LOW
MIMULUS SPP. MONKEY FLOWER	---	---	LOW
NASSELLA PULCHRA PURPLE NEEDLE GRASS	---	---	LOW

WATER QUALITY BASIN
PLANTS ADAPTABLE TO WET CONDITIONS.

JUNCUS PATENS GREY RUSH	---	---	HIGH
JUNCUS EFFUSUS SOFT RUSH	---	---	HIGH
NASSELLA PULCHRA PURPLE NEEDLE GRASS	---	---	MED
BIOSWALE SOD NATIVE BLEND FOR SWALE BOTTOM	---	---	MED

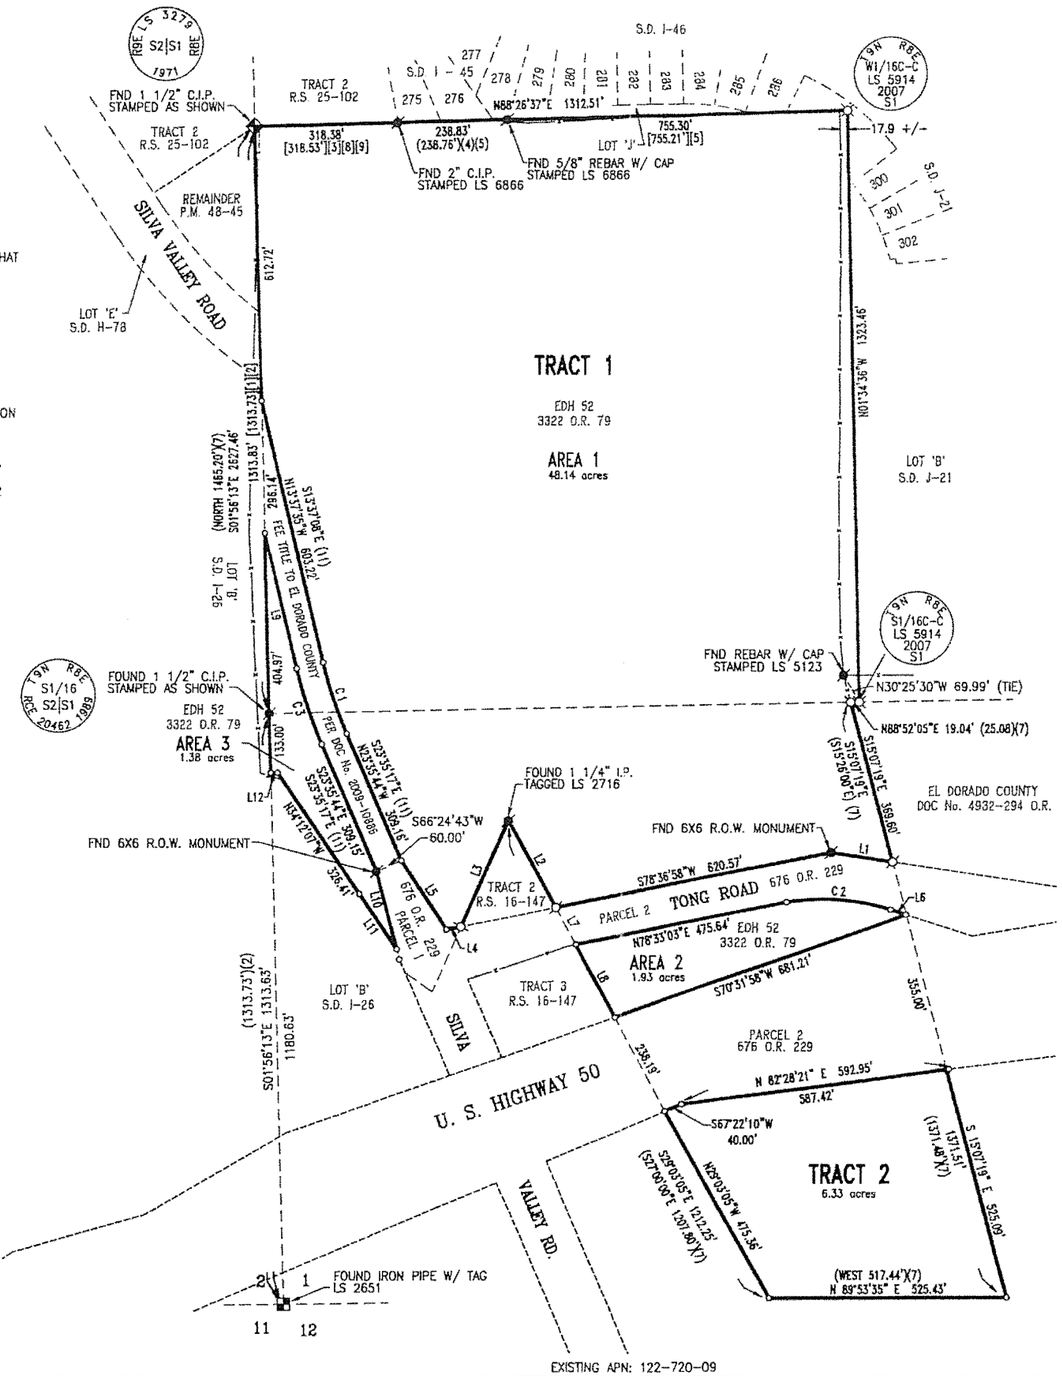
RECORD OF SURVEY

A PORTION OF THE SW 1/4 SECTION 1, T. 9 N., R. 8 E., M.D.M.
County of El Dorado, State of California
APRIL, 2010 PAGE 1 OF 1 SCALE: 1"=200'

cta Engineering & Surveying
Civil Engineering • Land Surveying • Land Planning
3233 Monier Circle, Rancho Cordova, CA 95742

BASIS OF BEARINGS

THE BASIS OF BEARING FOR THIS SURVEY IS IDENTICAL TO THAT CERTAIN RECORD OF SURVEY FILED IN THE OFFICE OF THE COUNTY RECORDER OF EL DORADO COUNTY IN BOOK 16 OF SURVEYS, PAGE 147, WHICH IS THE CALIFORNIA COORDINATE SYSTEM, ZONE II. ALL DISTANCES ARE GROUND DISTANCES. MULTIPLY DISTANCE SHOWN BY 0.99991 TO OBTAIN GRID DISTANCE.



NOTE

1) THE PURPOSE OF THIS SURVEY IS TO COMPLY WITH SECTION 8762(B)(4) OF THE PROFESSIONAL LAND SURVEYORS ACT.

2) TRACT 1 INCLUDES THE LANDS DESCRIBED IN BOOK 3322, PAGE 79, EXCEPTING THOSE PORTIONS GRANTED TO THE COUNTY OF EL DORADO IN DOC. NO. 2009-10886. TRACT 2 REFLECTS THE BALANCE OF ASSESSOR'S PARCEL NO. 122-720-09. IT IS NOT THE INTENT OF THIS SURVEY TO REFLECT LINES OF ACTUAL OWNERSHIP.

GENERAL PLANTING NOTES

1. ALL PLANTING AREAS SHALL BE IRRIGATED WITH AN AUTOMATIC IRRIGATION SYSTEM.
2. ALL SHRUB AND GROUNDCOVER AREAS SHALL RECEIVE A 2" LAYER OF BARK CHIP MULCH TOP DRESSING.
3. REDWOOD HEADERBOARD SHALL BE INSTALLED BETWEEN LAWN AND SHRUB AREAS.
4. ALL GROUND MOUNTED HVAC UNITS, GAS & ELECTRICAL METERS, AND EQUIPMENT ETC. SHALL RECEIVE SHRUB SCREENING IN SHRUB AND GROUNDCOVER AREAS AROUND BUILDINGS.
5. TRASH ENCLOSURES SHALL BE SCREENED WITH TREES AND SHRUB PLANTING.

Executive Summary

Foothill Associates' biologists conducted a biological resources assessment (BRA) and focused surveys for western burrowing owl, special-status plants, and California red-legged frog on the El Dorado Hills 52 Study Area located within El Dorado County, California. The purpose of this BRA is to summarize the general biological resources on the Study Area, to assess the suitability of the Study Area to support special-status species and sensitive habitat types, to summarize the results of various focused surveys, and to provide recommendations for regulatory permitting or further analysis that may be required prior to development activities occurring on the Study Area.

The El Dorado Hills 52 Study Area (Study Area) consists of ±34 acres of land that is primarily annual grassland. The Study Area is bifurcated by Silva Valley Parkway. A former home site is located on the southern portion of the property and a large part of the northern portion was used to stockpile soil during the construction of the adjacent Silva Valley Parkway – U.S. Highway 50 Interchange Project. Land uses surrounding the Study Area include an elementary school, residences, and U.S. Highway 50.

Known or potential biological constraints within the Study Area include:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for Blainville's horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. (seasonal wetlands, perennial marsh, and ephemeral and perennial drainages), riparian habitat, valley oak woodland, and purple needlegrass grassland.

1.0 INTRODUCTION

This report summarizes the findings of a BRA, focused surveys for burrowing owl, California red-legged frog, and special-status plants and an aquatic resources delineation completed for the ±34-acre El Dorado Hills 52 Study Area, located within El Dorado County, California. This document addresses the onsite physical features, as well as plant communities present and the common plant and wildlife species occurring, or potentially occurring, in the Study Area. Furthermore, the suitability of habitats to support special-status species and sensitive habitats are analyzed and recommendations are provided for any regulatory permitting or further analysis required prior to development activities occurring on the Study Area.

1.1. Project Description

Development proposed within the Study Area will ultimately result in the development of approximately 32-acres of commercial development. The northern portion of the Study Area is approximately 17.07 acres (North Site) and the southern portion is approximately 15.73 acres (South Site), net of the right-of-way for roads. Development is designed to allow either the North Site or the South Site to develop independent from the other. Proposed improvements will include construction of commercial buildings and associated parking, utilities, and storm water management facilities as well as multiple points of access, and a new traffic signal on Silva Valley Parkway. Ancillary amenities include pedestrian walkways, bicycle parking, signage and lighting and landscaping. A 7.69-acre area within the North Site is dedicated right-of-way associated with the future extension of Country Club Drive. A 1.38-acre open space area west of Old Silva Valley Road will not be developed.

2.0 REGULATORY FRAMEWORK

Federal, State, and local environmental laws, regulations, and policies relevant to the California Environmental Quality Act (CEQA) review process are summarized below. The CEQA significance criteria are also included in this section.

2.1. Federal Regulations

2.1.1. Federal Endangered Species Act

The U.S. Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend.

FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (FESA Section 3 [(3) (19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR §17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR §17.3). Actions that result in take can result in civil or criminal penalties.

In the context of the proposed project, FESA consultation with the U.S. Fish and Wildlife Service (USFWS) or the National Marine Fisheries Service (NMFS) would be initiated if development resulted in take of a threatened or endangered species or if issuance of a Section 404 permit or other federal agency action could result in take of an endangered species or adversely modify critical habitat of such a species.

2.1.2. Migratory Bird Treaty Act

Raptors (birds of prey), migratory birds, and other avian species are protected by a number of State and federal laws. The federal Migratory Bird Treaty Act (MBTA) prohibits the killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of Interior.

2.1.3. The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (Eagle Act) prohibits the taking or possession of and commerce in bald and golden eagles with limited exceptions. Under the Eagle Act, it is a violation to "*take, possess, sell, purchase, barter, offer to sell, transport, export or import, at any time or in any manner, any bald eagle commonly known as the American eagle, or golden eagle, alive or dead, or any part, nest, or egg, thereof*." Take is defined to include pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest, and disturb. Disturb is further defined in 50 CFR Part 22.3 as "*to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available (1) injury to*

an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior."

2.2. State Jurisdiction

2.2.1. California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to the FESA but pertains to State-listed endangered and threatened species. CESA requires state agencies to consult with the California Department of Fish and Wildlife (CDFW), when preparing CEQA documents. The purpose is to ensure that the State lead agency actions do not jeopardize the continued existence of a listed species or result in the destruction, or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code §2080). CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur and allows CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows CDFW to authorize exceptions to the State's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (Fish & Game Code § 2081).

2.2.2. California Department of Fish and Game Codes

A number of species have been designated "fully protected" species under Sections 5515, 5050, 3511, and 4700 of the Fish and Game Code, but are not listed as endangered (Section 2062) or threatened (Section 2067) species under CESA. Except for take related to scientific research, all take of fully protected species is prohibited. The California Fish and Game Code defines take as "*hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill.*" Additionally, Section 3503 of the California Fish and Game Code prohibits the killing of birds or the destruction of bird nests.

2.2.3. Native Plant Protection Act

The Native Plant Protection Act (NPPA), enacted in 1977, allows the Fish and Game Commission to designate plants as rare or endangered. There are 64 species, subspecies, and varieties of plants protected under the NPPA. The NPPA prohibits take of endangered or rare native plants, with some exceptions for agricultural and nursery operations and emergencies. Vegetation removal from canals, roads, and other sites, changes in land use, and certain other situations require proper advance notification to CDFW.

2.3. Jurisdictional Waters

2.3.1. Federal Jurisdiction

The U.S. Army Corps of Engineers (Corps) regulates discharge of dredge or fill material into waters of the U.S. under Section 404 of the Clean Water Act (CWA). "Discharges of fill material"

is defined as the addition of fill material into waters of the U.S., including, but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; fill for intake and outfall pipes and subaqueous utility lines [33 C.F.R. §328.2(f)].

Waters of the U.S. include a range of wet environments such as lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, and wet meadows. Boundaries between jurisdictional waters and uplands are determined in a variety of ways depending on which type of waters is present. Methods for delineating wetlands and non-tidal waters are described below.

- Wetlands are defined as "*those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions*" [33 C.F.R. §328.3(b)]. Presently, to be a wetland, a site must exhibit three wetland criteria: hydrophytic vegetation, hydric soils, and wetland hydrology existing under the "normal circumstances" for the site.
- The lateral extent of non-tidal waters is determined by delineating the ordinary high-water mark (OHWM) [33 C.F.R. §328.4(c)(1)]. The OHWM is defined by the Corps as "*that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas*" [33 C.F.R. §328.3(e)].

An aquatic feature is determined to be a water of the U.S. based on nexus with a traditionally navigable water pursuant to the Supreme Court's decision in the consolidated cases *Rapanos v. United States* and *Carabell v. United States* (126 S. Ct. 2208) and agency guidance subsequent to this decision. Under these rules, the Corps asserts jurisdiction over wetlands adjacent to traditional navigable waters, relatively permanent non-navigable tributaries (i.e., waters that have a continuous flow at least three months out of the year), and wetlands that abut relatively permanent tributaries. The Corps determines jurisdiction over waters that are non-navigable tributaries that are not relatively permanent, and wetlands adjacent to these tributaries, by making a determination whether such waters "significantly affect the chemical, physical, and biological integrity of other jurisdictional waters more readily understood as "navigable." Finally, the Corps generally does not consider the following to be "waters of the United States": swales or erosional features (e.g., gullies, small washes characterized by low volume, infrequent or short duration flow) and ditches "wholly in and draining only uplands…which do not carry a relatively permanent flow of water." Navigable waters of the United States are defined as waters that have been used in the past, are now used, or are susceptible to use as a means to transport interstate or foreign commerce up to the head of navigation.

2.3.2. State Jurisdiction

Regional Water Quality Control Boards

Discharges of fill or waste material to waters of the State are regulated by the State Water Resources Control Board (SWRCB) through its Regional Water Quality Control Boards (RWQCB) under Section 401 of the CWA and the Porter-Cologne Water Quality Control Act (contained in the California Water Code). All waters of the U.S. are also considered waters of the State. In addition, other aquatic features that are not subject to Corps' jurisdiction, such as roadside ditches or isolated wetlands, may be considered waters of the State. This determination will be made by RWQCB staff on a case-by-case basis.

Section 401 of the CWA requires an applicant to obtain "water quality certification" to ensure compliance with State water quality standards before certain federal licenses or permits may be issued. Section 13260(a) of the Porter-Cologne Water Quality Control Act requires any person discharging waste, including dredged or fill material, or proposing to discharge waste, other than to a community sewer system, within any region that could affect the quality of the waters of the State (all surface and subsurface waters) to file a report of waste discharge. The permits subject to Section 401 include CWA Section 404 permits issued by the Corps. Waste discharge requirements under the Porter-Cologne Water Quality Control Act were typically waived for projects that required certification. Discharges to waters of the State that are not subject to a CWA Section 404 permit rely on the report of waste discharge process.

California Department of Fish and Wildlife

The CDFW is a trustee agency that has jurisdiction under Section 1600 *et seq.* of the California Fish and Game Code. Under Sections 1602 and 1603, a private party must notify CDFW if a proposed project will "*substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds…except when the department has been notified pursuant to Section 1601.*" Additionally, CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over 4-inches in diameter at breast height (DBH). If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends submitting an application for a Streambed Alteration Agreement (SAA) for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater.

2.4. CEQA Significance

Section 15064.7 of the CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study Checklist contained in Appendix G of the CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these

examples, impacts to biological resources would normally be considered significant if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and
- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish, or result in the loss of, an important biological resource, or those that would obviously conflict with local, State, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

2.4.1. California Native Plant Society

The California Native Plant Society (CNPS) maintains a rank of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the *Inventory of Rare and Endangered Vascular Plants of California*. Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS ranks:

- Rank 1A: Plants presumed Extinct in California
- Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere
- Rank 2: Plants Rare, Threatened, or Endangered in California, but more numerous elsewhere

- Rank 3: Plants about which we need more information – A Review List
- Rank 4: Plants of limited distribution – A Watch List

All plants appearing on CNPS Rank 1 or 2 are considered to meet CEQA Guidelines Section 15380 criteria. While only some of the plants ranked 3 and 4 meet the definitions of threatened or endangered species, the CNPS recommends that all Rank 3 and Rank 4 plants be evaluated for consideration under CEQA.

2.4.2. California Department of Fish and Wildlife Species of Concern

Some additional fish, amphibian, reptile, bird, and mammal species may receive consideration by CDFW and lead agencies during the CEQA process, in addition to species that are formally listed under FESA and CESA or are fully protected. These species are included on the *Special Animals List*, which is maintained by CDFW. This list tracks species in California whose numbers, reproductive success, or habitat may be in decline. In addition to "Species of Special Concern" (SSC), the *Special Animals List* includes species that are tracked in the California Natural Diversity Database (CNDDB), but warrant no legal protection. These species are identified as "California Special Animals" (CSA).

2.5. El Dorado County Policies and Regulations

2.5.1. El Dorado County General Plan

In addition to the federal and State regulations described above, the *County of El Dorado General Plan* identifies goals, objectives, and policies to provide further protection to biological resources within the County's limits (El Dorado County 2004). Applicable General Plan policies are summarized below and included in **Appendix A**.

The General Plan's *Conservation Element* sets a number of goals to conserve, enhance, and manage water resources, wildlife, fisheries, vegetation, and wildlife habitat resources. In furtherance of these goals, the County has established a number of policies designed to minimize impacts to sensitive species and habitats. Policy 7.3.3.4 requires setbacks from riparian areas and wetlands. Policy 7.4.1.6 requires that development projects be designed to avoid fragmentation of sensitive habitats to the greatest extent feasible. A number of policies related to Objective 7.42 require preservation of wildlife migration and movement corridors, including increased oak canopy retention requirements and prohibition of fences or other structures that would restrict wildlife movement.

2.5.2. El Dorado Hills Specific Plan

In addition to federal and State regulations, the *El Dorado Hills Specific Plan* (Specific Plan) identifies goals, objectives, and policies regarding establishment and maintenance of open space and wetland areas. The construction of the El Dorado Hills 52 Project is in conformance with this Specific Plan. Applicable Specific Plan requirements are included in **Appendix A**.

2.5.3. El Dorado County Tree Ordinance

The County of El Dorado currently regulates impacts to oak woodland canopy under General Plan Policy 7.4.4.4. All oak trees, of all sizes, are included in the measurement of oak canopy. All new development projects on parcels greater than 1 acre with at least 1 percent canopy cover must adhere to the retention standard described in Option A of the policy. Canopy retention requirements are based on the amount of existing canopy on the site. In addition to preservation of existing oak woodland canopy, mitigation for impacts to oak woodland canopy is required at a 1:1 ratio. Application of the policy is described in the Interim Interpretive Guidelines for General Plan Policy 7.4.4.4 (Option A), which was last amended on October 12, 2007. The policy states that mitigation can be in the form of on-site or off-site planting of oak trees or acorns, or obtaining an offsite conservation easement to protect existing oak woodland habitat in lieu of planting. As per the Guidelines, a Monitoring and Reporting Plan needs to be prepared and is subject to maintenance and monitoring for up to ten years.

The County is in the process of revising the *El Dorado County Oak Resources Management Plan* (ORMP), which is expected to be adopted and go into effect in the near future. Under the proposed new plan, an oak woodland removal permit will be required prior to removal of oak trees that are part of an oak woodland. Mitigation requirements will be based on the percentage of existing oak woodland removed ranging from 1:1 mitigation for zero to 50 percent removal to 2:1 mitigation for more than 75 percent removal. Mitigation may be completed with a combination of the following options: acquisition of an off-site conservation easement, payment of in-lieu fees, or either on-site or off-site replacement planting of up to 50 percent of the required mitigation area. A tree removal permit shall be required prior to the removal of any oak tree not located in an oak woodland and for removal of all Heritage Trees (native oaks with a trunk diameter of 36” or greater at breast height). Trees removed under permit shall require replacement planting or payment of in-lieu fees in an amount equivalent to the number of trunk inches removed.

2.6. El Dorado Hills Community Services District Policies

In addition to federal and State regulations, the El Dorado Hills Community Services District (EDHCSD) identifies goals, objectives, and policies regarding oak tree preservation. Applicable policies are included in **Appendix A**.

3.0 METHODS

Available information pertaining to the natural resources of the region was reviewed. All references reviewed for this assessment are listed in the **References** section. The following site-specific information was reviewed:

- California Department of Fish and Wildlife (CDFW). 2017. *California Natural Diversity Data Base* (CNDDB: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek*, *Rocklin*, and *Folsom* U.S. Geological Survey (USGS) 7.5-minute series quadrangles), Sacramento, CA. Accessed [8/15/2017] (**Appendix B**);
- California Native Plant Society (CNPS). 2017. *Inventory of Rare and Endangered Plants* (online edition, v8-02) (CNPS: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek*, *Rocklin*, and *Folsom* quadrangles). Accessed [8/15/2017] (**Appendix B**);
- U.S. Fish and Wildlife Service (USFWS). 2017. *Information for Planning and Conservation* (IPaC) *Official Species List*: *El Dorado Hills 52*. Accessed [8/15/2017] (**Appendix B**);
- U.S. Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS). 2015. Web Soil Survey. Available online at: http://websoilsurvey.sc.egov.usda.gov/App/HomePage.html. Accessed [8/15/2017]; and
- U.S. Geological Survey. 1967. Photorevised 1980. *Clarksville, California*. 7.5-minute series topographic quadrangle. United States Department of Interior; and
- Biological reports and associated documents previously prepared for the Study Area.

Prior to the site survey, existing information, including the previous wetland delineation and soil maps, were reviewed and the results of the records search and five-mile radius CNNDB query were summarized in a table (**Appendix B**). General field surveys of the Study Area were conducted on April 5, 2013 and August 8, 2017. The Study Area was systematically surveyed on foot with binoculars to ensure total search coverage, with special attention given to identifying those portions of the Study Area with the potential for supporting special-status species and sensitive habitats. During the field surveys, biologists recorded plant and animal species observed (**Appendix C**), as well as characterized biological communities occurring onsite. Following the site survey, the potential for each species identified in the records search to occur in the Study Area was determined based on the site surveys, soils, and species-specific information, as shown in **Appendix B**.

A wetland delineation was performed separately utilizing the Corps 1987 three-parameter methodology to delineate potentially jurisdictional waters of the U.S. on the ±200-acre Silva Valley Interchange Project, which includes the Study Area. The Corps issued a Preliminary Jurisdictional Determination for the aquatic features delineated within the Study Area on June 30, 2009 (SPK-2005-00070), as part of the Silva Valley Interchange Project, concurring with the amount of jurisdictional aquatic features mapped. The delineation has since expired. Therefore,

an updated delineation was performed on December 15, 2015. The results of the wetland delineation are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2017a). The results are considered preliminary until the Corps verifies the findings.

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. The botanical inventories were conducted in accordance with CDFW's (CDFG 2009) protocol plant surveys. The results of the botanical surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c). A complete list of plants observed within the Study Area is provided in **Appendix C**.

Protocol-level burrowing owl surveys were conducted on March 12, 2015, April 24, 2015, May 26, 2015, and June 16, 2015. The surveys were conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (CDFW 2012). The results of the burrowing owl surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c).

Protocol-level breeding season California red-legged frog (CRLF) surveys were conducted on January 12 and 26, 2016 and February 2 and 9, 2016. The protocol-level breeding season surveys were conducted in accordance with the *Revised Guidance on Site Assessment and Field Surveys for the California Red-legged Frog* (USFWS 2005; CRLF Guidance). The results of the protocol-level breeding season surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016a).

An oak woodland analysis was performed to document the extent of the existing oak trees in the Study Area and impacts from the proposed project. The oak woodland report is contained under separate cover (Foothill Associates 2017b).

4.0 RESULTS

4.1. Site Location and Description

The Study Area is located in in El Dorado County adjacent to U.S. Highway 50 immediately east of Silva Valley Parkway and north of Tong Road. Land uses surrounding the Study Area include residential development to the north and paved roads, oak woodland, and annual grassland to the east, west, and south. The Study Area is located within Township 9 North, Range 8 East, Section 1 of the *Clarksvill*e USGS 7.5-minute series quadrangle. The approximate location of the center of the Study Area is 38° 39' 40.160" North, 121° 3' 23.354" West (**Figure 1**).

The Study Area consists of approximately 34 acres of land that is primarily annual grassland. The Study Area is bifurcated by Silva Valley Parkway. Two drainage corridors cross the Study Area from the northeast to the southwest.

4.2. Physical Features

4.2.1. Topography and Drainage

Topography within the Study Area ranges from relatively level to moderately sloped with elevations ranging from approximately 700 to 800 feet above mean sea level (MSL) (~210-240 meters). Surface runoff flows through and exits the Study Area via riverine drainages, which run in a northeast to southwest direction.

4.2.2. Soils

The Natural Resources Conservation Service (NRCS) has mapped one soil unit within the Study Area (**Figure 2**): **Auburn Silt Loam, 2 to 30 Percent Slopes**. General characteristics associated with this soil type are described below (USDA, NRCS 1974).

- **(AwD) Auburn Silt Loam, 2 to 30 Percent Slopes**: The soils in this series are well drained. Permeability is moderate. Vegetation associated with this soil series includes annual grasses, forbs, and oaks. The hydric soils list for El Dorado County does not identify this soil type as hydric (USDA, NRCS 2015).

4.3. Biological Communities

Six major biological communities occur in the Study Area including annual grassland, riparian woodland, valley oak woodland, seasonal wetland, perennial marsh, and disturbed/developed. These communities provide habitat to a number of common species of wildlife and may provide suitable habitat for special-status species. It should be noted that wetlands may occur within a biological community. For instance, a creek surrounded by riparian woodland would be included within the riparian woodland for the purposes of determining biological community acreage. Vernal pools and seasonal wetlands may be included in the annual grassland community and are often used by wildlife from the annual grassland. However, a very different aquatic habitat, such as a perennial marsh, is considered its own biological community. Dominant vegetation observed within each biological community is discussed in detail below. A

comprehensive list of plants observed within the Study Area is provided in **Appendix C**. The location and extent of each biological community are depicted in **Figure 3**.

4.3.1. Annual Grassland

Annual grassland dominates both the northern and southern portions of the Study Area (**Figure 3**). This vegetation community is characterized primarily by an assemblage of non-native annual grasses and forbs. Dominant vegetation includes ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) intermixed with red-stemmed filaree (*Erodium cicutarium*), popcornflower (*Plagiobothrys* sp.), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), scarlet pimpernel (*Anagallis arvensis*), St. John's wort (*Hypericum perforatum*), brodiaea (*Brodiaea elegans*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*).

Two areas within the annual grassland contain purple needlegrass within the southern portion of the Study Area (**Figure 3**). The purple needlegrass is interspersed with northern willow herb (*Epilobium ciliatum*), ripgut brome, soft chess, and wild oat.

The annual grassland community includes small ephemeral and perennial drainages. The ephemeral drainage is mostly unvegetated and highly seasonal. The perennial drainage has a small clump of willows (*Salix* sp.) and broadleaf cattail (*Typha latifolia*) and is otherwise minimally vegetated.

4.3.2. Riparian Woodland

Riparian woodland habitat occurs within the along perennial drainage on the western boundary of the Study Area (**Figure 3**). Dominant vegetation includes broadleaf cattail, willow, spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), Himalayan blackberry (*Rubus armeniacus*), and valley oak (*Quercus lobata*).

4.3.3. Valley Oak Woodland

Valley oak woodland is found in a small area on the southwest boundary of the Study Area where a small stand of mature valley oak trees overhangs a small perennial drainage (**Figure 3**). The understory is primarily annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal immediately adjacent to the drainage.

4.3.4. Seasonal Wetland

A number of seasonal wetland features are found in the Study Area (**Figure 3**). Most are associated with the eastern drainage system. The seasonal wetlands include riverine, depressional, and slope topography, but the vegetation is similar throughout the Study Area. Dominant vegetation in the seasonal wetlands includes rabbitsfoot grass (*Polypogon monspeliensis*), spike rush (*Eleocharis macrostachya*), nutsedge (*Cyperus eragrostis*), curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), ryegrass, annual hair grass (*Deschampsia danthonioides*), and rye grass (*Festuca perennis*).

4.3.5. Perennial Marsh

Perennial marsh habitat is found in the southern portion of the Study Area (**Figure 3**). It is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock with areas of dense cattails, Himalayan blackberry, and a small clump of willows.

4.3.6. Disturbed/ Developed

Disturbed/developed areas in the Study Area include graded roads and a stockpile area (**Figure 3**). The disturbed/developed areas are sparsely vegetated with red-stemmed filaree, soft chess, wild oat, and winter vetch.

4.4. Special-Status Species

Special-status species are plant and animal species that have been afforded special recognition by federal, State, or local resource agencies or organizations. Listed and special-status species are of relatively limited distribution and may require specialized habitat conditions. Special-status species are defined as meeting one or more of the following criteria:

- Listed or proposed for listing under CESA or FESA;
- Protected under other regulations (e.g. Migratory Bird Treaty Act);
- Included on the CDFW Special Animals List;
- Identified as Rank 1-4 by CNPS; or
- Receive consideration during environmental review under CEQA.

Special-status species considered for this analysis are based on queries of the CNDDB, the USFWS, and CNPS ranked species (online versions) for the *Clarksville* and eight surrounding quadrangles. **Appendix B** includes the common name and scientific name for each species, regulatory status (federal, State, local, CNPS), habitat descriptions, and potential for occurrence in the Study Area. The following set of criteria has been used to determine each species' potential for occurrence in the Study Area:

- **Present**: Species known to occur within the Study Area based on CNDDB records and/or observed within the Study Area during the biological surveys.
- **High**: Species known to occur on or in the vicinity of the Study Area (based on CNDDB records within five miles and/or based on professional expertise specific to the Study Area or species) and there is suitable habitat within the Study Area.
- **Low**: Species known to occur in the vicinity of the Study Area and there is marginal habitat within the Study Area **-OR-** Species is not known to occur in the vicinity of the Study Area, however, there is suitable habitat on the Study Area.
- **None**: Species is not known to occur on or in the vicinity of the Study Area and there is no suitable habitat within the Study Area -**OR-** Species was surveyed for during the

appropriate season with negative results **-OR-** The Study Area occurs outside of the known elevation or geographic ranges.

Only those species that are known to be *present* or have a *high* or *low* potential for occurrence are discussed further in the following sections. Species that were determined to have a potential for occurrence but for which focused surveys were conducted with negative results are not discussed further in this report. Detailed results of focused surveys are contained under separate covers.

4.4.1. Listed and Special-Status Plants

According to the records search, 30 special-status plant species have the potential to occur on or in the vicinity of the Study Area. Based on field observations and literature review, four species were determined to have the potential for occurrence to occur on the Study Area: big-scale balsamroot (*Balsamorhiza macrolep*is var. *macrolepis*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), and Sanford's arrowhead (*Sagittaria sanfordii*). Focused botanical surveys were conducted in 2015 during the bloom period of these plants. No special-status plant species were found.

4.4.2. Listed and Special-Status Wildlife

According to the records search, 41 special-status animal species have the potential to occur onsite or in the vicinity. Based on field observations and literature review, 15 species were determined to have the potential for occurrence to occur in the Study Area. Protocol surveys for burrowing owl (*Athene cunicularia*) and California red-legged frog (*Rana draytonii*) were conducted in 2015 and 2016. No observations or evidence of either species was found.

Species that are known to be *present* or that are considered to have a *high* potential to occur onsite include: western pond turtle (*Emys marmorata*) and raptors and other migratory birds. Species that are considered to have a *low* potential to occur onsite include: valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), Blainville's horned lizard (*Phrynosoma blainvillii*), foothill yellow-legged frog (*Rana boylii*), western spadefoot (*Spea hammondii*), golden eagle (*Aquila chrysaetos*), tricolored blackbird (*Agelaius tricolor*), American badger (*Taxidea taxus*), and special-status bat species.

Wildlife Species with a High Potential for Occurrence

Western Pond Turtle

Western pond turtles are found in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches with suitable basking sites (Californiaherps 2017). Suitable aquatic habitat typically has a muddy or rocky bottom and has emergent aquatic vegetation for cover (Stebbins 2003). Western pond turtles nest and overwinter in areas of sparse vegetation comprised of grassland and forbs with less than ten percent slopes, less than 492 feet (150 meters) from aquatic habitat (Rosenberg *et. al.* 2009). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The riverine perennial marsh, perennial drainage, and surrounding riparian habitat provide aquatic habitat and the surrounding annual grassland

provides upland habitat. This species was not observed within the Study Area during the biological surveys. This species has a *high* potential to occur within the Study Area.

Nesting Birds and Raptors

The nests of raptors and most other birds are protected under the MBTA. Raptors are also protected by Section 3503.5 of the California Fish and Game Code, which makes it illegal to destroy any active raptor nest. Additionally, the USFWS and CDFW identified a number of avian species of conservation concern that do not have specific statutory protection. Avian species forage and nest in a variety of habitats throughout El Dorado County. As shown in **Appendix B**, the riparian and valley oak woodlands, perennial marsh, and annual grasslands on and surrounding the Study Area may provide nesting or foraging habitat for raptors and other protected birds, including: white-tailed kite (*Elanus leucurus*), Cooper's hawk (*Accipiter cooperii*), ferruginous hawk (*Buteo regalis*), merlin (*Falco columbarius*), grasshopper sparrow (*Ammodramus savannarum*), and purple martin (*Progne subis*). Raptors and other protected migratory birds have a high potential to occur in the Study Area.

Wildlife Species with a Low Potential for Occurrence

Valley Elderberry Longhorn Beetle

The USFWS has determined the range of the valley elderberry longhorn beetle (VELB) to include the watersheds of the American, San Joaquin, and Sacramento Rivers and their tributaries up to approximately 3,000 feet above MSL (USFWS 1980). Typically, the beetles are found on elderberry shrubs within riparian plant communities. Some studies have found that multiple elderberry shrubs clumped together provide superior habitat for the beetle while isolated elderberry shrubs are less likely to support beetle populations. Typical plant species that co-occur with the elderberry shrubs include California sycamore (*Platanus racemosa*), willow, blackberry, and western poison oak (*Toxicodendron diversilobum*) (USFWS 1984). Beetles require elderberry stems with at least one-inch diameter at ground level (dgl) in order for the larvae to utilize the stems (USFWS 1999). The valley elderberry longhorn beetle depends on elderberry shrubs for its entire lifecycle. Adults are typically active from March through May during the flowering period of the elderberry shrub. The female lays its eggs on the leaves and stems of the elderberry shrub. The larvae emerge within a few days and burrow into the elderberry stem. The larvae feed on the stem pith until they pupate. When the host shrub begins flowering, the pupa emerges from the stem as an adult (Barr 1991). There is one CNDDB record of valley elderberry longhorn beetle listed within five miles of the Study Area (CDFW 2017a). One blue elderberry (*Sambucus nigra* ssp. *caerulea*) stem measuring one-inch dgl and several stems less than one-inch dgl occurs within the riparian habitat within the western portion of the Study Area (**Figure 3**). No exit holes were observed. This species has a *low* potential to occur within the Study Area.

Blainville's Horned Lizard

Blainville's horned lizard inhabits open areas of sandy soil and low vegetation in valleys, foothills, and semiarid mountains from sea level to 8,000 feet above MSL. It is typically found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose

soil. This species is often found in lowlands along sandy washes with scattered shrubs and along dirt roads, and frequently found near ant hills (Zeiner *et. al.* 1988). There are two CNDDB records of this species within five miles of the Study Area (CDFW 2017a). The species was not observed within the Study Area during the biological surveys. The annual grassland within the Study Area provides minimal habitat for the Blainville's horned lizard due to lack of sandy washes. Therefore, this species has a *low* potential to occur within the Study Area.

Foothill Yellow-Legged Frog

The Foothill yellow-legged frog (FYLF) is a moderate-sized frog (1.5-3.5" long) found on the western slope of the Sierras and along the coast. It has vague dorsolateral folds, horizontal pupils, yellow coloring on the underside of its hind legs, and a granular skin texture that covers the eardrums of colors that harmonize with the surroundings. The FYLF is a stream or river frog of chaparral, forest, and woodland ecozones. This species breeds after the high-water flows subside, mid-March to early June. The FYLF resides in streams and the associated riparian habitat. Metamorphosis generally occurs in three to four months and FYLF reach sexual maturity typically the first summer after they have metamorphosed. Breeding sties occur in shallow, slow flowing water with some pebble and/or cobble substrate. The introductions of bullfrogs and mosquitofish have led to declines in populations in California and Oregon. The perennial drainages provide marginal habitat for this species but there are no CNDDB records of this species within five miles of the Study Area (CDFW 2017a) and the species was not observed within the Study Area during the biological surveys. Therefore, this species has a *low* potential to occur within the Study Area.

Western Spadefoot

Western spadefoot occurs throughout the Central Valley and on the coast from Point Conception, south to the Mexican border. This species occurs from sea level up to 4,500 feet above MSL, in the southern Sierra foothills. Western spadefoot individuals are most commonly found in grassland habitats with temporary pools of water, but they have also been found in open chaparral and valley-foothill pine-oak woodlands (Stebbins 2003). This species spends most of the year underground, where members seek refuge from desiccating by constructing and residing in small burrows. This species often breeds in temporary pools and quiet streams between the months of January and May. There are no CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The species was not observed within the Study Area during the biological surveys. The depressional seasonal wetlands provide low quality breeding habitat given that they do not likely hold water for long enough for the western spadefoot to breed. This species has a *low* potential for utilizing the annual grassland as upland aestivation given the limited aquatic habitat available within the Study Area for breeding.

Golden Eagle

Golden eagles live in semi-open habitats where they have easy access to their primary prey of small to medium-sized mammals. Grasslands, deserts, savannahs, and early successional stages of forest and shrub habitats provide necessary foraging habitat. Nests are placed on cliffs or large trees and are maintained year after year. Breeding occurs from January through August (Kochert *et al.* 2002). Golden eagle home range territories vary widely from 8 to 77 square

miles (McGrady 1997) and are estimated to average 48 square miles in northern California (Zeiner *et al.* 1990). Breeding territories range from 8 to 21 square miles, or 3 to 5 miles surrounding the nest, but activity is often concentrated in a smaller core area. Although only one nest is used each year, a territory may contain multiple alternate nests. Typically, there are between 6 and 14 nests are found in a territory (Kochert *et al.* 2002). Golden eagles may use the same nest for multiple years or use new nest sites every year (Watson 2010).

There is one known occurrence approximately two miles northwest of the Study Area. This active nest was located in a foothill pine on a hillslope surrounded by oak woodland. Existing residences are located uphill within 300 feet of the nest on the north and east. Two juvenile and two adult golden eagles were observed at the nest in August 2013. A pair of adult eagles returned to the nest in 2014 and successfully raised one eaglet, which fledged by June 18, 2014. However, the nest tree fell over during a storm in November 2014. A golden eagle nest was subsequently identified in a foothill pine approximately 2.5 miles northwest of the Study Area on March 6, 2015. The new nest occurred within a foothill pine on a hillslope surrounded by oak woodland, approximately 25 feet from a residential dwelling. This foothill pine died in late 2015. The eagles relocated to another foothill pine downhill from their first nest location in 2016, but this nest is not active in 2017. The current nest location is unknown as of the writing of this report.

No golden eagles were observed during the biological surveys of the Study Area. Although the Study Area does not provide suitable nest trees, the annual grassland provides foraging habitat. This species has a *low* potential to occur within the Study Area.

Tricolored Blackbird

The tricolored blackbird is a colonial species that occurs in pastures, dry seasonal pools, and agricultural fields in the Central Valley and the surrounding foothills. This species usually nests within dense cattails (*Typha* sp.) or tules (*Scirpus* sp.) in emergent wetlands. Tricolored blackbird also nests in thickets of blackberry (*Rubus* sp.), wild rose (*Rosa* sp.), willows, and tall herbs (Zeiner *et. al.* 1990). Nesting locations typically must be large enough to support a minimum colony of approximately fifty pairs (Zeiner *et. al.* 1990). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The perennial marsh and surrounding riparian habitat could provide nesting habitat, though these areas are not large enough to support colonies. The annual grassland provides foraging habitat for this species. This species was not observed during the biological surveys of the Study Area. This species has a *low* potential to occur within the Study Area.

American Badger

American badgers are found in dry, open habitats including grassland and open woodland. Suitable burrowing habitat requires dry, sandy soil. Breeding occurs in summer and early fall, with young being born from March to April (Nature Serve 2015). There are no CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The annual grassland provides habitat for this species, however, very few potential burrow sites that could be utilized by this species were observed during the biological surveys. No American badgers were

observed during the biological surveys. This species has a *low* potential to occur within the Study Area.

Special-Status Bats

California is home to several special-status bat species, including pallid bat (*Antrozous pallidus*) and silver-haired bat (*Lasionycteris noctivagans*). Bat numbers are in decline throughout the U.S. due to loss of roosting habitat, habitat conversion, and habitat alteration. There are no CNDDB records for bats within five miles of the Study Area (CDFW 2017a). No bats were observed roosting or foraging during the biological surveys. However, the riparian habitat and isolated trees within the annual grassland provide roosting habitat for these species. This species has a *low* potential to occur within the Study Area.

4.5. Sensitive Habitats

Sensitive habitats include those that are of special concern to resource agencies or those that are protected under CEQA, Section 1600 of the California Fish and Game Code, and/or Sections 401 and 404 of the Clean Water Act. Additionally, sensitive habitats are protected under the specific policies outlined in the *El Dorado County General Plan*. Sensitive habitats known to occur onsite are seasonal wetlands, perennial marsh, ephemeral and perennial drainages, riparian woodland, oak woodlands, and purple needlegrass grassland (**Figure 3**).

4.5.1. Potential Jurisdictional Waters of the U.S. and State

Potential jurisdictional waters of the U.S. and State located in the Study Area total approximately 0.57 acres. This acreage includes 0.01 acres of depressional seasonal wetland, 0.07 acres of slope seasonal wetland, 0.05 acres of riverine seasonal wetland, 0.31 acres of riverine perennial marsh, 0.05 acres of ephemeral drainage, and 0.07 acres of perennial drainage (**Figure 3**). To date the Corps has not verified these acreages. As discussed in **Section 2.3**, jurisdictional waters of the U.S. are subject to Section 404 of CWA and are regulated by the Corps.

4.5.2. Riparian Habitat

A total of 0.15 acres of riparian habitat are located in the Study Area along the northern perennial drainage (**Figure 3**). As discussed in **Section 2.2**, riparian areas, defined as the outermost bank or the edge of riparian vegetation, whichever is greater, may be subject CDFW jurisdiction under Section 1602 of the Fish and Game Code. Additionally, CDFW may exert jurisdiction over the drainages and other riverine aquatic features. CDFW should be consulted prior to disturbance or development to determine whether issuance of a Section 1602 Lake or Streambed Alteration Agreement is required.

4.5.3. Oak Trees and Oak Woodlands

A total of ten oak trees protected under Policy 7.4.5.2, consisting of nine valley oaks (*Quercus lobata*) and one blue oak (*Quercus douglasii*) are present in the Study Area. In total, there is 0.55 acres of oak canopy in the Study Area, which is equivalent to 1.6 percent canopy cover (**Figure 3**). Oak woodland habitat is currently regulated under Section 7.4.4.4 of the *El Dorado*

County General Plan (refer to Section 3.8.1, 3.9, and 3.10) based on canopy coverage. The Study Area is within the area covered by the *El Dorado Hills Specific Plan*, which generally describes preservation criteria for oak trees within designated open space areas.

4.5.4. Purple Needlegrass

Approximately 0.33 acres of purple needlegrass are interspersed within the annual grassland. Purple needlegrass grassland is listed as a sensitive plant community on the CDFW Natural Communities List and is required to be considered in CEQA documents. In order for purple needlegrass grassland to be considered a natural community, at least five percent of the species is required as a characteristic to dominant species in the herbaceous layer and the species is usually greater than 10 percent relative cover of the herbaceous layer (Sawyer *et al.* 2009). These mapped areas contain greater than 10 percent relative cover within the herbaceous layer. Therefore, the two polygons of purple needlegrass are considered a sensitive habitat since the acreage meets the minimum percentage criteria necessary to be considered a purple needlegrass grassland natural community.

4.6. Wildlife Migration Corridors and Important Biological Corridors

Wildlife corridors link together areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. The fragmentation of open space areas by urbanization creates isolated "islands" of wildlife habitat. Fragmentation can also occur when a portion of one or more habitats is converted into another habitat, such as when woodland or scrub habitat is altered or converted into grasslands after a disturbance such as fire, mudslide, or grading activities. Wildlife corridors mitigate the effects of this fragmentation by: (1) allowing animals to move between remaining habitats, thereby permitting depleted populations to be replenished and promoting genetic exchange; (2) providing escape routes from fire, predators, and human disturbances, thus reducing the risk of catastrophic events (such as fire or disease) on population or local species extinction; and (3) serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs. The Study Area does not link two significant natural areas and is surrounded by similar habitat types; therefore, it is not considered a wildlife migration corridor.

The *El Dorado County General Plan* identifies a number of Important Biological Corridors (IBC). The Study Area is not located within any existing IBC.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Known or potential biological constraints within the Study Area include:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for Blainville's horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. (seasonal wetlands, perennial marsh, and ephemeral and perennial drainages), riparian habitat, valley oak woodland, and purple needlegrass grassland.

5.1. Special-Status Plant Species

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. No special-status plants occur within the Study Area. However, if construction does not commence within two years of the 2015 botanical inventories, additional botanical inventories are recommended to ensure that populations have not established in the intervening years, in accordance with CDFW's (CDFG 2009) plant protocols.

5.2. Valley Elderberry Longhorn Beetle

Although no VELB were observed, there is a low potential for VELB to be present in the Study Area due to a single blue elderberry shrub observed within southern portion of the Study Area. According to the USFWS *Conservation Guidelines for Valley Elderberry Longhorn Beetle* (Guidelines; USFWS 1999), encroachment within 100 feet from elderberry shrubs with stems measuring at least one-inch dgl should be approved by the USFWS and a minimum setback of 20 feet from the driplines of the elderberry shrubs must be maintained. Project activities that will encroach into the 20-foot minimum setback area are assumed to adversely affect VELB. Project activities that may directly or indirectly affect elderberry shrubs with stems measuring at least one-inch dgl require minimization measures including planting replacement habitat or

purchasing mitigation credits from a USFWS-approved mitigation bank. The mitigation ratios vary based on whether exit holes are present and whether the shrubs occur within riparian habitat.

The outer edge of the non-development area is approximately 25 feet from the elderberry shrub measuring one-inch dgl. Therefore, the proposed project would not adversely affect potential habitat for VELB. However, the project proponent should consult with the USFWS to establish avoidance measures to ensure that no indirect effects associated with the encroachment of 100-foot avoidance buffer would occur. At minimum, high visibility construction fencing followed by silt fencing should be placed around the perimeter of the open space area. Signs should be erected approximately 20 feet apart along the high visibility construction fencing with the following information, "*This area is habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the FESA, as amended. Violators are subject to prosecution, fines, and imprisonment.*" The signs should be clearly readable from a distance of 20 feet, and must be maintained for the duration of construction.

5.3. Western Pond Turtle

The perennial marsh and perennial drainages and surrounding uplands within the Study Area may be suitable habitat for western pond turtle and they are known to occur in the vicinity. Filling of these features could impact this species, if present. In addition, vegetation clearing and grading within the surrounding uplands could impact this species, if present.

A pre-construction survey for western pond turtle should be conducted within 14 days of the initiation of construction by a qualified biologist prior to any construction activity that would directly impact pond or stream habitat or disturb the ground within 300 feet of aquatic habitat. If no western pond turtles are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey or halts for more than 14 days a new survey should be conducted prior to reinitiating construction.

If western pond turtles are found during the pre-construction survey, then a qualified biological monitor should be onsite during initial clearing and grading within 300 feet of a drainage, pond, or other aquatic habitat. The biological monitor will relocate any western pond turtles found within the construction footprint to suitable habitat away from the construction zone, but within the vicinity of the Study Area, if required. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the western pond turtle.

5.4. Blainville's Horned Lizard

The annual grassland within the Study Area provides a low potential for Blainville's horned lizard to occur given the lack of sandy soil. Pre-construction surveys for Blainville's horned lizard are recommended within 14 days prior to the start of ground disturbance. If no Blainville's horned lizards are observed, then no additional measures are recommended. If construction

does not commence within 14 days of the pre-construction survey or halts for more than 14 days, a new survey is recommended.

If Blainville's horned lizards are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any Blainville's horned lizards found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.5. Foothill Yellow-Legged Frog

The perennial drainages and surrounding uplands within the Study Area provide potential habitat for foothill yellow-legged frog. A qualified biologist should conduct a pre-construction survey of the drainages and uplands within 150 feet for foothill yellow-legged frog within 14 days prior to commencement of construction activities. If no foothill yellow-legged frog are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any foothill yellow-legged frog are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any foothill yellow-legged frog found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.6. Western Spadefoot

The annual grassland within the Study Area provides a low potential for upland aestivation habitat and the depressional seasonal wetland provide low quality breeding habitat for western spadefoot. A qualified biologist should conduct a pre-construction survey for western spadefoot within 14 days prior to commencement of construction activities. If no western spadefoot are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any western spadefoot are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any western spadefoot found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.7. Golden Eagle

Although the Study Area does not provide suitable nest trees, the annual grassland provides foraging habitat for golden eagle. A map identifying suitable foraging habitat for golden eagle within a three-mile radius of the last known location of the nest, which includes the Study Area, is provided in **Figure 4**. There is over 4,495 acres of potential foraging habitat surrounding the nest, based on an assessment of current aerial photographs. The project will result in the removal of 27.71 acres of annual grassland. The removal of approximately 0.62 percent of foraging habitat would have no impact on this species. Therefore, no additional measures are recommended.

5.8. Tricolored Blackbird

Although the Study Area does not provide suitable nesting areas for a tricolored blackbird colony, the annual grassland provides suitable foraging habitat. There are currently no requirements for conservation or mitigation for tricolored blackbird foraging habitat. Therefore, no additional measures are recommended.

5.9. Burrowing Owl

Although burrowing owl has a low potential to occur within the annual grassland, given the lack of suitable burrows and that they were not observed during the protocol-level breeding and non-breeding season surveys (Foothill Associates 2016b) or any other biological surveys conducted within the Study Area, they are not currently present. However, the species could occupy the Study Area in the future. The project proponent should conduct a take avoidance survey within 30 days prior to commencement of construction, in accordance with the 2012 *California Department of Fish and Wildlife Staff Report on Burrowing Owl Mitigation* (2012 Staff Report) (CDFW 2012). The survey area includes an approximately 500-foot (150-meter) buffer around the Study Area, where access is permitted. If the surveys are negative, then no additional measures are recommended.

If burrows are observed within 500 feet of the Study Area, an impact assessment should be prepared and submitted to the CDFW, in accordance with the 2012 Staff Report. If it is determined that project activities may result in impacts to nesting, occupied, and satellite burrows and/or burrowing owl habitat, the project proponent should consult with CDFW and develop a detailed mitigation plan such that the habitat acreage, number of burrows, and burrowing owls impacted are replaced. The mitigation plan should be based on the requirements set forth in Appendix A of the 2012 Staff Report.

5.10. Other Raptors and Migratory Birds

Several species of raptors and other migratory birds may forage and nest in the Study Area, including the special-status species white-tailed kite, Cooper's hawk, golden eagle, ferruginous hawk, merlin, grasshopper sparrow, and purple martin. Active nests are protected by the California Fish and Game Code Section 3503.5 and the MBTA. Construction activities could result in disturbance of nest sites through temporary increases in ambient noise levels and increased human activity. In addition, vegetation clearing operations, including pruning or

removal of trees and shrubs, could impact nesting birds if these activities occur during the nesting season (February 15 to August 31). All vegetation clearing including removal of trees and shrubs should be completed between September 1 to February 14, if feasible.

If vegetation removal and grading activities begin during the nesting season (February 15 to August 31), a qualified biologist should conduct a pre-construction survey of the project footprint for active nests. Additionally, the surrounding 500 feet should be surveyed for active raptor nests. The pre-construction survey should be conducted within 14 days prior to commencement of ground-disturbing activities. If the pre-construction survey shows that there is no evidence of active nests, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If nests are found and considered to be active, the project biologist should establish buffer zones to prohibit construction activities and minimize nest disturbance until the young have successfully fledged. Buffer width will depend on the species in question, surrounding existing disturbances, and specific site characteristics, but may range from 20 feet for some songbirds to 250 feet for most raptors. If active nests are found within any trees slated for removal, then an appropriate buffer should be established around the trees and the trees should not be removed until a biologist determines that the nestlings have successfully fledged. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the active avian nests. If construction activities are proposed to begin during the non-breeding season (September 1 through January 31), a survey is not required and no further studies are necessary.

5.11. American Badger

The annual grassland provides habitat for American badger. A qualified biologist should conduct a pre-construction survey for American badger within 14 days prior to the start of ground disturbance. If no American badgers are observed, then a letter report documenting the results of the survey should be provided to the project proponent for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If American badgers or their dens are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of temporarily halting construction activities until the biologist determines that the badger has left the construction footprint on its own accord.

5.12. Special-Status Bat Species

The existing riparian and oak woodlands provide potential roosting habitat for various bat species that occur in the vicinity of the Study Area. Removal of trees could impact bats should they be roosting in areas proposed for removal.

A qualified biologist should conduct a preconstruction survey within 14 days prior to clearing or grading operations and removal of trees. If no bats are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If special-status bat species are present and roosting on or within 100 feet of the Study Area, then the biologist should establish an appropriate buffer around the roost site. At minimum, no trees should be removed until the biologist has determined that the bat is no longer roosting in the tree. Additional mitigation measures for bat species, such as installation of bat boxes or alternate roost structures, would be recommended only if special-status bat species are found to be roosting within the project area. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for various bat species.

5.13. Sensitive Habitats

5.13.1.Jurisdictional Waters

Since proposed construction activities will impact aquatic features located in the Study Area, a Section 404 permit should be obtained from the Corps and a Section 401 Water Quality Certification should be obtained for the Regional Water Quality Control Board (RWQCB) prior to the start of construction. Any waters of the U.S. or jurisdictional wetlands that would be lost or disturbed should be replaced or rehabilitated on a “no-net-loss” basis in accordance with the Corps mitigation guidelines. Habitat restoration, rehabilitation, and/or replacement should be at a location and by methods agreeable to the agencies.

If a 404 permit is required for the proposed project, water quality concerns during construction would be addressed in a Section 401 water quality certification from the Regional Water Quality Control Board. A Storm Water Pollution Prevention Plan (SWPPP) would also be required during construction activities. SWPPPs are required in issuance of a National Pollutant Discharge Elimination System (NPDES) construction discharge permit by the U.S. Environmental Protection Agency. Implementation of Best Management Practices (BMPs) during construction is standard in most SWPPPs and water quality certifications. Examples of BMPs include stockpiling of debris away from regulated wetlands and waterways; immediate removal of debris piles from the site during the rainy season; use of silt fencing and construction fencing around regulated waterways; and use of drip pans under work vehicles and containment of fuel waste throughout the site during construction.

5.13.2. Oak Woodlands

The Project would result in the removal of 9 protected oak trees, resulting in impacts to 0.45-acres of oak canopy. To mitigate for the biological resources impact associated with the loss of oak woodlands associated with the project, a combination of avoidance, protection, onsite replacement, where feasible, and offsite preservation or creation of oak woodland habitat is recommended. Tree protection measures should be implemented around trees to remain in the Study Area as detailed in the project's Tree Survey, Preservation, and Replacement Plan.

5.13.3. Riparian Habitats

Although proposed construction activities will not remove riparian woodland habitat, other drainages and riverine features that will be impacted may be subject to CDFW jurisdiction. It is recommended that a Streambed Alteration Agreement application be submitted to CDFW, pursuant to Section 1600 of the CDFW Code, for any activities affecting the bed, bank or associated riparian vegetation of the stream. If required, the project applicant should coordinate with CDFW in developing appropriate mitigation, and should abide by the conditions of any executed permits.

5.13.4. Purple Needlegrass Grassland

The proposed project would result in the removal of purple needlegrass grassland. Therefore, the acreage of removal should be replaced at a 1:1 ratio. The mitigation location may occur within project's open space areas currently characterized by annual grassland or may occur off-site. Purple needlegrass plants in areas slated for removal should be salvaged to the extent feasible and replanted within the open space area. If this is infeasible, then seedlings/saplings from a local nursery should be obtained. A mitigation and monitoring plan should be prepared outlining methods to be used, success criteria to be met, and adaptive management strategies will be completed prior to project construction. At minimum, the purple needlegrass creation areas shall be monitored twice annually for the first year and once annually for the four subsequent years for a total of five years, success criteria should be established to ensure an 80 percent success rate is met by the fifth year, and adaptive management techniques should be implemented to ensure that the 80 percent success rate is met by the fifth year. This plan may be combined with the Operations and Management Plan for the open space area.

5.14. Summary of Avoidance and Minimization Measures

- Obtain a Section 404 Clean Water Act Permit, 401 Water Quality Certification, and SAA prior to the start of construction;
- Conduct botanical inventories for potentially occurring special-status plants if construction does not commence within two years of the 2015 botanical inventories;
- Conduct clearing and tree and shrub removal operations between September 16 and February 28 to minimize potential impacts to nesting birds;
- If construction begins during the nesting season (March 1 – September 15) conduct a pre-construction survey for active bird nests within the Study Area;

- Conduct a take avoidance survey for burrowing owl within 30 days prior to commencement of construction activities, in accordance with the 2012 Staff Report;
- Within 14 days prior to the initiation of construction activities, conduct a pre-construction survey for coast horned lizard, foothill yellow-legged frog, western pond turtle, American badger, and special-status bat species;
- Implement the tree avoidance, maintenance, and mitigation measures as described in the Tree Survey, Preservation, and Replacement Plan (Foothill Associates 2017); and
- Mitigate for the removal of purple needlegrass grassland at a 1:1 ratio and prepare a mitigation and monitoring plan.

Appendix A — Selected General and Specific Plan Policies

El Dorado County General Plan

Conservation and Protection of Water Resources

GOAL 7.3: WATER QUALITY AND QUANTITY
Conserve, enhance, and manage water resources and protect their quality from degradation.

OBJECTIVE 7.3.1: WATER RESOURCE PROTECTION
Preserve and protect the supply and quality of the County's water resources including the protection of critical watersheds, riparian zones, and aquifers.

Policy 7.3.1.1 Encourage the use of Best Management Practices, as identified by the Soil Conservation Service, in watershed lands as a means to prevent erosion, siltation, and flooding.

Policy 7.3.1.2 Establish water conservation programs that include both drought tolerant landscaping and efficient building design requirements as well as incentives for the conservation and wise use of water.

Policy 7.3.1.3 The County shall develop the criteria and draft an ordinance to allow and encourage the use of domestic gray water for landscape irrigation purposes. (See Title 22 of the State Water Code and the Graywater Regulations of the Uniform Plumbing Code).

OBJECTIVE 7.3.2: WATER QUALITY
Maintenance of and, where possible, improvement of the quality of underground and surface water.

Policy 7.3.2.1 Stream and lake embankments shall be protected from erosion, and streams and lakes shall be protected from excessive turbidity.

Policy 7.3.2.2 Projects requiring a grading permit shall have an erosion control program approved, where necessary.

Policy 7.3.2.3 Where practical and when warranted by the size of the project, parking lot storm drainage shall include facilities to separate oils and salts from storm water in accordance with the recommendations of the Storm Water Quality Task Force's California Storm Water Best Management Practices Handbooks (1993).

Policy 7.3.2.4 The County should evaluate feasible alternatives to the use of salt for ice control on County roads.

Policy 7.3.2.5 As a means to improve the water quality affecting the County's recreational waters, enhanced and increased detailed analytical water quality studies and

monitoring should be implemented to identify and reduce point and non-point pollutants and contaminants. Where such studies or monitoring reports have identified sources of pollution, the County shall propose means to prevent, control, or treat identified pollutants and contaminants.

OBJECTIVE 7.3.3: WETLANDS

Protection of natural and man-made wetlands, vernal pools, wet meadows, and riparian areas from impacts related to development for their importance to wildlife habitat, water purification, scenic values, and unique and sensitive plant life.

Policy 7.3.3.1 *For projects that would result in the discharge of material to or that may affect the function and value of river, stream, lake, pond, or wetland features, the application shall include a delineation of all such features. For wetlands, the delineation shall be conducted using the U.S. Army Corps of Engineers (USACE) Wetland Delineation Manual*

Policy 7.3.3.2 *Intentionally blank*

Policy 7.3.3.3 *The County shall develop a database of important surface water features, including lake, river, stream, pond, and wetland resources.*

Policy 7.3.3.4 *The Zoning Ordinance shall be amended to provide buffers and special setbacks for the protection of riparian areas and wetlands. The County shall encourage the incorporation of protected areas into conservation easements or natural resource protection areas.*

Exceptions to riparian and wetland buffer and setback requirements shall be provided to permit necessary road and bridge repair and construction, trail construction, and other recreational access structures such as docks and piers, or where such buffers deny reasonable use of the property, but only when appropriate mitigation measures and Best Management Practices are incorporated into the project. Exceptions shall also be provided for horticultural and grazing activities on agriculturally zoned lands that utilize "best management practices (BMPs)" as recommended by the County Agricultural Commission and adopted by the Board of Supervisors.

Until standards for buffers and special setbacks are established in the Zoning Ordinance, the County shall apply a minimum setback of 100 feet from all perennial streams, rivers, lakes, and 50 feet from intermittent streams and wetlands. These interim standards may be modified in a particular instance if more detailed information relating to slope, soil stability, vegetation, habitat, or other site- or project-specific conditions supplied as part of the review for a specific project demonstrates that a different setback is necessary or would be sufficient to protect the particular riparian area at issue.

For projects where the County allows an exception to wetland and riparian buffers, development in or immediately adjacent to such features shall be planned so that impacts on the resources are minimized. If avoidance and minimization are not feasible, the County shall make findings, based on documentation provided by the project proponent, that avoidance and minimization are infeasible.

Policy 7.3.3.5 *Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.*

OBJECTIVE 7.3.4: DRAINAGE
Protection and utilization of natural drainage patterns.

Policy 7.3.4.1 *Natural watercourses shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site without disturbance.*

Policy 7.3.4.2 *Modification of natural stream beds and flow shall be regulated to ensure that adequate mitigation measures are utilized.*

OBJECTIVE 7.3.5: WATER CONSERVATION
Conservation of water resources, encouragement of water conservation, and construction of wastewater disposal systems designed to reclaim and re-use treated wastewater on agricultural crops and for other irrigation and wildlife enhancement projects.

Policy 7.3.5.1 *Drought-tolerant plant species, where feasible, shall be used for landscaping of commercial development. Where the use of drought-tolerant native plant species is feasible, they should be used instead of non-native plant species.*

Policy 7.3.5.2 *A list of appropriate local indigenous drought tolerant plant materials shall be maintained by the County Planning Department and made available to the public.*

Policy 7.3.5.3 *The County Parks and Recreation Division shall use drought tolerant landscaping for all new parks and park improvement projects.*

Policy 7.3.5.4 *Require efficient water conveyance systems in new construction. Establish a program of ongoing conversion of open ditch systems shall be considered for conversion to closed conduits, reclaimed water supplies, or both, as circumstances permit.*

Policy 7.3.5.5 *Encourage water reuse programs to conserve raw or potable water supplies consistent with State Law.*

Conservation of Biological Resources

GOAL 7.4: WILDLIFE AND VEGETATION RESOURCES
Identify, conserve, and manage wildlife, wildlife habitat, fisheries, and vegetation resources of significant biological, ecological, and recreational value.

OBJECTIVE 7.4.1: RARE, THREATENED, AND ENDANGERED SPECIES
The County shall protect State and federally recognized rare, threatened, or endangered species and their habitats consistent with Federal and State laws.

Policy 7.4.1.1 *The County shall continue to provide for the permanent protection of the eight sensitive plant species known as the Pine Hill endemics and their habitat through the establishment and management of ecological preserves consistent with County Code Chapter 17.71 and the USFWS's Gabbro Soil Plants for the Central Sierra Nevada Foothills Recovery Plan (USFWS 2002).*

Policy 7.4.1.2 *Private land for preserve sites will be purchased only from willing sellers.*

Policy 7.4.1.3 *Limit land uses within established preserve areas to activities deemed compatible. Such uses may include passive recreation, research and scientific study, and education. In conjunction with use as passive recreational areas, develop a rare plant educational and interpretive program.*

Policy 7.4.1.4 *Proposed rare, threatened, or endangered species preserves, as approved by the County Board of Supervisors, shall be designated Ecological Preserve (-EP) overlay on the General Plan land use map.*

Policy 7.4.1.5 *Species, habitat, and natural community preservation/conservation strategies shall be prepared to protect special-status plant and animal species and natural communities and habitats when discretionary development is proposed on lands with such resources unless it is determined that those resources exist, and either are or can be protected, on public lands or private Natural Resource lands.*

Policy 7.4.1.6 *All development projects involving discretionary review shall be designed to avoid disturbance or fragmentation of important habitats to the extent reasonably feasible. Where avoidance is not possible, the development shall be required to fully mitigate the effects of important habitat loss and fragmentation. Mitigation shall be defined in the Integrated Natural Resources Management Plan (INRMP) (see Policy 7.4.2.8 and Implementation Measure CO-M).*

The County Agricultural Commission, Plant and Wildlife Technical Advisory Committee, representatives of the agricultural community, academia, and other

stakeholders shall be involved and consulted in defining the important habitats of the County and in the creation and implementation of the INRMP.

Policy 7.4.1.7 The County shall continue to support the Noxious Weed Management Group in its efforts to reduce and eliminate noxious weed infestations to protect native habitats and to reduce fire hazards.

OBJECTIVE 7.4.2: IDENTIFY AND PROTECT RESOURCES
Identification and protection, where feasible, of critical fish and wildlife habitat including deer winter, summer, and fawning ranges; deer migration routes; stream and river riparian habitat; lake shore habitat; fish spawning areas; wetlands; wildlife corridors; and diverse wildlife habitat.

Policy 7.4.2.1 To the extent feasible in light of other General Plan policies and to the extent permitted by State law, the County of El Dorado will protect identified critical fish and wildlife habitat, as identified on the Important Biological Resources Map maintained at the Planning Department, through any of the following techniques: utilization of open space, Natural Resource land use designation, clustering, large lot design, setbacks, etc.

Policy 7.4.2.2 Where critical wildlife areas and migration corridors are identified during review of projects; the County shall protect the resources from degradation by requiring all portions of the Site that contain or influence said areas to be retained as non-disturbed natural areas through mandatory clustered development on suitable portions of the Site or other means such as density transfers if clustering cannot be achieved. The setback distance for designated or protected migration corridors shall be determined as part of the project's environmental analysis. The intent and emphasis of the Open Space land use designation and of the non-disturbance policy is to ensure continued viability of contiguous or interdependent habitat areas and the preservation of all movement corridors between related habitats. The intent of mandatory clustering is to provide a mechanism for natural resource protection while allowing appropriate development of private property. Horticultural and grazing projects on agriculturally designated lands are exempt from the restrictions placed on disturbance of natural areas when utilizing "Best Management Practices" (BMPs) recommended by the County Agricultural Commission and adopted by the Board of Supervisors when not subject to Policy 7.1.2.7.

Policy 7.4.2.3 Consistent with Policy 9.1.3.1 of the Parks and Recreation Element, low impact uses such as trails and linear parks may be provided within river and stream buffers if all applicable mitigation measures are incorporated into the design.

Policy 7.4.2.4 Establish and manage wildlife habitat corridors within public parks and natural resource protection areas to allow for wildlife use. Recreational uses within these areas shall be limited to those activities that do not require grading or vegetation removal.

Policy 7.4.2.5 Setbacks from all rivers, streams, and lakes shall be included in the Zoning Ordinance for all ministerial and discretionary development projects.

Policy 7.4.2.6 El Dorado County Biological Community Conservation Plans shall be required to protect, to the extent feasible, rare, threatened, and endangered plant species only when existing federal or State plans for non-jurisdictional areas do not provide adequate protection.

Policy 7.4.2.7 The County shall form a Plant and Wildlife Technical Advisory Committee to advise the Planning Commission and Board of Supervisors on plant and wildlife issues, and the committee should be formed of local experts, including agricultural, fire protection, and forestry representatives, who will consult with other experts with special expertise on various plant and wildlife issues, including representatives of regulatory agencies. The Committee shall formulate objectives which will be reviewed by the Planning Commission and Board of Supervisors.

Policy 7.4.2.8 Develop within five years and implement an Integrated Natural Resources Management Plan (INRMP) that identifies important habitat in the County and establishes a program for effective habitat preservation and management. The INRMP shall include the following components:

A. Habitat Inventory. This part of the INRMP shall inventory and map the following important habitats in El Dorado County:

1. *Habitats that support special-status species;*
2. *Aquatic environments including streams, rivers, and lakes;*
3. *Wetland and riparian habitat;*
4. *Important habitat for migratory deer herds; and*
5. *Large expanses of native vegetation.*

The County should update the inventory every three years to identify the amount of important habitat protected, by habitat type, through County programs and the amount of important habitat removed because of new development during that period. The inventory and mapping effort shall be developed with the assistance of the Plant and Wildlife Technical Advisory Committee, CDFW, and USFWS. The

inventory shall be maintained and updated by the County Planning Department and shall be publicly accessible.

B. *Habitat Protection Strategy. This component shall describe a strategy for protecting important habitats based on coordinated land acquisitions (see item D below) and management of acquired land. The goal of the strategy shall be to conserve and restore contiguous blocks of important habitat to offset the effects of increased habitat loss and fragmentation elsewhere in the county. The Habitat Protection Strategy should be updated at least once every five years based on the results of the habitat monitoring program (item F below). Consideration of wildlife movement will be given by the County on all future 4- and 6-lane roadway construction projects. When feasible, natural undercrossings along proposed roadway alignments that could be utilized by terrestrial wildlife for movement will be preserved and enhanced.*

C. *Mitigation Assistance. This part of the INRMP shall establish a program to facilitate mitigation of impacts to biological resources resulting from projects approved by the County that are unable to avoid impacts on important habitats. The program may include development of mitigation banks, maintenance of lists of potential mitigation options, and incentives for developers and landowner participation in the habitat acquisition and management components of the INRMP.*

D. *Habitat Acquisition. Based on the Habitat Protection Strategy and in coordination with the Mitigation Assistance program, the INRMP shall include a program for identifying habitat acquisition opportunities involving willing sellers. Acquisition may be by state or federal land management agencies, private land trusts or mitigation banks, the County, or other public or private organizations. Lands may be acquired in fee or protected through acquisition of a conservation easement designed to protect the core habitat values of the land while allowing other uses by the fee owner. The program should identify opportunities for partnerships between the County and other organizations for habitat acquisition and management. In evaluating proposed acquisitions, consideration will be given to site specific features (e.g., condition and threats to habitat, presence of special-status species), transaction related features (e.g., level of protection gained, time frame for purchase completion, relative costs), and regional considerations (e.g., connectivity with adjacent protected lands and important habitat, achieves multiple agency and community benefits). Parcels that include important habitat and are located generally to the west of the El Dorado National Forest should be given priority for acquisition. Priority will also be given to parcels that would preserve natural wildlife movement corridors such as*

crossing under major roadways (e.g., U.S. Highway 50 and across canyons). All land acquired shall be added to the Ecological Preserve overlay area.

E. *Habitat Management. Each property or easement acquired through the INRMP should be evaluated to determine whether the biological resources would benefit from restoration or management actions. Examples of the many types of restoration or management actions that could be undertaken to improve current habitat conditions include: removal of non-native plant species, planting native species, repair and rehabilitation of severely grazed riparian and upland habitats, removal of culverts and other structures that impede movement by native fishes, construction of roadway under and overcrossing that would facilitate movement by terrestrial wildlife, and installation of erosion control measures on land adjacent to sensitive wetland and riparian habitat.*

F. *Monitoring. The INRMP shall include a habitat monitoring program that covers all areas under the Ecological Preserve overlay together with all lands acquired as part of the INRMP. Monitoring results shall be incorporated into future County planning efforts so as to more effectively conserve and restore important habitats. The results of all special-status species monitoring shall be reported to the CNDDB. Monitoring results shall be compiled into an annual report to be presented to the Board of Supervisors.*

G. *Public Participation. The INRMP shall be developed with and include provisions for public participation and informal consultation with local, state, and federal agencies having jurisdiction over natural resources within the County.*

H. *Funding. The County shall develop a conservation fund to ensure adequate funding of the INRMP, including habitat maintenance and restoration. Funding may be provided from grants, mitigation fees, and the County general fund. The INRMP annual report described under item F above shall include information on current funding levels and shall project anticipated funding needs and anticipated and potential funding sources for the following five years.*

Policy 7.4.2.9 *The Important Biological Corridor (-IBC) overlay shall apply to lands identified as having high wildlife habitat values because of extent, habitat function, connectivity, and other factors. Lands located within the overlay district shall be subject to the following provisions except that where the overlay is applied to lands that are also subject to the Agricultural District (-A) overlay or that are within the Agricultural Lands (AL) designation, the land use restrictions associated with the -IBC policies will not apply to the extent that the agricultural practices do not interfere with the purposes of the -IBC overlay.*

- *Increased minimum parcel size;*
- *Higher canopy-retention standards and/or different mitigation standards/thresholds for oak woodlands;*
- *Lower thresholds for grading permits;*
- *Higher wetlands/riparian retention standards and/or more stringent mitigation requirements for wetland/riparian habitat loss;*
- *Increased riparian corridor and wetland setbacks;*
- *Greater protection for rare plants (e.g., no disturbance at all or disturbance only as recommended by U.S. Fish and Wildlife Service/California Department of Fish and Wildlife);*
- *Standards for retention of contiguous areas/large expanses of other (non-oak or non-sensitive) plant communities;*
- *Building permits discretionary or some other type of "site review" to ensure that canopy is retained;*
- *More stringent standards for lot coverage, floor area ratio (FAR), and building height; and*
- *No hindrances to wildlife movement (e.g., no fences that would restrict wildlife movement).*

The standards listed above shall be included in the Zoning Ordinance.

Wildland Fire Safe measures are exempt from this policy, except that Fire Safe measures will be designed insofar as possible to be consistent with the objectives of the Important Biological Corridor.

OBJECTIVE 7.4.3: COORDINATION WITH APPROPRIATE AGENCIES
Coordination of wildlife and vegetation protection programs with appropriate federal and State agencies.

OBJECTIVE 7.4.5: NATIVE VEGETATION AND LANDMARK TREES
Protect and maintain native trees including oaks and landmark and heritage trees.

Policy 7.4.5.1 A tree survey, preservation, and replacement plan shall be required to be filed with the County prior to issuance of a grading permit for discretionary permits on all high-density residential, multifamily residential, commercial, and industrial projects. To ensure that proposed replacement trees survive, a mitigation monitoring plan should be incorporated into discretionary projects when applicable and shall include provisions for necessary replacement of trees.

Policy 7.4.5.2 It shall be the policy of the County to preserve native oaks wherever feasible, through the review of all proposed development activities where such trees are present on either public or private property, while at the same time recognizing individual rights to develop private property in a reasonable manner. To ensure that oak tree loss is reduced to reasonable acceptable levels, the County shall develop and implement an Oak Tree Preservation Ordinance that includes the following components:

A. Oak Tree Removal Permit Process. Except under special exemptions, a tree removal permit shall be required by the County for removal of any native oak tree with a single main trunk of at least 6 inches diameter at breast height (dbh), or a multiple trunk with an aggregate of at least 10 inches dbh. Special exemptions when a tree removal permit is not needed shall include removal of trees less than 36 inches dbh on 1) lands in Williamson Act Contracts, Farmland Security Zone Programs, Timber Production Zones, Agricultural Districts, designated Agricultural Land (AL), and actions pursuant to a Fire Safe plan; 2) all single family residential lots of one acre or less that cannot be further subdivided; 3) when a native oak tree is cut down on the owner's property for the owner's personal use; and 4) when written approval has been received from the County Planning Department. In passing judgment upon tree removal permit applications, the County may impose such reasonable conditions of approval as are necessary to protect the health of existing oak trees, the public and the surrounding property, or sensitive habitats. The County Planning Department may condition any removal of native oaks upon the replacement of trees in kind. The replacement requirement shall be calculated based upon an inch for inch replacement of removed oaks. The total of replacement trees shall have a combined diameter of the tree(s) removed. Replacement trees may be planted onsite or in other areas to the satisfaction of the County Planning Department. The County may also condition any tree removal permit that would affect sensitive habitat (e.g., valley oak woodland), on preparation of a Biological Resources Study and an Important Habitat Mitigation Program as described in Policy 7.4.1.6. If an application is denied, the County shall provide written notification, including the reasons for denial, to the applicant.

B. Tree Removal Associated with Discretionary Project. Any person desiring to remove a native oak shall provide the County with the following as part of the project application:

- *A written statement by the applicant or an arborist stating the justification for the development activity, identifying how trees in the vicinity of the project or construction site will be protected and stating*

that all construction activity will follow approved preservation methods;

- *A site map plan that identifies all native oaks on the project site; and*
- *A report by a certified arborist that provides specific information for all native oak trees on the project site.*

C. *Commercial Firewood Cutting. Fuel wood production is considered commercial when a party cuts firewood for sale or profit. An oak tree removal permit shall be required for commercial firewood cutting of any native oak tree. In reviewing a permit application, the Planning Department shall consider the following:*

- *Whether the trees to be removed would have a significant negative environmental impact;*
- *Whether the proposed removal would not result in clear-cutting, but will result in thinning or stand improvement;*
- *Whether replanting would be necessary to ensure adequate regeneration;*
- *Whether the removal would create the potential for soil erosion;*
- *Whether any other limitations or conditions should be imposed in accordance with sound tree management practices; and*
- *What the extent of the resulting canopy cover would be.*

D. *Penalties. Fines will be issued to any person, firm, or corporation that is not exempt from the ordinance who damages or destroys an oak tree without first obtaining an oak tree removal permit. Fines may be as high as three times the current market value of replacement trees as well as the cost of replacement, and/or replacement of up to three times the number of trees required by the ordinance. If oak trees are removed without a tree removal permit, the County Planning Department may choose to deny or defer approval of any application for development of that property for a period of up to 5 years. All monies received for replacement of illegally removed or damaged trees shall be deposited in the County's Integrated Natural Resources Management Plan (INRMP) conservation fund.*

Preservation of Open Space

GOAL 7.6: OPEN SPACE CONSERVATION

Conserve open space land for the continuation of the County's rural character, commercial agriculture, forestry and other productive uses, the enjoyment of scenic beauty and recreation, the protection of natural resources, for protection from natural hazards, and for wildlife habitat.

OBJECTIVE 7.6.1: IMPORTANCE OF OPEN SPACE

Consideration of open space as an important factor in the County's quality of life.

Policy 7.6.1.1 *The General Plan land use map shall include an Open Space land use designation. The purpose of this designation is to implement the goals and objectives of the Land Use and the Conservation and Open Space Elements by serving one or more of the purposes stated below. In addition, the designations on the land use map for Rural Residential and Natural Resource areas are also intended to implement said goals and objectives. Primary purposes of open space include:*

A. Conserving natural resource areas required for the conservation of plant and animal life including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, banks of rivers and streams and watershed lands;

B. Conserving natural resource lands for the managed production of resources including forest products, rangeland, agricultural lands important to the production of food and fiber; and areas containing important mineral deposits;

C. Maintaining areas of importance for outdoor recreation including areas of outstanding scenic, historic and cultural value; areas particularly suited for park and recreation purposes including those providing access to lake shores, beaches and rivers and streams; and areas which serve as links between major recreation and open space reservations including utility easements, banks of rivers and streams, trails and scenic highway corridors;

D. Delineating open space for public health and safety including, but not limited to, areas which require special management or regulation because of hazardous or special conditions such as earthquake fault zones, unstable soil areas, flood plains, watersheds, areas presenting high fire risks, areas required for the protection of water quality and water reservoirs, and areas required for the protection and enhancement of air quality; and

E. Providing for open spaces to create buffers which may be landscaped to minimize the adverse impact of one land use on another.

Policy 7.6.1.2 *The County will provide for Open Space lands through:*

A. The designation of land as Open Space;

B. The designation of land for low-intensity land uses as provided in the Rural Residential and Natural Resource land use designations;

C. *Local implementation of the Federal Emergency Management Agency's National Flood Insurance Program;*

D. *Local implementation of the State Land Conservation Act Program; and*

E. *Open space land set aside through Planned Developments (PDs).*

Policy 7.6.1.3 *The County shall implement Policy 7.6.1.1 through zoning regulations and the administration thereof. It is intended that certain districts and certain requirements in zoning regulations carry out the purposes set forth in Policy 7.6.1.1 as follows:*

A. *The Open Space (OS) Zoning District is consistent with and shall implement the Open Space designation of the General Plan land use map and all other land use designations.*

B. *The Agricultural (A), Exclusive Agricultural (AE), Planned Agricultural (PA), Select Agricultural (SA-10), and Timberland Production Zone (TPZ) zoning districts are consistent with Policy 7.6.1.1 and serve one or more of the purposes set forth therein.*

C. *Zoning regulations shall provide for setbacks from all flood plains, streams, lakes, rivers and canals to maintain Purposes A, B, C, and D set forth in Policy 7.6.1.1.*

D. *Zoning regulations shall provide for maintenance of permanent open space in residential, commercial, industrial, agricultural, and residential agricultural zone districts based on standards established in those provisions of the County Code. The regulations shall minimize impacts on wetlands, flood plains, streams, lakes, rivers, canals, and slopes in excess of 30 percent and shall maintain Purposes A, B, C, and D in Policy 7.6.1.1.*

E. *Landscaping requirements in zoning regulations shall provide for vegetative buffers between incompatible land uses in order to maintain Purpose E in Policy 7.6.1.1.*

F. *Zoning regulations shall provide for Mineral Resource Combining Zone Districts and/or other appropriate mineral zoning categories which shall be applied to lands found to contain important mineral deposits if development of the resource can occur in compliance with all other policies of the General Plan. Those regulations shall maintain Purposes A, B, C, D, and E of Policy 7.6.1.1.*

Policy 7.6.1.4 *The creation of new open space areas, including Ecological Preserves, common areas of new subdivisions, and recreational areas, shall include wildfire safety planning.*

El Dorado Hills Specific Plan

1.4.1.1 Site Development and Grading

The policies set forth in the Specific Plan are intended to maintain, to the maximum extent possible, the natural land forms and to exercise control over vegetation removal, landscaping, and grading. Grading controls are intended to reduce soil erosion to a minimum to ensure capability with adjacent terrain.

a) *Grading for roadways, driveways, building pads, and onsite improvements shall be minimized.*

b) *Grading volumes of cut-and-fill material shall be minimized and balanced onsite wherever possible. Larger grading volumes may be acceptable where improved visual and environmental effects would result.*

c) *Residential structures or accessory structures on slopes in access of 20 percent shall be carefully designed through use of erosion controls, engineered grading, and use of post and beam or step-footing construction to ensure long-term slope stability. Benched hillsides for building sites shall be avoided and split-level structures encouraged.*

d) *A plan to minimize impact to oak trees shall be submitted to the El Dorado County Community Development Department prior to approval of any tentative map. The plan will include, at a minimum, the locations and sizes of individual trees that should not be impacted.*

e) *A minimum of 20 percent of all roadside trees and parking lot trees shall be native oaks.*

f) *Removal of oak trees and other large native trees with trunk circumferences of 25 inches at 4.5 feet above grade shall be avoided where feasible. A tree replacement policy is provided in the Design Guidelines on file with the County of El Dorado.*

g) *To avoid damage to root systems of retained trees, residential construction shall not occur within the canopy area of oak trees over 30 inches in circumference at breast height, and shall be subject to review as provided in the Design Guidelines.*

h) *Landscaping in improved common areas shall be of drought-resistant varieties.*

i) *To preserve the vegetative character of the Plan Area, the planting of native trees, shrubs, and ground cover shall be encouraged in all new landscaping.*

j) *Landscaping in areas adjacent to natural open spaces shall be fire resistant.*

k) *Site design, building orientation, and street and lot patterns shall follow solar orientation principles to the maximum extent practicable to maximize energy conservation.*

l) Archaeological test excavations for selected locations within the Plan Area shall be required as a condition of approval of tentative subdivision maps.

m) As part of the tentative map approval, areas having expansive clays and seasonably wet areas shall be identified by a geotechnical engineer. Such areas, if deemed to be potential construction hazards, shall be subject to further evaluation and identification to determine appropriate mitigation measures.

n) To the maximum extent feasible, development shall be sited and designed to avoid impacts to culturally significant sties identified by the Final EIR for the Plan Area as EDH-26 and EDH-29.

o) Where feasible, and given the physical constraints of the Plan Area, subdivisions and other new development shall be designed to facilitate solar use as a means of reducing total energy consumption. The design elements that shall be considered include:

- *Solar orientation*
- *Shade Control*
- *Wind Management*
- *Solar access*

p) The Design Guidelines shall be one of the implementation measures of the Specific Plan.

1.4.1.2 Development Near Native Oak Trees

These guidelines are for the protection of healthy oak trees that will remain after construction in developed areas. The term circumference is breast height (CBH) refers to the trunk measurement of either one trunk or the addition of all trunks in a multi-trunked tree. The respective measure in circumference would also apply. Also refer to **Section 3.10** for Oak Tree Preservation Guidelines.

a) Protect all oak trees larger than 25 inches CBH o the maximum extent feasible. Priority will be given to oaks larger than 56 inches CBH.

b) Trees to be saved will be surrounded by a barrier or fence installed at the dripline and flagged.

c) Pruning of limbs will be confined to low-hanging branches over roads and sidewalks, and large branches that are weak or may reasonably appear to pose a safety hazard. Pruning paint will not be used under any circumstances. Pruning cuts will be made cleanly to avoid damaged to the "bark ridge" tissue of adjacent limbs.

d) The El Dorado County Planning Department will be responsible for enforcement of oak tree protection during construction.

e) In development areas, no oak trees larger than 25 inches CBH will be removed until a site survey and inspection report is performed.

1.4.1.5 Vegetation and Fire Hazards

In areas of planned development:

a) All potentially dry herbaceous vegetation will be mowed or disked within a 50-foot radius of all construction site activity.

b) Disking or mowing will be done to keep herbaceous vegetation under 3 inches in height at all construction sites.

c) No construction equipment or vehicles will be allowed within 50 feet of the unmowed perimeter.

d) Firebreaks will be installed by disking or mowing a trail that is satisfactory to the El Dorado Hills Fire Development. Mowing is preferred to disking or scraping because the latter two practices promote invasion of noxious weed species on fire trails.

e) Temporary or permanent firebreaks will be installed on all ridgelines, crossing all areas in the vicinity of construction and grading activity, prior to beginning work.

f) Firebreak installation will avoid the removal of native oaks and other native trees.

1.4.8 Natural Open Space Policies

The Natural Open Space Policies are to guide the preservation, management, and maintenance of these areas in relation to adjacent land uses.

1.4.8.1 General Policies

a) The boundaries of natural open space shall blend with the boundaries of the development as to enhance the integration of open space and developed areas.

b) Perimeter fencing may be permitted for rural parcels as provided in the El Dorado County Design Guidelines and CC&Rs.

c) Increased runoff from adjacent development will require erosion control measures to be coordinated with landscape design of adjacent development areas. Emphasis shall be placed on methods that rely on natural drainage systems and minimize change to the existing condition of creek channels within open space areas.

d) An Open Space Management Plan shall be completed and submitted to the El Dorado County Community Development Department prior to approval of any tentative map creating open space. It shall be an implementation mechanism of the Specific Plan in order to set forth procedures and responsibilities as to the ownership, preservation, and management of public and private natural open space areas. The Open Space Management Plan shall consider dedication to the County of El Dorado of easements

over the public open space areas, should dedication of fee ownership of these areas be made to any other entity. The open space plan shall be reviewed by the El Dorado Hills Fire Department. The plan shall also include, at a minimum:

1. *The locations of fire access roads, fuel breaks, and passive recreation trails.*
2. *Control burning techniques.*
3. *Guidelines established in the Open Space Guidelines for El Dorado County*
4. *Investigation of opportunities for wildlife use of water in open space areas as a part of ongoing wildlife maintenance.*

1.4.8.2 Riparian and Other Drainageway Policies

A 200-foot-wide undeveloped buffer zone shall be established along Carson Creek in accordance with California Department of Fish and Wildlife requirements. In this buffer, vegetation removal shall be for the purpose of drainage improvements. In consideration of setback reductions for purposes of a gold course, the County shall consider such mitigation measures as additional plantings, erosion controls, and other habitat improvement and protection steps.

a) *Drainageway easements shall specifically preclude erection of structures and vegetation removal, except for drainage improvements, and shall forestall other site development not consistent with the purpose of these areas.*

b) *Drainageways located on privately owned property shall be placed within recorded easements that provide for routine maintenance and pedestrian access.*

c) *A 100-foot-wide buffer (50 feet horizontal on each side as measured from centerline of the creek) of natural vegetation shall be maintained along all intermittent creeks.*

d) *Grazing shall not be allowed in riparian buffer zones.*

e) *Plantings of riparian trees and shrubs shall be situated according to the flood and soil moisture tolerances of individual species as in Appendix C of the Specific Plan.*

f) *Areas disturbed during construction shall be replanted with native riparian species listed in Appendix C of the Specific Plan. Replanting will include a mandatory 3-year maintenance and irrigation period.*

g) *Riparian vegetation on the golf course areas shall be kept naturally dense and unpruned except where needed for crossings, ball pay passages, and personal and fire safety.*

h) *Pedestrian, vehicular, and utility bridges over creeks, if feasible, will be oriented at right angles to the waterway to minimize loss of vegetation.*

i) The capacity of flow under bridges and culverts will be designed to reduce the need for extensive vegetation clearing near the structures.

j) Periodic vegetation removal to ensure adequate floodway capacity in drainages will be performed to promote an overstory of mature individual riparian trees spaced to accommodate designed flows.

El Dorado Hills Community Services District Policies

5.27 Oak Tree Preservation

5.27.3 General Requirements for Development Activity in the Protected Zone of Protected Trees

The importance of oak tree preservation is recognized with tree protection provisions in the Covenants, Conditions, and Restrictions (CC&Rs) of the most units in El Dorado Hills and in County Code 17.73 titled Oak Woodland Conservation prior to initiating any activity that may affect an oak tree on their land or on that of an adjoining property, owners of property in El Dorado Hills should check their CC&Rs carefully to determine whether Design Review Committee (DRC) approval is required.

5.27.4 Removal of Protected Trees

It shall be the policy of the DRC to preserve protected trees wherever feasible while recognizing individual rights to develop private property in a reasonable manner. It shall be the responsibility of the applicant to demonstrate the need for any oak tree removal. In determining whether to approval the removal or major trimming of a protected tree, the DRC will consider the following listed factors and, depending upon particular circumstances, may consider others which are not listed:

a) The degree to which the tree will be an obstacle to approval development activity.

b) The condition of the tree with respect to disease, general health, damage, danger of falling.

c) The effect removal would have upon safety, public health, remaining trees, and the beauty and general welfare of the area.

d) The effect removal would have upon soil stability, erosion, particularly near water courses and on slopes.

e) Present and future shade effect with respect to cooling and solar power/heating.

f) Whether or not there are feasible alternative measures to removal.

g) Applicants may be required to provide an arborist report from an arborist who would not be performing any eventual tree removal or major limbing. Alternatively, and it is discretion the DRC may employ an arborist of its choice.

5.27.5 Protecting Oak Trees During Development Activity

Property owners are responsible for taking the following measures to protect oak trees, except any approval from removal during development activity.

a) *Erect protective orange "ski fencing" around the protected zone of each protected tree or group of trees within 50 feet of development activity prior to initiating work and excluded from the enclosed protected zone any work related activity such as storage and vehicle parking.*

b) *Exert every reasonable effort to preserve undisturbed the natural ground within protected zones.*

c) *If it is absolutely necessary to trench within a protected zone, if boring or drilling would not be feasible, excavate by hand under the supervision of a certified arborist. Do not cut any root larger than two inches in diameter; keep the exposed root moist and cover with soil as quickly as feasible. Sever small roots neatly, trim and cover quickly.*

d) *Make no grade changed within the protected zone unless specifically indicated in the approved plans.*

5.27.6 Mitigation EDHCSD Tree Preservation Fund, Public Education

In the event the owner of property with protected trees removed or significantly damages one or more of them without approval, the DRC, at its discretion, may require mitigation by planting a proportionate number of diameter inches of replacement oak trees on the owner's property or by assessing a fee at the rate of $200 per diameter inch (amount tripled for unapproved removal of a landmark tree) to compensate for the expense of planting a proportionate number of diameter inches of oak trees on public property or by a combination of these alternatives.

In the event the owner of the property with protection trees applies for approval of a protect that will damage protected trees, and the DRC determines they could be reasonably be preserved, the DRC, at its sole discretion, may offer the applicant the option of an approval in exchange for on-site mitigation or payment of a mitigation fee based upon the number of diameter inches that applicant would remove.

Mitigation fees paid by property owners are held by the EDHCSD in a Tree Preservation Fund until used to cover the expense of mitigation planting or for related purposes. It is widely recognized that the loss of oak tree is partly the result of the lack of public awareness on oak preservation. A portion of the funds collected for mitigation may be used to establish and promote educational programs to improve this situation.

Regulatory Status Legend

FE = Federal endangered FT = Federal threatened FC = Federal candidate PT = Federal proposed threatened FPD = Federal proposed for delisting FD = Federal delisted FSC = Federal Species of Concern	CE = California state endangered CT = California state threatened CFP = California fully protected CSC = California Species of Special Concern CSA = California Special Animals List CR = California state rare CC = California candidate	1A = plants presumed extinct in California 1B = plants rare, threatened, or endangered in California and elsewhere 2 = plants rare, threatened, or endangered in California, but common elsewhere 3 = plants about which we need more information 4 = plants of limited distribution

Table 1 — Legally Protected Species

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Boggs Lake hedge-hyssop *Gratiola heterosepala*	CE; 1B	Annual herb found on clay soils in vernal pools and along the lake margins of marshes and swamps from 10 to 2,375 meters.	Blooming period: April – August	**None**; the riverine perennial marsh within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
El Dorado bedstraw *Galium californicum* ssp. *sierrae*	FE; CR; 1B	Perennial herb found on gabbroic substrate in chaparral, cismontane woodland, and lower montane coniferous forest from 100 to 585 meters.	Blooming period: May – June.	**None**; there is no suitable soil for this species within the Study Area.
Layne's butterweed (=ragwort) *Packera layneae*	FT; CR; 1B	Perennial herb found on serpentine or gabbroic, rocky substrate in cismontane woodland or chaparral from 200 to 1,085 meters.	Blooming period: April – August.	**None**; there is no suitable soil for this species within the Study Area.
Legenere *Legenere limosa*	CT; 1B	Annual herb found in vernal pools from 1 to 880 meters.	Blooming period: April – June.	**None**; there is no vernal pool habitat within the Study Area.
Pine Hill ceanothus *Ceanothus roderickii*	FE; CR; 1B	Perennial evergreen shrub found on serpentinite or gabbroic substrate in chaparral or cismontane woodland from 245 to 1,090 meters.	Blooming period: April – June.	**None**; there is no suitable soil for this species within the Study Area.
Pine Hill flannelbush *Fremontodendron decumbens*	FE; CR; 1B	Perennial evergreen shrub found in chaparral and cismontane woodland on rocky gabbroic or serpentinite soils from 425 to 760 meters.	Blooming period: April-July	**None**; there is no suitable soil for this species within the Study Area.
Sacramento orcutt grass *Orcuttia viscida*	FE; CE; 1B	Annual herb found in vernal pools from 30 to 100 meters.	Blooming period: April – September.	**None**; the Study Area does not provide suitable habitat for this species.
Slender orcutt grass *Orcuttia tenuis*	FT; CE; 1B	Annual herb found in vernal pools that are often gravelly, from 35 to 1,760 meters.	Blooming period: May – October.	**None**; the Study Area does not provide suitable habitat for this species.
Stebbins' morning glory *Calystegia stebbinsii*	FE; CE; 1B	Perennial rhizomatous herb found occasionally in openings of chaparral and cismontane woodland on gabbro or serpentinite soils from 185 to 1,090 meters.	Blooming period: April – July.	**None**; there is no suitable soil for this species within the Study Area.
Invertebrates				
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT	Blue elderberry shrubs usually associated with riparian areas.	Adults emerge in spring until June. Exit holes visible year – round.	**Low**; small elderberry shrubs were observed in the Study Area but no exit holes were observed.
Vernal pool fairy shrimp *Branchinecta lynchi*	FT	Vernal pools, swales, and ephemeral freshwater habitat.	USFWS protocol-level wet-season sampling and/or dry season cyst identification.	**None**; the Study Area does not provide suitable habitat for this species.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE	Vernal pools, swales, and ephemeral freshwater habitat.	USFWS protocol-level wet-season sampling and/or dry season cyst identification.	**None**; the Study Area does not provide suitable habitat for this species.
Fish				
Central Valley steelhead *Oncorhynchus mykiss*	FT	Rivers and streams tributary to the Sacramento-San Joaquin Rivers and Delta ecosystems.	Spawn in winter and spring.	**None**; the Study Area does not provide suitable habitat for this species.
Delta smelt *Hypomesus transpacificus*	FT; CE	Found in estuarine waters. Majority of life span is spent within the freshwater outskirts of the mixing zone (saltwater-freshwater interface) within the Delta.	December – July (Spawn) Year-round (Present in delta)	**None**; the Study Area does not provide suitable habitat for this species.
Amphibians/ Reptiles				
California red-legged frog *Rana draytonii*	FT; CSC	Requires a permanent water source and is typically found along quiet, slow-moving streams, ponds, or marsh communities with emergent vegetation. Believed extirpated from the Central Valley floor since 1970s.	Aquatic surveys of breeding sites between January and September. Optimally after April 15.	**None**; the riverine perennial marsh and perennial drainage within the Study Area provide marginal habitat for this species, but no evidence of CRLF was observed during protocol breeding and non-breeding surveys (Foothill Associates 2016a).
California tiger salamander *Ambystoma californiense*	FT; CT	Required ponded water for breeding. Adults spend summer in small mammal burrows. This species is not known to occur within El Dorado County. There are no recorded instances of CTS north of the Cosumnes River and east of the Sacramento River despite extensive surveys.	March – June	**None**; the Study Area occurs outside of the known extant geographic range for this species.
Foothill yellow-legged frog *Rana boylii*	CC	Typically found in shaded, shallow, slow moving streams or channels with rocky or muddy bottoms. Typically stays within ~150' of water.	Breeds from mid-March to early June. Most active diurnally. Hibernates and aestivates.	**Low**; perennial drainage provides potential habitat for this species, but there are no known occurrences within 5 miles.

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Giant garter snake *Thamnophis gigas*	FT; CT	Found in agricultural wetlands and other wetlands such as irrigation and drainage canals, low gradient streams, marshes, ponds, sloughs, small lakes, and their associated uplands. Upland habitat should have burrows or other soil crevices suitable for snakes to reside during their dormancy period (November – mid March). This species is known from Sacramento, Sutter, Butte, Colusa, and Glenn counties.	Active outside of dormancy period November-mid March	**None**; the Study Area occurs outside of the known geographic range for this species.
Birds				
Bald eagle *Haliaeetus leucocephalus*	FD; CFP, CE	Breeding habitat most commonly includes areas within 2.5 miles (4.0 kilometers) of coastal areas, bays, rivers, lakes, and reservoirs. Nests usually are in tall trees or on pinnacles or cliffs near water.	Winter	**None**; there is no potential habitat for this species within the Study Area.
Bank swallow *Riparia*	CT	Nests in riverbanks and forages over riparian areas and adjacent uplands.	April – July	**None**; there is no potential nesting habitat for this species within the Study Area.
California black rail *Laterallus jamaicensis coturniculus*	CT	Saltwater, brackish, and freshwater marshes that remain shallowly inundated year-round.	Year – round	**None**; the Study Area occurs outside of the geographical range for this species.
Golden eagle *Aquila chrysaetos*	CFP (nesting and wintering)	Open and semi-open areas up to 12,000 feet in elevation. Builds large stick nests on cliffs, in trees, or on man-made structures.	Year – round	**Low**; although the Study Area provides foraging habitat, there is no breeding habitat present within the Study Area and no nests have been observed.
Swainson's hawk *Buteo swainsoni*	CT	Nest peripherally to Valley riparian systems lone trees or groves of trees in agricultural fields. Valley oak, Fremont cottonwood, walnut, and large willow trees, ranging in height from 41 to 82 feet, are the most commonly used nest trees in the Central Valley.	March – October	**None**; the Study Area occurs outside of the known geographical range for this species.
Tricolored blackbird *Agelaius tricolor*	CC; CSC (nesting colony)	Nests in dense blackberry, cattail, tules, bulrushes, sedges, willow, or wild rose within freshwater marshes. Nests in large colonies of at least 50 pairs (up to thousands of individuals). May forage up to 4 miles from nest site.	Year – round	**Low**; the riverine perennial marsh is not large enough to support breeding colonies, but colonies are recorded within 4 miles of the Study Area so the area may be used for foraging.
White-tailed kite *Elanus leucurus*	CFP (nesting)	Nests in isolated trees or woodland areas with suitable open foraging habitat.	February 15 – August 31	**High**; the riparian habitat and isolated trees within the annual grassland provide breeding habitat for this species.
Mammals				
Fisher *Martes pennanti*	PT; CSC	Occurs in intermediate to large-tree stages of coniferous and deciduous forests.	Year – round	**None**; there is no habitat for this species within the Study Area.

Table 1 includes federal threatened or endangered species and eagles, and State threatened, endangered, or fully protected species.

Table 2 — Species Subject to CEQA Review

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	1B	Annual herb found in mesic areas in valley and foothill grasslands from 30 to 229 meters.	Blooming period: April – August.	**None**; the Study Area does not provide habitat for this species.
Big-scale balsamroot *Balsamorhiza macrolepis*	1B	Perennial herb found in chaparral, cismontane woodland, valley and foothill grassland, sometimes on serpentinite soils from 90 to 1,555 meters in elevation.	Blooming period: March – June	**None**; the annual grassland within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
chaparral sedge *Carex xerophila*	1B	Perennial herb found on gabbroic or serpentine soils in chaparral, woodlands, and coniferous forest between 440 and 770 meters.	Blooming period: March – June	**None**; there is no suitable soil for this species within the Study Area.
Dwarf downingia *Downingia pusilla*	2	Annual herb found occasionally in mesic areas within valley and foothill grassland and vernal pools from 1 to 445 meters.	Blooming period: March – May.	**None**; the annual grassland within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
El Dorado bedstraw *Galium californicum* ssp. *sierrae*	FE; CR; 1B	Perennial herb found on gabbroic substrate in chaparral, cismontane woodland, and lower montane coniferous forest from 100 to 585 meters.	Blooming period: May – June.	**None**; there is no suitable soil for this species within the Study Area.
Jepson's onion *Allium jepsonii*	1B	Perennial bulbiferous herb found on serpentine or volcanic soils in chaparral, lower montane coniferous forest, and cismontane woodland from 300 to 1,320 meters.	Blooming period: April – August.	**None**; there is no suitable soil for this species within the Study Area.
Parry's horkelia *Horkelia parryi*	1B	Perennial herb found on Ione formation in chaparral and cismontane woodland from 80 to 1,070 meters.	Blooming period: April – September	**None**; there is no suitable soil for this species within the Study Area.
Pincushion navarretia *Navarretia myersii*	1B	Annual herb found in vernal pools, which are often acidic, from 20 to 330 meters.	Blooming period: April – May.	**None**; there is no vernal pool habitat within the Study Area.
Red Hills soaproot *Chlorogalum grandiflorum*	1B	Perennial bulbiferous herb found on gabbro, serpentine, or other soils in chaparral, cismontane woodland, and lower montane coniferous forest from 245 to 1,240 meters.	Blooming period: May - June	**None**; original site surveys were conducted within the evident and identifiable bloom period for this species and this species was not observed within the Study Area.
Sanford's arrowhead *Sagittaria sanfordii*	1B	Perennial rhizomatous herb found in marshes and swamps in assorted shallow freshwater areas from 0 to 650 meters.	Blooming period: May – October.	**None**; the riverine perennial marsh within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Starved daisy *Erigeron miser*	1B	Perennial herb found on rocky ground in upper montane coniferous forest from 1,840 to 2,620 meters.	Blooming period: June – October.	**None**; the Study Area does not provide habitat for this species and is outside the known elevational range.
Tuolumne button-celery *Eryngium pinnatisectum*	1B	Annual to perennial herb found in mesic areas in cismontane woodland, lower montane coniferous forest, and vernal pools from 70 to 915 meters.	Blooming period: May – August	**None**; original site surveys were conducted within the evident and identifiable bloom period for this species and this species was not observed within the Study Area.
Amphibians/ Reptiles				
Blainville's (Coast) horned lizard *Phrynosoma blainvillii*	CSC	Inhabits open areas of sandy soils and low vegetation in valleys, foothills, and semiarid mountains. Found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose sandy soil. Often found in lowlands along sandy washes with scattered shrubs and along dirt roads, and frequently found near ant hills.	Year – round (excluding extended periods of low temperatures or extreme heat).	**Low**; the Study Area provides marginal habitat within the annual grassland. However, the Study Area lacks suitable sandy washes and low scattered bushes or shrubs.
Western pond turtle *Emys marmorata*	CSC	Agricultural wetlands and other wetlands such as irrigation and drainage canals, low gradient streams, marshes, ponds, sloughs, small lakes, and their associated uplands.	Active outside of dormancy period November – February	**High**; the perennial drainage and riverine perennial marsh within the Study Area provide habitat for this species.
Western spadefoot *Spea hammondii*	CSC	Found in open grasslands and woodlands. Breeds in seasonal ponds and vernal pools.	Year – round	**Low**; there is minimal potential breeding habitat for this species in the Study Area in the depressional seasonal wetlands.

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Birds				
Burrowing owl *Athene cunicularia*	CSC (burrow sites and some wintering sites)	Nests in burrows in the ground, often in old ground squirrel burrows or badger, within open dry grassland and desert habitat. The burrows are found in dry, level, open terrain, including prairie, plains, desert, and grassland with low height vegetation for foraging and available perches, such as fences, utility poles, posts, or raised rodent mounds.	Year – round; Breeding season surveys between March and August.	**Low**; the annual grassland within the Study Area provides potential habitat for this species, however, few burrows that could be occupied by this species was observed and this species was not observed during the protocol level surveys conducted within the Study Area.
Cooper's hawk *Accipiter cooperii*	CSA (Nesting)	Found in cismontane woodland, riparian forest, riparian woodland, and upper montane coniferous forest.	Year – round	**Low;** the woodlands on site provide potential nesting and foraging habitat.
Double crested cormorant *Phalacrocorax auritus*	CSA (Nesting colony)	Breeds on ponds, lakes, artificial impoundments, slow-moving rivers, lagoons, estuaries, and open coastlines.	Migrate and winter non-breeding.	**None;** there is no suitable nesting habitat in the Study Area.
Ferruginous hawk *Buteo regalis*	CSA (Wintering)	Overwintering occurs in grasslands or deserts with abundant prey species (rabbits, pocket gophers, or prairie dogs).	Wintering	**Low**; the annual grassland habitat within the Study Area provides habitat for this species.
Grasshopper sparrow *Ammodramus savannarum*	CSC	Frequents dense, dry, or well drained grassland, especially native grassland. Nests at base of overhanging clump of grass.	April – July	**Low**; the annual grassland habitat within the Study Area provides habitat for this species.
Great blue heron *Ardea herodias*	CSA (Nesting colony)	Inhabits both freshwater and saltwater habitats and forages in grassland and agricultural field. Breeding colonies are located within 2 to 4 miles of feeding areas, often in isolated swamps or on islands, and near lakes and ponds bordered by forests.	Year – round	**None;** there is no suitable nesting habitat in the Study Area.
Great egret *Ardea alba*	CSA (Nesting colony)	Nests in colonies in large trees usually near water. Nesting colonies must be relatively isolated from human activities. Forages in shallow water in a variety of habitats.	Year – round	**None;** there is no suitable nesting habitat in the Study Area.
Merlin *Falco columbarius*	CSA (Wintering)	Winter in open and semi-open habitats that include estuaries, Great Basin grassland, and valley and foothill grasslands.	Wintering	**Low**; the annual grassland habitat within the Study Area provides habitat for this species.
Osprey *Pandion haliaetus*	CSA	Found in a variety of habitats nearby water sources.	Breeding	**None**; the Study Area does not provide suitable habitat for this species.
Purple martin *Progne subis*	CSC	Often nests in tall, old trees near body of water in woodland and conifer habitats. Feed in open areas near water and nest in tree cavities.	Year – round	**Low**; the Study Area does provide potential nesting habitat for this species.
Mammals				
American badger *Taxidea taxus*	CSC	Found in a variety of grasslands, shrublands, and open woodlands throughout California.	Year – round	**Low**; the annual grassland within the Study Area provides habitat, however, very few burrows that could be utilized by this species are present within the Study Area.
Pallid bat *Antrozous pallidus*	CSC	Most abundant in oak woodland, savannah, and riparian habitats. Roosts in crevices and hollows in trees, rocks, cliffs, bridges, and buildings.	Year – round	**Low**; the trees within the riparian habitat and isolated trees within the annual grassland provide roosting habitat for this species.
Silver-haired bat *Lasionycteris noctivagans*	CSA	Forests near water. Roosts in hollow trees, snags, buildings, rock crevices, caves, and under bark. Forages in ~300' home range over water and open brushy areas.	Dusk between spring and fall.	**Low**; there is marginal habitat in the woodlands for this species on the Study Area

Table 2 includes state and federal species of concern and Rank 1 and 2 CNPS species.

Table 3 — Other Species of Interest

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Bisbee Peak rush-rose *Crocanthemum suffrutescens*	3.2	Perennial evergreen shrub often found on gabbroic or lone soil and often in burned or disturbed areas within chaparral from 75 to 670 meters.	Blooming period: April – August.	**None**; the Study Area does not provide habitat for this species.
Brandegee's clarkia *Clarkia biloba* ssp. *brandegeeae*	4	Annual herb found often in roadcuts within chaparral, cismontane woodland, and lower montane coniferous forest from 75 to 915 meters.	Blooming period: May – July.	**None**; the woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Brewer's calandrinia *Calandrinia breweri*	4	Annual herb found on sandy or loamy, disturbed sites and burns within chaparral and coastal scrub from 10 to 1,220 meters.	Blooming period: March – June.	**None**; the Study Area does not provide habitat for this species.
Fresno ceanothus *Ceanothus fresnensis*	4	Perennial evergreen shrub found occasionally in openings of cismontane woodland and lower montane coniferous forest from 900 to 2,103 meters.	Blooming period: May – July.	**None**; the Study Area occurs outside of the known elevation range for this species.
Hernandez bluecurls *Trichostema rubisepalum*	4	Annual herb found on volcanic or serpentinite, gravelly substrate within broad-leafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, and vernal pools from 300 to 1,435 meters.	Blooming period: June – August.	**None**; there is no suitable soil for this species within the Study Area.
Humboldt lily *Lilium humboldtii* ssp. *humboldtii*	4	Perennial bulbiferous herb found in openings of chaparral, cismontane woodland, and lower montane coniferous forest from 90 to 1,280 meters.	Blooming period: May – July.	**None**; the woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Jepson's woolly sunflower *Eriophyllum jepsonii*	4	Perennial herb sometimes found on serpentinite substrate within chaparral, cismontane woodland, and coastal scrub from 200 to 1,025 meters.	Blooming period: April – June.	**None**; the Study Area does not contain the soils required for this species.
Sanborn's onion *Allium sanbornii* var. *sanbornii*	4	Perennial bulbiferous herb usually found on serpentinite, gravelly substrate within chaparral, cismontane woodland, and lower montane coniferous forest from 260 to 1,510 meters.	Blooming period: May – September.	**None**; there is no suitable soil for this species within the Study Area.
Streambank spring beauty *Claytonia parviflora* ssp. *grandiflora*	4	Annual herb found on rocky substrate within cismontane woodland from 250 to 1,200 meters.	Blooming period: February – May.	**None**; the Study Area does not provide habitat for this species and is outside of the known elevational range.
Invertebrates				
Alabaster Cave harvestman *Banksula californica*	CSA	Found in caves in the Sierra Nevada.	Year-round	**None**; there is no suitable habitat for this species in the Study Area.
Blennosperma vernal pool andrenid bee *Andrena blennospermaties*	CSA	Found in upland areas near vernal pools; dependent on populations of blennosperma flowers. Slender, dark-olive green bees with pale apical bands on the dorsum of the abdominal segments; females measure 8.5-9.5 mm, males 7-8 mm.	Year-round	**None**; there is no suitable habitat for this species in the Study Area.
California linderiella *Linderiella occidentalis*	CSA	Inhabits vernal pools, swales, and ephemeral freshwater habitat.	Wet-season sampling and/or dry season cyst identification.	**None**; the seasonal swales in the Study Area provide marginal habitat, but the Study Area is outside the locally recorded range of the species.
Cosumnes Stripetail *Cosumnoperla hypocrena*	CSA	Freshwater intermittent streams in the American River and Cosumnes River basins between 300 and 1500 meters.	Year – round	**None**; the Study Area is outside the geographic range of the species.
Hairy Water flea *Dumontia oregonensis*	CSA	Vernal pools, seasonal pools, and streams from Jackson County, Oregon to Sacramento and Solano Counties in California.	Wet Season	**None**; the Study Area is outside the geographic range of the species.
Mid-valley fairy shrimp *Branchinecta mesovallensis*	CSA	Inhabits vernal pools, swales, and ephemeral freshwater habitat.	Wet-season sampling and/or dry season cyst identification.	**None**; the Study Area is outside the geographic range of the species.
Ricksecker's water scavenger beetle *Hydrochara ricksecker*i	CSA	A small aquatic beetle known from pond habitats in the San Francisco Bay Area.	Year-round	**None**; there is no habitat for this species within the Study Area.
Western bumble bee *Bombus occidentalis*	CSA	Generally, nests underground in abandoned rodent burrows and bird nests. Forages on a wide variety of flowers. Found in Coast range north of Monterey County, Sierra mountain range north of Tuolumne County, and around the delta region of Contra Costa County.	New colonies established in spring. Overwinter in shallow burrows.	**None**; the Study Area is outside the geographic range of the species.

Table 3 includes Rank 3 and 4 CNPS species and non-listed invertebrates, which may not be subject to CEQA review.

Appendix C — Plants and Wildlife Observed in the Study Area

Appendix C
Wildlife Observed in the Study Area

Species	Common Name
Birds	
Agelaius phoeniceus	Red-winged blackbird
Buteo jamaicensis	Red-tailed hawk
Callipepla californica	California quail
Carpodacus mexicanus	House finch
Cathartes aura	Turkey vulture
Euphagus cyanocephalus	Brewer's blackbird
Falco sparverius	American kestrel
Melanerpes formicivorus	Acorn woodpecker
Meleagris gallopavo	Wild turkey
Sayornis nigricans	Black phoebe
Sturnella neglecta	Western meadowlark
Sturnus vulgaris	European starling
Zenaida macroura	Mourning dove
Mammals	
Microtus agrestis	Vole
Lepus californicus	Black-tailed jackrabbit
Plestiodon skiltonianus	Western skink
Sceloporus occidentalis	Western fence lizard
Sylvilagus sp.	Cottontail rabbit

Appendix C
Plants Observed in the Study Area

Genus	Species	Common Name	Wetland Indicator Status
Adoxaceae	*Sambucus nigra* ssp. caerulea	Blue elderberry	FACU
Apiaceae	*Eryngium vaseyi*	Coyote-thistle	FACW
Apocynaceae	*Asclepias fascicularis*	Mexican whorled milkweed	FAC
Asteraceae	*Anaphalis margaritacea*	Pearly everlasting	FACU
Asteraceae	*Artemisia douglasiana*	California mugwort	FAC
Asteraceae	*Baccharis pilularis*	Coyote brush	NI
Asteraceae	*Carduus pycnocephalus* ssp. pycnocephalus	Italian thistle	NI
Asteraceae	*Holocarpha virgata*	Tarweed, tarplant	NI
Asteraceae	*Hypochaeris glabra*	Smooth cat's ear	NI
Asteraceae	*Lactuca serriola*	Prickly lettuce	FACU
Asteraceae	*Silybum marianum*	Milk thistle	NI
Boraginaceae	*Amsinckia menziesii*	Fiddleneck	NI
Boraginaceae	*Phacelia cicutaria*	Phacelia	NI
Boraginaceae	*Plagiobothrys fulvus*	Common popcornflower	NI
Brassicaceae	*Brassica napus*	Swede rape, rapeseed	NI
Brassicaceae	*Brassica nigra*	Black mustard	NI
Caryophyllaceae	*Spergularia bocconi*	Boccon's sand spurry	FACW
Cyperaceae	*Cyperus eragrostis*	Nutsedge	FACW
Cyperaceae	*Eleocharis macrostachya*	Spikerush	OBL
Cyperaceae	*Schoenoplectus acutus* var. occidentalis	Tule	OBL
Euphorbiaceae	*Croton setiger*	Turkey-mullein	NI
Fabaceae	*Trifolium hirtum*	Rose clover	NI
Fagaceae	*Quercus lobata*	Valley oak	FACU
Fagaceae	*Quercus wislizeni*	Interior live oak	NI
Gentianaceae	*Zeltnera muehlenbergii*	Muehlenberg's centaury	FAC
Geraniaceae	*Erodium botrys*	Broadleaf filaree	FACU
Geraniaceae	*Erodium cicutarium*	Cutleaf filaree	NI
Geraniaceae	*Geranium molle*	Crane's bill geranium	NI
Hypericaceae	*Hypericum perforatum*	St. John's wort	FACU
Lamiaceae	*Mentha pulegium*	Pennyroyal	OBL
Marsileaceae	*Pilularia americana*	American pillwort	OBL
Moraceae	*Ficus carica*	Edible fig	FACU
Myrsinaceae	*Lysimachia arvensis*	Scarlet pimpernel	FAC
Onagraceae	*Epilobium ciliatum*	Northern willow herb	FACW
Papaveraceae	*Eschscholzia californica*	California poppy	NI
Papaveraceae	*Eschscholzia casespitosa*	Foothill poppy	NI
Poaceae	*Aira caryophyllea*	Silver hair grass	FACU
Poaceae	*Avena fatua*	Wild oat	UPL
Poaceae	*Bromus diandrus*	Ripgut grass	NI
Poaceae	*Bromus hordeaceus*	Soft chess	FACU
Poaceae	*Deschampsia danthonioides*	Annual hair grass	FACW
Poaceae	*Elymus caput-medusae*	Medusa head	NI
Poaceae	*Festuca bromoides*	Brome fescue	FACU
Poaceae	*Festuca perennis*	Rye grass	FAC
Poaceae	*Hordeum murinum*	Foxtail	FACU
Poaceae	*Polypogon monspeliensis*	Annual beard grass, rabbitfoot grass	FACW
Poaceae	*Stipa pulchra*	Purple needle grass	NI
Poaceae	*Vulpia myuros*	Foxtail fescue	FACU
Polygonaceae	*Persicaria lapathifolia*	Common knotweed	FACW
Polygonaceae	*Rumex crispus*	Curly dock	FAC
Rosaceae	*Rubus armeniacus*	Himalayan blackberry	FAC
Salicaceae	*Populus fremontii* ssp. fremontii	Alamo or Fremont cottonwood	NI
Salicaceae	*Salix* sp.	Willow	FACW
Scrophulariaceae	*Verbascum blattaria*	Moth mullein	UPL
Sonchus	*Sonchus asper*	Sow thistle, prickly sow thistle	FAC
Themidaceae	*Brodiaea elegans* ssp. elegans	Harvest brodiaea	FACU
Typhaceae	*Typha angustifolia*	Narrow-leaved cattail	OBL
Typhaceae	*Typha latifolia*	Common cattail, broadleaf cattail	OBL
Vicia	*Vicia villosa*	Hairy vetch	NI

Executive Summary

Foothill Associates' biologists conducted a biological resources assessment (BRA) and focused surveys for western burrowing owl, special-status plants, and California red-legged frog on the El Dorado Hills 52 Study Area located within El Dorado County, California. The purpose of this BRA is to summarize the general biological resources on the Study Area, to assess the suitability of the Study Area to support special-status species and sensitive habitat types, to summarize the results of various focused surveys, and to provide recommendations for regulatory permitting or further analysis that may be required prior to development activities occurring on the Study Area.

The El Dorado Hills 52 Study Area (Study Area) consists of ±34 acres of land that is primarily annual grassland. The Study Area is bifurcated by Silva Valley Parkway. A former home site is located on the southern portion of the property and a large part of the northern portion was used to stockpile soil during the construction of the adjacent Silva Valley Parkway – U.S. Highway 50 Interchange Project. Land uses surrounding the Study Area include an elementary school, residences, and U.S. Highway 50.

Known or potential biological constraints within the Study Area include:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for Blainville's horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. (seasonal wetlands, perennial marsh, and ephemeral and perennial drainages), riparian habitat, valley oak woodland, and purple needlegrass grassland.

1.0 INTRODUCTION

This report summarizes the findings of a BRA, focused surveys for burrowing owl, California red-legged frog, and special-status plants and an aquatic resources delineation completed for the ±34-acre El Dorado Hills 52 Study Area, located within El Dorado County, California. This document addresses the onsite physical features, as well as plant communities present and the common plant and wildlife species occurring, or potentially occurring, in the Study Area. Furthermore, the suitability of habitats to support special-status species and sensitive habitats are analyzed and recommendations are provided for any regulatory permitting or further analysis required prior to development activities occurring on the Study Area.

1.1. Project Description

Development proposed within the Study Area will ultimately result in the development of approximately 32-acres of commercial development. The northern portion of the Study Area is approximately 17.07 acres (North Site) and the southern portion is approximately 15.73 acres (South Site), net of the right-of-way for roads. Development is designed to allow either the North Site or the South Site to develop independent from the other. Proposed improvements will include construction of commercial buildings and associated parking, utilities, and storm water management facilities as well as multiple points of access, and a new traffic signal on Silva Valley Parkway. Ancillary amenities include pedestrian walkways, bicycle parking, signage and lighting and landscaping. A 7.69-acre area within the North Site is dedicated right-of-way associated with the future extension of Country Club Drive. A 1.38-acre open space area west of Old Silva Valley Road will not be developed.

2.0 REGULATORY FRAMEWORK

Federal, State, and local environmental laws, regulations, and policies relevant to the California Environmental Quality Act (CEQA) review process are summarized below. The CEQA significance criteria are also included in this section.

2.1. Federal Regulations

2.1.1. Federal Endangered Species Act

The U.S. Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend.

FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (FESA Section 3 [(3) (19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR §17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR §17.3). Actions that result in take can result in civil or criminal penalties.

In the context of the proposed project, FESA consultation with the U.S. Fish and Wildlife Service (USFWS) or the National Marine Fisheries Service (NMFS) would be initiated if development resulted in take of a threatened or endangered species or if issuance of a Section 404 permit or other federal agency action could result in take of an endangered species or adversely modify critical habitat of such a species.

2.1.2. Migratory Bird Treaty Act

Raptors (birds of prey), migratory birds, and other avian species are protected by a number of State and federal laws. The federal Migratory Bird Treaty Act (MBTA) prohibits the killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of Interior.

2.1.3. The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (Eagle Act) prohibits the taking or possession of and commerce in bald and golden eagles with limited exceptions. Under the Eagle Act, it is a violation to "*take, possess, sell, purchase, barter, offer to sell, transport, export or import, at any time or in any manner, any bald eagle commonly known as the American eagle, or golden eagle, alive or dead, or any part, nest, or egg, thereof*." Take is defined to include pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest, and disturb. Disturb is further defined in 50 CFR Part 22.3 as "*to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available (1) injury to*

an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior."

2.2. State Jurisdiction

2.2.1. California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to the FESA but pertains to State-listed endangered and threatened species. CESA requires state agencies to consult with the California Department of Fish and Wildlife (CDFW), when preparing CEQA documents. The purpose is to ensure that the State lead agency actions do not jeopardize the continued existence of a listed species or result in the destruction, or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code §2080). CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur and allows CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows CDFW to authorize exceptions to the State's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (Fish & Game Code § 2081).

2.2.2. California Department of Fish and Game Codes

A number of species have been designated "fully protected" species under Sections 5515, 5050, 3511, and 4700 of the Fish and Game Code, but are not listed as endangered (Section 2062) or threatened (Section 2067) species under CESA. Except for take related to scientific research, all take of fully protected species is prohibited. The California Fish and Game Code defines take as "*hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill.*" Additionally, Section 3503 of the California Fish and Game Code prohibits the killing of birds or the destruction of bird nests.

2.2.3. Native Plant Protection Act

The Native Plant Protection Act (NPPA), enacted in 1977, allows the Fish and Game Commission to designate plants as rare or endangered. There are 64 species, subspecies, and varieties of plants protected under the NPPA. The NPPA prohibits take of endangered or rare native plants, with some exceptions for agricultural and nursery operations and emergencies. Vegetation removal from canals, roads, and other sites, changes in land use, and certain other situations require proper advance notification to CDFW.

2.3. Jurisdictional Waters

2.3.1. Federal Jurisdiction

The U.S. Army Corps of Engineers (Corps) regulates discharge of dredge or fill material into waters of the U.S. under Section 404 of the Clean Water Act (CWA). "Discharges of fill material"

is defined as the addition of fill material into waters of the U.S., including, but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; fill for intake and outfall pipes and subaqueous utility lines [33 C.F.R. §328.2(f)].

Waters of the U.S. include a range of wet environments such as lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, and wet meadows. Boundaries between jurisdictional waters and uplands are determined in a variety of ways depending on which type of waters is present. Methods for delineating wetlands and non-tidal waters are described below.

- Wetlands are defined as "*those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions*" [33 C.F.R. §328.3(b)]. Presently, to be a wetland, a site must exhibit three wetland criteria: hydrophytic vegetation, hydric soils, and wetland hydrology existing under the "normal circumstances" for the site.
- The lateral extent of non-tidal waters is determined by delineating the ordinary high-water mark (OHWM) [33 C.F.R. §328.4(c)(1)]. The OHWM is defined by the Corps as "*that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas*" [33 C.F.R. §328.3(e)].

An aquatic feature is determined to be a water of the U.S. based on nexus with a traditionally navigable water pursuant to the Supreme Court's decision in the consolidated cases *Rapanos v. United States* and *Carabell v. United States* (126 S. Ct. 2208) and agency guidance subsequent to this decision. Under these rules, the Corps asserts jurisdiction over wetlands adjacent to traditional navigable waters, relatively permanent non-navigable tributaries (i.e., waters that have a continuous flow at least three months out of the year), and wetlands that abut relatively permanent tributaries. The Corps determines jurisdiction over waters that are non-navigable tributaries that are not relatively permanent, and wetlands adjacent to these tributaries, by making a determination whether such waters "significantly affect the chemical, physical, and biological integrity of other jurisdictional waters more readily understood as "navigable." Finally, the Corps generally does not consider the following to be "waters of the United States": swales or erosional features (e.g., gullies, small washes characterized by low volume, infrequent or short duration flow) and ditches "wholly in and draining only uplands…which do not carry a relatively permanent flow of water." Navigable waters of the United States are defined as waters that have been used in the past, are now used, or are susceptible to use as a means to transport interstate or foreign commerce up to the head of navigation.

2.3.2. State Jurisdiction

Regional Water Quality Control Boards

Discharges of fill or waste material to waters of the State are regulated by the State Water Resources Control Board (SWRCB) through its Regional Water Quality Control Boards (RWQCB) under Section 401 of the CWA and the Porter-Cologne Water Quality Control Act (contained in the California Water Code). All waters of the U.S. are also considered waters of the State. In addition, other aquatic features that are not subject to Corps' jurisdiction, such as roadside ditches or isolated wetlands, may be considered waters of the State. This determination will be made by RWQCB staff on a case-by-case basis.

Section 401 of the CWA requires an applicant to obtain "water quality certification" to ensure compliance with State water quality standards before certain federal licenses or permits may be issued. Section 13260(a) of the Porter-Cologne Water Quality Control Act requires any person discharging waste, including dredged or fill material, or proposing to discharge waste, other than to a community sewer system, within any region that could affect the quality of the waters of the State (all surface and subsurface waters) to file a report of waste discharge. The permits subject to Section 401 include CWA Section 404 permits issued by the Corps. Waste discharge requirements under the Porter-Cologne Water Quality Control Act were typically waived for projects that required certification. Discharges to waters of the State that are not subject to a CWA Section 404 permit rely on the report of waste discharge process.

California Department of Fish and Wildlife

The CDFW is a trustee agency that has jurisdiction under Section 1600 *et seq.* of the California Fish and Game Code. Under Sections 1602 and 1603, a private party must notify CDFW if a proposed project will "*substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds…except when the department has been notified pursuant to Section 1601.*" Additionally, CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over 4-inches in diameter at breast height (DBH). If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends submitting an application for a Streambed Alteration Agreement (SAA) for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater.

2.4. CEQA Significance

Section 15064.7 of the CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study Checklist contained in Appendix G of the CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these

examples, impacts to biological resources would normally be considered significant if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and
- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish, or result in the loss of, an important biological resource, or those that would obviously conflict with local, State, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

2.4.1. California Native Plant Society

The California Native Plant Society (CNPS) maintains a rank of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the *Inventory of Rare and Endangered Vascular Plants of California*. Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS ranks:

- Rank 1A: Plants presumed Extinct in California
- Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere
- Rank 2: Plants Rare, Threatened, or Endangered in California, but more numerous elsewhere

- Rank 3: Plants about which we need more information – A Review List
- Rank 4: Plants of limited distribution – A Watch List

All plants appearing on CNPS Rank 1 or 2 are considered to meet CEQA Guidelines Section 15380 criteria. While only some of the plants ranked 3 and 4 meet the definitions of threatened or endangered species, the CNPS recommends that all Rank 3 and Rank 4 plants be evaluated for consideration under CEQA.

2.4.2. California Department of Fish and Wildlife Species of Concern

Some additional fish, amphibian, reptile, bird, and mammal species may receive consideration by CDFW and lead agencies during the CEQA process, in addition to species that are formally listed under FESA and CESA or are fully protected. These species are included on the *Special Animals List*, which is maintained by CDFW. This list tracks species in California whose numbers, reproductive success, or habitat may be in decline. In addition to "Species of Special Concern" (SSC), the *Special Animals List* includes species that are tracked in the California Natural Diversity Database (CNDDB), but warrant no legal protection. These species are identified as "California Special Animals" (CSA).

2.5. El Dorado County Policies and Regulations

2.5.1. El Dorado County General Plan

In addition to the federal and State regulations described above, the *County of El Dorado General Plan* identifies goals, objectives, and policies to provide further protection to biological resources within the County's limits (El Dorado County 2004). Applicable General Plan policies are summarized below and included in **Appendix A**.

The General Plan's *Conservation Element* sets a number of goals to conserve, enhance, and manage water resources, wildlife, fisheries, vegetation, and wildlife habitat resources. In furtherance of these goals, the County has established a number of policies designed to minimize impacts to sensitive species and habitats. Policy 7.3.3.4 requires setbacks from riparian areas and wetlands. Policy 7.4.1.6 requires that development projects be designed to avoid fragmentation of sensitive habitats to the greatest extent feasible. A number of policies related to Objective 7.42 require preservation of wildlife migration and movement corridors, including increased oak canopy retention requirements and prohibition of fences or other structures that would restrict wildlife movement.

2.5.2. El Dorado Hills Specific Plan

In addition to federal and State regulations, the *El Dorado Hills Specific Plan* (Specific Plan) identifies goals, objectives, and policies regarding establishment and maintenance of open space and wetland areas. The construction of the El Dorado Hills 52 Project is in conformance with this Specific Plan. Applicable Specific Plan requirements are included in **Appendix A**.

2.5.3. El Dorado County Tree Ordinance

The County of El Dorado currently regulates impacts to oak woodland canopy under General Plan Policy 7.4.4.4. All oak trees, of all sizes, are included in the measurement of oak canopy. All new development projects on parcels greater than 1 acre with at least 1 percent canopy cover must adhere to the retention standard described in Option A of the policy. Canopy retention requirements are based on the amount of existing canopy on the site. In addition to preservation of existing oak woodland canopy, mitigation for impacts to oak woodland canopy is required at a 1:1 ratio. Application of the policy is described in the Interim Interpretive Guidelines for General Plan Policy 7.4.4.4 (Option A), which was last amended on October 12, 2007. The policy states that mitigation can be in the form of on-site or off-site planting of oak trees or acorns, or obtaining an offsite conservation easement to protect existing oak woodland habitat in lieu of planting. As per the Guidelines, a Monitoring and Reporting Plan needs to be prepared and is subject to maintenance and monitoring for up to ten years.

The County is in the process of revising the *El Dorado County Oak Resources Management Plan* (ORMP), which is expected to be adopted and go into effect in the near future. Under the proposed new plan, an oak woodland removal permit will be required prior to removal of oak trees that are part of an oak woodland. Mitigation requirements will be based on the percentage of existing oak woodland removed ranging from 1:1 mitigation for zero to 50 percent removal to 2:1 mitigation for more than 75 percent removal. Mitigation may be completed with a combination of the following options: acquisition of an off-site conservation easement, payment of in-lieu fees, or either on-site or off-site replacement planting of up to 50 percent of the required mitigation area. A tree removal permit shall be required prior to the removal of any oak tree not located in an oak woodland and for removal of all Heritage Trees (native oaks with a trunk diameter of 36” or greater at breast height). Trees removed under permit shall require replacement planting or payment of in-lieu fees in an amount equivalent to the number of trunk inches removed.

2.6. El Dorado Hills Community Services District Policies

In addition to federal and State regulations, the El Dorado Hills Community Services District (EDHCSD) identifies goals, objectives, and policies regarding oak tree preservation. Applicable policies are included in **Appendix A**.

3.0 METHODS

Available information pertaining to the natural resources of the region was reviewed. All references reviewed for this assessment are listed in the **References** section. The following site-specific information was reviewed:

- California Department of Fish and Wildlife (CDFW). 2017. *California Natural Diversity Data Base* (CNDDB: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek*, *Rocklin*, and *Folsom* U.S. Geological Survey (USGS) 7.5-minute series quadrangles), Sacramento, CA. Accessed [8/15/2017] (**Appendix B**);
- California Native Plant Society (CNPS). 2017. *Inventory of Rare and Endangered Plants* (online edition, v8-02) (CNPS: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek*, *Rocklin*, and *Folsom* quadrangles). Accessed [8/15/2017] (**Appendix B**);
- U.S. Fish and Wildlife Service (USFWS). 2017. *Information for Planning and Conservation* (IPaC) *Official Species List*: *El Dorado Hills 52*. Accessed [8/15/2017] (**Appendix B**);
- U.S. Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS). 2015. Web Soil Survey. Available online at: http://websoilsurvey.sc.egov.usda.gov/App/HomePage.html. Accessed [8/15/2017]; and
- U.S. Geological Survey. 1967. Photorevised 1980. *Clarksville, California*. 7.5-minute series topographic quadrangle. United States Department of Interior; and
- Biological reports and associated documents previously prepared for the Study Area.

Prior to the site survey, existing information, including the previous wetland delineation and soil maps, were reviewed and the results of the records search and five-mile radius CNNDB query were summarized in a table (**Appendix B**). General field surveys of the Study Area were conducted on April 5, 2013 and August 8, 2017. The Study Area was systematically surveyed on foot with binoculars to ensure total search coverage, with special attention given to identifying those portions of the Study Area with the potential for supporting special-status species and sensitive habitats. During the field surveys, biologists recorded plant and animal species observed (**Appendix C**), as well as characterized biological communities occurring onsite. Following the site survey, the potential for each species identified in the records search to occur in the Study Area was determined based on the site surveys, soils, and species-specific information, as shown in **Appendix B**.

A wetland delineation was performed separately utilizing the Corps 1987 three-parameter methodology to delineate potentially jurisdictional waters of the U.S. on the ±200-acre Silva Valley Interchange Project, which includes the Study Area. The Corps issued a Preliminary Jurisdictional Determination for the aquatic features delineated within the Study Area on June 30, 2009 (SPK-2005-00070), as part of the Silva Valley Interchange Project, concurring with the amount of jurisdictional aquatic features mapped. The delineation has since expired. Therefore,

an updated delineation was performed on December 15, 2015. The results of the wetland delineation are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2017a). The results are considered preliminary until the Corps verifies the findings.

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. The botanical inventories were conducted in accordance with CDFW's (CDFG 2009) protocol plant surveys. The results of the botanical surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c). A complete list of plants observed within the Study Area is provided in **Appendix C**.

Protocol-level burrowing owl surveys were conducted on March 12, 2015, April 24, 2015, May 26, 2015, and June 16, 2015. The surveys were conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (CDFW 2012). The results of the burrowing owl surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c).

Protocol-level breeding season California red-legged frog (CRLF) surveys were conducted on January 12 and 26, 2016 and February 2 and 9, 2016. The protocol-level breeding season surveys were conducted in accordance with the *Revised Guidance on Site Assessment and Field Surveys for the California Red-legged Frog* (USFWS 2005; CRLF Guidance). The results of the protocol-level breeding season surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016a).

An oak woodland analysis was performed to document the extent of the existing oak trees in the Study Area and impacts from the proposed project. The oak woodland report is contained under separate cover (Foothill Associates 2017b).

4.0 RESULTS

4.1. Site Location and Description

The Study Area is located in in El Dorado County adjacent to U.S. Highway 50 immediately east of Silva Valley Parkway and north of Tong Road. Land uses surrounding the Study Area include residential development to the north and paved roads, oak woodland, and annual grassland to the east, west, and south. The Study Area is located within Township 9 North, Range 8 East, Section 1 of the *Clarksvill*e USGS 7.5-minute series quadrangle. The approximate location of the center of the Study Area is 38° 39' 40.160" North, 121° 3' 23.354" West (**Figure 1**).

The Study Area consists of approximately 34 acres of land that is primarily annual grassland. The Study Area is bifurcated by Silva Valley Parkway. Two drainage corridors cross the Study Area from the northeast to the southwest.

4.2. Physical Features

4.2.1. Topography and Drainage

Topography within the Study Area ranges from relatively level to moderately sloped with elevations ranging from approximately 700 to 800 feet above mean sea level (MSL) (~210-240 meters). Surface runoff flows through and exits the Study Area via riverine drainages, which run in a northeast to southwest direction.

4.2.2. Soils

The Natural Resources Conservation Service (NRCS) has mapped one soil unit within the Study Area (**Figure 2**): **Auburn Silt Loam, 2 to 30 Percent Slopes**. General characteristics associated with this soil type are described below (USDA, NRCS 1974).

- **(AwD) Auburn Silt Loam, 2 to 30 Percent Slopes**: The soils in this series are well drained. Permeability is moderate. Vegetation associated with this soil series includes annual grasses, forbs, and oaks. The hydric soils list for El Dorado County does not identify this soil type as hydric (USDA, NRCS 2015).

4.3. Biological Communities

Six major biological communities occur in the Study Area including annual grassland, riparian woodland, valley oak woodland, seasonal wetland, perennial marsh, and disturbed/developed. These communities provide habitat to a number of common species of wildlife and may provide suitable habitat for special-status species. It should be noted that wetlands may occur within a biological community. For instance, a creek surrounded by riparian woodland would be included within the riparian woodland for the purposes of determining biological community acreage. Vernal pools and seasonal wetlands may be included in the annual grassland community and are often used by wildlife from the annual grassland. However, a very different aquatic habitat, such as a perennial marsh, is considered its own biological community. Dominant vegetation observed within each biological community is discussed in detail below. A

comprehensive list of plants observed within the Study Area is provided in **Appendix C**. The location and extent of each biological community are depicted in **Figure 3**.

4.3.1. Annual Grassland

Annual grassland dominates both the northern and southern portions of the Study Area (**Figure 3**). This vegetation community is characterized primarily by an assemblage of non-native annual grasses and forbs. Dominant vegetation includes ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) intermixed with red-stemmed filaree (*Erodium cicutarium*), popcornflower (*Plagiobothrys* sp.), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), scarlet pimpernel (*Anagallis arvensis*), St. John's wort (*Hypericum perforatum*), brodiaea (*Brodiaea elegans*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*).

Two areas within the annual grassland contain purple needlegrass within the southern portion of the Study Area (**Figure 3**). The purple needlegrass is interspersed with northern willow herb (*Epilobium ciliatum*), ripgut brome, soft chess, and wild oat.

The annual grassland community includes small ephemeral and perennial drainages. The ephemeral drainage is mostly unvegetated and highly seasonal. The perennial drainage has a small clump of willows (*Salix* sp.) and broadleaf cattail (*Typha latifolia*) and is otherwise minimally vegetated.

4.3.2. Riparian Woodland

Riparian woodland habitat occurs within the along perennial drainage on the western boundary of the Study Area (**Figure 3**). Dominant vegetation includes broadleaf cattail, willow, spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), Himalayan blackberry (*Rubus armeniacus*), and valley oak (*Quercus lobata*).

4.3.3. Valley Oak Woodland

Valley oak woodland is found in a small area on the southwest boundary of the Study Area where a small stand of mature valley oak trees overhangs a small perennial drainage (**Figure 3**). The understory is primarily annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal immediately adjacent to the drainage.

4.3.4. Seasonal Wetland

A number of seasonal wetland features are found in the Study Area (**Figure 3**). Most are associated with the eastern drainage system. The seasonal wetlands include riverine, depressional, and slope topography, but the vegetation is similar throughout the Study Area. Dominant vegetation in the seasonal wetlands includes rabbitsfoot grass (*Polypogon monspeliensis*), spike rush (*Eleocharis macrostachya*), nutsedge (*Cyperus eragrostis*), curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), ryegrass, annual hair grass (*Deschampsia danthonioides*), and rye grass (*Festuca perennis*).

4.3.5. Perennial Marsh

Perennial marsh habitat is found in the southern portion of the Study Area (**Figure 3**). It is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock with areas of dense cattails, Himalayan blackberry, and a small clump of willows.

4.3.6. Disturbed/ Developed

Disturbed/developed areas in the Study Area include graded roads and a stockpile area (**Figure 3**). The disturbed/developed areas are sparsely vegetated with red-stemmed filaree, soft chess, wild oat, and winter vetch.

4.4. Special-Status Species

Special-status species are plant and animal species that have been afforded special recognition by federal, State, or local resource agencies or organizations. Listed and special-status species are of relatively limited distribution and may require specialized habitat conditions. Special-status species are defined as meeting one or more of the following criteria:

- Listed or proposed for listing under CESA or FESA;
- Protected under other regulations (e.g. Migratory Bird Treaty Act);
- Included on the CDFW Special Animals List;
- Identified as Rank 1-4 by CNPS; or
- Receive consideration during environmental review under CEQA.

Special-status species considered for this analysis are based on queries of the CNDDB, the USFWS, and CNPS ranked species (online versions) for the *Clarksville* and eight surrounding quadrangles. **Appendix B** includes the common name and scientific name for each species, regulatory status (federal, State, local, CNPS), habitat descriptions, and potential for occurrence in the Study Area. The following set of criteria has been used to determine each species' potential for occurrence in the Study Area:

- **Present**: Species known to occur within the Study Area based on CNDDB records and/or observed within the Study Area during the biological surveys.
- **High**: Species known to occur on or in the vicinity of the Study Area (based on CNDDB records within five miles and/or based on professional expertise specific to the Study Area or species) and there is suitable habitat within the Study Area.
- **Low**: Species known to occur in the vicinity of the Study Area and there is marginal habitat within the Study Area **-OR-** Species is not known to occur in the vicinity of the Study Area, however, there is suitable habitat on the Study Area.
- **None**: Species is not known to occur on or in the vicinity of the Study Area and there is no suitable habitat within the Study Area -**OR-** Species was surveyed for during the

appropriate season with negative results **-OR-** The Study Area occurs outside of the known elevation or geographic ranges.

Only those species that are known to be *present* or have a *high* or *low* potential for occurrence are discussed further in the following sections. Species that were determined to have a potential for occurrence but for which focused surveys were conducted with negative results are not discussed further in this report. Detailed results of focused surveys are contained under separate covers.

4.4.1. Listed and Special-Status Plants

According to the records search, 30 special-status plant species have the potential to occur on or in the vicinity of the Study Area. Based on field observations and literature review, four species were determined to have the potential for occurrence to occur on the Study Area: big-scale balsamroot (*Balsamorhiza macrolep*is var. *macrolepis*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), and Sanford's arrowhead (*Sagittaria sanfordii*). Focused botanical surveys were conducted in 2015 during the bloom period of these plants. No special-status plant species were found.

4.4.2. Listed and Special-Status Wildlife

According to the records search, 41 special-status animal species have the potential to occur onsite or in the vicinity. Based on field observations and literature review, 15 species were determined to have the potential for occurrence to occur in the Study Area. Protocol surveys for burrowing owl (*Athene cunicularia*) and California red-legged frog (*Rana draytonii*) were conducted in 2015 and 2016. No observations or evidence of either species was found.

Species that are known to be *present* or that are considered to have a *high* potential to occur onsite include: western pond turtle (*Emys marmorata*) and raptors and other migratory birds. Species that are considered to have a *low* potential to occur onsite include: valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), Blainville's horned lizard (*Phrynosoma blainvillii*), foothill yellow-legged frog (*Rana boylii*), western spadefoot (*Spea hammondii*), golden eagle (*Aquila chrysaetos*), tricolored blackbird (*Agelaius tricolor*), American badger (*Taxidea taxus*), and special-status bat species.

Wildlife Species with a High Potential for Occurrence

Western Pond Turtle

Western pond turtles are found in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches with suitable basking sites (Californiaherps 2017). Suitable aquatic habitat typically has a muddy or rocky bottom and has emergent aquatic vegetation for cover (Stebbins 2003). Western pond turtles nest and overwinter in areas of sparse vegetation comprised of grassland and forbs with less than ten percent slopes, less than 492 feet (150 meters) from aquatic habitat (Rosenberg *et. al.* 2009). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The riverine perennial marsh, perennial drainage, and surrounding riparian habitat provide aquatic habitat and the surrounding annual grassland

provides upland habitat. This species was not observed within the Study Area during the biological surveys. This species has a *high* potential to occur within the Study Area.

Nesting Birds and Raptors

The nests of raptors and most other birds are protected under the MBTA. Raptors are also protected by Section 3503.5 of the California Fish and Game Code, which makes it illegal to destroy any active raptor nest. Additionally, the USFWS and CDFW identified a number of avian species of conservation concern that do not have specific statutory protection. Avian species forage and nest in a variety of habitats throughout El Dorado County. As shown in **Appendix B**, the riparian and valley oak woodlands, perennial marsh, and annual grasslands on and surrounding the Study Area may provide nesting or foraging habitat for raptors and other protected birds, including: white-tailed kite (*Elanus leucurus*), Cooper's hawk (*Accipiter cooperii*), ferruginous hawk (*Buteo regalis*), merlin (*Falco columbarius*), grasshopper sparrow (*Ammodramus savannarum*), and purple martin (*Progne subis*). Raptors and other protected migratory birds have a high potential to occur in the Study Area.

Wildlife Species with a Low Potential for Occurrence

Valley Elderberry Longhorn Beetle

The USFWS has determined the range of the valley elderberry longhorn beetle (VELB) to include the watersheds of the American, San Joaquin, and Sacramento Rivers and their tributaries up to approximately 3,000 feet above MSL (USFWS 1980). Typically, the beetles are found on elderberry shrubs within riparian plant communities. Some studies have found that multiple elderberry shrubs clumped together provide superior habitat for the beetle while isolated elderberry shrubs are less likely to support beetle populations. Typical plant species that co-occur with the elderberry shrubs include California sycamore (*Platanus racemosa*), willow, blackberry, and western poison oak (*Toxicodendron diversilobum*) (USFWS 1984). Beetles require elderberry stems with at least one-inch diameter at ground level (dgl) in order for the larvae to utilize the stems (USFWS 1999). The valley elderberry longhorn beetle depends on elderberry shrubs for its entire lifecycle. Adults are typically active from March through May during the flowering period of the elderberry shrub. The female lays its eggs on the leaves and stems of the elderberry shrub. The larvae emerge within a few days and burrow into the elderberry stem. The larvae feed on the stem pith until they pupate. When the host shrub begins flowering, the pupa emerges from the stem as an adult (Barr 1991). There is one CNDDB record of valley elderberry longhorn beetle listed within five miles of the Study Area (CDFW 2017a). One blue elderberry (*Sambucus nigra* ssp. *caerulea*) stem measuring one-inch dgl and several stems less than one-inch dgl occurs within the riparian habitat within the western portion of the Study Area (**Figure 3**). No exit holes were observed. This species has a *low* potential to occur within the Study Area.

Blainville's Horned Lizard

Blainville's horned lizard inhabits open areas of sandy soil and low vegetation in valleys, foothills, and semiarid mountains from sea level to 8,000 feet above MSL. It is typically found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose

soil. This species is often found in lowlands along sandy washes with scattered shrubs and along dirt roads, and frequently found near ant hills (Zeiner *et. al.* 1988). There are two CNDDB records of this species within five miles of the Study Area (CDFW 2017a). The species was not observed within the Study Area during the biological surveys. The annual grassland within the Study Area provides minimal habitat for the Blainville's horned lizard due to lack of sandy washes. Therefore, this species has a *low* potential to occur within the Study Area.

Foothill Yellow-Legged Frog

The Foothill yellow-legged frog (FYLF) is a moderate-sized frog (1.5-3.5" long) found on the western slope of the Sierras and along the coast. It has vague dorsolateral folds, horizontal pupils, yellow coloring on the underside of its hind legs, and a granular skin texture that covers the eardrums of colors that harmonize with the surroundings. The FYLF is a stream or river frog of chaparral, forest, and woodland ecozones. This species breeds after the high-water flows subside, mid-March to early June. The FYLF resides in streams and the associated riparian habitat. Metamorphosis generally occurs in three to four months and FYLF reach sexual maturity typically the first summer after they have metamorphosed. Breeding sties occur in shallow, slow flowing water with some pebble and/or cobble substrate. The introductions of bullfrogs and mosquitofish have led to declines in populations in California and Oregon. The perennial drainages provide marginal habitat for this species but there are no CNDDB records of this species within five miles of the Study Area (CDFW 2017a) and the species was not observed within the Study Area during the biological surveys. Therefore, this species has a *low* potential to occur within the Study Area.

Western Spadefoot

Western spadefoot occurs throughout the Central Valley and on the coast from Point Conception, south to the Mexican border. This species occurs from sea level up to 4,500 feet above MSL, in the southern Sierra foothills. Western spadefoot individuals are most commonly found in grassland habitats with temporary pools of water, but they have also been found in open chaparral and valley-foothill pine-oak woodlands (Stebbins 2003). This species spends most of the year underground, where members seek refuge from desiccating by constructing and residing in small burrows. This species often breeds in temporary pools and quiet streams between the months of January and May. There are no CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The species was not observed within the Study Area during the biological surveys. The depressional seasonal wetlands provide low quality breeding habitat given that they do not likely hold water for long enough for the western spadefoot to breed. This species has a *low* potential for utilizing the annual grassland as upland aestivation given the limited aquatic habitat available within the Study Area for breeding.

Golden Eagle

Golden eagles live in semi-open habitats where they have easy access to their primary prey of small to medium-sized mammals. Grasslands, deserts, savannahs, and early successional stages of forest and shrub habitats provide necessary foraging habitat. Nests are placed on cliffs or large trees and are maintained year after year. Breeding occurs from January through August (Kochert *et al.* 2002). Golden eagle home range territories vary widely from 8 to 77 square

miles (McGrady 1997) and are estimated to average 48 square miles in northern California (Zeiner *et al.* 1990). Breeding territories range from 8 to 21 square miles, or 3 to 5 miles surrounding the nest, but activity is often concentrated in a smaller core area. Although only one nest is used each year, a territory may contain multiple alternate nests. Typically, there are between 6 and 14 nests are found in a territory (Kochert *et al.* 2002). Golden eagles may use the same nest for multiple years or use new nest sites every year (Watson 2010).

There is one known occurrence approximately two miles northwest of the Study Area. This active nest was located in a foothill pine on a hillslope surrounded by oak woodland. Existing residences are located uphill within 300 feet of the nest on the north and east. Two juvenile and two adult golden eagles were observed at the nest in August 2013. A pair of adult eagles returned to the nest in 2014 and successfully raised one eaglet, which fledged by June 18, 2014. However, the nest tree fell over during a storm in November 2014. A golden eagle nest was subsequently identified in a foothill pine approximately 2.5 miles northwest of the Study Area on March 6, 2015. The new nest occurred within a foothill pine on a hillslope surrounded by oak woodland, approximately 25 feet from a residential dwelling. This foothill pine died in late 2015. The eagles relocated to another foothill pine downhill from their first nest location in 2016, but this nest is not active in 2017. The current nest location is unknown as of the writing of this report.

No golden eagles were observed during the biological surveys of the Study Area. Although the Study Area does not provide suitable nest trees, the annual grassland provides foraging habitat. This species has a *low* potential to occur within the Study Area.

Tricolored Blackbird

The tricolored blackbird is a colonial species that occurs in pastures, dry seasonal pools, and agricultural fields in the Central Valley and the surrounding foothills. This species usually nests within dense cattails (*Typha* sp.) or tules (*Scirpus* sp.) in emergent wetlands. Tricolored blackbird also nests in thickets of blackberry (*Rubus* sp.), wild rose (*Rosa* sp.), willows, and tall herbs (Zeiner *et. al.* 1990). Nesting locations typically must be large enough to support a minimum colony of approximately fifty pairs (Zeiner *et. al.* 1990). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The perennial marsh and surrounding riparian habitat could provide nesting habitat, though these areas are not large enough to support colonies. The annual grassland provides foraging habitat for this species. This species was not observed during the biological surveys of the Study Area. This species has a *low* potential to occur within the Study Area.

American Badger

American badgers are found in dry, open habitats including grassland and open woodland. Suitable burrowing habitat requires dry, sandy soil. Breeding occurs in summer and early fall, with young being born from March to April (Nature Serve 2015). There are no CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The annual grassland provides habitat for this species, however, very few potential burrow sites that could be utilized by this species were observed during the biological surveys. No American badgers were

observed during the biological surveys. This species has a *low* potential to occur within the Study Area.

Special-Status Bats

California is home to several special-status bat species, including pallid bat (*Antrozous pallidus*) and silver-haired bat (*Lasionycteris noctivagans*). Bat numbers are in decline throughout the U.S. due to loss of roosting habitat, habitat conversion, and habitat alteration. There are no CNDDB records for bats within five miles of the Study Area (CDFW 2017a). No bats were observed roosting or foraging during the biological surveys. However, the riparian habitat and isolated trees within the annual grassland provide roosting habitat for these species. This species has a *low* potential to occur within the Study Area.

4.5. Sensitive Habitats

Sensitive habitats include those that are of special concern to resource agencies or those that are protected under CEQA, Section 1600 of the California Fish and Game Code, and/or Sections 401 and 404 of the Clean Water Act. Additionally, sensitive habitats are protected under the specific policies outlined in the *El Dorado County General Plan*. Sensitive habitats known to occur onsite are seasonal wetlands, perennial marsh, ephemeral and perennial drainages, riparian woodland, oak woodlands, and purple needlegrass grassland (**Figure 3**).

4.5.1. Potential Jurisdictional Waters of the U.S. and State

Potential jurisdictional waters of the U.S. and State located in the Study Area total approximately 0.57 acres. This acreage includes 0.01 acres of depressional seasonal wetland, 0.07 acres of slope seasonal wetland, 0.05 acres of riverine seasonal wetland, 0.31 acres of riverine perennial marsh, 0.05 acres of ephemeral drainage, and 0.07 acres of perennial drainage (**Figure 3**). To date the Corps has not verified these acreages. As discussed in **Section 2.3**, jurisdictional waters of the U.S. are subject to Section 404 of CWA and are regulated by the Corps.

4.5.2. Riparian Habitat

A total of 0.15 acres of riparian habitat are located in the Study Area along the northern perennial drainage (**Figure 3**). As discussed in **Section 2.2**, riparian areas, defined as the outermost bank or the edge of riparian vegetation, whichever is greater, may be subject CDFW jurisdiction under Section 1602 of the Fish and Game Code. Additionally, CDFW may exert jurisdiction over the drainages and other riverine aquatic features. CDFW should be consulted prior to disturbance or development to determine whether issuance of a Section 1602 Lake or Streambed Alteration Agreement is required.

4.5.3. Oak Trees and Oak Woodlands

A total of ten oak trees protected under Policy 7.4.5.2, consisting of nine valley oaks (*Quercus lobata*) and one blue oak (*Quercus douglasii*) are present in the Study Area. In total, there is 0.55 acres of oak canopy in the Study Area, which is equivalent to 1.6 percent canopy cover (**Figure 3**). Oak woodland habitat is currently regulated under Section 7.4.4.4 of the *El Dorado*

County General Plan (refer to Section 3.8.1, 3.9, and 3.10) based on canopy coverage. The Study Area is within the area covered by the *El Dorado Hills Specific Plan*, which generally describes preservation criteria for oak trees within designated open space areas.

4.5.4. Purple Needlegrass

Approximately 0.33 acres of purple needlegrass are interspersed within the annual grassland. Purple needlegrass grassland is listed as a sensitive plant community on the CDFW Natural Communities List and is required to be considered in CEQA documents. In order for purple needlegrass grassland to be considered a natural community, at least five percent of the species is required as a characteristic to dominant species in the herbaceous layer and the species is usually greater than 10 percent relative cover of the herbaceous layer (Sawyer *et al.* 2009). These mapped areas contain greater than 10 percent relative cover within the herbaceous layer. Therefore, the two polygons of purple needlegrass are considered a sensitive habitat since the acreage meets the minimum percentage criteria necessary to be considered a purple needlegrass grassland natural community.

4.6. Wildlife Migration Corridors and Important Biological Corridors

Wildlife corridors link together areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. The fragmentation of open space areas by urbanization creates isolated "islands" of wildlife habitat. Fragmentation can also occur when a portion of one or more habitats is converted into another habitat, such as when woodland or scrub habitat is altered or converted into grasslands after a disturbance such as fire, mudslide, or grading activities. Wildlife corridors mitigate the effects of this fragmentation by: (1) allowing animals to move between remaining habitats, thereby permitting depleted populations to be replenished and promoting genetic exchange; (2) providing escape routes from fire, predators, and human disturbances, thus reducing the risk of catastrophic events (such as fire or disease) on population or local species extinction; and (3) serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs. The Study Area does not link two significant natural areas and is surrounded by similar habitat types; therefore, it is not considered a wildlife migration corridor.

The *El Dorado County General Plan* identifies a number of Important Biological Corridors (IBC). The Study Area is not located within any existing IBC.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Known or potential biological constraints within the Study Area include:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for Blainville's horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. (seasonal wetlands, perennial marsh, and ephemeral and perennial drainages), riparian habitat, valley oak woodland, and purple needlegrass grassland.

5.1. Special-Status Plant Species

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. No special-status plants occur within the Study Area. However, if construction does not commence within two years of the 2015 botanical inventories, additional botanical inventories are recommended to ensure that populations have not established in the intervening years, in accordance with CDFW's (CDFG 2009) plant protocols.

5.2. Valley Elderberry Longhorn Beetle

Although no VELB were observed, there is a low potential for VELB to be present in the Study Area due to a single blue elderberry shrub observed within southern portion of the Study Area. According to the USFWS *Conservation Guidelines for Valley Elderberry Longhorn Beetle* (Guidelines; USFWS 1999), encroachment within 100 feet from elderberry shrubs with stems measuring at least one-inch dgl should be approved by the USFWS and a minimum setback of 20 feet from the driplines of the elderberry shrubs must be maintained. Project activities that will encroach into the 20-foot minimum setback area are assumed to adversely affect VELB. Project activities that may directly or indirectly affect elderberry shrubs with stems measuring at least one-inch dgl require minimization measures including planting replacement habitat or

purchasing mitigation credits from a USFWS-approved mitigation bank. The mitigation ratios vary based on whether exit holes are present and whether the shrubs occur within riparian habitat.

The outer edge of the non-development area is approximately 25 feet from the elderberry shrub measuring one-inch dgl. Therefore, the proposed project would not adversely affect potential habitat for VELB. However, the project proponent should consult with the USFWS to establish avoidance measures to ensure that no indirect effects associated with the encroachment of 100-foot avoidance buffer would occur. At minimum, high visibility construction fencing followed by silt fencing should be placed around the perimeter of the open space area. Signs should be erected approximately 20 feet apart along the high visibility construction fencing with the following information, "*This area is habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the FESA, as amended. Violators are subject to prosecution, fines, and imprisonment.*" The signs should be clearly readable from a distance of 20 feet, and must be maintained for the duration of construction.

5.3. Western Pond Turtle

The perennial marsh and perennial drainages and surrounding uplands within the Study Area may be suitable habitat for western pond turtle and they are known to occur in the vicinity. Filling of these features could impact this species, if present. In addition, vegetation clearing and grading within the surrounding uplands could impact this species, if present.

A pre-construction survey for western pond turtle should be conducted within 14 days of the initiation of construction by a qualified biologist prior to any construction activity that would directly impact pond or stream habitat or disturb the ground within 300 feet of aquatic habitat. If no western pond turtles are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey or halts for more than 14 days a new survey should be conducted prior to reinitiating construction.

If western pond turtles are found during the pre-construction survey, then a qualified biological monitor should be onsite during initial clearing and grading within 300 feet of a drainage, pond, or other aquatic habitat. The biological monitor will relocate any western pond turtles found within the construction footprint to suitable habitat away from the construction zone, but within the vicinity of the Study Area, if required. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the western pond turtle.

5.4. Blainville's Horned Lizard

The annual grassland within the Study Area provides a low potential for Blainville's horned lizard to occur given the lack of sandy soil. Pre-construction surveys for Blainville's horned lizard are recommended within 14 days prior to the start of ground disturbance. If no Blainville's horned lizards are observed, then no additional measures are recommended. If construction

does not commence within 14 days of the pre-construction survey or halts for more than 14 days, a new survey is recommended.

If Blainville's horned lizards are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any Blainville's horned lizards found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.5. Foothill Yellow-Legged Frog

The perennial drainages and surrounding uplands within the Study Area provide potential habitat for foothill yellow-legged frog. A qualified biologist should conduct a pre-construction survey of the drainages and uplands within 150 feet for foothill yellow-legged frog within 14 days prior to commencement of construction activities. If no foothill yellow-legged frog are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any foothill yellow-legged frog are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any foothill yellow-legged frog found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.6. Western Spadefoot

The annual grassland within the Study Area provides a low potential for upland aestivation habitat and the depressional seasonal wetland provide low quality breeding habitat for western spadefoot. A qualified biologist should conduct a pre-construction survey for western spadefoot within 14 days prior to commencement of construction activities. If no western spadefoot are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any western spadefoot are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any western spadefoot found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.7. Golden Eagle

Although the Study Area does not provide suitable nest trees, the annual grassland provides foraging habitat for golden eagle. A map identifying suitable foraging habitat for golden eagle within a three-mile radius of the last known location of the nest, which includes the Study Area, is provided in **Figure 4**. There is over 4,495 acres of potential foraging habitat surrounding the nest, based on an assessment of current aerial photographs. The project will result in the removal of 27.71 acres of annual grassland. The removal of approximately 0.62 percent of foraging habitat would have no impact on this species. Therefore, no additional measures are recommended.

5.8. Tricolored Blackbird

Although the Study Area does not provide suitable nesting areas for a tricolored blackbird colony, the annual grassland provides suitable foraging habitat. There are currently no requirements for conservation or mitigation for tricolored blackbird foraging habitat. Therefore, no additional measures are recommended.

5.9. Burrowing Owl

Although burrowing owl has a low potential to occur within the annual grassland, given the lack of suitable burrows and that they were not observed during the protocol-level breeding and non-breeding season surveys (Foothill Associates 2016b) or any other biological surveys conducted within the Study Area, they are not currently present. However, the species could occupy the Study Area in the future. The project proponent should conduct a take avoidance survey within 30 days prior to commencement of construction, in accordance with the 2012 *California Department of Fish and Wildlife Staff Report on Burrowing Owl Mitigation* (2012 Staff Report) (CDFW 2012). The survey area includes an approximately 500-foot (150-meter) buffer around the Study Area, where access is permitted. If the surveys are negative, then no additional measures are recommended.

If burrows are observed within 500 feet of the Study Area, an impact assessment should be prepared and submitted to the CDFW, in accordance with the 2012 Staff Report. If it is determined that project activities may result in impacts to nesting, occupied, and satellite burrows and/or burrowing owl habitat, the project proponent should consult with CDFW and develop a detailed mitigation plan such that the habitat acreage, number of burrows, and burrowing owls impacted are replaced. The mitigation plan should be based on the requirements set forth in Appendix A of the 2012 Staff Report.

5.10. Other Raptors and Migratory Birds

Several species of raptors and other migratory birds may forage and nest in the Study Area, including the special-status species white-tailed kite, Cooper's hawk, golden eagle, ferruginous hawk, merlin, grasshopper sparrow, and purple martin. Active nests are protected by the California Fish and Game Code Section 3503.5 and the MBTA. Construction activities could result in disturbance of nest sites through temporary increases in ambient noise levels and increased human activity. In addition, vegetation clearing operations, including pruning or

removal of trees and shrubs, could impact nesting birds if these activities occur during the nesting season (February 15 to August 31). All vegetation clearing including removal of trees and shrubs should be completed between September 1 to February 14, if feasible.

If vegetation removal and grading activities begin during the nesting season (February 15 to August 31), a qualified biologist should conduct a pre-construction survey of the project footprint for active nests. Additionally, the surrounding 500 feet should be surveyed for active raptor nests. The pre-construction survey should be conducted within 14 days prior to commencement of ground-disturbing activities. If the pre-construction survey shows that there is no evidence of active nests, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If nests are found and considered to be active, the project biologist should establish buffer zones to prohibit construction activities and minimize nest disturbance until the young have successfully fledged. Buffer width will depend on the species in question, surrounding existing disturbances, and specific site characteristics, but may range from 20 feet for some songbirds to 250 feet for most raptors. If active nests are found within any trees slated for removal, then an appropriate buffer should be established around the trees and the trees should not be removed until a biologist determines that the nestlings have successfully fledged. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the active avian nests. If construction activities are proposed to begin during the non-breeding season (September 1 through January 31), a survey is not required and no further studies are necessary.

5.11. American Badger

The annual grassland provides habitat for American badger. A qualified biologist should conduct a pre-construction survey for American badger within 14 days prior to the start of ground disturbance. If no American badgers are observed, then a letter report documenting the results of the survey should be provided to the project proponent for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If American badgers or their dens are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of temporarily halting construction activities until the biologist determines that the badger has left the construction footprint on its own accord.

5.12. Special-Status Bat Species

The existing riparian and oak woodlands provide potential roosting habitat for various bat species that occur in the vicinity of the Study Area. Removal of trees could impact bats should they be roosting in areas proposed for removal.

A qualified biologist should conduct a preconstruction survey within 14 days prior to clearing or grading operations and removal of trees. If no bats are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If special-status bat species are present and roosting on or within 100 feet of the Study Area, then the biologist should establish an appropriate buffer around the roost site. At minimum, no trees should be removed until the biologist has determined that the bat is no longer roosting in the tree. Additional mitigation measures for bat species, such as installation of bat boxes or alternate roost structures, would be recommended only if special-status bat species are found to be roosting within the project area. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for various bat species.

5.13. Sensitive Habitats

5.13.1.Jurisdictional Waters

Since proposed construction activities will impact aquatic features located in the Study Area, a Section 404 permit should be obtained from the Corps and a Section 401 Water Quality Certification should be obtained for the Regional Water Quality Control Board (RWQCB) prior to the start of construction. Any waters of the U.S. or jurisdictional wetlands that would be lost or disturbed should be replaced or rehabilitated on a “no-net-loss” basis in accordance with the Corps mitigation guidelines. Habitat restoration, rehabilitation, and/or replacement should be at a location and by methods agreeable to the agencies.

If a 404 permit is required for the proposed project, water quality concerns during construction would be addressed in a Section 401 water quality certification from the Regional Water Quality Control Board. A Storm Water Pollution Prevention Plan (SWPPP) would also be required during construction activities. SWPPPs are required in issuance of a National Pollutant Discharge Elimination System (NPDES) construction discharge permit by the U.S. Environmental Protection Agency. Implementation of Best Management Practices (BMPs) during construction is standard in most SWPPPs and water quality certifications. Examples of BMPs include stockpiling of debris away from regulated wetlands and waterways; immediate removal of debris piles from the site during the rainy season; use of silt fencing and construction fencing around regulated waterways; and use of drip pans under work vehicles and containment of fuel waste throughout the site during construction.

5.13.2. Oak Woodlands

The Project would result in the removal of 9 protected oak trees, resulting in impacts to 0.45-acres of oak canopy. To mitigate for the biological resources impact associated with the loss of oak woodlands associated with the project, a combination of avoidance, protection, onsite replacement, where feasible, and offsite preservation or creation of oak woodland habitat is recommended. Tree protection measures should be implemented around trees to remain in the Study Area as detailed in the project's Tree Survey, Preservation, and Replacement Plan.

5.13.3. Riparian Habitats

Although proposed construction activities will not remove riparian woodland habitat, other drainages and riverine features that will be impacted may be subject to CDFW jurisdiction. It is recommended that a Streambed Alteration Agreement application be submitted to CDFW, pursuant to Section 1600 of the CDFW Code, for any activities affecting the bed, bank or associated riparian vegetation of the stream. If required, the project applicant should coordinate with CDFW in developing appropriate mitigation, and should abide by the conditions of any executed permits.

5.13.4. Purple Needlegrass Grassland

The proposed project would result in the removal of purple needlegrass grassland. Therefore, the acreage of removal should be replaced at a 1:1 ratio. The mitigation location may occur within project's open space areas currently characterized by annual grassland or may occur off-site. Purple needlegrass plants in areas slated for removal should be salvaged to the extent feasible and replanted within the open space area. If this is infeasible, then seedlings/saplings from a local nursery should be obtained. A mitigation and monitoring plan should be prepared outlining methods to be used, success criteria to be met, and adaptive management strategies will be completed prior to project construction. At minimum, the purple needlegrass creation areas shall be monitored twice annually for the first year and once annually for the four subsequent years for a total of five years, success criteria should be established to ensure an 80 percent success rate is met by the fifth year, and adaptive management techniques should be implemented to ensure that the 80 percent success rate is met by the fifth year. This plan may be combined with the Operations and Management Plan for the open space area.

5.14. Summary of Avoidance and Minimization Measures

- Obtain a Section 404 Clean Water Act Permit, 401 Water Quality Certification, and SAA prior to the start of construction;
- Conduct botanical inventories for potentially occurring special-status plants if construction does not commence within two years of the 2015 botanical inventories;
- Conduct clearing and tree and shrub removal operations between September 16 and February 28 to minimize potential impacts to nesting birds;
- If construction begins during the nesting season (March 1 – September 15) conduct a pre-construction survey for active bird nests within the Study Area;

- Conduct a take avoidance survey for burrowing owl within 30 days prior to commencement of construction activities, in accordance with the 2012 Staff Report;
- Within 14 days prior to the initiation of construction activities, conduct a pre-construction survey for coast horned lizard, foothill yellow-legged frog, western pond turtle, American badger, and special-status bat species;
- Implement the tree avoidance, maintenance, and mitigation measures as described in the Tree Survey, Preservation, and Replacement Plan (Foothill Associates 2017); and
- Mitigate for the removal of purple needlegrass grassland at a 1:1 ratio and prepare a mitigation and monitoring plan.

Appendix A — Selected General and Specific Plan Policies

El Dorado County General Plan

Conservation and Protection of Water Resources

GOAL 7.3: WATER QUALITY AND QUANTITY
Conserve, enhance, and manage water resources and protect their quality from degradation.

OBJECTIVE 7.3.1: WATER RESOURCE PROTECTION
Preserve and protect the supply and quality of the County's water resources including the protection of critical watersheds, riparian zones, and aquifers.

Policy 7.3.1.1 Encourage the use of Best Management Practices, as identified by the Soil Conservation Service, in watershed lands as a means to prevent erosion, siltation, and flooding.

Policy 7.3.1.2 Establish water conservation programs that include both drought tolerant landscaping and efficient building design requirements as well as incentives for the conservation and wise use of water.

Policy 7.3.1.3 The County shall develop the criteria and draft an ordinance to allow and encourage the use of domestic gray water for landscape irrigation purposes. (See Title 22 of the State Water Code and the Graywater Regulations of the Uniform Plumbing Code).

OBJECTIVE 7.3.2: WATER QUALITY
Maintenance of and, where possible, improvement of the quality of underground and surface water.

Policy 7.3.2.1 Stream and lake embankments shall be protected from erosion, and streams and lakes shall be protected from excessive turbidity.

Policy 7.3.2.2 Projects requiring a grading permit shall have an erosion control program approved, where necessary.

Policy 7.3.2.3 Where practical and when warranted by the size of the project, parking lot storm drainage shall include facilities to separate oils and salts from storm water in accordance with the recommendations of the Storm Water Quality Task Force's California Storm Water Best Management Practices Handbooks (1993).

Policy 7.3.2.4 The County should evaluate feasible alternatives to the use of salt for ice control on County roads.

Policy 7.3.2.5 As a means to improve the water quality affecting the County's recreational waters, enhanced and increased detailed analytical water quality studies and

monitoring should be implemented to identify and reduce point and non-point pollutants and contaminants. Where such studies or monitoring reports have identified sources of pollution, the County shall propose means to prevent, control, or treat identified pollutants and contaminants.

OBJECTIVE 7.3.3: WETLANDS

Protection of natural and man-made wetlands, vernal pools, wet meadows, and riparian areas from impacts related to development for their importance to wildlife habitat, water purification, scenic values, and unique and sensitive plant life.

Policy 7.3.3.1 *For projects that would result in the discharge of material to or that may affect the function and value of river, stream, lake, pond, or wetland features, the application shall include a delineation of all such features. For wetlands, the delineation shall be conducted using the U.S. Army Corps of Engineers (USACE) Wetland Delineation Manual*

Policy 7.3.3.2 *Intentionally blank*

Policy 7.3.3.3 *The County shall develop a database of important surface water features, including lake, river, stream, pond, and wetland resources.*

Policy 7.3.3.4 *The Zoning Ordinance shall be amended to provide buffers and special setbacks for the protection of riparian areas and wetlands. The County shall encourage the incorporation of protected areas into conservation easements or natural resource protection areas.*

Exceptions to riparian and wetland buffer and setback requirements shall be provided to permit necessary road and bridge repair and construction, trail construction, and other recreational access structures such as docks and piers, or where such buffers deny reasonable use of the property, but only when appropriate mitigation measures and Best Management Practices are incorporated into the project. Exceptions shall also be provided for horticultural and grazing activities on agriculturally zoned lands that utilize "best management practices (BMPs)" as recommended by the County Agricultural Commission and adopted by the Board of Supervisors.

Until standards for buffers and special setbacks are established in the Zoning Ordinance, the County shall apply a minimum setback of 100 feet from all perennial streams, rivers, lakes, and 50 feet from intermittent streams and wetlands. These interim standards may be modified in a particular instance if more detailed information relating to slope, soil stability, vegetation, habitat, or other site- or project-specific conditions supplied as part of the review for a specific project demonstrates that a different setback is necessary or would be sufficient to protect the particular riparian area at issue.

For projects where the County allows an exception to wetland and riparian buffers, development in or immediately adjacent to such features shall be planned so that impacts on the resources are minimized. If avoidance and minimization are not feasible, the County shall make findings, based on documentation provided by the project proponent, that avoidance and minimization are infeasible.

Policy 7.3.3.5 *Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.*

OBJECTIVE 7.3.4: DRAINAGE
Protection and utilization of natural drainage patterns.

Policy 7.3.4.1 *Natural watercourses shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site without disturbance.*

Policy 7.3.4.2 *Modification of natural stream beds and flow shall be regulated to ensure that adequate mitigation measures are utilized.*

OBJECTIVE 7.3.5: WATER CONSERVATION
Conservation of water resources, encouragement of water conservation, and construction of wastewater disposal systems designed to reclaim and re-use treated wastewater on agricultural crops and for other irrigation and wildlife enhancement projects.

Policy 7.3.5.1 *Drought-tolerant plant species, where feasible, shall be used for landscaping of commercial development. Where the use of drought-tolerant native plant species is feasible, they should be used instead of non-native plant species.*

Policy 7.3.5.2 *A list of appropriate local indigenous drought tolerant plant materials shall be maintained by the County Planning Department and made available to the public.*

Policy 7.3.5.3 *The County Parks and Recreation Division shall use drought tolerant landscaping for all new parks and park improvement projects.*

Policy 7.3.5.4 *Require efficient water conveyance systems in new construction. Establish a program of ongoing conversion of open ditch systems shall be considered for conversion to closed conduits, reclaimed water supplies, or both, as circumstances permit.*

Policy 7.3.5.5 *Encourage water reuse programs to conserve raw or potable water supplies consistent with State Law.*

Conservation of Biological Resources

GOAL 7.4: WILDLIFE AND VEGETATION RESOURCES
Identify, conserve, and manage wildlife, wildlife habitat, fisheries, and vegetation resources of significant biological, ecological, and recreational value.

OBJECTIVE 7.4.1: RARE, THREATENED, AND ENDANGERED SPECIES
The County shall protect State and federally recognized rare, threatened, or endangered species and their habitats consistent with Federal and State laws.

Policy 7.4.1.1 *The County shall continue to provide for the permanent protection of the eight sensitive plant species known as the Pine Hill endemics and their habitat through the establishment and management of ecological preserves consistent with County Code Chapter 17.71 and the USFWS's Gabbro Soil Plants for the Central Sierra Nevada Foothills Recovery Plan (USFWS 2002).*

Policy 7.4.1.2 *Private land for preserve sites will be purchased only from willing sellers.*

Policy 7.4.1.3 *Limit land uses within established preserve areas to activities deemed compatible. Such uses may include passive recreation, research and scientific study, and education. In conjunction with use as passive recreational areas, develop a rare plant educational and interpretive program.*

Policy 7.4.1.4 *Proposed rare, threatened, or endangered species preserves, as approved by the County Board of Supervisors, shall be designated Ecological Preserve (-EP) overlay on the General Plan land use map.*

Policy 7.4.1.5 *Species, habitat, and natural community preservation/conservation strategies shall be prepared to protect special-status plant and animal species and natural communities and habitats when discretionary development is proposed on lands with such resources unless it is determined that those resources exist, and either are or can be protected, on public lands or private Natural Resource lands.*

Policy 7.4.1.6 *All development projects involving discretionary review shall be designed to avoid disturbance or fragmentation of important habitats to the extent reasonably feasible. Where avoidance is not possible, the development shall be required to fully mitigate the effects of important habitat loss and fragmentation. Mitigation shall be defined in the Integrated Natural Resources Management Plan (INRMP) (see Policy 7.4.2.8 and Implementation Measure CO-M).*

The County Agricultural Commission, Plant and Wildlife Technical Advisory Committee, representatives of the agricultural community, academia, and other

stakeholders shall be involved and consulted in defining the important habitats of the County and in the creation and implementation of the INRMP.

Policy 7.4.1.7 The County shall continue to support the Noxious Weed Management Group in its efforts to reduce and eliminate noxious weed infestations to protect native habitats and to reduce fire hazards.

OBJECTIVE 7.4.2: IDENTIFY AND PROTECT RESOURCES
Identification and protection, where feasible, of critical fish and wildlife habitat including deer winter, summer, and fawning ranges; deer migration routes; stream and river riparian habitat; lake shore habitat; fish spawning areas; wetlands; wildlife corridors; and diverse wildlife habitat.

Policy 7.4.2.1 To the extent feasible in light of other General Plan policies and to the extent permitted by State law, the County of El Dorado will protect identified critical fish and wildlife habitat, as identified on the Important Biological Resources Map maintained at the Planning Department, through any of the following techniques: utilization of open space, Natural Resource land use designation, clustering, large lot design, setbacks, etc.

Policy 7.4.2.2 Where critical wildlife areas and migration corridors are identified during review of projects; the County shall protect the resources from degradation by requiring all portions of the Site that contain or influence said areas to be retained as non-disturbed natural areas through mandatory clustered development on suitable portions of the Site or other means such as density transfers if clustering cannot be achieved. The setback distance for designated or protected migration corridors shall be determined as part of the project's environmental analysis. The intent and emphasis of the Open Space land use designation and of the non-disturbance policy is to ensure continued viability of contiguous or interdependent habitat areas and the preservation of all movement corridors between related habitats. The intent of mandatory clustering is to provide a mechanism for natural resource protection while allowing appropriate development of private property. Horticultural and grazing projects on agriculturally designated lands are exempt from the restrictions placed on disturbance of natural areas when utilizing "Best Management Practices" (BMPs) recommended by the County Agricultural Commission and adopted by the Board of Supervisors when not subject to Policy 7.1.2.7.

Policy 7.4.2.3 Consistent with Policy 9.1.3.1 of the Parks and Recreation Element, low impact uses such as trails and linear parks may be provided within river and stream buffers if all applicable mitigation measures are incorporated into the design.

Policy 7.4.2.4 Establish and manage wildlife habitat corridors within public parks and natural resource protection areas to allow for wildlife use. Recreational uses within these areas shall be limited to those activities that do not require grading or vegetation removal.

Policy 7.4.2.5 Setbacks from all rivers, streams, and lakes shall be included in the Zoning Ordinance for all ministerial and discretionary development projects.

Policy 7.4.2.6 El Dorado County Biological Community Conservation Plans shall be required to protect, to the extent feasible, rare, threatened, and endangered plant species only when existing federal or State plans for non-jurisdictional areas do not provide adequate protection.

Policy 7.4.2.7 The County shall form a Plant and Wildlife Technical Advisory Committee to advise the Planning Commission and Board of Supervisors on plant and wildlife issues, and the committee should be formed of local experts, including agricultural, fire protection, and forestry representatives, who will consult with other experts with special expertise on various plant and wildlife issues, including representatives of regulatory agencies. The Committee shall formulate objectives which will be reviewed by the Planning Commission and Board of Supervisors.

Policy 7.4.2.8 Develop within five years and implement an Integrated Natural Resources Management Plan (INRMP) that identifies important habitat in the County and establishes a program for effective habitat preservation and management. The INRMP shall include the following components:

A. Habitat Inventory. This part of the INRMP shall inventory and map the following important habitats in El Dorado County:

1. *Habitats that support special-status species;*
2. *Aquatic environments including streams, rivers, and lakes;*
3. *Wetland and riparian habitat;*
4. *Important habitat for migratory deer herds; and*
5. *Large expanses of native vegetation.*

The County should update the inventory every three years to identify the amount of important habitat protected, by habitat type, through County programs and the amount of important habitat removed because of new development during that period. The inventory and mapping effort shall be developed with the assistance of the Plant and Wildlife Technical Advisory Committee, CDFW, and USFWS. The

inventory shall be maintained and updated by the County Planning Department and shall be publicly accessible.

B. *Habitat Protection Strategy. This component shall describe a strategy for protecting important habitats based on coordinated land acquisitions (see item D below) and management of acquired land. The goal of the strategy shall be to conserve and restore contiguous blocks of important habitat to offset the effects of increased habitat loss and fragmentation elsewhere in the county. The Habitat Protection Strategy should be updated at least once every five years based on the results of the habitat monitoring program (item F below). Consideration of wildlife movement will be given by the County on all future 4- and 6-lane roadway construction projects. When feasible, natural undercrossings along proposed roadway alignments that could be utilized by terrestrial wildlife for movement will be preserved and enhanced.*

C. *Mitigation Assistance. This part of the INRMP shall establish a program to facilitate mitigation of impacts to biological resources resulting from projects approved by the County that are unable to avoid impacts on important habitats. The program may include development of mitigation banks, maintenance of lists of potential mitigation options, and incentives for developers and landowner participation in the habitat acquisition and management components of the INRMP.*

D. *Habitat Acquisition. Based on the Habitat Protection Strategy and in coordination with the Mitigation Assistance program, the INRMP shall include a program for identifying habitat acquisition opportunities involving willing sellers. Acquisition may be by state or federal land management agencies, private land trusts or mitigation banks, the County, or other public or private organizations. Lands may be acquired in fee or protected through acquisition of a conservation easement designed to protect the core habitat values of the land while allowing other uses by the fee owner. The program should identify opportunities for partnerships between the County and other organizations for habitat acquisition and management. In evaluating proposed acquisitions, consideration will be given to site specific features (e.g., condition and threats to habitat, presence of special-status species), transaction related features (e.g., level of protection gained, time frame for purchase completion, relative costs), and regional considerations (e.g., connectivity with adjacent protected lands and important habitat, achieves multiple agency and community benefits). Parcels that include important habitat and are located generally to the west of the El Dorado National Forest should be given priority for acquisition. Priority will also be given to parcels that would preserve natural wildlife movement corridors such as*

crossing under major roadways (e.g., U.S. Highway 50 and across canyons). All land acquired shall be added to the Ecological Preserve overlay area.

E. *Habitat Management. Each property or easement acquired through the INRMP should be evaluated to determine whether the biological resources would benefit from restoration or management actions. Examples of the many types of restoration or management actions that could be undertaken to improve current habitat conditions include: removal of non-native plant species, planting native species, repair and rehabilitation of severely grazed riparian and upland habitats, removal of culverts and other structures that impede movement by native fishes, construction of roadway under and overcrossing that would facilitate movement by terrestrial wildlife, and installation of erosion control measures on land adjacent to sensitive wetland and riparian habitat.*

F. *Monitoring. The INRMP shall include a habitat monitoring program that covers all areas under the Ecological Preserve overlay together with all lands acquired as part of the INRMP. Monitoring results shall be incorporated into future County planning efforts so as to more effectively conserve and restore important habitats. The results of all special-status species monitoring shall be reported to the CNDDB. Monitoring results shall be compiled into an annual report to be presented to the Board of Supervisors.*

G. *Public Participation. The INRMP shall be developed with and include provisions for public participation and informal consultation with local, state, and federal agencies having jurisdiction over natural resources within the County.*

H. *Funding. The County shall develop a conservation fund to ensure adequate funding of the INRMP, including habitat maintenance and restoration. Funding may be provided from grants, mitigation fees, and the County general fund. The INRMP annual report described under item F above shall include information on current funding levels and shall project anticipated funding needs and anticipated and potential funding sources for the following five years.*

Policy 7.4.2.9 *The Important Biological Corridor (-IBC) overlay shall apply to lands identified as having high wildlife habitat values because of extent, habitat function, connectivity, and other factors. Lands located within the overlay district shall be subject to the following provisions except that where the overlay is applied to lands that are also subject to the Agricultural District (-A) overlay or that are within the Agricultural Lands (AL) designation, the land use restrictions associated with the -IBC policies will not apply to the extent that the agricultural practices do not interfere with the purposes of the -IBC overlay.*

- *Increased minimum parcel size;*
- *Higher canopy-retention standards and/or different mitigation standards/thresholds for oak woodlands;*
- *Lower thresholds for grading permits;*
- *Higher wetlands/riparian retention standards and/or more stringent mitigation requirements for wetland/riparian habitat loss;*
- *Increased riparian corridor and wetland setbacks;*
- *Greater protection for rare plants (e.g., no disturbance at all or disturbance only as recommended by U.S. Fish and Wildlife Service/California Department of Fish and Wildlife);*
- *Standards for retention of contiguous areas/large expanses of other (non-oak or non-sensitive) plant communities;*
- *Building permits discretionary or some other type of "site review" to ensure that canopy is retained;*
- *More stringent standards for lot coverage, floor area ratio (FAR), and building height; and*
- *No hindrances to wildlife movement (e.g., no fences that would restrict wildlife movement).*

The standards listed above shall be included in the Zoning Ordinance.

Wildland Fire Safe measures are exempt from this policy, except that Fire Safe measures will be designed insofar as possible to be consistent with the objectives of the Important Biological Corridor.

OBJECTIVE 7.4.3: COORDINATION WITH APPROPRIATE AGENCIES
Coordination of wildlife and vegetation protection programs with appropriate federal and State agencies.

OBJECTIVE 7.4.5: NATIVE VEGETATION AND LANDMARK TREES
Protect and maintain native trees including oaks and landmark and heritage trees.

Policy 7.4.5.1 A tree survey, preservation, and replacement plan shall be required to be filed with the County prior to issuance of a grading permit for discretionary permits on all high-density residential, multifamily residential, commercial, and industrial projects. To ensure that proposed replacement trees survive, a mitigation monitoring plan should be incorporated into discretionary projects when applicable and shall include provisions for necessary replacement of trees.

Policy 7.4.5.2 It shall be the policy of the County to preserve native oaks wherever feasible, through the review of all proposed development activities where such trees are present on either public or private property, while at the same time recognizing individual rights to develop private property in a reasonable manner. To ensure that oak tree loss is reduced to reasonable acceptable levels, the County shall develop and implement an Oak Tree Preservation Ordinance that includes the following components:

A. Oak Tree Removal Permit Process. Except under special exemptions, a tree removal permit shall be required by the County for removal of any native oak tree with a single main trunk of at least 6 inches diameter at breast height (dbh), or a multiple trunk with an aggregate of at least 10 inches dbh. Special exemptions when a tree removal permit is not needed shall include removal of trees less than 36 inches dbh on 1) lands in Williamson Act Contracts, Farmland Security Zone Programs, Timber Production Zones, Agricultural Districts, designated Agricultural Land (AL), and actions pursuant to a Fire Safe plan; 2) all single family residential lots of one acre or less that cannot be further subdivided; 3) when a native oak tree is cut down on the owner's property for the owner's personal use; and 4) when written approval has been received from the County Planning Department. In passing judgment upon tree removal permit applications, the County may impose such reasonable conditions of approval as are necessary to protect the health of existing oak trees, the public and the surrounding property, or sensitive habitats. The County Planning Department may condition any removal of native oaks upon the replacement of trees in kind. The replacement requirement shall be calculated based upon an inch for inch replacement of removed oaks. The total of replacement trees shall have a combined diameter of the tree(s) removed. Replacement trees may be planted onsite or in other areas to the satisfaction of the County Planning Department. The County may also condition any tree removal permit that would affect sensitive habitat (e.g., valley oak woodland), on preparation of a Biological Resources Study and an Important Habitat Mitigation Program as described in Policy 7.4.1.6. If an application is denied, the County shall provide written notification, including the reasons for denial, to the applicant.

B. Tree Removal Associated with Discretionary Project. Any person desiring to remove a native oak shall provide the County with the following as part of the project application:

- *A written statement by the applicant or an arborist stating the justification for the development activity, identifying how trees in the vicinity of the project or construction site will be protected and stating*

that all construction activity will follow approved preservation methods;

- *A site map plan that identifies all native oaks on the project site; and*
- *A report by a certified arborist that provides specific information for all native oak trees on the project site.*

C. *Commercial Firewood Cutting. Fuel wood production is considered commercial when a party cuts firewood for sale or profit. An oak tree removal permit shall be required for commercial firewood cutting of any native oak tree. In reviewing a permit application, the Planning Department shall consider the following:*

- *Whether the trees to be removed would have a significant negative environmental impact;*
- *Whether the proposed removal would not result in clear-cutting, but will result in thinning or stand improvement;*
- *Whether replanting would be necessary to ensure adequate regeneration;*
- *Whether the removal would create the potential for soil erosion;*
- *Whether any other limitations or conditions should be imposed in accordance with sound tree management practices; and*
- *What the extent of the resulting canopy cover would be.*

D. *Penalties. Fines will be issued to any person, firm, or corporation that is not exempt from the ordinance who damages or destroys an oak tree without first obtaining an oak tree removal permit. Fines may be as high as three times the current market value of replacement trees as well as the cost of replacement, and/or replacement of up to three times the number of trees required by the ordinance. If oak trees are removed without a tree removal permit, the County Planning Department may choose to deny or defer approval of any application for development of that property for a period of up to 5 years. All monies received for replacement of illegally removed or damaged trees shall be deposited in the County's Integrated Natural Resources Management Plan (INRMP) conservation fund.*

Preservation of Open Space

GOAL 7.6: OPEN SPACE CONSERVATION

Conserve open space land for the continuation of the County's rural character, commercial agriculture, forestry and other productive uses, the enjoyment of scenic beauty and recreation, the protection of natural resources, for protection from natural hazards, and for wildlife habitat.

OBJECTIVE 7.6.1: IMPORTANCE OF OPEN SPACE

Consideration of open space as an important factor in the County's quality of life.

Policy 7.6.1.1 *The General Plan land use map shall include an Open Space land use designation. The purpose of this designation is to implement the goals and objectives of the Land Use and the Conservation and Open Space Elements by serving one or more of the purposes stated below. In addition, the designations on the land use map for Rural Residential and Natural Resource areas are also intended to implement said goals and objectives. Primary purposes of open space include:*

A. Conserving natural resource areas required for the conservation of plant and animal life including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, banks of rivers and streams and watershed lands;

B. Conserving natural resource lands for the managed production of resources including forest products, rangeland, agricultural lands important to the production of food and fiber; and areas containing important mineral deposits;

C. Maintaining areas of importance for outdoor recreation including areas of outstanding scenic, historic and cultural value; areas particularly suited for park and recreation purposes including those providing access to lake shores, beaches and rivers and streams; and areas which serve as links between major recreation and open space reservations including utility easements, banks of rivers and streams, trails and scenic highway corridors;

D. Delineating open space for public health and safety including, but not limited to, areas which require special management or regulation because of hazardous or special conditions such as earthquake fault zones, unstable soil areas, flood plains, watersheds, areas presenting high fire risks, areas required for the protection of water quality and water reservoirs, and areas required for the protection and enhancement of air quality; and

E. Providing for open spaces to create buffers which may be landscaped to minimize the adverse impact of one land use on another.

Policy 7.6.1.2 *The County will provide for Open Space lands through:*

A. The designation of land as Open Space;

B. The designation of land for low-intensity land uses as provided in the Rural Residential and Natural Resource land use designations;

C. *Local implementation of the Federal Emergency Management Agency's National Flood Insurance Program;*

D. *Local implementation of the State Land Conservation Act Program; and*

E. *Open space land set aside through Planned Developments (PDs).*

Policy 7.6.1.3 *The County shall implement Policy 7.6.1.1 through zoning regulations and the administration thereof. It is intended that certain districts and certain requirements in zoning regulations carry out the purposes set forth in Policy 7.6.1.1 as follows:*

A. *The Open Space (OS) Zoning District is consistent with and shall implement the Open Space designation of the General Plan land use map and all other land use designations.*

B. *The Agricultural (A), Exclusive Agricultural (AE), Planned Agricultural (PA), Select Agricultural (SA-10), and Timberland Production Zone (TPZ) zoning districts are consistent with Policy 7.6.1.1 and serve one or more of the purposes set forth therein.*

C. *Zoning regulations shall provide for setbacks from all flood plains, streams, lakes, rivers and canals to maintain Purposes A, B, C, and D set forth in Policy 7.6.1.1.*

D. *Zoning regulations shall provide for maintenance of permanent open space in residential, commercial, industrial, agricultural, and residential agricultural zone districts based on standards established in those provisions of the County Code. The regulations shall minimize impacts on wetlands, flood plains, streams, lakes, rivers, canals, and slopes in excess of 30 percent and shall maintain Purposes A, B, C, and D in Policy 7.6.1.1.*

E. *Landscaping requirements in zoning regulations shall provide for vegetative buffers between incompatible land uses in order to maintain Purpose E in Policy 7.6.1.1.*

F. *Zoning regulations shall provide for Mineral Resource Combining Zone Districts and/or other appropriate mineral zoning categories which shall be applied to lands found to contain important mineral deposits if development of the resource can occur in compliance with all other policies of the General Plan. Those regulations shall maintain Purposes A, B, C, D, and E of Policy 7.6.1.1.*

Policy 7.6.1.4 *The creation of new open space areas, including Ecological Preserves, common areas of new subdivisions, and recreational areas, shall include wildfire safety planning.*

El Dorado Hills Specific Plan

1.4.1.1 Site Development and Grading

The policies set forth in the Specific Plan are intended to maintain, to the maximum extent possible, the natural land forms and to exercise control over vegetation removal, landscaping, and grading. Grading controls are intended to reduce soil erosion to a minimum to ensure capability with adjacent terrain.

a) *Grading for roadways, driveways, building pads, and onsite improvements shall be minimized.*

b) *Grading volumes of cut-and-fill material shall be minimized and balanced onsite wherever possible. Larger grading volumes may be acceptable where improved visual and environmental effects would result.*

c) *Residential structures or accessory structures on slopes in access of 20 percent shall be carefully designed through use of erosion controls, engineered grading, and use of post and beam or step-footing construction to ensure long-term slope stability. Benched hillsides for building sites shall be avoided and split-level structures encouraged.*

d) *A plan to minimize impact to oak trees shall be submitted to the El Dorado County Community Development Department prior to approval of any tentative map. The plan will include, at a minimum, the locations and sizes of individual trees that should not be impacted.*

e) *A minimum of 20 percent of all roadside trees and parking lot trees shall be native oaks.*

f) *Removal of oak trees and other large native trees with trunk circumferences of 25 inches at 4.5 feet above grade shall be avoided where feasible. A tree replacement policy is provided in the Design Guidelines on file with the County of El Dorado.*

g) *To avoid damage to root systems of retained trees, residential construction shall not occur within the canopy area of oak trees over 30 inches in circumference at breast height, and shall be subject to review as provided in the Design Guidelines.*

h) *Landscaping in improved common areas shall be of drought-resistant varieties.*

i) *To preserve the vegetative character of the Plan Area, the planting of native trees, shrubs, and ground cover shall be encouraged in all new landscaping.*

j) *Landscaping in areas adjacent to natural open spaces shall be fire resistant.*

k) *Site design, building orientation, and street and lot patterns shall follow solar orientation principles to the maximum extent practicable to maximize energy conservation.*

l) Archaeological test excavations for selected locations within the Plan Area shall be required as a condition of approval of tentative subdivision maps.

m) As part of the tentative map approval, areas having expansive clays and seasonably wet areas shall be identified by a geotechnical engineer. Such areas, if deemed to be potential construction hazards, shall be subject to further evaluation and identification to determine appropriate mitigation measures.

n) To the maximum extent feasible, development shall be sited and designed to avoid impacts to culturally significant sties identified by the Final EIR for the Plan Area as EDH-26 and EDH-29.

o) Where feasible, and given the physical constraints of the Plan Area, subdivisions and other new development shall be designed to facilitate solar use as a means of reducing total energy consumption. The design elements that shall be considered include:

- *Solar orientation*
- *Shade Control*
- *Wind Management*
- *Solar access*

p) The Design Guidelines shall be one of the implementation measures of the Specific Plan.

1.4.1.2 Development Near Native Oak Trees

These guidelines are for the protection of healthy oak trees that will remain after construction in developed areas. The term circumference is breast height (CBH) refers to the trunk measurement of either one trunk or the addition of all trunks in a multi-trunked tree. The respective measure in circumference would also apply. Also refer to **Section 3.10** for Oak Tree Preservation Guidelines.

a) Protect all oak trees larger than 25 inches CBH o the maximum extent feasible. Priority will be given to oaks larger than 56 inches CBH.

b) Trees to be saved will be surrounded by a barrier or fence installed at the dripline and flagged.

c) Pruning of limbs will be confined to low-hanging branches over roads and sidewalks, and large branches that are weak or may reasonably appear to pose a safety hazard. Pruning paint will not be used under any circumstances. Pruning cuts will be made cleanly to avoid damaged to the "bark ridge" tissue of adjacent limbs.

d) The El Dorado County Planning Department will be responsible for enforcement of oak tree protection during construction.

e) In development areas, no oak trees larger than 25 inches CBH will be removed until a site survey and inspection report is performed.

1.4.1.5 Vegetation and Fire Hazards

In areas of planned development:

a) All potentially dry herbaceous vegetation will be mowed or disked within a 50-foot radius of all construction site activity.

b) Disking or mowing will be done to keep herbaceous vegetation under 3 inches in height at all construction sites.

c) No construction equipment or vehicles will be allowed within 50 feet of the unmowed perimeter.

d) Firebreaks will be installed by disking or mowing a trail that is satisfactory to the El Dorado Hills Fire Development. Mowing is preferred to disking or scraping because the latter two practices promote invasion of noxious weed species on fire trails.

e) Temporary or permanent firebreaks will be installed on all ridgelines, crossing all areas in the vicinity of construction and grading activity, prior to beginning work.

f) Firebreak installation will avoid the removal of native oaks and other native trees.

1.4.8 Natural Open Space Policies

The Natural Open Space Policies are to guide the preservation, management, and maintenance of these areas in relation to adjacent land uses.

1.4.8.1 General Policies

a) The boundaries of natural open space shall blend with the boundaries of the development as to enhance the integration of open space and developed areas.

b) Perimeter fencing may be permitted for rural parcels as provided in the El Dorado County Design Guidelines and CC&Rs.

c) Increased runoff from adjacent development will require erosion control measures to be coordinated with landscape design of adjacent development areas. Emphasis shall be placed on methods that rely on natural drainage systems and minimize change to the existing condition of creek channels within open space areas.

d) An Open Space Management Plan shall be completed and submitted to the El Dorado County Community Development Department prior to approval of any tentative map creating open space. It shall be an implementation mechanism of the Specific Plan in order to set forth procedures and responsibilities as to the ownership, preservation, and management of public and private natural open space areas. The Open Space Management Plan shall consider dedication to the County of El Dorado of easements

over the public open space areas, should dedication of fee ownership of these areas be made to any other entity. The open space plan shall be reviewed by the El Dorado Hills Fire Department. The plan shall also include, at a minimum:

1. *The locations of fire access roads, fuel breaks, and passive recreation trails.*
2. *Control burning techniques.*
3. *Guidelines established in the Open Space Guidelines for El Dorado County*
4. *Investigation of opportunities for wildlife use of water in open space areas as a part of ongoing wildlife maintenance.*

1.4.8.2 Riparian and Other Drainageway Policies

A 200-foot-wide undeveloped buffer zone shall be established along Carson Creek in accordance with California Department of Fish and Wildlife requirements. In this buffer, vegetation removal shall be for the purpose of drainage improvements. In consideration of setback reductions for purposes of a gold course, the County shall consider such mitigation measures as additional plantings, erosion controls, and other habitat improvement and protection steps.

a) *Drainageway easements shall specifically preclude erection of structures and vegetation removal, except for drainage improvements, and shall forestall other site development not consistent with the purpose of these areas.*

b) *Drainageways located on privately owned property shall be placed within recorded easements that provide for routine maintenance and pedestrian access.*

c) *A 100-foot-wide buffer (50 feet horizontal on each side as measured from centerline of the creek) of natural vegetation shall be maintained along all intermittent creeks.*

d) *Grazing shall not be allowed in riparian buffer zones.*

e) *Plantings of riparian trees and shrubs shall be situated according to the flood and soil moisture tolerances of individual species as in Appendix C of the Specific Plan.*

f) *Areas disturbed during construction shall be replanted with native riparian species listed in Appendix C of the Specific Plan. Replanting will include a mandatory 3-year maintenance and irrigation period.*

g) *Riparian vegetation on the golf course areas shall be kept naturally dense and unpruned except where needed for crossings, ball pay passages, and personal and fire safety.*

h) *Pedestrian, vehicular, and utility bridges over creeks, if feasible, will be oriented at right angles to the waterway to minimize loss of vegetation.*

i) The capacity of flow under bridges and culverts will be designed to reduce the need for extensive vegetation clearing near the structures.

j) Periodic vegetation removal to ensure adequate floodway capacity in drainages will be performed to promote an overstory of mature individual riparian trees spaced to accommodate designed flows.

El Dorado Hills Community Services District Policies

5.27 Oak Tree Preservation

5.27.3 General Requirements for Development Activity in the Protected Zone of Protected Trees

The importance of oak tree preservation is recognized with tree protection provisions in the Covenants, Conditions, and Restrictions (CC&Rs) of the most units in El Dorado Hills and in County Code 17.73 titled Oak Woodland Conservation prior to initiating any activity that may affect an oak tree on their land or on that of an adjoining property, owners of property in El Dorado Hills should check their CC&Rs carefully to determine whether Design Review Committee (DRC) approval is required.

5.27.4 Removal of Protected Trees

It shall be the policy of the DRC to preserve protected trees wherever feasible while recognizing individual rights to develop private property in a reasonable manner. It shall be the responsibility of the applicant to demonstrate the need for any oak tree removal. In determining whether to approval the removal or major trimming of a protected tree, the DRC will consider the following listed factors and, depending upon particular circumstances, may consider others which are not listed:

a) The degree to which the tree will be an obstacle to approval development activity.

b) The condition of the tree with respect to disease, general health, damage, danger of falling.

c) The effect removal would have upon safety, public health, remaining trees, and the beauty and general welfare of the area.

d) The effect removal would have upon soil stability, erosion, particularly near water courses and on slopes.

e) Present and future shade effect with respect to cooling and solar power/heating.

f) Whether or not there are feasible alternative measures to removal.

g) Applicants may be required to provide an arborist report from an arborist who would not be performing any eventual tree removal or major limbing. Alternatively, and it is discretion the DRC may employ an arborist of its choice.

5.27.5 Protecting Oak Trees During Development Activity

Property owners are responsible for taking the following measures to protect oak trees, except any approval from removal during development activity.

a) *Erect protective orange "ski fencing" around the protected zone of each protected tree or group of trees within 50 feet of development activity prior to initiating work and excluded from the enclosed protected zone any work related activity such as storage and vehicle parking.*

b) *Exert every reasonable effort to preserve undisturbed the natural ground within protected zones.*

c) *If it is absolutely necessary to trench within a protected zone, if boring or drilling would not be feasible, excavate by hand under the supervision of a certified arborist. Do not cut any root larger than two inches in diameter; keep the exposed root moist and cover with soil as quickly as feasible. Sever small roots neatly, trim and cover quickly.*

d) *Make no grade changed within the protected zone unless specifically indicated in the approved plans.*

5.27.6 Mitigation EDHCSD Tree Preservation Fund, Public Education

In the event the owner of property with protected trees removed or significantly damages one or more of them without approval, the DRC, at its discretion, may require mitigation by planting a proportionate number of diameter inches of replacement oak trees on the owner's property or by assessing a fee at the rate of $200 per diameter inch (amount tripled for unapproved removal of a landmark tree) to compensate for the expense of planting a proportionate number of diameter inches of oak trees on public property or by a combination of these alternatives.

In the event the owner of the property with protection trees applies for approval of a protect that will damage protected trees, and the DRC determines they could be reasonably be preserved, the DRC, at its sole discretion, may offer the applicant the option of an approval in exchange for on-site mitigation or payment of a mitigation fee based upon the number of diameter inches that applicant would remove.

Mitigation fees paid by property owners are held by the EDHCSD in a Tree Preservation Fund until used to cover the expense of mitigation planting or for related purposes. It is widely recognized that the loss of oak tree is partly the result of the lack of public awareness on oak preservation. A portion of the funds collected for mitigation may be used to establish and promote educational programs to improve this situation.

Regulatory Status Legend

FE = Federal endangered FT = Federal threatened FC = Federal candidate PT = Federal proposed threatened FPD = Federal proposed for delisting FD = Federal delisted FSC = Federal Species of Concern	CE = California state endangered CT = California state threatened CFP = California fully protected CSC = California Species of Special Concern CSA = California Special Animals List CR = California state rare CC = California candidate	1A = plants presumed extinct in California 1B = plants rare, threatened, or endangered in California and elsewhere 2 = plants rare, threatened, or endangered in California, but common elsewhere 3 = plants about which we need more information 4 = plants of limited distribution

Table 1 — Legally Protected Species

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Boggs Lake hedge-hyssop *Gratiola heterosepala*	CE; 1B	Annual herb found on clay soils in vernal pools and along the lake margins of marshes and swamps from 10 to 2,375 meters.	Blooming period: April – August	**None**; the riverine perennial marsh within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
El Dorado bedstraw *Galium californicum* ssp. *sierrae*	FE; CR; 1B	Perennial herb found on gabbroic substrate in chaparral, cismontane woodland, and lower montane coniferous forest from 100 to 585 meters.	Blooming period: May – June.	**None**; there is no suitable soil for this species within the Study Area.
Layne's butterweed (=ragwort) *Packera layneae*	FT; CR; 1B	Perennial herb found on serpentine or gabbroic, rocky substrate in cismontane woodland or chaparral from 200 to 1,085 meters.	Blooming period: April – August.	**None**; there is no suitable soil for this species within the Study Area.
Legenere *Legenere limosa*	CT; 1B	Annual herb found in vernal pools from 1 to 880 meters.	Blooming period: April – June.	**None**; there is no vernal pool habitat within the Study Area.
Pine Hill ceanothus *Ceanothus roderickii*	FE; CR; 1B	Perennial evergreen shrub found on serpentinite or gabbroic substrate in chaparral or cismontane woodland from 245 to 1,090 meters.	Blooming period: April – June.	**None**; there is no suitable soil for this species within the Study Area.
Pine Hill flannelbush *Fremontodendron decumbens*	FE; CR; 1B	Perennial evergreen shrub found in chaparral and cismontane woodland on rocky gabbroic or serpentinite soils from 425 to 760 meters.	Blooming period: April-July	**None**; there is no suitable soil for this species within the Study Area.
Sacramento orcutt grass *Orcuttia viscida*	FE; CE; 1B	Annual herb found in vernal pools from 30 to 100 meters.	Blooming period: April – September.	**None**; the Study Area does not provide suitable habitat for this species.
Slender orcutt grass *Orcuttia tenuis*	FT; CE; 1B	Annual herb found in vernal pools that are often gravelly, from 35 to 1,760 meters.	Blooming period: May – October.	**None**; the Study Area does not provide suitable habitat for this species.
Stebbins' morning glory *Calystegia stebbinsii*	FE; CE; 1B	Perennial rhizomatous herb found occasionally in openings of chaparral and cismontane woodland on gabbro or serpentinite soils from 185 to 1,090 meters.	Blooming period: April – July.	**None**; there is no suitable soil for this species within the Study Area.
Invertebrates				
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT	Blue elderberry shrubs usually associated with riparian areas.	Adults emerge in spring until June. Exit holes visible year – round.	**Low**; small elderberry shrubs were observed in the Study Area but no exit holes were observed.
Vernal pool fairy shrimp *Branchinecta lynchi*	FT	Vernal pools, swales, and ephemeral freshwater habitat.	USFWS protocol-level wet-season sampling and/or dry season cyst identification.	**None**; the Study Area does not provide suitable habitat for this species.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE	Vernal pools, swales, and ephemeral freshwater habitat.	USFWS protocol-level wet-season sampling and/or dry season cyst identification.	**None**; the Study Area does not provide suitable habitat for this species.
Fish				
Central Valley steelhead *Oncorhynchus mykiss*	FT	Rivers and streams tributary to the Sacramento-San Joaquin Rivers and Delta ecosystems.	Spawn in winter and spring.	**None**; the Study Area does not provide suitable habitat for this species.
Delta smelt *Hypomesus transpacificus*	FT; CE	Found in estuarine waters. Majority of life span is spent within the freshwater outskirts of the mixing zone (saltwater-freshwater interface) within the Delta.	December – July (Spawn) Year-round (Present in delta)	**None**; the Study Area does not provide suitable habitat for this species.
Amphibians/ Reptiles				
California red-legged frog *Rana draytonii*	FT; CSC	Requires a permanent water source and is typically found along quiet, slow-moving streams, ponds, or marsh communities with emergent vegetation. Believed extirpated from the Central Valley floor since 1970s.	Aquatic surveys of breeding sites between January and September. Optimally after April 15.	**None**; the riverine perennial marsh and perennial drainage within the Study Area provide marginal habitat for this species, but no evidence of CRLF was observed during protocol breeding and non-breeding surveys (Foothill Associates 2016a).
California tiger salamander *Ambystoma californiense*	FT; CT	Required ponded water for breeding. Adults spend summer in small mammal burrows. This species is not known to occur within El Dorado County. There are no recorded instances of CTS north of the Cosumnes River and east of the Sacramento River despite extensive surveys.	March – June	**None**; the Study Area occurs outside of the known extant geographic range for this species.
Foothill yellow-legged frog *Rana boylii*	CC	Typically found in shaded, shallow, slow moving streams or channels with rocky or muddy bottoms. Typically stays within ~150' of water.	Breeds from mid-March to early June. Most active diurnally. Hibernates and aestivates.	**Low**; perennial drainage provides potential habitat for this species, but there are no known occurrences within 5 miles.

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Giant garter snake *Thamnophis gigas*	FT; CT	Found in agricultural wetlands and other wetlands such as irrigation and drainage canals, low gradient streams, marshes, ponds, sloughs, small lakes, and their associated uplands. Upland habitat should have burrows or other soil crevices suitable for snakes to reside during their dormancy period (November – mid March). This species is known from Sacramento, Sutter, Butte, Colusa, and Glenn counties.	Active outside of dormancy period November-mid March	**None**; the Study Area occurs outside of the known geographic range for this species.
Birds				
Bald eagle *Haliaeetus leucocephalus*	FD; CFP, CE	Breeding habitat most commonly includes areas within 2.5 miles (4.0 kilometers) of coastal areas, bays, rivers, lakes, and reservoirs. Nests usually are in tall trees or on pinnacles or cliffs near water.	Winter	**None**; there is no potential habitat for this species within the Study Area.
Bank swallow *Riparia*	CT	Nests in riverbanks and forages over riparian areas and adjacent uplands.	April – July	**None**; there is no potential nesting habitat for this species within the Study Area.
California black rail *Laterallus jamaicensis coturniculus*	CT	Saltwater, brackish, and freshwater marshes that remain shallowly inundated year-round.	Year – round	**None**; the Study Area occurs outside of the geographical range for this species.
Golden eagle *Aquila chrysaetos*	CFP (nesting and wintering)	Open and semi-open areas up to 12,000 feet in elevation. Builds large stick nests on cliffs, in trees, or on man-made structures.	Year – round	**Low**; although the Study Area provides foraging habitat, there is no breeding habitat present within the Study Area and no nests have been observed.
Swainson's hawk *Buteo swainsoni*	CT	Nest peripherally to Valley riparian systems lone trees or groves of trees in agricultural fields. Valley oak, Fremont cottonwood, walnut, and large willow trees, ranging in height from 41 to 82 feet, are the most commonly used nest trees in the Central Valley.	March – October	**None**; the Study Area occurs outside of the known geographical range for this species.
Tricolored blackbird *Agelaius tricolor*	CC; CSC (nesting colony)	Nests in dense blackberry, cattail, tules, bulrushes, sedges, willow, or wild rose within freshwater marshes. Nests in large colonies of at least 50 pairs (up to thousands of individuals). May forage up to 4 miles from nest site.	Year – round	**Low**; the riverine perennial marsh is not large enough to support breeding colonies, but colonies are recorded within 4 miles of the Study Area so the area may be used for foraging.
White-tailed kite *Elanus leucurus*	CFP (nesting)	Nests in isolated trees or woodland areas with suitable open foraging habitat.	February 15 – August 31	**High**; the riparian habitat and isolated trees within the annual grassland provide breeding habitat for this species.
Mammals				
Fisher *Martes pennanti*	PT; CSC	Occurs in intermediate to large-tree stages of coniferous and deciduous forests.	Year – round	**None**; there is no habitat for this species within the Study Area.

Table 1 includes federal threatened or endangered species and eagles, and State threatened, endangered, or fully protected species.

Table 2 — Species Subject to CEQA Review

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	1B	Annual herb found in mesic areas in valley and foothill grasslands from 30 to 229 meters.	Blooming period: April – August.	**None**; the Study Area does not provide habitat for this species.
Big-scale balsamroot *Balsamorhiza macrolepis*	1B	Perennial herb found in chaparral, cismontane woodland, valley and foothill grassland, sometimes on serpentinite soils from 90 to 1,555 meters in elevation.	Blooming period: March – June	**None**; the annual grassland within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
chaparral sedge *Carex xerophila*	1B	Perennial herb found on gabbroic or serpentine soils in chaparral, woodlands, and coniferous forest between 440 and 770 meters.	Blooming period: March – June	**None**; there is no suitable soil for this species within the Study Area.
Dwarf downingia *Downingia pusilla*	2	Annual herb found occasionally in mesic areas within valley and foothill grassland and vernal pools from 1 to 445 meters.	Blooming period: March – May.	**None**; the annual grassland within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
El Dorado bedstraw *Galium californicum* ssp. *sierrae*	FE; CR; 1B	Perennial herb found on gabbroic substrate in chaparral, cismontane woodland, and lower montane coniferous forest from 100 to 585 meters.	Blooming period: May – June.	**None**; there is no suitable soil for this species within the Study Area.
Jepson's onion *Allium jepsonii*	1B	Perennial bulbiferous herb found on serpentine or volcanic soils in chaparral, lower montane coniferous forest, and cismontane woodland from 300 to 1,320 meters.	Blooming period: April – August.	**None**; there is no suitable soil for this species within the Study Area.
Parry's horkelia *Horkelia parryi*	1B	Perennial herb found on Ione formation in chaparral and cismontane woodland from 80 to 1,070 meters.	Blooming period: April – September	**None**; there is no suitable soil for this species within the Study Area.
Pincushion navarretia *Navarretia myersii*	1B	Annual herb found in vernal pools, which are often acidic, from 20 to 330 meters.	Blooming period: April – May.	**None**; there is no vernal pool habitat within the Study Area.
Red Hills soaproot *Chlorogalum grandiflorum*	1B	Perennial bulbiferous herb found on gabbro, serpentine, or other soils in chaparral, cismontane woodland, and lower montane coniferous forest from 245 to 1,240 meters.	Blooming period: May - June	**None**; original site surveys were conducted within the evident and identifiable bloom period for this species and this species was not observed within the Study Area.
Sanford's arrowhead *Sagittaria sanfordii*	1B	Perennial rhizomatous herb found in marshes and swamps in assorted shallow freshwater areas from 0 to 650 meters.	Blooming period: May – October.	**None**; the riverine perennial marsh within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Starved daisy *Erigeron miser*	1B	Perennial herb found on rocky ground in upper montane coniferous forest from 1,840 to 2,620 meters.	Blooming period: June – October.	**None**; the Study Area does not provide habitat for this species and is outside the known elevational range.
Tuolumne button-celery *Eryngium pinnatisectum*	1B	Annual to perennial herb found in mesic areas in cismontane woodland, lower montane coniferous forest, and vernal pools from 70 to 915 meters.	Blooming period: May – August	**None**; original site surveys were conducted within the evident and identifiable bloom period for this species and this species was not observed within the Study Area.
Amphibians/ Reptiles				
Blainville's (Coast) horned lizard *Phrynosoma blainvillii*	CSC	Inhabits open areas of sandy soils and low vegetation in valleys, foothills, and semiarid mountains. Found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose sandy soil. Often found in lowlands along sandy washes with scattered shrubs and along dirt roads, and frequently found near ant hills.	Year – round (excluding extended periods of low temperatures or extreme heat).	**Low**; the Study Area provides marginal habitat within the annual grassland. However, the Study Area lacks suitable sandy washes and low scattered bushes or shrubs.
Western pond turtle *Emys marmorata*	CSC	Agricultural wetlands and other wetlands such as irrigation and drainage canals, low gradient streams, marshes, ponds, sloughs, small lakes, and their associated uplands.	Active outside of dormancy period November – February	**High**; the perennial drainage and riverine perennial marsh within the Study Area provide habitat for this species.
Western spadefoot *Spea hammondii*	CSC	Found in open grasslands and woodlands. Breeds in seasonal ponds and vernal pools.	Year – round	**Low**; there is minimal potential breeding habitat for this species in the Study Area in the depressional seasonal wetlands.

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Birds				
Burrowing owl *Athene cunicularia*	CSC (burrow sites and some wintering sites)	Nests in burrows in the ground, often in old ground squirrel burrows or badger, within open dry grassland and desert habitat. The burrows are found in dry, level, open terrain, including prairie, plains, desert, and grassland with low height vegetation for foraging and available perches, such as fences, utility poles, posts, or raised rodent mounds.	Year – round; Breeding season surveys between March and August.	**Low**; the annual grassland within the Study Area provides potential habitat for this species, however, few burrows that could be occupied by this species was observed and this species was not observed during the protocol level surveys conducted within the Study Area.
Cooper's hawk *Accipiter cooperii*	CSA (Nesting)	Found in cismontane woodland, riparian forest, riparian woodland, and upper montane coniferous forest.	Year – round	**Low;** the woodlands on site provide potential nesting and foraging habitat.
Double crested cormorant *Phalacrocorax auritus*	CSA (Nesting colony)	Breeds on ponds, lakes, artificial impoundments, slow-moving rivers, lagoons, estuaries, and open coastlines.	Migrate and winter non-breeding.	**None;** there is no suitable nesting habitat in the Study Area.
Ferruginous hawk *Buteo regalis*	CSA (Wintering)	Overwintering occurs in grasslands or deserts with abundant prey species (rabbits, pocket gophers, or prairie dogs).	Wintering	**Low**; the annual grassland habitat within the Study Area provides habitat for this species.
Grasshopper sparrow *Ammodramus savannarum*	CSC	Frequents dense, dry, or well drained grassland, especially native grassland. Nests at base of overhanging clump of grass.	April – July	**Low**; the annual grassland habitat within the Study Area provides habitat for this species.
Great blue heron *Ardea herodias*	CSA (Nesting colony)	Inhabits both freshwater and saltwater habitats and forages in grassland and agricultural field. Breeding colonies are located within 2 to 4 miles of feeding areas, often in isolated swamps or on islands, and near lakes and ponds bordered by forests.	Year – round	**None;** there is no suitable nesting habitat in the Study Area.
Great egret *Ardea alba*	CSA (Nesting colony)	Nests in colonies in large trees usually near water. Nesting colonies must be relatively isolated from human activities. Forages in shallow water in a variety of habitats.	Year – round	**None;** there is no suitable nesting habitat in the Study Area.
Merlin *Falco columbarius*	CSA (Wintering)	Winter in open and semi-open habitats that include estuaries, Great Basin grassland, and valley and foothill grasslands.	Wintering	**Low**; the annual grassland habitat within the Study Area provides habitat for this species.
Osprey *Pandion haliaetus*	CSA	Found in a variety of habitats nearby water sources.	Breeding	**None**; the Study Area does not provide suitable habitat for this species.
Purple martin *Progne subis*	CSC	Often nests in tall, old trees near body of water in woodland and conifer habitats. Feed in open areas near water and nest in tree cavities.	Year – round	**Low**; the Study Area does provide potential nesting habitat for this species.
Mammals				
American badger *Taxidea taxus*	CSC	Found in a variety of grasslands, shrublands, and open woodlands throughout California.	Year – round	**Low**; the annual grassland within the Study Area provides habitat, however, very few burrows that could be utilized by this species are present within the Study Area.
Pallid bat *Antrozous pallidus*	CSC	Most abundant in oak woodland, savannah, and riparian habitats. Roosts in crevices and hollows in trees, rocks, cliffs, bridges, and buildings.	Year – round	**Low**; the trees within the riparian habitat and isolated trees within the annual grassland provide roosting habitat for this species.
Silver-haired bat *Lasionycteris noctivagans*	CSA	Forests near water. Roosts in hollow trees, snags, buildings, rock crevices, caves, and under bark. Forages in ~300' home range over water and open brushy areas.	Dusk between spring and fall.	**Low**; there is marginal habitat in the woodlands for this species on the Study Area

Table 2 includes state and federal species of concern and Rank 1 and 2 CNPS species.

Table 3 — Other Species of Interest

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Bisbee Peak rush-rose *Crocanthemum suffrutescens*	3.2	Perennial evergreen shrub often found on gabbroic or lone soil and often in burned or disturbed areas within chaparral from 75 to 670 meters.	Blooming period: April – August.	**None**; the Study Area does not provide habitat for this species.
Brandegee's clarkia *Clarkia biloba* ssp. *brandegeeae*	4	Annual herb found often in roadcuts within chaparral, cismontane woodland, and lower montane coniferous forest from 75 to 915 meters.	Blooming period: May – July.	**None**; the woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Brewer's calandrinia *Calandrinia breweri*	4	Annual herb found on sandy or loamy, disturbed sites and burns within chaparral and coastal scrub from 10 to 1,220 meters.	Blooming period: March – June.	**None**; the Study Area does not provide habitat for this species.
Fresno ceanothus *Ceanothus fresnensis*	4	Perennial evergreen shrub found occasionally in openings of cismontane woodland and lower montane coniferous forest from 900 to 2,103 meters.	Blooming period: May – July.	**None**; the Study Area occurs outside of the known elevation range for this species.
Hernandez bluecurls *Trichostema rubisepalum*	4	Annual herb found on volcanic or serpentinite, gravelly substrate within broad-leafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, and vernal pools from 300 to 1,435 meters.	Blooming period: June – August.	**None**; there is no suitable soil for this species within the Study Area.
Humboldt lily *Lilium humboldtii* ssp. *humboldtii*	4	Perennial bulbiferous herb found in openings of chaparral, cismontane woodland, and lower montane coniferous forest from 90 to 1,280 meters.	Blooming period: May – July.	**None**; the woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Jepson's woolly sunflower *Eriophyllum jepsonii*	4	Perennial herb sometimes found on serpentinite substrate within chaparral, cismontane woodland, and coastal scrub from 200 to 1,025 meters.	Blooming period: April – June.	**None**; the Study Area does not contain the soils required for this species.
Sanborn's onion *Allium sanbornii* var. *sanbornii*	4	Perennial bulbiferous herb usually found on serpentinite, gravelly substrate within chaparral, cismontane woodland, and lower montane coniferous forest from 260 to 1,510 meters.	Blooming period: May – September.	**None**; there is no suitable soil for this species within the Study Area.
Streambank spring beauty *Claytonia parviflora* ssp. *grandiflora*	4	Annual herb found on rocky substrate within cismontane woodland from 250 to 1,200 meters.	Blooming period: February – May.	**None**; the Study Area does not provide habitat for this species and is outside of the known elevational range.
Invertebrates				
Alabaster Cave harvestman *Banksula californica*	CSA	Found in caves in the Sierra Nevada.	Year-round	**None**; there is no suitable habitat for this species in the Study Area.
Blennosperma vernal pool andrenid bee *Andrena blennospermaties*	CSA	Found in upland areas near vernal pools; dependent on populations of blennosperma flowers. Slender, dark-olive green bees with pale apical bands on the dorsum of the abdominal segments; females measure 8.5-9.5 mm, males 7-8 mm.	Year-round	**None**; there is no suitable habitat for this species in the Study Area.
California linderiella *Linderiella occidentalis*	CSA	Inhabits vernal pools, swales, and ephemeral freshwater habitat.	Wet-season sampling and/or dry season cyst identification.	**None**; the seasonal swales in the Study Area provide marginal habitat, but the Study Area is outside the locally recorded range of the species.
Cosumnes Stripetail *Cosumnoperla hypocrena*	CSA	Freshwater intermittent streams in the American River and Cosumnes River basins between 300 and 1500 meters.	Year – round	**None**; the Study Area is outside the geographic range of the species.
Hairy Water flea *Dumontia oregonensis*	CSA	Vernal pools, seasonal pools, and streams from Jackson County, Oregon to Sacramento and Solano Counties in California.	Wet Season	**None**; the Study Area is outside the geographic range of the species.
Mid-valley fairy shrimp *Branchinecta mesovallensis*	CSA	Inhabits vernal pools, swales, and ephemeral freshwater habitat.	Wet-season sampling and/or dry season cyst identification.	**None**; the Study Area is outside the geographic range of the species.
Ricksecker's water scavenger beetle *Hydrochara ricksecker*i	CSA	A small aquatic beetle known from pond habitats in the San Francisco Bay Area.	Year-round	**None**; there is no habitat for this species within the Study Area.
Western bumble bee *Bombus occidentalis*	CSA	Generally, nests underground in abandoned rodent burrows and bird nests. Forages on a wide variety of flowers. Found in Coast range north of Monterey County, Sierra mountain range north of Tuolumne County, and around the delta region of Contra Costa County.	New colonies established in spring. Overwinter in shallow burrows.	**None**; the Study Area is outside the geographic range of the species.

Table 3 includes Rank 3 and 4 CNPS species and non-listed invertebrates, which may not be subject to CEQA review.

Appendix C — Plants and Wildlife Observed in the Study Area

Appendix C
Wildlife Observed in the Study Area

Species	Common Name
Birds	
Agelaius phoeniceus	Red-winged blackbird
Buteo jamaicensis	Red-tailed hawk
Callipepla californica	California quail
Carpodacus mexicanus	House finch
Cathartes aura	Turkey vulture
Euphagus cyanocephalus	Brewer's blackbird
Falco sparverius	American kestrel
Melanerpes formicivorus	Acorn woodpecker
Meleagris gallopavo	Wild turkey
Sayornis nigricans	Black phoebe
Sturnella neglecta	Western meadowlark
Sturnus vulgaris	European starling
Zenaida macroura	Mourning dove
Mammals	
Microtus agrestis	Vole
Lepus californicus	Black-tailed jackrabbit
Plestiodon skiltonianus	Western skink
Sceloporus occidentalis	Western fence lizard
Sylvilagus sp.	Cottontail rabbit

Appendix C
Plants Observed in the Study Area

Genus	Species	Common Name	Wetland Indicator Status
Adoxaceae	*Sambucus nigra* ssp. caerulea	Blue elderberry	FACU
Apiaceae	*Eryngium vaseyi*	Coyote-thistle	FACW
Apocynaceae	*Asclepias fascicularis*	Mexican whorled milkweed	FAC
Asteraceae	*Anaphalis margaritacea*	Pearly everlasting	FACU
Asteraceae	*Artemisia douglasiana*	California mugwort	FAC
Asteraceae	*Baccharis pilularis*	Coyote brush	NI
Asteraceae	*Carduus pycnocephalus* ssp. pycnocephalus	Italian thistle	NI
Asteraceae	*Holocarpha virgata*	Tarweed, tarplant	NI
Asteraceae	*Hypochaeris glabra*	Smooth cat's ear	NI
Asteraceae	*Lactuca serriola*	Prickly lettuce	FACU
Asteraceae	*Silybum marianum*	Milk thistle	NI
Boraginaceae	*Amsinckia menziesii*	Fiddleneck	NI
Boraginaceae	*Phacelia cicutaria*	Phacelia	NI
Boraginaceae	*Plagiobothrys fulvus*	Common popcornflower	NI
Brassicaceae	*Brassica napus*	Swede rape, rapeseed	NI
Brassicaceae	*Brassica nigra*	Black mustard	NI
Caryophyllaceae	*Spergularia bocconi*	Boccon's sand spurry	FACW
Cyperaceae	*Cyperus eragrostis*	Nutsedge	FACW
Cyperaceae	*Eleocharis macrostachya*	Spikerush	OBL
Cyperaceae	*Schoenoplectus acutus* var. occidentalis	Tule	OBL
Euphorbiaceae	*Croton setiger*	Turkey-mullein	NI
Fabaceae	*Trifolium hirtum*	Rose clover	NI
Fagaceae	*Quercus lobata*	Valley oak	FACU
Fagaceae	*Quercus wislizeni*	Interior live oak	NI
Gentianaceae	*Zeltnera muehlenbergii*	Muehlenberg's centaury	FAC
Geraniaceae	*Erodium botrys*	Broadleaf filaree	FACU
Geraniaceae	*Erodium cicutarium*	Cutleaf filaree	NI
Geraniaceae	*Geranium molle*	Crane's bill geranium	NI
Hypericaceae	*Hypericum perforatum*	St. John's wort	FACU
Lamiaceae	*Mentha pulegium*	Pennyroyal	OBL
Marsileaceae	*Pilularia americana*	American pillwort	OBL
Moraceae	*Ficus carica*	Edible fig	FACU
Myrsinaceae	*Lysimachia arvensis*	Scarlet pimpernel	FAC
Onagraceae	*Epilobium ciliatum*	Northern willow herb	FACW
Papaveraceae	*Eschscholzia californica*	California poppy	NI
Papaveraceae	*Eschscholzia casespitosa*	Foothill poppy	NI
Poaceae	*Aira caryophyllea*	Silver hair grass	FACU
Poaceae	*Avena fatua*	Wild oat	UPL
Poaceae	*Bromus diandrus*	Ripgut grass	NI
Poaceae	*Bromus hordeaceus*	Soft chess	FACU
Poaceae	*Deschampsia danthonioides*	Annual hair grass	FACW
Poaceae	*Elymus caput-medusae*	Medusa head	NI
Poaceae	*Festuca bromoides*	Brome fescue	FACU
Poaceae	*Festuca perennis*	Rye grass	FAC
Poaceae	*Hordeum murinum*	Foxtail	FACU
Poaceae	*Polypogon monspeliensis*	Annual beard grass, rabbitfoot grass	FACW
Poaceae	*Stipa pulchra*	Purple needle grass	NI
Poaceae	*Vulpia myuros*	Foxtail fescue	FACU
Polygonaceae	*Persicaria lapathifolia*	Common knotweed	FACW
Polygonaceae	*Rumex crispus*	Curly dock	FAC
Rosaceae	*Rubus armeniacus*	Himalayan blackberry	FAC
Salicaceae	*Populus fremontii* ssp. fremontii	Alamo or Fremont cottonwood	NI
Salicaceae	*Salix* sp.	Willow	FACW
Scrophulariaceae	*Verbascum blattaria*	Moth mullein	UPL
Sonchus	*Sonchus asper*	Sow thistle, prickly sow thistle	FAC
Themidaceae	*Brodiaea elegans* ssp. elegans	Harvest brodiaea	FACU
Typhaceae	*Typha angustifolia*	Narrow-leaved cattail	OBL
Typhaceae	*Typha latifolia*	Common cattail, broadleaf cattail	OBL
Vicia	*Vicia villosa*	Hairy vetch	NI

Executive Summary

Foothill Associates' biologists conducted a biological resources assessment (BRA) and focused surveys for western burrowing owl, special-status plants, and California red-legged frog on the El Dorado Hills 52 Study Area located within El Dorado County, California. The purpose of this BRA is to summarize the general biological resources on the Study Area, to assess the suitability of the Study Area to support special-status species and sensitive habitat types, to summarize the results of various focused surveys, and to provide recommendations for regulatory permitting or further analysis that may be required prior to development activities occurring on the Study Area.

The El Dorado Hills 52 Study Area (Study Area) consists of ±34 acres of land that is primarily annual grassland. The Study Area is bifurcated by Silva Valley Parkway. A former home site is located on the southern portion of the property and a large part of the northern portion was used to stockpile soil during the construction of the adjacent Silva Valley Parkway – U.S. Highway 50 Interchange Project. Land uses surrounding the Study Area include an elementary school, residences, and U.S. Highway 50.

Known or potential biological constraints within the Study Area include:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for Blainville's horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. (seasonal wetlands, perennial marsh, and ephemeral and perennial drainages), riparian habitat, valley oak woodland, and purple needlegrass grassland.

1.0 INTRODUCTION

This report summarizes the findings of a BRA, focused surveys for burrowing owl, California red-legged frog, and special-status plants and an aquatic resources delineation completed for the ±34-acre El Dorado Hills 52 Study Area, located within El Dorado County, California. This document addresses the onsite physical features, as well as plant communities present and the common plant and wildlife species occurring, or potentially occurring, in the Study Area. Furthermore, the suitability of habitats to support special-status species and sensitive habitats are analyzed and recommendations are provided for any regulatory permitting or further analysis required prior to development activities occurring on the Study Area.

1.1. Project Description

Development proposed within the Study Area will ultimately result in the development of approximately 32-acres of commercial development. The northern portion of the Study Area is approximately 17.07 acres (North Site) and the southern portion is approximately 15.73 acres (South Site), net of the right-of-way for roads. Development is designed to allow either the North Site or the South Site to develop independent from the other. Proposed improvements will include construction of commercial buildings and associated parking, utilities, and storm water management facilities as well as multiple points of access, and a new traffic signal on Silva Valley Parkway. Ancillary amenities include pedestrian walkways, bicycle parking, signage and lighting and landscaping. A 7.69-acre area within the North Site is dedicated right-of-way associated with the future extension of Country Club Drive. A 1.38-acre open space area west of Old Silva Valley Road will not be developed.

2.0 REGULATORY FRAMEWORK

Federal, State, and local environmental laws, regulations, and policies relevant to the California Environmental Quality Act (CEQA) review process are summarized below. The CEQA significance criteria are also included in this section.

2.1. Federal Regulations

2.1.1. Federal Endangered Species Act

The U.S. Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect those species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend.

FESA prohibits the "take" of endangered or threatened wildlife species. "Take" is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (FESA Section 3 [(3) (19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR §17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR §17.3). Actions that result in take can result in civil or criminal penalties.

In the context of the proposed project, FESA consultation with the U.S. Fish and Wildlife Service (USFWS) or the National Marine Fisheries Service (NMFS) would be initiated if development resulted in take of a threatened or endangered species or if issuance of a Section 404 permit or other federal agency action could result in take of an endangered species or adversely modify critical habitat of such a species.

2.1.2. Migratory Bird Treaty Act

Raptors (birds of prey), migratory birds, and other avian species are protected by a number of State and federal laws. The federal Migratory Bird Treaty Act (MBTA) prohibits the killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of Interior.

2.1.3. The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (Eagle Act) prohibits the taking or possession of and commerce in bald and golden eagles with limited exceptions. Under the Eagle Act, it is a violation to "*take, possess, sell, purchase, barter, offer to sell, transport, export or import, at any time or in any manner, any bald eagle commonly known as the American eagle, or golden eagle, alive or dead, or any part, nest, or egg, thereof*." Take is defined to include pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest, and disturb. Disturb is further defined in 50 CFR Part 22.3 as "*to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available (1) injury to*

an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior."

2.2. State Jurisdiction

2.2.1. California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to the FESA but pertains to State-listed endangered and threatened species. CESA requires state agencies to consult with the California Department of Fish and Wildlife (CDFW), when preparing CEQA documents. The purpose is to ensure that the State lead agency actions do not jeopardize the continued existence of a listed species or result in the destruction, or adverse modification of habitat essential to the continued existence of those species, if there are reasonable and prudent alternatives available (Fish and Game Code §2080). CESA directs agencies to consult with CDFW on projects or actions that could affect listed species, directs CDFW to determine whether jeopardy would occur and allows CDFW to identify "reasonable and prudent alternatives" to the project consistent with conserving the species. CESA allows CDFW to authorize exceptions to the State's prohibition against take of a listed species if the "take" of a listed species is incidental to carrying out an otherwise lawful project that has been approved under CEQA (Fish & Game Code § 2081).

2.2.2. California Department of Fish and Game Codes

A number of species have been designated "fully protected" species under Sections 5515, 5050, 3511, and 4700 of the Fish and Game Code, but are not listed as endangered (Section 2062) or threatened (Section 2067) species under CESA. Except for take related to scientific research, all take of fully protected species is prohibited. The California Fish and Game Code defines take as "*hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill.*" Additionally, Section 3503 of the California Fish and Game Code prohibits the killing of birds or the destruction of bird nests.

2.2.3. Native Plant Protection Act

The Native Plant Protection Act (NPPA), enacted in 1977, allows the Fish and Game Commission to designate plants as rare or endangered. There are 64 species, subspecies, and varieties of plants protected under the NPPA. The NPPA prohibits take of endangered or rare native plants, with some exceptions for agricultural and nursery operations and emergencies. Vegetation removal from canals, roads, and other sites, changes in land use, and certain other situations require proper advance notification to CDFW.

2.3. Jurisdictional Waters

2.3.1. Federal Jurisdiction

The U.S. Army Corps of Engineers (Corps) regulates discharge of dredge or fill material into waters of the U.S. under Section 404 of the Clean Water Act (CWA). "Discharges of fill material"

is defined as the addition of fill material into waters of the U.S., including, but not limited to the following: placement of fill that is necessary for the construction of any structure, or impoundment requiring rock, sand, dirt, or other material for its construction; site-development fills for recreational, industrial, commercial, residential, and other uses; causeways or road fills; fill for intake and outfall pipes and subaqueous utility lines [33 C.F.R. §328.2(f)].

Waters of the U.S. include a range of wet environments such as lakes, rivers, streams (including intermittent streams), mudflats, sandflats, wetlands, sloughs, and wet meadows. Boundaries between jurisdictional waters and uplands are determined in a variety of ways depending on which type of waters is present. Methods for delineating wetlands and non-tidal waters are described below.

- Wetlands are defined as "*those areas that are inundated or saturated by surface or groundwater at a frequency and duration sufficient to support and under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions*" [33 C.F.R. §328.3(b)]. Presently, to be a wetland, a site must exhibit three wetland criteria: hydrophytic vegetation, hydric soils, and wetland hydrology existing under the "normal circumstances" for the site.
- The lateral extent of non-tidal waters is determined by delineating the ordinary high-water mark (OHWM) [33 C.F.R. §328.4(c)(1)]. The OHWM is defined by the Corps as "*that line on shore established by the fluctuations of water and indicated by physical character of the soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas*" [33 C.F.R. §328.3(e)].

An aquatic feature is determined to be a water of the U.S. based on nexus with a traditionally navigable water pursuant to the Supreme Court's decision in the consolidated cases *Rapanos v. United States* and *Carabell v. United States* (126 S. Ct. 2208) and agency guidance subsequent to this decision. Under these rules, the Corps asserts jurisdiction over wetlands adjacent to traditional navigable waters, relatively permanent non-navigable tributaries (i.e., waters that have a continuous flow at least three months out of the year), and wetlands that abut relatively permanent tributaries. The Corps determines jurisdiction over waters that are non-navigable tributaries that are not relatively permanent, and wetlands adjacent to these tributaries, by making a determination whether such waters "significantly affect the chemical, physical, and biological integrity of other jurisdictional waters more readily understood as "navigable." Finally, the Corps generally does not consider the following to be "waters of the United States": swales or erosional features (e.g., gullies, small washes characterized by low volume, infrequent or short duration flow) and ditches "wholly in and draining only uplands…which do not carry a relatively permanent flow of water." Navigable waters of the United States are defined as waters that have been used in the past, are now used, or are susceptible to use as a means to transport interstate or foreign commerce up to the head of navigation.

2.3.2. State Jurisdiction

Regional Water Quality Control Boards

Discharges of fill or waste material to waters of the State are regulated by the State Water Resources Control Board (SWRCB) through its Regional Water Quality Control Boards (RWQCB) under Section 401 of the CWA and the Porter-Cologne Water Quality Control Act (contained in the California Water Code). All waters of the U.S. are also considered waters of the State. In addition, other aquatic features that are not subject to Corps' jurisdiction, such as roadside ditches or isolated wetlands, may be considered waters of the State. This determination will be made by RWQCB staff on a case-by-case basis.

Section 401 of the CWA requires an applicant to obtain "water quality certification" to ensure compliance with State water quality standards before certain federal licenses or permits may be issued. Section 13260(a) of the Porter-Cologne Water Quality Control Act requires any person discharging waste, including dredged or fill material, or proposing to discharge waste, other than to a community sewer system, within any region that could affect the quality of the waters of the State (all surface and subsurface waters) to file a report of waste discharge. The permits subject to Section 401 include CWA Section 404 permits issued by the Corps. Waste discharge requirements under the Porter-Cologne Water Quality Control Act were typically waived for projects that required certification. Discharges to waters of the State that are not subject to a CWA Section 404 permit rely on the report of waste discharge process.

California Department of Fish and Wildlife

The CDFW is a trustee agency that has jurisdiction under Section 1600 *et seq.* of the California Fish and Game Code. Under Sections 1602 and 1603, a private party must notify CDFW if a proposed project will "*substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of any river, stream, or lake designated by the department, or use any material from the streambeds…except when the department has been notified pursuant to Section 1601.*" Additionally, CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over 4-inches in diameter at breast height (DBH). If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends submitting an application for a Streambed Alteration Agreement (SAA) for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater.

2.4. CEQA Significance

Section 15064.7 of the CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study Checklist contained in Appendix G of the CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these

examples, impacts to biological resources would normally be considered significant if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;
- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;
- Have a substantial adverse effect on federally protected wetlands as defined by Section 404 of the CWA (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and
- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish, or result in the loss of, an important biological resource, or those that would obviously conflict with local, State, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

2.4.1. California Native Plant Society

The California Native Plant Society (CNPS) maintains a rank of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the *Inventory of Rare and Endangered Vascular Plants of California*. Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS ranks:

- Rank 1A: Plants presumed Extinct in California
- Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere
- Rank 2: Plants Rare, Threatened, or Endangered in California, but more numerous elsewhere

- Rank 3: Plants about which we need more information – A Review List
- Rank 4: Plants of limited distribution – A Watch List

All plants appearing on CNPS Rank 1 or 2 are considered to meet CEQA Guidelines Section 15380 criteria. While only some of the plants ranked 3 and 4 meet the definitions of threatened or endangered species, the CNPS recommends that all Rank 3 and Rank 4 plants be evaluated for consideration under CEQA.

2.4.2. California Department of Fish and Wildlife Species of Concern

Some additional fish, amphibian, reptile, bird, and mammal species may receive consideration by CDFW and lead agencies during the CEQA process, in addition to species that are formally listed under FESA and CESA or are fully protected. These species are included on the *Special Animals List*, which is maintained by CDFW. This list tracks species in California whose numbers, reproductive success, or habitat may be in decline. In addition to "Species of Special Concern" (SSC), the *Special Animals List* includes species that are tracked in the California Natural Diversity Database (CNDDB), but warrant no legal protection. These species are identified as "California Special Animals" (CSA).

2.5. El Dorado County Policies and Regulations

2.5.1. El Dorado County General Plan

In addition to the federal and State regulations described above, the *County of El Dorado General Plan* identifies goals, objectives, and policies to provide further protection to biological resources within the County's limits (El Dorado County 2004). Applicable General Plan policies are summarized below and included in **Appendix A**.

The General Plan's *Conservation Element* sets a number of goals to conserve, enhance, and manage water resources, wildlife, fisheries, vegetation, and wildlife habitat resources. In furtherance of these goals, the County has established a number of policies designed to minimize impacts to sensitive species and habitats. Policy 7.3.3.4 requires setbacks from riparian areas and wetlands. Policy 7.4.1.6 requires that development projects be designed to avoid fragmentation of sensitive habitats to the greatest extent feasible. A number of policies related to Objective 7.42 require preservation of wildlife migration and movement corridors, including increased oak canopy retention requirements and prohibition of fences or other structures that would restrict wildlife movement.

2.5.2. El Dorado Hills Specific Plan

In addition to federal and State regulations, the *El Dorado Hills Specific Plan* (Specific Plan) identifies goals, objectives, and policies regarding establishment and maintenance of open space and wetland areas. The construction of the El Dorado Hills 52 Project is in conformance with this Specific Plan. Applicable Specific Plan requirements are included in **Appendix A**.

2.5.3. El Dorado County Tree Ordinance

The County of El Dorado currently regulates impacts to oak woodland canopy under General Plan Policy 7.4.4.4. All oak trees, of all sizes, are included in the measurement of oak canopy. All new development projects on parcels greater than 1 acre with at least 1 percent canopy cover must adhere to the retention standard described in Option A of the policy. Canopy retention requirements are based on the amount of existing canopy on the site. In addition to preservation of existing oak woodland canopy, mitigation for impacts to oak woodland canopy is required at a 1:1 ratio. Application of the policy is described in the Interim Interpretive Guidelines for General Plan Policy 7.4.4.4 (Option A), which was last amended on October 12, 2007. The policy states that mitigation can be in the form of on-site or off-site planting of oak trees or acorns, or obtaining an offsite conservation easement to protect existing oak woodland habitat in lieu of planting. As per the Guidelines, a Monitoring and Reporting Plan needs to be prepared and is subject to maintenance and monitoring for up to ten years.

The County is in the process of revising the *El Dorado County Oak Resources Management Plan* (ORMP), which is expected to be adopted and go into effect in the near future. Under the proposed new plan, an oak woodland removal permit will be required prior to removal of oak trees that are part of an oak woodland. Mitigation requirements will be based on the percentage of existing oak woodland removed ranging from 1:1 mitigation for zero to 50 percent removal to 2:1 mitigation for more than 75 percent removal. Mitigation may be completed with a combination of the following options: acquisition of an off-site conservation easement, payment of in-lieu fees, or either on-site or off-site replacement planting of up to 50 percent of the required mitigation area. A tree removal permit shall be required prior to the removal of any oak tree not located in an oak woodland and for removal of all Heritage Trees (native oaks with a trunk diameter of 36” or greater at breast height). Trees removed under permit shall require replacement planting or payment of in-lieu fees in an amount equivalent to the number of trunk inches removed.

2.6. El Dorado Hills Community Services District Policies

In addition to federal and State regulations, the El Dorado Hills Community Services District (EDHCSD) identifies goals, objectives, and policies regarding oak tree preservation. Applicable policies are included in **Appendix A**.

3.0 METHODS

Available information pertaining to the natural resources of the region was reviewed. All references reviewed for this assessment are listed in the **References** section. The following site-specific information was reviewed:

- California Department of Fish and Wildlife (CDFW). 2017. *California Natural Diversity Data Base* (CNDDB: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek*, *Rocklin*, and *Folsom* U.S. Geological Survey (USGS) 7.5-minute series quadrangles), Sacramento, CA. Accessed [8/15/2017] (**Appendix B**);
- California Native Plant Society (CNPS). 2017. *Inventory of Rare and Endangered Plants* (online edition, v8-02) (CNPS: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek*, *Rocklin*, and *Folsom* quadrangles). Accessed [8/15/2017] (**Appendix B**);
- U.S. Fish and Wildlife Service (USFWS). 2017. *Information for Planning and Conservation* (IPaC) *Official Species List*: *El Dorado Hills 52*. Accessed [8/15/2017] (**Appendix B**);
- U.S. Department of Agriculture (USDA), Natural Resources Conservation Service (NRCS). 2015. Web Soil Survey. Available online at: http://websoilsurvey.sc.egov.usda.gov/App/HomePage.html. Accessed [8/15/2017]; and
- U.S. Geological Survey. 1967. Photorevised 1980. *Clarksville, California*. 7.5-minute series topographic quadrangle. United States Department of Interior; and
- Biological reports and associated documents previously prepared for the Study Area.

Prior to the site survey, existing information, including the previous wetland delineation and soil maps, were reviewed and the results of the records search and five-mile radius CNNDB query were summarized in a table (**Appendix B**). General field surveys of the Study Area were conducted on April 5, 2013 and August 8, 2017. The Study Area was systematically surveyed on foot with binoculars to ensure total search coverage, with special attention given to identifying those portions of the Study Area with the potential for supporting special-status species and sensitive habitats. During the field surveys, biologists recorded plant and animal species observed (**Appendix C**), as well as characterized biological communities occurring onsite. Following the site survey, the potential for each species identified in the records search to occur in the Study Area was determined based on the site surveys, soils, and species-specific information, as shown in **Appendix B**.

A wetland delineation was performed separately utilizing the Corps 1987 three-parameter methodology to delineate potentially jurisdictional waters of the U.S. on the ±200-acre Silva Valley Interchange Project, which includes the Study Area. The Corps issued a Preliminary Jurisdictional Determination for the aquatic features delineated within the Study Area on June 30, 2009 (SPK-2005-00070), as part of the Silva Valley Interchange Project, concurring with the amount of jurisdictional aquatic features mapped. The delineation has since expired. Therefore,

an updated delineation was performed on December 15, 2015. The results of the wetland delineation are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2017a). The results are considered preliminary until the Corps verifies the findings.

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. The botanical inventories were conducted in accordance with CDFW's (CDFG 2009) protocol plant surveys. The results of the botanical surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c). A complete list of plants observed within the Study Area is provided in **Appendix C**.

Protocol-level burrowing owl surveys were conducted on March 12, 2015, April 24, 2015, May 26, 2015, and June 16, 2015. The surveys were conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (CDFW 2012). The results of the burrowing owl surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c).

Protocol-level breeding season California red-legged frog (CRLF) surveys were conducted on January 12 and 26, 2016 and February 2 and 9, 2016. The protocol-level breeding season surveys were conducted in accordance with the *Revised Guidance on Site Assessment and Field Surveys for the California Red-legged Frog* (USFWS 2005; CRLF Guidance). The results of the protocol-level breeding season surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016a).

An oak woodland analysis was performed to document the extent of the existing oak trees in the Study Area and impacts from the proposed project. The oak woodland report is contained under separate cover (Foothill Associates 2017b).

4.0 RESULTS

4.1. Site Location and Description

The Study Area is located in in El Dorado County adjacent to U.S. Highway 50 immediately east of Silva Valley Parkway and north of Tong Road. Land uses surrounding the Study Area include residential development to the north and paved roads, oak woodland, and annual grassland to the east, west, and south. The Study Area is located within Township 9 North, Range 8 East, Section 1 of the *Clarksvill*e USGS 7.5-minute series quadrangle. The approximate location of the center of the Study Area is 38° 39' 40.160" North, 121° 3' 23.354" West (**Figure 1**).

The Study Area consists of approximately 34 acres of land that is primarily annual grassland. The Study Area is bifurcated by Silva Valley Parkway. Two drainage corridors cross the Study Area from the northeast to the southwest.

4.2. Physical Features

4.2.1. Topography and Drainage

Topography within the Study Area ranges from relatively level to moderately sloped with elevations ranging from approximately 700 to 800 feet above mean sea level (MSL) (~210-240 meters). Surface runoff flows through and exits the Study Area via riverine drainages, which run in a northeast to southwest direction.

4.2.2. Soils

The Natural Resources Conservation Service (NRCS) has mapped one soil unit within the Study Area (**Figure 2**): **Auburn Silt Loam, 2 to 30 Percent Slopes**. General characteristics associated with this soil type are described below (USDA, NRCS 1974).

- **(AwD) Auburn Silt Loam, 2 to 30 Percent Slopes**: The soils in this series are well drained. Permeability is moderate. Vegetation associated with this soil series includes annual grasses, forbs, and oaks. The hydric soils list for El Dorado County does not identify this soil type as hydric (USDA, NRCS 2015).

4.3. Biological Communities

Six major biological communities occur in the Study Area including annual grassland, riparian woodland, valley oak woodland, seasonal wetland, perennial marsh, and disturbed/developed. These communities provide habitat to a number of common species of wildlife and may provide suitable habitat for special-status species. It should be noted that wetlands may occur within a biological community. For instance, a creek surrounded by riparian woodland would be included within the riparian woodland for the purposes of determining biological community acreage. Vernal pools and seasonal wetlands may be included in the annual grassland community and are often used by wildlife from the annual grassland. However, a very different aquatic habitat, such as a perennial marsh, is considered its own biological community. Dominant vegetation observed within each biological community is discussed in detail below. A

comprehensive list of plants observed within the Study Area is provided in **Appendix C**. The location and extent of each biological community are depicted in **Figure 3**.

4.3.1. Annual Grassland

Annual grassland dominates both the northern and southern portions of the Study Area (**Figure 3**). This vegetation community is characterized primarily by an assemblage of non-native annual grasses and forbs. Dominant vegetation includes ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) intermixed with red-stemmed filaree (*Erodium cicutarium*), popcornflower (*Plagiobothrys* sp.), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), scarlet pimpernel (*Anagallis arvensis*), St. John's wort (*Hypericum perforatum*), brodiaea (*Brodiaea elegans*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*).

Two areas within the annual grassland contain purple needlegrass within the southern portion of the Study Area (**Figure 3**). The purple needlegrass is interspersed with northern willow herb (*Epilobium ciliatum*), ripgut brome, soft chess, and wild oat.

The annual grassland community includes small ephemeral and perennial drainages. The ephemeral drainage is mostly unvegetated and highly seasonal. The perennial drainage has a small clump of willows (*Salix* sp.) and broadleaf cattail (*Typha latifolia*) and is otherwise minimally vegetated.

4.3.2. Riparian Woodland

Riparian woodland habitat occurs within the along perennial drainage on the western boundary of the Study Area (**Figure 3**). Dominant vegetation includes broadleaf cattail, willow, spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), Himalayan blackberry (*Rubus armeniacus*), and valley oak (*Quercus lobata*).

4.3.3. Valley Oak Woodland

Valley oak woodland is found in a small area on the southwest boundary of the Study Area where a small stand of mature valley oak trees overhangs a small perennial drainage (**Figure 3**). The understory is primarily annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal immediately adjacent to the drainage.

4.3.4. Seasonal Wetland

A number of seasonal wetland features are found in the Study Area (**Figure 3**). Most are associated with the eastern drainage system. The seasonal wetlands include riverine, depressional, and slope topography, but the vegetation is similar throughout the Study Area. Dominant vegetation in the seasonal wetlands includes rabbitsfoot grass (*Polypogon monspeliensis*), spike rush (*Eleocharis macrostachya*), nutsedge (*Cyperus eragrostis*), curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), ryegrass, annual hair grass (*Deschampsia danthonioides*), and rye grass (*Festuca perennis*).

4.3.5. Perennial Marsh

Perennial marsh habitat is found in the southern portion of the Study Area (**Figure 3**). It is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock with areas of dense cattails, Himalayan blackberry, and a small clump of willows.

4.3.6. Disturbed/ Developed

Disturbed/developed areas in the Study Area include graded roads and a stockpile area (**Figure 3**). The disturbed/developed areas are sparsely vegetated with red-stemmed filaree, soft chess, wild oat, and winter vetch.

4.4. Special-Status Species

Special-status species are plant and animal species that have been afforded special recognition by federal, State, or local resource agencies or organizations. Listed and special-status species are of relatively limited distribution and may require specialized habitat conditions. Special-status species are defined as meeting one or more of the following criteria:

- Listed or proposed for listing under CESA or FESA;
- Protected under other regulations (e.g. Migratory Bird Treaty Act);
- Included on the CDFW Special Animals List;
- Identified as Rank 1-4 by CNPS; or
- Receive consideration during environmental review under CEQA.

Special-status species considered for this analysis are based on queries of the CNDDB, the USFWS, and CNPS ranked species (online versions) for the *Clarksville* and eight surrounding quadrangles. **Appendix B** includes the common name and scientific name for each species, regulatory status (federal, State, local, CNPS), habitat descriptions, and potential for occurrence in the Study Area. The following set of criteria has been used to determine each species' potential for occurrence in the Study Area:

- **Present**: Species known to occur within the Study Area based on CNDDB records and/or observed within the Study Area during the biological surveys.
- **High**: Species known to occur on or in the vicinity of the Study Area (based on CNDDB records within five miles and/or based on professional expertise specific to the Study Area or species) and there is suitable habitat within the Study Area.
- **Low**: Species known to occur in the vicinity of the Study Area and there is marginal habitat within the Study Area **-OR-** Species is not known to occur in the vicinity of the Study Area, however, there is suitable habitat on the Study Area.
- **None**: Species is not known to occur on or in the vicinity of the Study Area and there is no suitable habitat within the Study Area -**OR-** Species was surveyed for during the

appropriate season with negative results **-OR-** The Study Area occurs outside of the known elevation or geographic ranges.

Only those species that are known to be *present* or have a *high* or *low* potential for occurrence are discussed further in the following sections. Species that were determined to have a potential for occurrence but for which focused surveys were conducted with negative results are not discussed further in this report. Detailed results of focused surveys are contained under separate covers.

4.4.1. Listed and Special-Status Plants

According to the records search, 30 special-status plant species have the potential to occur on or in the vicinity of the Study Area. Based on field observations and literature review, four species were determined to have the potential for occurrence to occur on the Study Area: big-scale balsamroot (*Balsamorhiza macrolep*is var. *macrolepis*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), and Sanford's arrowhead (*Sagittaria sanfordii*). Focused botanical surveys were conducted in 2015 during the bloom period of these plants. No special-status plant species were found.

4.4.2. Listed and Special-Status Wildlife

According to the records search, 41 special-status animal species have the potential to occur onsite or in the vicinity. Based on field observations and literature review, 15 species were determined to have the potential for occurrence to occur in the Study Area. Protocol surveys for burrowing owl (*Athene cunicularia*) and California red-legged frog (*Rana draytonii*) were conducted in 2015 and 2016. No observations or evidence of either species was found.

Species that are known to be *present* or that are considered to have a *high* potential to occur onsite include: western pond turtle (*Emys marmorata*) and raptors and other migratory birds. Species that are considered to have a *low* potential to occur onsite include: valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), Blainville's horned lizard (*Phrynosoma blainvillii*), foothill yellow-legged frog (*Rana boylii*), western spadefoot (*Spea hammondii*), golden eagle (*Aquila chrysaetos*), tricolored blackbird (*Agelaius tricolor*), American badger (*Taxidea taxus*), and special-status bat species.

Wildlife Species with a High Potential for Occurrence

Western Pond Turtle

Western pond turtles are found in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches with suitable basking sites (Californiaherps 2017). Suitable aquatic habitat typically has a muddy or rocky bottom and has emergent aquatic vegetation for cover (Stebbins 2003). Western pond turtles nest and overwinter in areas of sparse vegetation comprised of grassland and forbs with less than ten percent slopes, less than 492 feet (150 meters) from aquatic habitat (Rosenberg *et. al.* 2009). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The riverine perennial marsh, perennial drainage, and surrounding riparian habitat provide aquatic habitat and the surrounding annual grassland

provides upland habitat. This species was not observed within the Study Area during the biological surveys. This species has a *high* potential to occur within the Study Area.

Nesting Birds and Raptors

The nests of raptors and most other birds are protected under the MBTA. Raptors are also protected by Section 3503.5 of the California Fish and Game Code, which makes it illegal to destroy any active raptor nest. Additionally, the USFWS and CDFW identified a number of avian species of conservation concern that do not have specific statutory protection. Avian species forage and nest in a variety of habitats throughout El Dorado County. As shown in **Appendix B**, the riparian and valley oak woodlands, perennial marsh, and annual grasslands on and surrounding the Study Area may provide nesting or foraging habitat for raptors and other protected birds, including: white-tailed kite (*Elanus leucurus*), Cooper's hawk (*Accipiter cooperii*), ferruginous hawk (*Buteo regalis*), merlin (*Falco columbarius*), grasshopper sparrow (*Ammodramus savannarum*), and purple martin (*Progne subis*). Raptors and other protected migratory birds have a high potential to occur in the Study Area.

Wildlife Species with a Low Potential for Occurrence

Valley Elderberry Longhorn Beetle

The USFWS has determined the range of the valley elderberry longhorn beetle (VELB) to include the watersheds of the American, San Joaquin, and Sacramento Rivers and their tributaries up to approximately 3,000 feet above MSL (USFWS 1980). Typically, the beetles are found on elderberry shrubs within riparian plant communities. Some studies have found that multiple elderberry shrubs clumped together provide superior habitat for the beetle while isolated elderberry shrubs are less likely to support beetle populations. Typical plant species that co-occur with the elderberry shrubs include California sycamore (*Platanus racemosa*), willow, blackberry, and western poison oak (*Toxicodendron diversilobum*) (USFWS 1984). Beetles require elderberry stems with at least one-inch diameter at ground level (dgl) in order for the larvae to utilize the stems (USFWS 1999). The valley elderberry longhorn beetle depends on elderberry shrubs for its entire lifecycle. Adults are typically active from March through May during the flowering period of the elderberry shrub. The female lays its eggs on the leaves and stems of the elderberry shrub. The larvae emerge within a few days and burrow into the elderberry stem. The larvae feed on the stem pith until they pupate. When the host shrub begins flowering, the pupa emerges from the stem as an adult (Barr 1991). There is one CNDDB record of valley elderberry longhorn beetle listed within five miles of the Study Area (CDFW 2017a). One blue elderberry (*Sambucus nigra* ssp. *caerulea*) stem measuring one-inch dgl and several stems less than one-inch dgl occurs within the riparian habitat within the western portion of the Study Area (**Figure 3**). No exit holes were observed. This species has a *low* potential to occur within the Study Area.

Blainville's Horned Lizard

Blainville's horned lizard inhabits open areas of sandy soil and low vegetation in valleys, foothills, and semiarid mountains from sea level to 8,000 feet above MSL. It is typically found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose

soil. This species is often found in lowlands along sandy washes with scattered shrubs and along dirt roads, and frequently found near ant hills (Zeiner *et. al.* 1988). There are two CNDDB records of this species within five miles of the Study Area (CDFW 2017a). The species was not observed within the Study Area during the biological surveys. The annual grassland within the Study Area provides minimal habitat for the Blainville's horned lizard due to lack of sandy washes. Therefore, this species has a *low* potential to occur within the Study Area.

Foothill Yellow-Legged Frog

The Foothill yellow-legged frog (FYLF) is a moderate-sized frog (1.5-3.5" long) found on the western slope of the Sierras and along the coast. It has vague dorsolateral folds, horizontal pupils, yellow coloring on the underside of its hind legs, and a granular skin texture that covers the eardrums of colors that harmonize with the surroundings. The FYLF is a stream or river frog of chaparral, forest, and woodland ecozones. This species breeds after the high-water flows subside, mid-March to early June. The FYLF resides in streams and the associated riparian habitat. Metamorphosis generally occurs in three to four months and FYLF reach sexual maturity typically the first summer after they have metamorphosed. Breeding sties occur in shallow, slow flowing water with some pebble and/or cobble substrate. The introductions of bullfrogs and mosquitofish have led to declines in populations in California and Oregon. The perennial drainages provide marginal habitat for this species but there are no CNDDB records of this species within five miles of the Study Area (CDFW 2017a) and the species was not observed within the Study Area during the biological surveys. Therefore, this species has a *low* potential to occur within the Study Area.

Western Spadefoot

Western spadefoot occurs throughout the Central Valley and on the coast from Point Conception, south to the Mexican border. This species occurs from sea level up to 4,500 feet above MSL, in the southern Sierra foothills. Western spadefoot individuals are most commonly found in grassland habitats with temporary pools of water, but they have also been found in open chaparral and valley-foothill pine-oak woodlands (Stebbins 2003). This species spends most of the year underground, where members seek refuge from desiccating by constructing and residing in small burrows. This species often breeds in temporary pools and quiet streams between the months of January and May. There are no CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The species was not observed within the Study Area during the biological surveys. The depressional seasonal wetlands provide low quality breeding habitat given that they do not likely hold water for long enough for the western spadefoot to breed. This species has a *low* potential for utilizing the annual grassland as upland aestivation given the limited aquatic habitat available within the Study Area for breeding.

Golden Eagle

Golden eagles live in semi-open habitats where they have easy access to their primary prey of small to medium-sized mammals. Grasslands, deserts, savannahs, and early successional stages of forest and shrub habitats provide necessary foraging habitat. Nests are placed on cliffs or large trees and are maintained year after year. Breeding occurs from January through August (Kochert *et al.* 2002). Golden eagle home range territories vary widely from 8 to 77 square

miles (McGrady 1997) and are estimated to average 48 square miles in northern California (Zeiner *et al.* 1990). Breeding territories range from 8 to 21 square miles, or 3 to 5 miles surrounding the nest, but activity is often concentrated in a smaller core area. Although only one nest is used each year, a territory may contain multiple alternate nests. Typically, there are between 6 and 14 nests are found in a territory (Kochert *et al.* 2002). Golden eagles may use the same nest for multiple years or use new nest sites every year (Watson 2010).

There is one known occurrence approximately two miles northwest of the Study Area. This active nest was located in a foothill pine on a hillslope surrounded by oak woodland. Existing residences are located uphill within 300 feet of the nest on the north and east. Two juvenile and two adult golden eagles were observed at the nest in August 2013. A pair of adult eagles returned to the nest in 2014 and successfully raised one eaglet, which fledged by June 18, 2014. However, the nest tree fell over during a storm in November 2014. A golden eagle nest was subsequently identified in a foothill pine approximately 2.5 miles northwest of the Study Area on March 6, 2015. The new nest occurred within a foothill pine on a hillslope surrounded by oak woodland, approximately 25 feet from a residential dwelling. This foothill pine died in late 2015. The eagles relocated to another foothill pine downhill from their first nest location in 2016, but this nest is not active in 2017. The current nest location is unknown as of the writing of this report.

No golden eagles were observed during the biological surveys of the Study Area. Although the Study Area does not provide suitable nest trees, the annual grassland provides foraging habitat. This species has a *low* potential to occur within the Study Area.

Tricolored Blackbird

The tricolored blackbird is a colonial species that occurs in pastures, dry seasonal pools, and agricultural fields in the Central Valley and the surrounding foothills. This species usually nests within dense cattails (*Typha* sp.) or tules (*Scirpus* sp.) in emergent wetlands. Tricolored blackbird also nests in thickets of blackberry (*Rubus* sp.), wild rose (*Rosa* sp.), willows, and tall herbs (Zeiner *et. al.* 1990). Nesting locations typically must be large enough to support a minimum colony of approximately fifty pairs (Zeiner *et. al.* 1990). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The perennial marsh and surrounding riparian habitat could provide nesting habitat, though these areas are not large enough to support colonies. The annual grassland provides foraging habitat for this species. This species was not observed during the biological surveys of the Study Area. This species has a *low* potential to occur within the Study Area.

American Badger

American badgers are found in dry, open habitats including grassland and open woodland. Suitable burrowing habitat requires dry, sandy soil. Breeding occurs in summer and early fall, with young being born from March to April (Nature Serve 2015). There are no CNDDB records for this species within five miles of the Study Area (CDFW 2017a). The annual grassland provides habitat for this species, however, very few potential burrow sites that could be utilized by this species were observed during the biological surveys. No American badgers were

observed during the biological surveys. This species has a *low* potential to occur within the Study Area.

Special-Status Bats

California is home to several special-status bat species, including pallid bat (*Antrozous pallidus*) and silver-haired bat (*Lasionycteris noctivagans*). Bat numbers are in decline throughout the U.S. due to loss of roosting habitat, habitat conversion, and habitat alteration. There are no CNDDB records for bats within five miles of the Study Area (CDFW 2017a). No bats were observed roosting or foraging during the biological surveys. However, the riparian habitat and isolated trees within the annual grassland provide roosting habitat for these species. This species has a *low* potential to occur within the Study Area.

4.5. Sensitive Habitats

Sensitive habitats include those that are of special concern to resource agencies or those that are protected under CEQA, Section 1600 of the California Fish and Game Code, and/or Sections 401 and 404 of the Clean Water Act. Additionally, sensitive habitats are protected under the specific policies outlined in the *El Dorado County General Plan*. Sensitive habitats known to occur onsite are seasonal wetlands, perennial marsh, ephemeral and perennial drainages, riparian woodland, oak woodlands, and purple needlegrass grassland (**Figure 3**).

4.5.1. Potential Jurisdictional Waters of the U.S. and State

Potential jurisdictional waters of the U.S. and State located in the Study Area total approximately 0.57 acres. This acreage includes 0.01 acres of depressional seasonal wetland, 0.07 acres of slope seasonal wetland, 0.05 acres of riverine seasonal wetland, 0.31 acres of riverine perennial marsh, 0.05 acres of ephemeral drainage, and 0.07 acres of perennial drainage (**Figure 3**). To date the Corps has not verified these acreages. As discussed in **Section 2.3**, jurisdictional waters of the U.S. are subject to Section 404 of CWA and are regulated by the Corps.

4.5.2. Riparian Habitat

A total of 0.15 acres of riparian habitat are located in the Study Area along the northern perennial drainage (**Figure 3**). As discussed in **Section 2.2**, riparian areas, defined as the outermost bank or the edge of riparian vegetation, whichever is greater, may be subject CDFW jurisdiction under Section 1602 of the Fish and Game Code. Additionally, CDFW may exert jurisdiction over the drainages and other riverine aquatic features. CDFW should be consulted prior to disturbance or development to determine whether issuance of a Section 1602 Lake or Streambed Alteration Agreement is required.

4.5.3. Oak Trees and Oak Woodlands

A total of ten oak trees protected under Policy 7.4.5.2, consisting of nine valley oaks (*Quercus lobata*) and one blue oak (*Quercus douglasii*) are present in the Study Area. In total, there is 0.55 acres of oak canopy in the Study Area, which is equivalent to 1.6 percent canopy cover (**Figure 3**). Oak woodland habitat is currently regulated under Section 7.4.4.4 of the *El Dorado*

County General Plan (refer to Section 3.8.1, 3.9, and 3.10) based on canopy coverage. The Study Area is within the area covered by the *El Dorado Hills Specific Plan*, which generally describes preservation criteria for oak trees within designated open space areas.

4.5.4. Purple Needlegrass

Approximately 0.33 acres of purple needlegrass are interspersed within the annual grassland. Purple needlegrass grassland is listed as a sensitive plant community on the CDFW Natural Communities List and is required to be considered in CEQA documents. In order for purple needlegrass grassland to be considered a natural community, at least five percent of the species is required as a characteristic to dominant species in the herbaceous layer and the species is usually greater than 10 percent relative cover of the herbaceous layer (Sawyer *et al.* 2009). These mapped areas contain greater than 10 percent relative cover within the herbaceous layer. Therefore, the two polygons of purple needlegrass are considered a sensitive habitat since the acreage meets the minimum percentage criteria necessary to be considered a purple needlegrass grassland natural community.

4.6. Wildlife Migration Corridors and Important Biological Corridors

Wildlife corridors link together areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. The fragmentation of open space areas by urbanization creates isolated "islands" of wildlife habitat. Fragmentation can also occur when a portion of one or more habitats is converted into another habitat, such as when woodland or scrub habitat is altered or converted into grasslands after a disturbance such as fire, mudslide, or grading activities. Wildlife corridors mitigate the effects of this fragmentation by: (1) allowing animals to move between remaining habitats, thereby permitting depleted populations to be replenished and promoting genetic exchange; (2) providing escape routes from fire, predators, and human disturbances, thus reducing the risk of catastrophic events (such as fire or disease) on population or local species extinction; and (3) serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs. The Study Area does not link two significant natural areas and is surrounded by similar habitat types; therefore, it is not considered a wildlife migration corridor.

The *El Dorado County General Plan* identifies a number of Important Biological Corridors (IBC). The Study Area is not located within any existing IBC.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Known or potential biological constraints within the Study Area include:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for Blainville's horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. (seasonal wetlands, perennial marsh, and ephemeral and perennial drainages), riparian habitat, valley oak woodland, and purple needlegrass grassland.

5.1. Special-Status Plant Species

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. No special-status plants occur within the Study Area. However, if construction does not commence within two years of the 2015 botanical inventories, additional botanical inventories are recommended to ensure that populations have not established in the intervening years, in accordance with CDFW's (CDFG 2009) plant protocols.

5.2. Valley Elderberry Longhorn Beetle

Although no VELB were observed, there is a low potential for VELB to be present in the Study Area due to a single blue elderberry shrub observed within southern portion of the Study Area. According to the USFWS *Conservation Guidelines for Valley Elderberry Longhorn Beetle* (Guidelines; USFWS 1999), encroachment within 100 feet from elderberry shrubs with stems measuring at least one-inch dgl should be approved by the USFWS and a minimum setback of 20 feet from the driplines of the elderberry shrubs must be maintained. Project activities that will encroach into the 20-foot minimum setback area are assumed to adversely affect VELB. Project activities that may directly or indirectly affect elderberry shrubs with stems measuring at least one-inch dgl require minimization measures including planting replacement habitat or

purchasing mitigation credits from a USFWS-approved mitigation bank. The mitigation ratios vary based on whether exit holes are present and whether the shrubs occur within riparian habitat.

The outer edge of the non-development area is approximately 25 feet from the elderberry shrub measuring one-inch dgl. Therefore, the proposed project would not adversely affect potential habitat for VELB. However, the project proponent should consult with the USFWS to establish avoidance measures to ensure that no indirect effects associated with the encroachment of 100-foot avoidance buffer would occur. At minimum, high visibility construction fencing followed by silt fencing should be placed around the perimeter of the open space area. Signs should be erected approximately 20 feet apart along the high visibility construction fencing with the following information, "*This area is habitat of the valley elderberry longhorn beetle, a threatened species, and must not be disturbed. This species is protected by the FESA, as amended. Violators are subject to prosecution, fines, and imprisonment.*" The signs should be clearly readable from a distance of 20 feet, and must be maintained for the duration of construction.

5.3. Western Pond Turtle

The perennial marsh and perennial drainages and surrounding uplands within the Study Area may be suitable habitat for western pond turtle and they are known to occur in the vicinity. Filling of these features could impact this species, if present. In addition, vegetation clearing and grading within the surrounding uplands could impact this species, if present.

A pre-construction survey for western pond turtle should be conducted within 14 days of the initiation of construction by a qualified biologist prior to any construction activity that would directly impact pond or stream habitat or disturb the ground within 300 feet of aquatic habitat. If no western pond turtles are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey or halts for more than 14 days a new survey should be conducted prior to reinitiating construction.

If western pond turtles are found during the pre-construction survey, then a qualified biological monitor should be onsite during initial clearing and grading within 300 feet of a drainage, pond, or other aquatic habitat. The biological monitor will relocate any western pond turtles found within the construction footprint to suitable habitat away from the construction zone, but within the vicinity of the Study Area, if required. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the western pond turtle.

5.4. Blainville's Horned Lizard

The annual grassland within the Study Area provides a low potential for Blainville's horned lizard to occur given the lack of sandy soil. Pre-construction surveys for Blainville's horned lizard are recommended within 14 days prior to the start of ground disturbance. If no Blainville's horned lizards are observed, then no additional measures are recommended. If construction

does not commence within 14 days of the pre-construction survey or halts for more than 14 days, a new survey is recommended.

If Blainville's horned lizards are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any Blainville's horned lizards found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.5. Foothill Yellow-Legged Frog

The perennial drainages and surrounding uplands within the Study Area provide potential habitat for foothill yellow-legged frog. A qualified biologist should conduct a pre-construction survey of the drainages and uplands within 150 feet for foothill yellow-legged frog within 14 days prior to commencement of construction activities. If no foothill yellow-legged frog are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any foothill yellow-legged frog are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any foothill yellow-legged frog found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.6. Western Spadefoot

The annual grassland within the Study Area provides a low potential for upland aestivation habitat and the depressional seasonal wetland provide low quality breeding habitat for western spadefoot. A qualified biologist should conduct a pre-construction survey for western spadefoot within 14 days prior to commencement of construction activities. If no western spadefoot are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any western spadefoot are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any western spadefoot found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.7. Golden Eagle

Although the Study Area does not provide suitable nest trees, the annual grassland provides foraging habitat for golden eagle. A map identifying suitable foraging habitat for golden eagle within a three-mile radius of the last known location of the nest, which includes the Study Area, is provided in **Figure 4**. There is over 4,495 acres of potential foraging habitat surrounding the nest, based on an assessment of current aerial photographs. The project will result in the removal of 27.71 acres of annual grassland. The removal of approximately 0.62 percent of foraging habitat would have no impact on this species. Therefore, no additional measures are recommended.

5.8. Tricolored Blackbird

Although the Study Area does not provide suitable nesting areas for a tricolored blackbird colony, the annual grassland provides suitable foraging habitat. There are currently no requirements for conservation or mitigation for tricolored blackbird foraging habitat. Therefore, no additional measures are recommended.

5.9. Burrowing Owl

Although burrowing owl has a low potential to occur within the annual grassland, given the lack of suitable burrows and that they were not observed during the protocol-level breeding and non-breeding season surveys (Foothill Associates 2016b) or any other biological surveys conducted within the Study Area, they are not currently present. However, the species could occupy the Study Area in the future. The project proponent should conduct a take avoidance survey within 30 days prior to commencement of construction, in accordance with the 2012 *California Department of Fish and Wildlife Staff Report on Burrowing Owl Mitigation* (2012 Staff Report) (CDFW 2012). The survey area includes an approximately 500-foot (150-meter) buffer around the Study Area, where access is permitted. If the surveys are negative, then no additional measures are recommended.

If burrows are observed within 500 feet of the Study Area, an impact assessment should be prepared and submitted to the CDFW, in accordance with the 2012 Staff Report. If it is determined that project activities may result in impacts to nesting, occupied, and satellite burrows and/or burrowing owl habitat, the project proponent should consult with CDFW and develop a detailed mitigation plan such that the habitat acreage, number of burrows, and burrowing owls impacted are replaced. The mitigation plan should be based on the requirements set forth in Appendix A of the 2012 Staff Report.

5.10. Other Raptors and Migratory Birds

Several species of raptors and other migratory birds may forage and nest in the Study Area, including the special-status species white-tailed kite, Cooper's hawk, golden eagle, ferruginous hawk, merlin, grasshopper sparrow, and purple martin. Active nests are protected by the California Fish and Game Code Section 3503.5 and the MBTA. Construction activities could result in disturbance of nest sites through temporary increases in ambient noise levels and increased human activity. In addition, vegetation clearing operations, including pruning or

removal of trees and shrubs, could impact nesting birds if these activities occur during the nesting season (February 15 to August 31). All vegetation clearing including removal of trees and shrubs should be completed between September 1 to February 14, if feasible.

If vegetation removal and grading activities begin during the nesting season (February 15 to August 31), a qualified biologist should conduct a pre-construction survey of the project footprint for active nests. Additionally, the surrounding 500 feet should be surveyed for active raptor nests. The pre-construction survey should be conducted within 14 days prior to commencement of ground-disturbing activities. If the pre-construction survey shows that there is no evidence of active nests, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If nests are found and considered to be active, the project biologist should establish buffer zones to prohibit construction activities and minimize nest disturbance until the young have successfully fledged. Buffer width will depend on the species in question, surrounding existing disturbances, and specific site characteristics, but may range from 20 feet for some songbirds to 250 feet for most raptors. If active nests are found within any trees slated for removal, then an appropriate buffer should be established around the trees and the trees should not be removed until a biologist determines that the nestlings have successfully fledged. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the active avian nests. If construction activities are proposed to begin during the non-breeding season (September 1 through January 31), a survey is not required and no further studies are necessary.

5.11. American Badger

The annual grassland provides habitat for American badger. A qualified biologist should conduct a pre-construction survey for American badger within 14 days prior to the start of ground disturbance. If no American badgers are observed, then a letter report documenting the results of the survey should be provided to the project proponent for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If American badgers or their dens are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of temporarily halting construction activities until the biologist determines that the badger has left the construction footprint on its own accord.

5.12. Special-Status Bat Species

The existing riparian and oak woodlands provide potential roosting habitat for various bat species that occur in the vicinity of the Study Area. Removal of trees could impact bats should they be roosting in areas proposed for removal.

A qualified biologist should conduct a preconstruction survey within 14 days prior to clearing or grading operations and removal of trees. If no bats are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If special-status bat species are present and roosting on or within 100 feet of the Study Area, then the biologist should establish an appropriate buffer around the roost site. At minimum, no trees should be removed until the biologist has determined that the bat is no longer roosting in the tree. Additional mitigation measures for bat species, such as installation of bat boxes or alternate roost structures, would be recommended only if special-status bat species are found to be roosting within the project area. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for various bat species.

5.13. Sensitive Habitats

5.13.1.Jurisdictional Waters

Since proposed construction activities will impact aquatic features located in the Study Area, a Section 404 permit should be obtained from the Corps and a Section 401 Water Quality Certification should be obtained for the Regional Water Quality Control Board (RWQCB) prior to the start of construction. Any waters of the U.S. or jurisdictional wetlands that would be lost or disturbed should be replaced or rehabilitated on a “no-net-loss” basis in accordance with the Corps mitigation guidelines. Habitat restoration, rehabilitation, and/or replacement should be at a location and by methods agreeable to the agencies.

If a 404 permit is required for the proposed project, water quality concerns during construction would be addressed in a Section 401 water quality certification from the Regional Water Quality Control Board. A Storm Water Pollution Prevention Plan (SWPPP) would also be required during construction activities. SWPPPs are required in issuance of a National Pollutant Discharge Elimination System (NPDES) construction discharge permit by the U.S. Environmental Protection Agency. Implementation of Best Management Practices (BMPs) during construction is standard in most SWPPPs and water quality certifications. Examples of BMPs include stockpiling of debris away from regulated wetlands and waterways; immediate removal of debris piles from the site during the rainy season; use of silt fencing and construction fencing around regulated waterways; and use of drip pans under work vehicles and containment of fuel waste throughout the site during construction.

5.13.2. Oak Woodlands

The Project would result in the removal of 9 protected oak trees, resulting in impacts to 0.45-acres of oak canopy. To mitigate for the biological resources impact associated with the loss of oak woodlands associated with the project, a combination of avoidance, protection, onsite replacement, where feasible, and offsite preservation or creation of oak woodland habitat is recommended. Tree protection measures should be implemented around trees to remain in the Study Area as detailed in the project's Tree Survey, Preservation, and Replacement Plan.

5.13.3. Riparian Habitats

Although proposed construction activities will not remove riparian woodland habitat, other drainages and riverine features that will be impacted may be subject to CDFW jurisdiction. It is recommended that a Streambed Alteration Agreement application be submitted to CDFW, pursuant to Section 1600 of the CDFW Code, for any activities affecting the bed, bank or associated riparian vegetation of the stream. If required, the project applicant should coordinate with CDFW in developing appropriate mitigation, and should abide by the conditions of any executed permits.

5.13.4. Purple Needlegrass Grassland

The proposed project would result in the removal of purple needlegrass grassland. Therefore, the acreage of removal should be replaced at a 1:1 ratio. The mitigation location may occur within project's open space areas currently characterized by annual grassland or may occur off-site. Purple needlegrass plants in areas slated for removal should be salvaged to the extent feasible and replanted within the open space area. If this is infeasible, then seedlings/saplings from a local nursery should be obtained. A mitigation and monitoring plan should be prepared outlining methods to be used, success criteria to be met, and adaptive management strategies will be completed prior to project construction. At minimum, the purple needlegrass creation areas shall be monitored twice annually for the first year and once annually for the four subsequent years for a total of five years, success criteria should be established to ensure an 80 percent success rate is met by the fifth year, and adaptive management techniques should be implemented to ensure that the 80 percent success rate is met by the fifth year. This plan may be combined with the Operations and Management Plan for the open space area.

5.14. Summary of Avoidance and Minimization Measures

- Obtain a Section 404 Clean Water Act Permit, 401 Water Quality Certification, and SAA prior to the start of construction;
- Conduct botanical inventories for potentially occurring special-status plants if construction does not commence within two years of the 2015 botanical inventories;
- Conduct clearing and tree and shrub removal operations between September 16 and February 28 to minimize potential impacts to nesting birds;
- If construction begins during the nesting season (March 1 – September 15) conduct a pre-construction survey for active bird nests within the Study Area;

- Conduct a take avoidance survey for burrowing owl within 30 days prior to commencement of construction activities, in accordance with the 2012 Staff Report;
- Within 14 days prior to the initiation of construction activities, conduct a pre-construction survey for coast horned lizard, foothill yellow-legged frog, western pond turtle, American badger, and special-status bat species;
- Implement the tree avoidance, maintenance, and mitigation measures as described in the Tree Survey, Preservation, and Replacement Plan (Foothill Associates 2017); and
- Mitigate for the removal of purple needlegrass grassland at a 1:1 ratio and prepare a mitigation and monitoring plan.

Appendix A — Selected General and Specific Plan Policies

El Dorado County General Plan

Conservation and Protection of Water Resources

GOAL 7.3: WATER QUALITY AND QUANTITY
Conserve, enhance, and manage water resources and protect their quality from degradation.

OBJECTIVE 7.3.1: WATER RESOURCE PROTECTION
Preserve and protect the supply and quality of the County's water resources including the protection of critical watersheds, riparian zones, and aquifers.

Policy 7.3.1.1 Encourage the use of Best Management Practices, as identified by the Soil Conservation Service, in watershed lands as a means to prevent erosion, siltation, and flooding.

Policy 7.3.1.2 Establish water conservation programs that include both drought tolerant landscaping and efficient building design requirements as well as incentives for the conservation and wise use of water.

Policy 7.3.1.3 The County shall develop the criteria and draft an ordinance to allow and encourage the use of domestic gray water for landscape irrigation purposes. (See Title 22 of the State Water Code and the Graywater Regulations of the Uniform Plumbing Code).

OBJECTIVE 7.3.2: WATER QUALITY
Maintenance of and, where possible, improvement of the quality of underground and surface water.

Policy 7.3.2.1 Stream and lake embankments shall be protected from erosion, and streams and lakes shall be protected from excessive turbidity.

Policy 7.3.2.2 Projects requiring a grading permit shall have an erosion control program approved, where necessary.

Policy 7.3.2.3 Where practical and when warranted by the size of the project, parking lot storm drainage shall include facilities to separate oils and salts from storm water in accordance with the recommendations of the Storm Water Quality Task Force's California Storm Water Best Management Practices Handbooks (1993).

Policy 7.3.2.4 The County should evaluate feasible alternatives to the use of salt for ice control on County roads.

Policy 7.3.2.5 As a means to improve the water quality affecting the County's recreational waters, enhanced and increased detailed analytical water quality studies and

monitoring should be implemented to identify and reduce point and non-point pollutants and contaminants. Where such studies or monitoring reports have identified sources of pollution, the County shall propose means to prevent, control, or treat identified pollutants and contaminants.

OBJECTIVE 7.3.3: WETLANDS

Protection of natural and man-made wetlands, vernal pools, wet meadows, and riparian areas from impacts related to development for their importance to wildlife habitat, water purification, scenic values, and unique and sensitive plant life.

Policy 7.3.3.1 *For projects that would result in the discharge of material to or that may affect the function and value of river, stream, lake, pond, or wetland features, the application shall include a delineation of all such features. For wetlands, the delineation shall be conducted using the U.S. Army Corps of Engineers (USACE) Wetland Delineation Manual*

Policy 7.3.3.2 *Intentionally blank*

Policy 7.3.3.3 *The County shall develop a database of important surface water features, including lake, river, stream, pond, and wetland resources.*

Policy 7.3.3.4 *The Zoning Ordinance shall be amended to provide buffers and special setbacks for the protection of riparian areas and wetlands. The County shall encourage the incorporation of protected areas into conservation easements or natural resource protection areas.*

Exceptions to riparian and wetland buffer and setback requirements shall be provided to permit necessary road and bridge repair and construction, trail construction, and other recreational access structures such as docks and piers, or where such buffers deny reasonable use of the property, but only when appropriate mitigation measures and Best Management Practices are incorporated into the project. Exceptions shall also be provided for horticultural and grazing activities on agriculturally zoned lands that utilize "best management practices (BMPs)" as recommended by the County Agricultural Commission and adopted by the Board of Supervisors.

Until standards for buffers and special setbacks are established in the Zoning Ordinance, the County shall apply a minimum setback of 100 feet from all perennial streams, rivers, lakes, and 50 feet from intermittent streams and wetlands. These interim standards may be modified in a particular instance if more detailed information relating to slope, soil stability, vegetation, habitat, or other site- or project-specific conditions supplied as part of the review for a specific project demonstrates that a different setback is necessary or would be sufficient to protect the particular riparian area at issue.

For projects where the County allows an exception to wetland and riparian buffers, development in or immediately adjacent to such features shall be planned so that impacts on the resources are minimized. If avoidance and minimization are not feasible, the County shall make findings, based on documentation provided by the project proponent, that avoidance and minimization are infeasible.

Policy 7.3.3.5 *Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.*

OBJECTIVE 7.3.4: DRAINAGE
Protection and utilization of natural drainage patterns.

Policy 7.3.4.1 *Natural watercourses shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site without disturbance.*

Policy 7.3.4.2 *Modification of natural stream beds and flow shall be regulated to ensure that adequate mitigation measures are utilized.*

OBJECTIVE 7.3.5: WATER CONSERVATION
Conservation of water resources, encouragement of water conservation, and construction of wastewater disposal systems designed to reclaim and re-use treated wastewater on agricultural crops and for other irrigation and wildlife enhancement projects.

Policy 7.3.5.1 *Drought-tolerant plant species, where feasible, shall be used for landscaping of commercial development. Where the use of drought-tolerant native plant species is feasible, they should be used instead of non-native plant species.*

Policy 7.3.5.2 *A list of appropriate local indigenous drought tolerant plant materials shall be maintained by the County Planning Department and made available to the public.*

Policy 7.3.5.3 *The County Parks and Recreation Division shall use drought tolerant landscaping for all new parks and park improvement projects.*

Policy 7.3.5.4 *Require efficient water conveyance systems in new construction. Establish a program of ongoing conversion of open ditch systems shall be considered for conversion to closed conduits, reclaimed water supplies, or both, as circumstances permit.*

Policy 7.3.5.5 *Encourage water reuse programs to conserve raw or potable water supplies consistent with State Law.*

Conservation of Biological Resources

GOAL 7.4: WILDLIFE AND VEGETATION RESOURCES
Identify, conserve, and manage wildlife, wildlife habitat, fisheries, and vegetation resources of significant biological, ecological, and recreational value.

OBJECTIVE 7.4.1: RARE, THREATENED, AND ENDANGERED SPECIES
The County shall protect State and federally recognized rare, threatened, or endangered species and their habitats consistent with Federal and State laws.

Policy 7.4.1.1 *The County shall continue to provide for the permanent protection of the eight sensitive plant species known as the Pine Hill endemics and their habitat through the establishment and management of ecological preserves consistent with County Code Chapter 17.71 and the USFWS's Gabbro Soil Plants for the Central Sierra Nevada Foothills Recovery Plan (USFWS 2002).*

Policy 7.4.1.2 *Private land for preserve sites will be purchased only from willing sellers.*

Policy 7.4.1.3 *Limit land uses within established preserve areas to activities deemed compatible. Such uses may include passive recreation, research and scientific study, and education. In conjunction with use as passive recreational areas, develop a rare plant educational and interpretive program.*

Policy 7.4.1.4 *Proposed rare, threatened, or endangered species preserves, as approved by the County Board of Supervisors, shall be designated Ecological Preserve (-EP) overlay on the General Plan land use map.*

Policy 7.4.1.5 *Species, habitat, and natural community preservation/conservation strategies shall be prepared to protect special-status plant and animal species and natural communities and habitats when discretionary development is proposed on lands with such resources unless it is determined that those resources exist, and either are or can be protected, on public lands or private Natural Resource lands.*

Policy 7.4.1.6 *All development projects involving discretionary review shall be designed to avoid disturbance or fragmentation of important habitats to the extent reasonably feasible. Where avoidance is not possible, the development shall be required to fully mitigate the effects of important habitat loss and fragmentation. Mitigation shall be defined in the Integrated Natural Resources Management Plan (INRMP) (see Policy 7.4.2.8 and Implementation Measure CO-M).*

The County Agricultural Commission, Plant and Wildlife Technical Advisory Committee, representatives of the agricultural community, academia, and other

stakeholders shall be involved and consulted in defining the important habitats of the County and in the creation and implementation of the INRMP.

Policy 7.4.1.7 The County shall continue to support the Noxious Weed Management Group in its efforts to reduce and eliminate noxious weed infestations to protect native habitats and to reduce fire hazards.

OBJECTIVE 7.4.2: IDENTIFY AND PROTECT RESOURCES
Identification and protection, where feasible, of critical fish and wildlife habitat including deer winter, summer, and fawning ranges; deer migration routes; stream and river riparian habitat; lake shore habitat; fish spawning areas; wetlands; wildlife corridors; and diverse wildlife habitat.

Policy 7.4.2.1 To the extent feasible in light of other General Plan policies and to the extent permitted by State law, the County of El Dorado will protect identified critical fish and wildlife habitat, as identified on the Important Biological Resources Map maintained at the Planning Department, through any of the following techniques: utilization of open space, Natural Resource land use designation, clustering, large lot design, setbacks, etc.

Policy 7.4.2.2 Where critical wildlife areas and migration corridors are identified during review of projects; the County shall protect the resources from degradation by requiring all portions of the Site that contain or influence said areas to be retained as non-disturbed natural areas through mandatory clustered development on suitable portions of the Site or other means such as density transfers if clustering cannot be achieved. The setback distance for designated or protected migration corridors shall be determined as part of the project's environmental analysis. The intent and emphasis of the Open Space land use designation and of the non-disturbance policy is to ensure continued viability of contiguous or interdependent habitat areas and the preservation of all movement corridors between related habitats. The intent of mandatory clustering is to provide a mechanism for natural resource protection while allowing appropriate development of private property. Horticultural and grazing projects on agriculturally designated lands are exempt from the restrictions placed on disturbance of natural areas when utilizing "Best Management Practices" (BMPs) recommended by the County Agricultural Commission and adopted by the Board of Supervisors when not subject to Policy 7.1.2.7.

Policy 7.4.2.3 Consistent with Policy 9.1.3.1 of the Parks and Recreation Element, low impact uses such as trails and linear parks may be provided within river and stream buffers if all applicable mitigation measures are incorporated into the design.

Policy 7.4.2.4 Establish and manage wildlife habitat corridors within public parks and natural resource protection areas to allow for wildlife use. Recreational uses within these areas shall be limited to those activities that do not require grading or vegetation removal.

Policy 7.4.2.5 Setbacks from all rivers, streams, and lakes shall be included in the Zoning Ordinance for all ministerial and discretionary development projects.

Policy 7.4.2.6 El Dorado County Biological Community Conservation Plans shall be required to protect, to the extent feasible, rare, threatened, and endangered plant species only when existing federal or State plans for non-jurisdictional areas do not provide adequate protection.

Policy 7.4.2.7 The County shall form a Plant and Wildlife Technical Advisory Committee to advise the Planning Commission and Board of Supervisors on plant and wildlife issues, and the committee should be formed of local experts, including agricultural, fire protection, and forestry representatives, who will consult with other experts with special expertise on various plant and wildlife issues, including representatives of regulatory agencies. The Committee shall formulate objectives which will be reviewed by the Planning Commission and Board of Supervisors.

Policy 7.4.2.8 Develop within five years and implement an Integrated Natural Resources Management Plan (INRMP) that identifies important habitat in the County and establishes a program for effective habitat preservation and management. The INRMP shall include the following components:

A. Habitat Inventory. This part of the INRMP shall inventory and map the following important habitats in El Dorado County:

1. *Habitats that support special-status species;*
2. *Aquatic environments including streams, rivers, and lakes;*
3. *Wetland and riparian habitat;*
4. *Important habitat for migratory deer herds; and*
5. *Large expanses of native vegetation.*

The County should update the inventory every three years to identify the amount of important habitat protected, by habitat type, through County programs and the amount of important habitat removed because of new development during that period. The inventory and mapping effort shall be developed with the assistance of the Plant and Wildlife Technical Advisory Committee, CDFW, and USFWS. The

inventory shall be maintained and updated by the County Planning Department and shall be publicly accessible.

B. *Habitat Protection Strategy. This component shall describe a strategy for protecting important habitats based on coordinated land acquisitions (see item D below) and management of acquired land. The goal of the strategy shall be to conserve and restore contiguous blocks of important habitat to offset the effects of increased habitat loss and fragmentation elsewhere in the county. The Habitat Protection Strategy should be updated at least once every five years based on the results of the habitat monitoring program (item F below). Consideration of wildlife movement will be given by the County on all future 4- and 6-lane roadway construction projects. When feasible, natural undercrossings along proposed roadway alignments that could be utilized by terrestrial wildlife for movement will be preserved and enhanced.*

C. *Mitigation Assistance. This part of the INRMP shall establish a program to facilitate mitigation of impacts to biological resources resulting from projects approved by the County that are unable to avoid impacts on important habitats. The program may include development of mitigation banks, maintenance of lists of potential mitigation options, and incentives for developers and landowner participation in the habitat acquisition and management components of the INRMP.*

D. *Habitat Acquisition. Based on the Habitat Protection Strategy and in coordination with the Mitigation Assistance program, the INRMP shall include a program for identifying habitat acquisition opportunities involving willing sellers. Acquisition may be by state or federal land management agencies, private land trusts or mitigation banks, the County, or other public or private organizations. Lands may be acquired in fee or protected through acquisition of a conservation easement designed to protect the core habitat values of the land while allowing other uses by the fee owner. The program should identify opportunities for partnerships between the County and other organizations for habitat acquisition and management. In evaluating proposed acquisitions, consideration will be given to site specific features (e.g., condition and threats to habitat, presence of special-status species), transaction related features (e.g., level of protection gained, time frame for purchase completion, relative costs), and regional considerations (e.g., connectivity with adjacent protected lands and important habitat, achieves multiple agency and community benefits). Parcels that include important habitat and are located generally to the west of the El Dorado National Forest should be given priority for acquisition. Priority will also be given to parcels that would preserve natural wildlife movement corridors such as*

crossing under major roadways (e.g., U.S. Highway 50 and across canyons). All land acquired shall be added to the Ecological Preserve overlay area.

E. *Habitat Management. Each property or easement acquired through the INRMP should be evaluated to determine whether the biological resources would benefit from restoration or management actions. Examples of the many types of restoration or management actions that could be undertaken to improve current habitat conditions include: removal of non-native plant species, planting native species, repair and rehabilitation of severely grazed riparian and upland habitats, removal of culverts and other structures that impede movement by native fishes, construction of roadway under and overcrossing that would facilitate movement by terrestrial wildlife, and installation of erosion control measures on land adjacent to sensitive wetland and riparian habitat.*

F. *Monitoring. The INRMP shall include a habitat monitoring program that covers all areas under the Ecological Preserve overlay together with all lands acquired as part of the INRMP. Monitoring results shall be incorporated into future County planning efforts so as to more effectively conserve and restore important habitats. The results of all special-status species monitoring shall be reported to the CNDDB. Monitoring results shall be compiled into an annual report to be presented to the Board of Supervisors.*

G. *Public Participation. The INRMP shall be developed with and include provisions for public participation and informal consultation with local, state, and federal agencies having jurisdiction over natural resources within the County.*

H. *Funding. The County shall develop a conservation fund to ensure adequate funding of the INRMP, including habitat maintenance and restoration. Funding may be provided from grants, mitigation fees, and the County general fund. The INRMP annual report described under item F above shall include information on current funding levels and shall project anticipated funding needs and anticipated and potential funding sources for the following five years.*

Policy 7.4.2.9 *The Important Biological Corridor (-IBC) overlay shall apply to lands identified as having high wildlife habitat values because of extent, habitat function, connectivity, and other factors. Lands located within the overlay district shall be subject to the following provisions except that where the overlay is applied to lands that are also subject to the Agricultural District (-A) overlay or that are within the Agricultural Lands (AL) designation, the land use restrictions associated with the -IBC policies will not apply to the extent that the agricultural practices do not interfere with the purposes of the -IBC overlay.*

- *Increased minimum parcel size;*
- *Higher canopy-retention standards and/or different mitigation standards/thresholds for oak woodlands;*
- *Lower thresholds for grading permits;*
- *Higher wetlands/riparian retention standards and/or more stringent mitigation requirements for wetland/riparian habitat loss;*
- *Increased riparian corridor and wetland setbacks;*
- *Greater protection for rare plants (e.g., no disturbance at all or disturbance only as recommended by U.S. Fish and Wildlife Service/California Department of Fish and Wildlife);*
- *Standards for retention of contiguous areas/large expanses of other (non-oak or non-sensitive) plant communities;*
- *Building permits discretionary or some other type of "site review" to ensure that canopy is retained;*
- *More stringent standards for lot coverage, floor area ratio (FAR), and building height; and*
- *No hindrances to wildlife movement (e.g., no fences that would restrict wildlife movement).*

The standards listed above shall be included in the Zoning Ordinance.

Wildland Fire Safe measures are exempt from this policy, except that Fire Safe measures will be designed insofar as possible to be consistent with the objectives of the Important Biological Corridor.

OBJECTIVE 7.4.3: COORDINATION WITH APPROPRIATE AGENCIES
Coordination of wildlife and vegetation protection programs with appropriate federal and State agencies.

OBJECTIVE 7.4.5: NATIVE VEGETATION AND LANDMARK TREES
Protect and maintain native trees including oaks and landmark and heritage trees.

Policy 7.4.5.1 A tree survey, preservation, and replacement plan shall be required to be filed with the County prior to issuance of a grading permit for discretionary permits on all high-density residential, multifamily residential, commercial, and industrial projects. To ensure that proposed replacement trees survive, a mitigation monitoring plan should be incorporated into discretionary projects when applicable and shall include provisions for necessary replacement of trees.

Policy 7.4.5.2 It shall be the policy of the County to preserve native oaks wherever feasible, through the review of all proposed development activities where such trees are present on either public or private property, while at the same time recognizing individual rights to develop private property in a reasonable manner. To ensure that oak tree loss is reduced to reasonable acceptable levels, the County shall develop and implement an Oak Tree Preservation Ordinance that includes the following components:

A. Oak Tree Removal Permit Process. Except under special exemptions, a tree removal permit shall be required by the County for removal of any native oak tree with a single main trunk of at least 6 inches diameter at breast height (dbh), or a multiple trunk with an aggregate of at least 10 inches dbh. Special exemptions when a tree removal permit is not needed shall include removal of trees less than 36 inches dbh on 1) lands in Williamson Act Contracts, Farmland Security Zone Programs, Timber Production Zones, Agricultural Districts, designated Agricultural Land (AL), and actions pursuant to a Fire Safe plan; 2) all single family residential lots of one acre or less that cannot be further subdivided; 3) when a native oak tree is cut down on the owner's property for the owner's personal use; and 4) when written approval has been received from the County Planning Department. In passing judgment upon tree removal permit applications, the County may impose such reasonable conditions of approval as are necessary to protect the health of existing oak trees, the public and the surrounding property, or sensitive habitats. The County Planning Department may condition any removal of native oaks upon the replacement of trees in kind. The replacement requirement shall be calculated based upon an inch for inch replacement of removed oaks. The total of replacement trees shall have a combined diameter of the tree(s) removed. Replacement trees may be planted onsite or in other areas to the satisfaction of the County Planning Department. The County may also condition any tree removal permit that would affect sensitive habitat (e.g., valley oak woodland), on preparation of a Biological Resources Study and an Important Habitat Mitigation Program as described in Policy 7.4.1.6. If an application is denied, the County shall provide written notification, including the reasons for denial, to the applicant.

B. Tree Removal Associated with Discretionary Project. Any person desiring to remove a native oak shall provide the County with the following as part of the project application:

- *A written statement by the applicant or an arborist stating the justification for the development activity, identifying how trees in the vicinity of the project or construction site will be protected and stating*

that all construction activity will follow approved preservation methods;

- *A site map plan that identifies all native oaks on the project site; and*
- *A report by a certified arborist that provides specific information for all native oak trees on the project site.*

C. *Commercial Firewood Cutting. Fuel wood production is considered commercial when a party cuts firewood for sale or profit. An oak tree removal permit shall be required for commercial firewood cutting of any native oak tree. In reviewing a permit application, the Planning Department shall consider the following:*

- *Whether the trees to be removed would have a significant negative environmental impact;*
- *Whether the proposed removal would not result in clear-cutting, but will result in thinning or stand improvement;*
- *Whether replanting would be necessary to ensure adequate regeneration;*
- *Whether the removal would create the potential for soil erosion;*
- *Whether any other limitations or conditions should be imposed in accordance with sound tree management practices; and*
- *What the extent of the resulting canopy cover would be.*

D. *Penalties. Fines will be issued to any person, firm, or corporation that is not exempt from the ordinance who damages or destroys an oak tree without first obtaining an oak tree removal permit. Fines may be as high as three times the current market value of replacement trees as well as the cost of replacement, and/or replacement of up to three times the number of trees required by the ordinance. If oak trees are removed without a tree removal permit, the County Planning Department may choose to deny or defer approval of any application for development of that property for a period of up to 5 years. All monies received for replacement of illegally removed or damaged trees shall be deposited in the County's Integrated Natural Resources Management Plan (INRMP) conservation fund.*

Preservation of Open Space

GOAL 7.6: OPEN SPACE CONSERVATION

Conserve open space land for the continuation of the County's rural character, commercial agriculture, forestry and other productive uses, the enjoyment of scenic beauty and recreation, the protection of natural resources, for protection from natural hazards, and for wildlife habitat.

OBJECTIVE 7.6.1: IMPORTANCE OF OPEN SPACE

Consideration of open space as an important factor in the County's quality of life.

Policy 7.6.1.1 *The General Plan land use map shall include an Open Space land use designation. The purpose of this designation is to implement the goals and objectives of the Land Use and the Conservation and Open Space Elements by serving one or more of the purposes stated below. In addition, the designations on the land use map for Rural Residential and Natural Resource areas are also intended to implement said goals and objectives. Primary purposes of open space include:*

A. Conserving natural resource areas required for the conservation of plant and animal life including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, banks of rivers and streams and watershed lands;

B. Conserving natural resource lands for the managed production of resources including forest products, rangeland, agricultural lands important to the production of food and fiber; and areas containing important mineral deposits;

C. Maintaining areas of importance for outdoor recreation including areas of outstanding scenic, historic and cultural value; areas particularly suited for park and recreation purposes including those providing access to lake shores, beaches and rivers and streams; and areas which serve as links between major recreation and open space reservations including utility easements, banks of rivers and streams, trails and scenic highway corridors;

D. Delineating open space for public health and safety including, but not limited to, areas which require special management or regulation because of hazardous or special conditions such as earthquake fault zones, unstable soil areas, flood plains, watersheds, areas presenting high fire risks, areas required for the protection of water quality and water reservoirs, and areas required for the protection and enhancement of air quality; and

E. Providing for open spaces to create buffers which may be landscaped to minimize the adverse impact of one land use on another.

Policy 7.6.1.2 *The County will provide for Open Space lands through:*

A. The designation of land as Open Space;

B. The designation of land for low-intensity land uses as provided in the Rural Residential and Natural Resource land use designations;

C. *Local implementation of the Federal Emergency Management Agency's National Flood Insurance Program;*

D. *Local implementation of the State Land Conservation Act Program; and*

E. *Open space land set aside through Planned Developments (PDs).*

Policy 7.6.1.3 *The County shall implement Policy 7.6.1.1 through zoning regulations and the administration thereof. It is intended that certain districts and certain requirements in zoning regulations carry out the purposes set forth in Policy 7.6.1.1 as follows:*

A. *The Open Space (OS) Zoning District is consistent with and shall implement the Open Space designation of the General Plan land use map and all other land use designations.*

B. *The Agricultural (A), Exclusive Agricultural (AE), Planned Agricultural (PA), Select Agricultural (SA-10), and Timberland Production Zone (TPZ) zoning districts are consistent with Policy 7.6.1.1 and serve one or more of the purposes set forth therein.*

C. *Zoning regulations shall provide for setbacks from all flood plains, streams, lakes, rivers and canals to maintain Purposes A, B, C, and D set forth in Policy 7.6.1.1.*

D. *Zoning regulations shall provide for maintenance of permanent open space in residential, commercial, industrial, agricultural, and residential agricultural zone districts based on standards established in those provisions of the County Code. The regulations shall minimize impacts on wetlands, flood plains, streams, lakes, rivers, canals, and slopes in excess of 30 percent and shall maintain Purposes A, B, C, and D in Policy 7.6.1.1.*

E. *Landscaping requirements in zoning regulations shall provide for vegetative buffers between incompatible land uses in order to maintain Purpose E in Policy 7.6.1.1.*

F. *Zoning regulations shall provide for Mineral Resource Combining Zone Districts and/or other appropriate mineral zoning categories which shall be applied to lands found to contain important mineral deposits if development of the resource can occur in compliance with all other policies of the General Plan. Those regulations shall maintain Purposes A, B, C, D, and E of Policy 7.6.1.1.*

Policy 7.6.1.4 *The creation of new open space areas, including Ecological Preserves, common areas of new subdivisions, and recreational areas, shall include wildfire safety planning.*

El Dorado Hills Specific Plan

1.4.1.1 Site Development and Grading

The policies set forth in the Specific Plan are intended to maintain, to the maximum extent possible, the natural land forms and to exercise control over vegetation removal, landscaping, and grading. Grading controls are intended to reduce soil erosion to a minimum to ensure capability with adjacent terrain.

a) *Grading for roadways, driveways, building pads, and onsite improvements shall be minimized.*

b) *Grading volumes of cut-and-fill material shall be minimized and balanced onsite wherever possible. Larger grading volumes may be acceptable where improved visual and environmental effects would result.*

c) *Residential structures or accessory structures on slopes in access of 20 percent shall be carefully designed through use of erosion controls, engineered grading, and use of post and beam or step-footing construction to ensure long-term slope stability. Benched hillsides for building sites shall be avoided and split-level structures encouraged.*

d) *A plan to minimize impact to oak trees shall be submitted to the El Dorado County Community Development Department prior to approval of any tentative map. The plan will include, at a minimum, the locations and sizes of individual trees that should not be impacted.*

e) *A minimum of 20 percent of all roadside trees and parking lot trees shall be native oaks.*

f) *Removal of oak trees and other large native trees with trunk circumferences of 25 inches at 4.5 feet above grade shall be avoided where feasible. A tree replacement policy is provided in the Design Guidelines on file with the County of El Dorado.*

g) *To avoid damage to root systems of retained trees, residential construction shall not occur within the canopy area of oak trees over 30 inches in circumference at breast height, and shall be subject to review as provided in the Design Guidelines.*

h) *Landscaping in improved common areas shall be of drought-resistant varieties.*

i) *To preserve the vegetative character of the Plan Area, the planting of native trees, shrubs, and ground cover shall be encouraged in all new landscaping.*

j) *Landscaping in areas adjacent to natural open spaces shall be fire resistant.*

k) *Site design, building orientation, and street and lot patterns shall follow solar orientation principles to the maximum extent practicable to maximize energy conservation.*

l) Archaeological test excavations for selected locations within the Plan Area shall be required as a condition of approval of tentative subdivision maps.

m) As part of the tentative map approval, areas having expansive clays and seasonably wet areas shall be identified by a geotechnical engineer. Such areas, if deemed to be potential construction hazards, shall be subject to further evaluation and identification to determine appropriate mitigation measures.

n) To the maximum extent feasible, development shall be sited and designed to avoid impacts to culturally significant sties identified by the Final EIR for the Plan Area as EDH-26 and EDH-29.

o) Where feasible, and given the physical constraints of the Plan Area, subdivisions and other new development shall be designed to facilitate solar use as a means of reducing total energy consumption. The design elements that shall be considered include:

- *Solar orientation*
- *Shade Control*
- *Wind Management*
- *Solar access*

p) The Design Guidelines shall be one of the implementation measures of the Specific Plan.

1.4.1.2 Development Near Native Oak Trees

These guidelines are for the protection of healthy oak trees that will remain after construction in developed areas. The term circumference is breast height (CBH) refers to the trunk measurement of either one trunk or the addition of all trunks in a multi-trunked tree. The respective measure in circumference would also apply. Also refer to **Section 3.10** for Oak Tree Preservation Guidelines.

a) Protect all oak trees larger than 25 inches CBH o the maximum extent feasible. Priority will be given to oaks larger than 56 inches CBH.

b) Trees to be saved will be surrounded by a barrier or fence installed at the dripline and flagged.

c) Pruning of limbs will be confined to low-hanging branches over roads and sidewalks, and large branches that are weak or may reasonably appear to pose a safety hazard. Pruning paint will not be used under any circumstances. Pruning cuts will be made cleanly to avoid damaged to the "bark ridge" tissue of adjacent limbs.

d) The El Dorado County Planning Department will be responsible for enforcement of oak tree protection during construction.

e) In development areas, no oak trees larger than 25 inches CBH will be removed until a site survey and inspection report is performed.

1.4.1.5 Vegetation and Fire Hazards

In areas of planned development:

a) All potentially dry herbaceous vegetation will be mowed or disked within a 50-foot radius of all construction site activity.

b) Disking or mowing will be done to keep herbaceous vegetation under 3 inches in height at all construction sites.

c) No construction equipment or vehicles will be allowed within 50 feet of the unmowed perimeter.

d) Firebreaks will be installed by disking or mowing a trail that is satisfactory to the El Dorado Hills Fire Development. Mowing is preferred to disking or scraping because the latter two practices promote invasion of noxious weed species on fire trails.

e) Temporary or permanent firebreaks will be installed on all ridgelines, crossing all areas in the vicinity of construction and grading activity, prior to beginning work.

f) Firebreak installation will avoid the removal of native oaks and other native trees.

1.4.8 Natural Open Space Policies

The Natural Open Space Policies are to guide the preservation, management, and maintenance of these areas in relation to adjacent land uses.

1.4.8.1 General Policies

a) The boundaries of natural open space shall blend with the boundaries of the development as to enhance the integration of open space and developed areas.

b) Perimeter fencing may be permitted for rural parcels as provided in the El Dorado County Design Guidelines and CC&Rs.

c) Increased runoff from adjacent development will require erosion control measures to be coordinated with landscape design of adjacent development areas. Emphasis shall be placed on methods that rely on natural drainage systems and minimize change to the existing condition of creek channels within open space areas.

d) An Open Space Management Plan shall be completed and submitted to the El Dorado County Community Development Department prior to approval of any tentative map creating open space. It shall be an implementation mechanism of the Specific Plan in order to set forth procedures and responsibilities as to the ownership, preservation, and management of public and private natural open space areas. The Open Space Management Plan shall consider dedication to the County of El Dorado of easements

over the public open space areas, should dedication of fee ownership of these areas be made to any other entity. The open space plan shall be reviewed by the El Dorado Hills Fire Department. The plan shall also include, at a minimum:

1. *The locations of fire access roads, fuel breaks, and passive recreation trails.*
2. *Control burning techniques.*
3. *Guidelines established in the Open Space Guidelines for El Dorado County*
4. *Investigation of opportunities for wildlife use of water in open space areas as a part of ongoing wildlife maintenance.*

1.4.8.2 Riparian and Other Drainageway Policies

A 200-foot-wide undeveloped buffer zone shall be established along Carson Creek in accordance with California Department of Fish and Wildlife requirements. In this buffer, vegetation removal shall be for the purpose of drainage improvements. In consideration of setback reductions for purposes of a gold course, the County shall consider such mitigation measures as additional plantings, erosion controls, and other habitat improvement and protection steps.

a) *Drainageway easements shall specifically preclude erection of structures and vegetation removal, except for drainage improvements, and shall forestall other site development not consistent with the purpose of these areas.*

b) *Drainageways located on privately owned property shall be placed within recorded easements that provide for routine maintenance and pedestrian access.*

c) *A 100-foot-wide buffer (50 feet horizontal on each side as measured from centerline of the creek) of natural vegetation shall be maintained along all intermittent creeks.*

d) *Grazing shall not be allowed in riparian buffer zones.*

e) *Plantings of riparian trees and shrubs shall be situated according to the flood and soil moisture tolerances of individual species as in Appendix C of the Specific Plan.*

f) *Areas disturbed during construction shall be replanted with native riparian species listed in Appendix C of the Specific Plan. Replanting will include a mandatory 3-year maintenance and irrigation period.*

g) *Riparian vegetation on the golf course areas shall be kept naturally dense and unpruned except where needed for crossings, ball pay passages, and personal and fire safety.*

h) *Pedestrian, vehicular, and utility bridges over creeks, if feasible, will be oriented at right angles to the waterway to minimize loss of vegetation.*

i) The capacity of flow under bridges and culverts will be designed to reduce the need for extensive vegetation clearing near the structures.

j) Periodic vegetation removal to ensure adequate floodway capacity in drainages will be performed to promote an overstory of mature individual riparian trees spaced to accommodate designed flows.

El Dorado Hills Community Services District Policies

5.27 Oak Tree Preservation

5.27.3 General Requirements for Development Activity in the Protected Zone of Protected Trees

The importance of oak tree preservation is recognized with tree protection provisions in the Covenants, Conditions, and Restrictions (CC&Rs) of the most units in El Dorado Hills and in County Code 17.73 titled Oak Woodland Conservation prior to initiating any activity that may affect an oak tree on their land or on that of an adjoining property, owners of property in El Dorado Hills should check their CC&Rs carefully to determine whether Design Review Committee (DRC) approval is required.

5.27.4 Removal of Protected Trees

It shall be the policy of the DRC to preserve protected trees wherever feasible while recognizing individual rights to develop private property in a reasonable manner. It shall be the responsibility of the applicant to demonstrate the need for any oak tree removal. In determining whether to approval the removal or major trimming of a protected tree, the DRC will consider the following listed factors and, depending upon particular circumstances, may consider others which are not listed:

a) The degree to which the tree will be an obstacle to approval development activity.

b) The condition of the tree with respect to disease, general health, damage, danger of falling.

c) The effect removal would have upon safety, public health, remaining trees, and the beauty and general welfare of the area.

d) The effect removal would have upon soil stability, erosion, particularly near water courses and on slopes.

e) Present and future shade effect with respect to cooling and solar power/heating.

f) Whether or not there are feasible alternative measures to removal.

g) Applicants may be required to provide an arborist report from an arborist who would not be performing any eventual tree removal or major limbing. Alternatively, and it is discretion the DRC may employ an arborist of its choice.

5.27.5 Protecting Oak Trees During Development Activity

Property owners are responsible for taking the following measures to protect oak trees, except any approval from removal during development activity.

a) *Erect protective orange "ski fencing" around the protected zone of each protected tree or group of trees within 50 feet of development activity prior to initiating work and excluded from the enclosed protected zone any work related activity such as storage and vehicle parking.*

b) *Exert every reasonable effort to preserve undisturbed the natural ground within protected zones.*

c) *If it is absolutely necessary to trench within a protected zone, if boring or drilling would not be feasible, excavate by hand under the supervision of a certified arborist. Do not cut any root larger than two inches in diameter; keep the exposed root moist and cover with soil as quickly as feasible. Sever small roots neatly, trim and cover quickly.*

d) *Make no grade changed within the protected zone unless specifically indicated in the approved plans.*

5.27.6 Mitigation EDHCSD Tree Preservation Fund, Public Education

In the event the owner of property with protected trees removed or significantly damages one or more of them without approval, the DRC, at its discretion, may require mitigation by planting a proportionate number of diameter inches of replacement oak trees on the owner's property or by assessing a fee at the rate of $200 per diameter inch (amount tripled for unapproved removal of a landmark tree) to compensate for the expense of planting a proportionate number of diameter inches of oak trees on public property or by a combination of these alternatives.

In the event the owner of the property with protection trees applies for approval of a protect that will damage protected trees, and the DRC determines they could be reasonably be preserved, the DRC, at its sole discretion, may offer the applicant the option of an approval in exchange for on-site mitigation or payment of a mitigation fee based upon the number of diameter inches that applicant would remove.

Mitigation fees paid by property owners are held by the EDHCSD in a Tree Preservation Fund until used to cover the expense of mitigation planting or for related purposes. It is widely recognized that the loss of oak tree is partly the result of the lack of public awareness on oak preservation. A portion of the funds collected for mitigation may be used to establish and promote educational programs to improve this situation.

Regulatory Status Legend

FE = Federal endangered FT = Federal threatened FC = Federal candidate PT = Federal proposed threatened FPD = Federal proposed for delisting FD = Federal delisted FSC = Federal Species of Concern	CE = California state endangered CT = California state threatened CFP = California fully protected CSC = California Species of Special Concern CSA = California Special Animals List CR = California state rare CC = California candidate	1A = plants presumed extinct in California 1B = plants rare, threatened, or endangered in California and elsewhere 2 = plants rare, threatened, or endangered in California, but common elsewhere 3 = plants about which we need more information 4 = plants of limited distribution

Table 1 — Legally Protected Species

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Boggs Lake hedge-hyssop *Gratiola heterosepala*	CE; 1B	Annual herb found on clay soils in vernal pools and along the lake margins of marshes and swamps from 10 to 2,375 meters.	Blooming period: April – August	**None**; the riverine perennial marsh within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
El Dorado bedstraw *Galium californicum* ssp. *sierrae*	FE; CR; 1B	Perennial herb found on gabbroic substrate in chaparral, cismontane woodland, and lower montane coniferous forest from 100 to 585 meters.	Blooming period: May – June.	**None**; there is no suitable soil for this species within the Study Area.
Layne's butterweed (=ragwort) *Packera layneae*	FT; CR; 1B	Perennial herb found on serpentine or gabbroic, rocky substrate in cismontane woodland or chaparral from 200 to 1,085 meters.	Blooming period: April – August.	**None**; there is no suitable soil for this species within the Study Area.
Legenere *Legenere limosa*	CT; 1B	Annual herb found in vernal pools from 1 to 880 meters.	Blooming period: April – June.	**None**; there is no vernal pool habitat within the Study Area.
Pine Hill ceanothus *Ceanothus roderickii*	FE; CR; 1B	Perennial evergreen shrub found on serpentinite or gabbroic substrate in chaparral or cismontane woodland from 245 to 1,090 meters.	Blooming period: April – June.	**None**; there is no suitable soil for this species within the Study Area.
Pine Hill flannelbush *Fremontodendron decumbens*	FE; CR; 1B	Perennial evergreen shrub found in chaparral and cismontane woodland on rocky gabbroic or serpentinite soils from 425 to 760 meters.	Blooming period: April-July	**None**; there is no suitable soil for this species within the Study Area.
Sacramento orcutt grass *Orcuttia viscida*	FE; CE; 1B	Annual herb found in vernal pools from 30 to 100 meters.	Blooming period: April – September.	**None**; the Study Area does not provide suitable habitat for this species.
Slender orcutt grass *Orcuttia tenuis*	FT; CE; 1B	Annual herb found in vernal pools that are often gravelly, from 35 to 1,760 meters.	Blooming period: May – October.	**None**; the Study Area does not provide suitable habitat for this species.
Stebbins' morning glory *Calystegia stebbinsii*	FE; CE; 1B	Perennial rhizomatous herb found occasionally in openings of chaparral and cismontane woodland on gabbro or serpentinite soils from 185 to 1,090 meters.	Blooming period: April – July.	**None**; there is no suitable soil for this species within the Study Area.
Invertebrates				
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT	Blue elderberry shrubs usually associated with riparian areas.	Adults emerge in spring until June. Exit holes visible year – round.	**Low**; small elderberry shrubs were observed in the Study Area but no exit holes were observed.
Vernal pool fairy shrimp *Branchinecta lynchi*	FT	Vernal pools, swales, and ephemeral freshwater habitat.	USFWS protocol-level wet-season sampling and/or dry season cyst identification.	**None**; the Study Area does not provide suitable habitat for this species.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE	Vernal pools, swales, and ephemeral freshwater habitat.	USFWS protocol-level wet-season sampling and/or dry season cyst identification.	**None**; the Study Area does not provide suitable habitat for this species.
Fish				
Central Valley steelhead *Oncorhynchus mykiss*	FT	Rivers and streams tributary to the Sacramento-San Joaquin Rivers and Delta ecosystems.	Spawn in winter and spring.	**None**; the Study Area does not provide suitable habitat for this species.
Delta smelt *Hypomesus transpacificus*	FT; CE	Found in estuarine waters. Majority of life span is spent within the freshwater outskirts of the mixing zone (saltwater-freshwater interface) within the Delta.	December – July (Spawn) Year-round (Present in delta)	**None**; the Study Area does not provide suitable habitat for this species.
Amphibians/ Reptiles				
California red-legged frog *Rana draytonii*	FT; CSC	Requires a permanent water source and is typically found along quiet, slow-moving streams, ponds, or marsh communities with emergent vegetation. Believed extirpated from the Central Valley floor since 1970s.	Aquatic surveys of breeding sites between January and September. Optimally after April 15.	**None**; the riverine perennial marsh and perennial drainage within the Study Area provide marginal habitat for this species, but no evidence of CRLF was observed during protocol breeding and non-breeding surveys (Foothill Associates 2016a).
California tiger salamander *Ambystoma californiense*	FT; CT	Required ponded water for breeding. Adults spend summer in small mammal burrows. This species is not known to occur within El Dorado County. There are no recorded instances of CTS north of the Cosumnes River and east of the Sacramento River despite extensive surveys.	March – June	**None**; the Study Area occurs outside of the known extant geographic range for this species.
Foothill yellow-legged frog *Rana boylii*	CC	Typically found in shaded, shallow, slow moving streams or channels with rocky or muddy bottoms. Typically stays within ~150' of water.	Breeds from mid-March to early June. Most active diurnally. Hibernates and aestivates.	**Low**; perennial drainage provides potential habitat for this species, but there are no known occurrences within 5 miles.

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Giant garter snake *Thamnophis gigas*	FT; CT	Found in agricultural wetlands and other wetlands such as irrigation and drainage canals, low gradient streams, marshes, ponds, sloughs, small lakes, and their associated uplands. Upland habitat should have burrows or other soil crevices suitable for snakes to reside during their dormancy period (November – mid March). This species is known from Sacramento, Sutter, Butte, Colusa, and Glenn counties.	Active outside of dormancy period November-mid March	**None**; the Study Area occurs outside of the known geographic range for this species.
Birds				
Bald eagle *Haliaeetus leucocephalus*	FD; CFP, CE	Breeding habitat most commonly includes areas within 2.5 miles (4.0 kilometers) of coastal areas, bays, rivers, lakes, and reservoirs. Nests usually are in tall trees or on pinnacles or cliffs near water.	Winter	**None**; there is no potential habitat for this species within the Study Area.
Bank swallow *Riparia*	CT	Nests in riverbanks and forages over riparian areas and adjacent uplands.	April – July	**None**; there is no potential nesting habitat for this species within the Study Area.
California black rail *Laterallus jamaicensis coturniculus*	CT	Saltwater, brackish, and freshwater marshes that remain shallowly inundated year-round.	Year – round	**None**; the Study Area occurs outside of the geographical range for this species.
Golden eagle *Aquila chrysaetos*	CFP (nesting and wintering)	Open and semi-open areas up to 12,000 feet in elevation. Builds large stick nests on cliffs, in trees, or on man-made structures.	Year – round	**Low**; although the Study Area provides foraging habitat, there is no breeding habitat present within the Study Area and no nests have been observed.
Swainson's hawk *Buteo swainsoni*	CT	Nest peripherally to Valley riparian systems lone trees or groves of trees in agricultural fields. Valley oak, Fremont cottonwood, walnut, and large willow trees, ranging in height from 41 to 82 feet, are the most commonly used nest trees in the Central Valley.	March – October	**None**; the Study Area occurs outside of the known geographical range for this species.
Tricolored blackbird *Agelaius tricolor*	CC; CSC (nesting colony)	Nests in dense blackberry, cattail, tules, bulrushes, sedges, willow, or wild rose within freshwater marshes. Nests in large colonies of at least 50 pairs (up to thousands of individuals). May forage up to 4 miles from nest site.	Year – round	**Low**; the riverine perennial marsh is not large enough to support breeding colonies, but colonies are recorded within 4 miles of the Study Area so the area may be used for foraging.
White-tailed kite *Elanus leucurus*	CFP (nesting)	Nests in isolated trees or woodland areas with suitable open foraging habitat.	February 15 – August 31	**High**; the riparian habitat and isolated trees within the annual grassland provide breeding habitat for this species.
Mammals				
Fisher *Martes pennanti*	PT; CSC	Occurs in intermediate to large-tree stages of coniferous and deciduous forests.	Year – round	**None**; there is no habitat for this species within the Study Area.

Table 1 includes federal threatened or endangered species and eagles, and State threatened, endangered, or fully protected species.

Table 2 — Species Subject to CEQA Review

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	1B	Annual herb found in mesic areas in valley and foothill grasslands from 30 to 229 meters.	Blooming period: April – August.	**None**; the Study Area does not provide habitat for this species.
Big-scale balsamroot *Balsamorhiza macrolepis*	1B	Perennial herb found in chaparral, cismontane woodland, valley and foothill grassland, sometimes on serpentinite soils from 90 to 1,555 meters in elevation.	Blooming period: March – June	**None**; the annual grassland within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
chaparral sedge *Carex xerophila*	1B	Perennial herb found on gabbroic or serpentine soils in chaparral, woodlands, and coniferous forest between 440 and 770 meters.	Blooming period: March – June	**None**; there is no suitable soil for this species within the Study Area.
Dwarf downingia *Downingia pusilla*	2	Annual herb found occasionally in mesic areas within valley and foothill grassland and vernal pools from 1 to 445 meters.	Blooming period: March – May.	**None**; the annual grassland within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
El Dorado bedstraw *Galium californicum* ssp. *sierrae*	FE; CR; 1B	Perennial herb found on gabbroic substrate in chaparral, cismontane woodland, and lower montane coniferous forest from 100 to 585 meters.	Blooming period: May – June.	**None**; there is no suitable soil for this species within the Study Area.
Jepson's onion *Allium jepsonii*	1B	Perennial bulbiferous herb found on serpentine or volcanic soils in chaparral, lower montane coniferous forest, and cismontane woodland from 300 to 1,320 meters.	Blooming period: April – August.	**None**; there is no suitable soil for this species within the Study Area.
Parry's horkelia *Horkelia parryi*	1B	Perennial herb found on Ione formation in chaparral and cismontane woodland from 80 to 1,070 meters.	Blooming period: April – September	**None**; there is no suitable soil for this species within the Study Area.
Pincushion navarretia *Navarretia myersii*	1B	Annual herb found in vernal pools, which are often acidic, from 20 to 330 meters.	Blooming period: April – May.	**None**; there is no vernal pool habitat within the Study Area.
Red Hills soaproot *Chlorogalum grandiflorum*	1B	Perennial bulbiferous herb found on gabbro, serpentine, or other soils in chaparral, cismontane woodland, and lower montane coniferous forest from 245 to 1,240 meters.	Blooming period: May - June	**None**; original site surveys were conducted within the evident and identifiable bloom period for this species and this species was not observed within the Study Area.
Sanford's arrowhead *Sagittaria sanfordii*	1B	Perennial rhizomatous herb found in marshes and swamps in assorted shallow freshwater areas from 0 to 650 meters.	Blooming period: May – October.	**None**; the riverine perennial marsh within the Study Area provides marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Starved daisy *Erigeron miser*	1B	Perennial herb found on rocky ground in upper montane coniferous forest from 1,840 to 2,620 meters.	Blooming period: June – October.	**None**; the Study Area does not provide habitat for this species and is outside the known elevational range.
Tuolumne button-celery *Eryngium pinnatisectum*	1B	Annual to perennial herb found in mesic areas in cismontane woodland, lower montane coniferous forest, and vernal pools from 70 to 915 meters.	Blooming period: May – August	**None**; original site surveys were conducted within the evident and identifiable bloom period for this species and this species was not observed within the Study Area.
Amphibians/ Reptiles				
Blainville's (Coast) horned lizard *Phrynosoma blainvillii*	CSC	Inhabits open areas of sandy soils and low vegetation in valleys, foothills, and semiarid mountains. Found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose sandy soil. Often found in lowlands along sandy washes with scattered shrubs and along dirt roads, and frequently found near ant hills.	Year – round (excluding extended periods of low temperatures or extreme heat).	**Low**; the Study Area provides marginal habitat within the annual grassland. However, the Study Area lacks suitable sandy washes and low scattered bushes or shrubs.
Western pond turtle *Emys marmorata*	CSC	Agricultural wetlands and other wetlands such as irrigation and drainage canals, low gradient streams, marshes, ponds, sloughs, small lakes, and their associated uplands.	Active outside of dormancy period November – February	**High**; the perennial drainage and riverine perennial marsh within the Study Area provide habitat for this species.
Western spadefoot *Spea hammondii*	CSC	Found in open grasslands and woodlands. Breeds in seasonal ponds and vernal pools.	Year – round	**Low**; there is minimal potential breeding habitat for this species in the Study Area in the depressional seasonal wetlands.

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Birds				
Burrowing owl *Athene cunicularia*	CSC (burrow sites and some wintering sites)	Nests in burrows in the ground, often in old ground squirrel burrows or badger, within open dry grassland and desert habitat. The burrows are found in dry, level, open terrain, including prairie, plains, desert, and grassland with low height vegetation for foraging and available perches, such as fences, utility poles, posts, or raised rodent mounds.	Year – round; Breeding season surveys between March and August.	**Low**; the annual grassland within the Study Area provides potential habitat for this species, however, few burrows that could be occupied by this species was observed and this species was not observed during the protocol level surveys conducted within the Study Area.
Cooper's hawk *Accipiter cooperii*	CSA (Nesting)	Found in cismontane woodland, riparian forest, riparian woodland, and upper montane coniferous forest.	Year – round	**Low;** the woodlands on site provide potential nesting and foraging habitat.
Double crested cormorant *Phalacrocorax auritus*	CSA (Nesting colony)	Breeds on ponds, lakes, artificial impoundments, slow-moving rivers, lagoons, estuaries, and open coastlines.	Migrate and winter non-breeding.	**None;** there is no suitable nesting habitat in the Study Area.
Ferruginous hawk *Buteo regalis*	CSA (Wintering)	Overwintering occurs in grasslands or deserts with abundant prey species (rabbits, pocket gophers, or prairie dogs).	Wintering	**Low**; the annual grassland habitat within the Study Area provides habitat for this species.
Grasshopper sparrow *Ammodramus savannarum*	CSC	Frequents dense, dry, or well drained grassland, especially native grassland. Nests at base of overhanging clump of grass.	April – July	**Low**; the annual grassland habitat within the Study Area provides habitat for this species.
Great blue heron *Ardea herodias*	CSA (Nesting colony)	Inhabits both freshwater and saltwater habitats and forages in grassland and agricultural field. Breeding colonies are located within 2 to 4 miles of feeding areas, often in isolated swamps or on islands, and near lakes and ponds bordered by forests.	Year – round	**None;** there is no suitable nesting habitat in the Study Area.
Great egret *Ardea alba*	CSA (Nesting colony)	Nests in colonies in large trees usually near water. Nesting colonies must be relatively isolated from human activities. Forages in shallow water in a variety of habitats.	Year – round	**None;** there is no suitable nesting habitat in the Study Area.
Merlin *Falco columbarius*	CSA (Wintering)	Winter in open and semi-open habitats that include estuaries, Great Basin grassland, and valley and foothill grasslands.	Wintering	**Low**; the annual grassland habitat within the Study Area provides habitat for this species.
Osprey *Pandion haliaetus*	CSA	Found in a variety of habitats nearby water sources.	Breeding	**None**; the Study Area does not provide suitable habitat for this species.
Purple martin *Progne subis*	CSC	Often nests in tall, old trees near body of water in woodland and conifer habitats. Feed in open areas near water and nest in tree cavities.	Year – round	**Low**; the Study Area does provide potential nesting habitat for this species.
Mammals				
American badger *Taxidea taxus*	CSC	Found in a variety of grasslands, shrublands, and open woodlands throughout California.	Year – round	**Low**; the annual grassland within the Study Area provides habitat, however, very few burrows that could be utilized by this species are present within the Study Area.
Pallid bat *Antrozous pallidus*	CSC	Most abundant in oak woodland, savannah, and riparian habitats. Roosts in crevices and hollows in trees, rocks, cliffs, bridges, and buildings.	Year – round	**Low**; the trees within the riparian habitat and isolated trees within the annual grassland provide roosting habitat for this species.
Silver-haired bat *Lasionycteris noctivagans*	CSA	Forests near water. Roosts in hollow trees, snags, buildings, rock crevices, caves, and under bark. Forages in ~300' home range over water and open brushy areas.	Dusk between spring and fall.	**Low**; there is marginal habitat in the woodlands for this species on the Study Area

Table 2 includes state and federal species of concern and Rank 1 and 2 CNPS species.

Table 3 — Other Species of Interest

Special-Status Species	Regulatory Status	Habitat Requirements	Identification/ Survey Period	Potential for Occurrence
Plants				
Bisbee Peak rush-rose *Crocanthemum suffrutescens*	3.2	Perennial evergreen shrub often found on gabbroic or lone soil and often in burned or disturbed areas within chaparral from 75 to 670 meters.	Blooming period: April – August.	**None**; the Study Area does not provide habitat for this species.
Brandegee's clarkia *Clarkia biloba* ssp. *brandegeeae*	4	Annual herb found often in roadcuts within chaparral, cismontane woodland, and lower montane coniferous forest from 75 to 915 meters.	Blooming period: May – July.	**None**; the woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Brewer's calandrinia *Calandrinia breweri*	4	Annual herb found on sandy or loamy, disturbed sites and burns within chaparral and coastal scrub from 10 to 1,220 meters.	Blooming period: March – June.	**None**; the Study Area does not provide habitat for this species.
Fresno ceanothus *Ceanothus fresnensis*	4	Perennial evergreen shrub found occasionally in openings of cismontane woodland and lower montane coniferous forest from 900 to 2,103 meters.	Blooming period: May – July.	**None**; the Study Area occurs outside of the known elevation range for this species.
Hernandez bluecurls *Trichostema rubisepalum*	4	Annual herb found on volcanic or serpentinite, gravelly substrate within broad-leafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, and vernal pools from 300 to 1,435 meters.	Blooming period: June – August.	**None**; there is no suitable soil for this species within the Study Area.
Humboldt lily *Lilium humboldtii* ssp. *humboldtii*	4	Perennial bulbiferous herb found in openings of chaparral, cismontane woodland, and lower montane coniferous forest from 90 to 1,280 meters.	Blooming period: May – July.	**None**; the woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Jepson's woolly sunflower *Eriophyllum jepsonii*	4	Perennial herb sometimes found on serpentinite substrate within chaparral, cismontane woodland, and coastal scrub from 200 to 1,025 meters.	Blooming period: April – June.	**None**; the Study Area does not contain the soils required for this species.
Sanborn's onion *Allium sanbornii* var. *sanbornii*	4	Perennial bulbiferous herb usually found on serpentinite, gravelly substrate within chaparral, cismontane woodland, and lower montane coniferous forest from 260 to 1,510 meters.	Blooming period: May – September.	**None**; there is no suitable soil for this species within the Study Area.
Streambank spring beauty *Claytonia parviflora* ssp. *grandiflora*	4	Annual herb found on rocky substrate within cismontane woodland from 250 to 1,200 meters.	Blooming period: February – May.	**None**; the Study Area does not provide habitat for this species and is outside of the known elevational range.
Invertebrates				
Alabaster Cave harvestman *Banksula californica*	CSA	Found in caves in the Sierra Nevada.	Year-round	**None**; there is no suitable habitat for this species in the Study Area.
Blennosperma vernal pool andrenid bee *Andrena blennospermaties*	CSA	Found in upland areas near vernal pools; dependent on populations of blennosperma flowers. Slender, dark-olive green bees with pale apical bands on the dorsum of the abdominal segments; females measure 8.5-9.5 mm, males 7-8 mm.	Year-round	**None**; there is no suitable habitat for this species in the Study Area.
California linderiella *Linderiella occidentalis*	CSA	Inhabits vernal pools, swales, and ephemeral freshwater habitat.	Wet-season sampling and/or dry season cyst identification.	**None**; the seasonal swales in the Study Area provide marginal habitat, but the Study Area is outside the locally recorded range of the species.
Cosumnes Stripetail *Cosumnoperla hypocrena*	CSA	Freshwater intermittent streams in the American River and Cosumnes River basins between 300 and 1500 meters.	Year – round	**None**; the Study Area is outside the geographic range of the species.
Hairy Water flea *Dumontia oregonensis*	CSA	Vernal pools, seasonal pools, and streams from Jackson County, Oregon to Sacramento and Solano Counties in California.	Wet Season	**None**; the Study Area is outside the geographic range of the species.
Mid-valley fairy shrimp *Branchinecta mesovallensis*	CSA	Inhabits vernal pools, swales, and ephemeral freshwater habitat.	Wet-season sampling and/or dry season cyst identification.	**None**; the Study Area is outside the geographic range of the species.
Ricksecker's water scavenger beetle *Hydrochara ricksecker*i	CSA	A small aquatic beetle known from pond habitats in the San Francisco Bay Area.	Year-round	**None**; there is no habitat for this species within the Study Area.
Western bumble bee *Bombus occidentalis*	CSA	Generally, nests underground in abandoned rodent burrows and bird nests. Forages on a wide variety of flowers. Found in Coast range north of Monterey County, Sierra mountain range north of Tuolumne County, and around the delta region of Contra Costa County.	New colonies established in spring. Overwinter in shallow burrows.	**None**; the Study Area is outside the geographic range of the species.

Table 3 includes Rank 3 and 4 CNPS species and non-listed invertebrates, which may not be subject to CEQA review.

Appendix C — Plants and Wildlife Observed in the Study Area

Appendix C
Wildlife Observed in the Study Area

Species	Common Name
Birds	
Agelaius phoeniceus	Red-winged blackbird
Buteo jamaicensis	Red-tailed hawk
Callipepla californica	California quail
Carpodacus mexicanus	House finch
Cathartes aura	Turkey vulture
Euphagus cyanocephalus	Brewer's blackbird
Falco sparverius	American kestrel
Melanerpes formicivorus	Acorn woodpecker
Meleagris gallopavo	Wild turkey
Sayornis nigricans	Black phoebe
Sturnella neglecta	Western meadowlark
Sturnus vulgaris	European starling
Zenaida macroura	Mourning dove
Mammals	
Microtus agrestis	Vole
Lepus californicus	Black-tailed jackrabbit
Plestiodon skiltonianus	Western skink
Sceloporus occidentalis	Western fence lizard
Sylvilagus sp.	Cottontail rabbit

Appendix C
Plants Observed in the Study Area

Genus	Species	Common Name	Wetland Indicator Status
Adoxaceae	*Sambucus nigra* ssp. caerulea	Blue elderberry	FACU
Apiaceae	*Eryngium vaseyi*	Coyote-thistle	FACW

Phone: (530) 621-5355 www.edcgov.us/Planning/

CONDITIONAL/MINOR USE PERMIT

PURPOSE

Within each zone district there are land uses permitted by right and land uses permitted only by approval of a minor or conditional use permit. Land uses which are permitted by right are typically authorized by issuance of a building permit or business license. Those uses which are permitted only by the use permit process are those which are not typically found in the applicable zoning district and may be injurious to the neighborhood if not properly controlled. However, the use permit may be approved after public notice, public hearing, and subject to conditions which may limit or control the use.

Minor Use Permit. A Minor Use Permit is a process for reviewing uses and activities that are typically compatible with other allowed uses within a zone but due to their nature require consideration of site design and adjacent uses. Minor Use Permits provide for a discretionary review of minor projects or uses that are allowed, but do not meet the standards for administrative review. Unless the project incorporates standards or conditions that are capable of mitigating potentially significant environmental impacts to a level less than significant or is determined to be exempt from CEQA, it will be processed as a Conditional Use Permit.

A Minor Use Permit shall also be necessary for permitting oak tree/oak woodland removal in association with ministerial development (e.g., building or grading permits) where replacement planting or Oak Woodlands conservation (i.e. retention) is requested (either on-site or off-site), in accordance with Section 130.39.060.D (Mitigation – Oak Woodland Removal) of the Zoning Ordinance.

Conditional Use Permit. The determination for a Conditional Use Permit shall be made by the Director based on the nature of the application and the policy issues raised by the project.

REQUIRED FINDINGS

In accordance with Section 130.52.020 and 130.52.021 of the Zoning Ordinance, the following findings must be made by the Zoning Administrator or Planning Commission before the Minor/conditional use permit can be approved:

1. The issuance of the permit is consistent with the General Plan;

2. The proposed use would not be detrimental to the public health, safety and welfare, or injurious to the neighborhood; and

3. The proposed use is specifically permitted by minor/conditional use permit pursuant to this Title.

PROCESS

1. Applicant/agent prepares all required submittal information and makes an appointment to submit the application to Planning Services.

2. Planner is assigned and the application is distributed to affected agencies for consultation and recommendation.

3. Assigned planner and representative from Transportation Division perform site visit and meet on-site with the applicant/agent, if necessary.

4. Draft environmental document is prepared and conditions of approval are drafted (or recommendation for denial is proposed).

Based upon the provisions set forth in the California Environmental Quality Act (CEQA), a Negative Declaration or Mitigated Negative Declaration may be prepared for a proposed project that *will not* have significant environmental impacts, or where those impacts can be mitigated to a less than significant level, respectively. However, if the project *will* have significant environmental impacts that cannot be mitigated, an Environmental Impact Report (EIR) is required. Certain projects may be listed in CEQA as Statutorily or Categorically Exempt from those provisions, in which case the timing and processing of the project is expedited. If it is determined that an EIR is required for your project, processing of the application is placed on "hold" status. The project only proceeds if the applicant agrees to fund the more costly EIR process. The applicant has the right to appeal the decision to require an EIR to the Board of Supervisors.

5. Applicant/agent meet with the Technical Advisory Committee (TAC - staff representatives of affected agencies) to discuss environmental review, conditions of approval (or recommendation for denial), and potential hearing date(s).

   NOTE: This is a critical meeting and it is absolutely necessary for the applicant or agent to attend. If issues arise which cannot be resolved at this meeting, the application will either be placed on hold or the meeting rescheduled when the issue is resolved.

6. Project is noticed in the local newspaper advertising the required 30-day public review period for Negative Declarations as set by State law, or noting the project is Categorically Exempt from CEQA review.

7. Applicant receives the staff report at least two weeks prior to the public hearing which includes staff recommendation and proposed conditions of approval or mitigation measures.

8. Public hearing is conducted before the Zoning Administrator or Planning Commission where a final decision is made unless appealed by the applicant or affected party

9. An appeal may be filed by either the applicant or affected party within ten working days after decision (see Appeal process below).

TIMING

Steps 1 through 5 are typically completed within 60 days. The remaining steps are more flexible depending on the complexity of the application. Most applications will reach public hearing in four months. If appealed, an additional 30 days is required for the Board of Supervisors to hear the matter.

HEARING

Applications must be heard by either the Zoning Administrator (minor use permit applications) or the Planning Commission (conditional use permit applications), depending on the complexity of the application. More complex applications are typically heard by the Planning Commission. All public hearings are advertised in a local newspaper and notice is mailed to all property owners within a minimum 1,000-foot radius of the subject property.

APPEALS

If an appeal is made, the matter is heard at a public hearing of the Planning Commission or Board of Supervisors, depending on whether a minor or conditional use permit, with notice given as described above. Said appeal is usually heard 30 days after Zoning Administrator or Planning Commission decision.

FEES

Current application fees may be obtained by contacting Planning Services at (530) 621-5355 or by accessing Planning Services online fee schedule at www.edcgov.us/Government/planning/Pages/fees.aspx.

NOTE: Should your application be denied, application fees are nonrefundable. Should you request withdrawal of the application before a decision has been made, you may receive only that portion of the fee which has not yet been expended. If the public hearing notice has been advertised, fees are nonrefundable.

NOTE: In accordance with State Legislation (AB3158), you will be required to pay a State Department of Fish and Wildlife fee after approval of your application prior to the County filing the Notice of Determination on your project. This fee that increases annually, less $50.00 processing fee, is forwarded to the State Department of Fish and Wildlife and is used to help defray the cost of managing and protecting the State's fish and wildlife resources. If the project is found to have no effect on fish and game resources or otherwise exempt, only the $50.00 processing fee is required to file the Notice of Exemption with the State. These fees are due immediately after project approval, checks payable to "El Dorado County" and submitted to Planning Services for processing.

CONVERSION TO TIME AND MATERIALS

When in the opinion of the Development Services Director the required fee for an application is going to be inadequate to cover processing costs due to the complexity of the project or potential controversy that it may generate, the Development Services Director may convert the application to a time and materials process. When this conversion is proposed, the applicant will be notified in writing and will be requested to submit a deposit in an amount estimated to be sufficient to cover the remaining staff work to bring the application to a final decision. Staff work on the application will stop until a deposit is provided. Normally this conversion will occur when it is obvious the required fee is going to be insufficient, which would typically occur during or soon after the Technical Advisory committee meeting. However, it could occur later in the project if controversy becomes more evident and/or revisions are proposed to the project to mitigate project impacts or neighbor concerns. After the conversion, the applicant will receive a monthly statement/bill identifying the remaining processing fee and/or deposit, or the amount due if deposited funds have been exhausted. If monies are owed, they shall be paid before action by the hearing body.

CONDITIONS OF APPROVAL

As an applicant, you should be aware that environmental mitigation measures or other requirements will likely be made conditions of approval. Depending on the nature of the application, conditions of approval might involve landscaping, protection of riparian areas, fencing, paving of parking or access road, limited hours of operation, etc.

If your application involves a building permit, you should be aware of other costs that may be part of the building permit process that typically follows approval of an application. In addition to normal building permit fees, you will likely be required to pay traffic impact mitigation (TIM) fees, school fees based on square footage of the proposed building, plus fire and solid waste fees. The County Building Services has an informational document on commercial projects which identifies the extent of fees that may be required. It is also beneficial to contact those departments or agencies requiring the fees to determine actual estimated costs.

DEED RESTRICTIONS

Please review and understand any private deed restrictions recorded against your property to insure your proposed application does not violate such deed restrictions. If a conflict exists between the deed restrictions and your application, the County can still approve your application and issue necessary permits. However, County approval does not absolve your obligation to comply with deed restrictions.

APPLICATION

If the application and submittal requirements are not attached to this information packet, please contact Planning Services. You may also call Planning Services at **(530) 621-5355** for general assistance.

APPOINTMENT

Applications are accepted by appointment only. Please call ahead for an appointment with a planner when you are ready to submit your application. Please have all required submittal information completed before your appointment. Appointments are generally made within 48 hours of your call to Planning Services at (**530) 621-5355**.

Conditional/Minor Use Permit

REQUIRED SUBMITTAL INFORMATION

The following items 1 through 9 must be provided with all applications. The remaining items shall be required where applicable. **If all the required and applicable information is not provided, the application will be deemed incomplete and will not be accepted**. For your convenience, please use the check (√) column on the left to be sure you have all the required and applicable information. **All plans and maps MUST be folded to 8½" x 11".**

FORMS AND MAPS REQUIRED

Check (√) Applicant	Check (√) County		
_____	_____	1)	Application form, completed and signed.
_____	_____	2)	Letter of authorization from all property owners authorizing agent to act as applicant, when applicable.
_____	_____	3)	Proof of ownership (Grant Deed), if the property has changed title since the last tax roll.
_____	_____	4)	A copy of official Assessor's map, showing the property outlined in red.
_____	_____	5)	An 8 ½ x 11" vicinity map showing the location of the project in relation to the distance to major roads, intersections, and town sites.
_____	_____	6)	Environmental Questionnaire form, completed and signed.
_____	_____	7)	Provide name, mailing address and phone number of all property owners and their agents.
_____	_____	8)	A record search for archaeological resources shall be conducted through the North Central Information Center located at CSU-Sacramento, 6000 J Street, Adams Bldg, #103, Sacramento, CA 95819-6100, phone number (916) 278-6217. If the record search identifies a need for a field survey, a survey shall be required. (A list of Archaeological Consultants and survey requirements is available at the Planning Department.) Archaeological surveys shall meet the "Guidelines for Cultural Resource Studies" approved by the Board of Supervisors, available at the Planning Department.
_____	___	9)	A traffic impact determination shall be provided utilizing El Dorado County's "Transportation Impact Study (TIS) – Initial Determination Form, located on the Planning Services website under "Applications and Forms".
_____	___	10)	If public sewer or water service is proposed, obtain and provide a Facilities Improvement Letter if the project is located within the EID service area, or a similar letter if located in another sewer/water district.

FORMS AND MAPS REQUIRED

Check (√)
Applicant County

_____ _____ 11) If off-site sewer or water facilities are proposed to serve the project, provide four (4) copies of a map showing location and size of proposed facilities. If ground water is to be used for domestic water, submit a report noting well production data for adjacent parcels, or submit a hydrological report prepared by a geologist noting the potential for water based on the nature of project site geology.

_____ _____ 12) In an accompanying report, provide the following data for area on each proposed parcel that is to be used for sewage disposal:

_____ _____ a) Percolation rate and location of test on 4.5 acres or smaller
_____ _____ b) Depth of soil and location of test
_____ _____ c) Depth of groundwater and location of test
_____ _____ d) Direction and percent of slope of the ground
_____ _____ e) Location, if present, of rivers, streams, springs, areas subject to inundation, rock outcropping, lava caps, cuts, fills, and easements
_____ _____ f) Identify the area to be used for sewage disposal
_____ _____ g) Such additional data and information as may be required by the Division Director of Environmental Management to assess the source of potable water, the disposal of sewage and other liquid wastes, the disposal of solid wastes, drainage, and erosion control

_____ _____ 13) Preceding parcel map, final map, or record of survey, if any exists.

_____ _____ 14) Preliminary grading, drainage plan, and report. The plan should be of sufficient detail to identify the scope of grading, including quantities, depths of cut and fills (for roads and driveways where cuts/fills exceed 6 feet, and mass pad graded lots), location of existing drainage, proposed modifications, and impacts to downstream facilities. (See Section 110.14.240 of County Grading Ordinance for submittal detail)

_____ _____ 15) If located within one of the five Ecological Preserve - EP overlay zones (Mitigation Area 0), rare plants may exist on-site. The State Department of Fish & Wildlife will require an on-site biological plant survey to determine the extent and location of rare plants on the project site. Such a survey can only occur from March 15 through August 15 when plants are readily visible. Therefore, if the State Department of Fish & Wildlife requires the plant survey, a substantial delay in the processing of your application could result. To avoid potential delays, you may choose to provide this survey with application submittal. (A list of possible Botanical Consultants is available at Planning Services.)

____ _____ 16) Name and address of Homeowner's Association, CSA 9 Zone of Benefit, or other road maintenance entity if it exists in the project area.

____ _____ 17) A site-specific wetland investigation shall be required on projects with identified wetlands as delineated on the applicable U.S.G.S. Quadrangle and/or by site visit, when proposed improvements will directly impact the wetland (reduce the size of the wetland area) or lie near the wetlands. (Available from Planning Services are the U.S. Corps of Engineers requirements for a wetlands delineation study. A list of qualified consultants is also available.)

_____ _____ 18) An acoustical analysis shall be provided whenever a noise-sensitive land use (residences, hospitals, churches, libraries) are proposed adjacent to a major transportation source, or adjacent or near existing stationary noise sources. Such study shall define the existing and projected noise levels and define how the project will comply with standards set forth in the General Plan.

_____ _____ 19) Where potential for special status plant and/or animal habitats are identified on the parcel(s), an on-site biological study shall be required to determine if the site contains special status plant or animal species or natural communities and habitats.

_____ _____ 20) An air quality impact analysis shall be provided utilizing the El Dorado County Air Pollution Control District's "Guide to Air Quality Assessment."

OAK TREE/OAK WOODLAND REMOVAL

The following supplemental information shall be required if any Oak Woodlands, Individual Native Oak Trees, or Heritage Trees, as defined in Section 130.39.030 (Definitions) will be impacted by the project (i.e. cut down) consistent with Section 130.39.070 (Oak Tree and Oak Woodland Removal Permits – Discretionary Development Projects).

Check (√)
Applicant County

_____ _____ 1) Oak Resources Code Compliance Certificate.

_____ _____ 2) Oak Resources Technical Report prepared by a Qualified Professional consistent with Section 2.5 (Oak Resources Technical Reports) of the Oak Resources Management Plan.

_____ _____ 3) Completed Oak Resources Technical Report Checklist, including supplemental data for impacted Individual Native Oak Trees within Oak Woodlands, as applicable.

_____ _____ 4) Security deposit for on-site oak tree/oak woodland retention and/or replacement planting (if proposed as part of project mitigation) consistent with Section 130.39.070.F (Security Deposit for On-Site Oak Tree/Oak Woodland Retention and Section 130.30.070.G (Security Deposit for On-Site Oak Tree/Oak Woodland Replacement Planting).

_____ _____ 5) Reason and objective for impact to oak trees and/or oak woodlands.

SITE PLAN REQUIREMENTS

Five (5) copies plus an electronic copy (CD-ROM or other medium) of the site plan detailing what exists on the site at time of application shall be submitted on 24"' x 36" sheets or smaller, drawn to scale, and of sufficient size to clearly show all details and required data. **All plans MUST be folded to 8½" x 11", plus one 8½" x 11" reduction. NO ROLLED DRAWINGS WILL BE ACCEPTED.**

For your convenience, please check the Applicant column on the left to be sure you have all the required submittal information.

Check (√)
Applicant County

_____ _____ 1) Project name (if applicable).

_____ _____ 2) Name, address of applicant and designer (if applicable).

_____ _____ 3) Date, north arrow, and scale.

_____ _____ 4) Entire parcel of land showing perimeter with dimensions.

_____ _____ 5) All roads, alleys, streets, and their names.

_____ _____ 6) Location of easements, their purpose and width.

_____ _____ 7) All existing and proposed uses (i.e. buildings, driveways, dwellings, utility transmission lines, etc.).

_____ _____ 8) Parking and loading stalls with dimensions (refer to Zoning Ordinance Chapter 130.35 and the Community Design Standards-Parking and Loading Standards).

_____ _____ 9) Trash and litter storage or collection areas, and propane tank location(s).

_____ _____ 10) Total gross square footage of proposed buildings.

_____ _____ 11) Proposed/existing fences or walls.

_____ _____ 12) Sign locations and sizes (if proposed) (refer to Zoning Ordinance Chapter 130.16).

_____ _____ 13) Pedestrian walkways, courtyards, etc. (if proposed).

_____ _____ 14) Exterior lighting plan (if proposed), along with a Photometric Study and fixture specifications (refer to Zoning Ordinance Chapter 130.34 and the Community Design Standards-Outdoor Lighting Standards) .

_____ _____ 15) Existing/proposed water, sewer, septic systems, and wells (if applicable).

_____ _____ 16) Existing/proposed fire hydrants.

_____ _____ 17) Tentative subdivision or parcel map (if applicable).

_____ _____ 18) Public uses (schools, parks, etc.)

_____ _____ 19) The location, if present, of rock outcropping, lava caps, drainage courses, lakes, canals, reservoirs, rivers, streams, spring areas subject to inundation and wetlands. (Show respective 100-foot and 50-foot septic system setbacks when a septic system is proposed).

_____ _____ 20) Identify areas subject to a 100-year flood on perennial streams or creeks, and show high water level (100-year) on map. Where this data is not readily available, January 1997 flood level can be shown if known. (Refer to the Federal Emergency Management Agency (FEMA) website).

_____ _____ 21) Note any proposed trails within the project; and where applicable, connection to existing or proposed trail systems.

PRELIMINARY LANDSCAPE PLAN REQUIREMENTS

Required when parking facilities are proposed or otherwise at planner's discretion. (Refer to Zoning Ordinance Chapter 130.33 and the Community Design Standards – Landscaping and Irrigation Standards).
(Five (5) copies plus an electronic copy (CD-ROM or other medium), **folded to 8½" x 11", plus one 11" x 17" reduction).**

Check (√) Applicant	County		
_____	_____	1)	Location, quantity, and a gallon size of proposed plant material (See Zoning Ordinance Chapter 130.33 and the Community Design Standards – Landscaping and Irrigation Standards).
_____	_____	2)	Note quantity/type of trees to be removed.
_____	_____	3)	Location, general type (pine, oak, etc.) and size of all existing trees, in those areas that are subject to grading or otherwise may be removed/affected by proposed improvements. Note quantity of trees to be removed.
_____	_____	4)	List of both common and botanical names of plant material (use of drought tolerant species is highly recommended). A recommended list of drought-tolerant species is available at Planning Services.
_____	_____	5)	Location of irrigation proposed. (NOTE: The final Landscape Plan will ultimately be required to meet the County's Water Conserving Landscape Standards. Copies are available at Planning Services).

PRELIMINARY GRADING AND DRAINAGE PLAN

Required whenever any grading is proposed.
(Five (5) copies plus an electronic copy (CD-ROM or other medium), **folded to 8½" x 11", plus one 8.5" x 11" reduction).**

Check (√) Applicant	County		
_____	_____	1)	Contours or slope data (pursuant to Chapter 110.14 of County Code Grading, Erosion, and Sediment Control Ordinance).
_____	_____	2)	Drainage improvements, culverts, drains, etc.
	_____	3)	Limits of cut and fill._____

PLAN OF BUILDING ELEVATIONS

Required whenever a new structure or addition is proposed.
(Five (5) copies plus an electronic copy (CD-ROM or other medium), **folded to 8½" x 11", plus one 8.5" x 11" reduction).**

Check (√) Applicant	County		
_____	_____	1)	Building design, elevations of all sides.
_____	_____	2)	Exterior materials, finishes, and colors.
_____	_____	3)	Existing/proposed signs showing location, height and dimensions. Include sign plan for project with multiple businesses.

Planning Services reserves the right to require additional project information as provided by Section 15060 of the California Environment Quality Act, or as required by the General Plan development policies, when such is necessary to complete the environmental assessment.

NOTE: APPLICATION WILL BE ACCEPTED BY APPOINTMENT ONLY. MAKE YOUR APPOINTMENT IN ADVANCE BY CALLING (530) 621-5355.

ENVIRONMENTAL QUESTIONNAIRE

File Number _____

Date Filed _____

Project Title _____ Lead Agency _____

Name of Owner _____ Telephone _____

Address _____

Name of Applicant _____ Telephone _____

Address _____

Project Location _____

Assessor's Parcel Number(s)_____Acreage_____Zoning _____

Please answer all of the following questions as completely as possible. Subdivisions and other major projects will require a Technical Supplement to be filed together with this form.

1. Type of project and description:

2. What is the number of units/parcels proposed? _____

GEOLOGY AND SOILS

3. Identify the percentage of land in the following slope categories:

☐ 0 to 10% ☐ 11 to 15% ☐ 16 to 20% ☐ 21 to 29% ☐ over 30%

4. Have you observed any building or soil settlement, landslides, rock falls or avalanches on this property or in the nearby surrounding area? _____

5. Could the project affect any existing agriculture uses or result in the loss of agricultural land? _____

DRAINAGE AND HYDROLOGY

6. Is the project located within the flood plain of any stream or river?_____
   If so, which one?_____
7. What is the distance to the nearest body of water, river, stream or year-round drainage channel?
   _____ Name of the water body?_____
8. Will the project result in the direct or indirect discharge of silt or any other particles in noticeable amount into any lakes, rivers or streams? _____
9. Will the project result in the physical alteration of a natural body of water or drainage way?
   If so, in what way? _____
10. Does the project area contain any wet meadows, marshes or other perennially wet areas?

VEGETATION AND WILDLIFE

11. What is the predominant vegetative cover on the site (trees, brush, grass, etc.)? Estimate percentage of each:

12. How many trees of 6-inch diameter will be removed when this project is implemented?

_____

FIRE PROTECTION

13. In what structural fire protection district (if any) is the project located? _____
14. What is the nearest emergency source of water for fire protection purposes (hydrant, pond, etc.)? _____
15. What is the distance to the nearest fire station? _____
16. Will the project create any dead-end roads greater than 500 feet in length? _____
17. Will the project involve the burning of any material including brush, trees and construction materials? _____

NOISE QUALITY

18. Is the project near an industrial area, freeway, major highway or airport? _____
    If so, how far? _____
19. What types of noise would be created by the establishment of this land use, both during and after construction? _____

AIR QUALITY

20. Would any noticeable amounts of air pollution, such as smoke, dust or odors, be produced by this project? _____

WATER QUALITY

21. Is the proposed water source ☐ public or ☐ private, ☐ treated or ☐ untreated?

22. What is the water use (residential, agricultural, industrial or commercial)? _____

AESTHETICS

23. Will the project obstruct scenic views from existing residential areas, public lands, and/or public bodies of water or roads? _____

ARCHAEOLOGY/HISTORY

24. Do you know of any archaeological or historical areas within the boundaries or adjacent to the project? (e.g., Indian burial grounds, gold mines, etc.) _____

SEWAGE

25. What is the proposed method of sewage disposal? ☐ septic system ☐ sanitation district
Name of district: _____

26. Would the project require a change in sewage disposal methods from those currently used in the vicinity? _____

TRANSPORTATION

27. Will the project create any traffic problems or change any existing roads, highways or existing traffic patterns? _____

28. Will the project reduce or restrict access to public lands, parks or any public facilities?

_____

GROWTH-INDUCING IMPACTS

29. Will the project result in the introduction of activities not currently found within the community? _____

30. Would the project serve to encourage development of presently undeveloped areas, or increases in development intensity of already developed areas (include the introduction of new or expanded public utilities, new industry, commercial facilities or recreation activities)?

31. Will the project require the extension of existing public utility lines? _____
If so, identify and give distances: _____

GENERAL

32. Does the project involve lands currently protected under the Williamson Act or an Open Space Agreement? _____

33. Will the project involve the application, use or disposal of potentially hazardous materials, including pesticides, herbicides, other toxic substances or radioactive material?

_____

34. Will the proposed project result in the removal of a natural resource for commercial purposes (including rock, sand, gravel, trees, minerals or top soil)?

35. Could the project create new, or aggravate existing health problems (including, but not limited to, flies, mosquitoes, rodents and other disease vectors)? _____

36. Will the project displace any community residents? _____

DISCUSS ANY YES ANSWERS TO THE PREVIOUS QUESTIONS (attached additional sheets if necessary)

MITIGATION MEASURES (attached additional sheets if necessary)

Proposed mitigation measures for any of the above questions where there will be an adverse impact:

EDH Retail Shopping Center

Thursday, January 04, 2018
11:00 AM to 12:00 PM
TAC Conference Room/Optional Call-in: 1-866-740-1260 code: 5979027

Scheduled Attendees: Mel Pabalinas, Principal Planner
Michael Concepcion, Associate Planner
Pat Angell, Ascent Environmental
Kristen Stoner, Ascent Environmental
Angelo Christie, AKT
Tim Taron, HSM
Tiffany Wilson, RSC

Agenda

1) New Planner- Michael Concepcion

2) Next Steps

A) Project Review

B) EIR

1) NOP/Scoping Meeting

2) Administrative Procedures (ie. Mailing of Notices, Website Posting, Newspaper Noticing)

C) Agency Review

3) Other Topics

A) Status of Studies

B) Project/EIR Schedule

C) EDH 52 Tentative Parcel Map

D) Schedule of Project Meetings

Meeting Notes:

RSC ENGINEERING

January 9, 2018 104-003A

County of El Dorado
Development Services Department-Planning Division
2850 Fairlane Court
Placerville, CA 95667

Attention: Michael Concepcion

Subject: EDH 52 (PD15-0001)

Dear Michael,

We are responding to the County's letter dated November 9, 2017 regarding a few advisory items necessary to process the project. We have provided:

1. The Oak Resources Technical Report has been updated based on the new Oak Resource Management Plan adopted on October 23, 2017. Four copies are included with this submittal.
2. An updated FIL is in process with EID. It is anticipated the new FIL will be available at the end of January. We submitted the application on December 5th. EID's turnaround is estimated at 8 weeks. We will forward a copy of the new FIL once received.
3. The Rezone exhibit has been revised to show the correct designations. Twenty-five (25) full size copies folded and one 8x11 reduction are provided with this submittal.
4. As you are aware the Client has selected Ascent Environmental for preparation of the EIR document.

Please call if there are any questions.

Sincerely,

Tiffany Wilson

7700 College Town Drive, Suite 150
Sacramento, CA 95826

Subject: Facility Improvement Letter (FIL), EDH 52 -**Annexation**
Assessor's Parcel No. (s) 122-720-15 (Outside)

Dear Mr. Christie:

This letter is in response to your request dated December 4, 2017 and is valid for a period of three years. If Improvement plans for your project are not submitted to El Dorado Irrigation District (EID or District) within three years of the date of this letter, a new FIL will be required.

Design drawings for your project must be in conformance with the District's *Water, Sewer and Recycled Water Design and Construction Standards*.

This proposed project is a commercial development on 41.87 acres. Water and sewer service, recycled water service, private fire service and fire hydrants are requested. The property is **not** within the District boundary and will require annexation before service can be obtained.

This letter is not a commitment to serve, but does address the location and approximate capacity of existing facilities that may be available to serve your project.

Water Supply
As of January 1, 2017, there were approximately 15,591 equivalent dwelling units (EDUs) of water supply available in the El Dorado Hills Water Supply Region. Your project as proposed on this date would require 55 EDUs of water supply.

Water Facilities
An 18-inch water line is located along the western property boundary of the parcel to be developed. The El Dorado Hills Fire Department has determined that the minimum fire flow for this project is 2,875 GPM for a 3-hour duration while maintaining a 20-psi residual pressure. According to the District's hydraulic model, the existing system can deliver the required fire flow. In order to receive service, you must construct a water line extension connecting to the 18-

inch water line previously identified. The hydraulic grade line for the existing water distribution facilities is 960 feet above mean sea level at static conditions and 890 feet above mean sea level during fire flow and maximum day demands.

The flow predicted above was developed using a computer model and is not an actual field flow test.

Recycled Water Facilities

There is an 18-inch recycled water line located along the western property boundary of the parcel to be developed. In order to receive service from this line an extension of facilities of adequate size must be constructed.

The following items must be provided to and/or approved by the District before delivery of recycled water:

1. Non-Residential Sites:
   a. A User Reclamation Plan (URP) prepared in accordance with the Recycled Water On-site Design and Construction Standards; and
   b. On-site recycled water plans submitted with improvement plans.
2. Residential Sites:
   a. An Engineer's Report as described in California Code of Regulations, Title 22; and
   b. On-site recycled water landscape plans submitted for each individual home lot or standard plans to be used with production homes.

The Engineer's Report and/or User Reclamation Plan will need to be revised and approved before the District approves the project development plans. All costs for these studies, plans, and reports will be borne by the applicant.

Sewer Facilities

There is a 21-inch gravity sewer line (Silva Valley – EDH Sewer Line) located along the western property boundary. This sewer line has adequate capacity at this time. In order to receive service from this line, an extension of facilities of adequate size must be constructed. This sewer line is being evaluated for potential upsizing in the District's Wastewater Facilities Master Plan. The District will monitor the available capacity in this line and will be responsible for constructing upgrades as needed. The recommended capacity improvements and the timing of implementation will be included in the District's 5-year CIP, subject to Board approval.

Your project as proposed on this date would require 55 EDUs of sewer service.

Easement Requirements

Proposed water lines, sewer lines and related facilities must be located within an easement accessible by conventional maintenance vehicles. When the water lines or waste water lines are within streets, they shall be located within the paved section of the roadway. No structures will be permitted within the easements of any existing or proposed facilities. The District must have unobstructed access to these easements at all times, and does not generally allow water or waste water facilities along lot lines.

Easements for any new District facilities constructed by this project must be granted to the District prior to District approval of water and/or waste water improvement plans, whether on-site or off-site. In addition, due to either nonexistent or prescriptive easements for some older facilities, any existing on-site District facilities that will remain in place after the development of this property must also have an easement granted to the District.

Environmental

The County is the lead agency for environmental review of this project per Section 15051 of the California Environmental Quality Act Guidelines (CEQA). The County's environmental document should include a review of both off-site and on-site water and sewer facilities that may be constructed by this project. You may be requested to submit a copy of the County's environmental document to the District if your project involves significant off-site facilities. If the County's environmental document does not address all water and waste water facilities and they are not exempt from environmental review, a supplemental environmental document will be required. This document would be prepared by a consultant. It could require several months to prepare and you would be responsible for its cost.

Annexation

The applicant is charged for all costs associated with the annexation proposal. A preliminary cost benefit analysis has been completed. This project as currently defined will not have a negative financial impact on the District. Please contact Development Services regarding the annexation process.

Summary

Service to this proposed development is contingent upon the following:

- Annexation approval from the District's Board of Directors and El Dorado County Local Agency Formation Commission;
- Payment of District Annexation Impact Fee (Contact Development Services for fee calculation);
- Inclusion of lands into the District's service area from the United States Department of the Interior Bureau of Reclamation (Contact Development Services for more information);

- The availability of uncommitted water supplies at the time service is requested;
- Approval of the County's environmental document by the District (if requested);
- Approval of a Facility Plan Report by the District;
- Approval of an extension of facilities application by the District;
- Approval of facility improvement plans by the District;
- Construction by the developer of all on-site and off-site proposed water and sewer facilities;
- Acceptance of these facilities by the District; and
- Payment of all District connection costs.

Services shall be provided in accordance with El Dorado Irrigation District Board Policies and Administrative Regulations, as amended from time-to-time. As they relate to conditions of and fees for extension of service, District Administrative Regulations will apply as of the date of a fully executed Extension of Facilities Agreement.

If you have any questions, please contact me at (530) 642-4054.

Sincerely,

Mike Brink, P.E.
Supervising Civil Engineer

Subject: Facility Improvement Letter (FIL) 2782FIL, EDH 52 –**Annexation - REVISED**
Assessor's Parcel No. 122-720-15 (Outside)

Dear Mr. Christie:

This revised letter is in response to your request dated December 4, 2017 and is valid for a period of three years. If Improvement plans for your project are not submitted to El Dorado Irrigation District (EID or District) within three years of the date of this letter, a new FIL will be required. This letter supersedes the letter dated January 12, 2018 and reflects the removal of recycled water which is not available at this parcel.

Design drawings for your project must be in conformance with the District's *Water, Sewer and Recycled Water Design and Construction Standards*.

This proposed project is a commercial development on 48.29 acres. Water, sewer service, private fire service and fire hydrants are requested. The property is **not** within the District boundary and will require annexation before service can be obtained.

This letter is not a commitment to serve, but does address the location and approximate capacity of existing facilities that may be available to serve your project.

Water Supply
As of January 1, 2017, there were approximately 15,591 equivalent dwelling units (EDUs) of water supply available in the El Dorado Hills Water Supply Region. Your project as proposed on this date would require 65 EDUs of water supply.

Water Facilities
An 18-inch water line is located along the western property boundary of the parcel to be developed. The El Dorado Hills Fire Department has determined that the minimum fire flow for this project is 2,875 GPM for a 3-hour duration while maintaining a 20-psi residual pressure. According to the District's hydraulic model, the existing system can deliver the required fire

flow. In order to receive service, you must construct a water line extension connecting to the 18-inch water line previously identified. The hydraulic grade line for the existing water distribution facilities is 960 feet above mean sea level at static conditions and 890 feet above mean sea level during fire flow and maximum day demands.

The flow predicted above was developed using a computer model and is not an actual field flow test.

Sewer Facilities

There is a 21-inch gravity sewer line (Silva Valley – EDH Sewer Line) located along the western property boundary. This sewer line has adequate capacity at this time. In order to receive service from this line, an extension of facilities of adequate size must be constructed. This sewer line is being evaluated for potential upsizing in the District's Wastewater Facilities Master Plan. The District will monitor the available capacity in this line and will be responsible for constructing upgrades as needed. The recommended capacity improvements and the timing of implementation will be included in the District's 5-year CIP, subject to Board approval. Your project as proposed on this date would require 55 EDUs of sewer service.

Easement Requirements

Proposed water lines, sewer lines and related facilities must be located within an easement accessible by conventional maintenance vehicles. When the water lines or waste water lines are within streets, they shall be located within the paved section of the roadway. No structures will be permitted within the easements of any existing or proposed facilities. The District must have unobstructed access to these easements at all times, and does not generally allow water or waste water facilities along lot lines.

Easements for any new District facilities constructed by this project must be granted to the District prior to District approval of water and/or waste water improvement plans, whether on-site or off-site. In addition, due to either non-existent or prescriptive easements for some older facilities, any existing on-site District facilities that will remain in place after the development of this property must also have an easement granted to the District.

Environmental

The County is the lead agency for environmental review of this project per Section 15051 of the California Environmental Quality Act Guidelines (CEQA). IRRIGATION DESIGN STATEMENT:

The irrigation system will be a water efficient low flow, point source system designed to provide adequate watering to support plant growth and insure deeply rooted plant material while avoiding excess water application. The system will be programmable, allowing operation during late night and or early morning hours, with multiple start times and cycles. The system will interface with a weather based sensor that will adjust the amount of water applied to the plant material based on daily weather conditions. Irrigation materials specified for the site will be selected on the basis of durability and ease of maintenance. Landscape irrigation will comply with the California Department of Water Resources Model Water Efficient Landscape Ordinance (MWELO).

PLAN

NOTES

1. THIS PLOT WAS PREPARED FROM INFORMATION FURNISHED IN PRELIMINARY TITLE REPORTS, PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY, DATED JANUARY 9, 2019, NUMBER NCS-942714-WA1 & NUMBER NCS-942715-WA1. NO LIABILITY IS ASSUMED FOR MATTERS OF RECORD NOT STATED IN SAID PRELIMINARY TITLE REPORT THAT MAY AFFECT THE TITLE LINES, OR EXCEPTIONS, OR EASEMENTS OF THE PROPERTY.

2. ALL DISTANCES AND ELEVATIONS SHOWN HEREON ARE IN FEET AND DECIMALS THEREOF.

3. THE TYPES, LOCATIONS, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS TOPOGRAPHIC SURVEY WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. (A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES). HOWEVER, THE ENGINEER CAN ASSUME NO RESPONSIBILITY FOR THE COMPLETENESS OR ACCURACY OF ITS DELINEATION OF SUCH UNDERGROUND UTILITIES WHICH MAY BE ENCOUNTERED, BUT WHICH ARE NOT SHOWN ON THESE DRAWINGS.

4. PHYSICAL ITEMS SHOWN ON THIS SURVEY ARE LIMITED TO THOSE ITEMS VISIBLE AS OF THE DATE OF THIS SURVEY. SUBSURFACE STRUCTURES, IF ANY, ARE NOT SHOWN. SAID SUBSURFACE OBJECTS MAY INCLUDE, BUT ARE NOT LIMITED TO, CONCRETE FOOTINGS, SLABS, SHORING, STRUCTURAL PILES, UTILITY VAULTS, PIPING, UNDERGROUND TANKS, AND ANY OTHER SUBSURFACE STRUCTURES NOT REVEALED BY A SURFACE INSPECTION.

5. THE SUBJECT PROPERTY IS SHOWN ON THE FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM) FOR EL DORADO COUNTY, CALIFORNIA, MAP NUMBER 06017C0725E FOR COMMUNITY NUMBER 060040 (EL DORADO COUNTY), WITH AN EFFECTIVE DATE OF SEPTEMBER 26, 2008, AS BEING LOCATED IN FLOOD ZONE "X-UNSHADED". ACCORDING TO FEMA THE DEFINITION OF ZONE "X-UNSHADED" IS: AREA OF MINIMAL FLOOD HAZARD.

6. BENCHMARK:
CAL-TRANS TBM, NGS DISK ON TOP OF HEADWALL AT THE NORTHWEST CORNER OF THE BRIDGE ON CLARKSVILLE CROSSING AS TAKEN FROM THE CALTRANS IMPROVEMENT PLANS, SHEET 14 (PC-1) OF THE SILVA VALLEY CONSTRUCTION PLANS DATED JANUARY 4, 2013.
(PID: JS0692) ELEVATION= 673.08 FEET (NGVD 1929 DATUM)

7. BASIS OF BEARINGS:
THE BEARING OF NORTH 88° 27' 28" EAST, TAKEN ON THE NORTHERLY LINE OF PARCEL 4 AS SHOWN ON THAT CERTAIN PARCEL MAP FILED FOR RECORD ON DECEMBER 28, 2018, IN BOOK 52 OF MAPS AT PAGE 10, OFFICIAL RECORDS OF EL DORADO COUNTY WAS TAKEN AS THE BASIS FOR ALL BEARINGS SHOWN HEREON.

8. CORNER RECORD NOTE:
THE DEVELOPER AND/OR CONTRACTOR SHALL BE RESPONSIBLE FOR THE PREPARATION AND FILING OF PRE-CONSTRUCTION AND POST-CONSTRUCTION CORNER RECORDS FOR ANY MONUMENTS OR PROPERTY CORNERS SHOWN HEREON THAT MAY BE DESTROYED DURING IMPROVEMENTS TO THE SUBJECT PROPERTY AS DEFINED IN SECTION 8771(B) OF THE PROFESSIONAL LAND SURVEYORS ACT.

10. THE AERIAL MAPPING WAS PREPARED USING COMPUTER ASSISTED, PHOTOGRAMMETRIC METHODS BY COOPER AERIAL SURVEYS CO., IN PHOENIX ARIZONA. JOB NUMBER 1901022. IN AREAS OF DENSE VEGETATION, ACCURACY OF CONTOURS MAY DEVIATE FROM ACCEPTED ACCURACY STANDARDS. DATE OF PHOTOGRAPHY 02-22-19, ORIGINAL COMPILED MAP SCALE 1"=40', CONTOUR INTERVAL 1 FOOT. THE GRID IS BASED ON PHOTOGRAMMETRIC METHODS COMPILED ON DIGITAL STEREO WORKSTATIONS USING AERIAL PHOTOGRAPHY. CONTROL SURVEY PERFORMED BY KIER & WRIGHT, LIVERMORE, CA.

NORTH

SHEET 1 of 1

EDH 52-COSTCO

OVERALL COMMERCIAL CENTER

PROJECT DESCRIPTION

November 13, 2020

DESCRIPTION AND PURPOSE OF THE REQUEST

The owner is pleased to submit this revised application requesting approval to construct two (2) new commercial centers (collectively, the "Project") in El Dorado County encompassing APNs: 122-720-002, 018, 019, 020 & 021. In addition, a portion of 122-720-003 and the unused former Tong Road right-of-way between Silva Valley Parkway and Clarksville Crossing are proposed to be a part of the project. The property is located north of Highway 50 and Tong Road, east of Clarksville Crossing, and is bisected by Silva Valley Parkway. The northern portion of the property is approximately 18.26 acres (North Site) and the southern portion is approximately 17.05 acres (South Site), net of the right of way for roads. There is a 6.57-acre area on the North Site for the right of way associated with the future extension of Country Club Drive. There is a 1.38-acre area west of Clarksville Crossing on the South Site that will not be developed as part of the Project.

The revised application seeks a series of zoning changes to facilitate development of the Project, including a rezone proposed on the North Site to CC-PD to allow more uses primarily seen in a shopping center setting and to allow a self-storage use with the approval of a conditional use permit. In addition, the application proposes to extend the existing CR-PD zoning to the entire South Site to enable development of a commercial center there.

The Project is within the Planned Development Overlay zone such that a Development Plan Permit is required. To reflect the separate needs of each commercial center, the revised application includes two separate Development Plan Permit packages: one for the North Site and one for the South Site. Each Development Plan Permit will address the design guidelines and signage for the corresponding portion of the Project. In addition, the owner has processed separate wetlands permits from the Army Corps of Engineers for each area. However, both the North Site and the South Site are one "project" for purposes of evaluating the Project's environmental impacts under the California Environmental Quality Act ("CEQA").

The maximum building area for the South Site will be approximately 161,000 square feet and includes, without limitation, a Costco warehouse retail center, tire sales and installation, motor vehicle fuel sales, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and propane refueling and sales adjacent to tire sales and installation facility. Temporary outdoor sales may occur within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December. The building area for the North Site will be approximately 162,000 square feet and may include the following uses: drive through uses, gas station with car wash, food uses, outdoor patio, outdoor storage and outdoor sales and other retail and offices uses permitted in the CR zone.

ENTITLEMENTS REQUESTED

Overall Project:

- As preservation of 90% of the existing oak tree canopy is not feasible, this Project will be requesting relief from General Plan Policy 7.4.4.4 due to topographic constraints and the need to grade the site in relation to Silva Valley Parkway.

North Site:

- Rezoning from CR-PD to CC-PD zoning designation;
- Development Plan Permit approval to cover:
    - the site plan, building design, and preliminary landscape plan, storm drainage, and grading;
    - design guidelines;
    - a signage program;
- Tentative Parcel Map to reconfigure existing and create four new parcels for purposes of sale, lease or financing of the North Site.

South Site:

- Abandonment of the former Tong Road extension right of way and disposition of subsequent parcel;
- Disposition of County-owned land near Highway 50;
- Extension of existing CR-PD zoning designation for the entire South Site;
- Development Plan Permit approval to cover:
    - the site plan, building design, and preliminary landscape plan, storm drainage, and grading;
    - design guidelines;
    - a signage program that will allow for the size and square footage of the typical signage program for the warehouse, fuel facility, and pylon and monument signage;
- Lot Line adjustment and merger to configure up to four parcels for the South Site.

Each of the entitlements described above will be analyzed in an Environmental Impact Report to study the impacts and potential mitigation measures required for the Project.

PROJECT OBJECTIVES

Overall Project:

- Develop two high-quality planned commercial developments on currently vacant and underutilized land adjacent to Highway 50 adequately served by public services and utilities.
- Promote economic growth and diverse new employment and retail/service opportunities for County residents.
- Increase the number of employees and contribute to the local job/housing balance.

North Site:

- Develop architectural and landscaping designs that soften the scale and mass of the buildings, create a pleasant and attractive appearance, and complement the surrounding area.
- Develop site plans that minimize potential access and circulation conflicts between automobiles and pedestrians, provide adequate off-street parking for store customers and employees, and minimize impacts to the surrounding area.

South Site:

- Construct and operate a new Costco warehouse that serves the local community with goods and services from both nationally known businesses but also more regional and local businesses.
- Reduce energy consumption by incorporating sustainable design features and systems with enhanced energy efficiencies meeting State and federal code requirements.
- Provide a Costco warehouse in a location that is convenient for its members, the community, and employees to travel to shop and work.
- Provide a state-of-the-art Costco warehouse to better serve the membership in the greater El Dorado Hills area.
- Meet member demand for high-quality gasoline at a fair price via a new Fuel Facility developed in conjunction with the proposed warehouse.

- Enhance the area with a warehouse that is architecturally designed to be responsive to the El Dorado Hills area design context and sensitive to the adjacent community, future development(s) and compatible with the need for a new warehouse in this market area.

- Continue and increase contribution to the County's tax base by Costco.

- Expand the space available for integrated retail sales of goods and services in El Dorado Hills market.

- Minimize circulation conflicts between automobiles and pedestrians.

- Provide a Costco warehouse in a location that is serviced by adequate existing infrastructure including roadways and utilities.

- Develop a Costco warehouse that is large enough to accommodate all the uses and services Costco provides to its members elsewhere.

- Locate a Costco warehouse on a site Costco can purchase (rather than lease) to protect its substantial investment of time, money and goodwill in the location.

SITE INFORMATION

Location

The proposed Project is in El Dorado County. The Project site is on the north side of Highway 50 and is bisected by Silva Valley Parkway. It is bordered by existing residences and an elementary school to the north, vacant land to the east, Clarksville Crossing to the west, and Highway 50 to the south.

Site Description

The Project site is currently vacant. A small portion of the unused Tong Road right-of-way is proposed to be included in the South Site. The site consists of annual grassland with small oak woodlands. Slivers of wetlands and riparian areas are located on site.

DESCRIPTION OF THE PROPOSED PROJECT

The maximum building area for the South Site will be approximately 161,000 square feet and includes, without limitation, a Costco warehouse retail center, tire sales and installation, motor vehicle fuel sales, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and propane refueling and sales adjacent to tire sales and installation facility. Temporary outdoor sales may occur within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December. The building area for the North Site will be approximately 162,000 square feet and may include the following uses: drive through uses, gas station with car wash, food uses, outdoor patio, outdoor storage and outdoor sales and other retail and offices uses permitted in the CC zone.

North Site Architecture

The design theme for the North Site is based on the existing building design theme of the Serrano area, which is a California/Mediterranean style, examples of which are included in the design guidelines proposed for the North Site.

Where single tenant types (retail shops) occur, the guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants will use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as shown in the guidelines. No building design for any tenant type shall be repeated on the North Site.

Each building on the North Site shall vary in building height to achieve more visual interest and distinct building character, avoiding the monotony of continuous building height. Each building shall combine horizontal and vertical elements to provide variation, interest and rhythm within and among the buildings. In no case shall any roof mounted equipment be higher than the lowest parapet height of the building.

The color and material palette for the North Site contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the North Site so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette must be maintained throughout the development of the North Site.

Within the development of the North Site, all sides of all buildings will be visible from adjacent roadways and properties. The architecture of all sides of all buildings must, therefore, be of equal quality and attention. Screening is required for loading and storage areas, utilities meters and boxes using landscaping, walls, fences in combination.

The use of colored concrete, concrete pavers, accent patterns, etc. shall be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas shall be accomplished using intimate seating areas in near proximity of the building.

South Site Architecture

The warehouse design is proposed to be contemporary and will set the standard for large format retail facades with variety of massing and appropriate materials for the building. By combining concrete masonry block and architectural metal panels, Costco intends to create a scale and architectural interest to minimize the visual impact of a large retail warehouse. By use of design techniques such as the location of building materials, landscaping, and the incorporation of varying parapet cap heights, Costco can successfully break the long elevations both horizontally vertically. The technique of breaking a long elevation into smaller elements with varied materials and colors is used to create a more pedestrian-friendly scale in the proposed design. The proposed colors are warm natural earth tones, which will relate to the proposed surrounding development by utilizing similar building materials and architectural detailing.

The South Site has been designed to utilize the existing slope of the site by locating the warehouse at the lower elevation of the site and providing ramps to access the roof top and upper level of parking. The lower level of the plan is proposed to include 155 parking spaces adjacent to the warehouse entry at the northwest corner of the building. Vehicle access to the 670 parking spaces at the second level would be provided by two ramps on the east and west sides of the warehouse. A travelator, elevators, and stairs on the east side of the second level would provide pedestrian access from second level parking down to the lower level and entry to the warehouse The main entry feature to the warehouse is proposed to be oriented towards the northwest so that the loading dock and truck deliveries would be accessed and oriented towards Interstate 50 to provide greater separation with the existing residences.

The warehouse is proposed to include one customer entrance to the main Costco store that would be located at the northwest corner. The El Dorado Hills Costco is expected to include a bakery, pharmacy, optical center with optical exams and retail optical sales, hearing aid testing center, food court, and a photo center along with the sales of approximately 4,000 products. The warehouse would include a five bay Tire Center, a +/-5,300 square-foot facility with member access via the inside of the main Costco building, which would include tire sales and a tire installation facility. A promotional vehicle may be on display near the entry to the building. This vehicle would be only to promote online or offsite vehicle sales; no vehicles are proposed to be sold on site.

South Site Fuel Facility

The members-only Costco fuel facility proposed on the South Site would include a +/-11,200 square-foot canopy and a +/-125 square-foot controller enclosure that will be located on the southern portion of the planting island of the fuel station to house the control equipment. The controller enclosure would be built with steel walls and finished with paint to match the warehouse building colors. There would be four covered fueling bays, each with four two-sided fuel dispensers so as to provide for the fueling of eight cars at each island for a total of 32 fueling positions. The fueling station would also have 8 stacking lanes, allowing approximately 40 cars to wait for pumps at any given time in addition to the 32 cars at the dispensers. The dispensers would be fully automated and self-service for Costco members only. A Costco attendant would be present at all times of operation to oversee operations and assist members. Four underground fuel tanks would also be installed at the southern edge of the gas station. Lights would be recessed into the canopy to provide both lighting during operating hours and a lower level of security lighting after hours.

Costco Operations

It is anticipated that the El Dorado Hills Costco warehouse and fuel will employ approximately 165 to 170 employees.

Costco Wholesale is a membership-only retail/wholesale business, selling high quality national brands and private label merchandise for commercial and personal use. The warehouse hours are anticipated to be Monday through Friday from 9:00 am to 8:30 pm, and Saturday and Sunday from 9:00 am to 7:00 pm. The fuel facility hours are anticipated to be daily from 5:00 am to 10:00 pm.

Costco anticipates an average of about 10 trucks delivering goods on a typical weekday. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers.

Receiving time is from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before the 10:00 a.m. opening time. Deliveries to the warehouse are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from Interstate 50, and accessing the site from Silva Valley Parkway.

It is estimated that fuel will be delivered to the gasoline facility in two to three trucks per day. The largest fuel trucks are approximately 70 feet long. While delivering the fuel, the truck will be parked over the underground tanks located on the east side of the gas facility. The truck will not block access to any of the fueling positions or occupy any queuing space or parking spaces. The fuel facility is located and specifically designed to avoid traffic and queuing conflicts with the warehouse.

In order to open and operate the gas facility, Costco will have to meet requirements of local, state and federal regulators and agencies, including the County Fire Department, the County Department of Environmental Health, the Air Quality Management District, the State Water Resources Control Board, the California Environmental Protection Agency, and the United States Environmental Protection Agency.

The tire center typically will receive shipments of tires one to two times per week in single- or double-trailer trucks of up to 70 feet in length, and the same delivery truck will pick up old tires for recycling. Deliveries to and pickups from the tire center will be scheduled for pre-opening hours, typically about 6:00 a.m.

Sustainability Features

The entire proposed Project will incorporate sustainability features per the California Title 24 energy requirements. In addition, to reduce energy consumption and promote sustainability, Costco will incorporate many energy saving measures when constructing a new facility. Below are some of the significant practices that Costco currently incorporates into new buildings that help conserve energy and other natural resources that are expected to be used in connection with the development of the South Site:

- Parking lot light standards will be designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps can provide a higher level of perceived brightness with less energy than other lamps such as high-pressure sodium.

- New and renewable building materials are typically extracted and manufactured within the region. When masonry and concrete are used, the materials purchased are local to the project, minimizing the transportation distances and impact to local road networks.

- The use of pre-manufactured building components, including structural framing and metal panels, helps to minimize waste during construction.

- Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other

materials. Building heat absorption is further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall.

- A substantial amount of the proposed plant material for the South Site is climate adapted to the region and will use less water than other common species.

- The irrigation system includes the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas.

- Storm water management plans are designed to maintain quality control and storm water discharge rates based on the County requirements.

- High-efficiency restroom fixtures can achieve a 40% decrease and water savings over U.S. standards.

- Commissioning of mechanical systems will occur to ensure that the HVAC systems are preforming as designed. HVAC comfort systems can be controlled by a computerized building management system to maximize efficiency.

- HVAC units planned for the South Site are high efficiency direct ducted units, which have phased out the use of HCFC's completely, long before the Montreal Protocol timeline.

- Parking lot and exterior lights can be controlled by a photo sensor and time clock.

- Lighting is controlled by the overall project energy management system.

- Energy efficient Transformers (i.e., Square D Type EE transformers) are planned to be used.

- Variable speed motors will be used on make-up air units and booster pumps.

- Gas water heaters are direct vent and 94% efficient or greater.

- Reclaim tanks are used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.

- The Main Building structure is a pre-engineered system that uses 100% recycled steel materials and is designed to minimize the amount of material used.

- Construction waste is recycled whenever possible.

- Floor sealant is No-VOC and represents over 80% of the floor area.

- CO2 is monitored throughout the warehouse.
- Extensive recycling/reuse program is implemented for warehouse and office space including tires, cardboard, grease, plastics, and electronic waste.
- Use of plastic shopping bags is avoided.
- Suppliers are required to reduce packaging and consider alternative packaging solutions.
- Distribution facilities are strategically located to minimize miles traveled for delivery.
- Deliveries are made in full trucks.
- All Costco trucks are equipped with an engine idle shut off timers.

SIGNAGE

Proposed highway-oriented and monument sign locations are depicted on the proposed site plan for both the North Site and the South Site.

North Site

A highway-oriented sign is proposed on the North Site greater than 100 feet from the freeway right of way. The owner is requesting certain deviations from Chapter 130.36 of the County Code for the proposed highway-oriented signs, including a reduction in the minimum separation between highway-oriented signs, a reduction in the minimum setback from the adjacent residential district (North Site only), an increase in the maximum allowed area, and an increase in the maximum allowed height. Each highway-oriented sign will be a 75-foot tenant pylon sign allowing advertising from either commercial center and will include one (1) major tenant panel, one (1) junior tenant panel, and eight (8) shop tenant panels. The proposed sign area for each highway-oriented sign is 652 square feet. The highway-oriented signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be fabricated aluminum, pan channel construction. Tenant names and logos will be flush mounted to the panel background and internally illuminated with white LED lights. Colors will comply with tenant specifications.

The owner is also requesting certain deviations from Chapter 130.36 of the County Code for the proposed monument signs, including an increase in the maximum allowed area, and an increase in the maximum allowed height. The developer is proposing two (2) 28-foot tenant monument signs on the North Site. Each monument sign will have one (1) featured tenant panel and six (6) shop tenant panels. The proposed area for each monument sign is 242 square feet. The monument signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be routed out with acrylic push-through graphics and vinyl film overlays. Tenant names will be internally illuminated with white LED lights. Colors will comply with tenant specifications.

Building signs for the North Site will be a part of a separate sign permit and are not proposed at this time.

South Site

On the South Site, proposed signage includes the Costco warehouse typical signage, a pylon signage at the southeast corner of the parcel at Silva Valley Parkway, and a monument sign located at the northern side of the main entry. The south site is requesting deviations from Chapter 130.36 of the County Code, including an increase in maximum allowed sign area and an increase in maximum allowed sign height.

Building signage consists of the signature Costco red and blue corporate colors. The signage is scaled appropriately to the mass of the building elevations to not overwhelm but to reinforce the brand that Costco has established. The warehouse wall signage will consist of externally illuminated reverse pan channel letters, and the gas station signage will also be externally illuminated.

A pylon sign oriented towards Highway 50 will be located at the southeast corner of the site adjacent to Silva Valley Parkway. The sign will be approximately 56' tall and 23' wide with multiple internally illuminated panels for tenant identification for businesses located on the North Site. A monument sign located on the north side of the main entry will also be include as part of the project signage. The sign will be approximately 16' tall and 17' wide with multiple internally illuminated panels for tenant identification for businesses located on the North Site.

SITE ACCESS

It is anticipated that the Project site will have multiple points of access. A traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the South Site and the North Site. The project also proposes a new signalized intersection at Silva Valley Parkway and Clarksville Road.

North Site

A portion of Country Club Drive extension will be constructed to a secondary full access to the north site. An emergency access to Tong Road from the self-storage facility is proposed. Three full access driveways are proposed on Clarksville Crossing to provide additional points of access from the north Site to the South Site.

South Site

Access to the warehouse and fuel facility will be from Interstate 50 at Silva Valley Parkway from a proposed signalized intersection at the northern portion of the site. An ADA compliant pedestrian pathway will extend from the warehouse to the northern property boundary where it will connect to Silva Valley Parkway. The project provides oversized parking stalls of 10' x 20' that are larger than the minimum El Dorado County requirements to provide members with easier accessibility to vehicles.

LOADING

The South Site truck loading dock is located at the southwest corner of the building adjacent to Interstate 50. The bay doors will be equipped with sealed gaskets to limit noise impacts. A smaller on grade door is also located on the south side of the building. This door is to receive bread delivery and Federal Express type trucks. A transformer and two trash compactors will also be located along the south edge of the building proposed for the South Site. Dense landscape material provides the necessary screening to this area (see South Site Landscape Plan).

PARKING LOT

The North Site proposes a main parking lot area in front of the buildings. The parking lot will provide approximately 156 parking spaces, proposed at 90 degrees to maximize the number of stalls on the site. This number includes 11 accessible parking stalls and 8 compact stalls (5%) and 6 RV stalls.

The South Site proposes 825 total parking stalls, which exceeds the required El Dorado County parking requirement of 642 stalls. Approximately 155 parking stalls are provided on grade adjacent to the warehouse entry and tire center. The remaining 670 parking stalls are provided on the upper lever and roof of the warehouse. The project provides oversized parking stalls of 10' x 20' that are larger than the minimum El Dorado County requirements to provide members with easier and safer accessibility to vehicles.

ADA parking will comply with the County Code and Title 24 requirements.

BICYCLE PARKING

The Project will provide bicycle parking spaces (lockers and racks) throughout the site that will meet County and Title 24 requirements.

PEDESTRIAN CIRCULATION

A pedestrian walkway for each portion of the Project will connect the buildings to Silva Valley Parkway.

LANDSCAPING

The Project will include a variety of drought tolerant landscaping options. The North Site landscaping will provide screening along the boundary which will consist of evergreen trees and shrub rows. Shade trees with large canopy coverage will be planted in the North Site parking lot for shade. Planting at the North Site entries will be highlighted and defined by seasonal accented trees and shrubs with the use of colorful plant material. Shrubs will be low growing to maintain line of sight to the street. Along the streets, plantings will incorporate shade trees and mixed species and forms of shrubs to create interest, color, and buffering from the North Site shopping center.

The South Site landscape plan includes a mix of climate adapted shrubs and grasses, and a variety of shade trees. The South Site landscape design has incorporated a generous perimeter buffer which includes evergreen and deciduous trees and shrubs to enhance the streetscape. Landscape islands are typically provided at one island per 5 lineal parking spaces in the South Site parking field to provide shading of the parking lot with the parking lot trees and landscaping per County requirements. The South Site landscape plan has been designed to assist with the screening of the second level parking. The proposed trees and landscaping will meet El Dorado County requirements of 50% shading on the site at the lower level parking, with the second level deck of parking meeting this requirement only where trees can be planted due to the roof top parking structure.

The project proposes to pay in-lieu fees as mitigation for the loss of the oak woodland.

LIGHTING

The North Site will provide various single, two- or four-light fixtures throughout the parking areas and driveways. The overall height of the lighting on the North Site, including the lighting fixtures and a three-foot base, will be 33 feet in the parking lot, 25 feet along the perimeter and main drive aisles and 16' around drive thru lanes. LED luminaires will be used for the parking lot lights.

The South Site parking lot will be illuminated with standard downward LED fixtures affixed to a 37' foot light pole. The lighting fixtures are of a "shoe-box" style. Parking lot light standards are designed to provide even light distribution for vehicle and pedestrian safety. The parking lot lights will be timer controlled to limit lighting after the warehouse has closed and most employees are gone from the warehouse. Parking lot lighting will only remain on to provide security and emergency lighting only along the main driveways. Lighting fixtures will also be located on the building approximately every 40 feet around the exterior of the building to provide safety and security. Parking and site lighting will incorporate the use of cutoff lenses to keep light from overflowing beyond the South Site boundaries.

GRADING

A preliminary grading plan has been prepared for review as part of the application submittals. Each site is designed to balance independently, and it is the intent of this application to allow for mass grading of both sites individually.

ON-SITE IMPROVEMENTS

The Project is designed to allow either the North Site or the South Site to develop independent from the other. Mass grading of each site to accommodate future development will occur in the first phase of development, including filling of the permitted wetlands and permitted tree removal. In the event the South Site develops first, utility crossings under Silva Valley Parkway will be constructed as part of the South Site infrastructure work to serve the North Site. In the event the North Site develops first, interim facilities will be constructed on the North Site.

Following grading, construction of the parking, landscaping, lighting, utility infrastructure, and driveways will occur. Site improvements will be constructed in various phases depending on the extent of development occurring at any given time. Buildings can be started once site improvements are sufficiently completed to allow construction and emergency fire access.

OFF-SITE IMPROVEMENTS

A proposed traffic signal and appurtenant facilities will be located on Silva Valley Parkway at the center of the Project to provide a connection to both the South Site and the North Site.

A portion of Country Club Drive extension will be constructed up to the secondary access point to the North Site.

UTILITY INFRASTRUCTURE

The property will need to annex into El Dorado Irrigation District (EID) in order to acquire sanitary sewer and water service. EID stated in its December 6, 2018 Facilities Improvement Letter that there should be adequate water supply and sewer capacity available to serve a similar type project. The Project will tie into the existing 18-inch potable water main and the 21-inch gravity sewer line in Clarksville Crossing. An updated Facilities Improvement Letter will be requested through EID at the appropriate time.

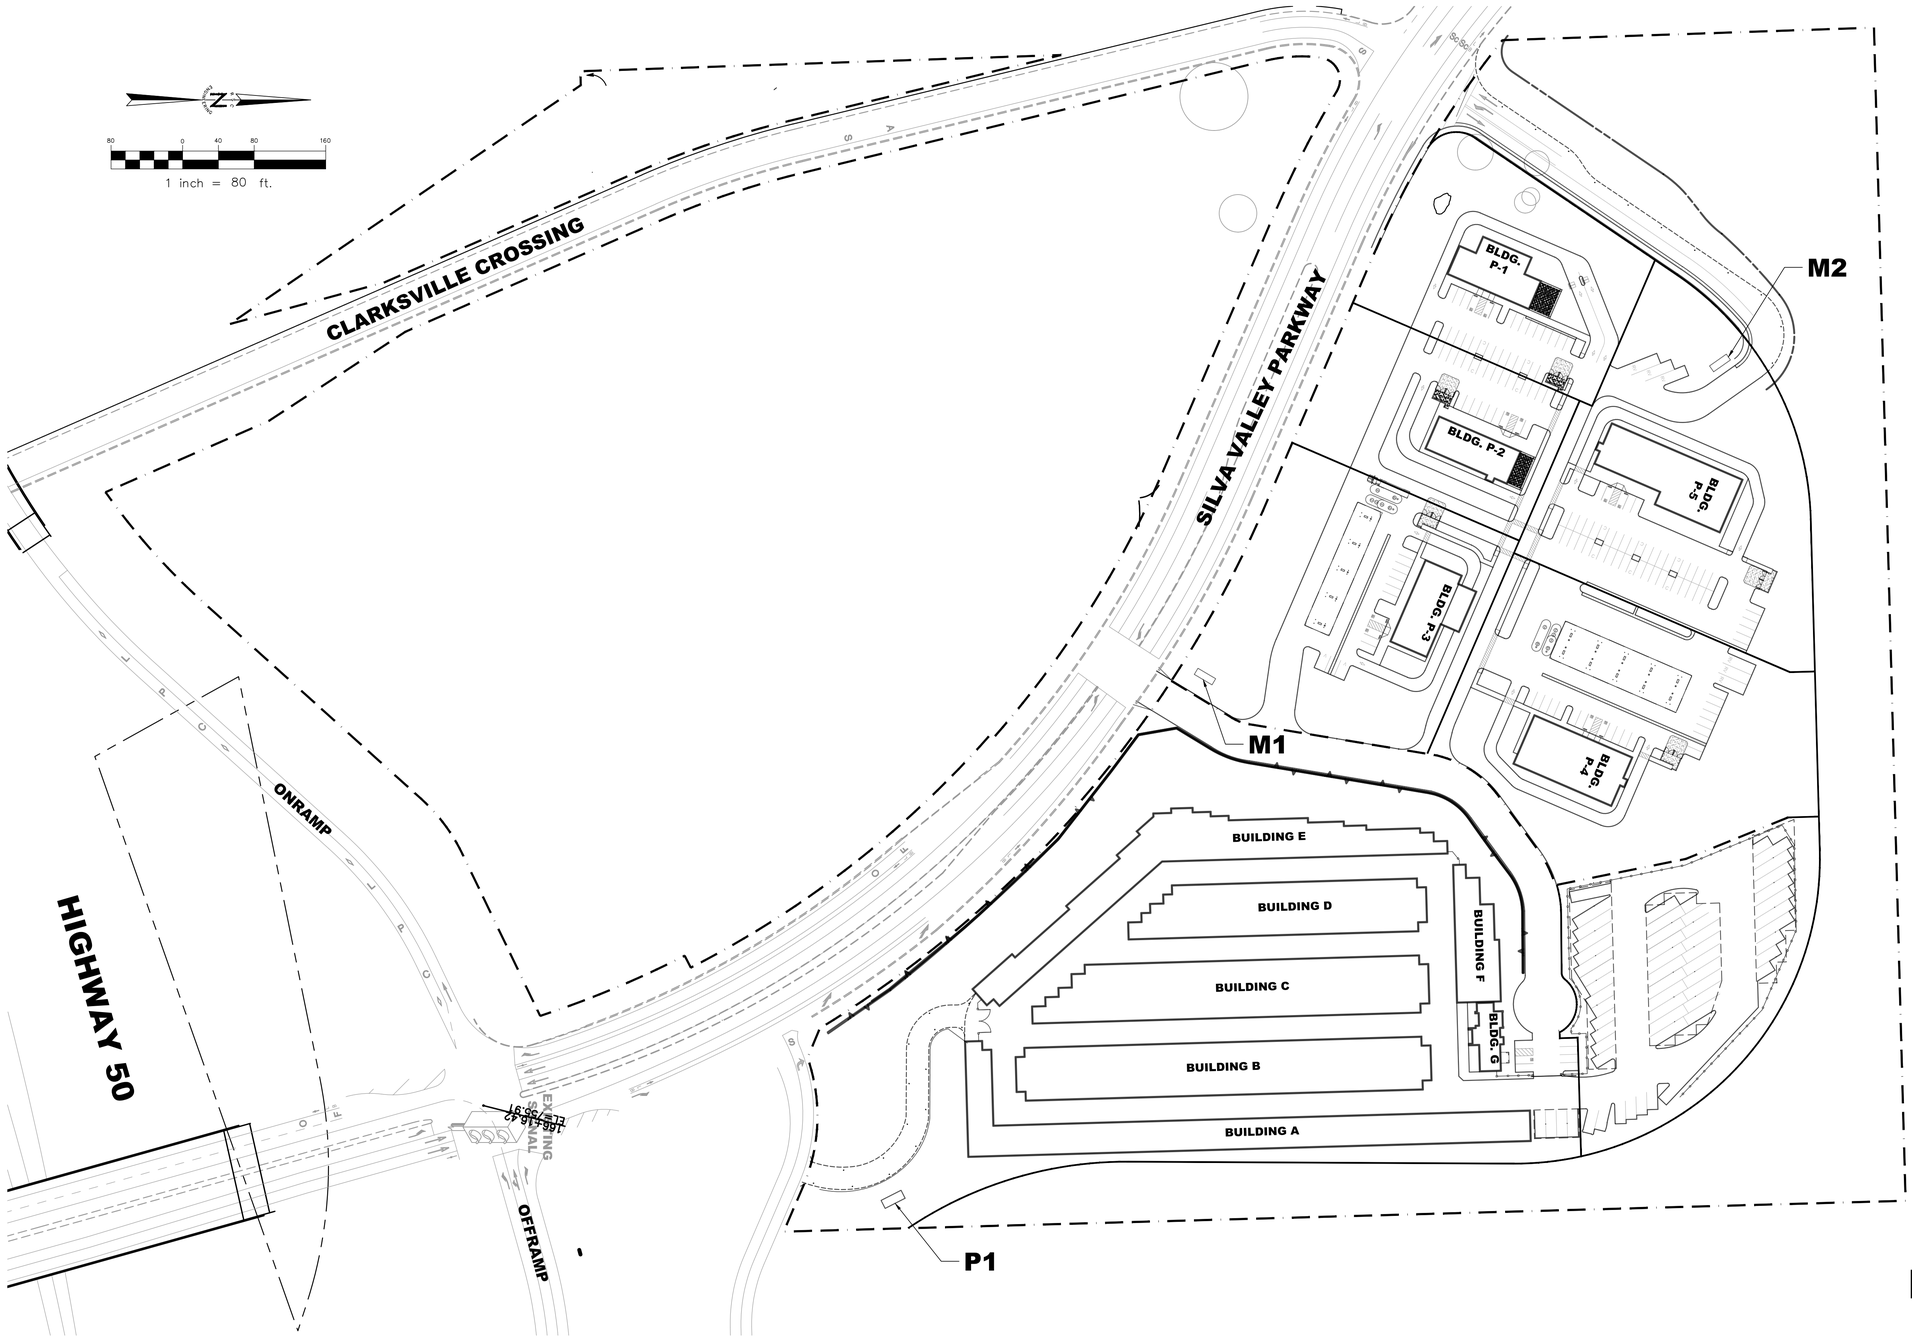
The property will also annex into the El Dorado Hills County Water District (Fire Protection) prior to building permit issuance.

Sanitary service and potable water for the North Site will be provided by public (EID) sanitary sewer and water lines that cross the South Site. Reclaimed water is available for non-potable irrigation use and will be provided by extending an existing reclaimed line in Silva Valley Parkway north of the Project site.

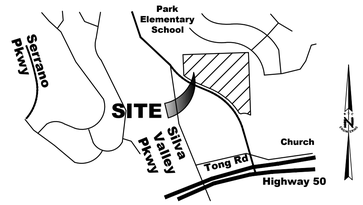
Dry utilities (electric, gas, telephone, and cable TV) will be provided from existing infrastructure located to the north of the Project site in Silva Valley Parkway. Dry utilities will need to be extended along the frontage of both the North Site and the South Site.

STORM DRAINAGE DESCRIPTION

The on-site drainage system will connect to El Dorado County's storm drain infrastructure in Clarksville Crossing. The Project has typical pollutant sources from parking lot runoff, loading/unloading areas, outdoor storage areas, and a trash compactor. This Project proposes bioretention areas and underground water quality vaults as the form of treatment for the site.



TRUCK CIRCULATION



Truck access will be allowed at all driveway locations depending on the size of the delivery truck and direction of travel.

OTHER GOVERNMENTAL AGENCY APPROVALS

Additional subsequent approvals and permits that may be required from local, regional, state, and federal agencies are identified below.

- El Dorado Irrigation District -Water and Sewer-Annexation and Utility Approval
- El Dorado County Resource Conservation District-Onsite Plan Approval
- El Dorado Hills County Water District (Fire Protection)-Annexation and Fire Approval
- El Dorado County Air Quality Management District-Air Quality Permit
- El Dorado County Department of Transportation -Encroachment Permit/Grading Permit/Onsite Plan Approval
- El Dorado County Building Services-Building Permit/Sign Permit
- Central Valley Regional Water Quality Control Board-NPDES General Permit for Stormwater Discharge
- California Department of Fish and Wildlife-Wetland Approval
- Army Corps-Wetland Permitting for each side
- LAFCO-Annexation approval for EID and El Dorado Fire Protection District along with the Bureau of Land Reclamation

EXECUTIVE SUMMARY

This report presents the results of a delineation of the aquatic resources at the ±36-acre El Dorado Hills 52 site (Study Area), located in western El Dorado County, California. Aquatic resources were identified and delineated following the technical guidelines provided in the *Corps of Engineers Wetlands Delineation Manual* (USACE Manual) (Environmental Laboratory 1987), the U.S. Army Corps of Engineers (USACE) Arid West Regional Supplement (Supplement) (USACE 2008), the USACE *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Field Guide) (Lichvar and McColley 2008), and the 2020 Navigable Waters Protection Rule. The Supplement and Field Guide present wetland and OHWM indicators, delineation guidance, and other information that is specific to the Arid West Region.

A total of 0.740 acre of aquatic resources and other waters of the U.S. were mapped within the Study Area. This acreage consists of 0.133 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainage, and 0.360 acre of intermittent drainage. Approximately 17.9 acres of the northern portion of the Study Area was previously verified by the USACE in August of 2019 to contain 0.19 acre of waters of the U.S. (SPK-2013-00090). This acreage was carried forward in this delineation.

This page intentionally left blank

1.0 INTRODUCTION

HELIX Environmental Planning, Inc. (HELIX) prepared this aquatic resources delineation report to present the results of a formal delineation of potential jurisdictional wetlands and other waters of the U.S. and State on the ±36-acre El Dorado Hills 52 Study Area (Appendix A, Figure 1). This report was prepared in accordance with the *Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (USACE 2016) and presents the results of HELIX's review of available literature, aerial photographs, soil surveys, and fieldwork in the Study Area. The purpose of our delineation was to identify aquatic resources on the project site that potentially qualify as waters of the U.S. and/or waters of the State of California. Waters of the U.S. and State on the site are subject to regulatory jurisdiction by the U.S. Army Corps of Engineers (USACE) and the Central Valley Regional Water Quality Control Board (CVRWQCB). Impacts to such resources may require obtaining permits from one or both of these agencies. The results presented in this document are preliminary unless and until concurrence is received from the USACE or the CVRWQCB.

1.1 PROJECT LOCATION

The ±36-acre Study Area is located in El Dorado County north of U.S. Highway 50. It is bifurcated by Silva Valley Parkway and bordered on the west by Clarksville Crossing and on the southeast by Tong Road. The Study Area is located within Township 9 North, Range 8 East, Section 1 of the *Clarksvill*e USGS 7.5-minute series quadrangle (Appendix A, Figure 2). The approximate center of the Study Area is at latitude 38.662023° and longitude -121.055946°, NAD 83, and is located at an elevation between 705 feet and 795 feet above mean sea level (msl).

1.2 DRIVING DIRECTIONS

From downtown Sacramento, travel east on U.S. Route 50 for approximately 25 miles, toward El Dorado Hills and exit on Silva Valley Parkway (exit 31) and turn right (south). Travel south on Silva Valley Parkway for approximately 0.2 mile and turn right (north) on Old Silva Valley Parkway and travel approximately 0.3 mile. The Study Area is located on the east side of the road and parking is available on the side of the road or on turnouts.

1.4 REGULATORY SETTING

1.4.1 Waters of the U.S.

Any person, firm, or agency planning to alter or work in "waters of the U.S.," including the discharge of dredged or fill material, must first obtain authorization from the USACE under Section 404 of the Clean Water Act (CWA; 33 USC 1344). Permits, licenses, variances, or similar authorization may also be required by other federal, state, and local statutes. Section 10 of the Rivers and Harbors Act prohibits the obstruction or alteration of navigable waters of the U.S. without a permit from USACE (33 USC 403).

On April 21, 2020, the Environmental Protection Agency (EPA) and USACE published the Navigable Waters Protection Rule to define "Waters of the United States" in the Federal Register. On June 22, 2020 the Navigable Waters Protection Rule: Definition of "Waters of the United States" (NWPR) became effective in 49 states, including California, and in all US territories.

The NWPR regulates traditional navigable waters and perennial or intermittent tributary systems, and defines four categories of regulated waters including:

- The territorial seas and traditional navigable waters;
- Perennial and intermittent tributaries to those waters;
- Certain lakes, ponds, and impoundments; and
- Wetlands adjacent to jurisdictional waters.

The NWPR also defines 12 categories of exempted aquatic resources:

- Waters not listed as waters of the U.S.
- Groundwater
- Ephemeral features
- Diffuse stormwater run-off
- Ditches not identified as waters of the U.S.
- Prior converted cropland (PCC)
- Artificially irrigated areas
- Artificial lakes and ponds
- Water-filled depressions incidental to mining or construction activity
- Stormwater control features
- Groundwater recharge, water reuse, and wastewater recycling structures
- Waste treatment systems

With non-tidal waters, in the absence of adjacent wetlands, the extent of USACE jurisdiction extends to the ordinary high water mark (OHWM) – the line on the shore established by fluctuations of water and indicated by a clear, natural line impressed on the bank, shelving, changes in soil character, destruction of terrestrial vegetation, or the presence of litter and debris. Wetlands are defined in 33 CFR Part 328 as:

> "those areas that are inundated or saturated by surface or ground water at a frequency and duration to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions."

Federal and state regulations pertaining to waters of the U.S., including wetlands, are discussed below.

Clean Water Act (33 USC 1251-1376). The CWA provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters.

Section 401 requires that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the U.S. must obtain a state certification that the discharge complies with other provisions of CWA. The Regional Water Quality Control Board (RWQCB) administers the certification program in California and may require State Water Quality Certification before other permits are issued.

Section 402 establishes a permitting system for the discharge of any pollutant (except dredged or fill material) into waters of the U.S.

Section 404 establishes a permit program administered by USACE that regulates the discharge of dredged or fill material into waters of the U.S. (including wetlands). Implementing regulations by USACE are found at 33 CFR Parts 320-332. The Section 404 (b)(1) Guidelines were developed by the USEPA in conjunction with USACE (40 CFR Part 230), allowing the discharge of dredged or fill material for non-water dependent uses into special aquatic sites only if there is no practicable alternative that would have less adverse impacts.

1.4.2 Waters of the State

Any action requiring a CWA Section 404 permit, or a Rivers and Harbors Act Section 10 permit, must also obtain a CWA Section 401 Water Quality Certification. The State of California Water Quality Certification (WQC) Program was formally initiated by the State Water Resources Control Board (SWRCB) in 1990 under the requirements stipulated by Section 401 of the Federal Clean Water Act. Although the Clean Water Act is a Federal law, Section 401 of the CWA recognizes that states have the primary authority and responsibility for setting water quality standards. In California, under Section 401, the State and Regional Water Boards are the authorities that certify that issuance of a federal license or permit does not violate California's water quality standards (i.e., that they do not violate Porter-Cologne and the Water Code). The WQC Program currently issues the WQC for discharges requiring USACE permits for fill and dredge discharges within Waters of the United States, and now also implements the State's wetland protection and hydromodification regulation program under the Porter Cologne Water Quality Control Act.

On May 28, 2020, the SWRCB implemented the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures) for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters and Enclosed Bays and Estuaries and Ocean Waters of California (SWRCB 2019). The Procedures consist of four major elements:

I. A wetland definition;
II. A framework for determining if a feature that meets the wetland definition is a water of the state;
III. Wetland delineation procedures; and
IV. Procedures for the submittal, review and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities.

Under the Procedures and the State Water Code (Water Code §13050(e)), "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." "Waters of the State" includes all "Waters of the U.S."

More specifically, a wetland is defined as: "*An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation*." The wetland definition encompasses the full range of wetland types commonly recognized in California, including some features not protected under federal law, and reflects current scientific understanding of the formation and functioning of wetlands (SWRCB 2019).

Unless excluded by the Procedures, any activity that could result in discharge of dredged or fill material to Waters of the State, which includes Waters of the U.S. and non-federal Waters of the State, requires filing of an application under the Procedures.

2.0 ENVIRONMENTAL SETTING

2.1 LOCATION DESCRIPTION

The ±36-acre Study Area is located in El Dorado County north of U.S. Highway 50. It is bifurcated by Silva Valley Parkway and bordered on the west by Clarksville Crossing and on the southeast by Tong Road. The Study Area is located within Township 9 North, Range 8 East, Section 1 of the *Clarksvill*e USGS 7.5-minute series quadrangle. The approximate center of the Study Area is latitude 38.662023° and longitude -121.055946° (Appendix A, Figure 1). The elevation on the site is approximately 705 to 795 feet above msl. Appendix A, Figure 3 is an aerial photograph of the project site and vicinity. Surface runoff flows through and exits the Study Area via ephemeral and intermittent drainages, which flow in a northeast to southwest direction. Slopes range from less than one percent to 30 percent.

2.2 EXISTING CONDITIONS

The Study Area is split into a northern portion and a southern portion, which are bisected by Silva Valley Parkway that runs in a general northwest to southeast direction. Land uses surrounding the Study Area include residential development and an elementary school to the north and paved roads and undeveloped land to the east, west, and south.

2.3 FIELD CONDITIONS

Fieldwork for the aquatic resource delineation was conducted on October 13, 2020 and the weather during the site visit was sunny and warm. The climate of El Dorado Hills is Mediterranean, characterized by wet, cool winters and dry, hot summers. The nearest weather station is the Sacramento Executive Airport weather station in Sacramento, California, located approximately 26 miles west of the project site. Average daily maximum and minimum temperatures are 92° and 59° Fahrenheit (F) in July and 56° and 39° F in January (NRCS 2020a). The mean annual precipitation is 17.8 inches, with 100 percent occurring as rain from September through May. The weather station received approximately 6.14 inches of rainfall this rain season starting in October (NRCS 2020a). In the previous year, the weather station received 24.6 inches, which is 138% of normal (NRCS 2020a).

2.4 INTERSTATE OR FOREIGN COMMERCE CONNECTION

The Study Area is located in the Upper Cosumnes watershed (USGS Hydrologic Unit Code (HUC8) 18040013). The Study Area is upslope of an unnamed tributary to Carson Creek, which is tributary to Deer Creek and the Cosumnes River. The Cosumnes River is tributary to the Mokelumne River, a traditional navigable water used in interstate and foreign commerce.

3.0 METHODS

3.1 DATA GATHERING

The following sources were used in preparation of this jurisdictional delineation:

- Aerial photography taken November 7, 2019 downloaded from Esri®,
- U.S. Fish and Wildlife Service's (USFWS) National Wetland Inventory online wetland mapper (USFWS 2020),
- Natural Resources Conservation Service (NRCS) web soil survey (NRCS 2020b),
- Corps of Engineers Wetlands Delineation Manual (Environmental Laboratory 1987),
- Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008),
- Field Indicators of Hydric Soils in the United States (Version 8.2) (NRCS 2018),
- A Field Guide to the Identification of the OHWM in the Arid West Region of the Western United States (Lichvar and McColley 2008), and
- USACE 2018 National Wetland Plant List for the Arid West (USACE 2018).

3.2 BOUNDARIES OF THE DELINEATION

The delineation area includes the entire 36-acre Study Area. Refer to the delineation map in Appendix B for the limits of the delineation.

3.3 DETERMINATION PROCEDURES

3.3.1 Delineation Methods

Fieldwork for the jurisdictional delineation was conducted by HELIX biologist Patrick Martin and Halie Goeman in accordance with the Corps of Engineers Wetlands Delineation Manual (Environmental Laboratory 1987), the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008), and the Corps of Engineers *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Field Guide) (Lichvar and McColley 2008). Vegetation, soils, and hydrologic characteristics were visually

assessed by walking meandering transects through the entire project site to obtain 100 percent visual coverage. The plant species identifiable at the time of the survey were recorded (refer to Appendix C for the list of plants observed with the wetland indicator status for each species). Representative photographs are included as Appendix D.

The three-parameter method was used to determine the presence/absence of wetlands, which involves identifying indicators of hydrophytic vegetation, hydric soils, and wetland hydrology according to the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008) and the Arid West 2018Regional Wetland Plant List (USACE 2018). In the field, a Munsell Color (Gregtag Macbeth 2000) chart was used to determine moist soil colors. A total of three additional data points were taken throughout the Study Area in 2020 to classify the site's soils, vegetation, and hydrologic characteristics and the accompanying data forms are included in Appendix E. The extent of wetlands and other waters within the Study Area were mapped in the field with a tablet wirelessly connected to an Arrow GPS unit with sub-meter accuracy. These data were exported into ArcMap 10.7.1® and used to produce the map of aquatic features in the delineation area and calculate the acreage of each aquatic feature.

3.3.2 Determination of Potential Jurisdiction

Waters of the U.S.

Under the NWPR, the USACE and EPA regulate traditional navigable waters and perennial or intermittent tributary systems. The four categories of regulated waters include:

I. The territorial seas and traditional navigable waters;
II. Perennial and intermittent tributaries to those waters;
III. Certain lakes, ponds, and impoundments; and
IV. Wetlands adjacent to jurisdictional waters.

The NWPR excludes from the definition of ''waters of the United States'' all waters or features not mentioned above. In addition to this general exclusion, the NWPR clarifies that waters of the U.S. do not include the following:

- Groundwater, including groundwater drained through subsurface drainage systems;
- Ephemeral features that flow only in direct response to precipitation, including ephemeral streams, swales, gullies, rills, and pools;
- Diffuse stormwater runoff and directional sheet flow over upland;
- Ditches that are not traditional navigable waters, tributaries, or that are not constructed in adjacent wetlands, subject to certain limitations;
- Prior converted cropland;
- Artificially irrigated areas that would revert to upland if artificial irrigation ceases;
- Artificial lakes and ponds that are not jurisdictional impoundments and that are constructed or excavated in upland or non-jurisdictional waters;

- Water-filled depressions constructed or excavated in upland or in non-jurisdictional waters incidental to mining or construction activity, and pits excavated in upland or in non-jurisdictional waters for the purpose of obtaining fill, sand, or gravel;

- Stormwater control features constructed or excavated in upland or in non-jurisdictional waters to convey, treat, infiltrate, or store stormwater runoff;

- Groundwater recharge, water reuse, and wastewater recycling structures constructed or excavated in upland or in non-jurisdictional waters; and

- Waste treatment systems.

Waters of the State

The RWQCB will assert jurisdiction over any waters of the State, including wetlands, regardless of whether or not the feature qualifies as waters of the U.S. Under the Procedures and the State Water Code (Water Code §13050(e)), "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." "Waters of the State" includes all "Waters of the U.S." The following wetlands are waters of the State:

1. Natural wetlands,

2. Wetlands created by modification of a surface water of the state,

3. Artificial wetlands that meet any of the following criteria:

    a. Approved by an agency as compensatory mitigation for impacts to other Waters of the State, except where the approving agency explicitly identifies the mitigation as being of limited duration;

    b. Specifically identified in a water quality control plan as a wetland or other water of the state;

    c. Resulted from historic human activity, is not subject to ongoing operation and maintenance, and has become a relatively permanent part of the natural landscape; or

    d. Greater than or equal to one acre in size, unless the artificial wetland was constructed, and is currently used and maintained, primarily for one or more of the following purposes (i.e., the following artificial wetlands are not Waters of the State unless they also satisfy the criteria set forth in 2, 3a, or 3b):
        i. Industrial or municipal wastewater treatment or disposal,
        ii. Settling of sediment,
        iii. Detention, retention, infiltration, or treatment of stormwater runoff and other pollutants or runoff subject to regulation under a municipal, construction, or industrial 58 stormwater permitting program,
        iv. Treatment of surface waters,
        v. Agricultural crop irrigation or stock watering,
        vi. Fire suppression,
        vii. Industrial processing or cooling,
        viii. Active surface mining – even if the site is managed for interim wetlands functions and values,

ix. Log storage,
x. Treatment, storage, or distribution of recycled water,
xi. Maximizing groundwater recharge (this does not include wetlands that have incidental groundwater recharge benefits), or
xii. Fields flooded for rice growing.

All artificial wetlands that are less than an acre in size and do not satisfy the criteria set forth in 2, 3.a, 3.b, or 3.c are not Waters of the State.

3.3.3 Plant/Habitat Nomenclature

Habitat nomenclature is generally derived from *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer 1988). Plant nomenclature is taken from The Jepson Manual: Vascular Plants of California, second edition (Baldwin et al. 2012).

4.0 RESULTS

4.1 VEGETATION COMMUNITIES/HABITAT TYPES

Terrestrial biological habitats and land covers present within the Study Area include non-native annual grassland, riparian woodland, valley oak woodland, and disturbed/developed, which are described in detail below. Aquatic resources are described in Section 5.0.

4.1.1 Non-Native Annual Grassland

Non-native annual grassland dominates the northern and southern portions of the Study Area. This vegetation community is characterized primarily by an assemblage of non-native annual grasses and forbs. Dominant vegetation includes ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) intermixed with red-stemmed filaree (*Erodium cicutarium*), popcornflower (*Plagiobothrys* sp.), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), scarlet pimpernel (*Anagallis arvensis*), St. John's wort (*Hypericum perforatum*), brodiaea (*Brodiaea elegans*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*). Isolated valley oak (*Quercus lobata*) trees also occur in the non-native annual grassland.

4.1.2 Riparian Woodland

Riparian habitat occurs along the riverine perennial marsh and perennial drainage in the northern drainage system. Dominant vegetation includes broadleaf cattail (*Typha latifolia*), willow (*Salix* sp.), spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), Himalayan blackberry (*Rubus armeniacus*), Fremont cottonwood (*Populus fremontii*), and isolated valley oak trees.

4.1.3 Valley Oak Woodland

Valley oak woodland is found in a small area on the southwest boundary of the Study Area where a small stand of mature valley oak trees overhangs a small perennial drainage. The understory is primarily annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal immediately adjacent to the drainage.

4.1.4 Disturbed/Developed

Disturbed/developed areas occur throughout the Study Area. Disturbed/developed areas include graded roads and a stockpile area. The ruderal/disturbed areas are sparsely vegetated with red-stemmed filaree, soft chess, wild oat, and winter vetch.

4.2 CLIMATE

The climate of El Dorado County is Mediterranean, characterized by wet, cool winters and dry, hot summers. The nearest weather station with complete climate data is the Sacramento Executive Airport weather station in Sacramento, California, located approximately 26 miles west of the project site. Average daily maximum and minimum temperatures are 92° and 59° Fahrenheit (F) in July and 56° and 39° F in January (NRCS 2020a). The mean annual precipitation is 17.8 inches, with 100 percent occurring as rain from September through May. The weather station received approximately 6.14 inches of rainfall this rain season starting in October (NRCS 2020a). In the previous year, the weather station received 24.6 inches, which is 138% of normal (NRCS 2020a).

4.3 SOILS

The Natural Resources Conservation Service (NRCS) has mapped one soil unit within the Study Area (Appendix A, Figure 4). Auburn Silt Loam, 2 to 30 Percent Slopes. General characteristics associated with this soil type are described below (USDA, NRCS 2020b).

Auburn Silt Loam, 2 to 30 Percent Slopes (AwD): The soils in this series are well drained. Permeability is moderate. Vegetation associated with this soil series includes annual grasses, forbs, and oaks. The hydric soils list for El Dorado County does not identify this soil as hydric (USDA, NRCS 2020c).

4.4 HYDROLOGY

The Study Area is located in the Upper Cosumnes River watershed (HUC8 18040013). The hydrologic regime on the Study Area is predominantly year-round irrigation runoff from the adjacent development to the north, seasonal stormwater runoff, and direct precipitation, which primarily falls between November and March. Annual average precipitation is approximately 15 to 20 inches. Surface water runoff runs in a general northeast to southwest direction.

4.5 USFWS NATIONAL WETLANDS INVENTORY

The USFWS National Wetlands Inventory online database was reviewed to determine if there are any wetlands or other waters of the U.S. mapped by the USFWS in the Study Area or vicinity. The National Wetlands Inventory does not identify any wetlands or other waters of the U.S. in the Study Area. Off-site and to the west and east, the NWI identifies an unnamed tributary to Carson Creek (Appendix A, Figure 5).

5.0 AQUATIC RESOURCES

A total of 0.740 acre of aquatic resources and other waters of the U.S. were mapped within the Study Area. This acreage consists of 0.133 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland

swale, 0.234 acre of ephemeral drainage, and 0.360 acre of intermittent drainage (Appendix B). This acreage includes 0.19 acre of waters of the U.S. that was previously verified by the USACE within a 17.9-acre portion of the northern portion of the Study Area (SPK-2013-00090). This previously verified acreage was carried forward in this delineation. A description of all of the features delineated within the Study Area are provided in the following sections.

5.1.1 Seasonal Wetland

A total of 0.133 acre of seasonal wetlands has been delineated within the Study Area (Appendix B). Seasonal wetlands are often depressions or topographic folds within the landscape that inundate for short periods of time following intense rains, but do not maintain seasonal aquatic or saturated soil conditions for durations long enough for colonization by perennial, obligate plant species. As such, plant species in seasonal wetlands are generally of two types: species that can tolerate short periods of inundation but have not adapted to withstand sustained aquatic or saturated soil conditions, and short-lived (primarily annual) species that take advantage of ephemeral aquatic and/or saturated soil conditions. Many of the seasonal wetlands within the Study Area are adjacent to the ephemeral drainage on the northern portion of the Study Area. There are also two depressional seasonal wetlands on the Study Area appear to have formed as a result of historic excavation as they are located next to large, steep mounds. Dominant vegetation includes rabbitsfoot grass (*Polypogon monspeliensis*), spike rush, and nutsedge (*Cyperus eragrostis*).

5.1.2 Seep

A total of 0.007 acre of seep has been delineated within the Study Area (Appendix B). Seeps are characterized as areas where subsurface flows intersects the soil surface. Typically, water flows from seeps persist for some period after the rainy season or, more rarely, nearly year-round. Seeps accessing sufficient amounts of subsurface water can support isolated wetland vegetation (such as on a hillside) or they may form the headwaters of other jurisdictional drainage or wetland features, such as wetland swales. Vegetation in seeps often consists of plant species associated with seasonal and semi-permanent marsh habitats. When seeps are active for only short periods beyond the rainy season and into the warm season, herbaceous perennial wetland species typically dominate, as is typical of the seeps within the Study Area. Vegetation in the seep include consisted almost entirely of iris leaved rush (*Juncus xiphioides*) (OBL). Hydric soil indicators in the seep included a redox dark surface with distinct or prominent redoximorphic features located along root channels of living roots and as concentrations in the matrix. Wetland hydrology requirements were met by oxidized rhizospheres, saturation visible on aerial imagery and the FAC-neutral test.

5.1.3 Wetland Swale

A total of 0.006 acre of wetland swale was delineated on the Study Area (Appendix B). The wetland swale within the Study Area is associated with SW-3 on the northern portion of the Study Area and conveys water from that feature to ED-16 during high flow events. Dominant vegetation occurring within the wetland swale includes curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), rye grass, annual hair grass (*Deschampsia danthonioides*), and rabbitsfoot grass.

5.1.4 Ephemeral Drainage

A total of 0.234 acre of ephemeral drainages have been delineated within the Study Area (Appendix B). Ephemeral drainages are not wetlands as they do not meet the three-parameter criteria for vegetation, hydrology, and soils but do convey water and exhibit an ordinary high water mark. Water flows within ephemeral drainages are fed primarily by precipitation and surface water runoff. These features convey water during and immediately after storm events, but do not flow continuously throughout the winter and spring. Typically, these features exhibit a defined bed and bank and show signs of scouring as a result of rapid flow events. Although the channels of the ephemeral drainages within the Study Area are largely unvegetated, what vegetation is present includes winter vetch, ripgut brome, ryegrass, phacelia (*Phacelia cicutaria*), and medusahead (*Elymus caput-medusae*).

5.1.5 Intermittent Drainage

A total of 0.360 acre of intermittent drainage (ID-18) has been delineated within the Study Area (Appendix B). Intermittent drainages receive substantial seasonal flows of significant velocity and may appear as perennial features during the normal wet season. These seasonal flows often scour the channel of vegetation. Intermittent drainages may support fringe wetland vegetation types, such as seasonal or semi-permanent marsh or riparian wetlands. Conversely, intermittent drainages may be associated with hydrophytic vegetation communities that lack further wetland indicators. A typical hydroperiod of intermittent drainages is one that begins with the onset of substantial rains in the normal wet season and persists for an extended, variable amount of time into summer.

A brick check dam has been constructed across a portion of the feature near datapoint 4a (Appendix B). This check dam has resulted in periods of water backing up during flow events that have supported the establishment of hydrophytic emergent vegetation upstream of datapoint 4a. The area containing emergent vegetation is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock with areas of dense cattails and Himalayan blackberry and a small clump of willows. This area is entirely within the ordinary high water mark of the intermittent drainage.

Table 1 below provides a summary of aquatic resources mapped within the Study Area.

Table 1
AQUATIC RESOURCES IN THE STUDY AREA

Feature	Lat./Long.	Cowardin Classification[1]	Area (ac.)	Area (sq. ft.)	Length (ft.)	Avg. Width (ft.)

[1] Cowardin Codes for Wetlands: System (P = Palustrine; R = Riverine) Subsystem (4 = Intermittent) – Class (EM = Emergent; SB = Streambed) – Subclass (1 = Persistent; 2 = Non-persistent; 7 = Vegetated) – Modifiers (E = Seasonally Flooded/Saturated; K = Artificial; f = Farmed; x = Excavated).

5.2 POTENTIAL WATERS OF THE U.S.

Ephemeral drainages are currently not considered to be jurisdictional features under the 2020 Navigable Waters Protection Rule (see Section 1.4.1). Therefore, the 0.234 acre of ephemeral drainages within the Study Area would not be expected to be considered waters of the U.S. Seasonal wetland 1 and seasonal wetland 2 (total of 0.015 acre) may also not be considered waters of the U.S. as they appear to have formed from historic excavations and are therefore a product of upland excavations and likely isolated from the remaining of the aquatic features on the site. The seep (0.007 acre) may also not be considered a water to the U.S. since it is not adjacent to the intermittent drainage feature and otherwise appears to be hydrologically isolated. The remaining 0.484 acres of aquatic resources within the Study Area would be expected to be considered waters of the U.S. subject to verification by the USACE.

5.3 POTENTIAL WATERS OF THE STATE

All aquatic resources in the Study Area (0.740 acre) are expected to be considered waters of the State subject to verification by the CVRWQCB under current regulatory guidance (see Section 1.4.2).

6.0 SUMMARY

HELIX conducted an aquatic resources delineation of the 36-acre Study Area in El Dorado Hills in El Dorado County. A total of 0.740 acre of aquatic resources was mapped within the Study Area. This acreage is comprised of 0.133 acre of seasonal wetland, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainage, and 0.360 acre of intermittent drainage. This aquatic resource delineation is preliminary and subject to verification by the resource agencies.

NOTES

- The boundaries and jurisdictional status of all waters shown on this map are preliminary and subject to verification by the U.S. Army Corps of Engineers.
- Approximately 17.9 acres of northern portion of Study Area was previously verified by USACE on August 19, 2019 (SPK-2013-00090)
- Northern portion originally delineated By: Kelly Bayne of Foothills Associates, December 15, 2015.
- Delineation updated By P. Martin on October 13, 2020.
- Aquatic resources were mapped by HELIX using an EOS Arrow Global Positioning System
- This delineation utilizes the Corps' 1987 three-parameter methodology and Arid West Supplement to delineate jurisdictional waters of the U.S.
- The Hydrologic Unit Code for this site is 18040013
- Topographic contour interval is 5 feet.
- Digital base data provided by RSC Engineering
- Coordinate System: NAD 83 UTM Zone 10N
- Projection: Transverse Mercator
- Datum: North American Datum 1983

OTHER FEATURES

- Coordinate Point

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: El Dorado Hills 52 City/County: El Dorado County Sampling Date: Dec. 15, 2015

Applicant/Owner: EDH 52, GP State: CA Sampling Point: 1B

Investigator(s): Kelly Bayne and Charlotte Marks Section, Township, Range: Township 9 North, Range 8 East, Section 1

Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): concave Slope (%): <1

Subregion (LRR): C Lat: 38 39 44.15"N Long: 121 03 22.66"W Datum: NAD 83

Soil Map Unit Name: Auburn Silt Loam, 2 to 30 Percent Slopes NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✓	No _____	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes _____	No ✓	
Wetland Hydrology Present?	Yes ✓	No _____	

Remarks:

Ephemeral drainage; although the soils do not meet the definition of a wetland, the feature has an OHWM. Therefore, it is considered an ephemeral drainage.

VEGETATION – Use scientific names of plants.

- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? **Yes** ✓ **No** _____

Remarks:

Prominent redoximorphic features in the matrix and pore linings in depleted soil support the hydric soil indicator Depleted Matrix (F3).

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ✓ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ✓ Drift Deposits (B3) (**Riverine**)
- ✓ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ✓ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✓ Depth (inches): _____

Water Table Present? Yes _____ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✓ Depth (inches): _____

Wetland Hydrology Present? **Yes** ✓ **No** _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Low area likely floods during precipitation events and likely has a high water table during the growing season.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: El Dorado Hills 52 City/County: El Dorado County Sampling Date: Oct. 13, 2020

Applicant/Owner: EDH 52, GP State: CA Sampling Point: 8B

Investigator(s): Patrick Martin, Halie Goeman Section, Township, Range: Township 9 North, Range 8 East, Section 1

Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): concave Slope (%): <1

Subregion (LRR): C Lat: 38 39 37.64"N Long: 121 03 25.63"W Datum: NAD 83

Soil Map Unit Name: Auburn Silt Loam, 2 to 30 Percent Slopes NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation ✓, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____	No ✓	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes ✓	No _____	
Wetland Hydrology Present?	Yes ✓	No _____	

Remarks:

Low floodplain dominated by upland vegetation.

VEGETATION – Use scientific names of plants.

- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ✓ **No** _____

Remarks:

Prominent redoximorphic features on a dark surface fulfill hydric soil criteria for Redox Dark Surface (F6).

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ✓ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ✓ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✓ Depth (inches): _____

Water Table Present? Yes _____ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes _____ **No** ✓

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Seasonal wetland along drainage is very wet. Soil is damp in the soil pit but it is not saturated. During the growing season, this data point likely has a high water table.

EXECUTIVE SUMMARY

This report presents the results of a delineation of the aquatic resources at the ±36-acre El Dorado Hills 52 site (Study Area), located in western El Dorado County, California. Aquatic resources were identified and delineated following the technical guidelines provided in the *Corps of Engineers Wetlands Delineation Manual* (USACE Manual) (Environmental Laboratory 1987), the U.S. Army Corps of Engineers (USACE) Arid West Regional Supplement (Supplement) (USACE 2008), the USACE *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Field Guide) (Lichvar and McColley 2008), and the 2020 Navigable Waters Protection Rule. The Supplement and Field Guide present wetland and OHWM indicators, delineation guidance, and other information that is specific to the Arid West Region.

A total of 0.740 acre of aquatic resources and other waters of the U.S. were mapped within the Study Area. This acreage consists of 0.133 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainage, and 0.360 acre of intermittent drainage. Approximately 17.9 acres of the northern portion of the Study Area was previously verified by the USACE in August of 2019 to contain 0.19 acre of waters of the U.S. (SPK-2013-00090). This acreage was carried forward in this delineation.

This page intentionally left blank

1.0 INTRODUCTION

HELIX Environmental Planning, Inc. (HELIX) prepared this aquatic resources delineation report to present the results of a formal delineation of potential jurisdictional wetlands and other waters of the U.S. and State on the ±36-acre El Dorado Hills 52 Study Area (Appendix A, Figure 1). This report was prepared in accordance with the *Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (USACE 2016) and presents the results of HELIX's review of available literature, aerial photographs, soil surveys, and fieldwork in the Study Area. The purpose of our delineation was to identify aquatic resources on the project site that potentially qualify as waters of the U.S. and/or waters of the State of California. Waters of the U.S. and State on the site are subject to regulatory jurisdiction by the U.S. Army Corps of Engineers (USACE) and the Central Valley Regional Water Quality Control Board (CVRWQCB). Impacts to such resources may require obtaining permits from one or both of these agencies. The results presented in this document are preliminary unless and until concurrence is received from the USACE or the CVRWQCB.

1.1 PROJECT LOCATION

The ±36-acre Study Area is located in El Dorado County north of U.S. Highway 50. It is bifurcated by Silva Valley Parkway and bordered on the west by Clarksville Crossing and on the southeast by Tong Road. The Study Area is located within Township 9 North, Range 8 East, Section 1 of the *Clarksvill*e USGS 7.5-minute series quadrangle (Appendix A, Figure 2). The approximate center of the Study Area is at latitude 38.662023° and longitude -121.055946°, NAD 83, and is located at an elevation between 705 feet and 795 feet above mean sea level (msl).

1.2 DRIVING DIRECTIONS

From downtown Sacramento, travel east on U.S. Route 50 for approximately 25 miles, toward El Dorado Hills and exit on Silva Valley Parkway (exit 31) and turn right (south). Travel south on Silva Valley Parkway for approximately 0.2 mile and turn right (north) on Old Silva Valley Parkway and travel approximately 0.3 mile. The Study Area is located on the east side of the road and parking is available on the side of the road or on turnouts.

1.4 REGULATORY SETTING

1.4.1 Waters of the U.S.

Any person, firm, or agency planning to alter or work in "waters of the U.S.," including the discharge of dredged or fill material, must first obtain authorization from the USACE under Section 404 of the Clean Water Act (CWA; 33 USC 1344). Permits, licenses, variances, or similar authorization may also be required by other federal, state, and local statutes. Section 10 of the Rivers and Harbors Act prohibits the obstruction or alteration of navigable waters of the U.S. without a permit from USACE (33 USC 403).

On April 21, 2020, the Environmental Protection Agency (EPA) and USACE published the Navigable Waters Protection Rule to define "Waters of the United States" in the Federal Register. On June 22, 2020 the Navigable Waters Protection Rule: Definition of "Waters of the United States" (NWPR) became effective in 49 states, including California, and in all US territories.

The NWPR regulates traditional navigable waters and perennial or intermittent tributary systems, and defines four categories of regulated waters including:

- The territorial seas and traditional navigable waters;
- Perennial and intermittent tributaries to those waters;
- Certain lakes, ponds, and impoundments; and
- Wetlands adjacent to jurisdictional waters.

The NWPR also defines 12 categories of exempted aquatic resources:

- Waters not listed as waters of the U.S.
- Groundwater
- Ephemeral features
- Diffuse stormwater run-off
- Ditches not identified as waters of the U.S.
- Prior converted cropland (PCC)
- Artificially irrigated areas
- Artificial lakes and ponds
- Water-filled depressions incidental to mining or construction activity
- Stormwater control features
- Groundwater recharge, water reuse, and wastewater recycling structures
- Waste treatment systems

With non-tidal waters, in the absence of adjacent wetlands, the extent of USACE jurisdiction extends to the ordinary high water mark (OHWM) – the line on the shore established by fluctuations of water and indicated by a clear, natural line impressed on the bank, shelving, changes in soil character, destruction of terrestrial vegetation, or the presence of litter and debris. Wetlands are defined in 33 CFR Part 328 as:

> "those areas that are inundated or saturated by surface or ground water at a frequency and duration to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions."

Federal and state regulations pertaining to waters of the U.S., including wetlands, are discussed below.

Clean Water Act (33 USC 1251-1376). The CWA provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters.

Section 401 requires that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the U.S. must obtain a state certification that the discharge complies with other provisions of CWA. The Regional Water Quality Control Board (RWQCB) administers the certification program in California and may require State Water Quality Certification before other permits are issued.

Section 402 establishes a permitting system for the discharge of any pollutant (except dredged or fill material) into waters of the U.S.

Section 404 establishes a permit program administered by USACE that regulates the discharge of dredged or fill material into waters of the U.S. (including wetlands). Implementing regulations by USACE are found at 33 CFR Parts 320-332. The Section 404 (b)(1) Guidelines were developed by the USEPA in conjunction with USACE (40 CFR Part 230), allowing the discharge of dredged or fill material for non-water dependent uses into special aquatic sites only if there is no practicable alternative that would have less adverse impacts.

1.4.2 Waters of the State

Any action requiring a CWA Section 404 permit, or a Rivers and Harbors Act Section 10 permit, must also obtain a CWA Section 401 Water Quality Certification. The State of California Water Quality Certification (WQC) Program was formally initiated by the State Water Resources Control Board (SWRCB) in 1990 under the requirements stipulated by Section 401 of the Federal Clean Water Act. Although the Clean Water Act is a Federal law, Section 401 of the CWA recognizes that states have the primary authority and responsibility for setting water quality standards. In California, under Section 401, the State and Regional Water Boards are the authorities that certify that issuance of a federal license or permit does not violate California's water quality standards (i.e., that they do not violate Porter-Cologne and the Water Code). The WQC Program currently issues the WQC for discharges requiring USACE permits for fill and dredge discharges within Waters of the United States, and now also implements the State's wetland protection and hydromodification regulation program under the Porter Cologne Water Quality Control Act.

On May 28, 2020, the SWRCB implemented the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures) for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters and Enclosed Bays and Estuaries and Ocean Waters of California (SWRCB 2019). The Procedures consist of four major elements:

I. A wetland definition;
II. A framework for determining if a feature that meets the wetland definition is a water of the state;
III. Wetland delineation procedures; and
IV. Procedures for the submittal, review and approval of applications for Water Quality Certifications and Waste Discharge Requirements for dredge or fill activities.

Under the Procedures and the State Water Code (Water Code §13050(e)), "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." "Waters of the State" includes all "Waters of the U.S."

More specifically, a wetland is defined as: "*An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and (3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation*." The wetland definition encompasses the full range of wetland types commonly recognized in California, including some features not protected under federal law, and reflects current scientific understanding of the formation and functioning of wetlands (SWRCB 2019).

Unless excluded by the Procedures, any activity that could result in discharge of dredged or fill material to Waters of the State, which includes Waters of the U.S. and non-federal Waters of the State, requires filing of an application under the Procedures.

2.0 ENVIRONMENTAL SETTING

2.1 LOCATION DESCRIPTION

The ±36-acre Study Area is located in El Dorado County north of U.S. Highway 50. It is bifurcated by Silva Valley Parkway and bordered on the west by Clarksville Crossing and on the southeast by Tong Road. The Study Area is located within Township 9 North, Range 8 East, Section 1 of the *Clarksvill*e USGS 7.5-minute series quadrangle. The approximate center of the Study Area is latitude 38.662023° and longitude -121.055946° (Appendix A, Figure 1). The elevation on the site is approximately 705 to 795 feet above msl. Appendix A, Figure 3 is an aerial photograph of the project site and vicinity. Surface runoff flows through and exits the Study Area via ephemeral and intermittent drainages, which flow in a northeast to southwest direction. Slopes range from less than one percent to 30 percent.

2.2 EXISTING CONDITIONS

The Study Area is split into a northern portion and a southern portion, which are bisected by Silva Valley Parkway that runs in a general northwest to southeast direction. Land uses surrounding the Study Area include residential development and an elementary school to the north and paved roads and undeveloped land to the east, west, and south.

2.3 FIELD CONDITIONS

Fieldwork for the aquatic resource delineation was conducted on October 13, 2020 and the weather during the site visit was sunny and warm. The climate of El Dorado Hills is Mediterranean, characterized by wet, cool winters and dry, hot summers. The nearest weather station is the Sacramento Executive Airport weather station in Sacramento, California, located approximately 26 miles west of the project site. Average daily maximum and minimum temperatures are 92° and 59° Fahrenheit (F) in July and 56° and 39° F in January (NRCS 2020a). The mean annual precipitation is 17.8 inches, with 100 percent occurring as rain from September through May. The weather station received approximately 6.14 inches of rainfall this rain season starting in October (NRCS 2020a). In the previous year, the weather station received 24.6 inches, which is 138% of normal (NRCS 2020a).

2.4 INTERSTATE OR FOREIGN COMMERCE CONNECTION

The Study Area is located in the Upper Cosumnes watershed (USGS Hydrologic Unit Code (HUC8) 18040013). The Study Area is upslope of an unnamed tributary to Carson Creek, which is tributary to Deer Creek and the Cosumnes River. The Cosumnes River is tributary to the Mokelumne River, a traditional navigable water used in interstate and foreign commerce.

3.0 METHODS

3.1 DATA GATHERING

The following sources were used in preparation of this jurisdictional delineation:

- Aerial photography taken November 7, 2019 downloaded from Esri®,
- U.S. Fish and Wildlife Service's (USFWS) National Wetland Inventory online wetland mapper (USFWS 2020),
- Natural Resources Conservation Service (NRCS) web soil survey (NRCS 2020b),
- Corps of Engineers Wetlands Delineation Manual (Environmental Laboratory 1987),
- Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008),
- Field Indicators of Hydric Soils in the United States (Version 8.2) (NRCS 2018),
- A Field Guide to the Identification of the OHWM in the Arid West Region of the Western United States (Lichvar and McColley 2008), and
- USACE 2018 National Wetland Plant List for the Arid West (USACE 2018).

3.2 BOUNDARIES OF THE DELINEATION

The delineation area includes the entire 36-acre Study Area. Refer to the delineation map in Appendix B for the limits of the delineation.

3.3 DETERMINATION PROCEDURES

3.3.1 Delineation Methods

Fieldwork for the jurisdictional delineation was conducted by HELIX biologist Patrick Martin and Halie Goeman in accordance with the Corps of Engineers Wetlands Delineation Manual (Environmental Laboratory 1987), the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008), and the Corps of Engineers *A Field Guide to the Identification of the Ordinary High Water Mark (OHWM) in the Arid West Region of the Western United States* (Field Guide) (Lichvar and McColley 2008). Vegetation, soils, and hydrologic characteristics were visually

assessed by walking meandering transects through the entire project site to obtain 100 percent visual coverage. The plant species identifiable at the time of the survey were recorded (refer to Appendix C for the list of plants observed with the wetland indicator status for each species). Representative photographs are included as Appendix D.

The three-parameter method was used to determine the presence/absence of wetlands, which involves identifying indicators of hydrophytic vegetation, hydric soils, and wetland hydrology according to the Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West Region (Version 2.0) (USACE 2008) and the Arid West 2018Regional Wetland Plant List (USACE 2018). In the field, a Munsell Color (Gregtag Macbeth 2000) chart was used to determine moist soil colors. A total of three additional data points were taken throughout the Study Area in 2020 to classify the site's soils, vegetation, and hydrologic characteristics and the accompanying data forms are included in Appendix E. The extent of wetlands and other waters within the Study Area were mapped in the field with a tablet wirelessly connected to an Arrow GPS unit with sub-meter accuracy. These data were exported into ArcMap 10.7.1® and used to produce the map of aquatic features in the delineation area and calculate the acreage of each aquatic feature.

3.3.2 Determination of Potential Jurisdiction

Waters of the U.S.

Under the NWPR, the USACE and EPA regulate traditional navigable waters and perennial or intermittent tributary systems. The four categories of regulated waters include:

I. The territorial seas and traditional navigable waters;
II. Perennial and intermittent tributaries to those waters;
III. Certain lakes, ponds, and impoundments; and
IV. Wetlands adjacent to jurisdictional waters.

The NWPR excludes from the definition of ''waters of the United States'' all waters or features not mentioned above. In addition to this general exclusion, the NWPR clarifies that waters of the U.S. do not include the following:

- Groundwater, including groundwater drained through subsurface drainage systems;
- Ephemeral features that flow only in direct response to precipitation, including ephemeral streams, swales, gullies, rills, and pools;
- Diffuse stormwater runoff and directional sheet flow over upland;
- Ditches that are not traditional navigable waters, tributaries, or that are not constructed in adjacent wetlands, subject to certain limitations;
- Prior converted cropland;
- Artificially irrigated areas that would revert to upland if artificial irrigation ceases;
- Artificial lakes and ponds that are not jurisdictional impoundments and that are constructed or excavated in upland or non-jurisdictional waters;

- Water-filled depressions constructed or excavated in upland or in non-jurisdictional waters incidental to mining or construction activity, and pits excavated in upland or in non-jurisdictional waters for the purpose of obtaining fill, sand, or gravel;

- Stormwater control features constructed or excavated in upland or in non-jurisdictional waters to convey, treat, infiltrate, or store stormwater runoff;

- Groundwater recharge, water reuse, and wastewater recycling structures constructed or excavated in upland or in non-jurisdictional waters; and

- Waste treatment systems.

Waters of the State

The RWQCB will assert jurisdiction over any waters of the State, including wetlands, regardless of whether or not the feature qualifies as waters of the U.S. Under the Procedures and the State Water Code (Water Code §13050(e)), "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." "Waters of the State" includes all "Waters of the U.S." The following wetlands are waters of the State:

1. Natural wetlands,

2. Wetlands created by modification of a surface water of the state,

3. Artificial wetlands that meet any of the following criteria:

    a. Approved by an agency as compensatory mitigation for impacts to other Waters of the State, except where the approving agency explicitly identifies the mitigation as being of limited duration;

    b. Specifically identified in a water quality control plan as a wetland or other water of the state;

    c. Resulted from historic human activity, is not subject to ongoing operation and maintenance, and has become a relatively permanent part of the natural landscape; or

    d. Greater than or equal to one acre in size, unless the artificial wetland was constructed, and is currently used and maintained, primarily for one or more of the following purposes (i.e., the following artificial wetlands are not Waters of the State unless they also satisfy the criteria set forth in 2, 3a, or 3b):
        i. Industrial or municipal wastewater treatment or disposal,
        ii. Settling of sediment,
        iii. Detention, retention, infiltration, or treatment of stormwater runoff and other pollutants or runoff subject to regulation under a municipal, construction, or industrial 58 stormwater permitting program,
        iv. Treatment of surface waters,
        v. Agricultural crop irrigation or stock watering,
        vi. Fire suppression,
        vii. Industrial processing or cooling,
        viii. Active surface mining – even if the site is managed for interim wetlands functions and values,

ix. Log storage,
x. Treatment, storage, or distribution of recycled water,
xi. Maximizing groundwater recharge (this does not include wetlands that have incidental groundwater recharge benefits), or
xii. Fields flooded for rice growing.

All artificial wetlands that are less than an acre in size and do not satisfy the criteria set forth in 2, 3.a, 3.b, or 3.c are not Waters of the State.

3.3.3 Plant/Habitat Nomenclature

Habitat nomenclature is generally derived from *A Guide to Wildlife Habitats of California* (Mayer and Laudenslayer 1988). Plant nomenclature is taken from The Jepson Manual: Vascular Plants of California, second edition (Baldwin et al. 2012).

4.0 RESULTS

4.1 VEGETATION COMMUNITIES/HABITAT TYPES

Terrestrial biological habitats and land covers present within the Study Area include non-native annual grassland, riparian woodland, valley oak woodland, and disturbed/developed, which are described in detail below. Aquatic resources are described in Section 5.0.

4.1.1 Non-Native Annual Grassland

Non-native annual grassland dominates the northern and southern portions of the Study Area. This vegetation community is characterized primarily by an assemblage of non-native annual grasses and forbs. Dominant vegetation includes ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) intermixed with red-stemmed filaree (*Erodium cicutarium*), popcornflower (*Plagiobothrys* sp.), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), scarlet pimpernel (*Anagallis arvensis*), St. John's wort (*Hypericum perforatum*), brodiaea (*Brodiaea elegans*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*). Isolated valley oak (*Quercus lobata*) trees also occur in the non-native annual grassland.

4.1.2 Riparian Woodland

Riparian habitat occurs along the riverine perennial marsh and perennial drainage in the northern drainage system. Dominant vegetation includes broadleaf cattail (*Typha latifolia*), willow (*Salix* sp.), spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), Himalayan blackberry (*Rubus armeniacus*), Fremont cottonwood (*Populus fremontii*), and isolated valley oak trees.

4.1.3 Valley Oak Woodland

Valley oak woodland is found in a small area on the southwest boundary of the Study Area where a small stand of mature valley oak trees overhangs a small perennial drainage. The understory is primarily annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal immediately adjacent to the drainage.

4.1.4 Disturbed/Developed

Disturbed/developed areas occur throughout the Study Area. Disturbed/developed areas include graded roads and a stockpile area. The ruderal/disturbed areas are sparsely vegetated with red-stemmed filaree, soft chess, wild oat, and winter vetch.

4.2 CLIMATE

The climate of El Dorado County is Mediterranean, characterized by wet, cool winters and dry, hot summers. The nearest weather station with complete climate data is the Sacramento Executive Airport weather station in Sacramento, California, located approximately 26 miles west of the project site. Average daily maximum and minimum temperatures are 92° and 59° Fahrenheit (F) in July and 56° and 39° F in January (NRCS 2020a). The mean annual precipitation is 17.8 inches, with 100 percent occurring as rain from September through May. The weather station received approximately 6.14 inches of rainfall this rain season starting in October (NRCS 2020a). In the previous year, the weather station received 24.6 inches, which is 138% of normal (NRCS 2020a).

4.3 SOILS

The Natural Resources Conservation Service (NRCS) has mapped one soil unit within the Study Area (Appendix A, Figure 4). Auburn Silt Loam, 2 to 30 Percent Slopes. General characteristics associated with this soil type are described below (USDA, NRCS 2020b).

Auburn Silt Loam, 2 to 30 Percent Slopes (AwD): The soils in this series are well drained. Permeability is moderate. Vegetation associated with this soil series includes annual grasses, forbs, and oaks. The hydric soils list for El Dorado County does not identify this soil as hydric (USDA, NRCS 2020c).

4.4 HYDROLOGY

The Study Area is located in the Upper Cosumnes River watershed (HUC8 18040013). The hydrologic regime on the Study Area is predominantly year-round irrigation runoff from the adjacent development to the north, seasonal stormwater runoff, and direct precipitation, which primarily falls between November and March. Annual average precipitation is approximately 15 to 20 inches. Surface water runoff runs in a general northeast to southwest direction.

4.5 USFWS NATIONAL WETLANDS INVENTORY

The USFWS National Wetlands Inventory online database was reviewed to determine if there are any wetlands or other waters of the U.S. mapped by the USFWS in the Study Area or vicinity. The National Wetlands Inventory does not identify any wetlands or other waters of the U.S. in the Study Area. Off-site and to the west and east, the NWI identifies an unnamed tributary to Carson Creek (Appendix A, Figure 5).

5.0 AQUATIC RESOURCES

A total of 0.740 acre of aquatic resources and other waters of the U.S. were mapped within the Study Area. This acreage consists of 0.133 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland

swale, 0.234 acre of ephemeral drainage, and 0.360 acre of intermittent drainage (Appendix B). This acreage includes 0.19 acre of waters of the U.S. that was previously verified by the USACE within a 17.9-acre portion of the northern portion of the Study Area (SPK-2013-00090). This previously verified acreage was carried forward in this delineation. A description of all of the features delineated within the Study Area are provided in the following sections.

5.1.1 Seasonal Wetland

A total of 0.133 acre of seasonal wetlands has been delineated within the Study Area (Appendix B). Seasonal wetlands are often depressions or topographic folds within the landscape that inundate for short periods of time following intense rains, but do not maintain seasonal aquatic or saturated soil conditions for durations long enough for colonization by perennial, obligate plant species. As such, plant species in seasonal wetlands are generally of two types: species that can tolerate short periods of inundation but have not adapted to withstand sustained aquatic or saturated soil conditions, and short-lived (primarily annual) species that take advantage of ephemeral aquatic and/or saturated soil conditions. Many of the seasonal wetlands within the Study Area are adjacent to the ephemeral drainage on the northern portion of the Study Area. There are also two depressional seasonal wetlands on the Study Area appear to have formed as a result of historic excavation as they are located next to large, steep mounds. Dominant vegetation includes rabbitsfoot grass (*Polypogon monspeliensis*), spike rush, and nutsedge (*Cyperus eragrostis*).

5.1.2 Seep

A total of 0.007 acre of seep has been delineated within the Study Area (Appendix B). Seeps are characterized as areas where subsurface flows intersects the soil surface. Typically, water flows from seeps persist for some period after the rainy season or, more rarely, nearly year-round. Seeps accessing sufficient amounts of subsurface water can support isolated wetland vegetation (such as on a hillside) or they may form the headwaters of other jurisdictional drainage or wetland features, such as wetland swales. Vegetation in seeps often consists of plant species associated with seasonal and semi-permanent marsh habitats. When seeps are active for only short periods beyond the rainy season and into the warm season, herbaceous perennial wetland species typically dominate, as is typical of the seeps within the Study Area. Vegetation in the seep include consisted almost entirely of iris leaved rush (*Juncus xiphioides*) (OBL). Hydric soil indicators in the seep included a redox dark surface with distinct or prominent redoximorphic features located along root channels of living roots and as concentrations in the matrix. Wetland hydrology requirements were met by oxidized rhizospheres, saturation visible on aerial imagery and the FAC-neutral test.

5.1.3 Wetland Swale

A total of 0.006 acre of wetland swale was delineated on the Study Area (Appendix B). The wetland swale within the Study Area is associated with SW-3 on the northern portion of the Study Area and conveys water from that feature to ED-16 during high flow events. Dominant vegetation occurring within the wetland swale includes curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), rye grass, annual hair grass (*Deschampsia danthonioides*), and rabbitsfoot grass.

5.1.4 Ephemeral Drainage

A total of 0.234 acre of ephemeral drainages have been delineated within the Study Area (Appendix B). Ephemeral drainages are not wetlands as they do not meet the three-parameter criteria for vegetation, hydrology, and soils but do convey water and exhibit an ordinary high water mark. Water flows within ephemeral drainages are fed primarily by precipitation and surface water runoff. These features convey water during and immediately after storm events, but do not flow continuously throughout the winter and spring. Typically, these features exhibit a defined bed and bank and show signs of scouring as a result of rapid flow events. Although the channels of the ephemeral drainages within the Study Area are largely unvegetated, what vegetation is present includes winter vetch, ripgut brome, ryegrass, phacelia (*Phacelia cicutaria*), and medusahead (*Elymus caput-medusae*).

5.1.5 Intermittent Drainage

A total of 0.360 acre of intermittent drainage (ID-18) has been delineated within the Study Area (Appendix B). Intermittent drainages receive substantial seasonal flows of significant velocity and may appear as perennial features during the normal wet season. These seasonal flows often scour the channel of vegetation. Intermittent drainages may support fringe wetland vegetation types, such as seasonal or semi-permanent marsh or riparian wetlands. Conversely, intermittent drainages may be associated with hydrophytic vegetation communities that lack further wetland indicators. A typical hydroperiod of intermittent drainages is one that begins with the onset of substantial rains in the normal wet season and persists for an extended, variable amount of time into summer.

A brick check dam has been constructed across a portion of the feature near datapoint 4a (Appendix B). This check dam has resulted in periods of water backing up during flow events that have supported the establishment of hydrophytic emergent vegetation upstream of datapoint 4a. The area containing emergent vegetation is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock with areas of dense cattails and Himalayan blackberry and a small clump of willows. This area is entirely within the ordinary high water mark of the intermittent drainage.

Table 1 below provides a summary of aquatic resources mapped within the Study Area.

Table 1

5.2 POTENTIAL WATERS OF THE U.S.

Ephemeral drainages are currently not considered to be jurisdictional features under the 2020 Navigable Waters Protection Rule (see Section 1.4.1). Therefore, the 0.234 acre of ephemeral drainages within the Study Area would not be expected to be considered waters of the U.S. Seasonal wetland 1 and seasonal wetland 2 (total of 0.015 acre) may also not be considered waters of the U.S. as they appear to have formed from historic excavations and are therefore a product of upland excavations and likely isolated from the remaining of the aquatic features on the site. The seep (0.007 acre) may also not be considered a water to the U.S. since it is not adjacent to the intermittent drainage feature and otherwise appears to be hydrologically isolated. The remaining 0.484 acres of aquatic resources within the Study Area would be expected to be considered waters of the U.S. subject to verification by the USACE.

5.3 POTENTIAL WATERS OF THE STATE

All aquatic resources in the Study Area (0.740 acre) are expected to be considered waters of the State subject to verification by the CVRWQCB under current regulatory guidance (see Section 1.4.2).

6.0 SUMMARY

HELIX conducted an aquatic resources delineation of the 36-acre Study Area in El Dorado Hills in El Dorado County. A total of 0.740 acre of aquatic resources was mapped within the Study Area. This acreage is comprised of 0.133 acre of seasonal wetland, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainage, and 0.360 acre of intermittent drainage. This aquatic resource delineation is preliminary and subject to verification by the resource agencies.

NOTES

- The boundaries and jurisdictional status of all waters shown on this map are preliminary and subject to verification by the U.S. Army Corps of Engineers.
- Approximately 17.9 acres of northern portion of Study Area was previously verified by USACE on August 19, 2019 (SPK-2013-00090)
- Northern portion originally delineated By: Kelly Bayne of Foothills Associates, December 15, 2015.
- Delineation updated By P. Martin on October 13, 2020.
- Aquatic resources were mapped by HELIX using an EOS Arrow Global Positioning System
- This delineation utilizes the Corps' 1987 three-parameter methodology and Arid West Supplement to delineate jurisdictional waters of the U.S.
- The Hydrologic Unit Code for this site is 18040013
- Topographic contour interval is 5 feet.
- Digital base data provided by RSC Engineering
- Coordinate System: NAD 83 UTM Zone 10N
- Projection: Transverse Mercator
- Datum: North American Datum 1983

Poaceae	*Festuca myuros*	Rattail sixweeks grass	FACU
Poaceae	*Festuca perennis*	Italian rye grass	FAC
Rhamnaceae	*Frangula californica* ssp. *Tomentella*	Hoary coffeeberry	--
Poaceae	*Gastridium phleoides*	Nit grass	FACU
Geraniaceae	*Geranium dissectum*	Cutleaf geranium	--
Geraniaceae	*Geranium molle*	Crane's bill geranium	--
Poaceae	*Glyceria declinata*	Low manna grass	FACW
Asteraceae	*Holocarpha virgata* ssp. *virgata*	Narrow tarplant	--
Poaceae	*Hordeum marinum*	Barley	FAC
Hypericaceae	*Hypericum perforatum* ssp. *Perforatum*	Klamathweed	FACU
Asteraceae	*Hypochaeris glabra*	Smooth cat's-ear	--
Juncaceae	*Juncus bufonius*	Toad rush	FACW
Juncaceae	*Juncus capitatus*	Leafy bracted dwarf rush	FACU

Appendix C (cont.)
List of Plants Observed within the Study Area

Family	Scientific Name	Common Name	Indicator Status*
Juncaceae	*Juncus* cf. *mexicanus*	Mexican rush	FACW
Juncaceae	*Juncus* cf. *tenuis*	Slender rush	FACW
Juncaceae	*Juncus xiphioides*	Iris leaved rush	OBL
Asteraceae	*Lactuca serriola*	Prickly lettuce	FACU
Asteraceae	*Lasthenia fremontii*	Vernal pool goldfields	OBL
Asteraceae	*Leontodon saxatilis*	Hairy hawkbit	FACU
Linaceae	*Linum usitatissimum*	Common flax	--
Lythraceae	*Lythrum hyssopifolia*	Hyssop loosestrife	OBL
Lamiaceae	*Mentha pulegium*	Pennyroyal	OBL
Poaceae	*Muhlenbergia rigens*	Deer grass	FAC
Polemoniaceae	*Navarretia intertexta*	Interwoven navarretia	FACW
Poaceae	*Paspalum dilatatum*	Dallis grass	FAC
Polygonaceae	*Persicaria* sp.	Smartweed	OBL
Boraginaceae	*Plagiobothrys stipitatus*	Stalked popcorn-flower	FACW
Poaceae	*Pleuropogon californicus*	Semaphore grass	OBL
Poaceae	*Poa annua*	Annual blue grass	FAC
Lamiaceae	*Pogogyne zizyphoroides*	Sacramento Mesa-mint	OBL
Poaceae	*Polypogon monspeliensis*	Rabbitsfoot grass	FACW
Salicaceae	*Populus fremontii [deltoides]* ssp. *fremontii*	Fremont's cottonwood	FAC
Rosaceae	*Prunus* sp.	Cherry tree	FACU
Fagaceae	*Quercus douglasii*	Blue oak	--
Fagaceae	*Quercus wislizeni*	Interior live oak	--
Ranunculaceae	*Ranunculus bonariensis* var. *trisepalus*	Vernal pool buttercup	OBL
Ranunculaceae	*Ranunculus muricatus*	Spiny buttercup	FACW
Brassicaceae	*Rorippa curvissiliqua*	Curvepod yellow cress	OBL
Rosaceae	*Rubus armeniacus*	Himalayan blackberry	FAC
Polygonaceae	*Rumex crispus*	Curly dock	FAC
Polygonaceae	*Rumex pulcher*	fiddledock	FAC
Salicaceae	*Salix exigua*	Narrow leaved willow	FACW
Salicaceae	*Salix* cf. *lasiolepis*	Arroyo willow	FACW
Asteraceae	*Senecio vulgaris*	Common groundsel	FACU
Asteraceae	*Sonchus asper*	Prickly sow thistle	FAC
Poaceae	*Stipa pulchra*	Purple needle grass	--
Lamiaceae	*Trichostema lanceolata*	Vinegar weed	FACU
Fabaceae	*Trifolium variegatum*	Variegated clover	FAC
Typhaceae	*Typha* sp.	Cattail	OBL
Scrophulariaceae	*Verbascum blattaria*	Moth mullein	UPL
Plantaginaceae	*Veronica* cf. *americana*	American brooklime	OBL
Fabaceae	*Vicia sativa*	Spring vetch	FACU
Gentianaceae	*Zeltnera muehlenbergii*	Muehlenberg's centaury	FAC

Scientific and common names from:

Baldwin, B.G.. D.H. Goldman, D.J. Keil, R. Patterson, T.J. Rosatti, D.H. Wilken, editors. 2012. The Jepson Manual: Vascular Plants of California, second edition. University of California Press, Berkley

or

U.S. Army Corps of Engineers Cold Regions Research and Engineering Laboratory, *Arid West 2018 Regional Wetland Plant List*

* Acronyms: FAC – facultative, FACU – facultative upland, FACW – facultative wetland, OBL – obligate, UPL – upland; -- Not Listed (considered upland) (USACE 2018)

Data Sheets

This page intentionally left blank

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: El Dorado Hills 52 City/County: El Dorado County Sampling Date: Dec. 15, 2015

Applicant/Owner: EDH 52, GP State: CA Sampling Point: 1B

Investigator(s): Kelly Bayne and Charlotte Marks Section, Township, Range: Township 9 North, Range 8 East, Section 1

Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): concave Slope (%): <1

Subregion (LRR): C Lat: 38 39 44.15"N Long: 121 03 22.66"W Datum: NAD 83

Soil Map Unit Name: Auburn Silt Loam, 2 to 30 Percent Slopes NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation _____, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes ✓	No _____	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes _____	No ✓	
Wetland Hydrology Present?	Yes ✓	No _____	

Remarks:

Ephemeral drainage; although the soils do not meet the definition of a wetland, the feature has an OHWM. Therefore, it is considered an ephemeral drainage.

VEGETATION – Use scientific names of plants.

Tree Stratum (Plot size: _____)	Absolute % Cover	Dominant Species?	Indicator Status
1.			
2.

Dominance Test worksheet:

Number of Dominant Species That Are OBL, FACW, or FAC: 1 (A)

Total Number of Dominant Species Across All Strata: 1 (B)

Percent of Dominant Species That Are OBL, FACW, or FAC: 100 (A/B)

Prevalence Index worksheet:

Total % Cover of:	Multiply by:
OBL species _____	x 1 = _____
FACW species _____	x 2 = _____
FAC species _____	x 3 = _____
FACU species _____	x 4 = _____
UPL species _____	x 5 = _____
Column Totals: _____ (A)	_____ (B)

Prevalence Index = B/A = _____

Hydrophytic Vegetation Indicators:

✓ Dominance Test is >50%

___ Prevalence Index is ≤3.0[1]

___ Morphological Adaptations[1] (Provide supporting data in Remarks or on a separate sheet)

___ Problematic Hydrophytic Vegetation[1] (Explain)

[1]Indicators of hydric soil and wetland hydrology must be present, unless disturbed or problematic.

Hydrophytic Vegetation Present? Yes ✓ No _____

Remarks:

SOIL

Sampling Point: 1B

Profile Description: (Describe to the depth needed to document the indicator or confirm the absence of indicators.)

Depth (inches)	Matrix Color (moist)	Matrix %	Redox Features Color (moist)	Redox Features %	Type[1]	Loc[2]	Texture	Remarks
0-8	7.5YR 3/2	100	None				Loam	

[1]Type: C=Concentration, D=Depletion, RM=Reduced Matrix, CS=Covered or Coated Sand Grains. [2]Location: PL=Pore Lining, M=Matrix.

Hydric Soil Indicators: (Applicable to all LRRs, unless otherwise noted.)

- ___ Histosol (A1)
- ___ Histic Epipedon (A2)
- ___ Black Histic (A3)
- ___ Hydrogen Sulfide (A4)
- ___ Stratified Layers (A5) (**LRR C**)
- ___ 1 cm Muck (A9) (**LRR D**)
- ___ Depleted Below Dark Surface (A11)
- ___ Thick Dark Surface (A12)
- ___ Sandy Mucky Mineral (S1)
- ___ Sandy Gleyed Matrix (S4)
- ___ Sandy Redox (S5)
- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ___ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? Yes ___ **No** ✓

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ___ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ✓ Water Marks (B1) (**Riverine**)
- ✓ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes ___ No ✓ Depth (inches): _____

Water Table Present? Yes ___ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes ___ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes ✓ **No** ___

Hydric Soil Present? Yes ✓ **No** _____

Remarks:

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ✓ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ___ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✓ Depth (inches): _____

Water Table Present? Yes _____ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✓ Depth (inches): _____

Wetland Hydrology Present? Yes ✓ **No** _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: El Dorado Hills 52 City/County: El Dorado County Sampling Date: Oct. 13, 2020

Applicant/Owner: EDH 52, GP State: CA Sampling Point: 7B

Investigator(s): Patrick Martin, Halie Goeman Section, Township, Range: Township 9 North, Range 8 East, Section 1

Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): concave Slope (%): <1

Subregion (LRR): C Lat: 38 39 37.64"N Long: 121 03 25.63"W Datum: NAD 83

Soil Map Unit Name: Auburn Silt Loam, 2 to 30 Percent Slopes NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation ✓, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____	No ✓	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes _____	No ✓	
Wetland Hydrology Present?	Yes _____	No ✓	

Remarks:

Low area along ephemeral stream with hydrophytes, but supports a dominance of upland vegetation and lacks other wetland criteria. This is likely a floodplain in uplands that rarely floods.

VEGETATION – Use scientific names of plants.

- ___ Stripped Matrix (S6)
- ___ Loamy Mucky Mineral (F1)
- ___ Loamy Gleyed Matrix (F2)
- ___ Depleted Matrix (F3)
- ✓ Redox Dark Surface (F6)
- ___ Depleted Dark Surface (F7)
- ___ Redox Depressions (F8)
- ___ Vernal Pools (F9)

Indicators for Problematic Hydric Soils[3]:

- ___ 1 cm Muck (A9) (**LRR C**)
- ___ 2 cm Muck (A10) (**LRR B**)
- ___ Reduced Vertic (F18)
- ___ Red Parent Material (TF2)
- ___ Other (Explain in Remarks)

[3]Indicators of hydrophytic vegetation and wetland hydrology must be present, unless disturbed or problematic.

Restrictive Layer (if present):

Type: _____

Depth (inches): _____

Hydric Soil Present? **Yes** ✓ **No** _____

Remarks:

Prominent redoximorphic features in the matrix and pore linings on a dark surface support the hydric soil indicator Redox Dark Surface (F6).

HYDROLOGY

Wetland Hydrology Indicators:

Primary Indicators (minimum of one required; check all that apply)

- ___ Surface Water (A1)
- ___ High Water Table (A2)
- ___ Saturation (A3)
- ___ Water Marks (B1) (**Nonriverine**)
- ___ Sediment Deposits (B2) (**Nonriverine**)
- ___ Drift Deposits (B3) (**Nonriverine**)
- ___ Surface Soil Cracks (B6)
- ___ Inundation Visible on Aerial Imagery (B7)
- ___ Water-Stained Leaves (B9)
- ___ Salt Crust (B11)
- ___ Biotic Crust (B12)
- ___ Aquatic Invertebrates (B13)
- ___ Hydrogen Sulfide Odor (C1)
- ✓ Oxidized Rhizospheres along Living Roots (C3)
- ___ Presence of Reduced Iron (C4)
- ___ Recent Iron Reduction in Tilled Soils (C6)
- ___ Thin Muck Surface (C7)
- ___ Other (Explain in Remarks)

Secondary Indicators (2 or more required)

- ___ Water Marks (B1) (**Riverine**)
- ___ Sediment Deposits (B2) (**Riverine**)
- ___ Drift Deposits (B3) (**Riverine**)
- ___ Drainage Patterns (B10)
- ___ Dry-Season Water Table (C2)
- ___ Crayfish Burrows (C8)
- ___ Saturation Visible on Aerial Imagery (C9)
- ___ Shallow Aquitard (D3)
- ✓ FAC-Neutral Test (D5)

Field Observations:

Surface Water Present? Yes _____ No ✓ Depth (inches): _____

Water Table Present? Yes _____ No ✓ Depth (inches): _____

Saturation Present? (includes capillary fringe) Yes _____ No ✓ Depth (inches): _____

Wetland Hydrology Present? **Yes** ✓ **No** _____

Describe Recorded Data (stream gauge, monitoring well, aerial photos, previous inspections), if available:

Remarks:

Seep spring dominated by obligate wetland plants likely has a high water table during the growing season.

WETLAND DETERMINATION DATA FORM – Arid West Region

Project/Site: El Dorado Hills 52 City/County: El Dorado County Sampling Date: Oct. 13, 2020

Applicant/Owner: EDH 52, GP State: CA Sampling Point: 9B

Investigator(s): Patrick Martin, Halie Goeman Section, Township, Range: Township 9 North, Range 8 East, Section 1

Landform (hillslope, terrace, etc.): Hillslope Local relief (concave, convex, none): concave Slope (%): <1

Subregion (LRR): C Lat: 38 39 37.64"N Long: 121 03 25.63"W Datum: NAD 83

Soil Map Unit Name: Auburn Silt Loam, 2 to 30 Percent Slopes NWI classification: None

Are climatic / hydrologic conditions on the site typical for this time of year? Yes ✓ No _____ (If no, explain in Remarks.)

Are Vegetation _____, Soil _____, or Hydrology _____ significantly disturbed? Are "Normal Circumstances" present? Yes ✓ No _____

Are Vegetation ✓, Soil _____, or Hydrology _____ naturally problematic? (If needed, explain any answers in Remarks.)

SUMMARY OF FINDINGS – Attach site map showing sampling point locations, transects, important features, etc.

Hydrophytic Vegetation Present?	Yes _____	No ✓	**Is the Sampled Area within a Wetland?** Yes _____ No ✓
Hydric Soil Present?	Yes _____	No ✓	
Wetland Hydrology Present?	Yes _____	No ✓	

Remarks:

Seep spring dominated by obligate wetland plant Juncus xiphioides.

VEGETATION – Use scientific names of plants.

EXECUTIVE SUMMARY

HELIX Environmental Planning, Inc. (HELIX) prepared this biological resources assessment (BRA) for the El Dorado Hills 52 Study Area located within El Dorado County, California. The purpose of this BRA is to summarize the general biological resources in the Study Area, to assess the suitability of the Study Area to support special-status species and sensitive habitat types, to summarize the results of various focused surveys, and to provide recommendations for regulatory permitting or further analysis that may be required prior to development activities occurring in the Study Area.

The El Dorado Hills 52 Study Area (Study Area) consists of ±36 acres of land that is primarily composed of annual grassland with a small area of oak woodland. The Study Area is bifurcated by Silva Valley Parkway. A former home site is located on the southern portion of the property and a large part of the northern portion was used to stockpile soil during the construction of the adjacent Silva Valley Parkway – U.S. Highway 50 Interchange Project. Land uses surrounding the Study Area include an elementary school, residential housing, and U.S. Highway 50.

Known or potential biological constraints within the Study Area include:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for coast horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. and waters of the State (seasonal wetlands, seep, wetland swale, and intermittent and ephemeral drainages), riparian habitat, and valley oak woodland.

This page intentionally left blank

1.0 INTRODUCTION

This report summarizes the findings of a BRA and an aquatic resources delineation conducted for the ±36-acre El Dorado Hills 52 Study Area, located within El Dorado County, California (Figure 1). This document addresses the onsite physical features, as well as plant communities present and the common plant and wildlife species occurring, or potentially occurring, in the Study Area. Furthermore, the suitability of onsite habitats to support special-status species and sensitive habitats is analyzed and recommendations are identified for anticipated requirements related to regulatory compliance or further analysis required prior to implementation of land use development within the Study Area.

1.1 PROJECT DESCRIPTION

Development proposed within the Study Area will ultimately result in the development of approximately 36 acres of commercial land uses. Development is designed to allow either the North Site or the South Site to develop independent from the other. Proposed improvements will include construction of commercial buildings and associated parking, utilities, and storm water management facilities as well as multiple points of access, and a new traffic signal on Silva Valley Parkway. Ancillary amenities include pedestrian walkways, bicycle parking, signage and lighting and landscaping.

2.0 REGULATORY FRAMEWORK

Federal, State, and local environmental laws, regulations, and policies relevant to the review of a "project" under the California Environmental Quality Act (CEQA) are summarized below. Applicable CEQA significance criteria are also addressed in this section.

2.1 FEDERAL REGULATIONS

2.1.1 Federal Endangered Species Act

The U.S. Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend.

FESA prohibits the "take" of endangered or threatened wildlife species. "Take" under FESA is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (FESA Section 3 [(3) (19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR §17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR §17.3). Actions that result in take can result in civil or criminal penalties.

In the context of the proposed Project, consultation with the U.S. Fish and Wildlife Service (USFWS) and/or the National Marine Fisheries Service (NMFS) would be initiated if proposed development activities had the potential to result in take of a federally threatened or endangered species or if

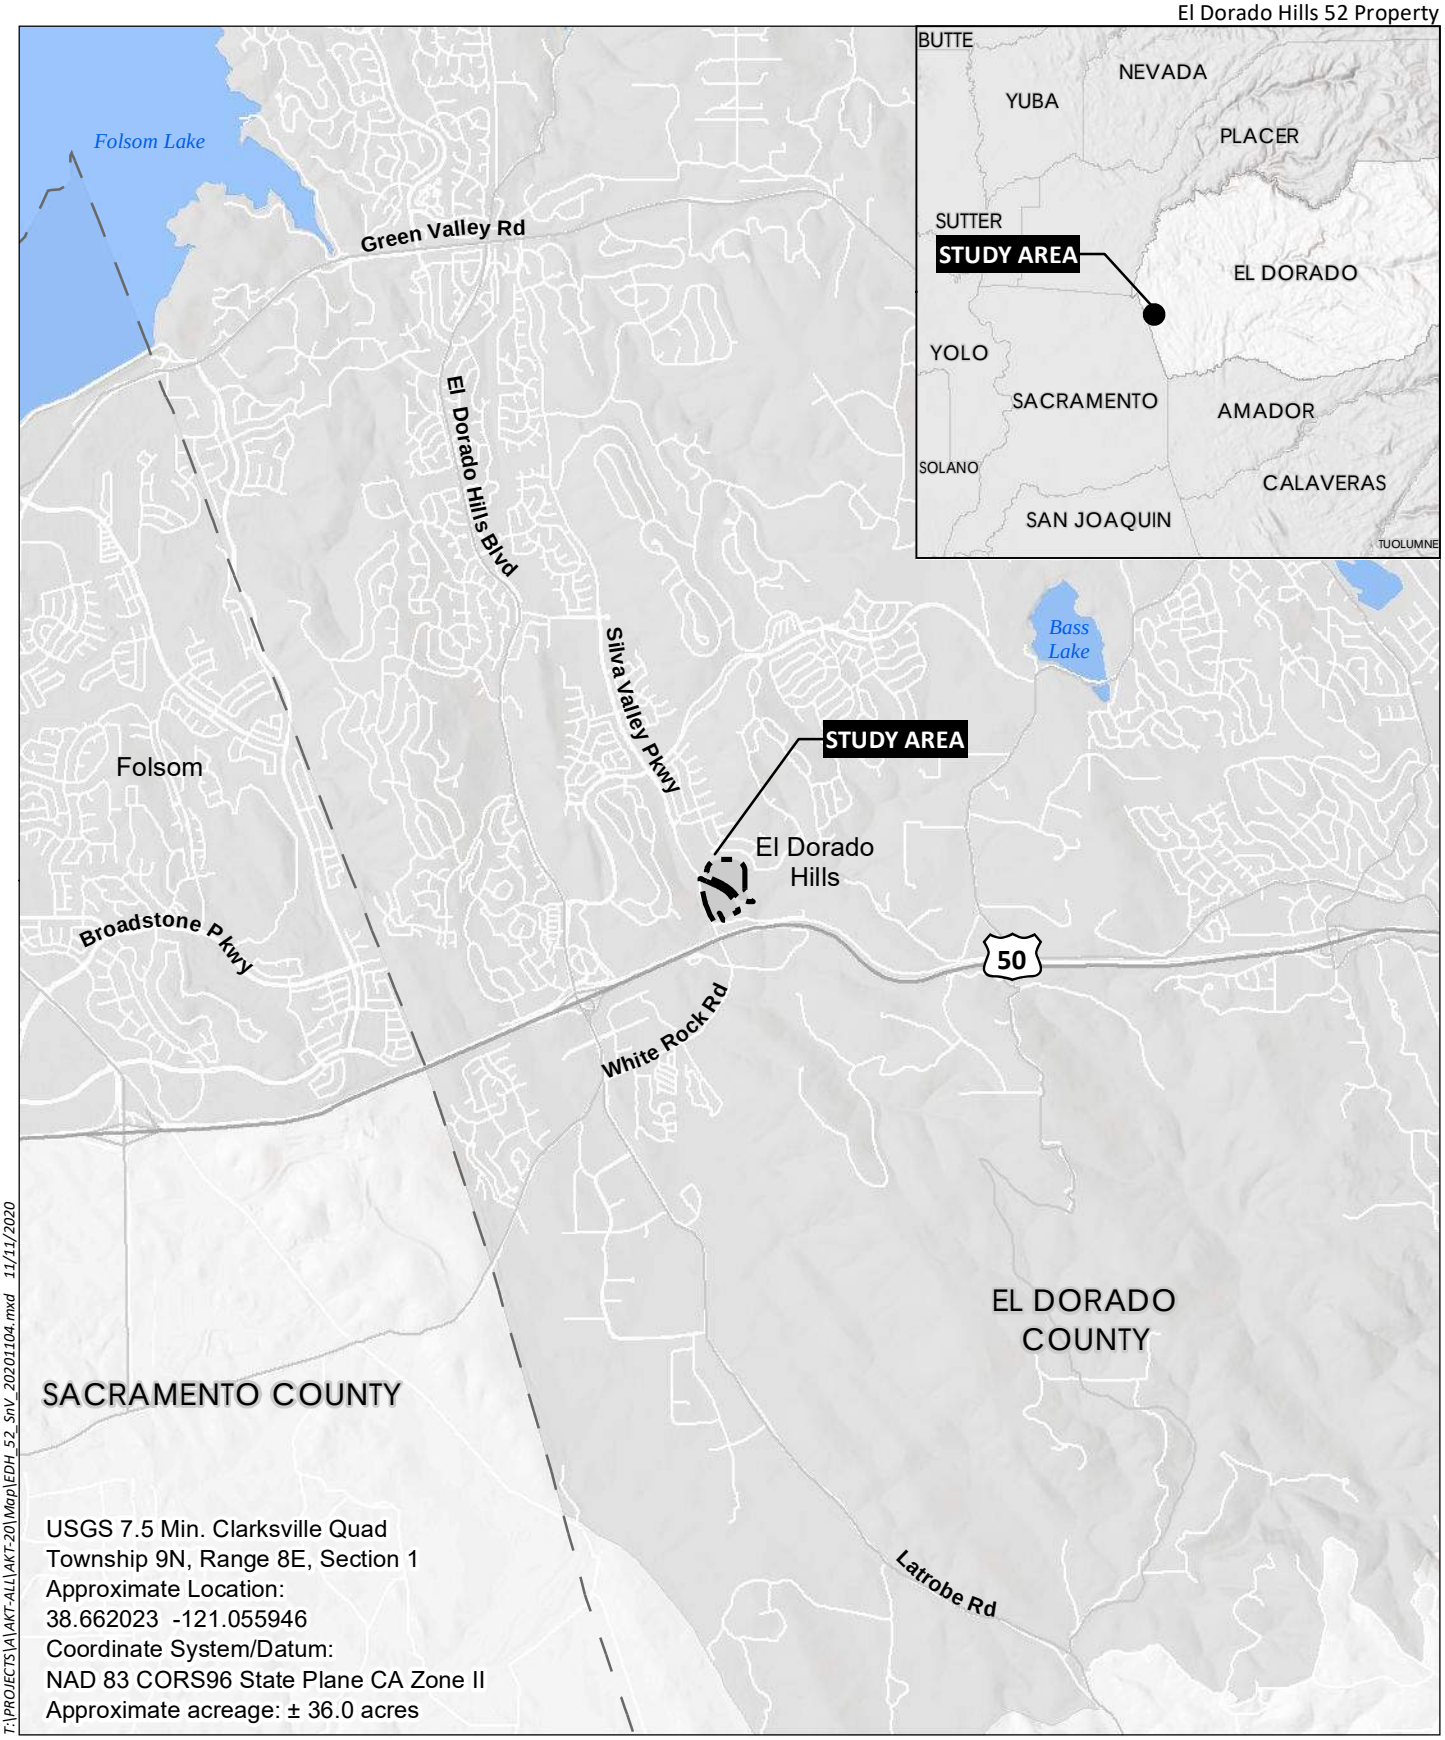
issuance of a Section 404 permit or other federal agency action could result in take of a federally endangered species or adversely modify designated critical habitat of such a species.

2.1.2 Migratory Bird Treaty Act

Raptors, migratory birds, and other avian species are protected by a number of State and federal laws. The federal Migratory Bird Treaty Act (MBTA) prohibits the killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of Interior.

2.1.3 The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (Eagle Act) prohibits the taking or possession of and commerce in bald and golden eagles with limited exceptions. Under the Eagle Act, it is a violation to "*take, possess, sell, purchase, barter, offer to sell, transport, export or import, at any time or in any manner, any bald eagle commonly known as the American eagle, or golden eagle, alive or dead, or any part, nest, or egg, thereof.*" Take is defined to include pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest, and disturb. Disturb is further defined in 50 CFR Part 22.3 as "*to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available (1) injury to an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior.*"



2.2 STATE JURISDICTION

2.2.1 California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to the FESA but pertains to State-listed endangered and threatened species. CESA directs agencies to consult with CDFW on projects or actions that could result in "take" of state-listed species. Section 2081 of the Fish and Game Code allows CDFW to authorize "take" of a state-listed species if the take is incidental to an otherwise lawful activity. The impacts of the take must be minimized and fully mitigated as determined by CDFW and the applicant must ensure adequate funding to implement measures to minimize and fully mitigate the impacts. No take permit may be issued if issuance of the permit would jeopardize the continued existence of a state-listed species.

2.2.2 California Department of Fish and Game Codes

A number of species have been designated as "fully protected" species under Sections 5515, 5050, 3511, and 4700 of the Fish and Game Code, but are not listed as endangered (Section 2062) or threatened (Section 2067) species under CESA. Except for take related to scientific research, all take of fully protected species is prohibited. The California Fish and Game Code defines take as "*hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill.*" Additionally, Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibits the killing of birds or the destruction of bird nests.

HELIX Environmental Planning

Site and Vicinity Map

Figure 1

2.2.3 Native Plant Protection Act

The Native Plant Protection Act (NPPA), enacted in 1977, allows the Fish and Game Commission to designate plants as rare or endangered. The NPPA prohibits take of endangered or rare native plants, with some exceptions for agricultural and nursery operations and emergencies. Vegetation removal from canals, roads, and other sites, changes in land use, and certain other situations require proper advance notification to CDFW.

2.3 JURISDICTIONAL WATERS

2.3.1 Federal Jurisdiction

Any person, firm, or agency planning to alter or work in "waters of the U.S.," including the discharge of dredged or fill material, must first obtain authorization from the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA; 33 USC 1344). Permits, licenses, variances, or similar authorization may also be required by other federal, state, and local statutes. Section 10 of the Rivers and Harbors Act prohibits the obstruction or alteration of navigable waters of the U.S. without a permit from USACE (33 USC 403).

On April 21, 2020, the Environmental Protection Agency (EPA) and USACE published the Navigable Waters Protection Rule to define "Waters of the United States" in the Federal Register. On June 22, 2020 the Navigable Waters Protection Rule: Definition of "Waters of the United States" (NWPR) became effective in 49 states, including California, and in all US territories.

The NWPR regulates traditional navigable waters and perennial or intermittent tributary systems, and defines four categories of regulated waters including:

- The territorial seas and traditional navigable waters;
- Perennial and intermittent tributaries to those waters;
- Certain lakes, ponds, and impoundments; and
- Wetlands adjacent to jurisdictional waters.

The NWPR also defines 12 categories of exempted aquatic resources:

- Waters not listed as WOTUS
- Groundwater
- Ephemeral features
- Diffuse stormwater run-off
- Ditches not identified as WOTUS
- Prior converted cropland (PCC)
- Artificially irrigated areas
- Artificial lakes and ponds
- Water-filled depressions incidental to mining or construction activity
- Stormwater control features
- Groundwater recharge, water reuse, and wastewater recycling structures
- Waste treatment systems

With non-tidal waters, in the absence of adjacent wetlands, the extent of USACE jurisdiction extends to the ordinary high water mark (OHWM) – the line on the shore established by fluctuations of water and indicated by a clear, natural line impressed on the bank, shelving, changes in soil character, destruction of terrestrial vegetation, or the presence of litter and debris. Wetlands are defined in 33 CFR Part 328 as:

> "those areas that are inundated or saturated by surface or ground water at a frequency and duration to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions."

Federal and state regulations pertaining to waters of the U.S., including wetlands, are discussed below.

Clean Water Act (33 USC 1251-1376). The CWA provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters.

Section 401 requires that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the U.S. must obtain a state certification that the discharge complies with other provisions of CWA. The Regional Water Quality Control Board (RWQCB) administers the certification program in California and may require State Water Quality Certification before other permits are issued.

Section 402 establishes a permitting system for the discharge of any pollutant (except dredged or fill material) into waters of the U.S.

Section 404 establishes a permit program administered by USACE that regulates the discharge of dredged or fill material into waters of the U.S. (including wetlands). Implementing regulations by USACE are found at 33 CFR Parts 320-332. The Section 404 (b)(1) Guidelines were developed by the USEPA in conjunction with USACE (40 CFR Part 230), allowing the discharge of dredged or fill material for non-water dependent uses into special aquatic sites only if there is no practicable alternative that would have less adverse impacts. State Jurisdiction

Regional Water Quality Control Board

Any action requiring a CWA Section 404 permit, or a Rivers and Harbors Act Section 10 permit, must also obtain a CWA Section 401 Water Quality Certification. The State of California Water Quality Certification (WQC) Program was formally initiated by the State Water Resources Control Board (SWRCB) in 1990 under the requirements stipulated by Section 401 of the Federal CWA. Although the Clean Water Act is a Federal law, Section 401 of the CWA recognizes that states have the primary authority and responsibility for setting water quality standards. In California, under Section 401, the State and Regional Water Boards are the authorities that certify that issuance of a federal license or permit does not violate California's water quality standards (i.e., that they do not violate Porter-Cologne and the Water Code). The WQC Program currently issues the WQC for discharges requiring USACE's permits for fill and dredge discharges within Waters of the United States, and now also implements the State's wetland protection and hydromodification regulation program under the Porter Cologne Water Quality Control Act.

On April 2, 2019, the SWRCB adopted a State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures), for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters and Enclosed Bays and Estuaries and Ocean Waters of California. The Procedures consist of four major elements: 1) a wetland definition; 2) a framework for determining if a feature that meets the wetland definition is a water of the state; 3) wetland delineation procedures; and 4) procedures for the submittal, review and approval of applications for Water Quality

Certifications and Waste Discharge Requirements for dredge or fill activities. The Office of Administrative Law approved the Procedures on August 28, 2019, and the Procedures became effective May 28, 2020.

Under the Procedures and the State Water Code (Water Code §13050(e)), "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." Unless excluded by the Procedures, any activity that could result in discharge of dredged or fill material to Waters of the State, which includes Waters of the U.S. and non-federal Waters of the State, requires filing of an application under the Procedures.

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Water Code Section 13000 et seq.) is California's statutory authority for the protection of water quality in conjunction with the federal CWA. The Porter-Cologne Act requires the SWRCB and RWQCBs to adopt and periodically update water quality control plans, or basin plans. Basin plans are plans in which beneficial uses, water quality objectives, and implementation programs are established for each of the nine regions in California. The Porter-Cologne Act also requires dischargers of pollutants or dredged or fill material to notify the RWQCBs of such activities by filing Reports of Waste Discharge and authorizes the SWRCB and RWQCBs to issue and enforce waste discharge requirements, National Pollution Discharge Elimination System (NPDES) permits, Section 401 water quality certifications, or other approvals.

California Department of Fish and Wildlife

The CDFW has jurisdiction over fish and wildlife resources under Section 1600 et seq. of the California Fish and Game Code. Under Sections 1602 and 1603, a private party must notify CDFW if a proposed project will "substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of streambeds…except when the department has been notified pursuant to Section 1601." Additionally, CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over four inches in diameter at breast height (DBH). If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends submitting an application for a Streambed Alteration Agreement (SAA) for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater.

2.4 CEQA SIGNIFICANCE

Section 15064.7 of the State CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study Checklist included in Appendix G of the State CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these examples, impacts to biological resources would normally be considered significant if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;

- Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and

- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish or result in the loss of an important biological resource, or those that would obviously conflict with local, State, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

2.4.1 California Native Plant Society

The California Native Plant Society (CNPS) maintains a rank of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the *Inventory of Rare and Endangered Vascular Plants of California*. Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS Rare Plant Ranking System:

Rank 1A: Plants presumed Extinct in California and either rare or extinct elsewhere

Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere

Rank 2A: Plants presumed extirpated in California but common elsewhere

Rank 2B: Plants Rare, Threatened, or Endangered in California, but more common elsewhere

Rank 3: Plants about which we need more information – A Review List

Rank 4: Plants of limited distribution – A Watch List

All plants appearing on CNPS Rank 1 or 2 are considered to meet CEQA Guidelines Section 15380 criteria. While only some of the plants ranked 3 and 4 meet the definitions of threatened or endangered species, the CNPS recommends that all Rank 3 and Rank 4 plants be evaluated for consideration under

CEQA. Furthermore, the CNPS Rare Plant Rankings include levels of threat for each species. These threat ranks include the following:

0.1 - Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat);

0.2 - Moderately threatened in California (20-80% occurrences threatened/moderate degree and immediacy of threat); and

0.3 - Not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known).

Threat ranks do not designate a change of environmental protections, so that each species (i.e., CRPR 1B.1, CRPR 1B.2, CRPR 1B.3, etc.), be fully considered during preparation of environmental documents under CEQA.

2.4.2 California Department of Fish and Wildlife Species of Concern

Additional fish, amphibian, reptile, bird, and mammal species may receive consideration by CDFW and lead agencies during the CEQA process, in addition to species that are formally listed under FESA and CESA or listed as fully protected. These species are included on the *Special Animals List*, which is maintained by CDFW. This list tracks species in California whose numbers, reproductive success, or habitat may be in decline. In addition to "Species of Special Concern" (SSC), the *Special Animals List* includes species that are tracked in the California Natural Diversity Database (CNDDB) but warrant no legal protection. These species are identified as "California Special Animals" (CSA).

2.5 LOCAL POLICIES AND REGULATIONS

2.5.1 El Dorado County General Plan

In addition to federal and State regulations described above, the *El Dorado County Adopted General Plan* (General Plan) includes goals, objectives, and policies regarding biological resources within the County limits (El Dorado County 2014). Applicable sections of the General Plan are included in Appendix A.

2.5.2 El Dorado County Oak Resources Management Plan

The County of El Dorado (County) adopted the El Dorado County Oak Resources Management Plan (ORMP) on October 24, 2017 and it went into effect on November 23, 2017 (El Dorado County 2017b, 2020). The ORMP designates three classes of protected oak resources: oak woodlands that have at least 10 percent oak canopy; Heritage trees, defined as native oaks with a total trunk DBH of 36 inches or greater; and individual oak trees, defined as native oak trees with a trunk DBH of 6 inches or greater that are not located in oak woodlands. An oak woodland removal permit is required prior to removal of oak trees that are part of an oak woodland and an oak tree removal permit is required prior to removal of Heritage trees and individual oak trees. Mitigation for impacts to oak woodlands is based on the total area impacted ranging from 1:1 mitigation for zero to 50 percent removal to 2:1 mitigation for more than 75 percent removal. Mitigation may be completed with a combination of the following options: acquisition of an off-site conservation easement, payment of in-lieu fees, or either on- or off-site replacement planting of up to 50 percent of the required mitigation area. Mitigation for removal of Heritage or individual oak trees requires on- or off-site replacement planting or payment of in-lieu fees

at a 3:1 or 1:1 ratio, respectively, to the number of trunk inches removed. Any oak woodland preserved onsite and all mitigation planting areas must be protected in perpetuity through deed restrictions or a conservation easement.

3.0 METHODOLOGY

Available information pertaining to the natural resources of the region was reviewed prior to conducting the field survey. The following site-specific published information was reviewed for this BRA:

- California Department of Fish and Wildlife (CDFW). 2020. *California Natural Diversity Database* (CNDDB); For: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek, Rocklin, and Folsom* USGS 7.5-minute series quadrangles, Sacramento, CA. Accessed [October 12, 2020];

- California Native Plant Society (CNPS). 2020. *Inventory of Rare and Endangered Plants* (online edition, v8-03 0.39) For: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek, Rocklin, and Folsom* USGS 7.5-minute series quadrangles, Sacramento, CA. Accessed [October 12, 2020];

- USDA, NRCS. 2020. *Web Soil Survey*. Available online at: http://websoilsurvey.sc.egov.usda.gov. Accessed [October 12, 2020];

- U.S. Fish and Wildlife Service (USFWS). 2020. *Information for Planning and Consultation* (IPaC) *the El Dorado Hills 52 Project.* Accessed [October 12, 2020];

- U.S. Geological Survey (USGS). 2018. *Clarksville, California*. 7.5-minute series topographic quadrangle. United States Department of Interior; and

- Biological reports and associated documents previously prepared for the Study Area.

Prior to the site survey, existing information, including the previous wetland delineation and soil maps, were reviewed and the results of the records search and five-mile radius CNNDB query were summarized in a table (Appendix B). General field surveys of the Study Area were conducted on April 5, 2013, August 8, 2017 and October 13, 2020. The Study Area was systematically surveyed on foot with binoculars to ensure total search coverage, with special attention given to identifying those portions of the Study Area with the potential for supporting special-status species and sensitive habitats. During the field surveys, biologists recorded plant and animal species observed (Appendix C), as well as characterized biological communities occurring onsite. Following the site survey, the potential for each species identified in the records search to occur in the Study Area was determined based on the site surveys, soils, and species-specific information, as shown in Appendix B. Representative photos of the Study Area are provided in Appendix D.

A wetland delineation was performed on December 15, 2015. A follow up wetland delineation was conducted on October 13, 2020 by HELIX biologists Patrick Martin and Halie Goeman to verify the previous wetland delineation, adjust potential wetland boundaries as applicable, and update regulatory requirements according to current standards, policies and regulations. The results of the aquatic resource delineation are summarized herein and are discussed in detail under a separate cover (HELIX

Environmental Planning, Inc. [HELIX] 2020a). The results are considered preliminary until the Corps verifies the findings.

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. The botanical inventories were conducted in accordance with CDFW's protocol plant surveys. The results of the botanical surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c). A complete list of plants observed within the Study Area is provided in Appendix C.

Protocol-level burrowing owl surveys were conducted within the majority of the Study Area on March 12, 2015, April 24, 2015, May 26, 2015, and June 16, 2015. The surveys were conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (CDFW 2012). The results of the burrowing owl surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c).

Protocol-level breeding season California red-legged frog (CRLF) surveys were conducted within the Study Area on January 12 and 26, 2016 and February 2 and 9, 2016. The protocol-level breeding season surveys were conducted in accordance with the *Revised Guidance on Site Assessment and Field Surveys for the California Red-legged Frog* (USFWS 2005; CRLF Guidance). The results of the protocol-level breeding season surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016a).

An oak woodland analysis was performed to document the extent of the existing oak trees in the Study Area and anticipated impacts from the proposed project. The oak woodland report is contained under separate cover (HELIX 2020b).

4.0 RESULTS

4.1 SITE LOCATION AND DESCRIPTION

The Study Area is located in El Dorado County adjacent to U.S. Highway 50 immediately east of Silva Valley Parkway and north of Tong Road. Land uses surrounding the Study Area include residential development to the north and paved roads, oak woodland, and annual grassland to the east, west, and south. The Study Area is located within Township 9 North, Range 8 East, Section 1 of the *Clarksvill*e USGS 7.5-minute series quadrangle. The approximate location of the center of the Study Area is at latitude 38.662023 and longitude -121.055946, NAD 83, and is located at an elevation between 705 feet and 795 feet above mean sea level (MSL).

The Study Area consists of approximately 36 acres of land that is primarily annual grassland. The Study Area is bifurcated by Silva Valley Parkway. Two drainage corridors cross the Study Area from the northeast to the southwest.

4.2 PHYSICAL FEATURES

4.2.1 Topography and Drainage

Topography within the Study Area ranges from relatively level to moderately sloped with elevations ranging from approximately 705 to 795 feet above MSL (215 to 242 meters). Surface runoff flows

through and exits the Study Area via ephemeral and intermittent drainages, which run in a northeast to southwest direction.

4.2.2 Soils

The Natural Resources Conservation Service has mapped one soil unit within the Study Area: Auburn silt loam, 2 to 30 percent slopes (Figure 2). The general characteristics and properties associated with this soil type are described below (USDA, NRCS 2020).

Auburn silt loam, 2 to 30 percent slopes: The soils in this series are well drained. Permeability is moderate. Vegetation associated with this soil series includes annual grasses, forbs, and oaks. The hydric soils list for El Dorado County does not identify this soil type as hydric (USDA, NRCS 2020)

4.3 BIOLOGICAL COMMUNITIES

Four upland biological communities occur in the Study Area including non-native annual grassland, riparian woodland, valley oak woodland, and disturbed/developed. Embedded within these upland communities are aquatic features including ephemeral stream, intermittent stream, seasonal wetlands, a wetland swale, and a seep. There is also an area of emergent wetland vegetation on the southern parcel within the ordinary high water mark of an intermittent drainage that forms a seasonal marsh (Figure 3). These communities provide habitat to a number of common species of wildlife and may provide suitable habitat for special-status species. It should be noted that wetlands may occur within a biological community. For instance, a creek surrounded by riparian woodland would be included within the riparian woodland for the purposes of determining biological community acreage. Vernal pools and seasonal wetlands may be included in the annual grassland community and are often used by wildlife from the annual grassland. However, a very different aquatic habitat, such as a seasonal marsh, is considered its own biological community. Dominant vegetation observed within each biological community is discussed in detail below. A comprehensive list of plants observed within the Study Area is provided in Appendix C.

4.3.1 Non-Native Annual Grassland

Non-native annual grassland dominates both the northern and southern portions of the Study Area. This vegetation community is characterized primarily by an assemblage of non-native annual grasses and forbs. Dominant vegetation includes ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) intermixed with red-stemmed filaree (*Erodium cicutarium*), popcornflower (*Plagiobothrys* sp.), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), scarlet pimpernel (*Anagallis arvensis*), St. John's wort (*Hypericum perforatum*), brodiaea (*Brodiaea elegans*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*).

Two small areas within the annual grassland contain purple needlegrass (*Nassella pulchra*) within the southern portion of the Study Area (Figure 3). The purple needlegrass is interspersed with annual willow herb (*Epilobium brachycarpum*), ripgut brome, soft chess, and wild oat.

The annual grassland community includes small ephemeral and intermittent drainages. The ephemeral drainages are mostly unvegetated and the intermittent drainage has a small clump of willows (*Salix* sp.) and broadleaf cattail (*Typha latifolia*) and is otherwise minimally vegetated.

HELIX Environmental Planning

Soils Map

Figure 2

HELIX Environmental Planning

Biological Communities

Figure 3

4.3.2 Riparian Woodland

Riparian woodland habitat occurs within the along the ephemeral drainage on the western boundary of the Study Area. Dominant vegetation includes broadleaf cattail, willow, spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), Himalayan blackberry (*Rubus armeniacus*), and valley oak (*Quercus lobata*).

4.3.3 Valley Oak Woodland

Valley oak woodland is found in a small area on the southwest boundary of the Study Area where a small stand of mature valley oak trees overhangs a small intermittent drainage. The understory is primarily annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal immediately adjacent to the drainage.

4.3.4 Seep

A seep is situated adjacent to the seasonal marsh and non-native annual grassland habitat. Seeps are characterized as areas where groundwater intersects the soil surface. Typically, water flows from seeps persist for some period after the rainy season or, more rarely, nearly year-round. Seeps accessing sufficient amounts of subsurface water can support isolated wetland vegetation (such as on a hillside) or they may form the headwaters of other jurisdictional drainage or wetland features, such as wetland swales. Vegetation in seeps often consists of plant species associated with seasonal and semi-permanent marsh habitats. When seeps are active for only short periods beyond the rainy season and into the warm season, herbaceous perennial wetland species typically dominate, as is typical of the seeps within the Study Area. Vegetation in the seep consisted almost entirely of iris leaved rush (*Juncus xiphioides*), an obligate wetland plant.

4.3.5 Seasonal Wetland

A number of seasonal wetland features are found in the Study Area. Most are associated with the ephemeral drainage on the northern portion of the Study Area. Dominant vegetation in the seasonal wetlands includes rabbitsfoot grass (*Polypogon monspeliensis*), spike rush (*Eleocharis macrostachya*), nutsedge (*Cyperus eragrostis*), curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), ryegrass, annual hair grass (*Deschampsia danthonioides*), and rye grass (*Festuca perennis*).

4.3.6 Seasonal Marsh

Seasonal marsh habitat is found in the southern portion of the Study Area within the ordinary high water mark of an intermittent drainage. This community appears to have formed as a result of a brick check dam that was constructed across the intermittent drainage allowing water to periodically back up in this area. This community is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock with areas of dense cattails, Himalayan blackberry, and a small clump of willows.

4.3.7 Disturbed/Developed

Disturbed/developed areas in the Study Area include graded roads and a stockpile area. The disturbed/developed areas are sparsely vegetated with red-stemmed filaree, soft chess, wild oat, and winter vetch.

4.4 SPECIAL-STATUS SPECIES

Special-status species are plant and wildlife species that have been afforded special recognition by federal, State, or local resource agencies or organizations. They are generally of relatively limited distribution and may require specialized habitat conditions. Special-status species are defined as meeting one or more of the following criteria:

- Listed or proposed for listing under CESA or FESA;
- Protected under other regulations (e.g., Migratory Bird Treaty Act);
- Included on the CDFW Special Animals List;
- Identified as Rare Plant Rank 1 to 4 by CNPS; or
- Receive consideration during environmental review under CEQA.

Special-status species considered for this analysis are based on queries of the CNDDB, the USFWS, and CNPS ranked species (online versions) for the *Rocklin* USGS quadrangle and eight surrounding quadrangles. Appendix B includes the common name and scientific name for each species, regulatory status (federal, State, local, CNPS), habitat descriptions, and potential for occurrence within the Study Area. The following set of criteria has been used to determine each species' potential for occurrence within the Study Area:

- **Present**: Species known to occur within the Study Area based on CNDDB records and/or observed within the Study Area during the biological survey.

- **High**: Species known to occur onsite or in the vicinity of the Study Area (based on CNDDB records within five miles and/or based on professional expertise specific to the Study Area or species) and there is suitable habitat within the Study Area.

- **Low**: Species known to occur in the vicinity of the Study Area and there is marginal habitat within the Study Area **-OR-** Species is not known to occur in the vicinity of the Study Area, however, there is suitable habitat on the Study Area.

- **None**: Species is not known to occur on or in the vicinity of the Study Area and there is no suitable habitat within the Study Area -**OR-** Species was surveyed for during the appropriate season with negative results **-OR-** The Study Area occurs outside of the known elevation or geographic ranges.

Only those species that are known to be *present* or have a *high* or *low* potential for occurrence are discussed further in the following sections.

4.4.1 Listed and Special-Status Plants

According to the records search, 31 special-status plant species have the potential to occur on or in the vicinity of the Study Area. Based on field observations and literature review, four species were determined to have the potential to occur on the Study Area: big-scale balsamroot (*Balsamorhiza macrolep*is var. *macrolepis*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), and Sanford's arrowhead (*Sagittaria sanfordii*). Focused botanical surveys were conducted within the Study Area in 2015 during the bloom period of these plants (Foothill Associates 2016c). No special-status plant species were found and therefore, it is unlikely that these species occur within the Study Area.

4.4.2 Listed and Special-Status Wildlife

According to the records search, 35 special-status animal species have the potential to occur onsite or in the vicinity. Based on field observations and literature review, 15 species were determined to have the potential for occurrence to occur in the Study Area. Protocol surveys for burrowing owl (*Athene cunicularia*) and California red-legged frog (*Rana draytonii*) were conducted in 2015 and 2016 (Foothill Associates 2016a, 2016b). No observations or evidence of either species was found within the Study Area.

Species that are known to be *present* or that are considered to have a *high* potential to occur onsite include: raptors and other migratory birds. Species that are considered to have a *low* potential to occur onsite include: valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), western pond turtle (*Actinemys marmorata*), coast horned lizard (*Phrynosoma blainvillii*), foothill yellow-legged frog (*Rana boylii*), western spadefoot (*Spea hammondii*), golden eagle (*Aquila chrysaetos*), tricolored blackbird (*Agelaius tricolor*), American badger (*Taxidea taxus*), and special-status bat species.

Special-Status Wildlife with a High Potential for Occurrence

Nesting Migratory Birds and Raptors

Migratory birds are protected under the MBTA of 1918 (16 U.S.C. 703-711). The MBTA makes it unlawful to take, possess, buy, sell, purchase, or barter any migratory bird listed under 50 CFR 10; this also includes feathers or other parts, nests, eggs, or products, except as allowed by implementing regulations (50 CFR 21). Additionally, Section 3503 of the California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. Section 3503.5 specifically states that it is unlawful to take, possess, or destroy any raptors (i.e., hawks, owls, eagles, and falcons), including their nests or eggs; and Section 3513 specifically states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA. Migratory birds and other birds of prey including have the potential to nest in trees, shrubs, structures (e.g., sheds), and bare ground within the Study Area.

Special-Status Wildlife with a Low Potential for Occurrence

Valley Elderberry Longhorn Beetle

Endemic to elderberry shrubs (*Sambucus* spp.) occurring in riparian habitat in the Sacramento and San Joaquin Valleys, riparian habitats in the Sacramento and San Joaquin Valleys, and less common

throughout riparian forests of the Central Valley from Redding to Fresno County (USFWS 2014) typically below 500 feet above MSL (USFWS 2017a). Typically, the beetles are found on elderberry shrubs within riparian plant communities. Some studies have found that multiple elderberry shrubs clumped together provide superior habitat for the beetle while isolated elderberry shrubs are less likely to support beetle populations. Typical plant species that co-occur with the elderberry shrubs include California sycamore (*Platanus racemosa*), willow, blackberry, and western poison oak (*Toxicodendron diversilobum*) (USFWS 1999, 2017a). Beetles require elderberry stems with at least one-inch diameter at ground level (dgl) in order for the larvae to utilize the stems (USFWS 1999). The valley elderberry longhorn beetle depends on elderberry shrubs for its entire lifecycle. Adults are typically active from March through May during the flowering period of the elderberry shrub. The female lays its eggs on the leaves and stems of the elderberry shrub. The larvae emerge within a few days and burrow into the elderberry stem. The larvae feed on the stem pith until they pupate. When the host shrub begins flowering, the pupa emerges from the stem as an adult (Barr 1991). There is one CNDDB record of valley elderberry longhorn beetle listed within five miles of the Study Area (CDFW 2020a), however the USFWS currently considers this species to occur at or below 500 feet above MSL (USFWS 2017a). Two blue elderberry (*Sambucus nigra* ssp. *caerulea*) occur within the riparian habitat within the western portion of the Study Area (Figure 3). No exit holes were observed. This species has a *low* potential to occur within the Study Area since habitat is limited to two small elderberry shrubs and the Study Area is currently outside of the accepted elevational range of the valley elderberry longhorn beetle as recognized by USFWS (USFWS 2017a).

Western Pond Turtle

Western pond turtles are found in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches with suitable basking sites (Jennings and Hayes 1994). Suitable aquatic habitat typically has a muddy or rocky bottom and has emergent aquatic vegetation for cover (Stebbins 2003). Western pond turtles nest and overwinter in areas of sparse vegetation comprised of grassland and forbs with less than ten percent slopes, less than 492 feet (150 meters) from aquatic habitat (Rosenberg et al. 2009). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2020a). The seasonal marsh area and intermittent drainage, and surrounding riparian habitat provide marginal aquatic habitat and the surrounding annual grassland provides upland habitat. During the survey on October 13, 2020 most of the features were dry and the Study Area is unlikely to provide year-round habitat for western pond turtle. This species was not observed within the Study Area during the biological surveys. This species has a *low* potential to occur within the Study Area and it is more likely to occur in larger creeks adjacent to but outside of the Study Area.

Coast Horned Lizard

Coast horned lizard inhabits open areas of sandy soil and low vegetation in valleys, foothills, and semiarid mountains from sea level to 8,000 feet above MSL. It is typically found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose soil. This species is often found in lowlands along sandy washes with scattered shrubs and along dirt roads, and frequently found near ant hills (Zeiner et al. 1988). There are two CNDDB records of this species within five miles of the Study Area (CDFW 2020a). The species was not observed within the Study Area during several biological surveys. The annual grassland within the Study Area provides marginal habitat for the coast horned lizard due to lack of sandy soils for this species to bury itself. The Study Area is also densely vegetated with annual grasses which makes movement for this species difficult. Therefore, this species has a *low* potential to occur within the Study Area.

Foothill Yellow-Legged Frog

The Foothill yellow-legged frog (FYLF) is a moderate-sized frog (1.5 to 3.5" long) found on the western slope of the Sierras and along the coast. It has vague dorsolateral folds, horizontal pupils, yellow coloring on the underside of its hind legs, and a granular skin texture that covers the eardrums of colors that harmonize with the surroundings. The FYLF is a stream or river frog of chaparral, forest, and woodland ecozones. This species breeds after the high-water flows subside, mid-March to early June. The FYLF resides in rocky streams and the associated riparian habitat. Metamorphosis generally occurs in three to four months and FYLF reach sexual maturity typically the first summer after they have metamorphosed. Breeding sites occur in shallow, slow flowing water with mostly pebble and/or cobble substrate. The introductions of bullfrogs and mosquitofish have led to declines in populations in California and Oregon. The intermittent drainage provides marginal habitat for this species and there is a nearby CNDDB recorded occurrence from 1972 located 3 miles north of the Study Area and documents a collected specimen (CDFW 2020a). CDFW considers this species extirpated in the Study Area and the surrounding area (CDFW 2020b). This species was not observed within the Study Area during the biological surveys. Therefore, this species has a *low* potential to occur within the Study Area.

Western Spadefoot

Western spadefoot occurs throughout the Central Valley and on the coast from Point Conception, south to the Mexican border. This species occurs from sea level up to 4,500 feet above MSL, in the southern Sierra foothills. Western spadefoot individuals are most commonly found in grassland habitats with temporary pools of water, but they have also been found in open chaparral and valley-foothill pine-oak woodlands (Stebbins 2003). This species spends most of the year underground, where members seek refuge from desiccating by constructing and residing in small burrows. This species often breeds in temporary pools and quiet streams between the months of January and May. There are no CNDDB records for this species within five miles of the Study Area (CDFW 2020a). The species was not observed within the Study Area during the biological surveys. The depressional seasonal wetlands provide low quality breeding habitat given that they do not likely hold water for long enough for the western spadefoot to breed. This species has a *low* potential for utilizing the annual grassland as upland aestivation given the limited aquatic habitat available within the Study Area for breeding.

Golden Eagle

Golden eagles live in semi-open habitats where they have easy access to their primary prey of small to medium-sized mammals. Grasslands, deserts, savannahs, and early successional stages of forest and shrub habitats provide necessary foraging habitat. Nests are placed on cliffs or large trees and are maintained year after year. Breeding occurs from January through August (Kochert et al. 2002). Golden eagle home range territories vary widely from 8 to 77 square miles (McGrady 1997) and are estimated to average 48 square miles in northern California (Zeiner et al. 1990). Breeding territories range from 8 to 21 square miles, or 3 to 5 miles surrounding the nest, but activity is often concentrated in a smaller core area. Although only one nest is used each year, a territory may contain multiple alternate nests. Typically, there are between 6 and 14 nests are found in a territory (Kochert et al. 2002). Golden eagles may use the same nest for multiple years or use new nest sites every year (Watson 2010).

There is one known occurrence for this species approximately two miles northwest of the Study Area (CDFW 2020a). This active nest was located in a foothill pine on a hillslope surrounded by oak woodland. Existing residences are located uphill within 300 feet of the nest on the north and east. Two juvenile and two adult golden eagles were observed at the nest in August 2013. A pair of adult eagles returned to the

nest in 2014 and successfully raised one eaglet, which fledged by June 18, 2014. However, the nest tree fell over during a storm in November 2014. A golden eagle nest was subsequently identified in a foothill pine approximately 2.5 miles northwest of the Study Area on March 6, 2015. The new nest occurred within a foothill pine on a hillslope surrounded by oak woodland, approximately 25 feet from a residential dwelling. This foothill pine died in late 2015. The eagles relocated to another foothill pine downhill from their first nest location in 2016, and this nest was not active in 2017. Per unprocessed CNDDB records, the nest was active in 2019 and 2020 with nestlings and shows that the territory remains active (CDFW 2020a).

No golden eagles were observed during the biological surveys of the Study Area. Although the Study Area is unlikely to provide suitable nest trees, the annual grassland provides suitable foraging habitat for this species. Therefore, this species has a *low* potential to occur within the Study Area.

Tricolored Blackbird

The tricolored blackbird is a colonial species that occurs in pastures, dry seasonal pools, and agricultural fields in the Central Valley and the surrounding foothills. This species usually nests within dense cattails (*Typha* sp.) or tules (*Scirpus* sp.) in emergent wetlands. Tricolored blackbird also nests in thickets of blackberry (*Rubus* sp.), wild rose (*Rosa* sp.), willows, and tall herbs (Zeiner et al. 1990). Nesting locations typically must be large enough to support a minimum colony of approximately fifty pairs (Zeiner et al. 1990). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2020a). The seasonal marsh and surrounding riparian habitat is unlikely to provide suitable nesting habitat for this since the marsh is not large enough to support nesting colonies. The annual grassland provides suitable foraging habitat for this species. This species was not observed during the biological surveys of the Study Area. This species has a *low* potential to occur within the Study Area.

American Badger

American badgers are found in dry, open habitats including grassland and open woodland. Suitable burrowing habitat requires dry, sandy soil. Breeding occurs in summer and early fall, with young being born from March to April. There is a nearby CNDDB recorded occurrence from 2015 located 4.9 miles northwest of the Study Area and documents an individual badger killed on the road (CDFW 2020a). CDFW considers this species to be extant (CDFW 2020a), however there are no other nearby records of this species near the Study Area. The annual grassland provides habitat for this species, however, burrows from this species or excavations were not observed during the biological surveys and no American badgers were observed during the biological surveys. This species has a *low* potential to occur within the Study Area.

Special-Status Bats

California is home to several special-status bat species, including pallid bat (*Antrozous pallidus*) and silver-haired bat (*Lasionycteris noctivagans*). Bat numbers are in decline throughout the U.S. due to loss of roosting habitat, habitat conversion, and habitat alteration. There are no CNDDB records for bats within five miles of the Study Area (CDFW 2020a). No bats were observed roosting or foraging during the biological surveys. However, the riparian habitat and isolated trees within the annual grassland provide roosting habitat for these species. Special-status bats have a *low* potential to roost within the Study Area.

4.5 SENSITIVE HABITATS

Sensitive habitats include those that are of special concern to resource agencies or those that are protected under CEQA, Section 1600 of the California Fish and Game Code, and/or Sections 401 and 404 of the Clean Water Act. Additionally, sensitive habitats are protected under the specific policies outlined in the *El Dorado County General Plan*. Sensitive habitats known to occur onsite are seep-spring, seasonal wetlands, seasonal marsh within the ordinary high water mark of an intermittent drainage, ephemeral and intermittent drainages, riparian woodland, oak woodlands, and purple needlegrass grassland Figure 3.

4.5.1 Potential Jurisdictional Waters of the U.S. and State

Potential jurisdictional waters of the U.S. and State located in the Study Area were delineated in 2020 by HELIX (HELIX 2020a). A total of approximately 0.740 acre of aquatic resources were delineated within the Study Area. This acreage includes 0.133 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainage, and 0.360 acre of intermittent drainage. To date the USACE has verified the acreage in the northern portion of the Study Area, but not within the southern portion of the Study Area.

4.5.2 Riparian Habitat

A total of 0.77 acre of riparian habitat is located in the Study Area along the northwestern ephemeral drainage. Riparian areas, defined as the outermost bank or the edge of riparian vegetation, whichever is greater, may be subject CDFW jurisdiction under Section 1602 of the Fish and Game Code. Additionally, CDFW may exert jurisdiction over the drainages and other riverine aquatic features. CDFW should be consulted prior to disturbance or development to determine whether issuance of a Section 1602 Lake or Streambed Alteration Agreement is required.

4.5.3 Oak Trees and Oak Woodland

A total of 13 protected oak trees protected under Policy 7.4.5.2, consisting of eleven valley oaks (*Quercus lobata*), one interior live oak (*Quercus wislizeni*), and one blue oak (*Quercus douglasii*) are present in the Study Area (HELIX 2020b). Oak woodland habitat and individual oak trees are currently regulated under Section 7.4.4.4 of the *El Dorado County General Plan* based on canopy coverage. The Study Area is within the area covered by the *El Dorado Hills Specific Plan*, which generally describes preservation criteria for oak trees within designated open space areas.

4.5.4 Purple Needlegrass

Approximately 0.29 acre of purple needlegrass is interspersed within the annual grassland community within the Study Area. Purple needlegrass grassland is listed as a sensitive plant community on the CDFW Natural Communities List and is required to be considered in CEQA documents. In order for purple needlegrass grassland to be considered a natural community, at least five percent of the species is required as a characteristic to dominant species in the herbaceous layer and the species is usually greater than 10 percent relative cover of the herbaceous layer. These small mapped areas contain greater than 10 percent relative cover within the herbaceous layer (Figure 3). However, the small acreage dominated by purple needlegrass is contained within the larger annual grassland community and therefore is not considered a sensitive habitat due to its extremely limited distribution.

4.5.5 Wildlife Migration Corridors

Wildlife corridors link areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. This fragmentation of habitat can also occur when a portion of one or more habitats is converted into another habitat; for instance, when woodland or scrub habitat is altered or converted into grasslands after a disturbance such as fire, mudslide, or construction activities. Wildlife corridors mitigate the effects of this fragmentation by: (1) allowing animals to move between remaining habitats thereby permitting depleted populations to be replenished and promoting genetic exchange; (2) providing escape routes from fire, predators, and human disturbances, thus reducing the risk of catastrophic events (such as fire or disease) on population or local species extinction; and (3) serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs. There are no wildlife migration corridors within the Study Area.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Known or potential biological constraints in the Study Area include the following:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for coast horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. (seasonal wetlands, seep, wetland swale, and ephemeral and intermittent drainages), riparian habitat, and valley oak woodland.

5.1 RECOMMENDATIONS

5.1.1 Special-Status Plant Species

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. No special-status plants were documented to occur within the Study Area. However, construction has not commenced within two years of the 2015 botanical inventories, therefore additional botanical inventories are recommended to ensure that populations have not established in the intervening years, in accordance with CDFW's plant protocols. In the event that focused surveys for special-status plants continue to be negative, no further measures are recommended. In the event that special-status plant species are found within the Study Area and they cannot be avoided by construction, a qualified botanist should prepare an avoidance and mitigation plan detailing protection and avoidance measures, transplanting procedures, success criteria, and long-term monitoring protocols for impacted plants. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for special-status plants.

5.1.2 Valley Elderberry longhorn Beetle

Although no VELB were observed, there is a low potential for VELB to be present in the Study Area due to two blue elderberry shrubs present within southern portion of the Study Area. However, under current guidance from the USFWS (USFWS 2017a), this species is not expected to be found above 500 feet in elevation. The elevation of the Study Area ranges from approximately 705 to 795 feet above MSL. Therefore, it is unlikely that this species would utilize the Study Area. In addition, the shrubs onsite showed no sign of exit holes. The 2017 guidance recommends consulting with the USFWS under these conditions. Based on the findings, it would be expected that the USFWS would determine that the Project would unlikely to affect VELB. However, if the USFWS were to find that the Project may affect VELB, the Project may be required to implement appropriate mitigation for impacts to elderberry shrubs within the Study Area which may include purchase of mitigation credits and transplantation of affected elderberry shrubs to an approved mitigation site.

5.1.3 Western Pond Turtle

The seasonal marsh habitat embedded within the intermittent drainage and surrounding uplands within the Study Area may be suitable habitat for western pond turtle and they are known to occur in the vicinity. Filling of these features could impact this species, if present. In addition, vegetation clearing and grading within the surrounding uplands could impact this species, if present.

A pre-construction survey for western pond turtle should be conducted within 14 days of the initiation of construction by a qualified biologist prior to any construction activity that would directly impact pond or stream habitat or disturb the ground within 300 feet of aquatic habitat. If no western pond turtles are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey or halts for more than 14 days a new survey should be conducted prior to reinitiating construction.

If western pond turtles are found during the pre-construction survey, then a qualified biological monitor should be onsite during initial clearing and grading within 300 feet of suitable aquatic habitat. The biological monitor will relocate any western pond turtles found within the construction footprint to suitable habitat away from the construction zone, but within the vicinity of the Study Area, if required.

In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the western pond turtle.

5.1.4 Coast Horned Lizard

The non-native annual grassland within the Study Area provides a low potential for coast horned lizard to occur given the lack of sandy soil. However, given that there is some potential for this species to occur within the Study Area, a pre-construction survey for coast horned lizard is recommended within 14 days prior to the start of ground disturbance. If no coast horned lizards are observed, then no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey or halts for more than 14 days, a new survey is recommended.

If coast horned lizards are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any coast horned lizards found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.1.5 Foothill Yellow-Legged Frog

The intermittent drainage and surrounding uplands within the Study Area provide marginal potential habitat for foothill yellow-legged frog. A qualified biologist should conduct a pre-construction survey of the drainages and uplands within 150 feet for foothill yellow-legged frog within 14 days prior to commencement of construction activities. If no foothill yellow-legged frog are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any foothill yellow-legged frog are found, agency consultation would be required to determine additional avoidance measures that might be required including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any foothill yellow-legged frog found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.1.6 Western Spadefoot

The annual grassland within the Study Area provides a low potential for upland aestivation habitat and the seasonal wetlands provide low quality breeding habitat for western spadefoot. A qualified biologist should conduct a pre-construction survey for western spadefoot within 14 days prior to commencement of construction activities. If no western spadefoot are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any western spadefoot are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of

construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any western spadefoot found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.1.7 Golden Eagle

Although the Study Area is unlikely to provide suitable nesting habitat for this species, the annual grassland provides suitable foraging habitat for golden eagle. A map identifying suitable foraging habitat for golden eagle within a three-mile radius of the last known location of the nest, which includes the Study Area, is provided in Figure 4. There are over 3,900 acres of potential foraging habitat surrounding the nest, based on an assessment of current aerial photographs. The project will result in the removal of 27.71 acres of annual grassland. The removal of approximately 0.71 percent of foraging habitat would have no impact on this species. Therefore, no additional measures are recommended.

5.1.8 Tricolored Blackbird

Although the Study Area does not provide suitable nesting areas for a tricolored blackbird colony, the annual grassland provides suitable foraging habitat. There are currently no requirements for conservation or mitigation for tricolored blackbird foraging habitat. Therefore, no additional measures are recommended.

5.1.9 Burrowing Owl

Although burrowing owl has a low potential to occur within the annual grassland, given the lack of suitable burrows and that they were not observed during the protocol-level breeding and non-breeding season surveys (Foothill Associates 2016b) or any other biological surveys conducted within the Study Area, they are not currently considered to be present. However, the species could occupy the Study Area in the future. Therefore, the project proponent should conduct a take avoidance survey within 30 days prior to commencement of construction, in accordance with the 2012 *California Department of Fish and Wildlife Staff Report on Burrowing Owl Mitigation* (2012 Staff Report) (CDFW 2012). The survey area includes an approximately 500-foot (150-meter) buffer around the Study Area, where access is permitted. If the surveys are negative, then no additional measures are recommended.

If burrows are observed within 500 feet of the Study Area, an impact assessment should be prepared and submitted to CDFW, in accordance with the 2012 Staff Report. If it is determined that project activities may result in impacts to nesting, occupied, and satellite burrows and/or burrowing owl habitat, the project proponent should consult with CDFW and develop a detailed mitigation plan such that the habitat acreage, number of burrows, and burrowing owls impacted are replaced. The mitigation plan should be based on the requirements set forth in Appendix A of the 2012 Staff Report.

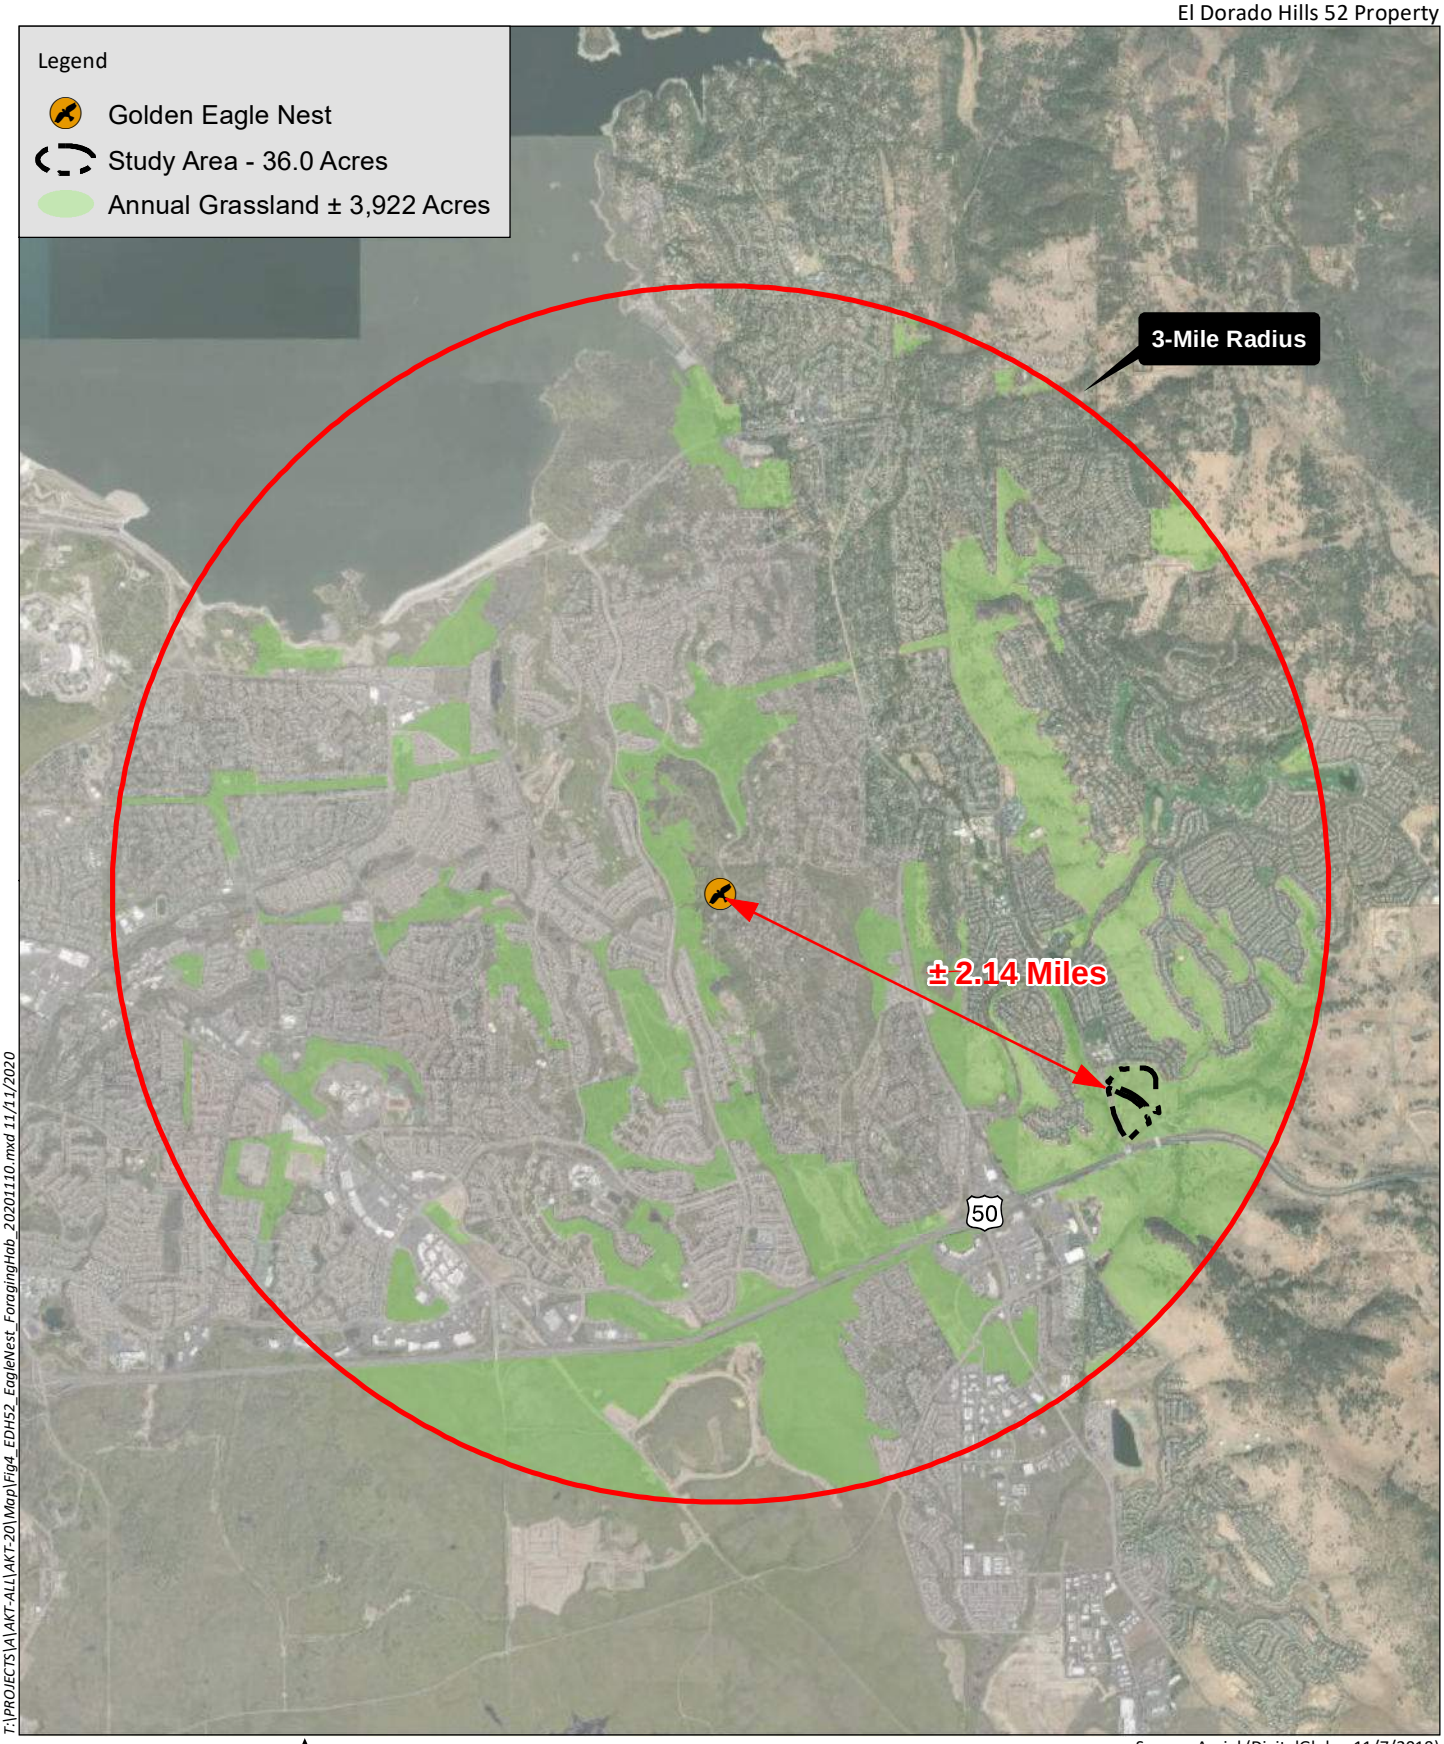
5.1.10 Nesting Migratory Birds and Raptors

Several species of raptors and other migratory birds may forage and nest in the Study Area, including the special-status species white-tailed kite, Cooper's hawk, golden eagle, ferruginous hawk, merlin, grasshopper sparrow, and purple martin. Active nests are protected by the California Fish and Game Code Section 3503.5 and the MBTA. Construction activities could result in disturbance of nest sites through temporary increases in ambient noise levels and increased human activity. In addition,

vegetation clearing operations, including pruning or removal of trees and shrubs, could impact nesting birds if these activities occur during the nesting season (February 15 to August 31). All vegetation clearing including removal of trees and shrubs should be completed between September 1 to February 14, if feasible.

If vegetation removal and grading activities begin during the nesting season (February 1 to August 31), a qualified biologist should conduct a pre-construction survey of the project footprint for active nests. Additionally, the surrounding 500 feet should be surveyed for active raptor nests where accessible. The pre-construction survey should be conducted within 14 days prior to commencement of ground-disturbing activities. If the pre-construction survey shows that there is no evidence of active nests, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If nests are found and considered to be active, the project biologist should establish buffer zones to prohibit construction activities and minimize nest disturbance until the young have successfully fledged. Buffer width will depend on the species in question, surrounding existing disturbances, and specific site characteristics, but may range from 20 feet for some songbirds to 250 feet for most raptors. If active nests are found within any trees slated for removal, then an appropriate buffer should be established around the trees and the trees should not be removed until a biologist determines that the nestlings have successfully fledged. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the active avian nests. If construction activities are proposed to begin during the non-breeding season (September 1 through January 31), a survey is not required and no further studies are necessary.



5.1.11 American Badger

The annual grassland provides habitat for American badger. A qualified biologist should conduct a pre-construction survey for American badger within 14 days prior to the start of ground disturbance. If no American badgers are observed, then a letter report documenting the results of the survey should be provided to the project proponent for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If American badgers or their dens are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of temporarily halting construction activities until the biologist determines that the badger has left the construction footprint on its own accord.

5.1.12 Special-Status Bat Species

The existing riparian and oak woodlands provide potential roosting habitat for various bat species that occur in the vicinity of the Study Area. Removal of trees could impact bats should they be roosting in areas proposed for removal.

HELIX Environmental Planning

Annual Grassland for Golden Eagle Foraging Habitat Within the Vicinity of the Study Area

Figure 4

A qualified biologist should conduct a preconstruction survey within 14 days prior to clearing or grading operations and removal of trees. If no bats are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If special-status bat species are present and roosting on or within 100 feet of the Study Area, then the biologist should establish an appropriate buffer around the roost site. At minimum, no trees should be removed until the biologist has determined that the bat is no longer roosting in the tree. Additional mitigation measures for bat species, such as installation of bat boxes or alternate roost structures, would be recommended only if special-status bat species are found to be roosting within the project area. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for various bat species.

5.1.13 Jurisdictional Waters

Since proposed construction activities will impact aquatic resources within the Study Area, a Section 404 permit should be obtained from the USACE and a Section 401 water quality certification and/or WDRs should be obtained from the RWQCB prior to the start of construction for any impacts to waters of the U.S. or State. Any waters of the U.S. or State or jurisdictional wetlands that would be lost or disturbed should be replaced or rehabilitated on a "no-net-loss" basis in accordance with the agency mitigation guidelines. Habitat restoration, rehabilitation, and/or replacement should be at a location and by methods agreeable to the agencies.

Water quality concerns during construction would be addressed through the preparation of a Storm Water Pollution Prevention Plan (SWPPP). SWPPPs are required in issuance of a NPDES construction discharge permit by the U.S. Environmental Protection Agency. Implementation of Best Management Practices (BMPs) during construction is standard in most SWPPPs. Examples of BMPs include stockpiling of debris away from regulated wetlands and waterways; immediate removal of debris piles from the site during the rainy season; use of silt fencing and construction fencing around regulated waterways; and use of drip pans under work vehicles and containment of fuel waste throughout the site during construction. If authorization for project-related activities within federally jurisdictional aquatic resources is required, Section 401 water quality certification from the Regional Water Quality Control Board would be required to certify compliance with State standards for maintaining water quality objectives. Alternately, WDRs are issued by the State Water Resources Control Board for activities impacting waters of the State.

The onsite drainages and associated riparian areas are likely subject to CDFW jurisdiction. Therefore, the project proponent should prepare a streambed alteration notification for submittal to CDFW documenting impacts to CDFW jurisdictional features (see Section 5.1.15).

5.1.14 Oak Trees and Oak Woodland

The Project would result in the removal of 11 protected oak trees. To mitigate for the biological resources impact associated with the loss of oak woodlands associated with the project, a combination of avoidance, protection, onsite replacement, where feasible, and offsite preservation or creation of oak woodland habitat is recommended. An Oak Resources Technical Report was prepared by HELIX in November of 2020 (HELIX 2020b). In that report, it was assumed that in lieu fees will be paid to

El Dorado County to offset project-related impacts to oak woodland and individual oak trees. Tree protection measures should be implemented around trees to remain in the Study Area as detailed in the project's Oak Resources Technical Report (HELIX 2020b).

5.1.15 Riparian Habitats

Riparian habitat and drainages within the Study Area are likely subject to CDFW jurisdiction. It is recommended that a Streambed Alteration Agreement application be submitted to CDFW, pursuant to Section 1600 of the Fish and Game Code, for any activities affecting the bed, bank or associated riparian vegetation of the onsite drainages. If required, the project applicant should coordinate with CDFW in developing appropriate mitigation, and should abide by the conditions of any executed permits.

5.2 SUMMARY OF AVOIDANCE AND MINIMIZATION MEASURES

Implementation of the following measures prior to development is recommended to minimize impacts to biological resources within the Study Area:

- Obtain a Section 404 Clean Water Act Permit, 401 Water Quality Certification or WDRs, and SAA for impacts to jurisdictional aquatic features and associated riparian habitat prior to the start of construction;
- Conduct updated focused botanical surveys for potentially occurring special-status plants;
- Conduct clearing and tree and shrub removal operations between September 1 and January 31 if feasible to minimize potential impacts to nesting birds;
- If construction begins during the nesting season (February 1 to August 31) conduct a pre-construction survey for active bird nests within the Study Area;
- Conduct a take avoidance survey for burrowing owl within 30 days prior to commencement of construction activities, in accordance with the 2012 Staff Report;
- Within 14 days prior to the initiation of construction activities, conduct a pre-construction survey for coast horned lizard, foothill yellow-legged frog, western pond turtle, American badger, and special-status bat species; and
- Implement the tree avoidance, maintenance, and mitigation measures as described in the Oak Resources Technical Report (HELIX 2020b).

Appendix A

Applicable Sections of the El Dorado County General Plan

This page intentionally left blank

El Dorado County General Plan

Conservation and Protection of Water Resources

GOAL 7.3: WATER QUALITY AND QUANTITY
Conserve, enhance, and manage water resources and protect their quality from degradation.

OBJECTIVE 7.3.1: WATER RESOURCE PROTECTION
Preserve and protect the supply and quality of the County's water resources including the protection of critical watersheds, riparian zones, and aquifers.

Policy 7.3.1.1 Encourage the use of Best Management Practices, as identified by the Soil Conservation Service, in watershed lands as a means to prevent erosion, siltation, and flooding.

Policy 7.3.1.2 Establish water conservation programs that include both drought tolerant landscaping and efficient building design requirements as well as incentives for the conservation and wise use of water.

Policy 7.3.1.3 The County shall develop the criteria and draft an ordinance to allow and encourage the use of domestic gray water for landscape irrigation purposes. (See Title 22 of the State Water Code and the Graywater Regulations of the Uniform Plumbing Code).

OBJECTIVE 7.3.2: WATER QUALITY
Maintenance of and, where possible, improvement of the quality of underground and surface water.

Policy 7.3.2.1 Stream and lake embankments shall be protected from erosion, and streams and lakes shall be protected from excessive turbidity.

Policy 7.3.2.2 Projects requiring a grading permit shall have an erosion control program approved, where necessary.

Policy 7.3.2.3 Where practical and when warranted by the size of the project, parking lot storm drainage shall include facilities to separate oils and salts from storm water in accordance with the recommendations of the Storm Water Quality Task Force's California Storm Water Best Management Practices Handbooks (1993).

Policy 7.3.2.4 The County should evaluate feasible alternatives to the use of salt for ice control on County roads.

Policy 7.3.2.5 As a means to improve the water quality affecting the County's recreational waters, enhanced and increased detailed analytical water quality studies and

monitoring should be implemented to identify and reduce point and non-point pollutants and contaminants. Where such studies or monitoring reports have identified sources of pollution, the County shall propose means to prevent, control, or treat identified pollutants and contaminants.

OBJECTIVE 7.3.3: WETLANDS

Protection of natural and man-made wetlands, vernal pools, wet meadows, and riparian areas from impacts related to development for their importance to wildlife habitat, water purification, scenic values, and unique and sensitive plant life.

Policy 7.3.3.1 *For projects that would result in the discharge of material to or that may affect the function and value of river, stream, lake, pond, or wetland features, the application shall include a delineation of all such features. For wetlands, the delineation shall be conducted using the U.S. Army Corps of Engineers (USACE) Wetland Delineation Manual*

Policy 7.3.3.2 *Intentionally blank*

Policy 7.3.3.3 *The County shall develop a database of important surface water features, including lake, river, stream, pond, and wetland resources.*

Policy 7.3.3.4 *The Zoning Ordinance shall be amended to provide buffers and special setbacks for the protection of riparian areas and wetlands. The County shall encourage the incorporation of protected areas into conservation easements or natural resource protection areas.*

Exceptions to riparian and wetland buffer and setback requirements shall be provided to permit necessary road and bridge repair and construction, trail construction, and other recreational access structures such as docks and piers, or where such buffers deny reasonable use of the property, but only when appropriate mitigation measures and Best Management Practices are incorporated into the project. Exceptions shall also be provided for horticultural and grazing activities on agriculturally zoned lands that utilize "best management practices (BMPs)" as recommended by the County Agricultural Commission and adopted by the Board of Supervisors.

Until standards for buffers and special setbacks are established in the Zoning Ordinance, the County shall apply a minimum setback of 100 feet from all perennial streams, rivers, lakes, and 50 feet from intermittent streams and wetlands. These interim standards may be modified in a particular instance if more detailed information relating to slope, soil stability, vegetation, habitat, or other site- or project-specific conditions supplied as part of the review for a specific project demonstrates that a different setback is necessary or would be sufficient to protect the particular riparian area at issue.

For projects where the County allows an exception to wetland and riparian buffers, development in or immediately adjacent to such features shall be planned so that impacts on the resources are minimized. If avoidance and minimization are not feasible, the County shall make findings, based on documentation provided by the project proponent, that avoidance and minimization are infeasible.

Policy 7.3.3.5 *Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.*

OBJECTIVE 7.3.4: DRAINAGE
Protection and utilization of natural drainage patterns.

Policy 7.3.4.1 *Natural watercourses shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site without disturbance.*

Policy 7.3.4.2 *Modification of natural stream beds and flow shall be regulated to ensure that adequate mitigation measures are utilized.*

OBJECTIVE 7.3.5: WATER CONSERVATION
Conservation of water resources, encouragement of water conservation, and construction of wastewater disposal systems designed to reclaim and re-use treated wastewater on agricultural crops and for other irrigation and wildlife enhancement projects.

Policy 7.3.5.1 *Drought-tolerant plant species, where feasible, shall be used for landscaping of commercial development. Where the use of drought-tolerant native plant species is feasible, they should be used instead of non-native plant species.*

Policy 7.3.5.2 *A list of appropriate local indigenous drought tolerant plant materials shall be maintained by the County Planning Department and made available to the public.*

Policy 7.3.5.3 *The County Parks and Recreation Division shall use drought tolerant landscaping for all new parks and park improvement projects.*

Policy 7.3.5.4 *Require efficient water conveyance systems in new construction. Establish a program of ongoing conversion of open ditch systems shall be considered for conversion to closed conduits, reclaimed water supplies, or both, as circumstances permit.*

Policy 7.3.5.5 *Encourage water reuse programs to conserve raw or potable water supplies consistent with State Law.*

Conservation of Biological Resources

GOAL 7.4: WILDLIFE AND VEGETATION RESOURCES
Identify, conserve, and manage wildlife, wildlife habitat, fisheries, and vegetation resources of significant biological, ecological, and recreational value.

OBJECTIVE 7.4.1: RARE, THREATENED, AND ENDANGERED SPECIES
The County shall protect State and federally recognized rare, threatened, or endangered species and their habitats consistent with Federal and State laws.

Policy 7.4.1.1 *The County shall continue to provide for the permanent protection of the eight sensitive plant species known as the Pine Hill endemics and their habitat through the establishment and management of ecological preserves consistent with County Code Chapter 17.71 and the USFWS's Gabbro Soil Plants for the Central Sierra Nevada Foothills Recovery Plan (USFWS 2002).*

Policy 7.4.1.2 *Private land for preserve sites will be purchased only from willing sellers.*

Policy 7.4.1.3 *Limit land uses within established preserve areas to activities deemed compatible. Such uses may include passive recreation, research and scientific study, and education. In conjunction with use as passive recreational areas, develop a rare plant educational and interpretive program.*

Policy 7.4.1.4 *Proposed rare, threatened, or endangered species preserves, as approved by the County Board of Supervisors, shall be designated Ecological Preserve (-EP) overlay on the General Plan land use map.*

Policy 7.4.1.5 *Species, habitat, and natural community preservation/conservation strategies shall be prepared to protect special-status plant and animal species and natural communities and habitats when discretionary development is proposed on lands with such resources unless it is determined that those resources exist, and either are or can be protected, on public lands or private Natural Resource lands.*

Policy 7.4.1.6 *All development projects involving discretionary review shall be designed to avoid disturbance or fragmentation of important habitats to the extent reasonably feasible. Where avoidance is not possible, the development shall be required to fully mitigate the effects of important habitat loss and fragmentation. Mitigation shall be defined in the Integrated Natural Resources Management Plan (INRMP) (see Policy 7.4.2.8 and Implementation Measure CO-M).*

The County Agricultural Commission, Plant and Wildlife Technical Advisory Committee, representatives of the agricultural community, academia, and other

stakeholders shall be involved and consulted in defining the important habitats of the County and in the creation and implementation of the INRMP.

Policy 7.4.1.7 The County shall continue to support the Noxious Weed Management Group in its efforts to reduce and eliminate noxious weed infestations to protect native habitats and to reduce fire hazards.

OBJECTIVE 7.4.2: IDENTIFY AND PROTECT RESOURCES
Identification and protection, where feasible, of critical fish and wildlife habitat including deer winter, summer, and fawning ranges; deer migration routes; stream and river riparian habitat; lake shore habitat; fish spawning areas; wetlands; wildlife corridors; and diverse wildlife habitat.

Policy 7.4.2.1 To the extent feasible in light of other General Plan policies and to the extent permitted by State law, the County of El Dorado will protect identified critical fish and wildlife habitat, as identified on the Important Biological Resources Map maintained at the Planning Department, through any of the following techniques: utilization of open space, Natural Resource land use designation, clustering, large lot design, setbacks, etc.

Policy 7.4.2.2 Where critical wildlife areas and migration corridors are identified during review of projects; the County shall protect the resources from degradation by requiring all portions of the Site that contain or influence said areas to be retained as non-disturbed natural areas through mandatory clustered development on suitable portions of the Site or other means such as density transfers if clustering cannot be achieved. The setback distance for designated or protected migration corridors shall be determined as part of the project's environmental analysis. The intent and emphasis of the Open Space land use designation and of the non-disturbance policy is to ensure continued viability of contiguous or interdependent habitat areas and the preservation of all movement corridors between related habitats. The intent of mandatory clustering is to provide a mechanism for natural resource protection while allowing appropriate development of private property. Horticultural and grazing projects on agriculturally designated lands are exempt from the restrictions placed on disturbance of natural areas when utilizing "Best Management Practices" (BMPs) recommended by the County Agricultural Commission and adopted by the Board of Supervisors when not subject to Policy 7.1.2.7.

Policy 7.4.2.3 Consistent with Policy 9.1.3.1 of the Parks and Recreation Element, low impact uses such as trails and linear parks may be provided within river and stream buffers if all applicable mitigation measures are incorporated into the design.

Policy 7.4.2.4 Establish and manage wildlife habitat corridors within public parks and natural resource protection areas to allow for wildlife use. Recreational uses within these areas shall be limited to those activities that do not require grading or vegetation removal.

Policy 7.4.2.5 Setbacks from all rivers, streams, and lakes shall be included in the Zoning Ordinance for all ministerial and discretionary development projects.

Policy 7.4.2.6 El Dorado County Biological Community Conservation Plans shall be required to protect, to the extent feasible, rare, threatened, and endangered plant species only when existing federal or State plans for non-jurisdictional areas do not provide adequate protection.

Policy 7.4.2.7 The County shall form a Plant and Wildlife Technical Advisory Committee to advise the Planning Commission and Board of Supervisors on plant and wildlife issues, and the committee should be formed of local experts, including agricultural, fire protection, and forestry representatives, who will consult with other experts with special expertise on various plant and wildlife issues, including representatives of regulatory agencies. The Committee shall formulate objectives which will be reviewed by the Planning Commission and Board of Supervisors.

Policy 7.4.2.8 Develop within five years and implement an Integrated Natural Resources Management Plan (INRMP) that identifies important habitat in the County and establishes a program for effective habitat preservation and management. The INRMP shall include the following components:

A. Habitat Inventory. This part of the INRMP shall inventory and map the following important habitats in El Dorado County:

1. *Habitats that support special-status species;*
2. *Aquatic environments including streams, rivers, and lakes;*
3. *Wetland and riparian habitat;*
4. *Important habitat for migratory deer herds; and*
5. *Large expanses of native vegetation.*

The County should update the inventory every three years to identify the amount of important habitat protected, by habitat type, through County programs and the amount of important habitat removed because of new development during that period. The inventory and mapping effort shall be developed with the assistance of the Plant and Wildlife Technical Advisory Committee, CDFW, and USFWS. The

inventory shall be maintained and updated by the County Planning Department and shall be publicly accessible.

B. *Habitat Protection Strategy. This component shall describe a strategy for protecting important habitats based on coordinated land acquisitions (see item D below) and management of acquired land. The goal of the strategy shall be to conserve and restore contiguous blocks of important habitat to offset the effects of increased habitat loss and fragmentation elsewhere in the county. The Habitat Protection Strategy should be updated at least once every five years based on the results of the habitat monitoring program (item F below). Consideration of wildlife movement will be given by the County on all future 4- and 6-lane roadway construction projects. When feasible, natural undercrossings along proposed roadway alignments that could be utilized by terrestrial wildlife for movement will be preserved and enhanced.*

C. *Mitigation Assistance. This part of the INRMP shall establish a program to facilitate mitigation of impacts to biological resources resulting from projects approved by the County that are unable to avoid impacts on important habitats. The program may include development of mitigation banks, maintenance of lists of potential mitigation options, and incentives for developers and landowner participation in the habitat acquisition and management components of the INRMP.*

D. *Habitat Acquisition. Based on the Habitat Protection Strategy and in coordination with the Mitigation Assistance program, the INRMP shall include a program for identifying habitat acquisition opportunities involving willing sellers. Acquisition may be by state or federal land management agencies, private land trusts or mitigation banks, the County, or other public or private organizations. Lands may be acquired in fee or protected through acquisition of a conservation easement designed to protect the core habitat values of the land while allowing other uses by the fee owner. The program should identify opportunities for partnerships between the County and other organizations for habitat acquisition and management. In evaluating proposed acquisitions, consideration will be given to site specific features (e.g., condition and threats to habitat, presence of special-status species), transaction related features (e.g., level of protection gained, time frame for purchase completion, relative costs), and regional considerations (e.g., connectivity with adjacent protected lands and important habitat, achieves multiple agency and community benefits). Parcels that include important habitat and are located generally to the west of the El Dorado National Forest should be given priority for acquisition. Priority will also be given to parcels that would preserve natural wildlife movement corridors such as*

crossing under major roadways (e.g., U.S. Highway 50 and across canyons). All land acquired shall be added to the Ecological Preserve overlay area.

E. *Habitat Management. Each property or easement acquired through the INRMP should be evaluated to determine whether the biological resources would benefit from restoration or management actions. Examples of the many types of restoration or management actions that could be undertaken to improve current habitat conditions include: removal of non-native plant species, planting native species, repair and rehabilitation of severely grazed riparian and upland habitats, removal of culverts and other structures that impede movement by native fishes, construction of roadway under and overcrossing that would facilitate movement by terrestrial wildlife, and installation of erosion control measures on land adjacent to sensitive wetland and riparian habitat.*

F. *Monitoring. The INRMP shall include a habitat monitoring program that covers all areas under the Ecological Preserve overlay together with all lands acquired as part of the INRMP. Monitoring results shall be incorporated into future County planning efforts so as to more effectively conserve and restore important habitats. The results of all special-status species monitoring shall be reported to the CNDDB. Monitoring results shall be compiled into an annual report to be presented to the Board of Supervisors.*

G. *Public Participation. The INRMP shall be developed with and include provisions for public participation and informal consultation with local, state, and federal agencies having jurisdiction over natural resources within the County.*

H. *Funding. The County shall develop a conservation fund to ensure adequate funding of the INRMP, including habitat maintenance and restoration. Funding may be provided from grants, mitigation fees, and the County general fund. The INRMP annual report described under item F above shall include information on current funding levels and shall project anticipated funding needs and anticipated and potential funding sources for the following five years.*

Policy 7.4.2.9 *The Important Biological Corridor (-IBC) overlay shall apply to lands identified as having high wildlife habitat values because of extent, habitat function, connectivity, and other factors. Lands located within the overlay district shall be subject to the following provisions except that where the overlay is applied to lands that are also subject to the Agricultural District (-A) overlay or that are within the Agricultural Lands (AL) designation, the land use restrictions associated with the -IBC policies will not apply to the extent that the agricultural practices do not interfere with the purposes of the -IBC overlay.*

- *Increased minimum parcel size;*
- *Higher canopy-retention standards and/or different mitigation standards/thresholds for oak woodlands;*
- *Lower thresholds for grading permits;*
- *Higher wetlands/riparian retention standards and/or more stringent mitigation requirements for wetland/riparian habitat loss;*
- *Increased riparian corridor and wetland setbacks;*
- *Greater protection for rare plants (e.g., no disturbance at all or disturbance only as recommended by U.S. Fish and Wildlife Service/California Department of Fish and Wildlife);*
- *Standards for retention of contiguous areas/large expanses of other (non-oak or non-sensitive) plant communities;*
- *Building permits discretionary or some other type of "site review" to ensure that canopy is retained;*
- *More stringent standards for lot coverage, floor area ratio (FAR), and building height; and*
- *No hindrances to wildlife movement (e.g., no fences that would restrict wildlife movement).*

The standards listed above shall be included in the Zoning Ordinance.

Wildland Fire Safe measures are exempt from this policy, except that Fire Safe measures will be designed insofar as possible to be consistent with the objectives of the Important Biological Corridor.

OBJECTIVE 7.4.3: COORDINATION WITH APPROPRIATE AGENCIES
Coordination of wildlife and vegetation protection programs with appropriate federal and State agencies.

OBJECTIVE 7.4.5: NATIVE VEGETATION AND LANDMARK TREES
Protect and maintain native trees including oaks and landmark and heritage trees.

Policy 7.4.5.1 A tree survey, preservation, and replacement plan shall be required to be filed with the County prior to issuance of a grading permit for discretionary permits on all high-density residential, multifamily residential, commercial, and industrial projects. To ensure that proposed replacement trees survive, a mitigation monitoring plan should be incorporated into discretionary projects when applicable and shall include provisions for necessary replacement of trees.

Policy 7.4.5.2 It shall be the policy of the County to preserve native oaks wherever feasible, through the review of all proposed development activities where such trees are present on either public or private property, while at the same time recognizing individual rights to develop private property in a reasonable manner. To ensure that oak tree loss is reduced to reasonable acceptable levels, the County shall develop and implement an Oak Tree Preservation Ordinance that includes the following components:

A. Oak Tree Removal Permit Process. Except under special exemptions, a tree removal permit shall be required by the County for removal of any native oak tree with a single main trunk of at least 6 inches diameter at breast height (dbh), or a multiple trunk with an aggregate of at least 10 inches dbh. Special exemptions when a tree removal permit is not needed shall include removal of trees less than 36 inches dbh on 1) lands in Williamson Act Contracts, Farmland Security Zone Programs, Timber Production Zones, Agricultural Districts, designated Agricultural Land (AL), and actions pursuant to a Fire Safe plan; 2) all single family residential lots of one acre or less that cannot be further subdivided; 3) when a native oak tree is cut down on the owner's property for the owner's personal use; and 4) when written approval has been received from the County Planning Department. In passing judgment upon tree removal permit applications, the County may impose such reasonable conditions of approval as are necessary to protect the health of existing oak trees, the public and the surrounding property, or sensitive habitats. The County Planning Department may condition any removal of native oaks upon the replacement of trees in kind. The replacement requirement shall be calculated based upon an inch for inch replacement of removed oaks. The total of replacement trees shall have a combined diameter of the tree(s) removed. Replacement trees may be planted onsite or in other areas to the satisfaction of the County Planning Department. The County may also condition any tree removal permit that would affect sensitive habitat (e.g., valley oak woodland), on preparation of a Biological Resources Study and an Important Habitat Mitigation Program as described in Policy 7.4.1.6. If an application is denied, the County shall provide written notification, including the reasons for denial, to the applicant.

B. Tree Removal Associated with Discretionary Project. Any person desiring to remove a native oak shall provide the County with the following as part of the project application:

- *A written statement by the applicant or an arborist stating the justification for the development activity, identifying how trees in the vicinity of the project or construction site will be protected and stating*

that all construction activity will follow approved preservation methods;

- *A site map plan that identifies all native oaks on the project site; and*
- *A report by a certified arborist that provides specific information for all native oak trees on the project site.*

C. *Commercial Firewood Cutting. Fuel wood production is considered commercial when a party cuts firewood for sale or profit. An oak tree removal permit shall be required for commercial firewood cutting of any native oak tree. In reviewing a permit application, the Planning Department shall consider the following:*

- *Whether the trees to be removed would have a significant negative environmental impact;*
- *Whether the proposed removal would not result in clear-cutting, but will result in thinning or stand improvement;*
- *Whether replanting would be necessary to ensure adequate regeneration;*
- *Whether the removal would create the potential for soil erosion;*
- *Whether any other limitations or conditions should be imposed in accordance with sound tree management practices; and*
- *What the extent of the resulting canopy cover would be.*

D. *Penalties. Fines will be issued to any person, firm, or corporation that is not exempt from the ordinance who damages or destroys an oak tree without first obtaining an oak tree removal permit. Fines may be as high as three times the current market value of replacement trees as well as the cost of replacement, and/or replacement of up to three times the number of trees required by the ordinance. If oak trees are removed without a tree removal permit, the County Planning Department may choose to deny or defer approval of any application for development of that property for a period of up to 5 years. All monies received for replacement of illegally removed or damaged trees shall be deposited in the County's Integrated Natural Resources Management Plan (INRMP) conservation fund.*

Preservation of Open Space

GOAL 7.6: OPEN SPACE CONSERVATION

Conserve open space land for the continuation of the County's rural character, commercial agriculture, forestry and other productive uses, the enjoyment of scenic beauty and recreation, the protection of natural resources, for protection from natural hazards, and for wildlife habitat.

OBJECTIVE 7.6.1: IMPORTANCE OF OPEN SPACE

Consideration of open space as an important factor in the County's quality of life.

Policy 7.6.1.1 *The General Plan land use map shall include an Open Space land use designation. The purpose of this designation is to implement the goals and objectives of the Land Use and the Conservation and Open Space Elements by serving one or more of the purposes stated below. In addition, the designations on the land use map for Rural Residential and Natural Resource areas are also intended to implement said goals and objectives. Primary purposes of open space include:*

A. Conserving natural resource areas required for the conservation of plant and animal life including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, banks of rivers and streams and watershed lands;

B. Conserving natural resource lands for the managed production of resources including forest products, rangeland, agricultural lands important to the production of food and fiber; and areas containing important mineral deposits;

C. Maintaining areas of importance for outdoor recreation including areas of outstanding scenic, historic and cultural value; areas particularly suited for park and recreation purposes including those providing access to lake shores, beaches and rivers and streams; and areas which serve as links between major recreation and open space reservations including utility easements, banks of rivers and streams, trails and scenic highway corridors;

D. Delineating open space for public health and safety including, but not limited to, areas which require special management or regulation because of hazardous or special conditions such as earthquake fault zones, unstable soil areas, flood plains, watersheds, areas presenting high fire risks, areas required for the protection of water quality and water reservoirs, and areas required for the protection and enhancement of air quality; and

E. Providing for open spaces to create buffers which may be landscaped to minimize the adverse impact of one land use on another.

Policy 7.6.1.2 *The County will provide for Open Space lands through:*

A. The designation of land as Open Space;

B. The designation of land for low-intensity land uses as provided in the Rural Residential and Natural Resource land use designations;

C. *Local implementation of the Federal Emergency Management Agency's National Flood Insurance Program;*

D. *Local implementation of the State Land Conservation Act Program; and*

E. *Open space land set aside through Planned Developments (PDs).*

Policy 7.6.1.3 The County shall implement Policy 7.6.1.1 through zoning regulations and the administration thereof. It is intended that certain districts and certain requirements in zoning regulations carry out the purposes set forth in Policy 7.6.1.1 as follows:

A. *The Open Space (OS) Zoning District is consistent with and shall implement the Open Space designation of the General Plan land use map and all other land use designations.*

B. *The Agricultural (A), Exclusive Agricultural (AE), Planned Agricultural (PA), Select Agricultural (SA-10), and Timberland Production Zone (TPZ) zoning districts are consistent with Policy 7.6.1.1 and serve one or more of the purposes set forth therein.*

C. *Zoning regulations shall provide for setbacks from all flood plains, streams, lakes, rivers and canals to maintain Purposes A, B, C, and D set forth in Policy 7.6.1.1.*

D. *Zoning regulations shall provide for maintenance of permanent open space in residential, commercial, industrial, agricultural, and residential agricultural zone districts based on standards established in those provisions of the County Code. The regulations shall minimize impacts on wetlands, flood plains, streams, lakes, rivers, canals, and slopes in excess of 30 percent and shall maintain Purposes A, B, C, and D in Policy 7.6.1.1.*

E. *Landscaping requirements in zoning regulations shall provide for vegetative buffers between incompatible land uses in order to maintain Purpose E in Policy 7.6.1.1.*

F. *Zoning regulations shall provide for Mineral Resource Combining Zone Districts and/or other appropriate mineral zoning categories which shall be applied to lands found to contain important mineral deposits if development of the resource can occur in compliance with all other policies of the General Plan. Those regulations shall maintain Purposes A, B, C, D, and E of Policy 7.6.1.1.*

Policy 7.6.1.4 The creation of new open space areas, including Ecological Preserves, common areas of new subdivisions, and recreational areas, shall include wildfire safety planning.

El Dorado Hills Specific Plan

1.4.1.1 Site Development and Grading

The policies set forth in the Specific Plan are intended to maintain, to the maximum extent possible, the natural land forms and to exercise control over vegetation removal, landscaping, and grading. Grading controls are intended to reduce soil erosion to a minimum to ensure capability with adjacent terrain.

a) *Grading for roadways, driveways, building pads, and onsite improvements shall be minimized.*

b) *Grading volumes of cut-and-fill material shall be minimized and balanced onsite wherever possible. Larger grading volumes may be acceptable where improved visual and environmental effects would result.*

c) *Residential structures or accessory structures on slopes in access of 20 percent shall be carefully designed through use of erosion controls, engineered grading, and use of post and beam or step-footing construction to ensure long-term slope stability. Benched hillsides for building sites shall be avoided and split-level structures encouraged.*

d) *A plan to minimize impact to oak trees shall be submitted to the El Dorado County Community Development Department prior to approval of any tentative map. The plan will include, at a minimum, the locations and sizes of individual trees that should not be impacted.*

e) *A minimum of 20 percent of all roadside trees and parking lot trees shall be native oaks.*

f) *Removal of oak trees and other large native trees with trunk circumferences of 25 inches at 4.5 feet above grade shall be avoided where feasible. A tree replacement policy is provided in the Design Guidelines on file with the County of El Dorado.*

g) *To avoid damage to root systems of retained trees, residential construction shall not occur within the canopy area of oak trees over 30 inches in circumference at breast height, and shall be subject to review as provided in the Design Guidelines.*

h) *Landscaping in improved common areas shall be of drought-resistant varieties.*

i) *To preserve the vegetative character of the Plan Area, the planting of native trees, shrubs, and ground cover shall be encouraged in all new landscaping.*

j) *Landscaping in areas adjacent to natural open spaces shall be fire resistant.*

k) *Site design, building orientation, and street and lot patterns shall follow solar orientation principles to the maximum extent practicable to maximize energy conservation.*

l) Archaeological test excavations for selected locations within the Plan Area shall be required as a condition of approval of tentative subdivision maps.

m) As part of the tentative map approval, areas having expansive clays and seasonably wet areas shall be identified by a geotechnical engineer. Such areas, if deemed to be potential construction hazards, shall be subject to further evaluation and identification to determine appropriate mitigation measures.

n) To the maximum extent feasible, development shall be sited and designed to avoid impacts to culturally significant sties identified by the Final EIR for the Plan Area as EDH-26 and EDH-29.

o) Where feasible, and given the physical constraints of the Plan Area, subdivisions and other new development shall be designed to facilitate solar use as a means of reducing total energy consumption. The design elements that shall be considered include:

- *Solar orientation*
- *Shade Control*
- *Wind Management*
- *Solar access*

p) The Design Guidelines shall be one of the implementation measures of the Specific Plan.

1.4.1.2 Development Near Native Oak Trees

These guidelines are for the protection of healthy oak trees that will remain after construction in developed areas. The term circumference is breast height (CBH) refers to the trunk measurement of either one trunk or the addition of all trunks in a multi-trunked tree. The respective measure in circumference would also apply. Also refer to **Section 3.10** for Oak Tree Preservation Guidelines.

a) Protect all oak trees larger than 25 inches CBH o the maximum extent feasible. Priority will be given to oaks larger than 56 inches CBH.

b) Trees to be saved will be surrounded by a barrier or fence installed at the dripline and flagged.

c) Pruning of limbs will be confined to low-hanging branches over roads and sidewalks, and large branches that are weak or may reasonably appear to pose a safety hazard. Pruning paint will not be used under any circumstances. Pruning cuts will be made cleanly to avoid damaged to the "bark ridge" tissue of adjacent limbs.

d) The El Dorado County Planning Department will be responsible for enforcement of oak tree protection during construction.

e) In development areas, no oak trees larger than 25 inches CBH will be removed until a site survey and inspection report is performed.

1.4.1.5 Vegetation and Fire Hazards

In areas of planned development:

a) All potentially dry herbaceous vegetation will be mowed or disked within a 50-foot radius of all construction site activity.

b) Disking or mowing will be done to keep herbaceous vegetation under 3 inches in height at all construction sites.

c) No construction equipment or vehicles will be allowed within 50 feet of the unmowed perimeter.

d) Firebreaks will be installed by disking or mowing a trail that is satisfactory to the El Dorado Hills Fire Development. Mowing is preferred to disking or scraping because the latter two practices promote invasion of noxious weed species on fire trails.

e) Temporary or permanent firebreaks will be installed on all ridgelines, crossing all areas in the vicinity of construction and grading activity, prior to beginning work.

f) Firebreak installation will avoid the removal of native oaks and other native trees.

1.4.8 Natural Open Space Policies

The Natural Open Space Policies are to guide the preservation, management, and maintenance of these areas in relation to adjacent land uses.

1.4.8.1 General Policies

a) The boundaries of natural open space shall blend with the boundaries of the development as to enhance the integration of open space and developed areas.

b) Perimeter fencing may be permitted for rural parcels as provided in the El Dorado County Design Guidelines and CC&Rs.

c) Increased runoff from adjacent development will require erosion control measures to be coordinated with landscape design of adjacent development areas. Emphasis shall be placed on methods that rely on natural drainage systems and minimize change to the existing condition of creek channels within open space areas.

d) An Open Space Management Plan shall be completed and submitted to the El Dorado County Community Development Department prior to approval of any tentative map creating open space. It shall be an implementation mechanism of the Specific Plan in order to set forth procedures and responsibilities as to the ownership, preservation, and management of public and private natural open space areas. The Open Space Management Plan shall consider dedication to the County of El Dorado of easements

over the public open space areas, should dedication of fee ownership of these areas be made to any other entity. The open space plan shall be reviewed by the El Dorado Hills Fire Department. The plan shall also include, at a minimum:

1. *The locations of fire access roads, fuel breaks, and passive recreation trails.*
2. *Control burning techniques.*
3. *Guidelines established in the Open Space Guidelines for El Dorado County*
4. *Investigation of opportunities for wildlife use of water in open space areas as a part of ongoing wildlife maintenance.*

1.4.8.2 Riparian and Other Drainageway Policies

A 200-foot-wide undeveloped buffer zone shall be established along Carson Creek in accordance with California Department of Fish and Wildlife requirements. In this buffer, vegetation removal shall be for the purpose of drainage improvements. In consideration of setback reductions for purposes of a gold course, the County shall consider such mitigation measures as additional plantings, erosion controls, and other habitat improvement and protection steps.

a) *Drainageway easements shall specifically preclude erection of structures and vegetation removal, except for drainage improvements, and shall forestall other site development not consistent with the purpose of these areas.*

b) *Drainageways located on privately owned property shall be placed within recorded easements that provide for routine maintenance and pedestrian access.*

c) *A 100-foot-wide buffer (50 feet horizontal on each side as measured from centerline of the creek) of natural vegetation shall be maintained along all intermittent creeks.*

d) *Grazing shall not be allowed in riparian buffer zones.*

e) *Plantings of riparian trees and shrubs shall be situated according to the flood and soil moisture tolerances of individual species as in Appendix C of the Specific Plan.*

f) *Areas disturbed during construction shall be replanted with native riparian species listed in Appendix C of the Specific Plan. Replanting will include a mandatory 3-year maintenance and irrigation period.*

g) *Riparian vegetation on the golf course areas shall be kept naturally dense and unpruned except where needed for crossings, ball pay passages, and personal and fire safety.*

h) *Pedestrian, vehicular, and utility bridges over creeks, if feasible, will be oriented at right angles to the waterway to minimize loss of vegetation.*

i) The capacity of flow under bridges and culverts will be designed to reduce the need for extensive vegetation clearing near the structures.

j) Periodic vegetation removal to ensure adequate floodway capacity in drainages will be performed to promote an overstory of mature individual riparian trees spaced to accommodate designed flows.

El Dorado Hills Community Services District Policies

5.27 Oak Tree Preservation

5.27.3 General Requirements for Development Activity in the Protected Zone of Protected Trees

The importance of oak tree preservation is recognized with tree protection provisions in the Covenants, Conditions, and Restrictions (CC&Rs) of the most units in El Dorado Hills and in County Code 17.73 titled Oak Woodland Conservation prior to initiating any activity that may affect an oak tree on their land or on that of an adjoining property, owners of property in El Dorado Hills should check their CC&Rs carefully to determine whether Design Review Committee (DRC) approval is required.

5.27.4 Removal of Protected Trees

It shall be the policy of the DRC to preserve protected trees wherever feasible while recognizing individual rights to develop private property in a reasonable manner. It shall be the responsibility of the applicant to demonstrate the need for any oak tree removal. In determining whether to approval the removal or major trimming of a protected tree, the DRC will consider the following listed factors and, depending upon particular circumstances, may consider others which are not listed:

a) The degree to which the tree will be an obstacle to approval development activity.

b) The condition of the tree with respect to disease, general health, damage, danger of falling.

c) The effect removal would have upon safety, public health, remaining trees, and the beauty and general welfare of the area.

d) The effect removal would have upon soil stability, erosion, particularly near water courses and on slopes.

e) Present and future shade effect with respect to cooling and solar power/heating.

f) Whether or not there are feasible alternative measures to removal.

g) Applicants may be required to provide an arborist report from an arborist who would not be performing any eventual tree removal or major limbing. Alternatively, and it is discretion the DRC may employ an arborist of its choice.

5.27.5 Protecting Oak Trees During Development Activity

Property owners are responsible for taking the following measures to protect oak trees, except any approval from removal during development activity.

a) *Erect protective orange "ski fencing" around the protected zone of each protected tree or group of trees within 50 feet of development activity prior to initiating work and excluded from the enclosed protected zone any work related activity such as storage and vehicle parking.*

b) *Exert every reasonable effort to preserve undisturbed the natural ground within protected zones.*

c) *If it is absolutely necessary to trench within a protected zone, if boring or drilling would not be feasible, excavate by hand under the supervision of a certified arborist. Do not cut any root larger than two inches in diameter; keep the exposed root moist and cover with soil as quickly as feasible. Sever small roots neatly, trim and cover quickly.*

d) *Make no grade changed within the protected zone unless specifically indicated in the approved plans.*

5.27.6 Mitigation EDHCSD Tree Preservation Fund, Public Education

In the event the owner of property with protected trees removed or significantly damages one or more of them without approval, the DRC, at its discretion, may require mitigation by planting a proportionate number of diameter inches of replacement oak trees on the owner's property or by assessing a fee at the rate of $200 per diameter inch (amount tripled for unapproved removal of a landmark tree) to compensate for the expense of planting a proportionate number of diameter inches of oak trees on public property or by a combination of these alternatives.

In the event the owner of the property with protection trees applies for approval of a protect that will damage protected trees, and the DRC determines they could be reasonably be preserved, the DRC, at its sole discretion, may offer the applicant the option of an approval in exchange for on-site mitigation or payment of a mitigation fee based upon the number of diameter inches that applicant would remove.

Mitigation fees paid by property owners are held by the EDHCSD in a Tree Preservation Fund until used to cover the expense of mitigation planting or for related purposes. It is widely recognized that the loss of oak tree is partly the result of the lack of public awareness on oak preservation. A portion of the funds collected for mitigation may be used to establish and promote educational programs to improve this situation.

Regionally Occurring Listed and Special-Status Species

This page intentionally left blank

Appendix B
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Plants			
Allium jepsonii Jepson's onion	--/--/1B.2	A perennial bulbiferous herb found in serpentinite or volcanic soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms April – August (CNPS 2020).	**None. S**uitable serpentinite and volcanic soils are absent from the Study Area.
Allium sanbornii var. *sanbornii* Jepson's onion	--/--/4.2	A perennial bulbiferous herb found in serpentinite and gravelly soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms May – September (CNPS 2020).	**None.** Suitable serpentinite soils are absent from the Study Area.
Balsamorhiza macrolepis big-scale balsamroot	--/--/1B.2	A perennial herb found on slopes in chaparral, cismontane woodland, and valley and foothill grassland, sometimes in serpentine soil. Elevation range 45 – 1,555 meters. Blooms March – June (CNPS 2020).	**None.** Annual grassland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in April, May and June of 2015.
Brodiaea rosea ssp. *vallicola* valley broadiaea	--/--/4.2	A perennial bulbiferous herb found in old alluvial terraces, silty, sandy, and gravelly loam soils and occurs in swales of valley and foothill grassland and vernal pools. Blooms April – May (June) (CNPS 2020).	**None.** Suitable soils and vernal pools are absent from the Study Area.
Calandrinia breweri Brewer's calandrinia	--/--/4.2	An annual herb found in sandy or loamy, disturbed sites of burns and occurs in chaparral and coastal scrub. Blooms (January) March – June (CNPS 2020).	**None.** Suitable habitat is absent from the Study Area.
Calystegia stebbinsii Stebbin's morning-glory	FE/SE/1B.1	A perennial rhizomatous herb found in gabbroic or serpentinite soils and occurs in chaparral openings and cismontane woodland. Blooms April – July (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Carex xerophila chaparral sedge	--/--/1B.2	A perennial herb found in gabbroic and serpentinite soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms March – June (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.
Ceanothus fresnensis Fresno ceanothus	--/--/4.3	A perennial evergreen shrub that occurs in openings of cismontane woodland and lower montane coniferous forest. Blooms May – July (CNPS 2020).	**None.** The Study Area occurs outside of the known elevation range for this species.
Ceanothus roderickii Pine Hill ceanothus	FE/--/1B.1	A perennial evergreen shrub found in serpentinite or nutrient-deficient forms of gabbro-derived soils characterized by low concentrations of available K, P, S, Fe, and Zn. Occurs in chaparral and cismontane woodland. Blooms April – June (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area. Additionally, this species would have been identifiable during the survey if it were present since it is an evergreen shrub.
Chlorogalum grandiflorum Red Hills soaproot	--/--/1B.2	A perennial bulbiferous herb found in serpentinite, gabbroic, and other soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms May – June (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.
Clarkia biloba ssp. *brandegeeae* Brandegee's clarkia	--/--/4	Annual herb found often in roadcuts within chaparral, cismontane woodland, and lower montane coniferous forest from 75 to 915 meters.	**Low.** The woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Claytonia parviflora ssp. *grandiflora* streambank spring beauty	--/--/4.2	An annual herb found in rocky soils and occurs in cismontane woodland. Blooms February – May (CNPS 2020).	**None.** The Study Area does not provide habitat for this species and is outside of the known elevational range.
Crocanthemum suffrutescens Bisbee Peak rush-rose	--/--/3.2	Perennial evergreen shrub often found on gabbroic or lone soil and often in burned or disturbed areas within chaparral from 75 to 670 meters.	**None.** Suitable Ione or gabbroic soils are absent from the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Downingia pusilla dwarf downingia	--/--/-2B.2	An annual herb that occurs in mesic valley and foothill grassland and vernal pools. Blooms March – May (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however, this species was not observed during botanical surveys which were conducted during the blooming period for this species in April, May and June of 2015.
Erigeron miser starved daisy	--/--/1B.3	A perennial herb found on rocky soils in upper montane coniferous forest from 1,840 – 2,620 meters elevation. Blooms June – October (CNPS 2020)	**None**. There is no suitable habitat in upper montane coniferous forest and the Study Area is below the elevational range of this species.
Eriophyllum jepsonii Jepson's woolly sunflower	--/--/4.3	A perennial herb found sometimes in serpentinite soils and occurs in chaparral, cismontane woodland and coastal scrub. Blooms April – June (CNPS 2020).	**None.** Suitable habitat is absent from the Study Area.
Eryngium pinnatisectum Tuolumne button-celery	--/--/1B.2	An annual/perennial herb found in vernal pools in cismontane woodland and lower montane coniferous forest from 70 – 915 meters elevation. Blooms May – August (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in May and June of 2015.
Fremontodendron decumbens Pine Hill flannelbush	FE/--/1B.2	A perennial evergreen shrub found in rocky gabbroic or serpentinite soils and occurs in chaparral and cismontane woodland. Blooms April – July (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area. Additionally, this species would have been identifiable during the survey if it were present since it is an evergreen shrub.
Galium californicum ssp. *sierrae* El Dorado bedstraw	FE/--/1B.2	A perennial herb found in gabbroic and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms May – June (CNPS 2020).	**None. S**uitable gabbroic soils are absent from the Study Area. Additionally, this species would have been identifiable during the survey if it were present since it is an evergreen shrub.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Gratiola heterosepala Bogg's Lake hedge-hyssop	--/--/1B.2	Annual herb found on clay soils in vernal pools and along the lake margins of marshes and swamps from 10 to 2,375 meters. Blooms April – August (CNPS 2020).	**None.** There are no vernal pools within the Study Area.
Horkelia parryi Parry's horkelia	--/--/1B.2	A perennial herb found in chaparral and cismontane woodland on Ione formation soils and other soils from 80 – 1,070 meters elevation. Blooms April – September (CNPS 2020).	**None. S**uitable Ione formation soil is absent from the Study Area.
Juncus leiospermus var*. ahartii* Ahart's dwarf rush	--/--/1B.2	An annual herb found in vernal pools in the eastern Sacramento Valley from 30 – 229 meters elevation. Blooms March – May (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in April and May of 2015.
Legenere limosa legenere	--/--/1B.1	An annual herb found in vernal pools from 1 – 880 meters elevation. Blooms April – June (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in April and May of 2015.
Lilium humboldtii ssp*. humboldtii* Humboldt lily	--/--/4.2	A perennial bulbiferous herb that occurs in the openings of chaparral, cismontane woodland, and lower montane coniferous forest. Blooms May – July (August) (CNPS 2020).	**Low.** The woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Navarretia myserii ssp. *myserii* pincushion navarretia	--/--/1B.1	An annual herb found often in acidic soils and occurs in vernal pools. Blooms April – May (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in April and May of 2015.
Orcuttia tenuis slender Orcutt grass	FT/SE/1B.1	An annual herb found in vernal pools from 35 – 1,760 meters elevation. Blooms May to October (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however, this species was not observed during botanical surveys which were conducted during the blooming period for this species in May and June of 2015.
Orcuttia viscida Sacramento Orcutt grass	FE/SE/1B.1	An annual herb that occurs in vernal pools. Blooms April – July (September) (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however, this species was not observed during botanical surveys which were conducted during the blooming period for this species in April, May and June of 2015.
Packera layneae Layne's ragwort	FT-/--/1B.2	A perennial herb found in rocky gabbroic or serpentinite soils and occurs in chaparral and cismontane woodland. Blooms April – August (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.
Sagittaria sanfordii Sanford's arrowhead	--/--/1B.2	An emergent perennial rhizomatous herb that occurs in assorted freshwater marshes and swamps. Blooms May – October (November) (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however, this species was not observed during botanical surveys which were conducted during the blooming period for this species in May and June of 2015.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Trichostema rubisepalum Hernandez bluecurls	--/--/4.3	An annual herb found in volcanic or serpentinite, and gravelly soils and occurs in broadleafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, and vernal pools. Blooms June – August (CNPS 2020).	**None.** Suitable volcanic and serpentinite soils are absent from the Study Area.
Wyethia reticulata El Dorado County mule ears	--/--/1B.2	A perennial herb found in clay or gabbroic soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms April – August (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.
Animals			
Invertebrates			
Bombus occidentalis western bumble bee	--/CE/--	Bumble bees are primitively eusocial insects that live in underground colonies made up of one queen, female workers, and reproductive members of the colony. New colonies are initiated by solitary queens, generally in the early spring, which typically occupy abandoned rodent burrows (Thorp et al. 1983). This species is a generalist forager and have been reported visiting a wide variety of flowering plants. A short-tongued bumble bee; select food plants include *Melilotus* spp., Cirsium spp., *Trifolium* spp., *Centaurea* spp., *Eriogonum* spp., and *Chrysothamnus* spp. (Koch et al. 2012). This species has a short tongue and typically prefers open flowers with short corollas but is known to chew through the base of flowers with long corollas. The flight period for queens in California is from early February to late November, peaking in late June and late September. New queens hibernate over the winter and initiate a new colony the following spring (Thorp et al. 1983). Rare throughout its range and in decline west of the Sierra Nevada crest.	**None.** Habitat is present for western bumble bee and some select food plants are present on site, such as clover. However, this species is currently rare across its range and in California it is currently limited to high elevation meadows in the Sierra Nevada and small coastal populations (CDFW 2020).

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Branchinecta lynchi vernal pool fairy shrimp	FT/--/--	The range of the vernal pool fairy shrimp (VPFS) within California includes the Central Valley and southern California. (USFWS 2005). Populations are known from Stillwater Plain in Shasta County through most of the length of the Central Valley to Pixley in Tulare County (additional disjunct populations exist at various locations throughout state). VPFS occurs mostly in vernal pools, however it is also found in a variety of both natural and artificial wetland habitats, such as alkali pools, ephemeral drainages, stock ponds, roadside ditches, vernal swales, and rock outcrop pools (USFWS 2005). Occupied wetlands are typically small (ranging from 0.1 to 0.05 acres in size), and pond for a relatively short duration (3-4 weeks) (Eriksen and Belk 1999). Soil types associated with VPFS vary greatly with geography and influence the ecology of the species. This fairy shrimp occurs in pools with 48 to 481 ppm salinity, and pH from 6.3 to 8.5 (Eriksen and Belk 1999).	**None.** There are no vernal pools within the Study Area.
Desmocerus californicus californicus valley elderberry longhorn beetle	FT/--/--	Endemic to elderberry shrubs (*Sambucus* spp.) occurring in riparian habitat in the Sacramento and San Joaquin Valleys, riparian habitats in the Sacramento and San Joaquin Valleys, and less common throughout riparian forests of the Central Valley from Redding to Fresno County (USFWS 2014) typically below 152 m amsl (USFWS 2017a).	**Low.** There are elderberry shrubs within the Study Area, however all elderberry shrubs were less than one inch as measured at the base of the shrub. At least one larger elderberry shrub observed on site during the October 13, 2020 site visit was observed to be dead. Additionally, elderberry shrubs are isolated and not a part of riparian habitat and the Study Area is outside of the current recognized elevational range of the species.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Lepidurus packardi vernal pool tadpole shrimp	FE/--/--	The vernal pool tadpole shrimp (VPTS) occurs within the Central Valley of California and in the San Francisco Bay area (USFWS 2005), with the majority of the populations occurring in the Sacramento Valley. Vernal pools may range in size from small, clear, and well-vegetated to highly turbid, alkali scald pools to large winter lakes ranging in size from 54 square feet to 89 acres (USFWS 2005), containing clear- to highly-turbid water. They may be seasonal or ephemeral and may exhibit a wide range of salinity levels. VPTS cysts (resting eggs) also must have the opportunity to dry out before they can hatch.	**None.** There are no vernal pools within the Study Area.
Fishes			
Hypomesus transpacificus Delta smelt	FT/SE/--	Delta smelt are tolerant of a wide salinity range. For a large part of their one-year life span, delta smelt live along the freshwater edge of the mixing zone (saltwater-freshwater interface). Shortly before spawning, adults migrate upstream from the brackish-water habitat associated with the mixing zone and disperse into river channels and tidally-influenced backwater sloughs. They spawn in shallow, fresh or slightly brackish water upstream of the mixing zone. Most spawning happens in tidally-influenced backwater sloughs and channel edgewaters. Although spawning has not been observed in the wild, the eggs are thought to attach to substrates such as cattails, tules, tree roots and submerged branches. Delta smelt are found only from Suisun Bay upstream through the Delta in Contra Costa, Sacramento, San Joaquin, Solano and Yolo counties (USFWS 1995).	**None.** There is no aquatic habitat within the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Oncorhynchus mykiss irideus pop. 11 Central Valley Steelhead DPS	FT/--/--	This distinct population segment includes all naturally spawned anadromous steelhead populations below natural and manmade impassable barriers in the Sacramento and San Joaquin Rivers and their tributaries, excluding steelhead from San Francisco and San Pablo Bays and their tributaries, as well as two artificial propagation programs: the Coleman NFH, and Feather River Hatchery steelhead hatchery programs (NMFS 2016). Steelhead spawn in rivers and streams with cool, clear, water and suitable silt free substrate (NMFS 2016).	**None.** There is no aquatic habitat within the Study Area.
Amphibians			
Ambystoma californiense California tiger salamander	FT/ST/--	Generally restricted to vernal pools and seasonal ponds, including many constructed stock ponds, in grassland and oak savannah plant communities from sea level to about 1,500 feet in central California. Adults spend the majority of their lives in upland areas surrounding suitable breeding ponds, in rodent burrows. Suitable breeding habitat must be present in combination with suitable upland habitat. In the Coastal region, populations are scattered from Sonoma County in the northern San Francisco Bay Area to Santa Barbara County, and in the Central Valley and Sierra Nevada foothills from Yolo to Kern counties (USFWS 2017b).	**None**. There are no vernal pools, seasonal ponds, or constructed stock ponds within the Study Area. The Study Area is outside of this species known range.
Rana boylii foothill yellow-legged frog	--/SE/SSC	The foothill yellow-legged frog occurs along the coast ranges from Oregon to Los Angeles and along the western side of the Sierra Nevada. This species uses perennial rocky streams in a wide variety of habitats up to 6,400 feet above msl. This species rarely ventures far from water, is usually found basking in the water, or under	**Low**. There is no breeding habitat within the Study Area, however perennial aquatic habitat could provide aquatic non-breeding habitat for this species. There is a nearby CNDDB recorded occurrence from 1972 located 3 miles north of the

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
		surface debris or underground within 165 feet of water. Eggs are laid in clusters attached to gravel or rocks along stream margins in flowing water. Tadpoles typically require up to four months to complete aquatic development. Breeding typically follows winter rainfall and snowmelt, which varies based upon location (Jennings and Hayes 1994).	Study Area and documents a collected specimen (CDFW 2020). CDFW considers this species extirpated in the Study Area and the surrounding area (CDFW 2020).
Rana draytonii California red-legged frog	FT/--/SSC	The California red-legged frog occupies a fairly distinct habitat, combining both specific aquatic and riparian components. The adults require dense, shrubby or emergent riparian vegetation closely associated with deep (greater than 2 1/3-foot deep) still or slow-moving water. The largest densities of California red-legged frogs are associated with deep-water pools with dense stands of overhanging willows (*Salix* spp.) and an intermixed fringe of cattails (*Typha latifolia*). Well-vegetated terrestrial areas within the riparian corridor may provide important sheltering habitat during winter. California red-legged frogs aestivate (enter a dormant state during summer or dry weather) in small mammal burrows and moist leaf litter. They have been found up to 100 feet from water in adjacent dense riparian vegetation. Studies have indicated that this species cannot inhabit water bodies that exceed 70° F, especially if there are no cool, deep portions (USFWS 2002).	**None.** There is no aquatic breeding habitat within the Study Area for this species. There is a nearby CNDDB recorded occurrence from 2005 located 3 miles north of the Study Area and documents an observation by a state biologist (CDFW 2020). CDFW considers this record to be of fair quality and the species to be extant (CDFW 2020), however there are no other nearby records of this species near the Study Area. No evidence of this species was observed during protocol breeding and non-breeding surveys (Foothill Associates 2016a).

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Spea hammondii western spadefoot	--/--/SSC	Amphibian that breeds in vernal pools and seasonal ponds or slow portions of streams in grasslands and woodlands. Adults spend most of their time in underground burrows in grasslands surrounding breeding pools (Jennings and Hayes 1994). Breeding is typically finished by the end of March. Tadpoles mature through late-spring and disperse as pools dry (Zeiner et al. 1990).	**Low.** There are no vernal pools, seasonal ponds, or streams within the Study Area that could provide breeding habitat for this species and the seasonal wetland habitats would be considered very marginal breeding habitat for this species.
Reptiles			
Actinemys marmorata western pond turtle	--/--/SSC	Inhabits slow-moving water with dense submerged vegetation, abundant basking sites, gently sloping banks, and dry clay or silt soils in nearby uplands. Turtles will lay eggs up to 0.25-mile from water, but typically go no more than 600 feet (Jennings and Hayes 1994).	**Low.** Aquatic habitat in the Study Area does not provide sufficient water for this species to occupy the Study Area year-round. All features were observed to be dry on October 13, 2020. This species could occur in streams adjacent to the Study Area.
Phrynosoma blainvillii Blainville horned lizard	--/--/SSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes in chaparral, cismontane woodland, coastal bluff scrub, coastal scrub, desert wash, pinyon and juniper woodlands, and riparian scrub and woodland (CDFW 2020).	**Low.** Suitable loose soil for burying is not present in the Study Area.
Thamnophis gigas giant garter snake	FT/ST/--	Endemic to the San Joaquin and Sacramento Valley floors. Inhabits agricultural wetlands and other waterways such as irrigation and drainage canals, sloughs, ponds, small lakes, low gradient streams, and adjacent uplands. Requires adequate water during its active season (early spring through mid-fall) to provide food and cover, emergent, herbaceous wetland vegetation for foraging and cover, grassy banks and openings in waterside vegetation for basking, and higher elevation uplands for cover and refuge from flood waters during its dormant	**None.** There is no suitable aquatic habitat within the Study Area and the Study Area is outside of the known range of this species.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
		season (winter). Inhabits small mammal burrows and other soil crevices with sunny exposure along south and west facing slopes, above prevailing flood elevations when dormant. Primarily found in marshes and sloughs as well as slow-moving creeks but absent from large rivers (USFWS 2017c).	
Birds			
Accipiter cooperii Cooper's hawk	--/--/WL	Found in cismontane woodland, riparian forest, riparian woodland, and upper montane coniferous forest.	**Low.** The woodlands on site provide potential nesting and foraging habitat.
Ammodramus savannarum grasshopper sparrow	--/--/SSC	Frequents dense, dry, or well drained grassland, especially native grassland. Nests at base of overhanging clump of grass.	**Low. T**he annual grassland habitat within the Study Area provides habitat for this species.
Agelaius tricolor tricolored blackbird	--/ST/SSC	Common locally throughout central California. Nests and seeks cover in emergent wetland vegetation and thorny vegetation such as Himalayan blackberry (*Rubus armeniacus*) as well as cattails and tules. Nesting area must be large enough to support a minimum colony of 50 pairs as they are a highly colonial species. Forages on ground in croplands, grassy fields, flooded land, and edges of ponds for insects (Shuford and Gardali 2008).	**Low. T**he riverine perennial marsh is not large enough to support breeding colonies, but colonies are recorded within 4 miles of the Study Area so the area may be used for foraging.
Ammodramus savannarum Grasshopper sparrow	--/--/SSC	Frequents dense, dry, or well drained grassland, especially native grassland. Nests at base of overhanging clump of grass.	**Low.** The annual grassland habitat within the Study Area provides habitat for this species.
Ardea alba Great egret	CSA (Nesting Colony)	Nests in colonies in large trees usually near water. Nesting colonies must be relatively isolated from human activities. Forages in shallow water in a variety of habitats.	**None.** There is no suitable nesting habitat in the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Ardea herodias Great blue heron	CSA (Nesting Colony)	Inhabits both freshwater and saltwater habitats and forages in grassland and agricultural field. Breeding colonies are located within 2 to 4 miles of feeding areas, often in isolated swamps or on islands, and near lakes and ponds bordered by forests.	**None. T**here is no suitable nesting habitat in the Study Area.
Aquila chrysaetos golden eagle	--/--/FP	Typically occurs in rolling foothills, mountain areas, deserts and other open habitats up to 3,822 m amsl. Typically nests on cliff ledges or large trees in open areas in canyons. Will occasionally use other tall structures for nesting, such as electrical transmission towers. Prey consists mostly of rodents, carrion, birds, reptiles and occasionally small livestock (Zeiner et al. 1990).	**Low.** There is no suitable nesting habitat within the Study Area. This species is known to nest and forage in nearby open spaces in the vicinity of the Study Area. Golden eagles typically require nesting locations with a commanding view of the surrounding terrain, which is not present in the Study Area. Nests documented in CNDDB in El Dorado Hills are placed in trees amongst residential areas in a similar situation to oak trees found in the Study Area. This species is unlikely to use the Study Area for nesting.
Athene cunicularia burrowing owl	--/--/SSC	Forages in grasslands, agricultural fields, and disturbed places where burrowing mammals are abundant with low and sparse vegetation. Nests in burrows, especially those of California ground squirrel, but will use other refuge sites (*Otospermophilus beecheyi*; Shuford and Gardali 2008). In the Central Valley of California, most foraging occurs within a 600-m radius of the nest (Gervais et al. 2003).	**Low. T**he annual grassland within the Study Area provides potential habitat for this species, however, few burrows that could be occupied by this species were observed and this species was not observed during the protocol level surveys conducted within the Study Area.
Buteo regalis ferruginous hawk	--/--/WL	Overwintering occurs in grasslands or deserts with abundant prey species (rabbits, pocket gophers, or prairie dogs). This species does not nest in California.	**Low. T**he annual grassland habitat within the Study Area provides foraging habitat for this species.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Buteo swainsoni Swainson's hawk	--/ST/--	Forages in grasslands, suitable grain or alfalfa fields, or livestock pastures adjacent to nesting habitat. Nests on large trees in open riparian habitat, scattered trees or small groves of trees in open areas (CDFW 1994).	**None.** The Study Area provides suitable nesting and foraging habitat within the Study Area. The Study Area is just outside the range of this species, which typically occurs further to the west of the Study Area.
Elanus leucurus white-tailed kite	--/--/FP	Raptor that inhabits rolling foothills and valley margins with scattered oaks, as well as river bottomlands or marshes next to deciduous woodland. Nests in isolated, dense-topped trees in open areas. Forages in a variety of habitats including grassland, marshes, and agricultural fields (Zeiner et al. 1990).	**High.** There is suitable nesting habitat riparian and oak woodland habitat in the Study Area. This species is known to forage in nearby open spaces in the vicinity of the Study Area and could occur nesting in or near the Study Area.
Falco columbarius merlin	--/--/WL	Winter in open and semi-open habitats that include estuaries, Great Basin grassland, and valley and foothill grasslands. This species does not nest in the region of the Study Area.	**Low. T**he annual grassland habitat within the Study Area provides foraging habitat for this species.
Haliaeetus leucocepahlus bald eagle	FD/SE/FP	Requires large bodies of water with an abundant fish population. Feeds on fish, carrion, small mammals, and water-fowl. Nests are usually located within a 1-mile radius of water. Nests are most often situated in large trees with a commanding view of the area (Zeiner et al. 1990).	**None.** There are no suitable nest trees in the Study Area that would support this species nesting. This species is well documented nesting in nearby Folsom Lake and Lake Natoma (CDFW).
Laterallus jamaicensis coturniculus California black rail	--/ST/FP	Inhabits brackish marsh, primarily in the upper marsh zone dominated by alkali heath (*Frankenia salina*), cattail, and rush (J*uncus* spp.); prefers lower salinity environments. In the Sierra Nevada foothills, black rail is a year-round resident along wetland edges where water is 1.2 inches or less (Richmond et al. 2010). Black rail is typically associated with perennial wetlands associated with flowing water such as irrigation canals, perennial streams and springs with dense	**None.** There is no suitable wetland habitat for breeding or foraging within the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
		vegetation in the Sierra Nevada foothills (Richmond et al. 2010). Forages on the ground, under cover of dense vegetation (Richmond et al. 2010).	
Pandion haliaetus osprey	--/--/WL	Found in a variety of habitats nearby water sources with abundant fish prey.	**None.** There are no suitable nest trees or structures in the Study Area that would support this species nesting.
Phalacrocorax auritus double-crested cormorant	--/--/WL	Breeds on ponds, lakes, artificial impoundments, slow-moving rivers, lagoons, estuaries, and open coastlines.	**None.** There is no suitable habitat for nesting within the Study Area.
Progne subis purple martin	--/--/SSC	Nests in cavities in open areas with low canopy cover at the height of the nest, near large bodies of water that support high densities of large insects. Martins use a variety of cavities including in bridges, large tree snags, and collapsed lava tubes. The species is very sensitive to competition from European starlings and is extirpated from most low-elevation areas by starlings (Shuford and Gardali 2008).	**None.** There is no suitable habitat for nesting within the Study Area.
Riparia riparia bank swallow	--/ST/--	Found primarily in riparian and lowland habitat in California. Nests in colonies along cliffs or steep river banks in holes. In California, a majority of the population is situated along the Sacramento River and the Feather River. Other smaller populations persist near Monterey and north of Shasta counties (Zeiner et al. 1990).	**None.** There are no steep banks or river habitat for nesting within the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Mammals			
Antrozous pallidus pallid bat	--/--/SSC	Occurs throughout California except for the high Sierra Nevada and the northern Coast Ranges. Habitats include grasslands, shrublands, woodlands, and forests from sea level to 6,000 feet. Most common in open, dry habitats with rocky areas for roosting; roosts also include cliffs, abandoned buildings, bird boxes, and under bridges (Bolster, ed. 1998).	**Low.** The trees within the riparian habitat and isolated trees within the annual grassland provide roosting habitat for this species.
Lasionycteris noctivagans Silver-haired bat	--/--/CSA	Forests near water. Roosts in hollow trees, snags, buildings, rock crevices, caves, and under bark. Forages in within 300 feet of home range over water and open brushy areas.	**Low.** There is marginal habitat in the woodlands for this species on the Study Area.
Pekania pennanti fisher – West Coast DPS	FE/ST/SSC	Occupy late-successional conifer and mixed conifer-hardwood forests with an abundance of downed wood, snags, large trees, and a dense canopy (Zielinski 2014). Typically found at elevations from 1,070 – 2,135 m amsl, where persistent snow does not accumulate and impede movement (Zielinski 2014). Riparian forests and habitat close to open water such as streams are important. Cavities and branches in trees, snags, stumps, rock piles, and downed timber are used as resting sites, and large diameter live, or dead trees are selected for natal and maternal dens (Zielinski 2014). There is a significant gap in the range of fisher between the southern Sierra Nevada population and the northern Sierra Nevada/southern Cascade population that stretches approximately 400 km wide (Zielinski 2014).	**None.** There are no suitable downed wood or snags for denning. The Study Area does not provide suitable habitat for this species.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Taxidea taxus American badger	--/--/SSC	Inhabits drier open stages of most shrub, forest, and herbaceous habitats with loose, friable soils. Preys on a wide variety of mammals, reptiles, birds, and carrion, and hunts mostly by digging out fossorial prey. Occasionally takes prey on the surface. Not tolerant of cultivation. No longer occur in the Central Valley except in the extreme western edge (Williams 1986).	**Low.** Annual grassland within the Study Area provides habitat, however, very few burrows that could be utilized by this species are present within the Study Area. There is a nearby CNDDB recorded occurrence from 2015 located 4.9-miles northwest of the Study Area and documents an individual badger killed on the road (CDFW 2020). CDFW considers this species to be extant (CDFW 2020), however there are no other nearby records of this species near the Study Area.

[1] Sensitive species reported in CNDDB or CNPS on the "Rio Linda" USGS quads, or in USFWS lists for the project site.

[2] Status is as follows: Federal (ESA) listing/State (CESA) listing/other CDFW status or CRPR. F = Federal; S = State of California; E = Endangered; T = Threatened; C = Candidate; FP=Fully Protected; SSC=Species of Special Concern.

[3] Status in the Project site is assessed as follows. **None**: Species is not known to occur on or in the vicinity of the Study Area and there is no suitable habitat within the Study Area -OR- Species was surveyed for during the appropriate season with negative results -OR- The Study Area occurs outside of the known elevation or geographic ranges; **Low**: Species known to occur in the vicinity of the Study Area and there is marginal habitat within the Study Area -OR- Species is not known to occur in the vicinity of the Study Area, however, there is suitable habitat on the Study Area; **High:** Species known to occur onsite or in the vicinity of the Study Area (based on CNDDB records within five miles and/or based on professional expertise specific to the Study Area or species) and there is suitable habitat within the Study Area; **Present**: Species known to occur within the Study Area based on CNDDB records and/or observed within the Study Area during the biological survey.

CRPR = California Rare Plant Rank: 1B – rare, threatened, or endangered in California and elsewhere; 2B – rare, threatened, or endangered in California but more common elsewhere. Extension codes: .1 – seriously endangered; .2 – moderately endangered.

EXECUTIVE SUMMARY

HELIX Environmental Planning, Inc. (HELIX) prepared this biological resources assessment (BRA) for the El Dorado Hills 52 Study Area located within El Dorado County, California. The purpose of this BRA is to summarize the general biological resources in the Study Area, to assess the suitability of the Study Area to support special-status species and sensitive habitat types, to summarize the results of various focused surveys, and to provide recommendations for regulatory permitting or further analysis that may be required prior to development activities occurring in the Study Area.

The El Dorado Hills 52 Study Area (Study Area) consists of ±36 acres of land that is primarily composed of annual grassland with a small area of oak woodland. The Study Area is bifurcated by Silva Valley Parkway. A former home site is located on the southern portion of the property and a large part of the northern portion was used to stockpile soil during the construction of the adjacent Silva Valley Parkway – U.S. Highway 50 Interchange Project. Land uses surrounding the Study Area include an elementary school, residential housing, and U.S. Highway 50.

Known or potential biological constraints within the Study Area include:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for coast horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. and waters of the State (seasonal wetlands, seep, wetland swale, and intermittent and ephemeral drainages), riparian habitat, and valley oak woodland.

This page intentionally left blank

1.0 INTRODUCTION

This report summarizes the findings of a BRA and an aquatic resources delineation conducted for the ±36-acre El Dorado Hills 52 Study Area, located within El Dorado County, California (Figure 1). This document addresses the onsite physical features, as well as plant communities present and the common plant and wildlife species occurring, or potentially occurring, in the Study Area. Furthermore, the suitability of onsite habitats to support special-status species and sensitive habitats is analyzed and recommendations are identified for anticipated requirements related to regulatory compliance or further analysis required prior to implementation of land use development within the Study Area.

1.1 PROJECT DESCRIPTION

Development proposed within the Study Area will ultimately result in the development of approximately 36 acres of commercial land uses. Development is designed to allow either the North Site or the South Site to develop independent from the other. Proposed improvements will include construction of commercial buildings and associated parking, utilities, and storm water management facilities as well as multiple points of access, and a new traffic signal on Silva Valley Parkway. Ancillary amenities include pedestrian walkways, bicycle parking, signage and lighting and landscaping.

2.0 REGULATORY FRAMEWORK

Federal, State, and local environmental laws, regulations, and policies relevant to the review of a "project" under the California Environmental Quality Act (CEQA) are summarized below. Applicable CEQA significance criteria are also addressed in this section.

2.1 FEDERAL REGULATIONS

2.1.1 Federal Endangered Species Act

The U.S. Congress passed the Federal Endangered Species Act (FESA) in 1973 to protect species that are endangered or threatened with extinction. FESA is intended to operate in conjunction with the National Environmental Policy Act (NEPA) to help protect the ecosystems upon which endangered and threatened species depend.

FESA prohibits the "take" of endangered or threatened wildlife species. "Take" under FESA is defined to include harassing, harming, pursuing, hunting, shooting, wounding, killing, trapping, capturing, or collecting wildlife species or any attempt to engage in such conduct (FESA Section 3 [(3) (19)]). Harm is further defined to include significant habitat modification or degradation that results in death or injury to listed species by significantly impairing behavioral patterns (50 CFR §17.3). Harass is defined as actions that create the likelihood of injury to listed species to such an extent as to significantly disrupt normal behavior patterns (50 CFR §17.3). Actions that result in take can result in civil or criminal penalties.

In the context of the proposed Project, consultation with the U.S. Fish and Wildlife Service (USFWS) and/or the National Marine Fisheries Service (NMFS) would be initiated if proposed development activities had the potential to result in take of a federally threatened or endangered species or if

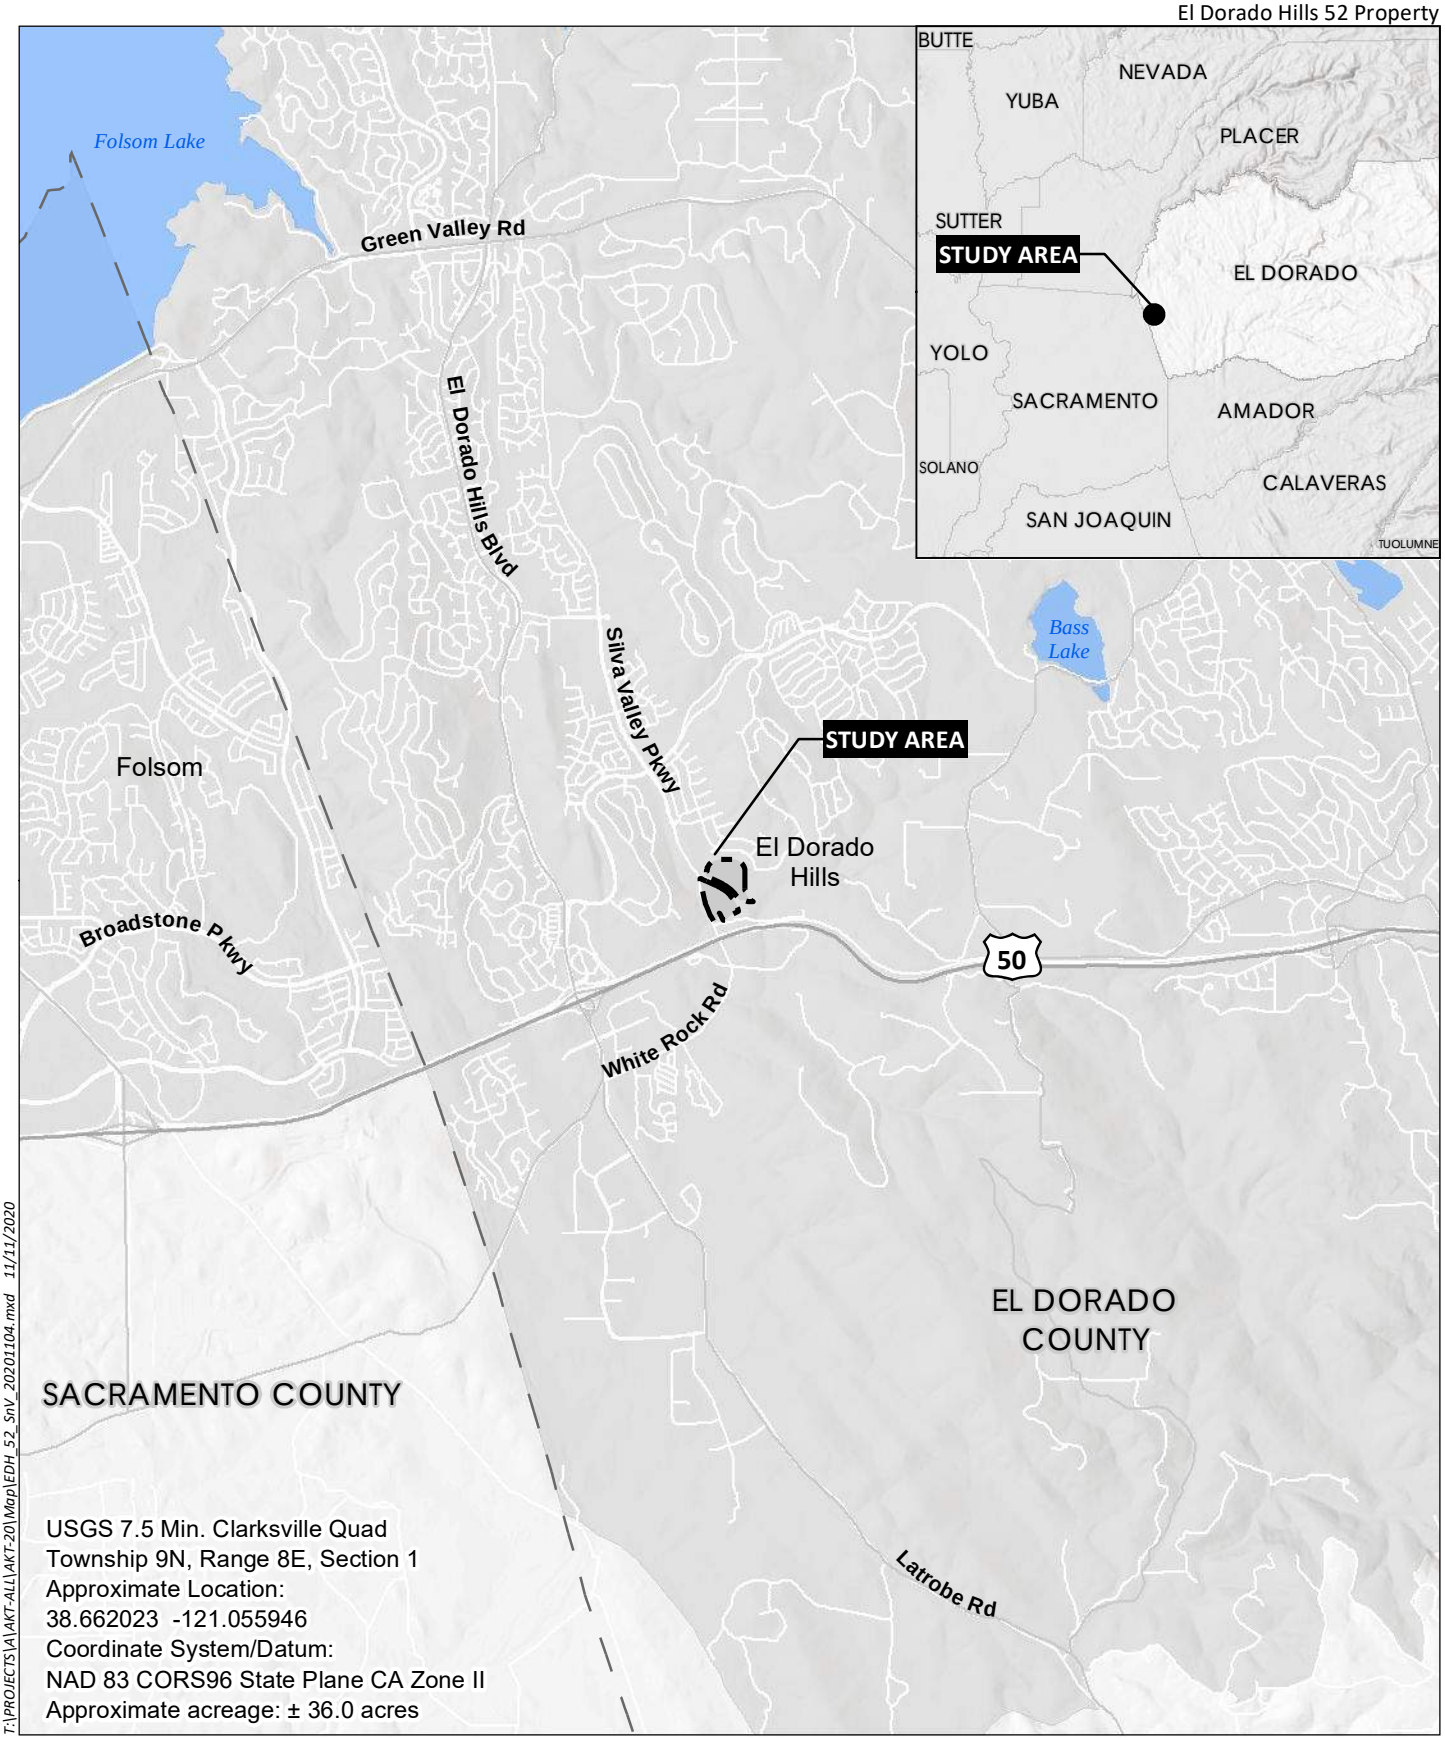
issuance of a Section 404 permit or other federal agency action could result in take of a federally endangered species or adversely modify designated critical habitat of such a species.

2.1.2 Migratory Bird Treaty Act

Raptors, migratory birds, and other avian species are protected by a number of State and federal laws. The federal Migratory Bird Treaty Act (MBTA) prohibits the killing, possessing, or trading of migratory birds except in accordance with regulations prescribed by the Secretary of Interior.

2.1.3 The Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act (Eagle Act) prohibits the taking or possession of and commerce in bald and golden eagles with limited exceptions. Under the Eagle Act, it is a violation to "*take, possess, sell, purchase, barter, offer to sell, transport, export or import, at any time or in any manner, any bald eagle commonly known as the American eagle, or golden eagle, alive or dead, or any part, nest, or egg, thereof.*" Take is defined to include pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, destroy, molest, and disturb. Disturb is further defined in 50 CFR Part 22.3 as "*to agitate or bother a bald or golden eagle to a degree that causes, or is likely to cause, based on the best scientific information available (1) injury to an eagle, (2) a decrease in its productivity, by substantially interfering with normal breeding, feeding, or sheltering behavior, or (3) nest abandonment, by substantially interfering with normal breeding, feeding, or sheltering behavior.*"



2.2 STATE JURISDICTION

2.2.1 California Endangered Species Act

The State of California enacted the California Endangered Species Act (CESA) in 1984. CESA is similar to the FESA but pertains to State-listed endangered and threatened species. CESA directs agencies to consult with CDFW on projects or actions that could result in "take" of state-listed species. Section 2081 of the Fish and Game Code allows CDFW to authorize "take" of a state-listed species if the take is incidental to an otherwise lawful activity. The impacts of the take must be minimized and fully mitigated as determined by CDFW and the applicant must ensure adequate funding to implement measures to minimize and fully mitigate the impacts. No take permit may be issued if issuance of the permit would jeopardize the continued existence of a state-listed species.

2.2.2 California Department of Fish and Game Codes

A number of species have been designated as "fully protected" species under Sections 5515, 5050, 3511, and 4700 of the Fish and Game Code, but are not listed as endangered (Section 2062) or threatened (Section 2067) species under CESA. Except for take related to scientific research, all take of fully protected species is prohibited. The California Fish and Game Code defines take as "*hunt, pursue, catch, capture, or kill, or attempt to hunt, pursue, catch, capture, or kill.*" Additionally, Sections 3503, 3503.5, and 3513 of the California Fish and Game Code prohibits the killing of birds or the destruction of bird nests.

HELIX Environmental Planning

Site and Vicinity Map

Figure 1

2.2.3 Native Plant Protection Act

The Native Plant Protection Act (NPPA), enacted in 1977, allows the Fish and Game Commission to designate plants as rare or endangered. The NPPA prohibits take of endangered or rare native plants, with some exceptions for agricultural and nursery operations and emergencies. Vegetation removal from canals, roads, and other sites, changes in land use, and certain other situations require proper advance notification to CDFW.

2.3 JURISDICTIONAL WATERS

2.3.1 Federal Jurisdiction

Any person, firm, or agency planning to alter or work in "waters of the U.S.," including the discharge of dredged or fill material, must first obtain authorization from the U.S. Army Corps of Engineers (USACE) under Section 404 of the Clean Water Act (CWA; 33 USC 1344). Permits, licenses, variances, or similar authorization may also be required by other federal, state, and local statutes. Section 10 of the Rivers and Harbors Act prohibits the obstruction or alteration of navigable waters of the U.S. without a permit from USACE (33 USC 403).

On April 21, 2020, the Environmental Protection Agency (EPA) and USACE published the Navigable Waters Protection Rule to define "Waters of the United States" in the Federal Register. On June 22, 2020 the Navigable Waters Protection Rule: Definition of "Waters of the United States" (NWPR) became effective in 49 states, including California, and in all US territories.

The NWPR regulates traditional navigable waters and perennial or intermittent tributary systems, and defines four categories of regulated waters including:

- The territorial seas and traditional navigable waters;
- Perennial and intermittent tributaries to those waters;
- Certain lakes, ponds, and impoundments; and
- Wetlands adjacent to jurisdictional waters.

The NWPR also defines 12 categories of exempted aquatic resources:

- Waters not listed as WOTUS
- Groundwater
- Ephemeral features
- Diffuse stormwater run-off
- Ditches not identified as WOTUS
- Prior converted cropland (PCC)
- Artificially irrigated areas
- Artificial lakes and ponds
- Water-filled depressions incidental to mining or construction activity
- Stormwater control features
- Groundwater recharge, water reuse, and wastewater recycling structures
- Waste treatment systems

With non-tidal waters, in the absence of adjacent wetlands, the extent of USACE jurisdiction extends to the ordinary high water mark (OHWM) – the line on the shore established by fluctuations of water and indicated by a clear, natural line impressed on the bank, shelving, changes in soil character, destruction of terrestrial vegetation, or the presence of litter and debris. Wetlands are defined in 33 CFR Part 328 as:

> "those areas that are inundated or saturated by surface or ground water at a frequency and duration to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions."

Federal and state regulations pertaining to waters of the U.S., including wetlands, are discussed below.

Clean Water Act (33 USC 1251-1376). The CWA provides guidance for the restoration and maintenance of the chemical, physical, and biological integrity of the nation's waters.

Section 401 requires that an applicant for a federal license or permit that allows activities resulting in a discharge to waters of the U.S. must obtain a state certification that the discharge complies with other provisions of CWA. The Regional Water Quality Control Board (RWQCB) administers the certification program in California and may require State Water Quality Certification before other permits are issued.

Section 402 establishes a permitting system for the discharge of any pollutant (except dredged or fill material) into waters of the U.S.

Section 404 establishes a permit program administered by USACE that regulates the discharge of dredged or fill material into waters of the U.S. (including wetlands). Implementing regulations by USACE are found at 33 CFR Parts 320-332. The Section 404 (b)(1) Guidelines were developed by the USEPA in conjunction with USACE (40 CFR Part 230), allowing the discharge of dredged or fill material for non-water dependent uses into special aquatic sites only if there is no practicable alternative that would have less adverse impacts. State Jurisdiction

Regional Water Quality Control Board

Any action requiring a CWA Section 404 permit, or a Rivers and Harbors Act Section 10 permit, must also obtain a CWA Section 401 Water Quality Certification. The State of California Water Quality Certification (WQC) Program was formally initiated by the State Water Resources Control Board (SWRCB) in 1990 under the requirements stipulated by Section 401 of the Federal CWA. Although the Clean Water Act is a Federal law, Section 401 of the CWA recognizes that states have the primary authority and responsibility for setting water quality standards. In California, under Section 401, the State and Regional Water Boards are the authorities that certify that issuance of a federal license or permit does not violate California's water quality standards (i.e., that they do not violate Porter-Cologne and the Water Code). The WQC Program currently issues the WQC for discharges requiring USACE's permits for fill and dredge discharges within Waters of the United States, and now also implements the State's wetland protection and hydromodification regulation program under the Porter Cologne Water Quality Control Act.

On April 2, 2019, the SWRCB adopted a State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (Procedures), for inclusion in the forthcoming Water Quality Control Plan for Inland Surface Waters and Enclosed Bays and Estuaries and Ocean Waters of California. The Procedures consist of four major elements: 1) a wetland definition; 2) a framework for determining if a feature that meets the wetland definition is a water of the state; 3) wetland delineation procedures; and 4) procedures for the submittal, review and approval of applications for Water Quality

Certifications and Waste Discharge Requirements for dredge or fill activities. The Office of Administrative Law approved the Procedures on August 28, 2019, and the Procedures became effective May 28, 2020.

Under the Procedures and the State Water Code (Water Code §13050(e)), "Waters of the State" are defined as "any surface water or groundwater, including saline waters, within the boundaries of the state." Unless excluded by the Procedures, any activity that could result in discharge of dredged or fill material to Waters of the State, which includes Waters of the U.S. and non-federal Waters of the State, requires filing of an application under the Procedures.

The Porter-Cologne Water Quality Control Act (Porter-Cologne Act, Water Code Section 13000 et seq.) is California's statutory authority for the protection of water quality in conjunction with the federal CWA. The Porter-Cologne Act requires the SWRCB and RWQCBs to adopt and periodically update water quality control plans, or basin plans. Basin plans are plans in which beneficial uses, water quality objectives, and implementation programs are established for each of the nine regions in California. The Porter-Cologne Act also requires dischargers of pollutants or dredged or fill material to notify the RWQCBs of such activities by filing Reports of Waste Discharge and authorizes the SWRCB and RWQCBs to issue and enforce waste discharge requirements, National Pollution Discharge Elimination System (NPDES) permits, Section 401 water quality certifications, or other approvals.

California Department of Fish and Wildlife

The CDFW has jurisdiction over fish and wildlife resources under Section 1600 et seq. of the California Fish and Game Code. Under Sections 1602 and 1603, a private party must notify CDFW if a proposed project will "substantially divert or obstruct the natural flow or substantially change the bed, channel, or bank of streambeds…except when the department has been notified pursuant to Section 1601." Additionally, CDFW asserts jurisdiction over native riparian habitat adjacent to aquatic features, including native trees over four inches in diameter at breast height (DBH). If an existing fish or wildlife resource may be substantially adversely affected by the activity, CDFW may propose reasonable measures that will allow protection of those resources. If these measures are agreeable to the parties involved, they may enter into an agreement with CDFW identifying the approved activities and associated mitigation measures. Generally, CDFW recommends submitting an application for a Streambed Alteration Agreement (SAA) for any work done within the lateral limit of water flow or the edge of riparian vegetation, whichever is greater.

2.4 CEQA SIGNIFICANCE

Section 15064.7 of the State CEQA Guidelines encourages local agencies to develop and publish the thresholds that the agency uses in determining the significance of environmental effects caused by projects under its review. However, agencies may also rely upon the guidance provided by the expanded Initial Study Checklist included in Appendix G of the State CEQA Guidelines. Appendix G provides examples of impacts that would normally be considered significant. Based on these examples, impacts to biological resources would normally be considered significant if the project would:

- Have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by the CDFW or USFWS;

- Have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, regulations or by the CDFW or USFWS;

- Have a substantial adverse effect on State or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;

- Interfere substantially with the movement of any native resident or migratory fish or wildlife species, or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;

- Conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and

- Conflict with the provisions of an adopted Habitat Conservation Plan (HCP), Natural Community Conservation Plan (NCCP), or other approved local, regional or state habitat conservation plan.

An evaluation of whether or not an impact on biological resources would be substantial must consider both the resource itself and how that resource fits into a regional or local context. Substantial impacts would be those that would diminish or result in the loss of an important biological resource, or those that would obviously conflict with local, State, or federal resource conservation plans, goals, or regulations. Impacts are sometimes locally important but not significant according to CEQA. The reason for this is that although the impacts would result in an adverse alteration of existing conditions, they would not substantially diminish, or result in the permanent loss of, an important resource on a population-wide or region-wide basis.

2.4.1 California Native Plant Society

The California Native Plant Society (CNPS) maintains a rank of plant species native to California that have low population numbers, limited distribution, or are otherwise threatened with extinction. This information is published in the *Inventory of Rare and Endangered Vascular Plants of California*. Potential impacts to populations of CNPS-ranked plants receive consideration under CEQA review. The following identifies the definitions of the CNPS Rare Plant Ranking System:

Rank 1A: Plants presumed Extinct in California and either rare or extinct elsewhere

Rank 1B: Plants Rare, Threatened, or Endangered in California and elsewhere

Rank 2A: Plants presumed extirpated in California but common elsewhere

Rank 2B: Plants Rare, Threatened, or Endangered in California, but more common elsewhere

Rank 3: Plants about which we need more information – A Review List

Rank 4: Plants of limited distribution – A Watch List

All plants appearing on CNPS Rank 1 or 2 are considered to meet CEQA Guidelines Section 15380 criteria. While only some of the plants ranked 3 and 4 meet the definitions of threatened or endangered species, the CNPS recommends that all Rank 3 and Rank 4 plants be evaluated for consideration under

CEQA. Furthermore, the CNPS Rare Plant Rankings include levels of threat for each species. These threat ranks include the following:

0.1 - Seriously threatened in California (over 80% of occurrences threatened/high degree and immediacy of threat);

0.2 - Moderately threatened in California (20-80% occurrences threatened/moderate degree and immediacy of threat); and

0.3 - Not very threatened in California (less than 20% of occurrences threatened/low degree and immediacy of threat or no current threats known).

Threat ranks do not designate a change of environmental protections, so that each species (i.e., CRPR 1B.1, CRPR 1B.2, CRPR 1B.3, etc.), be fully considered during preparation of environmental documents under CEQA.

2.4.2 California Department of Fish and Wildlife Species of Concern

Additional fish, amphibian, reptile, bird, and mammal species may receive consideration by CDFW and lead agencies during the CEQA process, in addition to species that are formally listed under FESA and CESA or listed as fully protected. These species are included on the *Special Animals List*, which is maintained by CDFW. This list tracks species in California whose numbers, reproductive success, or habitat may be in decline. In addition to "Species of Special Concern" (SSC), the *Special Animals List* includes species that are tracked in the California Natural Diversity Database (CNDDB) but warrant no legal protection. These species are identified as "California Special Animals" (CSA).

2.5 LOCAL POLICIES AND REGULATIONS

2.5.1 El Dorado County General Plan

In addition to federal and State regulations described above, the *El Dorado County Adopted General Plan* (General Plan) includes goals, objectives, and policies regarding biological resources within the County limits (El Dorado County 2014). Applicable sections of the General Plan are included in Appendix A.

2.5.2 El Dorado County Oak Resources Management Plan

The County of El Dorado (County) adopted the El Dorado County Oak Resources Management Plan (ORMP) on October 24, 2017 and it went into effect on November 23, 2017 (El Dorado County 2017b, 2020). The ORMP designates three classes of protected oak resources: oak woodlands that have at least 10 percent oak canopy; Heritage trees, defined as native oaks with a total trunk DBH of 36 inches or greater; and individual oak trees, defined as native oak trees with a trunk DBH of 6 inches or greater that are not located in oak woodlands. An oak woodland removal permit is required prior to removal of oak trees that are part of an oak woodland and an oak tree removal permit is required prior to removal of Heritage trees and individual oak trees. Mitigation for impacts to oak woodlands is based on the total area impacted ranging from 1:1 mitigation for zero to 50 percent removal to 2:1 mitigation for more than 75 percent removal. Mitigation may be completed with a combination of the following options: acquisition of an off-site conservation easement, payment of in-lieu fees, or either on- or off-site replacement planting of up to 50 percent of the required mitigation area. Mitigation for removal of Heritage or individual oak trees requires on- or off-site replacement planting or payment of in-lieu fees

at a 3:1 or 1:1 ratio, respectively, to the number of trunk inches removed. Any oak woodland preserved onsite and all mitigation planting areas must be protected in perpetuity through deed restrictions or a conservation easement.

3.0 METHODOLOGY

Available information pertaining to the natural resources of the region was reviewed prior to conducting the field survey. The following site-specific published information was reviewed for this BRA:

- California Department of Fish and Wildlife (CDFW). 2020. *California Natural Diversity Database* (CNDDB); For: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek, Rocklin, and Folsom* USGS 7.5-minute series quadrangles, Sacramento, CA. Accessed [October 12, 2020];

- California Native Plant Society (CNPS). 2020. *Inventory of Rare and Endangered Plants* (online edition, v8-03 0.39) For: *Clarksville, Pilot Hill, Coloma, Shingle Springs, Latrobe, Folsom SE, Buffalo Creek, Rocklin, and Folsom* USGS 7.5-minute series quadrangles, Sacramento, CA. Accessed [October 12, 2020];

- USDA, NRCS. 2020. *Web Soil Survey*. Available online at: http://websoilsurvey.sc.egov.usda.gov. Accessed [October 12, 2020];

- U.S. Fish and Wildlife Service (USFWS). 2020. *Information for Planning and Consultation* (IPaC) *the El Dorado Hills 52 Project.* Accessed [October 12, 2020];

- U.S. Geological Survey (USGS). 2018. *Clarksville, California*. 7.5-minute series topographic quadrangle. United States Department of Interior; and

- Biological reports and associated documents previously prepared for the Study Area.

Prior to the site survey, existing information, including the previous wetland delineation and soil maps, were reviewed and the results of the records search and five-mile radius CNNDB query were summarized in a table (Appendix B). General field surveys of the Study Area were conducted on April 5, 2013, August 8, 2017 and October 13, 2020. The Study Area was systematically surveyed on foot with binoculars to ensure total search coverage, with special attention given to identifying those portions of the Study Area with the potential for supporting special-status species and sensitive habitats. During the field surveys, biologists recorded plant and animal species observed (Appendix C), as well as characterized biological communities occurring onsite. Following the site survey, the potential for each species identified in the records search to occur in the Study Area was determined based on the site surveys, soils, and species-specific information, as shown in Appendix B. Representative photos of the Study Area are provided in Appendix D.

A wetland delineation was performed on December 15, 2015. A follow up wetland delineation was conducted on October 13, 2020 by HELIX biologists Patrick Martin and Halie Goeman to verify the previous wetland delineation, adjust potential wetland boundaries as applicable, and update regulatory requirements according to current standards, policies and regulations. The results of the aquatic resource delineation are summarized herein and are discussed in detail under a separate cover (HELIX

Environmental Planning, Inc. [HELIX] 2020a). The results are considered preliminary until the Corps verifies the findings.

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. The botanical inventories were conducted in accordance with CDFW's protocol plant surveys. The results of the botanical surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c). A complete list of plants observed within the Study Area is provided in Appendix C.

Protocol-level burrowing owl surveys were conducted within the majority of the Study Area on March 12, 2015, April 24, 2015, May 26, 2015, and June 16, 2015. The surveys were conducted in accordance with the *Staff Report on Burrowing Owl Mitigation* (CDFW 2012). The results of the burrowing owl surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016c).

Protocol-level breeding season California red-legged frog (CRLF) surveys were conducted within the Study Area on January 12 and 26, 2016 and February 2 and 9, 2016. The protocol-level breeding season surveys were conducted in accordance with the *Revised Guidance on Site Assessment and Field Surveys for the California Red-legged Frog* (USFWS 2005; CRLF Guidance). The results of the protocol-level breeding season surveys are summarized herein and are discussed in detail under a separate cover (Foothill Associates 2016a).

An oak woodland analysis was performed to document the extent of the existing oak trees in the Study Area and anticipated impacts from the proposed project. The oak woodland report is contained under separate cover (HELIX 2020b).

4.0 RESULTS

4.1 SITE LOCATION AND DESCRIPTION

The Study Area is located in El Dorado County adjacent to U.S. Highway 50 immediately east of Silva Valley Parkway and north of Tong Road. Land uses surrounding the Study Area include residential development to the north and paved roads, oak woodland, and annual grassland to the east, west, and south. The Study Area is located within Township 9 North, Range 8 East, Section 1 of the *Clarksvill*e USGS 7.5-minute series quadrangle. The approximate location of the center of the Study Area is at latitude 38.662023 and longitude -121.055946, NAD 83, and is located at an elevation between 705 feet and 795 feet above mean sea level (MSL).

The Study Area consists of approximately 36 acres of land that is primarily annual grassland. The Study Area is bifurcated by Silva Valley Parkway. Two drainage corridors cross the Study Area from the northeast to the southwest.

4.2 PHYSICAL FEATURES

4.2.1 Topography and Drainage

Topography within the Study Area ranges from relatively level to moderately sloped with elevations ranging from approximately 705 to 795 feet above MSL (215 to 242 meters). Surface runoff flows

through and exits the Study Area via ephemeral and intermittent drainages, which run in a northeast to southwest direction.

4.2.2 Soils

The Natural Resources Conservation Service has mapped one soil unit within the Study Area: Auburn silt loam, 2 to 30 percent slopes (Figure 2). The general characteristics and properties associated with this soil type are described below (USDA, NRCS 2020).

Auburn silt loam, 2 to 30 percent slopes: The soils in this series are well drained. Permeability is moderate. Vegetation associated with this soil series includes annual grasses, forbs, and oaks. The hydric soils list for El Dorado County does not identify this soil type as hydric (USDA, NRCS 2020)

4.3 BIOLOGICAL COMMUNITIES

Four upland biological communities occur in the Study Area including non-native annual grassland, riparian woodland, valley oak woodland, and disturbed/developed. Embedded within these upland communities are aquatic features including ephemeral stream, intermittent stream, seasonal wetlands, a wetland swale, and a seep. There is also an area of emergent wetland vegetation on the southern parcel within the ordinary high water mark of an intermittent drainage that forms a seasonal marsh (Figure 3). These communities provide habitat to a number of common species of wildlife and may provide suitable habitat for special-status species. It should be noted that wetlands may occur within a biological community. For instance, a creek surrounded by riparian woodland would be included within the riparian woodland for the purposes of determining biological community acreage. Vernal pools and seasonal wetlands may be included in the annual grassland community and are often used by wildlife from the annual grassland. However, a very different aquatic habitat, such as a seasonal marsh, is considered its own biological community. Dominant vegetation observed within each biological community is discussed in detail below. A comprehensive list of plants observed within the Study Area is provided in Appendix C.

4.3.1 Non-Native Annual Grassland

Non-native annual grassland dominates both the northern and southern portions of the Study Area. This vegetation community is characterized primarily by an assemblage of non-native annual grasses and forbs. Dominant vegetation includes ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) intermixed with red-stemmed filaree (*Erodium cicutarium*), popcornflower (*Plagiobothrys* sp.), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), scarlet pimpernel (*Anagallis arvensis*), St. John's wort (*Hypericum perforatum*), brodiaea (*Brodiaea elegans*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*).

Two small areas within the annual grassland contain purple needlegrass (*Nassella pulchra*) within the southern portion of the Study Area (Figure 3). The purple needlegrass is interspersed with annual willow herb (*Epilobium brachycarpum*), ripgut brome, soft chess, and wild oat.

The annual grassland community includes small ephemeral and intermittent drainages. The ephemeral drainages are mostly unvegetated and the intermittent drainage has a small clump of willows (*Salix* sp.) and broadleaf cattail (*Typha latifolia*) and is otherwise minimally vegetated.

HELIX Environmental Planning

Soils Map

Figure 2

HELIX Environmental Planning

Biological Communities

Figure 3

4.3.2 Riparian Woodland

Riparian woodland habitat occurs within the along the ephemeral drainage on the western boundary of the Study Area. Dominant vegetation includes broadleaf cattail, willow, spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), Himalayan blackberry (*Rubus armeniacus*), and valley oak (*Quercus lobata*).

4.3.3 Valley Oak Woodland

Valley oak woodland is found in a small area on the southwest boundary of the Study Area where a small stand of mature valley oak trees overhangs a small intermittent drainage. The understory is primarily annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal immediately adjacent to the drainage.

4.3.4 Seep

A seep is situated adjacent to the seasonal marsh and non-native annual grassland habitat. Seeps are characterized as areas where groundwater intersects the soil surface. Typically, water flows from seeps persist for some period after the rainy season or, more rarely, nearly year-round. Seeps accessing sufficient amounts of subsurface water can support isolated wetland vegetation (such as on a hillside) or they may form the headwaters of other jurisdictional drainage or wetland features, such as wetland swales. Vegetation in seeps often consists of plant species associated with seasonal and semi-permanent marsh habitats. When seeps are active for only short periods beyond the rainy season and into the warm season, herbaceous perennial wetland species typically dominate, as is typical of the seeps within the Study Area. Vegetation in the seep consisted almost entirely of iris leaved rush (*Juncus xiphioides*), an obligate wetland plant.

4.3.5 Seasonal Wetland

A number of seasonal wetland features are found in the Study Area. Most are associated with the ephemeral drainage on the northern portion of the Study Area. Dominant vegetation in the seasonal wetlands includes rabbitsfoot grass (*Polypogon monspeliensis*), spike rush (*Eleocharis macrostachya*), nutsedge (*Cyperus eragrostis*), curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), ryegrass, annual hair grass (*Deschampsia danthonioides*), and rye grass (*Festuca perennis*).

4.3.6 Seasonal Marsh

Seasonal marsh habitat is found in the southern portion of the Study Area within the ordinary high water mark of an intermittent drainage. This community appears to have formed as a result of a brick check dam that was constructed across the intermittent drainage allowing water to periodically back up in this area. This community is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock with areas of dense cattails, Himalayan blackberry, and a small clump of willows.

4.3.7 Disturbed/Developed

Disturbed/developed areas in the Study Area include graded roads and a stockpile area. The disturbed/developed areas are sparsely vegetated with red-stemmed filaree, soft chess, wild oat, and winter vetch.

4.4 SPECIAL-STATUS SPECIES

Special-status species are plant and wildlife species that have been afforded special recognition by federal, State, or local resource agencies or organizations. They are generally of relatively limited distribution and may require specialized habitat conditions. Special-status species are defined as meeting one or more of the following criteria:

- Listed or proposed for listing under CESA or FESA;
- Protected under other regulations (e.g., Migratory Bird Treaty Act);
- Included on the CDFW Special Animals List;
- Identified as Rare Plant Rank 1 to 4 by CNPS; or
- Receive consideration during environmental review under CEQA.

Special-status species considered for this analysis are based on queries of the CNDDB, the USFWS, and CNPS ranked species (online versions) for the *Rocklin* USGS quadrangle and eight surrounding quadrangles. Appendix B includes the common name and scientific name for each species, regulatory status (federal, State, local, CNPS), habitat descriptions, and potential for occurrence within the Study Area. The following set of criteria has been used to determine each species' potential for occurrence within the Study Area:

- **Present**: Species known to occur within the Study Area based on CNDDB records and/or observed within the Study Area during the biological survey.

- **High**: Species known to occur onsite or in the vicinity of the Study Area (based on CNDDB records within five miles and/or based on professional expertise specific to the Study Area or species) and there is suitable habitat within the Study Area.

- **Low**: Species known to occur in the vicinity of the Study Area and there is marginal habitat within the Study Area **-OR-** Species is not known to occur in the vicinity of the Study Area, however, there is suitable habitat on the Study Area.

- **None**: Species is not known to occur on or in the vicinity of the Study Area and there is no suitable habitat within the Study Area -**OR-** Species was surveyed for during the appropriate season with negative results **-OR-** The Study Area occurs outside of the known elevation or geographic ranges.

Only those species that are known to be *present* or have a *high* or *low* potential for occurrence are discussed further in the following sections.

4.4.1 Listed and Special-Status Plants

According to the records search, 31 special-status plant species have the potential to occur on or in the vicinity of the Study Area. Based on field observations and literature review, four species were determined to have the potential to occur on the Study Area: big-scale balsamroot (*Balsamorhiza macrolep*is var. *macrolepis*), Boggs Lake hedge-hyssop (*Gratiola heterosepala*), dwarf downingia (*Downingia pusilla*), and Sanford's arrowhead (*Sagittaria sanfordii*). Focused botanical surveys were conducted within the Study Area in 2015 during the bloom period of these plants (Foothill Associates 2016c). No special-status plant species were found and therefore, it is unlikely that these species occur within the Study Area.

4.4.2 Listed and Special-Status Wildlife

According to the records search, 35 special-status animal species have the potential to occur onsite or in the vicinity. Based on field observations and literature review, 15 species were determined to have the potential for occurrence to occur in the Study Area. Protocol surveys for burrowing owl (*Athene cunicularia*) and California red-legged frog (*Rana draytonii*) were conducted in 2015 and 2016 (Foothill Associates 2016a, 2016b). No observations or evidence of either species was found within the Study Area.

Species that are known to be *present* or that are considered to have a *high* potential to occur onsite include: raptors and other migratory birds. Species that are considered to have a *low* potential to occur onsite include: valley elderberry longhorn beetle (*Desmocerus californicus dimorphus*), western pond turtle (*Actinemys marmorata*), coast horned lizard (*Phrynosoma blainvillii*), foothill yellow-legged frog (*Rana boylii*), western spadefoot (*Spea hammondii*), golden eagle (*Aquila chrysaetos*), tricolored blackbird (*Agelaius tricolor*), American badger (*Taxidea taxus*), and special-status bat species.

Special-Status Wildlife with a High Potential for Occurrence

Nesting Migratory Birds and Raptors

Migratory birds are protected under the MBTA of 1918 (16 U.S.C. 703-711). The MBTA makes it unlawful to take, possess, buy, sell, purchase, or barter any migratory bird listed under 50 CFR 10; this also includes feathers or other parts, nests, eggs, or products, except as allowed by implementing regulations (50 CFR 21). Additionally, Section 3503 of the California Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. Section 3503.5 specifically states that it is unlawful to take, possess, or destroy any raptors (i.e., hawks, owls, eagles, and falcons), including their nests or eggs; and Section 3513 specifically states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA. Migratory birds and other birds of prey including have the potential to nest in trees, shrubs, structures (e.g., sheds), and bare ground within the Study Area.

Special-Status Wildlife with a Low Potential for Occurrence

Valley Elderberry Longhorn Beetle

Endemic to elderberry shrubs (*Sambucus* spp.) occurring in riparian habitat in the Sacramento and San Joaquin Valleys, riparian habitats in the Sacramento and San Joaquin Valleys, and less common

throughout riparian forests of the Central Valley from Redding to Fresno County (USFWS 2014) typically below 500 feet above MSL (USFWS 2017a). Typically, the beetles are found on elderberry shrubs within riparian plant communities. Some studies have found that multiple elderberry shrubs clumped together provide superior habitat for the beetle while isolated elderberry shrubs are less likely to support beetle populations. Typical plant species that co-occur with the elderberry shrubs include California sycamore (*Platanus racemosa*), willow, blackberry, and western poison oak (*Toxicodendron diversilobum*) (USFWS 1999, 2017a). Beetles require elderberry stems with at least one-inch diameter at ground level (dgl) in order for the larvae to utilize the stems (USFWS 1999). The valley elderberry longhorn beetle depends on elderberry shrubs for its entire lifecycle. Adults are typically active from March through May during the flowering period of the elderberry shrub. The female lays its eggs on the leaves and stems of the elderberry shrub. The larvae emerge within a few days and burrow into the elderberry stem. The larvae feed on the stem pith until they pupate. When the host shrub begins flowering, the pupa emerges from the stem as an adult (Barr 1991). There is one CNDDB record of valley elderberry longhorn beetle listed within five miles of the Study Area (CDFW 2020a), however the USFWS currently considers this species to occur at or below 500 feet above MSL (USFWS 2017a). Two blue elderberry (*Sambucus nigra* ssp. *caerulea*) occur within the riparian habitat within the western portion of the Study Area (Figure 3). No exit holes were observed. This species has a *low* potential to occur within the Study Area since habitat is limited to two small elderberry shrubs and the Study Area is currently outside of the accepted elevational range of the valley elderberry longhorn beetle as recognized by USFWS (USFWS 2017a).

Western Pond Turtle

Western pond turtles are found in ponds, lakes, rivers, streams, creeks, marshes, and irrigation ditches with suitable basking sites (Jennings and Hayes 1994). Suitable aquatic habitat typically has a muddy or rocky bottom and has emergent aquatic vegetation for cover (Stebbins 2003). Western pond turtles nest and overwinter in areas of sparse vegetation comprised of grassland and forbs with less than ten percent slopes, less than 492 feet (150 meters) from aquatic habitat (Rosenberg et al. 2009). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2020a). The seasonal marsh area and intermittent drainage, and surrounding riparian habitat provide marginal aquatic habitat and the surrounding annual grassland provides upland habitat. During the survey on October 13, 2020 most of the features were dry and the Study Area is unlikely to provide year-round habitat for western pond turtle. This species was not observed within the Study Area during the biological surveys. This species has a *low* potential to occur within the Study Area and it is more likely to occur in larger creeks adjacent to but outside of the Study Area.

Coast Horned Lizard

Coast horned lizard inhabits open areas of sandy soil and low vegetation in valleys, foothills, and semiarid mountains from sea level to 8,000 feet above MSL. It is typically found in grasslands, coniferous forests, woodlands, and chaparral, with open areas and patches of loose soil. This species is often found in lowlands along sandy washes with scattered shrubs and along dirt roads, and frequently found near ant hills (Zeiner et al. 1988). There are two CNDDB records of this species within five miles of the Study Area (CDFW 2020a). The species was not observed within the Study Area during several biological surveys. The annual grassland within the Study Area provides marginal habitat for the coast horned lizard due to lack of sandy soils for this species to bury itself. The Study Area is also densely vegetated with annual grasses which makes movement for this species difficult. Therefore, this species has a *low* potential to occur within the Study Area.

Foothill Yellow-Legged Frog

The Foothill yellow-legged frog (FYLF) is a moderate-sized frog (1.5 to 3.5" long) found on the western slope of the Sierras and along the coast. It has vague dorsolateral folds, horizontal pupils, yellow coloring on the underside of its hind legs, and a granular skin texture that covers the eardrums of colors that harmonize with the surroundings. The FYLF is a stream or river frog of chaparral, forest, and woodland ecozones. This species breeds after the high-water flows subside, mid-March to early June. The FYLF resides in rocky streams and the associated riparian habitat. Metamorphosis generally occurs in three to four months and FYLF reach sexual maturity typically the first summer after they have metamorphosed. Breeding sites occur in shallow, slow flowing water with mostly pebble and/or cobble substrate. The introductions of bullfrogs and mosquitofish have led to declines in populations in California and Oregon. The intermittent drainage provides marginal habitat for this species and there is a nearby CNDDB recorded occurrence from 1972 located 3 miles north of the Study Area and documents a collected specimen (CDFW 2020a). CDFW considers this species extirpated in the Study Area and the surrounding area (CDFW 2020b). This species was not observed within the Study Area during the biological surveys. Therefore, this species has a *low* potential to occur within the Study Area.

Western Spadefoot

Western spadefoot occurs throughout the Central Valley and on the coast from Point Conception, south to the Mexican border. This species occurs from sea level up to 4,500 feet above MSL, in the southern Sierra foothills. Western spadefoot individuals are most commonly found in grassland habitats with temporary pools of water, but they have also been found in open chaparral and valley-foothill pine-oak woodlands (Stebbins 2003). This species spends most of the year underground, where members seek refuge from desiccating by constructing and residing in small burrows. This species often breeds in temporary pools and quiet streams between the months of January and May. There are no CNDDB records for this species within five miles of the Study Area (CDFW 2020a). The species was not observed within the Study Area during the biological surveys. The depressional seasonal wetlands provide low quality breeding habitat given that they do not likely hold water for long enough for the western spadefoot to breed. This species has a *low* potential for utilizing the annual grassland as upland aestivation given the limited aquatic habitat available within the Study Area for breeding.

Golden Eagle

Golden eagles live in semi-open habitats where they have easy access to their primary prey of small to medium-sized mammals. Grasslands, deserts, savannahs, and early successional stages of forest and shrub habitats provide necessary foraging habitat. Nests are placed on cliffs or large trees and are maintained year after year. Breeding occurs from January through August (Kochert et al. 2002). Golden eagle home range territories vary widely from 8 to 77 square miles (McGrady 1997) and are estimated to average 48 square miles in northern California (Zeiner et al. 1990). Breeding territories range from 8 to 21 square miles, or 3 to 5 miles surrounding the nest, but activity is often concentrated in a smaller core area. Although only one nest is used each year, a territory may contain multiple alternate nests. Typically, there are between 6 and 14 nests are found in a territory (Kochert et al. 2002). Golden eagles may use the same nest for multiple years or use new nest sites every year (Watson 2010).

There is one known occurrence for this species approximately two miles northwest of the Study Area (CDFW 2020a). This active nest was located in a foothill pine on a hillslope surrounded by oak woodland. Existing residences are located uphill within 300 feet of the nest on the north and east. Two juvenile and two adult golden eagles were observed at the nest in August 2013. A pair of adult eagles returned to the

nest in 2014 and successfully raised one eaglet, which fledged by June 18, 2014. However, the nest tree fell over during a storm in November 2014. A golden eagle nest was subsequently identified in a foothill pine approximately 2.5 miles northwest of the Study Area on March 6, 2015. The new nest occurred within a foothill pine on a hillslope surrounded by oak woodland, approximately 25 feet from a residential dwelling. This foothill pine died in late 2015. The eagles relocated to another foothill pine downhill from their first nest location in 2016, and this nest was not active in 2017. Per unprocessed CNDDB records, the nest was active in 2019 and 2020 with nestlings and shows that the territory remains active (CDFW 2020a).

No golden eagles were observed during the biological surveys of the Study Area. Although the Study Area is unlikely to provide suitable nest trees, the annual grassland provides suitable foraging habitat for this species. Therefore, this species has a *low* potential to occur within the Study Area.

Tricolored Blackbird

The tricolored blackbird is a colonial species that occurs in pastures, dry seasonal pools, and agricultural fields in the Central Valley and the surrounding foothills. This species usually nests within dense cattails (*Typha* sp.) or tules (*Scirpus* sp.) in emergent wetlands. Tricolored blackbird also nests in thickets of blackberry (*Rubus* sp.), wild rose (*Rosa* sp.), willows, and tall herbs (Zeiner et al. 1990). Nesting locations typically must be large enough to support a minimum colony of approximately fifty pairs (Zeiner et al. 1990). There are three CNDDB records for this species within five miles of the Study Area (CDFW 2020a). The seasonal marsh and surrounding riparian habitat is unlikely to provide suitable nesting habitat for this since the marsh is not large enough to support nesting colonies. The annual grassland provides suitable foraging habitat for this species. This species was not observed during the biological surveys of the Study Area. This species has a *low* potential to occur within the Study Area.

American Badger

American badgers are found in dry, open habitats including grassland and open woodland. Suitable burrowing habitat requires dry, sandy soil. Breeding occurs in summer and early fall, with young being born from March to April. There is a nearby CNDDB recorded occurrence from 2015 located 4.9 miles northwest of the Study Area and documents an individual badger killed on the road (CDFW 2020a). CDFW considers this species to be extant (CDFW 2020a), however there are no other nearby records of this species near the Study Area. The annual grassland provides habitat for this species, however, burrows from this species or excavations were not observed during the biological surveys and no American badgers were observed during the biological surveys. This species has a *low* potential to occur within the Study Area.

Special-Status Bats

California is home to several special-status bat species, including pallid bat (*Antrozous pallidus*) and silver-haired bat (*Lasionycteris noctivagans*). Bat numbers are in decline throughout the U.S. due to loss of roosting habitat, habitat conversion, and habitat alteration. There are no CNDDB records for bats within five miles of the Study Area (CDFW 2020a). No bats were observed roosting or foraging during the biological surveys. However, the riparian habitat and isolated trees within the annual grassland provide roosting habitat for these species. Special-status bats have a *low* potential to roost within the Study Area.

4.5 SENSITIVE HABITATS

Sensitive habitats include those that are of special concern to resource agencies or those that are protected under CEQA, Section 1600 of the California Fish and Game Code, and/or Sections 401 and 404 of the Clean Water Act. Additionally, sensitive habitats are protected under the specific policies outlined in the *El Dorado County General Plan*. Sensitive habitats known to occur onsite are seep-spring, seasonal wetlands, seasonal marsh within the ordinary high water mark of an intermittent drainage, ephemeral and intermittent drainages, riparian woodland, oak woodlands, and purple needlegrass grassland Figure 3.

4.5.1 Potential Jurisdictional Waters of the U.S. and State

Potential jurisdictional waters of the U.S. and State located in the Study Area were delineated in 2020 by HELIX (HELIX 2020a). A total of approximately 0.740 acre of aquatic resources were delineated within the Study Area. This acreage includes 0.133 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainage, and 0.360 acre of intermittent drainage. To date the USACE has verified the acreage in the northern portion of the Study Area, but not within the southern portion of the Study Area.

4.5.2 Riparian Habitat

A total of 0.77 acre of riparian habitat is located in the Study Area along the northwestern ephemeral drainage. Riparian areas, defined as the outermost bank or the edge of riparian vegetation, whichever is greater, may be subject CDFW jurisdiction under Section 1602 of the Fish and Game Code. Additionally, CDFW may exert jurisdiction over the drainages and other riverine aquatic features. CDFW should be consulted prior to disturbance or development to determine whether issuance of a Section 1602 Lake or Streambed Alteration Agreement is required.

4.5.3 Oak Trees and Oak Woodland

A total of 13 protected oak trees protected under Policy 7.4.5.2, consisting of eleven valley oaks (*Quercus lobata*), one interior live oak (*Quercus wislizeni*), and one blue oak (*Quercus douglasii*) are present in the Study Area (HELIX 2020b). Oak woodland habitat and individual oak trees are currently regulated under Section 7.4.4.4 of the *El Dorado County General Plan* based on canopy coverage. The Study Area is within the area covered by the *El Dorado Hills Specific Plan*, which generally describes preservation criteria for oak trees within designated open space areas.

4.5.4 Purple Needlegrass

Approximately 0.29 acre of purple needlegrass is interspersed within the annual grassland community within the Study Area. Purple needlegrass grassland is listed as a sensitive plant community on the CDFW Natural Communities List and is required to be considered in CEQA documents. In order for purple needlegrass grassland to be considered a natural community, at least five percent of the species is required as a characteristic to dominant species in the herbaceous layer and the species is usually greater than 10 percent relative cover of the herbaceous layer. These small mapped areas contain greater than 10 percent relative cover within the herbaceous layer (Figure 3). However, the small acreage dominated by purple needlegrass is contained within the larger annual grassland community and therefore is not considered a sensitive habitat due to its extremely limited distribution.

4.5.5 Wildlife Migration Corridors

Wildlife corridors link areas of suitable wildlife habitat that are otherwise separated by rugged terrain, changes in vegetation, or human disturbance. This fragmentation of habitat can also occur when a portion of one or more habitats is converted into another habitat; for instance, when woodland or scrub habitat is altered or converted into grasslands after a disturbance such as fire, mudslide, or construction activities. Wildlife corridors mitigate the effects of this fragmentation by: (1) allowing animals to move between remaining habitats thereby permitting depleted populations to be replenished and promoting genetic exchange; (2) providing escape routes from fire, predators, and human disturbances, thus reducing the risk of catastrophic events (such as fire or disease) on population or local species extinction; and (3) serving as travel routes for individual animals as they move within their home ranges in search of food, water, mates, and other needs. There are no wildlife migration corridors within the Study Area.

5.0 CONCLUSIONS AND RECOMMENDATIONS

Known or potential biological constraints in the Study Area include the following:

- Potential habitat for special-status plant species;
- Potential habitat for valley elderberry longhorn beetle;
- Potential habitat for western pond turtle;
- Potential habitat for coast horned lizard;
- Potential habitat for foothill yellow-legged frog;
- Potential habitat for western spadefoot;
- Potential foraging habitat for golden eagle;
- Potential foraging habitat for tricolored blackbird;
- Potential habitat for burrowing owl;
- Potential nesting sites and foraging habitat for raptors and other birds;
- Potential habitat for American badger;
- Potential habitat for special-status bat species including pallid bat and silver-haired bat; and
- Sensitive habitats, including potentially jurisdictional waters of the U.S. (seasonal wetlands, seep, wetland swale, and ephemeral and intermittent drainages), riparian habitat, and valley oak woodland.

5.1 RECOMMENDATIONS

5.1.1 Special-Status Plant Species

Botanical inventories were conducted on April 24, 2015, May 26, 2015, and June 16, 2015. No special-status plants were documented to occur within the Study Area. However, construction has not commenced within two years of the 2015 botanical inventories, therefore additional botanical inventories are recommended to ensure that populations have not established in the intervening years, in accordance with CDFW's plant protocols. In the event that focused surveys for special-status plants continue to be negative, no further measures are recommended. In the event that special-status plant species are found within the Study Area and they cannot be avoided by construction, a qualified botanist should prepare an avoidance and mitigation plan detailing protection and avoidance measures, transplanting procedures, success criteria, and long-term monitoring protocols for impacted plants. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for special-status plants.

5.1.2 Valley Elderberry longhorn Beetle

Although no VELB were observed, there is a low potential for VELB to be present in the Study Area due to two blue elderberry shrubs present within southern portion of the Study Area. However, under current guidance from the USFWS (USFWS 2017a), this species is not expected to be found above 500 feet in elevation. The elevation of the Study Area ranges from approximately 705 to 795 feet above MSL. Therefore, it is unlikely that this species would utilize the Study Area. In addition, the shrubs onsite showed no sign of exit holes. The 2017 guidance recommends consulting with the USFWS under these conditions. Based on the findings, it would be expected that the USFWS would determine that the Project would unlikely to affect VELB. However, if the USFWS were to find that the Project may affect VELB, the Project may be required to implement appropriate mitigation for impacts to elderberry shrubs within the Study Area which may include purchase of mitigation credits and transplantation of affected elderberry shrubs to an approved mitigation site.

5.1.3 Western Pond Turtle

The seasonal marsh habitat embedded within the intermittent drainage and surrounding uplands within the Study Area may be suitable habitat for western pond turtle and they are known to occur in the vicinity. Filling of these features could impact this species, if present. In addition, vegetation clearing and grading within the surrounding uplands could impact this species, if present.

A pre-construction survey for western pond turtle should be conducted within 14 days of the initiation of construction by a qualified biologist prior to any construction activity that would directly impact pond or stream habitat or disturb the ground within 300 feet of aquatic habitat. If no western pond turtles are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey or halts for more than 14 days a new survey should be conducted prior to reinitiating construction.

If western pond turtles are found during the pre-construction survey, then a qualified biological monitor should be onsite during initial clearing and grading within 300 feet of suitable aquatic habitat. The biological monitor will relocate any western pond turtles found within the construction footprint to suitable habitat away from the construction zone, but within the vicinity of the Study Area, if required.

In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the western pond turtle.

5.1.4 Coast Horned Lizard

The non-native annual grassland within the Study Area provides a low potential for coast horned lizard to occur given the lack of sandy soil. However, given that there is some potential for this species to occur within the Study Area, a pre-construction survey for coast horned lizard is recommended within 14 days prior to the start of ground disturbance. If no coast horned lizards are observed, then no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey or halts for more than 14 days, a new survey is recommended.

If coast horned lizards are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any coast horned lizards found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.1.5 Foothill Yellow-Legged Frog

The intermittent drainage and surrounding uplands within the Study Area provide marginal potential habitat for foothill yellow-legged frog. A qualified biologist should conduct a pre-construction survey of the drainages and uplands within 150 feet for foothill yellow-legged frog within 14 days prior to commencement of construction activities. If no foothill yellow-legged frog are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any foothill yellow-legged frog are found, agency consultation would be required to determine additional avoidance measures that might be required including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any foothill yellow-legged frog found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.1.6 Western Spadefoot

The annual grassland within the Study Area provides a low potential for upland aestivation habitat and the seasonal wetlands provide low quality breeding habitat for western spadefoot. A qualified biologist should conduct a pre-construction survey for western spadefoot within 14 days prior to commencement of construction activities. If no western spadefoot are observed, then a letter report documenting the results of the survey should be provided to the applicant for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If any western spadefoot are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of

construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of relocating any western spadefoot found within the construction footprint to suitable habitat away from the construction zone, but within the Study Area.

5.1.7 Golden Eagle

Although the Study Area is unlikely to provide suitable nesting habitat for this species, the annual grassland provides suitable foraging habitat for golden eagle. A map identifying suitable foraging habitat for golden eagle within a three-mile radius of the last known location of the nest, which includes the Study Area, is provided in Figure 4. There are over 3,900 acres of potential foraging habitat surrounding the nest, based on an assessment of current aerial photographs. The project will result in the removal of 27.71 acres of annual grassland. The removal of approximately 0.71 percent of foraging habitat would have no impact on this species. Therefore, no additional measures are recommended.

5.1.8 Tricolored Blackbird

Although the Study Area does not provide suitable nesting areas for a tricolored blackbird colony, the annual grassland provides suitable foraging habitat. There are currently no requirements for conservation or mitigation for tricolored blackbird foraging habitat. Therefore, no additional measures are recommended.

5.1.9 Burrowing Owl

Although burrowing owl has a low potential to occur within the annual grassland, given the lack of suitable burrows and that they were not observed during the protocol-level breeding and non-breeding season surveys (Foothill Associates 2016b) or any other biological surveys conducted within the Study Area, they are not currently considered to be present. However, the species could occupy the Study Area in the future. Therefore, the project proponent should conduct a take avoidance survey within 30 days prior to commencement of construction, in accordance with the 2012 *California Department of Fish and Wildlife Staff Report on Burrowing Owl Mitigation* (2012 Staff Report) (CDFW 2012). The survey area includes an approximately 500-foot (150-meter) buffer around the Study Area, where access is permitted. If the surveys are negative, then no additional measures are recommended.

If burrows are observed within 500 feet of the Study Area, an impact assessment should be prepared and submitted to CDFW, in accordance with the 2012 Staff Report. If it is determined that project activities may result in impacts to nesting, occupied, and satellite burrows and/or burrowing owl habitat, the project proponent should consult with CDFW and develop a detailed mitigation plan such that the habitat acreage, number of burrows, and burrowing owls impacted are replaced. The mitigation plan should be based on the requirements set forth in Appendix A of the 2012 Staff Report.

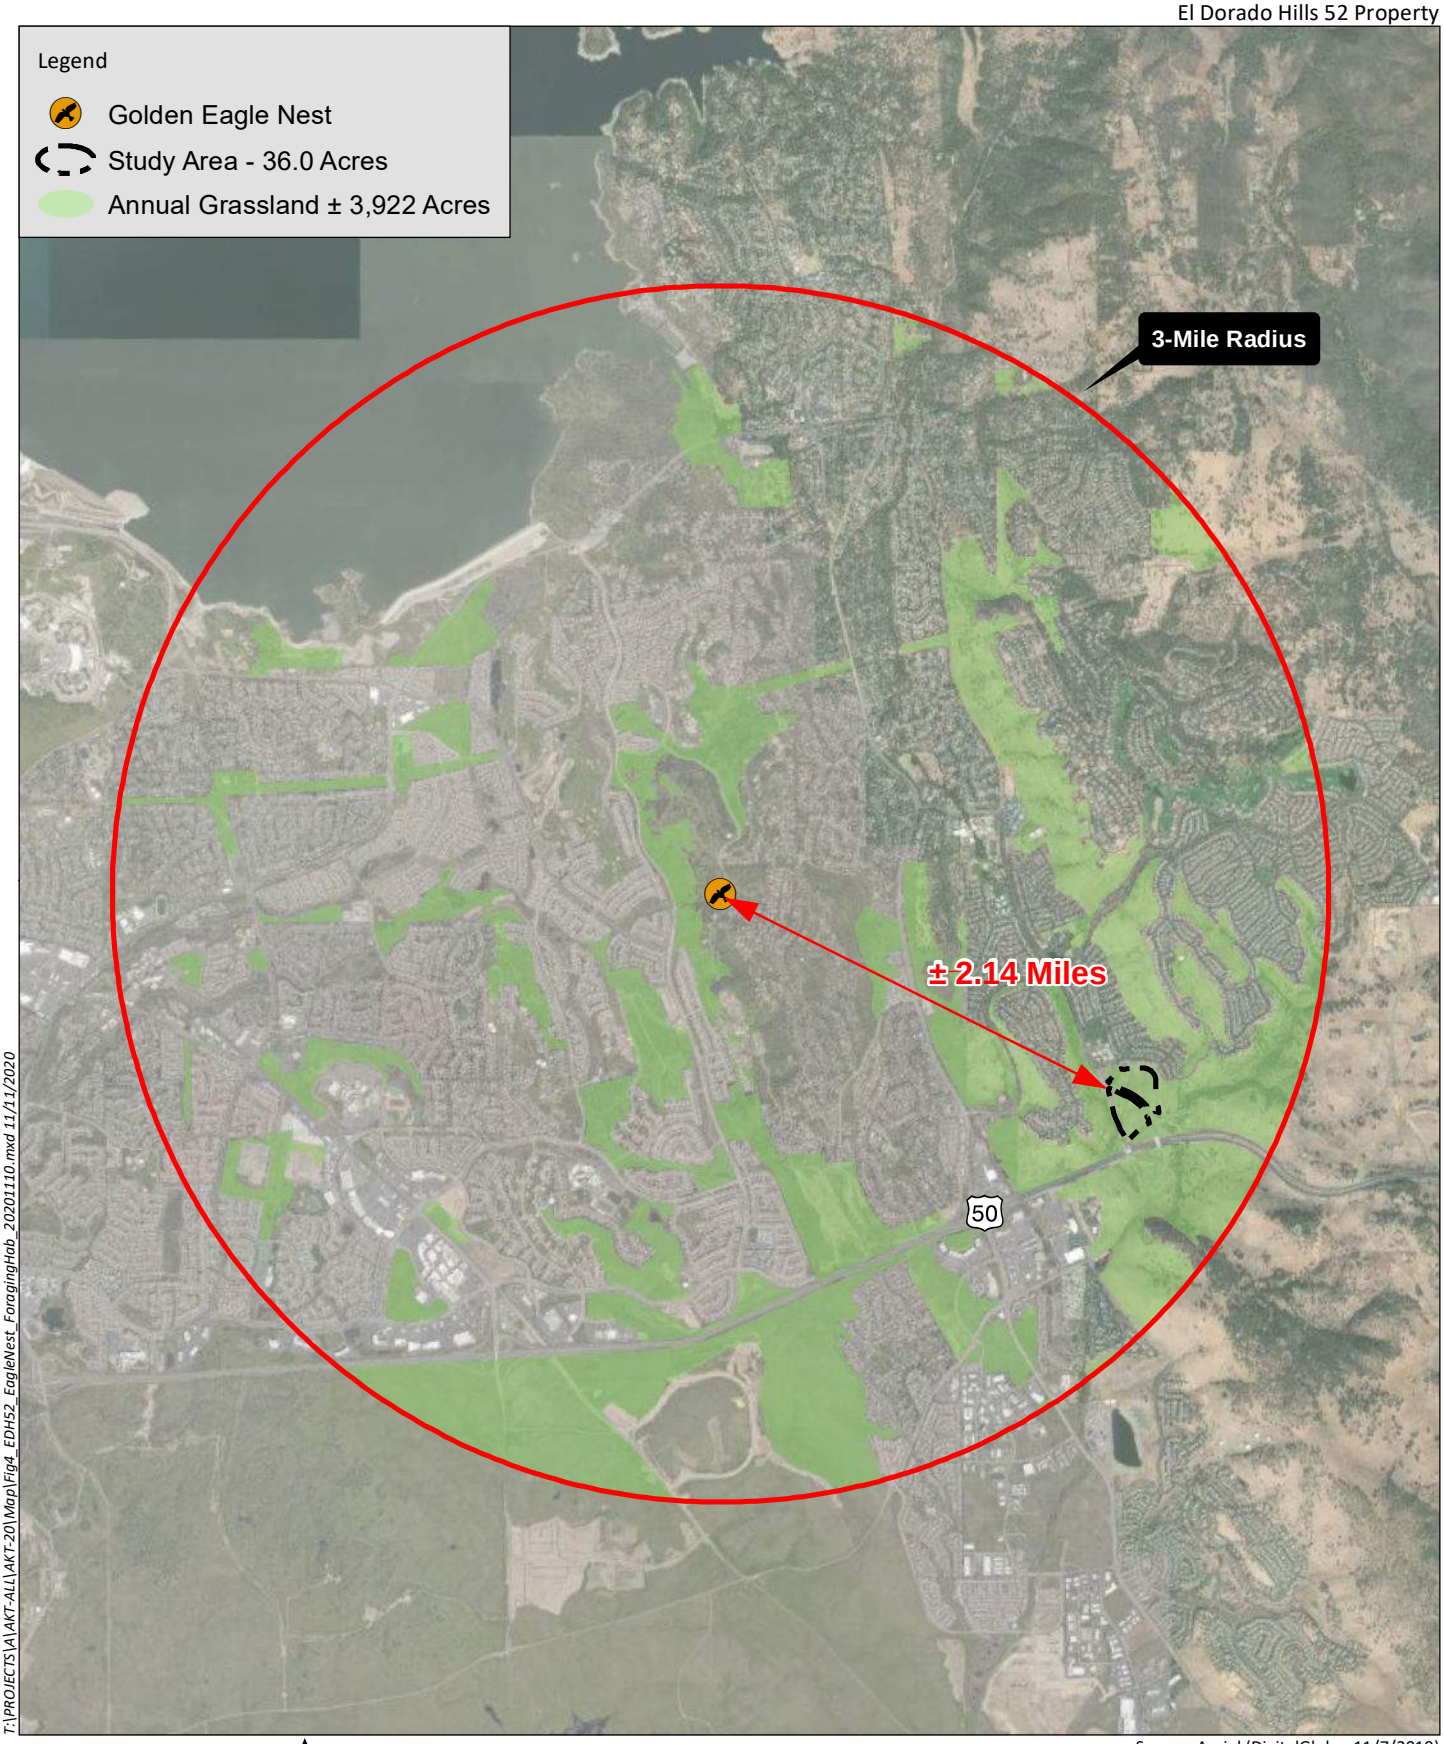
5.1.10 Nesting Migratory Birds and Raptors

Several species of raptors and other migratory birds may forage and nest in the Study Area, including the special-status species white-tailed kite, Cooper's hawk, golden eagle, ferruginous hawk, merlin, grasshopper sparrow, and purple martin. Active nests are protected by the California Fish and Game Code Section 3503.5 and the MBTA. Construction activities could result in disturbance of nest sites through temporary increases in ambient noise levels and increased human activity. In addition,

vegetation clearing operations, including pruning or removal of trees and shrubs, could impact nesting birds if these activities occur during the nesting season (February 15 to August 31). All vegetation clearing including removal of trees and shrubs should be completed between September 1 to February 14, if feasible.

If vegetation removal and grading activities begin during the nesting season (February 1 to August 31), a qualified biologist should conduct a pre-construction survey of the project footprint for active nests. Additionally, the surrounding 500 feet should be surveyed for active raptor nests where accessible. The pre-construction survey should be conducted within 14 days prior to commencement of ground-disturbing activities. If the pre-construction survey shows that there is no evidence of active nests, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If nests are found and considered to be active, the project biologist should establish buffer zones to prohibit construction activities and minimize nest disturbance until the young have successfully fledged. Buffer width will depend on the species in question, surrounding existing disturbances, and specific site characteristics, but may range from 20 feet for some songbirds to 250 feet for most raptors. If active nests are found within any trees slated for removal, then an appropriate buffer should be established around the trees and the trees should not be removed until a biologist determines that the nestlings have successfully fledged. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for the active avian nests. If construction activities are proposed to begin during the non-breeding season (September 1 through January 31), a survey is not required and no further studies are necessary.



5.1.11 American Badger

The annual grassland provides habitat for American badger. A qualified biologist should conduct a pre-construction survey for American badger within 14 days prior to the start of ground disturbance. If no American badgers are observed, then a letter report documenting the results of the survey should be provided to the project proponent for their records, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, a new survey is recommended.

If American badgers or their dens are found, additional avoidance measures are recommended including having a qualified biologist conduct a pre-construction survey within 24 hours prior to commencement of construction activities, performing a worker awareness training to all construction workers, and being present on the Study Area during grading activities for the purpose of temporarily halting construction activities until the biologist determines that the badger has left the construction footprint on its own accord.

5.1.12 Special-Status Bat Species

The existing riparian and oak woodlands provide potential roosting habitat for various bat species that occur in the vicinity of the Study Area. Removal of trees could impact bats should they be roosting in areas proposed for removal.

HELIX Environmental Planning

Annual Grassland for Golden Eagle Foraging Habitat Within the Vicinity of the Study Area

Figure 4

A qualified biologist should conduct a preconstruction survey within 14 days prior to clearing or grading operations and removal of trees. If no bats are observed, a letter report should be prepared to document the survey, and no additional measures are recommended. If construction does not commence within 14 days of the pre-construction survey, or halts for more than 14 days, an additional survey is required prior to starting work.

If special-status bat species are present and roosting on or within 100 feet of the Study Area, then the biologist should establish an appropriate buffer around the roost site. At minimum, no trees should be removed until the biologist has determined that the bat is no longer roosting in the tree. Additional mitigation measures for bat species, such as installation of bat boxes or alternate roost structures, would be recommended only if special-status bat species are found to be roosting within the project area. In addition, a pre-construction worker awareness training should be conducted alerting workers to the presence of and protections for various bat species.

5.1.13 Jurisdictional Waters

Since proposed construction activities will impact aquatic resources within the Study Area, a Section 404 permit should be obtained from the USACE and a Section 401 water quality certification and/or WDRs should be obtained from the RWQCB prior to the start of construction for any impacts to waters of the U.S. or State. Any waters of the U.S. or State or jurisdictional wetlands that would be lost or disturbed should be replaced or rehabilitated on a "no-net-loss" basis in accordance with the agency mitigation guidelines. Habitat restoration, rehabilitation, and/or replacement should be at a location and by methods agreeable to the agencies.

Water quality concerns during construction would be addressed through the preparation of a Storm Water Pollution Prevention Plan (SWPPP). SWPPPs are required in issuance of a NPDES construction discharge permit by the U.S. Environmental Protection Agency. Implementation of Best Management Practices (BMPs) during construction is standard in most SWPPPs. Examples of BMPs include stockpiling of debris away from regulated wetlands and waterways; immediate removal of debris piles from the site during the rainy season; use of silt fencing and construction fencing around regulated waterways; and use of drip pans under work vehicles and containment of fuel waste throughout the site during construction. If authorization for project-related activities within federally jurisdictional aquatic resources is required, Section 401 water quality certification from the Regional Water Quality Control Board would be required to certify compliance with State standards for maintaining water quality objectives. Alternately, WDRs are issued by the State Water Resources Control Board for activities impacting waters of the State.

The onsite drainages and associated riparian areas are likely subject to CDFW jurisdiction. Therefore, the project proponent should prepare a streambed alteration notification for submittal to CDFW documenting impacts to CDFW jurisdictional features (see Section 5.1.15).

5.1.14 Oak Trees and Oak Woodland

The Project would result in the removal of 11 protected oak trees. To mitigate for the biological resources impact associated with the loss of oak woodlands associated with the project, a combination of avoidance, protection, onsite replacement, where feasible, and offsite preservation or creation of oak woodland habitat is recommended. An Oak Resources Technical Report was prepared by HELIX in November of 2020 (HELIX 2020b). In that report, it was assumed that in lieu fees will be paid to

El Dorado County to offset project-related impacts to oak woodland and individual oak trees. Tree protection measures should be implemented around trees to remain in the Study Area as detailed in the project's Oak Resources Technical Report (HELIX 2020b).

5.1.15 Riparian Habitats

Riparian habitat and drainages within the Study Area are likely subject to CDFW jurisdiction. It is recommended that a Streambed Alteration Agreement application be submitted to CDFW, pursuant to Section 1600 of the Fish and Game Code, for any activities affecting the bed, bank or associated riparian vegetation of the onsite drainages. If required, the project applicant should coordinate with CDFW in developing appropriate mitigation, and should abide by the conditions of any executed permits.

5.2 SUMMARY OF AVOIDANCE AND MINIMIZATION MEASURES

Implementation of the following measures prior to development is recommended to minimize impacts to biological resources within the Study Area:

- Obtain a Section 404 Clean Water Act Permit, 401 Water Quality Certification or WDRs, and SAA for impacts to jurisdictional aquatic features and associated riparian habitat prior to the start of construction;
- Conduct updated focused botanical surveys for potentially occurring special-status plants;
- Conduct clearing and tree and shrub removal operations between September 1 and January 31 if feasible to minimize potential impacts to nesting birds;
- If construction begins during the nesting season (February 1 to August 31) conduct a pre-construction survey for active bird nests within the Study Area;
- Conduct a take avoidance survey for burrowing owl within 30 days prior to commencement of construction activities, in accordance with the 2012 Staff Report;
- Within 14 days prior to the initiation of construction activities, conduct a pre-construction survey for coast horned lizard, foothill yellow-legged frog, western pond turtle, American badger, and special-status bat species; and
- Implement the tree avoidance, maintenance, and mitigation measures as described in the Oak Resources Technical Report (HELIX 2020b).

Appendix A

Applicable Sections of the El Dorado County General Plan

This page intentionally left blank

El Dorado County General Plan

Conservation and Protection of Water Resources

GOAL 7.3: WATER QUALITY AND QUANTITY
Conserve, enhance, and manage water resources and protect their quality from degradation.

OBJECTIVE 7.3.1: WATER RESOURCE PROTECTION
Preserve and protect the supply and quality of the County's water resources including the protection of critical watersheds, riparian zones, and aquifers.

Policy 7.3.1.1 Encourage the use of Best Management Practices, as identified by the Soil Conservation Service, in watershed lands as a means to prevent erosion, siltation, and flooding.

Policy 7.3.1.2 Establish water conservation programs that include both drought tolerant landscaping and efficient building design requirements as well as incentives for the conservation and wise use of water.

Policy 7.3.1.3 The County shall develop the criteria and draft an ordinance to allow and encourage the use of domestic gray water for landscape irrigation purposes. (See Title 22 of the State Water Code and the Graywater Regulations of the Uniform Plumbing Code).

OBJECTIVE 7.3.2: WATER QUALITY
Maintenance of and, where possible, improvement of the quality of underground and surface water.

Policy 7.3.2.1 Stream and lake embankments shall be protected from erosion, and streams and lakes shall be protected from excessive turbidity.

Policy 7.3.2.2 Projects requiring a grading permit shall have an erosion control program approved, where necessary.

Policy 7.3.2.3 Where practical and when warranted by the size of the project, parking lot storm drainage shall include facilities to separate oils and salts from storm water in accordance with the recommendations of the Storm Water Quality Task Force's California Storm Water Best Management Practices Handbooks (1993).

Policy 7.3.2.4 The County should evaluate feasible alternatives to the use of salt for ice control on County roads.

Policy 7.3.2.5 As a means to improve the water quality affecting the County's recreational waters, enhanced and increased detailed analytical water quality studies and

monitoring should be implemented to identify and reduce point and non-point pollutants and contaminants. Where such studies or monitoring reports have identified sources of pollution, the County shall propose means to prevent, control, or treat identified pollutants and contaminants.

OBJECTIVE 7.3.3: WETLANDS

Protection of natural and man-made wetlands, vernal pools, wet meadows, and riparian areas from impacts related to development for their importance to wildlife habitat, water purification, scenic values, and unique and sensitive plant life.

Policy 7.3.3.1 *For projects that would result in the discharge of material to or that may affect the function and value of river, stream, lake, pond, or wetland features, the application shall include a delineation of all such features. For wetlands, the delineation shall be conducted using the U.S. Army Corps of Engineers (USACE) Wetland Delineation Manual*

Policy 7.3.3.2 *Intentionally blank*

Policy 7.3.3.3 *The County shall develop a database of important surface water features, including lake, river, stream, pond, and wetland resources.*

Policy 7.3.3.4 *The Zoning Ordinance shall be amended to provide buffers and special setbacks for the protection of riparian areas and wetlands. The County shall encourage the incorporation of protected areas into conservation easements or natural resource protection areas.*

Exceptions to riparian and wetland buffer and setback requirements shall be provided to permit necessary road and bridge repair and construction, trail construction, and other recreational access structures such as docks and piers, or where such buffers deny reasonable use of the property, but only when appropriate mitigation measures and Best Management Practices are incorporated into the project. Exceptions shall also be provided for horticultural and grazing activities on agriculturally zoned lands that utilize "best management practices (BMPs)" as recommended by the County Agricultural Commission and adopted by the Board of Supervisors.

Until standards for buffers and special setbacks are established in the Zoning Ordinance, the County shall apply a minimum setback of 100 feet from all perennial streams, rivers, lakes, and 50 feet from intermittent streams and wetlands. These interim standards may be modified in a particular instance if more detailed information relating to slope, soil stability, vegetation, habitat, or other site- or project-specific conditions supplied as part of the review for a specific project demonstrates that a different setback is necessary or would be sufficient to protect the particular riparian area at issue.

For projects where the County allows an exception to wetland and riparian buffers, development in or immediately adjacent to such features shall be planned so that impacts on the resources are minimized. If avoidance and minimization are not feasible, the County shall make findings, based on documentation provided by the project proponent, that avoidance and minimization are infeasible.

Policy 7.3.3.5 *Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.*

OBJECTIVE 7.3.4: DRAINAGE
Protection and utilization of natural drainage patterns.

Policy 7.3.4.1 *Natural watercourses shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site without disturbance.*

Policy 7.3.4.2 *Modification of natural stream beds and flow shall be regulated to ensure that adequate mitigation measures are utilized.*

OBJECTIVE 7.3.5: WATER CONSERVATION
Conservation of water resources, encouragement of water conservation, and construction of wastewater disposal systems designed to reclaim and re-use treated wastewater on agricultural crops and for other irrigation and wildlife enhancement projects.

Policy 7.3.5.1 *Drought-tolerant plant species, where feasible, shall be used for landscaping of commercial development. Where the use of drought-tolerant native plant species is feasible, they should be used instead of non-native plant species.*

Policy 7.3.5.2 *A list of appropriate local indigenous drought tolerant plant materials shall be maintained by the County Planning Department and made available to the public.*

Policy 7.3.5.3 *The County Parks and Recreation Division shall use drought tolerant landscaping for all new parks and park improvement projects.*

Policy 7.3.5.4 *Require efficient water conveyance systems in new construction. Establish a program of ongoing conversion of open ditch systems shall be considered for conversion to closed conduits, reclaimed water supplies, or both, as circumstances permit.*

Policy 7.3.5.5 *Encourage water reuse programs to conserve raw or potable water supplies consistent with State Law.*

Conservation of Biological Resources

GOAL 7.4: WILDLIFE AND VEGETATION RESOURCES
Identify, conserve, and manage wildlife, wildlife habitat, fisheries, and vegetation resources of significant biological, ecological, and recreational value.

OBJECTIVE 7.4.1: RARE, THREATENED, AND ENDANGERED SPECIES
The County shall protect State and federally recognized rare, threatened, or endangered species and their habitats consistent with Federal and State laws.

Policy 7.4.1.1 *The County shall continue to provide for the permanent protection of the eight sensitive plant species known as the Pine Hill endemics and their habitat through the establishment and management of ecological preserves consistent with County Code Chapter 17.71 and the USFWS's Gabbro Soil Plants for the Central Sierra Nevada Foothills Recovery Plan (USFWS 2002).*

Policy 7.4.1.2 *Private land for preserve sites will be purchased only from willing sellers.*

Policy 7.4.1.3 *Limit land uses within established preserve areas to activities deemed compatible. Such uses may include passive recreation, research and scientific study, and education. In conjunction with use as passive recreational areas, develop a rare plant educational and interpretive program.*

Policy 7.4.1.4 *Proposed rare, threatened, or endangered species preserves, as approved by the County Board of Supervisors, shall be designated Ecological Preserve (-EP) overlay on the General Plan land use map.*

Policy 7.4.1.5 *Species, habitat, and natural community preservation/conservation strategies shall be prepared to protect special-status plant and animal species and natural communities and habitats when discretionary development is proposed on lands with such resources unless it is determined that those resources exist, and either are or can be protected, on public lands or private Natural Resource lands.*

Policy 7.4.1.6 *All development projects involving discretionary review shall be designed to avoid disturbance or fragmentation of important habitats to the extent reasonably feasible. Where avoidance is not possible, the development shall be required to fully mitigate the effects of important habitat loss and fragmentation. Mitigation shall be defined in the Integrated Natural Resources Management Plan (INRMP) (see Policy 7.4.2.8 and Implementation Measure CO-M).*

The County Agricultural Commission, Plant and Wildlife Technical Advisory Committee, representatives of the agricultural community, academia, and other

stakeholders shall be involved and consulted in defining the important habitats of the County and in the creation and implementation of the INRMP.

Policy 7.4.1.7 The County shall continue to support the Noxious Weed Management Group in its efforts to reduce and eliminate noxious weed infestations to protect native habitats and to reduce fire hazards.

OBJECTIVE 7.4.2: IDENTIFY AND PROTECT RESOURCES
Identification and protection, where feasible, of critical fish and wildlife habitat including deer winter, summer, and fawning ranges; deer migration routes; stream and river riparian habitat; lake shore habitat; fish spawning areas; wetlands; wildlife corridors; and diverse wildlife habitat.

Policy 7.4.2.1 To the extent feasible in light of other General Plan policies and to the extent permitted by State law, the County of El Dorado will protect identified critical fish and wildlife habitat, as identified on the Important Biological Resources Map maintained at the Planning Department, through any of the following techniques: utilization of open space, Natural Resource land use designation, clustering, large lot design, setbacks, etc.

Policy 7.4.2.2 Where critical wildlife areas and migration corridors are identified during review of projects; the County shall protect the resources from degradation by requiring all portions of the Site that contain or influence said areas to be retained as non-disturbed natural areas through mandatory clustered development on suitable portions of the Site or other means such as density transfers if clustering cannot be achieved. The setback distance for designated or protected migration corridors shall be determined as part of the project's environmental analysis. The intent and emphasis of the Open Space land use designation and of the non-disturbance policy is to ensure continued viability of contiguous or interdependent habitat areas and the preservation of all movement corridors between related habitats. The intent of mandatory clustering is to provide a mechanism for natural resource protection while allowing appropriate development of private property. Horticultural and grazing projects on agriculturally designated lands are exempt from the restrictions placed on disturbance of natural areas when utilizing "Best Management Practices" (BMPs) recommended by the County Agricultural Commission and adopted by the Board of Supervisors when not subject to Policy 7.1.2.7.

Policy 7.4.2.3 Consistent with Policy 9.1.3.1 of the Parks and Recreation Element, low impact uses such as trails and linear parks may be provided within river and stream buffers if all applicable mitigation measures are incorporated into the design.

Policy 7.4.2.4 Establish and manage wildlife habitat corridors within public parks and natural resource protection areas to allow for wildlife use. Recreational uses within these areas shall be limited to those activities that do not require grading or vegetation removal.

Policy 7.4.2.5 Setbacks from all rivers, streams, and lakes shall be included in the Zoning Ordinance for all ministerial and discretionary development projects.

Policy 7.4.2.6 El Dorado County Biological Community Conservation Plans shall be required to protect, to the extent feasible, rare, threatened, and endangered plant species only when existing federal or State plans for non-jurisdictional areas do not provide adequate protection.

Policy 7.4.2.7 The County shall form a Plant and Wildlife Technical Advisory Committee to advise the Planning Commission and Board of Supervisors on plant and wildlife issues, and the committee should be formed of local experts, including agricultural, fire protection, and forestry representatives, who will consult with other experts with special expertise on various plant and wildlife issues, including representatives of regulatory agencies. The Committee shall formulate objectives which will be reviewed by the Planning Commission and Board of Supervisors.

Policy 7.4.2.8 Develop within five years and implement an Integrated Natural Resources Management Plan (INRMP) that identifies important habitat in the County and establishes a program for effective habitat preservation and management. The INRMP shall include the following components:

A. Habitat Inventory. This part of the INRMP shall inventory and map the following important habitats in El Dorado County:

1. *Habitats that support special-status species;*
2. *Aquatic environments including streams, rivers, and lakes;*
3. *Wetland and riparian habitat;*
4. *Important habitat for migratory deer herds; and*
5. *Large expanses of native vegetation.*

The County should update the inventory every three years to identify the amount of important habitat protected, by habitat type, through County programs and the amount of important habitat removed because of new development during that period. The inventory and mapping effort shall be developed with the assistance of the Plant and Wildlife Technical Advisory Committee, CDFW, and USFWS. The

inventory shall be maintained and updated by the County Planning Department and shall be publicly accessible.

B. *Habitat Protection Strategy. This component shall describe a strategy for protecting important habitats based on coordinated land acquisitions (see item D below) and management of acquired land. The goal of the strategy shall be to conserve and restore contiguous blocks of important habitat to offset the effects of increased habitat loss and fragmentation elsewhere in the county. The Habitat Protection Strategy should be updated at least once every five years based on the results of the habitat monitoring program (item F below). Consideration of wildlife movement will be given by the County on all future 4- and 6-lane roadway construction projects. When feasible, natural undercrossings along proposed roadway alignments that could be utilized by terrestrial wildlife for movement will be preserved and enhanced.*

C. *Mitigation Assistance. This part of the INRMP shall establish a program to facilitate mitigation of impacts to biological resources resulting from projects approved by the County that are unable to avoid impacts on important habitats. The program may include development of mitigation banks, maintenance of lists of potential mitigation options, and incentives for developers and landowner participation in the habitat acquisition and management components of the INRMP.*

D. *Habitat Acquisition. Based on the Habitat Protection Strategy and in coordination with the Mitigation Assistance program, the INRMP shall include a program for identifying habitat acquisition opportunities involving willing sellers. Acquisition may be by state or federal land management agencies, private land trusts or mitigation banks, the County, or other public or private organizations. Lands may be acquired in fee or protected through acquisition of a conservation easement designed to protect the core habitat values of the land while allowing other uses by the fee owner. The program should identify opportunities for partnerships between the County and other organizations for habitat acquisition and management. In evaluating proposed acquisitions, consideration will be given to site specific features (e.g., condition and threats to habitat, presence of special-status species), transaction related features (e.g., level of protection gained, time frame for purchase completion, relative costs), and regional considerations (e.g., connectivity with adjacent protected lands and important habitat, achieves multiple agency and community benefits). Parcels that include important habitat and are located generally to the west of the El Dorado National Forest should be given priority for acquisition. Priority will also be given to parcels that would preserve natural wildlife movement corridors such as*

crossing under major roadways (e.g., U.S. Highway 50 and across canyons). All land acquired shall be added to the Ecological Preserve overlay area.

E. *Habitat Management. Each property or easement acquired through the INRMP should be evaluated to determine whether the biological resources would benefit from restoration or management actions. Examples of the many types of restoration or management actions that could be undertaken to improve current habitat conditions include: removal of non-native plant species, planting native species, repair and rehabilitation of severely grazed riparian and upland habitats, removal of culverts and other structures that impede movement by native fishes, construction of roadway under and overcrossing that would facilitate movement by terrestrial wildlife, and installation of erosion control measures on land adjacent to sensitive wetland and riparian habitat.*

F. *Monitoring. The INRMP shall include a habitat monitoring program that covers all areas under the Ecological Preserve overlay together with all lands acquired as part of the INRMP. Monitoring results shall be incorporated into future County planning efforts so as to more effectively conserve and restore important habitats. The results of all special-status species monitoring shall be reported to the CNDDB. Monitoring results shall be compiled into an annual report to be presented to the Board of Supervisors.*

G. *Public Participation. The INRMP shall be developed with and include provisions for public participation and informal consultation with local, state, and federal agencies having jurisdiction over natural resources within the County.*

H. *Funding. The County shall develop a conservation fund to ensure adequate funding of the INRMP, including habitat maintenance and restoration. Funding may be provided from grants, mitigation fees, and the County general fund. The INRMP annual report described under item F above shall include information on current funding levels and shall project anticipated funding needs and anticipated and potential funding sources for the following five years.*

Policy 7.4.2.9 *The Important Biological Corridor (-IBC) overlay shall apply to lands identified as having high wildlife habitat values because of extent, habitat function, connectivity, and other factors. Lands located within the overlay district shall be subject to the following provisions except that where the overlay is applied to lands that are also subject to the Agricultural District (-A) overlay or that are within the Agricultural Lands (AL) designation, the land use restrictions associated with the -IBC policies will not apply to the extent that the agricultural practices do not interfere with the purposes of the -IBC overlay.*

- *Increased minimum parcel size;*
- *Higher canopy-retention standards and/or different mitigation standards/thresholds for oak woodlands;*
- *Lower thresholds for grading permits;*
- *Higher wetlands/riparian retention standards and/or more stringent mitigation requirements for wetland/riparian habitat loss;*
- *Increased riparian corridor and wetland setbacks;*
- *Greater protection for rare plants (e.g., no disturbance at all or disturbance only as recommended by U.S. Fish and Wildlife Service/California Department of Fish and Wildlife);*
- *Standards for retention of contiguous areas/large expanses of other (non-oak or non-sensitive) plant communities;*
- *Building permits discretionary or some other type of "site review" to ensure that canopy is retained;*
- *More stringent standards for lot coverage, floor area ratio (FAR), and building height; and*
- *No hindrances to wildlife movement (e.g., no fences that would restrict wildlife movement).*

The standards listed above shall be included in the Zoning Ordinance.

Wildland Fire Safe measures are exempt from this policy, except that Fire Safe measures will be designed insofar as possible to be consistent with the objectives of the Important Biological Corridor.

OBJECTIVE 7.4.3: COORDINATION WITH APPROPRIATE AGENCIES
Coordination of wildlife and vegetation protection programs with appropriate federal and State agencies.

OBJECTIVE 7.4.5: NATIVE VEGETATION AND LANDMARK TREES
Protect and maintain native trees including oaks and landmark and heritage trees.

Policy 7.4.5.1 A tree survey, preservation, and replacement plan shall be required to be filed with the County prior to issuance of a grading permit for discretionary permits on all high-density residential, multifamily residential, commercial, and industrial projects. To ensure that proposed replacement trees survive, a mitigation monitoring plan should be incorporated into discretionary projects when applicable and shall include provisions for necessary replacement of trees.

Policy 7.4.5.2 It shall be the policy of the County to preserve native oaks wherever feasible, through the review of all proposed development activities where such trees are present on either public or private property, while at the same time recognizing individual rights to develop private property in a reasonable manner. To ensure that oak tree loss is reduced to reasonable acceptable levels, the County shall develop and implement an Oak Tree Preservation Ordinance that includes the following components:

A. Oak Tree Removal Permit Process. Except under special exemptions, a tree removal permit shall be required by the County for removal of any native oak tree with a single main trunk of at least 6 inches diameter at breast height (dbh), or a multiple trunk with an aggregate of at least 10 inches dbh. Special exemptions when a tree removal permit is not needed shall include removal of trees less than 36 inches dbh on 1) lands in Williamson Act Contracts, Farmland Security Zone Programs, Timber Production Zones, Agricultural Districts, designated Agricultural Land (AL), and actions pursuant to a Fire Safe plan; 2) all single family residential lots of one acre or less that cannot be further subdivided; 3) when a native oak tree is cut down on the owner's property for the owner's personal use; and 4) when written approval has been received from the County Planning Department. In passing judgment upon tree removal permit applications, the County may impose such reasonable conditions of approval as are necessary to protect the health of existing oak trees, the public and the surrounding property, or sensitive habitats. The County Planning Department may condition any removal of native oaks upon the replacement of trees in kind. The replacement requirement shall be calculated based upon an inch for inch replacement of removed oaks. The total of replacement trees shall have a combined diameter of the tree(s) removed. Replacement trees may be planted onsite or in other areas to the satisfaction of the County Planning Department. The County may also condition any tree removal permit that would affect sensitive habitat (e.g., valley oak woodland), on preparation of a Biological Resources Study and an Important Habitat Mitigation Program as described in Policy 7.4.1.6. If an application is denied, the County shall provide written notification, including the reasons for denial, to the applicant.

B. Tree Removal Associated with Discretionary Project. Any person desiring to remove a native oak shall provide the County with the following as part of the project application:

- *A written statement by the applicant or an arborist stating the justification for the development activity, identifying how trees in the vicinity of the project or construction site will be protected and stating*

that all construction activity will follow approved preservation methods;

- *A site map plan that identifies all native oaks on the project site; and*
- *A report by a certified arborist that provides specific information for all native oak trees on the project site.*

C. *Commercial Firewood Cutting. Fuel wood production is considered commercial when a party cuts firewood for sale or profit. An oak tree removal permit shall be required for commercial firewood cutting of any native oak tree. In reviewing a permit application, the Planning Department shall consider the following:*

- *Whether the trees to be removed would have a significant negative environmental impact;*
- *Whether the proposed removal would not result in clear-cutting, but will result in thinning or stand improvement;*
- *Whether replanting would be necessary to ensure adequate regeneration;*
- *Whether the removal would create the potential for soil erosion;*
- *Whether any other limitations or conditions should be imposed in accordance with sound tree management practices; and*
- *What the extent of the resulting canopy cover would be.*

D. *Penalties. Fines will be issued to any person, firm, or corporation that is not exempt from the ordinance who damages or destroys an oak tree without first obtaining an oak tree removal permit. Fines may be as high as three times the current market value of replacement trees as well as the cost of replacement, and/or replacement of up to three times the number of trees required by the ordinance. If oak trees are removed without a tree removal permit, the County Planning Department may choose to deny or defer approval of any application for development of that property for a period of up to 5 years. All monies received for replacement of illegally removed or damaged trees shall be deposited in the County's Integrated Natural Resources Management Plan (INRMP) conservation fund.*

Preservation of Open Space

GOAL 7.6: OPEN SPACE CONSERVATION

Conserve open space land for the continuation of the County's rural character, commercial agriculture, forestry and other productive uses, the enjoyment of scenic beauty and recreation, the protection of natural resources, for protection from natural hazards, and for wildlife habitat.

OBJECTIVE 7.6.1: IMPORTANCE OF OPEN SPACE

Consideration of open space as an important factor in the County's quality of life.

Policy 7.6.1.1 *The General Plan land use map shall include an Open Space land use designation. The purpose of this designation is to implement the goals and objectives of the Land Use and the Conservation and Open Space Elements by serving one or more of the purposes stated below. In addition, the designations on the land use map for Rural Residential and Natural Resource areas are also intended to implement said goals and objectives. Primary purposes of open space include:*

A. Conserving natural resource areas required for the conservation of plant and animal life including habitat for fish and wildlife species; areas required for ecologic and other scientific study purposes; rivers, streams, banks of rivers and streams and watershed lands;

B. Conserving natural resource lands for the managed production of resources including forest products, rangeland, agricultural lands important to the production of food and fiber; and areas containing important mineral deposits;

C. Maintaining areas of importance for outdoor recreation including areas of outstanding scenic, historic and cultural value; areas particularly suited for park and recreation purposes including those providing access to lake shores, beaches and rivers and streams; and areas which serve as links between major recreation and open space reservations including utility easements, banks of rivers and streams, trails and scenic highway corridors;

D. Delineating open space for public health and safety including, but not limited to, areas which require special management or regulation because of hazardous or special conditions such as earthquake fault zones, unstable soil areas, flood plains, watersheds, areas presenting high fire risks, areas required for the protection of water quality and water reservoirs, and areas required for the protection and enhancement of air quality; and

E. Providing for open spaces to create buffers which may be landscaped to minimize the adverse impact of one land use on another.

Policy 7.6.1.2 *The County will provide for Open Space lands through:*

A. The designation of land as Open Space;

B. The designation of land for low-intensity land uses as provided in the Rural Residential and Natural Resource land use designations;

C. *Local implementation of the Federal Emergency Management Agency's National Flood Insurance Program;*

D. *Local implementation of the State Land Conservation Act Program; and*

E. *Open space land set aside through Planned Developments (PDs).*

Policy 7.6.1.3 The County shall implement Policy 7.6.1.1 through zoning regulations and the administration thereof. It is intended that certain districts and certain requirements in zoning regulations carry out the purposes set forth in Policy 7.6.1.1 as follows:

A. *The Open Space (OS) Zoning District is consistent with and shall implement the Open Space designation of the General Plan land use map and all other land use designations.*

B. *The Agricultural (A), Exclusive Agricultural (AE), Planned Agricultural (PA), Select Agricultural (SA-10), and Timberland Production Zone (TPZ) zoning districts are consistent with Policy 7.6.1.1 and serve one or more of the purposes set forth therein.*

C. *Zoning regulations shall provide for setbacks from all flood plains, streams, lakes, rivers and canals to maintain Purposes A, B, C, and D set forth in Policy 7.6.1.1.*

D. *Zoning regulations shall provide for maintenance of permanent open space in residential, commercial, industrial, agricultural, and residential agricultural zone districts based on standards established in those provisions of the County Code. The regulations shall minimize impacts on wetlands, flood plains, streams, lakes, rivers, canals, and slopes in excess of 30 percent and shall maintain Purposes A, B, C, and D in Policy 7.6.1.1.*

E. *Landscaping requirements in zoning regulations shall provide for vegetative buffers between incompatible land uses in order to maintain Purpose E in Policy 7.6.1.1.*

F. *Zoning regulations shall provide for Mineral Resource Combining Zone Districts and/or other appropriate mineral zoning categories which shall be applied to lands found to contain important mineral deposits if development of the resource can occur in compliance with all other policies of the General Plan. Those regulations shall maintain Purposes A, B, C, D, and E of Policy 7.6.1.1.*

Policy 7.6.1.4 The creation of new open space areas, including Ecological Preserves, common areas of new subdivisions, and recreational areas, shall include wildfire safety planning.

El Dorado Hills Specific Plan

1.4.1.1 Site Development and Grading

The policies set forth in the Specific Plan are intended to maintain, to the maximum extent possible, the natural land forms and to exercise control over vegetation removal, landscaping, and grading. Grading controls are intended to reduce soil erosion to a minimum to ensure capability with adjacent terrain.

a) *Grading for roadways, driveways, building pads, and onsite improvements shall be minimized.*

b) *Grading volumes of cut-and-fill material shall be minimized and balanced onsite wherever possible. Larger grading volumes may be acceptable where improved visual and environmental effects would result.*

c) *Residential structures or accessory structures on slopes in access of 20 percent shall be carefully designed through use of erosion controls, engineered grading, and use of post and beam or step-footing construction to ensure long-term slope stability. Benched hillsides for building sites shall be avoided and split-level structures encouraged.*

d) *A plan to minimize impact to oak trees shall be submitted to the El Dorado County Community Development Department prior to approval of any tentative map. The plan will include, at a minimum, the locations and sizes of individual trees that should not be impacted.*

e) *A minimum of 20 percent of all roadside trees and parking lot trees shall be native oaks.*

f) *Removal of oak trees and other large native trees with trunk circumferences of 25 inches at 4.5 feet above grade shall be avoided where feasible. A tree replacement policy is provided in the Design Guidelines on file with the County of El Dorado.*

g) *To avoid damage to root systems of retained trees, residential construction shall not occur within the canopy area of oak trees over 30 inches in circumference at breast height, and shall be subject to review as provided in the Design Guidelines.*

h) *Landscaping in improved common areas shall be of drought-resistant varieties.*

i) *To preserve the vegetative character of the Plan Area, the planting of native trees, shrubs, and ground cover shall be encouraged in all new landscaping.*

j) *Landscaping in areas adjacent to natural open spaces shall be fire resistant.*

k) *Site design, building orientation, and street and lot patterns shall follow solar orientation principles to the maximum extent practicable to maximize energy conservation.*

l) Archaeological test excavations for selected locations within the Plan Area shall be required as a condition of approval of tentative subdivision maps.

m) As part of the tentative map approval, areas having expansive clays and seasonably wet areas shall be identified by a geotechnical engineer. Such areas, if deemed to be potential construction hazards, shall be subject to further evaluation and identification to determine appropriate mitigation measures.

n) To the maximum extent feasible, development shall be sited and designed to avoid impacts to culturally significant sties identified by the Final EIR for the Plan Area as EDH-26 and EDH-29.

o) Where feasible, and given the physical constraints of the Plan Area, subdivisions and other new development shall be designed to facilitate solar use as a means of reducing total energy consumption. The design elements that shall be considered include:

- *Solar orientation*
- *Shade Control*
- *Wind Management*
- *Solar access*

p) The Design Guidelines shall be one of the implementation measures of the Specific Plan.

1.4.1.2 Development Near Native Oak Trees

These guidelines are for the protection of healthy oak trees that will remain after construction in developed areas. The term circumference is breast height (CBH) refers to the trunk measurement of either one trunk or the addition of all trunks in a multi-trunked tree. The respective measure in circumference would also apply. Also refer to **Section 3.10** for Oak Tree Preservation Guidelines.

a) Protect all oak trees larger than 25 inches CBH o the maximum extent feasible. Priority will be given to oaks larger than 56 inches CBH.

b) Trees to be saved will be surrounded by a barrier or fence installed at the dripline and flagged.

c) Pruning of limbs will be confined to low-hanging branches over roads and sidewalks, and large branches that are weak or may reasonably appear to pose a safety hazard. Pruning paint will not be used under any circumstances. Pruning cuts will be made cleanly to avoid damaged to the "bark ridge" tissue of adjacent limbs.

d) The El Dorado County Planning Department will be responsible for enforcement of oak tree protection during construction.

e) In development areas, no oak trees larger than 25 inches CBH will be removed until a site survey and inspection report is performed.

1.4.1.5 Vegetation and Fire Hazards

In areas of planned development:

a) All potentially dry herbaceous vegetation will be mowed or disked within a 50-foot radius of all construction site activity.

b) Disking or mowing will be done to keep herbaceous vegetation under 3 inches in height at all construction sites.

c) No construction equipment or vehicles will be allowed within 50 feet of the unmowed perimeter.

d) Firebreaks will be installed by disking or mowing a trail that is satisfactory to the El Dorado Hills Fire Development. Mowing is preferred to disking or scraping because the latter two practices promote invasion of noxious weed species on fire trails.

e) Temporary or permanent firebreaks will be installed on all ridgelines, crossing all areas in the vicinity of construction and grading activity, prior to beginning work.

f) Firebreak installation will avoid the removal of native oaks and other native trees.

1.4.8 Natural Open Space Policies

The Natural Open Space Policies are to guide the preservation, management, and maintenance of these areas in relation to adjacent land uses.

1.4.8.1 General Policies

a) The boundaries of natural open space shall blend with the boundaries of the development as to enhance the integration of open space and developed areas.

b) Perimeter fencing may be permitted for rural parcels as provided in the El Dorado County Design Guidelines and CC&Rs.

c) Increased runoff from adjacent development will require erosion control measures to be coordinated with landscape design of adjacent development areas. Emphasis shall be placed on methods that rely on natural drainage systems and minimize change to the existing condition of creek channels within open space areas.

d) An Open Space Management Plan shall be completed and submitted to the El Dorado County Community Development Department prior to approval of any tentative map creating open space. It shall be an implementation mechanism of the Specific Plan in order to set forth procedures and responsibilities as to the ownership, preservation, and management of public and private natural open space areas. The Open Space Management Plan shall consider dedication to the County of El Dorado of easements

over the public open space areas, should dedication of fee ownership of these areas be made to any other entity. The open space plan shall be reviewed by the El Dorado Hills Fire Department. The plan shall also include, at a minimum:

1. *The locations of fire access roads, fuel breaks, and passive recreation trails.*
2. *Control burning techniques.*
3. *Guidelines established in the Open Space Guidelines for El Dorado County*
4. *Investigation of opportunities for wildlife use of water in open space areas as a part of ongoing wildlife maintenance.*

1.4.8.2 Riparian and Other Drainageway Policies

A 200-foot-wide undeveloped buffer zone shall be established along Carson Creek in accordance with California Department of Fish and Wildlife requirements. In this buffer, vegetation removal shall be for the purpose of drainage improvements. In consideration of setback reductions for purposes of a gold course, the County shall consider such mitigation measures as additional plantings, erosion controls, and other habitat improvement and protection steps.

a) *Drainageway easements shall specifically preclude erection of structures and vegetation removal, except for drainage improvements, and shall forestall other site development not consistent with the purpose of these areas.*

b) *Drainageways located on privately owned property shall be placed within recorded easements that provide for routine maintenance and pedestrian access.*

c) *A 100-foot-wide buffer (50 feet horizontal on each side as measured from centerline of the creek) of natural vegetation shall be maintained along all intermittent creeks.*

d) *Grazing shall not be allowed in riparian buffer zones.*

e) *Plantings of riparian trees and shrubs shall be situated according to the flood and soil moisture tolerances of individual species as in Appendix C of the Specific Plan.*

f) *Areas disturbed during construction shall be replanted with native riparian species listed in Appendix C of the Specific Plan. Replanting will include a mandatory 3-year maintenance and irrigation period.*

g) *Riparian vegetation on the golf course areas shall be kept naturally dense and unpruned except where needed for crossings, ball pay passages, and personal and fire safety.*

h) *Pedestrian, vehicular, and utility bridges over creeks, if feasible, will be oriented at right angles to the waterway to minimize loss of vegetation.*

i) The capacity of flow under bridges and culverts will be designed to reduce the need for extensive vegetation clearing near the structures.

j) Periodic vegetation removal to ensure adequate floodway capacity in drainages will be performed to promote an overstory of mature individual riparian trees spaced to accommodate designed flows.

El Dorado Hills Community Services District Policies

5.27 Oak Tree Preservation

5.27.3 General Requirements for Development Activity in the Protected Zone of Protected Trees

The importance of oak tree preservation is recognized with tree protection provisions in the Covenants, Conditions, and Restrictions (CC&Rs) of the most units in El Dorado Hills and in County Code 17.73 titled Oak Woodland Conservation prior to initiating any activity that may affect an oak tree on their land or on that of an adjoining property, owners of property in El Dorado Hills should check their CC&Rs carefully to determine whether Design Review Committee (DRC) approval is required.

5.27.4 Removal of Protected Trees

It shall be the policy of the DRC to preserve protected trees wherever feasible while recognizing individual rights to develop private property in a reasonable manner. It shall be the responsibility of the applicant to demonstrate the need for any oak tree removal. In determining whether to approval the removal or major trimming of a protected tree, the DRC will consider the following listed factors and, depending upon particular circumstances, may consider others which are not listed:

a) The degree to which the tree will be an obstacle to approval development activity.

b) The condition of the tree with respect to disease, general health, damage, danger of falling.

c) The effect removal would have upon safety, public health, remaining trees, and the beauty and general welfare of the area.

d) The effect removal would have upon soil stability, erosion, particularly near water courses and on slopes.

e) Present and future shade effect with respect to cooling and solar power/heating.

f) Whether or not there are feasible alternative measures to removal.

g) Applicants may be required to provide an arborist report from an arborist who would not be performing any eventual tree removal or major limbing. Alternatively, and it is discretion the DRC may employ an arborist of its choice.

5.27.5 Protecting Oak Trees During Development Activity

Property owners are responsible for taking the following measures to protect oak trees, except any approval from removal during development activity.

a) *Erect protective orange "ski fencing" around the protected zone of each protected tree or group of trees within 50 feet of development activity prior to initiating work and excluded from the enclosed protected zone any work related activity such as storage and vehicle parking.*

b) *Exert every reasonable effort to preserve undisturbed the natural ground within protected zones.*

c) *If it is absolutely necessary to trench within a protected zone, if boring or drilling would not be feasible, excavate by hand under the supervision of a certified arborist. Do not cut any root larger than two inches in diameter; keep the exposed root moist and cover with soil as quickly as feasible. Sever small roots neatly, trim and cover quickly.*

d) *Make no grade changed within the protected zone unless specifically indicated in the approved plans.*

5.27.6 Mitigation EDHCSD Tree Preservation Fund, Public Education

In the event the owner of property with protected trees removed or significantly damages one or more of them without approval, the DRC, at its discretion, may require mitigation by planting a proportionate number of diameter inches of replacement oak trees on the owner's property or by assessing a fee at the rate of $200 per diameter inch (amount tripled for unapproved removal of a landmark tree) to compensate for the expense of planting a proportionate number of diameter inches of oak trees on public property or by a combination of these alternatives.

In the event the owner of the property with protection trees applies for approval of a protect that will damage protected trees, and the DRC determines they could be reasonably be preserved, the DRC, at its sole discretion, may offer the applicant the option of an approval in exchange for on-site mitigation or payment of a mitigation fee based upon the number of diameter inches that applicant would remove.

Mitigation fees paid by property owners are held by the EDHCSD in a Tree Preservation Fund until used to cover the expense of mitigation planting or for related purposes. It is widely recognized that the loss of oak tree is partly the result of the lack of public awareness on oak preservation. A portion of the funds collected for mitigation may be used to establish and promote educational programs to improve this situation.

Regionally Occurring Listed and Special-Status Species

This page intentionally left blank

Appendix B
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Plants			
Allium jepsonii Jepson's onion	--/--/1B.2	A perennial bulbiferous herb found in serpentinite or volcanic soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms April – August (CNPS 2020).	**None. S**uitable serpentinite and volcanic soils are absent from the Study Area.
Allium sanbornii var. *sanbornii* Jepson's onion	--/--/4.2	A perennial bulbiferous herb found in serpentinite and gravelly soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms May – September (CNPS 2020).	**None.** Suitable serpentinite soils are absent from the Study Area.
Balsamorhiza macrolepis big-scale balsamroot	--/--/1B.2	A perennial herb found on slopes in chaparral, cismontane woodland, and valley and foothill grassland, sometimes in serpentine soil. Elevation range 45 – 1,555 meters. Blooms March – June (CNPS 2020).	**None.** Annual grassland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in April, May and June of 2015.
Brodiaea rosea ssp. *vallicola* valley broadiaea	--/--/4.2	A perennial bulbiferous herb found in old alluvial terraces, silty, sandy, and gravelly loam soils and occurs in swales of valley and foothill grassland and vernal pools. Blooms April – May (June) (CNPS 2020).	**None.** Suitable soils and vernal pools are absent from the Study Area.
Calandrinia breweri Brewer's calandrinia	--/--/4.2	An annual herb found in sandy or loamy, disturbed sites of burns and occurs in chaparral and coastal scrub. Blooms (January) March – June (CNPS 2020).	**None.** Suitable habitat is absent from the Study Area.
Calystegia stebbinsii Stebbin's morning-glory	FE/SE/1B.1	A perennial rhizomatous herb found in gabbroic or serpentinite soils and occurs in chaparral openings and cismontane woodland. Blooms April – July (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Carex xerophila chaparral sedge	--/--/1B.2	A perennial herb found in gabbroic and serpentinite soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms March – June (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.
Ceanothus fresnensis Fresno ceanothus	--/--/4.3	A perennial evergreen shrub that occurs in openings of cismontane woodland and lower montane coniferous forest. Blooms May – July (CNPS 2020).	**None.** The Study Area occurs outside of the known elevation range for this species.
Ceanothus roderickii Pine Hill ceanothus	FE/--/1B.1	A perennial evergreen shrub found in serpentinite or nutrient-deficient forms of gabbro-derived soils characterized by low concentrations of available K, P, S, Fe, and Zn. Occurs in chaparral and cismontane woodland. Blooms April – June (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area. Additionally, this species would have been identifiable during the survey if it were present since it is an evergreen shrub.
Chlorogalum grandiflorum Red Hills soaproot	--/--/1B.2	A perennial bulbiferous herb found in serpentinite, gabbroic, and other soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms May – June (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.
Clarkia biloba ssp. *brandegeeae* Brandegee's clarkia	--/--/4	Annual herb found often in roadcuts within chaparral, cismontane woodland, and lower montane coniferous forest from 75 to 915 meters.	**Low.** The woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).
Claytonia parviflora ssp. *grandiflora* streambank spring beauty	--/--/4.2	An annual herb found in rocky soils and occurs in cismontane woodland. Blooms February – May (CNPS 2020).	**None.** The Study Area does not provide habitat for this species and is outside of the known elevational range.
Crocanthemum suffrutescens Bisbee Peak rush-rose	--/--/3.2	Perennial evergreen shrub often found on gabbroic or lone soil and often in burned or disturbed areas within chaparral from 75 to 670 meters.	**None.** Suitable Ione or gabbroic soils are absent from the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Downingia pusilla dwarf downingia	--/--/-2B.2	An annual herb that occurs in mesic valley and foothill grassland and vernal pools. Blooms March – May (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however, this species was not observed during botanical surveys which were conducted during the blooming period for this species in April, May and June of 2015.
Erigeron miser starved daisy	--/--/1B.3	A perennial herb found on rocky soils in upper montane coniferous forest from 1,840 – 2,620 meters elevation. Blooms June – October (CNPS 2020)	**None**. There is no suitable habitat in upper montane coniferous forest and the Study Area is below the elevational range of this species.
Eriophyllum jepsonii Jepson's woolly sunflower	--/--/4.3	A perennial herb found sometimes in serpentinite soils and occurs in chaparral, cismontane woodland and coastal scrub. Blooms April – June (CNPS 2020).	**None.** Suitable habitat is absent from the Study Area.
Eryngium pinnatisectum Tuolumne button-celery	--/--/1B.2	An annual/perennial herb found in vernal pools in cismontane woodland and lower montane coniferous forest from 70 – 915 meters elevation. Blooms May – August (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in May and June of 2015.
Fremontodendron decumbens Pine Hill flannelbush	FE/--/1B.2	A perennial evergreen shrub found in rocky gabbroic or serpentinite soils and occurs in chaparral and cismontane woodland. Blooms April – July (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area. Additionally, this species would have been identifiable during the survey if it were present since it is an evergreen shrub.
Galium californicum ssp. *sierrae* El Dorado bedstraw	FE/--/1B.2	A perennial herb found in gabbroic and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms May – June (CNPS 2020).	**None. S**uitable gabbroic soils are absent from the Study Area. Additionally, this species would have been identifiable during the survey if it were present since it is an evergreen shrub.

Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Gratiola heterosepala Bogg's Lake hedge-hyssop	--/--/1B.2	Annual herb found on clay soils in vernal pools and along the lake margins of marshes and swamps from 10 to 2,375 meters. Blooms April – August (CNPS 2020).	**None.** There are no vernal pools within the Study Area.
Horkelia parryi Parry's horkelia	--/--/1B.2	A perennial herb found in chaparral and cismontane woodland on Ione formation soils and other soils from 80 – 1,070 meters elevation. Blooms April – September (CNPS 2020).	**None. S**uitable Ione formation soil is absent from the Study Area.
Juncus leiospermus var*. ahartii* Ahart's dwarf rush	--/--/1B.2	An annual herb found in vernal pools in the eastern Sacramento Valley from 30 – 229 meters elevation. Blooms March – May (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in April and May of 2015.
Legenere limosa legenere	--/--/1B.1	An annual herb found in vernal pools from 1 – 880 meters elevation. Blooms April – June (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in April and May of 2015.
Lilium humboldtii ssp*. humboldtii* Humboldt lily	--/--/4.2	A perennial bulbiferous herb that occurs in the openings of chaparral, cismontane woodland, and lower montane coniferous forest. Blooms May – July (August) (CNPS 2020).	**Low.** The woodlands within the Study Area provide marginal habitat for this species. but it was not found during focused protocol surveys during the bloom period (Foothill Associates 2016c).

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Navarretia myserii ssp. *myserii* pincushion navarretia	--/--/1B.1	An annual herb found often in acidic soils and occurs in vernal pools. Blooms April – May (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however this species was not observed during botanical surveys which were conducted during the blooming period for this species in April and May of 2015.
Orcuttia tenuis slender Orcutt grass	FT/SE/1B.1	An annual herb found in vernal pools from 35 – 1,760 meters elevation. Blooms May to October (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however, this species was not observed during botanical surveys which were conducted during the blooming period for this species in May and June of 2015.
Orcuttia viscida Sacramento Orcutt grass	FE/SE/1B.1	An annual herb that occurs in vernal pools. Blooms April – July (September) (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however, this species was not observed during botanical surveys which were conducted during the blooming period for this species in April, May and June of 2015.
Packera layneae Layne's ragwort	FT-/--/1B.2	A perennial herb found in rocky gabbroic or serpentinite soils and occurs in chaparral and cismontane woodland. Blooms April – August (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.
Sagittaria sanfordii Sanford's arrowhead	--/--/1B.2	An emergent perennial rhizomatous herb that occurs in assorted freshwater marshes and swamps. Blooms May – October (November) (CNPS 2020).	**Low.** Seasonal wetland habitat is present for this species; however, this species was not observed during botanical surveys which were conducted during the blooming period for this species in May and June of 2015.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Trichostema rubisepalum Hernandez bluecurls	--/--/4.3	An annual herb found in volcanic or serpentinite, and gravelly soils and occurs in broadleafed upland forest, chaparral, cismontane woodland, lower montane coniferous forest, and vernal pools. Blooms June – August (CNPS 2020).	**None.** Suitable volcanic and serpentinite soils are absent from the Study Area.
Wyethia reticulata El Dorado County mule ears	--/--/1B.2	A perennial herb found in clay or gabbroic soils and occurs in chaparral, cismontane woodland, and lower montane coniferous forest. Blooms April – August (CNPS 2020).	**None. S**uitable serpentinite and gabbroic soils are absent from the Study Area.
Animals			
Invertebrates			
Bombus occidentalis western bumble bee	--/CE/--	Bumble bees are primitively eusocial insects that live in underground colonies made up of one queen, female workers, and reproductive members of the colony. New colonies are initiated by solitary queens, generally in the early spring, which typically occupy abandoned rodent burrows (Thorp et al. 1983). This species is a generalist forager and have been reported visiting a wide variety of flowering plants. A short-tongued bumble bee; select food plants include *Melilotus* spp., Cirsium spp., *Trifolium* spp., *Centaurea* spp., *Eriogonum* spp., and *Chrysothamnus* spp. (Koch et al. 2012). This species has a short tongue and typically prefers open flowers with short corollas but is known to chew through the base of flowers with long corollas. The flight period for queens in California is from early February to late November, peaking in late June and late September. New queens hibernate over the winter and initiate a new colony the following spring (Thorp et al. 1983). Rare throughout its range and in decline west of the Sierra Nevada crest.	**None.** Habitat is present for western bumble bee and some select food plants are present on site, such as clover. However, this species is currently rare across its range and in California it is currently limited to high elevation meadows in the Sierra Nevada and small coastal populations (CDFW 2020).

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Branchinecta lynchi vernal pool fairy shrimp	FT/--/--	The range of the vernal pool fairy shrimp (VPFS) within California includes the Central Valley and southern California. (USFWS 2005). Populations are known from Stillwater Plain in Shasta County through most of the length of the Central Valley to Pixley in Tulare County (additional disjunct populations exist at various locations throughout state). VPFS occurs mostly in vernal pools, however it is also found in a variety of both natural and artificial wetland habitats, such as alkali pools, ephemeral drainages, stock ponds, roadside ditches, vernal swales, and rock outcrop pools (USFWS 2005). Occupied wetlands are typically small (ranging from 0.1 to 0.05 acres in size), and pond for a relatively short duration (3-4 weeks) (Eriksen and Belk 1999). Soil types associated with VPFS vary greatly with geography and influence the ecology of the species. This fairy shrimp occurs in pools with 48 to 481 ppm salinity, and pH from 6.3 to 8.5 (Eriksen and Belk 1999).	**None.** There are no vernal pools within the Study Area.
Desmocerus californicus californicus valley elderberry longhorn beetle	FT/--/--	Endemic to elderberry shrubs (*Sambucus* spp.) occurring in riparian habitat in the Sacramento and San Joaquin Valleys, riparian habitats in the Sacramento and San Joaquin Valleys, and less common throughout riparian forests of the Central Valley from Redding to Fresno County (USFWS 2014) typically below 152 m amsl (USFWS 2017a).	**Low.** There are elderberry shrubs within the Study Area, however all elderberry shrubs were less than one inch as measured at the base of the shrub. At least one larger elderberry shrub observed on site during the October 13, 2020 site visit was observed to be dead. Additionally, elderberry shrubs are isolated and not a part of riparian habitat and the Study Area is outside of the current recognized elevational range of the species.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Lepidurus packardi vernal pool tadpole shrimp	FE/--/--	The vernal pool tadpole shrimp (VPTS) occurs within the Central Valley of California and in the San Francisco Bay area (USFWS 2005), with the majority of the populations occurring in the Sacramento Valley. Vernal pools may range in size from small, clear, and well-vegetated to highly turbid, alkali scald pools to large winter lakes ranging in size from 54 square feet to 89 acres (USFWS 2005), containing clear- to highly-turbid water. They may be seasonal or ephemeral and may exhibit a wide range of salinity levels. VPTS cysts (resting eggs) also must have the opportunity to dry out before they can hatch.	**None.** There are no vernal pools within the Study Area.
Fishes			
Hypomesus transpacificus Delta smelt	FT/SE/--	Delta smelt are tolerant of a wide salinity range. For a large part of their one-year life span, delta smelt live along the freshwater edge of the mixing zone (saltwater-freshwater interface). Shortly before spawning, adults migrate upstream from the brackish-water habitat associated with the mixing zone and disperse into river channels and tidally-influenced backwater sloughs. They spawn in shallow, fresh or slightly brackish water upstream of the mixing zone. Most spawning happens in tidally-influenced backwater sloughs and channel edgewaters. Although spawning has not been observed in the wild, the eggs are thought to attach to substrates such as cattails, tules, tree roots and submerged branches. Delta smelt are found only from Suisun Bay upstream through the Delta in Contra Costa, Sacramento, San Joaquin, Solano and Yolo counties (USFWS 1995).	**None.** There is no aquatic habitat within the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Oncorhynchus mykiss irideus pop. 11 Central Valley Steelhead DPS	FT/--/--	This distinct population segment includes all naturally spawned anadromous steelhead populations below natural and manmade impassable barriers in the Sacramento and San Joaquin Rivers and their tributaries, excluding steelhead from San Francisco and San Pablo Bays and their tributaries, as well as two artificial propagation programs: the Coleman NFH, and Feather River Hatchery steelhead hatchery programs (NMFS 2016). Steelhead spawn in rivers and streams with cool, clear, water and suitable silt free substrate (NMFS 2016).	**None.** There is no aquatic habitat within the Study Area.
Amphibians			
Ambystoma californiense California tiger salamander	FT/ST/--	Generally restricted to vernal pools and seasonal ponds, including many constructed stock ponds, in grassland and oak savannah plant communities from sea level to about 1,500 feet in central California. Adults spend the majority of their lives in upland areas surrounding suitable breeding ponds, in rodent burrows. Suitable breeding habitat must be present in combination with suitable upland habitat. In the Coastal region, populations are scattered from Sonoma County in the northern San Francisco Bay Area to Santa Barbara County, and in the Central Valley and Sierra Nevada foothills from Yolo to Kern counties (USFWS 2017b).	**None**. There are no vernal pools, seasonal ponds, or constructed stock ponds within the Study Area. The Study Area is outside of this species known range.
Rana boylii foothill yellow-legged frog	--/SE/SSC	The foothill yellow-legged frog occurs along the coast ranges from Oregon to Los Angeles and along the western side of the Sierra Nevada. This species uses perennial rocky streams in a wide variety of habitats up to 6,400 feet above msl. This species rarely ventures far from water, is usually found basking in the water, or under	**Low**. There is no breeding habitat within the Study Area, however perennial aquatic habitat could provide aquatic non-breeding habitat for this species. There is a nearby CNDDB recorded occurrence from 1972 located 3 miles north of the

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
		surface debris or underground within 165 feet of water. Eggs are laid in clusters attached to gravel or rocks along stream margins in flowing water. Tadpoles typically require up to four months to complete aquatic development. Breeding typically follows winter rainfall and snowmelt, which varies based upon location (Jennings and Hayes 1994).	Study Area and documents a collected specimen (CDFW 2020). CDFW considers this species extirpated in the Study Area and the surrounding area (CDFW 2020).
Rana draytonii California red-legged frog	FT/--/SSC	The California red-legged frog occupies a fairly distinct habitat, combining both specific aquatic and riparian components. The adults require dense, shrubby or emergent riparian vegetation closely associated with deep (greater than 2 1/3-foot deep) still or slow-moving water. The largest densities of California red-legged frogs are associated with deep-water pools with dense stands of overhanging willows (*Salix* spp.) and an intermixed fringe of cattails (*Typha latifolia*). Well-vegetated terrestrial areas within the riparian corridor may provide important sheltering habitat during winter. California red-legged frogs aestivate (enter a dormant state during summer or dry weather) in small mammal burrows and moist leaf litter. They have been found up to 100 feet from water in adjacent dense riparian vegetation. Studies have indicated that this species cannot inhabit water bodies that exceed 70° F, especially if there are no cool, deep portions (USFWS 2002).	**None.** There is no aquatic breeding habitat within the Study Area for this species. There is a nearby CNDDB recorded occurrence from 2005 located 3 miles north of the Study Area and documents an observation by a state biologist (CDFW 2020). CDFW considers this record to be of fair quality and the species to be extant (CDFW 2020), however there are no other nearby records of this species near the Study Area. No evidence of this species was observed during protocol breeding and non-breeding surveys (Foothill Associates 2016a).

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Spea hammondii western spadefoot	--/--/SSC	Amphibian that breeds in vernal pools and seasonal ponds or slow portions of streams in grasslands and woodlands. Adults spend most of their time in underground burrows in grasslands surrounding breeding pools (Jennings and Hayes 1994). Breeding is typically finished by the end of March. Tadpoles mature through late-spring and disperse as pools dry (Zeiner et al. 1990).	**Low.** There are no vernal pools, seasonal ponds, or streams within the Study Area that could provide breeding habitat for this species and the seasonal wetland habitats would be considered very marginal breeding habitat for this species.
Reptiles			
Actinemys marmorata western pond turtle	--/--/SSC	Inhabits slow-moving water with dense submerged vegetation, abundant basking sites, gently sloping banks, and dry clay or silt soils in nearby uplands. Turtles will lay eggs up to 0.25-mile from water, but typically go no more than 600 feet (Jennings and Hayes 1994).	**Low.** Aquatic habitat in the Study Area does not provide sufficient water for this species to occupy the Study Area year-round. All features were observed to be dry on October 13, 2020. This species could occur in streams adjacent to the Study Area.
Phrynosoma blainvillii Blainville horned lizard	--/--/SSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes in chaparral, cismontane woodland, coastal bluff scrub, coastal scrub, desert wash, pinyon and juniper woodlands, and riparian scrub and woodland (CDFW 2020).	**Low.** Suitable loose soil for burying is not present in the Study Area.
Thamnophis gigas giant garter snake	FT/ST/--	Endemic to the San Joaquin and Sacramento Valley floors. Inhabits agricultural wetlands and other waterways such as irrigation and drainage canals, sloughs, ponds, small lakes, low gradient streams, and adjacent uplands. Requires adequate water during its active season (early spring through mid-fall) to provide food and cover, emergent, herbaceous wetland vegetation for foraging and cover, grassy banks and openings in waterside vegetation for basking, and higher elevation uplands for cover and refuge from flood waters during its dormant	**None.** There is no suitable aquatic habitat within the Study Area and the Study Area is outside of the known range of this species.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
		season (winter). Inhabits small mammal burrows and other soil crevices with sunny exposure along south and west facing slopes, above prevailing flood elevations when dormant. Primarily found in marshes and sloughs as well as slow-moving creeks but absent from large rivers (USFWS 2017c).	
Birds			
Accipiter cooperii Cooper's hawk	--/--/WL	Found in cismontane woodland, riparian forest, riparian woodland, and upper montane coniferous forest.	**Low.** The woodlands on site provide potential nesting and foraging habitat.
Ammodramus savannarum grasshopper sparrow	--/--/SSC	Frequents dense, dry, or well drained grassland, especially native grassland. Nests at base of overhanging clump of grass.	**Low. T**he annual grassland habitat within the Study Area provides habitat for this species.
Agelaius tricolor tricolored blackbird	--/ST/SSC	Common locally throughout central California. Nests and seeks cover in emergent wetland vegetation and thorny vegetation such as Himalayan blackberry (*Rubus armeniacus*) as well as cattails and tules. Nesting area must be large enough to support a minimum colony of 50 pairs as they are a highly colonial species. Forages on ground in croplands, grassy fields, flooded land, and edges of ponds for insects (Shuford and Gardali 2008).	**Low. T**he riverine perennial marsh is not large enough to support breeding colonies, but colonies are recorded within 4 miles of the Study Area so the area may be used for foraging.
Ammodramus savannarum Grasshopper sparrow	--/--/SSC	Frequents dense, dry, or well drained grassland, especially native grassland. Nests at base of overhanging clump of grass.	**Low.** The annual grassland habitat within the Study Area provides habitat for this species.
Ardea alba Great egret	CSA (Nesting Colony)	Nests in colonies in large trees usually near water. Nesting colonies must be relatively isolated from human activities. Forages in shallow water in a variety of habitats.	**None.** There is no suitable nesting habitat in the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Ardea herodias Great blue heron	CSA (Nesting Colony)	Inhabits both freshwater and saltwater habitats and forages in grassland and agricultural field. Breeding colonies are located within 2 to 4 miles of feeding areas, often in isolated swamps or on islands, and near lakes and ponds bordered by forests.	**None. T**here is no suitable nesting habitat in the Study Area.
Aquila chrysaetos golden eagle	--/--/FP	Typically occurs in rolling foothills, mountain areas, deserts and other open habitats up to 3,822 m amsl. Typically nests on cliff ledges or large trees in open areas in canyons. Will occasionally use other tall structures for nesting, such as electrical transmission towers. Prey consists mostly of rodents, carrion, birds, reptiles and occasionally small livestock (Zeiner et al. 1990).	**Low.** There is no suitable nesting habitat within the Study Area. This species is known to nest and forage in nearby open spaces in the vicinity of the Study Area. Golden eagles typically require nesting locations with a commanding view of the surrounding terrain, which is not present in the Study Area. Nests documented in CNDDB in El Dorado Hills are placed in trees amongst residential areas in a similar situation to oak trees found in the Study Area. This species is unlikely to use the Study Area for nesting.
Athene cunicularia burrowing owl	--/--/SSC	Forages in grasslands, agricultural fields, and disturbed places where burrowing mammals are abundant with low and sparse vegetation. Nests in burrows, especially those of California ground squirrel, but will use other refuge sites (*Otospermophilus beecheyi*; Shuford and Gardali 2008). In the Central Valley of California, most foraging occurs within a 600-m radius of the nest (Gervais et al. 2003).	**Low. T**he annual grassland within the Study Area provides potential habitat for this species, however, few burrows that could be occupied by this species were observed and this species was not observed during the protocol level surveys conducted within the Study Area.
Buteo regalis ferruginous hawk	--/--/WL	Overwintering occurs in grasslands or deserts with abundant prey species (rabbits, pocket gophers, or prairie dogs). This species does not nest in California.	**Low. T**he annual grassland habitat within the Study Area provides foraging habitat for this species.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Buteo swainsoni Swainson's hawk	--/ST/--	Forages in grasslands, suitable grain or alfalfa fields, or livestock pastures adjacent to nesting habitat. Nests on large trees in open riparian habitat, scattered trees or small groves of trees in open areas (CDFW 1994).	**None.** The Study Area provides suitable nesting and foraging habitat within the Study Area. The Study Area is just outside the range of this species, which typically occurs further to the west of the Study Area.
Elanus leucurus white-tailed kite	--/--/FP	Raptor that inhabits rolling foothills and valley margins with scattered oaks, as well as river bottomlands or marshes next to deciduous woodland. Nests in isolated, dense-topped trees in open areas. Forages in a variety of habitats including grassland, marshes, and agricultural fields (Zeiner et al. 1990).	**High.** There is suitable nesting habitat riparian and oak woodland habitat in the Study Area. This species is known to forage in nearby open spaces in the vicinity of the Study Area and could occur nesting in or near the Study Area.
Falco columbarius merlin	--/--/WL	Winter in open and semi-open habitats that include estuaries, Great Basin grassland, and valley and foothill grasslands. This species does not nest in the region of the Study Area.	**Low. T**he annual grassland habitat within the Study Area provides foraging habitat for this species.
Haliaeetus leucocepahlus bald eagle	FD/SE/FP	Requires large bodies of water with an abundant fish population. Feeds on fish, carrion, small mammals, and water-fowl. Nests are usually located within a 1-mile radius of water. Nests are most often situated in large trees with a commanding view of the area (Zeiner et al. 1990).	**None.** There are no suitable nest trees in the Study Area that would support this species nesting. This species is well documented nesting in nearby Folsom Lake and Lake Natoma (CDFW).
Laterallus jamaicensis coturniculus California black rail	--/ST/FP	Inhabits brackish marsh, primarily in the upper marsh zone dominated by alkali heath (*Frankenia salina*), cattail, and rush (J*uncus* spp.); prefers lower salinity environments. In the Sierra Nevada foothills, black rail is a year-round resident along wetland edges where water is 1.2 inches or less (Richmond et al. 2010). Black rail is typically associated with perennial wetlands associated with flowing water such as irrigation canals, perennial streams and springs with dense	**None.** There is no suitable wetland habitat for breeding or foraging within the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
		vegetation in the Sierra Nevada foothills (Richmond et al. 2010). Forages on the ground, under cover of dense vegetation (Richmond et al. 2010).	
Pandion haliaetus osprey	--/--/WL	Found in a variety of habitats nearby water sources with abundant fish prey.	**None.** There are no suitable nest trees or structures in the Study Area that would support this species nesting.
Phalacrocorax auritus double-crested cormorant	--/--/WL	Breeds on ponds, lakes, artificial impoundments, slow-moving rivers, lagoons, estuaries, and open coastlines.	**None.** There is no suitable habitat for nesting within the Study Area.
Progne subis purple martin	--/--/SSC	Nests in cavities in open areas with low canopy cover at the height of the nest, near large bodies of water that support high densities of large insects. Martins use a variety of cavities including in bridges, large tree snags, and collapsed lava tubes. The species is very sensitive to competition from European starlings and is extirpated from most low-elevation areas by starlings (Shuford and Gardali 2008).	**None.** There is no suitable habitat for nesting within the Study Area.
Riparia riparia bank swallow	--/ST/--	Found primarily in riparian and lowland habitat in California. Nests in colonies along cliffs or steep river banks in holes. In California, a majority of the population is situated along the Sacramento River and the Feather River. Other smaller populations persist near Monterey and north of Shasta counties (Zeiner et al. 1990).	**None.** There are no steep banks or river habitat for nesting within the Study Area.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Mammals			
Antrozous pallidus pallid bat	--/--/SSC	Occurs throughout California except for the high Sierra Nevada and the northern Coast Ranges. Habitats include grasslands, shrublands, woodlands, and forests from sea level to 6,000 feet. Most common in open, dry habitats with rocky areas for roosting; roosts also include cliffs, abandoned buildings, bird boxes, and under bridges (Bolster, ed. 1998).	**Low.** The trees within the riparian habitat and isolated trees within the annual grassland provide roosting habitat for this species.
Lasionycteris noctivagans Silver-haired bat	--/--/CSA	Forests near water. Roosts in hollow trees, snags, buildings, rock crevices, caves, and under bark. Forages in within 300 feet of home range over water and open brushy areas.	**Low.** There is marginal habitat in the woodlands for this species on the Study Area.
Pekania pennanti fisher – West Coast DPS	FE/ST/SSC	Occupy late-successional conifer and mixed conifer-hardwood forests with an abundance of downed wood, snags, large trees, and a dense canopy (Zielinski 2014). Typically found at elevations from 1,070 – 2,135 m amsl, where persistent snow does not accumulate and impede movement (Zielinski 2014). Riparian forests and habitat close to open water such as streams are important. Cavities and branches in trees, snags, stumps, rock piles, and downed timber are used as resting sites, and large diameter live, or dead trees are selected for natal and maternal dens (Zielinski 2014). There is a significant gap in the range of fisher between the southern Sierra Nevada population and the northern Sierra Nevada/southern Cascade population that stretches approximately 400 km wide (Zielinski 2014).	**None.** There are no suitable downed wood or snags for denning. The Study Area does not provide suitable habitat for this species.

Appendix B (cont.)
Regionally Occurring Listed and Special-Status Species

Species Name/ Common Name[1]	Status[2]	Habitat, Ecology and Life History	Potential to Occur
Taxidea taxus American badger	--/--/SSC	Inhabits drier open stages of most shrub, forest, and herbaceous habitats with loose, friable soils. Preys on a wide variety of mammals, reptiles, birds, and carrion, and hunts mostly by digging out fossorial prey. Occasionally takes prey on the surface. Not tolerant of cultivation. No longer occur in the Central Valley except in the extreme western edge (Williams 1986).	**Low.** Annual grassland within the Study Area provides habitat, however, very few burrows that could be utilized by this species are present within the Study Area. There is a nearby CNDDB recorded occurrence from 2015 located 4.9-miles northwest of the Study Area and documents an individual badger killed on the road (CDFW 2020). CDFW considers this species to be extant (CDFW 2020), however there are no other nearby records of this species near the Study Area.

[1] Sensitive species reported in CNDDB or CNPS on the "Rio Linda" USGS quads, or in USFWS lists for the project site.

[2] Status is as follows: Federal (ESA) listing/State (CESA) listing/other CDFW status or CRPR. F = Federal; S = State of California; E = Endangered; T = Threatened; C = Candidate; FP=Fully Protected; SSC=Species of Special Concern.

[3] Status in the Project site is assessed as follows. **None**: Species is not known to occur on or in the vicinity of the Study Area and there is no suitable habitat within the Study Area -OR- Species was surveyed for during the appropriate season with negative results -OR- The Study Area occurs outside of the known elevation or geographic ranges; **Low**: Species known to occur in the vicinity of the Study Area and there is marginal habitat within the Study Area -OR- Species is not known to occur in the vicinity of the Study Area, however, there is suitable habitat on the Study Area; **High:** Species known to occur onsite or in the vicinity of the Study Area (based on CNDDB records within five miles and/or based on professional expertise specific to the Study Area or species) and there is suitable habitat within the Study Area; **Present**: Species known to occur within the Study Area based on CNDDB records and/or observed within the Study Area during the biological survey.

CRPR = California Rare Plant Rank: 1B – rare, threatened, or endangered in California and elsewhere; 2B – rare, threatened, or endangered in California but more common elsewhere. Extension codes: .1 – seriously endangered; .2 – moderately endangered.

EDH 52-COSTCO

OVERALL COMMERCIAL CENTER

PROJECT DESCRIPTION

April 23, 2021

DESCRIPTION AND PURPOSE OF THE REQUEST

The owner is pleased to submit this revised application requesting approval to construct two (2) new commercial centers (collectively, the "Project") in El Dorado County encompassing APNs: 122-720-002, 018, 019, 020 & 021. In addition, a portion of 122-720-003 and the unused former Tong Road right-of-way between Silva Valley Parkway and Clarksville Crossing are proposed to be a part of the Project. The property is located north of Highway 50 and Tong Road, east of Clarksville Crossing, and is bisected by Silva Valley Parkway. The northern portion of the property is approximately 18.26 acres (North Site), and the southern portion is approximately 17.05 acres (South Site), net of the right-of-way for roads. There is a 6.57-acre area on the North Site for the right-of-way associated with the future extension of Country Club Drive. There is a 1.38-acre area west of Clarksville Crossing on the South Site that will not be developed as part of the Project.

The revised application seeks a series of zoning changes to facilitate development of the Project, including a rezone proposed on the North Site to CC-PD to allow more uses primarily seen in a shopping center setting and to allow a self-storage use with the approval of a conditional use permit. In addition, the application proposes to extend the existing CR-PD zoning to the entire South Site to enable development of a commercial center there.

The Project is within the Planned Development Overlay zone such that a Development Plan Permit is required. To reflect the separate needs of each commercial center, the revised application includes two separate Development Plan Permit packages: one for the North Site and one for the South Site. Each Development Plan Permit will address the design guidelines and signage for the corresponding portion of the Project. In addition, the owner is processing separate wetlands permits from the Army Corps of Engineers for each area. However, both the North Site and the South Site are one "project" for purposes of evaluating the Project's environmental impacts under the California Environmental Quality Act ("CEQA").

The maximum building area for the South Site will be approximately 156,000 square feet and includes, without limitation, a Costco warehouse retail center, tire sales and installation, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and propane refueling and sales adjacent to tire sales and installation facility. Temporary outdoor sales may occur within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December. The building area for the North Site will be approximately 162,000 square feet and may include the following uses: drive through uses, gas station with car wash, food uses, outdoor patio, outdoor storage and outdoor sales and other retail and offices uses permitted in the CC zone as well as a self-storage use permitted with a use permit.

ENTITLEMENTS REQUESTED

Overall Project:

- As preservation of 90% of the existing oak tree canopy is not feasible, this Project will be requesting relief from General Plan Policy 7.4.4.4 due to topographic constraints and the need to grade the site in relation to Silva Valley Parkway.

North Site:

- Rezoning from CR-PD to CC-PD zoning designation;
- Development Plan Permit approval to cover:
    - the site plan, building design, and preliminary landscape plan, storm drainage, and grading;
    - design guidelines;
    - a signage program;
- Use Permit approval for a self-storage project within the CC-PD zone.
- Tentative Parcel Map to reconfigure existing and create eight (8) new parcels for purposes of sale, lease, or financing of the North Site.

South Site:

- Abandonment of the former Tong Road extension right of way and disposition of subsequent parcel;
- Disposition of County-owned land near Highway 50;
- Extension of existing CR-PD zoning designation for the entire South Site;
- Development Plan Permit approval to cover:
    - the site plan, building design, and preliminary landscape plan, storm drainage, and grading;
    - design guidelines;
    - a signage program that will allow for the size and square footage of the typical signage program for the warehouse, and pylon and monument signage;
- Lot Line adjustment and merger to configure up to four parcels for the South Site.

Each of the entitlements described above will be analyzed in an Environmental Impact Report to study the impacts and potential mitigation measures required for the Project.

PROJECT OBJECTIVES

Overall Project:

- Develop two high-quality planned commercial developments on currently vacant and underutilized land adjacent to Highway 50 adequately served by public services and utilities.
- Promote economic growth and diverse new employment and retail/service opportunities for County residents.
- Increase the number of employees and contribute to the local job/housing balance.

North Site:

- Develop architectural and landscaping designs that soften the scale and mass of the buildings, create a pleasant and attractive appearance, and complement the surrounding area.
- Develop site plans that minimize potential access and circulation conflicts between automobiles and pedestrians, provide adequate off-street parking for store customers and employees, and minimize impacts to the surrounding area.

South Site:

- Construct and operate a new Costco warehouse that serves the local community with goods and services from both nationally known businesses but also more regional and local businesses.
- Reduce energy consumption by incorporating sustainable design features and systems with enhanced energy efficiencies meeting State and federal code requirements.
- Provide a Costco warehouse in a location that is convenient for its members, the community, and employees to travel to shop and work.
- Provide a state-of-the-art Costco warehouse to better serve the membership in the greater El Dorado Hills area.
- Enhance the area with a warehouse that is architecturally designed to be responsive to the El Dorado Hills area design context and sensitive to the adjacent community, future development(s) and compatible with the need for a new warehouse in this market area.

- Continue and increase contribution to the County's tax base by Costco.
- Expand the space available for integrated retail sales of goods and services in El Dorado Hills market.
- Minimize circulation conflicts between automobiles and pedestrians.
- Provide a Costco warehouse in a location that is serviced by adequate existing infrastructure including roadways and utilities.
- Develop a Costco warehouse that is large enough to accommodate all the uses and services Costco provides to its members elsewhere.
- Locate a Costco warehouse on a site Costco can purchase (rather than lease) to protect its substantial investment of time, money and goodwill in the location.

SITE INFORMATION

Location

The proposed Project is in El Dorado County. The Project site is on the north side of Highway 50 and is bisected by Silva Valley Parkway. It is bordered by existing residences and an elementary school to the north, vacant land to the east, Clarksville Crossing to the west, and Highway 50 to the south.

Site Description

The Project site is currently vacant. A small portion of the unused Tong Road right-of-way is proposed to be included in the South Site. The site consists of annual grassland with small oak woodlands. Slivers of wetlands and riparian areas are located on site.

DESCRIPTION OF THE PROPOSED PROJECT

The maximum building area for the South Site will be approximately 156,000 square feet and includes, without limitation, a Costco warehouse retail center, tire sales and installation, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and propane refueling and sales adjacent to tire sales and installation facility. The warehouse retail center will also facilitate Costco's home delivery program by serving as a hub for Costco home delivery drivers to collect member orders for delivery to the surrounding area. Temporary outdoor sales may occur within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December.

The building area for the North Site will be approximately 162,000 square feet and may include the following uses: drive-through uses, gas station with car wash, food uses, outdoor patio, outdoor storage and outdoor sales and other retail and offices uses permitted in the CC zone. A use permit is requested for the self-storage project on the north site. The self-storage project will consist of 6 buildings plus an office and 52 RV storage spaces.

North Site Architecture

The design theme for the North Site is based on the existing building design theme of the Serrano area, which is a California/Mediterranean style, examples of which are included in the design guidelines proposed for the North Site.

Where single tenant types (retail shops) occur, the guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants will use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as shown in the guidelines. No building design for any tenant type shall be repeated on the North Site.

Each building on the North Site shall vary in building height to achieve more visual interest and distinct building character, avoiding the monotony of continuous building height. Each building shall combine horizontal and vertical elements to provide variation, interest, and rhythm within and among the buildings. In no case shall any roof mounted equipment be higher than the lowest parapet height of the building.

The color and material palette for the North Site contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the North Site so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette must be maintained throughout the development of the North Site.

Within the development of the North Site, all sides of all buildings will be visible from adjacent roadways and properties. The architecture of all sides of all buildings must, therefore, be of equal quality and attention. Screening is required for loading and storage areas, utilities meters and boxes using landscaping, walls, fences in combination.

The use of colored concrete, concrete pavers, accent patterns, etc. shall be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas shall be accomplished using intimate seating areas in near proximity of the building.

South Site Architecture

The warehouse design is proposed to be contemporary and will set the standard for large format retail facades with variety of massing and appropriate materials for the building. By combining concrete masonry block and architectural metal panels, Costco intends to create a scale and architectural interest to minimize the visual impact of a large retail warehouse. By use of design techniques such as the location of building materials, landscaping, and the incorporation of varying parapet cap heights, Costco can successfully break the long elevations both horizontally and vertically at the appropriate height to conceal roof top mounted mechanical equipment. The technique of breaking a long elevation into smaller elements with varied materials and colors is used to create a more pedestrian-friendly scale in the proposed design. The proposed colors are warm natural earth tones, which will relate to the proposed surrounding development by utilizing similar building materials and architectural detailing.

The South Site has been designed to utilize the existing slope of the site by locating the warehouse in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. By building the warehouse adjacent to higher elevation land and providing a subterranean parking structure, the height of the building and visual impacts relative to the surrounding environment are minimized. The subterranean portion of the parking structure will be adjacent to the west side of the warehouse and contain 214 parking spaces underneath the at-grade parking structure. Vehicle access to this lower-level parking would be provided by ramps on the north and south sides of the underground parking structure – the ramp on the north side would allow vehicles to enter the lower-level parking structure directly from Clarksville Crossing and the ramp on the south side would allow vehicle access from the at-grade parking lot above. A third ramp would provide pedestrian access from the lower level up to the at-grade parking and entry to the warehouse. The main entry feature to the warehouse is proposed to be oriented towards the northwest so that the loading dock and truck deliveries would be accessed from and oriented towards Interstate 50, providing greater separation with the existing residences.

The warehouse is proposed to include one customer entrance to the main Costco store that would be located at the northwest corner. The El Dorado Hills Costco is expected to include a bakery, pharmacy, optical center with optical exams and retail optical sales, hearing aid testing center, food court, and a photo center along with the sales of approximately 4,000 products. The warehouse would include a five bay Tire Center, a +/-5,300 square-foot facility with member access via the inside of the main Costco building, which would include tire sales and a tire installation facility. A promotional vehicle may be on display near the entry to the building. This vehicle would be used to promote online or offsite vehicle sales; no vehicles are proposed to be sold on site.

Costco Operations

It is anticipated that the El Dorado Hills Costco warehouse will employ approximately 165 to 170 employees.

Costco Wholesale is a membership-only retail/wholesale business, selling high quality national brands and private label merchandise for commercial and personal use. The warehouse hours are anticipated to be Monday through Friday from 9:00 am to 8:30 pm, and Saturday and Sunday from 9:00 am to 7:00 pm.

Costco anticipates an average of about 10 trucks delivering goods on a typical weekday. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers. Receiving time is from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before the 10:00 a.m. opening time. Deliveries to the warehouse are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from Interstate 50, and accessing the site from Silva Valley Parkway.

The tire center typically will receive shipments of tires one to two times per week in single- or double-trailer trucks of up to 70 feet in length, and the same delivery truck will pick up old tires for recycling. Deliveries to and pickups from the tire center will be scheduled for pre-opening hours, typically about 6:00 a.m.

Costco Sustainability Features

The entire proposed Project will incorporate sustainability features per the California Title 24 energy requirements. In addition, to reduce energy consumption and promote sustainability, Costco will incorporate many energy saving measures when constructing a new facility. Below are some of the significant practices that Costco currently incorporates into new buildings that help conserve energy and other natural resources that are expected to be used in connection with the development of the South Site:

- Parking lot light standards will be designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps can provide a higher level of perceived brightness with less energy than other lamps such as high-pressure sodium.

- New and renewable building materials are typically extracted and manufactured within the region. When masonry and concrete are used, the materials purchased are local to the project, minimizing the transportation distances and impact to local road networks.

- The use of pre-manufactured building components, including structural framing and metal panels, helps to minimize waste during construction.

- Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other materials. Building heat absorption is further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall.

- A substantial amount of the proposed plant material for the South Site is climate adapted to the region and will use less water than other common species.

- The irrigation system includes the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas.

- Storm water management plans are designed to maintain quality control and storm water discharge rates based on the County requirements.

- High-efficiency restroom fixtures can achieve a 40% decrease and water savings over U.S. standards.

- Commissioning of mechanical systems will occur to ensure that the HVAC systems are preforming as designed. HVAC comfort systems can be controlled by a computerized building management system to maximize efficiency.

- HVAC units planned for the South Site are high efficiency direct ducted units, which have phased out the use of HCFC's completely, long before the Montreal Protocol timeline.

- Parking lot and exterior lights can be controlled by a photo sensor and time clock.

- Lighting is controlled by the overall project energy management system.

- Energy efficient Transformers (i.e., Square D Type EE transformers) are planned to be used.

- Variable speed motors will be used on make-up air units and booster pumps.

- Gas water heaters are direct vent and 94% efficient or greater.

- Reclaim tanks are used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.

- The Main Building structure is a pre-engineered system that uses 100% recycled steel materials and is designed to minimize the amount of material used.

- Construction waste is recycled whenever possible.

- Floor sealant is No-VOC and represents over 80% of the floor area.

- CO2 is monitored throughout the warehouse.

- Extensive recycling/reuse program is implemented for warehouse and office space including tires, cardboard, grease, plastics, and electronic waste.

- Use of plastic shopping bags is avoided.

- Suppliers are required to reduce packaging and consider alternative packaging solutions.

- Distribution facilities are strategically located to minimize miles traveled for delivery.

- Deliveries are made in full trucks.

- All Costco trucks are equipped with an engine idle shut off timers.

SIGNAGE

Proposed highway-oriented and monument sign locations are depicted on the proposed site plan for both the North Site and the South Site.

North Site

A highway-oriented sign is proposed on the North Site greater than 100 feet from the freeway right of way. The owner is requesting certain deviations from Chapter 130.36 of the County Code for the proposed highway-oriented signs, including a reduction in the minimum separation between highway-oriented signs, a reduction in the minimum setback from the adjacent residential district (North Site only), an increase in the maximum allowed area, and an increase in the maximum allowed height. Each highway-oriented sign will be a 75-foot tenant pylon sign allowing advertising from either commercial center and will include one (1) major tenant panel, one (1) junior tenant panel, and eight (8) shop tenant panels. The proposed sign area for each highway-oriented sign is 652 square feet. The highway-oriented signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be fabricated aluminum, pan channel construction. Tenant names and logos will be flush mounted to the panel background and internally illuminated with white LED lights. Colors will comply with tenant specifications.

The owner is also requesting certain deviations from Chapter 130.36 of the County Code for the proposed monument signs, including an increase in the maximum allowed area, and an increase in the maximum allowed height. The developer is proposing two (2) 28-foot tenant monument signs on the North Site. Each monument sign will have one (1) featured tenant panel and six (6) shop tenant panels. The proposed area for each monument sign is 242 square feet. The monument signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be routed out with acrylic push-through graphics and vinyl film overlays. Tenant names will be internally illuminated with white LED lights. Colors will comply with tenant specifications.

Building signs for the North Site will be a part of a separate sign permit and are not proposed at this time.

South Site

On the South Site, proposed signage includes the Costco warehouse typical signage, a pylon signage at the southeast corner of the parcel at Silva Valley Parkway, and a monument sign located at the northern side of the main entry. The South Site is requesting deviations from Chapter 130.36 of the County Code, including an increase in maximum allowed sign area and an increase in maximum allowed sign height.

Building signage consists of the signature Costco red and blue corporate colors. The signage is scaled appropriately to the mass of the building elevations to not overwhelm but to reinforce the brand that Costco has established. The warehouse wall signage will consist of externally illuminated reverse pan channel letters, and the gas station signage will also be externally illuminated.

A pylon sign oriented towards Highway 50 will be located at the southeast corner of the site adjacent to Silva Valley Parkway. The sign will be approximately 75 feet tall and 28 feet wide with multiple internally illuminated panels for tenant identification for businesses located on the North Site. A monument sign located on the north side of the main entry will also be include as part of the Project signage. The sign will be approximately 16 feet tall and 17 feet wide with

multiple internally illuminated panels for tenant identification for businesses located on the North Site.

SITE ACCESS

It is anticipated that the Project site will have multiple points of access. A traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the South Site and the North Site

North Site

A portion of Country Club Drive extension will be constructed to a secondary full access to the North Site. An emergency access to Tong Road from the self-storage facility is proposed. Three full access driveways are proposed on Clarksville Crossing to provide additional points of access from the North Site to the South Site.

South Site

Regional access to the warehouse will be from Interstate 50 via the Silva Valley Parkway exit. One full-access driveway with a signalized intersection is proposed along the eastern portion of the site, and an additional three driveways are proposed along the Project's western side to provide access from Clarksville Crossing. An ADA-compliant pedestrian pathway will extend from the warehouse to the northern property boundary where it will connect to Silva Valley Parkway. The Project provides oversized parking stalls of 10 feet x 20 feet that are larger than the minimum El Dorado County requirements to provide members with easier accessibility to vehicles.

LOADING

The South Site truck loading dock is located at the southwest corner of the building adjacent to Interstate 50. The bay doors will be equipped with sealed gaskets to limit noise impacts. A smaller on grade door is also located on the south side of the building. This door is to receive bread delivery and Federal Express type trucks. A transformer and two trash compactors will also be located along the south edge of the building proposed for the South Site. Dense landscape material provides the necessary screening to this area (see South Site Landscape Plan).

PARKING LOT

The North Site proposes a main parking lot area in front of the buildings. The parking lot will provide approximately 166 parking spaces, proposed at 90 degrees to maximize the number of stalls on the site. This number includes 10 accessible parking stalls and 12 compact stalls (7%) and 8 RV stalls.

The self-storage project proposed 7 parking stalls including 1 accessible stall.

The South Site proposes 763 total parking stalls, which exceeds the required El Dorado County parking requirement of 642 stalls. Approximately 549 parking stalls are provided at

grade adjacent to the warehouse entry and tire center. The remaining 214 parking stalls are provided within the subterranean parking structure on the west side of the warehouse.

ADA parking will comply with the County Code and Title 24 requirements.

BICYCLE PARKING

The Project will provide bicycle parking spaces (lockers and racks) throughout the site that will meet County and Title 24 requirements.

PEDESTRIAN CIRCULATION

A pedestrian walkway for each portion of the Project will connect the buildings to Silva Valley Parkway.

LANDSCAPING

The Project will include a variety of drought-tolerant landscaping options. The North Site landscaping will provide screening along the boundary which will consist of evergreen trees and shrub rows. Shade trees with large canopy coverage will be planted in the North Site parking lot for shade. Planting at the North Site entries will be highlighted and defined by seasonal accented trees and shrubs with the use of colorful plant material. Shrubs will be low growing to maintain line-of-sight to the street. Along the streets, plantings will incorporate shade trees and mixed species and forms of shrubs to create interest, color, and buffering from the North Site shopping center.

The South Site landscape plan includes a mix of climate adapted shrubs and grasses, and a variety of shade trees. The South Site landscape design has incorporated a generous perimeter buffer which includes evergreen and deciduous trees and shrubs to enhance the streetscape. Landscape islands are typically provided at one island per five lineal parking spaces in the South Site parking field to provide shading of the parking lot with the parking lot trees and landscaping per County requirements. The South Site landscape plan has been designed to assist with the screening of the at-grade parking deck above the lower-level parking. The proposed trees and landscaping will meet El Dorado County requirements of 50% shading on the site within the majority of the provided parking area, with the grade-level deck above the subterranean parking meeting this requirement only where trees can be planted due to the constraints of the structure beneath.

The Project proposes to pay in-lieu fees as mitigation for the loss of the oak woodland.

LIGHTING

The North Site will provide various single, two- or four-light fixtures throughout the parking areas and driveways. The overall height of the lighting on the North Site, including the lighting fixtures and a 3-foot base, will be 33 feet in the parking lot, 25 feet along the perimeter and main drive aisles, and 16 feet around drive-through lanes. LED luminaires will be used for the parking lot lights.

The South Site parking lot will be illuminated with standard downward LED fixtures affixed to a 37-foot light pole. The lighting fixtures are of a "shoe-box" style. Parking lot light standards are designed to provide even light distribution for vehicle and pedestrian safety. The parking lot lights will be timer controlled to limit lighting after the warehouse has closed and most employees are gone from the warehouse. Parking lot lighting will only remain on to provide security and emergency lighting only along the main driveways. Lighting fixtures will also be located on the building approximately every 40 feet around the exterior of the building to provide safety and security. Parking and site lighting will incorporate the use of cutoff lenses to keep light from overflowing beyond the South Site boundaries.

GRADING

A preliminary grading plan has been prepared for review as part of the application submittals. Each site is designed to balance independently, and it is the intent of this application to allow for mass grading of both sites individually.

ON-SITE IMPROVEMENTS

The Project is designed to allow either the North Site or the South Site to develop independent from the other. Mass grading of each site to accommodate future development will occur in the first phase of development, including filling of the permitted wetlands and permitted tree removal. In the event the South Site develops first, utility crossings under Silva Valley Parkway will be constructed as part of the South Site infrastructure work to serve the North Site. In the event the North Site develops first, interim facilities will be constructed on the North Site.

The second phase for each site will include construction of the parking, landscaping, lighting, utility infrastructure, and driveways designed to support the buildings. Site improvements will be constructed in various phases depending on the extent of development occurring at any given time. Buildings can be started once site improvements are sufficiently completed to allow construction and emergency fire access.

OFF-SITE IMPROVEMENTS

A proposed traffic signal and appurtenant facilities will be located on Silva Valley Parkway at the main driveway of the Project to provide a connection to both the South Site and the North Site. An additional traffic signal is proposed at the intersection of Clarksville Crossing and Silva Valley Parkway.

A portion of Country Club Drive extension will be constructed up to the secondary access point to the North Site.

UTILITY INFRASTRUCTURE

The property will need to annex into El Dorado Irrigation District (EID) in order to acquire sanitary sewer and water service. EID stated in its December 6, 2018 Facilities Improvement Letter that there should be adequate water supply and sewer capacity available to serve a similar type of project. The Project will tie into the existing 18-inch potable water main and

the 21-inch gravity sewer line in Clarksville Crossing. An updated Facilities Improvement Letter will be requested through EID at the appropriate time.

The property will also annex into the El Dorado Hills County Water District (Fire Protection) prior to building permit issuance.

Sanitary service and potable water for the North Site will be provided by public (EID) sanitary sewer and water lines that cross the South Site. Reclaimed water is available for non-potable irrigation use and will be provided by extending an existing reclaimed line in Silva Valley Parkway north of the Project site.

Dry utilities (electric, gas, telephone, and cable TV) will be provided from existing infrastructure located to the north of the Project site in Silva Valley Parkway. Dry utilities will need to be extended along the frontage of both the North Site and the South Site.

STORM DRAINAGE DESCRIPTION

The on-site drainage system will connect to El Dorado County's storm drain infrastructure in Clarksville Crossing. The Project has typical pollutant sources from parking lot runoff, loading/unloading areas, outdoor storage areas, and a trash compactor. This Project proposes bioretention areas and underground water quality vaults as the form of treatment for the site.

TRUCK CIRCULATION

Truck access will be allowed at all driveway locations depending on the size of the delivery truck and direction of travel.

OTHER GOVERNMENTAL AGENCY APPROVALS

Additional subsequent approvals and permits that may be required from local, regional, state, and federal agencies are identified below.

- El Dorado Irrigation District -Water and Sewer-Annexation and Utility Approval
- El Dorado County Resource Conservation District-Onsite Plan Approval
- El Dorado Hills County Water District (Fire Protection)-Annexation and Fire Approval
- El Dorado County Air Quality Management District-Air Quality Permit
- El Dorado County Department of Transportation -Encroachment Permit/Grading Permit/Onsite Plan Approval
- El Dorado County Building Services-Building Permit/Sign Permit

- Central Valley Regional Water Quality Control Board-NPDES General Permit for Stormwater Discharge

- California Department of Fish and Wildlife-Wetland Approval

- Army Corps-Wetland Permitting for each side

- LAFCO-Annexation approval for EID and El Dorado Fire Protection District along with the Bureau of Land Reclamation

EDH 52-COSTCO

OVERALL COMMERCIAL CENTER

PROJECT DESCRIPTION

April 23, 2021

DESCRIPTION AND PURPOSE OF THE REQUEST

The owner is pleased to submit this revised application requesting approval to construct two (2) new commercial centers (collectively, the "Project") in El Dorado County encompassing APNs: 122-720-002, 018, 019, 020 & 021. In addition, a portion of 122-720-003 and the unused former Tong Road right-of-way between Silva Valley Parkway and Clarksville Crossing are proposed to be a part of the Project. The property is located north of Highway 50 and Tong Road, east of Clarksville Crossing, and is bisected by Silva Valley Parkway. The northern portion of the property is approximately 18.26 acres (North Site), and the southern portion is approximately 17.05 acres (South Site), net of the right-of-way for roads. There is a 6.57-acre area on the North Site for the right-of-way associated with the future extension of Country Club Drive. There is a 1.38-acre area west of Clarksville Crossing on the South Site that will not be developed as part of the Project.

The revised application seeks a series of zoning changes to facilitate development of the Project, including a rezone proposed on the North Site to CC-PD to allow more uses primarily seen in a shopping center setting and to allow a self-storage use with the approval of a conditional use permit. In addition, the application proposes to extend the existing CR-PD zoning to the entire South Site to enable development of a commercial center there.

The Project is within the Planned Development Overlay zone such that a Development Plan Permit is required. To reflect the separate needs of each commercial center, the revised application includes two separate Development Plan Permit packages: one for the North Site and one for the South Site. Each Development Plan Permit will address the design guidelines and signage for the corresponding portion of the Project. In addition, the owner is processing separate wetlands permits from the Army Corps of Engineers for each area. However, both the North Site and the South Site are one "project" for purposes of evaluating the Project's environmental impacts under the California Environmental Quality Act ("CEQA").

The maximum building area for the South Site will be approximately 156,000 square feet and includes, without limitation, a Costco warehouse retail center, tire sales and installation, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and propane refueling and sales adjacent to tire sales and installation facility. Temporary outdoor sales may occur within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December. The building area for the North Site will be approximately 162,000 square feet and may include the following uses: drive through uses, gas station with car wash, food uses, outdoor patio, outdoor storage and outdoor sales and other retail and offices uses permitted in the CC zone as well as a self-storage use permitted with a use permit.

ENTITLEMENTS REQUESTED

Overall Project:

- As preservation of 90% of the existing oak tree canopy is not feasible, this Project will be requesting relief from General Plan Policy 7.4.4.4 due to topographic constraints and the need to grade the site in relation to Silva Valley Parkway.

North Site:

- Rezoning from CR-PD to CC-PD zoning designation;
- Development Plan Permit approval to cover:
    - the site plan, building design, and preliminary landscape plan, storm drainage, and grading;
    - design guidelines;
    - a signage program;
- Use Permit approval for a self-storage project within the CC-PD zone.
- Tentative Parcel Map to reconfigure existing and create eight (8) new parcels for purposes of sale, lease, or financing of the North Site.

South Site:

- Abandonment of the former Tong Road extension right of way and disposition of subsequent parcel;
- Disposition of County-owned land near Highway 50;
- Extension of existing CR-PD zoning designation for the entire South Site;
- Development Plan Permit approval to cover:
    - the site plan, building design, and preliminary landscape plan, storm drainage, and grading;
    - design guidelines;
    - a signage program that will allow for the size and square footage of the typical signage program for the warehouse, and pylon and monument signage;
- Lot Line adjustment and merger to configure up to four parcels for the South Site.

Each of the entitlements described above will be analyzed in an Environmental Impact Report to study the impacts and potential mitigation measures required for the Project.

PROJECT OBJECTIVES

Overall Project:

- Develop two high-quality planned commercial developments on currently vacant and underutilized land adjacent to Highway 50 adequately served by public services and utilities.
- Promote economic growth and diverse new employment and retail/service opportunities for County residents.
- Increase the number of employees and contribute to the local job/housing balance.

North Site:

- Develop architectural and landscaping designs that soften the scale and mass of the buildings, create a pleasant and attractive appearance, and complement the surrounding area.
- Develop site plans that minimize potential access and circulation conflicts between automobiles and pedestrians, provide adequate off-street parking for store customers and employees, and minimize impacts to the surrounding area.

South Site:

- Construct and operate a new Costco warehouse that serves the local community with goods and services from both nationally known businesses but also more regional and local businesses.
- Reduce energy consumption by incorporating sustainable design features and systems with enhanced energy efficiencies meeting State and federal code requirements.
- Provide a Costco warehouse in a location that is convenient for its members, the community, and employees to travel to shop and work.
- Provide a state-of-the-art Costco warehouse to better serve the membership in the greater El Dorado Hills area.
- Enhance the area with a warehouse that is architecturally designed to be responsive to the El Dorado Hills area design context and sensitive to the adjacent community, future development(s) and compatible with the need for a new warehouse in this market area.

- Continue and increase contribution to the County's tax base by Costco.
- Expand the space available for integrated retail sales of goods and services in El Dorado Hills market.
- Minimize circulation conflicts between automobiles and pedestrians.
- Provide a Costco warehouse in a location that is serviced by adequate existing infrastructure including roadways and utilities.
- Develop a Costco warehouse that is large enough to accommodate all the uses and services Costco provides to its members elsewhere.
- Locate a Costco warehouse on a site Costco can purchase (rather than lease) to protect its substantial investment of time, money and goodwill in the location.

SITE INFORMATION

Location

The proposed Project is in El Dorado County. The Project site is on the north side of Highway 50 and is bisected by Silva Valley Parkway. It is bordered by existing residences and an elementary school to the north, vacant land to the east, Clarksville Crossing to the west, and Highway 50 to the south.

Site Description

The Project site is currently vacant. A small portion of the unused Tong Road right-of-way is proposed to be included in the South Site. The site consists of annual grassland with small oak woodlands. Slivers of wetlands and riparian areas are located on site.

DESCRIPTION OF THE PROPOSED PROJECT

The maximum building area for the South Site will be approximately 156,000 square feet and includes, without limitation, a Costco warehouse retail center, tire sales and installation, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and propane refueling and sales adjacent to tire sales and installation facility. The warehouse retail center will also facilitate Costco's home delivery program by serving as a hub for Costco home delivery drivers to collect member orders for delivery to the surrounding area. Temporary outdoor sales may occur within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December.

The building area for the North Site will be approximately 162,000 square feet and may include the following uses: drive-through uses, gas station with car wash, food uses, outdoor patio, outdoor storage and outdoor sales and other retail and offices uses permitted in the CC zone. A use permit is requested for the self-storage project on the north site. The self-storage project will consist of 6 buildings plus an office and 52 RV storage spaces.

North Site Architecture

The design theme for the North Site is based on the existing building design theme of the Serrano area, which is a California/Mediterranean style, examples of which are included in the design guidelines proposed for the North Site.

Where single tenant types (retail shops) occur, the guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants will use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as shown in the guidelines. No building design for any tenant type shall be repeated on the North Site.

Each building on the North Site shall vary in building height to achieve more visual interest and distinct building character, avoiding the monotony of continuous building height. Each building shall combine horizontal and vertical elements to provide variation, interest, and rhythm within and among the buildings. In no case shall any roof mounted equipment be higher than the lowest parapet height of the building.

The color and material palette for the North Site contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the North Site so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette must be maintained throughout the development of the North Site.

Within the development of the North Site, all sides of all buildings will be visible from adjacent roadways and properties. The architecture of all sides of all buildings must, therefore, be of equal quality and attention. Screening is required for loading and storage areas, utilities meters and boxes using landscaping, walls, fences in combination.

The use of colored concrete, concrete pavers, accent patterns, etc. shall be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas shall be accomplished using intimate seating areas in near proximity of the building.

South Site Architecture

The warehouse design is proposed to be contemporary and will set the standard for large format retail facades with variety of massing and appropriate materials for the building. By combining concrete masonry block and architectural metal panels, Costco intends to create a scale and architectural interest to minimize the visual impact of a large retail warehouse. By use of design techniques such as the location of building materials, landscaping, and the incorporation of varying parapet cap heights, Costco can successfully break the long elevations both horizontally and vertically at the appropriate height to conceal roof top mounted mechanical equipment. The technique of breaking a long elevation into smaller elements with varied materials and colors is used to create a more pedestrian-friendly scale in the proposed design. The proposed colors are warm natural earth tones, which will relate to the proposed surrounding development by utilizing similar building materials and architectural detailing.

The South Site has been designed to utilize the existing slope of the site by locating the warehouse in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. By building the warehouse adjacent to higher elevation land and providing a subterranean parking structure, the height of the building and visual impacts relative to the surrounding environment are minimized. The subterranean portion of the parking structure will be adjacent to the west side of the warehouse and contain 214 parking spaces underneath the at-grade parking structure. Vehicle access to this lower-level parking would be provided by ramps on the north and south sides of the underground parking structure – the ramp on the north side would allow vehicles to enter the lower-level parking structure directly from Clarksville Crossing and the ramp on the south side would allow vehicle access from the at-grade parking lot above. A third ramp would provide pedestrian access from the lower level up to the at-grade parking and entry to the warehouse. The main entry feature to the warehouse is proposed to be oriented towards the northwest so that the loading dock and truck deliveries would be accessed from and oriented towards Interstate 50, providing greater separation with the existing residences.

The warehouse is proposed to include one customer entrance to the main Costco store that would be located at the northwest corner. The El Dorado Hills Costco is expected to include a bakery, pharmacy, optical center with optical exams and retail optical sales, hearing aid testing center, food court, and a photo center along with the sales of approximately 4,000 products. The warehouse would include a five bay Tire Center, a +/-5,300 square-foot facility with member access via the inside of the main Costco building, which would include tire sales and a tire installation facility. A promotional vehicle may be on display near the entry to the building. This vehicle would be used to promote online or offsite vehicle sales; no vehicles are proposed to be sold on site.

Costco Operations

It is anticipated that the El Dorado Hills Costco warehouse will employ approximately 165 to 170 employees.

Costco Wholesale is a membership-only retail/wholesale business, selling high quality national brands and private label merchandise for commercial and personal use. The warehouse hours are anticipated to be Monday through Friday from 9:00 am to 8:30 pm, and Saturday and Sunday from 9:00 am to 7:00 pm.

Costco anticipates an average of about 10 trucks delivering goods on a typical weekday. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers. Receiving time is from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before the 10:00 a.m. opening time. Deliveries to the warehouse are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from Interstate 50, and accessing the site from Silva Valley Parkway.

The tire center typically will receive shipments of tires one to two times per week in single- or double-trailer trucks of up to 70 feet in length, and the same delivery truck will pick up old tires for recycling. Deliveries to and pickups from the tire center will be scheduled for pre-opening hours, typically about 6:00 a.m.

Costco Sustainability Features

The entire proposed Project will incorporate sustainability features per the California Title 24 energy requirements. In addition, to reduce energy consumption and promote sustainability, Costco will incorporate many energy saving measures when constructing a new facility. Below are some of the significant practices that Costco currently incorporates into new buildings that help conserve energy and other natural resources that are expected to be used in connection with the development of the South Site:

- Parking lot light standards will be designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps can provide a higher level of perceived brightness with less energy than other lamps such as high-pressure sodium.

- New and renewable building materials are typically extracted and manufactured within the region. When masonry and concrete are used, the materials purchased are local to the project, minimizing the transportation distances and impact to local road networks.

- The use of pre-manufactured building components, including structural framing and metal panels, helps to minimize waste during construction.

- Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other materials. Building heat absorption is further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall.

- A substantial amount of the proposed plant material for the South Site is climate adapted to the region and will use less water than other common species.

- The irrigation system includes the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas.

- Storm water management plans are designed to maintain quality control and storm water discharge rates based on the County requirements.

- High-efficiency restroom fixtures can achieve a 40% decrease and water savings over U.S. standards.

- Commissioning of mechanical systems will occur to ensure that the HVAC systems are preforming as designed. HVAC comfort systems can be controlled by a computerized building management system to maximize efficiency.

- HVAC units planned for the South Site are high efficiency direct ducted units, which have phased out the use of HCFC's completely, long before the Montreal Protocol timeline.

- Parking lot and exterior lights can be controlled by a photo sensor and time clock.

- Lighting is controlled by the overall project energy management system.

- Energy efficient Transformers (i.e., Square D Type EE transformers) are planned to be used.

- Variable speed motors will be used on make-up air units and booster pumps.

- Gas water heaters are direct vent and 94% efficient or greater.

- Reclaim tanks are used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.

- The Main Building structure is a pre-engineered system that uses 100% recycled steel materials and is designed to minimize the amount of material used.

- Construction waste is recycled whenever possible.

- Floor sealant is No-VOC and represents over 80% of the floor area.

- CO2 is monitored throughout the warehouse.

- Extensive recycling/reuse program is implemented for warehouse and office space including tires, cardboard, grease, plastics, and electronic waste.

- Use of plastic shopping bags is avoided.

- Suppliers are required to reduce packaging and consider alternative packaging solutions.

- Distribution facilities are strategically located to minimize miles traveled for delivery.

- Deliveries are made in full trucks.

- All Costco trucks are equipped with an engine idle shut off timers.

SIGNAGE

Proposed highway-oriented and monument sign locations are depicted on the proposed site plan for both the North Site and the South Site.

North Site

A highway-oriented sign is proposed on the North Site greater than 100 feet from the freeway right of way. The owner is requesting certain deviations from Chapter 130.36 of the County Code for the proposed highway-oriented signs, including a reduction in the minimum separation between highway-oriented signs, a reduction in the minimum setback from the adjacent residential district (North Site only), an increase in the maximum allowed area, and an increase in the maximum allowed height. Each highway-oriented sign will be a 75-foot tenant pylon sign allowing advertising from either commercial center and will include one (1) major tenant panel, one (1) junior tenant panel, and eight (8) shop tenant panels. The proposed sign area for each highway-oriented sign is 652 square feet. The highway-oriented signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be fabricated aluminum, pan channel construction. Tenant names and logos will be flush mounted to the panel background and internally illuminated with white LED lights. Colors will comply with tenant specifications.

The owner is also requesting certain deviations from Chapter 130.36 of the County Code for the proposed monument signs, including an increase in the maximum allowed area, and an increase in the maximum allowed height. The developer is proposing two (2) 28-foot tenant monument signs on the North Site. Each monument sign will have one (1) featured tenant panel and six (6) shop tenant panels. The proposed area for each monument sign is 242 square feet. The monument signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be routed out with acrylic push-through graphics and vinyl film overlays. Tenant names will be internally illuminated with white LED lights. Colors will comply with tenant specifications.

Building signs for the North Site will be a part of a separate sign permit and are not proposed at this time.

South Site

On the South Site, proposed signage includes the Costco warehouse typical signage, a pylon signage at the southeast corner of the parcel at Silva Valley Parkway, and a monument sign located at the northern side of the main entry. The South Site is requesting deviations from Chapter 130.36 of the County Code, including an increase in maximum allowed sign area and an increase in maximum allowed sign height.

Building signage consists of the signature Costco red and blue corporate colors. The signage is scaled appropriately to the mass of the building elevations to not overwhelm but to reinforce the brand that Costco has established. The warehouse wall signage will consist of externally illuminated reverse pan channel letters, and the gas station signage will also be externally illuminated.

A pylon sign oriented towards Highway 50 will be located at the southeast corner of the site adjacent to Silva Valley Parkway. The sign will be approximately 75 feet tall and 28 feet wide with multiple internally illuminated panels for tenant identification for businesses located on the North Site. A monument sign located on the north side of the main entry will also be include as part of the Project signage. The sign will be approximately 16 feet tall and 17 feet wide with

multiple internally illuminated panels for tenant identification for businesses located on the North Site.

SITE ACCESS

It is anticipated that the Project site will have multiple points of access. A traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the South Site and the North Site

North Site

A portion of Country Club Drive extension will be constructed to a secondary full access to the North Site. An emergency access to Tong Road from the self-storage facility is proposed. Three full access driveways are proposed on Clarksville Crossing to provide additional points of access from the North Site to the South Site.

South Site

Regional access to the warehouse will be from Interstate 50 via the Silva Valley Parkway exit. One full-access driveway with a signalized intersection is proposed along the eastern portion of the site, and an additional three driveways are proposed along the Project's western side to provide access from Clarksville Crossing. An ADA-compliant pedestrian pathway will extend from the warehouse to the northern property boundary where it will connect to Silva Valley Parkway. The Project provides oversized parking stalls of 10 feet x 20 feet that are larger than the minimum El Dorado County requirements to provide members with easier accessibility to vehicles.

LOADING

The South Site truck loading dock is located at the southwest corner of the building adjacent to Interstate 50. The bay doors will be equipped with sealed gaskets to limit noise impacts. A smaller on grade door is also located on the south side of the building. This door is to receive bread delivery and Federal Express type trucks. A transformer and two trash compactors will also be located along the south edge of the building proposed for the South Site. Dense landscape material provides the necessary screening to this area (see South Site Landscape Plan).

PARKING LOT

The North Site proposes a main parking lot area in front of the buildings. The parking lot will provide approximately 166 parking spaces, proposed at 90 degrees to maximize the number of stalls on the site. This number includes 10 accessible parking stalls and 12 compact stalls (7%) and 8 RV stalls.

The self-storage project proposed 7 parking stalls including 1 accessible stall.

The South Site proposes 763 total parking stalls, which exceeds the required El Dorado County parking requirement of 642 stalls. Approximately 549 parking stalls are provided at

grade adjacent to the warehouse entry and tire center. The remaining 214 parking stalls are provided within the subterranean parking structure on the west side of the warehouse.

ADA parking will comply with the County Code and Title 24 requirements.

BICYCLE PARKING

The Project will provide bicycle parking spaces (lockers and racks) throughout the site that will meet County and Title 24 requirements.

PEDESTRIAN CIRCULATION

A pedestrian walkway for each portion of the Project will connect the buildings to Silva Valley Parkway.

LANDSCAPING

The Project will include a variety of drought-tolerant landscaping options. The North Site landscaping will provide screening along the boundary which will consist of evergreen trees and shrub rows. Shade trees with large canopy coverage will be planted in the North Site parking lot for shade. Planting at the North Site entries will be highlighted and defined by seasonal accented trees and shrubs with the use of colorful plant material. Shrubs will be low growing to maintain line-of-sight to the street. Along the streets, plantings will incorporate shade trees and mixed species and forms of shrubs to create interest, color, and buffering from the North Site shopping center.

The South Site landscape plan includes a mix of climate adapted shrubs and grasses, and a variety of shade trees. The South Site landscape design has incorporated a generous perimeter buffer which includes evergreen and deciduous trees and shrubs to enhance the streetscape. Landscape islands are typically provided at one island per five lineal parking spaces in the South Site parking field to provide shading of the parking lot with the parking lot trees and landscaping per County requirements. The South Site landscape plan has been designed to assist with the screening of the at-grade parking deck above the lower-level parking. The proposed trees and landscaping will meet El Dorado County requirements of 50% shading on the site within the majority of the provided parking area, with the grade-level deck above the subterranean parking meeting this requirement only where trees can be planted due to the constraints of the structure beneath.

The Project proposes to pay in-lieu fees as mitigation for the loss of the oak woodland.

LIGHTING

The North Site will provide various single, two- or four-light fixtures throughout the parking areas and driveways. The overall height of the lighting on the North Site, including the lighting fixtures and a 3-foot base, will be 33 feet in the parking lot, 25 feet along the perimeter and main drive aisles, and 16 feet around drive-through lanes. LED luminaires will be used for the parking lot lights.

The South Site parking lot will be illuminated with standard downward LED fixtures affixed to a 37-foot light pole. The lighting fixtures are of a "shoe-box" style. Parking lot light standards are designed to provide even light distribution for vehicle and pedestrian safety. The parking lot lights will be timer controlled to limit lighting after the warehouse has closed and most employees are gone from the warehouse. Parking lot lighting will only remain on to provide security and emergency lighting only along the main driveways. Lighting fixtures will also be located on the building approximately every 40 feet around the exterior of the building to provide safety and security. Parking and site lighting will incorporate the use of cutoff lenses to keep light from overflowing beyond the South Site boundaries.

GRADING

A preliminary grading plan has been prepared for review as part of the application submittals. Each site is designed to balance independently, and it is the intent of this application to allow for mass grading of both sites individually.

ON-SITE IMPROVEMENTS

The Project is designed to allow either the North Site or the South Site to develop independent from the other. Mass grading of each site to accommodate future development will occur in the first phase of development, including filling of the permitted wetlands and permitted tree removal. In the event the South Site develops first, utility crossings under Silva Valley Parkway will be constructed as part of the South Site infrastructure work to serve the North Site. In the event the North Site develops first, interim facilities will be constructed on the North Site.

The second phase for each site will include construction of the parking, landscaping, lighting, utility infrastructure, and driveways designed to support the buildings. Site improvements will be constructed in various phases depending on the extent of development occurring at any given time. Buildings can be started once site improvements are sufficiently completed to allow construction and emergency fire access.

OFF-SITE IMPROVEMENTS

A proposed traffic signal and appurtenant facilities will be located on Silva Valley Parkway at the main driveway of the Project to provide a connection to both the South Site and the North Site. An additional traffic signal is proposed at the intersection of Clarksville Crossing and Silva Valley Parkway.

A portion of Country Club Drive extension will be constructed up to the secondary access point to the North Site.

UTILITY INFRASTRUCTURE

The property will need to annex into El Dorado Irrigation District (EID) in order to acquire sanitary sewer and water service. EID stated in its December 6, 2018 Facilities Improvement Letter that there should be adequate water supply and sewer capacity available to serve a similar type of project. The Project will tie into the existing 18-inch potable water main and

the 21-inch gravity sewer line in Clarksville Crossing. An updated Facilities Improvement Letter will be requested through EID at the appropriate time.

The property will also annex into the El Dorado Hills County Water District (Fire Protection) prior to building permit issuance.

Sanitary service and potable water for the North Site will be provided by public (EID) sanitary sewer and water lines that cross the South Site. Reclaimed water is available for non-potable irrigation use and will be provided by extending an existing reclaimed line in Silva Valley Parkway north of the Project site.

Dry utilities (electric, gas, telephone, and cable TV) will be provided from existing infrastructure located to the north of the Project site in Silva Valley Parkway. Dry utilities will need to be extended along the frontage of both the North Site and the South Site.

STORM DRAINAGE DESCRIPTION

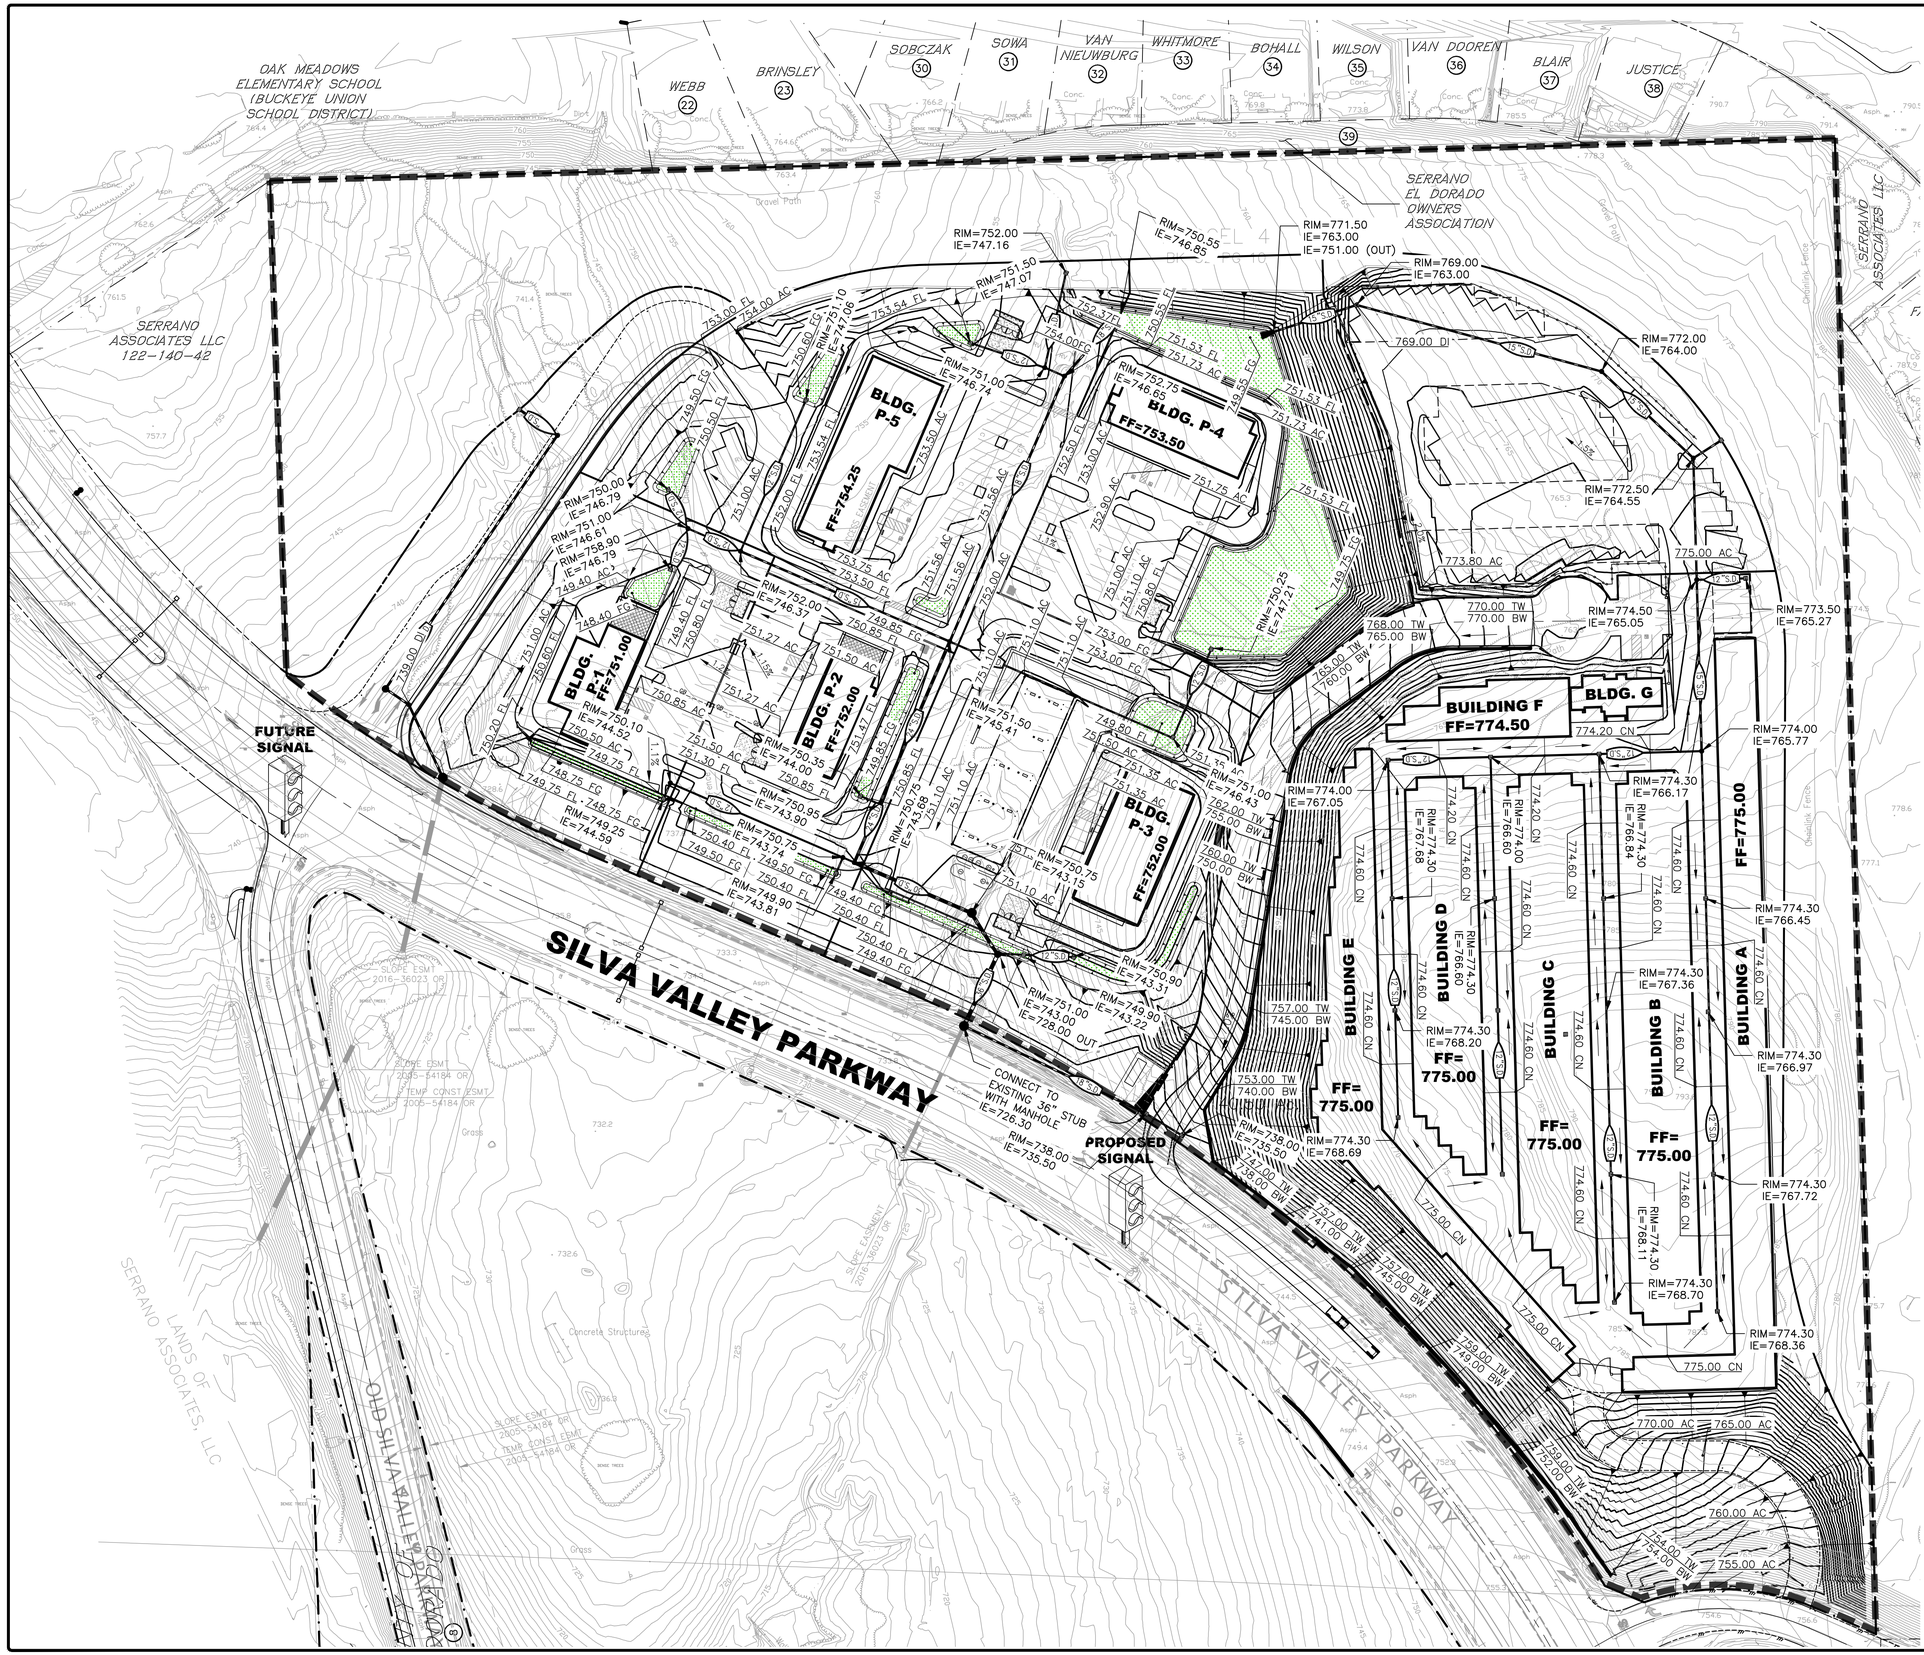
The on-site drainage system will connect to El Dorado County's storm drain infrastructure in Clarksville Crossing. The Project has typical pollutant sources from parking lot runoff, loading/unloading areas, outdoor storage areas, and a trash compactor. This Project proposes bioretention areas and underground water quality vaults as the form of treatment for the site.

TRUCK CIRCULATION

Truck access will be allowed at all driveway locations depending on the size of the delivery truck and direction of travel.

OTHER GOVERNMENTAL AGENCY APPROVALS

Additional subsequent approvals and permits that may be required from local, regional, state, and federal agencies are identified below.



- El Dorado Irrigation District -Water and Sewer-Annexation and Utility Approval
- El Dorado County Resource Conservation District-Onsite Plan Approval
- El Dorado Hills County Water District (Fire Protection)-Annexation and Fire Approval
- El Dorado County Air Quality Management District-Air Quality Permit
- El Dorado County Department of Transportation -Encroachment Permit/Grading Permit/Onsite Plan Approval
- El Dorado County Building Services-Building Permit/Sign Permit

- Central Valley Regional Water Quality Control Board-NPDES General Permit for Stormwater Discharge

- California Department of Fish and Wildlife-Wetland Approval

- Army Corps-Wetland Permitting for each side

- LAFCO-Annexation approval for EID and El Dorado Fire Protection District along with the Bureau of Land Reclamation

IRRIGATION DESIGN STATEMENT:

The irrigation system will be a water efficient low flow, point source system designed to provide adequate watering to support plant growth and insure deeply rooted plant material while avoiding excess water application. The system will be programmable, allowing operation during late night and or early morning hours, with multiple start times and cycles. The system will interface with a weather based sensor that will adjust the amount of water applied to the plant material based on daily weather conditions. Irrigation materials specified for the site will be selected on the basis of durability and ease of maintenance. Landscape irrigation will comply with the California Department of Water Resources Model Water Efficient Landscape Ordinance (MWELO).

LANDSCAPE DATA:

Costco Site Coverage
Total Parcel Area: +-17.04 AC (+- 742,262 SF)

PLAN

NOTES

1. THIS PLOT WAS PREPARED FROM INFORMATION FURNISHED IN PRELIMINARY TITLE REPORTS, PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY, DATED JANUARY 9, 2019, NUMBER NCS-942714-WA1 & NUMBER NCS-942715-WA1. NO LIABILITY IS ASSUMED FOR MATTERS OF RECORD NOT STATED IN SAID PRELIMINARY TITLE REPORT THAT MAY AFFECT THE TITLE LINES, OR EXCEPTIONS, OR EASEMENTS OF THE PROPERTY.

2. ALL DISTANCES AND ELEVATIONS SHOWN HEREON ARE IN FEET AND DECIMALS THEREOF.

3. THE TYPES, LOCATIONS, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS TOPOGRAPHIC SURVEY WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. (A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES). HOWEVER, THE ENGINEER CAN ASSUME NO RESPONSIBILITY FOR THE COMPLETENESS OR ACCURACY OF ITS DELINEATION OF SUCH UNDERGROUND UTILITIES WHICH MAY BE ENCOUNTERED, BUT WHICH ARE NOT SHOWN ON THESE DRAWINGS.

4. PHYSICAL ITEMS SHOWN ON THIS SURVEY ARE LIMITED TO THOSE ITEMS VISIBLE AS OF THE DATE OF THIS SURVEY. SUBSURFACE STRUCTURES, IF ANY, ARE NOT SHOWN. SAID SUBSURFACE OBJECTS MAY INCLUDE, BUT ARE NOT LIMITED TO, CONCRETE FOOTINGS, SLABS, SHORING, STRUCTURAL PILES, UTILITY VAULTS, PIPING, UNDERGROUND TANKS, AND ANY OTHER SUBSURFACE STRUCTURES NOT REVEALED BY A SURFACE INSPECTION.

5. THE SUBJECT PROPERTY IS SHOWN ON THE FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM) FOR EL DORADO COUNTY, CALIFORNIA, MAP NUMBER 06017C0725E FOR COMMUNITY NUMBER 060040 (EL DORADO COUNTY), WITH AN EFFECTIVE DATE OF SEPTEMBER 26, 2008, AS BEING LOCATED IN FLOOD ZONE "X-UNSHADED". ACCORDING TO FEMA THE DEFINITION OF ZONE "X-UNSHADED" IS: AREA OF MINIMAL FLOOD HAZARD.

6. BENCHMARK:
CAL-TRANS TBM, NGS DISK ON TOP OF HEADWALL AT THE NORTHWEST CORNER OF THE BRIDGE ON CLARKSVILLE CROSSING AS TAKEN FROM THE CALTRANS IMPROVEMENT PLANS, SHEET 14 (PC-1) OF THE SILVA VALLEY CONSTRUCTION PLANS DATED JANUARY 4, 2013.
(PID: JS0692) ELEVATION= 673.08 FEET (NGVD 1929 DATUM)

7. BASIS OF BEARINGS:
THE BEARING OF NORTH 88° 27' 28" EAST, TAKEN ON THE NORTHERLY LINE OF PARCEL 4 AS SHOWN ON THAT CERTAIN PARCEL MAP FILED FOR RECORD ON DECEMBER 28, 2018, IN BOOK 52 OF MAPS AT PAGE 10, OFFICIAL RECORDS OF EL DORADO COUNTY WAS TAKEN AS THE BASIS FOR ALL BEARINGS SHOWN HEREON.

8. CORNER RECORD NOTE:
THE DEVELOPER AND/OR CONTRACTOR SHALL BE RESPONSIBLE FOR THE PREPARATION AND FILING OF PRE-CONSTRUCTION AND POST-CONSTRUCTION CORNER RECORDS FOR ANY MONUMENTS OR PROPERTY CORNERS SHOWN HEREON THAT MAY BE DESTROYED DURING IMPROVEMENTS TO THE SUBJECT PROPERTY AS DEFINED IN SECTION 8771(B) OF THE PROFESSIONAL LAND SURVEYORS ACT.

10. THE AERIAL MAPPING WAS PREPARED USING COMPUTER ASSISTED, PHOTOGRAMMETRIC METHODS BY COOPER AERIAL SURVEYS CO., IN PHOENIX ARIZONA. JOB NUMBER 1901022. IN AREAS OF DENSE VEGETATION, ACCURACY OF CONTOURS MAY DEVIATE FROM ACCEPTED ACCURACY STANDARDS. DATE OF PHOTOGRAPHY 02-22-19, ORIGINAL COMPILED MAP SCALE 1"=40', CONTOUR INTERVAL 1 FOOT. THE GRID IS BASED ON PHOTOGRAMMETRIC METHODS COMPILED ON DIGITAL STEREO WORKSTATIONS USING AERIAL PHOTOGRAPHY. CONTROL SURVEY PERFORMED BY KIER & WRIGHT, LIVERMORE, CA.

IRRIGATION DESIGN STATEMENT:

The irrigation system will be a water efficient low flow, point source system designed to provide adequate watering to support plant growth and insure deeply rooted plant material while avoiding excess water application. The system will be programmable, allowing operation during late night and or early morning hours, with multiple start times and cycles. The system will interface with a weather based sensor that will adjust the amount of water applied to the plant material based on daily weather conditions. Irrigation materials specified for the site will be selected on the basis of durability and ease of maintenance. Landscape irrigation will comply with the California Department of Water Resources Model Water Efficient Landscape Ordinance (MWELO).

LANDSCAPE DATA:

Costco Site Coverage
Total Parcel Area: +-17.04 AC (+- 742,262 SF)
Landscape Area Provided: 240,027 SF

Shading Requirements:
Required: 50% parking lot shading at 15 years
Provided: 56%

Upper Level Parking:
Provides 100% shading of lower level parking

NOTES

1. THIS PLOT WAS PREPARED FROM INFORMATION FURNISHED IN PRELIMINARY TITLE REPORTS, PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY, DATED JANUARY 9, 2019, NUMBER NCS-942714-WA1 & NUMBER NCS-942715-WA1. NO LIABILITY IS ASSUMED FOR MATTERS OF RECORD NOT STATED IN SAID PRELIMINARY TITLE REPORT THAT MAY AFFECT THE TITLE LINES, OR EXCEPTIONS, OR EASEMENTS OF THE PROPERTY.

2. ALL DISTANCES AND ELEVATIONS SHOWN HEREON ARE IN FEET AND DECIMALS THEREOF.

3. THE TYPES, LOCATIONS, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS TOPOGRAPHIC SURVEY WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. (A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES). HOWEVER, THE ENGINEER CAN ASSUME NO RESPONSIBILITY FOR THE COMPLETENESS OR ACCURACY OF ITS DELINEATION OF SUCH UNDERGROUND UTILITIES WHICH MAY BE ENCOUNTERED, BUT WHICH ARE NOT SHOWN ON THESE DRAWINGS.

4. PHYSICAL ITEMS SHOWN ON THIS SURVEY ARE LIMITED TO THOSE ITEMS VISIBLE AS OF THE DATE OF THIS SURVEY. SUBSURFACE STRUCTURES, IF ANY, ARE NOT SHOWN. SAID SUBSURFACE OBJECTS MAY INCLUDE, BUT ARE NOT LIMITED TO, CONCRETE FOOTINGS, SLABS, SHORING, STRUCTURAL PILES, UTILITY VAULTS, PIPING, UNDERGROUND TANKS, AND ANY OTHER SUBSURFACE STRUCTURES NOT REVEALED BY A SURFACE INSPECTION.

5. THE SUBJECT PROPERTY IS SHOWN ON THE FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM) FOR EL DORADO COUNTY, CALIFORNIA, MAP NUMBER 06017C0725E FOR COMMUNITY NUMBER 060040 (EL DORADO COUNTY), WITH AN EFFECTIVE DATE OF SEPTEMBER 26, 2008, AS BEING LOCATED IN FLOOD ZONE "X-UNSHADED". ACCORDING TO FEMA THE DEFINITION OF ZONE "X-UNSHADED" IS: AREA OF MINIMAL FLOOD HAZARD.

6. BENCHMARK:
CAL-TRANS TBM, NGS DISK ON TOP OF HEADWALL AT THE NORTHWEST CORNER OF THE BRIDGE ON CLARKSVILLE CROSSING AS TAKEN FROM THE CALTRANS IMPROVEMENT PLANS, SHEET 14 (PC-1) OF THE SILVA VALLEY CONSTRUCTION PLANS DATED JANUARY 4, 2013.
(PID: JS0692) ELEVATION= 673.08 FEET (NGVD 1929 DATUM)

7. BASIS OF BEARINGS:
THE BEARING OF NORTH 88° 27' 28" EAST, TAKEN ON THE NORTHERLY LINE OF PARCEL 4 AS SHOWN ON THAT CERTAIN PARCEL MAP FILED FOR RECORD ON DECEMBER 28, 2018, IN BOOK 52 OF MAPS AT PAGE 10, OFFICIAL RECORDS OF EL DORADO COUNTY WAS TAKEN AS THE BASIS FOR ALL BEARINGS SHOWN HEREON.

8. CORNER RECORD NOTE:
THE DEVELOPER AND/OR CONTRACTOR SHALL BE RESPONSIBLE FOR THE PREPARATION AND FILING OF PRE-CONSTRUCTION AND POST-CONSTRUCTION CORNER RECORDS FOR ANY MONUMENTS OR PROPERTY CORNERS SHOWN HEREON THAT MAY BE DESTROYED DURING IMPROVEMENTS TO THE SUBJECT PROPERTY AS DEFINED IN SECTION 8771(B) OF THE PROFESSIONAL LAND SURVEYORS ACT.

10. THE AERIAL MAPPING WAS PREPARED USING COMPUTER ASSISTED, PHOTOGRAMMETRIC METHODS BY COOPER AERIAL SURVEYS CO., IN PHOENIX ARIZONA. JOB NUMBER 1901022. IN AREAS OF DENSE VEGETATION, ACCURACY OF CONTOURS MAY DEVIATE FROM ACCEPTED ACCURACY STANDARDS. DATE OF PHOTOGRAPHY 02-22-19, ORIGINAL COMPILED MAP SCALE 1"=40', CONTOUR INTERVAL 1 FOOT. THE GRID IS BASED ON PHOTOGRAMMETRIC METHODS COMPILED ON DIGITAL STEREO WORKSTATIONS USING AERIAL PHOTOGRAPHY. CONTROL SURVEY PERFORMED BY KIER & WRIGHT, LIVERMORE, CA.

IRRIGATION DESIGN STATEMENT:

The irrigation system will be a water efficient low flow, point source system designed to provide adequate watering to support plant growth and insure deeply rooted plant material while avoiding excess water application. The system will be programmable, allowing operation during late night and or early morning hours, with multiple start times and cycles. The system will interface with a weather based sensor that will adjust the amount of water applied to the plant material based on daily weather conditions. Irrigation materials specified for the site will be selected on the basis of durability and ease of maintenance. Landscape irrigation will comply with the California Department of Water Resources Model Water Efficient Landscape Ordinance (MWELO).

LANDSCAPE DATA:

Costco Site Coverage
Total Parcel Area: +-17.04 AC (+- 742,262 SF)
Landscape Area Provided: 240,027 SF

Shading Requirements:
Required: 50% parking lot shading at 15 years
Provided: 56%

Upper Level Parking:
Provides 100% shading of lower level parking

PLAN

NOTES

1. THIS PLOT WAS PREPARED FROM INFORMATION FURNISHED IN PRELIMINARY TITLE REPORTS, PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY, DATED JANUARY 9, 2019, NUMBER NCS-942714-WA1 & NUMBER NCS-942715-WA1. NO LIABILITY IS ASSUMED FOR MATTERS OF RECORD NOT STATED IN SAID PRELIMINARY TITLE REPORT THAT MAY AFFECT THE TITLE LINES, OR EXCEPTIONS, OR EASEMENTS OF THE PROPERTY.

2. ALL DISTANCES AND ELEVATIONS SHOWN HEREON ARE IN FEET AND DECIMALS THEREOF.

3. THE TYPES, LOCATIONS, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS TOPOGRAPHIC SURVEY WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. (A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES). HOWEVER, THE ENGINEER CAN ASSUME NO RESPONSIBILITY FOR THE COMPLETENESS OR ACCURACY OF ITS DELINEATION OF SUCH UNDERGROUND UTILITIES WHICH MAY BE ENCOUNTERED, BUT WHICH ARE NOT SHOWN ON THESE DRAWINGS.

4. PHYSICAL ITEMS SHOWN ON THIS SURVEY ARE LIMITED TO THOSE ITEMS VISIBLE AS OF THE DATE OF THIS SURVEY. SUBSURFACE STRUCTURES, IF ANY, ARE NOT SHOWN. SAID SUBSURFACE OBJECTS MAY INCLUDE, BUT ARE NOT LIMITED TO, CONCRETE FOOTINGS, SLABS, SHORING, STRUCTURAL PILES, UTILITY VAULTS, PIPING, UNDERGROUND TANKS, AND ANY OTHER SUBSURFACE STRUCTURES NOT REVEALED BY A SURFACE INSPECTION.

5. THE SUBJECT PROPERTY IS SHOWN ON THE FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM) FOR EL DORADO COUNTY, CALIFORNIA, MAP NUMBER 06017C0725E FOR COMMUNITY NUMBER 060040 (EL DORADO COUNTY), WITH AN EFFECTIVE DATE OF SEPTEMBER 26, 2008, AS BEING LOCATED IN FLOOD ZONE "X-UNSHADED". ACCORDING TO FEMA THE DEFINITION OF ZONE "X-UNSHADED" IS: AREA OF MINIMAL FLOOD HAZARD.

6. BENCHMARK:
CAL-TRANS TBM, NGS DISK ON TOP OF HEADWALL AT THE NORTHWEST CORNER OF THE BRIDGE ON CLARKSVILLE CROSSING AS TAKEN FROM THE CALTRANS IMPROVEMENT PLANS, SHEET 14 (PC-1) OF THE SILVA VALLEY CONSTRUCTION PLANS DATED JANUARY 4, 2013.
(PID: JS0692) ELEVATION= 673.08 FEET (NGVD 1929 DATUM)

7. BASIS OF BEARINGS:
THE BEARING OF NORTH 88° 27' 28" EAST, TAKEN ON THE NORTHERLY LINE OF PARCEL 4 AS SHOWN ON THAT CERTAIN PARCEL MAP FILED FOR RECORD ON DECEMBER 28, 2018, IN BOOK 52 OF MAPS AT PAGE 10, OFFICIAL RECORDS OF EL DORADO COUNTY WAS TAKEN AS THE BASIS FOR ALL BEARINGS SHOWN HEREON.

8. CORNER RECORD NOTE:
THE DEVELOPER AND/OR CONTRACTOR SHALL BE RESPONSIBLE FOR THE PREPARATION AND FILING OF PRE-CONSTRUCTION AND POST-CONSTRUCTION CORNER RECORDS FOR ANY MONUMENTS OR PROPERTY CORNERS SHOWN HEREON THAT MAY BE DESTROYED DURING IMPROVEMENTS TO THE SUBJECT PROPERTY AS DEFINED IN SECTION 8771(B) OF THE PROFESSIONAL LAND SURVEYORS ACT.

10. THE AERIAL MAPPING WAS PREPARED USING COMPUTER ASSISTED, PHOTOGRAMMETRIC METHODS BY COOPER AERIAL SURVEYS CO., IN PHOENIX ARIZONA. JOB NUMBER 1901022. IN AREAS OF DENSE VEGETATION, ACCURACY OF CONTOURS MAY DEVIATE FROM ACCEPTED ACCURACY STANDARDS. DATE OF PHOTOGRAPHY 02-22-19, ORIGINAL COMPILED MAP SCALE 1"=40', CONTOUR INTERVAL 1 FOOT. THE GRID IS BASED ON PHOTOGRAMMETRIC METHODS COMPILED ON DIGITAL STEREO WORKSTATIONS USING AERIAL PHOTOGRAPHY. CONTROL SURVEY PERFORMED BY KIER & WRIGHT, LIVERMORE, CA.

RE: **PD15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001 – EDH 52** *(AKT Investments/EDH 52 GP/RSC Engineering, Inc. – Tiffany Wilson)*

The El Dorado Hills Community Services District ("District") appreciates this opportunity to respond to the request to review and comment on the above referenced project. Below are comments and conditions to be addressed.

PLANNED DEVELOPMENT PERMIT, REZONE, TENTATIVE PARCEL MAP, LOT LINE ADJUSTMENT, AND VARIANCE PER REVISED PROJECT APPLICATION

The Revised Application proposes two sites – a southerly site of 17 acres with 156,000 square feet of commercial use (Costco) and a northerly site of 18 acres of mixed-use development with 14,000 square feet of commercial uses and 304 multifamily units within five four-story buildings, amenities including a pool area, gym, and outdoor gathering space on the properties identified as APNs 122-720-002, 122-720-003,122-720-018,122-720-019,122-720-020,122-720-021, consisting of 40.56 acres.

PARKLAND DEDICATION & IMPACT FEE REQUIREMENTS

District Policy 6110.10
All subdividers of land within the District's jurisdiction shall dedicate park land suitable for active recreation use, or pay fees in lieu thereof (Quimby), or by District Board authorization, follow a combination of these alternatives.

Application of all Parkland Dedication requirements shall follow the El Dorado County Subdivision Ordinance and be consistent with the project.

The below provides the requirements for project development related to acceptable parklands:

PARKLAND DEDICATION AND DEVELOPMENT STANDARDS

District Policy 6110.10
Park dedication amounts shall be determined as a result of calculation based on the legislated rate of 5 acres per 1000 population project yield. Population is calculated at the rate of 3.3 persons for single family subdivisions and 2.8 for multi-family subdivisions on a per parcel basis.

District Policy 6110.20
As an alternative to parkland dedication, where Quimby fees are paid in lieu of land dedication; the sum owed shall be determined by District staff by consulting with the County Assessor's Office, County Planning Department and/or an approved private appraiser, as authorized by ordinance.

The proposed tentative subdivision creates 304 multi-family housing units, which yields a population of 851 persons. Using the 5 acres per 1,000 persons formula, the required land dedication is 4.26 acres. The applicant can satisfy this requirement by way of Quimby fees paid in lieu of land dedication.

District Policy 6110.30 and 6110.40
The amount of park land to be dedicated shall be calculated on the basis of the subdivision's dwelling unit yield as determined from the approved tentative map or the final map should the yield increase. Also, per District Policy 6110.40, staff shall inspect and evaluate all proposed park land dedications to determine the suitability of the subdivider's offering. The District will confer jointly with the County to determine the amount of park land to be dedicated within the subdivision and its most suitable location.

LAND SUITABLE FOR PARKLAND DEDICATION

District Policy 6110.60
Land suitable for dedication as an active recreation site (park land) shall include the following important elements to take into consideration:

- Minimum desirable park site size is normally three (3) acres for purposes of economical maintenance and procuring adequate land for the development of multi-purpose fields.

- Active recreational pursuits, such as team field sports, game courts, and activity buildings require predominantly level land, 2% slope. Land with a greater slope, up to 20% of the site, may be acceptable where it has utility for picnicking or other passive recreation activities and when it complements usable park area (2% slope) or when it appears consistent with uses proposed for a special purpose park site. All parks improved for active recreation purposes (i.e., ball fields, hard courts, etc.) shall be graded to a maximum 2% slope within areas proposed for such uses.

- Site shall be free and clear of surface and overhead utility line easements which contain design, maintenance or operation constraints or place the public at unreasonable risk. Where easements unavoidably occur, only those compatible to the intended active recreation development, will be allowed for consideration as an acceptable dedication.

- A neighborhood park, to the extent practicable, shall be centrally located within its residential service area and easily accessed by pedestrian or light vehicular traffic. Typical amenities include children's play apparatus, hard court, a multi-purpose turfed area and suitable landscaping.

- Village/area parks shall generally provide recreation facilities needful by a larger community segment. These may be located on more significant transportation routes and shall furnish adequate parking. Ample hard courts, including tennis, larger field areas, group picnic facilities and a larger, more complex play apparatus for children, is customary.

- Drainage courses, or dedications near or adjacent to hazardous or noxious material's sites are not acceptable. Flood plains are generally not accepted unless the site's potential risks are fully mitigated at the subdivider's risk and expense.

Private parks (neighborhood parks behind development gates) are eligible for a portion of parkland credit per County Subdivision Ordinance and District policy, and are not eligible for park impact fee reduction, as the park impact fee imposed is for public parks, not private parks.

COMMUNITY FACILITIES DISTRICT (CFD)

As a Condition of Approval, prior to the approval of the project's Final Map, annexation into the following Community Facilities Districts (CFDs) is required:

El Dorado Hills Community Services District Master CFD 2019-01

Annexation into the District's Master CFD 2019-01 will satisfy the requirement for participating in the funding of the ongoing maintenance of future parks, trails and pathways, open space, landscaping, lighting and other common or public areas owned/maintained by the District within the District's service boundary.

For complete District Policy guidelines, please see Policy Guide Services 6000 – Facility Development on our website at www.eldoradohillscsd.org/about/administration-finance.html

Should you have any questions or comments regarding the concerns expressed in this letter, please contact me at (916) 614-3214.

Best regards,

Jeff Kernen

Re: Determination of Application Incompleteness
Project File Name: EDH 52-Costco
Project Application Nos.: Planned Development Permit PD15-0001, Rezone Z17-0004, Tentative Parcel Map P17-0007, Conditional Use Permit CUP-R21-0024 (reactivation of S17-0017), Lot Line Adjustment LLA21-0009
APNs: 122-720-002, -018, -019, -020, and -021

Dear Mr. Balingit,

Planning Services has reviewed the above-referenced project application set resubmittal and found it to be *incomplete* for preliminary review purposes. The resubmittal was received on April 28, 2021. Below is a list of information needed to *complete* the above-referenced applications.

Some outstanding information is duplicative for a project with multiple applications. The list of materials/ information below has been consolidated based on the assumptions that a) the same sets of project plans will be adequate for multiple applications, and b) that technical reports will encompass the entire project site, and, where applicable, construction and operational activities on the North and South Sites. As such, please ensure that all materials submitted for use in multiple applications and/or APNs include the relevant information for each application number and APN(s).

Note that some previously-submitted application materials reference the old APN that was applicable before the parcel map that was approved in 2018 (P17-0004).

Planned Development Permit PD15-0001

1. An updated signed Planned Development Permit (PD) application, including the Environmental Questionnaire (encompassing the North and South Sites). (PD application with Environmental Questionnaire attached). *PD checklist item no. 1*
2. Letter of authorization from all landowners, including Mee Capital Investments (owners of APN: 122-720-002) authorizing the agent(s) identified on the applications to act on their behalf. *PD checklist item no. 2*
3. A copy of the official Assessor's map, showing the project parcels outlined in red. *PD checklist item no. 4*
4. A stand-alone 8½ x 11 vicinity map showing the location of the project site in relation to the distance to major roads, intersections, and town sites. *PD checklist item no. 5*
5. Completed Environmental Questionnaire form *(included in PD application, attached). PD checklist item no. 6*
6. Our understanding is that Kittelson & Associates is preparing the traffic study. Please provide a final traffic study, when available. *PD checklist item no. 9*
7. An updated Facilities Improvement Letter (FIL) from El Dorado Irrigation District. (The previously submitted FIL expires on December 6, 2021 and references the old APN for the original parcel.) *PD checklist item no. 10*
8. Preliminary grading and drainage plan. *PD checklist item no. 14*
9. Confirmation letter from Foothill Associates, or other biological resources expert, that site conditions relative to biological resources have not changed since the previous Biological Resources Assessment was prepared in October 2017. *Relevant to PD checklist items no. 17 and 19*
10. Our understanding is that the EIR Consultant will be conducting the acoustical analysis in the course of preparing the environmental impact analysis for the project. Please let us know if you expect to submit this analysis directly. *Checklist item no. 18*
11. Our understanding is that Ramboll is preparing analyses for air quality, greenhouse gas, energy, and health effects. Please provide these reports, when available. *PD checklist item no. 20*
12. A completed and signed Oak Resources Code Compliance Certificate and Oak Resources Technical Report Checklist (attached). A security deposit for on-site oak tree/oak woodland retention and/or replacement planting may be required upon analysis of oak resource impacts. *Oak Tree/Oak Woodland Removal checklist items no. 1 and 3 (PD application, page 12)*
13. For the South Site, include the location of trash and litter storage or collection areas on the site plans. Site Plan Requirements checklist item no. 9 *(PD application, page 13)*
14. For the North Site, provide building elevations for all cardinal directions. *Plan of Building Elevations, checklist item no. 1 (PD application, page 15)*

15. On the landscape plan, indicate:

    - The quantity and number of trees to be removed.
    - The location, general type (pine, oak, etc.) and size of all existing trees, in those areas that are subject to grading or otherwise may be removed/affected by the proposed improvements. *Preliminary Landscape Plan Requirements checklist items no 2 and 3 (PD application, page 14)*

Rezone Z17-0004

16. A completed signed Rezone application and agreement for payment of processing fees (Rezone application and payment form attached). *Checklist item no. 1*

Tentative Parcel Map P17-0007

17. A completed signed Tentative Parcel Map (TPM) application and agreement for payment of processing fees (TPM application and payment form attached). *Checklist item no. 1*

18. Four copies of a slope map noting the following slope range categories: 0 to 10%, 11 to 20%, 21 to 29%, 30 to 39%, 40% and over. *Checklist item no. 20.b*

19. TPM plan sheet including all information listed as Required Information on Tentative Map section. *TPM application, starting on page 10*

CUP-R21-0024 (Reactivation of S17-0017)

20. A completed signed Conditional Use Permit (CUP) application and agreement for payment of processing fees (CUP application and payment form attached). *Checklist Item no 1*

Lot Line Adjustment LLA21-0009

21. Lot Line Adjustment (LLA) application and agreement for payment of processing fees, both completed and signed (both forms are provided alongside this letter). *Checklist item no. 1*

22. One full-size site plan drawn to scale and of sufficient size to allow for a clear delineation of the required information in items a-m as listed in the LLA application, as applicable, and one 11 x 17 version of the full-size site plan. *Checklist item no. 4*

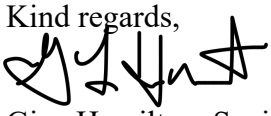
Note that this list of required information may not be exhaustive.

In addition, the project description dated April 23, 2021 indicates the intent to submit a separate PD application for the South Site/ Costco site. Please submit a completed signed PD application for the South Site if that is still the plan.

Planning staff recommends reviewing El Dorado County General Plan Policy 10.2.1.5 under Objective 10.2.1, Public and Civic Facilities Investment, in regard to the potential requirement for a Public Facilities Financing Plan for commercial projects that are located in a Community Region and that exceed 20 acres or 100,000 square feet. This policy can be found in the County's Economic Development Element here:

https://www.edcgov.us/Government/Planning/pages/Adopted_General_Plan.aspx

As indicated on in the above-referenced PD, Rezone, CUP, and TPM applications:



> Planning reserves the right to require additional project information as provided by Section 15060 of the California Environment Quality Act, or as required by the General Plan development policies, or when such is necessary to complete the environmental assessment.

Delayed submittal of the items listed above may affect timely preparation of the environmental assessment document(s). Please don't hesitate to let me know if you have any questions about these items.

Once it has been determined that we have enough information to go forward for Technical Advisory Committee (TAC) review, the applications will be distributed to affected departments and agencies for a 30-day review and comment period. In addition, a TAC meeting will be scheduled to discuss the comments received and any project issues. TAC meetings are for agency discussion and it is recommended that you or your agent be present at the TAC meeting to discuss the progress of your application.

New materials should be submitted to: Gina Hamilton, Planning Services, 2850 Fairlane Court, Building C, Placerville, CA 95667. Be sure to refer to the specific project number(s). Please call me at (530) 621-5980 or email me at gina.hamilton@edcgov.us if you have any questions or concerns regarding the requested items.

Kind regards,

Gina Hamilton, Senior Planner

RE: Drainage Study for EDH 52, Proposed Self Storage and Costco at Highway 50 and Silva Valley Parkway

OVERVIEW

The project consists of two separate but hydraulically connected developments covering about 50 acres. The projects are a self-storage complex on the northeast side of Silva Valley Parkway and a Costco on the southwest side, just north of the Highway 50 interchange. Figure 1 provides a vicinity map.

Figure 1. Vicinity Map

3153 Jenna Court
Roseville, CA 95747

Phone: 916- 774- 1111, Fax: 916- 774- 1181
Mobile: 916- 715- 1167, email: pstiehr@wtrmark.com

A drainage study completed by AE COM evaluated the downstream impacts of the proposed development. Their findings indicated that the development would increase flows at Highway 50 by about 2% for the 10- and 100-year storms. However, there is little development downstream, so the risk of increased damages is insignificant.

This study provides evaluation of the onsite facilities to demonstrate 10-year capacity of the proposed drainage facilities.

HYDROLOGY

The hydrology was based on the SCS methodology embedded within the XP-SWMM software.

Soils

The soils within the project area are identified by the NRCS as Auburn Silt Loam and are within Hydrologic Group D, low infiltration. The published hydraulic conductivity for the Auburn Silt Loan is 7.09 micrometers per second, or one inch per hour in US units.

Shed Definition

The self-storage site was subdivided into 17 shed areas and is shown on the SW Q1 sheet prepared by RSC Engineering. Shed 13 will be redirected south along the west side of the development. Runoff from Sheds 14 and 15 will be conveyed through the project. Sheds 16 and 17 will be graded and be the transition area, sloped from the project area down to collection swales and convey south under Silva Valley Parkway and then through the Costco site.

The Costco site was subdivided into seven DMAs as shown on Shed Map Exhibit prepared by Kier+Wright. There is an additional offsite shed at the southeast corner. Runoff from this area will be collected and conveyed southwest.

SCS Parameters

Rainfall- the idealized rainfall distribution for the 10-year, 24-hour storm was developed from the El Dorado County Table A2.2.3, depth-duration-frequency, developed by Jim Goodridge, 2008. A screen shot of the hyetograph is shown in Figure 2. The mean annual rainfall was estimated at 27 inches per year.

An assumed time-of-concentration of five minutes and a Curve Number of 95 were used for all nodes within the project areas. Table 1 provides a summary of the shed areas and peak flows from the 10-year, 24-hour storm.

Mobile: 916- 715- 1167, email: pstiehr@wtrmark.com

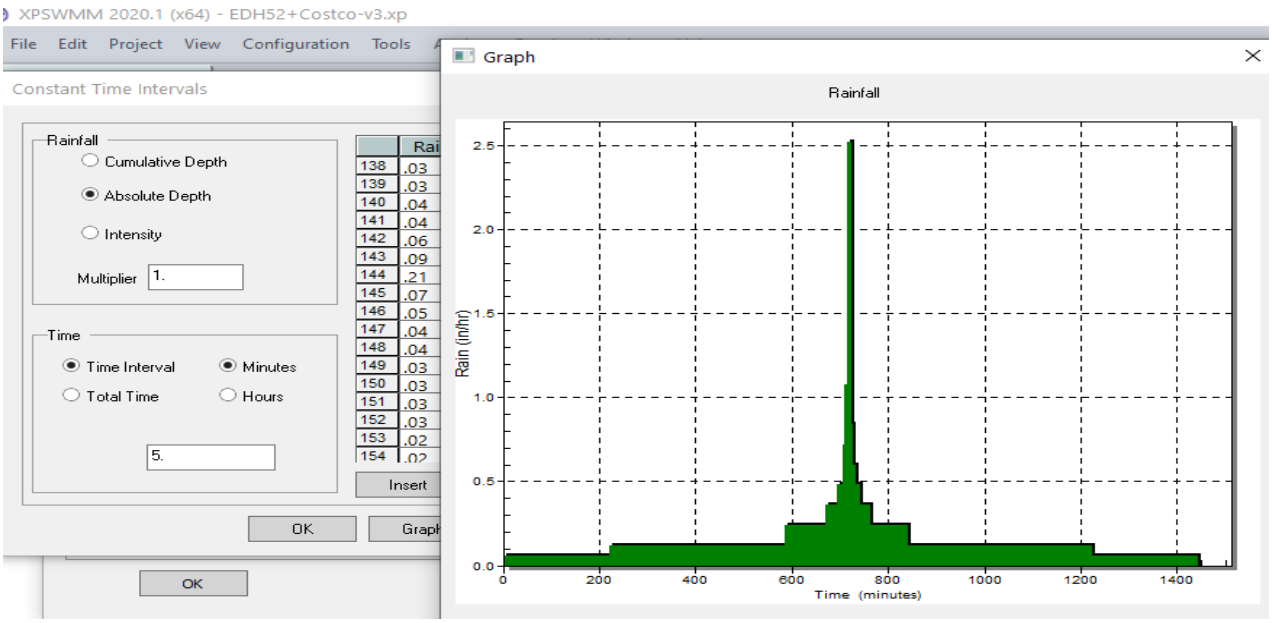

Figure 2. Plot of Rainfall Hyetograph for 10-year, 24-hour Storm

HYDRAULICS

The XP-SWMM software was used for the backwater analysis. Drainage facilities information for the modeling was based on the Preliminary Grading Plan by RSC Engineering for the self-storage site and the Drainage Exhibit prepared by Kier+Wright for the Costco site.

Figure 3 provides a schematic modeling map for the two projects. Table 1 provides a summary of the hydraulic parameters and characteristics of drainage facilities.

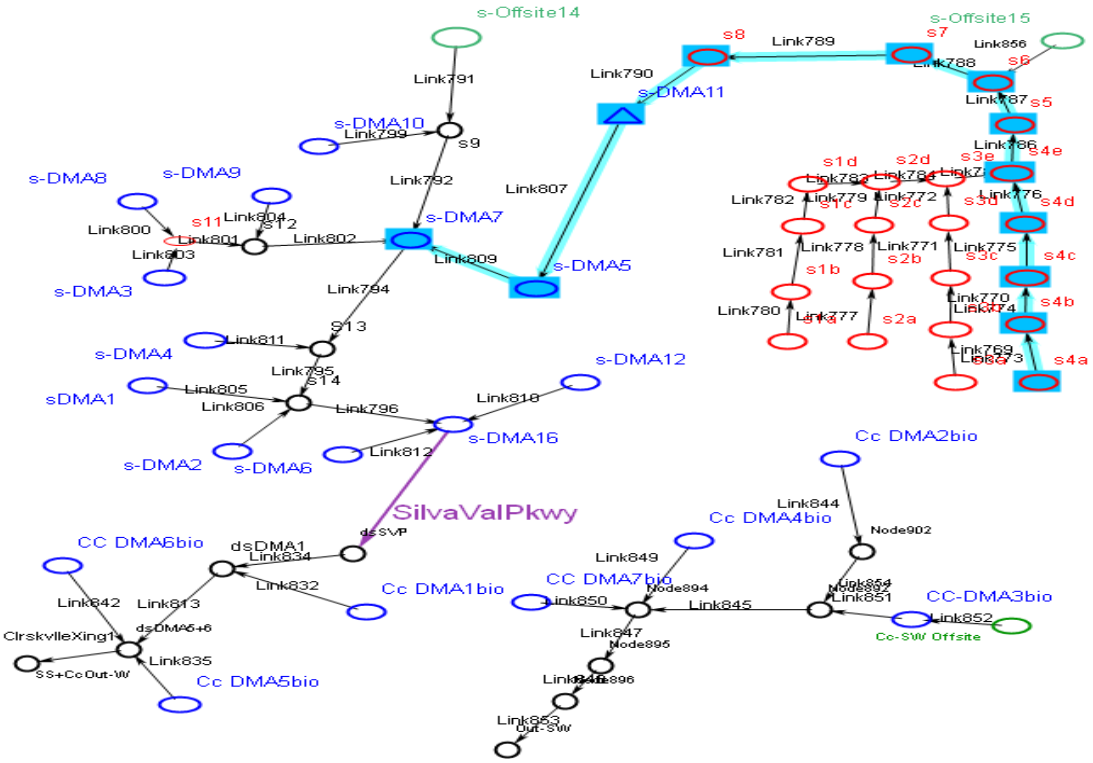
Note that the only DMA that was modelled as a storage area was at Node s-DMA11. This bio retention area is relatively large and does provide noticeable attenuation that reduces downstream outflow.

The other DMA bio retention areas could be added to the model if necessary. The modeling results indicate that the proposed storm drain pipes have adequate capacity to convey the 10-year, 24-hour storm. If the other bio retention areas were added, there would be increased peak flow attenuation throughout both projects. They were not added because it seemed unnecessary.

Attachment A provides there screen shots of a highlighted reach of storm drain pipe within the project, followed by a profile plot of the pipe with the 10-year, 24-hr storm water surface profile. This information is available in Table 1 but is also provided graphically.

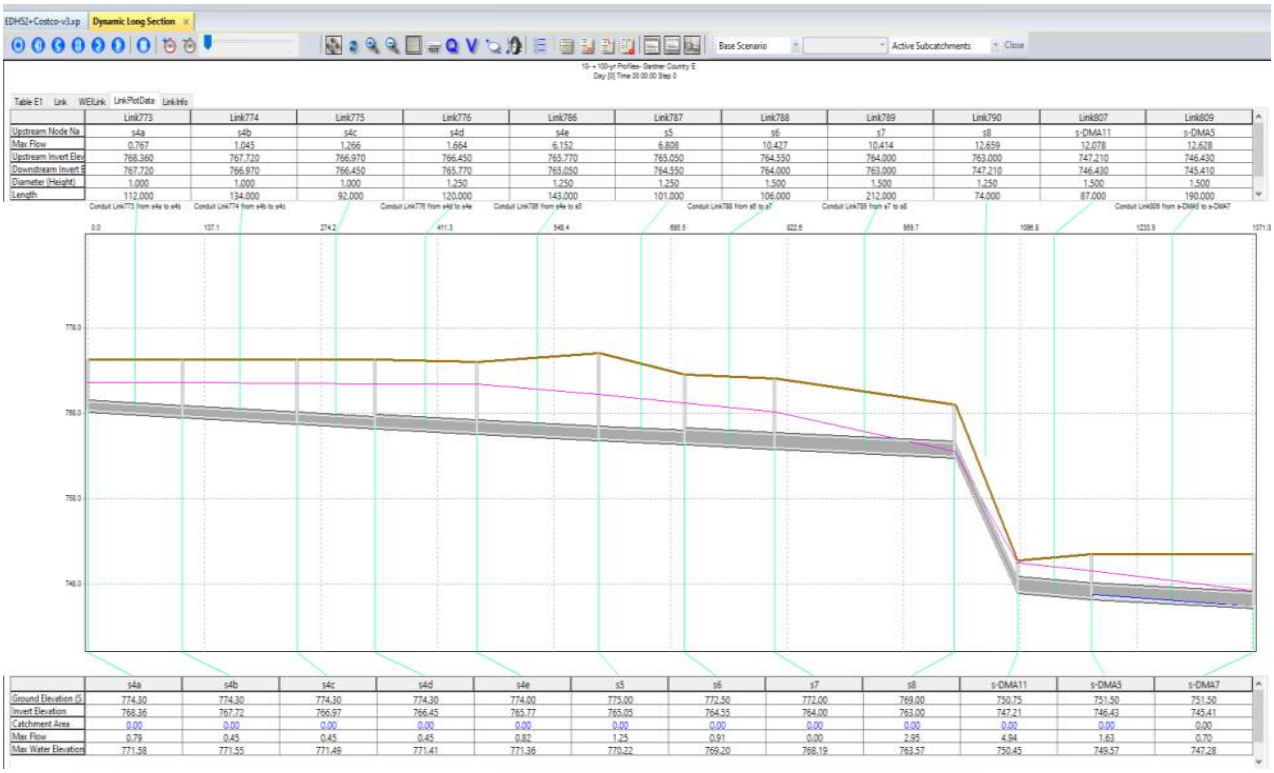
SUMMARY AND COMMENTS

The modeling clearly shows the proposed piping network for the two projects has adequate capacity to convey the 10-year storm.



Additional detailed are available upon request including the XP-SWMM model, and the rainfall 5-minute distribution depicted in Figure 2.

Water quality for the two projects is accomplished via the bio retention area planters scattered within the projects. No additional information has been provided within this document.



The offsite drainage is considered as a pass-through and has not been included in this study.

See the Shed and grading exhibits for both the Self-Storage and the Costco site for additional information.

☒	☐	1.	Application Form and Agreement for Payment of Processing Fees, completed and signed.
☒	☐	2.	Letter of authorization from all property owners authorizing agent to act as applicant, when applicable.
☒	☐	3.	Proof of ownership (Grant Deed), if the property has changed title since the last tax roll.
☒	☐	4.	A copy of official Assessor's map, showing the property outlined in red.
☒	☐	5.	An 8 ½" x 11" vicinity map showing the location of the project in relation to the distance to major roads, intersections, and town sites.
☒	☐	6.	Environmental Questionnaire form, completed and signed.
☒	☐	7.	Provide name, mailing address and phone number of all property owners and their agents.
☒	☐	8.	If public sewer or water service is proposed, obtain and provide a Facilities Improvement Letter if the project is located within the EID service area, or a similar letter if located in another sewer/water district. being updated
N/A ☐	☐	9.	If off-site sewer or water facilities are proposed to serve the project, provide four (4) copies of a map showing location and size of proposed facilities. If groundwater is to be used for domestic water, submit a report noting well production data for adjacent parcels, or submit a hydrological report prepared by a geologist noting the potential for water based on the nature of project site geology.

FORMS AND MAPS REQUIRED

Applicant	County		
	Check (√)		
[X]	☐	10.	Preceding parcel map, final map, or record of survey, if any exists.
N/A ☐	☐	11.	If located within one of the five Ecological Preserve - EP overlay zones (Mitigation Area 0), rare plants may exist on-site. The State Department of Fish & Game will require an on-site biological plant survey to determine the extent and location of rare plants on the project site. Such a survey can only occur from March 15 through August 15 when plants are readily visible. Therefore, if the State Department of Fish & Game requires the plant survey, a substantial delay in the processing of your application could result. To avoid potential delays, you may choose to provide this survey with application submittal. (A list of possible Botanical Consultants is available at Planning Services.)
N/A ☐	☐	12.	Name and address of Homeowners' Association, CSA 9 Zone of Benefit, or other road maintenance entity if it exists in the project area.
[X]	☐	13.	Preliminary grading, drainage plan, and report. The plan should be of sufficient detail to identify the scope of grading, including quantities, depths of cut and fills (for roads and driveways where cuts/fills exceed 6 feet, and mass pad graded lots), location of existing drainage, proposed modifications, and impacts to downstream facilities. (See Section 15.14.240 of County Grading Ordinance for submittal detail.)
		14.	In an accompanying report, provide the following data for area on each proposed parcel which is to be used for sewage disposal:
N/A ☐	☐		a) The percolation rate and location of test on 4.5 acres or smaller
☐	☐		b) The depth of soil and location of test
☐	☐		c) The depth of groundwater and location of test
☐	☐		d) The direction and percent of slope of the ground
☐	☐		e) The location, if present, of rivers, streams, springs, areas subject to inundation, rock outcropping, lava caps, cuts, fills, and easements
☐	☐		f) Identify the area to be used for sewage disposal
☐	☐		g) Such additional data and information as may be required by the Director of Environmental Health to assess the source of potable water, the disposal of sewage and other liquid wastes, the disposal of solid wastes, drainage, and erosion control
☐	☐		h) In circumstances where there are steep slopes, streams or other constraints as determined by staff, these must be noted on the tentative parcel map

El Dorado County

Community Development Agency

Development Services Division

2850 Fairlane Court

Placerville, CA 95667

Attn: Gina Hamilton, Senior Planner

Dear Gina,

The EDH 52 and Costco teams are pleased to update the submittal package to include items necessary to continue processing the package. Below are responses to comments from the May 23, 2021 letter.

Planned Development Permit PD15-0001

1. An updated signed Planned Development Permit (PD) application, including the Environmental Questionnaire (encompassing the North and South Sites).

   An updated Planned Development Permit Application is included. The agreement for payment is included. Only one form is being signed for the entire project.

2. Letter of authorization from all landowners, including Mee Capital Investments (owners of APN: 122-720-002) authorizing the agent(s) identified on the applications to act on their behalf.

   An updated letter of authorization from EDH 52 is included. Mee Capital Investments will arrive under separate cover next week.

3. A copy of the official Assessor's map, showing the project parcels outlined in red.

   A copy of the current assessor's numbers and configuration from the GOTNET County website is provided. An official assessor map has not been created by the County based on the 2018 recorded map.

1420 Rocky Ridge Dr.
Suite 150
Roseville, CA 95661
916.788.2884
Fax 916.788.4408
rsc-engr.com

4. A stand-alone 8½ x 11 vicinity map showing the location of the project site in relation to the distance to major roads, intersections, and town sites.

   A stand-alone 8 ½ x 11 vicinity map is included.

5. Completed Environmental Questionnaire form.

   An updated Environmental Questionnaire form is included.

6. Our understanding is that Kittelson & Associates is preparing the traffic study. Please provide a final traffic study, when available.

   Kittelson & Associates will be preparing the traffic study as part of the EIR.

7. An updated Facilities Improvement Letter (FIL) from El Dorado Irrigation District. (The previously submitted FIL expires on December 6, 2021 and references the old APN for the original parcel.)

   The current FIL which expires on 12-6-2021 is provided. An updated FIL with current APN's is being requested. The fire flow letter is in process with the Fire Department. This is required before submitting to EID for the FIL.

8. Preliminary grading and drainage plan.

   The preliminary grading and drainage plan is included. A drainage study for the overall project is being prepared and will be submitted separately within the next week or two.

9. Confirmation letter from Foothill Associates, or other biological resources expert, that site conditions relative to biological resources have not changed since the previous Biological Resources Assessment was prepared in October 2017.

   An updated biological resources assessment is included dated November 2020.

10. Our understanding is that the EIR Consultant will be conducting the acoustical analysis in the course of preparing the environmental impact analysis for the project. Please let us know if you expect to submit this analysis directly.

    The EIR Consultant will be conducting the acoustical analysis.

11. Our understanding is that Ramboll is preparing analyses for air quality, greenhouse gas, energy, and health effects. Please provide these reports, when available.

    Ramboll will be preparing the air quality, greenhouse gas, energy and health effects studies that will be a part of the EIR.

12. A completed and signed Oak Resources Code Compliance Certificate and Oak Resources Technical Report Checklist (attached). A security deposit for on-site oak tree/oak woodland retention and/or replacement planting may be required upon analysis of oak resource impacts.

    An updated Oak Resources Technical Report which includes the Oak Resources Code Compliance Certificate and Oak Resources Technical Report Checklist are included. The security deposit will be made after project approval.

13. For the South Site, include the location of trash and litter storage or collection areas on the site plans. Site Plan Requirements checklist item no. 9

    The Costco South site plan has been revised to show the location of the proposed trash compactors at the south façade of the building. Costco plans to use compactors for all exterior trash and recycling storage.

14. For the North Site, provide building elevations for all cardinal directions.

    The EDH 52-North side has design guidelines, general front elevations for the various types of retail buildings and a color and material board as part of the project. Since the project does not have specific tenants building elevations for all four sides are not proposed as we want to allow for flexibility for future tenants as they come forward after project approval.

15. On the landscape plan, indicate:

- The quantity and number of trees to be removed.
- The location, general type (pine, oak, etc.) and size of all existing trees, in those areas that are subject to grading or otherwise may be removed/affected by the proposed improvements.

    The landscape plan included quantity and number of trees to be removed. The location of the trees to be removed are shown on the tentative parcel map and the north side grading plan.

Rezone Z17-0004

16. A completed signed Rezone application and agreement for payment of processing fees (Rezone application and payment form attached).

    An updated Rezone Application is included. The agreement for payment is included. Only one form is being signed for the entire project.

Tentative Parcel Map P17-0007

17. A completed signed Tentative Parcel Map (TPM) application and agreement for payment of processing fees (TPM application and payment form attached).

    An updated Tentative Parcel Map Application is included. The agreement for payment is included. Only one form is being signed for the entire project.

18. Four copies of a slope map noting the following slope range categories: 0 to 10%, 11 to 20%, 21 to 29%, 30 to 39%, 40% and over.

    An updated Slope Exhibit is included.

19. TPM plan sheet including all information listed as Required Information on Tentative Map section.

    The tentative parcel map has been updated to include all information as required on the checklist.

CUP-R21-0024 (Reactivation of S17-0017)

20. A completed signed Conditional Use Permit (CUP) application and agreement for payment of processing fees (CUP application and payment form attached).

    An updated conditional use permit application is provided. The agreement for payment is included. Only one form is being signed for the entire project.

Lot Line Adjustment LLA21-0009

21. Lot Line Adjustment (LLA) application and agreement for payment of processing fees, both completed and signed (both forms are provided alongside this letter).

    An unsigned application is provided. The signed version will follow under separate cover.

22. One full-size site plan drawn to scale and of sufficient size to allow for a clear delineation of the required information in items a-m as listed in the LLA application, as applicable, and one 11 x 17 version of the full-size site plan.

    A LLA site plan is provided with this submittal.

Other

In addition, the project description dated April 23, 2021 indicates the intent to submit a separate PD application for the South Site/ Costco site. Please submit a completed signed PD application for the South Site if that is still the plan.

It is not the intent to have separate PD applications for the project. We would like the mitigation measures and conditions of approval to allow for each side to develop independently of each other.

Planning staff recommends reviewing El Dorado County General Plan Policy 10.2.1.5 under Objective 10.2.1, Public and Civic Facilities Investment, in regard to the potential requirement for a Public Facilities Financing Plan for commercial projects that are located in a Community Region and that exceed 20 acres or 100,000 square feet.

We do not believe a Public Facilities Financing Plan is required for this project as all infrastructure is existing and any offsite improvements required for the project will be constructed and paid for by the developer/owner. However we are looking to have an economic consultant prepare a memo per the County's comments.

The materials provided should provide enough information to distribute the package to the other departments and move forward with TAC. We also would like to confirm the agreement for the EIR is underway so that the consultant can be released to start the NOP. We look forward to your review. If there are any questions, please let us know.

Sincerely,

Tiffany Wilson

Re: Determination of Application Completeness
Project File Name: EDH 52 Commercial Center
Project Application Nos.: Planned Development Permit PD15-0001, Rezone Z17-0004, Tentative Parcel Map P17-0007, Conditional Use Permit CUP-R21-0024 (reactivation of S17-0017), Lot Line Adjustment LLA21-0009
APNs: 122-720-002, -003, -018, -019, -020, and -021

Dear Ms. Wilson,

Planning Services has reviewed the above-referenced project applications and found it to be complete for preliminary review purposes.

Our understanding is that

1. The process for obtaining an updated Facilities Improvement Letter (FIL) for the proposed project is in progress. It is our understanding that as part of that process, you are in contact with the El Dorado Irrigation District (EID) while also working with the El Dorado Hills Fire Department to obtain a Fire Flow Requirements Letter, which is required by EID in order to provide a FIL. Note that any analyses needed for the environmental assessment related to the fire flow information or the FIL cannot proceed until that information is received by the Planning Department;
2. A drainage study for the overall project is being prepared;
3. The EIR Consultant, Ascent Environmental, Inc. (Ascent), will be conducting the acoustical analysis in the course of preparing the environmental impact analysis for the project.
    a. Working as a subconsultant to Ascent, Kittelson & Associates, is preparing a Traffic Impact Study (TIS) for the proposed project, which will be submitted to the County once completed. Once submitted, the TIS will be reviewed by the County Department of Transportation (DOT). Note that any analyses needed for the environmental

assessment related to the TIS and the data contained in the TIS cannot proceed until the TIS has been approved by DOT, and

b. Working as a subconsultant to Ascent, Ramboll US Consulting is preparing analyses for air quality, greenhouse gas, energy, and health effects which will be part of the environmental impact analysis for the project

As mentioned in the above-referenced applications, please note that a security deposit for on-site oak tree/oak woodland retention and/or replacement planting, may be required upon determination of oak resource impacts.

This list of required information may not be exhaustive. As indicated on Page 15 of the Planned Development Permit application:

> Planning Services reserves the right to require additional project information as provided by Section 15060 of the California Environment Quality Act, or as required by the General Plan development policies, when such is necessary to complete the environmental assessment.

Delayed submittal of the items listed above may affect timely preparation of the environmental assessment document(s). Please let me know if you have any questions about these items.

Once it has been determined that we have enough information to go forward for Technical Advisory Committee (TAC) review, the application will be distributed to affected departments and agencies for a 30-day review and comment period. In addition, a TAC meeting will be scheduled to discuss the comments received and any project issues. TAC meetings are for agency discussion and it is recommended that you or your agent be present at the TAC meeting to discuss the progress of your application.

New materials should be submitted to: Gina Hamilton, Planning Services, 2850 Fairlane Court, Placerville, CA 95667. Be sure to refer to the specific project number(s). Please call me at (530) 621-5980 or email me at gina.hamilton@edcgov.us if you have any questions or concerns regarding the requested items.

Regards,

Gina Hamilton, Senior Planner

IRRIGATION DESIGN STATEMENT:

The irrigation system will be a water efficient low flow, point source system designed to provide adequate watering to support plant growth and insure deeply rooted plant material while avoiding excess water application. The system will be programmable, allowing operation during late night and or early morning hours, with multiple start times and cycles. The system will interface with a weather based sensor that will adjust the amount of water applied to the plant material based on daily weather conditions. Irrigation materials specified for the site will be selected on the basis of durability and ease of maintenance. Landscape irrigation will comply with the California Department of Water Resources Model Water Efficient Landscape Ordinance (MWELO).

NOTES

1. THIS PLOT WAS PREPARED FROM INFORMATION FURNISHED IN PRELIMINARY TITLE REPORTS, PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY, DATED JANUARY 9, 2019, NUMBER NCS-942714-WA1 & NUMBER NCS-942715-WA1. NO LIABILITY IS ASSUMED FOR MATTERS OF RECORD NOT STATED IN SAID PRELIMINARY TITLE REPORT THAT MAY AFFECT THE TITLE LINES, OR EXCEPTIONS, OR EASEMENTS OF THE PROPERTY.

2. ALL DISTANCES AND ELEVATIONS SHOWN HEREON ARE IN FEET AND DECIMALS THEREOF.

3. THE TYPES, LOCATIONS, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS TOPOGRAPHIC SURVEY WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. (A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES). HOWEVER, THE ENGINEER CAN ASSUME NO RESPONSIBILITY FOR THE COMPLETENESS OR ACCURACY OF ITS DELINEATION OF SUCH UNDERGROUND UTILITIES WHICH MAY BE ENCOUNTERED, BUT WHICH ARE NOT SHOWN ON THESE DRAWINGS.

4. PHYSICAL ITEMS SHOWN ON THIS SURVEY ARE LIMITED TO THOSE ITEMS VISIBLE AS OF THE DATE OF THIS SURVEY. SUBSURFACE STRUCTURES, IF ANY, ARE NOT SHOWN. SAID SUBSURFACE OBJECTS MAY INCLUDE, BUT ARE NOT LIMITED TO, CONCRETE FOOTINGS, SLABS, SHORING, STRUCTURAL PILES, UTILITY VAULTS, PIPING, UNDERGROUND TANKS, AND ANY OTHER SUBSURFACE STRUCTURES NOT REVEALED BY A SURFACE INSPECTION.

5. THE SUBJECT PROPERTY IS SHOWN ON THE FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM) FOR EL DORADO COUNTY, CALIFORNIA, MAP NUMBER 06017C0725E FOR COMMUNITY NUMBER 060040 (EL DORADO COUNTY), WITH AN EFFECTIVE DATE OF SEPTEMBER 26, 2008, AS BEING LOCATED IN FLOOD ZONE "X-UNSHADED". ACCORDING TO FEMA THE DEFINITION OF ZONE "X-UNSHADED" IS: AREA OF MINIMAL FLOOD HAZARD.

6. BENCHMARK:
CAL-TRANS TBM, NGS DISK ON TOP OF HEADWALL AT THE NORTHWEST CORNER OF THE BRIDGE ON CLARKSVILLE CROSSING AS TAKEN FROM THE CALTRANS IMPROVEMENT PLANS, SHEET 14 (PC-1) OF THE SILVA VALLEY CONSTRUCTION PLANS DATED JANUARY 4, 2013.
(PID: JS0692) ELEVATION= 673.08 FEET (NGVD 1929 DATUM)

7. BASIS OF BEARINGS:
THE BEARING OF NORTH 88° 27' 28" EAST, TAKEN ON THE NORTHERLY LINE OF PARCEL 4 AS SHOWN ON THAT CERTAIN PARCEL MAP FILED FOR RECORD ON DECEMBER 28, 2018, IN BOOK 52 OF MAPS AT PAGE 10, OFFICIAL RECORDS OF EL DORADO COUNTY WAS TAKEN AS THE BASIS FOR ALL BEARINGS SHOWN HEREON.

8. CORNER RECORD NOTE:
THE DEVELOPER AND/OR CONTRACTOR SHALL BE RESPONSIBLE FOR THE PREPARATION AND FILING OF PRE-CONSTRUCTION AND POST-CONSTRUCTION CORNER RECORDS FOR ANY MONUMENTS OR PROPERTY CORNERS SHOWN HEREON THAT MAY BE DESTROYED DURING IMPROVEMENTS TO THE SUBJECT PROPERTY AS DEFINED IN SECTION 8771(B) OF THE PROFESSIONAL LAND SURVEYORS ACT.

10. THE AERIAL MAPPING WAS PREPARED USING COMPUTER ASSISTED, PHOTOGRAMMETRIC METHODS BY COOPER AERIAL SURVEYS CO., IN PHOENIX ARIZONA. JOB NUMBER 1901022. IN AREAS OF DENSE VEGETATION, ACCURACY OF CONTOURS MAY DEVIATE FROM ACCEPTED ACCURACY STANDARDS. DATE OF PHOTOGRAPHY 02-22-19, ORIGINAL COMPILED MAP SCALE 1"=40', CONTOUR INTERVAL 1 FOOT. THE GRID IS BASED ON PHOTOGRAMMETRIC METHODS COMPILED ON DIGITAL STEREO WORKSTATIONS USING AERIAL PHOTOGRAPHY. CONTROL SURVEY PERFORMED BY KIER & WRIGHT, LIVERMORE, CA.

IRRIGATION DESIGN STATEMENT:

The irrigation system will be a water efficient low flow, point source system designed to provide adequate watering to support plant growth and insure deeply rooted plant material while avoiding excess water application. The system will be programmable, allowing operation during late night and or early morning hours, with multiple start times and cycles. The system will interface with a weather based sensor that will adjust the amount of water applied to the plant material based on daily weather conditions. Irrigation materials specified for the site will be selected on the basis of durability and ease of maintenance. Landscape irrigation will comply with the California Department of Water Resources Model Water Efficient Landscape Ordinance (MWELO).

LANDSCAPE DATA:

Costco Site Coverage
Total Parcel Area: +-17.04 AC (+- 742,262 SF)

PLAN

NOTES

1. THIS PLOT WAS PREPARED FROM INFORMATION FURNISHED IN PRELIMINARY TITLE REPORTS, PREPARED BY FIRST AMERICAN TITLE INSURANCE COMPANY, DATED JANUARY 9, 2019, NUMBER NCS-942714-WA1 & NUMBER NCS-942715-WA1. NO LIABILITY IS ASSUMED FOR MATTERS OF RECORD NOT STATED IN SAID PRELIMINARY TITLE REPORT THAT MAY AFFECT THE TITLE LINES, OR EXCEPTIONS, OR EASEMENTS OF THE PROPERTY.

2. ALL DISTANCES AND ELEVATIONS SHOWN HEREON ARE IN FEET AND DECIMALS THEREOF.

3. THE TYPES, LOCATIONS, SIZES AND/OR DEPTHS OF EXISTING UNDERGROUND UTILITIES AS SHOWN ON THIS TOPOGRAPHIC SURVEY WERE OBTAINED FROM SOURCES OF VARYING RELIABILITY. THE CONTRACTOR IS CAUTIONED THAT ONLY ACTUAL EXCAVATION WILL REVEAL THE TYPES, EXTENT, SIZES, LOCATIONS AND DEPTHS OF SUCH UNDERGROUND UTILITIES. (A REASONABLE EFFORT HAS BEEN MADE TO LOCATE AND DELINEATE ALL KNOWN UNDERGROUND UTILITIES). HOWEVER, THE ENGINEER CAN ASSUME NO RESPONSIBILITY FOR THE COMPLETENESS OR ACCURACY OF ITS DELINEATION OF SUCH UNDERGROUND UTILITIES WHICH MAY BE ENCOUNTERED, BUT WHICH ARE NOT SHOWN ON THESE DRAWINGS.

4. PHYSICAL ITEMS SHOWN ON THIS SURVEY ARE LIMITED TO THOSE ITEMS VISIBLE AS OF THE DATE OF THIS SURVEY. SUBSURFACE STRUCTURES, IF ANY, ARE NOT SHOWN. SAID SUBSURFACE OBJECTS MAY INCLUDE, BUT ARE NOT LIMITED TO, CONCRETE FOOTINGS, SLABS, SHORING, STRUCTURAL PILES, UTILITY VAULTS, PIPING, UNDERGROUND TANKS, AND ANY OTHER SUBSURFACE STRUCTURES NOT REVEALED BY A SURFACE INSPECTION.

5. THE SUBJECT PROPERTY IS SHOWN ON THE FEDERAL EMERGENCY MANAGEMENT AGENCY (FEMA) FLOOD INSURANCE RATE MAP (FIRM) FOR EL DORADO COUNTY, CALIFORNIA, MAP NUMBER 06017C0725E FOR COMMUNITY NUMBER 060040 (EL DORADO COUNTY), WITH AN EFFECTIVE DATE OF SEPTEMBER 26, 2008, AS BEING LOCATED IN FLOOD ZONE "X-UNSHADED". ACCORDING TO FEMA THE DEFINITION OF ZONE "X-UNSHADED" IS: AREA OF MINIMAL FLOOD HAZARD.

6. BENCHMARK:
CAL-TRANS TBM, NGS DISK ON TOP OF HEADWALL AT THE NORTHWEST CORNER OF THE BRIDGE ON CLARKSVILLE CROSSING AS TAKEN FROM THE CALTRANS IMPROVEMENT PLANS, SHEET 14 (PC-1) OF THE SILVA VALLEY CONSTRUCTION PLANS DATED JANUARY 4, 2013.
(PID: JS0692) ELEVATION= 673.08 FEET (NGVD 1929 DATUM)

7. BASIS OF BEARINGS:
THE BEARING OF NORTH 88° 27' 28" EAST, TAKEN ON THE NORTHERLY LINE OF PARCEL 4 AS SHOWN ON THAT CERTAIN PARCEL MAP FILED FOR RECORD ON DECEMBER 28, 2018, IN BOOK 52 OF MAPS AT PAGE 10, OFFICIAL RECORDS OF EL DORADO COUNTY WAS TAKEN AS THE BASIS FOR ALL BEARINGS SHOWN HEREON.

8. CORNER RECORD NOTE:
THE DEVELOPER AND/OR CONTRACTOR SHALL BE RESPONSIBLE FOR THE PREPARATION AND FILING OF PRE-CONSTRUCTION AND POST-CONSTRUCTION CORNER RECORDS FOR ANY MONUMENTS OR PROPERTY CORNERS SHOWN HEREON THAT MAY BE DESTROYED DURING IMPROVEMENTS TO THE SUBJECT PROPERTY AS DEFINED IN SECTION 8771(B) OF THE PROFESSIONAL LAND SURVEYORS ACT.

10. THE AERIAL MAPPING WAS PREPARED USING COMPUTER ASSISTED, PHOTOGRAMMETRIC METHODS BY COOPER AERIAL SURVEYS CO., IN PHOENIX ARIZONA. JOB NUMBER 1901022. IN AREAS OF DENSE VEGETATION, ACCURACY OF CONTOURS MAY DEVIATE FROM ACCEPTED ACCURACY STANDARDS. DATE OF PHOTOGRAPHY 02-22-19, ORIGINAL COMPILED MAP SCALE 1"=40', CONTOUR INTERVAL 1 FOOT. THE GRID IS BASED ON PHOTOGRAMMETRIC METHODS COMPILED ON DIGITAL STEREO WORKSTATIONS USING AERIAL PHOTOGRAPHY. CONTROL SURVEY PERFORMED BY KIER & WRIGHT, LIVERMORE, CA.

RE: NEW AND REVISED EXHIBITS FOR PD15-0001, Z17-0004, P17-0007, CUP-R21-0024, LLA21-0009

Dear Gina:

On behalf of Costco Wholesale, I am transmitting the following new and revised exhibits for the planning application for the EDH 52 Costco South Site project.

Updated APNs and Application Numbers

The title page has been updated to reflect new parcel numbers and application numbers for the south site.

Compiled Plan Set

The updated plan set includes the revised site plan, tree removal exhibit, and preliminary lot line adjustment exhibits from our previous submittals, which are also reflected in the sheet index of the title page.

We look forward to working with El Dorado County to move the project forward and are available to answer any questions you may have regarding the project.

Sincerely,
URBAN PLANNING PARTNERS, INC.

EDH52/Costco Scoping Meeting

John Davey <jdavey@daveygroup.net> Thu, Aug 12, 2021 at 6:55 AM
To: Gina Hamilton <gina.hamilton@edcgov.us>
Cc: Timothy White <tjwhitejd@gmail.com>, John Raslear <jjrazzpub@sbcglobal.net>, Brooke Washburn <washburn_bew@yahoo.com>, The BOSONE <bosone@edcgov.us>, Jon/ Stacy Vegna <jvegna@edcgov.us>

Good morning Gina,

Thanks again for your feedback last night regarding the audio in the virtual meeting format. We hope to have all of the issues in the setup of the EDH FIre Station meeting room squared away before our next meeting.

EDH APAC Vice Chair Tim White was informed by the project applicants after our meeting that the Scoping Meeting for the project would be in a virtual environment, and not in-person.

As a resident, and as APAC Chair, this is a significant concern for our community. This will be a transformative project for the El Dorado Hills Community - regardless of the levels of project support, or opposition, this one project will forever alter the nature of the El Dorado Hills Community. It is important for our community to have the benefit of a traditional scoping meeting, with access to the applicants, planning staff, the consultant, and to review project exhibits and details.

APAC Vice Chair Tim White summarized it well:

> This is, IMHO, both disappointing and unacceptable. This project is one of major concern to the community-many in the community are of the opinion that this is a “done deal”!
> Not having an in-person Scoping Meeting will just further the belief that the Planning Department doesn’t care about resident feedback.
> I appreciate the health concerns that exist, but masks could be required and social distancing observed.

Again, both as a resident, and as EDH APAC Chair, I feel that it is critical that some in-person aspect be considered for the scoping meeting.

Thanks again for your continuing assistance to EDH APAC as we review development projects in El Dorado Hills - your willingness to answer questions, and to support and facilitate our participation is deeply appreciated.

John.

FROM: Patrick Stiehr, PE

RE: Drainage Study for EDH 52, Proposed Self Storage and Costco at Highway 50 and Silva Valley Parkway

OVERVIEW

The project consists of two separate but hydraulically connected developments covering about 50 acres that includes a self-storage complex on the northeast side of Silva Valley Parkway and a Costco on the southwest side. Both are located just north of the Highway 50 interchange. See Figure 1, Vicinity Map.

Figure 1. Vicinity Map

3153 Jenna Court
Roseville, CA 95747

Phone: 916- 774- 1111, Fax: 916- 774- 1181
Mobile: 916- 715- 1167, email: pstiehr@wtrmark.com

A drainage study completed by AE COM evaluated the downstream impacts of the proposed development. Their findings indicated that the development would increase flows at Highway 50 by about 2% for the 10- and 100-year storms.

The AE-COM Drainage Report also included a conclusion that "with little development downstream, the chance of increased damages due to flooding is insignificant." A review using Google Maps indicates the watercourse does pass through several developments south of Hwy 50. After that, there is little or development downstream to State Highway 16 at Sloughhouse.

This study provides evaluation of the onsite facilities to demonstrate 10-year capacity of the proposed drainage facilities and does not address downstream conditions. However, as a comparison, the AE-COM had a unit runoff (cfs per acre) of about 2.0 from the proposed development for the 10-year storm. The analysis provided herein indicates the proposed facilities generate a peak unit runoff of about 1.5 cfs per acre, or about 20 cfs less than indicated within the AE-COM Study.

Another consideration is that the proposed self-storage and Costco development site are at the lower end of the 763-acre watershed the passes under Highway 50. The peak flow from this development area will enter the watercourse and pass under Highway 50 at least 15 minutes before the main stem peak arrives, meaning the likelihood of the proposed development increasing the main stem peak flow is minimal.

HYDROLOGY

The hydrology was based on the SCS methodology embedded within the XP-SWMM software.

Soils

The soils within the project area are classified by the NRCS as Auburn Silt Loam and fall within Hydrologic Group D, low infiltration. The published hydraulic conductivity for the Auburn Silt Loam is 7.09 micrometers per second, or one inch per hour in US units.

Shed Definition

The self-storage site was subdivided into 17 shed areas and as shown on the SW Q1 sheet prepared by RSC Engineering. Sheds 13 thru 17 are offsite sheds. Shed 13 and 17 will be redirected south along the west side of the development. Runoff from Sheds 14 and 15 will be conveyed through the project. Sheds 16 and 17 will be graded and be the transition area. These sheds will be sloped from the project area down to collection swales and then conveyed south under Silva Valley Parkway and then through the Costco site.

The Costco site was subdivided into seven Drainage Management Areas (DMAs) as shown on the Shed Map Exhibit prepared by Kier+Wright. There is an additional offsite shed at the southeast corner. Runoff from this area will be collected and conveyed southwest.

SCS Parameters

The idealized rainfall distribution for the 10-year, 24-hour storm was developed from the El Dorado County Table A2.2.3, depth-duration-frequency, developed by Jim Goodridge, 2008. A screen shot of the hyetograph is shown in Figure 2. The mean annual rainfall was estimated at 27 inches per year.

An assumed time-of-concentration of five minutes and a Curve Number of 95 were used for all nodes within the project areas. **Table 1** provides a summary of the shed areas and peak flows from the 10-year, 24-hour storm.

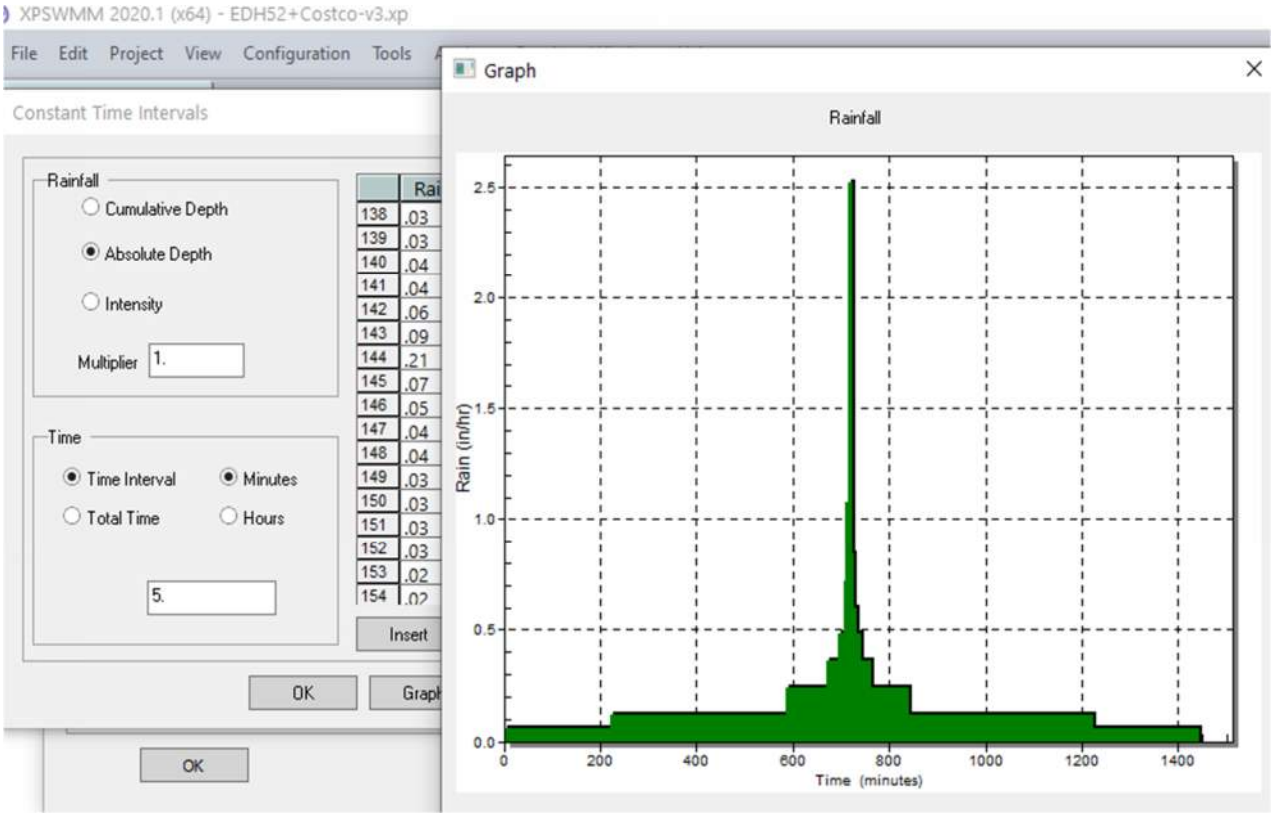

Figure 2. Plot of Rainfall Hyetograph for 10-year, 24-hour Storm

Table 1 – Shed Summary

HYDRAULICS

The XP-SWMM software was used for the backwater analysis. Drainage facilities information for the modeling was based on the Preliminary Grading Plan by RSC Engineering for the self-storage site and the Drainage Exhibit prepared by Kier+Wright for the Costco site.

Figure 3 provides a schematic modeling map for the two projects. **Figures 4 and 5** provide additional detail of the modeling schematic. **Table 2** provides a summary of the hydraulic parameters and characteristics of drainage facilities.

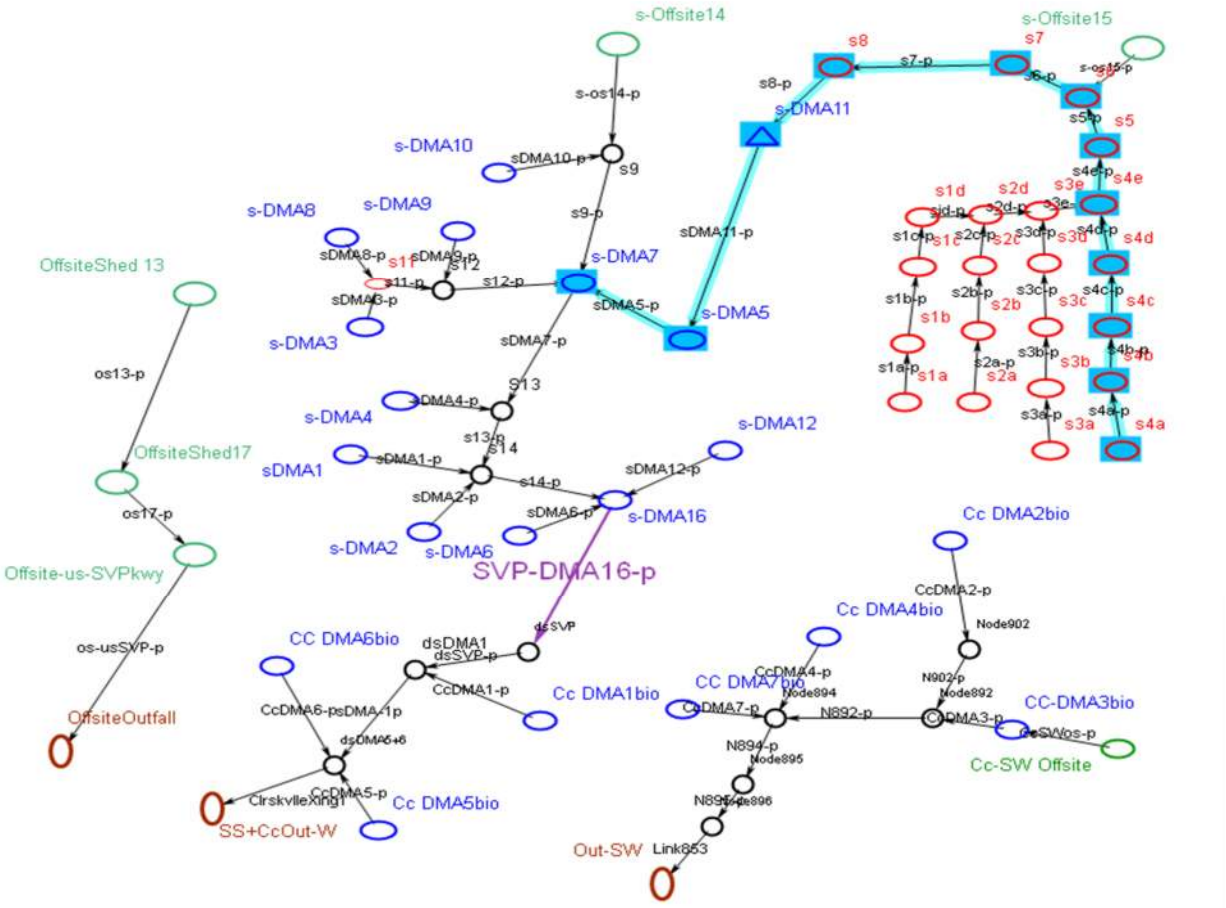
Table 2 Summary of Hydraulic Parameters & Characteristics of Drainage Facilities

Note that the only DMA that was modelled as a storage area was at Node s-DMA11. This bio-retention area is relatively large and does provide noticeable attenuation that reduces downstream outflow.

The other DMA bio-retention areas could be added to the model if necessary. The modeling results indicate that the proposed storm drain pipes have adequate capacity to convey the 10-year, 24-hour storm. If the other bio-retention areas were added, there would be a decreased peak flow because of the attenuation throughout both projects. They were not added because it seemed unnecessary.

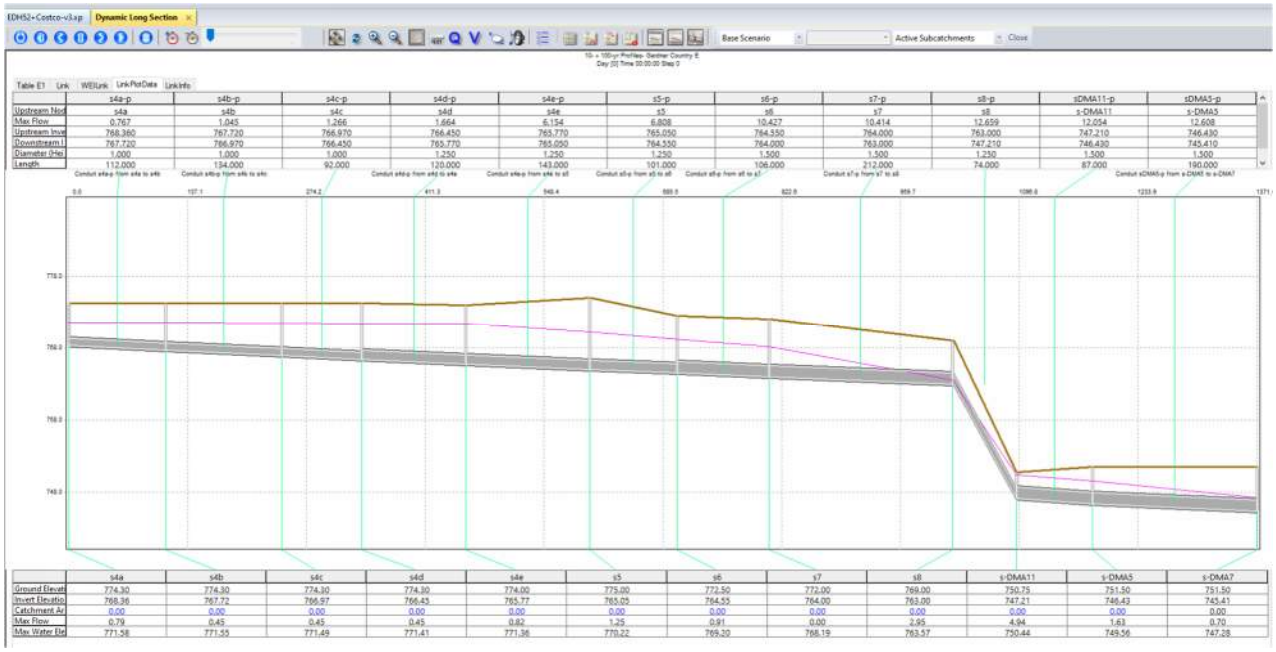
Attachment 1a provides a screen shot of a highlighted reach of storm drain pipe within the project, followed by **Attachment 1b** that shows a profile plot of the pipe with the 10-year, 24-hr storm water surface profile. A similar approach shows the other two drain systems identified as **Attachment 2** and **Attachment 3**. This information is available in Table 1 but is also provided graphically in these attachments to aid the reader.

SUMMARY AND COMMENTS



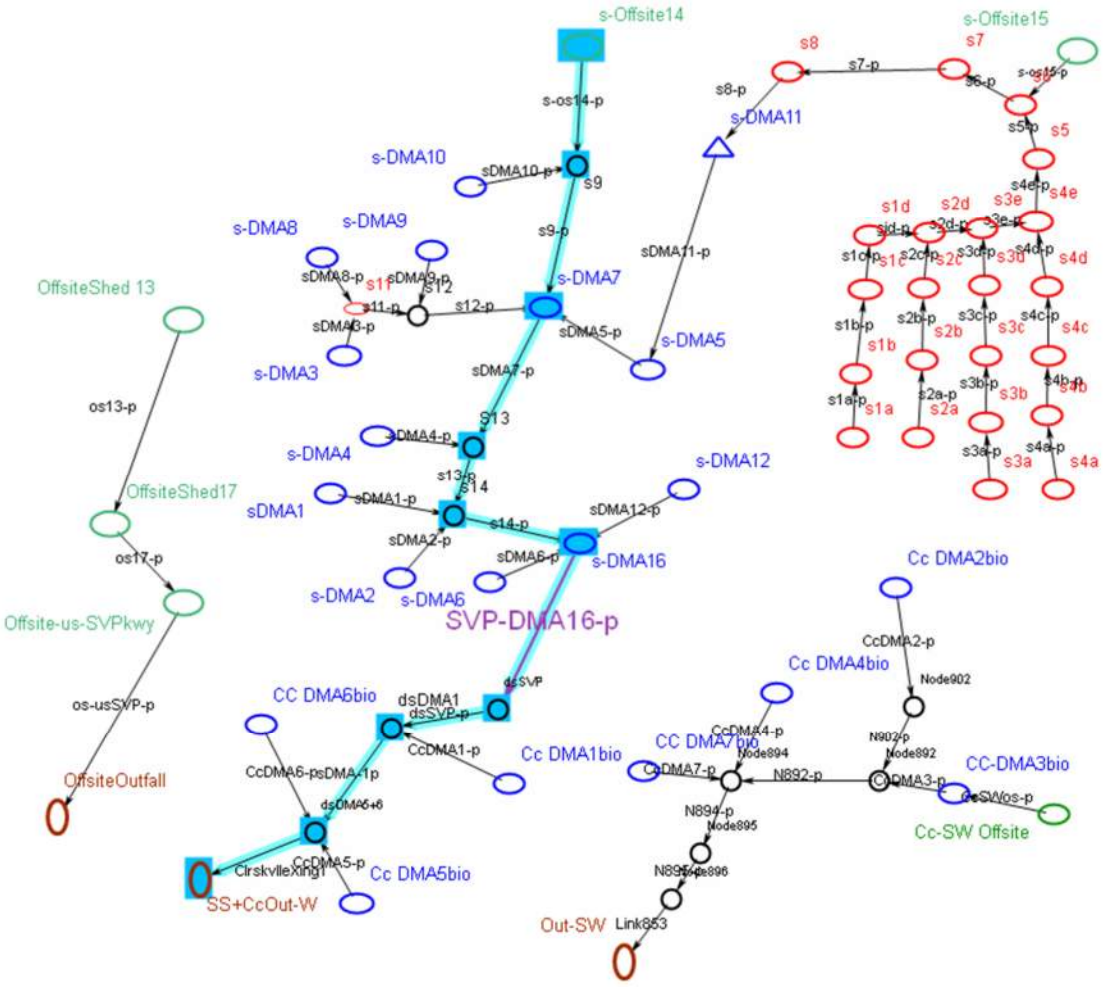
The modeling clearly shows that the proposed piping network for the two projects has adequate capacity to convey the 10-year storm.

Additional detailed information is available upon request including the XP-SWMM model and the rainfall 5-minute distribution depicted in Figure 2.



Water quality for the two projects is accomplished via the bio-retention area planters scattered within the projects. No additional information has been provided within this document.

The offsite drainage northwest of the self-storage development has been included in the analysis but is considered as pass-through flow.



See the Shed and grading exhibits for both the Self-Storage and the Costco site for additional information.

RE: Drainage Study for EDH 52, Proposed Self Storage and Costco at Highway 50 and Silva Valley Parkway

OVERVIEW

The project consists of two separate but hydraulically connected developments covering about 50 acres that includes a self-storage complex on the northeast side of Silva Valley Parkway and a Costco on the southwest side. Both are located just north of the Highway 50 interchange. See Figure 1, Vicinity Map.

Figure 1. Vicinity Map

3153 Jenna Court
Roseville, CA 95747

Phone: 916- 774- 1111, Fax: 916- 774- 1181
Mobile: 916- 715- 1167, email: pstiehr@wtrmark.com

A drainage study completed by AE COM evaluated the downstream impacts of the proposed development. Their findings indicated that the development would increase flows at Highway 50 by about 2% for the 10- and 100-year storms.

The AE-COM Drainage Report also included a conclusion that "with little development downstream, the chance of increased damages due to flooding is insignificant." A review using Google Maps indicates the watercourse does pass through several developments south of Hwy 50. After that, there is little or development downstream to State Highway 16 at Sloughhouse.

This study provides evaluation of the onsite facilities to demonstrate 10-year capacity of the proposed drainage facilities and does not address downstream conditions. However, as a comparison, the AE-COM had a unit runoff (cfs per acre) of about 2.0 from the proposed development for the 10-year storm. The analysis provided herein indicates the proposed facilities generate a peak unit runoff of about 1.5 cfs per acre, or about 20 cfs less than indicated within the AE-COM Study.

Another consideration is that the proposed self-storage and Costco development site are at the lower end of the 763-acre watershed the passes under Highway 50. The peak flow from this development area will enter the watercourse and pass under Highway 50 at least 15 minutes before the main stem peak arrives, meaning the likelihood of the proposed development increasing the main stem peak flow is minimal.

HYDROLOGY

The hydrology was based on the SCS methodology embedded within the XP-SWMM software.

Soils

The soils within the project area are classified by the NRCS as Auburn Silt Loam and fall within Hydrologic Group D, low infiltration. The published hydraulic conductivity for the Auburn Silt Loam is 7.09 micrometers per second, or one inch per hour in US units.

Shed Definition

The self-storage site was subdivided into 17 shed areas and as shown on the SW Q1 sheet prepared by RSC Engineering. Sheds 13 thru 17 are offsite sheds. Shed 13 and 17 will be redirected south along the west side of the development. Runoff from Sheds 14 and 15 will be conveyed through the project. Sheds 16 and 17 will be graded and be the transition area. These sheds will be sloped from the project area down to collection swales and then conveyed south under Silva Valley Parkway and then through the Costco site.

The Costco site was subdivided into seven Drainage Management Areas (DMAs) as shown on the Shed Map Exhibit prepared by Kier+Wright. There is an additional offsite shed at the southeast corner. Runoff from this area will be collected and conveyed southwest.

SCS Parameters

The idealized rainfall distribution for the 10-year, 24-hour storm was developed from the El Dorado County Table A2.2.3, depth-duration-frequency, developed by Jim Goodridge, 2008. A screen shot of the hyetograph is shown in Figure 2. The mean annual rainfall was estimated at 27 inches per year.

An assumed time-of-concentration of five minutes and a Curve Number of 95 were used for all nodes within the project areas. **Table 1** provides a summary of the shed areas and peak flows from the 10-year, 24-hour storm.

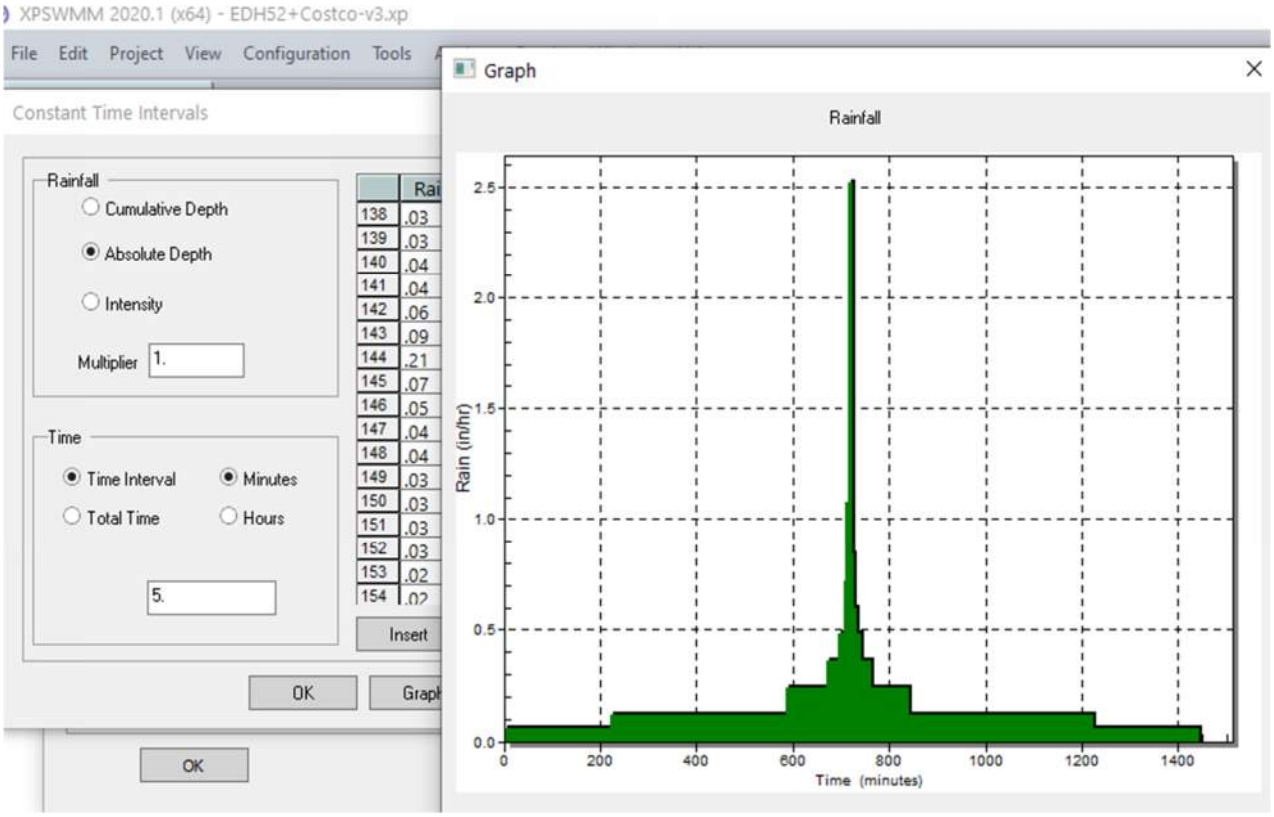

Figure 2. Plot of Rainfall Hyetograph for 10-year, 24-hour Storm

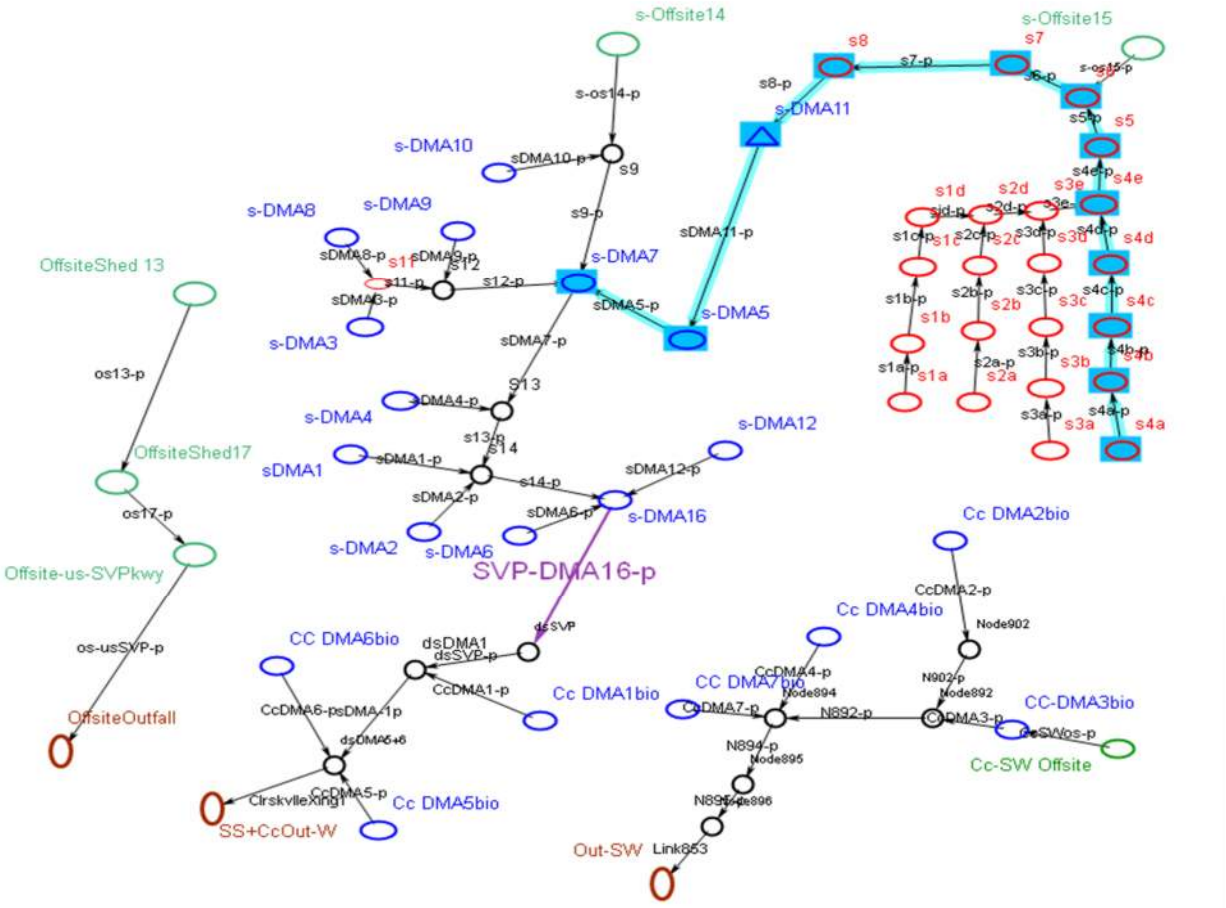
Table 2 Summary of Hydraulic Parameters & Characteristics of Drainage Facilities

Note that the only DMA that was modelled as a storage area was at Node s-DMA11. This bio-retention area is relatively large and does provide noticeable attenuation that reduces downstream outflow.

The other DMA bio-retention areas could be added to the model if necessary. The modeling results indicate that the proposed storm drain pipes have adequate capacity to convey the 10-year, 24-hour storm. If the other bio-retention areas were added, there would be a decreased peak flow because of the attenuation throughout both projects. They were not added because it seemed unnecessary.

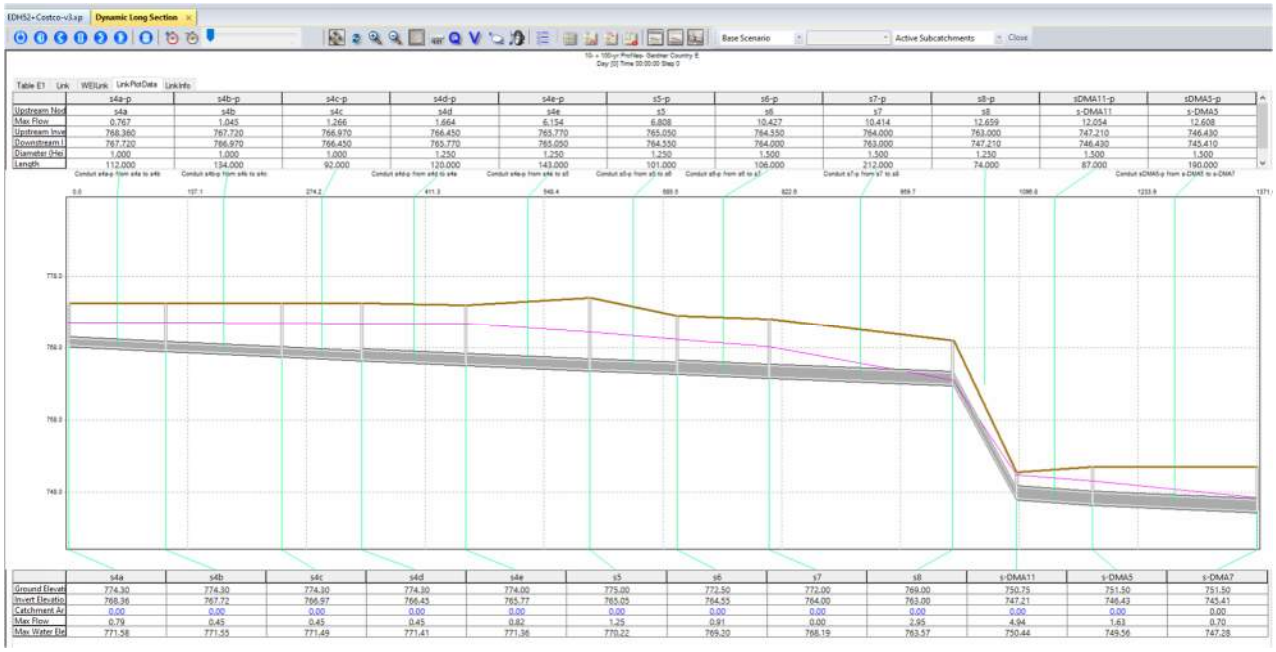
Attachment 1a provides a screen shot of a highlighted reach of storm drain pipe within the project, followed by **Attachment 1b** that shows a profile plot of the pipe with the 10-year, 24-hr storm water surface profile. A similar approach shows the other two drain systems identified as **Attachment 2** and **Attachment 3**. This information is available in Table 1 but is also provided graphically in these attachments to aid the reader.

SUMMARY AND COMMENTS



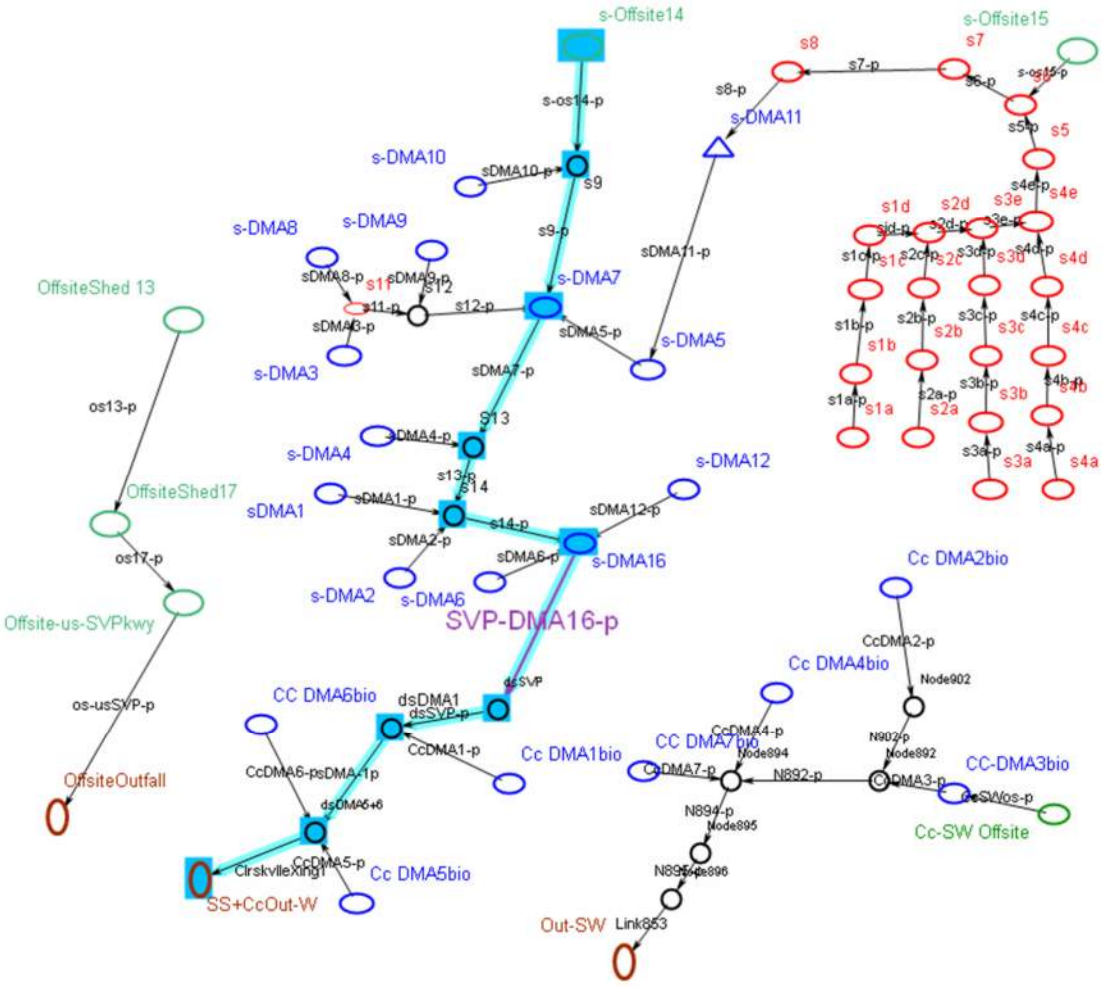
The modeling clearly shows that the proposed piping network for the two projects has adequate capacity to convey the 10-year storm.

Additional detailed information is available upon request including the XP-SWMM model and the rainfall 5-minute distribution depicted in Figure 2.



Water quality for the two projects is accomplished via the bio-retention area planters scattered within the projects. No additional information has been provided within this document.

The offsite drainage northwest of the self-storage development has been included in the analysis but is considered as pass-through flow.



See the Shed and grading exhibits for both the Self-Storage and the Costco site for additional information.

NOTICE OF PREPARATION
OF A DRAFT ENVIRONMENTAL IMPACT REPORT

Date: August 23, 2021

To: Agencies and Interested Parties

From: Gina Hamilton, Senior Planner, County of El Dorado

Subject: **Notice of Preparation of Draft Environmental Impact Report and Notice of Public Scoping Meeting for the EDH 52 Commercial Center (Application Nos. Planned Development Permit PD15-0001, Rezone Z17-0004, Conditional Use Permit CUP-R21-0024, Tentative Parcel Map P17-0007, Lot Line Adjustment LLA21-0009)**

Review Period: August 23, 2021 to September 21, 2021

The County of El Dorado will be the Lead Agency and will prepare an Environmental Impact Report (EIR) for the proposed EDH 52 Commercial Center (project) located in unincorporated El Dorado County (County). This Notice of Preparation (NOP) initiates the environmental scoping process in accordance with the California Environmental Quality Act (CEQA) (Public Resources Code Section 21080.4) and CEQA Guidelines (14 California Code of Regulations [CCR] Section 15082). The purpose of an NOP is to provide sufficient information about the proposed project and its potential environmental effects to allow public agencies, organizations, tribes, and interested members of the public the opportunity to provide a meaningful response related to the scope and content of the EIR, including feasible mitigation measures and project alternatives that should be considered in the EIR (CEQA Guidelines, 14 CCR Section 15082[b]). The proposed project and location are briefly described below.

PROVIDING COMMENTS

El Dorado County is soliciting written comments from public agencies, organizations, tribes, and individuals regarding the scope and content of the environmental document. Because of time limits mandated by State law, comments should be provided at the earliest possible date, but no later than 5:00 p.m. on Tuesday, September 21, 2021. Please send all comments to:

Gina Hamilton, Senior Planner
County of El Dorado Planning Division
2850 Fairlane Court, Building C
Placerville, CA 95667
Email: EDH52CommercialCenter@edcgov.us

Agencies that are responsible agencies or trustee agencies will need to use the EIR when considering permits or other approvals for the project. Such agencies should provide the name of a contact person, phone number, and email address in their comment. Comments provided by email should include "EDH 52 Commercial Center NOP Comment" in the subject line, and the name and physical address of the commenter in the body of the email.

PROJECT LOCATION

The project site is located in an unincorporated area of El Dorado County, in the El Dorado Hills area (Figure 1). As shown in Figure 2, the project site is on the north side of U.S. Highway 50 (U.S. 50) and is bisected by Silva Valley Parkway. Existing land uses near the project site include vacant land, residences, and an elementary school to the north; Tong Road and U.S. 50 to the south; a church to the southeast; vacant land to the east; and Clarksville Crossing Road to the west. The project site encompasses 43.26 acres, including Assessor's Parcel Numbers (APNs) 122-720-002, -003, -018, -019, -020, and -021.

PROJECT DESCRIPTION

The project site is split into the North Site and the South Site. The northern portion of the site (North Site) is 24.83 acres and the southern site (South Site) is 18.43 acres. The entire project site has a General Plan Land Use Designation of Commercial (C). The North Site is currently zoned Commercial Regional – Planned Development (CR-PD). The South Site is predominantly zoned CR-PD and also includes small parcels of Commercial Limited (CL) and Transportation Corridor (TC). Because the project site has an existing Planned Development overlay, the applicant is seeking a Planned Development Permit (PD). Figure 3 shows the site plans for both the North Site and South Site.

North Site

The North Site would include rezoning the site from CR-PD to Community Commercial – Planned Development (CC-PD). The project also seeks approval of a Tentative Parcel Map for the North Site to reconfigure existing parcels create 8 individual parcels. Development of parcels 1 through 5 may include the following uses: drive-through uses, gas station with car wash, food service, outdoor patio, and other retail and office uses permitted in the CC zone. A self-storage facility would utilize parcels 5 and 6 for a recreational vehicle (RV) storage lot and self-storage buildings with approval of a Conditional Use Permit (CUP). A portion of the planned Country Club Drive extension (County Capital Improvement Project No. 36105008) would be constructed and would provide a secondary full access to the North Site on parcel 8. The remainder of parcel 8 would be for the future extension of Country Club Drive. The building area for the North Site would be approximately 162,000 square feet (sf).

South Site

The South Site would include rezoning of the CL and TC portions to CR-PD, resulting in the entire site having the CR-PD zone. The project also seeks a lot line adjustment for the South Site. Development of the South Site would include approximately 156,000 sf of building area that would include a Costco warehouse retail center, tire sales and installation, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and propane refueling and sales adjacent to the tire sales and installation facility. The warehouse is proposed to include one customer entrance to the main Costco store, which would be located at the northwest corner. Development on the South Site would exclude the 1.38-acre area located west of Clarksville Crossing.

The South Site has been designed to accommodate the existing slope of the site by locating the Costco warehouse building in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. Parking would be provided in two at-grade lots and one subterranean lot beneath one of the at-grade lots. Vehicle access to this lower-level parking would be provided by ramps on the north and south sides of the underground parking structure. A third ramp would provide pedestrian access from the lower level up to the at-grade parking and entry to the warehouse building.

It is anticipated that the Costco warehouse would employ approximately 165 to 170 employees. The warehouse hours are anticipated to be Monday through Friday from 9:00 a.m. to 8:30 p.m., and Saturday and Sunday from 9:00 a.m. to 7:00 p.m.

Signage

The project also proposes signage to include highway-oriented and monument signs as well as building signage.

Site Access

A traffic signal is proposed at the main driveways and Silva Valley Parkway where access would be provided to both the North Site and the South Site. A portion of Country Club Drive extension would be constructed to a secondary full access driveway to the North Site. An emergency access to Tong Road from the self-storage facility on the North Site is also proposed. Three full access driveways are proposed on Clarksville Crossing Road to provide additional points of access from the South Site.

Loading

The South Site truck loading dock is proposed to be located at the southwest corner of the building adjacent to U.S. 50. The bay doors would be equipped with sealed gaskets to limit noise impacts. A smaller on-grade door would also be located on the south side of the building. This door is to receive bread deliveries and small delivery vans/trucks. A transformer and two trash compactors would also be located along the south edge of the building proposed for the South Site. Landscape material would provide the necessary screening to this area.

Lighting

Lighting fixtures would also be located around the exterior of the building to provide safety and security. Parking and site lighting would incorporate the use of cutoff lenses to keep light from overflowing beyond the project site boundaries.

Off-Site Improvements

A proposed traffic signal and appurtenant facilities would be located on Silva Valley Parkway at the main driveway of the project to provide a connection to both the North Site and the South Site. An additional traffic signal is proposed at the intersection of Clarksville Crossing and Silva Valley Parkway. A portion of Country Club Drive extension would be constructed up to the secondary access point to the North Site.

Utilities

The project site would be required to annex into El Dorado Irrigation District (EID) to acquire sanitary sewer and water service. The project would connect into the existing 18-inch potable water main and the 21-inch gravity sewer pipeline in Clarksville Crossing Road.

The project site would also be required to annex into the El Dorado Hills County Water District (Fire Protection) prior to building permit issuance.

Sanitary service and potable water for the North Site would be provided by EID sanitary sewer and water lines that cross the South Site. Reclaimed water is available for non-potable irrigation use and would be provided by extending an existing reclaimed line in Silva Valley Parkway.

Dry utilities (e.g., electric, gas, and telecommunications) would be provided from existing infrastructure located in Silva Valley Parkway. Dry utilities would need to be extended along the frontage of both the North Site and the South Site.

Storm Drainage

The on-site drainage system would connect to County's storm drain infrastructure in Clarksville Crossing. The project proposes bioretention areas and underground water quality vaults for treatment of stormwater within the site.

Additional project information can be accessed via the following web link:

https://edc-trk.aspgov.com/etrakit/

POTENTIAL ENVIRONMENTAL IMPACTS

Pursuant to the CEQA Guidelines, 14 CCR Section 15063(a), the County has determined that an EIR is clearly required for the project and has elected to not prepare an initial study. The County anticipates that the EIR will address the following topic areas:

- Aesthetics
- Air Quality
- Archaeological and Historic Resources
- Biological Resources
- Energy
- Geology and Soils
- Greenhouse Gas Emissions
- Hazards, Hazardous Materials, and Wildfire
- Hydrology and Water Quality
- Land Use and Planning
- Noise
- Public Services and Recreation
- Transportation

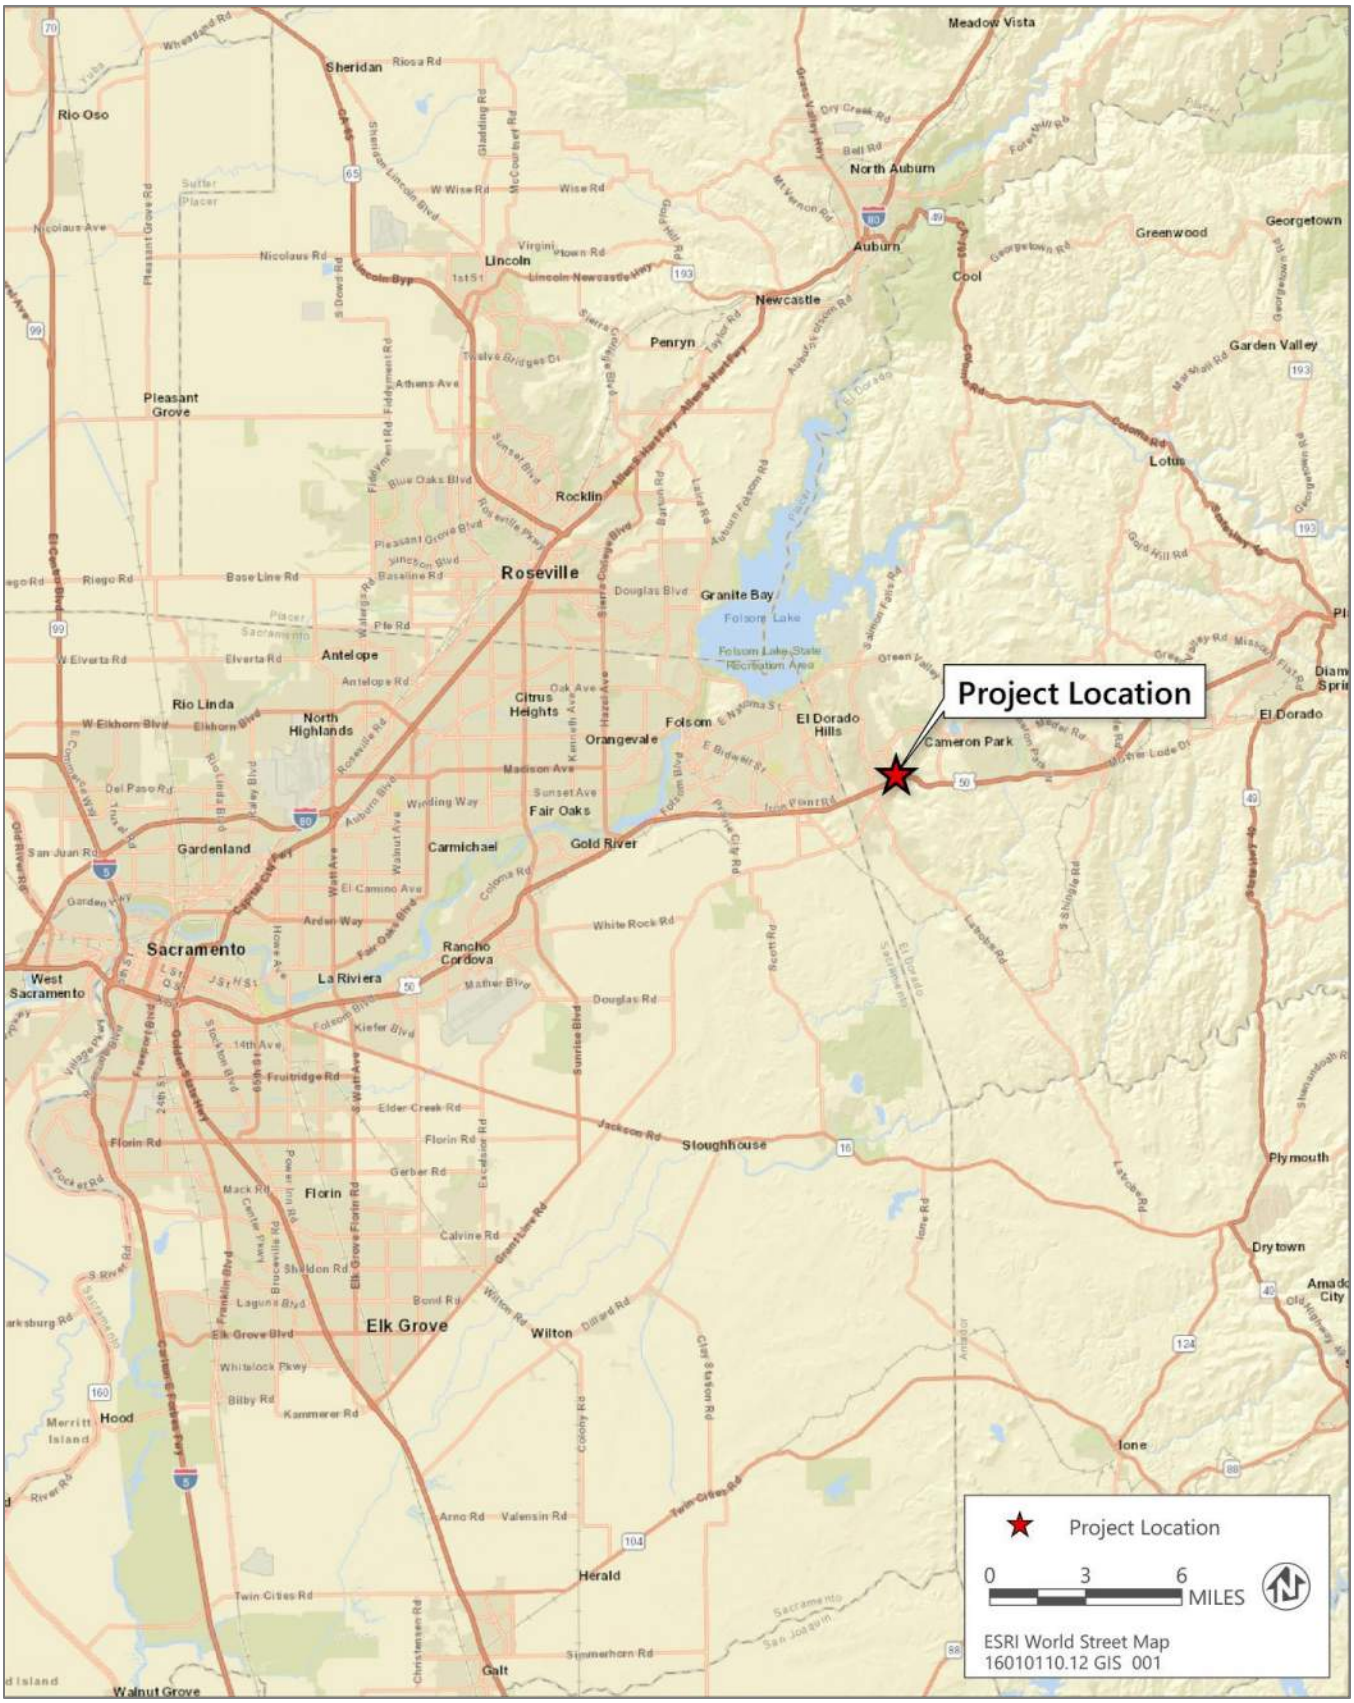
- Tribal Cultural Resources
- Utilities and Service Systems

Based on a preliminary analysis, the County has determined that impacts to the following topics would not be significant. Therefore, these topics will not be analyzed further in the EIR.

- Agricultural and Forestry Resources - no agricultural or forestry resources would be affected because these resources do not exist on the project site.
- Mineral Resources - no mineral resources would be affected because these resources do not exist on the project site.
- Population and Housing - no new residents would be added because no housing is proposed. The project would also not displace any people or housing.

Full documentation of the factual basis for this determination will be provided in the EIR. Unless specific comments are received during the NOP public comment period that indicates a potential for the project to result in significant impacts, these topics will not be analyzed further in the EIR.

SCOPING MEETING



El Dorado County will hold a scoping meeting to receive comments regarding the scope and content of the environmental document and answer general questions regarding the environmental process. Due to COVID-19, the scoping meeting will be held remotely. The meeting will be on Wednesday, September 8, 2020 from 6:00 p.m. to 8:00 p.m. Please preregister using the link below. After registering, you will receive a confirmation email containing information about joining the webinar.

https://us06web.zoom.us/webinar/register/WN_Mri8i2thQmKx2ysgNOa2NA

By participating in this meeting, you acknowledge that you are being recorded. While speaking, please reduce any background noise to ensure that your comments can be heard. For those joining via Zoom, once public comment is open, if you wish to comment, press the "raise a hand" button. For those joining via phone, once public comment open, if you wish to comment, press *9 to indicate a desire to make a comment. You will be called by the last three digits of your phone number when it is your turn to comment. When your number is called, please press *6 to unmute your line.

Written comments regarding the scope and content of the environmental document may be submitted throughout the scoping period, which closes at 5:00 p.m. on Tuesday, September 21, 2021.

The County of El Dorado is committed to ensuring that persons with disabilities are provided the resources to participate in its public meetings. If you require accommodation, please contact Planning Services at 530-621-5355 or via e-mail, planning@edcgov.us.

EDH 52 Comment Letter

Amy Frith <amfrith@gmail.com> Thu, Aug 26, 2021 at 10:46 AM
To: www.EDH52Commercialcenter@edcgov.us
Cc: Gina Hamilton <gina.hamilton@edcgov.us>

Good morning,

I would like to formally submit a comment letter on the EHD 52 project from the 300+ Oak Meadow families in the attached signature document. Please let me know if there is anything else that you need from me to have our comments formally submitted on record for this project.

Unfortunately I am not able to merge these two PDF documents together. Please note that the "petition_signatures_jobs_30202180_202108180" document belongs with the "Oak Meadow Costco Comment Letter_APAC". You can also find these documents here: https://chng.it/qNYsTBgx

Thank you,

Amy Frith

Comments on the NOP for the Proposed EDH52 Commercial Center

marty abell <abellmarty@gmail.com> Sun, Sep 5, 2021 at 2:30 PM
To: EDH52CommercialCenter@edcgov.us
Cc: gina.hamilton@edcgov.us, jdavey@devygroup.net

Following are our comments on the Notice of Preparation for the Draft EIR on the proposed EDH52 Commercial Center. These are not comments on the proposed project itself, but rather, comments to be considered in preparing the Draft EIR(s) for the project(s).

As a modest, full-disclosure prologue, we are a recently retired couple, who are residents of El Dorado Hills. We have a pleasant home, immediately adjacent to the proposed North Site. Before my retirement, I had a 35-year career in writing, managing, and directing the preparation of EIRs for a well-known, successful, and respected environmental consulting firm. Upon my retirement, I received the California Association of Environmental Professionals' Lifetime Achievement Award for my EIR work. (I am pleased to be one of the rare recipients who did not receive the award posthumously.) One of the biggest lessons I learned in those 35 years of preparing EIRs is that combining two distinct and separate projects into one EIR leads inevitably to delay, if not processing disaster, for one, if not both, projects, and to prolonged, costly, and unnecessary agonies for not only the project sponsors, but for the staff of the lead agency, the decision-makers of the lead agency, the involved consultants, the interested members of the public, and all the lawyers who also inevitably become involved (though the lawyers don't seem to mind so much, since they get paid by the hour). When two projects are combined into one EIR, the problems of one project inevitably become the problems of the other (are you listening, Costco?).

1. The proposed project is actually two separate, distinct, and independent projects, each of which is subject to its own "Development Plan Permit package," each of which will be developed on its on its own schedule, each of which is on a site separate from the other, the success of neither of which is dependent on the success of the other, and each of which should be the subject of its own freestanding EIR. Each site is subject to its own discrete set of permits and approvals, which should be subject to separate processing schedules. The fact that the sites currently share a common owner is irrelevant to the environmental evaluation of the applications for the two separate individual projects. Only if the projects have separate EIRs can readers and decision-makers efficiently consider the impacts and actions proposed for each site separately and independently. The cumulative impacts of the projects can be addressed in a common, shared analysis of cumulative impacts. It seems clear that the Costco project is prepared to develop expeditiously, without respect to the progress of the North Site project, while the patchwork, speculative development of the North Site would inevitably proceed more slowly and sporadically. The EIRs must make it possible for the county to approve or deny the projects and requested approvals proposed for each site separately, each on its own merits and schedule, without the problems of one becoming the problems of the other. The EIR must not present the overall, two-site, project as an "all-or-nothing" "package deal" for both sites combined. The project proposed for the North Site should not be able to "piggy-back" on the Costco project, or vice-versa.

2. The current NOP should be withdrawn, and two new NOPs issued, one for each site.

3. In the interests of transparency and public disclosure, the DEIR should specifically identify the actual people who are the project sponsors, and describe their experience and qualifications to develop the proposed project. Have they ever successfully developed projects of this scale? If so, where, and when? Describe.

4.The EIR should also identify the consultants, and subconsultants, the county has retained to prepare the EIR. Describe the experience and qualifications of the prime EIR contractor and its subcontractors. Have any EIRs prepared by these consultants been found legally inadequate in court? If so, with what results? Explain.

5. The DEIR's statement of project objectives for the South Site should fully explain why Costco believes it necessary to construct a full-scale warehouse store within three miles of its next nearest existing Costco store in Folsom? (We are regular customers of the existing Folsom Costco, enjoy shopping there, and have had no problems with crowds or traffic congestion. And, even though the proposed store would be three minutes closer to our home, we have no problem with our existing nine-minute drive to the Folsom store).

6. The DEIR should fully describe the project's objectives concerning the natural environment. How does the project intend to preserve and protect existing on-site natural resources? What, if anything, will be left of the existing natural environment on each site when the project is built out?

7. The EIR should express all criteria for determining impact significance in objective, quantitative terms (See CEQA Guidelines, Appendix G). The EIR should be as graphic as possible, using color graphics, maps, photos, and tables to the maximum extent possible. The EIR should present all information for each site separately, but in consistent format, so as to readily permit comparisons of the settings, impacts and mitigation measures for each site.

8. What is the project schedule for each site? What is the timeline for completion of mass grading on each site? Installation of infrastructure improvements? Landscaping? Building construction? Full project occupancy? How long will it be between commencement of project grading and ultimate project buildout and occupancy of each site? How long will it be between completion and operation of the Costco store and completion and operation of all uses proposed for the North Site? Show the project schedules on a multi-color, fold-out bar graph, with the South Site in one color, and the North Site in another color, and plenty of footnotes to describe all uncertainties.

9. Who are the specific known prospective occupants, if any, of the individual parcels proposed for the North Site? Will the project sponsor actually build any buildings on the North Site, or will that be left up to the individual buyer or lessee of each parcel? By what time are all Parcels 1-7 expected to be sold or leased? By what time are Parcels 1-7 on the North Site expected to be built out and operational? By what time are all proposed components of the Costco project on the South Site, expected to be built out and fully operational? What is the expected time differential between full buildout and operation of Costco and full buildout and operation of all proposed components of the North Site?

10. The EIR should present, ideally in spreadsheet form, a summary of each county general plan policy relevant to the project, and the project's relationship with each policy, clearly identifying any inconsistencies between the policies and the proposed project. Would the inconsistencies be significant? The spreadsheet should clearly distinguish between the sites.

11. Will the project sponsor leave the remainder parcel on the South Site, adjacent to and west of Clarksville Crossing, and the remainder Parcel 8 (except for the proposed site access) on the North Site vacant and unimproved? Will the project sponsor be responsible for any ongoing maintenance of these remainder parcels, such as mowing, fire protection, litter cleanup, etc.?

12. How many acres of each site's existing topography will remain on each site after full buildout? What percentage of each site does that represent? What will be the maximum depth of fill at buildout on each site? What will be the maximum depth of cut? What will be the average depth of fill in areas to be filled? What will be the average depth of cut in areas to be cut? How many cubic yards of fill will need to be imported, or exported, at each site? The sponsor's Project Description, dated June 24, 2021, states that each site is designed "to balance independently," (p.12), but the engineers' Earthwork Summary diagram for the North Site indicates a net fill requirement of 28,150 cubic yards "net volume." It also shows, without explanation, a "Rock Quantity" of 19,130 cubic yards. Please explain "Rock Quantity." .

13. How will erosion be controlled during and after mass grading? How will site runoff be collected, treated, and discharged during grading and site preparation? What will be the quality of offsite runoff during these activities? Will the water quality of runoff and discharge meet applicable water quality standards?

14. Where will stormwater "bioretention areas" and "underground water quality vaults" be located? What's the difference between the two? What will be their storage capacities? When will they be constructed? How will collected stormwater be treated? Where will the treatment facilities be located? Will treated water be stored and used on each site?

15. Quantify, and show on a map, how many acres of riparian area/wetland area exist on each site? How many acres will be filled and how many will remain after full buildout? What is the status of the Corps of Engineers' Clean Water Act Section 404 review of the sponsor's application to fill? If the Corps has already approved the fill, what is its stated justification? If the Corps has not already approved the fill, what is the basis stated in the applications for the proposed fill?

16. How many trees exist on each site now? Of which species? How many will remain after project buildout? How many of these trees are subject to El Dorado County's tree preservation Ordinance 5061? How many will be preserved? Show all existing trees, and trees to be removed, on a map, designating which are subject to Ordinance 5061, and which are not. Describe the project's consistency with county General Plan Policy 7.4.4.4. In the Setting Section of the EIR, show color photos of the largest oaks and oak groupings proposed to be removed.

17. How will "payment of in-lieu fees" mitigate the actual physical loss of "oak woodland?" To whom will the fees be paid? How will the fees be used? What will be the total dollar amount of the fees, and how will the dollar amount be determined? If the in-lieu fees are to be used to replace trees removed from the project site, at a 2:1 ratio, where will those new trees be installed? Who will be responsible for actually planting and maintaining those trees? What is the estimated age of the oldest trees to be removed? When will the replacement trees be as mature as the oldest trees removed?

18. When will all proposed trees and other landscaping be fully mature?

19. Describe, and show on a map, how the perimeter of the North Site, particularly at its eastern edge, will be secured to prevent pedestrian intruders from entering the Serrano Village residential area from the project site? An unsecured gap of approximately 240 feet currently exists between residential parcels AP 122-100-038 (4894 Village Green Drive) and AP 122-580-001 (4924 Village Green Drive).

20. Since the project would reconfigure several property lines on the project's North Site, why not reconfigure them to connect the rear corners of the existing residential parcels at 4894 and 4924 Village Green, and offer to sell, or otherwise transfer, the resulting, commercially useless, quarter-acre acre triangular parcel to Serrano Partners, LLC? Serrano could then combine the new parcel with its existing "Remainder Parcel D" of the proposed Serrano Village A14 subdivision, thereby enabling Serrano LLC to further subdivide the resulting parcel into three standard residential lots fronting on Village Green Drive. Serrano could develop the three new lots as part of its proposed 51-unit Village A14, thus filling the existing residence gap on Village Green Drive with conforming, compatible residences, and making constructive use of an otherwise permanently wasted, commercially useless, and unimproved quarter-acre corner of North Site Parcel 8?

21. Why is a recreational vehicle storage facility proposed for the North Site, in the viewshed of, and a few yards from, neighboring and abutting, million-dollar homes? Because of the generally unsightly nature of stored RVs, open storage of individual RVs is prohibited in Serrano residential areas. Yet, ironically, the project proposes to store a group of as many as 52 RVs in the viewshed of, and a few yards from, neighboring residences. Same question for the proposed six-building "self-storage" facility? Why does the project sponsor believe such facilities would be good neighbors, and that they are visually, or otherwise, appropriate for this location? The EIR should make clear that the conditional use permit required for all proposed North Site storage uses will be subject to its own discrete conditional use action, independent of the county's actions on all other required project approvals.

22. Why not use the area proposed for the code-surplus 121 parking stalls proposed for the Costco site for these storage uses?

23. Why is surplus parking on the Costco site even proposed in the first place? If the proposed 121 excess spaces are fully occupied by Costco shoppers, won't the store become inconveniently, if not unsafely, overcrowded?

24. Provide visual analyses for each project site, including representative color visual simulations from Silva Valley Parkway, Clarksville Crossing, the upper and lower floors of neighboring residences, and any other relevant vantage points. Indicate on the simulations the date of the future year the simulations purport to simulate.

25. CEQA requires the EIR to consider "the whole of the action," which includes project signage. The EIR should examine the visual impacts of proposed on-site and off-site signage as part of the EIR's visual analysis, even though a sign permit "is not proposed at this time" for the North Site. (Is a sign permit proposed for the South Site "at this time?") Explain the sponsor's rationale for requesting substantial height, area, and location exceptions to the County's sign code (County Code Section 130.36). Omission of signage from consideration in the visual analysis will render the EIR incomplete and inadequate. The sign permits must not be "piecemealed" after the fact. Would the visual and aesthetic impacts of the signage as proposed be significant? Would the visual impacts of the signage be significant if the signage complied with the county sign code?

26. Is the "promotional vehicle" proposed for the Costco site allowable under the county's sign code? Will it promote off-site sales? Will the vehicle actually be used for transportation? If so, from where, to where? Will it be subject to a separate conditional use permit, or other county permit?

27. Will all rooftop mechanical equipment be concealed from view from neighboring residences at higher elevations?

28. Describe the existing quality of each site as a scenic vista and scenic resource. Describe how the scenic qualities of the existing sites would be altered, and whether these alterations would constitute significant and substantial degradation of their existing visual character. Describe the relationship of the terms "Oak Meadow" and "El Dorado Hills" to the proposed project sites? Will those terms become nostalgic?

29. Describe the proposed outdoor lighting for each site, and its effects on night time views from surrounding residences and other land uses.

30. Identify all animal species that inhabit, forage, and traverse each site? Which are classified as candidate, sensitive, or special status species in any local or regional plans, policies, or regulations, or by the California Department of Fish and Wildlife or the U.S. Fish and Wildlife Service? Identify the special status of each. What will be the impacts to these species, and how will the impacts be mitigated? Map sensitive habitats and migration corridors.

31. What will be the increase in average auto travel time on Silva Valley Parkway, between the signal at the top of the eastbound Highway 50 offramp at Silva Valley Parkway/White Rock Road and Serrano Parkway, as a result of project-

related traffic and operation of the project's proposed traffic signals? What will be the increase in travel time during the pm weekday peak commute hours, and during Costco's peak weekday and weekend hours of operation?

32. What will be the increase in total vehicle miles travelled as a result of project-related traffic attributable to each site at full buildout? What will be the changes in average and peak-hour levels of service at intersections directly and indirectly affected by project traffic, including the driveway at Oak Meadow School during periods of student pick-up and drop-off, and the Serrano entrance at Entrada Way. Will additional signals or stop signs not proposed by the project be warranted at these, or any other, intersections?

33. Identify the traffic mitigation measures, including signalization of intersections, that would be required if only the development proposed for the South Site were approved? If only the development for the North Site? Describe how necessary signalization measures would differ if only one, or the other, of the North, or South, projects were approved. Describe the proposed "appurtenant facilities."

34. What will be the project's impacts on pedestrian, vehicle, and bicycle safety, particularly for children going to and from Oak Meadow School?

35.. Does the project propose crosswalks at its proposed signalized intersections, or elsewhere? Does the project propose sidewalks along Clarksville Crossing or Silva Valley Parkway (e.g., connecting the North Site to Oak Meadow School)? Does the project propose any particular measures to provide, protect, or enhance pedestrian safety, particularly as it relates to Oak Meadow School? How will pedestrians be able to walk safely across Silva Valley Parkway between the North Site and the South Site? Will the project provide any amenities for bicyclists other than the racks and lockers at Costco required by California Administrative Code Title 24? How will all traffic safety impacts be mitigated to less than significant levels?

36. Will road or lane closures be required during project grading or construction? If so, at what times of day, for how long, and how often? What will be the overall aggregate duration of any road and lane closures? How will emergency access be maintained during closures?

37. What is the County's best estimate for the year in which the Country Club Drive loop from Silva Valley Parkway to Tong Road will be completed? What does the timing depend on? Will the completion of Country Club Drive require its own separate EIR?

38.The North Site is windy. Characterize its degree of windiness in quantitative terms. In consideration of the relatively high degree of windiness, how will fugitive dust emissions from mass grading, and other site development activities, from the time of the commencement of mass grading until project buildout, be controlled? Notwithstanding these control measures, quantify, as best possible, the total cumulative depth, in inches, of project-generated particulate that will be deposited on the adjacent backyards and solar panels of adjoining residences, and on the parking and playground surfaces of Oak Meadow School, during the period between the commencement of mass grading and the completion of project buildout. Will these accumulations of particulate be significant? According to what criteria?

39. What will be the likely health effects of this dust, and hydrocarbon and other emissions from construction equipment, on school children at Oak Meadow School and on neighboring residents, including seniors, like us?

40. What will be the effects of wind on pedestrian comfort levels for future users of exposed project parking areas?

41. Quantify the project-related emissions of criteria pollutants and greenhouse gases based upon estimates of project-related vehicle miles traveled (VMT) and normal project operations. Identify any potential health effects of these emissions on sensitive receptors, including children at Oak Meadow School. Identify any potential project-related violations of applicable air quality standards, including those of the El Dorado County Air Quality Management District.

42. Would the project conflict with, or obstruct implementation of, any applicable air quality management plan? Would the project contribute to an existing or projected air quality violation?

43. Would the project result in a cumulatively considerable increase in any criteria pollutant or greenhouse gas emission for which the region is designated as non-attainment under an applicable federal or state ambient air quality standard? Would it release emissions which exceed quantitative thresholds for ozone precursors?

44. Would project-related greenhouse gas emissions contribute significantly to global climate change? What is the EIR's criterion for determining the significance level of this incremental cumulative contribution? Would the project conflict with any applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gasses?

45. How much water is currently supplied annually to each site by the El Dorado Irrigation District? How much would the district supply annually to each site at full buildout? Would the district be able to meet this additional demand in drought

years? What percentages of the district's total district-wide annual water deliveries are currently delivered to each site? What percentages would be delivered to each site at project buildout?

46. Would the project utilize any renewable energy sources independent of those already incorporated into the PG&E power grid? Would the project employ solar energy from on-site solar panels? If so, where would the panels be located? Would they be visible from neighboring residences? How would the project contribute to the overall reduction of global fossil fuel consumption?

47. Would the project have back-up electrical generation capability in the event of a PG&E electrical blackout? If so, where would the back-up generators be located on each site? What would be their visual impact? Noise impact? Would the increased electrical demand attributable to the project contribute significantly to the likelihood of future localized PG&E blackouts?

48. Would the project violate any applicable noise standard during mass grading, site preparation, construction, or operation? Would project noise from construction and operation contribute cumulatively to existing and projected noise levels, including roadway noise from Highway 50 and Silva Valley Parkway? What would be the increase in future cumulative ambient noise levels attributable to projected increases in traffic on Highway 50, Silva Valley Parkway, and other local roadways? Would project-related construction or other noise interfere with instruction or supervision activities at Oak Meadow School? What mitigation measures does the project propose to minimize day-time and night-time noise impacts to the school and local residents?

49. Concerning seismic issues, who cares? The engineers will take care of them, right? Same with hazardous materials and hazardous materials disposal, right? And the sewer plant has plenty of capacity, right? And the project couldn't possibly have a significant adverse impact on recreational resources, right? So, fuhgeddaboudit.

50. But, would the project impact any tribal, or other historical, archaeological, paleontological, or other, cultural resource? Would it disturb the burial site of any human remains? If so, describe and assess the significance.

51. Concerning topics dismissed from the EIR in the Notice of Preparation:
-- Provide evidence for the NOP's summary conclusion that there are "no mineral resources... on the project site."
-- The Costco project would employ "approximately 165 to 170 employees," the North Site would presumably employ an additional 50-100, or more, for a total project employment of approximately 220-270. The EIR should examine the effects of these new employees, their households, and the secondary population they would induce, on local housing supply, and public utility and service systems.

52. The EIR must identify and evaluate alternatives to the project that are environmentally superior to the proposed project, including:
-- A "No Project Alternative," with no development on either site;
-- A "Partial Project Alternative," with no development on the North Site;
-- A "Plan Consistent Alternative," that does not require any general plan amendment(s), rezoning(s), conditional use permit(s), or exception(s) to the county sign code, and that simply complies with all existing applicable county policies, rules and regulations;
-- An "Off Site Alternative" that would develop the proposed uses on a site, or sites, that would not be immediately adjacent to, and in the viewshed of, an existing school or neighboring single-family residences;
-- On-site alternatives that would preserve all or significant portions of existing land forms, existing riparian and wetland areas, existing trees and tree clusters; and other existing habitats, migration routes, and other on-site natural resources;
-- On-site alternatives of lower density than the proposed project, including alternatives with alternative combinations of uses, including single-family and multi-family residential, commercial, open space, and recreational uses;
-- On-site alternatives with no big-box commercial component (e.g., no Costco);
-- On-site alternatives with no recreational vehicle storage component;
-- On-site alternatives with no self-service storage component;
-- On-site alternatives with neither a self-storage component, nor an RV storage component;
-- Other alternatives, on-site or off-site, as necessary, to avoid, or mitigate to less than significant levels, any identified significant impacts of the proposed project on traffic, air quality, visual quality, noise, land use, water use, tribal and other cultural resources, and greenhouse gas emissions.

53. CEQA does not generally require that an EIR address the economic impacts of a proposed project, but it does not prohibit it from doing so. Because the economic effects of the project will undoubtedly be critical to the overall public perception of the project, and to the county's ultimate determination of whether and how to approve or deny the proposed project(s), and whether to ultimately issue a statement of overriding considerations, a cost-revenue analysis should be prepared, either as part of the EIR(s), or as a separate free-standing report. The cost-revenue analysis should examine in detail the direct and indirect, fiscal and economic impacts of the proposed project on the economies and treasuries of El Dorado County, and other economically affected public agencies and private entities. The economic analyses should be made publicly available, and subject to public review and comment, at the time of, or before, the publication of the Draft EIR, with ample time for public review and comment on each.

Thank you for your attention to these comments. We look forward to reviewing the Draft EIR(s).

Marty and Susan Abell

Subject: Comments in Opposition to Notice of Preparation of Draft Environmental Impact Report and Notice of Public Scoping Meeting for the EDH 52 Commercial Center (Application Nos. Planned Development Permit PF15-0001, Rezone Z17-0004, Conditional Use Permit CUP-R21-0024, Tentative Parcel Map, P17-0007, Lot Line Adjustment LLA21-0009)

Dear Ms. Hamilton,

We would like to express **our gravest concerns** about the impact of the proposed use and rezoning of the properties identified in this study. These parcels are located at the bottom of a valley surrounded by many existing residential homes that are located higher up on both sides of the valley, up and down the hills, overlooking the subject properties. The proposed development is not suitable for this location for the following reasons:

1. The Sylva Valley road traffic noise level is magnified by the echo chamber created by the hills on both sides of the roadway. This roadway is not suitable to support high volume traffic for businesses such as Costco or drive-throughs. The noise level for homes located on both sides of Sylva Valley has already increased significantly since the development of the intersection with HW-50 and can now be heard indoors day and night. The proposed developments can further increase the noise level many folds, particularly at night when these businesses receive deliveries.
2. The proposed properties and buildings and contents within the properties will be in the direct line of sight of hundreds of existing homes. Due to the properties being overlooked from the hills, these views cannot be screened with trees and landscaping. Therefore, use cases such as self-storage for RVs and boats, gas-stations, or Costco warehouse will be in full view of hundreds of residential properties day and night, creating an unsightly environment that can negatively impact the value of all these residential properties.
3. The proposed properties can also impact nighttime environment by generating too much reflective light that will be a nuisance to many homes in the area.
4. The nature of the proposed businesses does not allow for an architectural plan that is consistent with the surrounding residential buildings and subdivisions.

We therefore request that you kindly NOT APPROVE the proposed plans.

Best Regards,

Roy Templet

Dear Gina Hamilton,

Re: Proposed commercial developments-EDH52

My husband and I are residents of The Serrano Community, Village A. As like others in our community when we heard of the pending Costco and a Gas Station development next to our neighborhood, we were shocked and in disbelief.

These parcels of land are surrounded by low hills in which homes lie, (a residential community). Serrano is a gated community in which the homeowners pay HOA dues to keep our neighborhood clean, safe, quiet and friendly. The proposed parcels of land for the Costco development and Gas Station are too close to these homes. This is a residential area and not an area to place a bustling Costco that brings thousands of people a day or a Gas Station likely to release toxic fumes!

The Proposed developments run along Silva Valley Pkwy which is two-lanes in each direction, at times is very busy, especially during drop off and the pick-up of children from the local schools. The road conditions are not sufficient to handle the increased traffic especially considering the safety of children and probable increased auto accidents. Additionally, pollution, crowds, trash, noise and likely increased crime is a significant concern for the neighborhood residents.

The nearest school is Oak Meadow Elementary and would be adjacent to the proposed Gas Station (unacceptable). This gas station is unnecessary due to at least 2 other gas stations in the Town Center only a mile away and increased risks of Toxic Fumes to the community and elementary children.

Another consideration is that the Costco development sits adjacent to a nature trail (Buck Creek Trail) which is the home of several different wildlife species and with all the traffic, increased lights in the parking area would endanger these animals.

I recommend that you come to this area and visit the schools, go into the neighborhoods walk the nature trail. Ask yourself does this feel right and would you like to have a Costco and Gas Station in your backyard? Also, consider that there is another Costco only 6 minutes down the road and is not needed at this location. Gas Stations are to become a thing of the past with the development of electric vehicles.

Thank You for your consideration and doing what is right,

To: Gina Hamilton, Senior Planner
County of El Dorado Hills Planning Division

I am a resident of El Dorado Hills and live in the vicinity of the proposed EDH 52 Commercial Center development. My wife and I moved to El Dorado Hills to get away from the overpopulated Bay Area a little more than 2 years ago. I also have family that have lived in EDH for 20 years, so we were familiar with the area. We work in the public sector with one of us an elementary school teacher and the other a District Administrator for a local Park and Recreation District. We purchased a home in Serrano and have enjoyed the experience overall. We saw the signs for the commercial development near Oak Meadow School but never imagined the size and scope of the proposed buildings, especially the Costco.

I attended the on-line Scoping Meeting on Wednesday, September 8th and would like to add my voice to the opposition to what is being proposed with EDH 52 Commercial Center development. As I mentioned, we came from the Bay Area and saw what poor planning and urban sprawl did there over the years. The idea of a gas station, retail and commercial development, and a Costco look just like the development that ruined the Bay Area. I read the documents/comments on-line, and in one, it referenced the Costco in Redwood City, where I grew up and raised my daughters. I can tell you that the traffic gridlock in that area by Hoover School has become a disaster. I had to drive through it for 3+ years as my oldest daughter attended high school in the area. It is unsafe and the amount of light, noise, and carbon pollution is off the charts. I've seen the backup of traffic daily at Oak Meadow, and it will be so much more dangerous with this proposed development (just like Redwood City). Even worse, someone is going to get seriously hurt or killed.

This is not what El Dorado Hills should become. I'm not opposed to development, but what is being proposed does not fit the area. I also think adding a Costco in El Dorado County isn't a bad idea but having it in a location that fits better is what should be looked at by the developer, the County staff, and elected/appointed officials.

I know this is only the first step with the EIR, but there should be enough evidence after it's done that the whole concept for the area should go back to the drawing board.

Thank you for your time.

Hello!

Attached is a letter regarding the EDH 25 Commercial Center development that I would like added to the EIR comments. I attended the virtual scoping meeting and thought it was very valuable and done well.

I appreciate the work you to for El Dorado County.

We already have a Costco in Folsom. You are ruining our quality of life in every aspect from traffic to air quality to taking away from the beautiful nature we have. That's what why we live here is to enjoy our wonderful nature. You are also putting danger to kids that walk in the schools nearby. Shame on you guys for putting money before humans and nature!!!!! 😠😠😠😠😠 I guarantee that your Costco will fail. No one is going to go. Go somewhere else to build!!!!

COMMENTS TO REQUEST FOR REVIEW FOR THE NOTICE OF PREPARATION FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT, EDH 52 COMMERCIAL CENTER PROJECT, SCH#2021080402, EL DORADO COUNTY

Pursuant to the State Clearinghouse's 20 August 2021 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Notice of Preparation for the Draft Environmental Impact Report* for the EDH 52 Commercial Center Project, located in El Dorado County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by

the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the State Water Resources Control Board website at:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Phase I and II Municipal Separate Storm Sewer System (MS4) Permits[1]

The Phase I and II MS4 permits require the Permittees reduce pollutants and runoff flows from new development and redevelopment using Best Management Practices (BMPs) to the maximum extent practicable (MEP). MS4 Permittees have their own development standards, also known as Low Impact Development (LID)/post-construction standards that include a hydromodification component. The MS4 permits also require specific design concepts for LID/post-construction BMPs in the early stages of a project during the entitlement and CEQA process and the development plan review process.

For more information on which Phase I MS4 Permit this project applies to, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/

For more information on the Phase II MS4 permit and who it applies to, visit the State Water Resources Control Board at:
http://www.waterboards.ca.gov/water_issues/programs/stormwater/phase_ii_municipal.shtml

Industrial Storm Water General Permit

Storm water discharges associated with industrial sites must comply with the regulations contained in the Industrial Storm Water General Permit Order No. 2014-0057-DWQ. For more information on the Industrial Storm Water General Permit, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/industrial_general_permits/index.shtml

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

[1] Municipal Permits = The Phase I Municipal Separate Storm Water System (MS4) Permit covers medium sized Municipalities (serving between 100,000 and 250,000 people) and large sized municipalities (serving over 250,000 people). The Phase II MS4 provides coverage for small municipalities, including non-traditional Small MS4s, which include military bases, public campuses, prisons and hospitals.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at:

http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/help/permit/

If you have questions regarding these comments, please contact me at (916) 464-4709 or Greg.Hendricks@waterboards.ca.gov.

[EDH52 commercial center] EDH 52 Commercial Center Application

Curtis Cheney <cvcheney332@gmail.com> Tue, Sep 21, 2021 at 11:53 AM
To: edh52commercialcenter@edcgov.us
Cc: bosone@edcgov.us

Ms. Hamilton:

My name is Curtis V. Cheney. My wife is Sharon G. Cheney. We reside at 1008 Terracina Drive in El Dorado Hills. Please add our names to the many who oppose the referenced project.

I am certain that you have received many communications that address eloquently and in great detail the numerous reasons this application should be denied. A drive up the Silva Valley Parkway from Highway 50 provides ample reason for denial of this application. This is the entryway into a residential area with a school annexed. The proposed project will destroy residential vistas for dozens of homes, create massive traffic and safety problems adjacent to the school and residences and completely change the tone and mood of the area.

The residents of El Dorado Hills who have invested in homes and who enjoy the residential feel of this area deserve far better than what will be created if this application is approved. If the government of El Dorado County is truly dedicated to the well being of its citizens, this application will be summarily denied.

No commercial development should be permitted in this area, in particular, with respect to Costco, when there is an existing location three miles away.

Thank you,

C.V.Cheney

Gina Hamilton <gina.hamilton@edcgov.us>

COMMENTS TO REQUEST FOR REVIEW FOR THE NOTICE OF PREPARATION FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT, EDH 52 COMMERCIAL CENTER PROJECT, SCH#2021080402, EL DORADO COUNTY

Pursuant to the State Clearinghouse's 20 August 2021 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Notice of Preparation for the Draft Environmental Impact Report* for the EDH 52 Commercial Center Project, located in El Dorado County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by

the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the State Water Resources Control Board website at:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Phase I and II Municipal Separate Storm Sewer System (MS4) Permits[1]

The Phase I and II MS4 permits require the Permittees reduce pollutants and runoff flows from new development and redevelopment using Best Management Practices (BMPs) to the maximum extent practicable (MEP). MS4 Permittees have their own development standards, also known as Low Impact Development (LID)/post-construction standards that include a hydromodification component. The MS4 permits also require specific design concepts for LID/post-construction BMPs in the early stages of a project during the entitlement and CEQA process and the development plan review process.

For more information on which Phase I MS4 Permit this project applies to, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/

For more information on the Phase II MS4 permit and who it applies to, visit the State Water Resources Control Board at:
http://www.waterboards.ca.gov/water_issues/programs/stormwater/phase_ii_municipal.shtml

Industrial Storm Water General Permit

Storm water discharges associated with industrial sites must comply with the regulations contained in the Industrial Storm Water General Permit Order No. 2014-0057-DWQ. For more information on the Industrial Storm Water General Permit, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/industrial_general_permits/index.shtml

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

[1] Municipal Permits = The Phase I Municipal Separate Storm Water System (MS4) Permit covers medium sized Municipalities (serving between 100,000 and 250,000 people) and large sized municipalities (serving over 250,000 people). The Phase II MS4 provides coverage for small municipalities, including non-traditional Small MS4s, which include military bases, public campuses, prisons and hospitals.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at:

http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/help/permit/

If you have questions regarding these comments, please contact me at (916) 464-4709 or Greg.Hendricks@waterboards.ca.gov.

COMMENTS TO REQUEST FOR REVIEW FOR THE NOTICE OF PREPARATION FOR THE DRAFT ENVIRONMENTAL IMPACT REPORT, EDH 52 COMMERCIAL CENTER PROJECT, SCH#2021080402, EL DORADO COUNTY

Pursuant to the State Clearinghouse's 20 August 2021 request, the Central Valley Regional Water Quality Control Board (Central Valley Water Board) has reviewed the *Request for Review for the Notice of Preparation for the Draft Environmental Impact Report* for the EDH 52 Commercial Center Project, located in El Dorado County.

Our agency is delegated with the responsibility of protecting the quality of surface and groundwaters of the state; therefore our comments will address concerns surrounding those issues.

I. Regulatory Setting

Basin Plan

The Central Valley Water Board is required to formulate and adopt Basin Plans for all areas within the Central Valley region under Section 13240 of the Porter-Cologne Water Quality Control Act. Each Basin Plan must contain water quality objectives to ensure the reasonable protection of beneficial uses, as well as a program of implementation for achieving water quality objectives with the Basin Plans. Federal regulations require each state to adopt water quality standards to protect the public health or welfare, enhance the quality of water and serve the purposes of the Clean Water Act. In California, the beneficial uses, water quality objectives, and the Antidegradation Policy are the State's water quality standards. Water quality standards are also contained in the National Toxics Rule, 40 CFR Section 131.36, and the California Toxics Rule, 40 CFR Section 131.38.

The Basin Plan is subject to modification as necessary, considering applicable laws, policies, technologies, water quality conditions and priorities. The original Basin Plans were adopted in 1975, and have been updated and revised periodically as required, using Basin Plan amendments. Once the Central Valley Water Board has adopted a Basin Plan amendment in noticed public hearings, it must be approved by

the State Water Resources Control Board (State Water Board), Office of Administrative Law (OAL) and in some cases, the United States Environmental Protection Agency (USEPA). Basin Plan amendments only become effective after they have been approved by the OAL and in some cases, the USEPA. Every three (3) years, a review of the Basin Plan is completed that assesses the appropriateness of existing standards and evaluates and prioritizes Basin Planning issues. For more information on the *Water Quality Control Plan for the Sacramento and San Joaquin River Basins*, please visit our website:
http://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/

Antidegradation Considerations

All wastewater discharges must comply with the Antidegradation Policy (State Water Board Resolution 68-16) and the Antidegradation Implementation Policy contained in the Basin Plan. The Antidegradation Implementation Policy is available on page 74 at:
https://www.waterboards.ca.gov/centralvalley/water_issues/basin_plans/sacsjr_201805.pdf

In part it states:

Any discharge of waste to high quality waters must apply best practicable treatment or control not only to prevent a condition of pollution or nuisance from occurring, but also to maintain the highest water quality possible consistent with the maximum benefit to the people of the State.

This information must be presented as an analysis of the impacts and potential impacts of the discharge on water quality, as measured by background concentrations and applicable water quality objectives.

The antidegradation analysis is a mandatory element in the National Pollutant Discharge Elimination System and land discharge Waste Discharge Requirements (WDRs) permitting processes. The environmental review document should evaluate potential impacts to both surface and groundwater quality.

II. Permitting Requirements

Construction Storm Water General Permit

Dischargers whose project disturb one or more acres of soil or where projects disturb less than one acre but are part of a larger common plan of development that in total disturbs one or more acres, are required to obtain coverage under the General Permit for Storm Water Discharges Associated with Construction and Land Disturbance Activities (Construction General Permit), Construction General Permit Order No. 2009-0009-DWQ. Construction activity subject to this permit includes clearing, grading, grubbing, disturbances to the ground, such as stockpiling, or excavation, but does not include regular maintenance activities performed to restore the original line, grade, or capacity of the facility. The Construction General Permit requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). For more information on the Construction General Permit, visit the State Water Resources Control Board website at:

http://www.waterboards.ca.gov/water_issues/programs/stormwater/constpermits.shtml

Phase I and II Municipal Separate Storm Sewer System (MS4) Permits[1]

The Phase I and II MS4 permits require the Permittees reduce pollutants and runoff flows from new development and redevelopment using Best Management Practices (BMPs) to the maximum extent practicable (MEP). MS4 Permittees have their own development standards, also known as Low Impact Development (LID)/post-construction standards that include a hydromodification component. The MS4 permits also require specific design concepts for LID/post-construction BMPs in the early stages of a project during the entitlement and CEQA process and the development plan review process.

For more information on which Phase I MS4 Permit this project applies to, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/municipal_permits/

For more information on the Phase II MS4 permit and who it applies to, visit the State Water Resources Control Board at:
http://www.waterboards.ca.gov/water_issues/programs/stormwater/phase_ii_municipal.shtml

Industrial Storm Water General Permit

Storm water discharges associated with industrial sites must comply with the regulations contained in the Industrial Storm Water General Permit Order No. 2014-0057-DWQ. For more information on the Industrial Storm Water General Permit, visit the Central Valley Water Board website at:
http://www.waterboards.ca.gov/centralvalley/water_issues/storm_water/industrial_general_permits/index.shtml

Clean Water Act Section 404 Permit

If the project will involve the discharge of dredged or fill material in navigable waters or wetlands, a permit pursuant to Section 404 of the Clean Water Act may be needed from the United States Army Corps of Engineers (USACE). If a Section 404 permit is required by the USACE, the Central Valley Water Board will review the permit application to ensure that discharge will not violate water quality standards. If the project requires surface water drainage realignment, the applicant is advised to contact the Department of Fish and Game for information on Streambed Alteration Permit requirements. If you have any questions regarding the Clean Water Act Section 404 permits, please contact the Regulatory Division of the Sacramento District of USACE at (916) 557-5250.

[1] Municipal Permits = The Phase I Municipal Separate Storm Water System (MS4) Permit covers medium sized Municipalities (serving between 100,000 and 250,000 people) and large sized municipalities (serving over 250,000 people). The Phase II MS4 provides coverage for small municipalities, including non-traditional Small MS4s, which include military bases, public campuses, prisons and hospitals.

Clean Water Act Section 401 Permit – Water Quality Certification

If an USACE permit (e.g., Non-Reporting Nationwide Permit, Nationwide Permit, Letter of Permission, Individual Permit, Regional General Permit, Programmatic General Permit), or any other federal permit (e.g., Section 10 of the Rivers and Harbors Act or Section 9 from the United States Coast Guard), is required for this project due to the disturbance of waters of the United States (such as streams and wetlands), then a Water Quality Certification must be obtained from the Central Valley Water Board prior to initiation of project activities. There are no waivers for 401 Water Quality Certifications. For more information on the Water Quality Certification, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/water_issues/water_quality_certification/

Waste Discharge Requirements – Discharges to Waters of the State

If USACE determines that only non-jurisdictional waters of the State (i.e., "non-federal" waters of the State) are present in the proposed project area, the proposed project may require a Waste Discharge Requirement (WDR) permit to be issued by Central Valley Water Board. Under the California Porter-Cologne Water Quality Control Act, discharges to all waters of the State, including all wetlands and other waters of the State including, but not limited to, isolated wetlands, are subject to State regulation. For more information on the Waste Discharges to Surface Water NPDES Program and WDR processes, visit the Central Valley Water Board website at:https://www.waterboards.ca.gov/centralvalley/water_issues/waste_to_surface_water/

Projects involving excavation or fill activities impacting less than 0.2 acre or 400 linear feet of non-jurisdictional waters of the state and projects involving dredging activities impacting less than 50 cubic yards of non-jurisdictional waters of the state may be eligible for coverage under the State Water Resources Control Board Water Quality Order No. 2004-0004-DWQ (General Order 2004-0004). For more information on the General Order 2004-0004, visit the State Water Resources Control Board website at: https://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2004/wqo/wqo2004-0004.pdf

Dewatering Permit

If the proposed project includes construction or groundwater dewatering to be discharged to land, the proponent may apply for coverage under State Water Board General Water Quality Order (Low Threat General Order) 2003-0003 or the Central Valley Water Board's Waiver of Report of Waste Discharge and Waste Discharge Requirements (Low Threat Waiver) R5-2018-0085. Small temporary construction dewatering projects are projects that discharge groundwater to land from excavation activities or dewatering of underground utility vaults. Dischargers seeking coverage under the General Order or Waiver must file a Notice of Intent with the Central Valley Water Board prior to beginning discharge.

For more information regarding the Low Threat General Order and the application process, visit the Central Valley Water Board website at:

http://www.waterboards.ca.gov/board_decisions/adopted_orders/water_quality/2003/wqo/wqo2003-0003.pdf

For more information regarding the Low Threat Waiver and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/waivers/r5-2018-0085.pdf

Limited Threat General NPDES Permit

If the proposed project includes construction dewatering and it is necessary to discharge the groundwater to waters of the United States, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. Dewatering discharges are typically considered a low or limited threat to water quality and may be covered under the General Order for *Limited Threat Discharges to Surface Water* (Limited Threat General Order). A complete Notice of Intent must be submitted to the Central Valley Water Board to obtain coverage under the Limited Threat General Order. For more information regarding the Limited Threat General Order and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/board_decisions/adopted_orders/general_orders/r5-2016-0076-01.pdf

NPDES Permit

If the proposed project discharges waste that could affect the quality of surface waters of the State, other than into a community sewer system, the proposed project will require coverage under a National Pollutant Discharge Elimination System (NPDES) permit. A complete Report of Waste Discharge must be submitted with the Central Valley Water Board to obtain a NPDES Permit. For more information regarding the NPDES Permit and the application process, visit the Central Valley Water Board website at: https://www.waterboards.ca.gov/centralvalley/help/permit/

But regardless, Greg brings up very good points about supporting Water documentation for the EIR. The Tech Memo should be reviewed by EID staff. A WSA would need to be approved by the EID Board.

Mike,

The trigger for a WSA include the following, which may trigger under “commercial office building” or “business establishment” but both have different thresholds. More importantly, the County’s CEQA document should include an analysis equivalent to elements of a WSA regardless. This can protect against using water availability/reliability as a basis for protest. Specifically, they would want to look at your UWMP and document that this project’s water needs fit within the non-residential forecast water needs included into the future (e.g. by 2030 or whenever expected). We often help draft this material, sometimes creating a technical memo we call a Water Supply Evaluation that the CEQA consultant can reference in their docs.
