Here is the relevant code:

10912. For the purposes of this part, the following terms have the following meanings:

(a) “Project” means any of the following:

(1) A proposed residential development of more than 500 dwelling units.

(2) A proposed shopping center or business establishment employing more than 1,000 persons or having more than 500,000 square feet of floor space.

(3) A proposed commercial office building employing more than 1,000 persons or having more than 250,000 square feet of floor space.

(4) A proposed hotel or motel, or both, having more than 500 rooms.

(5) A proposed industrial, manufacturing, or processing plant, or industrial park planned to house more than 1,000 persons, occupying more than 40 acres of land, or having more than 650,000 square feet of floor area.

(6) A mixed-use project that includes one or more of the projects specified in this subdivision.

(7) A project that would demand an amount of water equivalent to, or greater than, the amount of water required by a 500 dwelling unit project.

Subject: WSA for Commercial?

Greg –

The County is working on the EIR for the proposed Costco Site, which will include about 320,000 SF retail and no residential. It is proposed on the north side of Hwy 50 at the Silva Valley off ramp.

The County is asking if a WSA is required. I think the answer is no since does not involve over 500 residential lots.

Thanks for your input.

Subject: AQMD Comments for a Planned Development Permit, a Rezone, a Tentative Parcel Map, Conditional Use Permit Revision and a Lot Line Adjustment for the proposed El Dorado Hills (EDH) 52 Commercial Center (Application Planned Development Permit PD15-0001, Rezone Z17-0004, Conditional Use Permit CUP-R21-0024, Tentative Parcel Map P17-0007, Lot Line Adjustment LLA21-0009)

Dear Ms. Hamilton:

The El Dorado County Air Quality Management District (AQMD) has reviewed the proposed project for a Planned Development Permit, a Rezone, a Tentative Parcel Map, a Conditional Use Permit Revision and a Lot Line Adjustment for the development of EDH 52 Commercial Center project. The proposed project will have approximately 318,000 square feet of commercial/retail development on both sides of Silva Valley Parkway, approximately 100 feet north of Highway 50. The property, identified by Assessor's Parcel Numbers 122-720-002, 122-720-003, 122-720-018, 122-720-019, 122-720-020, and 122-720-021, consists of 41.87 acres, and is located on the east side of old Silva Valley Road, north of the intersection with Tong Road, in the El Dorado Hills area. Based on the AQMD's review of the proposed project, the AQMD concluded the 318,000 square feet of commercial and retail development will be above the size of projects identified in the AQMD Guide to Air Quality Assessment for determining Significance of Air Quality Impacts under the California Environmental Quality Act, and it is expected to cause a significant air quality impact and has the following comments regarding potential air quality impacts.

Air Quality/GHG Analysis Required:

The western portion of El Dorado County (where the project is located) is in non-attainment of the state Ambient Air Quality Standards (AAQS) for Particulate Matter 10 micrometers (PM10), and the federal AAQS for PM2.5 (2.5 micrometers) in size. Additionally, the western portion of the County is in non-attainment of both the 1-hour and 8-hour state AAQS for ozone, and of the 8-hour federal AAQS for ozone. The two ozone precursor pollutants most responsible for ozone generated by this project are Volatile Organic Compounds (VOC, also known as Reactive Organic Gases or ROG) and Nitrogen Oxides (NOx).

An Air Quality and Greenhouse Gas (GHG) Analysis is required for adequate environmental review of the proposed project. AQMD recommends the use of the latest version of the California Emissions Estimator Model (CalEEMod), which can be downloaded for free at www.caleemod.com. This will compute mass emissions of criteria pollutants (NOx, ROG, SOx, PM & CO) and GHG (in CO2 equivalents) from both construction and operation of the project. Someone knowledgeable in all aspects of the project, such as construction phasing, materials usage, etc., should run the model and modify the defaults as appropriate, assuring that notes are included about any changes to defaults as the program requires.

AQMD's Guide to Air Quality Assessment: Determining Significance of Air Quality Impacts under the California Environmental Quality Act, February 2002 ("CEQA Guide") should be used to assess criteria pollutant emissions impacts and can be found here:
https://www.edcgov.us/Government/AirQualityManagement/pages/Guide_to_Air_Quality_Assessment.aspx

Additionally, the following standard conditions apply to the proposed project:

- Asbestos Dust: Current county records indicate the portions of the subject property are located within the Naturally Occurring Asbestos Review Area. An Asbestos Dust Mitigation Plan (ADMP) Application with applicable fees shall be submitted to and approved by the AQMD prior to project construction if the project moves more than 20 cubic yards of soil, pursuant to AQMD Rule 223.2, Fugitive Dust – Asbestos Hazard Mitigation. Mitigation measures for the control of fugitive dust shall comply with the requirements of Rule 223, Fugitive Dust – General Requirements, and Rule 223.2 Fugitive Dust – Asbestos Hazard Mitigation.

- Paving: Project construction and related paving shall adhere to AQMD Rule 224, Cutback and Emulsified Asphalt Paving Materials if applicable.

- Painting/Coating: The project construction will involve the application of architectural coatings, which shall adhere to AQMD Rule 215, Architectural Coatings.

- Open Burning: Burning of wastes that result from "Land Development Clearing" must be permitted through the AQMD. Only dry vegetative waste materials originating from the property may be disposed of using an open outdoor fire. Burning shall adhere to AQMD Rule 300, Open Burning.

- Construction Emissions: During construction, all self-propelled diesel-fueled engines greater than 25 horsepower shall be in compliance with the California Air Resources Board (CARB) Regulation for In-Use Off-Road Diesel Fueled Fleets (§ 2449 et al, title 13, article 4.8, chapter 9, California Code of Regulations (CCR)). The full text of the regulation can be found at CARB's website here: https://ww2.arb.ca.gov/our-work/topics/construction-earthmoving-equipment Questions on applicability should be directed to CARB at 1.866.634.3735. CARB is responsible for enforcement of this regulation.

- Portable Equipment: All portable combustion engine equipment with a rating of 50 horsepower or greater shall be registered with CARB. A copy of the current portable equipment registration shall be with said equipment. The applicant shall provide a complete list of heavy-duty diesel-fueled equipment to be used on this project, which includes the make, model, year of equipment, and daily hours of operations of each piece of equipment.

- New Point or Stationary Source: Prior to construction/installation of any new point/stationary source emissions units (e.g., emergency standby engine greater than 50 HP, etc.), Authority to Construct applications shall be submitted to the AQMD. Submittal of applications shall include facility diagram(s), equipment specifications and emissions estimates, and shall adhere to AQMD Rules 501, General Permit Requirements and 523, New Source Review.

- Electric Vehicle Charging – Non-Residential: The project shall comply with the Non-Residential Mandatory Measures identified in the 2019 Cal Green Building Code §5.106.5.3 concerning installation

of electric vehicle supply equipment (EVSE). Plans shall include; the location(s) and type of EVSE, a listed raceway capable of accommodating a 208/240-volt dedicated branch circuit originating at a service panel with sufficient capacity to accommodate a minimum 40A dedicated circuit, and terminating in a suitable enclosure in close proximity to the proposed location of the charging equipment. Plans, specifications and electrical calculations shall show the electrical system has sufficient capacity to simultaneously charge all required electric vehicles at their full rated amperage. Raceways shall be installed from the electrical service panel to the designated parking areas at the time of initial construction. Please refer to Cal Green Building Stds Code §5.106.5.3 for specific requirements[1]: https://www.edcgov.us/Government/building/pages/california_building_standards_in_effect.aspx

AQMD Rules and Regulations are available at the following CARB's webpage: https://ww2.arb.ca.gov/current-air-district-rules?frm=/app/www/outside/drdb/ed

Thank you for the opportunity to comment on this proposed project. If you have any questions regarding this letter, please contact me at 530.621.7509.

Respectfully,

Rania Serieh
Sr. Air Quality Engineer
Air Quality Management District

Costco - Signage Calcs

Brandon Northart <BNorthart@up-partners.com> Thu, Oct 7, 2021 at 10:49 AM
To: "gina.hamilton@edcgov.us" <gina.hamilton@edcgov.us>

Hi Gina,

Attached are my calculations for signage. Few notes:

1. The sign ID's shown in the excel correspond to the sign plan in the Costco Plans.
2. Technically, we are only allowed 120 square feet of wall signage in TOTAL for the Costco site. Our calculations show a per sign basis, which doesn't account for this.
3. The way the sign area is calculated for Costco's sign isn't necessarily in accordance with the Sign Code. Last I heard they were going to recalculate, but I don't anticipate changing the total area of each sign by too much.

MEMORANDUM

REVIEW COMMENTS

Date: October 7, 2021

Project #: 26783

To: Natalie Porter, El Dorado County Department of Transportation
CC: Gina Hamilton, El Dorado County Planning and Building Department
Patrick Angell, Ascent Environmental, Inc.
Cori Resha, Ascent Environmental, Inc.

From: Amy Lopez, RSP; Joceline Suhaimi, Andrew McIntyre

Project: El Dorado Hills 52 Costco Commercial Center

Subject: Transportation Impact Study Scope of Work

AKT Investment, Inc. (AKT) and Costco Wholesale (Costco) together are proposing to jointly develop the El Dorado Hills (EDH) 52 Costco Commercial Center (project) in El Dorado County. This memorandum summarizes the scope of the transportation study to be prepared for the project. The scope includes the study area, trip generation, trip distribution, and analysis methodology to evaluate traffic operations on local and regional streets changes in relation to the County's General Plan Circulation Element level of service policies (Measure E and Y), as well as a vehicle-miles traveled (VMT) analysis based on the County's recently adopted VMT significance thresholds to evaluate environmental impacts pursuant to the California Environmental Quality Act (CEQA).

Kittelson & Associates, Inc. (Kittelson) developed this scope of work based on our review of the El Dorado County Community Development Agency's Transportation Impact Study Guidelines (TIS Guidelines), as approved in November 2014, and in coordination with Natalie Porter, Senior Traffic Civil Engineer with the County of El Dorado (County), as well as Ken Anderson of KD Anderson & Associates, Inc. (KDA).

PROJECT BACKGROUND

The El Dorado Hills (EDH) 52 Costco Commercial Center consists of two (2) separate commercial center sites (North Site and South Site) located north of U.S. 50 at the Silva Valley Parkway Interchange. These two commercial centers are being processed by El Dorado County as a single project for local land use entitlements and CEQA purposes. The North Site consists of 18.26 acres and would provide approximately 161,608 square feet (sf) of commercial uses, which would be split between 130,358 sf of self-storage building space and 30,250 sf of general commercial building space and would include approximately 173 parking stalls. The South Site is approximately 17.04 acres and would support a 155,693-square-foot Costco Warehouse with Tire Center and two levels of parking with up to 762 parking stalls.

Primary access to both sites is proposed via a new traffic signal on Silva Valley Parkway, situated approximately midway between the U.S. 50 westbound ramp and Clarksville Crossing. A second signal is proposed at the intersection of Silva Valley Parkway and ~~Clarksville Crossing/~~Country Club Drive. For the North Site, a second access is proposed on the planned Country Club Drive, and a third access is proposed on Tong Road. Two additional minor access points for the South Site are proposed along Clarksville Crossing.

The "second signal" should reflect the intersection of Country Club Dr and Silva Valley Pkwy. It is anticipated that Clarksville Crossing will no longer intersect with Silva Valley Pkwy.

Hours of operation for the Costco warehouse are expected to be approximately as follows:

- Monday – Friday: 10:00 AM – 8:30 PM
- Saturday: 9:30 AM – 7:00 PM
- Sunday: 10:00 AM – 6:00 PM

TASK 1 – PROJECT SCOPING

Kittelson's project manager and analyst, along with a representative from KDA, will meet with County staff to develop the scope of the transportation impact study (TIS) for the project. Kittelson will document the scope of work (contained herein) for review by the project proponents before submitting the scope of work to the County for review and confirmation.

The scope of work substantially mirrors the scope of the TIS report dated August 21, 2018 and prepared by KDA for a previously proposed development for the North and South Sites.

Deliverable: *Scope of work (contained herein)*

TASK 2 – DATA COLLECTION

County confirmed with Caltrans that this would be acceptable. Caltrans noted that the Bass Lake Ramps are not in PeMS.

Kittelson will access Caltrans Performance Measurement System (PeMS) traffic data during 2019 (before the COVID-19 pandemic shelter-in-place practices went into effect) for Caltrans facilities listed in Task 3. Kittelson will collect new traffic counts after Labor Day 2021 at intersections and on roadway segments for the study segments listed in Task 3. Kittelson will collect trip generation data at up to three exemplary Costco warehouses sites[1] (e.g., Elk Grove, Folsom, and Clovis) for use in estimating trip generation of the South Site under Task 3.

Kittelson has signed a confidentiality agreement with Costco, which permits Kittelson to utilize certain member-based data. Kittelson will request data regarding Costco members and their transactions at other Costco warehouses in the area, namely the Folsom Costco, to inform certain components of the analysis associated with the Costco warehouse and fuel station. Costco will scrub the data of identifying

[1] While the proposed Costco warehouse site does not include a fuel station, the trip generation data collected at the similar sites, which do have fuel stations, will provide a conservative basis for estimating trips for the TIS.

information to maintain privacy for its members prior to sharing with Kittelson. Summary trends and insights derived from the data will be presented in the traffic study; however, the raw data will not be shared with outside parties, such as the County, AKT, Ascent, or KDA out of respect for the confidentiality agreement requirements.

TASK 3 – TRAFFIC OPERATIONS ANALYSIS

Consistent with the County TIS Guidelines required under Measures E and Y, Kittelson will perform traffic operations analyses for selected intersections, roadway segments, and freeway ramp junctions. The following section outlines the analysis locations, methodology, and study scenarios.

Study Locations

Kittelson will analyze traffic operations on local and regional roadways, as described in this section and presented in Figure 1.

Intersections

Study intersections identified consistent with the 2018 TIS report by KDA are listed below. Pending further trip generation and distribution analysis, this list is subject to change.

1. Silva Valley Parkway/Harvard Way (signalized)
2. Silva Valley Parkway/Golden Eagle Lane (all-way stop controlled)
3. Silva Valley Parkway/Serrano Parkway (signalized)
4. Silva Valley Parkway/Entrada Lane (two-way stop controlled)
5. Silva Valley Parkway/Oak Meadow Elementary School (two-way stop controlled)
6. Silva Valley Parkway/Future Country Club Drive (two-way stop controlled; future signalized)
7. Silva Valley Parkway/Tong Road (side street stop controlled)
8. U.S. 50 Westbound Ramps/Silva Valley Parkway (signalized)
9. U.S. 50 Eastbound Ramps/Silva Valley Parkway (signalized)
10. White Rock Road/Clarksville Crossing-Old White Rock Road (signalized)
11. White Rock Road/Valley View Parkway-Vine Street (signalized)
12. White Rock Road/Post Street (signalized)
13. White Rock Road/Latrobe Road (signalized)
14. Bass Lake Road/Country Club Drive (signalized)
15. Silva Valley Parkway/Project Driveway (future intersection: signalized)
16. North Site access on Country Club Drive
17. North Site access on Tong Road
18. South Site north access on Clarksville Crossing
19. South Site south access on Clarksville Crossing
20. Serrano Pkwy/Future Country Club Drive (Future Conditions)

Intersection 15 - Silva Valley Pkwy and Project Driveway should be analyzed as signalized and unsignalized.

21. U.S. 50 Westbound Ramps/El Dorado Hills Blvd (Future Conditions)
22. U.S. 50 Eastbound Ramps/Latrobe Rd ramps (Future Conditions)
23. Bass Lake/Serrano Pkwy (Future Conditions)
24. U.S. 50 Westbound Ramps/Bass Lake Rd ramps (Future Conditions)
25. U.S. 50 Eastbound Ramps/Marble Valley Rd ramps (Future Conditions)

Roadway Segments

1. Silva Valley Parkway – U.S. 50 Westbound Ramps to Clarksville Crossing
2. Silva Valley Parkway – Future Country Club Drive to Serrano Parkway
3. White Rock Road – U.S. 50 Eastbound ramps to Clarksville Crossing
4. Clarksville Crossing – Future Country Club Drive to White Rock Road
5. U.S. 50 Westbound – Silva Valley Parkway to El Dorado Hills Boulevard
6. U.S. 50 Westbound – east of Silva Valley Parkway interchange
7. U.S. 50 Eastbound – El Dorado Hills Boulevard to Silva Valley Parkway
8. U.S. 50 Eastbound – east of Silva Valley Parkway interchange

Freeway Merge/Diverge Sections

1. U.S. 50 at Silva Valley Parkway – westbound on-ramp merge
2. U.S. 50 at Silva Valley Parkway – westbound off-ramp diverge
3. U.S. 50 at Silva Valley Parkway – eastbound on-ramp merge
4. U.S. 50 at Silva Valley Parkway – eastbound off-ramp diverge

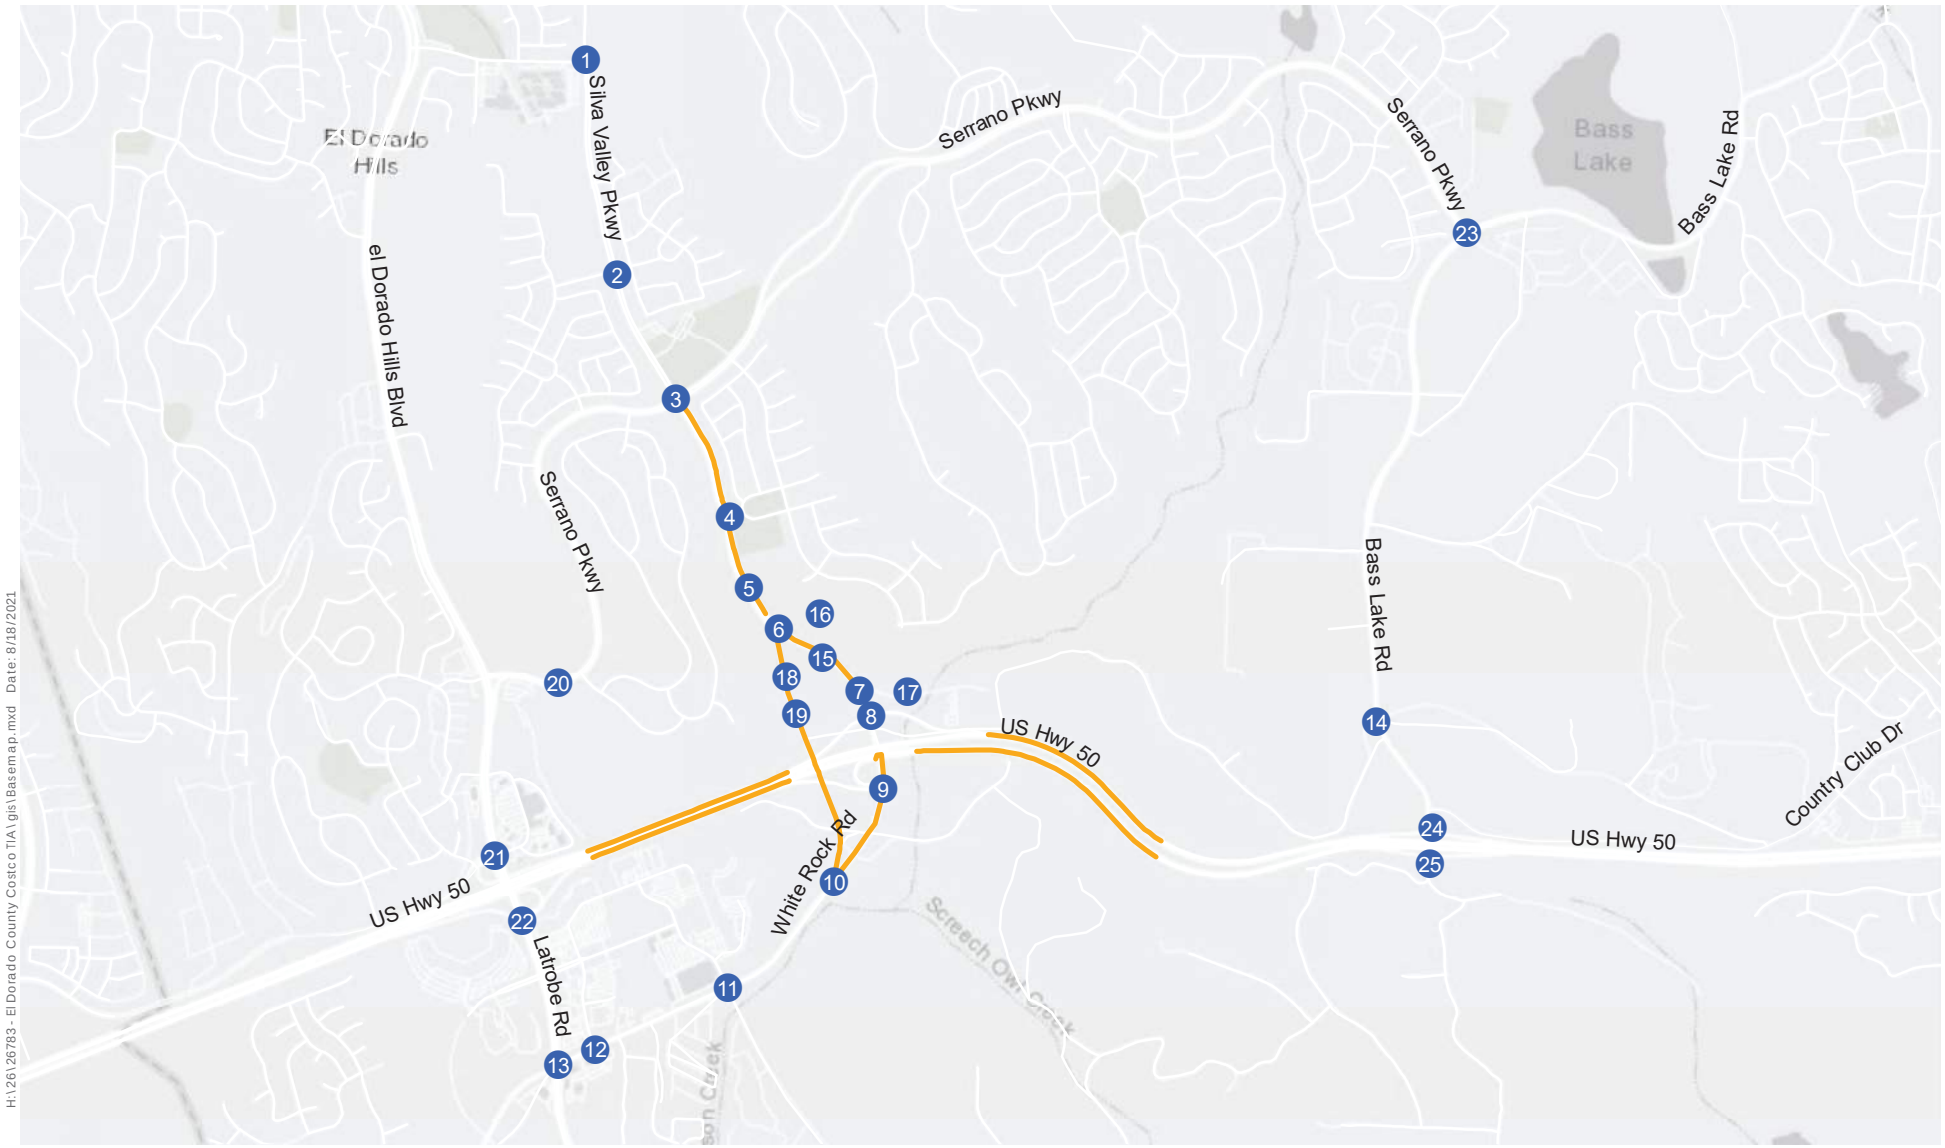

Figure 1

Study Intersections
El Dorado Hills, CA

KITTELSON & ASSOCIATES

Trip Generation

Kittelson will develop project weekday AM[2] and PM peak hour, weekday daily, and Saturday peak hour trip generation for the North Site and South Site using separate methodologies.

North Site. For the AKT development, Kittelson will estimate the trip generation of the AKT development using the 10th Edition of the Institute of Transportation Engineers (ITE) *Trip Generation Manual*. Kittelson will select the most appropriate ITE Land Use Codes to represent the uses planned for the North Site and will vet the selection with the County before continuing with the analysis.

South Site. Kittelson will use trip generation data from an exemplary Costco warehouse as well as warehouse transaction data in 2019 and 2021 to estimate use trip generation of the Costco warehouse and fuel station. Additionally, they will use data previously collected at Costco warehouses to develop trip characteristics (i.e., primary, pass-by, and diverted link trips).

- *Primary Trips* (an entirely new trip on the roadway system for the express purpose of driving to and from Costco),
- *Pass-by Trips* (existing trips that are on roadways adjacent to the site which allow the motorist to turn into the Costco development, and then continue on to their ultimate destination when their shopping is concluded), and
- *Diverted-Linked Trips* (existing trips on nearby roadways in which the motorist makes a decision to drive out-of-direction for a distance to stop at Costco, and when their shopping is concluded, continue on their trip to the ultimate destination).

While the ITE *Trip Generation Manual* does offer trip rates for a Discount Club land use (ITE Land Use Code 857), data collected at other Costco sites has demonstrated Costco warehouses typically generate higher traffic volumes than would be estimated using ITE rates.

Trip Generation Data

Kittelson will collect trip generation data as part of Task 2 to estimate trip generation for the South site. Table 1 summarizes average trip rates recorded at other Costco warehouse sites for reference purposes only. The table does not provide a weekday AM peak hour trip rate because the Costco warehouse is not open to members until 10:00 AM.

[2] Trip generation for the South Site (Costco) will not include a weekday AM peak hour trip generation estimate since the warehouse does not open to members until 10:00 a.m.

Table 1: Average Trip Characteristics for a Costco Warehouse with Gas Station

Land Use	Weekday Daily Trip Rate (per KSF)	Weekday PM Peak Hour of Adjacent Street Traffic Trip Rate (per KSF)			Saturday Midday Peak Hour (per KSF)		
		Total	In	Out	Total	In	Out
Costco Warehouse with Fuel Station	79.27	7.17	49%	51%	9.79	51%	49%
Primary Trips	*No Data*		*35.1%*			*50%*	
Pass-by Trips	*No Data*		*33.3%*			*29%*	
Diverted Trips	*No Data*		*31.5%*			*21%*	

Source: Kittelson & Associates, Inc., 2021

Trip generation studies were conducted at Costco Wholesale sites located across the western region of the United States using industry standard engineering practices consistent with guidance within the Institute of Transportation Engineers (ITE) standard reference, *Trip Generation Manual*, 10th *Edition*. These cordon surveys were conducted between 2001 and 2010 and include surveys of 22 Costco Warehouses with fuel centers in California, Oregon, Washington, Montana, Utah, and Colorado. The Costco Wholesale buildings surveyed range in size between 120,000 square-feet and 162,115 square-feet, with an average size of 143,782 square-feet. Trip generation rates are correlated to the overall warehouse size regardless of the number of fueling positions.

Trip Type Considerations

The previously surveyed Costco buildings are situated in a variety of locations, some adjacent to freeways/arterials, while others are located a couple of blocks away. This variation in warehouse locations results in differences in diverted and pass-by trips between locations. For example, sites adjacent to major arterial roadways tend to exhibit a high percentage of pass-by trips and a lower percentage of diverted trips. Similarly, Costco facilities located a block or two away from a freeway tend to experience a higher percentage of diverted trips. Given these factors, diverted and pass-by trips should be considered together with engineering judgment used to identify how these two trip characteristics should be applied.

Proper accounting of the diverted trips within the analysis models should include the impacts associated with these trips at the study area intersections. However, it should be noted that these trips do not create similar system capacity issues as new trips to the system because these trips generally provide no impact beyond the study area.

Trip Distribution

For the North Site, the trip distribution and assignment will be developed based on an analysis using the El Dorado County Travel Demand Model.

For the South Site, trip distribution will be developed based on Costco membership data. Two Costco Wholesale sites with fuel stations are currently located along Highway 50 in Folsom and Rancho Cordova. Based on Costco membership data and the existing Costco sites to the west, the market area served by the El Dorado County site is generally towards the east of the site.

> ***Task 3 Deliverable***: Technical memorandum summarizing project trip generation and distribution – *Draft, Final*
>
> ***Assumption:*** *Two (2) rounds of review; the County, their Peer Reviewer, and Ascent together will provide a single set of consolidated, non-conflicting comments per their review period(s) listed here:*
>
> - *County, Peer Reviewer, and Ascent review of Draft*
> - *County, Peer Reviewer, and Ascent review of Final Draft*

Study Scenarios

The study will assess weekday AM and PM peak hour conditions at the study intersections. The analysis excludes trips made on weekends. The following analysis horizon periods are anticipated:

- Existing (Year 2021) Conditions
- Existing plus Project Conditions (three alternatives)
  - Existing plus North Site
  - Existing plus South Site
  - Existing plus Both Projects
- Future (Year 2030) Conditions
  - 2030 conditions established using straight line interpolation of County travel demand model 2035 traffic projections
  - Assumes new roadway connections, including Country Club Drive extension to the west and east of Silva Valley Parkway
- Future plus Project Conditions

A Saturday mid-day peak analysis should be performed at the study intersections located along Silva Valley Pkwy, from Serrano Pkwy to the intersection of Clarksville Crossing and White Rock Rd.

For Future Conditions, the County will provide in writing any assumptions or adjustments Kittelson should make to the travel demand model (e.g., roadway connections not already coded in the model) to accurately represent reasonably foreseeable future roadway improvements and/or land uses.

The County intends for Country Club Drive to extend and connect to Serrano Pkwy in the future, and should be analyzed as such. Also, Clarksville Crossing will no longer intersect with Silva Valley Pkwy following construction of the new Country Club Dr intersection with Silva Valley Pkwy.

Kittelson will employ the methodologies discussed below to analyze traffic operations at intersections, along roadway segments, and at freeway ramp junctions (weaving analysis).

Intersections

Kittelson will use Synchro traffic analysis software version 10 for assessing signalized and unsignalized intersection performance using methodologies from the 6th Edition of the *Highway Capacity Manual (HCM)*. The traffic study of the proposed development will include an evaluation of level of service and control delay at the study intersections, as well as 95th percentile queuing for each of the proposed access points.

Roadways Segments

Roadway operations will be analyzed using methods presented in the 6th Edition HCM. The HCM provides guidance on developing level-of-service for different roadway types, including two-lane highways and multi-lane highway roadway segments.

Freeway Weaving Sections

Kittelson will analyze freeway weaving sections using methods presented in the 6th Edition HCM.

> ***Assumption:*** *Kittelson assumes KDA will provide traffic analysis files from the 2018 TIS by KDA to serve as a starting point for all analyses described in Task 3.*

TASK 4 – GENERAL TRANSPORTATION ASSESSMENT

This analysis will include a qualitative assessment of the following elements required by El Dorado County's *Transportation Impact Study Guidelines*:

- Emergency vehicle access
- Deliveries of goods and services
- On-Site Transportation Review
    - Existence of any current traffic problems in the local area such as a high-accident location, non-standard intersection or roadway, or an intersection in need of a traffic signal
    - Proximity of proposed site driveway(s) to other driveways or intersections
    - Adequacy of vehicle parking relative to both the anticipated demand and zoning code requirements
    - Adequacy of the project site design to fully satisfy truck loading demand on-site, when the anticipated number of deliveries and service calls may exceed 10 per day
    - Adequacy of the project site design to provide at least a 25' minimum required throat depth (MRTD) at project driveways, including calculation of the MRTD
    - Adequacy of the project site design to convey all vehicle types
    - Adequacy of sight distance on-site
    - Queuing analysis of "drive-through" facilities
- Complete street implementation, wherever possible

TASK 5 – CEQA ANALYSIS

Kittelson will prepare additional transportation analyses to address the CEQA Appendix G Checklist items for TRANSPORTATION/TRAFFIC consistent with the County's adopted VMT thresholds of significance in Resolution 141-2020:

Would the project:

a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
d) Result in inadequate emergency access?

Item (a) of the checklist refers to plans, which includes the County's General Plan. Per the TIS Guidelines, Kittelson will conduct a qualitative assessment of the proposed project for consistency with the following General Plan Circulation Element goals:

- Access to public transit services consistent with General Plan Circulation Element Goal TC-2:
  "To promote a safe and efficient transit system that provides service to all residents, including senior citizens, youths, the disabled, and those without access to automobiles that also helps to reduce congestion, and improves the environment."
- Transportation system management consistent with General Plan Circulation Element Goal TC-3:
  "To reduce travel demand on the County's road system and maximize the operating efficiency of transportation facilities, thereby reducing the quantity of motor vehicle emissions and the amount of investment required in new or expanded facilities."
- Non-Motorized Transportation consistent with General Plan Circulation Element Goal TC-4:
  "To provide a safe, continuous, and easily accessible non-motorized transportation system that facilitates the use of the viable alternative transportation modes."

Item (b) of the checklist centers on analysis of vehicle-miles traveled (VMT). As outlined in El Dorado County Resolution 141-2020 (and recommended by the Governor's Office of Planning and Research (OPR)), the significance threshold for identifying impacts resulting from retail projects is "no net increase" in VMT.[4]

Consistent with the County TIS Guidelines, Kittelson will work with the County to use the El Dorado County travel demand model to estimate VMT for the North Site. Because trip-making characteristics of Costco warehouses and fuel stations are not accurately reflected by the land uses in the County

[4] El Dorado County Resolution 141-2020

travel demand model, Kittelson will develop VMT for the South Site using member transaction data at nearby Costco warehouses (namely the Folsom Costco) to establish existing travel patterns and anticipated shifts in travel patterns by Costco members who would shop at the El Dorado Hills Costco warehouse if it were constructed. Kittelson will use these data to calculate the expected change in daily VMT within the County associated with the North and South Sites, and the total VMT attributable to the project.

The TIS will also include delay-based analysis required under Measures E and Y to document the results of the analysis described in Task 3; however, because traffic delay is not an environmental impact, the TIS will state clearly this information will not be used in any transportation impact determination for CEQA purposes.

If the TIS identifies any significant impacts, it will propose mitigation measures to reduce the severity of the identified impacts to the extent feasible. In addition, the TIS will identify any transportation improvements required based on the results of the analysis described in Task 3 so that Ascent can analyze the environmental effects that would result from construction of the identified improvements.

Alternatives Analysis

Kittelson will prepare a qualitative assessment of up to two project alternatives and document their anticipated effects on the transportation system in El Dorado County.

Task 3 – 5 Deliverables: *TIS Report – Draft, Final Draft, Final*

Assumption: *Two (2) rounds of review; the County, their Peer Reviewer, and Ascent together will provide a single set of consolidated, non-conflicting comments per their review period(s) listed here:*

- *County, Peer Reviewer, and Ascent review of Draft*
- *County, Peer Reviewer, and Ascent review of Final Draft*

TASK 6 – MEETINGS AND PROJECT TEAM COORDINATION

The Kittelson project manager will participate in up to 20 hours of project team coordination meetings (video conference) to support fulfillment of Tasks 2 – 5. On select occasions, other Kittelson staff will join project team coordination meetings, as appropriate for the purpose of fulfilling Tasks 2 – 5.

TASK 7 – PROJECT MANAGEMENT

Kittelson will utilize in-house resources to actively manage the project, including our internal project, budget, and schedule management systems. Kittelson will prepare monthly invoices with bullet point summaries of progress to keep the project team informed on our budget and schedule status and to highlight any modifications needed to address unexpected changes (such as alterations to the project description or site plan).

Deliverables: *Monthly invoices with bullet point summary of progress*

MEMORANDUM

REVIEW COMMENTS

Date: October 7, 2021

Project #: 26783

To: Natalie Porter, El Dorado County Department of Transportation
CC: Gina Hamilton, El Dorado County Planning and Building Department
Patrick Angell, Ascent Environmental, Inc.
Cori Resha, Ascent Environmental, Inc.

From: Amy Lopez, RSP; Joceline Suhaimi, Andrew McIntyre

Project: El Dorado Hills 52 Costco Commercial Center

Subject: Transportation Impact Study Scope of Work

AKT Investment, Inc. (AKT) and Costco Wholesale (Costco) together are proposing to jointly develop the El Dorado Hills (EDH) 52 Costco Commercial Center (project) in El Dorado County. This memorandum summarizes the scope of the transportation study to be prepared for the project. The scope includes the study area, trip generation, trip distribution, and analysis methodology to evaluate traffic operations on local and regional streets changes in relation to the County's General Plan Circulation Element level of service policies (Measure E and Y), as well as a vehicle-miles traveled (VMT) analysis based on the County's recently adopted VMT significance thresholds to evaluate environmental impacts pursuant to the California Environmental Quality Act (CEQA).

Kittelson & Associates, Inc. (Kittelson) developed this scope of work based on our review of the El Dorado County Community Development Agency's Transportation Impact Study Guidelines (TIS Guidelines), as approved in November 2014, and in coordination with Natalie Porter, Senior Traffic Civil Engineer with the County of El Dorado (County), as well as Ken Anderson of KD Anderson & Associates, Inc. (KDA).

PROJECT BACKGROUND

The El Dorado Hills (EDH) 52 Costco Commercial Center consists of two (2) separate commercial center sites (North Site and South Site) located north of U.S. 50 at the Silva Valley Parkway Interchange. These two commercial centers are being processed by El Dorado County as a single project for local land use entitlements and CEQA purposes. The North Site consists of 18.26 acres and would provide approximately 161,608 square feet (sf) of commercial uses, which would be split between 130,358 sf of self-storage building space and 30,250 sf of general commercial building space and would include approximately 173 parking stalls. The South Site is approximately 17.04 acres and would support a 155,693-square-foot Costco Warehouse with Tire Center and two levels of parking with up to 762 parking stalls.

Primary access to both sites is proposed via a new traffic signal on Silva Valley Parkway, situated approximately midway between the U.S. 50 westbound ramp and Clarksville Crossing. A second signal is proposed at the intersection of Silva Valley Parkway and ~~Clarksville Crossing/~~Country Club Drive. For the North Site, a second access is proposed on the planned Country Club Drive, and a third access is proposed on Tong Road. Two additional minor access points for the South Site are proposed along Clarksville Crossing.

The "second signal" should reflect the intersection of Country Club Dr and Silva Valley Pkwy. It is anticipated that Clarksville Crossing will no longer intersect with Silva Valley Pkwy.

Hours of operation for the Costco warehouse are expected to be approximately as follows:

- Monday – Friday: 10:00 AM – 8:30 PM
- Saturday: 9:30 AM – 7:00 PM
- Sunday: 10:00 AM – 6:00 PM

TASK 1 – PROJECT SCOPING

Kittelson's project manager and analyst, along with a representative from KDA, will meet with County staff to develop the scope of the transportation impact study (TIS) for the project. Kittelson will document the scope of work (contained herein) for review by the project proponents before submitting the scope of work to the County for review and confirmation.

The scope of work substantially mirrors the scope of the TIS report dated August 21, 2018 and prepared by KDA for a previously proposed development for the North and South Sites.

Deliverable: *Scope of work (contained herein)*

TASK 2 – DATA COLLECTION

County confirmed with Caltrans that this would be acceptable. Caltrans noted that the Bass Lake Ramps are not in PeMS.

Kittelson will access Caltrans Performance Measurement System (PeMS) traffic data during 2019 (before the COVID-19 pandemic shelter-in-place practices went into effect) for Caltrans facilities listed in Task 3. Kittelson will collect new traffic counts after Labor Day 2021 at intersections and on roadway segments for the study segments listed in Task 3. Kittelson will collect trip generation data at up to three exemplary Costco warehouses sites[1] (e.g., Elk Grove, Folsom, and Clovis) for use in estimating trip generation of the South Site under Task 3.

Kittelson has signed a confidentiality agreement with Costco, which permits Kittelson to utilize certain member-based data. Kittelson will request data regarding Costco members and their transactions at other Costco warehouses in the area, namely the Folsom Costco, to inform certain components of the analysis associated with the Costco warehouse and fuel station. Costco will scrub the data of identifying

[1] While the proposed Costco warehouse site does not include a fuel station, the trip generation data collected at the similar sites, which do have fuel stations, will provide a conservative basis for estimating trips for the TIS.

information to maintain privacy for its members prior to sharing with Kittelson. Summary trends and insights derived from the data will be presented in the traffic study; however, the raw data will not be shared with outside parties, such as the County, AKT, Ascent, or KDA out of respect for the confidentiality agreement requirements.

TASK 3 – TRAFFIC OPERATIONS ANALYSIS

Consistent with the County TIS Guidelines required under Measures E and Y, Kittelson will perform traffic operations analyses for selected intersections, roadway segments, and freeway ramp junctions. The following section outlines the analysis locations, methodology, and study scenarios.

Study Locations

Kittelson will analyze traffic operations on local and regional roadways, as described in this section and presented in Figure 1.

Intersections

Study intersections identified consistent with the 2018 TIS report by KDA are listed below. Pending further trip generation and distribution analysis, this list is subject to change.

1. Silva Valley Parkway/Harvard Way (signalized)
2. Silva Valley Parkway/Golden Eagle Lane (all-way stop controlled)
3. Silva Valley Parkway/Serrano Parkway (signalized)
4. Silva Valley Parkway/Entrada Lane (two-way stop controlled)
5. Silva Valley Parkway/Oak Meadow Elementary School (two-way stop controlled)
6. Silva Valley Parkway/Future Country Club Drive (two-way stop controlled; future signalized)
7. Silva Valley Parkway/Tong Road (side street stop controlled)
8. U.S. 50 Westbound Ramps/Silva Valley Parkway (signalized)
9. U.S. 50 Eastbound Ramps/Silva Valley Parkway (signalized)
10. White Rock Road/Clarksville Crossing-Old White Rock Road (signalized)
11. White Rock Road/Valley View Parkway-Vine Street (signalized)
12. White Rock Road/Post Street (signalized)
13. White Rock Road/Latrobe Road (signalized)
14. Bass Lake Road/Country Club Drive (signalized)
15. Silva Valley Parkway/Project Driveway (future intersection: signalized)
16. North Site access on Country Club Drive
17. North Site access on Tong Road
18. South Site north access on Clarksville Crossing
19. South Site south access on Clarksville Crossing
20. Serrano Pkwy/Future Country Club Drive (Future Conditions)

21. U.S. 50 Westbound Ramps/El Dorado Hills Blvd (Future Conditions)
22. U.S. 50 Eastbound Ramps/Latrobe Rd ramps (Future Conditions)
23. Bass Lake/Serrano Pkwy (Future Conditions)
24. U.S. 50 Westbound Ramps/Bass Lake Rd ramps (Future Conditions)
25. U.S. 50 Eastbound Ramps/Marble Valley Rd ramps (Future Conditions)

Roadway Segments

1. Silva Valley Parkway – U.S. 50 Westbound Ramps to Clarksville Crossing
2. Silva Valley Parkway – Future Country Club Drive to Serrano Parkway
3. White Rock Road – U.S. 50 Eastbound ramps to Clarksville Crossing
4. Clarksville Crossing – Future Country Club Drive to White Rock Road
5. U.S. 50 Westbound – Silva Valley Parkway to El Dorado Hills Boulevard
6. U.S. 50 Westbound – east of Silva Valley Parkway interchange
7. U.S. 50 Eastbound – El Dorado Hills Boulevard to Silva Valley Parkway
8. U.S. 50 Eastbound – east of Silva Valley Parkway interchange

Freeway Merge/Diverge Sections

1. U.S. 50 at Silva Valley Parkway – westbound on-ramp merge
2. U.S. 50 at Silva Valley Parkway – westbound off-ramp diverge
3. U.S. 50 at Silva Valley Parkway – eastbound on-ramp merge
4. U.S. 50 at Silva Valley Parkway – eastbound off-ramp diverge

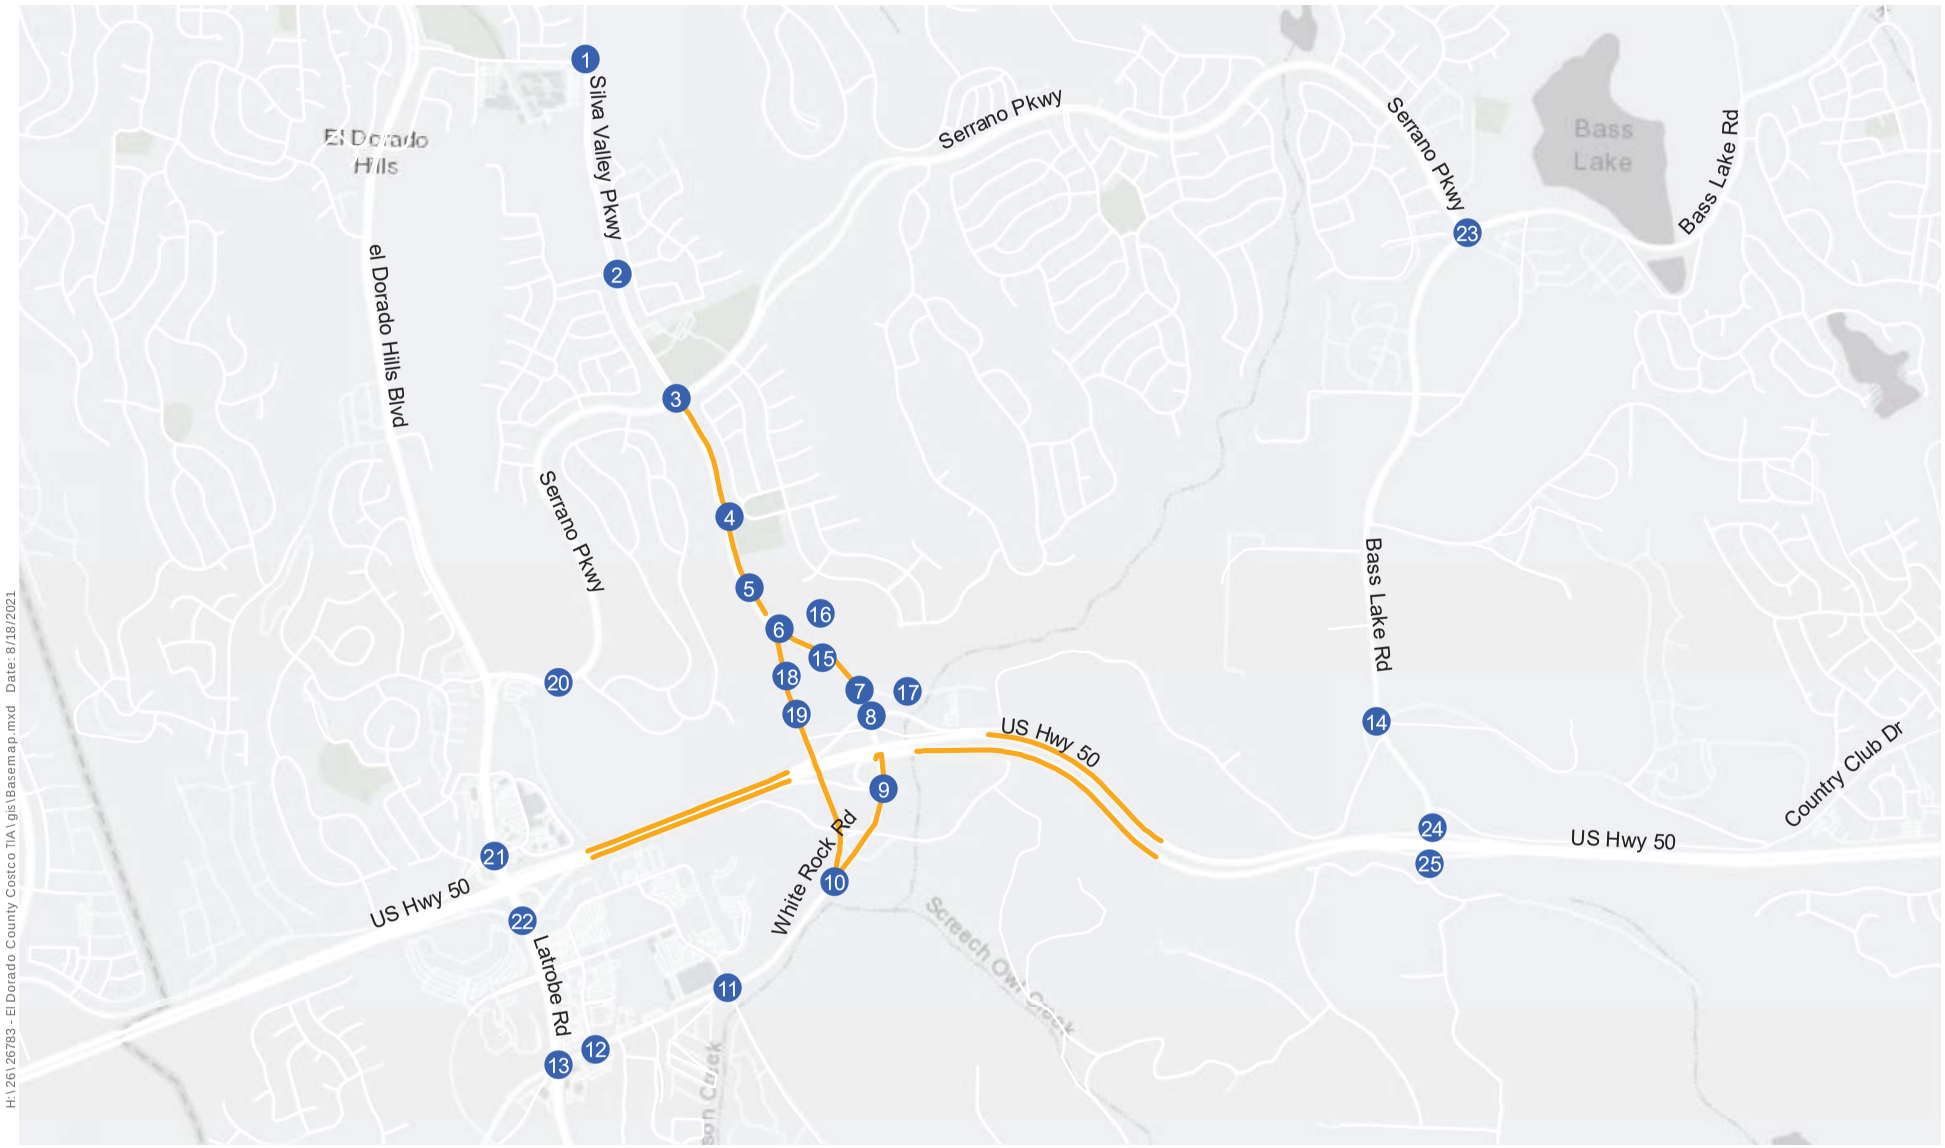

Figure 1

Study Intersections
El Dorado Hills, CA

KITTELSON & ASSOCIATES

Trip Generation

Kittelson will develop project weekday AM[2] and PM peak hour, weekday daily, and Saturday peak hour trip generation for the North Site and South Site using separate methodologies.

North Site. For the AKT development, Kittelson will estimate the trip generation of the AKT development using the 10th Edition of the Institute of Transportation Engineers (ITE) *Trip Generation Manual*. Kittelson will select the most appropriate ITE Land Use Codes to represent the uses planned for the North Site and will vet the selection with the County before continuing with the analysis.

South Site. Kittelson will use trip generation data from an exemplary Costco warehouse as well as warehouse transaction data in 2019 and 2021 to estimate use trip generation of the Costco warehouse and fuel station. Additionally, they will use data previously collected at Costco warehouses to develop trip characteristics (i.e., primary, pass-by, and diverted link trips).

- *Primary Trips* (an entirely new trip on the roadway system for the express purpose of driving to and from Costco),
- *Pass-by Trips* (existing trips that are on roadways adjacent to the site which allow the motorist to turn into the Costco development, and then continue on to their ultimate destination when their shopping is concluded), and
- *Diverted-Linked Trips* (existing trips on nearby roadways in which the motorist makes a decision to drive out-of-direction for a distance to stop at Costco, and when their shopping is concluded, continue on their trip to the ultimate destination).

While the ITE *Trip Generation Manual* does offer trip rates for a Discount Club land use (ITE Land Use Code 857), data collected at other Costco sites has demonstrated Costco warehouses typically generate higher traffic volumes than would be estimated using ITE rates.

Trip Generation Data

Kittelson will collect trip generation data as part of Task 2 to estimate trip generation for the South site. Table 1 summarizes average trip rates recorded at other Costco warehouse sites for reference purposes only. The table does not provide a weekday AM peak hour trip rate because the Costco warehouse is not open to members until 10:00 AM.

[2] Trip generation for the South Site (Costco) will not include a weekday AM peak hour trip generation estimate since the warehouse does not open to members until 10:00 a.m.

Table 1: Average Trip Characteristics for a Costco Warehouse with Gas Station

Land Use	Weekday Daily Trip Rate (per KSF)	Weekday PM Peak Hour of Adjacent Street Traffic Trip Rate (per KSF)			Saturday Midday Peak Hour (per KSF)		
		Total	In	Out	Total	In	Out
Costco Warehouse with Fuel Station	79.27	7.17	49%	51%	9.79	51%	49%
Primary Trips	*No Data*		*35.1%*			*50%*	
Pass-by Trips	*No Data*		*33.3%*			*29%*	
Diverted Trips	*No Data*		*31.5%*			*21%*	

Source: Kittelson & Associates, Inc., 2021

Trip generation studies were conducted at Costco Wholesale sites located across the western region of the United States using industry standard engineering practices consistent with guidance within the Institute of Transportation Engineers (ITE) standard reference, *Trip Generation Manual*, 10th *Edition*. These cordon surveys were conducted between 2001 and 2010 and include surveys of 22 Costco Warehouses with fuel centers in California, Oregon, Washington, Montana, Utah, and Colorado. The Costco Wholesale buildings surveyed range in size between 120,000 square-feet and 162,115 square-feet, with an average size of 143,782 square-feet. Trip generation rates are correlated to the overall warehouse size regardless of the number of fueling positions.

Trip Type Considerations

The previously surveyed Costco buildings are situated in a variety of locations, some adjacent to freeways/arterials, while others are located a couple of blocks away. This variation in warehouse locations results in differences in diverted and pass-by trips between locations. For example, sites adjacent to major arterial roadways tend to exhibit a high percentage of pass-by trips and a lower percentage of diverted trips. Similarly, Costco facilities located a block or two away from a freeway tend to experience a higher percentage of diverted trips. Given these factors, diverted and pass-by trips should be considered together with engineering judgment used to identify how these two trip characteristics should be applied.

Proper accounting of the diverted trips within the analysis models should include the impacts associated with these trips at the study area intersections. However, it should be noted that these trips do not create similar system capacity issues as new trips to the system because these trips generally provide no impact beyond the study area.

Trip Distribution

For the North Site, the trip distribution and assignment will be developed based on an analysis using the El Dorado County Travel Demand Model.

For the South Site, trip distribution will be developed based on Costco membership data. Two Costco Wholesale sites with fuel stations are currently located along Highway 50 in Folsom and Rancho Cordova. Based on Costco membership data and the existing Costco sites to the west, the market area served by the El Dorado County site is generally towards the east of the site.

> ***Task 3 Deliverable***: Technical memorandum summarizing project trip generation and distribution – *Draft, Final*
>
> ***Assumption:*** *Two (2) rounds of review; the County, their Peer Reviewer, and Ascent together will provide a single set of consolidated, non-conflicting comments per their review period(s) listed here:*
>
> - *County, Peer Reviewer, and Ascent review of Draft*
> - *County, Peer Reviewer, and Ascent review of Final Draft*

A Saturday mid-day peak analysis should be performed at the study intersections located along Silva Valley Pkwy, from Serrano Pkwy to the intersection of Clarksville Crossing and White Rock Rd.

Study Scenarios

The study will assess weekday AM and PM peak hour conditions at the study intersections. The analysis excludes trips made on weekends. The following analysis horizon periods are anticipated:

- Existing (Year 2021) Conditions
- Existing plus Project Conditions (three alternatives)
  - Existing plus North Site
  - Existing plus South Site
  - Existing plus Both Projects
- Future (Year 2030) Conditions
  - 2030 conditions established using straight line interpolation of County travel demand model 2035 traffic projections
  - Assumes new roadway connections, including Country Club Drive extension to the west and east of Silva Valley Parkway
- Future plus Project Conditions

There are two design alternatives being proposed. Refer to the following page for revisions made to the study intersection list for the existing and future scenarios listed.

For Future Conditions, the County will provide in writing any assumptions or adjustments Kittelson should make to the travel demand model (e.g., roadway connections not already coded in the model) to accurately represent reasonably foreseeable future roadway improvements and/or land uses.

The County intends for Country Club Drive to extend and connect to Serrano Pkwy in the future, and should be analyzed as such. Also, Clarksville Crossing will no longer intersect with Silva Valley Pkwy following construction of the new Country Club Dr intersection with Silva Valley Pkwy.

Kittelson will employ the methodologies discussed below to analyze traffic operations at intersections, along roadway segments, and at freeway ramp junctions (weaving analysis).

Existing Conditions:

1) Intersection 6 should be SVP at Clarksville Crossing (side street stop-controlled)

Alternative 1

Existing + Project Study Intersection Revisions

1) Intersection 6: SVP at Country Club Drive (signalized)
2) Intersection 15: SVP at new Project Driveway (signalized) - left turn for northbound traffic into south site only, no left turn for southbound traffic into north site. The driveway into north site at this intersection will be right in, right out only.

Future + Project Study Intersection Revisions:

Match revisions made to existing + project.

Alternative 2

Existing + Project Study Intersection Revisions:

1) Intersection 6: SVP at Clarksville Crossing (signalized, interim signal until Country Club Dr is constructed) right turn in, right turn out for southbound traffic, left turn in for northbound traffic, right turn only for eastbound Clarksville Crossing traffic (no left turn or through movement)
2) Intersection 15: SVP at Project Driveway (signalized)

Future + Project Study Intersection Revisions:

1) Intersection 6 SVP at Country Club Drive (signalized) Clarksville Crossing will no longer intersect with SVP.
2) Intersection 15 SVP at new Project Driveway (signalized), same as existing + project

Alternative 2 must include a simulation model of northbound and southbound SVP traffic crossing the Highway 50 interchange for both existing + project and future + project scenarios.

Intersections

Kittelson will use Synchro traffic analysis software version 10 for assessing signalized and unsignalized intersection performance using methodologies from the 6th Edition of the *Highway Capacity Manual (HCM)*. The traffic study of the proposed development will include an evaluation of level of service and control delay at the study intersections, as well as 95th percentile queuing for each of the proposed access points.

Roadways Segments

Roadway operations will be analyzed using methods presented in the 6th Edition HCM. The HCM provides guidance on developing level-of-service for different roadway types, including two-lane highways and multi-lane highway roadway segments.

Freeway Weaving Sections

Kittelson will analyze freeway weaving sections using methods presented in the 6th Edition HCM.

> ***Assumption:*** *Kittelson assumes KDA will provide traffic analysis files from the 2018 TIS by KDA to serve as a starting point for all analyses described in Task 3.*

TASK 4 – GENERAL TRANSPORTATION ASSESSMENT

This analysis will include a qualitative assessment of the following elements required by El Dorado County's *Transportation Impact Study Guidelines*:

- Emergency vehicle access
- Deliveries of goods and services
- On-Site Transportation Review
    - Existence of any current traffic problems in the local area such as a high-accident location, non-standard intersection or roadway, or an intersection in need of a traffic signal
    - Proximity of proposed site driveway(s) to other driveways or intersections
    - Adequacy of vehicle parking relative to both the anticipated demand and zoning code requirements
    - Adequacy of the project site design to fully satisfy truck loading demand on-site, when the anticipated number of deliveries and service calls may exceed 10 per day
    - Adequacy of the project site design to provide at least a 25' minimum required throat depth (MRTD) at project driveways, including calculation of the MRTD
    - Adequacy of the project site design to convey all vehicle types
    - Adequacy of sight distance on-site
    - Queuing analysis of "drive-through" facilities
- Complete street implementation, wherever possible

TASK 5 – CEQA ANALYSIS

Kittelson will prepare additional transportation analyses to address the CEQA Appendix G Checklist items for TRANSPORTATION/TRAFFIC consistent with the County's adopted VMT thresholds of significance in Resolution 141-2020:

Would the project:

a) Conflict with a program, plan, ordinance, or policy addressing the circulation system, including transit, roadway, bicycle and pedestrian facilities?
b) Conflict or be inconsistent with CEQA Guidelines section 15064.3, subdivision (b)?
c) Substantially increase hazards due to a geometric design feature (e.g., sharp curves or dangerous intersections) or incompatible uses (e.g., farm equipment)?
d) Result in inadequate emergency access?

Item (a) of the checklist refers to plans, which includes the County's General Plan. Per the TIS Guidelines, Kittelson will conduct a qualitative assessment of the proposed project for consistency with the following General Plan Circulation Element goals:

- Access to public transit services consistent with General Plan Circulation Element Goal TC-2:
  "To promote a safe and efficient transit system that provides service to all residents, including senior citizens, youths, the disabled, and those without access to automobiles that also helps to reduce congestion, and improves the environment."
- Transportation system management consistent with General Plan Circulation Element Goal TC-3:
  "To reduce travel demand on the County's road system and maximize the operating efficiency of transportation facilities, thereby reducing the quantity of motor vehicle emissions and the amount of investment required in new or expanded facilities."
- Non-Motorized Transportation consistent with General Plan Circulation Element Goal TC-4:
  "To provide a safe, continuous, and easily accessible non-motorized transportation system that facilitates the use of the viable alternative transportation modes."

Item (b) of the checklist centers on analysis of vehicle-miles traveled (VMT). As outlined in El Dorado County Resolution 141-2020 (and recommended by the Governor's Office of Planning and Research (OPR)), the significance threshold for identifying impacts resulting from retail projects is "no net increase" in VMT.[4]

Consistent with the County TIS Guidelines, Kittelson will work with the County to use the El Dorado County travel demand model to estimate VMT for the North Site. Because trip-making characteristics of Costco warehouses and fuel stations are not accurately reflected by the land uses in the County

[4] El Dorado County Resolution 141-2020

travel demand model, Kittelson will develop VMT for the South Site using member transaction data at nearby Costco warehouses (namely the Folsom Costco) to establish existing travel patterns and anticipated shifts in travel patterns by Costco members who would shop at the El Dorado Hills Costco warehouse if it were constructed. Kittelson will use these data to calculate the expected change in daily VMT within the County associated with the North and South Sites, and the total VMT attributable to the project.

The TIS will also include delay-based analysis required under Measures E and Y to document the results of the analysis described in Task 3; however, because traffic delay is not an environmental impact, the TIS will state clearly this information will not be used in any transportation impact determination for CEQA purposes.

If the TIS identifies any significant impacts, it will propose mitigation measures to reduce the severity of the identified impacts to the extent feasible. In addition, the TIS will identify any transportation improvements required based on the results of the analysis described in Task 3 so that Ascent can analyze the environmental effects that would result from construction of the identified improvements.

Alternatives Analysis

Kittelson will prepare a qualitative assessment of up to two project alternatives and document their anticipated effects on the transportation system in El Dorado County.

Task 3 – 5 Deliverables: *TIS Report – Draft, Final Draft, Final*

Assumption: *Two (2) rounds of review; the County, their Peer Reviewer, and Ascent together will provide a single set of consolidated, non-conflicting comments per their review period(s) listed here:*

- *County, Peer Reviewer, and Ascent review of Draft*
- *County, Peer Reviewer, and Ascent review of Final Draft*

TASK 6 – MEETINGS AND PROJECT TEAM COORDINATION

The Kittelson project manager will participate in up to 20 hours of project team coordination meetings (video conference) to support fulfillment of Tasks 2 – 5. On select occasions, other Kittelson staff will join project team coordination meetings, as appropriate for the purpose of fulfilling Tasks 2 – 5.

TASK 7 – PROJECT MANAGEMENT

Kittelson will utilize in-house resources to actively manage the project, including our internal project, budget, and schedule management systems. Kittelson will prepare monthly invoices with bullet point summaries of progress to keep the project team informed on our budget and schedule status and to highlight any modifications needed to address unexpected changes (such as alterations to the project description or site plan).

Deliverables: *Monthly invoices with bullet point summary of progress*

Project for Review & Comment - PD15-0001/Z17-0004/P17-0007/CUP-R21-0024/LLA21-0009 - EDH 52 COMMERCIAL CENTER

Amy Phillips <amy.phillips@edcgov.us> Fri, Sep 3, 2021 at 4:19 PM
To: Gina Hamilton <gina.hamilton@edcgov.us>

Hi Gina,

The County is subject to the State of CA Phase II MS4 Permit and thus the County's post construction water quality requirements follow those outlined in that Permit in Section E.12. Projects typically qualify as a "Regulated" project under the MS4 Permit / West Slope Development and Redevelopment Standards and Post Construction Stormwater Plan Requirements if improvements (i.e., parking lots, rooftops, driveways, etc.) create or replace 5,000 sf or more of impervious surface. Regulated Projects are required to provide treatment of stormwater from the 85th percentile/24-hour storm event prior to the water leaving the site or entering a waterbody. Submittal requirements for Regulated projects are provided here.

An Erosion and Sediment Control Plan will need to be included in the plan submittal. If the project will disturb an acre or more of land, the Legally Responsible Person (LRP) is required to obtain Construction General Permit (CGP) coverage through the State Water Resources Control Board. The CGP requires the development and implementation of a Storm Water Pollution Prevention Plan (SWPPP). CGP requirements can be found at the following link: https://www.waterboards.ca.gov/water_issues/programs/stormwater/construction.html

Thank you,

INTEROFFICE MEMORANDUM

TO: **GINA HAMILTON**, Project Planner
EDC Development Services Division

FROM: Environmental Management

SUBJECT: PD15-0001 EDC52 COMMERCIAL CENTER

DATE: 10/3/2021

CC:

Environmental Management Department staff has reviewed the subject application. The following reflects our concerns and requirements:

Environmental Health (Bryan Vyverberg x5924):

This project will be served by public water and sewer. Facilities that prepare food and create fats, oils, and grease are part of this project. Please coordinate grease interceptor sizing requirements with the El Dorado Irrigation District.

Food facilities planned for the EDC52 Commercial Center are required to be constructed and operated to the standards of the California Retail Food Code. Each facility that will sell food at the retail level is required to submit plans to this Department for review and approval prior to construction. Once constructed, an annual health permit will be required for these facilities before they begin operating.

Hazardous Materials (Mark Moss x6665):

Solid Waste Division (Timothy Engle x6587):

Construction and Demolition (C&D) Debris Recycling
State Law mandates that a minimum of 65% of the waste materials generated from covered Construction and Demolition projects must be diverted from being landfilled by being recycled or reused on site. Please visit the following website to view El Dorado County's Construction & Demolition Debris Recycling Ordinance Program information and requirements. If after reviewing this information you still have questions, you're welcome to call Environmental Management at (530) 621-5300.

AB 341 - Mandatory Commercial Recycling (Non-Residential)
State law requires that all non-residential dwellings that generate at least two cubic yards of solid waste per week to have a recycling program for common recyclable materials such as bottles, cans, and paper

AB 1826 - Mandatory Commercial Organics Recycling (Non-Residential)
State law requires that all non-residential dwellings that generate at least two cubic yards of solid waste per week to have an organics recycling program for the following types of organic wastes: green waste, landscape, and pruning waste, non-hazardous wood waste, food waste

Trash and Recycling Enclosures: CalGreen Section 5.410.1
Recycling by occupants requires that new projects provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive. Please direct questions about this provision to Building Services. Building Services can be reached at (530) 621-5315

Trash and Recycling Enclosures: CalGreen Section 5.410.1

Subject: AQMD Comments for a Planned Development Permit, a Rezone, a Tentative Parcel Map, Conditional Use Permit Revision and a Lot Line Adjustment for the proposed El Dorado Hills (EDH) 52 Commercial Center (Application Planned Development Permit PD15-0001, Rezone Z17-0004, Conditional Use Permit CUP-R21-0024, Tentative Parcel Map P17-0007, Lot Line Adjustment LLA21-0009)

Dear Ms. Hamilton:

The El Dorado County Air Quality Management District (AQMD) has reviewed the proposed project for a Planned Development Permit, a Rezone, a Tentative Parcel Map, a Conditional Use Permit Revision and a Lot Line Adjustment for the development of EDH 52 Commercial Center project. The proposed project will have approximately 318,000 square feet of commercial/retail development on both sides of Silva Valley Parkway, approximately 100 feet north of Highway 50. The property, identified by Assessor's Parcel Numbers 122-720-002, 122-720-003, 122-720-018, 122-720-019, 122-720-020, and 122-720-021, consists of 41.87 acres, and is located on the east side of old Silva Valley Road, north of the intersection with Tong Road, in the El Dorado Hills area. Based on the AQMD's review of the proposed project, the AQMD concluded the 318,000 square feet of commercial and retail development will be above the size of projects identified in the AQMD Guide to Air Quality Assessment for determining Significance of Air Quality Impacts under the California Environmental Quality Act, and it is expected to cause a significant air quality impact and has the following comments regarding potential air quality impacts.

Air Quality/GHG Analysis Required:

The western portion of El Dorado County (where the project is located) is in non-attainment of the state Ambient Air Quality Standards (AAQS) for Particulate Matter 10 micrometers (PM10), and the federal AAQS for PM2.5 (2.5 micrometers) in size. Additionally, the western portion of the County is in non-attainment of both the 1-hour and 8-hour state AAQS for ozone, and of the 8-hour federal AAQS for ozone. The two ozone precursor pollutants most responsible for ozone generated by this project are Volatile Organic Compounds (VOC, also known as Reactive Organic Gases or ROG) and Nitrogen Oxides (NOx).

An Air Quality and Greenhouse Gas (GHG) Analysis is required for adequate environmental review of the proposed project. AQMD recommends the use of the latest version of the California Emissions Estimator Model (CalEEMod), which can be downloaded for free at www.caleemod.com. This will compute mass emissions of criteria pollutants (NOx, ROG, SOx, PM & CO) and GHG (in CO2 equivalents) from both construction and operation of the project. Someone knowledgeable in all aspects of the project, such as construction phasing, materials usage, etc., should run the model and modify the defaults as appropriate, assuring that notes are included about any changes to defaults as the program requires.

AQMD's Guide to Air Quality Assessment: Determining Significance of Air Quality Impacts under the California Environmental Quality Act, February 2002 ("CEQA Guide") should be used to assess criteria pollutant emissions impacts and can be found here:
https://www.edcgov.us/Government/AirQualityManagement/pages/Guide_to_Air_Quality_Assessment.aspx

Additionally, the following standard conditions apply to the proposed project:

- Asbestos Dust: Current county records indicate the portions of the subject property are located within the Naturally Occurring Asbestos Review Area. An Asbestos Dust Mitigation Plan (ADMP) Application with applicable fees shall be submitted to and approved by the AQMD prior to project construction if the project moves more than 20 cubic yards of soil, pursuant to AQMD Rule 223.2, Fugitive Dust – Asbestos Hazard Mitigation. Mitigation measures for the control of fugitive dust shall comply with the requirements of Rule 223, Fugitive Dust – General Requirements, and Rule 223.2 Fugitive Dust – Asbestos Hazard Mitigation.

- Paving: Project construction and related paving shall adhere to AQMD Rule 224, Cutback and Emulsified Asphalt Paving Materials if applicable.

- Painting/Coating: The project construction will involve the application of architectural coatings, which shall adhere to AQMD Rule 215, Architectural Coatings.

- Open Burning: Burning of wastes that result from "Land Development Clearing" must be permitted through the AQMD. Only dry vegetative waste materials originating from the property may be disposed of using an open outdoor fire. Burning shall adhere to AQMD Rule 300, Open Burning.

- Construction Emissions: During construction, all self-propelled diesel-fueled engines greater than 25 horsepower shall be in compliance with the California Air Resources Board (CARB) Regulation for In-Use Off-Road Diesel Fueled Fleets (§ 2449 et al, title 13, article 4.8, chapter 9, California Code of Regulations (CCR)). The full text of the regulation can be found at CARB's website here: https://ww2.arb.ca.gov/our-work/topics/construction-earthmoving-equipment Questions on applicability should be directed to CARB at 1.866.634.3735. CARB is responsible for enforcement of this regulation.

- Portable Equipment: All portable combustion engine equipment with a rating of 50 horsepower or greater shall be registered with CARB. A copy of the current portable equipment registration shall be with said equipment. The applicant shall provide a complete list of heavy-duty diesel-fueled equipment to be used on this project, which includes the make, model, year of equipment, and daily hours of operations of each piece of equipment.

- New Point or Stationary Source: Prior to construction/installation of any new point/stationary source emissions units (e.g., emergency standby engine greater than 50 HP, etc.), Authority to Construct applications shall be submitted to the AQMD. Submittal of applications shall include facility diagram(s), equipment specifications and emissions estimates, and shall adhere to AQMD Rules 501, General Permit Requirements and 523, New Source Review.

- Electric Vehicle Charging – Non-Residential: The project shall comply with the Non-Residential Mandatory Measures identified in the 2019 Cal Green Building Code §5.106.5.3 concerning installation

of electric vehicle supply equipment (EVSE). Plans shall include; the location(s) and type of EVSE, a listed raceway capable of accommodating a 208/240-volt dedicated branch circuit originating at a service panel with sufficient capacity to accommodate a minimum 40A dedicated circuit, and terminating in a suitable enclosure in close proximity to the proposed location of the charging equipment. Plans, specifications and electrical calculations shall show the electrical system has sufficient capacity to simultaneously charge all required electric vehicles at their full rated amperage. Raceways shall be installed from the electrical service panel to the designated parking areas at the time of initial construction. Please refer to Cal Green Building Stds Code §5.106.5.3 for specific requirements[1]: https://www.edcgov.us/Government/building/pages/california_building_standards_in_effect.aspx

AQMD Rules and Regulations are available at the following CARB's webpage: https://ww2.arb.ca.gov/current-air-district-rules?frm=/app/www/outside/drdb/ed

Thank you for the opportunity to comment on this proposed project. If you have any questions regarding this letter, please contact me at 530.621.7509.

Respectfully,

Rania Serieh
Sr. Air Quality Engineer
Air Quality Management District

COUNTY OF EL DORADO
OFFICE of COUNTY SURVEYOR

MEMO

DATE: October 8, 2021

TO: Gina Hamilton, Project Planner

FROM: Brian Frazier - Phone (530) 621-5325 brian.frazier@edcgov.us

SUBJECT: PD15-0001/P17-0007 - EDH 52 COMMERCIAL CENTER (RSC Engineering, Inc./EDH 52 GP)

We have looked over the application and have the following comments.

1) All survey monuments must be set prior to filing the Parcel Map.

2) The roads serving the development shall be named by filing a Road Name Petition, with the County Surveyors Office. Proof of any signage required by the Surveyor's Office must be provided to our office prior to filing the Parcel Map.

3) Situs addressing for the project shall be coordinated with the County Surveyors Office prior to filing the Parcel Map.

4) Prior to filing the Parcel Map, a letter will be required from all agencies that have placed conditions on the map. The letter will state that **"all conditions placed on P17-0007 by (that agency) have been satisfied."** The letters are to be compiled and sent to the County Surveyor.

5) All boundary monuments disturbed during project construction shall be reset by a Professional Land Surveyor or Qualified Engineer as defined by Section 8771 of the California Business and Professions Code (Land Surveyors Act).

RE: EDH 52 COMMERCIAL CENTER – PD15-0001 / Z17-0004 / P17-0007 / CUP-R21-0024 / LLA21-0009 (RSC Engineering, Inc. / EDH 52 GP)

Dear Ms. Hamilton:

Thank you for the opportunity to review and provide comments on the EDH 52 Commercial Center. LAFCO's State mandated role is to promote orderly growth and development and to encourage efficient service areas for local service providers. To that end, LAFCO has reviewed the information relating to this project and would like to comment on the proposed development and necessary future services.

APNs 122-720-018, 122-720-019, 122-720-020, and 122-720-021 are not within the boundaries of the El Dorado Irrigation District (EID) nor the El Dorado Hills County Water District (EDH Fire). These parcels will require annexation into these districts prior to receiving water and sewer services from EID, or fire protection and emergency medical services from EDH Fire. APNs 122-720-002 and 122-720-003 do appear to be within the EID and EDH Fire boundaries and will not require any LAFCO action.

LAFCO requests that annexation into EID and EDH Fire be included as required conditions of approval for this project. Annexation would occur after the County's approval process; please ensure the applicant is aware of this future requirement and advise the applicant to contact LAFCO staff near the end of the County's approval process to schedule a pre-application meeting. LAFCO may also request additional roadway parcels be included in the annexation application, to result in more orderly local government boundaries.

Since the above project will require LAFCO involvement for future boundary changes, and LAFCO will also require an environmental review for the application, it is in the best interest of the applicant and all involved parties if one CEQA document is prepared that covers all of the necessary processes. LAFCO respectfully requests that the project description include annexation into EID for water and wastewater services, and annexation into EDH Fire for fire

COMMISSIONERS
Public Member: Michael Powell • Alternate Public Member: Vacant
City Members: Cody Bass, Jackie Neau • Alternate City Member: Patricia "Patty" Borelli
County Members: John Hidahl, Wendy Thomas • Alternate County Member: George Turnboo
Special District Members: Brian Veerkamp, Vacant • Alternate Special District Member: Michael Saunders
STAFF
Erica Sanchez, Assistant Executive Officer • Kelly Witt, Administrative Assistant
Malathy Subramanian, Commission Counsel

protection and emergency medical services, and that the Initial Study and subsequent environmental document include the following:

Water Supply, Pumping and Treatment Facilities: A detailed analysis of all existing and planned on-site and off-site water facilities required for this project. A discussion of the potential water supply impacts that may occur as a result of the project, including how much water would be required to adequately serve this project, whether that water is currently projected to be available, the existing infrastructure that will be used to deliver service; the location, size and capacity of existing infrastructure, and how this water requirement will affect the overall water supply for the service area. The same scope of discussion should occur in regards to local pumping and treatment facilities: the location and size of the existing infrastructure of the nearest water treatment facility; whether it has the capacity to serve the proposed project; or whether additional infrastructure will be required for pumping the water to the project site.

Water Quality / Wastewater Treatment Issues: A detailed analysis of all existing and planned on-site and off-site sewer facilities required for this project. The same scope of discussion and analysis for water issues should also be included for sewer treatment issues.

Fire and Emergency Medical Services: The proposed project's impact on fire and emergency services, including a discussion on the impacts on existing facilities and financial implications to EDH Fire. In addition, please include the location(s) of the nearest staffed fire station(s) and estimated response time, and any existing or planned fire hydrants that will be used to deliver water to the project area.

In addition, please continue to ensure that LAFCO is on the distribution list for any project notices, hearings, or decisions as this project moves through the County's approval process. Once again, we thank you for giving LAFCO the opportunity to comment and we look forward to receiving additional materials in the future.

I can be contacted at (530) 295-2707 if you have any questions.

Sincerely,

Erica Sanchez
LAFCO Interim Executive Officer

Project for Review & Comment - PD15-0001/Z17-0004/P17-0007/CUP-R21-0024/LLA21-0009 - EDH 52 COMMERCIAL CENTER

Brink, Mike <mbrink@eid.org> Tue, Sep 21, 2021 at 2:04 PM
To: Gina Hamilton <gina.hamilton@edcgov.us>

Gina –

A ached is the most current FIL dated December 6, 2018. As noted in the first paragraph, this FIL is valid for 3 years. We are a long ways away from Improvement Plans. It might be advisable for the applicant to get an updated FIL for the EIR so all the numbers/water availability values are more current.

The property will need to be annexed into EID's service area. To do that, LAFCO will need a cer fied EIR. Once the LAFCO Commission condi onally approves the annexa on, it then will be considered by the EID's Board. Assuming they approve it, it then must be approved by the USBR. That is a linear process. When we met with AKT on this a few years ago they were going to reach out to the USBR to see if they could do some reviews in parallel. I never heard the outcome of that.

Once annexa on is complete EID can accept plans for review. Depending on workload we may be able to review plans in parallel with the annexa on process. Other projects, that are annexed, will have priority for review. Plans cannot be approved un l the annexa on is fully approved by all agencies.

Please let me know if any ques ons.

Mike Brink, PE

EID Supervising Engineer

Subject: Revised Review Comments on the Transportation Impact Study Scope of Work for the El Dorado Hills 52 Commercial Center

---

The County received the latest draft Transportation Impact Study Scope of Work (Scope) for the El Dorado Hills 52 Commercial Center project on October 7, 2021. We have reviewed the Scope and have provided minor comments listed below. Comments have also been added to the Scope in the accompanying attachment.

Scope Comments:

- Project Background
  - On page 2, the description of the "second signal" should be revised to reflect the intersection of the new Country Club Drive and Silva Valley Parkway. It is anticipated that Clarksville Crossing will no longer intersect with Silva Valley Parkway.
- Task 2 - Data collection:
  - On page 2, Kittelson is proposing to use Caltrans data from pre-pandemic 2019 for the Caltrans facilities outlined in the analysis sections. We discussed this with Caltrans, and they find it acceptable. Caltrans did note that the Bass Lake Rd ramps are not in the PeMS.
- Task 3 – Traffic Operations Analysis
  - On page 3, you are missing the Intersection of Silva Valley Parkway/Clarksville Crossing (existing conditions only – side street stop controlled)
  - On page 3, Intersection #15 (Silva Valley Parkway/Project Driveway) should be analyzed for both signalized and unsignalized operations

- On page 4, Road Segment #1 – the limits should be U.S. 50 Westbound Ramps to Future Country Club Drive.
- Study Scenarios on page 8: Per comments sent on a previous version of the draft Scope, a Saturday analysis should also be performed. The draft as written states, "The analysis excludes trips made on weekends." Per 10/21 phone conversation, traffic counts for Saturday mid-day peak analysis should be collected at the following locations:

    1. Silva Valley Parkway at Serrano Parkway
    2. Silva Valley Parkway at Entrada Drive
    3. Silva Valley Parkway at Clarksville Crossing
    4. Silva Valley Parkway at the westbound US Hwy 50 ramps
    5. Silva Valley Parkway at the eastbound US Hwy 50 ramps
    6. Clarksville Crossing at White Rock Road

    Additionally, the future scenario should also include a Saturday mid-day peak analysis for the future intersection of Silva Valley Parkway and Country Club Drive.

- Study Scenarios on page 8: Kittelson asked for written assumptions for adjustments to the Travel Demand Model to accurately represent foreseeable roadway improvements. The following two assumptions should be accounted for during analysis:

    1. As part of the General Plan, Country Club Drive will extend beyond the project to the west, and connect to Serrano Parkway. As of this review, this segment of Country Club Drive is included in the 20 year CIP.
    2. The intersection of Silva Valley Parkway and Clarksville Crossing will be replaced by the intersection of Silva Valley Parkway and Country Club Drive slightly to the north. Clarksville Crossing will terminate into a cul-de-sac at its northern end.

Attached: Draft Transportation Impact Study Scope of Work with County Comments Included

El Dorado Hills Community Council

***2021 Leadership Team*:** Jon Vegna, Richard Ross, Mike Lilienthal, Glenn Krakow, Sita Burgess, John Davey and Cindy Munt

AGENDA: Monday, November 1st, 2021 @ **5:00 PM**

Held in person at EDH Fire Station 85, 1050 Wilson Blvd.

For those who would like to attend virtually, go to https://us06web.zoom.us/j/97259116041

To call in, 530-621-7603 or 530-621-7610. The Meeting ID is 972 5911 6041

By participating in this meeting, you acknowledge that you are being recorded.

1. **Call to Order - Leadership Team Roll Call and recognition of District 1 Commissioners and Committee members present**

2. **Adoption of regular meeting Agenda**

3. **Public Comment**

4. **Guest Speaker: Rob Peters, EDC Deputy Director of Planning will describe the pros and cons of Planned Development (PD) projects per the County Zoning Ordinance**

5. **Supervisor Communications**

- Karen Purtich and Jan Robbins-Friends of the EDH Library will describe their Annual Campaign which starts November 1st
- EDH Redistricting- City Based Alternative selected unanimously by the BOS as being the baseline for additional alternative maps that better accommodate not splitting up significant Communities of interest (i.e. Serrano Village, Cameron Park, Pollock Pines). The next redistricting meeting is Weds. November 3rd from 9 AM to noon.
- Town and Country Village J-6 (Conceptual) presentation to the BOS was well received with significant support, while recognizing the Traffic/circulation and Air Quality issues that will need to be mitigated.
- Special BOS meeting scheduled for Tuesday November 2nd to primarily address the Caldor Fire Relief planning, and will include the initial discussion of the Federal-American Rescue Plan Act (ARPA) funding distributions.

6. **Leadership Team Progress Reports (~3 to 5 minutes each)**

- Public Safety - Sheriff's report, CHP report and EDH Fire report

- Economic Development- Community and Economic Development Advisory Committee report
- Infrastructure- EDH52/Costco/Country Club Drive-Traffic/Circulation preliminary planning
- Good Governance- CAL-OES appeal letter to FEMA for Caldor Fire Individual Assistance and supporting letters from Senators Feinstein and Padilla
- Healthy Communities- November 8th Special Community Council Meeting on Mental Illness and related County Services
- APAC – November 10th meeting agenda topics
- Community Information and Outreach

7. Council Member Items

- Next meeting is Monday December 6th, 2021
- Next month's Guest Speaker- Irene Muzio and Wendi-Mae Davis from the Assistance League of the Sierra Foothills

8. Adjournment

Courtesy Notice: Anyone wishing to record any segment of a CC meeting shall express their intent to do so before they start recording.

Questions regarding this agenda should be addressed to Supervisor John Hidahl @ (530) 621-5650
Email: Bosone@edcgov.us

Subject: CUP-R21-0024 EDH52 Self-Storage and RV Storage Outstanding Application Materials Request

---

The following list is inclusive of outstanding application materials for the Conditional Use Permit CUP-R21-0024 only. No other permits associated with the EDH52 project are discussed within this letter.

The County is in need of an expanded project description to include the following information:

- The square footage ranges for proposed storage units, if possible
- A clarification of what stored items will be allowed within the outdoor parking area on site (ex. RV's, boats, tractors)
- Expected activities allowed on site
- Hours of operation, including 24-hour access
- Number of employees working on site
- Number of employees living in caretaker unit
- Justification of the necessity for the caretaker unit
- Odor impacts
- Proposed drive aisle surfacing for both the self-storage and RV/outdoor storage areas (pavement, gravel, etc)
- Proposed outdoor lighting to be used, if not provided on a preliminary outdoor lighting plan sheet.

Additionally, the county is in need of more project site plan sheets including the following:

- A preliminary outdoor lighting plan along with a photometric study as outlined in item number 14 of the site plan requirements on page 8 of the CUP application form
- A plan sheet denoting the interior floor plans for the proposed caretaker unit. Alternatively, an updated project description which includes the proposed number of bedrooms/bathrooms and total square feet of proposed living space.

Kind regards,
Matt Aselage
Matthew Aselage
Assistant Planner

3.3 ARCHAEOLOGICAL, HISTORICAL, AND TRIBAL CULTURAL RESOURCES

This section analyzes and evaluates the potential impacts of the project on known and unknown cultural resources. Cultural resources include districts, sites, buildings, structures, or objects generally older than 50 years and considered to be important to a culture, subculture, or community for scientific, traditional, religious, or other reasons. They include pre-historic resources, historic-period resources, and "tribal cultural resources" (the latter as defined by Assembly Bill (AB) 52, Statutes of 2014, in Public Resources Code [PRC] Section 21074).

Archaeological resources are locations where human activity has measurably altered the earth or left deposits of prehistoric or historic-period physical remains (e.g., stone tools, bottles, former roads, house foundations). Historical (or built-environment) resources include standing buildings (e.g., houses, barns, outbuildings, cabins) and intact structures (e.g., dams, bridges, roads, districts), or landscapes. A cultural landscape is defined as a geographic area (including both cultural and natural resources and the wildlife therein), associated with a historic event, activity, or person or exhibiting other cultural or aesthetic values. Tribal cultural resources are sites, features, places, cultural landscapes, sacred places and objects, with cultural value to a tribe.

One comment letter regarding cultural resources was received in response to the Notice of Preparation (see Appendix A). The Native American Heritage Commission (NAHC) requested AB 52 and SB 18 compliance information; SB 18 does not apply to the project because there is no General Plan amendment associated with the project. AB 52 compliance is described below.

3.3.1 Regulatory Setting

FEDERAL

National Register of Historic Places

The National Register of Historic Places (NRHP) is the nation's master inventory of known historic properties. It is administered by the National Park Service and includes listings of buildings, structures, sites, objects, and districts that possess historic, architectural, engineering, archaeological, or cultural significance at the national, state, or local level.

The formal criteria (36 CFR 60.4) for determining NRHP eligibility are as follows:

1. The property is at least 50 years old (however, properties under 50 years of age that are of exceptional importance or are contributors to a district can also be included in the NRHP);
2. It retains integrity of location, design, setting, materials, workmanship, feeling, and associations; and
3. It possesses at least one of the following characteristics:

   Criterion A Is associated with events that have made a significant contribution to the broad patterns of history (events).

   Criterion B Is associated with the lives of persons significant in the past (persons).

   Criterion C Embodies the distinctive characteristics of a type, period, or method of construction, or represents the work of a master, or possesses high artistic values, or represents a significant, distinguishable entity whose components may lack individual distinction (architecture).

   Criterion D Has yielded, or may be likely to yield, information important in prehistory or history (information potential).

For a property to retain and convey historic integrity it must possess most of the seven aspects of integrity: location, design, setting, materials, workmanship, feeling, and association. Location is the place where the historic property was constructed or the place where a historic event occurred. Integrity of location refers to whether the property has been moved since its construction. Design is the combination of elements that create the form, plan, space, structure, and style of a property. Setting is the physical environment of a historic property that illustrates the character of the place. Materials are the physical elements that were combined or deposited during a particular period of time and in a particular pattern or configuration to form a historic property. Workmanship is the physical evidence of the crafts of a particular culture or people during any given period in history or prehistory. Feeling is a property's expression of the aesthetic or historic sense of a particular period of time. This is an intangible quality evoked by physical features that reflect a sense of a past time and place. Association is the direct link between the important historic event or person and a historic property. Continuation of historic use and occupation help maintain integrity of association.

Listing in the NRHP does not entail specific protection or assistance for a property but it does guarantee consideration in planning for federal or federally-assisted projects, eligibility for federal tax benefits, and qualification for federal historic preservation assistance. Additionally, project effects on properties listed in the NRHP must be evaluated under CEQA.

The National Register Bulletin series was developed to assist evaluators in the application of NRHP criteria. For example, National Register Bulletin #36 provides guidance in the evaluation of archaeological site significance. If a property cannot be placed within a particular theme or time period, and thereby lacks "focus," it will be unlikely to possess characteristics which would make it eligible for listing in the NRHP. Evaluation standards for linear features (such as roads, trails, fence lines, railroads, ditches, and flumes) are considered in terms of four related criteria that account for specific elements that define engineering and construction methods of linear features: (1) size and length, (2) presence of distinctive engineering features and associated properties, (3) structural integrity, and (4) setting. The highest probability for NRHP eligibility exists in the intact, longer segments, where multiple criteria coincide.

STATE

California Register of Historical Resources

All properties in California that are listed in or formally determined eligible for listing in the NRHP are also listed in the California Register of Historical Resources (CRHR). The CRHR is a listing of State of California resources that are significant in the context of California's history. It is a Statewide program with a scope and with criteria for inclusion similar to those used for the NRHP. In addition, properties designated under municipal or county ordinances are also eligible for listing in the CRHR.

A historical resource must be significant at the local, state, or national level under one or more of the criteria defined in the California Code of Regulations Title 15, Chapter 11.5, Section 4850 to be included in the CRHR. The CRHR criteria are tied to CEQA because any resource that meets the criteria below is considered a significant historical resource under CEQA. As noted above, all resources listed in or formally determined eligible for listing in the NRHP are automatically listed in the CRHR.

The CRHR uses four evaluation criteria:

Criterion 1. Is associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States.

Criterion 2. Is associated with the lives of persons important to local, California, or national history.

Criterion 3. Embodies the distinctive characteristics of a type, period, region, or method of construction; represents the work of a master; or possesses high artistic values.

Criterion 4. Has yielded, or has the potential to yield, information important to the prehistory or history of the local area, California or the nation.

Similar to the NRHP, a historical resource must meet one of the above criteria and retain integrity to be listed in the CRHR. The CRHR uses the same seven aspects of integrity used by the NRHP.

California Environmental Quality Act

CEQA requires public agencies to consider the effects of their actions on "historical resources," "unique archaeological resources," and "tribal cultural resources." Pursuant to PRC Section 21084.1, a "project that may cause a substantial adverse change in the significance of an historical resource is a project that may have a significant effect on the environment." Section 21083.2 requires agencies to determine whether projects would have effects on unique archaeological resources. PRC Section 21084.2 establishes that "[a] project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment."

Historical Resources

"Historical resource" is a term with a defined statutory meaning (PRC Section 21084.1; State CEQA Guidelines Sections 15064.5[a] and [b]). Under State CEQA Guidelines Section 15064.5(a), historical resources include the following:

1) A resource listed in, or determined to be eligible by the State Historical Resources Commission for listing in, the CRHR (PRC Section 5024.1).

2) A resource included in a local register of historical resources, as defined in PRC Section 5020.1(k) or identified as significant in a historical resource survey meeting the requirements of PRC Section 5024.1(g), will be presumed to be historically or culturally significant. Public agencies must treat any such resource as significant unless the preponderance of evidence demonstrates that it is not historically or culturally significant.

3) Any object, building, structure, site, area, place, record, or manuscript that a lead agency determines to be historically significant or significant in the architectural, engineering, scientific, economic, agricultural, educational, social, political, military, or cultural annals of California may be considered to be a historical resource, provided the lead agency's determination is supported by substantial evidence in light of the whole record. Generally, a resource will be considered by the lead agency to be historically significant if the resource meets the criteria for listing in the CRHR (PRC Section 5024.1).

4) The fact that a resource is not listed in or determined to be eligible for listing in the CRHR, not included in a local register of historical resources (pursuant to PRC Section 5020.1[k]), or identified in a historical resources survey (meeting the criteria in PRC Section 5024.1[g]) does not preclude a lead agency from determining that the resource may be a historical resource as defined in PRC Sections 5020.1(j) or 5024.1.

Unique Archaeological Resources

CEQA also requires lead agencies to consider whether projects will affect unique archaeological resources. PRC Section 21083.2(g) states that "unique archaeological resource" means an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets one or more of the following criteria:

1. Contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information.
2. Has a special and particular quality such as being the oldest of its type or the best available example of its type.
3. Is directly associated with a scientifically recognized important prehistoric or historic event or person.

Tribal Cultural Resources

CEQA also requires lead agencies to consider whether projects will affect tribal cultural resources. PRC Section 21074 states:

a) "Tribal cultural resources" are either of the following:

1) Sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe that are either of the following:

   A) Included or determined to be eligible for inclusion in the California Register of Historical Resources.

   B) Included in a local register of historical resources as defined in subdivision (k) of Section 5020.1.

2) A resource determined by the lead agency, in its discretion and supported by substantial evidence, to be significant pursuant to criteria set forth in subdivision (c) of Section 5024.1. In applying the criteria set forth in subdivision (c) of Section 5024.1 for the purposes of this paragraph, the lead agency shall consider the significance of the resource to a California Native American tribe.

b) A cultural landscape that meets the criteria of subdivision (a) is a tribal cultural resource to the extent that the landscape is geographically defined in terms of the size and scope of the landscape.

c) A historical resource described in Section 21084.1, a unique archaeological resource as defined in subdivision (g) of Section 21083.2, or a "nonunique archaeological resource" as defined in subdivision (h) of Section 21083.2 may also be a tribal cultural resource if it conforms with the criteria of subdivision (a).

Public Resources Code Section 21080.3

AB 52, signed by the California Governor in September of 2014, established a new class of resources under CEQA: "tribal cultural resources," defined in PRC Section 21074. Pursuant to PRC Sections 21080.3.1, 21080.3.2, and 21082.3, lead agencies undertaking CEQA review must, upon written request of a California Native American Tribe, begin consultation before the release of an EIR, negative declaration, or mitigated negative declaration. PRC Section 21080.3.2 states:

> Within 14 days of determining that a project application is complete, or to undertake a project, the lead agency must provide formal notification, in writing, to the tribes that have requested notification of proposed projects in the lead agency's jurisdiction. If it wishes to engage in consultation on the project, the tribe must respond to the lead agency within 30 days of receipt of the formal notification. The lead agency must begin the consultation process with the tribes that have requested consultation within 30 days of receiving the request for consultation. Consultation concludes when either: 1) the parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource, or 2) a party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached.

California Native American Historical, Cultural, and Sacred Sites Act

The California Native American Historical, Cultural, and Sacred Sites Act (PRC Section 5097.9) applies to both State and private lands. The act requires, upon discovery of human remains, that construction or excavation activity cease and that the county coroner be notified. If the remains are those of a Native American, the coroner must notify the Native American Heritage Commission (NAHC), which notifies and has the authority to designate the most likely descendant (MLD) of the deceased. The act stipulates the procedures the descendants may follow for treating or disposing of the remains and associated grave goods.

Health and Safety Code, Sections 7050.5

Section 7050.5 of the Health and Safety Code requires that construction or excavation be stopped in the vicinity of discovered human remains until the coroner can determine whether the remains are those of a Native American. If they are determined to be those of a Native American, the coroner must contact NAHC.

Public Resources Code, Section 5097

PRC Section 5097 specifies the procedures to be followed if human remains are unexpectedly discovered on nonfederal land. The disposition of Native American burials falls within the jurisdiction of NAHC. Section 5097.5 of the code states:

> No person shall knowingly and willfully excavate upon, or remove, destroy, injure, or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized

footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor.

LOCAL

El Dorado County General Plan

The El Dorado County General Plan includes policies related to cultural resources related to the project.

- **Policy 7.5.1.2.** Reports and/or maps identifying specific locations of archaeological or historical sites shall be kept confidential in the Planning Department but shall be disclosed where applicable.
- **Policy 7.5.1.3.** Cultural resource studies (historic, prehistoric, and paleontological resources) shall be conducted prior to approval of discretionary projects. Studies may include, but are not limited to, record searches through the North Central Information Center at California State University, Sacramento, the Museum of Paleontology, University of California, Berkeley, field surveys, subsurface testing, and/or salvage excavations. The avoidance and protection of sites shall be encouraged.
- **Policy 7.5.1.6.** The County shall treat any significant cultural resources (i.e., those determined California Register of Historical Resources/National Register of Historic Places eligible and unique paleontological resources), documented as a result of a conformity review for ministerial development, in accordance with CEQA standards.
- **Policy 7.5.2.4.** The County shall prohibit the modification of all National Register of Historic Places (NRHP)/California Register of Historical Resources (CRHR) listed properties that would alter their integrity, historic setting, and appearance to a degree that would preclude their continued listing on these registers. If avoidance of such modifications on privately owned listed properties is deemed infeasible, mitigation measures commensurate with NRHP/CRHR standards shall be formulated in cooperation with the property owner.

3.3.2 Environmental Setting

REGIONAL PREHISTORY

California archaeology can be described as a series of patterns—an essentially non-temporal, integrative cultural unit–the way of general life shared by people within a given geographic region. The Archaic Period, which in California lasted from about 6000 before current era (BCE) to 1000 CE, is divided by archaeologists into three sub-periods: Lower, Middle, and Upper (Helix 2020).

During the Lower Archaic, between 6000 and 3000 BCE, many pluvial lakes across the state became dry playas as a result of climatic changes. Early milling stone complexes of this sub-period have been identified by scholars at a number of sites in southern and northern California. Previous finds of milling stones and Pinto-like projectile points at sites in Marble Valley, two miles east of Clarksville, could reflect Native American use of the area dating back 4000 to 7000 years (Helix 2020).

The Middle Archaic, dating between 3000 and 500 BCE, marked the beginning of the fluorescence of aboriginal cultures in California's Great Central Valley. Though concerted exploration of the Sacramento Delta's ancient village mounds was well underway by the 1930s, it was not until much later that archaeologists began taking a systematic look at the region where the Sacramento Valley meets the Sierra foothills (Helix 2020).

The petroglyphs or "Indian rock art" of Sacramento and adjoining counties was reported on in 1959. This included an analysis of rock art styles found at sites along the valley edge in the general vicinity of Clarksville. In 1962, a protohistoric and prehistoric midden (village site) along Alder Creek, five miles west of Clarksville was discovered. Native Americans of the Middle Archaic may have used the lower foothills as a summer resource area. A study of Hawyer Cave located in the foothills near the American River revealed artifact types common in the Middle Archaic

levels of village mounds in the Sacramento Delta region. Bedrock mortars are common along the Sacramento Valley-Sierra foothills edge. Reliance on acorns as a staple is inferred from what is generally recognized as the first appearance of mortars and pestles in archeological sites dating early in the period. In the mid-Sacramento Valley, these developments followed the formation of the Sacramento Delta and marsh lands, which were fully formed by 2000 BCE. Birth of the delta was a consequence of the rising sea level caused by global warming and melting of glaciers at the end of the Pleistocene (Helix 2020).

The Windmiller Pattern dates back as early as 2400 BCE in the Central Valley. Its origins are also tentatively traced to the Altithermal cultures of the northwest Great Basin and southern Columbia Plateau, as archaeologists have speculated that people of the same language group occupied the juncture between the Great Basin and Plateau provinces before 2500 BCE. It is also possible that other Great Basin peoples occupied the area in place of the proto-Yokutsan speaking people of the Windmiller Pattern. The so-called "Martis Complex" with its characteristic dart points made of basalt originally identified by archaeologists at sites in the high Sierra is also represented in the Sierra foothills and may reflect local settlement by an entirely different language group. Such sites may date to the period of 2000 BCE to 500 CE. Large, Martis-like projectile points have been discovered at archaeological sites in the lower foothills. Finds in Marble Valley included projectile point styles similar to Martis (Helix 2020).

Between 2000 and 500 BCE, Utian populations appear to have occupied the Sacramento Delta, the areas along rivers and streams, and marsh land, as well as the hills on both the east and west sides of the Sacramento Valley. Expansion westward into the San Francisco Bay area seems to have brought about some type of fusion between the bearers of Utian languages and the resident speakers of Hokan and Yukian languages. This apparent fusion of cultures, whatever its precise nature, resulted in what archaeologists now recognize as the Berkeley Pattern, sometimes still referred to as the "Middle Horizon" (Helix 2020).

Ancestors of the Nisenan, a Maiduan people who historically inhabited the American River drainage and who lived for part of their history in the Clarksville vicinity, migrated to the region rather late in time. Increased aridity in the Great Basin seems to have been an important factor that initially prompted entry of ancestral Maiduans into the northern Sierra Nevada (Helix 2020).

The Emergent Period, 1000 to 1800 CE, was characterized by the consolidation of territories formed as a result of the migration of native groups, including the Nisenan. The territories formed during the Emergent probably remained in much the same locations as noted by early Spanish observers. Interregional trade seems to have expanded greatly during the Emergent, up to the succeeding Mission Period when Spanish intrusions began tearing the fabric of native life in California (Helix 2020).

ETHNOHISTORY

The project site is located within a boundary zone between traditional Nisenan and Miwok territories; this boundary area has been described as being located between Latrobe on the south and Folsom on the north.

In both Valley Nisenan and Plains Miwok groups, the tribelet, a loose political organization, controlled specific districts usually bounded by the land between drainages. Prior to the gold rush, the establishment of Sutter's Fort, and the 1833 epidemic, villages were distributed along the banks and tributaries of major rivers such as the Sacramento, American, and Cosumnes (Helix 2020).

Valley Nisenan communities ranged in size from small, extended families of 15 to 25 people to large villages with a population over 500. In the early 1800s, a large group could be found at a single village or a cluster of small camps around a large village. The Valley Nisenan built their villages on low, natural levees along rivers and streams, or on gentle slopes with southern exposure. The post-Sutter Nisenan village of *Kadema* was situated on a low knoll along the American River 20 miles west of Clarksville. The villages varied in size from three to 40 or 50 houses. Living quarters were dome shaped, 10 to 15 feet in diameter, and covered with earth, tule mats or grasses. Brush shelters supported by upright posts were constructed in summer and during seasonal rounds of food-gathering. Specialized structures included the semi-subterranean assembly house located at major villages, the sweat house used for curing

and purification, and the acorn granary. The women of most villages made mortar holes in exposures of bedrock to pulverize acorns (Helix 2020).

According to the published literature, foothill Nisenan villages were located on ridges and large flats along major streams. These village sites were smaller than their valley counterparts. Littlejohn reported on the Nisenan village sites of *Bamon* at Shingle Springs, *Yo hi mu* and *Tu lul* near Shingle Springs, *Po lun kit* near Clarksville, and *Wapumi* at Latrobe. In the foothills, it was common for families to live away from the main village. Other sites included seasonal camps, quarries, ceremonial grounds, trading sites, fishing locales, cemeteries, river crossings, and battlefields. The nearest known historic Native American cemetery is located on a ridge between the ravine of Screech Owl Creek and Marble Valley some distance southeast of Clarksville (Helix 2020).

The 1833 epidemic, probably malaria brought south from Oregon by a party of trappers, decimated an estimated 75 percent of California's native population. By the 1840s, a number of the remaining Nisenan people settled around Sutter's Fort and worked for Sutter until the gold rush. Others pressed into traditional Miwok territory. Independent records show the 1840 to 1843 location of *Yusumne*, a Valley Nisenan village, on the valley portion of the American River six miles east of Sutter's Fort. However, in 1846, records show that *Yusumne* was located between Sloughhouse and Plymouth. This apparent move is the first concrete evidence of Nisenan intrusion into Miwok territory (Helix 2020).

A Nisenan group from Carson Creek moved five miles southwest of Clarksville to Walltown under pressure from miners on Carson Creek during the early part of the gold rush. The Walltown Nisenan group attended a "Big Time" (dances and ceremonies) at *Po lun kit*, thereby retaining their connections with the Clarksville area. In the 1870s, however, Walltown residents apparently forced the native people to move again. This time, the move was to *Palmul* at Michigan Bar on the Cosumnes River. Prior to 1848, members of another Nisenan tribelet, the *Wapumne*, were apparently located along the foothills portion of the American River drainage. The tribelet's center may have been near Shingle Springs. However, the tribelet moved to Latrobe, several miles south of Clarksville, sometime between 1847 and 1864 (Helix 2020).

HISTORIC SETTING

Clarksville History

Following the initial discovery of gold at Sutter's Mill, Coloma, in January 1848, two members of the disbanded Mormon Battalion found gold on the South Fork of the American River about a mile above its confluence with the North Fork. The March 1848 discovery at "Mormon Island" actually started the gold rush. The discoveries spurred thousands of immigrants to California. By May 1848, there were only a few hundred working at shallow placer mines. By the end of 1848, there were 8,000 to 10,000. During the following year, almost 40,000 followed routes by land and sea to the gold fields. The early mining focused on the river placers. Deposits of gravel along the river meanders were an initial attraction. Mining camps arose at these river "bars." Early placer mining expanded from Coloma to Weber Creek and then to the rich creek gravels in the vicinity of present-day Placerville. Fueled by discoveries at Coloma, Placerville and Folsom, soon nearly every ravine in the region was mined (Helix 2020).

The earliest settlement in the project area vicinity was Mormon Tavern. There is some discrepancy as to the original owner of the inn. It was established either in 1848 by a Mormon immigrant named "Morgan," or in 1849 by another Mormon, Asabel A. Lathrop. Mormon Tavern was situated at the foot of the first steep grade into the Sierra foothills from Sacramento. As the earliest settlement in the locality, Mormon Tavern lent its name to the steep grade beyond it and to the toll road that climbed the grade (also known as the old Bass Lake Road). Mormon Tavern was a stage stop during the 1850s. During the short-lived Pony Express, Mormon Tavern also served as a changing station for the horses (Helix 2020).

Most of what is now the project site was first deeded to the Central Pacific Railroad. On the west side of the project site was William Daly's homestead. On the northeast was William Johnson's homestead. Clarksville, established one-eighth mile southeast of the project site and one-half mile east of Mormon Tavern, began as a mining camp and way station. In the early years of the gold rush, Clarksville was known as "Clarkson's" or "Clarkson Town." The town was

apparently named after David P. Clark who, along with his wife and daughter, settled there in 1850. The mining camp was situated near the junction of the freighting road to the mines and the stagecoach road that connected Rhoad's Diggings, Prairie City, and Sacramento. The freight wagon road was a separate route owing to the fact that freight wagons were much slower than stagecoaches. The freighting route connected Clarksville with Placerville to the east and White Rock Springs and Mill's Station to the west (Helix 2020).

The early period of mining was confined to the wet seasons of winter and spring when sufficient water was available in the local creeks. Miners constructed small, temporary camps near the diggings along the creeks and gullies. Archaeologist Susan Lindstrom indicated that Carson, Screech Owl, and Plunket creeks were all seasonal; the seasonal availability of water needed for mining along these creeks and their tributaries was supplemented by ditches tapping the system connected with the American Reservoir (Bass Lake), which was constructed in 1856 (Helix 2020).

By the 1860s, most of the region surrounding Clarksville was dry farmed and winter grazed by sheep or cattle. The land around Clarksville was rocky and clearing fields was necessary to allow the grass to grow and to relieve difficulty in mowing. Ranchers would extend brush fences or, later, barbed wire from the rock walls to create acreage. The fences functioned as field divisions, section lines and corrals. Sheep were introduced to the semi-arid foothills around Clarksville in the 1850s. The peak of sheep raising was probably reached by the 1860s and 1870s. The California Trespass Act of 1850 required farmers to fence their crops to keep out grazing animals. By the late 1860s, however, the burden of fencing was placed on the ranchers who kept livestock. Many of the rock fences found in the region may date to this period and later (Helix 2020).

The period from 1870 to 1960 was characterized by a consolidation of land holdings and the transhumance or seasonal movement of livestock to greener pastures in the Sierra. By the early 1870s, it was virtually impossible to earn a living from the smaller parcels of land that once dotted the countryside around Clarksville. The early mixed economy of mining, ranching and other activities was replaced by the focused strategy of large-scale cattle and sheep ranching (Helix 2020).

The 1960s brought significant changes to the Clarksville viewshed. U.S. Highway 50, which by then bypassed Clarksville, was widened into a modern divided freeway. High voltage 115kV lines parallel the highway. During the 1965 construction of additional highway lanes and Tong Road, construction equipment graded at least a portion of the area where the Richmond-Hall graves were reputedly located (Helix 2020).

RECORDS SEARCHES, SURVEYS, AND CONSULTATION

On March 29, 2013, a California Historical Resources Information System (CHRIS) records search of the project site was conducted at the North Central Information Center (NCIC), at California State University, Sacramento. On February 5, 2018, a supplemental CHRIS records search was conducted for the project site and a 1-mile radius. The following information was reviewed as part of the records search:

- NRHP and CRHR,
- California Office of Historic Preservation Historic Property Directory,
- California Inventory of Historic Resources,
- California State Historic Landmarks,
- California Points of Historical Interest, and
- Historic properties reference map.

The records searches determined that six previously recorded archaeological sites are located within the project site and an additional 57 located within 1 mile of the project site. The six sites within the project site are a fieldstone reinforced fence segment, a precontact bedrock milling feature, the Finch House Site, a pile of quarried rock associated with the Finch House Site, the Sacramento to Placerville Road segment of Lincoln Highway, and the Mormon Hill Historic District. There were no previously recoded built environment features.

The project site was surveyed in 2013; in 2018 known archaeological sites were revisited [COUNTY: the site has not been fully surveyed since 2013, which is considered out of date]. On October 15, 2020, a pedestrian survey was conducted for the approximately 2-acre portion of the project's south site that had not been addressed by previous surveys The survey consisted of a pedestrian inspection, with the surveyors walking 10-meter-wide intervals to ensure maximum ground. No precontact or historic-era artifacts or features were found during the 2020 survey.

Archaeological Sites

P-09-00016

The site consists of the remnants of an east-west bearing fieldstone reinforced fence. The linear resource was first recorded in 1987 and is made up of a single course of stones appearing at regular intervals where barbed-wire posts were once place. All posts have since been removed and evidence of the remnant stone piles that once supported them is scant. In a June 27, 2012 letter from the US Army Corps of Engineers (USACOE) to the State Historic Preservation Officer (SHPO), the USACOE determined that P-09-00016 was a non-contributing resource in the Mormon Hill Historic District. In a December 2012 Memorandum of Agreement, the SHPO concurred with the USACOE regarding the fence's ineligibility for the NRHP. [COUNTY: no CRHR eligibility evaluation is included in the cultural report]

P-09-00017

This minor archaeological feature is a single shallow bedrock mortar hole located on a greenstone outcrop. The cupule measures 9 centimeters (cm) by 10 cm and is 2 cm deep. No artifacts have been found in association with the feature. In 2013 a single shovel test pit adjacent to the outcrop revealed no artifacts or cultural deposits. Inspection of nearby backdirt from gophers and/or other bun-owing animals was also negative. In a June 2012 letter from the USACOE to the SHPO, the USACOE recommended that P-09-00017 was not eligible for the NRHP as an individual resource or as a contributing resource to the Mormon Hill Historic District. The SHPO concurred with these determinations in an August 2012 letter. [COUNTY: no CRHR eligibility evaluation is included in the cultural report]

P-09-00646 and P-09-05361

The Fitch House Site (P-09-00646) was originally recorded as the remains of a 1920s residential building including an associated garden and other features in 1987 and additional elements were added in 1992. Site records for all elements were updated subsequently in 2010 and 2013. Features 4, 6, and 7 are within the project site. Feature 4 is a circular concrete well with timbers. Feature 6 was described as a locally quarried rock pile measuring 12 feet by 5 feet by 3 feet high. It was subsequently documented as P-09-05361 with some disturbance to the resource noted by that time. Feature 7 is a linear north-south bearing, rock reinforced, split-rail and barbed-wire fence that marks the eastern boundary of the historical Fitch House Site. In 2003 the Fitch residence site was evaluated and recommended not eligible for the NRHP and CRHR. In 2004, the Albert Fitch House and features were determined ineligible for the NRHP as an individual resource and as a contributing resource to the Mormon Hill Historic District by consensus between USACOE and the SHPO.

P-09-00809

The primary number "P-09-00809" has been assigned to more than one historic route between Sacramento and Placerville. The specific road segment evaluated here is associated with an old fence line remnant that follows the road on its east side from the north side of Tong Road northeast to the west edge of a hill where the road and the fence line remnant tum east and end at the east boundary of the project site. Modem traffic over the old road trace has literally made it impossible to distinguish the old from the new. The southern portion of the trace, while not impacted by modern traffic, is so eroded that it is difficult to distinguish from the surrounding landscape. The USACOE recommended that the road segment was a non-contributing resource to the Mormon Hill Historic District. In a December 2012 Memorandum of Agreement, the SHPO concurred with the USACOE regarding the road segment's ineligibility for the NRHP. [COUNTY: no CRHR eligibility evaluation is included in the cultural report]

P-09-01670

The Mormon Hill Historic District contains remains associated with both the Gold Rush-era and late 19th century agricultural development. Its key characteristics include economic dependence on the Sacramento to Placerville transportation corridor, the Mormon Tavern, the town of Clarksville, eight large ranch complexes, mining camps, transitional mining claims and homesteads, and the remains of the Eureka Ditch. Mormon Hill Historic District encompasses the entire project site and surrounding area, however. none of the six archaeological sites described above are considered contributing resources to the Mormon Hill Historic District. SHPO recommended further evaluation and review. Because the boundaries of the Mormon Hill District encompass numerous unevaluated resources outside the project site, evaluation and review of the district as a whole exceeded the scope of the studies discussed here.

Tribal Cultural Resources

Native American Consultation

On August 2, 2021, in compliance with AB 52 requirements, El Dorado County sent notification letters to the following seven California Native American tribal representatives:

- Colfax-Todds Valley Consolidated Tribe; Pamela Cubbler, Treasurer
- Ione Band of Miwok Indians; Sara D. Setshwaelo, Chairperson
- Nashville Enterprise Miwok-Maidu-Nishinam Tribe; Mr. Cosme Valdez, Chairperson
- Shingle Springs Band of Miwok Indians (Shingle Springs); Regina Cuellar, Chairperson
- Tsi Akim Maidu; Mr. Don Ryberg, Chairperson
- United Auburn Indian Community of the Auburn Rancheria; Gene Whitehouse, Chairperson
- Washoe Tribe of Nevada and California; Darrel Cruz, Cultural Resources Department

On August 18, 2021, United Auburn Indian Community of the Auburn Rancheria responded, and deferred to Shingle Springs, as the project site is more closely in Shingle Spring's territory. On September 22, 2021, Shingle Springs responded to the County's notification letter and requested consultation. On October 6th, the County provided the cultural resources report; the County requested potential meeting dates on October 7th and November 18th of 2021, and again on May 18, 2022. Shingle Springs has not replied to these messages. [County, please conclude AB 52 consultation with Shingle Springs, if still outstanding. Recommend sending a follow-up email stating that because they have not responded, County considers consultation closed.]

Additionally, a search of NAHC's sacred lands file on May 2, 2022, returned negative results.

3.3.3 Impacts and Mitigation Measures

METHODOLOGY

The impact analysis for archaeological and historical resources is based on the findings and recommendations of the *El Dorado Hills 52 Project Cultural Resources Technical Report* (Helix 2020). The analysis is also informed by the provisions and requirements of federal, state, and local laws and regulations that apply to cultural resources.

PRC Section 21083.2(g) defines a "unique archaeological resource" as an archaeological artifact, object, or site about which it can be clearly demonstrated that, without merely adding to the current body of knowledge, there is a high probability that it meets one or more of the following CRHR-related criteria: (1) that it contains information needed to answer important scientific research questions and that there is a demonstrable public interest in that information; (2) that it as a special and particular quality, such as being the oldest of its type or the best available example of its type; or (3) that it is directly associated with a scientifically recognized important prehistoric or historic event or person. An impact on a resource that is not unique is not a significant environmental impact under CEQA (State CEQA Guidelines

Section 15064.5[c][4]). If an archaeological resource qualifies as a resource under CRHR criteria, then the resource is treated as a unique archaeological resource for the purposes of CEQA.

PRC Section 21074 defines "tribal cultural resources" as "sites, features, places, cultural landscapes, sacred places, and objects with cultural value to a California Native American tribe" that are listed or determined eligible for listing in the CRHR, listed in a local register of historical resources, or otherwise determined by the lead agency to be a tribal cultural resource.

For the purposes of the impact discussion, "historical resource" is used to describe built-environment historic-period resources. Archaeological resources (both prehistoric and historic-period), which may qualify as "historical resources" pursuant to CEQA, are analyzed separately from built-environment historical resources.

THRESHOLDS OF SIGNIFICANCE

Based on Appendix G of the State CEQA Guidelines, the project would result in a significant impact on cultural resources if it would:

- cause a substantial adverse change in the significance of a historical resource pursuant to Section 15064.5 of the State CEQA Guidelines;
- cause a substantial adverse change in the significance of an archaeological resource pursuant to Section 15064.5 of the State CEQA Guidelines;
- cause a substantial adverse change in the significance of a tribal cultural resource, defined in PRC Section 21074 as either a site, feature, place, cultural landscape that is geographically defined in terms of the size and scope of the landscape, sacred place, or object with cultural value to a California Native American tribe; or
- disturb any human remains, including those interred outside of formal cemeteries.

ISSUES NOT DISCUSSED FURTHER

As described above, no built environment features that would qualify as historical resources were identified on the project site, either from the CHRIS records search or any of the pedestrian surveys. Therefore, project construction and operation would have no impact on historical resources. This issue is not analyzed further.

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Impact 3.3-1: Cause a Substantial Adverse Change in the Significance of Unique Archaeological Resources

The NCIC records search revealed one archaeological site that has not been evaluated for NRHP- or CRHR-listing. Additionally, project-related ground-disturbing activities could result in discovery or damage of yet undiscovered archaeological resources pursuant to Section 15064.5. This would be a **significant** impact.

The following analysis applies to both the North Site and South Site.

North Site and South Site

The Mormon Hill Historic District (P-09-001670) encompasses the entire project site (North Site and South Site) and surrounding area but has not been fully evaluated for NRHP/CRHR significance. Five other known archaeological sites within the project site have been determined to be ineligible for listing the NRHP and/or CRHR **[COUNTY: CRHR eligibility was not included in the cultural report. This is required for CEQA analysis]** and are not considered resources for purposes of CEQA. These five archaeological sites have also been determined through concurrence with SHPO to be non-contributing elements of the potential historic district. Therefore, project activities affecting these five sites will not affect the ability of the potential historic district to qualify for NRHP- or CRHR-listing.

Additionally, because these five archaeological sites are non-contributing elements, the project site itself would not be considered a contributor to the potential Mormon Hill Historic District. Therefore, development of the entirety of the project site would not affect the ability of the potential historic district to qualify for NRHP- or CRHR-listing. [COUNTY: NEED CRHR FROM HELIX]

Nevertheless, components of the project that require earth-moving and excavation may result in the discovery of previously undisturbed archaeological deposits. Because project-related ground-disturbing activities could result in the damage or destruction of yet undiscovered significant archaeological resources pursuant to Section 15064.5, the impact would be **significant**.

Mitigation Measures

Mitigation Measure 3.3-1: Halt Ground Disturbance Upon Discovery of Subsurface Archaeological Features

In the event that any prehistoric or historic-period subsurface archaeological features or deposits, including locally darkened soil ("midden"), and concentrations of charcoal, flaked stone, glass, metal, or ceramic, that could conceal cultural deposits are discovered during construction, all ground-disturbing activity within 100 feet of the find shall be halted and a qualified professional archaeologist shall be retained to assess the significance of the find. If the qualified archaeologist determines the archaeological material to be Native American in nature, applicant shall contact the appropriate Native American tribe for their input on the preferred treatment of the find. [This may be revised after AB 52 is complete] If the find is determined to be significant by the archaeologist (i.e., because it is determined to constitute a unique archaeological resource), the archaeologist shall develop, and applicant shall implement, appropriate procedures to protect the integrity of the resource and ensure that no additional resources are affected. Procedures could include but would not necessarily be limited to preservation in place (which shall be the preferred manner of mitigating impacts to archaeological sites), archival research, subsurface testing, or contiguous block unit excavation and data recovery (when it is the only feasible mitigation, and pursuant to a data recovery plan).

Significance after Mitigation

Implementation of Mitigation Measure 3.3-1 would reduce impacts associated with archaeological resources to a **less-than-significant** level by requiring the performance of professionally accepted and legally compliant procedures in the event of a discovery, as well as the protection of any previously undocumented significant archaeological resources.

Impact 3.3-2: Cause a Substantial Adverse Change in the Significance of a Tribal Cultural Resource

Although consultation did not result in the identification of any tribal cultural resources, ground-disturbing activities could damage or destroy previously unknown tribal cultural resources. Therefore, impacts to tribal cultural resources is considered to be **significant**.

The following analysis applies to both the North Site and South Site.

North Site and South Site

As described previously, the County sent letters notifying that the proposed project was being addressed under CEQA, as required by PRC 21080.3.1, to seven California Native American tribal representatives. Only the Shingle Springs Band of Miwok Indians requested consultation. However, numerous messages sent to Shingle Springs went unanswered and no consultation meetings took place, and no tribal cultural resources were identified. In addition, the precontact archaeological site identified in the CHRIS search has been evaluated as not eligible for CRHR-listing **[CRHR evaluation still needed]** and the record search of the NAHC Sacred Lands File database was completed with negative results. For these reasons, no part of the project site meets any of the criteria for tribal cultural resources as defined in PRC Section 21074.

Nevertheless, construction-related activities, both ground-disturbing and staging access, could encounter previously undiscovered or unrecorded resources. This could result in physical changes to sites, structures, and areas that have

religious or sacred significance or other cultural significance to the Washoe people. Therefore, this impact would be **potentially significant**.

Mitigation Measures

Mitigation Measure 3.3-2: Protect Previously Undiscovered Tribal Cultural Resources

Implement Mitigation Measure 3.3-1.

Significance after Mitigation

Implementation of Mitigation Measure 3.3-2 would reduce the proposed project's impact to a **less-than-significant** level by requiring preservation options and proper care of significant artifacts if they are recovered.

Impact 3.3-3: Disturb Human Remains

Based on documentary research, no evidence suggests that any prehistoric or historic-period marked or un-marked human interments are present within or in the immediate vicinity of the project site. However, ground-disturbing construction activities could uncover previously unknown human remains. Compliance with California Health and Safety Code Section 7050.5 and California Public Resources Code Section 5097 would make this impact **less than significant**.

The following analysis applies to both the North Site and South Site.

North Site and South Site

Based on documentary research, no evidence suggests that any prehistoric or historic-period marked or un-marked human interments are present within or in the immediate vicinity of the project site. However, the location of grave sites and Native American remains can occur outside of identified cemeteries or burial sites. Therefore, there is a possibility that unmarked, previously unknown Native American or other graves could be present within the project site and could be uncovered by project-related construction activities.

California law recognizes the need to protect Native American human burials, skeletal remains, and items associated with Native American burials from vandalism and inadvertent destruction. The procedures for the treatment of Native American human remains are contained in California Health and Safety Code Section 7050.5 and California Public Resources Code Section 5097.

These statutes require that, if human remains are discovered, potentially damaging ground-disturbing activities in the area of the remains shall be halted immediately, and the appropriate County coroner shall be notified immediately. If the remains are determined by the coroner to be Native American, NAHC shall be notified within 24 hours and the guidelines of the NAHC shall be adhered to in the treatment and disposition of the remains. Following the coroner's findings, the NAHC-designated Most Likely Descendant, and the landowner shall determine the ultimate treatment and disposition of the remains and take appropriate steps to ensure that additional human interments, if present, are not disturbed. The responsibilities for acting upon notification of a discovery of Native American human remains are identified in PRC Section 5097.94.

Compliance with California Health and Safety Code Section 7050.5 and California Public Resources Code Section 5097 would provide an opportunity to avoid or minimize the disturbance of human remains, and to appropriately treat any remains that are discovered. Therefore, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required for this impact.

This page intentionally left blank.

3.4 BIOLOGICAL RESOURCES

This section addresses biological resources known or with potential to occur on or near the project site and describes potential effects of implementation of the EDH Commercial Center Project on those resources. Data reviewed in preparation of this analysis include:

- *Biological Resources Assessment* (Foothill Associates, 2017);
- *El Dorado Hills 52 Project Biological Resources Assessment* (Helix Environmental Planning 2020a);
- *El Dorado Hills 52 Project Aquatic Resources Delineation Report* (Helix Environmental Planning 2020b);
- *El Dorado Hills 52 Oak Resources Technical Reports* (Helix Environmental Planning 2020c and 2021);
- *California Red-Legged Frog (*Rana draytonii*) Protocol-Level Survey Report* (Foothill Associates 2016a);
- *Special-Status Plant Surveys within the El Dorado Hills 52 Project Site* (Foothill Associates 2016b);
- *Protocol-Level Burrowing Owl Surveys within the El Dorado Hills 52 Project Site* (Foothill Associates 2016c);
- Results of California Natural Diversity Database (CNDDB) record search of the Rocklin, Pilot Hill, Coloma, Folsom, Clarksville, Shingle Springs, Buffalo Creek, Folsom SE, and Latrobe US Geological Survey (USGS) 7.5-minute quadrangles (CNDDB 2022);
- Results of California Native Plant Society (CNPS), Inventory of Rare Plants search of the Rocklin, Pilot Hill, Coloma, Folsom, Clarksville, Shingle Springs, Buffalo Creek, Folsom SE, and Latrobe USGS 7.5-minue quadrangles (CNPS 2022);
- Results of US Fish and Wildlife Service (USFWS) Information for Planning and Consultation (IPaC) electronic records search (USFWS 2022);
- Reconnaissance-level survey of the project site by an Ascent Environmental wildlife biologist on April 18, 2022; and
- Aerial photographs of the project site and region.

In response to the NOP for the project EIR, comment letters were received from several members of the public; however, no comments specifically pertaining to biological resources were received. Refer to Appendix A for comments received on the NOP.

3.4.1 Regulatory Setting

FEDERAL

Federal Endangered Species Act

Pursuant to the federal Endangered Species Act (ESA) (16 U.S.C. Section 1531 et seq.), USFWS regulates the taking of species listed in the ESA as threatened or endangered. In general, persons subject to ESA (including private parties) are prohibited from "taking" endangered or threatened fish and wildlife species on private property, and from "taking" endangered or threatened plants in areas under federal jurisdiction or in violation of state law. Under Section 9 of the ESA, the definition of "take" is to "harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in any such conduct." USFWS has also interpreted the definition of "harm" to include significant habitat modification that could result in take.

Section 10 of the ESA applies if a non-federal agency is the lead agency for an action that results in take and no other federal agencies are involved in permitting or funding the action. Section 7 of the ESA applies if a federal discretionary action is required (e.g., a federal agency must issue a permit), in which case the involved federal agency consults with USFWS.

Migratory Bird Treaty Act

The Migratory Bird Treaty Act (MBTA), first enacted in 1918, provides for protection of international migratory birds and authorizes the Secretary of the Interior to regulate the taking of migratory birds. The MBTA provides that it will be unlawful, except as permitted by regulations, to pursue, take, or kill any migratory bird, or any part, nest, or egg of any such bird. Under the MBTA, "take" is defined as "to pursue, hunt, shoot, wound, kill, trap, capture, or collect, or any attempt to carry out these activities." A take does not include habitat destruction or alteration, as long as there is not a direct taking of birds, nests, eggs, or parts thereof. The current list of species protected by the MBTA can be found in Title 50 of the Code of Federal Regulations (CFR), Section 10.13 (50 CFR 10.13). The list includes nearly all birds native to the United States.

Bald and Golden Eagle Protection Act

The Bald and Golden Eagle Protection Act, enacted in 1940 and amended multiple times since, prohibits the taking of bald and golden eagles without a permit from the Secretary of the Interior. Similar to ESA, the Bald and Golden Eagle Protection Act defines "take" to include "pursue, shoot, shoot at, poison, wound, kill, capture, trap, collect, molest or disturb" (16 U.S. Code 668–668c). For the purpose of the act, disturbance that would injure an eagle, decrease productivity, or cause nest abandonment, including habitat alterations that could have these results, are considered take and can result in civil or criminal penalties.

Clean Water Act

Section 404 of the Clean Water Act (CWA) requires project applicants to obtain a permit from US Army Corps of Engineers (USACE) before performing any activity that involves any discharge of dredged or fill material into waters of the United States, including wetlands. Waters of the United States include navigable waters of the United States, interstate waters, tidally influenced waters, and all other waters where the use, degradation, or destruction of the waters could affect interstate or foreign commerce, tributaries to any of these waters, and wetlands that meet any of these criteria or that are adjacent to any of these waters or their tributaries. Many surface waters and wetlands in California meet the criteria for waters of the United States.

In accordance with Section 401 of the CWA, projects that apply for a USACE permit for discharge of dredged or fill material must obtain water quality certification from the appropriate state agency, which in California is the State Water Resources Control Board or designated regional water quality control board (RWQCB), indicating that the action would uphold state water quality standards.

STATE

California Endangered Species Act

Pursuant to the California Endangered Species Act (CESA), a permit from California Department of Fish and Wildlife (CDFW) is required for projects that could result in the "take" of a plant or animal species that is listed by the state as threatened or endangered. Under CESA, "take" is defined as an activity that would directly or indirectly kill an individual of a species but does not include "harm" or "harass," as does the federal definition. As a result, the threshold for take is higher under CESA than under the federal ESA. Authorization for take of state-listed species can be obtained through a California Fish and Game Code Section 2081 incidental take permit.

California Fish and Game Code Sections 3503 and 3503.5—Protection of Bird Nests and Raptors

Section 3503 of the Fish and Game Code states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird. Section 3503.5 of the California Fish and Game Code states that it is unlawful to take, possess, or destroy any raptors (i.e., species in the orders *Falconiformes* and *Strigiformes*), including their nests or eggs. Typical violations include destruction of active nests as a result of tree removal or disturbance caused by project construction or other activities that cause the adults to abandon the nest, resulting in loss of eggs and/or young.

Fully Protected Species under the California Fish and Game Code

Protection of fully protected species is described in Sections 3511, 4700, 5050, and 5515 of the California Fish and Game Code. These statutes prohibit take or possession of fully protected species and do not provide for authorization of incidental take.

California Fish and Game Code Section 1602—Lake and Streambed Alteration

All diversions, obstructions, or changes to the natural flow or bed, channel, or bank of any river, stream, or lake in California that supports fish or wildlife resources are subject to regulation by CDFW under Section 1602 of the California Fish and Game Code. Under Section 1602, it is unlawful for any person, governmental agency, or public utility to do any of the following without first notifying CDFW:

- substantially divert or obstruct the natural flow of, or substantially change or use any material from, the bed, channel, or bank of any river, stream, or lake; or
- deposit or dispose of debris, waste, or other material containing crumbled, flaked, or ground pavement where it may pass into any river, stream, or lake.

The regulatory definition of a stream is a body of water that flows at least periodically or intermittently through a bed or channel that has banks and supports fish or other aquatic life. This definition includes watercourses with a surface or subsurface flow that supports or has supported riparian vegetation (California Code of Regulations Title 14, Section 1.72). CDFW jurisdiction within altered or artificial waterways is based on the value of those waterways to fish and wildlife. A lake and streambed alteration agreement must be obtained for any diversion or alteration that would substantially adversely affect a fish or wildlife resource in a river, stream, or lake.

Native Plant Protection Act

The Native Plant Protection Act (NPPA) (California Fish and Game Code Section 1900 et seq.) allows the California Fish and Game Commission to designate plants as rare or endangered. Sixty-four species, subspecies, and varieties of plants are protected as rare under the NPPA. The act prohibits take of endangered or rare native plants but includes exceptions for agricultural and nursery operations; for emergencies; and, after proper notification of CDFW, for vegetation removal from canals, roads, and other building sites, changes in land use, and other situations.

Porter-Cologne Water Quality Control Act

Under the Porter-Cologne Act, waters of the state fall under the jurisdiction of the appropriate RWQCB. The project site is within the Central Valley RWQCB. The RWQCB must prepare and periodically update water quality control plans (basin plans). Each basin plan sets forth water quality standards for surface water and groundwater, as well as actions to control point and nonpoint sources of pollution to achieve and maintain these standards. The RWQCB's jurisdiction includes federally protected waters as well as areas that meet the definition of "waters of the state," including waters meeting the state definition of a wetland. Waters of the state are defined as any surface water or groundwater, including saline waters, within the boundaries of the state. Under the state definition, an area is a wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater or shallow surface water or both; (2) the duration of such saturation is sufficient to cause anaerobic conditions in the upper substrate; and; (3) the area either lacks vegetation or the vegetation is dominated by hydrophytes.

RWQCB has the discretion to take jurisdiction over areas not federally protected under Section 401 of the CWA provided they meet the definition of waters of the State. The California Water Code generally regulates more substances contained in discharges and defines discharges to receiving waters more broadly than does the CWA. In addition, waters of the State cover a broader range of aquatic habitats than the CWA, including ephemeral streams and wetlands. Actions that affect waters of the State, including wetlands, must meet the RWQCB waste discharge requirements. This issue is addressed comprehensively in Section 3.9, "Hydrology and Water Quality," as well as herein with respect to state protected wetlands and associated biological resources.

LOCAL

El Dorado County General Plan

The adopted El Dorado County General Plan Conservation and Open Space Element discusses significant natural resources in the County, including aquatic habitat, special-status species, and sensitive habitats, and establishes goals, objectives, and policies related to these topics. Relevant policies from the El Dorado County General Plan include:

- **Policy 7.3.3.1:** For projects that would result in the discharge of material to or that may affect the function and value of river, stream, lake, pond, or wetland features, the application shall include a delineation of all such features. For wetlands, the delineation shall be conducted using the US Army Corps of Engineers (USACE) Wetland Delineation Manual.
- **Policy 7.3.3.5**: Rivers, streams, lakes and ponds, and wetlands shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site while disturbance to the resource is avoided or minimized and fragmentation is limited.
- **Policy 7.3.4.1**: Natural watercourses shall be integrated into new development in such a way that they enhance the aesthetic and natural character of the site without disturbance.
- **Policy 7.3.4.2**: Modification of natural stream beds and flow shall be regulated to ensure that adequate mitigation measures are utilized.
- **Policy 7.4.1.1:** The County shall continue to provide for the permanent protection of the eight sensitive plant species known as the Pine Hill endemics and their habitat through the establishment and management of ecological preserves consistent with County Code Chapter 17.71 and the USFWS *Gabbro Soil Plants for the Central Sierra Nevada Foothills Recovery Plan* (USFWS 2002).
- **Policy 7.4.1.6**: All development projects involving discretionary review shall be designed to avoid disturbance or fragmentation of important habitats to the extent reasonably feasible. Where avoidance is not possible, the development shall be required to fully mitigate the effects of important habitat loss and fragmentation. Mitigation shall be defined in the Integrated Natural Resources Management Plan (INRMP) (see Policy 7.4.2.8 and Implementation Measure CO-M).

  The County Agricultural Commission, Plant and Wildlife Technical Advisory Committee, representatives of the agricultural community, academia, and other stakeholders shall be involved and consulted in defining the important habitats of the County and in the creation and implementation of the INRMP.
- **Policy 7.4.2.8:** Conserve contiguous blocks of important habitat to offset the effects of increased habitat loss and fragmentation elsewhere in the County through a Biological Resource Mitigation Program (Program). The Program will result in the conservation of:
  - Habitats that support special status species;
  - Aquatic environments including streams, rivers, and lakes;
  - Wetland and riparian habitat;
  - Important habitat for migratory deer herds; and
  - Large expanses of native vegetation.

  A. **Habitat Protection Strategy**. The Program establishes mitigation ratios to offset impacts to special-status species habitat and special-status vegetation communities within the County.

  Special-status species include plants and animals in the following categories:
  - Species listed or proposed for listing as Threatened or Endangered under the federal Endangered Species Act (ESA) or the California Endangered Species Act (CESA);
  - Species considered as candidates for listing as Threatened or Endangered under ESA or CESA;

- Wildlife species identified by CDFW as Species of Special Concern;
- Wildlife species identified by US Fish and Wildlife Service (USFWS) and National Marine Fisheries Service (NMFS) as Species of Concern;
- Plants listed as Endangered or Rare under the California Native Plant Protection Act;
- Animals fully protected under the California Fish and Game Code; and
- Plants that have a California Native Plant Society (CNPS) California Rare Plant Rank (CRPR) of 1A (plants presumed extirpated in California and either rare or extinct elsewhere), 1B (plants rare, threatened, or endangered in California and elsewhere), 2A (plants presumed extirpated in California, but more common elsewhere), or 2B (plants rare, threatened, or endangered in California, but more common elsewhere). The CNPS CRPRs are used by both CDFW and USFWS in their consideration of formal species protection under ESA or CESA.

With the exception of oak woodlands, which would be mitigated in accordance with the Oak Resources Management Plan (ORMP) (see General Plan Policy 7.4.4.4), and Pine Hill rare plant species and their habitat, which would be mitigated in accordance with County Code Chapter 130.71 (see General Plan Policy 7.4.1.1), mitigation of impacts to vegetation communities will be implemented in accordance with the table below. Preservation and creation of the following vegetation communities will ensure that the current range and distribution of special-status species within the County are maintained.

Habitat Mitigation Summary Table

Vegetation Type	Preservation	Creation	Total
Water	NA	1:1	1:1
Herbaceous Wetland	1:1	1:1	2:1
Shrub and Tree Wetlands	2:1	1:1	3:1
Upland (non-oak and non-Pine Hill rare plant species habitat)	1:1	NA	1:1

C. Biological Resources Assessment. A site-specific biological resources technical report will be required to determine the presence of special-status biological resources that may be affected by a proposed discretionary project. Vegetation communities and special-status plants shall be mapped and assessed in accordance with the CDFG 2009 Protocols for Surveying and Evaluating Impacts to Special Status Native Plant Populations and Natural Communities and subsequent updates, and the List of Vegetation Alliances and Associations and subsequent updates. Any surveys conducted to evaluate potential presence of special-status wildlife species shall conform to practices recommended by CDFW and/or USFWS at the time of the surveys. The report will include an assessment of direct, indirect, and cumulative impacts to biological resources, including vegetation communities, plant and wildlife species and wildlife movement. The report shall include recommendations for:

   - pre-construction surveys and avoidance/protection measures for nesting birds;
   - pre-construction surveys and avoidance/protection measures for roosting bats;
   - avoidance and minimization measures to reduce impacts related to entrapment, entanglement, injury, or poisoning of wildlife; and
   - avoidance and minimization measures to reduce indirect impacts to wildlife in open space adjacent to a project site. The results of the biological resources technical report shall be used as the basis for establishing mitigation requirements in conformance with this policy and the Oak Resources Management Plan (ORMP, see General Plan Policy 7.4.4.4).

D. Habitat Protection. Mitigation for impacts to vegetation communities defined above in Section A will occur within the County on a minimum contiguous habitat block of 5 acres. Wetlands mitigation may occur within

mitigation banks and/or outside the County if within the watershed of impact. Mitigation sites will be prioritized based on the following criteria:

- Location within PCAs and IBCs;
- Location within other important ecological areas, as defined in the Updated INRMP Initial Inventory and Mapping (June 2010);
- Woodland, forest and shrub communities with diverse age structure;
- Woodland and forest communities with large trees and dense canopies;
- Opportunities for active land management to be used to enhance or restore natural ecosystem processes;
- Presence of or potential to support special-status species;
- Connectivity with adjacent protected lands;
- Parcels that achieve multiple agency and community benefits;
- Parcels that are located generally to the west of the Eldorado National Forest; and
- Parcels that would preserve natural wildlife movement corridors such as crossings under major roadways (e.g., US Highway 50 and across canyons).

F. Mitigation Monitoring. Prior to final approval of an individual development project, applicants shall submit to the County a Mitigation Monitoring Plan that provides for periodic monitoring of preserved lands to assess effectiveness of the measures implemented to protect special-status and native species. The Mitigation Monitoring Plan shall demonstrate that funding is secured to implement the monitoring strategy in perpetuity.

- Policy 7.4.4.4: For all new development projects or actions that result in impacts to oak woodlands and/or individual native oak trees, including Heritage Trees, the County shall require mitigation as outlined in the El Dorado County Oak Resources Management Plan (ORMP). The ORMP functions as the oak resources component of the County's biological resources mitigation program, identified in Policy 7.4.2.8

El Dorado County General Plan Biological Resources Policy Update and Oak Resources Management Plan

The El Dorado County Board of Supervisors adopted the Biological Resources Policy Update and ORMP in October 2017. The Biological Resources Policy Update included revisions to the General Plan objectives, policies, and implementation measures to establish a comprehensive Biological Resource Mitigation Program. The objective of this program is to conserve special-status species habitat, aquatic habitat, wetland and riparian habitat, habitat for migratory deer herds, and large expanses of native vegetation. The ORMP updated and revised the existing Oak Woodland Management Plan, and now defines mitigation requirements for impacts on oak woodlands, individual native oak trees, and heritage trees; and also outlines El Dorado County's strategy for oak resource management and conservation. The ORMP establishes an in-lieu fee payment option for impacts on oak woodlands and oak trees and identifies Priority Conservation Areas where oak woodland conservation efforts will be focused.

The ORMP designates three classes of protected oak resources: oak woodlands that have at least 10 percent oak canopy; heritage trees, defined as native oaks with a total trunk diameter at breast height of 36 inches or greater; and individual oak trees, defined as native oak trees with a trunk diameter at breast height of 6 inches or greater that are not located in oak woodlands. An oak woodland removal permit is required before removal of oak trees that are part of an oak woodland and an oak tree removal permit is required before removal of heritage trees and individual oak trees. Mitigation for impacts on oak woodlands is based on the total area affected ranging from 1:1 mitigation for zero to 50 percent removal to 2:1 mitigation for more than 75 percent removal. Mitigation may be completed with a combination of the following options: acquisition of an off-site conservation easement, payment of in-lieu fees, or either on- or off-site replacement planting of up to 50 percent of the required mitigation area. Mitigation for removal

of heritage or individual oak trees requires on- or off-site replacement planting or payment of in-lieu fees at a 3:1 (heritage trees) or 1:1 (individual oak trees) ratio, respectively, to the number of trunk inches removed. Any oak woodland preserved on site and all mitigation planting areas must be protected in perpetuity through deed restrictions or a conservation easement.

3.4.2 Environmental Setting

HABITAT TYPES

As described in Section 2.0, "Project Description," the project site is split into the North Site and the South Site. Habitat types present on both sections of the project site are shown in Figure 3.4-1 and summarized in Table 3.4-1. Four upland habitat types are present on the project site: annual grassland, riparian woodland, valley oak woodland, and disturbed/developed land. Several aquatic features are present within these upland habitats: perennial marsh, seasonal wetland, wetland swale, seeps, and seasonal drainages. Descriptions of each habitat type are included below (Helix Environmental Planning 2020a). Five habitat types; purple needlegrass grassland, elderberry shrubs, valley oak woodland, perennial marsh, and seep; are present only on the South Site.

Upland Habitat Types

Annual Grassland

Annual grassland on the project site is characterized primarily by an assemblage of nonnative annual grasses and forbs. Dominant species include ripgut brome (*Bromus diandrus*), soft chess (*Bromus hordeaceus*), and wild oat (*Avena fatua*) associated with red-stemmed filaree (*Erodium cicutarium*), popcornflower (*Plagiobothrys* spp.), black mustard (*Brassica nigra*), winter vetch (*Vicia villosa*), scarlet pimpernel (*Lysimachia arvensis*), St. John's wort (*Hypericum perforatum*), brodiaea (*Brodiaea elegans*), fiddleneck (*Amsinckia* sp.), rose clover (*Trifolium hirtum*), and milk-thistle (*Silybum marianum*).

Purple Needlegrass Grassland

Two small areas within the annual grassland habitat on the South Site contain purple needlegrass (*Nassella pulchra*; Figure 3.4-1). Species associated with the purple needlegrass include annual willow herb (*Epilobium brachycarpum*), ripgut brome, soft chess, and wild oat. Purple needlegrass grassland has not been mapped on the North Site, but could be present.

Disturbed/Developed

Disturbed/developed areas on the project site include graded roads and a stockpile area (Figure 3.4-1). The disturbed/developed areas are sparsely vegetated with red-stemmed filaree, soft chess, wild oat, and winter vetch.

Riparian Woodland

Riparian woodland habitat on the project site occurs along the seasonal drainage on the northwest boundary of the project site including portions of the North Site and South Site (Figure 3.4-1). Dominant species include broadleaf cattail (*Typha latifolia*), willow, spike rush (*Eleocharis macrostachya*), pennyroyal (*Mentha pulegium*), Himalayan blackberry (*Rubus armeniacus*), and valley oak (*Quercus lobata*).

Valley Oak Woodland

Valley oak woodland is present on the South Site where a small stand of mature valley oak trees overhangs a small seasonal drainage. Scattered blue oaks (*Quercus douglasii*) are also present in this habitat type. The understory is primarily annual grassland with small areas of milkweed (*Asclepias fascicularis*) and pennyroyal immediately adjacent to the seasonal drainage.

Elderberry Shrubs

Two small clumps of blue elderberry shrubs (*Sambucus nigra* ssp. *caerulea*) are present on the South Site; one near the riparian woodland habitat another within the annual grassland habitat (Figure 3.4-1). There are no elderberry shrubs on the North Site.

Wetland Habitat Types

Perennial Marsh

Perennial marsh habitat is present on the project site only on the South Site within the ordinary high-water mark of the seasonal drainage (Figure 3.4-1). This habitat appears to have formed as a result of a brick check dam that was constructed across the seasonal drainage allowing water to periodically back up in this area. The perennial marsh is dominated by common knotweed (*Persicaria lapathifolia*) and curly dock with areas of dense cattails, Himalayan blackberry, and a small clump of willows (*Salix* spp.).

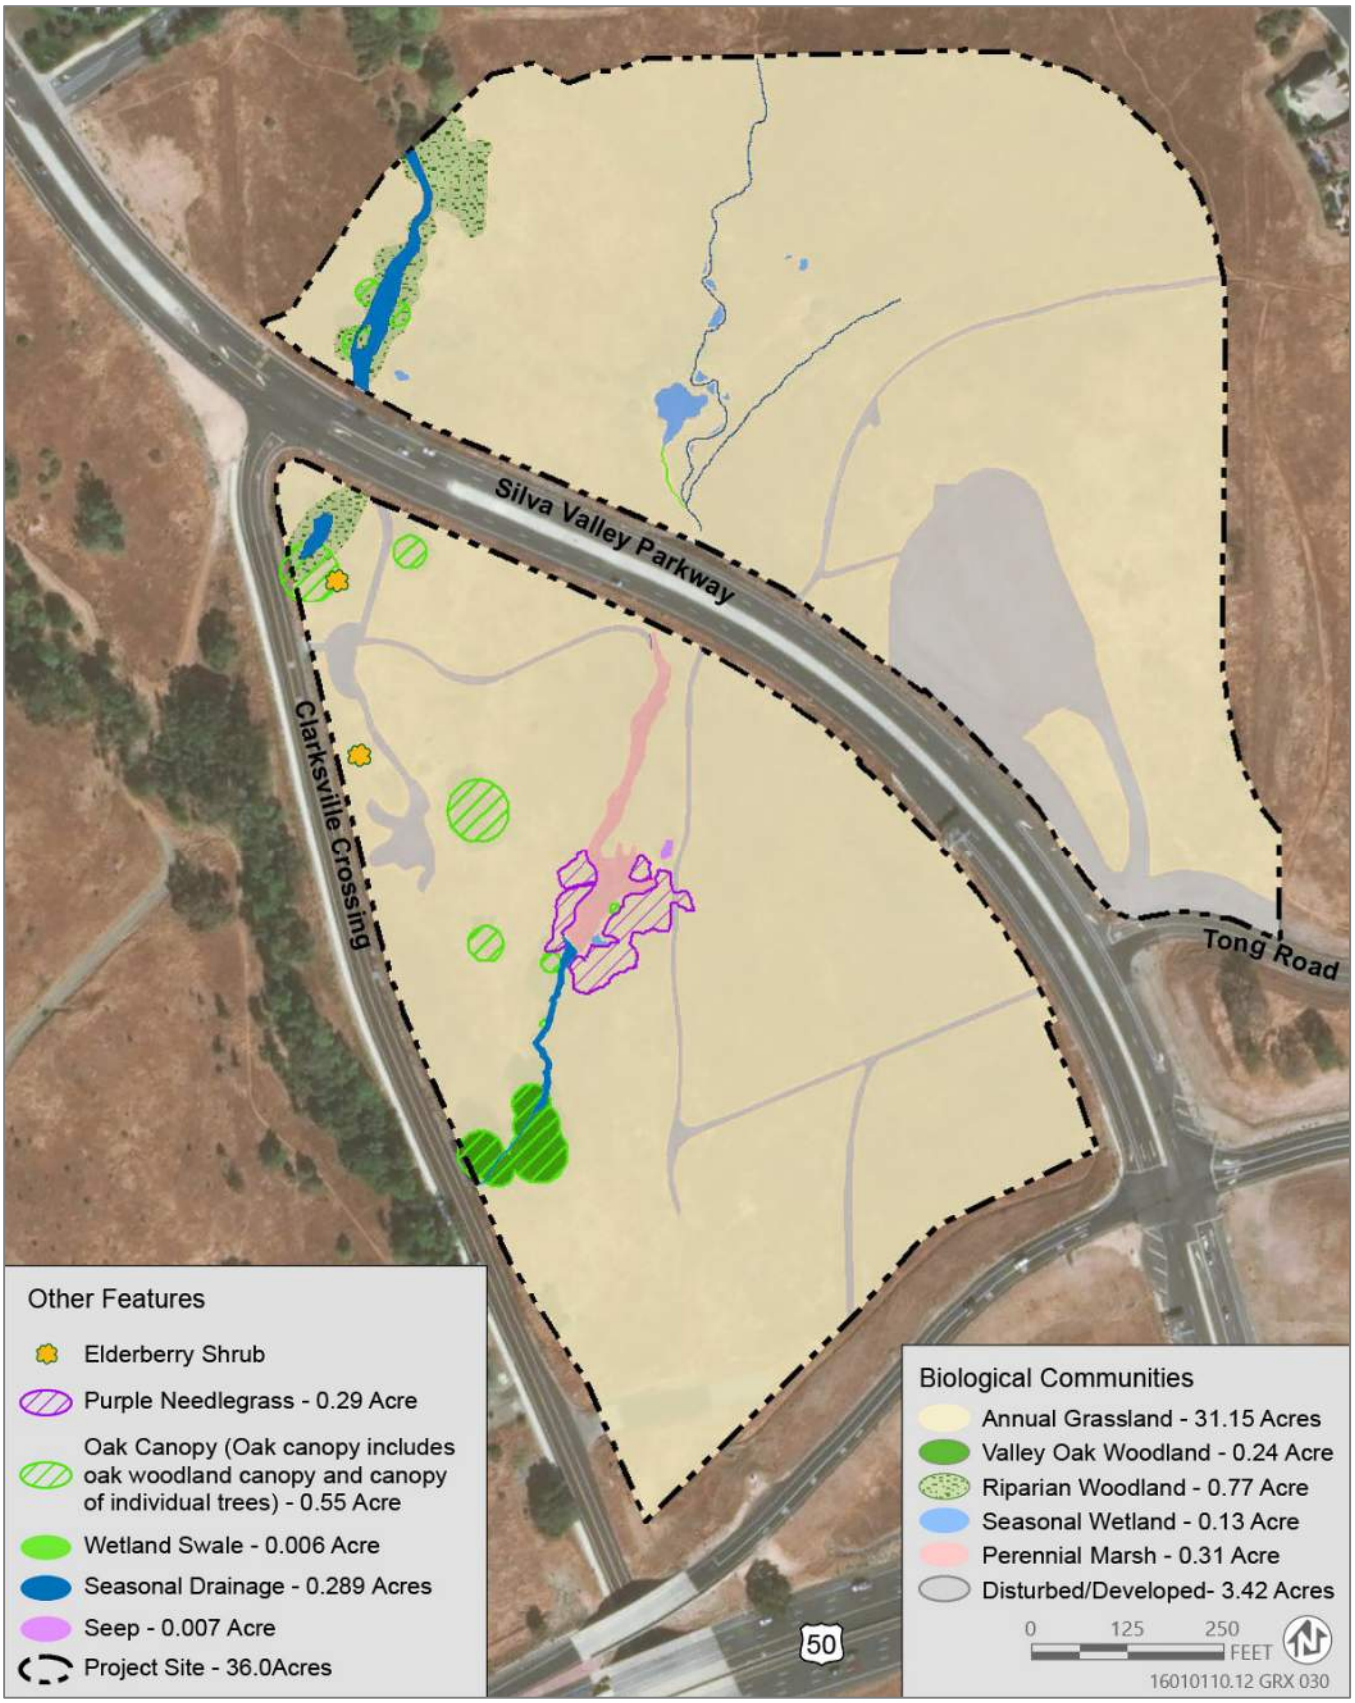
Seasonal Drainages

The annual grassland habitat on the project site contains small seasonal drainages (Figure 3.4-1). The seasonal drainages vary from mostly unvegetated to containing small clumps of willows and broadleaf cattail.

Seasonal Wetland and Wetland Swale

A number of seasonal wetland and wetland swale features are present on the project site (Figure 3.4-1). Most of the seasonal wetlands and wetland swales are associated with the seasonal drainage on the North Site (Figure 3.4-1). Dominant species in the seasonal wetland and wetland swale habitat include rabbitsfoot grass (*Polypogon monspeliensis*), spike rush, nutsedge (*Cyperus eragrostis*), curly dock (*Rumex crispus*), pennyroyal, coyote-thistle (*Eryngium vaseyi*), brome fescue (*Festuca bromoides*), ryegrass, annual hair grass (*Deschampsia danthonioides*), and rye grass (*Festuca perennis*).

Seep



Seep habitat is present adjacent to the perennial marsh habitat on the South Site (Figure 3.4-1). Seeps are characterized as areas where groundwater intersects the soil surface. Typically, water flow from seeps persists for some period after the rainy season or, more rarely, nearly year-round. Seeps accessing sufficient amounts of subsurface water can support isolated wetland vegetation (such as on a hillside) or they may form the headwaters of other jurisdictional drainage or wetland features, such as wetland swales. Vegetation in seeps often consists of plant species associated with seasonal and semi-permanent marsh habitats. When seeps are active for only short periods beyond the rainy season and into the warm season, herbaceous perennial wetland species typically dominate, as is of the case with the seep within the project site. Vegetation in the seep consists almost entirely of iris leaved rush (*Juncus xiphioides*), an obligate wetland plant.

Table 3.4-1 Habitat Types on the Project Site

Habitat Types	Size (acres)
Upland Habitat Types	
Annual Grassland	31.15
Purple Needlegrass Grassland	*0.29*
Disturbed/Developed	3.42

Figure 3.4-1 Habitat Types on the Project Site

SENSITIVE BIOLOGICAL RESOURCES

State and Federally Protected Wetlands

The perennial marsh, seasonal wetland, wetland swale, and seep habitats on the project site may meet the state- and federal definitions of wetlands. While the seasonal drainages are not vegetated wetlands, they and all of the wetland features on the project site meet the criteria for protection as waters of the United States and state.

Sensitive Natural Communities

Sensitive natural communities are those native plant communities defined by CDFW as having limited distribution statewide or within a county or region and that are often vulnerable to environmental effects of projects (CDFW 2018). These communities may or may not contain special-status plants or their habitat (CDFW 2018). CDFW designates sensitive natural communities based on their state rarity and threat ranking using NatureServe's Heritage Methodology. Natural communities with rarity ranks of S1 to S3, where S1 is critically imperiled, S2 is imperiled, and S3 is vulnerable, are considered sensitive natural communities to be addressed in the environmental review processes of CEQA and its equivalents (CDFW 2018). Four sensitive natural communities were identified in the CNDDB as having potential to occur on the project site: central valley drainage hardhead/squawfish stream, northern hardpan vernal pool, northern volcanic mud flow vernal pool, and valley needlegrass grassland (CNDDB 2022). The project site does not contain hardhead/squawfish stream habitat, vernal pool habitat, or volcanic soils. Approximately 0.3 acres of purple needlegrass grassland is present on the South Site (Figure 3.4-1, Table 3.4-1). This sensitive natural community is also referred to as Needle grass – Melic grass grassland and has a state rank of S3S4 (i.e., vulnerable; Sawyer et al. 2009)

Many riparian plant communities qualify as sensitive natural communities based on the plant associations therein. In addition, riparian habitats are protected under section 1602 of California Fish and Game Code. The project site contains approximately 0.8 acre of riparian woodland habitat (Table 3.4-1, Figure 3.4-1).

Special-Status Species

Special-status species are defined as species that are legally protected or that are otherwise considered sensitive by federal, state, or local resource agencies. Special-status species are species, subspecies, or varieties that fall into one or more of the following categories, regardless of their legal or protection status:

- officially listed under the California Endangered Species Act (CESA) or under the federal Endangered Species Act (ESA) as endangered, threatened, or rare;
- a candidate for state or federal listing as endangered, threatened, or rare under CESA or ESA;
- taxa (i.e., taxonomic category or group) that meet the criteria for listing, even if not currently included on any list, as described in Section 15380 of the State CEQA Guidelines;
- species identified by CDFW as species of special concern;
- species listed as fully protected under the California Fish and Game Code;
- species afforded protection under local planning documents; and
- taxa considered by the CDFW to be "rare, threatened, or endangered in California" and assigned a California Rare Plant Rank (CRPR) of 1, or 2. The CDFW system includes rarity and endangerment ranks for categorizing plant species of concern, and ranks 1 and 2 are summarized as follows:
  - CRPR 1A - Plants presumed to be extinct in California;
  - CRPR 1B - Plants that are rare, threatened, or endangered in California and elsewhere;
  - CRPR 2A - Plants presumed to be extinct in California but common elsewhere; and
  - CRPR 2B - Plants that are rare, threatened, or endangered in California but more common elsewhere.

The term "California species of special concern" is applied by CDFW to animals not listed under ESA or CESA, but that are considered to be declining at a rate that could result in listing, or that historically occurred in low numbers and known threats to their persistence currently exist. CDFW's fully protected status was California's first attempt to identify and protect animals that were rare or facing extinction. Most species listed as fully protected were eventually listed as threatened or endangered under CESA; however, some species remain listed as fully protected but do not have simultaneous listing under CESA. Fully protected species may not be taken or possessed at any time and no take permits can be issued for these species except for scientific research purposes, for relocation to protect livestock, or as part of a Natural Community Conservation Plan (NCCP).

Of the 19 special-status plant species that are known to occur within the nine USGS 7.5-minute quadrangles including and surrounding the project site, three species were determined to have potential to occur on the project site based on the presence of habitat suitable for the species (CNDDB 2022; CNPS 2022; Table 3.4-2). Of the 33 special-status wildlife species known to occur within the nine USGS quadrangles, 17 species were determined to have potential to occur on the project site based on the presence of habitat suitable for the species (CNDDB 2022; USFWS 2022; Table 3.4-3). The tables describe the species' regulatory status, habitat, and potential for occurrence on the project site.

Table 3.4-2 Special-Status Plant Species Known to Occur in the Vicinity of the Project Site and Potential for Occurrence on the Project Site

Species	Listing Status[1] Federal	Listing Status[1] State	CRPR	Habitat	Potential for Occurrence
Jepson's onion *Allium jepsonii*	–	–	1B.2	On serpentine soils in Sierra foothills, volcanic soil on Table Mountain. On slopes and flats; usually in an open area. 1,165–3,710 feet in elevation. Blooms April–August. Geophyte.	Not expected to occur. The project site does not contain serpentine soils.
Big-scale balsamroot *Balsamorhiza macrolepis*	–	–	1B.2	Chaparral, valley and foothill grassland, cismontane woodland. Most often, on serpentine. 115–4,810 feet in elevation. Blooms March–June. Perennial.	May occur. While serpentine soils are not present, the project site contains annual grassland habitat, and this species is not restricted to serpentine soils (65 to 74 percent of known occurrences are on serpentine).
Stebbins' morning-glory *Calystegia stebbinsii*	FE	SE	1B.1	On red clay soils of the Pine Hill formation; gabbro or serpentine; open areas. 980–2,380 feet in elevation. Blooms April–July. Geophyte.	Not expected to occur. The project site does not contain gabbro or serpentine soils.
Chaparral sedge *Carex xerophila*	–	–	1B.2	Serpentine and gabbro soils. 900–2,530 feet in elevation. Blooms March–June. Perennial.	Not expected to occur. The project site does not contain gabbro or serpentine soils.
Pine Hill ceanothus *Ceanothus roderickii*	FE	SR	1B.1	Gabbroic or serpentine soils; often in disturbed areas with an ensemble of other rare plants. 850–2,070 feet in elevation. Blooms April–June. Perennial.	Not expected to occur. The project site does not contain gabbro or serpentine soils.
Red Hills soaproot *Chlorogalum grandiflorum*	–	–	1B.2	Occurs frequently on serpentine or gabbro, but also on non-ultramafic substrates; often on disturbed sites. 800–4,070 feet in elevation. Blooms May–June. Geophyte.	Not expected to occur. The project site does not contain gabbro or serpentine soils.
Dwarf downingia *Downingia pusilla*	–	–	2B.2	Vernal lake and pool margins with a variety of associates. In several types of vernal pools and seasonal wetlands. 0–1,610 feet in elevation. Blooms March–May. Annual.	May occur. The project site contains seasonal wetland habitat potentially suitable for this species.

Species	Listing Status[1] Federal	Listing Status[1] State	CRPR	Habitat	Potential for Occurrence
Tuolumne button-celery *Eryngium pinnatisectum*	–	–	1B.2	Volcanic soils; vernal pools and mesic sites within other natural communities. 230–3,000 feet in elevation. Blooms May–August. Annual/Perennial.	Not expected to occur. The project site does not contain volcanic soils.
Pine Hill flannelbush *Fremontodendron decumbens*	FE	SR	1B.2	Rocky ridges; gabbro or serpentine endemic; often among rocks and boulders. 1,390–2,510 feet in elevation. Blooms April–July. Perennial.	Not expected to occur. The project site does not contain gabbro or serpentine soils.
El Dorado bedstraw *Galium californicum* ssp. *sierrae*	FE	SR	1B.2	In pine-oak woodland or chaparral. Restricted to gabbroic or serpentine soils. 425–1,920 feet in elevation. Blooms May–June. Perennial.	Not expected to occur. The project site does not contain gabbro or serpentine soils.
Boggs Lake hedge-hyssop *Gratiola heterosepala*	–	SE	1B.2	Clay soils; usually in vernal pools, sometimes on lake margins. 30–7,795 feet in elevation. Blooms April–August. Annual.	Not expected to occur. The project site does not contain vernal pools or lakes.
Ahart's dwarf rush *Juncus leiospermus* var. *ahartii*	–	–	1B.2	Valley and foothill grassland. Restricted to the edges of vernal pools in grassland. 100–330 feet in elevation. Blooms March–May. Annual.	Not expected to occur. The project site does not contain vernal pools.
Legenere *Legenere limosa*	–	–	1B.1	In beds of vernal pools. 0–2,890 feet in elevation. Blooms April–June. Annual.	Not expected to occur. The project site does not contain vernal pools.
Pincushion navarretia *Navarretia myersii* ssp. *myersii*	–	–	1B.1	Vernal pools with clay soils. 145–330 feet in elevation. Blooms April–May. Annual.	Not expected to occur. The project site does not contain vernal pools.
Slender Orcutt grass *Orcuttia tenuis*	FT	SE	1B.1	Vernal pools. Often in gravelly substrate. 80–5,760 feet in elevation. Blooms May–September. Annual.	Not expected to occur. The project site does not contain vernal pools.
Sacramento Orcutt grass *Orcuttia viscida*	FE	SE	1B.1	Vernal pools, wetland. 50–280 feet in elevation. Blooms April–July. Annual.	Not expected to occur. The project site does not contain vernal pools.
Layne's ragwort *Packera layneae*	FT	SR	1B.2	Ultramafic soil (serpentine or gabbro); occasionally along streams. 655–3,560 feet in elevation. Blooms April–August. Perennial.	Not expected to occur. The project site does not contain gabbro or serpentine soils.
Sanford's arrowhead *Sagittaria sanfordii*	–	–	1B.2	In standing or slow-moving freshwater ponds, marshes, and ditches. 0–2,130 feet in elevation. Blooms May–October. Geophyte.	May occur. The project site contains seasonal drainage habitat potentially suitable for this species.
El Dorado County mule ears *Wyethia reticulata*	–	–	1B.2	Stony red clay and gabbroic soils; often in openings in gabbro chaparral. 605–2,070 feet in elevation. Blooms April–August. Perennial.	Not expected to occur. The project site does not contain gabbro or red clay soils.

Notes: CRPR = California Rare Plant Rank; CEQA = California Environmental Quality Act; ESA = Endangered Species Act; NPPA = Native Plant Protection Act

1 Legal Status Definitions

Federal:

FE Federally Listed as Endangered (legally protected by ESA)
FT Federally Listed as Threatened (legally protected by ESA)

State:

SE State Listed as Endangered (legally protected by CESA)
SR State Listed as Rare (legally protected by NPPA)

California Rare Plant Ranks (CRPR):

1B Plant species considered rare or endangered in California and elsewhere (protected under CEQA, but not legally protected under ESA or CESA).
2B Plant species considered rare or endangered in California but more common elsewhere (protected under CEQA, but not legally protected under ESA or CESA).

CRPR Threat Ranks:

0.1 Seriously threatened in California (over 80% of occurrences threatened; high degree and immediacy of threat)
0.2 Moderately threatened in California (20-80% occurrences threatened; moderate degree and immediacy of threat)

Sources: CNDDB 2022; CNPS 2022

Table 3.4-3 Special-Status Wildlife Species Known to Occur in the Vicinity of the Project Site and Their Potential for Occurrence on the Project Site

Species	Listing Status[1] Federal	Listing Status[1] State	Habitat	Potential for Occurrence
Amphibians and Reptiles				
California red-legged frog *Rana draytonii*	FT	SSC	Lowlands and foothills in or near permanent sources of deep water with dense, shrubby or emergent riparian vegetation. Requires 11-20 weeks of permanent water for larval development. Must have access to estivation habitat.	Not expected to occur. Breeding habitat marginally suitable for California red-legged frog is present in the project site within perennial marsh habitat, which holds water for at least four consecutive months (Foothill Associates 2016a). Upland migration habitat is also present on the project site (Foothill Associates 2016a). A protocol-level survey for California red-legged frog was conducted in 2016 and no California red-legged frogs were detected on the project site (Foothill Associates 2016a). The nearest known occurrence of California red-legged frog is approximately 5 miles north of the project site near Folsom Lake (CNDDB 2022). The project site is surrounded by dense residential development to the north, and it is unlikely that frogs from these documented occurrences would disperse to the project site.
California tiger salamander - central California DPS *Ambystoma californiense* pop. 1	FT	ST	Lives in vacant or mammal-occupied burrows throughout most of the year; in grassland, savanna, or open woodland habitats. Need underground refuges, especially ground squirrel burrows, and vernal pools or other seasonal water sources for breeding.	Not expected to occur. The project site is outside of the current range of California tiger salamander.
Coast horned lizard *Phrynosoma blainvillii*	–	SSC	Frequents a wide variety of habitats, most common in lowlands along sandy washes with scattered low bushes. Open areas for sunning, bushes for cover, patches of loose soil for burial, and abundant supply of ants and other insects.	May occur. The project site is within the range of coast horned lizard and annual grassland and woodland habitats on the project site may provide marginal habitat for this species.

Species	Listing Status[1] Federal	Listing Status[1] State	Habitat	Potential for Occurrence
Foothill yellow-legged frog *Rana boylii*	–	SE SSC	Partly-shaded, shallow streams and riffles with a rocky substrate in a variety of habitats. Need at least some cobble-sized substrate for egg-laying. Need at least 15 weeks to attain metamorphosis.	Not expected to occur. The nearest documented occurrence of foothill yellow-legged frog is approximately 3.4 miles north of the project site (CNDDB 2022). Most of the occurrences in the vicinity of the project site are considered extirpated (CNDDB 2022). Therefore, the likelihood of foothill yellow-legged frogs occurring on the project site is relatively low. Aquatic habitat on the project site does not provide breeding habitat suitable for this species; however, seasonal drainages on the project site are hydrologically connected with a stream west of the project site (on the west side of Clarksville Road) and the larger local watershed. The stream west of the project site, which flows into Carson Creek south of the project site, would provide only marginal habitat for foothill yellow-legged frog due to extensive shading, and the intermittent nature of the stream. Based on the marginal nature of the aquatic habitat on the project site and the lack of nearby extant occurrences of the species, foothill yellow-legged frog is unlikely to occur.
Giant garter snake *Thamnophis gigas*	FT	ST	Prefers freshwater marsh and low gradient streams. Has adapted to drainage canals and irrigation ditches. This is the most aquatic of the garter snakes in California.	Not expected to occur. The project site is outside of the current range of giant garter snake.
Western pond turtle *Emys marmorata*	–	SSC	Ponds, marshes, rivers, streams, and irrigation ditches, usually with aquatic vegetation, below 6,000 ft elevation. Needs basking sites and suitable (sandy banks or grassy open fields) upland habitat up to approximately 1,650 feet (0.5 km) from water for egg-laying.	May occur. Aquatic habitat on the project site may provide marginal habitat for western pond turtle. Additionally, suitable aquatic habitat for western pond turtle is present in a stream west of the project site and the project site may provide upland habitat suitable for the species.
Western spadefoot *Spea hammondii*	–	SSC	Occurs primarily in grassland habitats, but can be found in valley-foothill hardwood woodlands. Vernal pools are essential for breeding and egg-laying.	May occur. The nearest documented occurrence of western spadefoot is approximately 3.8 miles northwest of the project site near Folsom Lake (CNDDB 2022). While marginal, the seasonal wetland habitats on the project site may provide habitat suitable for this species.
Birds				
Bald eagle *Haliaeetus leucocephalus*	FD	SE FP	Ocean shore, lake margins, and rivers for both nesting and wintering. Most nests within 1 mile of water. Nests in large, old-growth, or dominant live tree with open branches, especially ponderosa pine. Roosts communally in winter.	Not expected to occur. Nesting habitat suitable for bald eagle (i.e., large trees within 1 mile of water) is not present on the project site.

Species	Listing Status[1] Federal	Listing Status[1] State	Habitat	Potential for Occurrence
Bank swallow *Riparia riparia*	–	ST	Colonial nester; nests primarily in riparian and other lowland habitats west of the desert. Requires vertical banks/cliffs with fine-textured/sandy soils near streams, rivers, lakes, ocean to dig nesting hole.	Not expected to occur. Bank or cliff habitat suitable for bank swallows is not present on the project site.
Burrowing owl *Athene cunicularia*	–	SSC	Open, dry annual or perennial grasslands, deserts and scrublands characterized by low-growing vegetation. Subterranean nester, dependent upon burrowing mammals, most notably, the California ground squirrel.	May occur. The project site is within the wintering range of burrowing owl and contains annual grassland habitat that may provide wintering habitat suitable for this species. A protocol-level survey for burrowing owl was conducted in 2016 and no burrowing owls or their sign (e.g., burrows, scat, pellets) were detected on the project site (Foothill Associates 2016a). However, burrowing owls may have established burrows on the project site since completion of the 2016 survey.
California black rail *Laterallus jamaicensis coturniculus*	–	ST FP	Inhabits freshwater marshes, wet meadows and shallow margins of saltwater marshes bordering larger bays. Needs water depths of about 1 inch that do not fluctuate during the year and dense vegetation for nesting habitat.	Not expected to occur. The perennial marsh habitat on the project site does not provide sufficient nesting habitat for California black rail due to its limited size and lack of connectivity to other marsh habitat nearby.
Golden eagle *Aquila chrysaetos*	–	FP	Rolling foothills, mountain areas, sage-juniper flats, and desert. Cliff-walled canyons provide nesting habitat in most parts of range; also, large trees in open areas.	Not expected to occur. The nearest documented nesting occurrence of golden eagle is approximately 2 miles northwest of the project site (CNDDB 2022). This documented nest is atypical for golden eagles because it is surrounded by residential development. The project site does not contain nesting habitat (i.e., large trees surrounded by open habitat) for golden eagle.
Grasshopper sparrow *Ammodramus savannarum*	–	SSC	Dense grasslands on rolling hills, lowland plains, in valleys and on hillsides on lower mountain slopes. Favors native grasslands with a mix of grasses, forbs and scattered shrubs. Loosely colonial when nesting.	May occur. Annual grassland habitat potentially suitable for grasshopper sparrow is present on the project site.
Loggerhead shrike *Lanius ludovicianus*	–	SSC	Broken woodlands, savannah, pinyon-juniper, Joshua tree, and riparian woodlands, desert oases, scrub and washes. Prefers open country for hunting, with perches for scanning, and fairly dense shrubs and brush for nesting.	May occur. The oak woodland on the project site may provide nesting habitat suitable for loggerhead shrike.
Northern harrier *Circus hudsonius*	–	SSC	Nest and forage in grasslands, from salt grass in desert sink to mountain cienagas. Nests on ground in shrubby vegetation, usually at marsh edge; nest built of a large mound of sticks in wet areas.	May occur. The perennial marsh and annual grassland on the project site may provide nesting habitat suitable for northern harrier.

Species	Listing Status[1] Federal	Listing Status[1] State	Habitat	Potential for Occurrence
Purple martin *Progne subis*	–	SSC	Inhabits woodlands, low elevation coniferous forest of Douglas-fir, ponderosa pine, and Monterey pine. Nests in old woodpecker cavities mostly, also in human-made structures. Nest often located in tall, isolated tree/snag.	Not expected to occur. The project site does not contain coniferous forest habitat or human-made structures suitable for purple martin nesting.
Swainson's hawk *Buteo swainsoni*	–	ST	Breeds in grasslands with scattered trees, juniper-sage flats, riparian areas, savannahs, and agricultural or ranch lands with groves or lines of trees. Requires adjacent suitable foraging areas such as grasslands, or alfalfa or grain fields supporting rodent populations.	May occur. Nesting habitat potentially suitable for Swainson's hawk is present in oak woodlands on the project site.
Tricolored blackbird *Agelaius tricolor*	–	ST SSC	Highly colonial species, most numerous in Central Valley and vicinity. Largely endemic to California. Requires open water, protected nesting substrate, and foraging area with insect prey within a few kilometers of the colony.	May occur. The project site contains a large bramble of Himalayan blackberry that may provide nesting habitat suitable for tricolored blackbirds.
White-tailed kite *Elanus leucurus*	–	FP	Rolling foothills and valley margins with scattered oaks and river bottomlands or marshes next to deciduous woodland. Open grasslands, meadows, or marshes for foraging close to isolated, dense-topped trees for nesting and perching.	May occur. Nesting habitat potentially suitable for white-tailed kite is present in oak woodlands on the project site.
Yellow warbler *Setophaga petechia*	–	SSC	Dense riparian plant associations in close proximity to water. Also nests in montane shrubbery in open conifer forests in Cascades and Sierra Nevada. Frequently found nesting and foraging in willow shrubs and thickets, and in other riparian plants including cottonwoods, sycamores, ash, and alders.	Not expected to occur. The project site does not contain dense riparian nesting habitat suitable for this species.
Yellow-breasted chat *Icteria virens*	–	SSC	Summer resident; inhabits riparian thickets of willow and other brushy tangles near watercourses. Nests in low, dense riparian, consisting of willow, blackberry, wild grape; forages and nests within 10 feet of ground.	May occur. The project site contains a large bramble of Himalayan blackberry that may provide nesting habitat suitable for yellow-breasted chat.

Species	Listing Status[1] Federal	Listing Status[1] State	Habitat	Potential for Occurrence
Fish				
Delta smelt *Hypomesus transpacificus*	FT	SE	Sacramento-San Joaquin Delta. Seasonally in Suisun Bay, Carquinez Strait and San Pablo Bay.	Not expected to occur. The project site does not contain aquatic habitat suitable for this species.
Steelhead - Central Valley DPS *Oncorhynchus mykiss irideus* pop. 11	FT	–	Populations in the Sacramento and San Joaquin rivers and their tributaries.	Not expected to occur. The project site does not contain aquatic habitat suitable for this species.
Invertebrates				
Crotch bumble bee *Bombus crotchii*	–	–	Coastal California east to the Sierra-Cascade crest and south into Mexico. Food plant genera include *Antirrhinum*, *Phacelia*, *Clarkia*, *Dendromecon*, *Eschscholzia*, and *Eriogonum*.	May occur. While the population of crotch bumble bee has declined significantly, the project site is within the current range of this species. The nearest recent (2020) occurrence of crotch bumble bee is approximately 11 miles southwest of the project site (CNDDB 2022). The project site contains floral resources and natural habitat that may provide foraging, breeding, and overwintering habitat suitable for crotch bumble bee.
Monarch *Danaus plexippus*	FC	–	Winter roost sites extend along the coast from northern Mendocino to Baja California, Mexico. Roosts located in wind-protected tree groves (eucalyptus, Monterey pine, cypress), with nectar and water sources nearby. Along migration routes and within summer ranges, monarch butterflies require two suites of plants: (1) host plants for monarch caterpillars, which are primarily milkweeds (*Asclepias* spp.) within the family Apocynaceae upon which adult monarchs lay eggs; and (2) nectar-producing flowering plants of many other species that provide food for adult butterflies. Having both host and nectar plants available from early spring to late fall and along migration corridors is critical to the survival of migrating pollinators.	May occur. The project site is outside of the overwintering range of monarch butterflies. However, milkweed plants and other floral resources are present on the project site (Helix Environmental Planning 2020a); thus, monarch may forage or breed on the project site.
Valley elderberry longhorn beetle *Desmocerus californicus dimorphus*	FT	–	Occurs only in the Central Valley of California, in association with blue elderberry (*Sambucus nigra* ssp. *caerulea*). Prefers to lay eggs in elderberry stems 2-8 inches in diameter; some preference shown for "stressed" elderberry shrubs.	May occur. The South Site contains two blue small clumps of elderberry shrubs, which may provide habitat suitable for valley elderberry longhorn beetle.

Species	Listing Status[1] Federal	Listing Status[1] State	Habitat	Potential for Occurrence
Vernal pool fairy shrimp *Branchinecta lynchi*	FT	–	Endemic to the grasslands of the Central Valley, Central Coast mountains, and South Coast mountains, in astatic rain-filled pools. Inhabit small, clear-water sandstone-depression pools and grassed swale, earth slump, or basalt-flow depression pools.	Not expected to occur. The project site does not contain vernal pool habitat.
Vernal pool tadpole shrimp *Lepidurus packardi*	FE	–	Inhabits vernal pools and swales in the Sacramento Valley containing clear to highly turbid water. Pools commonly found in grass bottomed swales of unplowed grasslands. Some pools are mud-bottomed and highly turbid.	Not expected to occur. The project site does not contain vernal pool habitat.
Western bumble bee Bombus occidentalis	–	–	Bumble bees have three basic habitat requirements: suitable nesting sites for the colonies, availability of nectar and pollen from floral resources throughout the duration of the colony period (spring, summer, and fall), and suitable overwintering sites for the queens.	Not expected to occur. The project site is outside of the current range of western bumble bee, which includes high elevation areas in the Sierra Nevada and some areas along the northern California coast (Xerces 2018).
Mammals				
American badger *Taxidea taxus*	–	SSC	Most abundant in drier open stages of most shrub, forest, and herbaceous habitats, with friable soils. Needs sufficient food, friable soils and open, uncultivated ground. Preys on burrowing rodents. Digs burrows.	May occur. Annual grassland habitat potentially suitable for American badger is present on the project site.
Fisher - West Coast DPS *Pekania pennanti*	–	SSC	Intermediate to large-tree stages of coniferous forests and deciduous-riparian areas with high percent canopy closure. Uses cavities, snags, logs and rocky areas for cover and denning. Needs large areas of mature, dense forest. Endangered status applies to Southern Sierra DPS.	Not expected to occur. The project site is outside of the current range of this species.
Pallid bat *Antrozous pallidus*	–	SSC	Deserts, grasslands, shrublands, woodlands and forests. Most common in open, dry habitats with rocky areas for roosting. Roosts must protect bats from high temperatures. Very sensitive to disturbance of roosting sites.	May occur. Large oak trees on the project site may provide roosting habitat suitable for pallid bat.
Ringtail *Bassariscus astutus*	–	FP	Riparian habitats, forest habitats, and shrub habitats in lower to middle elevations.	Not expected to occur. While the project site contains riparian woodland and valley oak woodland that may provide habitat suitable for ringtail, the habitat is marginal due to surrounding urban and residential development and lack of connectivity with other natural habitat.

Species	Listing Status[1] Federal	Listing Status[1] State	Habitat	Potential for Occurrence
Western red bat *Lasiurus blossevillii*	–	SSC	Roosts primarily in trees, 2-40 feet above ground, from sea level up through mixed conifer forests. Prefers habitat edges and mosaics with trees that are protected from above and open below with open areas for foraging.	May occur. Large oak trees on the project site may provide roosting habitat suitable for western red bat.

Wildlife Movement Corridors

A wildlife movement corridor is generally a topographical/landscape feature or movement zone that connects two or more natural habitat areas. Wildlife corridors link areas of suitable wildlife habitat that are separated by variation in vegetation, rugged terrain, human disturbance and habitat fragmentation, or other biophysical factors. Movement corridors may provide favorable locations for wildlife to travel between different habitat areas, such as foraging sites, breeding sites, cover areas, and preferred summer and winter range locations. They may also function as dispersal corridors allowing animals to move between various locations within their range. Therefore, wildlife movement and migration corridors are considered an important ecological resource by CDFW and other agencies and are protected by many local governments in California.

Some of the important areas for habitat connectivity in California were mapped as Essential Connectivity Areas (ECA) for the California Essential Habitat Connectivity Project, which was commissioned by the California Department of Transportation and CDFW with the purpose of making transportation and land-use planning more efficient and less costly, while helping reduce dangerous wildlife-vehicle collisions (Spencer et al. 2010). The ECAs were not developed for the purposes of defining areas subject to specific regulations by CDFW or other agencies. The project site is located within a modeled ECA, connecting natural landscape blocks to the south to undeveloped areas north and east of the project site (Figure 3.4-2). The project site contains natural habitat; however, it is surrounded by residential development to the north and west and US 50 to the south. Therefore, it is unlikely that the project site currently functions as a critical habitat linkage; however, it likely functions as a movement corridor for some wildlife species.

Wildlife Nursery Sites

Nursery sites are locations where fish or wildlife concentrate for hatching and/or raising young, such as nesting rookeries for birds (e.g., herons, egrets), spawning areas for native fish, fawning areas for mule deer (*Odocoileus hemionus*), and maternal roosts for bats. The valley oak woodland and riparian woodland habitats on the project site may provide roosting habitat potentially suitable for special-status bats (e.g., pallid bat) or common bat species (e.g., big brown bat [*Eptesicus fuscus*], silver-haired bat [*Lasionycteris noctivagans*]).

Figure 3.4-2 Essential Connectivity Areas and Natural Landscape Blocks in the Vicinity of the Project Site

3.4.3 Environmental Impacts and Mitigation Measures

METHODOLOGY

This impact evaluation is based on existing biological resource assessments, review of aerial photographs, and review of existing databases that address biological resources in the project vicinity as described above.

THRESHOLDS OF SIGNIFICANCE

An impact on biological resources is considered significant if implementation of EDH 52 Commercial Center Project would do any of the following:

- have a substantial adverse effect, either directly or through habitat modifications, on any species identified as a candidate, sensitive, or special-status species in local or regional plans, policies, or regulations, or by CDFW or USFWS;
- have a substantial adverse effect on any riparian habitat or other sensitive natural community identified in local or regional plans, policies, or regulations or by CDFW or USFWS;
- have a substantial adverse effect on state or federally protected wetlands (including, but not limited to, marsh, vernal pool, coastal, etc.) through direct removal, filling, hydrological interruption, or other means;
- interfere substantially with the movement of any native resident or migratory fish or wildlife species or with established native resident or migratory wildlife corridors, or impede the use of native wildlife nursery sites;
- conflict with any local policies or ordinances protecting biological resources, such as a tree preservation policy or ordinance; and/or
- conflict with the provisions of an adopted Habitat Conservation Plan, Natural Community Conservation Plan, or other approved local, regional, or state habitat conservation plan.

ISSUES NOT DISCUSSED FURTHER

Consistency with Habitat Conservation Plans

The project site is not located within the plan area of any adopted habitat conservation plan, natural community conservation plan, or other approved local, regional, or state habitat conservation plan. Therefore, this impact is not discussed further.

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Impact 3.4-1: Result in Disturbance or Loss of Special-Status Plant Species

Development of the project site, including ground disturbance associated with construction of roads, parking areas, or buildings, could result in direct removal, or damage that results in eventual death or loss of special-status plants, if present on the project site. Because the loss of special-status plants could substantially affect the abundance, distribution, and viability of local and regional populations of these species, this would be a **significant** impact.

A total of 19 special-status plant species were identified as having potential to occur within the vicinity of the project site (Table 3.4-2; CNDDB 2022, CNPS 2022). Of these 19 species, three have potential to occur on the project site: big-scale balsamroot, dwarf downingia, and Sanford's arrowhead. Protocol-level surveys for special-status plants were conducted on the project site in 2015, and these species were not observed (Foothill Associates 2016b). However, because these surveys were conducted approximately seven years ago, and because there has not been any

significant disturbance (i.e., vegetation removal, ground disturbance) on the project site, it is possible that these species could have colonized suitable habitat within the project site since the surveys.

North Site

Development of the North Site, including ground disturbance associated with construction of roads, parking areas, or buildings, as well as extension of a natural gas pipeline approximately 1,900 feet north of the site along eastern side of Silva Valley Parkway, could result in direct removal of special-status plants, if present on the North Site, or in habitat alterations or plant damage that leads to the ultimate death of special-status plants or failure to successfully reproduce. Loss of special-status plants could substantially affect the abundance, distribution, and viability of local and regional populations of these species; thus, this would be a **significant** impact.

South Site

Development of the South Site, including ground disturbance associated with construction of roads, parking areas, or buildings, extension of a natural gas pipeline approximately 1,900 feet north of the site along eastern side of Silva Valley Parkway and the connection to the existing sewer pipeline along the western side of Clarksville Crossing, could result in direct removal of special-status plants, if present on the South Site, or in habitat alterations or plant damage that leads to the ultimate death of special-status plants or failure to successfully reproduce. Loss of special-status plants could substantially affect the abundance, distribution, and viability of local and regional populations of these species; thus, this would be a **significant** impact.

Mitigation Measures

Mitigation 3.4-1: Conduct Special-Status Plant Surveys and Implement Avoidance Measures and Mitigation

- Before implementation of project activities and during the blooming period for the special-status plant species with potential to occur on the project site, a qualified botanist shall conduct protocol-level surveys for special-status plants within the project site following survey methods from CDFW's *Protocols for Surveying and Evaluating Impacts on Special-Status Native Plant Populations and Natural Communities* (CDFW 2018 or most recent version). The qualified botanist shall: 1) be knowledgeable about plant taxonomy, 2) be familiar with plants of the Sierra Nevada region, including special-status plants and sensitive natural communities, 3) have experience conducting floristic botanical field surveys as described in CDFW 2018, 4) be familiar with the *California Manual of Vegetation* (Sawyer et al. 2009 or current version, including updated natural communities data at http://vegetation.cnps.org/), and 5) be familiar with federal and state statutes and regulations related to plants and plant collecting.
- If special-status plants are not found, the botanist shall document the findings in a report to the applicant and El Dorado County, and no further mitigation shall be required.

Typical Blooming Period for Special-Status Plants That May Occur within the Project Site[1]

Species	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Big-scale balsamroot												
Dwarf downingia												
Sanford's arrowhead												

[1] This is the published blooming period for the species across their entire range and through history. The actual blooming period for any species at a given location in a given year is variable and should be based on observations of nearby reference populations.

Source: Data compiled by Ascent Environmental in 2022; CNPS 2022

- If special-status plants are found during special-status plant surveys and cannot be avoided, the applicant shall, in consultation with CDFW or USFWS, as appropriate depending on species status, develop and implement a site-specific mitigation strategy to compensate for loss of occupied habitat or individuals. Mitigation measures shall include, at a minimum, preserving and enhancing existing populations, establishing populations through seed collection or transplantation from the site that is to be affected, and/or restoring or creating habitat in sufficient quantities to offset loss of occupied habitat or individuals. Potential mitigation sites could include suitable locations

within or outside of the project site. Habitat and individual plants lost shall be mitigated at a minimum 1:1 ratio, considering acreage as well as function and value. Success criteria for preserved and compensatory populations shall include:

- The extent of occupied area and plant density (number of plants per unit area) in compensatory populations shall be equal to or greater than the affected occupied habitat.
- Compensatory and preserved populations shall be self-producing. Populations would be considered self-producing when:
  - plants reestablish annually for a minimum of five years with no human intervention such as supplemental seeding; and
  - reestablished and preserved habitats contain an occupied area and flower density comparable to existing occupied habitat areas in similar habitat types in the project vicinity.
  - If off-site mitigation includes dedication of conservation easements, purchase of mitigation credits, or other off-site conservation measures, the details of these measures shall be included in the mitigation plan, including information on responsible parties for long-term management, conservation easement holders, long-term management requirements, success criteria such as those listed above and other details, as appropriate to target the preservation of long-term viable populations.

Significance after Mitigation

Implementation of Mitigation Measure 3.4-1 would reduce significant impacts on special-status plants to a **less-than-significant** level by requiring protocol-level surveys for special-status plants and implementation of avoidance measures and compensation for impacts on special-status plants if present on the project site and offsite infrastructure improvements.

Impact 3.4-2: Result in Disturbance to or Loss of Special-Status Wildlife Species and Habitat

Project implementation would include land use conversion and development activities including ground disturbance, vegetation removal, and overall conversion of wildlife habitat, which could result in disturbance, injury, or mortality of several special-status wildlife species if present, reduced breeding productivity of these species, and loss of species habitat. This would be a **potentially significant** impact.

Seventeen special-status wildlife species have potential to occur on the project site: coast horned lizard, western pond turtle, western spadefoot, burrowing owl, grasshopper sparrow, loggerhead shrike, northern harrier, Swainson's hawk, tricolored blackbird, white-tailed kite, yellow-breasted chat, crotch bumble bee, monarch, valley elderberry longhorn beetle, American badger, pallid bat, and western red bat. Additionally, native birds without special status protected by California Fish and Game Code and the federal MBTA may also nest on the project site. Project activities associated with development of the North Site and South Site and extension of a natural gas pipeline along eastern side of Silva Valley Parkway (i.e., tree removal, vegetation clearing, ground disturbance, staging, heavy equipment use) may result in direct loss of special-status wildlife species, loss of or disturbance to nests or dens, or disturbance leading to abandonment of active nests or dens.

Coast Horned Lizard and Western Spadefoot

Coast horned lizards typically occur in open areas with loose soil and scattered, low bushes for cover. Habitat potentially suitable for coast horned lizard on the project site includes annual grassland and valley oak woodland habitat. Western spadefoot has potential to occur in low-elevation (i.e., less than approximately 1,000 feet) grassland and oak woodland habitats that contain vernal pools or other seasonal wetland habitat formed by winter rains. Seasonal wetland habitat on the project site may provide marginal habitat for western spadefoot.

North Site

Project activities (i.e., vegetation clearing, ground disturbance, staging, heavy equipment use) may result in direct loss of coast horned lizards or western spadefoot if present on the North Site. This would be a **significant** impact.

South Site

Project activities (i.e., vegetation clearing, ground disturbance, staging, heavy equipment use) may result in direct loss of coast horned lizards or western spadefoot if present on the South Site as well as the proposed connection to the existing sewer pipeline along the western side of Clarksville Crossing. This would be a **significant** impact.

Mitigation Measures

Mitigation 3.4-2a: Conduct Preconstruction Surveys for Coast Horned Lizard and Western Spadefoot, Implement Avoidance Measures, and Relocate Individuals

- A qualified biologist familiar with the life history of coast horned lizard and western spadefoot shall conduct a focused visual survey of habitat suitable for these species within the project site, which shall include walking linear transects of the project site. The biologist shall identify burrow habitat potentially suitable for western spadefoot and will inspect the burrows for use by western spadefoots, which may include the use of a borescope or other methods. The surveys shall be conducted at the appropriate time of year to detect western spadefoot, generally the breeding season, according to methods approved by CDFW.
- If coast horned lizards or western spadefoot are not detected during the focused survey, the qualified biologist shall submit a report summarizing the results of the survey to the applicant and El Dorado County, and further mitigation shall not be required.
- If western spadefoot is found in habitat that will be eliminated or made unsuitable for western spadefoot, then a plan to collect and relocate adult and larval western spadefoot and egg masses to suitable habitat that will be preserved in perpetuity.
- If coast horned lizards are detected, a qualified biologist with an appropriate CDFW Scientific Collecting Permit that allows handling of reptiles and amphibians shall be present during initial ground disturbance activities and shall inspect the project site before initiation of project activities. If coast horned lizards or western spadefoot toads are detected, the qualified biologist shall move individuals into nearby suitable habitat for the respective species that will not be disturbed by project activities.

Significance after Mitigation

Implementation of Mitigation Measure 3.5-2a would reduce potential impacts on coast horned lizard and western spadefoot to a **less-than-significant** level by requiring focused visual surveys for the species and relocation to protected suitable habitat of individuals by a qualified biologist with an appropriate CDFW Scientific Collecting Permit, if detected.

Western Pond Turtle

Western pond turtle can be found in many different aquatic habitats, including ponds (natural or human-made), marshes, rivers, and irrigation ditches. Western pond turtle uses upland habitat for basking and egg-laying. Upland habitat may include grasslands, scrub, or woodland habitats. Western pond turtles are known to travel into uplands up to 0.3 mile (approximately 1,600 feet) from aquatic habitat (Reese and Welsh 1997).

North Site

Project activities (i.e., vegetation clearing, ground disturbance, staging, heavy equipment use, fill of wetlands and other waters) may result in direct loss of western pond turtles and occupied burrows if present on the North Site. This would be a **significant** impact.

South Site

Project activities (i.e., vegetation clearing, ground disturbance, staging, heavy equipment use, fill of wetlands and other waters) may result in direct loss of western pond turtles and occupied burrows if present on the South Site as well as if they are present along the proposed connection corridor to the existing sewer pipeline along the western side of Clarksville Crossing. This would be a **significant** impact.

Mitigation Measures

Mitigation 3.4-2b: Conduct Preconstruction Surveys for Western Pond Turtle, Implement Avoidance Measures, and Relocate Individuals

- Within 24 hours of commencement of ground disturbing activities, a qualified biologist familiar with the life history of western pond turtle and experienced in performing surveys for western pond turtle shall conduct a focused survey of aquatic and upland habitat suitable for the species within the project site. The qualified biologist shall inspect the project site for western pond turtles as well as suitable burrow habitat.
- If western pond turtles are not detected during the focused survey, the qualified biologist shall submit a report summarizing the results of the survey to the applicant and El Dorado County, and further mitigation shall not be required.
- If western pond turtles are detected, a no-disturbance buffer of at least 100 feet shall be established around any identified nest sites or overwintering sites until the nest is no longer active as determined by a qualified biologist, and no project activities will occur within the no-disturbance buffer. A qualified biologist with an appropriate CDFW Scientific Collecting Permit that allows handling of reptiles shall be present during initial ground disturbance activities and shall inspect the project site before initiation of project activities. If western pond turtles are detected, the qualified biologist shall move the turtles to Carson Creek or its tributaries that provide suitable aquatic habitat for western pond turtle.

Significance after Mitigation

Implementation of Mitigation Measures 3.5-2b would reduce potential impacts on western pond turtle to a **less-than-significant** level by requiring focused surveys for the species, implementation of measures to avoid injury or mortality of western pond turtles if detected, and relocation of individual turtles by a qualified biologist with an appropriate CDFW Scientific Collecting Permit.

Burrowing Owl

Annual grassland habitat on the project site may provide habitat suitable for this species. The project site and vicinity are located in the westernmost extent of the range of burrowing owl on the western slope of the Sierra Nevada. The portion of the species' range that overlaps the project site is considered winter range for burrowing owl; therefore, burrowing owls are not expected to nest on the project site. However, burrowing owls may overwinter on the project site. Protocol-level surveys for burrowing owls were conducted on the project site in 2015, and burrowing owls were not observed (Foothill Associates 2016c). However, because these surveys were conducted approximately seven years ago, it is possible that burrowing owls could have established overwintering burrows within the project site since the surveys.

North Site

Project activities (i.e., vegetation clearing, ground disturbance, staging, heavy equipment use) may result in direct loss of burrowing owls or active burrows if present on the North Site. This would be a **significant** impact.

South Site

Project activities (i.e., vegetation clearing, ground disturbance, staging, heavy equipment use) may result in direct loss of burrowing owls or active burrows if present on the South Site as well as if they are present along the proposed connection corridor to the existing sewer pipeline along the western side of Clarksville Crossing. This would be a **significant** impact.

Mitigation Measures

Mitigation 3.4-2c: Conduct Take Avoidance Survey for Burrowing Owl, Implement Avoidance Measures, and Compensate for Loss of Occupied Burrows

- A qualified biologist shall conduct a focused survey for burrowing owls in areas of habitat suitable for the species on and within 1,640 feet (500 meters) of the project site no less than 14 days before initiating ground disturbance

activities using survey methods described in Appendix D of the CDFW Staff Report on Burrowing Owl Mitigation (CDFW 2012).

- If no occupied burrows are found, the qualified biologist shall submit a report documenting the survey methods and results to the applicant and El Dorado County, and no further mitigation shall be required.
- If an active burrow is found within 1,500 feet of pending construction activities that would occur during the nonbreeding season (September 1 through January 31), the applicant shall establish and maintain a minimum protection buffer of 164 feet (50 meters) around the occupied burrow throughout construction. The actual buffer size shall be determined by the qualified biologist based on the time of year and level of disturbance in accordance with guidance provided in the CDFW Staff Report on Burrowing Owl Mitigation (CDFW 2012). The protection buffer may be adjusted if, in consultation with CDFW, a qualified biologist determines that an alternative buffer would not disturb burrowing owl use of the burrow because of particular site features or other buffering measures. If occupied burrows are present that cannot be avoided or adequately protected with a no-disturbance buffer, a burrowing owl exclusion plan shall be developed, as described in Appendix E of the CDFW Staff Report. Burrowing owls shall not be excluded from occupied burrows until the project burrowing owl exclusion plan is approved by CDFW. The exclusion plan shall include a compensatory habitat mitigation plan (see below).
- If an active burrow is found during the breeding season (February 1 through August 31), occupied burrows shall not be disturbed and shall be provided with a protective buffer at a minimum of 164 feet unless a qualified biologist verifies through noninvasive means that either: (1) the birds have not begun egg laying, or (2) juveniles from the occupied burrows are foraging independently and are capable of independent survival. The size of the buffer may be adjusted depending on the time of year and level of disturbance as outlined in the CDFW Staff Report. The size of the buffer may be reduced if a broad-scale, long-term, monitoring program acceptable to CDFW is implemented so that burrowing owls are not adversely affected. Once the fledglings are capable of independent survival, the owls can be evicted, and the burrow can be destroyed per the terms of a CDFW-approved burrowing owl exclusion plan developed in accordance with Appendix E of CDFW Staff Report.
- If burrowing owls are evicted from burrows and the burrows are destroyed by implementation of project activities, the applicant shall mitigate the loss of occupied habitat in accordance with guidance provided in the CDFW Staff Report, which states that permanent impacts on nesting, occupied and satellite burrows, and burrowing owl habitat (i.e., grassland habitat with suitable burrows) shall be mitigated such that habitat acreage and number of burrows are replaced through permanent conservation of comparable or better habitat with similar vegetation communities and burrowing mammals (e.g., ground squirrels) present to provide for nesting, foraging, wintering, and dispersal. The applicant shall retain a qualified biologist to develop a burrowing owl mitigation and management plan that incorporates the following goals and standards:
    - Mitigation lands shall be selected based on comparison of the habitat lost to the compensatory habitat, including type and structure of habitat, disturbance levels, potential for conflicts with humans, pets, and other wildlife, density of burrowing owls, and relative importance of the habitat to the species throughout its range.
    - If feasible, mitigation lands shall be provided adjacent or proximate to the project site so that displaced owls can relocate with reduced risk of injury or mortality. Feasibility of providing mitigation adjacent or proximate to the project site depends on availability of sufficient habitat to support displaced owls that may be preserved in perpetuity.
    - If habitat suitable for burrowing owl is not available for conservation adjacent or proximate to the project site, mitigation lands can be secured offsite and shall aim to consolidate and enlarge conservation areas outside of planned development areas and within foraging distance of other conservation lands. Mitigation may be also accomplished through purchase of mitigation credits at a CDFW-approved mitigation bank, if available. Alternative mitigation sites and acreages may also be determined in consultation with CDFW.
    - If burrowing owl habitat mitigation is completed through permittee-responsible conservation lands, the mitigation plan shall include mitigation objectives, site selection factors, site management roles and

responsibilities, vegetation management goals, financial assurances and funding mechanisms, performance standards and success criteria, monitoring and reporting protocols, and adaptive management measures. Success shall be based on the number of adult burrowing owls and pairs using the site and if the numbers are maintained over time. Measures of success, as suggested in the CDFW Staff Report, shall include site tenacity, number of adult owls present and reproducing colonization by burrowing owls from elsewhere, changes in distribution, and trends in stressors.

Significance after Mitigation

Implementation of Mitigation Measure 3.5-2c would reduce potential impacts on burrowing owl to a **less-than-significant** level by requiring protocol-level surveys for the species, implementation of measures to avoid injury or mortality of burrowing owls and destruction of active burrows if detected, and compensation for loss of burrows.

Special-Status Birds and Other Native Nesting Birds

Six special-status bird species have potential to nest on the project site: grasshopper sparrow, loggerhead shrike, northern harrier, Swainson's hawk, tricolored blackbird, white-tailed kite, and yellow-breasted chat (Table 3.4-3). These species may nest in grassland and trees on the project site. Additionally, other raptor species (e.g., Cooper's hawk [*Accipiter cooperi*], red-tailed hawk [*Buteo jamaicensis*], red-shouldered hawk [*Buteo lineatus*]) and other native nesting birds could nest on the project site, and these species and their nests are protected under California Fish and Game Code and MBTA.

North Site

Project activities (i.e., tree removal, vegetation clearing, ground disturbance, staging, heavy equipment use) may result in direct loss of special-status birds or active nests if present on the North Site. Additionally, operation of heavy equipment and other construction activities could result in noise or visual stimuli that could result in disturbance to nearby nesting birds, which may result in nest abandonment and potential loss of eggs or chicks. This would be a **significant** impact.

South Site

Project activities (i.e., tree removal, vegetation clearing, ground disturbance, staging, heavy equipment use) may result in direct loss of special-status birds or active nests if present on the South Site as well as if they are present along the proposed connection corridor to the existing sewer pipeline along the western side of Clarksville Crossing. Additionally, operation of heavy equipment and other construction activities could result in noise or visual stimuli that could result in disturbance to nearby nesting birds, which may result in nest abandonment and potential loss of eggs or chicks. This would be a **significant** impact.

Mitigation Measures

Mitigation 3.4-2d: Conduct Focused Surveys for Special-Status Birds, Nesting Raptors, and Other Native Nesting Birds and Implement Protective Buffers

- To minimize the potential for loss of special-status bird species, raptors, and other native birds, project activities (e.g., tree removal, vegetation clearing, ground disturbance, staging) shall be conducted during the nonbreeding season (approximately September 1-January 31, as determined by a qualified biologist), if feasible. If project activities are conducted during the nonbreeding season, no further mitigation shall be required.
- Within 14 days before the onset of project activities during the breeding season (approximately February 1 through August 31, as determined by a qualified biologist), a qualified biologist familiar with birds of California and with experience conducting nesting bird surveys shall conduct focused surveys for special-status birds, other nesting raptors, and other native birds. Surveys shall be conducted in accessible areas within 0.25 mile of the project site for Swainson's hawk, within 500 feet of the project site for other raptor species and special-status birds, and within 50 feet of the project site for non-raptor common native bird nests.
- If no active nests are found, the qualified biologist shall submit a report documenting the survey methods and results to the applicant and El Dorado County, and no further mitigation shall be required.

- If active nests are found, impacts on nesting birds shall be avoided by establishing appropriate buffers around active nest sites identified during focused surveys to prevent disturbance to the nest. Project activity shall not commence within the buffer areas until a qualified biologist has determined that the young have fledged, the nest is no longer active, or reducing the buffer would not likely result in nest abandonment. Buffers typically shall be 0.25 mile for Swainson's hawk, and 500 feet for other raptors. Buffer size for non-raptor bird species shall be determined by a qualified biologist. Factors to be considered for determining buffer size shall include presence of natural buffers provided by vegetation or topography, nest height above ground, baseline levels of noise and human activity, species sensitivity, and proposed project activities. Generally, buffer size for these species shall be at least 20 feet. The size of the buffer may be adjusted if a qualified biologist, determines that such an adjustment shall not be likely to adversely affect the nest. Any buffer reduction for a special-status species shall require consultation with CDFW. Periodic monitoring of the nest by a qualified biologist during project activities shall be required if the activity has potential to adversely affect the nest, the buffer has been reduced, or if birds within active nests are showing behavioral signs of agitation (e.g., standing up from a brooding position, flying off the nest) during project activities, as determined by the qualified biologist.

Significance after Mitigation

Implementation of Mitigation Measure 3.4-2d would reduce potential impacts on special-status birds, raptors, and other native nesting birds to a **less-than-significant** level by requiring focused surveys for the nesting birds and implementation of measures to avoid disturbance, injury, or mortality of the species if nests are detected.

Crotch Bumble Bee

Crotch bumble bee was designated as a candidate for listing as endangered under CESA by the California Fish and Game Commission on June 12, 2019. A November 13, 2020, court decision by the Superior Court of Sacramento ruled that insects are not eligible for listing under CESA and vacated the candidacy of this and four other bumble bee species. Although crotch bumble bee is not currently a candidate for listing under CESA, the species is imperiled and considered sufficiently rare by the scientific community to be considered a special-status species under CEQA. Crotch bumble bee has recently undergone a decline in abundance and distribution and is no longer present across much of its historic range. In California, crotch bumble bee populations are currently largely restricted to the Central Valley and adjacent foothills (Williams et al. 2014; Xerces 2018). There is a known occurrence of crotch bumble bee approximately 11 miles southwest of the project site (CNDDB 2022).

Although the life history characteristics of crotch bumble bees are not well understood, bumble bees have three basic habitat requirements: suitable nesting sites for the colonies, availability of nectar and pollen from floral resources throughout the duration of the colony period (spring, summer, and fall), and suitable overwintering sites for queens. Bumble bees in general are capable of flying up to approximately 6 miles from the nest while foraging; however, most foraging activity is likely conducted much closer to the nest (Williams et al. 2014).

Known native floral resources for crotch bumble bee include milkweed (*Asclepias* spp.), lupine (*Lupinus* spp.), *Phacelia* spp., *Clarkia* spp., poppy (*Eschscholzia* spp.), sage (*Salvia* spp.), and buckwheat (*Eriogonum* spp.). Bumble bees are typically generalist foragers and are known to use other native and nonnative floral resources, such as vetch (*Vicia* spp.) and clover (*Trifolium* spp.) (Williams et al. 2014). These floral species are fairly common within grassland habitats in California. Grassland habitat within the project site is dominated by nonnative grasses and forbs and may include flowering plants that could be used by bumble bees for foraging. Vegetation removal activities would result in removal of this potential foraging habitat, and conversion of the habitat to urban uses.

Crotch bumble bee is generally believed to overwinter near the ground surface in loose soil or under leaf litter or other debris (e.g., thatch and bunch grasses). Crotch bumble bee nests typically occur in abandoned rodent burrows or other animal nests. Nesting and overwintering habitat potentially suitable for this species may be present on the project site within grassland, oak woodland, or riparian woodland habitats. Vegetation removal and ground disturbing activities could result in mortality of crotch bumble bees while foraging and within nesting or overwintering colonies (e.g., in underground rodent holes, loose soil, leaf litter, log/tree cavities, surface vegetation).

While project implementation could result in loss of individual crotch bumble bees and loss of foraging and breeding habitat for the species, it is unlikely that the project site would support a high concentration of bumble bee colonies due to the lack of documented occurrences nearby, and project implementation is not expected to result in loss of a significant number of bumble bees, if present. While loss of individual crotch bumble bees or a colony as a result of project activities may not cause the population to drop below self-sustaining levels, threaten to eliminate the species, or substantially reduce the range of the species, the population status of this species is poorly understood, and loss of a colony could have a substantial effect on the population.

Additionally, if the decision by the Superior Court of Sacramento is appealed by CDFW and overturned, CDFW would reinstate the candidacy of crotch bumble bee, and the species would be provided protection under CESA. It is possible that the candidacy of crotch bumble bee under CESA could be reinstated before completion of the project. If this were to occur, the project applicant would be required to demonstrate that project implementation would not result in take of crotch bumble bees.

North Site

Project activities that could result in loss (i.e., take) of crotch bumble bees include ground disturbance and vegetation removal. Loss of crotch bumble bees would be a **significant** impact.

South Site

Project activities that could result in loss (i.e., take) of crotch bumble bees include ground disturbance and vegetation removal. This would also include proposed connection corridor to the existing sewer pipeline along the western side of Clarksville Crossing. Loss of crotch bumble bees would be a **significant** impact.

Mitigation Measure 3.4-e: Conduct Focused Surveys for Crotch Bumble Bee and Implement Avoidance Measures

Before implementation of vegetation removal of ground disturbing activities, the applicant shall implement the following measures:

- The applicant shall retain a qualified biologist familiar with bumble bees of California, with experience using survey methods for bumble bees, to conduct focused surveys of suitable habitat within the project site. Because a survey protocol for this species has not been established, survey methods shall include but not be limited to the following elements (included in survey protocols for other bumble bee species in the United States [USFWS 2018]):
  - Surveys shall be conducted during the active flight season (typically March through September).
  - Surveys shall be conducted by walking transects through suitable habitat, or by surveying a minimum of one person-hour per three acres of suitable habitat without transects.
  - Bumble bees within the project site shall be identified through passive, non-lethal methods (e.g., visual surveys using binoculars, photographic documentation).
- If no crotch bumble bees are detected during focused surveys, the survey results shall be submitted to El Dorado County, and further mitigation would not be required.
- If crotch bumble bees are detected during focused surveys, the survey results shall be submitted to El Dorado County, and appropriate avoidance measures shall be implemented. Avoidance measures may include but not be limited to the following, if feasible:
  - Protective buffers shall be implemented around active overwintering or breeding colonies until the colonies are no longer active.
  - Vegetation removal shall occur from October through February to avoid the bumble bee flight season.
  - Vegetation removal and ground disturbance shall be conducted using a phased approach, such that the entirety of the habitat is not removed at once; the objective of this measure is to provide refuge for bumble bees during project activities and temporary retention of suitable floral resources proximate to the active construction areas.

- If the candidacy of crotch bumble bee under CESA is reinstated before completion of the project, and project activities that could result in take of crotch bumble bees (e.g., ground disturbance, vegetation removal) would occur, the applicant shall implement the above measures in consultation with and with approval from CDFW. If crotch bumble bees are detected on the project site and the candidacy of the species under CESA has been reinstated, then an incidental take permit pursuant to California Fish and Game Code Section 2081, and implementation of measures required under such a permit (i.e., potentially including compensatory mitigation to fully mitigate impacts on crotch bumble bee) may be required.

Significance after Mitigation

Implementation of Mitigation Measure 3.4-2e would reduce potential impacts on crotch bumble bee to a **less-than-significant** level by requiring focused surveys for the species and implementation of measures to avoid injury or mortality of crotch bumble bees if detected.

Monarch Butterfly

There are no documented occurrences of monarchs on the project site and the nearest documented sighting of a monarch is approximately 4.6 miles east of the project site in Cameron Park (Western Monarch Milkweed Mapper 2022). However, the project site is within the range of this species and milkweed plants and other floral resources on the project site may provide foraging or breeding habitat suitable for monarchs (Helix Environmental Planning 2020a). Project implementation would result in loss of approximately 43 acres of potential breeding and migratory habitat for monarchs. Project activities, including ground disturbance or vegetation removal, could result in disturbance of monarchs and habitat suitable for the species. Milkweed host plants and breeding monarch butterflies could be disturbed, injured, or lost during construction activities if present on the project site.

North Site

While project implementation could result in loss of individual monarchs and loss of foraging and breeding habitat for the species, the North Site is not expected to support large numbers of monarch butterflies due to the lack of documented occurrences nearby and the small number of milkweed plants observed on the project site (Helix Environmental Planning 2020a). As a result, project implementation is not expected to substantially reduce the number of monarchs, restrict the range of the species, or cause the population to drop below self-sustaining levels. Further, the North Site and associated infrastructure improvements are relatively small compared to natural habitat areas to the north and south, and development is not expected to result in a significant loss of foraging or breeding habitat for the local and statewide populations of monarchs. Therefore, impacts on monarchs would be **less than significant**.

South Site

While project implementation could result in loss of individual monarchs and loss of foraging and breeding habitat for the species, the South Site is not expected to support large numbers of monarch butterflies due to the lack of documented occurrences nearby and the small number of milkweed plants observed on the project site (Helix Environmental Planning 2020a). As a result, project implementation is not expected to substantially reduce the number of monarchs, restrict the range of the species, or cause the population to drop below self-sustaining levels. Further, the South Site and associated infrastructure improvements are relatively small compared to natural habitat areas to the north and south, and development is not expected to result in a significant loss of foraging or breeding habitat for the local and statewide populations of monarchs. Therefore, impacts on monarchs would be **less than significant**.

Mitigation Measures

No mitigation is required for this impact.

Valley Elderberry Longhorn Beetle

Valley elderberry longhorn beetles are entirely dependent on blue elderberry shrubs for habitat. Two clumps of blue elderberry shrubs are present on the project site (Figure 3.4-1). The USFWS *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle* outlines circumstances under which blue elderberry shrubs would be considered

likely to be occupied by valley elderberry longhorn beetles (USFWS 2017). These circumstances include presence of shrubs with stems greater than 1 inch in diameter, valley elderberry longhorn beetle records within 800 meters (approximately 0.5 mile) of the project site, and presence of riparian habitat or a historic riparian corridor on the project site (USFWS 2017). When riparian habitat or a historic riparian corridor is present on a project site, elderberry shrubs are considered potentially occupied regardless of the presence of beetle exit holes (USFWS 2017).

All elderberry shrubs on the project site contain stems greater than 1 inch in diameter. The nearest documented occurrence of valley elderberry longhorn beetle is approximately 3.8 miles west of the project site (CNDDB 2022). However, the project site contains approximately 0.8 acre of riparian woodland habitat (Table 3.4-1, Figure 3.4-1) that is part of a historic riparian corridor. One of the elderberry shrub clumps on the project site is located adjacent to this riparian woodland habitat (Figure 3.4-1). The other elderberry shrub clump is isolated; however, it may be continuous with a historical riparian corridor based on nearby riparian habitat. Based on the guidelines included in the USFWS *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle*, the elderberry shrubs on the project site may be occupied by valley elderberry longhorn beetle (USFWS 2017).

North Site

Elderberry shrubs are not present on the North Site; thus, impacts on valley elderberry longhorn beetle are not expected to occur as a result of development of the North Site. There would be **no impact**.

South Site

Project activities that could result in loss (i.e., take) of valley elderberry longhorn beetle include removal of elderberry shrubs on the South Site and potentially the associated infrastructure improvements or damage to these shrubs from ground disturbance that may result in eventual loss of the shrubs (e.g., root damage, trimming). Loss of valley elderberry longhorn beetle would be a **significant** impact.

Mitigation 3.4-2f: Consult with USFWS, Relocate Elderberry Shrubs, and Compensate for Impacts

The following measures shall be implemented to avoid or minimize loss of elderberry shrubs, and valley elderberry longhorn beetle consistent with the USFWS *Framework for Assessing Impacts to the Valley Elderberry Longhorn Beetle* (USFWS 2017):

- Because elderberry shrubs cannot be avoided, compliance with the ESA and consultation with USFWS is required and may involve acquiring an incidental take permit through Section 10, or a take exemption through Section 7. All elderberry shrubs with stems greater than 1 inch in diameter that cannot be avoided or have been adversely affected by indirect damage to stems of the entire shrub shall be transplanted.
- No elderberry shrub shall be removed or transplanted until authorization has been issued by USFWS and the project applicant has abided by all pertinent conditions of the incidental take permit or biological opinion.
- Relocation of existing elderberry shrubs and planting of new elderberry seedlings and associated riparian species shall be implemented according to the Framework (USFWS 2017). The Framework uses presence or absence of exit holes, and whether the affected elderberry shrubs are located in riparian habitat to determine the number of elderberry seedlings or cuttings and associated riparian vegetation that would need to be planted as compensatory mitigation for affected valley elderberry longhorn beetle habitat. Compensatory mitigation may include purchasing credits at a USFWS-approved conservation bank or establishing and protecting habitat for valley elderberry longhorn beetle.

Significance after Mitigation

Implementation of Mitigation Measure 3.4-2f would reduce potential impacts on valley elderberry longhorn beetle to a **less-than-significant** level by requiring relocation (i.e., transplantation) of elderberry shrubs and compensatory mitigation for unavoidable loss of elderberry shrubs.

American Badger

North Site

Annual grassland habitat on the North Site may provide habitat suitable for American badger. Project activities (i.e., vegetation clearing, ground disturbance, staging, heavy equipment use) may result in direct loss of American badgers or active badger dens if present on the North Site. This would be a **significant** impact.

South Site

Annual grassland habitat on the South Site proposed connection corridor to the existing sewer pipeline along the western side of Clarksville Crossing may provide habitat suitable for American badger. Project activities (i.e., vegetation clearing, ground disturbance, staging, heavy equipment use) may result in direct loss of American badgers or active badger dens if present on the South Site. This would be a **significant** impact.

Mitigation Measures

Mitigation 3.4-2g: Conduct Focused American Badger Survey and Establish Protective Buffers

- Within 30 days before commencement of project activities, a qualified wildlife biologist familiar with American badger and experience using survey methods for the species shall conduct focused surveys of habitat suitable for the species within the project site to identify any American badger dens.
- If occupied dens are not found, the qualified biologist shall submit a report summarizing the results of the survey to the applicant and El Dorado County, and further mitigation shall not be required.
- If occupied dens are found, impacts on active badger dens shall be avoided by establishing exclusion zones around all active badger dens, the size of which shall be determined by the qualified biologist. No project activities (e.g., vegetation removal, ground disturbance, staging) shall occur within the exclusion zone until denning activities are complete or the den is abandoned, as confirmed by a qualified biologist. The qualified biologist shall monitor each den once per week to track the status of the den and to determine when it is no longer occupied. When it is no longer occupied, project activities within the exclusion zone may occur.

Significance after Mitigation

Implementation of Mitigation Measure 3.4-2g would reduce potential impacts on American badger to a **less-than-significant** level by requiring focused surveys for the species and implementation of measures to avoid injury or mortality of American badger and destruction of active dens if detected.

Special-Status Bats

North Site

Two special-status bat species have potential to occur on the North Site: pallid bat and western red bat. Roosting habitat potentially suitable for these species on the North Site is present within large oak trees (i.e., crevices, cavities, exfoliating bark, foliage). Project activities (i.e., tree removal) may result in direct loss of roosting special-status bats if present on the North Site. This would be a **significant** impact.

South Site

Two special-status bat species have potential to occur on the South Site: pallid bat and western red bat. Roosting habitat potentially suitable for these species on the South Site and the proposed connection corridor to the existing sewer pipeline along the western side of Clarksville Crossing is present within large oak trees (i.e., crevices, cavities, exfoliating bark, foliage). Project activities (i.e., tree removal) may result in direct loss of roosting special-status bats if present on the South Site. This would be a **significant** impact.

Mitigation Measures

Mitigation 3.4-2h: Conduct Focused Bat Surveys and Implement Avoidance Measures

- Before the start of project activities, a qualified biologist familiar with bats and bat ecology, and experienced in conducting bat surveys, shall conduct surveys for bat roosts in suitable habitat (e.g., large trees, crevices, cavities, exfoliating bark, foliage) within and adjacent to the project site.
- If no evidence of bat roosts is found, the qualified biologist shall submit a report summarizing the results of the survey to the applicant and El Dorado County, and no further study shall be required.
- If evidence of bat roosts is observed, the species and number of bats using the roost shall be determined by a qualified biologist. Bat detectors shall be used if deemed necessary to supplement survey efforts by the qualified biologist.
- A no-disturbance buffer of 250 feet shall be established around active pallid bat or western red bat roosts, and project activities shall not occur within this buffer until after the roosts are unoccupied.
- If roosts of pallid bat or western red bat are determined to be present and must be removed, the bats shall be excluded from the roosting site before the tree is removed. A program addressing compensation, exclusion methods, and roost removal procedures shall be developed in consultation with CDFW before implementation. Exclusion methods may include use of one-way doors at roost entrances (bats may leave but not reenter) or sealing roost entrances when the site can be confirmed to contain no bats. Exclusion efforts may be restricted during periods of sensitive activity (e.g., during hibernation or while females in maternity colonies are nursing young). The loss of each roost (if any) shall be replaced in consultation with CDFW and may require construction and installation of bat boxes suitable to the bat species and colony size excluded from the original roosting site. If determined necessary during consultation with CDFW, replacement roosts shall be implemented before bats are excluded from the original roost sites. Once the replacement roosts are constructed and it is confirmed that bats are not present in the original roost site by a qualified biologist, the roost tree may be removed

Significance after Mitigation

Implementation of Mitigation Measure 3.4-2h would reduce potential impacts on pallid bat and western red bat to **less than significant** by requiring focused surveys for bat roosts and implementation of no-disturbance buffers around active special-status bat roosts.

Impact 3.4-3: Result in Degradation or Loss of Riparian Habitat or Other Sensitive Natural Communities

Project implementation would include activities resulting in ground disturbance, vegetation removal, and land development, which would result in removal of riparian habitat and sensitive natural communities. This would be a **significant** impact.

Approximately 0.3 acre of purple needlegrass grassland (also known as Needle grass – Melic grass grassland) is present on the South Site and 0.8 acre of riparian woodland habitat is present on the project site, including portions of the North Site and South Site (Table 3.4-1; Figure 3.4-1).

North Site

Project activities would include ground disturbance, vegetation removal, and land development, which would result in removal of all riparian woodland on the North Site. This would be a **significant** impact.

South Site

Project activities would include ground disturbance, vegetation removal, and land development, which would result in removal of all purple needlegrass grassland and riparian woodland on the South Site and the proposed connection corridor to the existing sewer pipeline along the western side of Clarksville Crossing. This would be a **significant** impact.

Mitigation Measures

Mitigation Measure 3.4-3a: Compensate for Loss of Sensitive Natural Communities

The following measures shall be implemented before vegetation removal or ground disturbing activities:

- The applicant shall compensate for unavoidable loss of purple needlegrass grassland on the South Site such that no net loss of habitat function occurs by:
  - restoring degraded purple needlegrass grassland outside of the project site at a sufficient ratio to offset the loss of habitat function (at least 1:1); or
  - preserving existing purple needlegrass grassland of equal or better value to the sensitive natural community affected through a conservation easement at a sufficient ratio to offset the loss of habitat function (at least 1:1).
- Prepare and implement a Compensatory Mitigation Plan that includes the following:
  - For preserving existing habitat outside of the project site in perpetuity, the Compensatory Mitigation Plan shall include a summary of the proposed compensation lands (e.g., the number and type of credits, location of mitigation bank or easement), parties responsible for the long-term management of the land, and the legal and funding mechanism for long-term conservation (e.g., holder of conservation easement or fee title). The applicant shall provide evidence in the plan that the necessary mitigation has been implemented or that the applicant has entered into a legal agreement to implement it and that compensatory habitat shall be preserved in perpetuity.
  - For restoring or enhancing habitat outside of the project site, the Compensatory Mitigation Plan shall include a description of the proposed habitat improvements, success criteria that demonstrate the performance standard of maintained habitat function has been met, legal and funding mechanisms, and parties responsible for long-term management and monitoring of the restored or enhanced habitat.
  - Success criteria required to maintain habitat function for preserved and compensatory populations shall include:
    - The extent of occupied area and density of plants associated with the sensitive natural community (number of plants per unit area) in compensatory habitats shall be equal to or greater than the affected occupied habitat.
    - Compensatory and preserved sensitive natural communities shall be self-producing. Populations would be considered self-producing when:
      - Plants associated with sensitive natural communities reestablish annually for a minimum of five years with no human intervention such as supplemental seeding; and
      - Reestablished and preserved habitats contain an occupied area and density comparable to existing occupied habitat areas in similar habitat types in the project vicinity.

Mitigation Measure 3.4-3b: Compensate for Loss of Riparian Habitat

The following measures shall be implemented before vegetation removal or ground disturbing activities on the North Site and South Site:

- A Streambed Alteration Notification shall be submitted to CDFW, pursuant to Section 1602 of the California Fish and Game Code. If proposed project activities are determined to be subject to CDFW jurisdiction, the applicant shall abide by the measures to protect fish and wildlife resources required by any executed agreement before any vegetation removal or activity that may affect the resource. Measures to protect fish and wildlife resources shall include, at a minimum, a combination of the following mitigation.

- The applicant shall compensate for the loss of riparian habitat such that no net loss of habitat function and values occurs by:
  - restoring degraded riparian habitat outside of the project site;
  - purchasing riparian habitat credits at a CDFW-approved mitigation bank; or
  - preserving existing riparian habitat of equal or better value to the affected riparian habitat through a conservation easement at a sufficient ratio to offset the loss of riparian habitat function (at least 1:1).
- The applicant shall prepare and implement a Compensatory Mitigation Plan that includes the following:
  - For preserving existing riparian habitat outside of the project site in perpetuity, the Compensatory Mitigation Plan shall include a summary of the proposed compensation lands (e.g., the number and type of credits, location of mitigation bank or easement), parties responsible for the long-term management of the land, and the legal and funding mechanism for long-term conservation (e.g., holder of conservation easement or fee title). The applicant shall provide evidence in the plan that the necessary mitigation has been implemented or that the applicant has entered into a legal agreement to implement it and that compensatory habitat shall be preserved in perpetuity.
  - For restoring or enhancing riparian habitat outside of the project site, the Compensatory Mitigation Plan shall include a description of the proposed habitat improvements, success criteria that demonstrate the performance standard of maintained habitat function has been met, legal and funding mechanisms, and parties responsible for long-term management and monitoring of the restored or enhanced habitat.
  - Compensatory mitigation may be satisfied through compliance with permit conditions, or other authorizations obtained by the applicant (e.g., Lake and Streambed Alteration Agreement), if these requirements are equally or more effective than the mitigation identified above.

Significance after Mitigation

Implementation of Mitigation Measures 3.5-3a and 3.5-3b would reduce significant impacts on sensitive natural communities and riparian habitat to a **less-than-significant** level by requiring compensation for permanent loss of these habitats such that there is no net loss, potentially including a streambed alteration agreement with CDFW.

Impact 3.4-4: Result in Degradation or Loss of State or Federally Protected Wetlands

Project implementation would include activities resulting in ground disturbance, vegetation removal, and land development, which would result in removal (fill) of wetlands. This would be a **significant** impact.

An aquatic resources delineation of the project site was conducted on October 13, 2020 (Helix Environmental Planning 2020b). A total of 0.740 acre of aquatic resources was delineated on the project site, including 0.15 acre of wetlands (i.e., seasonal wetland, wetland swale, seep) and 0.59 acre of other waters (i.e., seasonal drainage; Table 3.4-1; Figure 3.4-1; Helix Environmental Planning 2020b). This aquatic resources delineation has not been verified by USACE. A previous aquatic resources delineation was conducted on December 15, 2015, of approximately 17.9-acres on the North Site (Helix Environmental Planning 2020a and 2020b). This 2015 delineation, which identified 0.19 acre of waters of the United States, was verified by USACE in August of 2019 (Helix Environmental Planning 2020a; 2020b). All delineated aquatic resources in the project site are expected to be considered waters of the state, and would be subject to regulation by the Central Valley RWQCB. At least a subset of these aquatic resources would likely also be considered waters of the United States subject to verification by USACE.

North Site

Project activities would include ground disturbance, vegetation removal, and land development. These activities would result in removal of all wetland habitats on the North Site. This would be a **significant** impact.

South Site

Project activities would include ground disturbance, vegetation removal, and land development. These activities would result in removal of all wetland habitats on the South Site. This would be a **significant** impact.

Mitigation Measures

Mitigation 3.4-4: Obtain Permits for Impacts on Wetlands

- The 2020 aquatic resources delineation report shall be submitted by the applicant to USACE, with a request for preliminary jurisdictional determination.
- Authorization for fill or waters of the United States shall be secured from USACE and the RWQCB through the Clean Water Act Sections 401 and 404 permitting processes. In association with the Section 404 and before the issuance of any grading permit, Section 401 Water Quality Certification from the Central Valley RWQCB shall be obtained. For impacts on waters of the state that are not also waters of the United States and are therefore not covered by the 401 Water Quality Certification, the applicant shall apply to the RWQCB for Waste Discharge Requirements following the State Wetland Definition and Procedures for Discharges of Dredged or Fill Material to Waters of the State (State Water Resources Control Board 2021). Any waters of the United States or waters of the state that are affected by the project shall be replaced on a no-net-loss basis in accordance with the applicable USACE and California Water Board mitigation standards in place at the time of construction.
- Prior to commencing activity that may divert the natural flow or otherwise alter the bed or bank, of any lake or stream on the project site, the applicant shall notify CDFW, through issuance of a Lake and Streambed Alteration Notification (notification). If CDFW determines, based on the notification, project activities trigger the need for a Lake and Streambed Alteration Agreement, the proponent shall obtain an agreement from CDFW before the activity commences. The applicant shall conduct project construction activities in accordance with the agreement, including implementing reasonable measures in the agreement necessary to protect fish and wildlife resources, when working within the bed or bank of waterways or in riparian habitats associated with those waterways. These measures may include but not be limited to demarcation of the construction area, biological monitoring, environmental awareness training for construction crews, and compensatory measures (e.g., restoration, long-term habitat management).

Significance after Mitigation

Implementation of Mitigation Measure 3.4-4 would reduce significant impacts on state and federally protected wetlands to a **less-than-significant** level by requiring permitting and compensation for unavoidable impacts on state or federally protected wetlands such that there is no net loss of these resources.

Impact 3.4-5: Interfere with Wildlife Movement Corridors or Impede the Use of Wildlife Nurseries

Development of the project site would result in removal of natural habitat, which has been identified as an ECA. Natural habitat on the project site may also provide roosting habitat for common bat species (i.e., in large oak trees). However, the oak trees on the project site are unlikely to support substantial bat colonies, and the project site is surrounded by dense residential development and large roads and highways. As a result, the project site likely does not currently function as a significant wildlife nursery site or wildlife movement corridor. Therefore, the impact related wildlife movement corridors or wildlife nurseries would be **less than significant**.

The project site is located within a modeled ECA, connecting natural landscape blocks to the south to undeveloped areas north and east of the project site (Figure 3.4-2). The valley oak woodland and riparian woodland habitats on the project site may provide roosting habitat potentially suitable for common bat species. However, based on the number and size of the trees on the project site, it is unlikely that the project site would support a large colony of common bats. Further, as discussed above in Impact 3.4-2, while implementation of the project may affect special-status birds and bats, mitigation measures, including preconstruction surveys and avoidance of active bird nests and bat roosts, would be implemented to reduce impacts to less than significant. These mitigation measures would also result in protection of active bat roosts that would be considered nursery sites.

While the project site contains natural habitat and may provide some wildlife nursery habitat and function as a movement corridor for some wildlife species, it is surrounded by residential development to the north and west and I-50 (including onramps and offramps) to the south. Silva Valley Parkway, which bisects the north and south portions of the project site, is a busy four-lane road. There are relatively undeveloped areas south of the project site, characterized by rural residences, creeks, streams, wetlands, and oak woodlands; and north of the project site, characterized by rural residences, oak woodlands, chaparral, creeks, streams, the American River, and Folsom Lake. However, I-50 presents a significant barrier to movement to the south and dense residential development and roads present a significant barrier to movement to the north. Therefore, it is unlikely that the project site currently functions as a critical habitat linkage for wildlife.

North Site

Project activities are not expected to significantly impede wildlife movement in the vicinity of the North Site or the region, and this impact would be **less than significant**.

South Site

Project activities are not expected to significantly impede wildlife movement in the vicinity of the South Site or the region, and this impact would be **less than significant**.

Mitigation Measures

No mitigation is required for this impact.

Impact 3.4-6: Conflict with Local Policies and Ordinances

Project implementation would include activities resulting in removal of oak trees and oak woodlands which could result in conflict with the El Dorado County ORMP. This would be a **significant** impact.

The El Dorado County General Plan includes policies intended to protect aquatic habitat, special-status species, and sensitive habitats (See Section 3.4.1, "*Regulatory Setting*"). Development of the INRMP as required under the El Dorado County General Plan has included mapping of important habitats (i.e., aquatic environments, wetland and riparian habitat, important habitat for migratory deer herds, California red-legged frog recovery plan areas, Pine Hill Preserve areas, valley oak woodlands, important biological corridors; El Dorado County 2010). The El Dorado County General Plan also includes development of a Biological Resource Mitigation Program; however, this program has not yet been developed. No important habitats have been identified on the project site at the scale of the INRMP mapping; however, aquatic environments, wetland and riparian habitat, and valley oak woodlands are present on the project site. As discussed above in Impacts 3.4-1, 3.4-2, 3.4-3, and 3.4-4, while implementation of the project may affect special-status plants, special-status wildlife, sensitive natural communities, riparian habitat, and wetlands, mitigation measures would be implemented to reduce impacts to less than significant. Therefore, there would be no conflict with General Plan policies protecting these resources.

The El Dorado County ORMP defines mitigation requirements for impacts on oak woodlands, individual native oak trees, and heritage trees; and also outlines El Dorado County's strategy for oak resource management and conservation (See Section 3.4.1, "*Regulatory Setting*"). Oak trees on the project site were surveyed in 2013, 2015, and 2020 (Helix Environmental Planning 2020c and 2021). Four protected oak trees were identified on the North Site (Helix Environmental Planning 2021). A total of 0.51 acre of oak woodland habitat was identified on the South Site (Helix Environmental Planning 2021). Seven protected oak trees were identified on the South Site; four of which are considered heritage trees: three valley oaks and one blue oak (Helix Environmental Planning 2021).

North Site

Project implementation will result in removal of protected oak trees oak woodlands on the North Site. Removal of these trees would conflict with tree protection requirements in El Dorado County ORMP. This impact would be **significant**.

South Site

Project implementation will result in removal of protected oak trees, heritage trees, and oak woodlands on the South Site and potentially in the proposed connection corridor to the existing sewer pipeline along the western side of Clarksville Crossing.. Removal of these trees and woodlands would conflict with tree protection requirements in El Dorado County ORMP. This impact would be **potentially significant**.

Mitigation Measures

Mitigation 3.4-6: Remove Protected Oak Trees and Oak Woodlands and Compensate for Impacts through In-Lieu Fee Payment Consistent with the El Dorado County ORMP

Prior to removing oak trees or oak woodlands on the project site, the applicant shall implement the following measures:

- The applicant will submit a final version of the Oak Resources Technical Report and an Oak Resources Code Compliance Certificate to the El Dorado County Community Development Services Planning and Building Department that address all onsite and offsite oak tree and oak woodland impacts.
- Upon application approval, the applicant will compensate for loss of protected oak trees and oak woodlands through any combination of in-lieu fees, conservation, and/or replanting, as required under the ORMP.

Significance after Mitigation

Implementation of Mitigation Measure 3.4-6 would reduce significant impacts related to compliance with local ordinances to a **less-than-significant** level by requiring compensation for removal of oak trees and oak woodlands consistent with the El Dorado County ORMP.

3.7 GEOLOGY AND SOILS

This section describes current conditions relative to geology and soils at the EDH 52 Commercial Center project site. It includes a description of soils and mineral resources, analysis of environmental impacts, and recommendations for mitigation measures for any significant or potentially significant impacts. The primary source of information used for this analysis is the Geotechnical Report prepared by Blackburn Consulting (Blackburn Consulting 2013). The information contained in the Geotechnical Report is representative of existing conditions because no ground disturbing or engineering work has occurred on the site that would change geologic conditions since its preparation.

3.7.1 Regulatory Setting

FEDERAL

National Earthquake Hazards Reduction Act

In October 1977, the U.S. Congress passed the Earthquake Hazards Reduction Act to reduce the risks to life and property from future earthquakes in the United States. To accomplish this, the act established the National Earthquake Hazards Reduction Program (NEHRP). The mission of NEHRP includes improved understanding, characterization, and prediction of hazards and vulnerabilities; improved building codes and land use practices; risk reduction through post-earthquake investigations and education; development and improvement of design and construction techniques; improved mitigation capacity; and accelerated application of research results.

STATE

Alquist-Priolo Earthquake Fault Zoning Act

The Alquist-Priolo Earthquake Fault Zoning Act of 1972 (PRC Sections 2621-2630) intends to reduce the risk to life and property from surface fault rupture during earthquakes by regulating construction in active fault corridors, and by prohibiting the location of most types of structures intended for human occupancy across the traces of active faults. A fault is considered sufficiently active if one or more of its segments or strands shows evidence of surface displacement during Holocene time (defined for purposes of the act as within the last 11,000 years). The law addresses only the hazard of surface fault rupture and is not directed toward other earthquake hazards.

Seismic Hazards Mapping Act

The intention of the Seismic Hazards Mapping Act of 1990 (PRC Sections 2690–2699.6) is to reduce damage resulting from earthquakes. While the Alquist-Priolo Act addresses surface fault rupture, the Seismic Hazards Mapping Act addresses other earthquake-related hazards, including ground shaking, liquefaction, and seismically induced landslides. The act's provisions are similar in concept to those of the Alquist-Priolo Act: The State is charged with identifying and mapping areas at risk of strong ground shaking, liquefaction, landslides, and other corollary hazards, and cities and counties are required to regulate development within mapped Seismic Hazard Zones. Under the Seismic Hazards Mapping Act, permit review is the primary mechanism for local regulation of development.

California Building Code

The California Building Code (CBC) (California Code of Regulations, Title 24) is based on the International Building Code. The CBC has been modified from the International Building Code for California conditions, with more detailed and/or more stringent regulations. Specific minimum seismic safety and structural design requirements are set forth in Chapter 16 of the CBC. The CBC identifies seismic factors that must be considered in structural design. Chapter 18 of the CBC regulates the excavation of foundations and retaining walls, while Chapter 18A regulates construction on unstable soils, such as expansive soils and areas subject to liquefaction. Appendix J of the CBC regulates grading activities, including drainage and erosion control. The CBC contains a provision that provides for a preliminary soil

report to be prepared to identify "…the presence of critically expansive soils or other soil problems which, if not corrected, would lead to structural defects." (CBC Chapter 18 Section 1803.1.1.2).

National Pollutant Discharge Elimination System Construction General Permit for Stormwater Discharges Associated with Construction Activity

The State Water Resources Control Board has adopted a Statewide National Pollutant Discharge Elimination System (NPDES) General Permit for Stormwater Discharges Associated with Construction Activity (SWRCB Construction General Permit Order 2009-0009-DWQ). The State requires that projects disturbing more than 1 acre of land during construction file a Notice of Intent with the regional water quality control board (RWQCB) to be covered under this permit. Construction activities subject to the general permit include clearing, grading, stockpiling, and excavating. Dischargers are required to eliminate or reduce nonstormwater discharges to storm sewer systems and other waters. A storm water pollution prevention plan (SWPPP) must be developed and implemented for each site covered by the permit. The SWPPP must include best management practices (BMPs) designed to prevent construction pollutants from contacting stormwater and keep products of erosion from moving off-site into receiving waters throughout the construction and life of the project; the BMPs must address source control and, if necessary, pollutant control.

Regulations Regarding Paleontological Resources

Paleontological resources on private property are considered the property of the landowner and receive no particular legal protection unless otherwise addressed in the conditions of approval of a land development permit, as mitigation in an applicable CEQA document, or through local policy and/or regulation (see below). Paleontological resources on public lands are protected by State statute (PRC Chapter 1.7, Section 5097.5, Archeological, Paleontological, and Historical Sites and Appendix G). This statute states:

> A person shall not knowingly and willfully excavate upon, or remove, destroy, injure, or deface, any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, rock art, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over the lands.

LOCAL

El Dorado County General Plan

The adopted El Dorado County General Plan Conservation and Open Space Element discusses significant natural resources in the County, including geology and soils and paleontological resources, and establishes goals, objectives, and policies related to these topics. Relevant policies from the El Dorado County General Plan include:

- **Policy 6.3.2.5:** Applications for development of habitable structures shall be reviewed for potential hazards associated with steep or unstable slopes, areas susceptible to high erosion, and avalanche risk. Geotechnical studies shall be required when development may be subject to geological hazards. If hazards are identified, applicants shall be required to mitigate or avoid identified hazards as a condition of approval. If no mitigation is feasible, the project will not be approved.
- **Policy 7.1.2.1:** Development or disturbance shall be prohibited on slopes exceeding 30 percent unless necessary for access. The County may consider and allow development or disturbance on slopes 30 percent and greater when:
  - Reasonable use of the property would otherwise be denied.
  - The project is necessary for the repair of existing infrastructure to avoid and mitigate hazards to the public, as determined by a California registered civil engineer or a registered engineering geologist.
  - Replacement or repair of existing structures would occur in substantially the same footprint.
  - The use is a horticultural or grazing use that utilizes "best management practices (BMPs)" recommended by the County Agricultural Commission and adopted by the Board of Supervisors.

Access corridors on slopes 30 percent and greater shall have a site-specific review of soil type, vegetation, drainage contour, and site placement to encourage proper site selection and mitigation. Septic systems may only be located on slopes under 30 percent. Roads needed to complete circulation/access and for emergency access may be constructed on such cross slopes if all other standards are met.

- **Policy 7.1.2.2:** Discretionary and ministerial projects that require earthwork and grading, including cut and fill for roads, shall be required to minimize erosion and sedimentation, conform to natural contours, maintain natural drainage patterns, minimize impervious surfaces, and maximize the retention of natural vegetation. Specific standards for minimizing erosion and sedimentation shall be incorporated into the Zoning Ordinance.
- **Policy 7.1.2.3:** Enforce Grading Ordinance provisions for erosion control on all development projects and adopt provisions for ongoing, applicant-funded monitoring of project grading.
- **Policy 7.5.1.3:** Cultural resource studies (historic, prehistoric, and paleontological resources) shall be conducted prior to approval of discretionary projects. Studies may include, but are not limited to, record searches through the North Central Information Center at California State University, Sacramento, the Museum of Paleontology, University of California, Berkeley, field surveys, subsurface testing, and/or salvage excavations. The avoidance and protection of sites shall be encouraged.

El Dorado County Code

County Code Chapter 110.14 (Grading, Erosion, and Sediment Control) covers grading and requires grading and drainage plans to be developed for major development projects. Chapter 4 of the County Land Development Manual sets forth standards and procedures for grading activities in the County. The purpose of these requirements are to protect lives, property, and public improvements from damage due to unregulated grading and to limit water quality and sediment impacts.

Chapter 4 includes the following:

- All earthwork shall comply with CBC for design and construction standards.
- Complete fills shall comply with the provisions of CBC, unless recommended otherwise in an accepted geotechnical report.
- For projects on the West Slope of the Sierra Nevada, storm water manage storm water management, erosion and sediment control and drainage shall comply with the adopted Drainage Manual, Storm Water Management Plan (SWMP) and current California State Water Resources Control Board's (SWRCB) Order(s) regulating construction activities. This includes the development of a storm water pollution prevention plan (SWPPP).
- Proper design and construction of retaining wall systems.
- Provision of certain technical reports as part of grading permit applications (e.g., geotechnical report, geologic report, and drainage report).

3.7.2 Environmental Setting

REGIONAL AND LOCAL GEOLOGY

The project site is located at the western base of the foothills of the Sierra Nevada Mountain Range. The Sierra Nevada geomorphic province trends in a northwest direction and is about 40 to 80 miles wide and 430 miles long. The Sierra Nevada Mountain Range resulted from buckling and warping of sediment and volcanic rocks about 120 to 130 million years ago, which were then intruded by granitic rock. Metavolcanic and metasedimentary rocks underlay much of El Dorado County. Metavolcanic rock underlays the project site at shallow depths, with some rocks exposed on the project site surface (Blackburn Consulting 2013).

There is no known mapped occurrence of naturally occurring asbestos (NOA) minerals on the project site, nor are there ultramafic rocks that are typical hosts for NOA. There are ultramafic rocks and faulting nearby, such that there

remains a potential for NOA to occur in the area (Blackburn Consulting 2013). El Dorado County's NOA Review Area Map also shows the project site straddling the border of an area that is mapped as a quarter mile buffer for more likely to contain asbestos or fault line (Blackburn Consulting 2013, El Dorado County 2015). Hazards associated with NOA are addressed in Section 3.8, Hazards and Hazardous Materials.

FAULTING AND SEISMICITY

Most earthquakes originate along fault lines. A fault is a fracture in the Earth's crust along which rocks on one side are displaced relative to those on the other side due to shear and compressive crustal stresses. The state of California has a classification system that designates faults as either active, potentially active, or inactive, depending on how recently displacement has occurred along them. Faults that show evidence of movement within the last 11,000 years (the Holocene geologic period) are considered active, and faults that have moved between 11,000 and 1.6 million years ago (comprising the later Pleistocene geologic period) are considered potentially active. There are no active or potentially active mapped faults on or near the project site (Blackburn Consulting 2013). Additionally, and the project site is not in an Alquist-Priolo Earthquake Fault Zone (CGS 2021). The West Bear Mountains Fault crosses U.S. 50 approximately 3,100 feet west of Silva Valley Parkway, with a splay crossing U.S. 50 1,200 feet to the west. However, these are not considered active faults, and the risk for fault rupture on the site is low (Blackburn Consulting 2013).

As noted in the Blackburn Geotechnical Report, the project site is underlaid with metavolcanic rock at shallow depths with groundwater limited to fractures in the bedrock. Thus, the project has low potential for liquefaction during a seismic event.

TOPOGRAPHY AND DRAINAGE

The site is located on the flank of a ridge. The slope of the project site generally ranges from 3 to 25 percent, with the steepest areas located in the northeast area of the project site (Blackburn Consulting 2013). There are limited areas where the slope exceeds 30 percent (EDH 52, LLC 2021). There are two drainages in the western area of the project site that flow south-southwest and cross Silva Valley Parkway. There is an old dam in one of the drainages. Project site disturbance consists of minor areas of fill and disturbance (Blackburn Consulting 2013).

GROUNDWATER

In boring and test pits, no groundwater was encountered; however, borings were cored below depths that could be augered, and groundwater could not be confirmed at core depths because of the use of water in the coring process. No springs or seeps were observed, but there was standing water during field work in one of the drainages. It is anticipated that groundwater could occur in isolated areas in fractured rock underlying the site, and that water can accumulate in the soil-rock interface during and after the rainy season, and perched groundwater and saturated soil conditions were identified as geotechnical challenges (Blackburn Consulting 2013).

SITE GEOLOGY AND SOIL STABILITY

Significant ground instability and unsuitable soil conditions were not observed on the site (Blackburn Consulting 2013). Based on 17 borings and test pits on the project site, the following is a summary of the soil and geologic conditions of the North Site and South Site:

- North Site Profile
  - 1 to 2 feet of soil that consists of brown, stiff sandy silt with gravel, over
  - 1.5 to 5 feet of decomposed to intensely weathered, metavolcanic rock, over
  - Intensely to moderately weathered rock to depths of 5.5 to 8 feet where refusal to excavation with the backhoe was encountered.

- South Site Profile
  - 0.5 to 2 feet of soil that consists of brown to reddish brown, stiff sandy silt, over
  - 0 to 7 feet of decomposed to intensely weathered, metavolcanic rock, over
  - Intensely to moderately weathered rock to depths of 2 to 15 feet. Refusal to excavation with the backhoe was encountered at depths of2.5 to 7.5 feet.

MINERAL RESOURCES

The California Geologic Survey has mapped mineral and mineral aggregate resources in El Dorado County. The County General Plan does not indicate the project vicinity is within an important mineral resource area (El Dorado County 2004: Figure C0-1). No mineral extraction operations exist at the property and there are no oil and gas extraction wells within or in the vicinity of the property (CalGEM 2021).

PALEONTOLOGICAL RESOURCES

Paleontological resources consist of vertebrate, invertebrate, and plant fossils. These resources are usually found in sedimentary and metasedimentary deposits. As noted above, the project site is underlain by metavolcanic rocks; therefore, the project area is unlikely to contain paleontological resources.

3.7.3 Environmental Impacts and Mitigation Measures

METHODOLOGY

The examination of geology, soils, and mineral resources is based on information obtained from reviews of:

- the project description;
- applicable elements of the County of El Dorado General Plan as well as applicable State and County regulations related to seismic, geologic, and soil stability related to development activities;
- available literature, including documents published by the State and County dealing with geotechnical conditions in the Sacramento area; and
- Geotechnical Report prepared by Blackburn Consulting (Blackburn Consulting 2013).

THRESHOLDS OF SIGNIFICANCE

A geology and soils or minerals impact is considered significant if implementation of the EDH 52 Commercial Center Project would do any of the following:

- A geology and soils impact is considered significant if implementation of the project would do any of the following. These thresholds of significance are based on State CEQA Guidelines Appendix G and were determined appropriate for this project due to its existing geologic, soil, and slope conditions.
- Directly or indirectly cause potential substantial adverse effects, including the risk of loss, injury, or death involving:
  - Rupture of a known earthquake fault, as delineated on the most recent Alquist-Priolo Earthquake Fault Zoning Map issued by the State Geologist for the area or based on other substantial evidence of a known fault? (Refer to California Geological Survey Special Publication 42.)
  - Strong seismic ground shaking
  - Seismic-related ground failure, including liquefaction

  - Landslides
- Result in substantial soil erosion or the loss of topsoil;
- Be located on a geologic unit or soil that is unstable, or that would become unstable as a result of the project, and potentially result in on- or off-site landslide, lateral spreading, subsidence, liquefaction, or collapse;
- Be located on expansive soil, as defined in Table 18-1-B of the Uniform Building Code (1994, as updated), creating substantial direct or indirect risks to life or property;
- Have soils incapable of adequately supporting the use of septic tanks or alternative waste water disposal systems where sewers are not available for the disposal of waste water;
- Directly or indirectly destroy a unique paleontological resource or site or unique geologic feature; and/or
- Result in the loss of availability of a known mineral resource that would be of value to the region and the residents of the state; and/or
- Result in the loss of availability of a locally important mineral resources recovery site delineated on a local general plan, specific plan, or other land use plan.

ISSUES NOT DISCUSSED FURTHER

The project would be annexed to the EID service boundary for public water and wastewater service and would not involve the construction and operation of a septic or alternative wastewater disposal system. Thus, no impact is expected, and this topic is not further addressed in the Draft EIR.

As described in Section 3.7.1, "Environmental Setting," the project site geologic conditions would not support paleontological resources and does not have mineral resources. Thus, no impact is expected, and these topics are not further addressed in the Draft EIR.

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Impact 3.7-1: Loss, Injury or Death Resulting from Seismic Hazards

Construction and operation of the project would not exacerbate existing seismic hazards and would comply with state and County regulatory design requirements related to seismic hazards (e.g., building codes and other laws and regulations), such that the exposure of people or structures to hazards, risk of loss, injury or death resulting from rupture of a known earthquake fault or strong seismic shaking would be avoided or reduced. This impact would be **less than significant**.

An earthquake of moderate to high magnitude generated in the region may cause considerable ground shaking at the project site. To account for the potential effects of ground shaking, project structures would be designed using sound engineering judgment and the latest CBC requirements. The seismic design provisions of the CBC generally prescribe minimum lateral forces (horizontal pressure caused by seismic movement), applied to the structure, combined with gravity forces. The code-prescribed lateral forces are generally considered to be substantially smaller than the comparable forces that would be associated with a major earthquake. Therefore, structures should be able to (1) resist minor earthquakes without damage; (2) resist moderate earthquakes without structural damage but with some nonstructural damage; and (3) resist major earthquakes without collapse but with some structural, as well as nonstructural damage.

It is also important to note that environmental impact analyses under CEQA generally are not required to analyze the impact of existing environmental conditions on a project's future users or residents unless the proposed project might cause or risk exacerbating environmental hazards or conditions that already exist (CCR Section 15126.2[a]). In those specific instances, it is the project's impact on the environment and not the environment's impact on the project that compels an evaluation of how future residents or users may be affected by exacerbated conditions

(*California Building Industry Association v. Bay Area Air Quality Management District* [2015] 62 Cal. 4th 369). Project construction and operation would not create new seismic events or exacerbate existing seismic hazards, because the project improvements would involve limited excavation (e.g., 30 feet in depth) that would not alter seismic and fault conditions in the region.

North Site

As identified in Chapter 2, "Project Description," development of the North Site would involve grading of the site that would recontour the site using 30,000 cubic yards of fill from onsite excavation as well as the removal of approximately 19,000 cubic yards of rock from the site. The North Site would also include trenching for utilities as well as excavation for the fuel tanks for the proposed gas station, but would not occur at a depth that would alter fault conditions to seismic hazards. All project structures and final grading would be subject to CBC standards and County Code that specific address stability and safety during seismic events. Therefore, the potential for the North Site to cause adverse effects related to strong seismic shaking would be **less than significant**.

South Site

Development of the South Site would involve grading of the site that would recontour the site as well as creation of a subterranean parking structure and trenching for utilities. Approximately 11,000 cubic yards of fill would be imported as part of the final grade of the site. All project structures and final grading would be subject to CBC standards and County Code that specific address stability and safety during seismic events. Therefore, the potential for the South Site to cause adverse effects related to strong seismic shaking would be **less than significant**.

Mitigation Measures

No mitigation is required in addition to CBC seismic standards.

Impact 3.7-2: Soil Erosion

Project construction activities would expose soils and increase the potential for soil erosion. Compliance with the statewide NPDES General Permit for Discharge of Stormwater Associated with Construction Activity as well as the conditions associated with obtaining a grading permit from the County would require the project to implement best management practices to reduce erosion and loss of topsoil. Therefore, this impact would be **less than significant**.

Project construction would require earthwork activities, which could temporarily expose soils and increase the potential for soil erosion from wind or stormwater runoff. This would also include earthwork activities and soil erosion potential associated with offsite roadway improvements and extension of natural gas pipeline along Silva Valley Parkway.

Because construction activities would disturb more than 1 acre of soil, the applicant would need to obtain coverage under the statewide NPDES General Permit for Discharge of Stormwater Associated with Construction Activity (Construction General Permit). Coverage under the Construction General Permit and Chapter 4 of the County Land Development Manual requires preparation and implementation of an SWPPP. The SWPPP would be required to identify temporary BMPs to prevent the transport of earthen materials from construction sites during periods of precipitation or runoff, and temporary BMPs would be required to prevent wind erosion of earthen materials. Mandatory compliance with adopted regulations would require the project to minimize erosion and loss of topsoil during construction. Operations and maintenance would not require additional soil disturbance and would not result in erosion or loss of topsoil. In addition, once the project is constructed, there would be a reduction in areas of exposed soil compared to current conditions, limiting the potential for soil erosion to occur.

Additionally, the applicant would need to obtain a grading permit from El Dorado County. As part of that permit, an erosion and sediment control plan would be required because the site includes more than 10,000 feet of grading for a non-agricultural project. The erosion and sediment control plan would have to comply with the County's Storm Water Management Plan and Chapter 4 of the County Land Development Manual that implements County Code Chapter 110.14 (Grading, Erosion, and Sediment Control). These standards are designed to prevent increased

discharge of sediment during construction. The project proposed operational water quality controls consist of the use of bioretention basins to treat storm water consistent with State and County standards.

North Site

As noted above, construction of the North Site would include the implementation of SWPPP that would identify best management practices to address soil erosion (e.g., temporary sediment basins, waddles, and silt fencing). As identified in Chapter 2, "Project Description," the North Site storm drainage system would include 12 onsite bioretention basins that would capture sediment from being discharged to the South Site and eventually to natural waterways. The potential for increased erosion would be addressed through compliance with the County and SWRCB erosion control requirements and project design. Thus, this impact would be **less than significant**.

South Site

Like the North Site, construction of the South Site would include the implementation of SWPPP that would identify best management practices to address soil erosion (e.g., temporary sediment basins, waddles, and silt fencing). As identified in Chapter 2, "Project Description," the South Site storm drainage system would include six onsite bioretention basins that would capture sediment from being discharged with treated North Site drainage to natural waterways. The potential for increased erosion would be addressed through compliance with the County and SWRCB erosion control requirements and project design. Thus, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required in addition to compliance with County Code Chapter 110.14 (Grading, Erosion, and Sediment Control) and the requirements of SWRCB Construction General Permit Order 2009-0009-DWQ.

Impact 3.7-3: Locate Project Facilities on an Unstable Geologic Unit or Expansive Soils

Construction of the project would require earthwork that could destabilize slope and soil conditions. The project is required to comply with California Building Code and County Code and improvement standards for grading and erosion control that are designed to ensure slope and soil stability. The project geotechnical report identified that the project site does not contain areas of significant ground instability or unsuitable soil conditions; however, the report did identify geotechnical challenges for site development. This impact would be **significant**.

As identified in Chapter 2, "Project Description," the project site would involve grading activities that would recontour the North Site and South Site and involve the use of retaining walls. As noted above, substantial ground instability and unsuitable soil conditions were not observed on the site. However, the project geotechnical report identified geotechnical challenges with the 2013 grading plans for the project associated with hard rock excavations, generation of rocky fill material from excavation, perched groundwater, possibility for expansive soil issues (depending on the extent of rocky material in the fill), and the construction of utilities and foundations in areas of hard rock. As a result, it is possible that the current project design (which differs from the previous 2013 grading plans for the project) may also result in unstable slopes if it does not incorporate project-specific geotechnical recommendations.

North Site

Development of the North Site would involve grading of the site that would recontour the site using 30,000 cubic yards of fill from onsite excavation as well as the removal of approximately 19,000 cubic yards of rock from the site. Final grading would be subject to CBC standards and County Code that specific address stability. However, no details on how site development would implement recommendations of the geotechnical report have been identified. Therefore, the potential for the North Site to create geologic and soil stability issues could be **significant**.

South Site

Development of the South Site would involve grading of the site that would recontour the site as well as creation of a subterranean parking structure and trenching for utilities. Approximately 11,000 cubic yards of fill would be imported as part of the final grade of the site. Final grading would be subject to CBC standards and County Code that specific address stability. However, no details on how site development would implement recommendations of the

geotechnical report have been identified. Therefore, the potential for the South Site to create geologic and soil stability issues could be **significant**.

Mitigation Measures

Mitigation Measure 3.7-3: Incorporate Recommendations of Geotechnical Report In Project Design.

Final grading plans and foundation design for the both the North Site and South Site shall incorporate the recommendations regarding slope design and stability, retaining wall design, foundation and pavement specifications, and other grading and soil treatments of the final geotechnical report that will be reflective of the proposed project site plans. The final geotechnical report and project design shall be prepared consistent with Chapter 4 of the County Land Development Manual.

Significance after Mitigation

Mitigation Measure 3.7-3 would require that the applicant prepare a final geotechnical report for the proposed project that would address the final site design to ensure geologic and soil stability consistent with the requirements of CBC and County Code Chapter 110.14. Therefore, implementation of Mitigation Measure 3.7-3 would reduce impacts to **less than significant**.

This page intentionally left blank.

3.8 HAZARDS, HAZARDOUS MATERIALS, AND WILDFIRE

This section describes the potential impacts of the EDH 52 Commercial Center Project related to hazardous materials and public health. The evaluation provided in this section is based, in part, on review of State databases and other material pertaining to wildfire and other hazards, including an Initial Site Assessment and update to that Initial Site Assessment for the Silva Valley Parkway/U.S. 50 interchange, which addresses the proposed project site (Blackburn Consulting 2007, Blackburn Consulting 2010). The reader is referred to Section 3.2, "Air Quality," for an analysis of toxic air contaminant impacts associated with the project's operation.

For purposes of this section, the term "hazardous materials" refers to both hazardous substances and hazardous wastes. A "hazardous material" is defined in the CFR as "a substance or material that … is capable of posing an unreasonable risk to health, safety, and property when transported in commerce" (49 CFR 171.8). California Health and Safety Code Section 25501 defines a hazardous material as follows:

> "Hazardous material" means any material that, because of its quantity, concentration, or physical, or chemical characteristics, poses a significant present or potential hazard to human health and safety or to the environment if released into the workplace or the environment. "Hazardous materials" include, but are not limited to, hazardous substances, hazardous waste, and any material which a handler or the administering agency has a reasonable basis for believing that it would be injurious to the health and safety of persons or harmful to the environment if released into the workplace or the environment.

"Hazardous wastes" are defined in California Health and Safety Code Section 25141(b) as wastes that:

> … because of their quantity, concentration, or physical, chemical, or infectious characteristics, [may either] cause, or significantly contribute to an increase in mortality or an increase in serious illness [or] pose a substantial present or potential hazard to human health or the environment when improperly treated, stored, transported, disposed of, or otherwise managed.

3.8.1 Regulatory Setting

FEDERAL

The US Environmental Protection Agency (EPA) has primary responsibility for enforcing and implementing federal laws and regulations pertaining to hazardous materials. Applicable regulations are contained mainly in Titles 29, 40, and 49 of the CFR. Hazardous materials, as defined in the CFR, are listed in 49 CFR 172.101. Management of hazardous materials is governed by the following laws:

- **Resource Conservation and Recovery Act of 1976:** The Resource Conservation and Recovery Act of 1976 (RCRA) (42 U.S. Code [U.S.C.] 6901 et seq.) established a federal regulatory program for the generation, transport, and disposal of hazardous substances. Under RCRA, EPA regulates the generation, transportation, treatment, storage, and disposal of hazardous substances. RCRA was amended by the Hazardous and Solid Waste Amendments of 1984, which banned the disposal of hazardous waste on land and strengthened EPA's reporting requirements.
- **Comprehensive Environmental Response, Compensation, and Liability Act of 1980:** Also called the Superfund Act, the Comprehensive Environmental Response, Compensation, and Liability Act (42 U.S.C. 9601 et seq.) provided broad federal authority and created a trust fund for addressing releases and threatened releases of hazardous substances that could endanger public health or the environment. EPA is responsible for compiling the National Priorities List for known or threatened release sites of hazardous substances, pollutants, or contaminants (commonly referred to as "Superfund sites"). EPA provides oversight of, and supervision for, Superfund investigation/remediation projects, evaluates remediation technologies, and develops hazardous materials disposal restrictions and treatment standards.

- **Superfund Amendments and Reauthorization Act of 1986:** Also called SARA Title III or the Emergency Planning and Community Right-to-Know Act of 1986, the Superfund Amendments and Reauthorization Act (Public Law 99-499; U.S.C. Title 42, Chapter 116) imposes hazardous materials planning requirements to help protect local communities in the event of accidental release.
- **Clean Air Act:** Regulations under the Clean Air Act (42 U.S.C. 7401 et seq., as amended) are designed to prevent accidental releases of hazardous materials. The regulations require facilities that store a threshold quantity or greater of regulated substances to develop a risk management plan that includes hazard assessments and response programs to prevent accidental releases of listed chemicals.
- **Spill Prevention, Control, and Countermeasure Rule:** The Spill Prevention, Control, and Countermeasure (SPCC) rule includes requirements for oil spill prevention, preparedness, and response to prevent oil discharges to navigable waters and adjoining shorelines. The rule requires specific facilities to prepare, amend, and implement SPCC Plans. The SPCC rule is part of the Oil Pollution Prevention regulation, which also includes the Facility Response Plan rule.

Transport of Hazardous Materials

The US Department of Transportation (DOT) regulates transport of hazardous materials between states and is responsible for protecting the public from dangers associated with such transport. The basic statute regulating transport of hazardous materials in the United States, addressed in 49 USC 5101 et seq. (formerly the Hazardous Materials Transportation Act, 49 USC 1801 et seq.), regulates intrastate and interstate transport by rail car, aircraft, motor vehicle, and vessel and includes requirements related to the appropriate packaging and labeling of the hazardous material for transit. There are registration requirements for individuals that offer and accept hazardous wastes, and hazardous materials must be properly classed, described, packaged, marked, and labeled. Hazardous materials transport regulations are enforced by the Federal Highway Administration, the US Coast Guard, the Federal Railroad Administration, and FAA.

Occupational Safety and Health Administration Worker Safety Requirements

The Occupational Safety and Health Administration (OSHA) is responsible for ensuring worker safety. OSHA sets federal standards for implementation of workplace training, exposure limits, and safety procedures for handling hazardous substances and addressing other potential industrial hazards. OSHA also establishes criteria by which each state can implement its own health and safety program. The Hazard Communication Standard (CFR Title 29, Part 1910) requires that workers be informed of the hazards associated with the materials they handle. Workers must be trained in safe handling of hazardous materials, use of emergency response equipment, and building emergency response plans and procedures. Containers must be labeled appropriately, and material safety data sheets must be available in the workplace.

STATE

The Hazardous Waste Control Act

The Hazardous Waste Control Act (HSC Section 25100 et seq.) is the seminal hazardous waste control law in California. It establishes standards for regulating the generation, handling, processing, storage, transportation, and disposal of hazardous wastes. The hazardous waste control program is administered by California Department of Toxic Substances Control (DTSC) and local Certified Unified Program Agencies (CUPAs). Within the California Environmental Protection Agency (CalEPA), DTSC is primarily responsible for regulating the generation, transport, and disposal of hazardous substances under the authority of the Hazardous Waste Control Act; enforcement is delegated to local jurisdictions. Regulations implementing the Hazardous Waste Control Act list hazardous chemicals and common substances that may be hazardous; establish criteria for identifying, packaging, and labeling hazardous substances; prescribe hazardous substances management; establish permit requirements for the treatment, storage, disposal, and transportation of hazardous substances; and identify hazardous substances prohibited from landfills. These regulations apply to the protection of human health and the environment during construction.

Unified Program

CalEPA has adopted regulations implementing the Unified Hazardous Waste and Hazardous Materials Management Regulatory Program (Unified Program). The six program elements of the Unified Program are hazardous waste generation and on-site treatment, underground storage tanks, aboveground storage tanks, hazardous material release response plans and inventories, risk management and prevention programs, and Uniform Fire Code hazardous materials management plans and inventories. The program is implemented at the local level by a local agency, referred to as the CUPA, which is responsible for consolidating the administration of the six program elements within its jurisdiction.

Emergency Response to Hazardous Materials Incidents

California has developed an emergency response plan to coordinate emergency services provided by federal, State, and local governments and private agencies. Response to hazardous material incidents is one part of this plan. The plan is managed by the California Emergency Management Agency, which coordinates the responses of other agencies, including CalEPA, the California Highway Patrol, the California Department of Fish and Wildlife, and regional water quality control boards (RWQCBs).

California Government Code Section 65962.5 (Cortese List)

The provisions of California Government Code Section 65962.5 are commonly referred to as the "Cortese List" (after the legislator who authored the law). The Cortese List is a planning document used by State and local agencies to comply with CEQA requirements in providing information about the location of hazardous materials release sites. The list, or a site's presence on the list, has bearing on the local permitting process. DTSC is responsible for a portion of the information contained in the Cortese List. Other State and local government agencies in California, such as the State Water Resources Control Board (SWRCB), also must provide additional release information.

Government Code Section 65962.5 requires CalEPA to develop an updated Cortese List at least annually. However, because this statute was enacted more than 20 years ago, some of the provisions refer to agency activities that are no longer being implemented, and in some cases, the information to be included in the Cortese List does not exist. Further, although Government Code Section 65962.5 makes reference to the preparation of a "list," many changes have occurred related to web-based information access since 1992, and this information is now largely available on the internet sites of the responsible organizations. A centralized list is no longer compiled.

California Hazardous Materials Release Response Plans and Inventory Law

The California Hazardous Materials Release Response Plans and Inventory Law requires preparation of hazardous materials business plans and disclosure of hazardous materials inventories. Such plans must include an inventory of hazardous materials handled, facility floor plans showing where hazardous materials are stored, and an emergency response plan, and they must establish emergency response procedures that include employee training (HSC, Division 20, Chapter 6.95, Article 1). The business plan program is administered by the California Emergency Management Agency.

California Accidental Release Prevention Program

The goal of the California Accidental Release Prevention Program (CCR Title 19, Division 2, Chapter 4.5) is to reduce the likelihood and severity of consequences of any releases of extremely hazardous materials. Any business that handles regulated substances (chemicals that pose a major threat to public health and safety or the environment because they are highly toxic, flammable, or explosive, including ammonia, chlorine gas, hydrogen, nitric acid, and propane) must prepare a risk management plan. The risk management plan is a detailed engineering analysis of the potential accident factors present at a business and the measures that can be implemented to reduce this accident potential. The plan must provide safety information, hazard data, operating procedures, and training and maintenance requirements. The list of regulated substances is found in Article 8, Section 2770.5 of the program regulations.

Porter-Cologne Water Quality Control Act

Through the Porter-Cologne Water Quality Control Act and the National Pollutant Discharge Elimination System (NPDES) program, RWQCBs have the authority to require proper management of hazardous materials during project

construction. For a detailed description of the Porter-Cologne Water Quality Control Act, the NPDES program, and the role of the Central Valley RWQCB, see Section 3.9, "Hydrology and Water Quality."

SWRCB adopted the Statewide NPDES General Permit in August 1999. The State requires that projects disturbing more than 1 acre of land during construction file a notice of intent with the RWQCB to be covered under this permit. Construction activities subject to the general permit include clearing, grading, stockpiling, and excavation. Dischargers are required to eliminate or reduce nonstormwater discharges to storm sewer systems and other waters. A stormwater pollution prevention plan must be developed and implemented for each site covered by the permit. The plan must identify best management practices (BMPs) designed to prevent construction pollutants from contacting stormwater and keep products of erosion from moving off-site into receiving waters throughout the construction and life of the project; the BMPs must address source control and, if necessary, pollutant control.

California Occupational Safety and Health Administration Worker Safety Requirements

The California Occupational Safety and Health Administration (Cal/OSHA) assumes primary responsibility for developing and enforcing workplace safety regulations in California. Cal/OSHA regulations for the use of hazardous materials in the workplace (CCR Title 8) require safety training, available safety equipment, accident and illness prevention programs, hazardous substance exposure warnings, and preparation of emergency action and fire prevention plans. Cal/OSHA enforces regulations on hazard communication programs and mandates specific training and information requirements. These requirements include procedures for identifying and labeling hazardous substances, providing hazard information about hazardous substances and their handling, and preparing health and safety plans to protect workers and employees at hazardous waste sites. Employers must make material safety data sheets available to employees and document employee information and training programs.

Transport of Hazardous Materials and Hazardous Materials Emergency Response Plan

The State of California has adopted US Department of Transportation regulations for the movement of hazardous materials originating within the state and passing through the state; state regulations are contained in 26 California Code of Regulations (CCR). State agencies with primary responsibility for enforcing state regulations and responding to hazardous materials transportation emergencies are the California Highway Patrol and the California Department of Transportation (Caltrans). Together, these agencies determine container types used and license hazardous waste haulers to transport hazardous waste on public roads.

California has developed an emergency response plan to coordinate emergency services provided by federal, state, and local governments and private agencies. Response to hazardous materials incidents is one part of the plan. The plan is managed by the Governor's Office of Emergency Services, which coordinates the responses of other agencies in the project area.

California Fire Code

The California Fire Code (CFC) is Chapter 9 of CCR Title 24. It is the primary means for authorizing and enforcing procedures and mechanisms to ensure the safe handling and storage of any substance that may pose a threat to public health and safety. The CFC regulates the use, handling, and storage requirements for hazardous materials at fixed facilities. The CFC and the California Building Code use a hazard classification system to determine what protective measures are required to protect life and provide fire safety. These measures may include applying construction standards, requiring separation between structures and property lines, and using specialized equipment. To ensure that these safety measures are met, the CFC employs a permit system based on hazard classification. The CFC is updated every 3 years.

California Public Resources Code – State Responsibility Area

The State of California has determined that some non-federal lands in unincorporated areas with watershed value are of statewide interest and have classified those lands as State Responsibility Areas (SRAs). SRAs are managed by the California Department of Forestry and Fire Protection (CAL FIRE), the state agency established for fire protection and stewardship of over 31 million acres of the state's privately-owned wildlands and to provide emergency services in 36 of California's 58 counties via contracts with local governments.

The **Error! Bookmark not defined.** requires the designation of SRAs, which are identified based on cover, beneficial water uses, probable erosion damage and fire risks, and hazards. CAL FIRE is required by law to map areas of significant fire hazards based on fuels, terrain, weather, and other relevant factors (PRC 4201-4204, Government Code 51175-89, and Title 14 of the California Code of Regulations (Title 14 CCR) Section 1280.01). Factors that increase an area's susceptibility to fire hazards include slope, vegetation type and condition, and atmospheric conditions. CAL FIRE has identified two types of wildland fire risk areas: 1) wildland areas that may contain substantial forest fire risks and hazards, and 2) very high fire hazard risk zones. The financial responsibility of preventing and suppressing fires in the SRA is primarily the responsibility of the State pursuant to PRC Sections 4113 and 4125). New development located in SRAs are subject to the following requirements:

- Determination that new subdivisions are consistent with regulations adopted by the State Board of Forestry and Fire Protection pursuant to PRC Sections 4290 and 4291 or are consistent with local ordinances certified by the State Board of Forestry and Fire Protection as meeting or exceeding the state regulations (14 CCR Section 1266.01)
- Defensible space of 100 feet around all buildings and structures (PRC Section 4291 and Title 14 CCR Section 1299.03)
- Provision of adequate emergency access and egress (PRC Sections 4290 and 4291, Title 14 CCR Sections 1273.01 through 1273.09)
- Emergency water requirements (Title 14 CCR Sections 1275.01 through 1275.04)
- Building signing and number requirements (PRC Sections 4290 and 4291 and Title 14 CCR Sections 1274.01 through 1274.04)
- Title 24 CCR, Part 2, S Section 701A.3 (New Buildings Located in Any Fire Hazard Severity Zone) requires that new buildings located in any Fire Hazard Severity Zone within SRAs, any local agency Very-High Fire Hazard Severity Zone, or any Wildland-Urban Interface Fire Area designated by the enforcing agency for which an application for a building permit is submitted, shall comply with all the requirements of Chapter 7A. These requirements include the following:
  - roofing design to be fire resistant and constructed to prevent the intrusion of flames and embers (Section 705A);
  - attic ventilation designed to be resistant to the intrusion of flames and embers into the attic area of the structure (Section 706A);
  - exterior walls design (including vents, window, and door) with noncombustible or ignition-resistant material and resist the intrusion of flame and ember (Section 707A and 707A);
  - decking be designed with ignition-resistant material (Section 709A); and
  - ancillary buildings and structures comply with the above provisions (Section 710A).

Fire protection in areas outside the SRA are the responsibilities of local or federal jurisdictions and are referred to as local responsibility areas and federal responsibility areas, respectively. El Dorado County includes SRAs and local responsibility areas. The project site is located within a SRA, but seeks annexation into the El Dorado Hills Fire Department's service area, which would transfer the project site from State responsibility to local responsibility.

California Public Resources Code – Extremely Hazardous Substances Near Schools

Under PRC Section 21151.4,

a) An environmental impact report shall not be certified or a negative declaration shall not be approved for any project involving the construction or alteration of a facility within one-fourth of a mile of a school that might reasonably be anticipated to emit hazardous air emissions, or that would handle an extremely hazardous substance or a mixture containing extremely hazardous substances in a quantity equal to or greater than the state threshold quantity specified pursuant to subdivision (j) of Section 25532 of the Health and Safety Code , that may pose a health or safety hazard to persons who would attend or would be employed at the school, unless both of the following occur:

1. The lead agency preparing the environmental impact report or negative declaration has consulted with the school district having jurisdiction regarding the potential impact of the project on the school.
2. The school district has been given written notification of the project not less than 30 days prior to the proposed certification of the environmental impact report or approval of the negative declaration.

b) As used in this section, the following definitions apply:

1. "Extremely hazardous substance" means an extremely hazardous substance as defined pursuant to paragraph (2) of subdivision (g) of Section 25532 of the Health and Safety Code.
2. "Hazardous air emissions" means emissions into the ambient air of air contaminants that have been identified as a toxic air contaminant by the State Air Resources Board or by the air pollution control officer for the jurisdiction in which the project is located. As determined by the air pollution control officer, hazardous air emissions also means emissions into the ambient air of a substance identified in subdivisions (a) to (f), inclusive, of Section 44321 of the Health and Safety Code.

LOCAL

El Dorado County General Plan

The following goals and associated policies are established in the El Dorado County General Plan and are applicable to the project.

- **Policy 2.1.1.7:** Development within Community Regions, as with development elsewhere in the County, may proceed only in accordance with all applicable General Plan Policies, including those regarding infrastructure availability as set forth in the Transportation and Circulation and the Public Services and Utilities Elements. Accordingly, development in Community Regions and elsewhere will be limited in some cases until such time as adequate roadways, utilities, and other public service infrastructure become available and wildfire hazards are mitigated as required by an approved Fire Safe Plan
- **Policy 6.2.1.1:** Implement Fire Safe ordinance to attain and maintain defensible space through conditioning of tentative maps and in new development at the final map and/or building permit stage.
- **Policy 6.2.2.2:** The County shall preclude development in areas of high and very high wildland fire hazard or in areas identified as wildland-urban interface (WUI) communities within the vicinity of Federal lands that are a high risk for wildfire, as listed in the Federal Register Executive Order 13728 of May 18, 2016, unless such development can be adequately protected from wildland fire hazard, as demonstrated in a WUI Fire Safe Plan prepared by a qualified professional as approved by the El Dorado County Fire Prevention Officers Association. The WUI Fire Safe Plan shall be approved by the local Fire Protection District having jurisdiction and/or California Department of Forestry and Fire Protection.
- **Policy 6.2.3.1:** As a requirement for approving new development, the County must find, based on information provided by the applicant and the responsible fire protection district that, concurrent with development, adequate emergency water flow, fire access, and firefighting personnel and equipment will be available in accordance with applicable State and local fire district standards.
- **Policy 6.2.3.2:** As a requirement of new development, the applicant must demonstrate that adequate access exists, or can be provided to ensure that emergency vehicles can access the site and private vehicles can evacuate the area.
- **Policy 6.2.3.4:** All new development and public works projects shall be consistent with applicable State Wildland Fire Standards and other relevant State and federal fire requirements.

- **Policy 6.2.4.1:** Discretionary development within high and very high fire hazard areas shall be conditioned to designate fuel break zones that comply with fire safe requirements to benefit the new and, where possible, existing development.
- **Policy 6.2.4.2:** The County shall cooperate with the California Department of Forestry and Fire Protection and local fire protection districts to identify opportunities for fuel breaks in zones of high and very high fire hazard either prior to or as a component of project review
- **Policy 6.6.1.2:** Prior to the approval of any subdivision of land or issuing of a permit involving ground disturbance, a site investigation, performed by a Registered Environmental Assessor or other person experienced in identifying potential hazardous wastes, shall be submitted to the County for any subdivision or parcel that is located on a known or suspected contaminated site included in a list on file with the Environmental Management Department as provided by the State of California and federal agencies. If contamination is found to exist by the site investigations, it shall be corrected and remediated in compliance with applicable laws, regulations, and standards prior to the issuance of a new land use entitlement or building permit.

El Dorado County Hazardous Waste Management Plan

Objectives of the El Dorado County Hazardous Waste Management Plan include promoting source reduction and proper management of hazardous materials at businesses; developing public education programs; promoting clean-up of contaminated sites; minimizing improper disposal of hazardous wastes; developing siting criteria for hazardous waste management facilities; ensuring emergency response capabilities; and coordination of hazardous waste planning efforts with the public and private sectors, as well as local and state plans.

El Dorado County Local Hazard Mitigation Plan

The County developed its Local Hazard Mitigation Plan to reduce or eliminate long-term risk to people and property from natural hazards consistent with the Disaster Mitigation Act of 2000. The Plan identifies actions associated with wildfire that are summarized below (El Dorado County Sheriff 2018: 4-33 through 4-36). This Plan does not establish designated evacuation routes. Direction regarding evacuation routes is provided as part of evacuation orders issued by the El Dorado County Sheriff through the El Dorado County Sheriff's Office- Office of Emergency Services Alert Notification System.

- Action 2. Ensure Public Education and Awareness of Natural Hazards and Public Understanding of Disaster Preparedness: Implementation of a comprehensive multi-hazard outreach program to provide timely and consistent messaging to communicate the risk and vulnerability of natural hazards of concern to the community.
- Action 13. Public Education: Community outreach by County, fire agencies, animal services, Fire Safe councils, and other stakeholders work regarding defensible space and living with fire.
- Action 14. Defensible Space Programs: Manage properties and infrastructure through the management of fuels.
- Action 15. Large Strategic Fuel Break: Provision of large strategic fuel breaks to provide landscape scale community protection.
- Action 16. Fuel Breaks in the Wildland Urban Interface: Establishment of "Shaded Fuel" breaks for dense vegetation areas approximately 300 feet wide for communities with a wildland urban interface.

El Dorado County Code

Chapter 8.09 (Vegetation Management and Defensible Space) of Title 8 of the County Code requires the removal or abatement of all hazardous vegetation and combustible material, which constitutes a fire hazard which may endanger or damage neighboring property. Section 8.09.070(F) establishes defensible space requirements for parcels in, upon, or adjoining land that is covered with flammable material.

Chapter 17 of Title 14 contains El Dorado County's SRA Fire Safe Regulations, which apply to construction within an SRA that is approved after January 1, 1991, including activities such as permitting new parcels, applying for a building permit for new construction, and road construction.

El Dorado Hills Fire Department Standards

The project is located within the sphere of influence for the El Dorado Hills Fire Department (also known as the El Dorado Hills County Water District) (EDHFD). Applicable fire protection regulations and programs consist of Ordinance 2019-01, Resolution 2021-01, and the implementation of community Wildland Fire Safe Plans.

Ordinance 2019-01 consists of the adoption of the 2019 California Fire Code with amendments to address local climate, geologic, and topographic conditions of the El Dorado Hills area. These amendments consist of more restrictive standards than the California Fire Code that include, but is not limited to, the following:

- Fire apparatus access roads (Chapter 5, Section 503 and Appendix D)
- Fire protection water supplies (Chapter 5, Section 507 and Chapter 33, Section 3312)
- Fire sprinkler requirements (Chapter 9, Section 903 and Chapter 80)
- Development plan review and wildfire protection for building construction (Chapter 49, Section 4903 and 4905)

Resolution 2021-01 declares that weeds and similar materials on vacant properties to be a fire hazard and public nuisance. Property owners of vacant parcels are required to maintain their property in accordance with El Dorado Hills Fire Department Standard W-001 by no later than May 1.

El Dorado County General Plan policies 2.1.1.7, 6.2.2.2, 7.4.2.2, and 7.6.1.4 require new development to prepare a Fire Safe Plan (also referred to as a Wildfire Safe Plan). EDHFD provides assistance and review of Fire Safe Plans.

Standard #B-003 (Emergency Apparatus Access Ways) requirements include roadway access distances from structures, roadway design must handle the weight of fire apparatus equipment, two points of access during construction activities, roadway width, vertical clearance and turning radii standards.

El Dorado County Air Quality Management District Rule 223-2

Rule 223-2 regulates grading in asbestos review areas and requires that finished grade surface asbestos concentrations be below 0.25 percent as measured by CARB Test Method (TM) 435; potentially requiring testing and management for asbestos during grading followed by the testing of finished grades for asbestos. All export soil/rock is required to be tested along with the completion of special documentation to accompany the export. Public disclosure is required for properties containing asbestos.

3.8.2 Environmental Setting

WILDLAND FIRE CONDITIONS

Long, hot, dry summers in El Dorado County, combined with inadequate clearance between structures and vegetation, flammable vegetation, and steep topography, result in conditions conducive for wildfires. The community of El Dorado Hills includes open space areas that consist of grassland habitat that are at current risk to fire. In 2021, a fire incident occurred on the land area of the closed El Dorado Hills Executive Golf Course south of Serrano Parkway that burned approximately 10 acres

Wind direction and intensity during wildfires are important because air quality is poorest immediately adjacent to and downwind of such fires. Fires near populated areas may pose an increased risk of air quality-related health problems. Mountain-to-valley breezes may also distribute smoke. At night, the air drains down-slope, but during the day winds reverse and blow upslope, carrying the polluted air. Mountain areas may become smoky in late afternoon or early evening for this reason. By morning, however, cold, dense nighttime air has traveled down-slope and polluted valleys and mountain basins. This may cause ground-level inversions to form as the land radiates heat. Mountain basins or valleys, such as the Sacramento Valley, have high smoke impact potential creating public health issues. This condition was recently experienced during the 2018 and 2020 fire seasons when smoke from northern California fires elevated particulate matter levels in the Sacramento Valley Air Basin to unhealthy levels.

Wildland fire may be started by natural processes (primarily lightning) or it may be started (intentionally or accidentally) by human activities, such as smoking and equipment operation. Emergency fire access plays a major role in whether a fire can be quickly extinguished. The State Board of Forestry identifies lands where the California Department of Forestry and Fire Protection (CAL FIRE) has the primary duty for wildland fire prevention and suppression in SRAs and has mapped the fire hazard potential within SRAs based on relevant factors such as fuels, terrain, and weather. Hazards are described according to their potential to cause ignition of buildings. The project site is mapped as an in a moderate fire hazard severity zone (CAL FIRE 2007).

In 2009, the CPUC adopted fire-safety regulations that apply to high fire-threat areas, in which there is a heightened risk of power lines igniting fires that spread rapidly. The CPUC adopted a final CPUC Fire-Threat Map in 2018, which is one of several documents that form the HFTD Map where stricter fire-safety regulations apply. The other documents forming the High Fire-Threat District Map include the map of Tier 1 High Hazard Zones (HHZs) in the US Forest Service and CAL FIRE's joint map of tree mortality HHZs. The project area is mapped as a Tier 2 CPUC High Fire-Threat District, which designates an "elevated risk from wildfires associated with overhead utility power lines or overhead utility power-line facilities also supporting communication facilities" (CPUC 2021).

KNOWN AND POTENTIAL CONTAMINATION

The project site consists of undeveloped grazing land. There are remnant concrete structures and related debris, but it is unclear what the use of the structures were. It appears the site was a ranch, with structures made out of concrete. Potential hazards associated with sites previously used for agriculture with a residential structure includes leach fields, septic tanks, and buried heating oil tanks. The concrete structures may contain lead-based paint and asbestos containing material. The parcel may also contain aerially deposited lead due to proximity to US 50. The risk of residual pesticides is low because the land was used for grazing (Blackburn Consulting 2007). Lead tends to be found within 30 feet of the edge of pavement and within the top 6 inches of soil, though can be found a few feet below the ground surface (DTSC 2016). Recent queries of the State Water Resources Control Board's GeoTracker database and DTSC's EnviroStor database found no known contamination on the project site (DTSC 2021, SWRCB 2021).

NATURALLY OCCURRING ASBESTOS

There is no known mapped occurrence of naturally occurring asbestos (NOA) minerals on the project site, nor are there ultramafic rocks that are typical hosts for NOA. There are ultramafic rocks and faulting nearby, such that there remains a potential for NOA to occur in the area (Blackburn Consulting 2013). El Dorado County's NOA Review Area Map also shows the project site straddling the border of an area that is mapped as a quarter mile buffer for more likely to contain asbestos or fault line (Blackburn Consulting 2013, El Dorado County 2015).

PROXIMITY TO AIRPORTS

The Cameron Airpark Airport is located approximately 4 miles northeast of the project site. It is a public use airport with two runways and an average of 99 operations per day during 2017 (FAA 2021). The project site is not within the Airport Influence Area of the Cameron Park Airport established in the Land Use Compatibility Plan (EDCALUC 2012).

PROXIMITY TO SCHOOLS

Oak Meadow Elementary School is about 0.15 miles north of the project site at 7701 Silva Valley Parkway.

EMERGENCY RESPONSE AND EVACUATION

Emergency response is addressed through several planning documents, including the El Dorado County's Local Hazard Mitigation Plan and Hazardous Materials Emergency Response Plan (El Dorado County Sheriff 2018, El Dorado County 2009). Direction regarding evacuation routes is provided as part of evacuation orders issued by the El

Dorado County Sheriff through the El Dorado County Sheriff's Office- Office of Emergency Services Alert Notification System. There are several two to six lane roadways in the El Dorado Hills community (e.g., El Dorado Hills Boulevard, Serrano Parkway, Silva Valley Parkway, US 50, White Rock Road, Green Valley Road) that can be used for evacuation depending on the details of the emergency, such as the speed and trajectory of a fire or other hazard.

3.8.3 Environmental Impacts and Mitigation Measures

METHODOLOGY

The following reports and data sources document potential hazardous conditions at the project site and were reviewed for this analysis:

- available literature, including documents published by federal, State, County, and other local agencies (e.g., El Dorado Hills Fire Department);
- review of applicable elements from the El Dorado County General Plan; and
- the Initial Site Assessment and update to that Initial Stie Assessment for the Silva Valley Parkway/U.S. 50 interchange, which addresses the proposed project site (Blackburn Consulting 2007, Blackburn Consulting 2010).

Project construction and operation were evaluated against the hazardous materials and wildfire information gathered from these sources to determine whether any risks to public health and safety or other conflicts would occur.

THRESHOLDS OF SIGNIFICANCE

An impact related to hazards and hazardous materials is considered significant if implementation of the project would do any of the following:

- create a significant hazard to the public or the environment through the routine transport, use, or disposal of hazardous materials;
- create a significant hazard to the public or the environment through reasonably foreseeable upset and/or accident conditions involving the release of hazardous materials into the environment;
- emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school;
- be located on a site which is included on a list of hazardous materials sites compiled pursuant to Government Code Section 65962.5 and, as a result, would it create a significant hazard to the public or the environment;
- for a project located within an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project result in a safety hazard or excessive noise for people residing or working in the project area;
- implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan;
- expose people or structures, either directly or indirectly, to a significant risk of loss, injury, or death involving wildland fires;
- due to slope, prevailing winds, and other factors, exacerbate wildfire risks, and thereby expose project occupants to, pollutant concentrations from a wildfire or the uncontrolled spread of a wildfire;
- require the installation or maintenance of associated infrastructure (such as roads, fuel breaks, emergency water sources, power lines or other utilities) that may exacerbate fire risk or that may result in temporary or ongoing impacts to the environment; and/or
- expose people or structures to significant risks, including downslope or downstream flooding or landslides, as a result of runoff, post-fire slope instability, or drainage changes

ISSUES NOT DISCUSSED FURTHER

No known hazardous materials sites are located on or immediately adjacent to the project site. Impacts related to locating the project on site included on a list of hazardous materials sites pursuant to Government Code Section 65962.5 is not discussed further in this EIR.

The Cameron Airpark Airport is located approximately 4 miles northeast of the project site. The project site is not within the Airport Influence Area of the Cameron Park Airport established in the Land Use Compatibility Plan and would not result in a safety hazard. Impacts related to airport hazards is not discussed further in this EIR.

The project site, including the surrounding El Dorado Hills area, is exposed to single-noise events from cargo aircraft landing at Mather Airport, approximately 13 miles southwest of the site. The 2004 General Plan EIR states that new development under the County General Plan could be subject to aircraft noise and that development within El Dorado Hills is an area that is already considered to be affected by single event levels, because of aircraft overflights associated with the operation of Mather Airport in Sacramento County. The project would not include noise-sensitive land uses exposed to this noise source. Thus, this issue is not discussed further in this EIR.

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Impact 3.8-1: Create a Significant Hazard Through the Routine Transport, Use, or Disposal of Hazardous Materials or Accidental Release of Hazardous Materials During Construction

Construction of the project would involve grading, excavation, and other ground-disturbing activities which could result in the accidental release of hazardous materials. No known contamination is located on the project site. The site may contain NOA, and construction would involve transportation, use, storage, and disposal of common hazardous materials. Existing laws and regulations govern management of these hazards. Therefore, impacts would be **less than significant**.

Construction activities associated with the project would involve transportation, use, storage, and disposal of hazardous materials and petroleum products commonly used at construction sites (such as diesel fuel, lubricants, paints and solvents, and cement products containing strong basic or acidic chemicals). Construction of the project would involve grading, excavation, facility construction, and other activities that could result in the accidental release of hazardous materials. Standard accident and hazardous materials recovery training and procedures—enforced by the state and followed by private state-licensed, certified, and bonded transportation companies and contractors—reduce the potential for hazards associated with this routine use. Hazardous materials would be transported to the project area according to applicable hazardous materials transport and handling laws and regulations (such as the DOT Office of Hazardous Materials Safety regulations for the safe transportation of hazardous materials described in Title 49 of the CFR) and would only be stored in proper containers within a secured construction staging area. Hazardous wastes (including used oil, used oil filters, used gasoline containers, spent batteries, and other items) would be collected regularly and disposed of in accordance with all applicable laws and regulations.

As required under State and federal law, plans for notification and evacuation of site workers and local residents and other persons nearby in the event of a hazardous materials release would be in place throughout construction. Inspections would be conducted to verify consistent implementation of general construction permit conditions and BMPs to avoid and minimize the potential for spills and releases, and of the immediate cleanup and response thereto. BMPs include, for example, the designation of special storage areas and labeling, containment berms, coverage from rain, and concrete washout areas. Compliance with various federal, State, and local regulations would minimize the risk of a spill or accidental release of hazardous materials.

As stated previously, the project site is not identified as a hazardous materials site on any list maintained by the California Environmental Protection Agency pursuant to Government Code Section 65962.5. Because of the relatively recent ground disturbance and development of the current uses on the site, it is unlikely that undocumented hazards, such as spills of potentially hazardous materials that have not been reported, are present. Nevertheless, the

disturbance of undocumented hazardous wastes during grading or excavation activities may result in hazards to the environment and human health. Potential hazards to human health include ignition of flammable liquids or vapors, inhalation of toxic vapors in confined spaces, such as trenches, and skin contact with contaminated soil or water. If hazardous materials are discovered through the construction process, existing regulations provide prescriptive requirements for ceasing work, notifying appropriate government agencies, and providing remediation if necessary. Federal and State laws require that soils and groundwater having concentrations of contaminants such as lead, gasoline, or industrial solvents that are higher than certain acceptable levels are handled and disposed of as hazardous waste during excavation, transportation, and disposal. Title 22 of the CCR, Sections 66261.20–66261.24, contains technical descriptions of characteristics that would cause soil to be classified as a hazardous waste. Additionally, although many hazardous construction materials remaining after project construction can likely be reused on other projects, those materials that cannot be (or are not) reused would require disposal. Hazardous waste generated during construction may consist of welding materials, fuel and lubricant containers, paint and solvent containers, and cement products containing strong basic or acidic chemicals.

North Site and South Site

As discussed above, construction of the North Site would involve transportation, use, storage, and disposal of hazardous materials and petroleum products commonly used at construction sites. These activities are regulated through a variety of agencies and instruments. All construction activities involving the transportation, use, storage, and disposal of hazardous materials would be subject to the requirements and regulations that would minimize the risk of a spill or accidental release of hazardous materials. Therefore, the potential for the North Site to create a significant hazard through the routine transport, use, or disposal of hazardous materials or accidental release of hazardous materials during construction would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact 3.8-2: Create a Significant Hazard Through the Routine Transport, Use, or Disposal of Hazardous Materials or Accidental Release of Hazardous Materials During Operation

The project would involve the routine transport, use, and disposal of hazardous materials during fueling activities, vehicle maintenance, and landscaping and site maintenance. Given measures taken to improve the safety of USTs and fuel storage areas, compliance with applicable regulations which would reduce impacts associated with the use, transport, storage, and sale of hazardous materials; and the handling of hazardous materials in accordance with the HMBEP, impacts associated the routine transport, use, and disposal of hazardous materials would be **less than significant**.

For both the North Site and South Site, potentially hazardous materials such as petroleum products, paint products, solvents, cleaning products, and automotive fluids may be transported, stored, and used. Potentially hazardous materials such as pesticides, fertilizer, and other household hazardous products may also be used during landscaping and site maintenance activities.

As described in Title 49 of the Code of Federal Regulations and implemented by Title 13 of the CCR, the USDOT Office of Hazardous Materials Safety has established strict regulations for the safe transportation of hazardous materials. Appropriate documentation for all hazardous waste that is transported in connection with project activities would be provided as required for compliance with existing hazardous materials regulations. Hazardous wastes produced on site are subject to requirements associated with accumulation time limits, proper storage locations and containers, and proper labeling. Additionally, for removal of hazardous waste from the site, hazardous waste generators are required to use a certified hazardous waste transportation company, which must ship hazardous waste to a permitted facility for treatment, storage, recycling, or disposal.

The State of California requires all businesses that handle more than a specified amount of hazardous material or extremely hazardous material, to submit an HMBEP to its local CUPA. The HMBEP must include an inventory of the hazardous materials used in the facility, and emergency response plans and procedures to be used in the event of a significant or threatened significant release of a hazardous material. The HMBEP must also include the Material Safety Data Sheet for each hazardous and potentially hazardous substance used, which summarizes the physical and chemical properties of the substances and their health impacts. In the event of an accidental release of hazardous materials, the HMBEP requires immediate notification to all appropriate agencies and personnel of a release, identification of local emergency medical assistance appropriate for potential accident scenarios, contact information of all company emergency coordinators of the business, a listing and location of emergency equipment at the business, an evacuation plan, and a training program for business personnel.

Typical retail and office land uses do not typically involve transport, use, or disposal of significant quantities of hazardous materials. Generally, small quantities of hazardous materials, such as paints, cleaning chemicals, and fertilizers, are used for routine maintenance within these types of land uses. As described under Impact 3.8-1 for construction, conformance with established regulations and policies would reduce the potential for improper handling of materials and wastes that could result in accidental releases. In addition, the El Dorado County EMD inspects businesses that handle hazardous materials and responds to hazardous material spills and releases.

North Site

As identified in Chapter 2, "Project Description," the North Site would include operation of a fueling station. Fueling station uses are subject to standard regulations related to the routine transportation, storage, and dispensing of gasoline. Fuel pump dispensers would be required to be equipped with automatic shutoffs and other safety device and signage, as required by Fire, Building, and Health codes. All USTs would be double walled and all above ground fuel storage tanks would be surrounded by fencing. In accordance with Title 23, Section 2635(b) of the CCR, USTs would be required to have spill containment and overfill prevention systems. Fuel tank storage areas would have appropriate safety design, equipment, and signage to protect public health and safety from leaks, fires, or spills involving vehicle fuel if any were to occur on the project site. A SWPPP would be prepared and would include BMPs designed to prevent project-generated pollutants from entering stormwater and moving off-site into receiving waters throughout the operation of the project. Compliance with all federal, State, and local requirements related to hazardous materials would ensure that operational impacts from the North Site would be **less than significant**.

South Site

As identified in Chapter 2, "Project Description," the South Site would include a tire center for the repair and replacement of tires, as well as propane sales and refueling. Propane refill operations also present potential hazards from improper refilling. OSHA regulates storage and handling of liquefied petroleum gases. For example, section 1910.110 of Title 29 of the Code of Federal Regulations contains requirements related to odorizing, approval of equipment and systems, container welding, container marking, and transfer of liquids to reduce hazards. Compliance with all federal, State, and local requirements related to hazardous materials would ensure that operational impacts from the South Site would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact 3.8-3: Emit hazardous emissions or handle hazardous or acutely hazardous materials, substances, or waste within one-quarter mile of an existing or proposed school

The project would involve the routine transport, use, and disposal of hazardous materials during construction and operation activities within one-quarter mile of an existing elementary school. However, the project would not involve handling of extremely hazardous substances. This impact would be **less than significant**.

North Site

As identified in Chapter 2, "Project Description," the North Site would include operation of a fueling station. Oak Meadow Elementary School is about 0.15 miles north of the project site at 7701 Silva Valley Parkway. Proposed activities include the handling of hazardous materials as discussed in detail under Impact 3.8-1 and Impact 3.8-2. Specific to schools and hazardous materials, Public Resources Code section 21151.4 requires consultation with school districts for a "project involving the construction or alteration of a facility within one-fourth of a mile of a school that might reasonably be anticipated to emit hazardous air emissions, or that would handle an extremely hazardous substance or a mixture containing extremely hazardous substances in a quantity equal to or greater than the state threshold quantity" in HSC Section 25532. The list of extremely hazardous substances under HSC Section 25534 can be found in Appendix A of Part 355 (commencing with Section 355.10) of Subchapter J of Chapter I of Title 40 of the Code of Federal Regulations. According to this list, gasoline is not considered an extremely hazardous substance. Therefore, the North Site would not include the handling of an extremely hazardous substance and consultation with the school district is not required under PRC Section 21151.4. Regarding air emissions, refer to Section 3.2, "Air Quality," for an analysis of toxic air contaminants. As discussed under Impact 3.8-1 and 3.8-2, the project would adhere to all applicable federal, State, and local requirements related to hazardous materials. This impact would be **less than significant**.

South Site

As identified in Chapter 2, "Project Description," the South Site would include a tire center for the repair and replacement of tires, as well as propane sales and refueling. As discussed above relative to the North Site, PRC Section 21151.4 requires consultation with the school district for uses that propose to handle extremely hazardous substances near schools. Like gasoline, propane is not included on the list of extremely hazardous substances. Therefore, no consultation with the school district is necessary under PRC Section 21151.4. Regarding air emissions, refer to Section 3.2, "Air Quality," for an analysis of toxic air contaminants. As discussed under Impact 3.8-1 and 3.8-2, the project would adhere to all applicable federal, State, and local requirements related to hazardous materials.

Mitigation Measures

No mitigation is required for this impact in addition to federal, State, and local requirements.

Impact 3.8-4: Impair Implementation or Physically Interfere with an Adopted Emergency Response Plan or Emergency Evacuation Plan

Project construction and operation would not impair implementation of, or interfere with, the County Multi-Jurisdictional Hazard Mitigation Plan. Adequate road design for emergency vehicle access and private vehicle evacuation would be provided, as required El Dorado County Fire Department Standard #B-003. This impact would be **less than significant**.

The project site is vacant and does not currently have an internal roadway system. A traffic signal is proposed at the main driveways and Silva Valley Parkway where access would be provided to both the North Site and the South Site.

Three full access driveways are proposed on Clarksville Crossing Road to provide additional points of access from the South Site. Access to the site would need to comply with El Dorado County Regional Fire Protection Standard B-003, which applies to fire access roadways. This standard requires following standards that ensure that there are adequate vehicle access points for Fire Department vehicles, other emergency access vehicles, and evacuations (EDCFPO 2009).

El Dorado County has not identified specific roads as emergency evacuation routes but encourages residents to learn their local roads in preparation for an emergency. The El Dorado County Sheriff's Office would determine whether evacuation is recommended or required of the El Dorado Hills community based on parameters of an emergency. An evacuation is developed and directed in real time in response to the unique conditions of the emergency. Direction regarding evacuation routes is provided as part of evacuation orders issued by the El Dorado County Sheriff through the El Dorado County Sheriff's Office- Office of Emergency Services Alert Notification System. There are several two to six lane roadways in the El Dorado Hills community (e.g., El Dorado Hills Boulevard, Serrano Parkway, Silva Valley

Parkway, US 50, White Rock Road, Green Valley Road) that can be used for evacuation depending on the details of the emergency, such as the speed and trajectory of a fire or other hazard.

North Site

As discussed in Chapter 2, "Project Description," right-in and right-out access would also be provided to the North Site from Silva Valley Parkway via a driveway north of the new signal at the main driveway. An emergency access to Tong Road from the self-storage facility on the North Site is also proposed.

South Site

As discussed above, the main driveway for the South Site would be via a signalized intersection at Silva Valley Parkway. There would also be an intersection at Silva Valley Parkway and Clarksville Crossing Road that would be partially signalized to provide protected turn movements to vehicles traveling northbound on Silva Valley Parkway to make a left turn on to Clarksville Crossing Road. From Clarksville Crossing Road, there would be three driveways providing access to the South Site. The signalization of the intersection of Silva Valley Parkway and Clarksville Crossing Road would remain in place until the County constructs the Country Club Drive extension project in 2041. After completion of the Country Club Drive extension project the signal at the intersection of Silva Valley Parkway and Clarksville Crossing Road would be removed and Clarksville Crossing Road's existing connection to Silva Valley Parkway would be eliminated.

Development of the proposed project would not impair implementation of or physically interfere with an adopted emergency response plan or emergency evacuation plan because no such plans exist within the County's Local Hazard Mitigation Plan or as a separate planning document.. Thus, the project would result in a **less-than-significant** impact.

Mitigation Measures

No mitigation is required for this impact.

Impact 3.8-5: Expose People or Structures to Wildland Fire Hazards or Exacerbate Wildland Fire Hazards

The project site is surrounded mostly by undeveloped grassy areas, though there are residential areas to the north and west. The project site is also partially bordered by existing roadways. Implementation of the project would result in construction of a commercial center that would extend water and fire hydrant infrastructure through the site. These improvements would reduce the potential for wildland fire conditions as compared to existing undeveloped conditions. This impact would be **less than significant**.

Several factors contribute to the susceptibility of wildfire danger in El Dorado County, including climate, winds, steep terrain, vegetation, subdivision design, and water supply. The community of El Dorado Hills includes open space areas that consist of grassland habitat that are at current risk to fire. Introducing construction activities, electrical service, structures, and people to this area could expose them and the surrounding community to potential increases in wildfire risk and associated impacts from tree and habitat loss and air quality impacts from smoke.

Development of the project site would be required to comply with state and El Dorado Hills Fire Department (once the site is annexed to their service area) requirements that are designed to mitigate the potential for wildfire events to occur from site development as well as limit the extent of fire events. As noted above, Title 14 and 24 CCR and EDHFD Ordinance 2019-01 requires buildings on the project site comply with specific requirements intended to provide defensible space, adequate emergency access, water for firefighting, and structure construction to improve fire resistance. The provision of defensible space and the associated reduction of vegetative fuels have specifically been found to be effective at reducing fire frequency, fire severity, and annual area burned over an extended period of time. Where treatments have occurred, the pattern of wildfire progression may be limited to low-intensity underbrush and surface burning, which can create safe conditions for firefighters to successfully suppress fires in areas near homes or other structures, or around areas of high resource value (Kim et al. 2013; Martinson and Omi 2013; Tubbesing et al. 2019). The project has prepared a Fire Safe Plan in compliance with General Plan Policy 2.1.1.7.

Commented [PA1]: County - placeholder for plan

Given the implementation of the fire requirements and standards that would minimize the potential for wildfire to occur from site development, implementation of the project would not exacerbate existing wildfire hazards in the El Dorado Hills community. Therefore, impacts would be **less than significant**.

Mitigation Measures

No mitigation is required for this impact.

3.9 HYDROLOGY AND WATER QUALITY

This section identifies the regulatory context and policies related to hydrology and water quality, describes the existing hydrologic conditions at the project site, and evaluates potential hydrology and receiving water-quality impacts of the proposed EDH 52 Commercial Center Project. Potential effects on the capacity of County of El Dorado water-supply, sewer/wastewater, and drainage/stormwater facilities are addressed in Section 3.14, "Utilities and Service Systems."

3.9.1 Regulatory Setting

FEDERAL

Clean Water Act

The US Environmental Protection Agency (EPA) is the lead federal agency responsible for water quality management. The Clean Water Act (CWA) is the primary federal law that governs and authorizes water quality control activities by EPA as well as the states. Various elements of the CWA address water quality. These are discussed below.

CWA Water Quality Criteria/Standards

Pursuant to federal law, EPA has published water quality regulations under Title 40 of the Code of Federal Regulations (CFR). Section 303 of the CWA requires states to adopt water quality standards for all surface waters of the United States. As defined by the act, water quality standards consist of designated beneficial uses of the water body in question and criteria that protect the designated uses. Section 304(a) requires EPA to publish advisory water quality criteria that accurately reflect the latest scientific knowledge on the kind and extent of all effects on health and welfare that may be expected from the presence of pollutants in water. Where multiple uses exist, water quality standards must protect the most sensitive use. As described in the discussion of state regulations below, the State Water Resources Control Board (State Water Board) and its nine regional water quality control boards (RWQCBs) have designated authority in California to identify beneficial uses and adopt applicable water quality objectives.

CWA Section 303(d) Impaired Waters List

Under Section 303(d) of the CWA, states are required to develop lists of water bodies that do not attain water quality objectives after implementation of required levels of treatment by point source dischargers (municipalities and industries). Section 303(d) requires that the state develop a total maximum daily load (TMDL) for each of the listed pollutants. The TMDL is the amount of the pollutant that the water body can receive and still comply with water quality objectives. The TMDL is also a plan to reduce loading of a specific pollutant from various sources to achieve compliance with water quality objectives. In California, implementation of TMDLs is achieved through water quality control plans, known as Basin Plans, of the State RWQCBs. See "State Plans, Policies, Regulations, and Laws," below.

National Pollutant Discharge Elimination System

The National Pollutant Discharge Elimination System (NPDES) permit program was established in the CWA to regulate municipal and industrial discharges to surface waters of the United States. NPDES permit regulations have been established for broad categories of discharges including point source waste discharges and nonpoint source stormwater runoff. Each NPDES permit identifies limits on allowable concentrations and mass emissions of pollutants contained in the discharge. Sections 401 and 402 of the CWA contain general requirements regarding NPDES permits.

"Nonpoint source" pollution originates over a wide area rather than from a definable point. Nonpoint source pollution often enters receiving water in the form of surface runoff and is not conveyed by way of pipelines or discrete conveyances. Two types of nonpoint source discharges are controlled by the NPDES program: discharges caused by general construction activities and the general quality of stormwater in municipal stormwater systems. The goal of the NPDES nonpoint source regulations is to improve the quality of stormwater discharged to receiving

waters to the maximum extent practicable. The RWQCBs in California are responsible for implementing the NPDES permit system (see the discussion of "State Plans, Policies, Regulations, and Laws" section below).

National Flood Insurance Act

The Federal Emergency Management Agency (FEMA) is tasked with responding to, planning for, recovering from and mitigating against disasters. The Federal Insurance and Mitigation Administration within FEMA is responsible for administering the National Flood Insurance Program (NFIP) and administering programs that aid with mitigating future damages from natural hazards. FEMA prepares Flood Insurance Rate Maps (FIRMs) that delineate the regulatory floodplain to assist local governments with the land use planning and floodplain management decisions needed to meet the requirements of NFIP. Floodplains are divided into flood hazard areas, which are areas designated per their potential for flooding, as delineated on FIRMs. Special Flood Hazard Areas are the areas identified as having a one percent chance of flooding in each year (otherwise known as the 100-year flood).

STATE

California Porter-Cologne Act

California's primary statute governing water quality and water pollution issues with respect to both surface waters and groundwater is the Porter-Cologne Water Quality Control Act of 1970 (Porter-Cologne Act). The Porter-Cologne Act grants the State Water Board and each of the nine RWQCBs power to protect water quality, and is the primary vehicle for implementation of California's responsibilities under the Clean Water Act. The applicable RWQCB for the proposed project is the Central Valley RWQCB. The State Water Board and the Central Valley RWQCB have the authority and responsibility to adopt plans and policies, regulate discharges to surface and groundwater, regulate waste disposal sites, and require cleanup of discharges of hazardous materials and other pollutants. The Porter-Cologne Act also establishes reporting requirements for unintended discharges of any hazardous substances, sewage, or oil or petroleum products.

Under the Porter-Cologne Act, each RWQCB must formulate and adopt a water quality control plan (known as a "Basin Plan") for its region. The Basin Plan for the Central Valley Region includes a comprehensive list of waterbodies within the region and detailed language about the components of applicable Water Quality Objectives (WQOs). The Basin Plan recognizes natural water quality, existing and potential beneficial uses, and water quality problems associated with human activities throughout the Sacramento and San Joaquin River Basins. Through the Basin Plan, the Central Valley RWQCB executes its regulatory authority to enforce the implementation of TMDLs, and to ensure compliance with surface WQOs. The Basin Plan includes both narrative, and numerical WQOs designed to provide protection for all designated and potential beneficial uses in all its principal streams and tributaries. Applicable beneficial uses include municipal and domestic water supply, irrigation, non-contact and contact water recreation, groundwater recharge, fresh water replenishment, hydroelectric power generation, and preservation and enhancement of wildlife, fish, and other aquatic resources. The nearest stream is an unnamed tributary to Carson Creek, which a tributary to Deer Creek and the Cosumnes River (Helix Environmental Planning 2020). Deer Creek's beneficial uses include municipal domestic supply, various fish habitat, and contact and non-contact recreation. The Basin Plan also outlines temperature, turbidity, and diazinon and chlorpyrifos water quality objectives for Deer Creek (CVRWQCB 2018).

The Central Valley RWQCB also administers the adoption of waste discharge requirements (WDRs), manages groundwater quality, and adopts projects within its boundaries under the NPDES General Permit for Stormwater Discharges Associated with Construction and Land Disturbance Activities (General Permit).

NPDES Construction General Permit for Stormwater Discharges Associated with Construction Activity

The State Water Board adopted the statewide NPDES General Permit in August 1999. The state requires that projects disturbing more than one acre of land during construction file a Notice of Intent with the RWQCB to be covered under this permit. Construction activities subject to the General Permit include clearing, grading, stockpiling, and excavation. Dischargers are required to eliminate or reduce non stormwater discharges to storm sewer systems and

other waters. A stormwater pollution prevention plan (SWPPP) must be developed and implemented for each site covered by the permit. The SWPPP must include best management plans (BMPs) designed to prevent construction pollutants from contacting stormwater and keep products of erosion from moving off-site into receiving waters throughout the construction and life of the project; the BMPs must address source control and, if necessary, pollutant control.

NPDES Stormwater Permit for Discharges from Small Municipal Separate Storm Sewer Systems

The Municipal Stormwater Permitting Program regulates stormwater discharges from municipal separate storm sewer systems (MS4s). Stormwater is runoff from rain or snow melt that runs off surfaces such as rooftops, paved streets, highways or parking lots and can carry with it pollutants such as oil, pesticides, herbicides, sediment, trash, bacteria and metals. The runoff can then drain directly into a local stream, lake or bay. Often, the runoff drains into storm drains which eventually drain untreated into a local waterbody.

Groundwater Management

Groundwater Management is outlined in the California Water Code, Division 6, Part 2.75, Chapters 1-5, Sections 10750 through 10755.4. The Sustainable Groundwater Management Act of 2014 (SGMA) became law on January 1, 2015, and applies to all groundwater basins in the state (Water Code Section 10720.3). By enacting the SGMA, the legislature intended to provide local agencies with the authority and the technical and financial assistance necessary to sustainably manage groundwater within their jurisdiction (Water Code Section 10720.1).

LOCAL

El Dorado County General Plan

Policies included in the El Dorado County General Plan (El Dorado County 2004) that are relevant to the proposed project including the following:

- **Policy 5.4.1.1:** Require storm drainage systems for discretionary development that protect public health and safety, preserve natural resources, prevent erosion of adjacent and downstream lands, prevent the increase in potential for flood hazard or damage on either adjacent, upstream or downstream properties, minimize impacts to existing facilities, meet the NPDES requirements, and preserve natural resources such as wetlands and riparian areas.
- **Policy 7.3.1.2:** Establish water conservation programs that include both drought tolerant landscaping and efficient building design requirements as well as incentives for the conservation and wise use of water.
- **Policy 7.3.2.2:** Projects requiring a grading permit shall have an erosion control program approved, where necessary.

Design and Improvement Standards Manual

The purpose of the Design and Improvement Standards Manual is to standardize development practices used in the hillside environment that is prevalent in El Dorado County and to minimize the environmental effects of construction. Volume II of the manual includes drainage and design criteria for stormwater and Volume III of the manual provides guidance on how to implement the erosion and sediment control standards in Chapter 110.14 of the El Dorado County Code.

Drainage Manual

The El Dorado County Drainage Manual (Drainage Manual) establishes guidelines for the design of stormwater drainage facilities and the performance of hydraulic and hydrologic analyses. This manual is designed to supplement El Dorado County ordinances and the provisions defined in the Design and Improvement Standards Manual. For example, the Drainage Manual requires that potential downstream impacts to water quality and flow regimes be taken into account when designing stormwater drainage systems and that mitigation measures be included as part of drainage analyses.

Western El Dorado County Storm Water Management Plan

The unincorporated areas of El Dorado County's west slope are covered by a Phase III NPDES that went into effect on July 1, 2013. A new Phase II MS4 Permit (2013-0001-DWQ) was adopted by the SWRCB on February 5, 2013. The permit focuses on the enhancement of surface water quality within high priority urbanized areas. The West Slope of the County implemented new Development and Redevelopment Standards and Post Construction Storm Water Plan Requirements pursuant to the requirements listed in the current MS4 Permit on July 1, 2015 and these new requirements supersede Section 4.5 of the SWMP, which contains a Construction Site Runoff Control Program. Depending on the type of project, there are varying requirements for implementation of site design measures. For example, for projects other than single family homes that create or replace 5,000 square feet or more of impervious surface, requirements include but are not limited to:

- Remaining runoff from the 85th percentile 24-hour storm event (~1.13 inches of water) shall be directed to one or more storm water treatment and baseline hydromodification measures using volumetric and/or flow-based sizing criteria.
- Identify potential sources of pollutants and implement corresponding source control measures.
- Provide ongoing maintenance of water retention and treatment facilities.

El Dorado County Stormwater Quality Ordinance

The El Dorado County Stormwater Quality Ordinance is contained in El Dorado County Code of Ordinances Chapter 8.79. The Stormwater Quality Ordinance intends to ensure the County is compliant with state and federal laws, fulfilling its requirements to:

- protect the health, safety, and general welfare of the citizens of the County;
- enhance and protect the quality of Waters of the State in the County by reducing pollutants in storm water discharges to the maximum extent practicable and controlling non-storm water discharges to a storm water facility; and
- cause the use of Best Management Practices by the County and its citizens that will reduce the adverse effects of polluted runoff discharges of Waters of the State.

El Dorado County Code

The purpose of the Grading, Erosion and Sediment Control Ordinance (Chapter 110.14) is to regulate grading within the unincorporated areas of El Dorado County, to prevent the pollution of surface water, and to ensure that the intended use of the site is consistent with all applicable local and state plans and standards, including the El Dorado County General Plan, SWMP, and County Code. This ordinance also establishes the procedures for the issuance of permits, approval of plans, and inspection of construction sites. The Grading, Erosion and Sediment Control Ordinance requires that waterways and adjacent properties be protected from erosion, flooding, or sediment deposits that could result from grading activities. It also states that the discharge of sediments to any waterway, drainage system, or adjacent property remain at or below levels before grading activities.

El Dorado County has provided the following standard conditions of approval related to stormwater drainage and infrastructure that apply to the proposed project.

Grading Permit/Plan

A grading permit is required for the proposed project. The plan shall be in conformance with the El Dorado County Design and Improvement Standards Manual; the Grading, Erosion and Sediment Control Ordinance; and the Drainage Manual.

Grading and improvement plans shall be submitted to the El Dorado County Resource Conservation District (RCD) and the Transportation Division. The RCD shall review and make appropriate recommendations to the County. Upon receipt of the review report by the RCD, the Transportation Division shall consider imposition of appropriate conditions for reducing or mitigating erosion and sedimentation from the project. Grading plans shall incorporate appropriate erosion control measures as provided in the Grading, Erosion and Sediment Control Ordinance and

El Dorado County SWMP. Appropriate runoff controls such as berms, storm gates, detention basins, overflow collection areas, filtration systems, and sediment traps shall be implemented to control siltation, and the potential discharge of pollutants into drainages.

Resource Conservation District Coordination

The timing of construction and method of revegetation shall be coordinated with the El Dorado County RCD. If grading activities are not completed by September, the applicant shall implement a temporary grading and erosion control plan. Such temporary plans shall be submitted to the RCD for review and recommendation to the Transportation Division. The Transportation Division shall approve or conditionally approve such plans and cause the applicant to implement said plan on or before October 15.

Drainage Study/SWMP Compliance

The applicant shall provide a drainage report at time of improvement plans or grading permit application, consistent with the Drainage Manual, the County's West Slope Development and Redevelopment Standards and Post Construction Water Plan Requirements, and the SWMP, which addresses stormwater runoff increase, impacts to downstream facilities and properties, and identification of appropriate stormwater quality management practices to the satisfaction of the Transportation Division. The drainage study must demonstrate the subject property has adequate existing and proposed storm drainage facilities. At a minimum, the drainage study, plans, and calculations shall provide evidence of the following:

- The site can be adequately drained.
- The development of the site will not cause problems to nearby properties, particularly downstream sites.
- The onsite drainage will be controlled in such a manner as to not increase the downstream peak flow more than the pre-development 10-year storm event or cause a hazard or public nuisance. Detention shall be required if said condition is not met or the applicant shall demonstrate that there are no downstream impacts.
- The improvements to the drainage outfall shall be completed to the approval of the Transportation Division before the filing of the final map or the applicant shall obtain an approved improvement agreement with security.

National Pollutant Discharge Elimination System Permit

At the time that an application is submitted for improvement plans or a grading permit, and if the proposed project disturbs more than 1 acre of land area, the applicant shall file a notice of intent to comply with the Statewide General NPDES Permit for stormwater discharges associated with construction activity with the SWRCB. This condition is mandated by the CWA and the California Water Code. A filing form, a filing fee, a location map, and a SWPPP are required for this filing. A copy of the application shall be submitted to the County, before building permit issuance, and by state law must be done before commencing construction.

Storm Water Drainage Best Management Practices

Storm drainage from on- and offsite impervious surfaces (including roads) shall be collected and routed through specially designed water quality treatment facilities (i.e., BMPs) pursuant to the County's West Slope Development and Redevelopment Standards and Post Construction Water Plan Requirements for removal of pollutants of concern (e.g., sediment, oil/grease), as approved by the Transportation Division. The applicant shall verify that the proposed BMPs are appropriate to treat the pollutants of concern from the project.

El Dorado County Multi-Jurisdiction Hazard Mitigation Plan

The El Dorado County Local Hazard Mitigation Plan (LHMP) recommends specific actions to combat the forces of nature and protect its residents from hazard losses. For flooding, goals include (El Dorado County Sheriff 2018):

- Prevent and reduce flood risk and related damages, with a focus on repetitive loss if structures and infrastructure.
- Provide protection for critical infrastructure from flood (e.g., repeaters, cell towers, water tanks, utilities).

3.9.2 Environmental Setting

HYDROLOGY AND DRAINAGE

Regional Hydrology

The climate of the El Dorado Hills area is Mediterranean, with cool wet winters and warm dry summers. Total rainfall in 2020 was about 15 inches, with the highest precipitation occurring in March, and no precipitation occurring from July through October (NOAA Regional Climate Centers 2021). El Dorado County contains four major watersheds: the Tahoe Watershed, the Middle Fork American River, the South Fork American River, and the Cosumnes River. The project site is located within the South Fork American River Watershed, and drains into the Cosumnes River Watershed. The South Fork American River watershed encompasses the central portion of the county and extends from the Echo Summit west to Folsom Reservoir. Major tributaries within the South Fork American River Watershed include Silver Fork American River, Silver Creek, Slab Creek, Rock Creek, and Weber Creek. Other water features within the watershed include Caples Lake, Silver Lake, Lake Aloha, Weber Reservoir, Ice House Reservoir, Union Valley Reservoir, Junction Reservoir, Camino Reservoir, Brush Creek Reservoir, Slab Creek Reservoir, and Chili Bar Reservoir (El Dorado County 2003).

The Cosumnes River watershed is within the southern portion of El Dorado County and south of the South Fork American River Watershed. The Cosumnes River Watershed extends from Iron Mountain Ridge west to where the Cosumnes River enters Sacramento County. Tributaries to the Cosumnes River include the South, Middle, and North Fork Cosumnes Rivers, Canyon Creek, Deer Creek, and Carson Creek. Bass Lake and Sly Park Reservoir are also located in the Carson Creek watershed, which is tributary to the Cosumnes River watershed (El Dorado County 2003).

Hydrology in the area is dominated by irrigation runoff and seasonal stormwater runoff from surrounding developments and direct precipitation. Precipitation primarily occurs as snowfall in the upper elevations of the watershed and rainfall in the lower elevations (El Dorado County 2003).

Geologic conditions and associated fragmented/fractured rock groundwater systems limit access to groundwater within the county. Recharge, movement, and storage of water in rock fractures are also limited. As such, the long-term reliability of groundwater within the county is difficult to estimate (El Dorado County 2003).

Local Hydrology

Hydrology, Runoff, and Drainage

Drainage generally trends northeast–southwest across the project site. The project area contains aquatic resources and other waters of the United States., as described in the aquatic resources delineation report prepared by Helix Environmental (2020). This includes 0.133 acre of seasonal wetlands, 0.007 acre of seep, 0.006 acre of wetland swale, 0.234 acre of ephemeral drainage, and 0.360 acre of intermittent drainage (Helix Environmental 2020:9-10). Much of the area mapped as seasonal wetland is adjacent to the ephemeral drainage in the North Parcel, though there is one area of seasonal wetland on the south parcel. Two seasonal wetlands appear to be the result of excavation as there are mounds adjacent to them. The wetland swale is located in the northern parcel and conveys water from a seasonal wetland to an ephemeral drainage. The largest area of ephemeral drainage is located on the west side of the north parcel. The intermittent drainage bisects the south parcel. There is a brick check dam across part of the intermittent drainage, which occasionally results in retention of water. It expected the waters of the United States would also be considered waters of the State (Helix Environmental 2020:12). Impacts specific to waters of the United States are also addressed in Section 3.4, Biological Resources.

Flooding

The 100-year flood refers to the flood resulting from a storm event which has a probability of occurring once every 100 years, or a 1 percent chance of occurring in any given year. Areas mapped in the 100-year floodplain area are subject to inundation during a 100-year storm event. According to the FEMA flood insurance rate map (FIRM), the project site is not located within or adjacent to the 100-year or 500-year floodplain (FEMA 2008).

Water Quality

a segment of Carson Creek located approximately 0.5 mile southeast of the project site was listed under Section 303(d) as water quality impaired in 2012 for aluminum and manganese. The segment of Carson Creek that was listed as water quality impaired is approximately 12 miles in length and extends from the Wastewater Treatment Plant to Deer Creek (EPA 2012). However, that segment is currently unlisted and noted as "condition unknown" (EPA 2018).

Groundwater

The project site is not located in an area mapped as a groundwater basin (DWR 2018). No active seeps or springs were identified on site; however, perched groundwater may occur near in isolated locations in the fractured rock that underlies the project site (Blackburn Consulting 2013).

Stormwater Drainage

There is existing stormwater infrastructure under Clarksville Crossing and Silva Valley Parkway, which includes gutters as well as storm drains.

3.9.3 Environmental Impacts and Mitigation Measures

METHODOLOGY

Evaluation of potential hydrologic and water quality impacts is based on a review of existing documents and studies that address water resources in the vicinity of the project. Information obtained from these sources was reviewed and summarized to describe existing conditions and to identify potential environmental effects, based on the standards of significance presented in this section. In determining the level of significance, the analysis assumes that the project would comply with relevant federal, state, and local laws, ordinances, and regulations.

THRESHOLDS OF SIGNIFICANCE

An impact on hydrology or water quality is considered significant if implementation of the EDH 52 Commercial Center Project would do any of the following:

- violate any water quality standards or waste discharge requirements or otherwise substantially degrade surface or ground water quality;
- substantially decrease groundwater supplies or interfere substantially with groundwater recharge such that the project may impede sustainable groundwater management of the basin;
- substantially alter the existing drainage pattern of the site or area, including through the alteration of the course of a stream or river, in a manner that would
  - result in substantial erosion or siltation on- or off-site;
  - result in flooding on-site or off-site;
  - create or contribute runoff water that would exceed the capacity of existing or planned stormwater- drainage systems or provide substantial additional sources of polluted runoff;
  - impede or redirect flood flows
- in flood hazard, tsunami, or seiche zones, risk release of pollutants due to project inundation; and/or
- conflict with or obstruct implementation of a water quality control plan or sustainable groundwater management plan.

ISSUES NOT DISCUSSED FURTHER

The project would not use groundwater for its water supply needs. The applicant has proposed that potable water be supplied to the project site by El Dorado Irrigation District (EID). EID's existing water supplies include surface water and recycled water; EID does not use groundwater. Although project construction would result in new impervious surfaces, bioretention areas and underground water quality vaults would be included in the project design to treat stormwater runoff. The project is not anticipated to significantly affect groundwater quality because this proposed stormwater infrastructure would sufficiently detain and infiltrate stormwater runoff and prevent long-term water quality degradation. Therefore, project construction and operation would have no impact on groundwater resources and these issues are not discussed further in this Draft EIR.

According to the FEMA flood insurance rate map (FIRM), the project site is not located within or adjacent to the 100-year or 500-year floodplain (FEMA 2008). Therefore, project implementation would not place buildings and structures in a 100-year flood hazard area that would redirect flood flows. Furthermore, the project would not expose people or structures to a significant risk of loss, injury, or death involving flooding, including flooding as a result of the failure of a levee or dam. Thus, the project would have no impact to exposure to flood hazards and these issues are not discussed further in this Draft EIR.

Because the Pacific Ocean is more than 80 miles west of the project site, there is no risk of tsunami on site. Folsom Lake is the nearest large lake and is about 4 miles from the project site. It is also about 270 feet lower in elevation. Therefore, there is no risk of seiche on the project site.

The project site is near a tributary to Carson Creek, which is a tributary to Deer Creek. Deer Creek has beneficial uses outlined in the Basin Plan for the CVRWQCB. However, stormwater would be controlled and treated in the stormwater system on site, so that it would not adversely affect beneficial uses in Deer Creek. Therefore, the project would not conflict with or obstruct implementation of a water quality control plan. There is no sustainable groundwater management plan in the project area; therefore, the project would not conflict with or obstruct implementation of a sustainable groundwater management plan.

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Impact 3.9-1: Short-Term Construction-Related Water Quality Degradation

Project construction activities would involve extensive grading, movement of soil, and blasting, which could result in erosion and sedimentation, and discharge of other nonpoint source pollutants in onsite stormwater that could then drain to offsite areas and degrade local water quality. To avoid or minimize the potential for adverse construction-related effects on water quality, the project would be required to comply with Central Valley RWQCB and County regulations that protect water quality and minimize erosion. The applicant would also be required to prepare and implement a SWPPP for compliance with the NPDES General Construction Permit. With adherence to existing requirements, impacts related to water quality degradation as a result of soil erosion would be **less than significant**.

Construction activities would create the potential for soil erosion and sedimentation of stormwater drainage systems, both within and downstream of the project site. Project construction would involve extensive ground-disturbing activities over approximately 43.3 acres, including grading, trenching, blasting, and facility construction activities. The increase in exposed surfaces and the earth-moving activities would result in an increased potential for erosion and sedimentation, particularly during the rainy season.

The construction process may also result in accidental release of other pollutants to surface waters, including oil and gas, chemical substances used during construction, waste concrete, and wash water. Many construction-related wastes have the potential to degrade existing water quality by altering the dissolved-oxygen content, temperature, pH, suspended-sediment and turbidity levels, or nutrient content, or by causing toxic effects in the aquatic environment. Proposed construction activities, if not properly implemented, could violate water quality standards or cause direct harm to aquatic organisms.

Because the project site has some steep slopes and the soils onsite are susceptible to erosion, project implementation could cause localized erosion hazards (see Section 3.6, "Geology and Soils"). Intense rainfall and associated stormwater runoff could result in short periods of sheet erosion within areas of exposed or stockpiled soils. If uncontrolled, these soil materials could contribute to sedimentation and blockage of offsite waterways. Further, the compaction of soils by heavy equipment may reduce the infiltration capacity of soils and increase the potential for runoff and erosion. Stormwater runoff could also wash construction materials into receiving waterbodies and negatively impact water quality. Non-stormwater discharges could result from activities such as discharge or accidental spills of hazardous substances such as fuels, oils, concrete, paints, solvents, cleaners, or other construction materials.

Construction activities would be required to comply with State and County regulations pertaining to the control of onsite stormwater, including requirements of the Central Valley RWQCB. Additionally, compliance with the NPDES General Construction Permit would be required because grading would be conducted across the 43.3-acre site. Applicants for coverage under the General Construction Permit must submit a notice of intent to the SWRCB and to prepare a SWPPP, which identifies BMPs that will be implemented to reduce construction effects on receiving water quality by protecting water quality from polluted stormwater runoff. These BMPs may include:

- Erosion control blankets/mats, geotextiles, plastic covers: These erosion control methods would be used on flat or sloped surfaces to keep soil in place and can be used to cover disturbed soil to prevent runoff.
- Hydraulic, straw, and wood mulch: The use of these various mulches temporarily stabilizes soil on surfaces with little or no slope.
- Scheduling and planning: Appropriate scheduling and planning provide ways to minimize disturbed areas, which reduces the amount of activity in the area that requires protection and minimizes the duration of exposure of disturbed soils to erosion.
- Stabilized construction entrance/exit: A graveled area or pad located at points where vehicles enter and leave a construction site can be built. This BMP provides a buffer area where vehicles can drop their mud and sediment to avoid transporting it onto public roads, to control erosion from surface runoff and to help control dust.
- Storm drain inlet protection: Protection consists of devices and procedures that detain or filter sediment from runoff, thereby preventing them from reaching drainage systems that would be used post-construction, as well as surface waters.

In addition to preparing a SWPPP, the project applicant would comply with the SWMP, Construction General Permit, Grading, Erosion and Sediment Control and Stormwater Quality Ordinances, Design and Improvement Standards Manual, and Drainage Manual.

North Site

As discussed above, construction of the North Site and associated offsite infrastructure improvements (natural gas pipeline) could result in erosion and sedimentation, and discharge of other nonpoint source pollutants in onsite stormwater that could then drain to offsite areas and degrade local water quality Implementation of the SWPPP would reduce construction-related water quality impacts by requiring the project applicant to incorporate appropriate BMPs into the design of the development to prevent water quality degradation. The plan would be designed to prevent increased discharge of sediment at all stages of construction, from initial ground disturbance to project completion. Adequate surface drainage control would be designed by the project civil engineer in accordance with the latest applicable edition of the California Building Code. All slopes would have appropriate drainage and vegetation measures to minimize erosion of soils. In addition, the project would fully comply with El Dorado County's SWMP, Grading, Erosion and Sediment Control and Stormwater Quality Ordinances, Design and Improvement Standards Manual, and Drainage Manual. Contract provisions would also require compliance with County requirements. With adherence to existing requirements, impacts related to water quality degradation as a result of soil erosion would be **less than significant**.

South Site

As discussed above, construction of the South Site and offsite infrastructure improvements (natural gas pipeline and sewer pipeline connection west of Clarksville Crossing) could result in erosion and sedimentation, and discharge of other nonpoint source pollutants in onsite stormwater that could then drain to offsite areas and degrade local water quality Implementation of the SWPPP would reduce construction-related water quality impacts by requiring the project applicant to incorporate appropriate BMPs into the design of the development to prevent water quality degradation. The plan would be designed to prevent increased discharge of sediment at all stages of construction, from initial ground disturbance to project completion. Adequate surface drainage control would be designed by the project civil engineer in accordance with the latest applicable edition of the California Building Code. All slopes would have appropriate drainage and vegetation measures to minimize erosion of soils. In addition, the project would fully comply with El Dorado County's SWMP, Grading, Erosion and Sediment Control and Stormwater Quality Ordinances, Design and Improvement Standards Manual, and Drainage Manual. Contract provisions would also require compliance with County requirements. With adherence to existing requirements, impacts related to water quality degradation as a result of soil erosion would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact 3.9-2: Increase in Surface Water Runoff Potentially Exceeding the Capacity of Existing Stormwater Drainage Systems

The proposed development would add additional impervious surfaces at the project site as well as fill drainages, which would increase surface runoff on an ongoing basis. This increase could result in an increase in both the total volume and the peak discharge rate of stormwater runoff, and could result in exceeding the capacity of onsite stormwater systems and greater potential for on- and offsite flooding. However, project proposed drainage improvements would attenuate peak drainage flows to predevelopment conditions. Therefore, this impact would be **less than significant**.

The development would cover the majority of the 43.4-acre project site with impervious areas such as buildings, parking lots, and walkways. The project would also fill the existing drainages on site. Therefore, the project would substantially increase the amount of impervious surface on-site and change the on-site drainage. To accommodate the increase, the project would include storm drain improvements with on-site drainage facilities, manholes and drain lines designed to collect and convey stormwater to existing stormwater infrastructure in Silva Valley Parkway and Clarksville Crossing. North Site

Modeling of the proposed development and stormwater infrastructure (consisting of 12 bioretention basins) indicates that the proposed infrastructure is adequate to convey a 10-year, 24-hour storm. Additionally, the drainage study prepared for the project notes that the project site is at the lower end of the watershed so that the peak flow from the project area would enter the watercourse and pass under U.S. 50 at least 15 minutes before the main stem peak flow arrives. As a result, there is only a minimal possibility that the proposed project would increase the main stem peak flow (Watermark Engineering 2021). Thus, this impact would be **less than significant**.

South Site

Modeling of the proposed development and stormwater infrastructure (consisting of six bioretention basins) indicates that the proposed infrastructure is adequate to convey a 10-year, 24-hour storm. Additionally, the drainage study prepared for the project notes that the project site is at the lower end of the watershed so that the peak flow from the project area would enter the watercourse and pass under U.S. 50 at least 15 minutes before the main stem peak flow arrives. As a result, there is only a minimal possibility that the proposed project would increase the main stem peak flow (Watermark Engineering 2021). Thus, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

Impact 3.9-3: Long-Term Water Quality Degradation

The conversion of undeveloped land to developed uses would alter the types, quantities, and timing of contaminant discharges in stormwater runoff. Overall, the project could cause or contribute to long-term discharges of urban contaminants (e.g., oil and grease, trace metals and organics, trash) into the stormwater drainage system compared with existing conditions. The project's drainage improvements include water quality control features consistent with County standards to address stormwater quality. This impact would be **less than significant**.

The proposed development would alter land uses at the project site, which could increase the level of urban contaminants discharged into the stormwater drainage system if the system is not properly designed. Anticipated pollutants associated with the project include trash, debris, heavy metals, and hydrocarbons from roads and parking lots. Potential pollutants could also include pesticides from potential pest control activities, nutrients, fertilizers, and oxygen-demanding substances from landscaped areas.

North Site

Project on-site storm drainage improvements would include LID features, underground stormwater detention piping, and aboveground basins (12 bioretention basins) to detain runoff such that pre-development flow volumes are maintained consistent with County water quality requirements identified in Section 3.9.2, "Regulatory Setting." See Figure 2-8 in Chapter 2, "Project Description," for the preliminary landscape plan showing the water quality basins and Figure 2-14 for the preliminary utility plan. These water quality controls have been identified effective in protecting water quality in the California Storm Water Quality Association Industrial and Commercial and New and Redevelopment BMP Handbook. Thus, this impact would be **less than significant**.

South Site

Project on-site storm drainage improvements would include LID features, underground stormwater detention piping, and aboveground basins (six 12 bioretention basins) to detain runoff such that pre-development flow volumes are maintained consistent with County water quality requirements identified in Section 3.9.2, "Regulatory Setting." See Figure 2-18 in Chapter 2, "Project Description," for the South Site preliminary landscape plan and Figure 2-22 for the preliminary utility plan. These water quality controls have been identified effective in protecting water quality in the California Storm Water Quality Association Industrial and Commercial and New and Redevelopment BMP Handbook. Thus, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required.

3.14 UTILITIES AND SERVICE SYSTEMS

This section evaluates the availability of existing utility and infrastructure systems (water, wastewater, stormwater, electricity and natural gas, and solid waste) to serve the EDH 52 Commercial Center Project and the impact of the project on these systems. The analysis is based on documents prepared by the El Dorado Irrigation District (EID) and California's Department of Resources Recycling and Recovery (Cal Recycle).

3.14.1 Regulatory Setting

Federal

Safe Drinking Water Act

As mandated by the Safe Drinking Water Act (SDWA) (Public Law 93-523), passed in 1974, the United States Environmental Protection Agency (EPA) regulates contaminants of concern to domestic water supply. Such contaminants are defined as those that pose a public health threat or that alter the aesthetic acceptability of the water. These types of contaminants are regulated by EPA primary and secondary Maximum Contaminant Levels (MCLs). MCLs and the process for setting these standards are reviewed every three years. Amendments to the Safe Drinking Water Act enacted in 1986 established an accelerated schedule for setting drinking water MCLs. EPA has delegated responsibility for California's drinking water program to the State Water Resources Control Board Division of Drinking Water (SWRCB-DDW). SWRCB-DDW is accountable to EPA for program implementation and for adoption of standards and regulations that are at least as stringent as those developed by EPA.

State

Urban Water Management Plan

In 1983, the California Legislature enacted the Urban Water Management Planning Act (UWMPA) (California Water Code Sections 10610–10656). The UWMPA states that every urban water supplier that provides water to 3,000 or more customers, or that provides more than 3,000 acre-feet (af) of water annually, should make every effort to ensure the appropriate level of reliability in its water service sufficient to meet the needs of its various categories of customers during normal, dry, and multiple dry years. This effort includes the adoption of an Urban Water Management Plan (UWMP) by every urban-water supplier and an update of the plan every 5 years on or before December 31, of every year ending in a five or zero. The UWMPA has been amended several times since 1983 with the most recent amendment occurring with Senate Bill (SB) 318 in 2004. El Dorado Irrigation District (EID) adopted the *2020 Urban Water Management Plan* was adopted on June 28, 2021. .

California Safe Drinking Water Act

The California Safe Drinking Water Act (CA SDWA) was passed in 1976 to build on and strengthen the federal SDWA. The CA SDWA protects the public from contaminants in drinking water by establishing maximum contaminant levels (MCLs) that are at least as stringent as those developed by EPA, as required by the federal SDWA.

The SWRCB-DDW is responsible for implementing the federal SDWA and its updates, as well as California statutes and regulations related to drinking water. State primary and secondary drinking-water standards are promulgated in California Code of Regulations (CCR) Title 22, Sections 64431–64501.

California Green Building Standards Code

The Green Building Standards Code, which was first adopted in 2010 and revised in 2013, applies to all newly-constructed structures. Indoor water standards established in the code are satisfied through incorporation of appliances and fixtures such as high-efficiency toilets, faucet aerators, and on-demand water heaters, as well as Energy Star and appliances approved by the California Energy Commission.

California Waste Management Act

The California Waste Management Act of 1989 requires State, County, and local governments to substantially decrease the volume of waste disposed at landfills by the year 2000 and beyond. The act requires each County to submit an Integrated Waste Management Plan to the California Integrated Waste Management Board that includes an adopted Source Reduction and Recycling Element from each of its cities as well as a County-prepared Source Reeducation and Recycling Element for the unincorporated area. The element identifies existing and future quantities and types of solid waste, an inventory of existing disposal sites, a determination of the plan's economic feasibility, enforcement programs, and implementation schedule.

SB 1383 and AB 1826 have established additional waste reductions for organic waste. SB 1383 was placed in code and requires 50-percent reduction in organic waste levels from 2014 levels by 2020 and 75-percent reduction by 2025. AB 1826 requires business recycling of organic waste.

Local

El Dorado Local Agency Formation Commission

El Dorado Local Agency Formation Commission (LAFCo) approval is required for annexation of the project site into the El Dorado Irrigation District (EID) and the El Dorado Hills County Water District (El Dorado Hills Fire Department). LAFCo requires that applicants and service providers document their ability to provide service to areas proposed for annexations. When considering applications for annexation to a special district, LAFCo evaluates the following items:

- 6.2.1 The annexation must provide for the most efficient delivery of services. The most efficient services are those provided at the lowest cost and highest service level. In the case of similar providers with the same level of service, the one that delivers the same service at the lowest cost will be considered to be most efficient.
- 6.2.2 The annexation shall be modified, conditioned or disapproved if it permits the more efficient delivery of one or more services to the detriment of other services.
- 6.2.3 The annexing agency must demonstrate that no parcel located within district boundaries will be deprived of its right to receive services if the annexation is approved (§56668).
- 6.2.4 The annexing agency must demonstrate that levels of service for existing and potential customers within its service boundaries will not be lowered, or costs of service increased, if the annexation is approved (§56668). If any adverse impacts may occur, the applicant or annexing agency must provide, for LAFCO consideration, a written justification for project approval despite the negative impacts. (El Dorado LAFCO 2021:6-3)

El Dorado Irrigation District

El Dorado Irrigation District (EID) is a public agency dedicated to providing high quality water, wastewater treatment, recycled water, hydropower, and recreation services. Strategic goals associated with EID include:

- maintain continuous, dependable water service and a clean, healthy water supply;
- provide quality wastewater collection, treatment and disposal service;
- provide recycled water in geographic locations where feasible;
- generate hydro-electric power, when appropriate, and according to the Federal Energy Regulatory Commission requirements;
- ensure opportunities for quality recreation; and
- ensure District operations consistently meet all appropriate environmental and other regulations.

EID policies relevant to the project include the following:

- **AR 5010.1 Annual reporting:** The District will maintain adequate water supply and demand records to ensure accurate monitoring and reporting. The General Manager will ensure that an updated Water Resources and Service Reliability Report is prepared annually for review by the Board of Directors. The report will include the current

system firm yield of the overall District, along with the water supply and infrastructure capacity, potential demands, existing commitments, and meter availability for each water service area of the District as defined in the report.

- **AR 5010.2 Shortages:** The Water Resources and Service Reliability Report will use a system firm yield method to determine that sufficient water supply exists to meet potential demands. Under this methodology, approximately 95 percent of the time sufficient water supply is available to meet normal water demands, but during the remaining 5 percent of the time water shortages may occur. Such shortages may result in the implementation of voluntary or mandatory conservation measures.
- **AR 5010.3 New meter restrictions:** Should findings in the Water Resources and Service Reliability Report warrant restrictions on the issuance of new water meters, the General Manager will bring the situation to the attention of the Board of Directors. During emergency conditions when supplies are restricted or limited, the General Manager may also bring to the Board's attention possible restrictions on water meter availability.
- **BP 6010 Wastewater System Management:** The District will maintain a wastewater collection, treatment, and disposal system that complies with applicable state and federal wastewater discharge requirements and regulations.
- **AR 6020 Wastewater Discharge and Disposal:** Where sufficient capacity exists in mainline and collection sewers, the District will make service available subject to applicable connection procedures and fees. Connection to the District's sewer shall not cause objectionable odors or significant corrosive conditions such as those associated with effluent-only systems or pumped services.
- **AR 9028.6 Letters issued by the District:** The District will issue a Facility Improvement Letter (FIL) for water, wastewater, and/or recycled water services to applicants requesting service to existing parcels, lands being subdivided, and lands being rezoned or involving petition for amendment to the County or City general plans. The FIL will be valid for three years from the date of issuance. This document will state the current availability of service and the ability of the District's existing system to provide the requested service. The District may require the submittal of a Facility Plan Report for approval if deemed necessary because of project size or complexity. An extension of up to one year for the FIL may be granted upon request and submittal of the appropriate application and fee.

El Dorado County General Plan

Policies included in the El Dorado County General Plan relevant to the project are identified below.

- **Policy 5.1.2.3:** New development shall be required to pay its proportionate share of the costs of infrastructure improvements required to serve the project to the extent permitted by State law. Lack of available public or private services or adequate infrastructure to serve the project which cannot be satisfactorily mitigated shall be grounds for denial of any project or cause for the reduction of size, density, and/or intensity otherwise indicated on the general plan land use map to the extent allowed by State law.
- **Policy 5.2.1.2:** An adequate quantity and quality of water for all uses, including fire protection, shall be provided for with discretionary development.
- **Policy 5.2.1.3:** All medium-density residential, high-density residential, multifamily residential, commercial, industrial and research and development projects shall be required to connect to public water systems when located within Community Regions and to either a public water system or to an approved private water systems in Rural Centers.
- **Policy 5.2.1.4:** Rezoning and subdivision approvals in Community Regions or other areas dependent on public water supply shall be subject to the availability of a permanent and reliable water supply.
- **Policy 5.2.1.6:** Priority shall be given to discretionary developments that are infill or where there is an efficient expansion of the water supply delivery system.
- **Policy 5.2.1.7:** In times of declared water shortages, the Board of Supervisors shall give priority within the affected water district to approving affordable housing and non-residential development projects.

- **Policy 5.2.1.9:** In an area served by a public water purveyor or an approved private water system, the applicant for a tentative map or for a building permit on a parcel that has not previously complied with this requirement must provide a WSA that contains the information that would be required if a water supply assessment were prepared pursuant to Water Code section 10910. In order to approve the tentative map or building permit for which the assessment was prepared the County must (a) find that by the time the first grading or building permit is issued in connection with the approval, the water supply from existing water supply facilities will be adequate to meet the highest projected demand associated with the approval on the lands in question; and (b) require that before the first grading permit or building permit is issued in connection with the approval, the applicant will have received a sufficient water meters or a comparable supply guarantee to provide adequate water supply to meet the projected demand associated with the entire approval. A water supply is adequate if the total entitled water supplies available during normal, single, dry, and multiple dry years within a 20-year projection will meet the highest projected demand associated with the approval, in addition to existing and 20-year projected future uses within the area served by the water supplier, including but not limited to, fire protection, agricultural, and industrial uses, 95 percent of the time, with cutbacks calculated not to exceed 20 percent in the remaining 5 percent of the time.
- **Policy 5.2.1.11:** The County shall direct new development to areas where public water service already exists. In Community Regions, all new development shall connect to a public water system. In Rural Centers, all new development shall connect either to a public water system or to an approved private water system.
- **Policy 5.3.1.1:** High-density and multifamily residential, commercial, and industrial projects shall be required to connect to public wastewater collection facilities as a condition of approval except in Rural Centers and areas designated as Platted Lands (-PL). In the Community Region of Camino/Pollock Pines, the long term development of public sewer service shall be encouraged; however, development projects will not be required to connect to wastewater collection facilities where such connection is infeasible, based on the scale of the project. (Res. No. 298-98; 12/8/98)
- **Policy 5.3.1.7:** In Community Regions, all new development shall connect to public wastewater treatment facilities. In Community Regions where public wastewater collection facilities do not exist project applicants must demonstrate that the proposed wastewater disposal system can accommodate the highest possible demand of the project.
- **Policy 5.5.2.1:** Concurrent with the approval of new development, evidence will be required that capacity exists within the solid waste system for the processing, recycling, transformation, and disposal of solid waste.
- **Policy 5.5.2.3:** The County shall adopt a Construction and Demolition Debris Diversion Ordinance requiring that a minimum of 50 percent of the debris from construction and demolition projects be reused or recycled. The County shall encourage a higher rate of diversion.

El Dorado County Construction and Demolition Debris Recycling Ordinance

The El Dorado County Construction and Demolition Debris Recycling Ordinance establishes a program for the recycling and salvage of construction and demolition debris. The ordinance requires at least 50 percent of the debris from construction and demolition project with structure footprints exceeding 5,000 square feet to be diverted from landfills through recycling practices. Before the issuance of a permit, the project applicant must file a Debris Recycling Acknowledgment (DRA) with the County's Environmental Management Division. A Debris Recycling Report (demonstrating compliance with the 50 percent diversion goal) must be filed within 60 days after final and/or occupancy approval. If the in two years of the date the DRA was filed, the project applicant would be required to submit a Performance Securities with subsequent DRAs.

3.14.2 Environmental Setting

WATER

The El Dorado Irrigation District (EID) is an irrigation special district, organized and existing under the California Irrigation District Law (Water Code Section 20500, et seq.) and authorizing statutes (Water Code Section 22975, et seq.). EID serves nearly 110,000 residents in El Dorado County. EID is a public water agency that provides potable and recycled water directly to retail customers and the City of Placerville throughout the approximately 220 square mile service area boundary.

EID serves a combination of municipal and agricultural customers throughout the County in 16 unique service zones. While the population of nearly 130,000 residential customers are the primary water users, the number of connections, ratio of different user classifications, and water use characteristics vary across each service zone. EID serves these customers from an array of surface water supplies, diversion points, treatment plants, and water infrastructure.

Water Supply Plans

As discussed above, EID serves nearly 130,000 residents in El Dorado County. EID's existing sources of water include surface water and recycled water. The potable water system has three principal points of diversion that deliver raw water to the system: 1) EID-owned-and-operated Sly Park Dam and Jenkinson Lake; 2) EID-owned-and-operated El Dorado Hydroelectric Federal Energy Regulatory Commission Project 184 at Forebay Reservoir; and 3) Folsom Reservoir via two US Bureau of Reclamation water service contracts. Raw water diverted at these locations is treated at the Reservoir A Water Treatment Plant (WTP), Reservoir 1 WTP, and El Dorado Hills WTP, respectively.

EID's 2020 UWMP was prepared in accordance with the State's UWMPA. The 2020 UWMP provides the following information: water services and systems, water supply, water use, existing and forecasted customer uses, water system reliability, and water shortage contingency planning (EID 2021).

The available supply in the El Dorado Hills supply area is currently restricted by infrastructure, which includes the capacity of the El Dorado Hills WTP and other conveyance facilities. Water allocations associated with supply areas are limited to their physical boundaries. As a result, consideration of water supply associated with the project is relevant only to the El Dorado Hills supply area. The most recent Water Supply and Demand Report (2019) provides data, shown in Table 3.14-1.

Table 3.14-1 El Dorado Hills Supply Area – 2019 Water Meter Availability

Water Supply	23,775 acre feet
Total Potential Demand	11,734 acre feet
Unallocated Water Supply	12,041 acre feet
Water Meter Availability	20,068 equivalent dwelling units

Source: EID 2019:ES-2.

From a water use characteristics and infrastructure perspective, EID has been divided into three water service regions:

- El Dorado Hills Region – includes Service Zones 1, 2 and 4 which represent the communities of Bass Lake, El Dorado Hills and Cameron Park.
- Western Region – includes Service Zones 3, 5, 6, and 7 which represent the communities of Lotus/Coloma, Shingle Springs, Logtown, and Diamond Springs/El Dorado.
- Eastern Region – includes Service Zones 9, 10, 11, 12, 13, 18, and 28 which represent the communities of Swansboro, Camino, Pleasant Valley, Sly Park, Pollock Pines, and Placerville, but also includes the two small independent systems for Service Zones 14 and 15, which represent the communities of Outingdale and Strawberry, respectively.

The project site is located within the El Dorado Hills Region, Service Zone 2.

Growth in the El Dorado Hills region was recently projected to build-out conditions in conjunction with EID's activities to extend provision related to its Water Right Permit 21112. The effort developed growth projections using two categories:

- Facility Improvement Letters (FILs) – this designation reflects all development projects known to EID at a particular point in time that have formally submitted an initial request for service to EID. A full list of current FILs is available from EID.
- Future Beyond FILs – this designation reflects additional development beyond the current FILs on existing parcels within Zone 1, 2 and 4 that are greater than 10 acres and are not otherwise designated for any other use.

The analysis projected total Equivalent Dwelling Units (EDU) expected within the EDH region, where the EDU value represents the number of residential "dwelling units" that each project would reflect regardless of whether the project includes residential or non-residential land uses. One EDU is the quantity of water an average single-family residential customer uses, based on standards adopted by the American Water Works Association (AWWA) and is approximately 0.70 acre feet of water demand. Each residential home is assigned one EDU. Commercial customers are assigned EDUs based on their expected water demand, relative to an average single-family residential customer. The analysis determined over 25,000 EDUs could ultimately occur at build-out within this demand region – about 45 percent represented in the existing FILs and the remainder projected as part of the "Beyond FILs." This EDU projection was compared to projected housing demand expected by 2040 to estimate the potential growth rate and determine if build-out would occur beyond the 2020 UWMP's planning horizon of 2045.

The 2020 UWMP indicates that the project site has been accounted for within its expected growth area for Water Rights Permit 2112, because a FIL has been reviewed for the project site (EID 2021: Figure 2-7).

EID Facility Improvement Letter

On March 30, 2022, EID provided a Facility Improvement Letter (FIL) to the applicant in response to a request for water, sewer, private fire service, and fire hydrant services for the project. The FIL does not represent a commitment to serve, but rather addresses the location and approximate capacity of existing facilities that may be available to serve the project. EID expresses existing and available wastewater and water supply service levels in terms of equivalent dwelling units (EDUs). Pertinent discussions related to water supply, provided in the FIL, are summarized as follows (Brink, pers. comm., 2022).

- The project site is not located within the EID service district boundary and would require annexation before service could be obtained.
- As of January 1, 2021, there were approximately 18,968 EDUs of water supply were available in the El Dorado Hills Water Supply Region. The project would require approximately 50 EDUs of water supply. An 18-inch water pipeline is located along the western edge of the project site. The El Dorado Hills Fire Department has determined that the minimum fire flow for this project ranges from 1,500 gallons per minute (gmp) up to 3,000 gpm for a 3-hour duration while maintaining a 20-pounds per square inch (psi) residual pressure. According to EID's hydraulic model, the existing system can deliver the required fire flow; however, the applicant must construct a looped water pipeline extension connecting to the 18-inch water pipeline located along the western edge of the project site.

Water Treatment Facilities

The project is located within Zone 2, which would be served water under Permit 2112 (Project 184 Warren Act Contract). EID acquired Federal Energy Regulatory Commission (FERC) Project 184 from Pacific Gas and Electric (PG&E) in 1999. Project 184 includes Silver Lake, Lake Aloha, Echo Lake, Caples Lake and associated dams, 22 miles of canals, flumes and tunnels, a 21-megawatt powerhouse, and other ancillary facilities. The El Dorado Hills region obtains its primary supplies under rights and entitlements from Folsom Reservoir. This water is delivered to the El Dorado Hills water treatment plant and currently serves El Dorado Hills Zone 2. EID also has a separate recycled water system in the El Dorado Hills system, which delivers treated wastewater from the El Dorado Hills Wastewater Treatment Plant (EDHWWTP) and the Deer Creek Wastewater Treatment Plant (DCWWTP) for residential and

commercial landscape irrigation. Water supplies conveyed from Folsom Reservoir and the EDHWTP are currently limited to use in the El Dorado Hills system to avoid the costs of pumping to higher elevations.

Water Distribution System and Facilities

The EID water conveyance system is a combination of pipelines, regulating reservoirs, diurnal storage tanks, and a few gold-rush-era ditches. The piped potable system consists of 1,245 miles of pipelines, 50 miles of canals and ditches, 5 treatment plants, 38 potable water storage reservoirs/ tanks, 42 pump stations (EID 2022a).

In addition to a potable water system, EID operates a recycled water system. EID's two treatment plants produce more than 900 million gallons of recycled water each year for landscape irrigation. The recycled water is delivered to over 5,000 residential customers and almost 100 businesses in the El Dorado Hills community (EID 2022b).

WASTEWATER

Wastewater Collection and Treatment Systems

EID provides wastewater collection and treatment services to the project area. EID has the following four permitted wastewater collection systems: El Dorado Hills, Deer Creek, Camino Heights, and Gold Ridge Forest. The project would be served by the El Dorado Hills Collection System, which consists of a series of lift stations, force mains, and gravity mains that convey wastewater to the El Dorado Hills Wastewater Treatment Plant (EDHWWTP).

The EDHWWTP is located approximately 1.25 miles south of Highway 50 on Latrobe Road in the El Dorado Hills business park area. Liquid treatment processes located within the EDHWWTP consist of headworks, screening and grit removal, primary clarifiers, biological nutrient removal basins, activated sludge basins with nitrification, secondary clarifiers, tertiary filters, and ultraviolet light disinfection. Solids handling processes consist of waste activated sludge, dissolved air flotation thickeners, anaerobic digesters, and belt filter presses. Dewatered biosolids are hauled offsite for use in biosolids land application (El Dorado LAFCO 2020).

The EDHWWTP has a rated average dry weather flow capacity of 4 million gallons per day (mgd). Treated effluent is either recycled or discharged into Carson Creek, a tributary to the Cosumnes River, during the wet season. The EDHWWTP typically discharges to Carson Creek between November and April, and recycles all of the treated effluent for beneficial reuse between May and October. At times, there is intermittent discharge to Carson Creek during periods when the EHDWWTP is recycling the treated effluent for beneficial reuse. The existing average dry weather flow at EDHWWTP is 1.80 mgd (El Dorado LAFCO 2020).

EID Facility Improvement Letter

As described above for water supply, EID's March 30, 2022 FIL does not represent a commitment to provide wastewater service but addresses the location and approximate capacity of existing facilities that may be available to serve the project. Pertinent discussions related to wastewater treatment capacity, provided in the FIL, are summarized as follows (Brink, pers. comm., 2022).

Sewer Facilities

According to the FIL, the project would require approximately 42 EDUs of sewer service. Existing gravity sewer pipelines are located at the western edge of the project site. While the sewer line currently has adequate capacity, an extension of facilities of adequate size must be constructed for the project to receive services from the line. Currently, the existing sewer pipeline is under evaluation for potential upsizing, per EID's Wastewater Facilities Master Plan.

ELECTRICITY AND NATURAL GAS

The Pacific Gas and Electric Company (PG&E) provides electricity and natural gas service to the El Dorado Hills community. PG&E Company charges connection and user fees for all new development, in addition to sliding rates for electrical and natural gas service based on use. The project would connect to existing electrical transmission

facilities along Clarksville Crossing. Natural gas is to the project site by an extension of an existing natural gas pipeline located approximately 1,900 feet north of the project site along the eastern edge of Silva Valley Parkway.

SOLID WASTE

The project site is located within the El Dorado Hills Community Services District (EDHCSD) boundary. EDHCSD contracts with El Dorado Disposal Service, a Waste Connections Company, for franchised solid waste collection, disposal, and recycling services. El Dorado Disposal Service transports waste to the Western El Dorado Recovery Systems (WERS) Transfer Station and Material Recovery Facility, which handles mixed municipal waste and has a maximum permitted throughput of 400 tons per day. Transferred materials is be disposed either at Kiefer Landfill, Forward Landfill, Potrero Hills Landfill, or another Class III permitted landfill (see Table 3.14-1 for information related to these landfills) (CalRecycle 2022).

Table 3.14-2 Disposal Facilities and Remaining Capacities

Facility	Total Estimated Permitted Capacity (in cubic yards)	Remaining Estimated Capacity Cubic Yards	Remaining Estimated Capacity Percentage	Estimated Closure Year
Sacramento County Landfill (Kiefer) (34-AA-0001)	117,400,000	112,900,000	96.2%	2064
Forward Landfill, Inc. (39-AA-0015)	59,160,000	24,720,669	43.2%	2036
Potrero Hills Landfill (48-AA-0075)	83,100,000	13,872,000	16.7%	2048

Source: CalRecycle 2022.

3.14.3 Environmental Impacts and Mitigation Measures

ANALYSIS METHODOLOGY

As required by EID, water and sewer service is determined through the allocation of EDUs. The potential for EDU availability for the project site was provided in the FIL, submitted to the project applicant in March 2022. Solid waste generation rates from CalRecycle's Targeted Statewide Waste Characterization Study, which included a waste generation rate of 21 pounds/employee/day (lbs/employee/day) for big box retail facilities and 10 lbs/employee/day for other types of retail, is used to calculate the projected solid waste that would be generated by the project (CalRecycle 2006).

THRESHOLDS OF SIGNIFICANCE

A utilities and service systems impact is considered significant if implementation of the EDH 52 Commercial Center Project would do any of the following:

- require or result in the relocation or construction of new or expanded water, or wastewater treatment or storm water drainage, electric power, natural gas, or telecommunications facilities, the construction or relocation of which could cause significant environmental effects
- have sufficient water supplies available to serve the project and reasonably foreseeable future development during normal, dry and multiple dry years
- result in a determination by the wastewater treatment provider that serves or may serve the project that it has adequate capacity to serve the project's projected demand, in addition to the provider's existing commitments
- generate solid waste in excess of State or local standards or in excess of the capacity of local infrastructure
- negatively impact the provision of solid waste services or impair the attainment of solid waste reduction goals; and/or

- comply with federal, state, and local management and reduction statutes and regulations related to solid waste.

ENVIRONMENTAL IMPACTS AND MITIGATION MEASURES

Impact 3.14-1: Expansion of Infrastructure That Could Cause Adverse Environmental Effects

Infrastructure associated with the water, wastewater, stormwater, electricity, and natural gas services for the project would be into the project site as part of site development. Connections to existing infrastructure would be expected to occur primarily within new paved areas and disturbed areas along and near the project's frontage with Silva Valley Parkway and Clarksville Crossing. This impact would be **significant**.

Commented [PA1]: County - this impact conclusion and associated mitigation may change depending on the Air Quality construction impact analysis

The following describes the extent of infrastructure extent improvements for the North Site and South Site. All connections would be made in accordance with the County's, EID's, and PG&E's requirements. These requirements may include, but are not limited to, approval of engineered improvement plans, extension of facilities applications and fees, payment of applicable connection feeds, and service agreement approvals.

North Site

Figure 2-14 in Chapter 2, "Project Description," shows the preliminary utility plan for the North Site. Water would be provided to the North Site through a 12-inch pipeline that would connect to the existing 18-inch water pipeline within Silva Valley Parkway. This 12-inch pipeline would connect north of the northern driveway access and would traverse the site until it splits such that one branch would serve the storage facility and the other would follow the main driveway and cross Silva Valley Parkway where it would serve the South Site. An eight-inch sewer pipeline would connect with South Site sewer infrastructure near the North Site's main driveway at Silva Valley Parkway. Stormwater pipelines varying in size from 12 inches to 36 inches would be installed throughout the North Site that interconnect with 12 onsite bioretention basin, with connections to the South Site. Electrical and natural gas service would be provided by PG&E would be extended from existing facilities along Clarksville Crossing (electrical) and extension of a natural gas pipeline approximately 1,900 feet north of the site along eastern side of Silva Valley Parkway. These areas of infrastructure extension consist of pavement, disturbed shoulders of the roadways, and grassland/riparian areas. The environmental effects of the construction of these offsite connections are considered in each technical analysis of this EIR (see Sections 3.2, "Air Quality," 3.3, "Archaeological, Historical, and Tribal Cultural Resources," 3.4, "Biological Resources," and 3.9, "Hydrology and Water Quality") and would be subject to applicable mitigation measures to mitigate impacts. No significant offsite improvements that would involve significant environmental impacts beyond what is addressed in this EIR would occur. This impact would be **significant**.

South Site

Figure 2-22 in Chapter 2, "Project Description," shows the preliminary utility plan for the South Site. Water would be provided to the site via 10-inch pipelines connecting to existing water pipeline within Silva Valley Parkway as well as a 6-inch and 10-inch water pipeline connection to the existing water pipeline in Clarksville Crossing. An eight-inch sewer pipeline would connect to North Site sewer infrastructure within Silva Valley Parkway and would serve the South Site via six-inch and eight-inch pipelines. This onsite sewer system would connect an existing sewer pipeline along the west side of Clarksville Crossing. Stormwater pipelines varying in size from 12 inches to 36 inches would be installed throughout the site and would convey stormwater to proposed six bioretention basins within the South Site as well as existing vaults and boxes. Electrical and natural gas service would be provided by PG&E that would be extended from existing facilities along Clarksville Crossing (electrical) and extension of a natural gas pipeline approximately 1,900 feet north of the site along eastern side of Silva Valley Parkway.. These areas of infrastructure extension consist of pavement, disturbed shoulders of the roadways, and grassland/riparian areas. The environmental effects of the construction of these offsite connections are considered in each technical analysis of this EIR (see Sections 3.2, "Air Quality," 3.3, "Archaeological, Historical, and Tribal Cultural Resources," 3.4, "Biological Resources," and 3.9, "Hydrology and Water Quality") and would be subject to applicable mitigation measures to mitigate impacts. No significant offsite improvements that would involve significant environmental impacts beyond what is addressed in this EIR would occur. This impact would be **significant**.

Mitigation Measures

Implementation of mitigation measures NEED TO ADD ANY CONSTRUCTION AIR QUALITY MITIGATION MEASURES, 3.3-1, 3.4-1, 3.4-2a through 3.4-2h, 3.4-3a, and 3.4-3b would address construction air pollutant emissions, protect discovered cultural resources, and minimize impacts to biological resources. As identified in Sections 3.2, "Air Quality," 3.3, "Archaeological, Historical, and Tribal Cultural Resources," and 3.4, "Biological Resources," implementation of these mitigation measures would reduce this impact to **less than significant**.

Impact 3.14-2: Provision of Sufficient Water Supplies

The project would require approximately 50 EDUs of water supply from EID. As stated in the FIL, sufficient water supply exists to serve buildout of the project. Fire flow would be provided to the site upon construction of a looped water line extension. Thus, because water supply and connections are currently available for the project, this impact would be **less than significant**.

North Site and South Site

Project implementation would result in development of land that is currently vacant with no existing use of municipal water. As of January 1, 2021, 18,968 EDUs (approximately 13,278 acre-feet) of water supply were available in the El Dorado Hills Water Supply Region (Brink, pers. comm. 2022). The project would require approximately 50 EDUs (approximately 35 acre-feet) of water supply, which have been requested from EID. In response to the request, as described above under Section 3.14.1, "Environmental Setting," an FIL was prepared by EID on March 30, 2022 and received by the applicant. As stated in the FIL, sufficient water supply exists to serve buildout of the project. It is important to note that water supply is not yet guaranteed by EID and the entire project site would require approval from El Dorado LAFCo for annexation into EID's service area.

The El Dorado Hills Fire Department has determined that the minimum fire flow for this project ranges from 1,500 gallons per minute (gmp) to 3,000 gpm for a 3-hour duration while maintaining a 20-pounds per square inch (psi) residual pressure. According to the EID's hydraulic model, the existing system can deliver the required fire flow; however, the applicant must construct a looped water line extension connecting to the 18-inch water line located within Silva Valley Parkway.

Thus, because water supply and connections are currently available for the project, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required for this impact.

Impact 3.14-3: Availability of Wastewater Treatment Capacity

The project site does not currently have any connection to the existing wastewater collection and conveyance infrastructure. The project would require approximately 42 EDUs of sewer service. EID provided a FIL to the applicant on, which confirmed that adequate wastewater conveyance and treatment capacity is available. Thus, this impact would be **less than significant**.

North Site and South Site

The project site is located within EID's service area, but does not currently have any connection to the existing collection and conveyance infrastructure. Sewer service to the project site was requested from EID from the project applicant. The FIL received for the project indicates that the project would require approximately 42 EDUs of sewer service. The FIL indicated that adequate wastewater treatment capacity is available. Existing gravity sewer lines are located at the western edge of the South Site. While the sewer pipeline currently has adequate capacity, an extension of facilities of adequate size must be constructed for the project to receive services from the pipeline. Currently, the existing sewer line is under evaluation for potential upsizing, per EID's Wastewater Facilities Master Plan. However,

upsizing is not part of this requirement or necessary to accommodate the project. All connections would be made in accordance with the County's and EID's requirements as well as require approval from El Dorado LAFCo for annexation into EID's service area. Thus, because adequate sewer capacity is available, and because connections would be made in accordance with County and EID requirements, this impact would be **less than significant**.

Mitigation Measures

No mitigation is required for this impact.

Impact 3.14-4: Provision of Adequate Capacity at Solid Waste Facilities and Compliance with Regulations Related to Solid Waste

As discussed above, the project site is located within EDHCSD boundary where the El Dorado Disposal Service provides solid waste collection, disposal, and recycling services. The project would generate levels of solid waste that would not be a substantial amount of the permitted capacity and would not result in the need to expand or construct new landfill facilities. In addition, this project would adhere to all required State and County waste management ordinances and requirements. Thus, impacts on solid waste disposal facilities would be **less than significant**.

As discussed above, the project site is located within EDHCSD boundary where the El Dorado Disposal Service provides solid waste collection, disposal, and recycling services. Collected waste is transported to the WERS Transfer Station and Materials Recovery Facility, which is permitted to accept up to 400 tons per day. Transferred materials is be disposed either at Kiefer Landfill, Forward Landfill, Potrero Hills Landfill, or another Class III permitted landfill. As shown in Table 3.14-2, capacity at the listed landfills is available through 2064.

North Site

Assuming up to 100 employees, the North Site would generate approximately 1,000 pounds of waste per day (0.5 tons). This represents approximately 0.25 percent of the permitted capacity at WERS Transfer Station and Materials Recovery Facility. This relatively small increase in solid waste would not consume a substantial proportion of the permitted capacity of 400 ton per day. Transferred materials is be disposed either at Kiefer Landfill, Forward Landfill, Potrero Hills Landfill, or another Class III permitted landfill. As shown in Table 3.14-2, capacity at the listed landfills is available through 2064.

In addition, this project would adhere to all required State or County waste management ordinances and requirements, such as diversion of construction and demolition debris and hazardous waste handing requirements that ensure that use of landfill space is limited and potential for accidental spills is minimized. Thus, impacts on solid waste would be **less than significant**.

South Site

The South Site would include a Costco warehouse retail center and a tire sales and installation center. Based on a targeted statewide study prepared for Cal Recycle, waste generation rates for big box retail is 21 lbs/employee/day (Cal Recycle 2006). Assuming up to 170 employees, the Costco Center would generate 3,570 pounds of waste per day (1.8 tons per day). This represents approximately 0.5 percent of the permitted capacity at WERS Transfer Station and Materials Recovery Facility. This relatively small increase in solid waste would not consume a substantial proportion of the permitted capacity of 400 ton per day. Transferred materials is be disposed either at Kiefer Landfill, Forward Landfill, Potrero Hills Landfill, or another Class III permitted landfill. As shown in Table 3.14-2, capacity at the listed landfills is available through 2064.

In addition, this project would adhere to all required State or County waste management ordinances and requirements, such as diversion of construction and demolition debris and hazardous waste handing requirements that ensure that use of landfill space is limited and potential for accidental spills is minimized. Thus, impacts on solid waste would be **less than significant**.

Mitigation Measures

No mitigation is required for this impact.

1 INTRODUCTION

This draft environmental impact report (Draft EIR) evaluates the environmental impacts of the proposed EDH 52 Commercial Center Project. This Draft EIR has been prepared under the direction of El Dorado County in accordance with the requirements of the California Environmental Quality Act (CEQA) (Public Resources Code [PRC] Section 21000 et seq.) and the State CEQA Guidelines. This chapter of the Draft EIR provides information on the following:

- project requiring environmental analysis (synopsis);
- type, purpose, and intended uses of the Draft EIR;
- scope of the Draft EIR;
- agency roles and responsibilities; and
- standard terminology.

1.1 PROJECT REQUIRING ENVIRONMENTAL ANALYSIS

The project site is split into the North Site and the South Site. The North Site is 24.83 acres and the South Site is 18.43 acres. The entire project site has a General Plan Land Use Designation of Commercial (C). The North Site is currently zoned Commercial Regional – Planned Development (CR-PD). The South Site is predominantly zoned CR-PD and also includes small parcels of Commercial Limited (CL) and Transportation Corridor (TC). Because the project site has an existing Planned Development overlay, the applicant is seeking a Planned Development Permit (PD) and Master Signage Program. Figure 2-3 shows the site plans for both the North Site and South Site. The North Site would consist of a self-storage facility and five commercial buildings that would include drive-through uses, gas station with car wash, food service, outdoor patio, and other retail and office uses. The South Site would consist of the development of a Costco warehouse retail center. The project is also anticipated to require offsite roadway improvements to address conformance with El Dorado County General Plan transportation policies and extension of natural gas pipeline along Silva Valley Parkway. For further information on the proposed project, see Chapter 2, "Project Description."

1.2 PURPOSE AND INTENDED USES OF THIS DRAFT EIR

According to CEQA, preparation of an EIR is required whenever it can be fairly argued, based on substantial evidence, that a proposed project may result in a significant environmental impact. An EIR is an informational document used to inform public-agency decision makers and the general public of the significant environmental impacts of a project, identify possible ways to minimize the significant impacts, and describe reasonable alternatives to the project that could feasibly attain most of the basic objectives of the project while substantially lessening or avoiding any of the significant environmental impacts. Public agencies are required to consider the information presented in the EIR when determining whether to approve a project. This Draft EIR has been prepared to meet the requirements of a project EIR as defined by Section 15161 of the State CEQA Guidelines. A project EIR focuses on the changes in the physical environment that would result from the implementation of a project, including its planning, construction, and operation. The State's intention in preparing a project EIR is that no further environmental analysis would be required for additional regulatory approvals following approval of the project, absent conditions requiring a subsequent EIR, a supplement to the EIR, or an addendum. (See State CEQA Guidelines Sections 15162–15164.)

1.3 SCOPE OF THIS DRAFT EIR

This Draft EIR includes an evaluation of the following 15 environmental issue areas as well as other CEQA-mandated issues (e.g., cumulative impacts, growth-inducing impacts, significant unavoidable impacts, alternatives):

- Aesthetics;
- Air Quality;
- Archaeological, Historical, and Tribal Cultural Resources;
- Biological Resources;
- Energy;
- Geology and Soils;
- Greenhouse Gas Emissions and Climate Change;
- Hazards, Hazardous Materials, and Wildfire;
- Hydrology and Water Quality;
- Land Use and Planning;
- Noise and Vibration;
- Public Services;
- Transportation; and
- Utilities and Service Systems.

Under the CEQA statutes and the State CEQA Guidelines, a lead agency may limit an EIR's discussion of environmental effects when such effects are not considered potentially significant (PRC Section 21002.1[e]; State CEQA Guidelines Sections 15128, 15143). Information used to determine which impacts would be potentially significant was derived from review of the EDH 52 Commercial Center Project; review of applicable planning documents and CEQA documentation; field work; feedback from public and agency consultation; comments received during a public scoping meeting held on September 8, 2021; and comments received on the notice of preparation (NOP) (see Appendix A of this Draft EIR).

The NOP was distributed on August 23, 2021, to responsible agencies, interested parties, and organizations, as well as private organizations and individuals that may have an interest in the project. The purpose of the NOP and the scoping meeting was to provide notification that an EIR for the EDH 52 Commercial Center Project was being prepared and to solicit input on the scope and content of the environmental document. As a result of the review of existing information and the scoping process, it was determined that each of the issue areas listed above should be evaluated fully in this Draft EIR. Further information on the NOP and scoping process is provided below in Section 1.5, "Public Review Process."

1.4 AGENCY ROLES AND RESPONSIBILITIES

1.4.1 LEAD AGENCY

El Dorado County is the lead agency responsible for approving the project and for ensuring that the requirements of CEQA have been met.

1.4.2 TRUSTEE AND RESPONSIBLE AGENCIES

A trustee agency is a State agency that has jurisdiction by law over natural resources that are held in trust for the people of the State of California. The only trustee agency that has jurisdiction over resources potentially affected by the project is the California Department of Fish and Wildlife (CDFW).

Responsible agencies are public agencies, other than the lead agency, that have discretionary-approval responsibility for reviewing, carrying out, or approving elements of a project. Responsible agencies should participate in the lead agency's CEQA process, review the lead agency's CEQA document, and use the document when making a decision on project elements. Agencies that may have responsibility for, or jurisdiction over, the implementation of elements of the project include the following:

STATE AGENCIES

- California Department of Fish and Wildlife (CDFW)
- Central Valley Regional Water Quality Control Board (RWQCB)

REGIONAL AND LOCAL AGENCIES

- El Dorado County Air Management District (EDCAQMD)
- El Dorado Local Agency Formation Commission (LAFCo)
- El Dorado Hills Water District (El Dorado Hills Fire Department)
- El Dorado Irrigation District (EID)

1.5 CEQA PUBLIC REVIEW PROCESS

1.5.1 Notice of Preparation

In accordance with PRC Section 21092 and State CEQA Guidelines Section 15082, the County issued a notice of preparation (NOP) on August 23, 2021, to inform agencies and the general public that an EIR was being prepared and to invite comments on the scope and content of the document (Appendix A). The NOP was submitted to the State Clearinghouse. In addition, the NOP was distributed directly to public agencies (including potential responsible and trustee agencies) and the public. The NOP was circulated for a 30-day review period, with comments accepted between August 23, 2021 and September 21, 2021. In accordance with State CEQA Guidelines Section 15082 (c), a noticed virtual scoping session for the EIR occurred on September 8, 2021.

The purpose of an NOP is to provide sufficient information about the project and its potential environmental impacts to allow agencies and interested parties the opportunity to provide a meaningful response related to the scope and content of the EIR, including mitigation measures that should be considered and alternatives that should be addressed (State CEQA Guidelines Section 15082[b]). Comments submitted in response to the NOP are used by the lead agency to identify broad topics to be addressed in the EIR. Comments on environmental issues received during the NOP public comment periods are considered and addressed in this Draft EIR.

1.5.2 Draft EIR

This Draft EIR is being circulated for public review and comment for a period of 60 days. During the public comment period, written comments from the general public as well as organizations and agencies on the Draft EIR's accuracy and completeness may be submitted to the lead agency. Please send all comments to:

Gina Hamilton, Planning Manager
El Dorado County Planning and Building Department, Planning Services Division
2850 Fairlane Court, Building C
Placerville, CA 95667
Email: EDH52CommercialCenter@edcgov.us
Fax: (530) 642-0508

Agencies that will need to use the EIR when considering permits or other approvals for the project should provide the name of a contact person, phone number, and email address. Comments provided by email should include the name and physical address of the commenter.

Copies of this Draft EIR are available for public review at the following locations:

- El Dorado County Planning and Building Department, Planning Services Division, 2850 Fairlane Court, Building C, Placerville, CA 95667
- El Dorado County Library, 345 Fair Lane, Placerville, CA 95667
- El Dorado County Library, 7455 Silva Valley Parkway, El Dorado Hills, CA 95762
- El Dorado County Library, 2500 Country Club Drive, Cameron Park, CA 95682.

Commented [PA1]: County - please confirm

The Draft EIR is also available for public review online at: http://www.edcgov.us/government/planning

1.5.3 Response to Comments/Final EIR and Project Consideration

Upon completion of the public review and comment period, a Final EIR will be prepared that will include both written and oral comments on the Draft EIR received during the public-review period, responses to those comments, and any revisions to the Draft EIR made in response to public comments. The Draft EIR and Final EIR will comprise the EIR for the project.

Before approving the project, the lead agency, is required to certify that the EIR has been completed in compliance with CEQA, that the decision-making body reviewed and considered the information in the EIR, and that the EIR reflects the independent judgment of the County.

1.6 DRAFT EIR ORGANIZATION

This Draft EIR is organized into chapters, as identified and briefly described below. Chapters are further divided into sections (e.g., Chapter 3, "Environmental Impacts and Mitigation Measures" and Section 3.6, "Energy"):

- The "Executive Summary": This chapter introduces the EDH 52 Commercial Center Project; provides a summary of the environmental review process, effects found not to be significant, and key environmental issues; and lists significant impacts and mitigation measures to reduce significant impacts to less-than-significant levels.
- Chapter 1, "Introduction": This chapter provides a description of the lead and responsible agencies, the legal authority and purpose for the document, and the public review process.
- Chapter 2, "Project Description": This chapter describes the location, background, and goals and objectives for the EDH 52 Commercial Center Project, and describes the project elements in detail.
- Chapter 3, "Environmental Impacts and Mitigation Measures": The sections within this chapter evaluate the expected environmental impacts generated by the EDH 52 Commercial Center Project, arranged by subject area

(e.g., Land Use, Hydrology and Water Quality). Within each subsection of Chapter 3, the regulatory background, existing conditions, analysis methodology, and thresholds of significance are described. The anticipated changes to the existing conditions after development of the project are then evaluated for each subject area. For any significant or potentially significant impact that would result from project implementation, mitigation measures are presented and the level of impact significance after mitigation is identified. Environmental impacts are numbered sequentially within each section (e.g., Impact 3.2-1, Impact 3.2-2, etc.). Any required mitigation measures are numbered to correspond to the impact numbering; therefore, the mitigation measure for Impact 3.2-2 would be Mitigation Measure 3.2-2.

- Chapter 4, "Cumulative Impacts": This chapter provides information required by CEQA regarding cumulative impacts that would result from implementation of the EDH 52 Commercial Center Project together with other past, present, and probable future projects.
- Chapter 5, "Alternatives": This chapter evaluates alternatives to the EDH 52 Commercial Center Project, including alternatives considered but eliminated from further consideration, the No Project Alternative, and two alternative development options. The environmentally superior alternative is identified.
- Chapter 6, "Other CEQA Sections": This chapter evaluates growth-inducing impacts and irreversible and irretrievable commitment of resources, and discloses any significant and unavoidable adverse impacts.
- Chapter 7, "Report Preparers": This chapter identifies the preparers of the document.
- Chapter 8, "References": This chapter identifies the organizations and persons consulted during preparation of this Draft EIR and the documents and individuals used as sources for the analysis.

1.7 STANDARD TERMINOLOGY

This Draft EIR uses the following standard terminology:

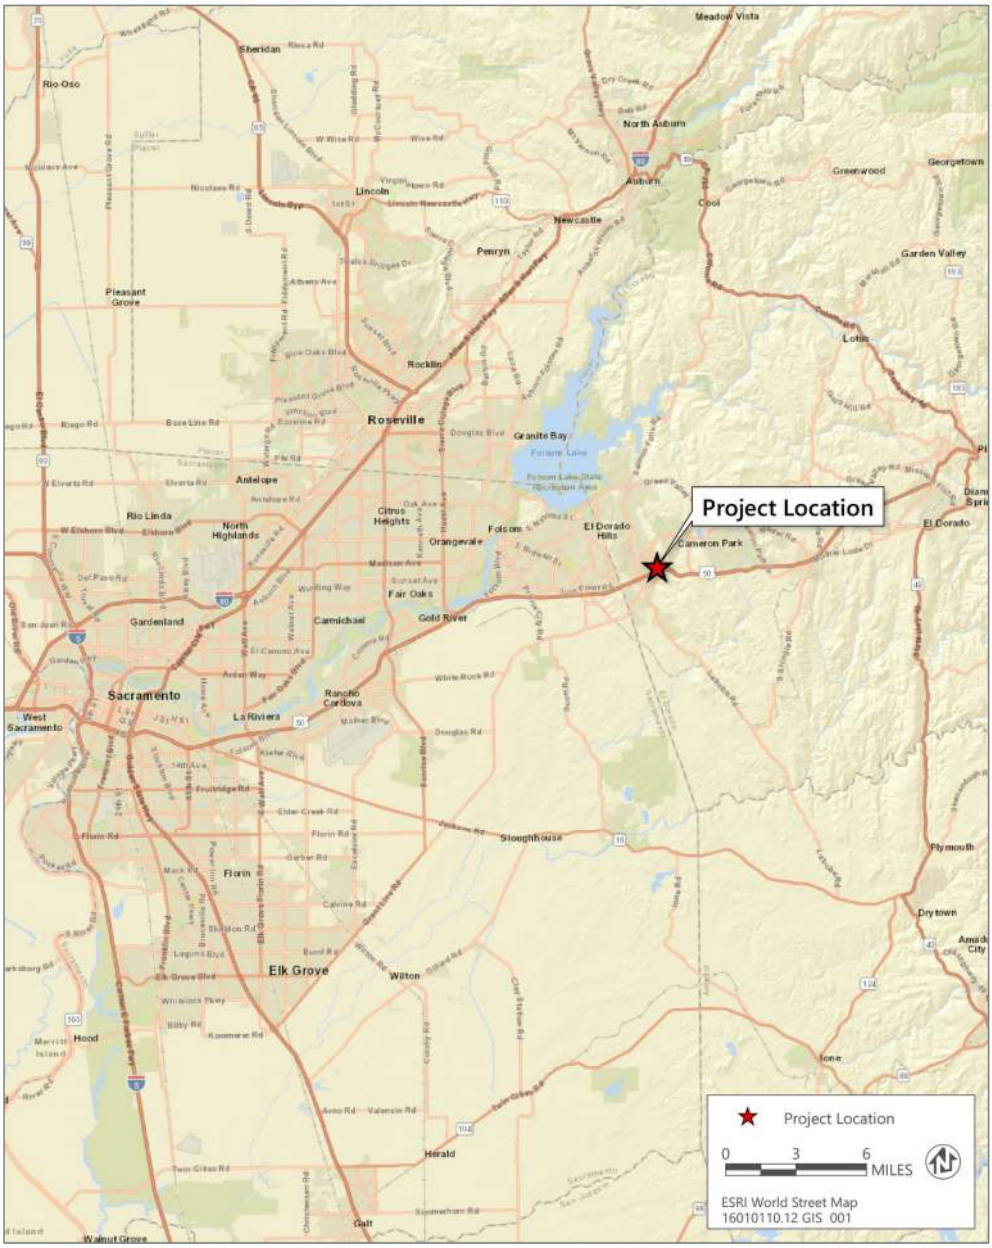
- "No impact" means no change from existing conditions (no mitigation is needed).
- "Less-than-significant impact" means no substantial adverse change in the physical environment (no mitigation is needed).
- "Potentially significant impact" means an impact that might cause a substantial adverse change in the environment (mitigation is recommended because potentially significant impacts are treated as significant).
- "Significant impact" means an impact that would cause a substantial adverse change in the physical environment (mitigation is recommended).
- "Significant and unavoidable impact" means an impact that would cause a substantial adverse change in the physical environment and that cannot be avoided, even with the implementation of all feasible mitigation.

This page intentionally left blank.

2 PROJECT DESCRIPTION

2.1 PROJECT OVERVIEW

The proposed EDH 52 Commercial Center (project) would develop various commercial uses on two vacant sites bisected by Silva Valley Parkway just north of U.S. Highway 50 (U.S. 50).



2.2 PROJECT LOCATION AND SETTING

The project is in the El Dorado Hills community of California, which is located in an unincorporated area of El Dorado County approximately 23 miles east of Sacramento and 20 miles west of the City of Placerville (Figure 2-1). As shown in Figure 2-2, the project site is on the north side of U.S. 50 and is bisected by Silva Valley Parkway. Existing land uses near the project site include vacant land, residences, and an elementary school to the north; Tong Road and U.S. 50 to the south; a church to the southeast; vacant land to the east; and Clarksville Crossing Road to the west. The project site encompasses approximately 43.26 acres, including Assessor's Parcel Numbers (APNs) 122-720-002, -003, -018, -019, -020, and -021.

2.3 PROJECT OBJECTIVES

- Overall Project:
  - Develop two high-quality planned commercial developments on currently vacant and underutilized land adjacent to U.S. 50 adequately served by public services and utilities.
  - Promote economic growth and diverse new employment and retail/service opportunities for County residents.
  - Increase the number of employees and contribute to the local job/housing balance.
- North Site:
  - Provide additional retail uses for the local market area that is serviced by adequate existing utilities and roadways.
  - Provide additional commercial services closer to existing housing.
  - Increase contribution to the County's tax base.
  - Develop architectural and landscaping designs that soften the scale and mass of the buildings, create a pleasant and attractive appearance, and complement the surrounding area.
  - Develop site plans that minimize potential access and circulation conflicts between automobiles and pedestrians, provide adequate off-street parking for store customers and employees, and minimize impacts to the surrounding area.
- South Site:
  - Construct and operate a new, state-of-the-art Costco warehouse that serves the membership in the greater El Dorado Hills area with competitively priced goods and services from both nationally known businesses and also more regional and local businesses.
  - Reduce energy consumption by incorporating sustainable design features and systems with enhanced energy efficiencies meeting State and federal code requirements.
  - Provide a membership wholesale center in a location that is convenient for its members, the community, and employees to travel to shop and work.

- Create an architectural design that enhances the area by responding to the El Dorado Hills area design context in a way that is sensitive to the adjacent community, future development(s) and compatible with the need for a new warehouse in this market area.
- Increase contributions to the County's tax base.
- Expand the space available for integrated retail sales of goods and services in the El Dorado Hills market.

Source: adapted by Ascent Environmental in 2021

Figure 2-1 Regional Location

Source: adapted by Ascent Environmental in 2021

Figure 2-2 Project Site Location

- Minimize circulation conflicts between automobiles and pedestrians.
- Provide a Costco warehouse in a location that is serviced by adequate existing infrastructure, including roadways and nearby utilities.
- Develop a Costco warehouse that is large enough to accommodate all of the uses and services Costco provides to its members.
- Locate a Costco warehouse on a site Costco can purchase (rather than lease) to protect its substantial investment of time, money and goodwill in the location.

2.4 PROJECT DESCRIPTION

The project site is split into the North Site and the South Site. The North Site is 24.83 acres and the South Site is 18.43 acres. The entire project site has a General Plan Land Use Designation of Commercial (C). The North Site is currently zoned Commercial Regional – Planned Development (CR-PD). The South Site is predominantly zoned CR-PD and also includes small parcels of Commercial Limited (CL) and Transportation Corridor (TC). Because the project site has an existing Planned Development overlay, the applicant is seeking a Planned Development Permit (PD) and the following rezoning (Figure 2-4):

- North Site: from CR-PD to Community Commercial-Planned Development (CC-PD)
- South Site: from CR-PD, CL, and TC to CR-PD for the entire site

Figure 2-3 shows the site plans for both the North Site and South Site. The proposed Master Signage Program applies to both the North Site and the South Site.

2.4.1 North Site

The North Site would include rezoning the site from CR-PD to Community Commercial – Planned Development (CC-PD) (See Figure 2-4). The project also seeks approval of a Tentative Parcel Map for the North Site to reconfigure existing parcels create 8 individual parcels (See Figure 2-5). Development of parcels 1 through 5 may include the following uses: up to five drive-through uses, one gas station with car wash, food service uses, an outdoor patio, and/or other retail and office uses permitted in the CC zone. A self-storage facility would use parcels 6 and 7 for a recreational vehicle (RV) storage lot with 56 RV spaces and six self-storage buildings, which are allowed with the approval of a Conditional Use Permit (CUP). A portion of the planned Country Club Drive extension (County Capital Improvement Project No. 36105008) would be constructed at a future date by the County within parcel 8. The total building area for the North Site would be approximately 162,000 square feet (sf). Table 2-1 below identifies the proposed parcel sizes, building square footage, and potential future uses.

Commented [MAA1]: Creating 8 parcels rather than reconfiguring?

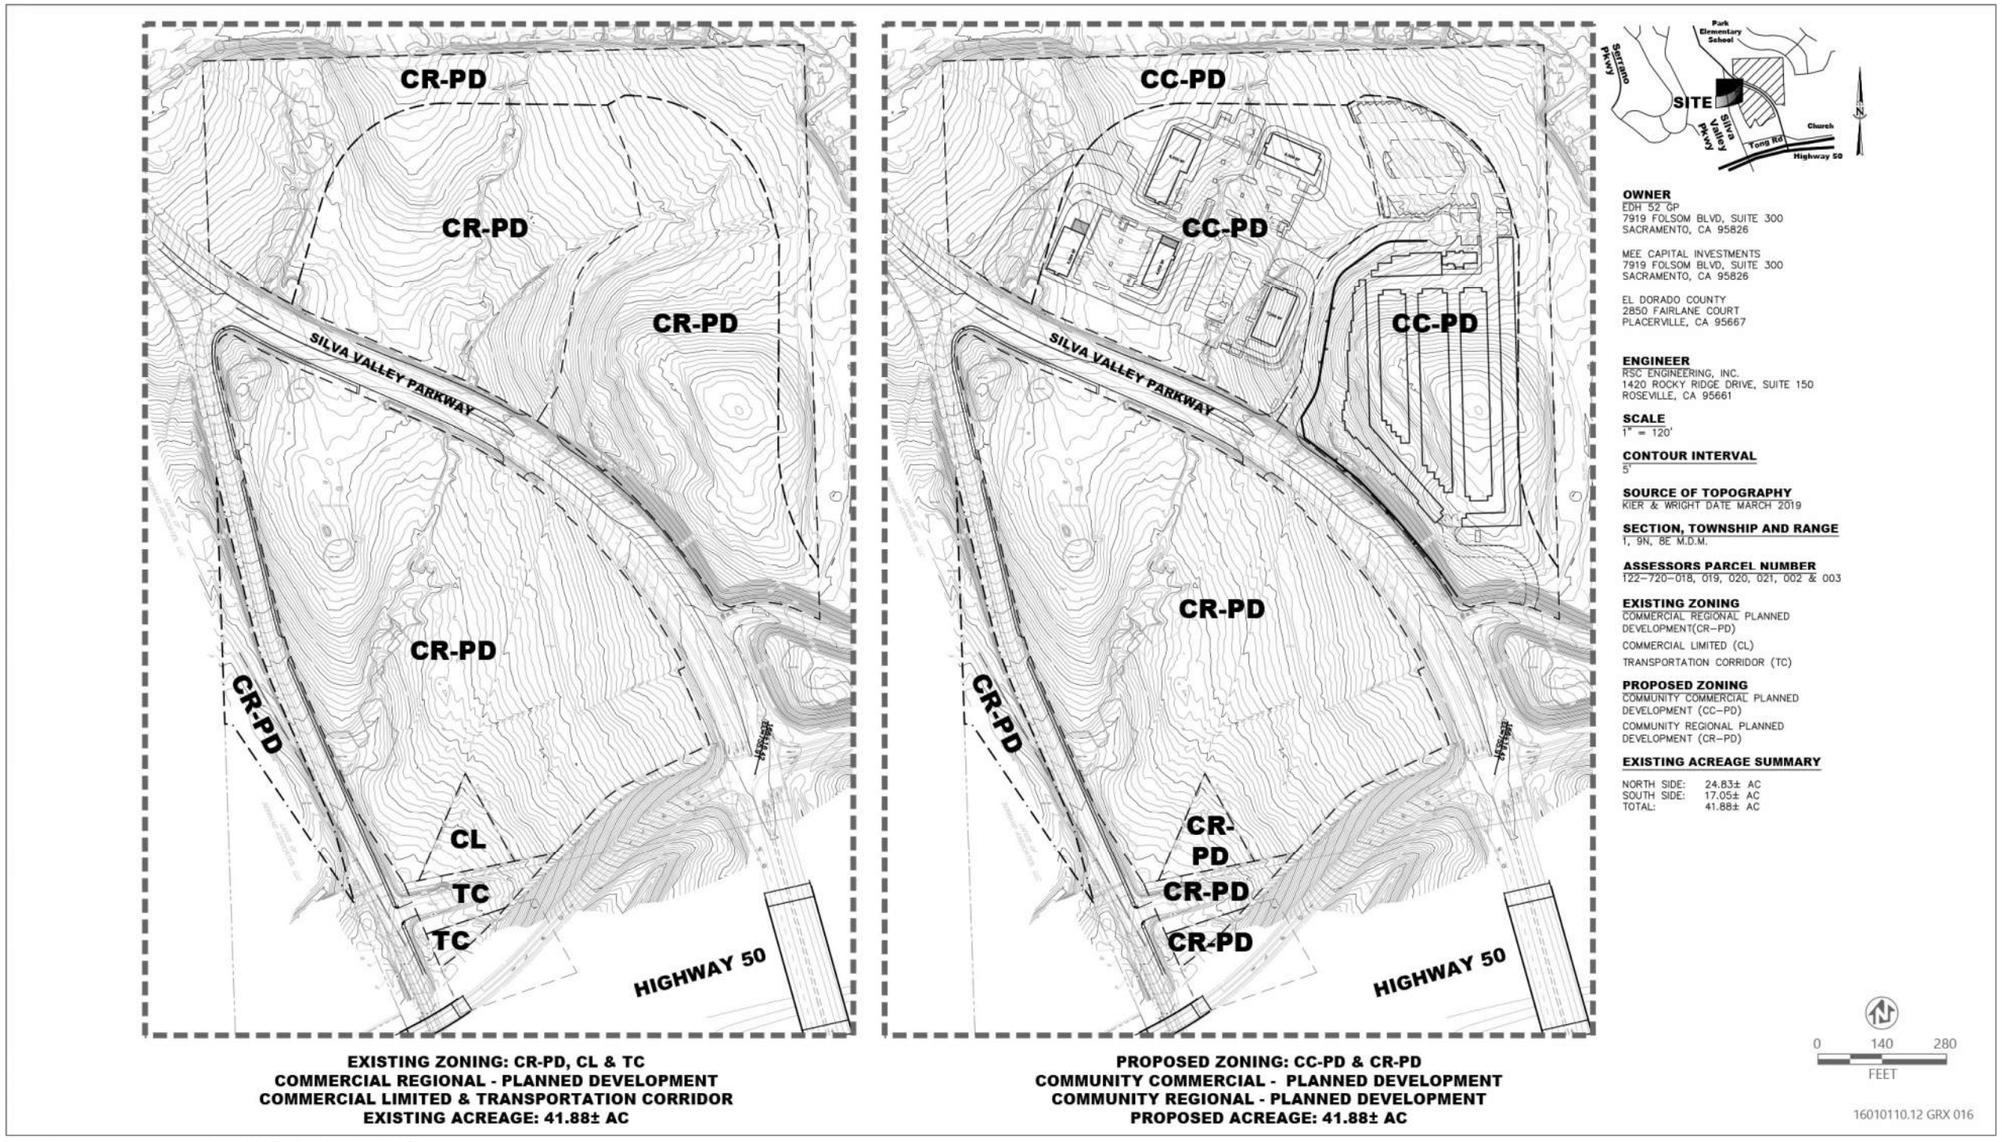


Table 2-1 North Site Parcel and Building Size

Parcel	Acreage	Building Size (square feet)	Proposed Use
1	2.49	5,000	Retail with a Potential Drive-through
2	1.92	9,250	Retail with a Potential Drive-through
3	1.99	6,000	Retail with a Potential Drive-through
4	2.23	7,250	Gas Station with a Potential Drive-through
5	1.08	4,050	Retail with a Potential Drive-through
6	7.84	130,358	Self-Storage and RV Storage
7	1.66		
8	5.63	0	Future Country Club Drive Extension
Total	**24.83**	**161,908**

Figure 2-5 North Site - Tentative Parcel Map

SITE ACCESS AND ROADWAY IMPROVEMENTS

As shown in Figure 2-6, a traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the North Site and the South Site. Right-in and right-out access would also be provided to the North Site from Silva Valley Parkway via a driveway north of the new signal at the main driveway. An emergency access to Tong Road from the self-storage facility is also proposed. The North Site would include 166 surface parking spaces for retail uses and seven spaces for the self-storage facility. Sidewalks and bike lanes would be provided along the site frontage.

ARCHITECTURE

The design theme for the North Site is based on the existing building design theme of the Serrano area, which is a California/Mediterranean style. Preliminary elevations for the self-storage facility are shown in Figure 2-7 and provide an example of the proposed design theme for the North Site. Where single tenant types (retail shops) occur, the proposed design guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the proposed design guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants would use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as identified in the proposed North Site Design Guidelines (Appendix B).

Each building on the North Site would vary in building height to achieve visual interest and distinct building character, avoiding the monotony of multiple structures with a continuous building height. Each building would combine horizontal and vertical elements to provide variation, interest, and rhythm within and among the buildings. In no case would any roof mounted equipment be higher than the lowest parapet height of the building.

The color and material palette for the North Site contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the North Site so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette would be maintained throughout the development of the North Site.

Within the development of the North Site, all sides of all buildings would be visible from adjacent roadways and properties. Screening would be required for loading and storage areas, utilities meters and boxes using landscaping, walls, fences in combination. The use of colored concrete, concrete pavers, accent patterns, etc. would be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas would be accomplished using intimate seating areas in near proximity of the building.

LANDSCAPING

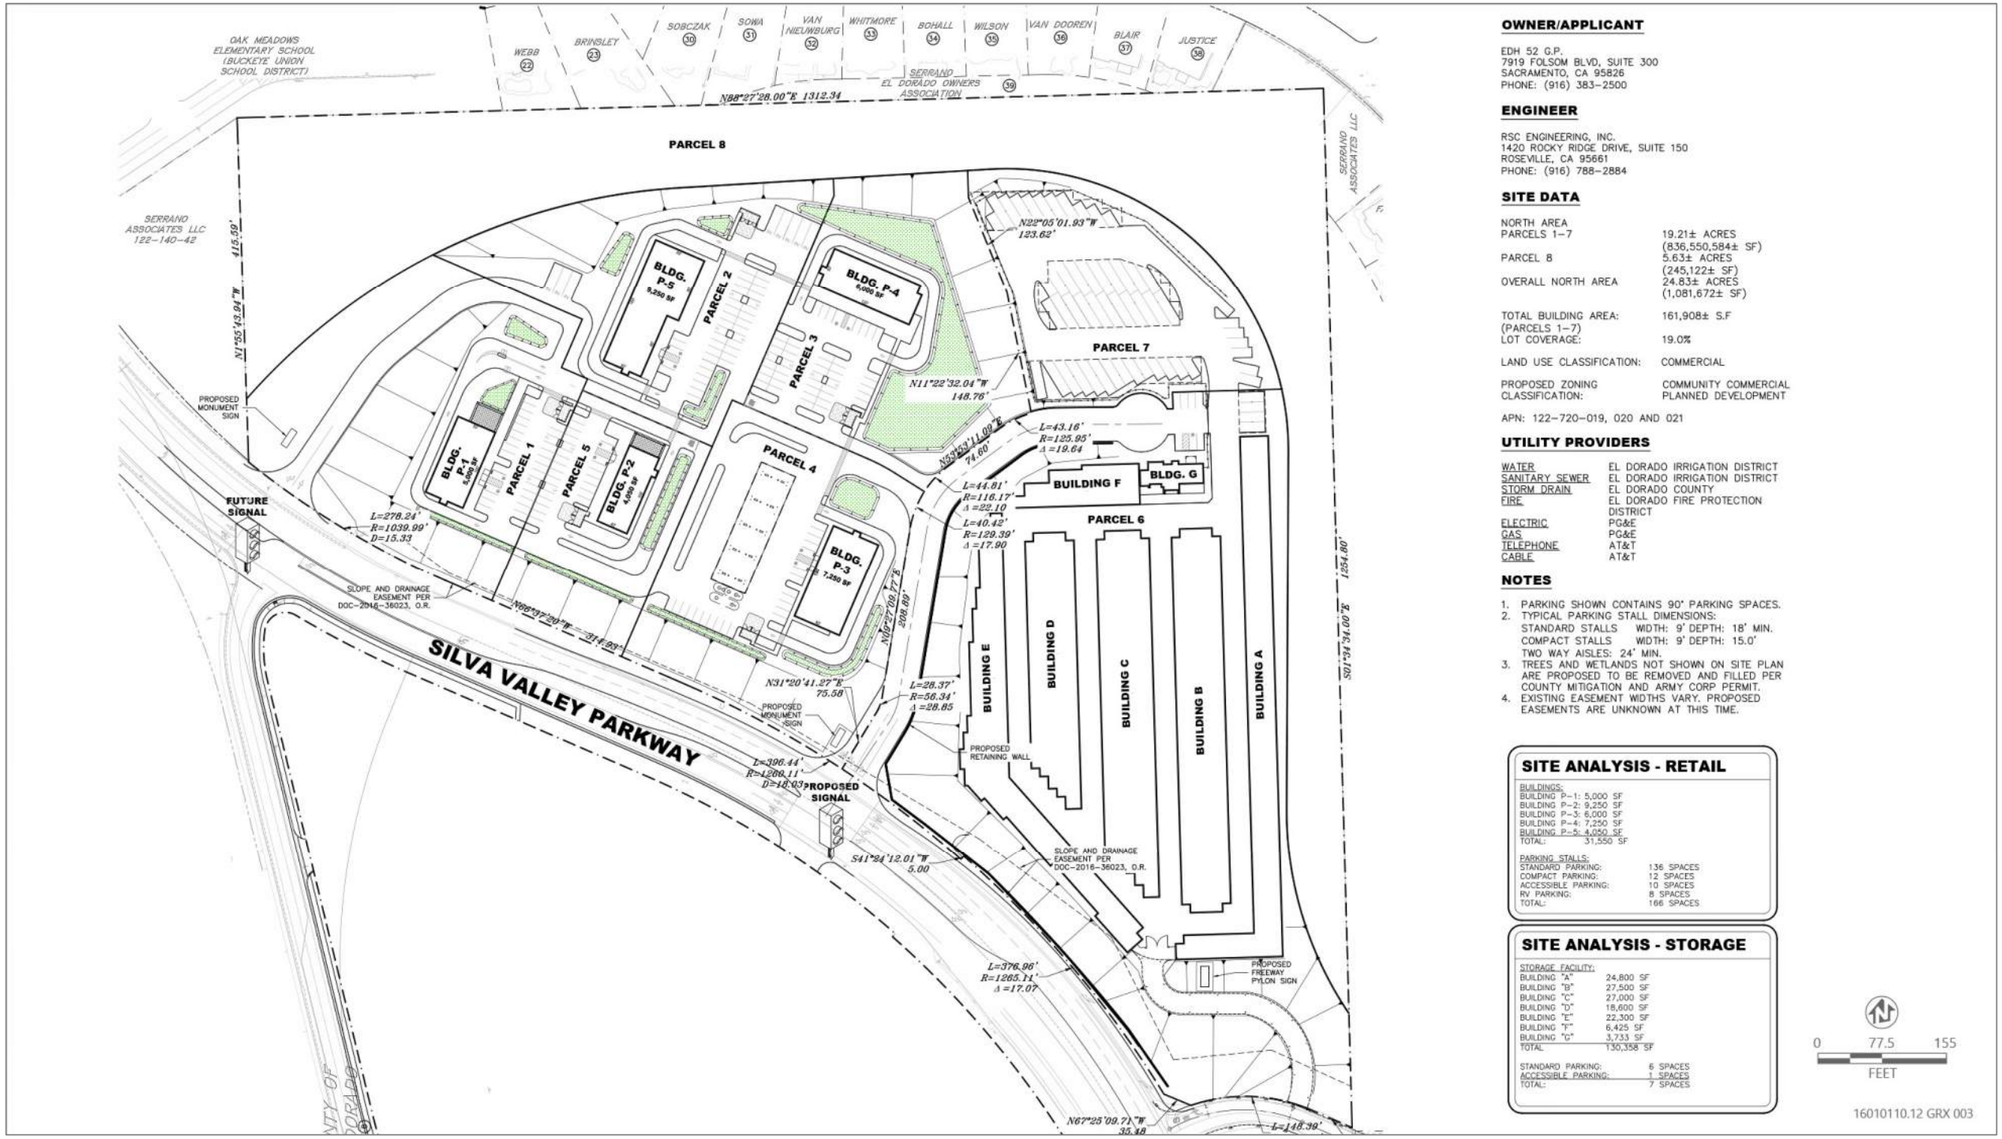
The preliminary landscape plan for the North Site is shown in Figure 2-8. Within the parking lots of the North Site, trees would provide a shade canopy while understory plantings would consist of low shrubs and groundcovers. Primary plantings along the property boundaries would consist of evergreen trees and shrub rows designed to screen adjacent properties. Areas fronting the streets would incorporate shade trees along with mixed species and forms of shrubs for interest, color, and buffering the shopping center from the streets. Plantings at entries would include seasonal accent trees and low shrubs in order to maintain sight lines. Landscaping would include drought tolerant species. The project would remove four individual oak trees located near the western edge of the North Site, which requires an oak tree removal permit.

LIGHTING

The North Site would provide various single, two- or four-light fixtures throughout the parking areas and driveways. The overall height of the lighting on the North Site, including the lighting fixtures and a three-foot base, would be 33 feet in the parking lot, 25 feet along the perimeter and main drive aisles, and 16 feet around drive-through lanes. LED luminaires would be used for the parking lot lights. The lighting plan for the North Site is shown in Figure 2-9.

SIGNAGE

As part of the proposed Master Signage Program (see Section 2.4.3, "Master Signage Program"), the applicant proposes a 75-foot pylon sign designed to be visible to motorists on U.S. 50 as well as two 28-foot monument signs at entrances to the North Site (see Figure 2-10). Figure 2-11 shows the proposed sign elevations. The highway-oriented pylon sign would allow advertising from either commercial center and would include one (1) major tenant panel, one (1) junior tenant panel, and eight (8) shop tenant panels (see Figure 2-10). The proposed sign area for the highway-oriented pylon sign would not exceed 652 square feet. The highway-oriented pylon sign would have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos would be fabricated aluminum, pan channel construction. Tenant names and logos would be flush mounted to the panel background and internally illuminated with white LED lights. Colors would comply with tenant specifications.



Each of the two monument signs would have one (1) featured tenant panel and six (6) shop tenant panels. The proposed area for each monument sign is 242 square feet. The monument signs would have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos would be routed out with acrylic push-through graphics and vinyl film overlays. Tenant names would be internally illuminated with white LED lights. Colors would comply with tenant specifications.

INFRASTRUCTURE IMPROVEMENTS

Figure 2-14 shows the preliminary utility plan for the North Site. Water would be provided to the North Site through a 12-inch pipeline that would connect to the existing water pipeline within Silva Valley Parkway. This 12-inch pipeline would connect north of the northern driveway access and would traverse the site until it splits such that one branch would serve the storage facility and the other would follow the main driveway and cross Silva Valley Parkway where it would serve the South Site. Within the North Site, various smaller water pipelines would be installed to serve specific buildings as well as fire hydrants. An eight-inch sewer pipeline would connect with existing infrastructure near the North Site's main driveway at Silva Valley Parkway and would continue through the site to serve all proposed buildings. Stormwater pipelines varying in size from 12 inches to 36 inches would be installed throughout the North Site that interconnect with 12 onsite bioretention basins, with connections to the South Site. Electrical and natural gas service would be provided by Pacific Gas and Electric Company (PG&E) that would be extended from existing facilities along Clarksville Crossing (electrical) and extension of a natural gas pipeline approximately 1,900 feet north of the site along eastern side of Silva Valley Parkway.

CONSTRUCTION

Construction for the North Site is anticipated to begin as early as October 2023 and last approximately 14 months. The timing for development of the North Site is dependent on market conditions, so all parcels on the North Site may not be developed at the same time. Figure 2-12 identifies proposed earthwork movement (cut and fill), while Figure 2-13 identifies the proposed grading plan. Site development is expected to require the import of approximately 30,000 cubic yards (CY) of fill material and the removal of approximately 19,000 CY of rock material offsite.

Freestanding Shopping Center / Tenant Signs Scope of Work

- Two (2) 75' D/F shared tenant pylon signs with one (1) Major Tenant panel and one (1) Junior Tenant Panel with eight (8) Shop Tenant panels.
- Six (6) 28' D/F shared tenant monument signs with one (1) Featured Tenant panel and six (6) Shop Tenant panels.

Pylon Sign
Tenant cabinets (tenant panels) to be fabricated aluminum construction with texcote finish to match/compliment color scheme of shopping center development. Base to be stone veneer to match shopping center development.
Tenant names/logos to be fabricated aluminum, pan channel construction with color scheme and content per tenant specifications, flush mounted to tenant panel background. Fabricated pan channel letters/logo to be internally illuminated with White LEDs. Tenant panel backgrounds to be consistant color throughout.

Monument Signs
Tenant cabinets (tenant panels) to be fabricated aluminum construction with texcote finish to match/compliment color scheme of shopping center development. Base to be stone veneer to match shopping center development.
Tenant names/logos to be routed out, with acrylic push-thru graphics and vinyl film overlays on faces of graphics. Color scheme and content of push-thru graphics per tenant specifications. Tenant panel backgrounds to be consistant color throughout. Cabinets to be internally illuminated with White LEDs.

Figure 2-14 North Site Preliminary Utility Plan

OPERATIONS

As discussed previously, development of the North Site may include the following uses: operation of up to five drive-through uses, one gas station with car wash, food service uses, an outdoor patio, and/or other retail and office uses permitted in the CC zone, and an RV and self-storage facility. The proposed gas station would be expected to have an annual throughput of less than 3.6 million gallons per year. The proposed self-storage facility would consist of 6 buildings plus an office and 52 RV storage spaces.

While specific end users have not been determined for the North Site, it is estimated that it would provide between 90 and 100 employees based on review of a range of employee per square foot of building area estimates for a range of commercial uses (ABAG 2011).

ENERGY EFFICENCY FEATURES

As noted above, the North Site would obtain electrical and natural gas services from PG&E. The development would comply with energy efficiency standards under California Code of Regulations Title 24. Additional energy efficiency measures incorporated into the project would include high efficiency restroom fixtures, low or no VOC paints, drought tolerant planting, and LED parking lot lights. The reader is referred to Section 3.5, "Energy," for a further discussion of project energy demands.

2.4.2 South Site

The majority of the South Site is already zoned CR-PD. The project would include rezoning of the CL portion to CR-PD, both to harmonize the zoning designation across the South Site and to apply the PD designation uniformly as required by General Plan Policy 2.2.6.1 (see Figure 2-15). Development of the South Site would include up to approximately 165,000 sf of building area that would include a Costco warehouse retail center and a tire sales and installation center. The proposed site plan is shown in Figure 2-16. Within the warehouse retail center, Costco would offer optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, and alcohol sales. The tire center would include propane refueling and sales as well as tire sales and installation. The warehouse is proposed to include one customer entrance to the main Costco store, which would be located at the northwest corner. The tire center would have bay doors accessible from outside of the warehouse, though the tire center sales area would be accessible through the warehouse building. Promotional sales materials would occasionally be placed outside near the entrance to the warehouse or in the parking area. Development on the South Site would exclude the 1.38-acre area located west of Clarksville Crossing. No uses are proposed for the 1.38-acre site, which would be its own parcel (see Figure 2-15).

The South Site has been designed to accommodate the existing slope of the site by locating the Costco warehouse building in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. Parking would be provided in two at-grade lots and one subterranean lot beneath one of the at-grade lots. Vehicle access to this lower-level parking would be provided by ramps on the north and south sides of the underground parking structure consisting of 214 spaces. A third ramp would provide pedestrian access from the lower level up to the at-grade parking and entry to the warehouse building. Total parking for the South Site would be 762 spaces.

SITE ACCESS AND ROADWAY IMPROVEMENTS

As shown in Figure 2-16, the primary customer entrance to the South Site would be from a signalized intersection at the main driveway at Silva Valley Parkway. There would also be an intersection at Silva Valley Parkway and Clarksville Crossing Road that would be partially signalized to provide protected turn movements to vehicles traveling northbound on Silva Valley Parkway to make a left turn on to Clarksville Crossing Road. From Clarksville Crossing Road, there would be three driveways providing access to the South Site. The signalization of the intersection of Silva

Valley Parkway and Clarksville Crossing Road would remain in place until the County constructs the Country Club Drive extension project in 2041. After completion of the Country Club Drive extension project, the signal at the intersection of Silva Valley Parkway and Clarksville Crossing Road would be removed and Clarksville Crossing Road's existing connection to Silva Valley Parkway would be eliminated. Sidewalks and bike lanes would be provided along the site frontage.

ARCHITECTURE

The warehouse design for the South Site is proposed to be contemporary and would include a variety of massing and appropriate materials for the building, as shown in Figure 2-17. By combining concrete masonry block and architectural metal panels, Costco intends to create a scale and architectural interest to minimize the visual impact of a large retail warehouse. By use of design techniques such as the location of building materials, landscaping, and the incorporation of varying parapet cap heights, Costco proposes to break the long elevations both horizontally and vertically at the appropriate height to conceal roof top mounted mechanical equipment. The proposed colors are warm natural earth tones, which would relate to the proposed surrounding development by utilizing similar building materials and architectural detailing.

The South Site has been designed to use the existing slope of the site by locating the warehouse in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. By building the warehouse adjacent to higher elevation land and providing a subterranean parking structure, the height of the building and visual impacts relative to the surrounding environment would be minimized. The subterranean portion of the parking structure would be adjacent to the west side of the warehouse and contain 214 parking spaces underneath the at-grade parking structure. Vehicle access to this lower-level parking would be provided by ramps on the north and south sides of the underground parking structure – the ramp on the north side would allow vehicles to enter the lower-level parking structure directly from Clarksville Crossing and the ramp on the south side would allow vehicle access from the at-grade parking lot above. A third ramp would provide pedestrian access from the lower level up to the at-grade parking and entry to the warehouse. The main entry feature to the warehouse is proposed to be oriented towards the northwest so that the loading dock and truck deliveries would be accessed from and oriented towards U.S. 50, providing greater separation between the warehouse's commercial activities and the existing residences.

The South Site truck loading dock is proposed to be located at the southwest corner of the building adjacent to U.S. 50. The bay doors would be equipped with sealed gaskets to limit noise impacts. A smaller on-grade door would also be located on the south side of the building. This door is to receive bread deliveries and small delivery vans/trucks. A transformer and two trash compactors would also be located along the south edge of the building proposed for the South Site. Landscape material would provide the necessary screening to this area.

LANDSCAPING

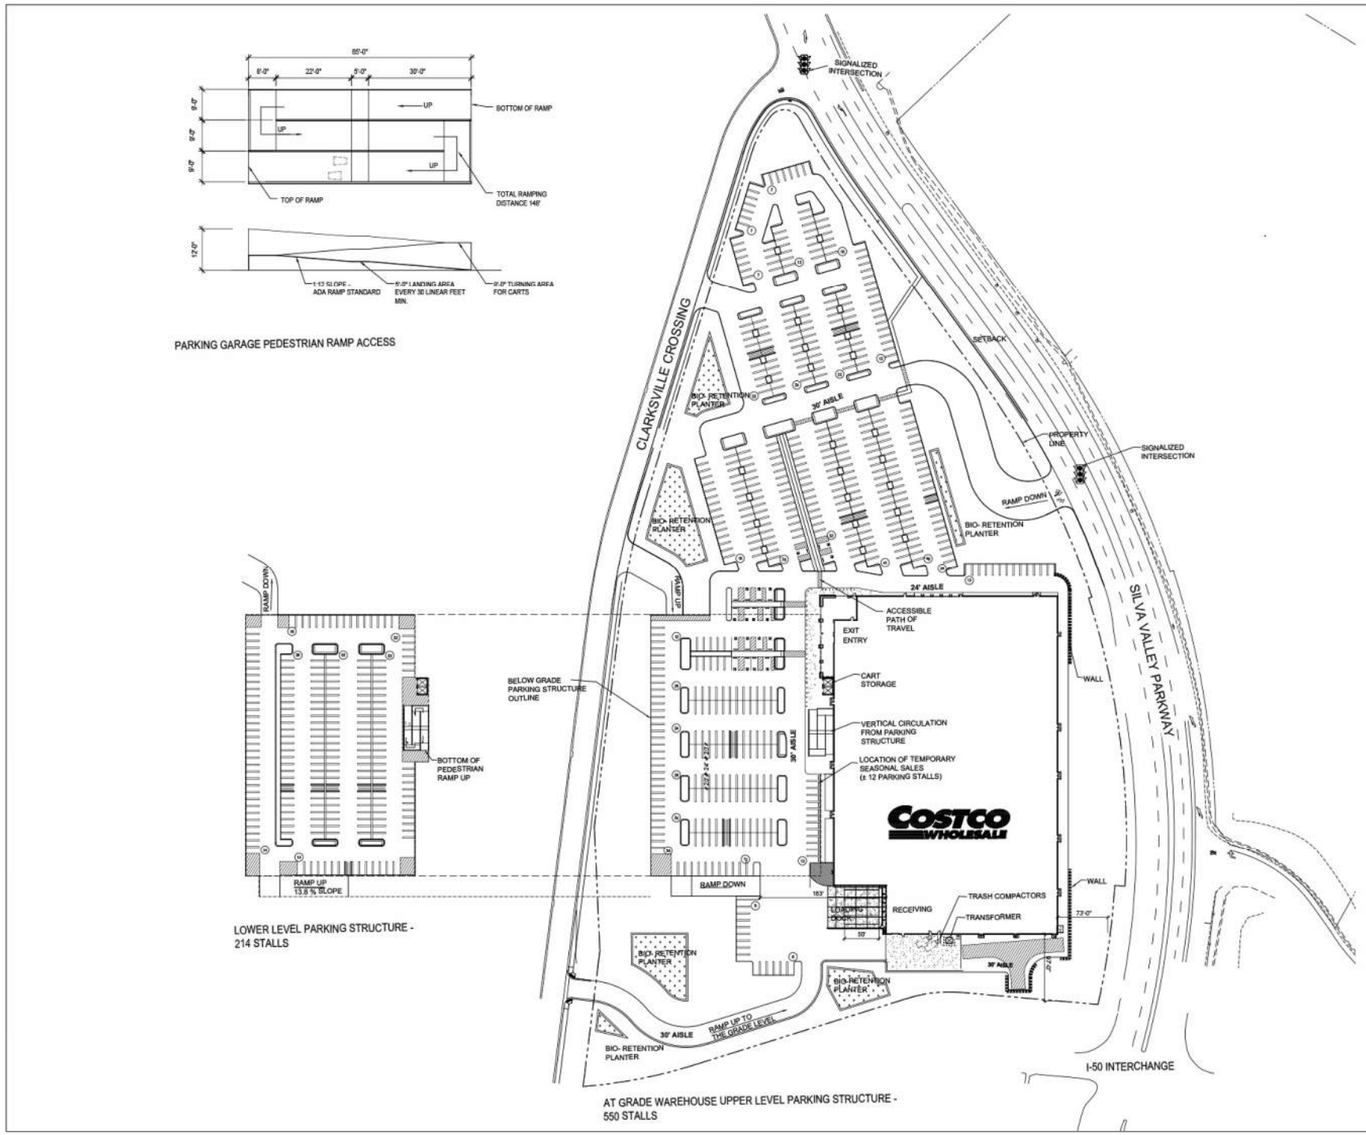
The preliminary landscape plan for the South Site is shown in Figure 2-18. Landscaping would include a variety of tree species along the property lines and throughout the surface parking area. The side of the warehouse building facing Silva Valley Parkway would be shielded from the road by tree plantings. Shrubs, perennials, ornamental grasses, ground covers and vines would occupy the understory. The landscape plan would include multiple stormwater treatment planters (SWTPs) that would include trees, perennials, and grasses. While some existing oak trees on the site would remain, development of the South Site would require an oak tree removal permit for the removal of 10 individual oak trees (see Figure 2-19).

Commented [PA2]: What is their proposal for addressing tree removal? I know they asked for "relief" - no idea what that is...

Commented [CR3R2]: I do not see anything in the

LIGHTING

The preliminary site lighting plan is shown in Figure 2-20. The South Site parking lot would be illuminated with standard downward LED fixtures affixed to a 37-foot light pole. The lighting fixtures are of a "shoe-box" style. Parking lot light standards are typically designed to provide even light distribution for vehicle and pedestrian safety. The parking lot lights would be controlled by a timer to limit lighting after the warehouse has closed and most employees



Commented [PA4]: Include exhibit/figure of lighting plan

are gone from the site. Parking lot lighting would only remain on to provide security and emergency lighting only along the main driveways. Lighting fixtures would also be located approximately every 40 feet around the exterior of the building to provide safety and security. Parking and site lighting would incorporate the use of cutoff lenses to keep light from overflowing beyond the South Site boundaries.

Figure 2-20 South Site Lighting Plan

SIGNAGE

As part of the proposed Master Signage Program (see Section 2.4.3, "Master Signage Program"), proposed signage includes the typical Costco warehouse signage (externally illuminated reverse pan channel letters), a pylon sign at the southeast corner of the parcel at Silva Valley Parkway, and a monument sign located at the northern side of the main entry (see Figure 2-21).

Source: Adapted by Ascent 2022

Figure 2-21 Costco Sign Locations

A pylon sign oriented towards U.S. 50 would be located at the southeast corner of the South Site adjacent to Silva Valley Parkway. The sign would be approximately 75 feet tall and 28 feet wide with multiple internally illuminated panels for tenant identification for businesses located on the North Site. A monument sign located on the north side of the main entry would also be included as part of the project signage. The sign would be approximately 16 feet tall and 17 feet wide with multiple internally illuminated panels for tenant identification for businesses located on the North Site.

INFRASTRUCTURE IMPROVEMENTS

Figure 2-22 shows the preliminary utility plan for the South Site. Water would be provided to the site via 10-inch pipelines connecting to existing water pipelines within Silva Valley Parkway. An eight-inch water pipeline would connect the warehouse building to the 10-inch pipeline. An eight-inch sewer pipeline would connect to existing infrastructure within Silva Valley Parkway and would serve the South Site via six-inch and eight-inch pipelines. Stormwater pipelines varying in size from 12 inches to 36 inches would be installed throughout the site and would convey stormwater to proposed six bioretention basins within the South Site as well as existing vaults and boxes. Electrical and natural gas service would be provided by PG&E.

CONSTRUCTION

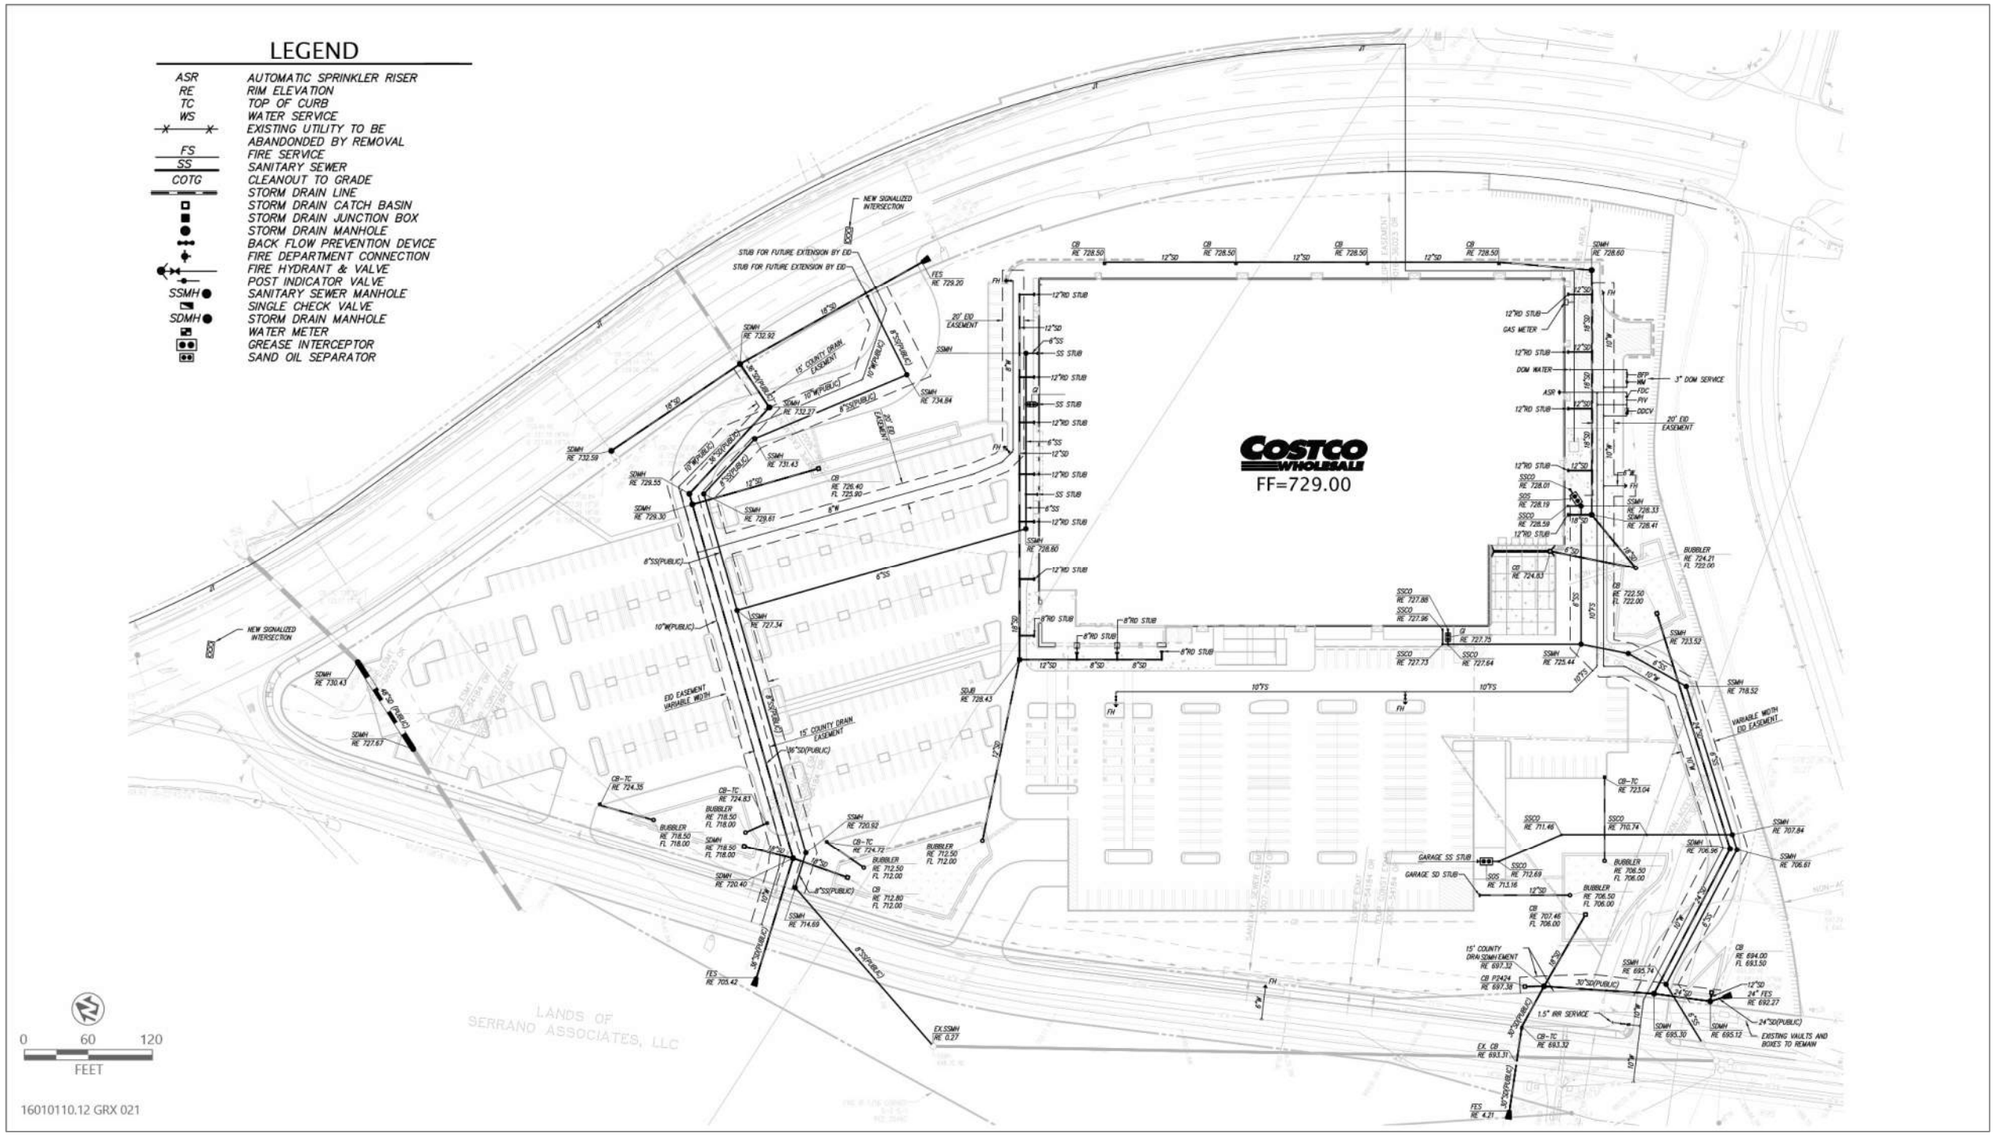
Construction for the South Site is anticipated to begin in early 2024 and would take approximately 9 months. Approximately 11,000 CY of fill would be exported offsite as part of site grading activities.

OPERATIONS

The warehouse is proposed to include one member entrance to the main Costco store, which would be located at the northwest corner. The El Dorado Hills Costco is expected to include a bakery and sales of baked goods, meat preparation and sales, alcohol sales, food service preparation and sales, pharmacy, optical center with optical exams and retail optical sales, hearing aid testing center, food court, and a photo center along with the sales of approximately 4,000 products. The warehouse would include a five-bay tire center, an approximately 5,300 sf facility with member access via the inside of the main Costco building, which would include tire sales and a tire installation facility.

It is anticipated that the El Dorado Hills Costco warehouse would employ approximately 165 to 170 employees. The warehouse hours are anticipated to be Monday through Friday from 9:00 am to 8:30 pm, and Saturday and Sunday from 9:00 am to 7:00 pm.

Costco anticipates an average of about 10 trucks delivering goods on a typical weekday. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers. Receiving time would be from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before 10:00 a.m. Deliveries to the warehouse are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from U.S. 50, and accessing the site from Silva Valley Parkway via Clarksville Crossing Road.



The tire center typically would receive shipments of tires once or twice per week in single- or double-trailer trucks up to 70 feet in length, and the same delivery truck will pick up old tires for recycling. Deliveries to and pickups from the tire center would be scheduled for pre-opening hours, typically about 6:00 a.m. Tire center deliveries would not occur at the loading dock but would occur directly at the tire center.

ENERGY EFFICIENCY FEATURES

As noted above, the South Site would obtain electrical and natural gas services from PG&E. The development would comply with energy efficiency standards under California Code of Regulations Title 24. Additional energy efficiency and sustainability measures incorporated into the Costco warehouse are noted below. The reader is referred to Section 3.5, "Energy," for a further discussion of project energy demands.

- Parking lot light standards would be designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps can provide a higher level of perceived brightness with less energy than other lamps such as high-pressure sodium.
- New and renewable building materials are typically extracted and manufactured within the region. When masonry and concrete are used, the materials purchased are local to the project, minimizing the transportation distances and impact to local road networks.

- The use of pre-manufactured building components, including structural framing and metal panels, helps to minimize waste during construction.
- Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other materials. Building heat absorption is further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall.
- A substantial amount of the proposed landscaping material for the South Site is climate adapted to the region and would use less water than other common species.
- The irrigation system proposes to include the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas.
- Storm water management plans are designed to maintain quality control and storm water discharge rates based on the County requirements.
- High-efficiency restroom fixtures.
- Commissioning of mechanical systems will occur to ensure that the HVAC systems are preforming as designed. HVAC comfort systems can be controlled by a computerized building management system to maximize efficiency.
- HVAC units planned for the South Site are high efficiency direct ducted units, which have phased out the use of HCFC's completely.
- Parking lot and exterior lights would be controlled by a photo sensor and time clock.
- Lighting is controlled by the overall project energy management system.
- Energy efficient Transformers (i.e., Square D Type EE transformers) would be used.
- Variable speed motors would be used on make-up air units and booster pumps.
- Gas water heaters are direct vent and 94 percent efficient or greater.
- Reclaim tanks are used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.
- The building structure is a pre-engineered system that uses 100 percent recycled steel materials and is designed to minimize the amount of material used.
- Construction waste is recycled whenever possible.
- Floor sealant is No-VOC and represents over 80 percent of the floor area.
- CO_2 is monitored throughout the warehouse.
- Extensive recycling/reuse program is implemented for warehouse including tires, cardboard, grease, plastics, and electronic waste.
- Use of plastic shopping bags is avoided.
- Suppliers are required to reduce packaging and consider alternative packaging solutions.
- Distribution facilities are strategically located to minimize miles traveled for delivery.
- Deliveries are made in full trucks.
- All Costco trucks are equipped with an engine idle shut off timers.

Figure 2-22 South Site Utility Plan

2.4.3 Master Signage Program

The applicant has proposed a master signage program to cover the signage for both the North Site and South Site. Details about the proposed signage are included above for each of the sites. The applicant is requesting deviations from Chapter 130.36 of the County Code, including an increase in maximum allowed sign area and an increase in maximum allowed sign height.

2.5 REQUIRED OFFSITE TRANSPORTATION IMPROVEMENTS

An analysis and identification of recommended roadway improvements for the project to comply with El Dorado County General Plan Transportation policies are provided in the EDH 52 Transportation Impact Analysis (Appendix E). It is anticipated that the County would require the following conditions of approval to be applied to the project:

- Silva Valley Parkway and Entrada Lane Intersection: Signalize the intersection.
- White Rock Road and Valley View Parkway-Vine Street Intersection: Add a northbound right turn lane and change the right turn phase to permissive and overlap. Increase the westbound left turn storage length.
- Bass Lake Road and Country Club Drive Intersection: Add a southbound right turn lane and an eastbound left turn lane. Optimize the signal timing.
- Serrano Parkway and Bass Lake Road Intersection: Optimize the signal timing.
- US 50 EB Ramps and Marble Lake Road Intersection: Signalize the intersection. If this intersection is signalized, the U.S. 50 Westbound Ramps/Bass Lake Rd Ramp Intersection will likely need to be signalized as well.
- Silva Valley Parkway and Project Driveway Intersection: Optimize the signal timing to reduce the queue length. Increase length of southbound left turn pocket to 380 feet.

2.6 REQUESTED ENTITLEMENTS

2.6.1 Both Sites

- Master Sign Program
- Variance to allow Master Sign Program that would allow for signage beyond currently allowed by PD zoning regulations
- Oak Tree Removal Permit

2.6.2 North Site

- Planned Development Permit (PD15-0001) to include site plans, and design guidelines;
- Rezone (Z17-0004) of site from Regional Commercial – Planned Development (CR-PD) to Community Commercial - Planned Development (CC-PD) ;
- Conditional Use Permit (CUP-R21-0024) to allow the use of a self-storage operation within the CC-PD zone; and
- Tentative Parcel Map (P17-0007) to reconfigure existing and create new parcels .

2.6.3 South Site

- Planned Development Permit (PD15-0001) to include site plans, design guidelines, and signage program;

- Rezone the entire site to CR-PD zoning; and
- County Road Improvement and Maintenance Agreement

2.7 OTHER AGENCY APPROVALS

The project may require additional approvals or entitlements from agencies other than El Dorado County. The agencies and approvals that may be required include the following:

- El Dorado Local Agency Formation Commission: annexation of the project site into the El Dorado Irrigation District (EID) and the El Dorado Hills County Water District (El Dorado Hills Fire Department) for both North Site and South Site;
- EID (associated U.S. Bureau of Reclamation action) for water supply service and wastewater service for both North Site and South Site;
- El Dorado Hills Fire Department approval of Fire Safe Plan for both North Site and South Site;
- El Dorado Air Quality Management District permitting approval for the North Site gas station;
- California Department of Fish and Wildlife streambed alteration agreement for both North Site and South Site; and
- U.S. Army Corps of Engineers for wetland fill for both North Site and South Site.

RE: UPDATED PROJECT MATERIALS FOR PD15-0001, Z17-0004, P17-0007, CUP-R21-0024, LLA21-0009

Dear Gina:

On behalf of the EDH-52 team, I am transmitting the following new and revised exhibits for the planning application for the EDH-52 Commercial Center project.

Updated Project Description

The project description has been updated to reflect the off-site improvements and other various project revisions such as the Costco warehouse square footage and revised zoning proposal.

Updated South Site Exhibits

Several new exhibits have been created, including a new site plan detailing the revised off-site transportation improvements, a revised preliminary utility plan, and revised zoning proposal.

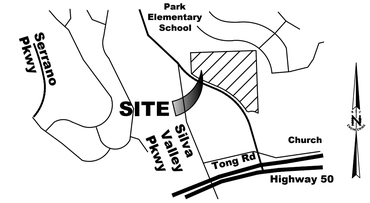
Updated North Site Exhibit

Revised North Site Plan has been included.

Variance Application and Master Signage Program

We've included an application for a variance and associated justification memo which details our reasoning for the need for modifications to the current County signage ordinance. We've also included our draft Master Signage Program which details our unified signage proposal for both the North and South site.

We look forward to working with El Dorado County to move the project forward and are available to answer any questions you may have regarding the project.



Sincerely,
URBAN PLANNING PARTNERS, INC.

Brandon Northart

RE: CUP-R21-0024 EDH52 Self-Storage and RV Storage

Dear Matt,

Please find below the responses to your list of information needs for the self-storage project dated January 6, 2022.

1. Storage unit sizes range from 25 sf per unit to a maximum of 450 sf/unit. A 5'x5' units is the smallest with the largest being approximately 10'x45'. This is a draft unit mix from our initial conversations with the storage operator. The actual unit size and count will vary from this.

Type of Unit / Bldg	UNIT SIZE			Sq. Ft. Per Unit	Total # of Units
INTERIOR GROUND LEVEL CC	5.00	X	5.00	25.00	19
INTERIOR GROUND LEVEL CC	5.00	X	7.00	35.00	3
INTERIOR GROUND LEVEL CC	10.00	X	5.00	50.00	40
INTERIOR GROUND LEVEL CC	5.00	X	15.00	75.00	3
INTERIOR GROUND LEVEL CC	10.00	X	10.00	100.00	118
INTERIOR GROUND LEVEL CC	10.00	X	15.00	150.00	140
INTERIOR GROUND LEVEL CC				175.00	1
INTERIOR GROUND LEVEL CC	10.00	X	20.00	200.00	75
INTERIOR GROUND LEVEL CC	10.00	X	25.00	250.00	4
INTERIOR GROUND LEVEL CC	10.00	X	30.00	300.00	3
INTERIOR GROUND LEVEL CC	10.00	X	35.00	350.00	3
INTERIOR GROUND LEVEL CC	10.00	X	45.00	450.00	3
GROUND LEVEL OUTSIDE LOADED	10.00	X	5.00	50.00	1
GROUND LEVEL OUTSIDE LOADED	10.00	X	10.00	100.00	6
GROUND LEVEL OUTSIDE LOADED	10.00	X	15.00	150.00	1
GROUND LEVEL OUTSIDE LOADED	10.00	X	20.00	200.00	74
GROUND LEVEL OUTSIDE LOADED	10.00	X	25.00	250.00	35
GROUND LEVEL OUTSIDE LOADED	10.00	X	30.00	300.00	36
GROUND LEVEL OUTSIDE LOADED	10.00	X	35.00	350.00	5
GROUND LEVEL OUTSIDE LOADED	12.00	X	35.00	420.00	50

2. The outdoor storage area may include open and canopy parking spaces with spot sizes between 12'x20' and 12'x35'. The allowable uses are recreation vehicles class A, B & C, travel trailers, 5th wheels, compact cars, boats, any recreation trailer (ATV, motorcycle, snowmobile). Farm equipment can be stored is located on a trailer. Mobile contractor trailers (landscaper, framer, plumber, etc.). All vehicles must have a current registration to be stored.

3. Activities allowed on site will be limited to parking the vehicles and loading and unloading storage units. Tenants may visit the storage facility to organize, pickup, drop off contents of their units. Customers cannot run any business activities from their storage units. There may be a small retail component to allow purchasing of storage and moving supplies such as boxes, tape, and packing materials either on-line or at the facility.

4. Office business hours will be from 9 am to 6 pm 7 days a week. The gate hours will be from 7 am to 7 pm 7 days a week. We do not allow 24-hour access to the facility. The office is closed for all major holidays, but gate access is available 365 days per year.

5. There will be up to 2 people living in the caretaker unit or 1 person depending on the employment contract. Typically, a couple is hired to live in the caretaker unit and work full time. Or it can be one person in the caretaker unit and one employee offsite. This depends on the qualified hiring of the employee and job experience. Having a caretaker on site provides security of the tenant's goods and for emergencies. Tenants appreciate having someone watching over their contents. It also helps if someone is locked out or a gate is damaged if it is outside office hours.

6. There will be 2 full time employees working 40 hours per week and 1 relief manager working part time.

7. We don't foresee any potential odor impacts.

8. The drive aisle surface for both the self-storage and RV/Boat storage will be asphalt or concrete depending on the economics of the material.

9. Lighting at the self-storage will be from wall packs. The RV/Boat storage parking will have 25' tall parking lot lights. The lights will be shielded and pointed downward.

10. The caretaker's unit will consist of 1 bedroom and 1 bathroom. A floor plan has not be prepared at this stage.

EDH 52 NORTH AND COSTCO SOUTH

OVERALL COMMERCIAL CENTER

PROJECT DESCRIPTION

~~April 23~~January ~~28~~March 18, ~~2021~~2022

DESCRIPTION AND PURPOSE OF THE REQUEST

The owner is pleased to submit this revised application requesting approval to construct two (2) new commercial centers (collectively, the "Project") in El Dorado County encompassing APNs: 122-720-002, 018, 019, 020 & 021. In addition, a portion of 122-720-003 and the unused former Tong Road right-of-way between Silva Valley Parkway and Clarksville Crossing are proposed to be a part of the Project. The property is located north of Highway 50 and Tong Road, east of Clarksville Crossing, and is bisected by Silva Valley Parkway. The northern portion of the property is approximately 18.26 acres (EDH 52 – North Site), and the southern portion is approximately 17.05 acres (EDH 52 Costco South Site), net of the right-of-way for roads. There is a 6.57-acre area on the North Site for the right-of-way associated with the future extension of Country Club Drive. There is a 1.38-acre area west of Clarksville Crossing on the Costco South Site that will not be developed as part of the Project.

The revised application seeks a series of zoning changes to facilitate development of the Project, including a rezone proposed on the North Site to CC-PD to allow more uses primarily seen in a shopping center setting and to allow a self-storage use with the approval of a conditional use permit. In addition, the application proposes to extend the existing CR-PD zoning to a portion of the Costco South Site to enable development of a commercial center there.

The Project is within the Planned Development Overlay zone such that a Development Plan Permit is required. To reflect the separate needs of each commercial center, the revised application includes two separate Development Plan Permit packages: one for the North Site and one for the Costco South Site. Each Development Plan Permit will address the design guidelines and signage for the corresponding portion of the Project. In addition, the owner is processing separate wetlands permits from the Army Corps of Engineers for the North Site and Costco South Site. However, both the North Site and the Costco South Site are one "project" for purposes of evaluating the Project's environmental impacts under the California Environmental Quality Act ("CEQA").

The maximum building area for the Costco South Site will be approximately 165,000 square feet and includes, without limitation, a Costco warehouse retail center, tire sales and installation, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and propane refueling and sales adjacent to tire sales and installation facility. Temporary outdoor sales may occur within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December. The building area for the North Site will be approximately 162,000 square feet and may include the following uses: drive through uses, gas station with car wash, food uses, outdoor patio, outdoor storage and outdoor sales and other retail and offices uses permitted in the CC zone as well as a self-storage use permitted with a use permit.

ENTITLEMENTS REQUESTED

Overall Project:

- ~~As preservation of 90% of the existing oak tree canopy is not feasible, this Project will be requesting relief from General Plan Policy 7.4.4.4 due to topographic constraints and the need to grade the site in relation to Silva Valley Parkway.~~ Tree Permit for removal of all trees on site as development will impact the entire site. Mitigation is expected through the payment of in lieu fees.

- Master Sign Program for uniform signage for both North and Site South.

- Variance to allow for Master Sign Program that will allow for signage beyond currently permitted by PD zoning regulations.

North Site:

- Rezoning from CR-PD to CC-PD zoning designation.

- Development Plan Permit approval to cover:

    - the site plan, building design, and preliminary landscape plan, storm drainage, and grading;

    - design guidelines;

- Use Permit approval for a self-storage project within the CC-PD zone.

- Tentative Parcel Map to reconfigure existing and create eight (8) new parcels for purposes of sale, lease, or financing of the North Site.

Costco South Site:

- Abandonment of the former Tong Road extension right of way and disposition of subsequent parcel;

- Disposition of County-owned land near Highway 50;

- Extension of existing CR-PD zoning designation for the portion of the South Site currently zoned as Commercial Limited (CL);

- Development Plan Permit approval to cover:

    - the site plan, building design, and preliminary landscape plan, storm drainage, and grading;

- Each of the entitlements described above will be analyzed in an Environmental Impact Report to study the impacts and potential mitigation measures required for the Project.

PROJECT OBJECTIVES

Overall Project:

- Develop two high-quality planned commercial developments on currently vacant and underutilized land adjacent to Highway 50 adequately served by public services and utilities.

- Promote economic growth and diverse new employment and retail/service opportunities for County residents.

- Increase the number of employees and contribute to the local job/housing balance.

North Site:

- Develop architectural and landscaping designs that soften the scale and mass of the buildings, create a pleasant and attractive appearance, and complement the surrounding area.

- Develop site plans that minimize potential access and circulation conflicts between automobiles and pedestrians, provide adequate off-street parking for store customers and employees, and minimize impacts to the surrounding area.

Costco South Site:

- Construct and operate a new Costco warehouse that serves the local community with goods and services from both nationally known businesses but also more regional and local businesses.

- Reduce energy consumption by incorporating sustainable design features and systems with enhanced energy efficiencies meeting State and federal code requirements.

- Provide a Costco warehouse in a location that is convenient for its members, the community, and employees to travel to shop and work.

- Provide a state-of-the-art Costco warehouse to better serve the membership in the greater El Dorado Hills area.

- Enhance the area with a warehouse that is architecturally designed to be responsive to the El Dorado Hills area design context and sensitive to the adjacent community, future development(s) and compatible with the need for a new warehouse in this market area.

- Continue and increase contribution to the County's tax base by Costco.
- Expand the space available for integrated retail sales of goods and services in El Dorado Hills market.
- Minimize circulation conflicts between automobiles and pedestrians.
- Provide a Costco warehouse in a location that is serviced by adequate existing infrastructure including roadways and utilities.
- Develop a Costco warehouse that is large enough to accommodate all the uses and services Costco provides to its members elsewhere.
- Locate a Costco warehouse on a site Costco can purchase (rather than lease) to protect its substantial investment of time, money and goodwill in the location.

SITE INFORMATION

Location

The proposed Project is in El Dorado County. The Project site is on the north side of Highway 50 and is bisected by Silva Valley Parkway. It is bordered by existing residences and an elementary school to the north, vacant land to the east, Clarksville Crossing to the west, and Highway 50 to the south.

Site Description

The Project site is currently vacant. A small portion of the unused Tong Road right-of-way is proposed to be included in the South Site. The site consists of annual grassland with small oak woodlands. Slivers of wetlands and riparian areas are located on site.

DESCRIPTION OF THE PROPOSED PROJECT

The building area for the North Site will be approximately 162,000 square feet and may include the following uses: drive-through uses, gas station with car wash, food uses, outdoor patio, outdoor storage and outdoor sales and other retail and offices uses permitted in the CC zone. A use permit is requested for the self-storage project on the north site. The self-storage project will consist of 6 buildings plus an office and 52 RV storage spaces.

The maximum building area for the Costco South Site will be approximately 165,000 square feet and includes, without limitation, a Costco warehouse retail center, tire sales and installation, optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, alcohol sales, and propane refueling and sales adjacent to tire sales and installation facility. The warehouse retail center will also facilitate Costco's home delivery program by serving as a hub for Costco home delivery drivers to collect member orders for delivery to the surrounding area. Temporary outdoor sales may occur within the parking field adjacent to the warehouse for seasonal sales, such as Christmas trees from late November through December.

North Site Architecture

The design theme for the North Site is based on the existing building design theme of the Serrano area, which is a California/Mediterranean style, examples of which are included in the design guidelines proposed for the North Site.

Where single tenant types (retail shops) occur, the guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants will use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as shown in the guidelines. No building design for any tenant type shall be repeated on the North Site.

Each building on the North Site shall vary in building height to achieve more visual interest and distinct building character, avoiding the monotony of continuous building height. Each building shall combine horizontal and vertical elements to provide variation, interest, and rhythm within and among the buildings. In no case shall any roof mounted equipment be higher than the lowest parapet height of the building.

The color and material palette for the North Site contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the North Site so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette must be maintained throughout the development of the North Site.

Within the development of the North Site, all sides of all buildings will be visible from adjacent roadways and properties. The architecture of all sides of all buildings must, therefore, be of equal quality and attention. Screening is required for loading and storage areas, utilities meters and boxes using landscaping, walls, fences in combination.

The use of colored concrete, concrete pavers, accent patterns, etc. shall be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas shall be accomplished using intimate seating areas in near proximity of the building.

Costco South Site Architecture

The warehouse design is proposed to be contemporary and will set the standard for large format retail facades with variety of massing and appropriate materials for the building. By combining concrete masonry block and architectural metal panels, Costco intends to create a scale and architectural interest to minimize the visual impact of a large retail warehouse. By use of design techniques such as the location of building materials, landscaping, and the incorporation of varying parapet cap heights, Costco can successfully break the long elevations both horizontally and vertically at the appropriate height to conceal roof top mounted mechanical equipment. The technique of breaking a long elevation into smaller elements with varied materials and colors is used to create a more pedestrian-friendly scale in the proposed design. The proposed colors are warm natural earth tones, which will relate to the proposed surrounding development by utilizing similar building materials and architectural detailing.

The Costco South Site has been designed to utilize the existing slope of the site by locating the warehouse in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. By building the warehouse adjacent to higher elevation land and providing a subterranean parking structure, the height of the building and visual impacts relative to the surrounding environment are minimized. The subterranean portion of the parking structure will be adjacent to the west side of the warehouse and contain 214 parking spaces underneath the at-grade parking structure. Vehicle access to this lower-level parking would be provided by ramps on the north and south sides of the underground parking structure – the ramp on the north side would allow vehicles to enter the lower-level parking structure directly from Clarksville Crossing and the ramp on the south side would allow vehicle access from the at-grade parking lot above. A third ramp would provide pedestrian access from the lower level up to the at-grade parking and entry to the warehouse. The main entry feature to the warehouse is proposed to be oriented towards the northwest so that the loading dock and truck deliveries would be accessed from and oriented towards Interstate 50, providing greater separation with the existing residences.

The warehouse is proposed to include one customer entrance to the main Costco store that would be located at the northwest corner. The El Dorado Hills Costco is expected to include a bakery, pharmacy, optical center with optical exams and retail optical sales, hearing aid testing center, food court, and a photo center along with the sales of approximately 4,000 products. The warehouse would include a five bay Tire Center, a +/-5,300 square-foot facility with member access via the inside of the main Costco building, which would include tire sales and a tire installation facility. A promotional vehicle may be on display near the entry to the building. This vehicle would be used to promote online or offsite vehicle sales; no vehicles are proposed to be sold on site.

Costco Operations

It is anticipated that the El Dorado Hills Costco warehouse will employ approximately 165 to 170 employees.

Costco Wholesale is a membership-only retail/wholesale business, selling high quality national brands and private label merchandise for commercial and personal use. The warehouse hours are anticipated to be Monday through Friday from 9:00 am to 8:30 pm, and Saturday and Sunday from 9:00 am to 7:00 pm.

Costco anticipates an average of about 10 trucks delivering goods on a typical weekday. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers. Receiving time is from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before the 10:00 a.m. opening time. Deliveries to the warehouse are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from Interstate 50, and accessing the site from Silva Valley Parkway.

The tire center typically will receive shipments of tires one to two times per week in single- or double-trailer trucks of up to 70 feet in length, and the same delivery truck will pick up old tires for recycling. Deliveries to and pickups from the tire center will be scheduled for pre-opening hours, typically about 6:00 a.m.

Costco Sustainability Features

The entire proposed Project will incorporate sustainability features per the California Title 24 energy requirements. In addition, to reduce energy consumption and promote sustainability, Costco will incorporate many energy saving measures when constructing a new facility. Below are some of the significant practices that Costco currently incorporates into new buildings that help conserve energy and other natural resources that are expected to be used in connection with the development of the South Site:

- Parking lot light standards will be designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps can provide a higher level of perceived brightness with less energy than other lamps such as high-pressure sodium.

- New and renewable building materials are typically extracted and manufactured within the region. When masonry and concrete are used, the materials purchased are local to the project, minimizing the transportation distances and impact to local road networks.

- The use of pre-manufactured building components, including structural framing and metal panels, helps to minimize waste during construction.

- Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other materials. Building heat absorption is further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall.

- A substantial amount of the proposed plant material for the South Site is climate adapted to the region and will use less water than other common species.

- The irrigation system includes the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas.

- Storm water management plans are designed to maintain quality control and storm water discharge rates based on the County requirements.

- High-efficiency restroom fixtures can achieve a 40% decrease and water savings over U.S. standards.

- Commissioning of mechanical systems will occur to ensure that the HVAC systems are preforming as designed. HVAC comfort systems can be controlled by a computerized building management system to maximize efficiency.

- HVAC units planned for the South Site are high efficiency direct ducted units, which have phased out the use of HCFC's completely, long before the Montreal Protocol timeline.

- Parking lot and exterior lights can be controlled by a photo sensor and time clock.

- Lighting is controlled by the overall project energy management system.

- Energy efficient Transformers (i.e., Square D Type EE transformers) are planned to be used.

- Variable speed motors will be used on make-up air units and booster pumps.

- Gas water heaters are direct vent and 94% efficient or greater.

- Reclaim tanks are used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.

- The Main Building structure is a pre-engineered system that uses 100% recycled steel materials and is designed to minimize the amount of material used.

- Construction waste is recycled whenever possible.

- Floor sealant is No-VOC and represents over 80% of the floor area.

- CO2 is monitored throughout the warehouse.

- Extensive recycling/reuse program is implemented for warehouse and office space including tires, cardboard, grease, plastics, and electronic waste.

- Use of plastic shopping bags is avoided.

- Suppliers are required to reduce packaging and consider alternative packaging solutions.

- Distribution facilities are strategically located to minimize miles traveled for delivery.

- Deliveries are made in full trucks.

- All Costco trucks are equipped with an engine idle shut off timers.

SIGNAGE

Proposed highway-oriented and monument sign locations are depicted on the proposed site plan and in the Master Sign Program for both the North Site and the South Site.

North Site

A highway-oriented sign is proposed on the North Site greater than 100 feet from the freeway right of way. The owner is requesting certain deviations from Chapter 130.36 of the County Code via a Variance for the proposed highway-oriented signs, including a reduction in the minimum separation between highway-oriented signs, a reduction in the minimum setback from the adjacent residential district (North Site only), an increase in the maximum allowed area, and an increase in the maximum allowed height. Each highway-oriented sign will be a 75-foot tenant pylon sign allowing advertising from either commercial center and will include one (1) major tenant panel, one (1) junior tenant panel, and eight (8) shop tenant panels. The proposed sign area for each highway-oriented sign is 652 square feet. The highway-oriented signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be fabricated aluminum, pan channel construction. Tenant names and logos will be flush mounted to the panel background and internally illuminated with white LED lights. Colors will comply with tenant specifications.

The owner is also requesting certain deviations from Chapter 130.36 of the County Code for the proposed monument signs, including an increase in the maximum allowed area, and an increase in the maximum allowed height. The developer is proposing two (2) 28-foot tenant monument signs on the North Site. Each monument sign will have one (1) featured tenant panel and six (6) shop tenant panels. The proposed area for each monument sign is 242 square feet. The monument signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be routed out with acrylic push-through graphics and vinyl film overlays. Tenant names will be internally illuminated with white LED lights. Colors will comply with tenant specifications.

Building signs for retail tenants of the North Site are described in detail in the Master Signage Program.

Costco South Site

On the Costco South Site, proposed signage includes the Costco warehouse typical signage, a pylon signage at the southeast corner of the parcel at Silva Valley Parkway, and a monument sign located at the northern side of the main entry. The South Site is requesting deviations from Chapter 130.36 of the County Code via the proposed Variance, including an increase in maximum allowed sign area and an increase in maximum allowed sign height.

Building signage consists of the signature Costco red and blue corporate colors. The signage is scaled appropriately to the mass of the building elevations to not overwhelm but to reinforce the brand that Costco has established. The warehouse wall signage will consist of externally illuminated reverse pan channel letters, and the gas station signage will also be externally illuminated.

A pylon sign oriented towards Highway 50 will be located at the southeast corner of the site adjacent to Silva Valley Parkway. The sign will be approximately 75 feet tall and 28 feet wide with multiple internally illuminated panels for tenant identification for businesses located on the North Site. A monument sign consistent with the Master Signage Program would be located on the north side of the main entry will also be include as part of the Project signage.

SITE ACCESS

It is anticipated that the Project site will have multiple points of access. A traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the Costco South Site and the North Site. A partial traffic signal is also proposed at Silva Valley Parkway and Clarksville Crossing for a protected left turn into the North Site via Clarksville Crossing.

North Site

A right in and out is proposed on Silva Valley Parkway generally across from the existing Clarksville Crossing.~~A portion of Country Club Drive extension will be constructed to a secondary full access to the North Site.~~ An emergency access to Tong Road from the self-storage facility is proposed. ~~Three full access driveways are proposed on Clarksville Crossing to provide additional points of access from the North Site to the South Site.~~

Costco South Site

Regional access to the warehouse will be from Interstate 50 via the Silva Valley Parkway exit. One full-access driveway with a signalized intersection is proposed along the eastern portion of the site, and an additional three driveways are proposed along the Project's western side to provide access from Clarksville Crossing. An interim signal at Clarksville Crossing is proposed to allow a northbound left turn from Silva Valley Parkway onto Clarksville Crossing. This signal will go away when the County constructs the Country Club Drive extension further north. At that time the Clarksville Crossing will become a right in and out only. An ADA-compliant pedestrian pathway will extend from the warehouse to the northern property boundary where it will connect to Silva Valley Parkway. The Project provides oversized parking stalls of 10 feet x 20 feet that are larger than the minimum El Dorado County requirements to provide members with easier accessibility to vehicles.

LOADING

The Costco warehouse truck loading dock is located at the southwest corner of the building adjacent to Interstate 50. The bay doors will be equipped with sealed gaskets to limit noise impacts. A smaller on-grade door is also located on the south side of the building. This door is to receive bread delivery and Federal Express type trucks. A transformer and two trash compactors will also be located along the south edge of the warehouse building. Dense landscape material provides the necessary screening to this area (see Costco South Site Landscape Plan).

PARKING LOT

The North Site proposes a main parking lot area in front of the buildings. The parking lot will provide approximately 166 parking spaces, proposed at 90 degrees to maximize the number of stalls on the site. This number includes 10 accessible parking stalls and 12 compact stalls (7%) and 8 RV stalls.

The self-storage project proposed 7 parking stalls including 1 accessible stall.

The South Site proposes 763 total parking stalls, which exceeds the required El Dorado County parking requirement of 642 stalls. Approximately 549 parking stalls are provided at grade adjacent to the warehouse entry and tire center. The remaining 214 parking stalls are provided within the subterranean parking structure on the west side of the warehouse.

ADA parking will comply with the County Code and Title 24 requirements.

BICYCLE PARKING

The Project will provide bicycle parking spaces (lockers and racks) throughout the site that will meet County and Title 24 requirements.

PEDESTRIAN CIRCULATION

A pedestrian walkway for each portion of the Project will connect the buildings to Silva Valley Parkway.

LANDSCAPING

The Project will include a variety of drought-tolerant landscaping options. The North Site landscaping will provide screening along the boundary which will consist of evergreen trees and shrub rows. Shade trees with large canopy coverage will be planted in the North Site parking lot for shade. Planting at the North Site entries will be highlighted and defined by seasonal accented trees and shrubs with the use of colorful plant material. Shrubs will be low growing to maintain line-of-sight to the street. Along the streets, plantings will incorporate shade trees and mixed species and forms of shrubs to create interest, color, and buffering from the North Site shopping center.

The Costco South Site landscape plan includes a mix of climate adapted shrubs and grasses, and a variety of shade trees. The Costco South Site landscape design has incorporated a generous perimeter buffer which includes evergreen and deciduous trees and shrubs to enhance the streetscape. Landscape islands are typically provided at one island per five lineal parking spaces in the Costco South Site parking field to provide shading of the parking lot with the parking lot trees and landscaping per County requirements. The Costco South Site landscape plan has been designed to assist with the screening of the at-grade parking deck above the lower-level parking. The proposed trees and landscaping will meet El Dorado County requirements of 50% shading on the site within the majority of the provided parking area, with the grade-level deck above the subterranean parking meeting this requirement only where trees can be planted due to the constraints of the structure beneath.

The Project proposes to pay in-lieu fees as mitigation for the loss of the oak woodland.

LIGHTING

The North Site will provide various single, two- or four-light fixtures throughout the parking areas and driveways. The overall height of the lighting on the North Site, including the

lighting fixtures and a 3-foot base, will be 33 feet in the parking lot, 25 feet along the perimeter and main drive aisles, and 16 feet around drive-through lanes. LED luminaires will be used for the parking lot lights.

The Costco South Site parking lot will be illuminated with standard downward LED fixtures affixed to a 37-foot light pole. The lighting fixtures are of a "shoe-box" style. Parking lot light standards are designed to provide even light distribution for vehicle and pedestrian safety. The parking lot lights will be timer controlled to limit lighting after the warehouse has closed and most employees are gone from the warehouse. Parking lot lighting will only remain on to provide security and emergency lighting only along the main driveways. Lighting fixtures will also be located on the building approximately every 40 feet around the exterior of the building to provide safety and security. Parking and site lighting will incorporate the use of cutoff lenses to keep light from overflowing beyond the Costco South Site boundaries.

GRADING

A preliminary grading plan has been prepared for review as part of the application submittals. Each site is designed to balance independently, and it is the intent of this application to allow for mass grading of both sites individually.

ON-SITE IMPROVEMENTS

The Project is designed to allow either the North Site or the Costco South Site to develop independent from the other. Mass grading of each site to accommodate future development will occur in the first phase of development, including filling of the permitted wetlands and permitted tree removal. In the event the South Site develops first, utility crossings under Silva Valley Parkway will be constructed as part of the South Site infrastructure work to serve the North Site. In the event the North Site develops first, interim facilities will be constructed on the North Site.

The second phase for each site will include construction of the parking, landscaping, lighting, utility infrastructure, and driveways designed to support the buildings. Site improvements will be constructed in various phases depending on the extent of development occurring at any given time. Buildings can be started once site improvements are sufficiently completed to allow construction and emergency fire access.

OFF-SITE IMPROVEMENTS

A proposed traffic signal and appurtenant facilities will be located on Silva Valley Parkway at the main driveway of the Project to provide a connection to both the South Site and the North Site. An additional partial traffic signal is proposed at the intersection of Clarksville Crossing and Silva Valley Parkway.

A portion of Country Club Drive extension will be constructed up to the secondary access point to the North Site.

UTILITY INFRASTRUCTURE

The property will need to annex into El Dorado Irrigation District (EID) in order to acquire sanitary sewer and water service. EID stated in its December 6, 2018 Facilities Improvement Letter that there should be adequate water supply and sewer capacity available to serve a similar type of project. The Project will tie into the existing 18-inch potable water main and the 21-inch gravity sewer line in Clarksville Crossing. An updated Facilities Improvement Letter will be requested through EID at the appropriate time.

The property will also annex into the El Dorado Hills County Water District (Fire Protection) prior to building permit issuance.

Sanitary service and potable water for the North Site will be provided by public (EID) sanitary sewer and water lines that cross the South Site. Reclaimed water is available for non-potable irrigation use and will be provided by extending an existing reclaimed line in Silva Valley Parkway north of the Project site.

Dry utilities (electric, gas, telephone, and cable TV) will be provided from existing infrastructure located to the north of the Project site in Silva Valley Parkway. Dry utilities will need to be extended along the frontage of both the North Site and the Costco South Site.

STORM DRAINAGE DESCRIPTION

The on-site drainage system will connect to El Dorado County's storm drain infrastructure in Clarksville Crossing. The Project has typical pollutant sources from parking lot runoff, loading/unloading areas, outdoor storage areas, and a trash compactor. This Project proposes bioretention areas and underground water quality vaults as the form of treatment for the site.

TRUCK CIRCULATION

Truck access will be allowed at all driveway locations depending on the size of the delivery truck and direction of travel.

OTHER GOVERNMENTAL AGENCY APPROVALS

Additional subsequent approvals and permits that may be required from local, regional, state, and federal agencies are identified below.

- El Dorado Irrigation District -Water and Sewer-Annexation and Utility Approval
- El Dorado County Resource Conservation District-Onsite Plan Approval
- El Dorado Hills County Water District (Fire Protection)-Annexation and Fire Approval
- El Dorado County Air Quality Management District-Air Quality Permit

- El Dorado County Department of Transportation -Encroachment Permit/Grading Permit/Onsite Plan Approval

- El Dorado County Building Services-Building Permit/Sign Permit

- Central Valley Regional Water Quality Control Board-NPDES General Permit for Stormwater Discharge

- California Department of Fish and Wildlife-Wetland Approval

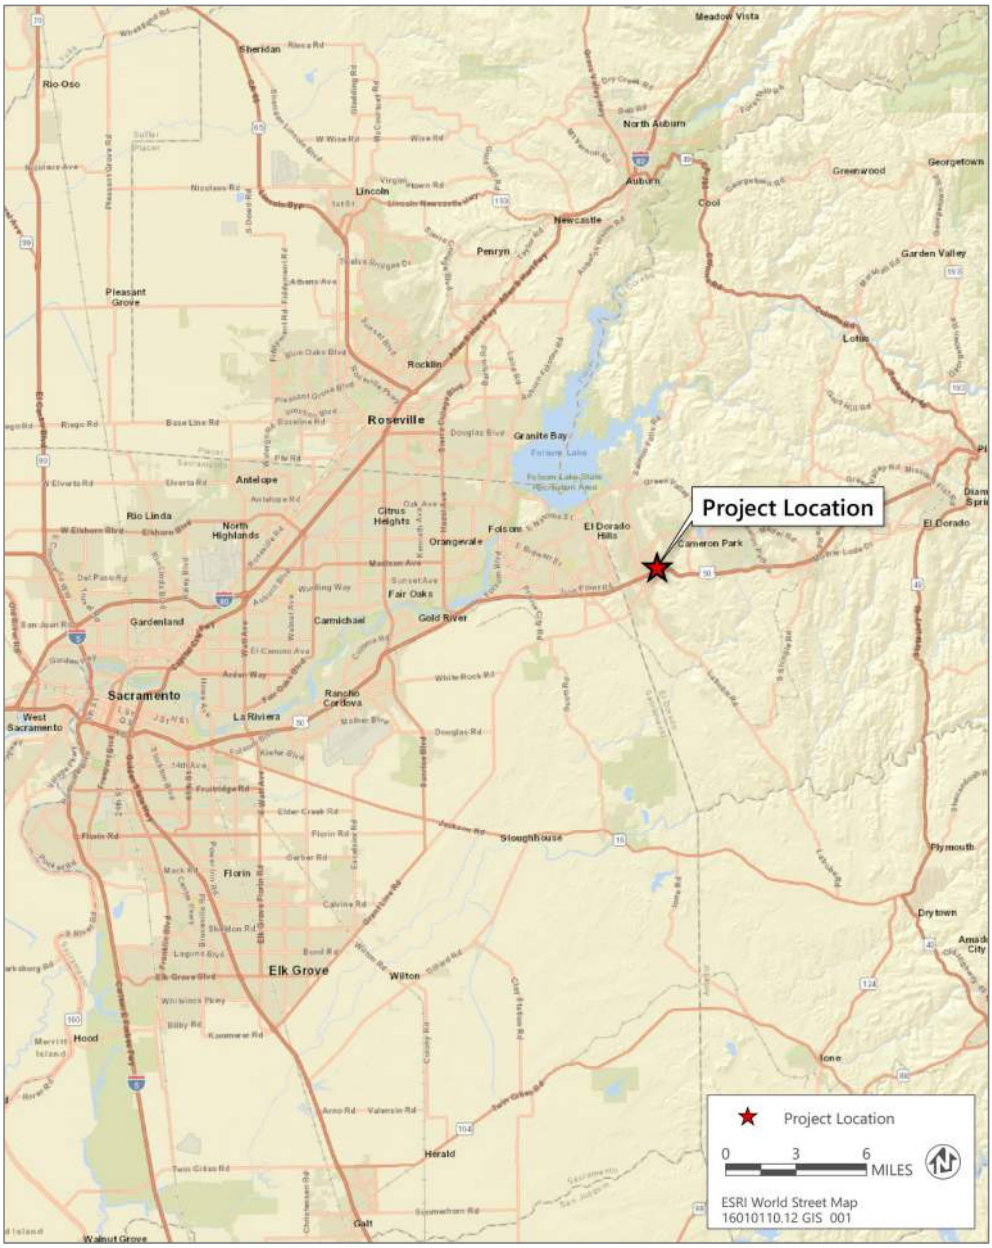
- Army Corps-Wetland Permitting for each side

- LAFCO-Annexation approval for EID and El Dorado Fire Protection District along with the Bureau of Land Reclamation

2 PROJECT DESCRIPTION

2.1 PROJECT OVERVIEW

The proposed EDH 52 Commercial Center (project) would develop various commercial uses on two vacant sites bisected by Silva Valley Parkway just north of U.S. Highway 50 (U.S. 50).



2.2 PROJECT LOCATION AND SETTING

The project is in the El Dorado Hills community of California, which is located in an unincorporated area of El Dorado County approximately 23 miles east of Sacramento and 20 miles west of the City of Placerville (Figure 2-1). As shown in Figure 2-2, the project site is on the north side of U.S. 50 and is bisected by Silva Valley Parkway. Existing land uses near the project site include vacant land, residences, and an elementary school to the north; Tong Road and U.S. 50 to the south; a church to the southeast; vacant land to the east; and Clarksville Crossing Road to the west. The project site encompasses approximately 43.26 acres, including Assessor's Parcel Numbers (APNs) 122-720-002, -003, -018, -019, -020, and -021.

2.3 PROJECT OBJECTIVES

- Overall Project:
  - Develop two high-quality planned commercial developments on currently vacant and underutilized land adjacent to U.S. 50 adequately served by public services and utilities.
  - Promote economic growth and diverse new employment and retail/service opportunities for County residents.
  - Increase the number of employees and contribute to the local job/housing balance.
- North Site:
  - Provide additional retail uses for the local market area that is serviced by adequate existing utilities and roadways.
  - Provide additional commercial services closer to existing housing.
  - Increase contribution to the County's tax base.
  - Develop architectural and landscaping designs that soften the scale and mass of the buildings, create a pleasant and attractive appearance, and complement the surrounding area.
  - Develop site plans that minimize potential access and circulation conflicts between automobiles and pedestrians, provide adequate off-street parking for store customers and employees, and minimize impacts to the surrounding area.
- South Site:
  - Construct and operate a new, state-of-the-art Costco warehouse that serves the membership in the greater El Dorado Hills area with competitively priced goods and services from both nationally known businesses and also more regional and local businesses.
  - Reduce energy consumption by incorporating sustainable design features and systems with enhanced energy efficiencies meeting State and federal code requirements.
  - Provide a membership wholesale center in a location that is convenient for its members, the community, and employees to travel to shop and work.

- Create an architectural design that enhances the area by responding to the El Dorado Hills area design context in a way that is sensitive to the adjacent community, future development(s) and compatible with the need for a new warehouse in this market area.
- Increase contributions to the County's tax base.
- Expand the space available for integrated retail sales of goods and services in the El Dorado Hills market.

Source: adapted by Ascent Environmental in 2021

Figure 2-1 Regional Location

Source: adapted by Ascent Environmental in 2021

Figure 2-2 Project Site Location

- Minimize circulation conflicts between automobiles and pedestrians.
- Provide a Costco warehouse in a location that is serviced by adequate existing infrastructure, including roadways and nearby utilities.
- Develop a Costco warehouse that is large enough to accommodate all of the uses and services Costco provides to its members.
- Locate a Costco warehouse on a site Costco can purchase (rather than lease) to protect its substantial investment of time, money and goodwill in the location.

2.4 PROJECT DESCRIPTION

The project site is split into the North Site and the South Site. The North Site is 24.83 acres and the South Site is 18.43 acres. The entire project site has a General Plan Land Use Designation of Commercial (C). The North Site is currently zoned Commercial Regional – Planned Development (CR-PD). The South Site is predominantly zoned CR-PD and also includes small parcels of Commercial Limited (CL) and Transportation Corridor (TC). Because the project site has an existing Planned Development overlay, the applicant is seeking a Planned Development Permit (PD) and the following rezoning (Figure 2-4):

- North Site: from CR-PD to Community Commercial-Planned Development (CC-PD)
- South Site: from CR-PD, CL, and TC to CR-PD for the entire site

Figure 2-3 shows the site plans for both the North Site and South Site. The proposed Master Signage Program applies to both the North Site and the South Site.

2.4.1 North Site

The North Site would include rezoning the site from CR-PD to Community Commercial – Planned Development (CC-PD) (See Figure 2-4). The project also seeks approval of a Tentative Parcel Map for the North Site to reconfigure existing parcels create 8 individual parcels (See Figure 2-5). Development of parcels 1 through 5 may include the following uses: up to five drive-through uses, one gas station with car wash, food service uses, an outdoor patio, and/or other retail and office uses permitted in the CC zone. A self-storage facility would use parcels 6 and 7 for a recreational vehicle (RV) storage lot with 56 RV spaces and six self-storage buildings, which are allowed with the approval of a Conditional Use Permit (CUP). A portion of the planned Country Club Drive extension (County Capital Improvement Project No. 36105008) would be constructed at a future date by the County within parcel 8. The total building area for the North Site would be approximately 162,000 square feet (sf). Table 2-1 below identifies the proposed parcel sizes, building square footage, and potential future uses.

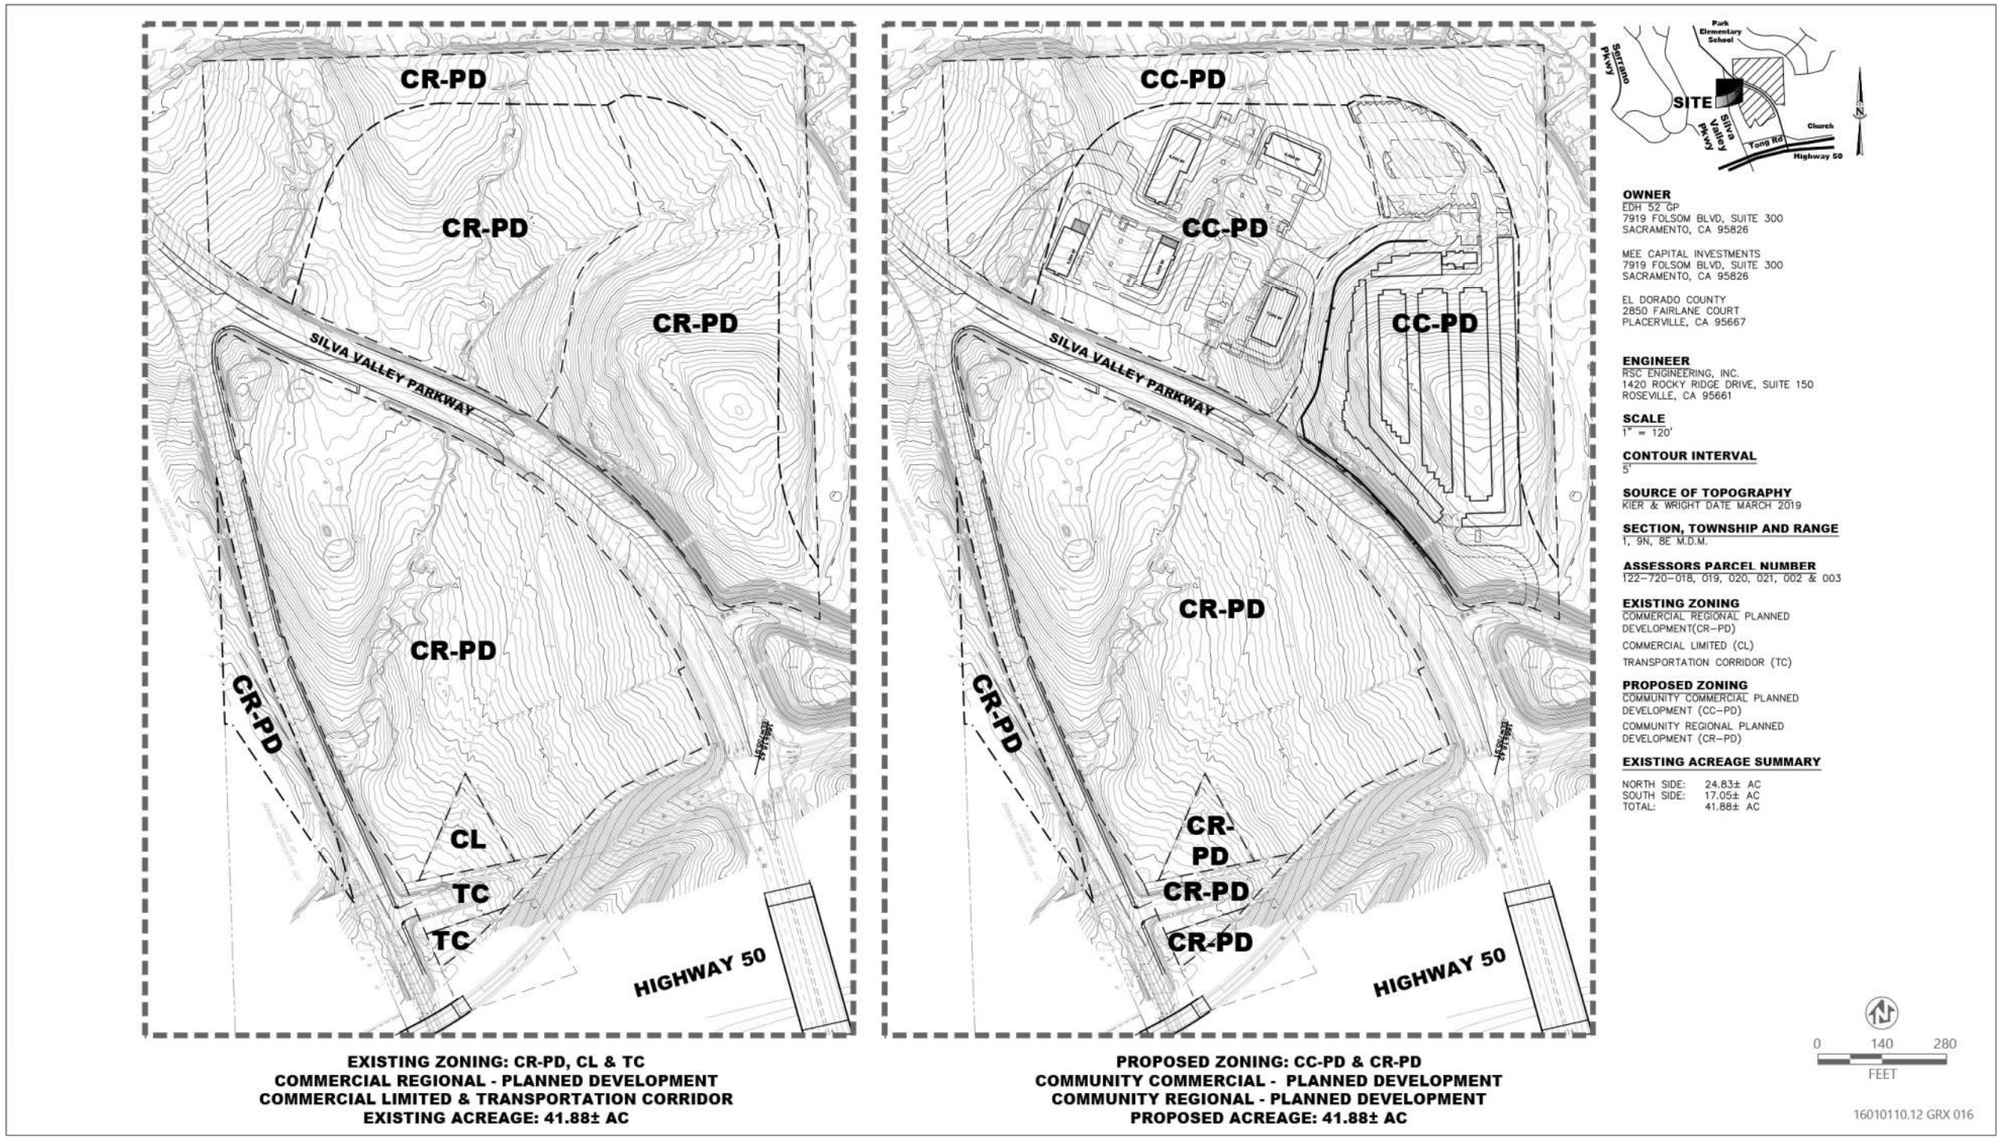


Table 2-1 North Site Parcel and Building Size

Parcel	Acreage	Building Size (square feet)	Proposed Use
1	2.49	5,000	Retail with a Potential Drive-through
2	1.92	9,250	Retail with a Potential Drive-through
3	1.99	6,000	Retail with a Potential Drive-through
4	2.23	7,250	Gas Station with a Potential Drive-through
5	1.08	4,050	Retail with a Potential Drive-through
6	7.84	130,358	Self-Storage and RV Storage
7	1.66		
8	5.63	0	Future Country Club Drive Extension
Total	**24.83**	**161,908**

SITE ACCESS AND ROADWAY IMPROVEMENTS

As shown in Figure 2-6, a traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the North Site and the South Site. Right-in and right-out access would also be provided to the North Site from Silva Valley Parkway via a driveway north of the new signal at the main driveway. An emergency access to Tong Road from the self-storage facility is also proposed. The North Site would include 166 surface parking spaces for retail uses and seven spaces for the self-storage facility. Sidewalks and bike lanes would be provided along the site frontage.

ARCHITECTURE

The design theme for the North Site is based on the existing building design theme of the Serrano area, which is a California/Mediterranean style. Preliminary elevations for the self-storage facility are shown in Figure 2-7 and provide an example of the proposed design theme for the North Site. Where single tenant types (retail shops) occur, the proposed design guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the proposed design guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants would use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as identified in the proposed North Site Design Guidelines (Appendix B).

Each building on the North Site would vary in building height to achieve visual interest and distinct building character, avoiding the monotony of multiple structures with a continuous building height. Each building would combine horizontal and vertical elements to provide variation, interest, and rhythm within and among the buildings. In no case would any roof mounted equipment be higher than the lowest parapet height of the building.

The color and material palette for the North Site contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the North Site so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette would be maintained throughout the development of the North Site.

Within the development of the North Site, all sides of all buildings would be visible from adjacent roadways and properties. Screening would be required for loading and storage areas, utilities meters and boxes using landscaping, walls, fences in combination. The use of colored concrete, concrete pavers, accent patterns, etc. would be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas would be accomplished using intimate seating areas in near proximity of the building.

LANDSCAPING

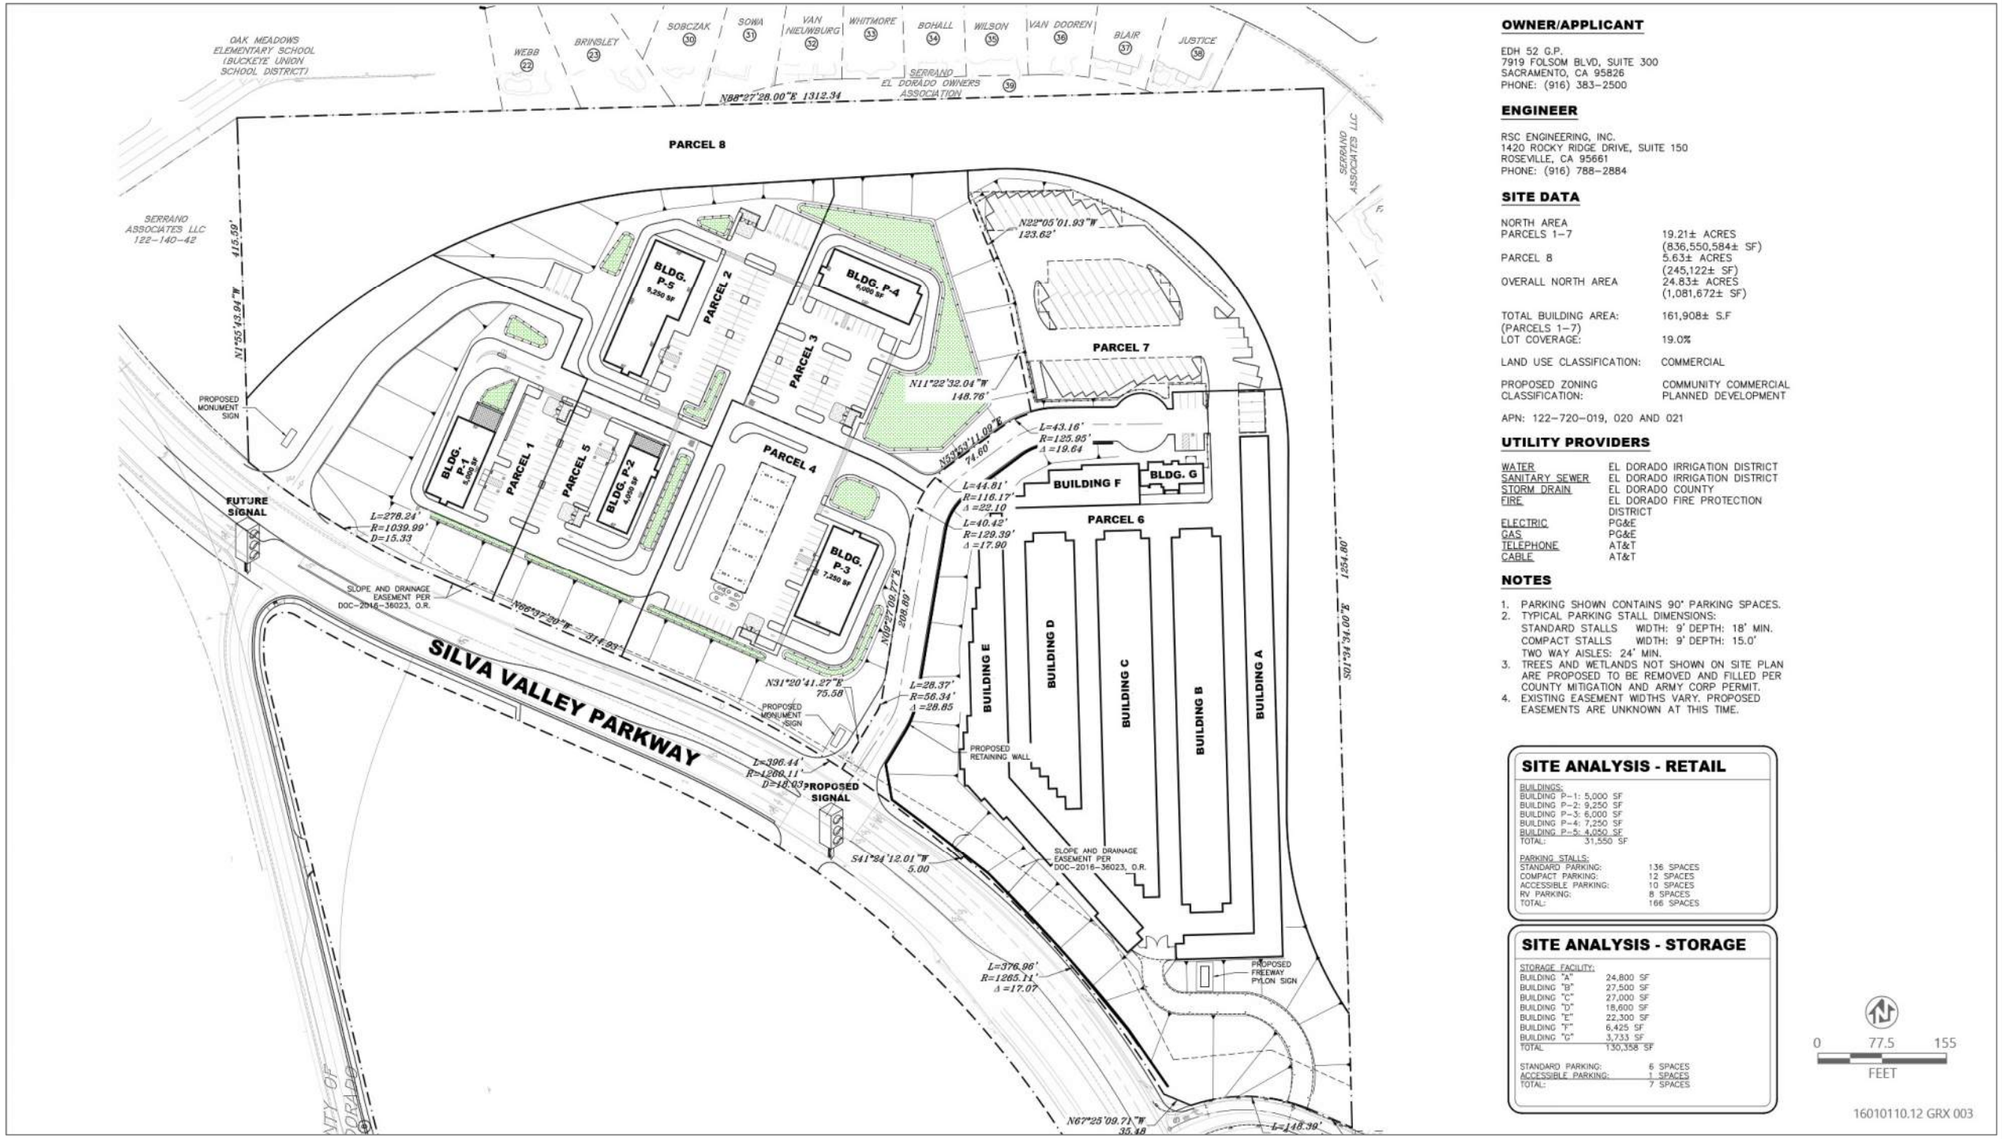
The preliminary landscape plan for the North Site is shown in Figure 2-8. Within the parking lots of the North Site, trees would provide a shade canopy while understory plantings would consist of low shrubs and groundcovers. Primary plantings along the property boundaries would consist of evergreen trees and shrub rows designed to screen adjacent properties. Areas fronting the streets would incorporate shade trees along with mixed species and forms of shrubs for interest, color, and buffering the shopping center from the streets. Plantings at entries would include seasonal accent trees and low shrubs in order to maintain sight lines. Landscaping would include drought tolerant species. The project would remove four individual oak trees located near the western edge of the North Site, which requires an oak tree removal permit.

LIGHTING

The North Site would provide various single, two- or four-light fixtures throughout the parking areas and driveways. The overall height of the lighting on the North Site, including the lighting fixtures and a three-foot base, would be 33 feet in the parking lot, 25 feet along the perimeter and main drive aisles, and 16 feet around drive-through lanes. LED luminaires would be used for the parking lot lights. The lighting plan for the North Site is shown in Figure 2-9.

SIGNAGE

As part of the proposed Master Signage Program (see Section 2.4.3, "Master Signage Program"), the applicant proposes a 75-foot pylon sign designed to be visible to motorists on U.S. 50 as well as two 28-foot monument signs at entrances to the North Site (see Figure 2-10). Figure 2-11 shows the proposed sign elevations. The highway-oriented pylon sign would allow advertising from either commercial center and would include one (1) major tenant panel, one (1) junior tenant panel, and eight (8) shop tenant panels (see Figure 2-10). The proposed sign area for the highway-oriented pylon sign would not exceed 652 square feet. The highway-oriented pylon sign would have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos would be fabricated aluminum, pan channel construction. Tenant names and logos would be flush mounted to the panel background and internally illuminated with white LED lights. Colors would comply with tenant specifications.



Each of the two monument sign would have one (1) featured tenant panel and six (6) shop tenant panels. The proposed area for each monument sign is 242 square feet. The monument signs would have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos would be routed out with acrylic push-through graphics and vinyl film overlays. Tenant names would be internally illuminated with white LED lights. Colors would comply with tenant specifications.

INFRASTRUCTURE IMPROVEMENTS

Figure 2-14 shows the preliminary utility plan for the North Site. Water would be provided to the North Site through a 12-inch pipeline that would connect to the existing 18-inch water pipeline within Silva Valley Parkway. This 12-inch pipeline would connect north of the northern driveway access and would traverse the site until it splits such that one branch would serve the storage facility and the other would follow the main driveway and cross Silva Valley Parkway where it would serve the South Site. Within the North Site, various smaller water pipelines would be installed to serve specific buildings as well as fire hydrants. An eight-inch sewer pipeline would connect with South Site sewer infrastructure near the North Site's main driveway at Silva Valley Parkway and would continue through the site to serve all proposed buildings. Stormwater pipelines varying in size from 12 inches to 36 inches would be installed throughout the North Site that interconnect with 12 onsite bioretention basin, with connections to the South Site. Electrical and natural gas service would be provided by Pacific Gas and Electric Company (PG&E) that would be extended from existing facilities along Clarksville Crossing (electrical) and extension of a natural gas pipeline approximately 1,900 feet north of the site along eastern side of Silva Valley Parkway.

CONSTRUCTION

Construction for the North Site is anticipated to begin as early as October 2023 and last approximately 14 months. The timing for development of the North Site is dependent on market conditions, so all parcels on the North Site may not be developed at the same time. Figure 2-12 identifies proposed earthwork movement (cut and fill), while Figure 2-13 identifies the proposed grading plan. Site development is expected to require the import of approximately 30,000 cubic yards (CY) of fill material and the removal of approximately 19,000 CY of rock material offsite.

Freestanding Shopping Center / Tenant Signs Scope of Work

- Two (2) 75' D/F shared tenant pylon signs with one (1) Major Tenant panel and one (1) Junior Tenant Panel with eight (8) Shop Tenant panels.
- Six (6) 28' D/F shared tenant monument signs with one (1) Featured Tenant panel and six (6) Shop Tenant panels.

Pylon Sign
Tenant cabinets (tenant panels) to be fabricated aluminum construction with texcote finish to match/compliment color scheme of shopping center development. Base to be stone veneer to match shopping center development.
Tenant names/logos to be fabricated aluminum, pan channel construction with color scheme and content per tenant specifications, flush mounted to tenant panel background. Fabricated pan channel letters/logo to be internally illuminated with White LEDs. Tenant panel backgrounds to be consistant color throughout.

Monument Signs
Tenant cabinets (tenant panels) to be fabricated aluminum construction with texcote finish to match/compliment color scheme of shopping center development. Base to be stone veneer to match shopping center development.
Tenant names/logos to be routed out, with acrylic push-thru graphics and vinyl film overlays on faces of graphics. Color scheme and content of push-thru graphics per tenant specifications. Tenant panel backgrounds to be consistant color throughout. Cabinets to be internally illuminated with White LEDs.

Figure 2-14 North Site Preliminary Utility Plan

OPERATIONS

As discussed previously, development of the North Site may include the following uses: operation of up to five drive-through uses, one gas station with car wash, food service uses, an outdoor patio, and/or other retail and office uses permitted in the CC zone, and an RV and self-storage facility. The proposed gas station would be expected to have an annual throughput of less than 3.6 million gallons per year. The proposed self-storage facility would consist of 6 buildings plus an office and 52 RV storage spaces.

While specific end users have not been determined for the North Site, it is estimated that it would provide between 90 and 100 employees based on review of a range of employee per square foot of building area estimates for a range of commercial uses (ABAG 2011).

ENERGY EFFICENCY FEATURES

As noted above, the North Site would obtain electrical and natural gas services from PG&E. The development would comply with energy efficiency standards under California Code of Regulations Title 24. Additional energy efficiency measures incorporated into the project would include high efficiency restroom fixtures, low or no VOC paints, drought tolerant planting, and LED parking lot lights. The reader is referred to Section 3.5, "Energy," for a further discussion of project energy demands.

2.4.2 South Site

The majority of the South Site is already zoned CR-PD. The project would include rezoning of the CL portion to CR-PD, both to harmonize the zoning designation across the South Site and to apply the PD designation uniformly as required by General Plan Policy 2.2.6.1 (see Figure 2-15). Development of the South Site would include up to approximately 165,000 sf of building area that would include a Costco warehouse retail center and a tire sales and installation center. The proposed site plan is shown in Figure 2-16. Within the warehouse retail center, Costco would offer optical exams and optical sales, photo center and processing, hearing aid testing and sales, food service preparation and sales, meat preparation and sales, bakery and sales of baked goods, and alcohol sales. The tire center would include propane refueling and sales as well as tire sales and installation. The warehouse is proposed to include one customer entrance to the main Costco store, which would be located at the northwest corner. The tire center would have bay doors accessible from outside of the warehouse, though the tire center sales area would be accessible through the warehouse building. Promotional sales materials would occasionally be placed near outside near the entrance to the warehouse or in the parking area. Development on the South Site would exclude the 1.38-acre area located west of Clarksville Crossing. No uses are proposed for the 1.38-acre site, which would be its own parcel (see Figure 2-15).

The South Site has been designed to accommodate the existing slope of the site by locating the Costco warehouse building in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. Parking would be provided in two at-grade lots and one subterranean lot beneath one of the at-grade lots. Vehicle access to this lower-level parking would be provided by ramps on the north and south sides of the underground parking structure consisting of 214 spaces. A third ramp would provide pedestrian access from the lower level up to the at-grade parking and entry to the warehouse building. Total parking for the South Site would be 762 spaces.

SITE ACCESS AND ROADWAY IMPROVEMENTS

As shown in Figure 2-16, the primary customer entrance to the South Site would be from a signalized intersection at the main driveway at Silva Valley Parkway. There would also be an intersection at Silva Valley Parkway and Clarksville Crossing Road that would be partially signalized to provide protected turn movements to vehicles traveling northbound on Silva Valley Parkway to make a left turn on to Clarksville Crossing Road. From Clarksville Crossing Road, there would be three driveways providing access to the South Site. The signalization of the intersection of Silva

Valley Parkway and Clarksville Crossing Road would remain in place until the County constructs the Country Club Drive extension project in 2041. After completion of the Country Club Drive extension project the signal at the intersection of Silva Valley Parkway and Clarksville Crossing Road would be removed and Clarksville Crossing Road's existing connection to Silva Valley Parkway would be eliminated. Sidewalks and bike lanes would be provided along the site frontage.

ARCHITECTURE

The warehouse design for the South Site is proposed to be contemporary and would include a variety of massing and appropriate materials for the building, as shown in Figure 2-17. By combining concrete masonry block and architectural metal panels, Costco intends to create a scale and architectural interest to minimize the visual impact of a large retail warehouse. By use of design techniques such as the location of building materials, landscaping, and the incorporation of varying parapet cap heights, Costco proposes to break the long elevations both horizontally and vertically at the appropriate height to conceal roof top mounted mechanical equipment. The proposed colors are warm natural earth tones, which would relate to the proposed surrounding development by utilizing similar building materials and architectural detailing.

The South Site has been designed to use the existing slope of the site by locating the warehouse in the southeast corner of the site, where the elevation of existing streets adjacent to the site are the highest. By building the warehouse adjacent to higher elevation land and providing a subterranean parking structure, the height of the building and visual impacts relative to the surrounding environment would be minimized. The subterranean portion of the parking structure would be adjacent to the west side of the warehouse and contain 214 parking spaces underneath the at-grade parking structure. Vehicle access to this lower-level parking would be provided by ramps on the north and south sides of the underground parking structure – the ramp on the north side would allow vehicles to enter the lower-level parking structure directly from Clarksville Crossing and the ramp on the south side would allow vehicle access from the at-grade parking lot above. A third ramp would provide pedestrian access from the lower level up to the at-grade parking and entry to the warehouse. The main entry feature to the warehouse is proposed to be oriented towards the northwest so that the loading dock and truck deliveries would be accessed from and oriented towards U.S. 50, providing greater separation between the warehouse's commercial activities and the existing residences.

The South Site truck loading dock is proposed to be located at the southwest corner of the building adjacent to U.S. 50. The bay doors would be equipped with sealed gaskets to limit noise impacts. A smaller on-grade door would also be located on the south side of the building. This door is to receive bread deliveries and small delivery vans/trucks. A transformer and two trash compactors would also be located along the south edge of the building proposed for the South Site. Landscape material would provide the necessary screening to this area.

LANDSCAPING

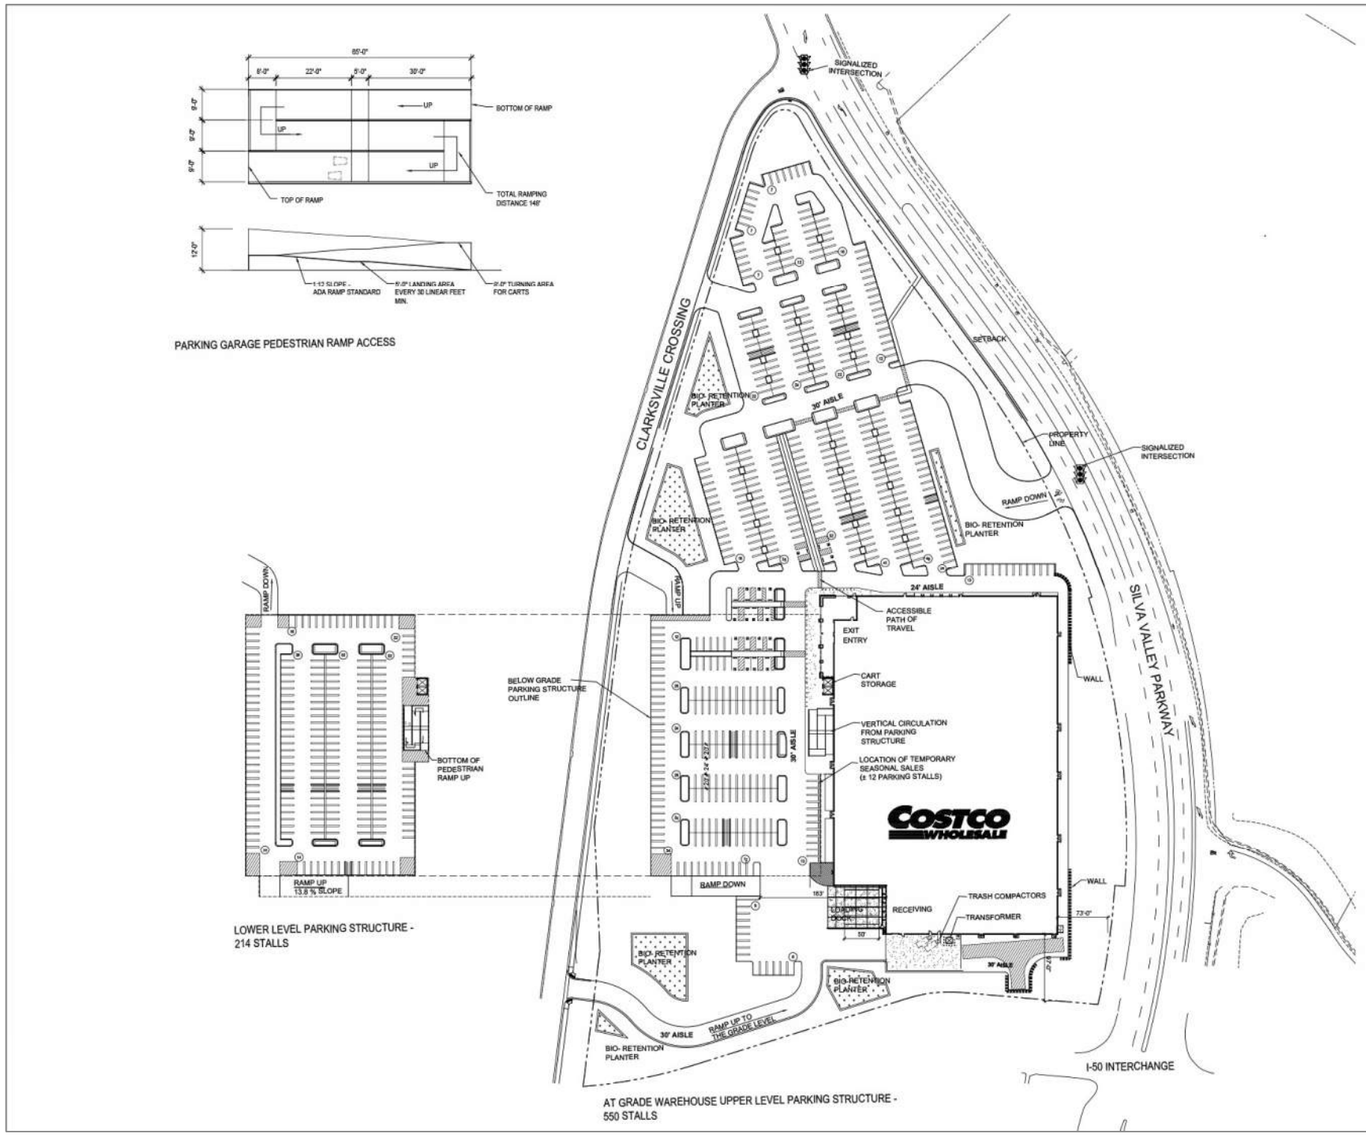
The preliminary landscape plan for the South Site is shown in Figure 2-18. Landscaping would include a variety of tree species along the property lines and throughout the surface parking area. The side of the warehouse building facing Silva Valley Parkway would be shielded from the road by tree plantings. Shrubs, perennials, ornamental grasses, ground covers and vines would occupy the understory. The landscape plan would include multiple stormwater treatment planters (SWTPs) that would include trees, perennials, and grasses. While some existing oak trees on the site would remain, development of the South Site would require an oak tree removal permit for the removal of 10 individual oak trees (see Figure 2-19).

Commented [PA1]: What is their proposal for addressing tree removal? I know they asked for "relief" - no idea what that is...

Commented [CR2R1]: I do not see anything in the

LIGHTING

The preliminary site lighting plan is shown in Figure 2-20. The South Site parking lot would be illuminated with standard downward LED fixtures affixed to a 37-foot light pole. The lighting fixtures are of a "shoe-box" style. Parking lot light standards are typically designed to provide even light distribution for vehicle and pedestrian safety. The parking lot lights would be controlled by a timer to limit lighting after the warehouse has closed and most employees



Commented [PA3]: Include exhibit/figure of lighting plan

are gone from the site. Parking lot lighting would only remain on to provide security and emergency lighting only along the main driveways. Lighting fixtures would also be located approximately every 40 feet around the exterior of the building to provide safety and security. Parking and site lighting would incorporate the use of cutoff lenses to keep light from overflowing beyond the South Site boundaries.

Figure 2-20 South Site Lighting Plan

SIGNAGE

As part of the proposed Master Signage Program (see Section 2.4.3, "Master Signage Program"), proposed signage includes the typical Costco warehouse signage (externally illuminated reverse pan channel letters), a pylon sign at the southeast corner of the parcel at Silva Valley Parkway, and a monument sign located at the northern side of the main entry (see Figure 2-21).

Source: Adapted by Ascent 2022

Figure 2-21 Costco Sign Locations

A pylon sign oriented towards U.S. 50 would be located at the southeast corner of the South Site adjacent to Silva Valley Parkway. The sign would be approximately 75 feet tall and 28 feet wide with multiple internally illuminated panels for tenant identification for businesses located on the North Site. A monument sign located on the north side of the main entry would also be include as part of the project signage. The sign would be approximately 16 feet tall and 17 feet wide with multiple internally illuminated panels for tenant identification for businesses located on the North Site.

INFRASTRUCTURE IMPROVEMENTS

Figure 2-22 shows the preliminary utility plan for the South Site. Water would be provided to the site via 10-inch pipelines connecting to existing water pipeline within Silva Valley Parkway as well as a 6-inch and 10-inch water pipeline connection to the existing water pipeline in Clarksville Crossing. An eight-inch sewer pipeline would connect to North Site sewer infrastructure within Silva Valley Parkway and would serve the South Site via six-inch and eight-inch pipelines. This onsite sewer system would connect an existing sewer pipeline along the west side of Clarksville Crossing. Stormwater pipelines varying in size from 12 inches to 36 inches would be installed throughout the site and would convey stormwater to proposed six bioretention basins within the South Site as well as existing vaults and boxes. Electrical and natural gas service would be provided by PG&E that would be extended from existing facilities along Clarksville Crossing (electrical) and extension of a natural gas pipeline approximately 1,900 feet north of the site along eastern side of Silva Valley Parkway.

CONSTRUCTION

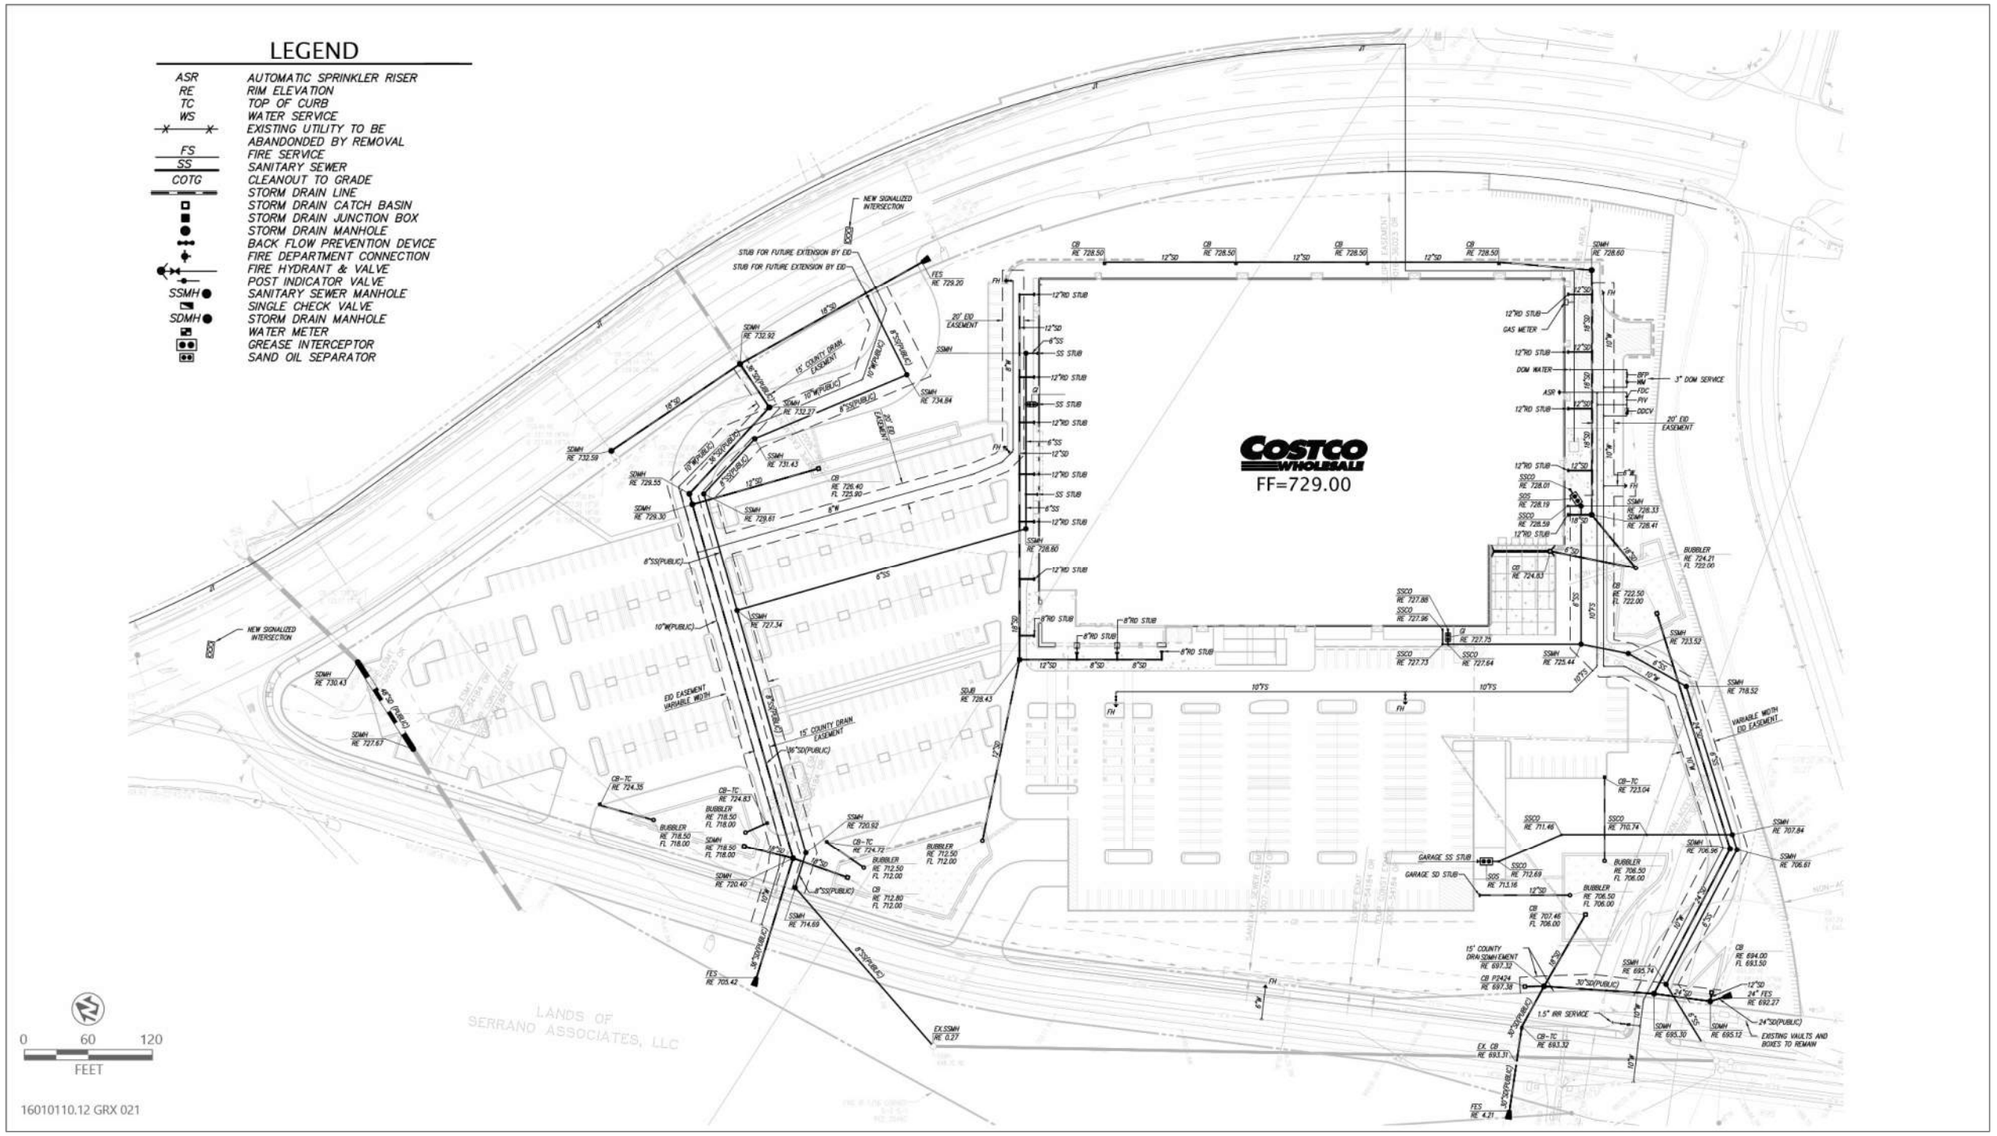
Construction for the South Site is anticipated to begin in early 2024 and would take approximately 9 months. Approximately 11,000 CY of fill would be exported offsite as part of site grading activities.

OPERATIONS

The warehouse is proposed to include one member entrance to the main Costco store, which would be located at the northwest corner. The El Dorado Hills Costco is expected to include a bakery and sales of baked goods, meat preparation and sales, alcohol sales, food service preparation and sales, pharmacy, optical center with optical exams and retail optical sales, hearing aid testing center, food court, and a photo center along with the sales of approximately 4,000 products. The warehouse would include a five-bay tire center, an approximately 5,300 sf facility with member access via the inside of the main Costco building, which would include tire sales and a tire installation facility.

It is anticipated that the El Dorado Hills Costco warehouse would employ approximately 165 to 170 employees. The warehouse hours are anticipated to be Monday through Friday from 9:00 am to 8:30 pm, and Saturday and Sunday from 9:00 am to 7:00 pm.

Costco anticipates an average of about 10 trucks delivering goods on a typical weekday. The trucks range in size from 26 feet long for single-axle trailers to 70 feet long for double-axle trailers. Receiving time would be from 2:00 a.m. to 1:00 p.m., averaging 2 to 3 trucks per hour, with most of the deliveries completed before 10:00 a.m. Deliveries to the warehouse are made primarily in Costco trucks from its freight consolidation facility in Tracy, California, coming to the site from U.S. 50, and accessing the site from Silva Valley Parkway via Clarksville Crossing Road.



The tire center typically would receive shipments of tires once or twice per week in single- or double-trailer trucks up to 70 feet in length, and the same delivery truck will pick up old tires for recycling. Deliveries to and pickups from the tire center would be scheduled for pre-opening hours, typically about 6:00 a.m. Tire center deliveries would not occur at the loading dock but would occur directly at the tire center.

ENERGY EFFICIENCY FEATURES

As noted above, the South Site would obtain electrical and natural gas services from PG&E. The development would comply with energy efficiency standards under California Code of Regulations Title 24. Additional energy efficiency and sustainability measures incorporated into the Costco warehouse are noted below. The reader is referred to Section 3.5, "Energy," for a further discussion of project energy demands.

- Parking lot light standards would be designed in order to provide even light distribution, and utilize less energy compared to a greater number of fixtures at lower heights. The use of LED lamps can provide a higher level of perceived brightness with less energy than other lamps such as high-pressure sodium.

- New and renewable building materials are typically extracted and manufactured within the region. When masonry and concrete are used, the materials purchased are local to the project, minimizing the transportation distances and impact to local road networks.
- The use of pre-manufactured building components, including structural framing and metal panels, helps to minimize waste during construction.
- Pre-manufactured metal wall panels with insulation carry a higher R-Value and greater solar reflectivity to help conserve energy as compared to other materials. Building heat absorption is further reduced by a decrease in the thermal mass of the metal wall when compared to a typical masonry block wall.
- A substantial amount of the proposed landscaping material for the South Site is climate adapted to the region and would use less water than other common species.
- The irrigation system proposes to include the use of deep root watering bubblers for parking lot trees to minimize usage and ensure that water goes directly to the intended planting areas.
- Storm water management plans are designed to maintain quality control and storm water discharge rates based on the County requirements.
- High-efficiency restroom fixtures.
- Commissioning of mechanical systems will occur to ensure that the HVAC systems are preforming as designed. HVAC comfort systems can be controlled by a computerized building management system to maximize efficiency.
- HVAC units planned for the South Site are high efficiency direct ducted units, which have phased out the use of HCFC's completely.
- Parking lot and exterior lights would be controlled by a photo sensor and time clock.
- Lighting is controlled by the overall project energy management system.
- Energy efficient Transformers (i.e., Square D Type EE transformers) would be used.
- Variable speed motors would be used on make-up air units and booster pumps.
- Gas water heaters are direct vent and 94 percent efficient or greater.
- Reclaim tanks are used to capture heat released by refrigeration equipment to heat domestic water in lieu of venting heat to the outside.
- The building structure is a pre-engineered system that uses 100 percent recycled steel materials and is designed to minimize the amount of material used.
- Construction waste is recycled whenever possible.
- Floor sealant is No-VOC and represents over 80 percent of the floor area.
- CO_2 is monitored throughout the warehouse.
- Extensive recycling/reuse program is implemented for warehouse including tires, cardboard, grease, plastics, and electronic waste.
- Use of plastic shopping bags is avoided.
- Suppliers are required to reduce packaging and consider alternative packaging solutions.
- Distribution facilities are strategically located to minimize miles traveled for delivery.
- Deliveries are made in full trucks.
- All Costco trucks are equipped with an engine idle shut off timers.

Source: Image produced and provided by Kier+Wright in 2021

Figure 2-22 South Site Utility Plan

2.4.3 Master Signage Program

The applicant has proposed a master signage program to cover the signage for both the North Site and South Site. Details about the proposed signage are included above for each of the sites. The applicant is requesting deviations from Chapter 130.36 of the County Code, including an increase in maximum allowed sign area and an increase in maximum allowed sign height.

2.5 REQUIRED OFFSITE TRANSPORTATION IMPROVEMENTS

An analysis and identification of recommended roadway improvements for the project to comply with El Dorado County General Plan Transportation policies are provided in the EDH 52 Transportation Impact Analysis (Appendix E). It is anticipated that the County would require the following conditions of approval to be applied to the project:

- Silva Valley Parkway and Entrada Lane Intersection: Signalize the intersection.
- White Rock Road and Valley View Parkway-Vine Street Intersection: Add a northbound right turn lane and change the right turn phase to permissive and overlap. Increase the westbound left turn storage length.
- Bass Lake Road and Country Club Drive Intersection: Add a southbound right turn lane and an eastbound left turn lane. Optimize the signal timing.
- Serrano Parkway and Bass Lake Road Intersection: Optimize the signal timing.
- US 50 EB Ramps and Marble Lake Road Intersection: Signalize the intersection. If this intersection is signalized, the U.S. 50 Westbound Ramps/Bass Lake Rd Ramp Intersection will likely need to be signalized as well.
- Silva Valley Parkway and Project Driveway Intersection: Optimize the signal timing to reduce the queue length. Increase length of southbound left turn pocket to 380 feet.

2.6 REQUESTED ENTITLEMENTS

2.6.1 Both Sites

- Master Sign Program
- Variance to allow Master Sign Program that would allow for signage beyond currently allowed by PD zoning regulations
- Oak Tree Removal Permit

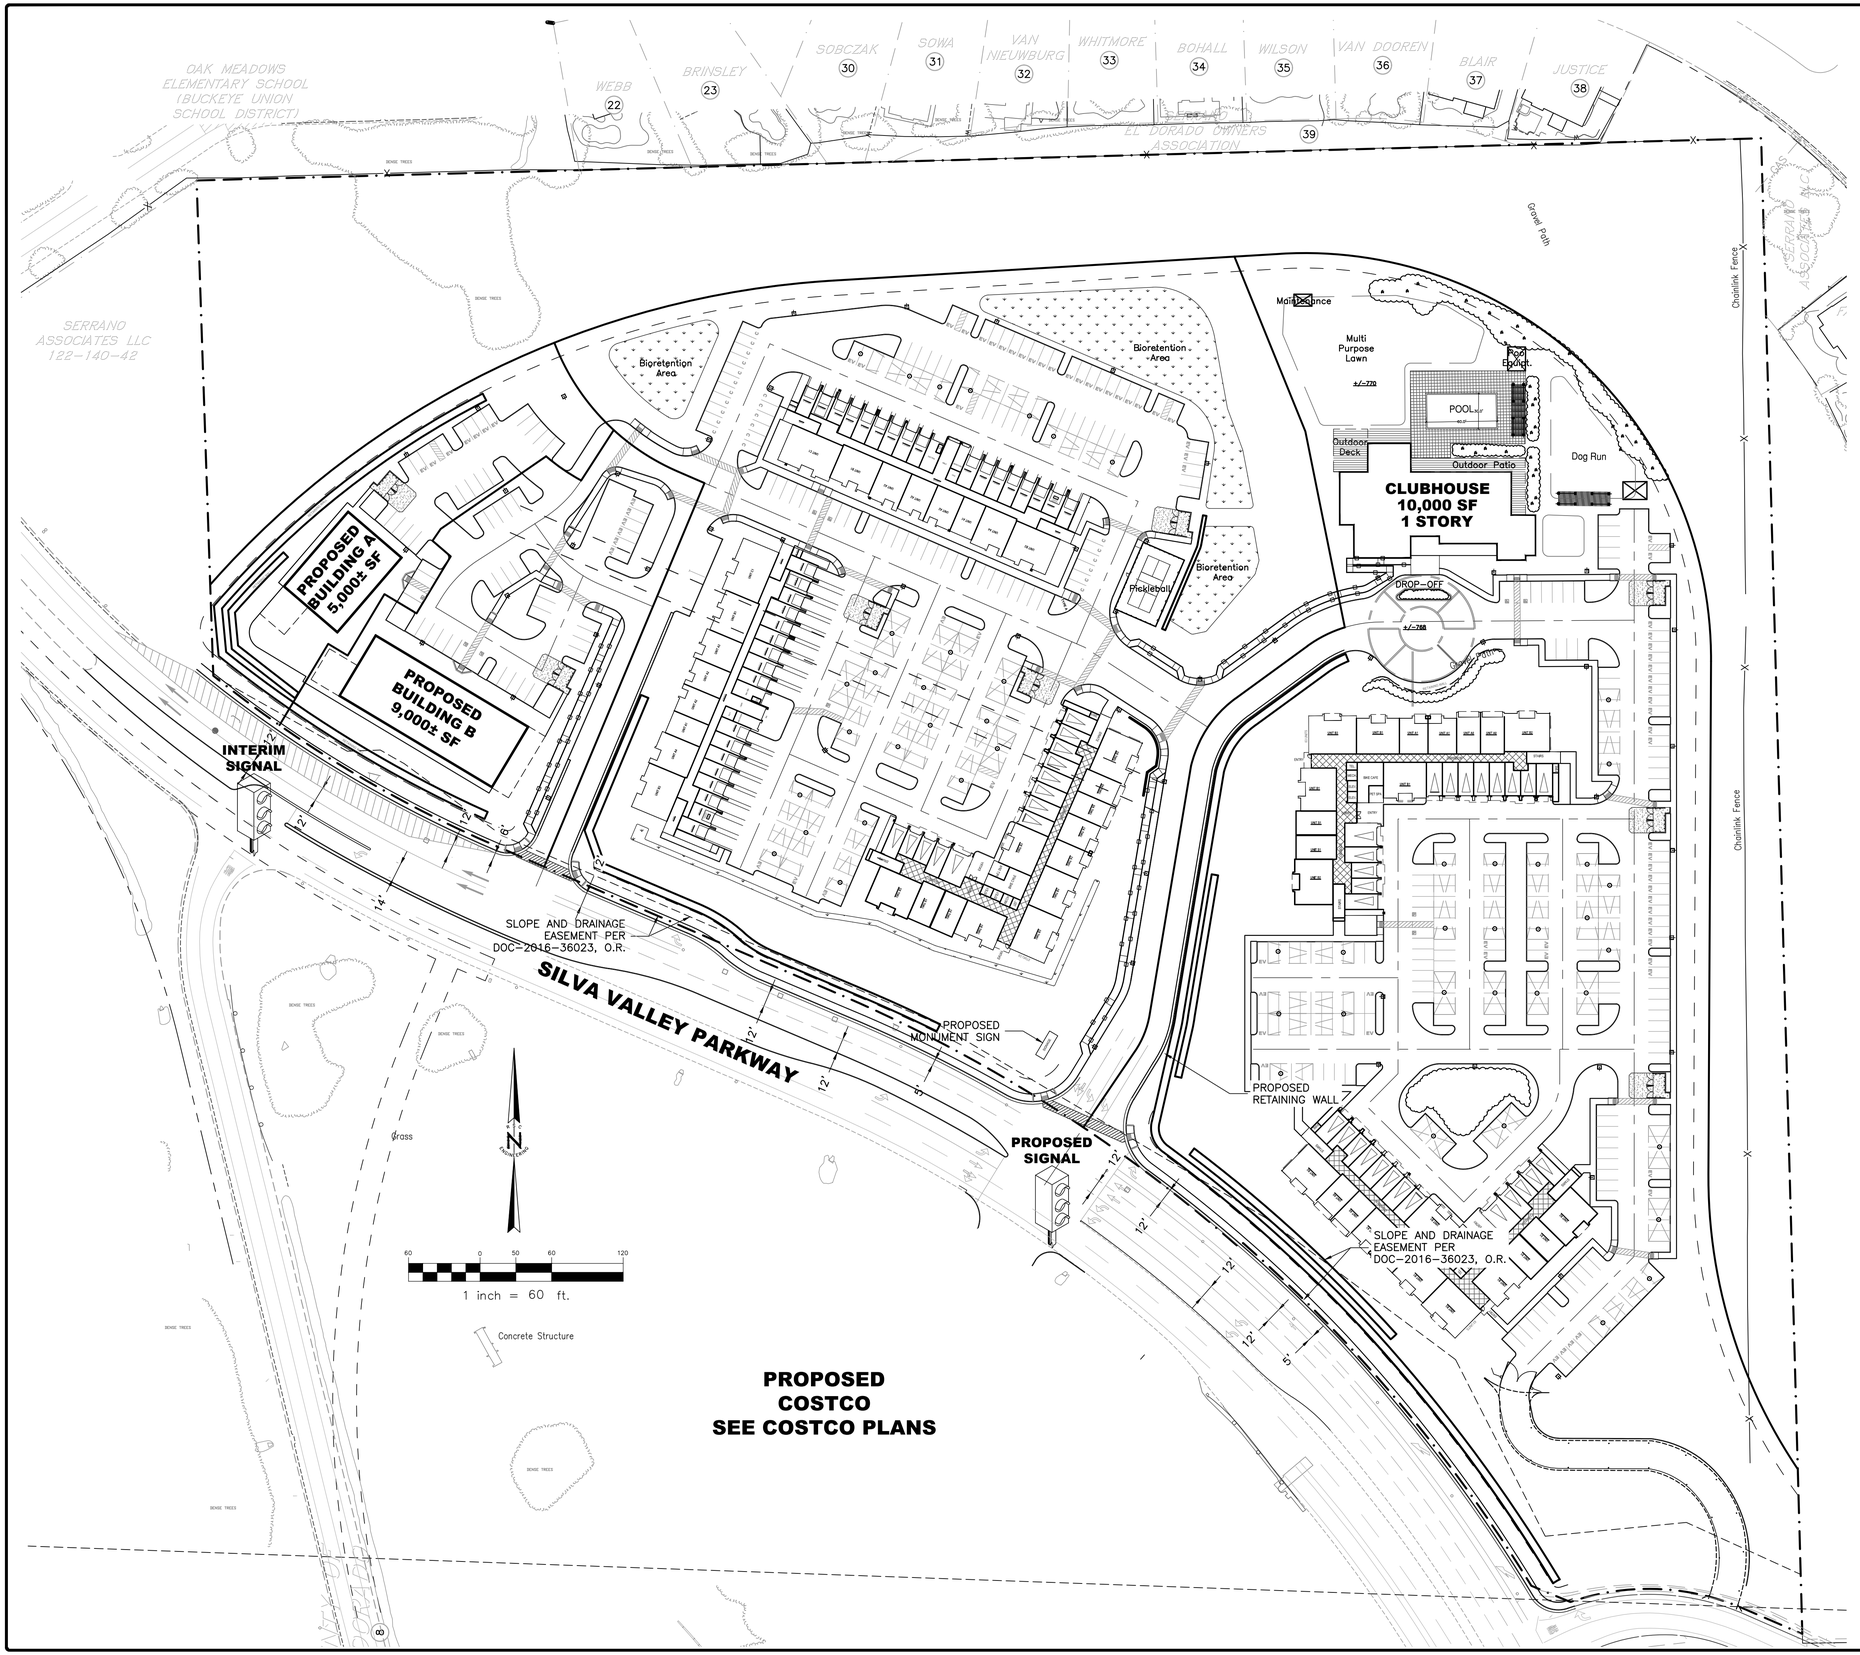
2.6.2 North Site

- Planned Development Permit (PD15-0001) to include site plans, and design guidelines;
- Rezone (Z17-0004) of from Regional Commercial – Planned Development (CR-PD) to Community Commercial - Planned Development (CC-PD) ;
- Conditional Use Permit (CUP-R21-0024) to allow the use of a self-storage operation within the CC-PD zone; and
- Tentative Parcel Map (P17-0007) to reconfigure existing and create new parcels .

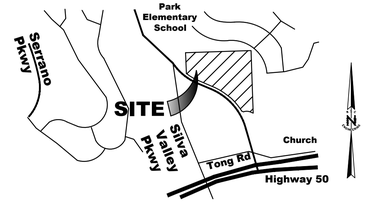
2.6.3 South Site

- Planned Development Permit (PD15-0001) to include site plans, design guidelines, and signage program;

- Rezone the entire site to CR-PD zoning; and
- County Road Improvement and Maintenance Agreement



2.7 OTHER AGENCY APPROVALS



The project may require additional approvals or entitlements from agencies other than El Dorado County. The agencies and approvals that may be required include the following:

- El Dorado Local Agency Formation Commission: annexation of the project site into the El Dorado Irrigation District (EID) and the El Dorado Hills County Water District (El Dorado Hills Fire Department) for both North Site and South Site;
- EID (associated U.S. Bureau of Reclamation action) for water supply service and wastewater service for both North Site and South Site;
- El Dorado Hills Fire Department approval of Fire Safe Plan for both North Site and South Site;
- El Dorado Air Quality Management District permitting approval for the North Site gas station;
- California Department of Fish and Wildfire streambed alteration agreement for both North Site and South Site; and
- U.S .Army Corps of Engineers for wetland fill for both North Site and South Site.

RE: PD15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001 – EDH 52 Technical Advisory Committee Meeting, scheduled for July 31, 2023

The El Dorado Hills Area Planning Advisory Committee (EDH APAC) would like to offer the following questions, concerns, and comments on the proposed PD15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001 – EDH 52 to member agencies and staff for the July 31, 2023 Technical Advisory Committee meeting.

1. Reviewing the July 13, 2023 Revised Project Application Packet, EDH APAC has concerns regarding the following elements.
2. "*SITE ACCESS: It is anticipated that the Project site will have multiple points of access. A traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the South Site and the North Site.*"
   In discussions with EDC DOT, it has been explained that a signalized FMA intersection on Silva Valley Pkwy at the center of the project site(s) is an unworkable element. The impacts to the SIlva Valley Pkwy-HWY50 interchange would negatively impact the performance of the interchange, and circulation on Silva Valley Pkwy.
3. EDH APAC also has concerns about the signalized FMA intersection on Silva Valley Pkwy at the center of the project site(s) that would negatively impact the existing performance of the roadway in relation to the challenges currently existing for access at Oak Meadow Elementary School. With the close proximity to the Oak Meadow Elementary School site, improvements and mitigations MUST consider impacts on the sensitive population of students, staff, and families accessing the school property.
4. "*North Site: A right in and out is proposed on Silva Valley Parkway generally across from the existing Clarksville Crossing in the interim. An emergency access to Tong Road from the apartments is proposed. After Country Club Drive is extended through the property a driveway will connect to that road for an additional point of access. South Site Regional*

access to the warehouse will be from Interstate 50 via the Silva Valley Parkway exit. One full-access driveway with a signalized intersection is proposed along the eastern portion of the site, and an additional three driveways are proposed along the Project's western side to provide access from Clarksville Crossing. An interim signal at Clarksville Crossing is proposed to allow a northbound left turn from Silva Valley Parkway onto Clarksville Crossing. This signal will go away when the County constructs the Country Club Drive extension further north. At that time the Clarksville Crossing will become a right in and out only. An ADA-compliant pedestrian pathway will extend from the warehouse to the northern property boundary where it will connect to Silva Valley Parkway. The Project provides oversized parking stalls of 10 feet x 20 feet that are larger than the minimum El Dorado County requirements to provide members with easier accessibility to vehicles."

Also:

"*OFF-SITE IMPROVEMENTS A proposed traffic signal and appurtenant facilities will be located on Silva Valley Parkway at the main driveway of the Project to provide a connection to both the South Site and the North Site. An additional traffic signal is proposed at the intersection of Clarksville Crossing and Silva Valley Parkway as an interim until Country Club Drive is extended by the County.*"

EDH APAC is concerned about the timing of the proposed circulation improvements/mitigation elements of the final conditions to Silva Valley Pkwy, Tong Road, Clarksville Crossing, and the future Country Club Drive alignment. EDH APAC believes the construction of Country Club Drive from Silva Valley Pkwy to the northeast side of the North Site MUST be concurrent with the development of the first Apartment Buildings, and the first of the two Retail buildings.

5. "*TRUCK CIRCULATION Truck access will be allowed at all driveway locations depending on the size of the delivery truck and direction of travel.*"
   EDH APAC suggests that to avoid circulation impacts, that Truck Access MUST be limited to specific driveway locations, designed to accommodate commercial traffic, with signage. Truck Access should NOT be unlimited at ALL driveway locations.
6. "*South Site Objectives: Minimize circulation conflicts between automobiles and pedestrians.*" EDH APAC is concerned about the driveway locations proposed along Clarksville Crossing. As it exists now, Clarksville Crossing is a two lane road, constrained by an elevated bridge section of HWY50. EDH APAC is concerned that adequate vehicle and pedestrian capacity does not exist on Clarksville Crossing to facilitate the South Site/Costco portion of the proposed project.
7. Building Heights. Have building heights been established for the apartment buildings or the two retail buildings proposed for the north site - including the height added by architectural elements? Will they fall with the building heights established by El Dorado County Design standards for the proposed zoning?

EDH APAC appreciates the opportunity to review and provide feedback on proposed development projects to mitigate impacts in our El Dorado Hills Community. Through question and feedback, our goal is to realize the best possible project outcome for our community, the project applicants, and for El Dorado County.

Respectfully,

John Davey

RE: **EDH 52** (AKT Investments / EDH 52 GP / RSC Engineering, Inc. – Tiffany Wilson)
PD15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001

Dear Ms. Leanza:

Thank you for the opportunity to review and provide additional comments on the revised EDH 52 project. LAFCO's State mandated role is to promote orderly growth and development and to encourage efficient service areas for local service providers. To that end, LAFCO has reviewed the information relating to this project and would like to comment on the proposed development and necessary future services.

As you are aware, APNs 122-720-018, 122-720-019, 122-720-020, and 122-720-021 are not within the boundaries of the El Dorado Irrigation District (EID) nor the El Dorado Hills County Water District (EDH Fire). These parcels will require annexation into these districts prior to receiving water and/or sewer services from EID, or fire protection and emergency medical services from EDH Fire. APNs 122-720-002 and 122-720-003 do appear to be within the EID and EDH Fire boundaries and will not require any LAFCO action.

LAFCO requests that annexation into EID and EDH Fire be included as required conditions of approval for this project. Annexation would occur after the County's approval process; please ensure the applicant is aware of this future requirement and advise the applicant to contact LAFCO staff near the end of the County's approval process to schedule a pre-application meeting. LAFCO may also request additional roadway parcels be included in the annexation application, to result in more orderly local government boundaries.

Since the above project will require LAFCO involvement for future boundary changes, and LAFCO will also require an environmental review for the application, it is in the best interest of the applicant and all involved parties if one CEQA document is prepared that covers all of the necessary processes. LAFCO respectfully requests that the project description include annexation into EID for water and wastewater services, and annexation into EDH Fire for fire

COMMISSIONERS
Public Member: Bill Wilde • Alternate Public Member: Dawn Hodson
City Members: John Clerici, Tamara Wallace • Alternate City Member: Nicole Gotberg
County Members: John Hidahl, George Turnboo • Alternate County Member: Wendy Thomas

STAFF
Shiva Frentzen, Executive Officer • Erica Sanchez, Assistant Executive Officer
Malathy Subramanian, Commission Counsel

protection and emergency medical services, and that the Initial Study and subsequent environmental document include the following:

Water Supply, Pumping and Treatment Facilities: A detailed analysis of all existing and planned on-site and off-site water facilities required for this project. A discussion of the potential water supply impacts that may occur as a result of the project, including how much water would be required to adequately serve this project, whether that water is currently projected to be available, the existing infrastructure that will be used to deliver service; the location, size and capacity of existing infrastructure, and how this water requirement will affect the overall water supply for the service area. The same scope of discussion should occur in regards to local pumping and treatment facilities: the location and size of the existing infrastructure of the nearest water treatment facility; whether it has the capacity to serve the proposed project; or whether additional infrastructure will be required for pumping the water to the project site.

Water Quality / Wastewater Treatment Issues: A detailed analysis of all existing and planned on-site and off-site sewer facilities required for this project. The same scope of discussion and analysis for water issues should also be included for sewer treatment issues.

Fire and Emergency Medical Services: The proposed project's impact on fire and emergency services, including a discussion on the impacts on existing facilities and financial implications to EDH Fire. In addition, please include the location(s) of the nearest staffed fire station(s) and estimated response time, and any existing or planned fire hydrants that will be used to deliver water to the project area.

In addition, please continue to ensure that LAFCO is on the distribution list for any project notices, hearings, or decisions as this project moves through the County's approval process. Once again, we thank you for giving LAFCO the opportunity to comment and we look forward to receiving additional materials in the future.

I can be contacted at (530) 295-2707 if you have any questions.

Sincerely,

Erica Sanchez
Assistant Executive Officer

RE: **PD15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001 – EDH 52** *(AKT Investments/EDH 52 GP/RSC Engineering, Inc. – Tiffany Wilson)*

The El Dorado Hills Community Services District ("District") appreciates this opportunity to respond to the request to review and comment on the above referenced project. Below are comments and conditions to be addressed.

PLANNED DEVELOPMENT PERMIT, REZONE, TENTATIVE PARCEL MAP, LOT LINE ADJUSTMENT, AND VARIANCE PER REVISED PROJECT APPLICATION

The Revised Application proposes two sites – a southerly site of 17 acres with 156,000 square feet of commercial use (Costco) and a northerly site of 18 acres of mixed-use development with 14,000 square feet of commercial uses and 304 multifamily units within five four-story buildings, amenities including a pool area, gym, and outdoor gathering space on the properties identified as APNs 122-720-002, 122-720-003,122-720-018,122-720-019,122-720-020,122-720-021, consisting of 40.56 acres.

PARKLAND DEDICATION & IMPACT FEE REQUIREMENTS

District Policy 6110.10
All subdividers of land within the District's jurisdiction shall dedicate park land suitable for active recreation use, or pay fees in lieu thereof (Quimby), or by District Board authorization, follow a combination of these alternatives.

Application of all Parkland Dedication requirements shall follow the El Dorado County Subdivision Ordinance and be consistent with the project.

The below provides the requirements for project development related to acceptable parklands:

PARKLAND DEDICATION AND DEVELOPMENT STANDARDS

District Policy 6110.10
Park dedication amounts shall be determined as a result of calculation based on the legislated rate of 5 acres per 1000 population project yield. Population is calculated at the rate of 3.3 persons for single family subdivisions and 2.8 for multi-family subdivisions on a per parcel basis.

District Policy 6110.20
As an alternative to parkland dedication, where Quimby fees are paid in lieu of land dedication; the sum owed shall be determined by District staff by consulting with the County Assessor's Office, County Planning Department and/or an approved private appraiser, as authorized by ordinance.

The proposed tentative subdivision creates 304 multi-family housing units, which yields a population of 851 persons. Using the 5 acres per 1,000 persons formula, the required land dedication is 4.26 acres. The applicant can satisfy this requirement by way of Quimby fees paid in lieu of land dedication.

District Policy 6110.30 and 6110.40
The amount of park land to be dedicated shall be calculated on the basis of the subdivision's dwelling unit yield as determined from the approved tentative map or the final map should the yield increase. Also, per District Policy 6110.40, staff shall inspect and evaluate all proposed park land dedications to determine the suitability of the subdivider's offering. The District will confer jointly with the County to determine the amount of park land to be dedicated within the subdivision and its most suitable location.

LAND SUITABLE FOR PARKLAND DEDICATION

District Policy 6110.60
Land suitable for dedication as an active recreation site (park land) shall include the following important elements to take into consideration:

- Minimum desirable park site size is normally three (3) acres for purposes of economical maintenance and procuring adequate land for the development of multi-purpose fields.

- Active recreational pursuits, such as team field sports, game courts, and activity buildings require predominantly level land, 2% slope. Land with a greater slope, up to 20% of the site, may be acceptable where it has utility for picnicking or other passive recreation activities and when it complements usable park area (2% slope) or when it appears consistent with uses proposed for a special purpose park site. All parks improved for active recreation purposes (i.e., ball fields, hard courts, etc.) shall be graded to a maximum 2% slope within areas proposed for such uses.

- Site shall be free and clear of surface and overhead utility line easements which contain design, maintenance or operation constraints or place the public at unreasonable risk. Where easements unavoidably occur, only those compatible to the intended active recreation development, will be allowed for consideration as an acceptable dedication.

- A neighborhood park, to the extent practicable, shall be centrally located within its residential service area and easily accessed by pedestrian or light vehicular traffic. Typical amenities include children's play apparatus, hard court, a multi-purpose turfed area and suitable landscaping.

- Village/area parks shall generally provide recreation facilities needful by a larger community segment. These may be located on more significant transportation routes and shall furnish adequate parking. Ample hard courts, including tennis, larger field areas, group picnic facilities and a larger, more complex play apparatus for children, is customary.

- Drainage courses, or dedications near or adjacent to hazardous or noxious material's sites are not acceptable. Flood plains are generally not accepted unless the site's potential risks are fully mitigated at the subdivider's risk and expense.

Private parks (neighborhood parks behind development gates) are eligible for a portion of parkland credit per County Subdivision Ordinance and District policy, and are not eligible for park impact fee reduction, as the park impact fee imposed is for public parks, not private parks.

COMMUNITY FACILITIES DISTRICT (CFD)

As a Condition of Approval, prior to the approval of the project's Final Map, annexation into the following Community Facilities Districts (CFDs) is required:

El Dorado Hills Community Services District Master CFD 2019-01

Annexation into the District's Master CFD 2019-01 will satisfy the requirement for participating in the funding of the ongoing maintenance of future parks, trails and pathways, open space, landscaping, lighting and other common or public areas owned/maintained by the District within the District's service boundary.

For complete District Policy guidelines, please see Policy Guide Services 6000 – Facility Development on our website at www.eldoradohillscsd.org/about/administration-finance.html

Should you have any questions or comments regarding the concerns expressed in this letter, please contact me at (916) 614-3214.

Best regards,

Jeff Kernen

Subject: Planned Development Permit (PD)15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001 – EDH 52 (AKT Investments/EDH 52 GP/RSC– AQMD Comment

Dear Ms. Leanza:

The El Dorado County Air Quality Management District (AQMD) has reviewed the proposed project for subject PD, Rezone, Tentative Parcel Map, Lot Line Adjustment, and Variance to develop two sites; the southerly site is approximately 17 acres where 156,000 square feet of commercial uses are proposed, the northerly site is approximately 18 acres where a mixed-use development is proposed. The mixed-use development will include 14,000 square feet of neighborhood commercial uses, as well as 304 multifamily units within five four-story buildings, amenities include a pool area, gym and outdoor gathering space, with associated site improvements. The properties, identified by Assessor's Parcel Numbers 122-720-002, 122-720-003, 122-720-018, 122-720-019, 122-720-020 and 122-720-021, consist of 40.56 acres, and are located directly north of US Highway 50 at the Silva Valley Parkway exit, in the El Dorado Hills area. Based on the AQMD's review of the proposed project, the AQMD concluded that the project will be above the size of projects identified in the AQMD Guide to Air Quality Assessment for determining Significance of Air Quality Impacts under the California Environmental Quality Act, and it is expected to cause a significant air quality impact and has the following comments regarding potential air quality impacts.

Air Quality/GHG Analysis Required:

The western portion of El Dorado County (where the project is located) is in non-attainment of the state Ambient Air Quality Standards (AAQS) for Particulate Matter 10 micrometers (PM10), and the federal AAQS for PM2.5 (2.5 micrometers) in size. Additionally, the western portion of the County is in non-attainment of both the 1-hour and 8-hour state AAQS for ozone, and of the 8-hour federal AAQS for ozone. The two ozone precursor pollutants most responsible for ozone generated by this project are Volatile Organic Compounds (VOC, also known as Reactive Organic Gases or ROG) and Nitrogen Oxides (NOx).

An Air Quality and Greenhouse Gas (GHG) Analysis is required for adequate environmental review of the proposed project. AQMD recommends the use of the latest version of the California Emissions Estimator Model (CalEEMod), which can be downloaded for free at www.caleemod.com. This will compute mass emissions of criteria pollutants (NOx, ROG, SOx, PM & CO) and GHG (in CO2 equivalents) from both construction and operation of the project. Someone knowledgeable in all aspects of the project, such as construction phasing, materials usage, etc., should run the model and modify the defaults as appropriate, assuring that notes are included about any changes to defaults as the program requires.

Additionally, the following standard conditions may apply to the project:

- Asbestos Dust: Current county records indicate the portions of the subject property are located within the Naturally Occurring Asbestos Review Area. An Asbestos Dust Mitigation Plan (ADMP) Application with applicable fees shall be submitted to and approved by the AQMD prior to project construction if the project moves more than 20 cubic yards of soil, pursuant to AQMD Rule 223.2, Fugitive Dust – Asbestos Hazard Mitigation. Mitigation measures for the control of fugitive dust shall comply with the requirements of Rule 223, Fugitive Dust – General Requirements, and Rule 223.2 Fugitive Dust – Asbestos Hazard Mitigation.

- Open Burning: Burning of waste vegetation that results from "Land Development Clearing" must be permitted through the AQMD. Only dry vegetative waste materials originating from the property may be disposed of using an open outdoor fire. Burning shall adhere to AQMD Rule 300, Open Burning.

- Paving: Road construction shall adhere to AQMD Rule 224, Cutback and Emulsified Asphalt Paving Materials.

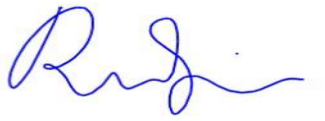
- Painting/Coating: The application of architectural coatings shall adhere to AQMD Rule 215, Architectural Coatings.

- New Point or Stationary Source: Prior to construction/installation of any new point/stationary source emissions units (e.g., emergency standby engine greater than 50 HP, etc.), Authority to Construct applications shall be submitted to the AQMD. Submittal of applications shall include facility diagram(s), equipment specifications and emissions estimates, and shall adhere to AQMD Rules 501, General Permit Requirements and 523, New Source Review.

- Open Burning: Burning of waste vegetation that results from "Land Development Clearing" must be permitted through the AQMD. Only dry vegetative waste materials originating from the property may be disposed of using an open outdoor fire. Burning shall adhere to AQMD Rule 300, Open Burning.

- Construction Emissions: During construction, all self-propelled diesel-fueled engines greater than 25 horsepower shall be in compliance with the California Air Resources Board (CARB) Regulation for In-Use Off-Road Diesel Fueled Fleets (§ 2449 et al, title 13, article 4.8, chapter 9,

California Code of Regulations (CCR)). The full text of the regulation can be found at CARB's website here: https://ww2.arb.ca.gov/our-work/topics/construction-earthmoving-equipment Questions on applicability should be directed to CARB at 1.866.634.3735. CARB is responsible for enforcement of this regulation.



- Portable Equipment: All portable combustion engine equipment with a rating of 50 horsepower or greater shall be registered with CARB. A copy of the current portable equipment registration shall be with said equipment. The applicant shall provide a complete list of heavy-duty diesel-fueled equipment to be used on this project, which includes the make, model, year of equipment, and daily hours of operations of each piece of equipment.

- Electric Vehicle Charging – Non-Residential: The project shall comply with the non-Residential Mandatory Measures identified in the 2022 Cal Green Building Code to facilitate future installation and use of EV chargers[1].

- Electric Vehicle Charging – Residential: The residential portion of the project shall comply with the Residential Mandatory Measures identified in the 2022 Cal Green Building Code §4.106.4.2.2 to facilitate future installation and use of EV chargers[2].

If you have any questions, please do not hesitate to contact me at (530) 621-7509. The complete list of District Rules can be viewed at: https://ww2.arb.ca.gov/current-air-district-rules.

Respectfully,

Rania Serieh
Sr. Air Quality Engineer

RE: **EDH 52** (AKT Investments / EDH 52 GP / RSC Engineering, Inc. – Tiffany Wilson)
PD15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001

Dear Ms. Leanza:

Thank you for the opportunity to review and provide additional comments on the revised EDH 52 project. LAFCO's State mandated role is to promote orderly growth and development and to encourage efficient service areas for local service providers. To that end, LAFCO has reviewed the information relating to this project and would like to comment on the proposed development and necessary future services.

As you are aware, APNs 122-720-018, 122-720-019, 122-720-020, and 122-720-021 are not within the boundaries of the El Dorado Irrigation District (EID) nor the El Dorado Hills County Water District (EDH Fire). These parcels will require annexation into these districts prior to receiving water and/or sewer services from EID, or fire protection and emergency medical services from EDH Fire. APNs 122-720-002 and 122-720-003 do appear to be within the EID and EDH Fire boundaries and will not require any LAFCO action.

LAFCO requests that annexation into EID and EDH Fire be included as required conditions of approval for this project. Annexation would occur after the County's approval process; please ensure the applicant is aware of this future requirement and advise the applicant to contact LAFCO staff near the end of the County's approval process to schedule a pre-application meeting. LAFCO may also request additional roadway parcels be included in the annexation application, to result in more orderly local government boundaries.

Since the above project will require LAFCO involvement for future boundary changes, and LAFCO will also require an environmental review for the application, it is in the best interest of the applicant and all involved parties if one CEQA document is prepared that covers all of the necessary processes. LAFCO respectfully requests that the project description include annexation into EID for water and wastewater services, and annexation into EDH Fire for fire

COMMISSIONERS
Public Member: Bill Wilde • Alternate Public Member: Dawn Hodson
City Members: John Clerici, Tamara Wallace • Alternate City Member: Nicole Gotberg
County Members: John Hidahl, George Turnboo • Alternate County Member: Wendy Thomas

Malathy Subramanian, Commission Counsel

protection and emergency medical services, and that the Initial Study and subsequent environmental document include the following:

Water Supply, Pumping and Treatment Facilities: A detailed analysis of all existing and planned on-site and off-site water facilities required for this project. A discussion of the potential water supply impacts that may occur as a result of the project, including how much water would be required to adequately serve this project, whether that water is currently projected to be available, the existing infrastructure that will be used to deliver service; the location, size and capacity of existing infrastructure, and how this water requirement will affect the overall water supply for the service area. The same scope of discussion should occur in regards to local pumping and treatment facilities: the location and size of the existing infrastructure of the nearest water treatment facility; whether it has the capacity to serve the proposed project; or whether additional infrastructure will be required for pumping the water to the project site.

Water Quality / Wastewater Treatment Issues: A detailed analysis of all existing and planned on-site and off-site sewer facilities required for this project. The same scope of discussion and analysis for water issues should also be included for sewer treatment issues.

Fire and Emergency Medical Services: The proposed project's impact on fire and emergency services, including a discussion on the impacts on existing facilities and financial implications to EDH Fire. In addition, please include the location(s) of the nearest staffed fire station(s) and estimated response time, and any existing or planned fire hydrants that will be used to deliver water to the project area.

In addition, please continue to ensure that LAFCO is on the distribution list for any project notices, hearings, or decisions as this project moves through the County's approval process. Once again, we thank you for giving LAFCO the opportunity to comment and we look forward to receiving additional materials in the future.

I can be contacted at (530) 295-2707 if you have any questions.

Sincerely,

Erica Sanchez

RE: PD15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001 – EDH 52 Technical Advisory Committee Meeting, scheduled for July 31, 2023

The El Dorado Hills Area Planning Advisory Committee (EDH APAC) would like to offer the following questions, concerns, and comments on the proposed PD15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001 – EDH 52 to member agencies and staff for the July 31, 2023 Technical Advisory Committee meeting.

1. Reviewing the July 13, 2023 Revised Project Application Packet, EDH APAC has concerns regarding the following elements.
2. "*SITE ACCESS: It is anticipated that the Project site will have multiple points of access. A traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the South Site and the North Site.*"
   In discussions with EDC DOT, it has been explained that a signalized FMA intersection on Silva Valley Pkwy at the center of the project site(s) is an unworkable element. The impacts to the SIlva Valley Pkwy-HWY50 interchange would negatively impact the performance of the interchange, and circulation on Silva Valley Pkwy.
3. EDH APAC also has concerns about the signalized FMA intersection on Silva Valley Pkwy at the center of the project site(s) that would negatively impact the existing performance of the roadway in relation to the challenges currently existing for access at Oak Meadow Elementary School. With the close proximity to the Oak Meadow Elementary School site, improvements and mitigations MUST consider impacts on the sensitive population of students, staff, and families accessing the school property.
4. "*North Site: A right in and out is proposed on Silva Valley Parkway generally across from the existing Clarksville Crossing in the interim. An emergency access to Tong Road from the apartments is proposed. After Country Club Drive is extended through the property a driveway will connect to that road for an additional point of access. South Site Regional*

access to the warehouse will be from Interstate 50 via the Silva Valley Parkway exit. One full-access driveway with a signalized intersection is proposed along the eastern portion of the site, and an additional three driveways are proposed along the Project's western side to provide access from Clarksville Crossing. An interim signal at Clarksville Crossing is proposed to allow a northbound left turn from Silva Valley Parkway onto Clarksville Crossing. This signal will go away when the County constructs the Country Club Drive extension further north. At that time the Clarksville Crossing will become a right in and out only. An ADA-compliant pedestrian pathway will extend from the warehouse to the northern property boundary where it will connect to Silva Valley Parkway. The Project provides oversized parking stalls of 10 feet x 20 feet that are larger than the minimum El Dorado County requirements to provide members with easier accessibility to vehicles."

Also:

"*OFF-SITE IMPROVEMENTS A proposed traffic signal and appurtenant facilities will be located on Silva Valley Parkway at the main driveway of the Project to provide a connection to both the South Site and the North Site. An additional traffic signal is proposed at the intersection of Clarksville Crossing and Silva Valley Parkway as an interim until Country Club Drive is extended by the County.*"

EDH APAC is concerned about the timing of the proposed circulation improvements/mitigation elements of the final conditions to Silva Valley Pkwy, Tong Road, Clarksville Crossing, and the future Country Club Drive alignment. EDH APAC believes the construction of Country Club Drive from Silva Valley Pkwy to the northeast side of the North Site MUST be concurrent with the development of the first Apartment Buildings, and the first of the two Retail buildings.

5. "*TRUCK CIRCULATION Truck access will be allowed at all driveway locations depending on the size of the delivery truck and direction of travel.*"
   EDH APAC suggests that to avoid circulation impacts, that Truck Access MUST be limited to specific driveway locations, designed to accommodate commercial traffic, with signage. Truck Access should NOT be unlimited at ALL driveway locations.
6. "*South Site Objectives: Minimize circulation conflicts between automobiles and pedestrians.*" EDH APAC is concerned about the driveway locations proposed along Clarksville Crossing. As it exists now, Clarksville Crossing is a two lane road, constrained by an elevated bridge section of HWY50. EDH APAC is concerned that adequate vehicle and pedestrian capacity does not exist on Clarksville Crossing to facilitate the South Site/Costco portion of the proposed project.
7. Building Heights. Have building heights been established for the apartment buildings or the two retail buildings proposed for the north site - including the height added by architectural elements? Will they fall with the building heights established by El Dorado County Design standards for the proposed zoning?

EDH APAC appreciates the opportunity to review and provide feedback on proposed development projects to mitigate impacts in our El Dorado Hills Community. Through question and feedback, our goal is to realize the best possible project outcome for our community, the project applicants, and for El Dorado County.

Respectfully,

John Davey

PROJECT: PD15-0001 & CUP23-0012 – EDH 52 – APN: 122-720-002, 018-021, 122-720-003 THROUGH 050 AND 117-210-060

Dear AKT Investments,

The El Dorado Hills Fire Department (EDHFD) has reviewed the above-referenced project application submittal, hereafter referenced as the "project". Our review of the application is intended to ensure this agency can provide fire and emergency medical services that are consistent with the El Dorado County General Plan, State Fire Safe Regulations, as adopted by El Dorado County, and the California Fire Code as amended locally.

This agency reviewed the application based on the following criteria provided by the applicant:

A Costco warehouse retail center, 304 multi-family housing units, and 2 14,000 square feet retail buildings.

See Table 1 that describes our review of the application in conformance with these standards.

Table 1: El Dorado County General Plan Policies Related to Fire Protection

Policy	Topic	Standard	Does the Project Comply			Comments
			Yes	No	N/A	
5.1.2.2	Fire District Response	Community Region – 8-Minute Response to 80% of Population.	X			
5.7.2.1	Fire Protection	Sufficient emergency water supply, storage, and conveyance facilities for fire protection. Adequate access is provided.		X		See comments below.
6.2.1	Defensible Space	Tentative maps shall be conditioned to attain and maintain defensible space.		X		See comments below.

6.2.2	Limits to Development	Development in areas of moderate, high, and very high fire hazard areas shall have a WUI Fire Safe Plan.		X		See comments below.
6.2.3	Adequate Fire Protection	The development shall meet uniform fire protection standards.		X		See comments below.
6.2.4	Area Wide Fire Management	Reduce fire hazards through cooperative fuel management activities.		X		See comments below.

EDHFD GENERAL CONDITIONS OF APPROVAL SPECIFIC TO THIS PROJECT:

1. **Structural Fire Protection and Suppression Services:** Consistent with California Code of Regulations Title 14 §1266.01, structural fire protection and suppression services will be available for this project by the El Dorado Hills Fire Department (EDHFD). The project is located within the service boundaries of EDHFD. The nearest staffed fire station to the project location is EDHFD Station No. 85 located at 1050 Wilson Blvd., El Dorado Hills, CA 95762 in El Dorado Hills. The average response time to the project site from this fire station is approximately 8 minutes or less to 80% of the population in the area.

2. **Natural Hazard Disclosure:** The project is located in a **MODERATE** Fire Hazard Severity Zone within a CAL FIRE Responsibility Area (SRA). The applicant shall provide a Wildfire Hazard Real Estate Disclosure to all future property owners regarding this risk.

3. **Limits to Development:** The project is **NOT** currently identified in an area of high or very-high wildland fire hazard or in an area identified as a wildland-urban interface (WUI) community within the vicinity of federal land that is a high risk of a wildfire.

PRIOR TO THE RECORDATION OF PARCEL/SUBDIVISION MAP

1. **Annexation:** This development shall be conditioned to annex into the El Dorado Hills County Water District and pay all fees associated with that annexation.

2. **Emergency Water Supply:** The project area **IS** currently provided with an adequate means of emergency water supply, storage, or conveyance facilities. Prior to new buildings or structures being placed on one or more of these parcels, the applicant will need to demonstrate that they can meet the required emergency water supply provisions found in Chapter 5 of the California Fire Code, along with local ordinances and standards of EDHFD.

    a. Approved fire hydrants capable of providing the required fire flow for the protection of any and all structures shall be located along the fire apparatus access roadway. Fire hydrant quantities and locations shall be in accordance with the California Fire Code, as amended locally. The required fire hydrants shall be installed and operational prior to any combustible construction (including foundations).

3. **Roads and Driveways:** Roads and driveways, whether public or private, shall comply with California Code of Regulations (CCR) Title 14 §§ 1270.00 - 1276.04 and California Code of Regulations Title 24 – Part 9 (CFC), Section 503 (Fire Apparatus Access Roads), as amended locally.

The required fire access roads shall be installed prior to any combustible construction (including foundations).

Aerial apparatus access shall be provided to all buildings 30-ft in height or greater. Aerial apparatus access shall be in accordance with California Fire Code, Appendix D and El Dorado Hills Standard B-003.

Circumferential fire access shall be provided at all new buildings in accordance with California Fire Code, Appendix D, as amended locally.

a. Fire access roadways shall be of not less than 20 feet of unobstructed width, 15 feet of vertical clearance, and minimum turning radii of 40 feet inside and 56 feet outside dimensions on the improvement plans. The access roadway shall extend to within 150 feet of all portions of the exterior walls of the first story of any proposed building. **The use of turf-block or Grass-Crete or similar alternate road surfaces is not approved for installation in fire apparatus access roadways.**

b. Fire access roadways shall be built to bear a minimum of 75,000 pounds and meet County Department of Transportation standards for roadways. A report, prepared by a registered geotechnical or California-licensed Civil engineer, verifying the ability of the road to bear the required minimum weight, shall be submitted with any plan indicating the construction of the roadway. Verification of constructed roadway shall be provided by a registered geotechnical or California-licensed Civil engineer prior to the final of the project.

c. Where a bridge or elevated surface is part of a fire apparatus access road, the bridge shall be constructed and maintained in accordance with AASHTO HB-17.

d. Traffic calming measures and gates along fire access roads are prohibited unless approved by EDHFD.

e. When a road is required, it shall be named in accordance with the requirements identified by the County of El Dorado Surveyors Office. An approved street sign shall be placed at the entrance to the road.

f. Fire Lane identification shall be provided along required fire access roadways. Fire Lane identification shall be in accordance with the El Dorado County Regional Fire Protection Standard #B-004 and the California Vehicle Code. Vehicle parking is prohibited on any street less than 30 feet in width. Vehicle parking is permitted on both sides of streets 40 feet or more in width. Roadway widths shall be measured between the gutter line or edge of pavement on opposite sides of the road. Identification of fire apparatus access roadways may be required on private roads.

g. All essential road and driveway improvements shall be complete and meet all of the requirements of CCR Title 14 and the California Fire Code prior to the approval of the final map for the project.

4. **Shared Access Agreement or Easement:** Provide shared access agreement or easement between all parcels connected to and served by the fire access roadway and/or driveway when serving

more than one parcel. The Fire Access Roadway Maintenance Agreement shall be recorded with the El Dorado County Recorder's Office

5. **Road Maintenance Agreement:** Provide Fire Access Roadway Maintenance Agreement (RMA) between all parcels connected to and served by the fire access roadway and/or driveway when serving more than one parcel. The Fire Access Roadway Maintenance Agreement shall be recorded with the El Dorado County Recorder's Office. The roadway maintenance agreement shall include the following:

   a) Provisions for the necessary repair and maintenance of the roadway surface
   b) Removal of vegetation overgrowing the roadway and infringing on the roadway clear vertical height of fifteen feet (15') or width of twenty feet (20')
   c) Provisions for the maintenance, repair, and/or replacement of NO PARKING-FIRE LANE signage or striping
   d) Provisions for the necessary repair and maintenance of vehicle and pedestrian access gates and opening systems

6. **Fire Protection Plan (Fire Safe Plan):** A preliminary fire protection plan shall be prepared to determine the acceptability of fire protection and life safety measures designed to mitigate wildfire hazards. The wildfire protection plan shall be in accordance with Chapter 49 of the California Fire Code and EDHFD standards.

7. **Community Facilities District:** In order to maintain certain services provided by the Department, which are impacted by the proposed development, including, but not limited to, fire protection and suppression, ambulance response services, emergency response services, administrative fees of the Department, and any other services permitted under the Mello-Roos Community Facilities Act of 1982, as amended, commencing with Section 53311 of the Government Code (the "Act"), as well as costs of administration, operating, and reporting, the Developer shall elect and provide for one (1) of three (3) financing options. The Developer can (i) form a new Community Facilities District ("CFD") subject to the review and approval of the Department, (ii) make a deposit and annex into any existing and approved Department CFD, or (iii) make a lump-sum payment for the present value of an annuity authorized by the Department. If the Developer chooses to create a new CFD or annex into an existing El Dorado Hills Fire Department CFD, the creation of the new CFD or the annexation into the existing El Dorado Hills Fire Department CFD shall be completed concurrently with final approval, as determined jointly by the Department and the County, of all land use entitlements requested by the landowner/applicant/developer.

PRIOR TO THE ISSUANCE OF THE FINAL BUILDING PERMIT

1. **Fire Protection Plan (Fire Safe Plan):** A final fire protection plan shall be prepared to determine the acceptability of fire protection and life safety measures designed to mitigate wildfire hazards. The wildfire protection plan shall be in accordance with Chapter 49 of the California Fire Code and EDHFD standards.

2. **Plan submittal.** The applicant shall meet the following: Civil Site Plans and Architectural Plans shall be submitted and approved prior to Final Building Permit being issued. Fire Sprinkler and Fire Alarm plans shall be submitted prior to Final Building Permit being issued. Please note: EDHFD **does not** allow deferred submittals for Fire Sprinkler or Fire Alarm plans.

3. **Roof Coverings:** Residential roof coverings shall consist of materials having a minimum Class A rating.

4. **New Buildings and Structures:** New buildings and structures placed on a parcel shall comply with all applicable fire safety regulations found in the California Code of Regulations Titles 14, 19, 24, and EDHFD ordinances and regulations.

   a. All parcels shall provide a minimum thirty (30) foot setback for all buildings from all property lines and/or the center of a road in accordance with California Code of Regulations Title 14 – Section 1276 (Setback for Structure Defensible Space).

PRIOR TO GRANTING FINAL OCCUPANCY

1. **Address.** All parcels shall be provided with an approved address number as issued by the County Surveyors Office. Approved numbers or addresses shall be placed on all new or existing buildings in such a position as to be easily read from the street or road fronting the property. The minimum size of the numbers shall not be less than sixteen (16) inches and shall be mounted immediately adjacent to a light source and shall also contrast with their background. Addressing shall be in accordance with EDH Fire standard B-001.

Applicant: It is highly recommended that specific requirements for your project be addressed with the Fire District during the planning stage. Specific requirements for bridges, fire hydrants, entry gates, and access roadways shall be clearly understood and complied with. It is advisable to schedule a design review conference with the Fire District to provide clarification on specific requirements or to enquire about an Alternative Materials & Methods Request.

If this property is sold prior to development, the seller shall disclose the above requirements to the buyer.

EDHFD requirements are not to be construed as abrogating more restrictive requirements by other agencies having jurisdiction. Final acceptance is subject to field approval and completion of required tests.

EDHFD reserves the right to update the following comments to comply with all current Codes, Standards, Local Ordinances, and Laws with respect to the official documented time of project application and/or building application to the County. Any omissions and/or errors in respect to this letter, as it relates to the aforementioned codes, regulations, and plans, shall not be valid, and does not constitute a waiver to the responsible party of the project from complying as required with all Codes, Standards, Local Ordinances, and Laws.

Please do not hesitate to contact me at (916) 933-6623, Extension 1021 with any questions pertaining to the content of this review letter.

Sincerely,

Chrishana Fields
Fire Marshal

INTEROFFICE MEMORANDUM

TO: **ANNA LEANZA**, Project Planner
EDC Development Services Division

FROM: Environmental Management

SUBJECT: PD15-0001 EDH 52

DATE: 7/25/2023

CC:

Environmental Management Department staff has reviewed the subject application. The following reflects our concerns and requirements:

Environmental Health (Bryan Vyverberg x5924):

This project proposes a mixed-use development adding up to 304 multifamily housing units with a public pool, a Costco warehouse, and other commercial uses. The project will be served by a public water supply provided by the El Dorado Irrigation District and will be annexed into public sewer services provided by EID.

Facilities selling food at the retail level are required to be constructed an operated to the requirements of the California Retail Food Code. A plan review and approval by this department is required in conjunction with a building permit prior to construction. Once the facility has been built, an annual health permit issued by this department will be required and health inspections of the facility will be conducted.

Public pools are required to be constructed to the standards of the California Building Code, the California Health and Safety Code, and the Virginia Graeme Baker Pool Safety Act. A plan review and approval by this department will be required in conjunction with a building permit will be required prior to construction. Once constructed an approved for operation, an annual health permit and pool inspections will be required/conducted.

Hazardous Materials (Mark Moss x6665):

Solid Waste Division (Timothy Engle x6587):

Construction and Demolition (C&D) Debris Recycling
State Law mandates that a minimum of 65% of the waste materials generated from covered Construction and Demolition projects must be diverted from being landfilled by being recycled or reused on site. Please visit the following website to view El Dorado County's Construction & Demolition Debris Recycling Ordinance Program information and requirements. If after reviewing this information you still have questions, you're welcome to call Environmental Management at (530) 621-5300.

AB 341 - Mandatory Commercial Recycling (Non-Residential)
State law requires that all non-residential dwellings that generate at least two cubic yards of solid waste per week to have a recycling program for common recyclable materials such as bottles, cans, and paper

AB 1826 - Mandatory Commercial Organics Recycling (Non-Residential)
State law requires that all non-residential dwellings that generate at least two cubic yards of solid waste per week to have an organics recycling program for the following types of organic wastes: green waste, landscape, and pruning waste, non-hazardous wood waste, food waste

Trash and Recycling Enclosures: CalGreen Section 5.410.1
Recycling by occupants requires that new projects provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive. Please direct questions about this provision to Building Services. Building Services can be reached at (530) 621-5315

Trash and Recycling Enclosures: CalGreen Section 5.410.1
Recycling by occupants requires that new projects provide readily accessible areas that serve the entire building and are identified for the depositing, storage, and collection of non-hazardous materials for recycling, including (at a minimum) paper, corrugated cardboard, glass, plastics, organic waste, and metals or meet a lawfully enacted local recycling ordinance, if more restrictive. Please direct questions about this provision to Building Services. Building Services can be reached at (530) 621-5315.

SB 1383 – Short-Lived Climate Pollutants (Non-Residential)

State and County law requires that all non-residential dwellings that generate at least two cubic yards of solid waste per week to have an organics recycling program for the following types of organic wastes: green waste, landscape, pruning waste, food waste, and food-soiled paper

Subject: Planned Development Permit (PD)15-0001, Z17-0004, P17-0007, LLA21-0009, V22-0001 – EDH 52 (AKT Investments/EDH 52 GP/RSC– AQMD Comment

Dear Ms. Leanza:

The El Dorado County Air Quality Management District (AQMD) has reviewed the proposed project for subject PD, Rezone, Tentative Parcel Map, Lot Line Adjustment, and Variance to develop two sites; the southerly site is approximately 17 acres where 156,000 square feet of commercial uses are proposed, the northerly site is approximately 18 acres where a mixed-use development is proposed. The mixed-use development will include 14,000 square feet of neighborhood commercial uses, as well as 304 multifamily units within five four-story buildings, amenities include a pool area, gym and outdoor gathering space, with associated site improvements. The properties, identified by Assessor's Parcel Numbers 122-720-002, 122-720-003, 122-720-018, 122-720-019, 122-720-020 and 122-720-021, consist of 40.56 acres, and are located directly north of US Highway 50 at the Silva Valley Parkway exit, in the El Dorado Hills area. Based on the AQMD's review of the proposed project, the AQMD concluded that the project will be above the size of projects identified in the AQMD Guide to Air Quality Assessment for determining Significance of Air Quality Impacts under the California Environmental Quality Act, and it is expected to cause a significant air quality impact and has the following comments regarding potential air quality impacts.

Air Quality/GHG Analysis Required:

The western portion of El Dorado County (where the project is located) is in non-attainment of the state Ambient Air Quality Standards (AAQS) for Particulate Matter 10 micrometers (PM10), and the federal AAQS for PM2.5 (2.5 micrometers) in size. Additionally, the western portion of the County is in non-attainment of both the 1-hour and 8-hour state AAQS for ozone, and of the 8-hour federal AAQS for ozone. The two ozone precursor pollutants most responsible for ozone generated by this project are Volatile Organic Compounds (VOC, also known as Reactive Organic Gases or ROG) and Nitrogen Oxides (NOx).

An Air Quality and Greenhouse Gas (GHG) Analysis is required for adequate environmental review of the proposed project. AQMD recommends the use of the latest version of the California Emissions Estimator Model (CalEEMod), which can be downloaded for free at www.caleemod.com. This will compute mass emissions of criteria pollutants (NOx, ROG, SOx, PM & CO) and GHG (in CO2 equivalents) from both construction and operation of the project. Someone knowledgeable in all aspects of the project, such as construction phasing, materials usage, etc., should run the model and modify the defaults as appropriate, assuring that notes are included about any changes to defaults as the program requires.

Additionally, the following standard conditions may apply to the project:

- Asbestos Dust: Current county records indicate the portions of the subject property are located within the Naturally Occurring Asbestos Review Area. An Asbestos Dust Mitigation Plan (ADMP) Application with applicable fees shall be submitted to and approved by the AQMD prior to project construction if the project moves more than 20 cubic yards of soil, pursuant to AQMD Rule 223.2, Fugitive Dust – Asbestos Hazard Mitigation. Mitigation measures for the control of fugitive dust shall comply with the requirements of Rule 223, Fugitive Dust – General Requirements, and Rule 223.2 Fugitive Dust – Asbestos Hazard Mitigation.

- Open Burning: Burning of waste vegetation that results from "Land Development Clearing" must be permitted through the AQMD. Only dry vegetative waste materials originating from the property may be disposed of using an open outdoor fire. Burning shall adhere to AQMD Rule 300, Open Burning.

- Paving: Road construction shall adhere to AQMD Rule 224, Cutback and Emulsified Asphalt Paving Materials.

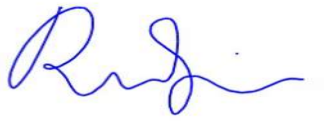
- Painting/Coating: The application of architectural coatings shall adhere to AQMD Rule 215, Architectural Coatings.

- New Point or Stationary Source: Prior to construction/installation of any new point/stationary source emissions units (e.g., emergency standby engine greater than 50 HP, etc.), Authority to Construct applications shall be submitted to the AQMD. Submittal of applications shall include facility diagram(s), equipment specifications and emissions estimates, and shall adhere to AQMD Rules 501, General Permit Requirements and 523, New Source Review.

- Open Burning: Burning of waste vegetation that results from "Land Development Clearing" must be permitted through the AQMD. Only dry vegetative waste materials originating from the property may be disposed of using an open outdoor fire. Burning shall adhere to AQMD Rule 300, Open Burning.

- Construction Emissions: During construction, all self-propelled diesel-fueled engines greater than 25 horsepower shall be in compliance with the California Air Resources Board (CARB) Regulation for In-Use Off-Road Diesel Fueled Fleets (§ 2449 et al, title 13, article 4.8, chapter 9,

California Code of Regulations (CCR)). The full text of the regulation can be found at CARB's website here: https://ww2.arb.ca.gov/our-work/topics/construction-earthmoving-equipment Questions on applicability should be directed to CARB at 1.866.634.3735. CARB is responsible for enforcement of this regulation.



- Portable Equipment: All portable combustion engine equipment with a rating of 50 horsepower or greater shall be registered with CARB. A copy of the current portable equipment registration shall be with said equipment. The applicant shall provide a complete list of heavy-duty diesel-fueled equipment to be used on this project, which includes the make, model, year of equipment, and daily hours of operations of each piece of equipment.

- Electric Vehicle Charging – Non-Residential: The project shall comply with the non-Residential Mandatory Measures identified in the 2022 Cal Green Building Code to facilitate future installation and use of EV chargers[1].

- Electric Vehicle Charging – Residential: The residential portion of the project shall comply with the Residential Mandatory Measures identified in the 2022 Cal Green Building Code §4.106.4.2.2 to facilitate future installation and use of EV chargers[2].

If you have any questions, please do not hesitate to contact me at (530) 621-7509. The complete list of District Rules can be viewed at: https://ww2.arb.ca.gov/current-air-district-rules.

Respectfully,

Rania Serieh
Sr. Air Quality Engineer

RE: EDH 52 Mixed-Use Project/PD15-0001, P17-0007, V22-0001, CUP23-0012
Assessor's Parcel Numbers (APNs) 122-720-019, -020, -021, and 122-720-018, -002, -003

Dear Mr. Christie:

The following information is being provided as summary of staff review regarding your above-referenced proposal.

Planning Observations and Notes

A. The proposed project design generally complies with the County's General Plan and Zoning Ordinance, with the following exceptions:
   a. Bicycle parking: Per the Mixed-Use Design Standards, three bicycle parking spaces per 2,000 square feet of commercial space is required, for a total of 21 bicycle parking spaces. (See Mixed-Use Design Standards, Page 28 here.)

B. **Electric Vehicle Charging Stations:** AQMD may require electric vehicle charging stations at the Building Permit stage depending on the regulations at submittal.

C. **Ecological Preserve Mitigation:** The project site is located within Pine Hill Endemic Rare Plant Mitigation Areas 1. Per Section 130.71.060, Off-site Mitigation or Fee Payment in Lieu of Ecological Preserve Mitigation in Mitigation Areas 1 and 2, development on the site is subject to either a) in-lieu fees or b) participation in an off-site mitigation program.

D. **Environmental Analysis:** At this time, the processing of the Design Review application and associated environmental analysis is subject to CEQA. The CEQA document required for this project will not be determined until the traffic study and associated documents are submitted and reviewed.

E. **Model Water Efficient Landscape Ordinance (MWELO):** The project will need to submit a complete MWELO landscape package demonstrating compliance with landscaping and water use.

F. **State of California Phase II MS4** permit may be required subject to actual project specifics

G. **Erosion and Sediment Control Plan** will be required at permit submittal.

This list is **not** necessarily exhaustive.

7. **Suggestions and Recommendations**

A. The applicant should contact the Cameron Park Community Services District Fire Department (CPCSD Fire District) directly to request review of any proposed project on the site. The CPCSD Fire District can be contacted at: 530.644.9630.

B. Applicant shall be required to submit various materials (appropriate applications, project plans, and technical studies and reports, if appropriate) in order for the County to adequately review and analyze the project. The project will be reviewed for consistency with the applicable policies of the General Plan and for adherence

with applicable development standards in the Zoning Ordinance including setbacks, building heights, site lighting and landscaping, signs, and parking.

The General Plan and Zoning Ordinance can be accessed online at:

https://www.edcgov.us/Government/Planning/pages/Adopted_General_Plan.aspx

https://www.edcgov.us/Government/planning/Pages/zoning_ordinance.aspx

8. Potentially Affected Departments and Agencies

Submittal of a formal project application and/or individual project applications to the Planning Department or for grading, building, or other site improvement applications may be routed to the following agencies for input and comment. Note that this is not necessarily an exhaustive list of potential reviewing and permitting bodies and agencies:

- El Dorado County Building Department: Review of building and grading permit plans
- El Dorado County Environmental Management Department: Hazardous Materials, Food/Safety
- El Dorado County Air Quality Management District
- Utility Companies: AT&T, PG&E, Comcast, etc. to review impacts to utilities in area.
- El Dorado County Department of Transportation
- Surveyor
- Cameron Park Community Services District
- Cameron Park Fire Protection Division
- County of El Dorado Stormwater

LIMITS OF STAFF RESPONSE

While staff will take utmost care to accurately represent County Codes, Policies, and applicable past positions of staff, the Planning Commission and the Board of Supervisors, it should be noted that matters discussed in the pre-application meeting should be not construed to bind, restrict, or obligate the staff or review boards when processing a subsequent application. A more thorough review that occurs during a formal application process could reveal issues and circumstances that were not known or reviewed during the much shorter review of the pre-application review process. Further, it is incumbent on the part of the applicant to obtain and understand all applicable Codes and Policies

Should you have any questions regarding the project or this letter, please feel free to contact me by email at jon.mijat@edcgov.us. or 5306215993.

Regards,

Jon Philip Mijat

Subject: **Initial Site Assessment**
Silva Valley Pkwy/SR50 Interchange
03-ED-50, KP 3.1 (PM 1.7)
El Dorado Hills, California

Dear Mr. Melis:

In accordance with our June 14, 2005, agreement, Blackburn Consulting, Inc. (BCI) prepared this Initial Site Assessment (ISA) for a proposed new interchange located east of the Silva Valley Road underpass on State Route 50 (SR50), near El Dorado Hills, California. The purpose of this assessment is to identify soil and groundwater contamination issues in the area of the proposed interchange.

Our investigation did not reveal the presence of significant hazardous materials impaets to the parcels located within the proposed project limits. Our report presents information about the minor hazardous materials issues noted in the project area.

Thank you for selecting BCI to assist you on this project. Please call if you have questions or require additional information.

Sincerely,

BLACKBURN CONSULTING

INVESTIGATIVE SUMMARY

This section summarizes soil and groundwater contamination issues that could impact land acquisition and/or construction of the proposed improvements for the Silva Valley Parkway/SR50 Interchange project. Contamination and hazardous materials impacts along the proposed roadway widening corridor appear minimal, and are not expected to significantly affect the project. However, the following potential items of concern were identified. Parcels are identified by the Mark Thomas and Company (MTCo) assigned Parcel Number, ("Property Owner Information," Plan Sheet 1, March 22, 2006), followed by the business/owner name and the assessors parcel number (APN).

Sites with Potential Contamination/Hazardous Materials Issues

- PARCEL 10, "PG&E CLARKSVILLE ELECTRICAL SUBSTATION" – APN 107-130-06

Parcel is subject to partial acquisition. No site specific hazardous material issues were identified through the commercial database search. Based on use and age of the site, the substation is considered a potential risk for PCB contamination from older transformers and a risk for potential petroleum hydrocarbon contamination from leaking coolant oils and site maintentance activities. We recommend contacting PG&E and obtain a statement of fact addressing potential contamination/hazardous materials. PG&E needs to provide a "clean site" record. If a statement can not be provided, we recommend limited soil sampling and analysis within the potential acquisistion areas of the Parcel. Associated with Parcel 10 by proximity, we identified a former gas station/commercial structure along the old, two-lane SR50, as shown on the 1952 and 1961 airphotos. Although the structures were removed for the widening of SR50, we can not rule out the potential for petroleum hydrocarbon impacts to the subsurface, in the general area of Joeger Cutoff Rd, between the PG&E substation and SR50.

- PARCEL 5, "LAFONTSEE PROPERTY" – APN 108-070-0310

Parcel is subject to partial acquisition. No specific hazardous material issues were identified in the database search. The site's previous residential structure and outlying storage structures are removed, but many discarded objects, domestic-appearing waste, and smaller wooden-framed, delapidated structures remain. Historical aerial photos exhibited numerous automobiles, trucks, commercial truck trailers, boats, and farm vehicles on the site. Based on airphotos and our site reconnaissance, many of these items appear abandoned.

Common contamination/hazardous materials issues associated with the identified land use include: 1) potential petroleum hydrocarbon (oil) spillage, 2) leach fields and septic tanks, and 3) buried heating oil tanks, 4) asbestos containing building materials (ACM), and 5) lead-containing paint (LCP). Although none of these were positively identified in this ISA, plans for construction, and/or complete or partial site acquisition, should account for the potential of encountering one or more of these issues.

We recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM, and his responsibility to respond accordingly. If potentially hazardous materials are encountered during grading operations, the local environmental health department and fire department should be notified.

- "SHELL", (ADJACENT TO PARCEL 32) - APN UNKNOWN

This is an active, petroleum fuel service station. No specific hazardous material issues were identified in the database and website searches. However, it appears that a Phase II investigation was recently conducted at the site, as indicated by the presence of at least ten, 55-gal drums, each mark as "hazardous waste". To determine the current status of possible clean-up activities, we recommend a review of existing regulatory documentation, which may be obtained from the local environmental health department, the RWQCB, and/or the site owner. Current plans do not include acquisition of this site; however groundwater and/or soil contamination could impact road widening or related project improvement activities at the adjacent properties, which includes Parcels 32 (APN 107-680-0910), 33 (APN 107-680-1010), and 34 (APN 107-680-0810).

- PARCEL 25, WILMINGTON TRUST/TOSCO TRUST" (UNION 76) - APN 107-120-0410

Parcel is subject to partial acquisition. This is an active, petroleum fuel service station. No specific hazardous material issues were identified in the database search. However, this site will require further assessment. Initially, further assessment should include a review of existing documentation from the local environmental health department, the RWQCB, and the site owner. If building demolition is planned, the existing structures need to be assessed for potential hazardous materials, such as LCP and ACM.

- PARCEL 21, "SERRANO ASSOCIATES" - APN 114-160-19

Parcel is subject to partial acquisition. No specific hazardous material issues were identified in the database search. Remnant structures were observed adjacent to the north (west-bound) side of SR50, approximately 600 feet west of the Silva Valley Parkway underpass. A house structure, barns, warehouse and associated improvements are observed in historical air photos. Common contamination/hazardous materials issues associated with the identified land use are: 1) ACM and LCP, 2) unidentified leach fields/septic tanks and buried heating oil tanks, and 3) ADL from the immediately adjacent SR50.

The presence of these one or more of these materials could affect the value of the parcel. If this project includes acquisition and demolition of any of the existing structures, then the structures should be assessed for potential ACM and LCP prior to acquisition. Assessment results will be used to estimate the financial impact to the project. Results of the assessment shall also be included in the plans and specifications (bid documents) so the contractors can plan for worker safety and material handling and disposal issues. Based on the proximity to SR50, some level of ADL may be present in the shallow subsurface soils adjacent to the freeway. ADL recommendations are presented in the section titled "General Contamination/Hazardous Materials Issues" of this report.

- PARCELS 13 AND 14, "KFRD INVESTORS INC. & TONG RANCH LLC" - APN 108-070-0510 AND 108-070-0610

Parcels are subject to partial or complete acquisition. No specific hazardous material issues were identified in the database search. During our site reconnnaissance, we noted poor housekeeping practices along Tong Road, where it passes through the two properties. We observed 55-gal drums, rusting machinery, trash and rubbish, and above ground fuel storage tanks (AST). Existing structures (large barn, mobile home, small sheds, etc.) may present an ACM and LCP issue if demolition is planned. Other issues include encountering unidentified items such as leach fields/septic tanks and buried heating oil tanks. An old cemetary is located in Parcel 13, close to SR50.

Existing structures subject to demolition need to be assessed for LCP and ACM, prior to preparation of construction documents. Additionally, we recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM during grading operations, and his responsibility to respond accordingly.
Based on the proximity to SR50, some level of ADL may be present in the shallow subsurface soils adjaeent to the freeway. ADL may also be present adjacent to White Rock Road. ADL recommendations are presented in the section titled "General Contamination/Hazardous Materials Issues" of this report.

- PARCEL 31, "SYERS PROPERTIES, LLC" (VALERO SERVICE STATION) – APN 107-130-5010

Parcel does not appear to be subject to acquisition. The parcel is known as the "Town Center" shopping area. There is an active, petroleum fuel service station (Valero) located within the shopping center. We found no records of suspected soil and/or groundwater contamination from the searched database. Service stations are a principal concern for subsurface contamination. We recommend a local file search and review for additional environmental records at the EDCEHD and at the RWQCB and an interview with the current site owners.

- PARCEL 1, "EDH 52" - APN 108-030-1010

Parcel is subject to partial or complete acquisition. No specific hazardous material issues were identified at this site through the database search. The parcel consists of undeveloped grazing land that appears unused at the present. We observed remnant, concrete structures (ruins) and associated debris. We were unable to determine the past use of the concrete structure. These "ruins" are located east of Silva Valley Parkway, approximately 1,000 feet north of the existing underpass. The structure consists of a rectangular shaped, three-bin, concrete-walled basins, with concrete columns at the corners of each bin. Other outlying columns are located north and south of the described structure. Archeological research (LSA, 2006) indicates that this site was a ranch, and the owner had a fondness for constructing with concrete.

Issues associated with a former farm residence include leach fields/septic tanks and buried heating oil tanks. The remnant concrete structures need to be assessed for LCP and ACM, prior to demolition and preparation of construction documents. An assessment for the presenee of these materials may materially affect the purchase of the parcel. We recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM during grading operations, and his responsibility to respond accordingly.

General Contamination/Hazardous Materials Issues

- PESTICIDES

The project includes acquisition of former cattle grazing and crop land; however, it appears that most of the open land in the project vicinity was used for grazing. Therefore, there is low to moderate potential for residual pesticides, herbicides, and fungicides. Based on the reviewed data, there is no obvious evidence of pesticide mixing, storage and/or misuse within the proposed right-of-way acquisition areas. Nonetheless, agricultural chemicals are typically used on farm lands. BCI considers it possible that pesticides, herbicides, and fungicides have been applied and used within the properties identified by MTCo as properties of interest.

Residual pesticides from normal agricultural application are generally exempt from mandatory assessment. This does not, however, preclude their existence. For roadway right-of-way acquisition projects, requirements for additional investigation are not clearly established. Therefore, it's important that the County of El Dorado understand the issue so they can make an informed decision on how to proceed. At a minimum, for sites with potential right-of-way acquisition, we recommend the County obtain a statement from the current property owner regarding past agricultural chemical use. If the statement is conclusive and suggests that usage would not result in significant residual pesticides concentrations, then no further action, such as sample collection and analysis, would be required.

- NATURALLY OCCURRING ASBESTOS

The project site is located in a geologic region identified as having at or near surface naturally occurring asbestos (NOA) bearing rocks and soils. Consequently, any development and/or construction in this area must comply with applicable rules and regulations, as written by El Dorado County Environmental Health Department. NOA-bearing rocks and soils potentially affect all parcels.

The contractor shall have experience implementing El Dorado County's special NOA grading requirements. An NOA monitoring plan will be required prior to grading. Some of the plan elements include: 1) a geologist trained in the recognition of NOA should be intermittently present during grading operations, 2) the geologist shall observe site conditions and implement special grading conditions when NOA is present. BMPs for dust control should be practiced during all grading operations in El Dorado County.

- AERIALLY DEPOSITED LEAD

The proposed interchange improvements will include grading within the existing SR50 shoulders and right-of-way (ROW). Caltrans is likely to require an aerially deposited lead (ADL) investigation prior to construction. Soil that is potentially impacted by ADL and disturbed during grading activities is subject to Department of Toxic Substances Control (DTSC) definition for handling hazardous waste. California currently defines material containing lead concentrations above 350 parts per million (ppm) as subject to Class I hazardous waste disposal. If ADL is detected at concentrations requiring hazardous waste handling and disposal, then we recommend that the local Caltrans district office be contacted to determine the applicability of reusing ADL-impacted soil under the terms of the DTSC-issued "Lead-impacted Soil Reuse

Variance". If the variance is not available to this district, then lead containing soils may require disposal at a Class I landfill.

ADL may also be present on privately-owned parcels adjacent to SR50. The potential ADL impact is likely limited to surface and shallow subsurface soils located within 2 feet of the existing ground surface (DTSC, 1995; Caltrans, 1998), and within 150 ft of the existing freeway right-of-way (Caltrans, 1995). The following Parcels are identified as potentially ADL-impacted: Parcels 1, 6, 7, 8, 9, 10, 11, 12, 13, 14, 17, 18, 19, 22, 25, 26, 27, and 28. We recommend a minimum of one surface soil sample be obtained for ADL screening. The assessment should be performed on that portion of the parcel directly adjacent to and within 50 feet of the edge of pavement. Parcels with a long contiguaous portion of property adjacent to the freeway shall be sampled for ADL every 300 feet.

- TRANSFORMERS

The scope of this assessment did not include an inventory of past and present transformers along the alignment. However, BCI observed several pole-mounted transformers and high voltage power lines along the proposed SR 50 widening corridor, and along the existing Silva Valley Parkway, White Rock Road, Tong Road, and Joerger Cutoff Road. Many of these overhead electrical powerlines are located within the proposed right-of-way acquisition areas. The transmission lines and poles appear relatively new, and few of the transformers show signs of external rust or discoloration. The existing pole-mounted transfomers need to be considered potentially impacted if their removal or relocation is required during construction. Existing transformers should be checked for the presence of PCBs, and if present, they should be disposed of in accordance with current regulations. Surface mounted transformers and electrical switeh boxes were also observed within the project area, and may also constitute a potential PCB-impacted risk.

- YELLOW TRAFFIC STRIPES

Yellow traffic stripes are known to contain heavy metals such as lead and chromium at concentrations in excess of the hazardous waste thresholds established by the California Code of Regulations (CCR) and may produce toxic fumes when heated. Consequently, any yellow traffic striping removed from the existing surface streets and SR50 highway will require proper disposal, which may include disposal at a Class 1 disposal facility.

- UNDERGROUND PRODUCT DISTRIBUTION LINES

An assessment of utilities or buried petroleum product distribution lines is not within the scope of this ISA. We did not observe warning signs for petroleum product lines. We observed markings for gas, water, electric, sewer, and storm drain at various locations. A sewer lift-pump station is located along the west side of Silva Valley Road. These and other utilities are present throughout the proposed interchange improvement area. The database records do not indicate contamination resulting from utility spills; however, there is the potential for unidentified leaks.

1 INTRODUCTION

Mark Thomas & Company, Inc. retained Blackburn Consulting (BCI) to perform an Initial Site Assessment (ISA) for the El Dorado County Department of Transportation's proposed Silva Valley Parkway/SR50 Interchange project (03-ED-50, KP 3.1 (PM 1.7). The purpose of this assessment is to identify hazardous and potentially hazardous materials issues for parcels directly impacted by the proposed interchange project.

We show the general location of the project site on Figure 1. The proposed interchange improvements and identification of parcels impacted by the proposed project are shown on Figure 2.

1.1 Scope of Services

The purpose of this ISA is to:

- Identify known contamination as well as hazardous and potentially hazardous materials issues that may influence construction of the project, and
- Identify impacted parcels within the project area and assess the potential impacts to site acquisition and/or construction if all or a part of these must be acquired to facilitate the planned improvements.

To conduct this ISA, BCI:

- Received right-of-entry permits for the majority of parcels within the project area. Permits were obtained from the County of El Dorado, Department of Transportation (ELDOT) right-of-way staff. We provided ELDOT with 48-notice prior to parcel entry.
- Conducted a limited site reconnaissance to observe current land uses and indications of potential contamination on properties subject to partial or complete site acquisition, and to view publicly accessible portions of adjacent properties.
- Reviewed the site geology.
- Reviewed historical aerial photograph coverage and topographic map coverage of the project corridor and surrounding properties for indications of potential sources of contamination.
- Performed federal, state, and county records search for indications of the use, misuse, or storage of hazardous and/or potentially hazardous materials on or near the site. Environmental Data Resources, Inc. (EDR) of Southport, Connecticut, provided the federal, state, and county database search. We provide an electronic copy of EDR's report on a CD in Appendix A.
- Prepared this report to summarize the findings of our review, site reconnaissance, historical photographs, and regulatory records review. We identified potential contamination/hazardous materials impacts and provided recommendations for further investigation where necessary.

2 PROJECT DESCRIPTION AND LOCATION

2.1 Project Description

The interchange will eonnect Silva Valley Parkway, an arterial roadway linking approved development in El Dorado Hills, to State Route (SR) 50. The interchange will provide a needed eonnection, and relieve congestion at the existing El Dorado Hills/Latrobe Road interchange. There are several interchange configurations being evaluated, including variations on a Type L-9 partial cloverleaf interchange and a Type L-2 spread diamond interchange.

According to the preliminary site plan (MTCo, February 2006), this section describes parcels that may require partial or complete site acquisition to accommodate planned improvements. The current improvement plans also identifies parcels that are potentially impacted by the project, but which may not be subject to acquisition. We identify parcels by site name and APN. Each brief site description is followed by corresponding photo numbers. We provide a photograph of individual sites in Appendix B. We identify parcels by APN on Figure 2.

PARCEL 1, "EDH 52", APN 108-030-1010
Current interchange improvement plans require complete acquisition of this parcel. The parcel existing features include old foundations, pilasters, and concrete debris piles. The majority of the site is undeveloped barren land (Photos 15, 16, and 40 through 43).

PARCEL 2, "EL DORADO HILLS INVESTORS", APN 107-130-0110
Proposed for partial or complete site acquisition. Impact may be right-of-way acquisition along the property boundary with Tong Road. This parcel is currently undeveloped (Photo 13).

PARCEL 3, "COUNTY OF EL DORADO", APN 108-070-3210
Currently owned by the County. Proposed plans show an on- and off-ramp through the western part of the site. This parcel is currently undeveloped (Photo 17).

PARCEL 4, "CAPITAL KOREAN PRESBYTERIAN CHURCH", APN 108-070-0210
Proposed for partial site acquisition. Impact may be right-of-way acquisition along the south property boundary with Tong Road. This parcel is developed by a large church structure and parking area (Photo 21).

PARCEL 5, "LAFONTSEE BONNIE L & CHRIS L", APN 108-070-0310
Proposed for partial site acquisition. Impact may be right-of-way acquisition along the south property boundary. This parcel is undeveloped, with remnants of previous structures visible on the ground surface (Photo 21).

PARCEL 6, "TONG ARTHUR D & FAM REV 1999", APN 108-070-0410
Plans appear to indicate partial site acquisition, which shows possible improvements along Tong Road. Impacts may be along Tong Road, which bisects the property. This parcel is undeveloped (Photos 18 through 20).

PARCEL 7, "MOHANNA MOE & NASRIN", APN 108-070-2210
Plans appear to indicate partial site acquisition. Impacts may be along the south property boundary, where SR50 borders the parcel. This parcel is currently undeveloped along the freeway, but improved by a residence on the north side (Photos 69 and 72), away from the freeway.

PARCEL 8, "MOHANNA MOE & NASRIN", APN 108-070-2610
Plans appear to indicate partial site acquisition. Impacts may be along the south property boundary, where SR50 borders the parcel. This parcel is currently undeveloped along the freeway, but improved by a residence on the north side (Photos 69 and 70).

PARCEL 9, "EL DORADO HILLS INVESTORS", APN 107-130-0210
Current interchange improvement plans require complete acquisition of this parcel. This parcel is currently undeveloped and barren (Photo 14).

PARCEL 10, "PG&E CLARKSVILLE SUBSTATION", APN 107-130-0610
Proposed for partial site acquisition. Impacts may be along the north property boundary, where the pareel borders SR50. This parcel is currently used as an electrical transfer and substation (Photo 1).

PARCEL 11, "EL DORADO HILLS INVESTORS", APN 107-130-0510
Proposed for partial or complete site acquisition. Impacts are along the north property boundary, where the site borders SR50. This parcel is currently undeveloped, the majority of which is a marshy, wetland area (Photos 6 & 7).

PARCEL 12, "EL DORADO HILLS INVESTORS", APN 107-130-0410
The site is proposed for partial or complete site acquisition. Impacts may be along White Rock Road, which borders the site on the west, and where the property borders SR50 on the north. This parcel is currently undeveloped and barren (Photos 7 & 10).

PARCELS 13 & 14, "KFRD INVESTORS & TONG RANCH LLC", APN 108-070-0510 and -0610
Proposed for partial site acquisition along the northwest boundary of Parcel 13 with SR50, and partial acquisition where both properties border SR50 on the north. The parcels are mostly undeveloped; however a small residence, rusted farm equipment, debris piles, and a large barn are present along White Rock Road (Photos 30 through 39), which bisects Parcel 14. An old cemetery is also present on Parcel 13.

PARCELS 15 AND16, "HUDDRIDGE PARTNERS ", APN 108-780-0210 & 108-780-0110
Proposed for partial site acquisition. Impacts may occur along White Rock Road, which bisects between the parcels, and where the road is proposed to be re-aligned through both parcels as a part of the new interchange. The parcels are currently undeveloped and barren (Photos 8 & 9).

PARCEL 17, "PEERMAN, JACK & BETTY", APN 107-130-0710
Proposed for partial site acquisition along north boundary with SR50. The parcel is improved by a residential structure, garage, storage barn, pavement, and related improvements. The remainder of the parcel is mostly barren (Photo 3).

PARCEL 18, "EL DORADO HILLS INVESTORS", APN 107-130-0410
Proposed for partial site acquisition. Impacts are predominately along the north property line with SR50. This parcel is currently developed by a Mercedes dealership (Photos 2 and 4).

PARCEL 19, "PHOENIX PACIFIC COMPANY", APN 107-680-1310
May be proposed for partial acquisition. Impacts are likely located along the south property line with the west-bound off-ramp at the SR50/El Dorado Hills Boulevard interchange. This parcel is currently developed by a children's daycare facility (Photos 48 and 49) and associated paved parking improvements.

PARCEL 20, "SERRANO ASSOCIATES", APN 107-660-0310
Proposed for partial site acquisition. Impacts are located along the south property line with SR50. This parcel is currently developed by a country club and golf course (Photo 63).

PARCEL 21, "SERRANO ASSOCIATES", APN 114-160-1910
Proposed for partial site acquisition. Impacts are located along the south property line with SR50 and along the east property boundary with Silva Valley Parkway. This hilly parcel is currently undeveloped (Photos 62, 64, and 65). We note the presence of a former residence, exampled by old foundations.

PARCEL 22, "EL DORADO SAVINGS BANK", APN 107-680-0610
Similar to Parcel 19, may be proposed for partial acquisition. Impacts are likely along the south property line with the west-bound off-ramp at the SR50/El Dorado Hills Boulevard interchange. This parcel is developed by an El Dorado Savings Bank (Photos 49 and 50).

PARCEL 23, "SERRANO ASSOCIATES LLC", APN 114-780-0110
Proposed for partial site acquisition. Potential impacts are located near the west and south property lines, for the proposed Country Club Drive roadway improvements. The proposed road is located along the northern boundary of Parcels 3, 4, 5, and 6. This parcel is currently improved by a dirt road, but is otherwise barren (Photos 22 and 23), with some trees and imported gravel and soil stockpiles along the north boundary.

PARCEL 24, "SERRANO ASSOCIATES LLC", APN 114-150-42100
Proposed for partial site acquisition along the western property line with Silva Valley Parkway. The parcel is currently undeveloped (Photos 24 and 25). The parcel is located next to a sehool. We observed a soil stockpile, which may have been generated during grading for the recently completed, adjacent school.

PARCEL 25, "WILMINGTON TRUST / TOSCO TRUST", APN 107-120-0410
Parcel subject to partial site acquisition. Impacts located along south property line at the west-bound SR50 off-ramp. The site is currently developed by a Union 76 service station (Photo 25).

PARCEL 26, "AHART TRUST / JONES TRUST", APN 107-120-2610
Similar to Parcel 19, may be proposed for partial acquisition. Impact is likely located along the south property line with the west-bound off-ramp at the SR50/El Dorado Hills Boulevard interchange. This parcel is currently developed by a "Taco Bell" (Photo 51).

PARCEL 27, "TOWN CENTER EAST LP", APN 107-130-3610
Proposed for partial site acquisition. Impact is located along the north property line, adjacent to the SR50 eastbound on-ramp from the El Dorado Hills Blvd/Latrobe Road interchange. The parcel is developed as a shopping are and associated paved parking (Photos 56 and 57).

PARCEL 28, "EDH TOWN CNTR EAST OWNERS ASSOC", APN 107-130-4310
Proposed for partial site acquisition along the north property line with the SR50 eastbound on-ramp. This parcel is an undeveloped marshy area next to the "Town Center" (Photo 58).

PARCEL 29, "SYERS PROPERTIES III LLC", APN 107-130-4810
Possible partial site acquisition along western boundary with El Dorado Hills Boulevard. This parcel is developed as a landscaped area (no photo).

PARCEL 30, "SYERS PROPERTIES III LLC", APN 107-130-4910
Possible partial site acquisition along western boundary with El Dorado Hills Boulevard. This parcel is improved by a shopping center (no photo).

PARCEL 31, "SYERS PROPERTIES III LLC", APN 107-130-5010
Based on the current improvement plans, the parcel is identified within the project limits, but does not appear to be proposed for partial acquisition. This parcel is currently improved by a shopping center, which includes a gasoline service station (Photos 59, 60, and 61).

PARCEL 32, "COUNTY OF EL DORADO", APN 107-680-0910
Based on the current improvement plans, the parcel is identified within the project limits, but does not appear to be proposed for partial acquisition. The site is currently developed by a "Taco Bell", and is located adjacent to a "Shell" service station (Photos 53, 54 and 55).

PARCEL 33, "CRISP FAMILY TRUST", APN 107-680-1010
Based on the current improvement plans, the parcel is identified within the project limits, and may be subject to partial acquisition. The potential impact is located along the south boundary line with the paved entrance to the shopping center. The parcel is improved as a landscaped area (no photo) along El Dorado Hills Boulevard.

PARCEL 34, "MCNAN LLC", APN 107-680-0810
Based on the current improvement plans, the parcel is identified within the project limits, and may be subject to partial acquisition. The potential impact is located along the west boundary with El Dorado Hills Boulevard. This parcel is developed as a landscaped area (Photo 53).

2.1.1 Surrounding Area

Current land use surrounding the interchange is generally commercial, rural/urban residential, recreational. Historic uses are similar and include limited agricultural/ranching, and minor surface mining/dredging. In general, high-density residential and commercial uses are beginning to dominate the area. Low density, rural residential and ranch land are located to the south and east. Commercial development is located along El Dorado Hills Boulevard and Latrobe Road, southwest of the proposed Silva Valley interchange.

2.2 Site Conditions and Local Geologic Characteristics

The topography through the corridor is generally mild to moderately sloped, consisting of rolling hills of the western Sierra Nevada Foothills. The average elevation is between 610 to 825 feet above mean sea level (msl), with the proposed interchange at SR50 reaching Elev.736 feet near the Silva Valley/White Rock Road undercrossing. Elevations are based on the USGS 7.5 Minute Topographic Map, Clarksville, CA.

The region surrounding and including this project, is known to be potentially impacted by naturally occuring asbestos (NOA). Geologic maps of the project area (Churchill, 2001[1]) show ultramafic rock with the potential to contain NOA. NOA is typically present within local zones of ultramafic rock, typically serpentinite. In California, ultramafic rocks are often associated with fault complexes like the ones present in this portion of the Western Sierra Nevada Foothills. NOA is a known hazardous material. The following discussion is a summary of the geologic conditions related to the occurance of NOA in the project area.

Our site work and published geologic literature indicate that meta-volcanic, meta-sedimentary, granitic, and gabbroic (igneous) rocks underlie the site at shallow depth. Regionally, these rocks occur within an area that is predominately composed of a northwest trending belt of Mesozoic-age rock that extends along the western slopes of the Sierra Nevada, including most of western El Dorado County. This metamorphic belt is intruded by numerous small to moderately large bodies of mafic and ultra-mafic igneous rock, including the Pine Hills Intrusive complex composed predominately of gabbroic igneous rock. Published geologic literature indicates that the study area is underlain by Mesozoic age metavolcanic rocks of the Copper Hill Formation and metasedimentary rocks of the Salt Springs Slate Formation (CDMG, 1981).

The rock structure is dominated by a series of northwest trending faults and fault zones that mark the boundaries of various rock types. Wagner, 1987[2], and Busch, 2001[3], show the site approximately 1 mile east of the West Bear Mountains Fault Zone. The East Bear Mountains Fault Zone is located approximately 8 miles east of the site. The igneous rocks located between the west and east Bear Mountains Fault Zones are an ophiolitic terrain comprised of altered basic igneous rocks. Amphibolites and serpentinized ultramafic rocks are common alteration products and are present within selected areas of the Pine Hill intrusive complex. Amphibolites and

[1] Churchill, et al., 2001, Areas Most Likely to Contain Natural Occurrences of Asbestos in Western El Dorado County, California, California Geological Survey, OFR 2000-02

[2] Wagner, D.L. et al., 1987, The Geologic Map of the Sacramento Quadrangle, California Geological Survey, Map No. 1A

[3] Busch, 2001, Geologic Map of El Dorado County, California Geological Survey, OFR 2000-03

serpentine are silicate minerals that can occur as both asbestiform (fibrous) and non-asbestiform (platy or blocky) varieties. Exposed rock at the site consists predominantly of rocks identified as the Copper Hill Volcanics Formation. The rocks are moderately to intensely weathered, metamorphosed volcanics, with some metamorphosed sandstone and shale.

Occurrences of naturally occurring asbestos (NOA) are typically associated with local faulting and ultramafic rocks. We observed prominent shear zones along the western road-cut of El Dorado Hills Boulevard and along SR50 road cuts east and west of the El Dorado Hills Boulevard/SR50 interchange. The shear zones are related to faulting and/or compressional stresses from the west spur of the Bear Mountains Fault Zone. The fault trace, bearing approximately north-south, is located 500 feet east of the El Dorado Hills Interchange. Rocks associated with the faulting may contain talc-sericite schist or talc-chlorite schist.

2.3 Current Land Use

Land uses on parcels discussed in this report include:

- Retail gas and petroleum product sales
- Retail Convenience Stores
- "Strip Mall" - Grocers and Retail sales
- Auto Sales and Repair
- Restaurants
- State Route 50 (SR50)
- Dense, urban residential and rural residential
- Commercial Building Supplies
- Undeveloped land

Land use in the surrounding area includes commercial, urban and rural residential, and ranching (agricultural). The most notable surrounding land uses include a large commercial complex at the southeast corner of the El Dorado Hills Boulevard (EDHB) and SR50 interchange, and urban residential development to the north and west of the proposed new interchange. At the proposed interchange site, the predominant land use is rural residential, an electrical switching yard, ranch/farm land, a golf course, and a church. A marshy, wetland area borders two significant drainages that flow from northeast to southwest and beneath SR50, and are located east and west of the Silva Valley Parkway/White Rock Road undercrossing of SR50.

2.4 Historical Land Use

2.4.1 Summary

Prior to 1944, land use in the project area appears as rural residential, ranching, and agriculture. A 1944 topographic map shows SR50 as a two-lane road connecting Scotts Road to the Lake Tahoe area. This portion of the SR50 alignment appears similar to the present alignment of the four lane SR50 highway. The old road alignment passes through the community of Clarksville,

and connects eastward to the town of Shingle Springs. Based on the 1994 topographic map (Folsom Quad, USGS, 1944), Clarksville appears as the only significant residential community in the vicinity of the proposed new interchange.

The alignment of SR50 appears fixed between the years 1944 and 1952. Substantial residential and commercial development did not begin until around 1970, around the time of the improvements of SR50 to a four-lane highway. Residential development north of SR 50 started after construction of the freeway. Dense residential and commerical development north and south of SR50 began to flourish in the late 1990s.

2.4.2 Aerial Photograph Review

BCI's aerial photo review included photos from 1952, 1961, 1971, 1981, 1993, and 1998. For partial or complete acquisition parcels, the following summarizes noteworthy changes in each photo interval. We used the following photos:

1952 Photo by Pacific Air, Scale 1" = 555'
1961 Photo by Cartwright, Scale 1" = 555'
1971 Photo by Cartwright, Scale 1" = 333' and 1" = 666'
1981 Photo by Cartwright, Scale 1" = 333' and 1" = 666'
1993 Photo by USGS, Scale 1" = 666'
1998 Photo by USGS, Scale 1" = 666'

PARCEL 1, "EDH 52", APN 108-030-1010

1952 Predominately barren land, with a farm/ranch improvement at the center of property. The improvements are located on about one (1) acre of the site. Drainage flows from north to south across this site. SR50 borders the south side of the property. An access road connects the farm/ranch to SR50.
1961 The farm/ranch structures are partially removed, and site appears abandoned. A box shaped tower remains on site. Otherwise, the site is unchanged from the previous photograph.
1971 A box-shaped tower removed. SR50 is now a 4-lane freeway immediately adjacent to the south boundary of the site. The Silva Valley undercrossing (UC) of SR50 is present to the southwest of the parcel, and a golf course is present to the west. Residential development begins on the east side of El Dorado Hills Boulevard, directly west of this parcel.
1981 The site is essentially unchanged from the previous photograph.
1993 An east-west oriented dirt access road crosses the middle property. Otherwise, the parcel is essentially unchanged from the previous photograph.
1998 Essentially unchanged from previous photograph.

PARCEL 2, "EL DORADO HILLS INVESTORS", APN 107-130-0110

1952 Bare, unimproved parcel. Site is essentially unchanged from 1952 to the present.

PARCEL 3, "COUNTY OF EL DORADO", APN 108-070-3210

1952 Bare, unimproved parcel. Site is essentially unchanged from 1952 to the present.

PARCEL 4, "CAPITAL KOREAN PRESBYTERIAN CHURCH", APN 108-070-0210

1952 Bare, unimproved parcel. Site is essentially unchanged from 1952 to 1998.

1998 Sometime after 1998, a church structure is built on the parcel.

PARCEL 5, "LAFONTSEE BONNIE L & CHRIS L", APN 108-070-0310

1952 Site appears improved by a rural residential structure. Ancillary storage/barn structures and numerous motor vehicles and farm-type equipment also appear on the site.

1961 Not visible in the photograph.

1971 Not visible in the photograph.

1981 Essentially unchanged from the 1952 photograph.

1993 Essentially unchanged from previous photograph.

1998 Essentially unchanged from previous photograph.

PARCELS 6, 13 & 14, "TONG ARTHUR D & KFRD INVESTORS/TONG RANCH LLC ", APN 108-070-0410, 108-070-0510 & 108-070-0610, (RESPECTIVELY)

1952 White Rock Road/Tong Road bisects the Tong properties along a north-south orientation, and SR50 bisects the Tong properties from east to west. The majority of this large property is barren, unimproved land.

1961 Sometime between 1961 and 1998, residential/farm structure are built along White Rock Road, south of SR50.

1971 Property further bisected by the construction of the 4-lanes of SR50. The site is not visible in the photographs between 1971 and 1998.

1998 Essentially no change in the site from 1971 to 1998.

PARCELS 7 & 8, "MOHANNA MOE & NASRIN", APN 108-070-2210 & 108-070-2610

1952 Barren, undeveloped land in 1952. Essentially no site change from 1952 to 1993.

1993 A residence is present near the north property lines. Except for the construction of SR50, the properties are essentially unchanged.

1998 Essentially unchanged from previous aerial photograph.

PARCELS 9, 11, & 12, "EL DORADO HILLS INVESTORS", APN 107-130-0210, 107-130-0510, & 107-130-0410, (RESPECTIVELY)

1952 Barren, fallow land, covered by grasses. A significant drainage bisects Parcel 11, flowing into a marshy, wetland area just south of SR50. The parcels appear as a single contiguous parcel bisected by the two-lane SR50 highway.

1961 Essentially unchanged from previous aerial photograph.

1971 The existing, individual parcels are formed because of the construction of the 4-lane section of SR50. The White Rock Road/Silva Valley Parkway and the Clarksville undercrossing are constructed between Parcels 11 and 12. A PG&E substation is constructed adjacent and west of Parcel 11.

1981 Essentially unchanged from previous aerial photograph.

1993 Essentially unchanged from previous aerial photograph.

1998 Essentially unchanged from previous aerial photograph.

PARCEL 10, "PG&E CLARKSVILLE SUBSTATION", APN 107-130-0610

1952 *The site is partially improved by structures that appear to be a gas station/commercial building adjacent to eastbound SR50, a 2-lane road at this time.*

1961 *Essentially unchanged from previous aerial photograph.*

1971 *Previously noted structures are removed, and the PG&E "Clarksville" substation constructed.*

1981 *Additional electrical equipment improvements constructed on the substation site. Open space is noted within the station. A single–family residence is present adjacent and west of the PG&E substation.*

1993 *The substation appears to be fully built-out with additional transformers and related electrical equipment occupying the previous open space.*

1998 *Essentially unchanged from previous aerial photograph.*

PARCELS 15 AND16, "HUDDRIDGE PARTNERS ", APN 108-780-0210 & 108-780-0110

1952 *These parcels are located near confluence of Screech Owl Creek, Carson Creek, and an un-named drainage located adjacent to the future White Rock Road. Grasses and a sparse amount of trees cover the parcels. White Rock Road bisects the two parcels in a north-south orientation.*

1998 *White Rock Road is realigned to meet Silva Valley Road at SR50, further bisecting the two parcels. There are no other changes between 1952 and 1998.*

PARCEL 17, "PEERMAN, JACK & BETTY", APN 107-130-0710

1952 *Barren, undeveloped land, covered by low grasses. The Clarksville cemetery is located immediately southwest of the parcel.*

1961 *Essentially unchanged from previous aerial photograph.*

1971 *Essentially unchanged from previous aerial photograph, except for a small unidentified-use structure constructed adjacent and west of the PG&E substation.*

1981 *A residential structure, garage, and small barn are present.*

1993 *Essentially unchanged from previous aerial photograph.*

1998 *Essentially unchanged from previous aerial photograph. The vegetation has matured around the house.*

PARCEL 18, "EL DORADO HILLS INVESTORS", APN 107-130-0410

1952 *Barren, unimproved land, covered by low grasses. Site borders old SR50 on the south.*

1961 *Essentially unchanged from previous aerial photograph.*

1971 *Except for the improvement of SR50 to a 4-lane highway, the site is essentially unchanged from previous aerial photograph.*

1981 *Essentially unchanged from previous aerial photograph.*

1993 *Unchanged from previous aerial photograph. There is some maturation of vegetation.*

1998 *Essentially unchanged from previous aerial photograph.*

PARCEL 19, "PHOENIX PACIFIC COMPANY", APN 107-680-1310

1952 *Barren, unimproved land, covered by grasses.*

1961 *Essentially unchanged from previous aerial photograph.*

1971 The El Dorado Hills Boulevard/SR50 interchange is constructed. Commercial developments begin at the strip mall, where the parcel is located.
1981 The parcel is not located within the boundaries of the photograph.
1993 Other parcels around Parcel 19 are commercially improved. Site is graded, but no structural improvements (buildings) begun.
1998 Unchanged from previous aerial photograph.

PARCEL 20, "SERRANO ASSOCIATES LLC", APN 107-660-0310

1952 Parcel borders old SR50 on the north, and consists of barren, grass-covered, unimproved land.
1961 Essentially unchanged from previous aerial photograph. Grading begun for the construction of the Parcel's golf course and for El Dorado Hills Boulevard (adjacent to the west.
1971 The El Dorado Hills Boulevard/SR50 interchange is complete, and the construction of the golf course is complete.
1981 Aside from general landscaping improvements, the site is essentially unchanged from previous aerial photograph.
1993 Essentially unchanged from previous aerial photograph.
1998 Some vegetation maturation. Otherwise, unchanged from previous photograph.

PARCELS 21 & 24, "SERRANO ASSOCIATES LLC", APN 114-160-1910 & 114-150-42100

1952 Predominately barren, grass-covered land. A single-family residence is present where the property borders old SR50 on the north. Few trees on site.
1961 Essentially unchanged from previous aerial photograph.
1971 The residential foundation is still present, but the house is removed for the widening of SR50.
1981 Essentially unchanged from previous aerial photograph.
1993 Except for some minor dirt roads across the parcels they appear unchanged from previous aerial photograph.
1998 Essentially unchanged from previous aerial photograph.

PARCEL 22, "EL DORADO SAVINGS BANK", APN 107-680-0610

1952 Barren, unimproved land, covered by grasses.
1961 Essentially unchanged from previous aerial photograph.
1971 The El Dorado Hills Boulevard/SR50 interchange is constructed, and the first improvements are started for the commercial development, of which this parcel is a part.
1981 Not located within the boundaries of the photograph.
1993 Commercial structures built around Parcel 22. However, there are no structural improvements (building) on site. Minor grading of parcel is evident.
1998 Essentially unchanged from the previous aerial photograph.

PARCEL 23, "SERRANO ASSOCIATES LLC", APN 114-780-0110

1952 Site consists of barren, unimproved land covered by low grasses.
1961 Essentially unchanged from previous aerial photograph.
1971 Site not visible in the photograph.

1981 The parcel is essentially unchanged from previous 1961 aerial photograph.
1993 Essentially unchanged.
1998 Except for the maturation of trees along existing drainages the site is essentially unchanged from the previous aerial photograph.

PARCEL 25, "WILMINGTON TRUST / TOSCO TRUST", APN 107-120-0410

1952 Barren, unimproved land, covered by grasses.
1961 The El Dorado Hills Boulevard/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.
1971 Not located within the boundaries of the photograph.
1981 Not located within the boundaries of the photograph.
1993 The Union 76 service station is constructed on the parcel.
1998 Essentially unchanged from the previous aerial photograph.

PARCEL 26, "AHART TRUST / JONES TRUST", APN 107-120-2610

1952 Parcel consists of barren, unimproved land, covered by grasses.
1961 The El Dorado Hills Boulevard/SR50 (EDHB/SR50) interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.
1971 Not located within the boundaries of the photograph.
1981 Not located within the boundaries of the photograph.
1993 Site surrounded by commercial development. No structural improvements (building) on site.
1998 The current "Taco Bell" is constructed on the site.

PARCEL 27, "TOWN CENTER EAST LP", APN 107-130-3610

1952 Barren, unimproved land, covered by grasses.
1961 The El Dorado Hills Boulevard/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.
1971 Not located within the boundaries of the photograph.
1981 Not located within the boundaries of the photograph.
1993 The parcel is essentially unchanged from previous improvements to the interchange. Construction of the new "Town Center" commercial development has started to the south.
1998 Parcel 27 is included in the areas developed as the "Town Center" commercial development.

PARCEL 28, "EDH TOWN CNTR EAST OWNERS ASSOC. ", APN 107-130-4310

1952 Barren, unimproved land, covered by grasses. A major drainage runs through the site.
1961 The EDHB/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.
1971 The widening of SR50 to a 4-lane highway is complete. SR50 borders the site on the north.
1981 Property is virtually unchanged from the previous aerial photograph.

1993 *Construction of the new "Town Center" commercial development has begun to the south of the site.*

1998 *The drainage that previously flowed due south from the eastbound SR50 on-ramp has been rerouted, and flows eastward to connect with the drainage flowing through Parcel 28.*

PARCELS 29 & 30, "SYERS PROPERTIES III LLC", APN 107-130-4810 & 107-130-4910

1952 *Barren, unimproved land, covered by grasses.*

1961 *The EDHB/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.*

1971 *Not located within the boundaries of the photograph.*

1981 *Not located within the boundaries of the photograph.*

1993 *The parcels are rough-graded as a part of the improvements for the new "Town Center" commercial development, under construction.*

1998 *New buildings and landscaping are constructed on the Parcel.*

PARCEL 31, "SYERS PROPERTIES III LLC", APN 107-130-5010

1952 *Bare, unimproved land, covered by grasses.*

1961 *The El Dorado Hills Boulevard/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.*

1971 *Predominately unchanged from previous photograph.*

1981 *Not located within the boundaries of the photograph.*

1993 *Roads for the new "Town Center" shopping area are visible. The drainage from a new, south flowing channel crosses diagonally across the site.*

1998 *Drainage re-routed to the north and east of the parcel. Construction of the "Town Center" commercial development is underway, with a new gas station and other structures on the site.*

PARCEL 32, "COUNTY OF EL DORADO", APN 107-680-0910

1952 *Parcel consists of barren, unimproved land, covered by grasses.*

1961 *The EDHB/SR50 interchange is under construction. The entrance road to the future shopping area is rough graded. Otherwise, site is essentially unchanged from the previous aerial photograph.*

1971 *Not located within the boundaries of the photograph.*

1981 *Not located within the boundaries of the photograph.*

1993 *Parcel 32 is graded for new commercial development. No structural improvements (building) on site.*

1998 *A "Jack in the Box" restaurant is constructed on the parcel.*

Parcel 33, "CRISP FAMILY TRUST", APN 107-680-1010

1952 *Parcel consists of narrow strip of barren, unimproved land, covered by grasses.*

1961 *Unchanged from previous aerial photograph.*

1971 *Not located within the boundaries of the photograph.*

1981 *Not located within the boundaries of the photograph.*

1993 Parcel 33 is a part of an existing commercial development, consisting of landscaping and a curb area on the north side of the shopping center's entrance from EDHB.
1998 Unchanged from previous aerial photograph.

Parcel 34, "MCNAN LLC", APN 107-680-0810
1952 Parcel consists of narrow strip of barren, unimproved land, covered by grasses.
1961 Unchanged from previous aerial photograph.
1971 Not located within the boundaries of the photograph.
1981 Not located within the boundaries of the photograph.
1993 Parcel 34 is a part of an existing commercial development, consisting of landscaping and a curb area east of EDHB, and bordering the shopping center on the west.
1998 Unchanged from previous aerial photograph.

2.4.3 Topographic Map Review

BCI's topographic map review includes 7½-minute USGS quad maps from 1944, 1953, and 1973. This summary includes the noted changes within the project area as recorded on the maps:

1944 USGS Folsom Quad, Scale 1:62,500

- SR50 shown along nearly the same alignment it has today. However, it terminates at Scott's Road to the west, where that road runs parallels to the Southern Pacific Railroad tracks, then continues eastward towards Shingle Springs.
- Clarksville/White Rock Road is shown as it exists today. The preliminary alignment of Silva Valley Road is present, and comprises a dirt/gravel road that crosses old SR50 and proceeds in a northerly direction.
- The Tong Road alignment appears on the map as a dirt road. The road has a spur that goes to a cemetery. The Clarksville cemetery is observed on the map.
- We note no other improvements within a one-mile radius of the subject intersection.

1953 USGS Clarksville Quad, Scale 1:24,000

- SR50 exists as a single lane road in each direction. Embankment fill and roadway cuts are visible, based on contours shown on the topographic map.
- There are no significant changes to the topography and road alignments observed in the 1944 map. Clarksville appears as the only concentration of residential and/or commercial structures in the immediate area.

1973 USGS Clarksville Quad, Scale 1:24,000

- SR50 is widened to a 4-lane highway, with a new 2-lane road constructed to the south of the earlier 2-lane alignment.

- The White Rock Road at-grade intersection is converted to an underpass with a concrete deck bridge at SR50. The road continues north of the freeway, where it is renamed Silva Valley Parkway.
- The EDHB/SR50 interchange is constructed, and a new subdivision is present north of the freeway. The map shows the golf course. Between EDHB/SR50 and the Bass Lake/SR50 interchange, all prior at-grade connections of local roads with SR50 are gone.
- Residential subdivision development is present along El Dorado Hills Boulevard.

3 RECORDS REVIEW

3.1 Review of County, State, and Federal Records

We requested EDR to perform a "Radius Search Report" for the Silva Valley Interchange, from roughly west of the El Dorado Hills Boulevard/SR50 interchange to the Bass Lake/SR50 interchange. The study included a search and review of county, state, and federal databases. The following databases were searched:

- National Priorities List (NPL)
- NPL Proposed
- NPL Delisted
- Resource Conservation and Recovery Act information (RCRA-SQG)
- Unconfirmed Properties Referred to Another Agency (REF)
- School Property Evaluation Program (SCH)
- Properties Needing Further Evaluation (NFE)
- Statewide SLIC Cases
- Emissions inventory data (EMI)
- Voluntary Cleanup Program Properties (VCP)
- Indian LUST
- Calsites Database (CAL-SITES)
- Section 7 tracking systems (SSTS)
- Uranium Mill Tailings Sites (UMTRA)
- Open dump inventory (ODI)
- Formerly used deposit sites (FUDS)
- Biennial Reporting systems (BRS)
- Department of defense sites (DOD)
- Deed restriction listing (DEED)
- No further Action determination (NFA)
- Notify 65
- Toxic Pits
- Comprehensive Environmental Response, Compensation, And Liability Information (CERLCIS)

- Comprehensive Environmental Response, Compensation, And Liability Information, No Further Remedial Action Planned (CERC-NFRAP)
- Corrective Action Report (CORRACTS)
- Above Ground Petroleum Storage Tank Facilities (AST)
- Leaking Underground Storage Tank Information System (LUST)
- Hazardous Substance Storage Container Database (UST)
- Cal Sites-AWP
- California Hazardous RCRA Administrative Tracking System (RAATS)
- Hazardous Materials Information Reporting System (HMIRS)
- California State Landfills ((SWF/L)\(SWIS))
- Waste Management Unit Database (WMUDS/SWAT)
- California Hazardous Materials Information Reporting System (CHMIRS)
- PCB Activity Database System (PADS)
- Emergency Response Notification System (ERNS)
- Faeility Index System (FINDS)
- Toxic Chemical Release Inventory System (TRIS)
- Toxic Substances Control Act (TSCA)
- Material Licensing Tracking System (MLTS)
- Federal Superfund Liens (NPL liens)
- CA Bond Exp. Plan (Ca. BEP)
- Records Of Decision (ROD)
- Superfund Consent Decrees (CONSENT)
- Waste Discharge System (CA WDS)
- HAZNET
- Mines Master Index File (MINES)
- Indian RESERV
- FIFRA/TSCA Tracking System (FTTS)
- Historical UST Database
- CLEANERS Drycleaners (Department of Toxic Substance Control)

The EDR reports are included as Appendix A. We requested a two-point search along the a corridor encompasing SR50, from El Dorado Hills Boulevard to west of Bass Lake Road, using a search radius of 1 mile. Figures in the EDR reports shows the approximate search radius of the project. Sites with adequate address information are plotted on EDR's site plan "EDR Radius Map with GeoCheck, Silva Valley Parkway IC, SR50".

Sites with inadequate address information were listed as "orphan sites" and were not plotted on EDR's site plan. Instead of plotting the "orphan sites", EDR provided available address information. BCI reviewed the address infromation for the orphan sites and determined that, with one exception, none of the list sites are located within 1,000 feet of the proposed corridor. The exception is a listing for naturally occurring asbestos in El Dorado Hills. There is no specific address for El Dorado Hills.

3.2 Summary of Records Search

No sites with known contamination or hazardous material leaks, spills, or dumping were noted in the EDR database search.

3.3 Review of Title Documents

BCI's scope did not include a review of title documents for this assessment.

3.4 Prior Environmental Investigations

We did not review any environmental assessment documents conducted for this or other nearby projects. If applicable documents are discovered, they should be reviewed relative to the conclusion and recommendations provided in this report. When available, submit these documents for BCI review during the next phase of the study.

3.5 Well Search

The well search portion of the EDR report did not identify any wells within 1-mile of the proposed interchange improvements. Our review of the Department of Water Resources website did not reveal known, recorded groundwater wells. However, based on our site reconnaissance and historic photo review, we believe that domestic water wells associated with former and current ranch properties are present within the former Clarksville rural residential area. Parcels where wells may be present include Parcels 1, 4, 5, 14, 17 and 21.

4 RECONNAISSANCE INFORMATION

4.1 Visual Observations

BCI staff performed reconnaissance observations from public streets, intersections, driveways, access roads, business parks, sidewalks and other public right-of-way. We also conducted a site inspection of all private properties, where El Dorado County Public Works, Department of Transportation staff, have obtained permission for entry. With the following qualifiers and/or exceptions, our observations generally support the described physical descriptions in Section 2.1 of this report.

PARCEL 1, "EDH 52", APN 108-030-1010
Low grasses, trees, and numerous shallow drainages and seasonal streams cover the majority of the site. Silva Valley Parkway borders the property on the west. Residential development borders the site on the north. Tong Road and SR50 bisect the southern one-third of the property.

Approximately 1,000 feet north of the freeway, and about 100 feet east of Silva Valley Parkway, we identified "ruins", including numerous columnar structures, masonry rubble, a portion of a concrete perimeter foundation, and a concrete box-basin with three separate bins. Over-grown landscaping (trees and brush) surround the "ruins." Our research did not identify specific structures associated with the ruins. It is our opinion that the "ruins" are most likely associated with the former agricultural use (farming and ranching) of the site.

PARCEL 2, "EL DORADO HILLS INVESTORS", APN 107-130-0110
A barbed wire fence borders this small triangular shaped parcel. We did not observe any obvious soil and/or groundwater contamination or hazardous materials issues on the site. However, a soil stockpile of unknown origin covers the majority of the parcel.

PARCEL 3, "COUNTY OF EL DORADO", APN 108-070-3210
Site is unimproved and covered by low grasses. The parcel is located immediately north of Tong Road. We did not identified obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCEL 4, "CAPITAL KOREAN PRESBYTERIAN CHURCH", APN 108-070-0210
A two-story church is on the site. We observed a large parking area and two large propane tanks. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 5, "LAFONTSEE BONNIE L & CHRIS L", PARCEL 5, APN 108-070-0310
We observed the "remains" of a prior residence and/or small business that we identified in air photos. The remains include a perimeter fence, a commercial advertising sign, a gravel access road, a small, abandoned wooden sheds, and similar dilapidated wooden structures. We did not have permission to enter the property. We were not granted site access; therefore, we made all observations from Tong Road.

PARCEL 6, "TONG ARTHUR", APN 108-070-0410
The site is located north of SR50. We were not granted access to this site. We made observations from Tong Road. It comprises bare, unimproved land, covered by low grasses and few trees. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCELS 7 & 8, "MOHANNA MOE & NASRIN", APN 108-070-2210 & 108-070-2610
We did not have permission to enter the properties. We made all observations from publicly accessible roads (SR50, Tong Road, and Bass Lake Road). The two parcels border SR50 on the north. Parcel 7 is improved by a single residential structure, driveway, and related improvements. Parcel 8 appears unimproved at this time. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the two parcels.

PARCEL 9, "EL DORADO HILLS INVESTORS", APN 107-130-0210
The site is unimproved and covered by low grasses. The parcel is located between Tong Road and SR50. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 10, "PG&E CLARKSVILLE SUBSTATION", APN 107-130-0610
The site is an electrical substation located south of SR50, about 500 west of White Rock Road. Improvements include electrical transformers, circuit switchers, regulators, reclosers and control buildings. PG&E did not grant us access to the site. We observed the site from public roads and adjacent Parcel 17. We did not identify obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCELS 11 & 12, "EL DORADO HILLS INVESTORS", PARCELS 11 & 12, APN 107-130-0510 & 107-130-0410
The two sites are bisected by Silva Valley Parkway, and are bordered by SR50 to the north. A perennial stream flows through Parcel 11, creating a marshy area over at least one-third of the parcel. Parcel 12 is east of Parcel 11 and covered by low grasses and a few trees. We did not identify obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCELS 13 & 14, "KFRD INVESTORS & TONG RANCH LLC ", APN 108-070-0510 AND 108-070-0610
The two parcels are adjacent to each other, and are bordered by SR50 on the north. White Rock Road provides access and terminates at SR50. Along White Rock Road, we observed a large barn, fencing, and numerous small wooden storage sheds on Parcel 14. Two significant drainages flow from east to west across the eastern two-thirds of Parcel 14. The majority of Parcel 14 is open land, covered by low grasses. This parcel appears to be used for cattle grazing. Parcel 13 is immediately west of Parcel 14. The "Tong Cemetery" occupies the northwestern corner of Parcel 13, and is located within 100 feet of the freeway. Grasses cover the majority of the remainder of the site, and we observed its use as a horse pasture.

In general, we observed abandoned wooden sheds, miscellaneous trash, and related debris along the road through Parcel 14. The debris included household trash, discarded farm equipment, 55-gal drums, and rusting, above-ground, fuel storage tanks.

PARCELS 15 AND16, "HUDDRIDGE PARTNERS ", APN 108-780-0210 & 108-780-0110
These parcels are separated by White Rock Road. Similar to nearby parcels, they are covered by low grasses and a few trees. Previously described drainages to the north and east converge on Parcel 16, to become Carson Creek flowing south along White Rock Road. Some shrubs and bushes line the drainages, especially on Parcel 16, where the convergence of drainages forms a small wooded area in the north central portion of the parcel. We did not identify obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCEL 17, "PEERMAN, JACK & BETTY", APN 107-130-0710
This parcel has a single family residence. Improvements include two small storage/barn structures, and a paved driveway and parking area. The property is bordered by Parcel 18 on the west, SR50 on the north, the Clarksville cemetery on the southwest, Parcel 15 on the east, and by Parcel 10(the PG&E site) on the northeast. We observed a "Mormon Tavern" historical marker located between Joerger Cutoff Road and SR50. The marker is placed east of the Parcel 17 property line and north of the PG&E substation.

Beyond the residence, the property is bare land covered with variable-height grasses. Overhead electrical lines are located along the north property line, parallel to SR50. We did not identify obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCEL 18, "EL DORADO HILLS INVESTORS", APN 107-130-0410
The Von Hausen's Motors auto retail and repair facility occupies this site. Improvements include a large commercial structure and surrounding asphalt-paved parking area. We were able

to observe the site from publicly accessible locations within the shopping center. Access to the site was not granted; therefore, we did not observe any of the operations within the vehicle service area of the dealership. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 19, "PHOENIX PACIFIC COMPANY LL", APN 107-680-1310
We were able to observe the site from public roads within the shopping center. Access to the site was not provided. The shopping center is located at the northeast corner of the El Dorado Hills Boulevard/SR50 interchange. The parcel is a part of the shopping center, and is improved by the "Kinder Kare Learning Center" building. A 10-foot masonry wall surrounds the building on the south and east. A paved parking area is located to the west of the building, and serves both the learning center and other commercial/retail businesses in the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues exterior of the building.

PARCEL 20, "SERRANO ASSOCIATES LLC", APN 107-660-0310
A golf course occupies the parcel. Trees and shrubs line the parcel's south border with SR50. We did not observe significant contamination or hazardous materials issues on the site. We made all observations from public roads adjacent to the parcel, as we were not granted aecess at the time of our site visit.

PARCEL 21, "SERRANO ASSOCIATES LLC", APN 114-160-1910
SR50 borders the site on the south and Parcel 20 is located to the west. Silva Valley Parkway borders the site on the east. This sloping parcel is covered with moderately high grasses. Residential development occupies the top of the hill above the parcel. There is a minor drainage along the eastern property line, adjacent and west of Silva Valley Parkway. The "EID South Boost Pump Station" is located between the drainage and Silva Valley Parkway. We also observed remnant concrete foundations on the site. These structures are located adjacent and north of SR50, nearly opposite of the PG&E substation. Access to the parcel had not been granted at the time of our site visit; therefore, all observations were made from adjacent public roads. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 22, "EL DORADO SAVINGS BANK", PARCEL 22, APN 107-680-0610
We were able to observe the site from publicly accessible locations within the shopping center. The parcel is developed with an "El Dorado Savings Bank," and surrounded by a paved parking lot. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues from the exterior of the parcel's building.

PARCEL 23, "SERRANO ASSOCIATES LLC", APN 114-780-0110
This is a large, undeveloped parcel located to the north of Parcels 3 through 6, and east of Parcel 1. A large, residential subdivision is located along the north property line. Access permission was not provided at the time of our site visit; therefore, we observed the parcel from Tong Road and Parcel 1. We observed imported, soil stockpiles at the northern portion of the site. The "spoils" are composed of processed rock (similar to aggregate baserock) and soil, and based on their location adjacent to the nearby residential streets, it appears that these "spoils" are derived

from recent construction activities at the adjacent residential area. Surface drainage from the residential subdivision (to the north) has created gullying and erosion in the north area of the parcel. The gully slopes to the southeast to a nearby stream channel that eventually becomes a part of Bass Lake Creek. Most of the parcel is gently to moderately sloping to the south and covered by low grasses. A moderate cover of trees is located adjacent to the stream channel. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 24, "SERRANO ASSOCIATES LLC", APN 114-150-42100
Access to the property was not granted; therefore, all observations were made from adjacent public roads. This parcel is relatively small, and bordered by Parcel 1 on the east and by Silva Valley Road on the west and south. A large soil stockpile covered by low grasses is present on the site. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 25, "WILMINGTON TRUST / TOSCO TRUST", APN 107-120-0410
The parcel is located adjacent to the east side of El Dorado Hills Boulevard, and north of SR50. We observed the site from publicly accessible locations within the shopping center. A "Union 76" service station, with dispensing islands, a retail shop, and a service area, occupies the parcel. The station has a paved parking area for both its customers and customers of other commercial/retail businesses in the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 26, "AHART TRUST / JONES TRUST", APN 107-120-2610
Parcel 26 is located in the northeast quadrant of the El Dorado Hills Boulevard/SR50 interchange. We were able to observe the site from publicly accessible locations within the shopping center. The parcel is improved by a "Taco Bell" restaurant. A paved parking area with modest landscaping surrounds the building. We did not observe significant contamination or hazardous materials issues on the site.

PARCEL 27, "TOWN CENTER EAST LP", APN 107-130-3610
Parcel 27 is a narrow (less than 100 ft wide) strip of land located north of Parcel 31 and south of the eastbound SR50 on-ramp. Improvements on the parcel consist of several commercial buildings occupied by retail businesses. We were able to observe the site from publicly accessible locations within the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 28, "EDH TOWN CNTR EAST OWNERS ASSOC. ", APN 107-130-4310
Parcel 28 is a marshy area partially modified into a pond and fountain surrounded by landscaping and sidewalks. The pond is located between Parcels 18 and 27, and bordered by SR50 on the north. Carson Creek flows from the north side of SR50 and through this parcel. We were able to observe the site from publicly accessible locations within the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 29, "SYERS PROPERTIES III LLC", PARCEL 29, APN 107-130-4810
Parcel 29 is a small, less than 1-acre, parcel located east of Latrobe Road, and is a part of the "Town Center" development. The site is used for landscaping, and is located near the entrance to the "Town Center". We were able to observe the site from adjacent El Dorado Hills Boulevard. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCELS 30 & 31, "SYERS PROPERTIES III LLC", APN 107-130-4910 AND 107-130-5010
Parcels 30 and 31 are improved properties for the "Town Center" shopping development. Improvements include a "Valero" service station, paved parking, 2-story shopping structures (strip-mall), and related improvements. A "Chevron" service station is located immediately adjacent to the south side of Parcel 31, just south of the entrance to the shopping center. We were able to observe the development from publicly accessible locations within the "Town Center". We did not observe activities that would indicate that subsurface contamination and/or remediation is occurring at either service station.

PARCEL 32, "COUNTY OF EL DORADO", APN 107-680-0910
A "Jack in the Box" restaurant is present on Parcel 32. The site appeared clean and well maintained. A "Shell" service station occupies the property immediately adjacent and west of the parcel. We observed approximately ten (10), 55-gal drums, marked as hazardous waste on the "Shell" site. We did not observe any monitoring wells. We observe evidence that may indicate an investigation for subsurface soil and/or groundwater contamination or hazardous materials issues is occurring at the "Shell" service station.

Parcel 33, "CRISP FAMILY TRUST", APN 107-680-1010
Parcel 33 is a small, narrow strip of land located along the north curb of the entrance to the shopping center. The shopping cneter is located at the northeast quadrant of the EDHB/SR50 interchange. Parcel 33 is currently used for landscaping along the west side of the previously described "Shell" service station. We were able to observe the site from publicly accessible locations within the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

Parcel 34, "MCNAN LLC", APN 107-680-0810
Parcel 34 is a small, narrow strip of land adjacent to El Dorado Hill Boulevard, north of the entrance to the shopping center. It is currently used for landscaping purposes adjacent to the above described "Shell" service station. We were able to observe the site from publicly accessible locations within the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

5 FINDINGS, CONCLUSIONS, & RECOMMENDATIONS

BCI performed an Initial Site Assessment for the Silva Valley Interchange project. Typieal of an Initial Site Assessment, the scope of this assessment was directed at:

- Determining whether there may be hazardous materials on, or near, proposed roadway improvements at levels likely to warrant mitigation pursuant to regulations, and to,

- Identify sites with hazardous material issues that may impact property acquisition and redevelopment, or that will be a significant consideration in determining the final alignment.

Our assessment identified the following environmental conditions that should be considered in present and future planning for the roadway alignment.

5.1 Sites with Potential Contamination/Hazardous Materials Issues

Following is a description of specific parcels within the proposed roadway widening that are identified as having potential soil and/or groundwater contamination or hazardous materials issues that could impact project related land acquisition and/or construction.

- PARCEL 10, "PG&E CLARKSVILLE ELECTRICAL SUBSTATION" – APN 107-130-06

Parcel is subject to partial acquisition. No site specific hazardous material issues were identified through the commercial database search. Based on use and age of the site, the substation is considered a potential risk for PCB contamination from older transformers and a risk for potential petroleum hydrocarbon contamination from leaking coolant oils and site maintentance activities. We recommend contacting PG&E and obtain a statement of fact addressing potential contamination/hazardous materials. PG&E needs to provide a "clean site" record. If a statement can not be provided, we recommend limited soil sampling and analysis within the potential acquisistion areas of the Parcel.

Associated with Parcel 10 by proximity, we identified a former gas station/commercial structure along the old, two-lane SR50, as shown on the 1952 and 1961 airphotos. Although the structures were removed for the widening of SR50, we can not rule out the potential for petroleum hydrocarbon impacts to the subsurface, in the general area of Joeger Cutoff Rd, between the PG&E substation and SR50.

- PARCEL 5, "LAFONTSEE PROPERTY" – APN 108-070-0310

Parcel is subject to partial acquisition. No specific hazardous material issues were identified in the database search. The site's previous residential structure and outlying storage structures are removed, but many discarded objects, domestic-appearing waste, and smaller wooden-framed, delapidated structures remain. Historical aerial photos exhibited numerous automobiles, trucks, commercial truck trailers, boats, and farm vehicles on the site. Based on airphotos and our site reconnaissance, many of these items appear abandoned.

Common contamination/hazardous materials issues associated with the identified land use include: 1) potential petroleum hydrocarbon (oil) spillage, 2) leach fields and septic tanks, and 3) buried heating oil tanks, 4) asbestos containing building materials (ACM), and 5) lead-containing paint (LCP). Although none of these were positively identified in this ISA, plans for construction, and/or complete or partial site acquisition, should account for the potential of encountering one or more of these issues.

We recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM, and his responsibility to respond accordingly. If potentially hazardous materials are encountered during grading operations, the local environmental health department and fire department should be notified.

- "SHELL", (ADJACENT TO PARCEL 32) - APN UNKNOWN

This is an active, petroleum fuel service station. No specific hazardous material issues were identified in the database and website searches. However, it appears that a Phase II investigation was recently conducted at the site, as indicated by the presence of at least ten, 55-gal drums, each mark as "hazardous waste". To determine the current status of possible clean-up activities, we recommend a review of existing regulatory documentation, which may be obtained from the local environmental health department, the RWQCB, and/or the site owner. Current plans do not inelude acquisition of this site; however groundwater and/or soil contamination could impact road widening or related project improvement activities at the adjacent properties, which includes Parcels 32 (APN 107-680-0910), 33 (APN 107-680-1010), and 34 (APN 107-680-0810).

- PARCEL 25, WILMINGTON TRUST/TOSCO TRUST" (UNION 76) - APN 107-120-0410

Pareel is subject to partial acquisition. This is an active, petroleum fuel service station. No specific hazardous material issues were identified in the database search. However, this site will require further assessment. Initially, further assessment should include a review of existing documentation from the local environmental health department, the RWQCB, and the site owner. If building demolition is planned, the existing structures need to be assessed for potential hazardous materials, such as LCP and ACM.

- PARCEL 21, "SERRANO ASSOCIATES" - APN 114-160-19

Parcel is subject to partial acquisition. No specific hazardous material issues were identified in the database search. Remnant structures were observed adjacent to the north (west-bound) side of SR50, approximately 600 feet west of the Silva Valley Parkway underpass. A house structure, barns, warehouse and associated improvements are observed in historical air photos. Common contamination/hazardous materials issues associated with the identified land use are: 1) ACM and LCP, 2) unidentified leach fields/septic tanks and buried heating oil tanks, and 3) ADL from the immediately adjacent SR50.

The presence of these one or more of these materials could affect the value of the parcel. If this project includes acquisition and demolition of any of the existing structures, then the structures should be assessed for potential ACM and LCP prior to acquisition. Assessment results will be used to estimate the financial impact to the project. Results of the assessment shall also be included in the plans and specifications (bid documents) so the contractors can plan for worker safety and material handling and disposal issues.

Based on the proximity to SR50, some level of ADL may be present in the shallow subsurface soils adjacent to the freeway. ADL recommendations are presented in the section titled "General Contamination/Hazardous Materials Issues" of this report.

- PARCELS 13 AND 14, "KFRD INVESTORS INC. & TONG RANCH LLC" - APN 108-070-0510 AND 108-070-0610

Parcels are subject to partial or complete acquisition. No specific hazardous material issues were identified in the database search. During our site reconnnaissance, we noted poor housekeeping practices along Tong Road, where it passes through the two properties. We observed 55-gal drums, rusting machinery, trash and rubbish, and above ground storage tanks (AST). Existing structures (large barn, mobile home, small sheds, etc.) may present an ACM and LCP issue if demolition is planned. Other issues include encountering unidentified items such as leach fields/septic tanks and buried heating oil tanks. An old cemetary is located in Parcel 13, close to SR50.

Existing structures subject to demolition need to be assessed for LCP and ACM, prior to preparation of construction documents. Additionally, we recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM during grading operations, and his responsibility to respond accordingly.
Based on the proximity to SR50, some level of ADL may be present in the shallow subsurface soils adjacent to the freeway. ADL may also be present adjacent to White Rock Road. ADL recommendations are presented in the section titled "General Contamination/Hazardous Materials Issues" of this report.

- PARCEL 31, "SYERS PROPERTIES, LLC" (VALERO SERVICE STATION) – APN 107-130-5010

Parcel does not appear to be subject to acquisition. The parcel is known as the "Town Center" shopping area. There is an active, petroleum fuel service station (Valero) located within the shopping center. We found no records of suspected soil and/or groundwater contamination from the searched database. Service stations are a principal concern for subsurface contamination. We recommend a local file search and review for additional environmental records at the EDCEHD and at the RWQCB and an interview with the current site owners.

- PARCEL 1, "EDH 52" - APN 108-030-1010

Parcel is subject to partial or complete acquisition. No specific hazardous material issues were identified at this site through the database search. The parcel consists of undeveloped grazing land that appears unused at the present. We observed remnant, concrete structures (ruins) and associated debris. We were unable to determine the past use of the concrete structure. These "ruins" are located east of Silva Valley Parkway, approximately 1,000 feet north of the existing underpass. The structure consists of a rectangular shaped, three-bin, concrete-walled basins, with concrete columns at the corners of each bin. Other outlying columns are located north and south of the described structure. Archeological research (LSA, 2006) indicates that this site was a ranch, and the owner had a fondness for constructing with concrete.

Issues associated with a former farm residence include leach fields/septic tanks and buried heating oil tanks. The remnant concrete structures need to be assessed for LCP and ACM, prior to demolition and preparation of construction documents. An assessment for the presence of these materials may materially affect the purchase of the parcel. We recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM during grading operations, and his responsibility to respond accordingly.

5.2 General Contamination/Hazardous Materials Issues

- PESTICIDES

The project includes acquisition of former cattle grazing and crop land; however, it appears that most of the open land in the project vicinity was used for grazing. Therefore, there is low to moderate potential for residual pesticides, herbicides, and fungicides. Based on the reviewed data, there is no obvious evidence of pesticide mixing, storage and/or misuse within the proposed right-of-way acquisition areas. Nonetheless, agricultural chemicals are typically used on farm lands. BCI considers it possible that pesticides, herbicides, and fungicides have been applied and used within the properties identified by MTCo as properties of interest.

Residual pesticides from normal agricultural application are generally exempt from mandatory assessment. This does not, however, preclude their existence. For roadway right-of-way acquisition projects, requirements for additional investigation are not clearly established. Therefore, it's important that the County of El Dorado understand the issue so they can make an informed decision on how to proceed. At a minimum, for sites with potential right-of-way acquisition, we recommend the County obtain a statement from the current property owner regarding past agricultural chemical use. If the statement is conclusive and suggests that usage would not result in significant residual pesticides concentrations, then no further action, such as sample collection and analysis, would be required.

- NATURALLY OCCURRING ASBESTOS

The project site is located in a geologic region identified as having at or near surface naturally occurring asbestos (NOA) bearing rocks and soils. Consequently, any development and/or construction in this area must comply with applicable rules and regulations, as written by El Dorado County Environmental Health Department. NOA-bearing rocks and soils potentially affect all parcels.

The contractor shall have experience implementing El Dorado County's special NOA grading requirements. An NOA monitoring plan will be required prior to grading. Some of the plan elements include: 1) a geologist trained in the recognition of NOA should be intermittently present during grading operations, 2) the geologist shall observe site conditions and implement special grading conditions when NOA is present. BMPs for dust control should be practiced during all grading operations in El Dorado County.

- AERIALLY DEPOSITED LEAD

The proposed interchange improvements will include grading within the existing SR50 shoulders and right-of-way (ROW). Caltrans is likely to require an aerially deposited lead (ADL) investigation prior to construction. Soil that is potentially impacted by ADL and disturbed during grading activities is subject to Department of Toxic Substances Control (DTSC) definition for handling hazardous waste. California currently defines material containing lead concentrations above 350 parts per million (ppm) as subject to Class I hazardous waste disposal. If ADL is detected at concentrations requiring hazardous waste handling and disposal, then we

recommend that the local Caltrans district office be contacted to determine the applicability of reusing ADL-impacted soil under the terms of the DTSC-issued "Lead-impacted Soil Reuse Variance". If the variance is not available to this district, then lead containing soils may require disposal at a Class I landfill.

ADL may also be present on privately-owned parcels adjacent to SR50. The potential ADL impact is likely limited to surface and shallow subsurface soils located within 2 feet of the existing ground surface (DTSC, 1995; Caltrans, 1998), and within 150 ft of the existing freeway right-of-way (Caltrans, 1995). The following Parcels are identified as potentially ADL-impacted: Parcels 1, 6, 7, 8, 9, 10, 11, 12, 13, 14, 17, 18, 19, 22, 25, 26, 27, and 28. We recommend a minimum of one surface soil sample be obtained for ADL screening. The assessment should be performed on that portion of the parcel directly adjacent to and within 50 feet of the edge of pavement. Parcels with a long contiguaous portion of property adjacent to the freeway shall be sampled for ADL every 300 feet.

- TRANSFORMERS

The scope of this assessment did not include an inventory of past and present transformers along the alignment. However, BCI observed several pole-mounted transformers and high voltage power lines along the proposed SR 50 widening corridor, and along the existing Silva Valley Parkway, White Rock Road, Tong Road, and Joerger Cutoff Road. Many of these overhead electrical powerlines are located within the proposed right-of-way acquisition areas. The transmission lines and poles appear relatively new, and few of the transformers show signs of external rust or discoloration. The existing pole-mounted transfomers need to be considered potentially impacted if their removal or relocation is required during construction. Existing transformers should be checked for the presence of PCBs, and if present, they should be disposed of in accordance with current regulations. Surface mounted transformers and electrical switch boxes were also observed within the project area, and may also constitute a potential PCB-impacted risk.

- YELLOW TRAFFIC STRIPES

Yellow traffic stripes are known to contain heavy metals such as lead and chromium at concentrations in excess of the hazardous waste thresholds established by the California Code of Regulations (CCR) and may produce toxic fumes when heated. Consequently, any yellow traffic striping removed from the existing surface streets and SR50 highway will require proper disposal, which may include disposal at a Class 1 disposal facility.

- UNDERGROUND PRODUCT DISTRIBUTION LINES

An assessment of utilities or buried petroleum product distribution lines is not within the seope of this ISA. We did not observe warning signs for petroleum product lines. We observed markings for gas, water, electric, sewer, and storm drain at various locations. A sewer lift-pump station is located along the west side of Silva Valley Road. These and other utilities are present throughout the proposed interchange improvement area. The database records do not indieate contamination resulting from utility spills; however, there is the potential for unidentified leaks.

6 LIMITATIONS

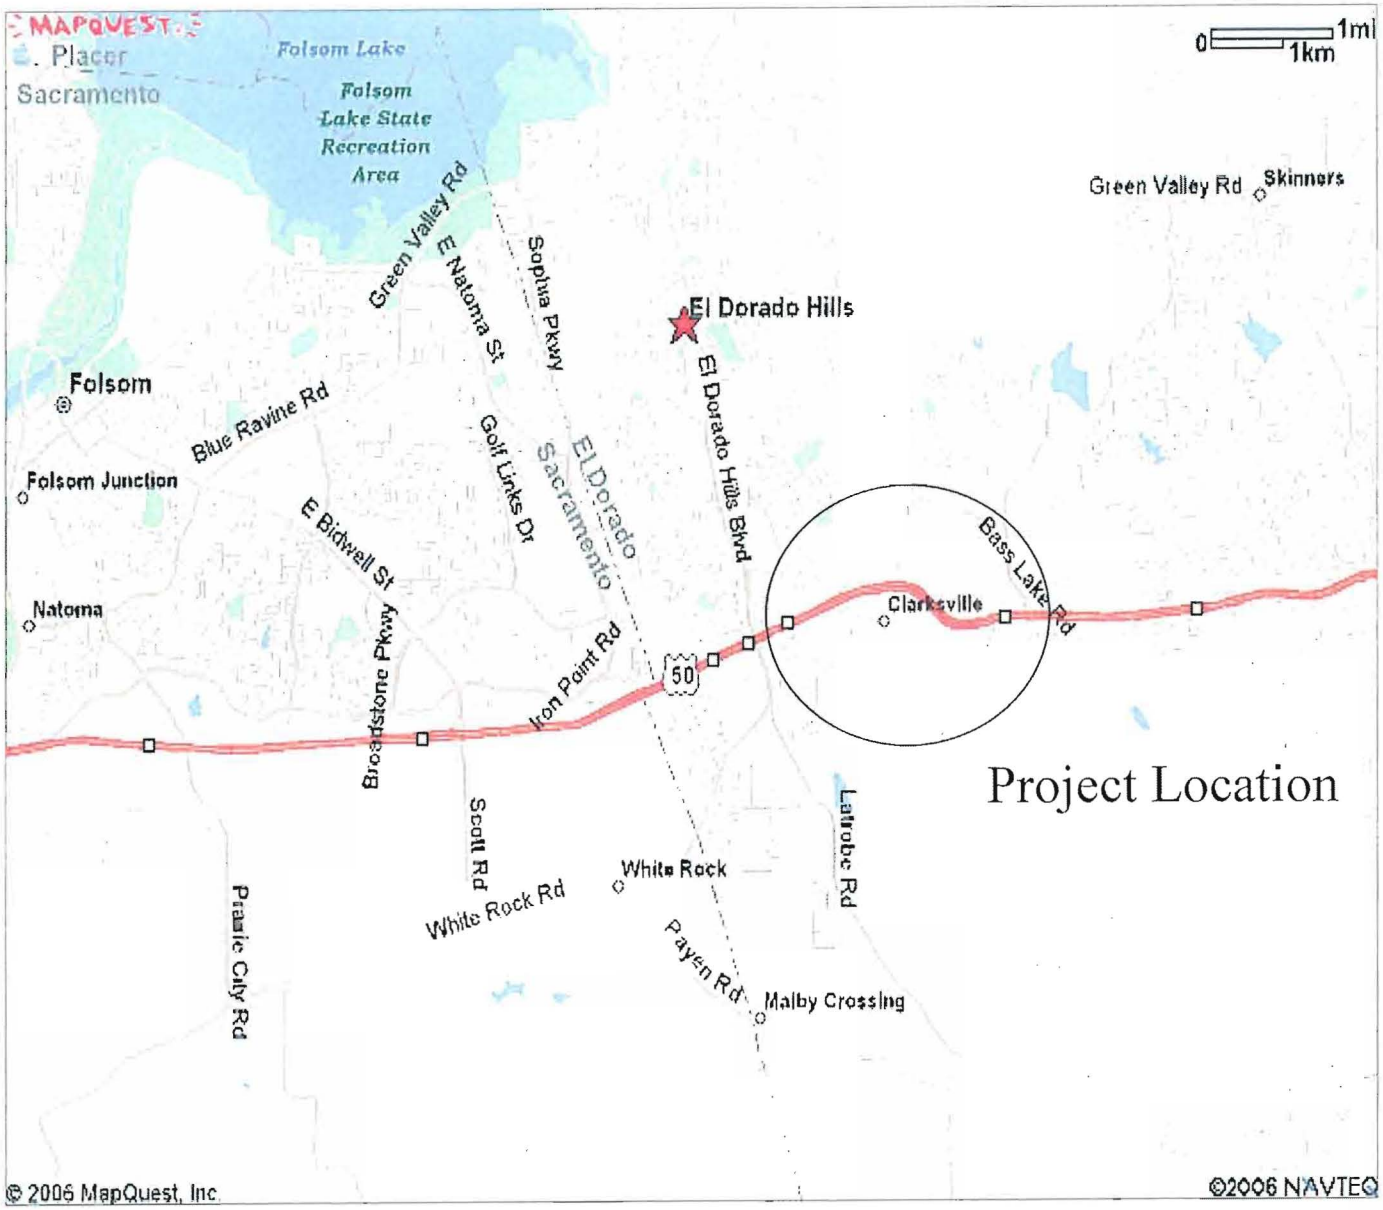
This report summarizes the findings and opinions of Blackburn Consulting, Inc. (BCI), with regard to the potential for contamination/hazardous materials to be present on the subject parcels at concentrations likely to warrant mitigation under current statutes and guidelines. Our findings and opinions are based on information obtained on given dates or provided by specified individuals, through records review, site review, and related activities. Our information is only as good as the information provided to us. Conditions can change after we have made our observations. We cannot warrant or guarantee that hazardous materials do not exist within the study area. To further reduce your risk, an invasive exploration program may be necessary.

Site assessment activities performed, our findings obtained, and our recommendations prepared in accordance with currently and generally accepted principles and practices for this type of Initial Site Assessment. Information in this report does not confirm the presence or absence of hazardous materials within the MTCo-defined project boundaries, but indicates whether the possibility of such materials exists. We performed our on-site observations by reconnaissance of visible surface features only. Site conditions are subject to change. Certain indicators of the presence of hazardous materials may have been latent at the time of our site reconnaissance and may have subsequently become observable. In a similar manner, the research effort conducted for an ISA is limited. Accordingly, it is possible that our research, while fully appropriate, failed to indicate the existence of important information sources. Assuming such sources actually exists, their information is not considered in the formulation of our findings and opinions.

Environmental issues not specifically addressed in the proposal or this report, are beyond the scope of services, and are not included in our evaluation. We base our report upon various selected information sources available to us at the time of our investigation. These sources may not have accurate or complete information. We base our conclusions and recommendations on the information available and our interpretation of this information.
Our communications with selected agency personnel are limited to the information kept on file at the various offices we contacted. Some agencies may not maintain accurate or complete records. Many agencies have only recently developed hazardous materials programs and so historical information may be incomplete. We did not contact owners, property renters, or operators. Our on-site study was limited to a general observation of the property and use. Evidence of hazardous material use or misuse, not observed during our site visit, and may be present.

This report was prepared for the specific use of our client and applies only to the subject project. We are not responsible for interpretations by others of data presented in this report. This report does not represent a legal opinion. No warranty is expressed or implied. We base our conclusions in this report on judgment and experience. This report is not intended to follow the Phase I site assessment guidelines provided by ASTM. Instead, the scope of this report addresses the needs of the project.

The scope of our investigation does not include determining the presence of naturally-occurring asbestos (NOA), radon, lead based paint, or asbestos containing building products. However, this report does identify parcels where these items may be present. Identification of endangered



speeies, geologic hazards, wetlands habitat, archeological sites, or ecologically sensitive areas is also beyond the scope of this assessment. Our site reconnaissance did not include evaluation of possible hidden/buried dumps or pits within the property.

The governmental records portion of this report is derived from public records. The governmental records are updated on a continual basis. For this reason, we do not advise you to use this information to base a decision after 180 days of the issue date of this report. Also, conditions at the site can and will change over time. Please contact BCI to revise this report to reflect new information.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/14/05

Next Scheduled EDR Contact: 01/30/06
Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Next Scheduled EDR Contact: 03/20/06
Data Release Frequency: Quarterly

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

As of February 1995, CERCLIS sites designated "No Further Remedial Action Planned" (NFRAP) have been removed from CERCLIS. NFRAP sites may be sites where, following an initial investigation, no contamination was found, contamination was removed quickly without the need for the site to be placed on the NPL, or the contamination was not serious enough to require Federal Superfund action or NPL consideration. EPA has removed approximately 25,000 NFRAP sites to lift the unintended barriers to the redevelopment of these properties and has archived them as historical records so EPA does not needlessly repeat the investigations in the future. This policy change is part of the EPA's Brownfields Redevelopment Program to help cities, states, private investors and affected citizens to promote economic redevelopment of unproductive urban sites.

RCRA: Resource Conservation and Recovery Act Information

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. RCRAInfo replaces the data recording and reporting abilities of the Resource Conservation and Recovery Information System (RCRIS). The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Conditionally exempt small quantity generators (CESQGs) generate less than 100 kg of hazardous waste, or less than 1 kg of acutely hazardous waste per month. Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month. Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month. Transporters are individuals or entities that move hazardous waste from the generator off-site to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

US BROWNFIELDS: A Listing of Brownfields Sites

Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Next Scheduled EDR Contact: 04/03/06
Data Release Frequency: Annually

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized. In 1978, 24 inactive uranium mill tailings sites in Oregon, Idaho, Wyoming, Utah, Colorado, New Mexico, Texas, North Dakota, South Dakota, Pennsylvania, and on Navajo and Hopi tribal lands, were targeted for cleanup by the Department of Energy.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data

Source: PennWell Corporation
Telephone: (800) 823-6277
This map includes information copyrighted by PennWell Corporation. This information is provided on a best effort basis and PennWell Corporation does not guarantee its accuracy nor warrant its fitness for any particular purpose. Such information has been reprinted with the permission of PennWell.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:

Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes

Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools

Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

GEOCHECK®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

SILVA VALLEY PARKWAY IC
SR 50
EL DORADO HILLS, CA 95762

TARGET PROPERTY COORDINATES

Latitude (North):	38.657700 - 38° 39' 27.7"
Longitude (West):	121.055199 - 121° 3' 18.7"
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	669223.6
UTM Y (Meters):	4280379.5
Elevation:	721 ft. above sea level

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

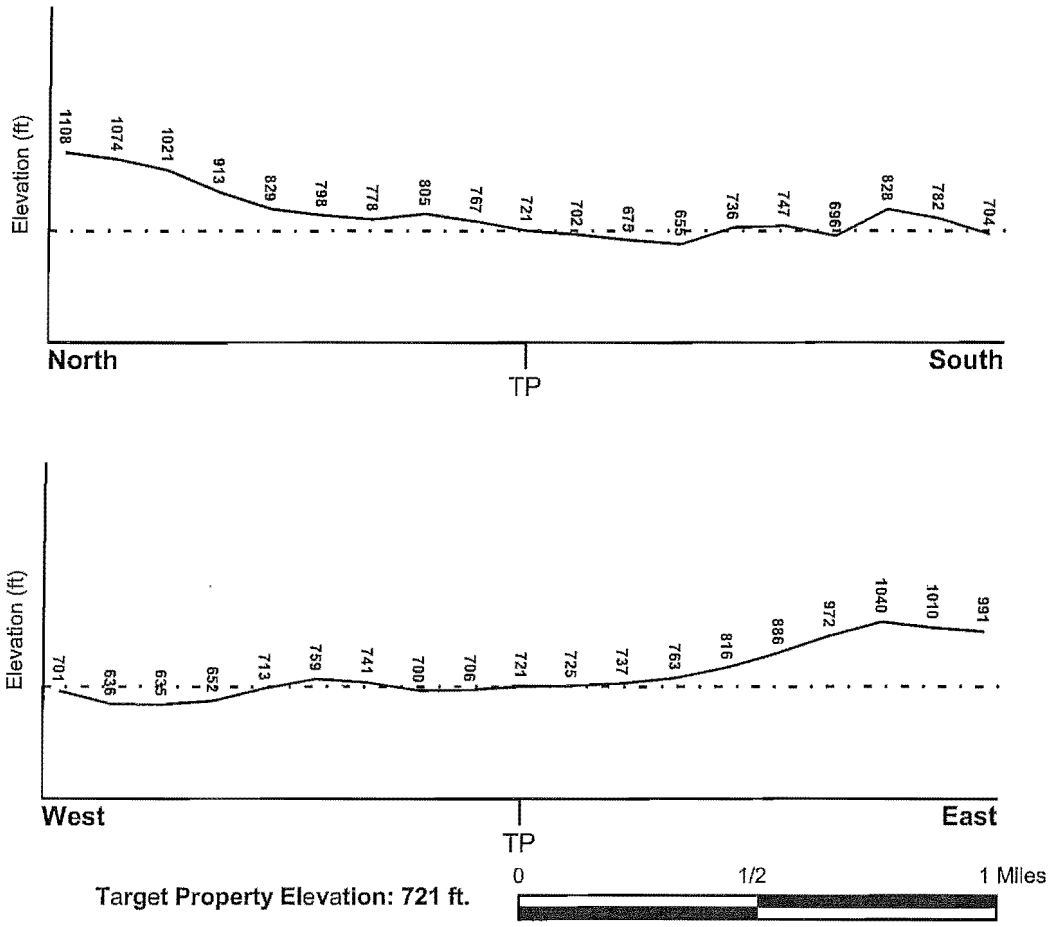
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

USGS Topographic Map:	38121-F1 CLARKSVILLE, CA
General Topographic Gradient:	General South
Source:	USGS 7.5 min quad index

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 721 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
EL DORADO, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 0600400700C

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CLARKSVILLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius: 1.25 miles
Status: Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT **GEOLOGIC AGE IDENTIFICATION**

Era:	Mesozoic	Category:	Eugeosynclinal Deposits
System:	Lower Jurassic and Upper Triassic		
Series:	Lower Mesozoic		
Code:	IMze *(decoded above as Era, System & Series)*		

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	AUBURN
Soil Surface Texture:	loam
Hydrologic Group:	Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.
Soil Drainage Class:	Well drained. Soils have intermediate water holding capacity. Depth to water table is more than 6 feet.

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel: MODERATE

Depth to Bedrock Min: > 10 inches

Depth to Bedrock Max: > 28 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	14 inches	loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Silty Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), silt.	Max: 2.00 Min: 0.60	Max: 7.30 Min: 5.60
2	14 inches	18 inches	unweathered bedrock	Not reported	Not reported	Max: 0.00 Min: 0.00	Max: 0.00 Min: 0.00

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: silt loam
unweathered bedrock
gravelly - loam
gravelly - silt loam

Surficial Soil Types: silt loam
unweathered bedrock
gravelly - loam
gravelly - silt loam

Shallow Soil Types: clay loam
gravelly - loam
gravelly - clay loam
gravelly - sandy clay loam
sandy clay loam

Deeper Soil Types: weathered bedrock
stratified

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002. 7.5-Minute DEMs correspond to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 1999 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^R Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

THE EDR AERIAL PHOTO DECADE PACKAGE

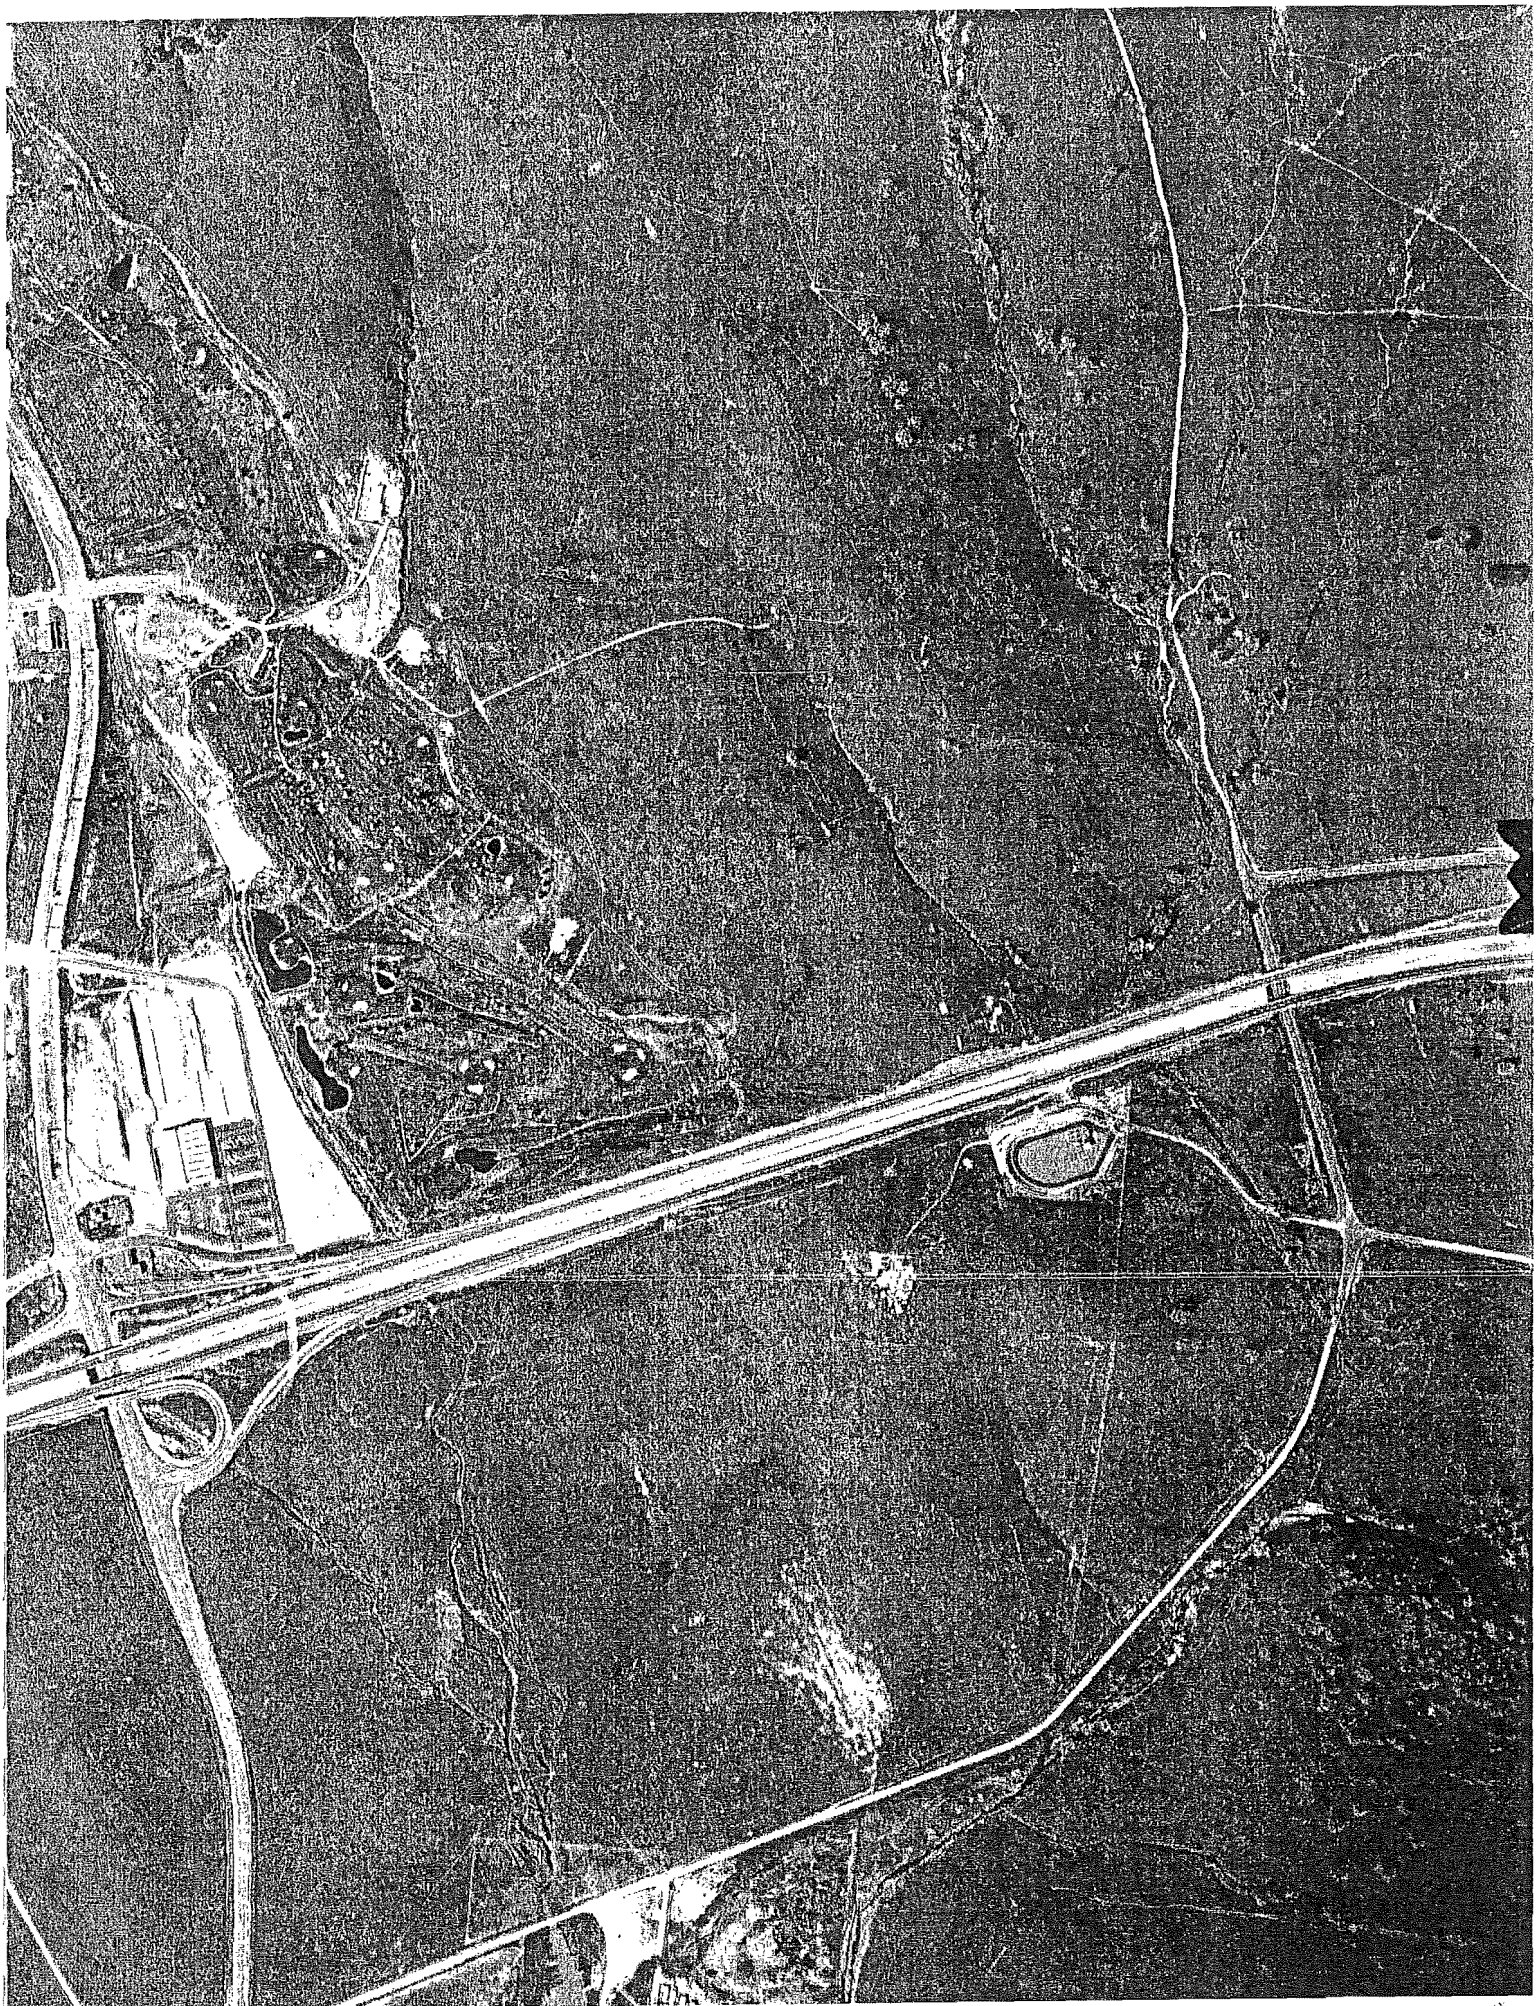
Environmental Data Resources, Inc.s (EDR) Aerial Photography Print Service is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDRs professional researchers provide digitally reproduced historical aerial photographs at one photo per decade.

References
EPAs Standards and Practices for All Appropriate Inquiries (AAI), section 312.24, identifies the historical sources of information necessary to achieve the objectives and performance factors of section 312.20. According to AAI, *"historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps, building department records, chain of title documents, and land use records."*

To meet the prior use requirements of ASTM E 1527-05, Section 8.3.2, the following standard *historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-05, Section 8.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. ASTM E 1527-05 requires *"All obvious uses of the property shall be identified from the present, back to the property's first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historcal sources as are necessary and both reasonably ascertainable and likely to be useful."* (ASTM E 1527-05, Section 8.3.2) *Reasonably ascertainable means information that is publicly available, obtainable from a source within reasonable time and cost constraints, and practically reviewable.*

Data Gaps
In order to address *data gaps*, additional sources of information may be consulted. According the AAI, Section 312.20 (g), *"to the extent there are data gaps (as defined in section 312.10) in the information developed...that affect the ability of persons (including the environmental professional) conducting the all appropriate inquiries to identify conditions indicative of releases or threatened releases...such persons should identify such data gaps, identify the sources of information consulted to address such data gaps, and comment upon the significance of such data gaps."* According to ASTM E 1527-05, Section 8.3.2.3, *"historical research is complete when either: (1) the objectives in 8.3.1 through 8.3.2.2 are achieved; or (2) data failure is encountered. Data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met....If data failure is encountered, the report shall document the failure and, if any of the standard historical sources were excluded, give the reasons for their exclusion."*

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account executive.



Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EDR Historical Topographic Map Report

Environmental Data Resources, Inc.'s (EDR) Historical Topographic Map Report is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR Historical Topographic Map Report includes a search of available public and private color historical topographic map collections. For more than a century, the USGS has been creating and revising topographic maps for the entire country at a variety of scales. There are about 60,000 U.S. Geological Survey (USGS) produced topographic maps covering the United States.

References

To meet the prior use requirements of ASTM E 1527-05, Section 8.3.2, the following *standard historical sources* may be used: aerial photographs, fire insurance maps, property tax files, land title records (although these cannot be the sole historical source consulted), topographic maps, city directories, building department records, or zoning/land use records. ASTM E 1527-05, Section 8.3 on Historical Use Information, identifies the prior use requirements for a Phase I environmental site assessment. ASTM E 1527-05 requires *"All obvious uses of the property shall be identified from the present, back to the property's first developed use, or back to 1940, whichever is earlier. This task requires reviewing only as many of the standard historcal sources as are necessary and both reasonably ascertainable and likely to be useful."* (ASTM E 1527-05, Section 8.3.2) *Reasonably ascertainable means information that is publicly available, obtainable from a source within reasonable time and cost constraints,and practically reviewable.*

EPA's Standards and Practices for All Appropriate Inquiries (AAI), Section § 312.24, identifies the historical sourcesof information necessary to achieve the objectives and performance factors of § 312.20. According to AAI,*"historical documents and records may include, but are not limited to, aerial photographs, fire insurance maps,building department records, chain of title documents, and land use records."*

Data Gaps

In order to address data gaps, additional sources of information may be consulted. According the AAI, Section § 312.20 (g), *"to the extent there are data gaps (as defined in § 312.10) in the information developed...that affect the ability of persons (including the environmental professional) conducting the all appropriate inquiries to identify conditions indicative of releases or threatened releases...such persons should identify such data gaps, identify the sources of information consulted to address such data gaps, and comment upon the significance of such data gaps."* According to ASTM E 1527-05, Section 8.3.2.3, "historical research is complete when either: (1) the objectives in 8.3.1 through 8.3.2.2 are achieved; or (2) data failure is encountered. Data failure occurs when all of the standard historical sources that are reasonably ascertainable and likely to be useful have been reviewed and yet the objectives have not been met....If data failure is encountered, the report shall document the failure and, if any of the standard historical sources were excluded, give the reasons for their exclusion."

BCI File No. 556.1
February 23, 2010

Mr. Derek Minnema
Mark Thomas & Company, Inc.
7300 Folsom Boulevard, Suite 203
Sacramento, CA 95826

Subject: **UPDATED INITIAL SITE ASSESSMENT (ISA)**
Silva Valley Parkway/State Route 50 Interchange (03-ED-50, KP 3.1, PM 1.7)
El Dorado County, California

Dear Mr. Minnema,

Blackburn Consulting (BCI) has prepared this Update of the Initial Site Assessment dated April 2007 for the Silva Valley Parkway/Route 50 Interchange (03-ED-50, KP 3.1, PM 1.7) Project in El Dorado County, California. BCI prepared this update per your request and includes the following:

- Current Database Search. Environmental Data Resources, Inc. (EDR), a commercial data base search firm performed a radius search for the study area on February 16, 2010.
- Review of BCI's Initial Site Assessment for US 50/El Dorado Hills Boulevard Interchange (EA 03-2E5100) and Pedestrian Overcrossing Project (EA 03-2E4700) El Dorado Hills, CA, BCI File No. 1072.5 dated May 2009.
- Review of Geocon's Aerially Deposited Lead, Naturally Occurring Asbestos, and Lead Containing Paint Site Investigation and Bridge Survey/Highway 50 Report, dated March 10, 2008.
- Site Visit conducted on February 18, 2010.

The purpose of this update is to identify and discuss significant changes in site use and/or facilities that may indicate the potential for hazardous materials and/or petroleum hydrocarbon contamination within or adjacent to the project area. It is understood that the project scope includes the original thirty-four (34) parcels as identified in the 2007 Initial Site Assessment.

Based on this review, no significant changes in site use were identified. Supplemental information for several parcels was obtained and is presented below:

Parcel 25, *Wilmington Trust/Tosco Trust (Union 76) – APN 107-120-0410, El Dorado Hills Union 76, 1020 Saratoga Way*

Our recommendations regarding risks associated with this active petroleum fuel service station have not changed. Records review, however, provided the following updated information:

This service station appears to have been operating since 1971. A leaking underground storage tank (LUST) was discovered in 1987 during tank closure. The release is estimated at five hundred (500) gallons of gasoline. Following tank removal, contaminated soil was excavated and disposed of at an approved facility. Contamination was reported as "soil only" and the case was closed in 1991. Currently, four registered Underground Fuel Storage Tanks (USTs) installed in 1993 exist at the site.

Parcel 31, "*Syers Properties, LLC" (Valero Service Station) – APN 107-130-5010*

Our recommendations regarding the exiting Valero service station have not changed. Site reconnaissance, however, identified a second service station, El Dorado Hills Chevron at this parcel. We found no records of suspected soil and/or ground water contamination from the searched database. Service stations are a principal concern for subsurface contamination. If acquisition is to occur at this site we recommend further review and investigation of potential petroleum hydrocarbon impacts including an in depth records review, site inspection, and interviews with the property owner and county environmental health department.

Parcel 32 *(Adjacent) "Shell" - APN 121-180-08, 1021 Saratoga Way*

Our recommendations regarding the existing Shell service station have not changed; however, the records review (1985 City Directory) identified a dry cleaning facility (Swanson Cleaners Store 67) at this parcel where the Shell service station is now located. The records search did not indicate if underground product storage tanks were utilized for material storage, or if any releases were indicated. Dry cleaners have been associated with releases of hazardous materials, such as perchloroethylene (PCE). If acquisition occurs on this property we recommend further review and investigation of potential contaminant impacts.

AERIALLY DEPOSITED LEAD

Geocon Consultants performed ADL Testing along US 50 (PM 0.16/2.90) for the California Department of Transportation (Caltrans). In their report, titled Aerially Deposited Lead, Naturally Occurring Asbestos, and Lead Containing Paint Site Investigation and Bridge Survey Report, dated March 10, 2008, Geocon concluded that soil generated from excavations to depths between 0.0 and 3.0 feet would not be classified as California hazardous waste. Sampling, however, was conducted in the center median and not the shoulder area, therefore we recommend that Caltrans verify that the Geocon Report results are valid for this project.

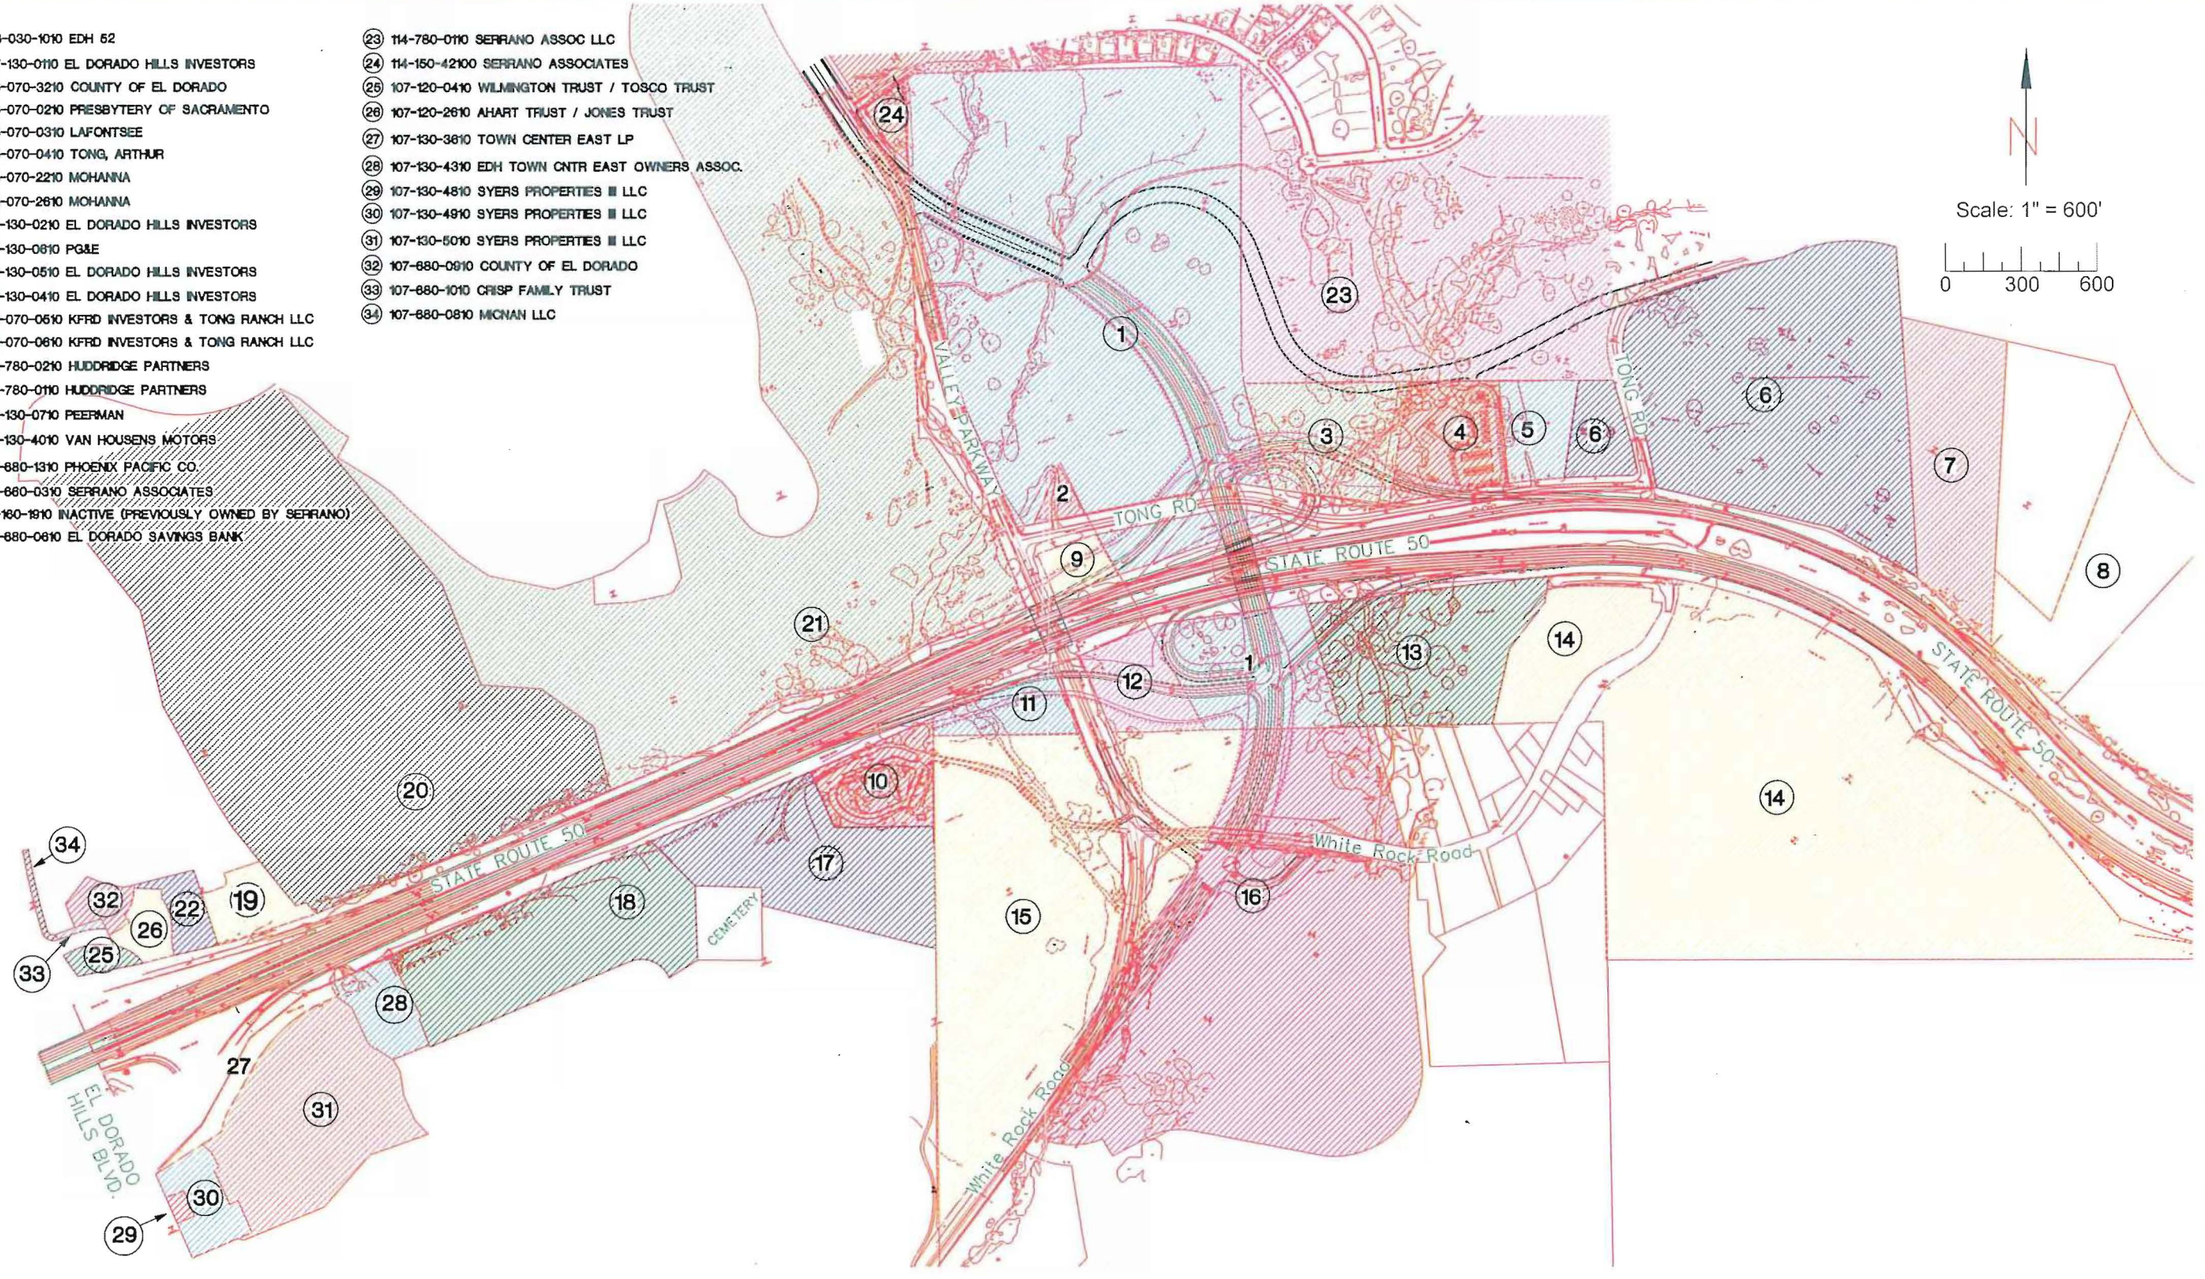
NATURALLY OCCURRING ASBESTOS

Our recommendations regarding naturally occurring asbestos (NOA) have not changed. Additional supporting information is provided in Geocon's Aerially Deposited Lead, Naturally Occurring Asbestos, and Lead Containing Paint Site Investigation and Bridge Survey Report, dated March 10, 2008.

ASBESTOS CONTAINING MATERIALS (ACM)

In Geocon's Aerially Deposited Lead, Naturally Occurring Asbestos, and Lead Containing Paint Site Investigation and Bridge Survey Report, dated March 10, 2008, Geocon concluded that ACM is present in the Clarkesville Road bridge guardrail shim. The guardrail shims are classified as Category I ACM (nonfriable/nonhazardous material). National Emissions Standards for Hazardous Air Pollutants regulations do not require that the Category I material be removed prior to demolition or treated as hazardous waste; however, the disturbance of the material is still covered by the Cal-OSHA asbestos standard.

Please contact us if you have any questions concerning this report update or if we may be of further service.



Sincerely,

BLACKBURN CONSULTING

Dear Mr. Verrios,

Blackburn Consulting (BCI) prepared this Geotechnical Report for the EDH 52 site rough grading in accordance with our proposal dated January 15, 2013. Below, we present a summary of site conditions and recommendations for rough site grading and preliminary foundation design.

Thank you for selecting us to be on the design team. Please call if you have questions.

Sincerely,

INTRODUCTION

Purpose

This report is for rough grading and preliminary foundation design, pavement, and utility installation considerations; final geotechnical design recommendations will be necessary following rough grading and determination of actual improvements. Do not rely upon this report for different locations or improvements without the written consent of BCI.

Scope of Services

To prepare this report, BCI:

- Reviewed our previously obtained subsurface data and analyses for the Silva Valley Parkway Interchange project
- Drilled, sampled, and logged four borings
- Excavated, sampled, and logged 11 test pits
- Performed a site review and reconnaissance
- Performed laboratory tests including a compaction curve, direct shear, moisture density, and rock compression testing
- Compiled existing and new subsurface data
- Performed engineering analyses.

PROJECT LOCATION AND DESCRIPTION

Project Location

The EDH 52 site is a roughly rectangular parcel of land located at the northeast corner of the intersection of Silva Valley Parkway and Tong Road (just north of Highway 50), in El Dorado Hills, California. Figure 1 (attached) shows the approximate site location.

Project Description

Based on the rough grading plans dated January 2013, the EDH 52 site will be split diagonally by the new Silva Valley Parkway which will be constructed as part of the new interchange. Two large commercial lots, Area 1 in the southwest portion and Area 2 in the northeast portion, will be created by the split. The Site Map, attached as Figure 2, shows the general site layout.

Rough grading will create a flat building pad along the south side of Area 1 that will then slope gently up to the north. A flat building pad will also be created along the east side of Area 2 that will then slope gently down to the west. Significant cut and fill are proposed for rough grading in each area.

In Area 1, cuts will generally occur along the east and north sides and fills along the west side. Rough Grading Plans provided by RSC Engineering (1/23/2013) show planned cuts along the east side are up to a maximum of approximately 28 feet in height and fills along the west side are up to approximately 30 feet deep. In general, cut slopes will be created along the east side of Area 1 (below the new Silva Valley Parkway) and fill slopes along the south and west sides (along the existing Silva Valley Parkway). Cut slopes are proposed at gradients of 2:1 to 4:1 (horizontal to vertical) and fill slopes at 2:1 or flatter with most slopes at a gradient of 2:1. Drainages cross the central portion and north end of Area 1 in a southwesterly direction; the central drainage will likely be filled and the other may be filled depending on the final rough grading alternative selected.

In Area 2, cuts will generally occur along the east side and fills in the central and west side. Planned cuts along the east side are up to a maximum of approximately 35 feet in height and fills are up to approximately 25 feet deep. Cut slopes will be created along the south, east, and north sides of Area 2 and fill slopes along the south and west sides. Cut and fill slopes are proposed at a gradient of 2:1. Drainages cross the central and western portion of Area 2 in a southwesterly direction; the central drainage may be filled depending on the final rough grading alternative selected and the western drainage will not be filled.

Structure and foundation details are not known at this time but we assume conventional slab-on-grade commercial/retail structures, likely concrete tilt-up, with light to moderate loads on shallow spread and strip footing foundations.

GEOLOGIC CONDITIONS

General Geology

The project site is located within the foothills of the Sierra Nevada Geomorphic Province of California. The Sierra Nevada has a general northwest topographic/structural trend and is on the order of 430 miles long and 40 to 80 miles wide. The mountain ranges of the Sierra Nevada were created roughly 120 to 130 million years ago when sediments as thick as 30,000 feet along with volcanic rocks were buckled and warped resulting in a series of low mountain ranges. The roots of these mountain ranges were then intruded by granitic rock.

The Sierra Nevada was tilted upward along faulting at the eastern edge. In the higher elevations, much of the younger sedimentary material and older metamorphic rock has been eroded and exposes the granitic rock. In the lower foothills of the Sierra Nevada, the older metamorphic rocks remain and are exposed at the surface.

Much of El Dorado County is underlain by Mesozoic-age metavolcanic and metasedimentary rocks and metavolcanic rock occurs at relatively shallow depths throughout the project site. Published geologic mapping by Wagner[1] and Busch[2] shows Jurassic-age metavolcanic rock at the project site. Our site review and subsurface work confirm the presence of shallow, metavolcanic rock. The Geologic Map, attached as Figure 3, shows the local site geology.

Regional rock structure is dominated by northwest trending foliation and northwest trending faults and fault zones that mark the boundaries of major rock types. Rock structure that we mapped within the project area has a predominant foliation with a general strike of north, 35° to 40° west, and a steep dip of 70°-90° to the northeast.

Rock is exposed intermittently on the surface of the site. We did not observe indications of slope instability on the natural slopes in the area.

Faulting

Active or potentially active faults have not been mapped on or near the site. In general, faults with Historic or Holocene (last 10,000 to 11,000 years) rupture are often considered "active." Late Quaternary or Quaternary age faults are often referred to as "potentially active."

Our review of published geologic mapping and site review did not reveal the presence of Late Quaternary (displacement within the last 700,000 years) or younger faults within or adjacent to the project site.

The site does not lie within or adjacent to an Alquist–Priolo Earthquake Fault Zone for fault rupture hazard (Bryant and Hart, 2007)[3], and no known active faults are mapped with the project area. Busch (2001) shows the main trace of the West Bear Mountains Fault crossing US 50 approximately 3,100 feet west of the existing Silva Valley Parkway and a north-south trending splay associated with this fault crossing US 50 approximately 1,200 feet to the west. Jennings (2010)[4] shows the West Bear Mountains Fault as Pre-Quaternary in age and is not considered as an active seismic source. We consider the potential for fault rupture at the site to be low.

Naturally Occurring Asbestos Minerals

Published mapping and our site review does not indicate that the project is within an ultramafic rock area which is typical host rock for naturally occurring asbestos (NOA) minerals; however, ultramafic rock and faulting are mapped nearby and NOA can potentially occur in the area.

Geologic mapping by Churchill[5] shows an "area more likely to contain naturally occurring asbestos" (NOA) about one mile north of the existing Silva Valley Parkway and also east of Bass Lake Road (over 1 mile east of the site). The map shows the project area to be within an area "that probably does not contain asbestos." Mapping by Bruyn[6], shows the western third of Area 1 (along the existing Silva Valley Parkway) as within an Asbestos Review Area identified as "Quarter Mile Buffer for More Likely to Contain Asbestos or Fault Line".

FIELD INVESTIGATION AND LABORATORY TESTING

To characterize the subsurface soil and rock conditions at the site, BCI observed and logged four borings (B1-B4) and 11 test pits (TP1-TP11). We field located exploration locations by taping and pacing from features shown on the topographic map; therefore, consider exploration locations and elevations shown as approximate.

Exploratory Borings

Taber Drilling drilled and sampled four exploratory borings in February 2013. Boring depths range from 24.2 to 40 feet below ground surface (bgs). BCI planned the general location of the borings based on existing data, planned rough grade, and site accessibility. The depth of the borings is based on the proposed rough grade elevation (excavation depths). Figure 2 shows the approximate boring locations and Appendix A has a discussion of drilling and sampling procedures, logs of the borings, and photographs of rock core.

Exploratory Test Pits

Burke Backhoe excavated 11 test pits with a Caterpillar 430D backhoe equipped with a 2-foot wide bucket in February 2013. The backhoe weighs approximately 14,500 pounds. Typical trenches were 2 to 3 feet wide, 8 to 12 feet long, and 3 to 8 feet deep. Figure 2 shows the approximate test pit locations and Appendix A has a discussion of excavation details and logs and photographs of the test pits.

[5] Churchill, 2000, Areas More Likely to Contain Natural Occurrences of Asbestos in Western El Dorado County, California; California Geological Survey, OFR 2000-002.
[6] Bruyn, 2005, Asbestos Review Areas, Western Slope, County of El Dorado, State of California; El Dorado County, Environmental Management

Laboratory Tests

In addition to the field penetration tests and pocket penetrometer field testing, we completed the following laboratory tests on representative soil samples from our borings and test pits:

- Moisture Content (ASTM D 2216) and Unit Weight (ASTM D 2937) for soil classification and in-place soil characteristics.
- Direct Shear (ASTM D 3080) for soil strength.
- Unconfined Compression (ASTM D 2938) for rock strength.
- Liquid and Plastic (Atterberg) Limits (ASTM D 4318) for soil classification and characteristics
- Maximum Dry Density (ASTM D 1557) for compaction characteristics.

Moisture and density tests indicate that the dry density of the shallow soils and weathered rock generally range from 100 to 108 pounds per cubic foot (pcf) with moisture contents generally in the range of 18% to 22%.

A direct shear test on a mix of soil and weathered rock (clayey sand with gravel) indicates an internal friction angle of 36 degrees and cohesion of 219 pounds per square foot (psf) at normal loads of 1000, 2000, and 3000 psf.

Unconfined compressive strength tests on rock resulted in values that range from 3,200 pounds per square inch (psi) to 17,370 psi. The unit weight of the rock varies from 174 pcf to 184 pcf.

Liquid and Plastic Limit tests confirm the presence of low plasticity silts, with a Plasticity Index of 3, in the upper 1 to 2 feet of soil.

Maximum dry density tests on mixed surface soils and weathered rock is 134.1 to 135.4 pcf at an optimum moisture content of 8.7% and 8.0%.

We attach complete laboratory test results in Appendix B and show selected results on the boring logs in Appendix A.

Seismic Refraction Survey

Seismic refraction profiling is the process by which seismic waves are produced, recorded and analyzed to determine the seismic velocity of subsurface materials. The seismic velocity of the subsurface materials can be correlated to soil and rock types, and rock weathering and competency.

We performed our seismic refraction fieldwork in January 2013. Refraction work consisted of 5 survey lines (SR1 to SR5), each 110 feet in length. The location of our refraction work is based on the rough grading plan and where significant cuts are proposed.

Our Professional Geologist led the field exercises, monitored the data acquisition, and used the computer program SeisImager by Geometrics, Inc. to analyze the acquired data. Figure 2 shows the approximate location of each seismic refraction survey. Appendix C contains a discussion of data retrieval procedures and the interpreted seismic profiles.

Existing Subsurface Information

BCI completed subsurface exploration (borings and test pits) in the project area for the planned Silva Valley Parkway Interchange[7]. Some of this information was collected within or adjacent to the EDH 52 project site. We use the information from these additional exploration points to supplement this evaluation. Figure 2 shows the location of these additional borings and test pits and we include the logs in Appendix D.

SITE CONDITIONS

Surface Conditions

In general, the site is located along the westerly flank of a northwest trending ridge with south-southwest flowing drainages. Natural slope gradients range from a low of approximately 3% (within the drainage areas) to as steep as 25% (4:1, horizontal to vertical) in the northeastern portion of the site. Elevations across the site range from a low of approximately 695 feet in the southwestern portion of the site to a high of approximately 793 feet in the northeast. Figure 1 shows the regional topography and Figure 2, Site Map, shows site details.

The site is covered with moderately dense grasses with scattered oak on knoll tops. Oak and other brush occurs along the drainages particularly in the northwest corner of the site. A thin (1 to 3 inch) layer of organic debris typically covers the ground surface.

Two well-defined drainages are present along the western half of the site (in Area 1 and Area 2, see Figure 2). The drainages flow south-southwest and across Silva Valley Parkway. At the time of our fieldwork, only the more westerly drainage had water in it (several inches with low flow). Flow in this drainage appears to emanate from piping (covered in dense vegetation) below an off-site fill at the north end.

Other surface features of significance include the following (see Figure 2 for approximate locations):

- Soil stockpile in the east-central portion of the site (southeast corner of Area 2)
- Old excavated wells or cisterns. One in the northwestern corner of the site (west end of Area 2 along the drainage) that is approximately 5.5 ft in diameter, and one in the north-central portion of the site (center of Area 2) that is approximately 4 ft in diameter. Depths are unknown.
- Structure remnants on the knoll top in the west-central portion (north end of Area 1)
- Old dam in the drainage at the west central portion (central portion of Area 1)

[7] BCI, 2012, Geotechnical Design Report, US50, Silva Valley Parkway Interchange, Phase 1, El Dorado County, California, 03-ED-50, PM 1.07/R2.40, EA 03-1E2901; Consultants Report to Mark Thomas & Co., Inc.

Tong Road, which will be realigned with the interchange project, traverses the southwest corner of the site. Minor cut slopes exist along Tong Road and along Silva Valley Parkway at the south end of the site. The soil and rock exposed in these slopes stands without significant sloughing or erosion issues (except where water has been directed down a dirt road).

In general, most of the site is undisturbed and we did not observe significant amounts of existing fill or cut area on site. We did observe some existing fill where the new Silva Valley Parkway will cross the most westerly drainage (primarily within the road right-of-way). Also, areas of disturbed ground (minor excavated areas and mounds of soil) occur in and adjacent to the drainage located east of the remnant structures in Area 1.

Subsurface Soil and Rock Conditions

Soil and rock conditions are relatively uniform across the site. In general, we observed 1 to 3 feet of stiff, sandy silt (ML) over weathered metavolcanic rock. We briefly describe the soil and rock conditions below. Refer to the Boring and Test Pit Logs in Appendix A for more specific subsurface conditions in each area.

In Area 1(southwest portion of the site) we typically encountered the following profile:

- 1 to 2 feet of soil that consists of brown, stiff sandy silt with gravel, over
- 1.5 to 5 feet of decomposed to intensely weathered, metavolcanic rock, over
- Intensely to moderately weathered rock to depths of 5.5 to 8 feet where refusal to excavation with the backhoe was encountered. Our borings and seismic refraction work show that rock below this depth becomes progressively less weathered and harder with depth.

In Area 2(northeast portion of the site) we typically encountered the following profile:

- 0.5 to 2 feet of soil that consists of brown to reddish brown, stiff sandy silt, over
- 0 to 7 feet of decomposed to intensely weathered, metavolcanic rock, over
- Intensely to moderately weathered rock to depths of 2 to 15 feet. Refusal to excavation with the backhoe was encountered at depths of 2.5 to 7.5 feet. Our borings and seismic refraction work show that rock below these depths becomes progressively less weathered and harder with depth.

We observed the rock to be intensely to moderately fractured with a predominant/pervasive foliation fracture that has a north-northwest strike and steep dip to the east. Other fracturing we observed appears to be mostly random (no preferred or repeated orientation observed).

Probing of the drainages with a rod indicates that generally 1 to 3 feet of soft or loose soil is present at the surface. Saturated soil conditions can (and do) occur within the drainages.

Groundwater

We did not encounter groundwater in any of our borings or test pits. The borings were cored below augerable depths and the presence of groundwater could not be confirmed at core depths because water is used in the coring process. We did not observe active springs or seeps within the site; however, water was standing in the drainage in the northwest corner of the site at the time of our field investigation.

Based on our experience in the area, groundwater can occur at isolated locations within the fractured rock, and an accumulation of water often occurs near the soil rock interface during and for several months following the rainy season.

Seismic Refraction Profiling

We completed seismic refraction surveys at 5 locations across the site and recorded seismic velocities from ±2,000 to over ±20,000 feet per second (fps). Based on mapped ground conditions and the materials encountered in our borings, we estimate that residual soils have a seismic velocity of 2,000 to 3,000 fps, or less. The underlying metavolcanic rock has velocities ranging from 3,000 to 20,000 fps or higher, depending on the depth, general weathering conditions, and rock fracturing. In general, the less weathered and less fractured the underlying rock, the greater the seismic velocity.

For profiles at each seismic refraction location, refer to the Seismic Refraction Profiles in Appendix C. The refraction surveys reflect average rock conditions; harder or softer rock can occur at depths different than that shown on the profiles.

CONCLUSIONS AND RECOMMENDATIONS

General Site Suitability

We did not observe areas of significant ground instability or unsuitable soil conditions at the site. The site should be suitable for the planned improvements when graded in accordance with the project plans, industry standards, and our geotechnical recommendations. Significant geotechnical challenges for site development include the following:

- Hard rock excavation especially below depths of 10 to 15 feet below existing grade
- Generation of rocky fill material from deeper cuts
- Presence of perched groundwater and/or saturated surface soil conditions during the winter and spring and at low drainage areas throughout the year
- Construction of utilities and foundations in areas cut down to hard rock

Slope Stability and Slope Construction

Fill slopes

Fill slopes are proposed at gradients of 2:1 (horizontal to vertical) or flatter. Maximum fill slope heights are 25 to 30 feet. Fill slopes constructed at a gradient of 2:1 or flatter will be stable when constructed in accordance with our grading recommendations.

Cut Slopes

Cut slopes are proposed at gradients of 2:1 or flatter. Cuts will expose surficial soils and rock that is weathered/fractured to varying degrees. Rock slope stability is commonly controlled by failure along discontinuities within the rock mass; however, weak rock masses can also fail through general shear. At the proposed slope gradients, we do not expect potential for failure through general shear.

We recorded prominent/pervasive discontinuities within test pits and at rock outcrop and reviewed the potential for failure at the proposed cut slopes. In general, most pervasive discontinuities are foliation fracture that has a steep dip (greater than 70° to the northeast) and, therefore, do not create planes or wedges out of proposed slopes with a gradient of 2:1 or flatter. We consider the proposed cut slopes to be stable.

Retain BCI to review cut slopes upon completion to confirm anticipated conditions and evaluate potential for rockfall (and mitigation methods if necessary). Some removal of loose rock blocks may be necessary upon completion of slope cuts. While slopes at a gradient of 2:1 or flatter do not typically present a rockfall hazard, it is possible that some rockfall protection (such as fencing at the base of slope) may be necessary in some areas where the rock has been disturbed. The west facing slopes are more likely to have rock pieces that can roll downslope due to foliation fracture that approximately parallels the slope and the potential for some intersecting fractures that can create larger loose rock pieces following grading (particularly in the upper 10 feet where weathering and fracture is more intense).

Grading

Soil and Rock Excavatability

Our trenching and drilling work can provide insight into rock excavation characteristics. Refer to the logs of the Borings and Test Pits in Appendix A for auger drilling and excavation results.

Based on the soil and rock conditions in our test pits, borings, and existing cuts in the vicinity, the soil and rock should be excavatable with conventional grading equipment such as scrapers, dozers, backhoes and excavators to the depth of refusal encountered in our test pits. This typically occurred at a depth of approximately 5.5 to 8 feet below existing grade in Area 1 and 2.5 to 7 feet in Area 2.

We drilled borings to auger refusal prior to coring. Generally, when auger refusal is encountered using a small diameter auger and a moderate sized drill rig, it's an indication that conventional excavation can be difficult below those depths. Table 1 summarizes the depth of auger refusal at each boring location. At depths greater than these (auger refusal depths), we expect difficult excavation when using equipment such as a D8 to D11 and blasting may be required to facilitate excavation at some locations.

TABLE 1

AUGER REFUSAL DEPTH		
Boring No.	**General Location (see Figure 2)**	**Auger Refusal Depth (bgs)**
B1	Area 1, southeast corner	10 feet
B2	Area 2, southeast corner	20 feet
B3	Area 2, northeast corner	13 feet
B4	Area 2, north side, central	4.5 feet

To further evaluate rock conditions and excavation characteristics, BCI completed seismic refraction surveys. The seismic refraction survey provides an estimate of rock rippability based on compression wave velocities in the underlying soil and rock.

Based on our review of cuts and the results of our seismic refraction survey, we present an estimate of general material rippability in Table 2.

TABLE 2

GENERAL RIPPABILITY		
Seismic Velocity (feet per second, fps)	**Material Type**	**Estimated Rippability**
$\leq 3{,}000$	Soil and decomposed to intensely weathered rock	Rippable with common construction equipment
3,000 to 8,000	Intensely to moderately weathered rock, with local less weathered blocks	Rippable, with local resistant blocks that may require blasting or alternative excavation methods
$\geq 8{,}000$	Slightly weathered to fresh rock	Blasting or alternative excavation methods, with local blocks rippable along natural discontinuities

Seismic velocities we interpret within the site range from ±2,000 to greater than ±20,000 fps. In general, we find a velocity of approximately 4,000 fps or higher indicate material (rock) that is expected to present difficulty to conventional trenching equipment (large backhoe to moderate size excavator). Additionally, Caterpillar publishes the "Caterpillar Performance Handbook (2009)," which relates the performance of various tractors to the seismic velocity of various rock types. According to the handbook, metamorphic rock with seismic velocities less than ±6,000 fps should be rippable using a D8 with a multi or single shank No. 8 ripper. Rock with velocities greater than ±8,000 fps are likely non-rippable with a D8. For a D10, these values are about ±8,000 and ±10,000 fps. Table 3 shows the approximate depth to the 4,000 fps and 8,000 fps horizon at each of our survey locations.

TABLE 3

SEISMIC REFRACTION SUMMARY			
Seismic Profile No.	**General Location (see Figure 2)**	**Approx. Depth to 4000 fps horizon (ft bgs)[1]**	**Approx. Depth to 8000 fps horizon (ft bgs)[2]**
SR1	Area 2, southeast corner	3 to 5	10 to 15
SR2	Area 2, northeast corner	3 to 5	12 to 15
SR3	Area 1, east side	4 to 7	> 25*
SR4	Area 1, southeast corner	4 to 6	8 to 28
SR5	Area 2, north side	3 to 5	12 to 18

[1]Approximate seismic velocity expected to present difficulty to conventional trenching equipment
[2]Approximate seismic velocity expected to present difficulty to conventional excavation equipment (D8)
*Possible more deeply weathered zone

In general, it appears blasting may be required to facilitate excavation at depths greater than approximately 15 to 20 feet. The refraction surveys reflect average rock conditions; harder or softer rock can occur at depths different than that shown on the profiles. For profiles at each seismic refraction location, refer to the Seismic Refraction Profiles in Appendix C.

Competent rock and large boulders may also be present at shallower depths at other locations within the project, which may require alternative excavation methods and/or localized controlled blasting.

To facilitate foundation and utility trench excavation, consider overexcavation of hard rock where building pads will be cut down to this material.

Site Clearing and Original Ground Preparation

Prior to making cuts and fills complete the following:

1. Remove any debris and boulders from the surface of the site.
2. Completely remove all structures and associated foundations, pits, and piping. Structure remnants occur on the knoll top in the west-central portion of Area 1.
3. Remove the dam and accumulated loose/soft soils behind the dam where located in the drainage at the west central portion of Area 1.
4. Remove pavement at Tong Road where new fill will be placed across the old road.
5. Strip vegetation to a minimum depth of 2 inches below the ground surface, and remove brush and trees including the roots. Do not use strippings within engineered fill. Remove strippings from the site or place in landscape areas if approved by the landscape architect. As an alternative to stripping, if vegetation is thin at the time of grading based on review and approval of BCI, thin vegetation may be disced to mix with the upper soils.
6. Widen excavations resulting from tree, foundation, and other buried features to provide access for self-propelled compaction equipment.
7. Remove concentrations of organic material and loose/soft soils from the two drainages located in the western portion of the site. In general, we expect 1 to 3 feet of overexcavation within the drainages.
8. Two open wells or cisterns are present in Area 2. Probe these features to determine depth, completely remove any backfill materials, and backfill with concrete slurry or other approved backfill based on the conditions exposed.
9. Completely remove the soil stockpile in the east-central portion of the site (southeast corner of Area 2). This stockpile is expected to be completely removed when the area is cut down to planned grade.

Prior to placing fill on stripped or cut ground surfaces, scarify the ground surface to a minimum depth of 8 inches. Moisture condition the scarified soil to within 2% of optimum and compact it to a minimum of 90% relative compaction based on ASTM D 1557 test procedure. Scarification and recompaction may not be necessary if fresh to moderately weathered rock is present as determined by a BCI representative.

Subdrainage

Drainages tend to accumulate water even after they have been filled. To reduce the potential for detrimental accumulations of subsurface water along buried drainage locations, install subdrains where the existing drainages will be filled with more than 6 feet of cover (to avoid interference with utilities). We expect this to occur at the southwest trending drainage that crosses the central portion of Area 1 and Area 2, and possibly the drainage crossing the northwest corner of Area 2 (if filled).

Excavate subdrains into the prepared ground surface (surface following removal of organics and loose/soft soils). Refer to the subdrain detail on Figure 4 and construct as follows:

- Minimum depth of 3 feet below the prepared surface
- Minimum width of 2 feet
- Fill the trench with ¾-inch washed, crushed drain rock wrapped with a non-woven filtration geotextile (Mirafi 180N or equivalent)
- Place 6-inch diameter perforated plastic pipe 4 to 6 inches above the trench base (pipe strength must be adequate to support the load of the overlying drain rock and fill)
- Use a minimum gradient of 1% for trench base and pipe
- Provide cleanouts at regular intervals (200 to 300 feet)

Taper off drain rock and filter fabric approximately 15 feet upstream of the subdrain outlet to collect water within the trench. Use solid drain pipe for the last 15 feet and outlet to suitable drainage facilities at the toe of the fill slope or into the storm drain system. Accurately record subdrain and cleanout locations so that future underground installations do not damage them.

Fill Placement and Compaction

On-site soil and weathered rock excavated from proposed cut areas may be used as fill. Fill must be free of debris and concentrations of organic material.

Based on our exploratory work and experience in the area, fill material generated from cuts will predominantly consist of a mixture of sandy silt with gravel and rock fragments up to about 8 inches in greatest dimension. Fill material generated from cuts deeper than about 15 to 20 feet will likely have a relatively small amount of soil or decomposed rock mixed with the rock fragments, and may require mixing with less rocky material to generate suitable fill material. Large rock, several feet in diameter, will be generated at isolated locations during general excavation.

Unless otherwise approved by BCI and the project engineer, limit rock dimensions as follows:

- Upper 4 feet of fill in pavement and structural areas should not contain rock larger than 4 inches in greatest dimension
- Upper 10 feet of fill should not contain rock larger than 12 inches in greatest dimension
- Place rock greater than 12 inches but less than 36 inches in greatest dimension in fills deeper than 10 feet below finish grade. Disperse the large rock throughout the fill and compact soil around the rocks as necessary to prevent voids and nesting.
- Rock larger than 36 inches should be broken down or disposed of at pre-designated locations. Large rock may be placed at the toe of slopes or other locations specifically designated for rock disposal if approved by BCI and the project engineer.

Thoroughly mix soil and rock to prevent nesting and voids.

To reduce the potential for damaging differential settlement, where structures will be located across a cut/fill transition, maintain a maximum fill depth differential of 10 feet within a horizontal length of 50 feet (average fill depth gradient of 1ft of depth over 5ft horizontally). It appears that this condition may need to be addressed at the west central and southwest sides of the Area 2 pad. Overexcavation and recompaction on the cut side of the building pad will reduce fill depth differential.

Construct fill as follows:

- Place fill in maximum 8-inch-thick loose lifts (excluding large rock placement).
- Moisture condition to within 2% of optimum moisture content.
- Compact all fill below planned structure areas and 10 feet beyond to a minimum of 95% relative compaction up to subgrade elevation.
- Compact areas outside of structure locations to a minimum 90% relative compaction within 5 feet of finish subgrade, and a minimum 95% relative compaction when deeper than 5 feet below finish subgrade.
- Fill placed on or against existing slopes with a gradient steeper than 6H:1V must be benched into the existing slope a minimum of 2 feet (or into competent soil/weathered rock as determined by BCI's field representative) so that surficial soils are removed and stepped benches are created.
- Base relative compaction and optimum moisture content on the current ASTM D 1557 test procedure.
- Restrict maximum rock size as indicated above.

If the fill is untestable because of the quantity of rock; moisture condition thoroughly as recommended by BCI, and compact each 8-inch lift with 5 to 7 passes of a Caterpillar 825 sheepsfoot compactor or the equivalent. BCI may modify the number of passes and lift thickness during construction based on the compaction equipment used and material types.

Fill Slope Construction

Where fill slopes will be more than 5 feet high, construct a key at the base of the slope prior to fill placement. The base key excavation must be a minimum of 8 feet wide and extend a minimum of 2 feet below the ground surface or to weathered rock as determined by a BCI representative. Backfill the base key excavation and place fill as recommended above. Construct fill slopes at gradients no steeper than those indicated in the "Slope Stability and Slope Construction" section of this report.

Grading Factors

It is very difficult to assess overall shrink and swell for grading volume in rocky materials due to variation in soil cover, rock weathering and presence of bouldery materials; only rough estimates for general guidance are possible. We expect very little shrinkage (cut to compacted fill) for materials in the upper 10 to 15 feet (say approximately 0% to 5%). Excavations below that depth will likely result in swell (bulking) on the order of 10% to 20% (considering some loss due to oversize material).

The amount of oversize material (large boulders) generated from deeper cuts could significantly reduce the amount of useable fill. Other considerations in shrink/swell estimates include material loss during transport and site work, potential for variability within the weathered/fractured rock, survey errors, and import used for pavement construction and trench backfill.

FOUNDATIONS

Shallow, continuous strip and spread footings will be suitable for structure foundations when the ground surface is prepped and fills are placed in accordance with our recommendations. Structure plans are not available at this time but wood frame, masonry, or concrete tilt-up structures are anticipated. We expect light to moderate loads on the order of 75 to 85 kips for columns and 2 to 6 kips per lineal foot for strip footings.

Bearing Capacity

When building pads are prepared in accordance with these recommendations, the site will be suitable for conventional foundations (i.e., continuously reinforced perimeter wall footings and isolated interior column footings) and slab-on-grade floors.

For preliminary foundation sizing considerations, embed foundations a minimum of 18 inches into the prepared subgrade. Footings must be a minimum of 24 inches wide for continuous and 36 inches for isolated columns, and sized not to exceed an allowable bearing capacity of 5,000 psf. The allowable bearing capacity may be increased by one-third if transient loads are included.

To resist lateral movement, use a coefficient of friction of 0.45 and passive earth pressure of 300 psf per foot of embedment depth or up to 440 psf per foot of embedment if lateral movements of up to 2% of the foundation embedment depth can be tolerated.

Settlement

If the design and construction team follow the recommendations in this report, we expect that total settlement at foundation locations will not exceed 1-inch. Differential settlement between column loads and along strip footings (over a distance of approximately 50 feet) are expected to be less than ½ -inch.

Foundations and slabs-on-grade underlain by fill can experience greater magnitudes of total and differential settlement when the underlying fill thickness is significant (greater than 5 feet) even when properly compacted. Modified fill placement and compaction recommendations are provided in the "Grading Recommendations" section of this report to minimize differential settlement in areas of deep fill.

Seismic Design

The building pads will be underlain by weathered rock to fresh rock that would be classified as Site Class "B" (California Building Code (CBC), 2010). Based on the rough grading plan, portions of the building pad in Area 1 (west side of pad) will have fill and soil in excess of 10 feet deep between the foundations and the underlying rock; therefore, the Site Class must be adjusted to "C" for that location. For design in accordance with current California Building Code (CBC) procedures, we provide parameters in Table 4a and 4b below.

TABLE 4a

Seismic Design Parameters (CBC 2010) EDH 52 (Area 1) – Site Class C

CONCRETE SLABS-ON-GRADE

Design Recommendations for Geotechnical Support

Provided the contractor(s) prepares the building pads in accordance with our grading recommendations and any addendums by BCI, slab-on-grade floors may be used to support normal floor loads. Underlay the concrete slabs with a minimum of 4 inches of washed, crushed, and compacted rock to provide uniform support. Crushed rock used beneath floor slabs should be graded so that 100% passes the ¾ inch sieve and less than 5% passes the No. 4 sieve. Compact crushed rock with at least two passes of a vibratory type compactor.

For building pads Concrete floor slabs with crushed rock underlayment may be designed using a Modulus of Subgrade Reaction, k, of 200 psi per inch in cut or fill locations.

Exterior flatwork such as sidewalks, etc. may be placed directly on the prepared subgrade without the use of rock underlayment. The subgrade should be free of debris, uniformly compacted, and thoroughly wetted before the concrete is placed.

Design Considerations for Moisture

Construction of the building pads will require deep cuts into intensely to slightly weathered rock. BCI did not observe seepage in our exploratory borings or test pits. However, after development, irrigation and rainwater may access deep excavations in rock via seepage and/or from the ground surface. While we don't expect this seepage to be significant enough to require underfloor drainage systems, water will travel on relatively impermeable rock surfaces and could be enough to cause higher than normal moisture vapor to pass through the concrete floor slabs. Excessive vapor can cause floor covering damage and mold.

The designer must consider the potential for excessive water vapor and design the slabs and underlayment accordingly. References providing guidelines for vapor mitigation and slab underlayment include ASTM E 1643, ACI 302.1R, PCA, and flooring manufacturer requirements for the intended use.

No matter how extensive the vapor mitigation design, some vapor will pass through the slabs and, the slabs themselves will absorb and release some moisture. Therefore, consult with floor covering and mold specialists, and include a contingency to replace some floor coverings and mitigate some mold growth.

PRELIMINARY PAVEMENT DESIGN

For this report, we provide preliminary pavement design recommendations based on the anticipated soil conditions in subgrade areas and Resistance (R) values we obtained during our work on the Silva Valley Parkway Interchange project. Base final pavement design on the subgrade conditions present after rough grading.

Preliminary Structural Sections

In general, we find that shallow soils in the area have R-Values on the order of 20 to 30, and mixtures of soil and rock have R-Values on the order of 40 to 60. In-place rock that has been ripped and prepped for subgrade is expected to have an R-Value in excess of 50.

The site has a relatively thin soil horizon that overlies weathered rock. We expect pavement subgrade to be composed of either fill that consists of a mixture of minor amounts of silt soil with excavated rock, or cut locations where the rock is exposed at subgrade elevation. For preliminary pavement considerations, an R-Value of 40 is applicable.

Based on an R-value of 40 and the Caltrans Flexible Pavement Design method, we recommend the preliminary asphalt concrete pavement sections in Table 5 for the Traffic Index (TI) shown. The TI is a measure of wheel load, frequency, and intensity. Our experience is that TI's of 4.0–5.0 are often used for automobile parking, and TI's of 6.0-7.0 are often used for fire truck access, channelized flow, and bus traffic. Use of the proper TI should be confirmed by the project designers.

TABLE 5

Preliminary Pavement Structural Sections (Based on an R-Value = 40)					
Material	**TI = 4**	**TI = 5**	**TI = 6**	**TI = 7**	**TI= 8**
Asphalt Concrete (ft)	0.20	0.20	0.25	0.30	0.40
Class 2 Agg. Baserock* (ft)	0.35	0.40	0.50	0.65	0.65

* ¾–inch or 1½-inch maximum

To develop these pavement sections we assume that the native subgrade soil (minimum of upper 1 foot) is uniformly compacted to 95% or higher relative compaction and that the baserock is uniformly compacted to 95% or higher relative compaction. BCI should provide design R-Value testing prior to final design.

Pavement Subgrade Preparation

Prior to placing aggregate base, check for subgrade stability by running a loaded water truck over the subgrade. Mitigate unstable areas as recommended by BCI.

Design the pavement areas to allow for positive surface drainage. Adequate surface slope, subgrade crown, and uniform compaction contribute to long-term pavement performance.

It is important to design the drainage of pavement areas so that water is not allowed under the paved areas. If water is trapped under paving the water can saturate the base course and soil subgrade, which results in premature pavement failures.

To reduce the amount of water that can seep beneath the pavement, install cutoff curbs where pavement abuts landscaped areas. Extend cutoff curbs a minimum depth of 4 inches below the pavement subgrade or to in-place rock, whichever depth is less. Where cutoff curbs are undesirable, subgrade drains can be constructed to remove excess water from landscape areas or an impermeable barrier, such as 20 mil HDPE, could be placed at the back of curb to a depth of approximately 1 foot below subgrade.

UNDERGROUND UTILITY CONSTRUCTION

Excavation of the exploratory trenches was difficult when we encountered moderately weathered rock. Trenching in moderately weathered to fresh rock will require heavy trenching equipment and or excavation facilitated by chiseling, pre-drilling, and/or blasting. The depth to moderately weathered rock varies throughout the site but it generally occurs at depths of 5 to 15 feet below the existing ground surface.

Trenches should be sloped or braced in accordance with current Cal/OSHA requirements.

With the exception of trenches that cross the existing drainages, we do not anticipate the need for significant dewatering during installation of utility lines (assuming construction takes place in the drier months of the year when the surface soil is not saturated and there is no surface water on the site).

Backfill utility trenches with approved on site soil and/or broken down rock mixed with soil. Use a maximum material size of 4 inches. Some excavated materials will have to be crushed and/or screened to a maximum size of 4 inches for use as trench backfill. Trench backfill materials should be approved by the geotechnical engineer prior to use. Due to the potentially rocky nature of trench backfill on the site, extend bedding materials at least 6-12 inches above the pipe before general trench backfill proceeds to reduce the potential for pipe damage.

Compact trench backfill as follows:

- Maximum uncompacted lift thickness of 1 foot unless field performance testing can demonstrate adequate compaction of thicker lifts
- Base compaction on ASTM D 1557 test specifications
- Minimum of 95% relative compaction in structural areas and 10 feet beyond
- Minimum of 90% relative compaction in pavement areas
- Minimum of 95% relative compaction where trench backfill exceeds a depth of 10 feet
- Minimum of 85% relative compaction in landscape areas
- Use mechanical methods of compaction
- Jetting is not an acceptable means of compaction
- Base compaction of untestable (rocky fill) on performance specifications determined to be adequate by the project geotechnical engineer at the time of backfilling

PRELIMINARY SOIL CORROSIVITY

For the adjacent Silva Valley Parkway Interchange project (BCI, 2012), we completed corrosion tests (pH, resistivity, chlorides, and sulfates) on soil and weathered rock samples retrieved from exploratory borings and trenches. Tests indicate maximum chloride and sulfate concentrations of 24 and 68 part per million (ppm), respectively. The soil pH ranged from 5.3 to 7.6 and the minimum resistivity ranged from 1,420 to 10,724 ohm-cm (most greater than 2,000 ohm-cm). In general, our tests indicate that the surface soils have a relatively low pH ranging from 5.3 to 6.1 and the underlying, weathered rock has a relatively neutral pH ranging from 7.1 to 7.6.

Based on our tests in the area and site conditions, we expect mild to moderate corrosion potential for iron pipe along the alignment and a generally non-corrosive environment for concrete. To further define site specific potential for corrosive soil and rock, additional testing should be completed.

NATURALLY OCCURRING ASBESTOS

We did not observe rock likely to contain NOA (serpentinite or ultramafic rock) within the site and our rock cores show no indication of fibrous minerals. However, the western third of Area 1 (along the existing Silva Valley Parkway) falls within area identified by El Dorado County Environmental Management as being within an "Asbestos Review Area".

El Dorado County Air Quality Management rule 223-2 requires that an Asbestos Dust Mitigation Plan be prepared, submitted, approved and implemented when more than 20 cubic yards of earth will be moved at sites identified as being in an "Asbestos Review Area". If desired, it is possible that an exemption to the rule may be obtained with further geologic evaluation for NOA. Since preliminary rough grading plans indicate that the portion of the site that falls within the "Asbestos Review Area" will only be filled above, discussion with the County regarding exemption on this basis could be considered.

RISK MANAGEMENT

Our experience and that of our profession clearly indicates that the risks of costly design, construction, and maintenance problems can be significantly lowered by retaining the geotechnical engineer of record to provide additional services during design and construction. For this project, BCI should be retained to:

- Review and provide comments on the civil plans, foundation plans, and specifications prior to construction.
- Monitor construction to check and document our report assumptions. At a minimum, BCI should monitor/test grading, cut slope excavation, foundation excavation, pavement subgrade, aggregate baserock and asphalt compaction.
- Update this report if design changes occur, 2 years or more lapses between this report and construction, and/or site conditions have changed.

If we are not retained to perform the above applicable services, we are not responsible for any other party's interpretation of our report, and subsequent addendums, letters, and discussions.

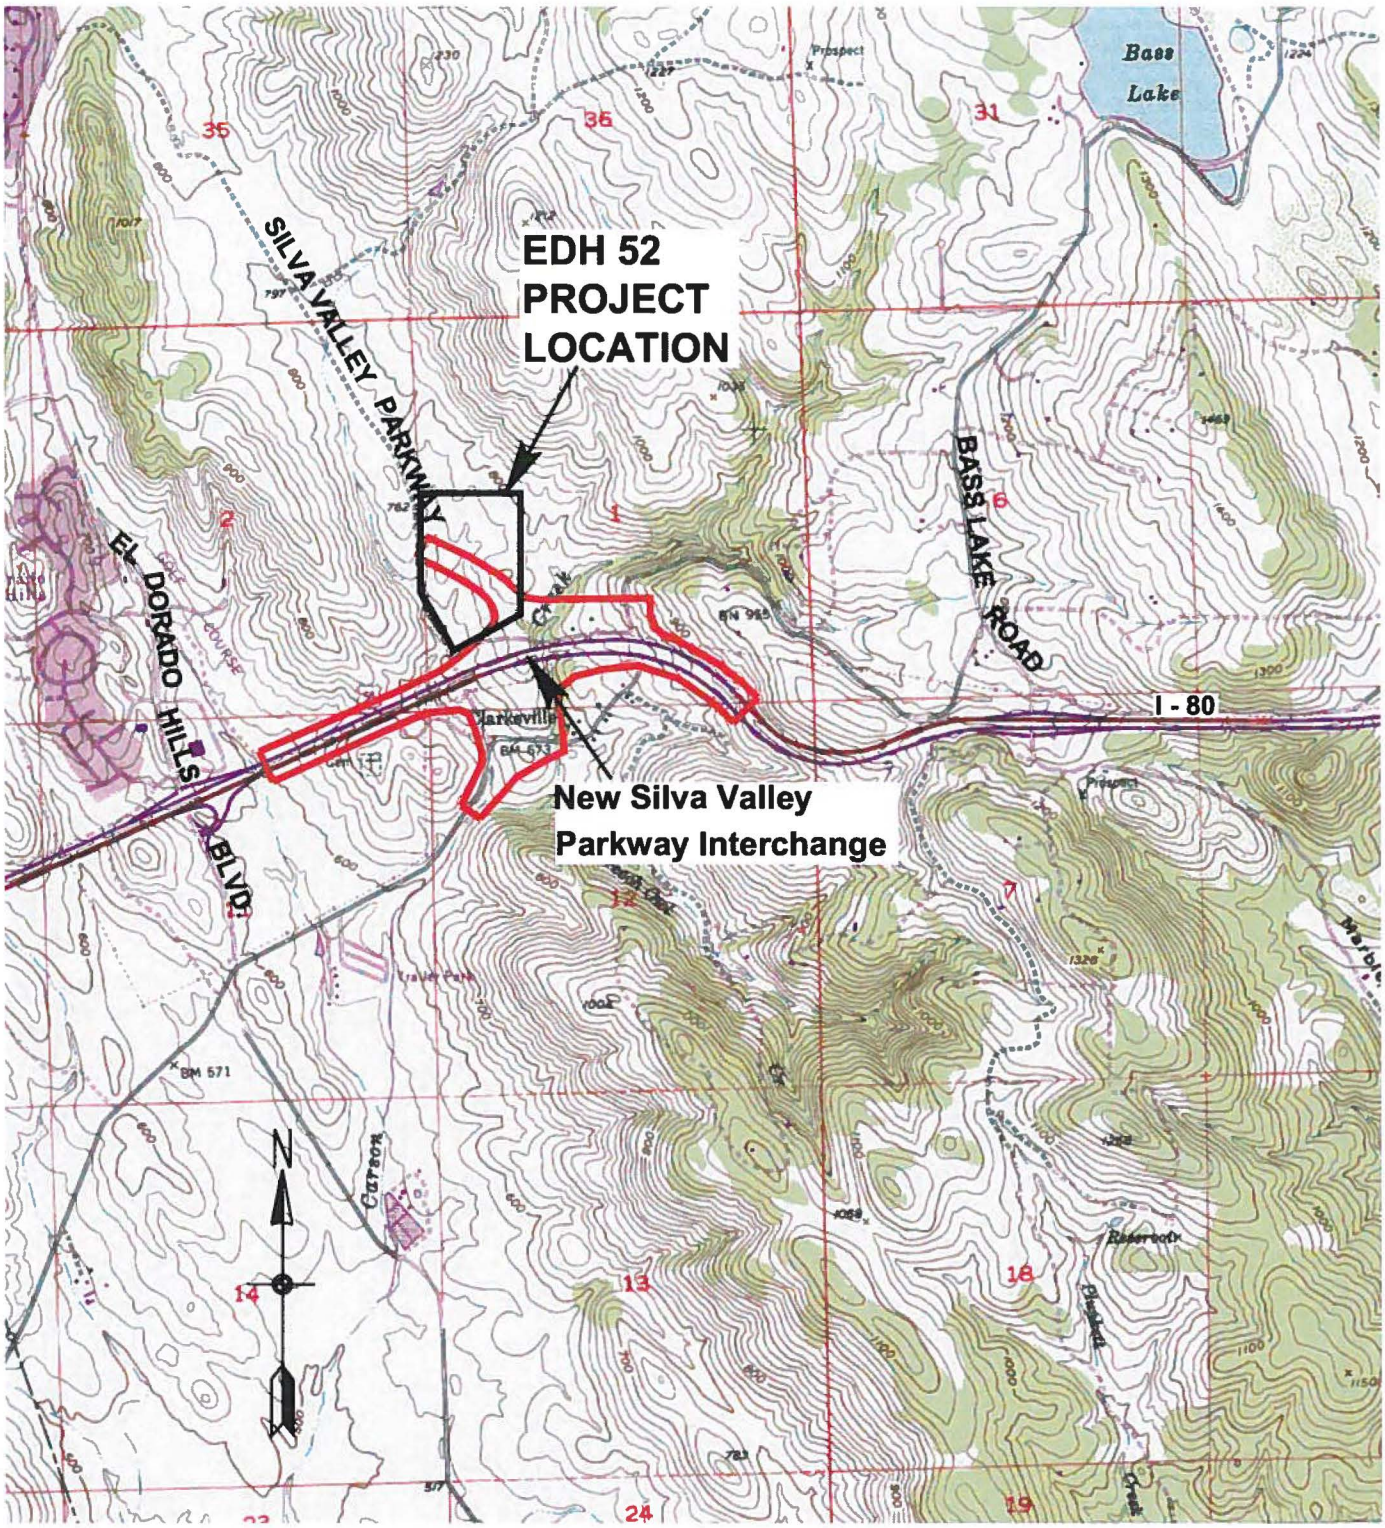
LIMITATIONS

BCI performed services in accordance with generally accepted geotechnical engineering principles and practices currently used in this area. We do not warranty our services.

This is report and preliminary foundation recommendations are based on rough grading plans. Final geotechnical recommendations will be necessary for final improvements.

BCI based this report on the current site conditions. We assumed the soil, rock and groundwater conditions are representative of the subsurface conditions on the site. Actual conditions between probes could be different.

Our scope did not include evaluation of on-site hazardous materials, soil corrosion potential, or flooding.



Modern design and construction are complex, with many regulatory sources/restrictions, involved parties, construction alternatives, etc. It is common to experience changes and delays. The owner should set aside a reasonable contingency fund based on complexities and cost estimates to cover changes and delays.

Logs of our borings and test pits are presented in Appendix A. The lines designating the interface between soil and rock types are approximate. The transition between soil types may be abrupt or gradual. Our recommendations are based on the final logs, which represent our interpretation of the field logs and general knowledge of the site and geological conditions.

Boring, test pit, and seismic refraction survey locations and elevations are approximate (locations were not surveyed).

APPENDIX A

Exploration Notes
Boring and Test Pit Logs
Rock Core and Test Pit Photographs

APPENDIX A – Logs of Borings and Test Pits

Field Exploration Notes

BCI drilled and sampled 4 exploratory borings and excavated 11 test pits in February 2013. The Site Map, Figure 2, shows boring and test pit locations. Logs of the borings and test pits are attached.

Our drilling subcontractor (Taber Drilling) drilled the borings using a CME 55 crawler and solid-stem (4-inch diameter) auger techniques in soil and weathered/fractured, penetrable rock. Harder, more competent rock was drilled and sampled using HQ wire-line coring techniques. Boring depths range from 24.2 to 40 feet below the ground surface (bgs). We obtained soil samples at various intervals using a 3.0-inch O.D. Modified California (MC) sampler (equipped with 2.4-inch diameter brass liners) and a Standard Penetration Test (SPT) sampler driven with an automatic hammer, weighing 140-pounds and falling approximately 30 inches.

Burke Backhoe excavated the test pits with a Caterpillar 430D backhoe equipped with a 2-foot wide bucket. The backhoe weighs approximately 14,500 pounds. Typical trenches were 2 to 3 feet wide, 8 to 12 feet long, and 3 to 8 feet deep. We obtained both hand-driven and bulk soil samples at various intervals.

BCI's project engineer logged the borings and test pits, retrieved samples for laboratory testing, and used plastic caps to seal and label the 2.4-inch diameter, 6-inch long brass tubes retrieved from MC sampling and hand-driven samples. We also retrieved bulk soil samples from soil/rock cuttings, placed this material in large cloth bags, and labeled for laboratory identification. We placed continuous core samples (rock) in labeled core boxes.

During drilling and trench excavation, BCI performed field strength testing with a pocket penetrometer on select cohesive and/or cemented soil samples. The logs include field test results.

BORING RECORD LEGEND

COUNTY	ROUTE	POSTMILE
El Dorado		

PROJECT NAME
El Dorado Hills EDH 52

File No.	PREPARED BY	DATE	SHEET
556.6	**RCP**		**1 of 3**

CONSISTENCY OF COHESIVE SOILS				
Descriptor	**Unconfined Compressive Strength (tsf)**	**Pocket Penetrometer (tsf)**	**Torvane (tsf)**	**Field Approximation**
Very Soft	< 0.25	< 0.25	< 0.12	Easily penetrated several inches by fist
Soft	0.25 - 0.50	0.25 - 0.50	0.12 - 0.25	Easily penetrated several inches by thumb
Medium Stiff	0.50 - 1.0	0.50 - 1.0	0.25 - 0.50	Can be penetrated several inches by thumb with moderate effort
Stiff	1.0 - 2.0	1.0 - 2.0	0.50 - 1.0	Readily indented by thumb but penetrated only with great effort
Very Stiff	2.0 - 4.0	2.0 - 4.0	1.0 - 2.0	Readily indented by thumbnail
Hard	> 4.0	> 4.0	> 2.0	Indented by thumbnail with difficulty

APPARENT DENSITY OF COHESIONLESS SOILS	
Descriptor	**SPT N_{60} - Value (blows / foot)**
Very Loose	0 - 4
Loose	5 - 10
Medium Dense	11 - 30
Dense	31 - 50
Very Dense	> 50

MOISTURE	
Descriptor	**Criteria**
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

PERCENT OR PROPORTION OF SOILS	
Descriptor	**Criteria**
Trace	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

SOIL PARTICLE SIZE		
Descriptor		**Size**
Boulder		> 12 inches
Cobble		3 to 12 inches
Gravel	Coarse	3/4 inch to 3 inches
	Fine	No. 4 Sieve to 3/4 inch
Sand	Coarse	No. 10 Sieve to No. 4 Sieve
	Medium	No. 40 Sieve to No. 10 Sieve
	Fine	No. 200 Sieve to No. 40 Sieve
Silt and Clay		Passing No. 200 Sieve

PLASTICITY OF FINE-GRAINED SOILS	
Descriptor	**Criteria**
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

CEMENTATION	
Descriptor	**Criteria**
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

NOTE: This legend sheet provides descriptors and associated criteria for required soil description components only. Refer to Caltrans Soil and Rock Logging, Classification, and Presentation Manual (July 2007), Section 2, for tables of additional soil description components and discussion of soil description and identification.

ROCK GRAPHIC SYMBOLS

IGNEOUS ROCK

SEDIMENTARY ROCK

METAMORPHIC ROCK

BEDDING SPACING

Descriptor	Thickness or Spacing
Massive	> 10 ft
Very thickly bedded	3 to 10 ft
Thickly bedded	1 to 3 ft
Moderately bedded	3-5/8 inches to 1 ft
Thinly bedded	1-1/4 to 3-5/8 inches
Very thinly bedded	3/8 inch to 1-1/4 inches
Laminated	< 3/8 inch

WEATHERING DESCRIPTORS FOR INTACT ROCK

	Diagnostic Features					
	Chemical Weathering-Discoloration-Oxidation		Mechanical Weathering and Grain Boundary Conditions	Texture and Solutioning		
Descriptor	Body of Rock	Fracture Surfaces		Texture	Solutioning	General Characteristics
Fresh	No discoloration, not oxidized	No discoloration or oxidation	No separation, intact (tight)	No change	No solutioning	Hammer rings when crystalline rocks are struck.
Slightly Weathered	Discoloration or oxidation is limited to surface of, or short distance from, fractures; some feldspar crystals are dull	Minor to complete discoloration or oxidation of most surfaces	No visible separation, intact (tight)	Preserved	Minor leaching of some soluble minerals may be noted	Hammer rings when crystalline rocks are struck. Body of rock not weakened.
Moderately Weathered	Discoloration or oxidation extends from fractures usually throughout; Fe-Mg minerals are "rusty"; feldspar crystals are "cloudy"	All fracture surfaces are discolored or oxidized	Partial separation of boundaries visible	Generally preserved	Soluble minerals may be mostly leached	Hammer does not ring when rock is struck. Body of rock is slightly weakened.
Intensely Weathered	Discoloration or oxidation throughout; all feldspars and Fe-Mg minerals are altered to clay to some extent; or chemical alteration produces in situ disaggregation (refer to grain boundary conditions)	All fracture surfaces are discolored or oxidized; surfaces are friable	Partial separation, rock is friable; in semi-arid conditions, granitics are disaggregated	Altered by chemical disintegration such as via hydration or argillation	Leaching of soluble minerals may be complete	Dull sound when struck with hammer; usually can be broken with moderate to heavy manual pressure or by light hammer blow without reference to planes of weakness such as incipient or hairline fractures or veinlets. Rock is significantly weakened.
Decomposed	Discolored of oxidized throughout, but resistant minerals such as quartz may be unaltered; all feldspars and Fe-Mg minerals are completely altered to clay		Complete separation of grain boundaries (disaggregated)	Resembles a soil; partial or complete remnant rock structure may be preserved; leaching of soluble minerals usually complete		Can be granulated by hand. Resistant minerals such as quartz may be present as "stringers" or "dikes".

Note: Combination descriptors (such as "slightly weathered to fresh") are used where equal distribution of both weathering characteristics is present over significant intervals or where characteristics present are "in between" the diagnostic feature. However, combination descriptors should not be used where significant identifiable zones can be delineated. Only two adjacent descriptors shall be combined. "Very intensely weathered" is the combination descriptor for "decomposed to intensely weathered".

RELATIVE STRENGTH OF INTACT ROCK

Descriptor	Uniaxial Compressive Strength (psi)
Extremely Strong	> 30,000
Very Strong	14,500 - 30,000
Strong	7,000 - 14,500
Medium Strong	3,500 - 7,000
Weak	700 - 3,500
Very Weak	150 - 700
Extremely Weak	< 150

ROCK HARDNESS

Descriptor	Criteria
Extremely Hard	Specimen cannot be scratched with pocket knife or sharp pick; can only be chipped with repeated heavy hammer blows
Very hard	Specimen cannot be scratched with pocket knife or sharp pick; breaks with repeated heavy hammer blows
Hard	Specimen can be scratched with pocket knife or sharp pick with heavy pressure; heavy hammer blows required to break specimen
Moderately Hard	Specimen can be scratched with pocket knife or sharp pick with light or moderate pressure; breaks with moderate hammer blows
Moderately Soft	Specimen can be grooved 1/6 in. with pocket knife or sharp pick with moderate or heavy pressure; breaks with light hammer blow or heavy hand pressure
Soft	Specimen can be grooved or gouged with pocket knife or sharp pick with light pressure, breaks with light to moderate hand pressure
Very Soft	Specimen can be readily indented, grooved, or gouged with fingernail, or carved with pocket knife; breaks with light hand pressure

CORE RECOVERY CALCULATION (%)

$$\frac{\Sigma \text{ Length of the recovered core pieces (in.)}}{\text{Total length of core run (in.)}} \times 100$$

RQD CALCULATION (%)

$$\frac{\Sigma \text{ Length of intact core pieces} > 4 \text{ in.}}{\text{Total length of core run (in.)}} \times 100$$

FRACTURE DENSITY

Descriptor	Criteria
Unfractured	No fractures
Very Slightly Fractured	Lengths greater 3 ft
Slightly Fractured	Lengths from 1 to 3 ft, few lengths outside that range
Moderately Fractured	Lengths mostly in range of 4 in. to 1 ft, with most lengths about 8 in.
Intensely Fractured	Lengths average from 1 in. to 4 in. with scattered fragmented intervals with lengths less than 4 in.
Very Intensely Fractured	Mostly chips and fragments with few scattered short core lengths

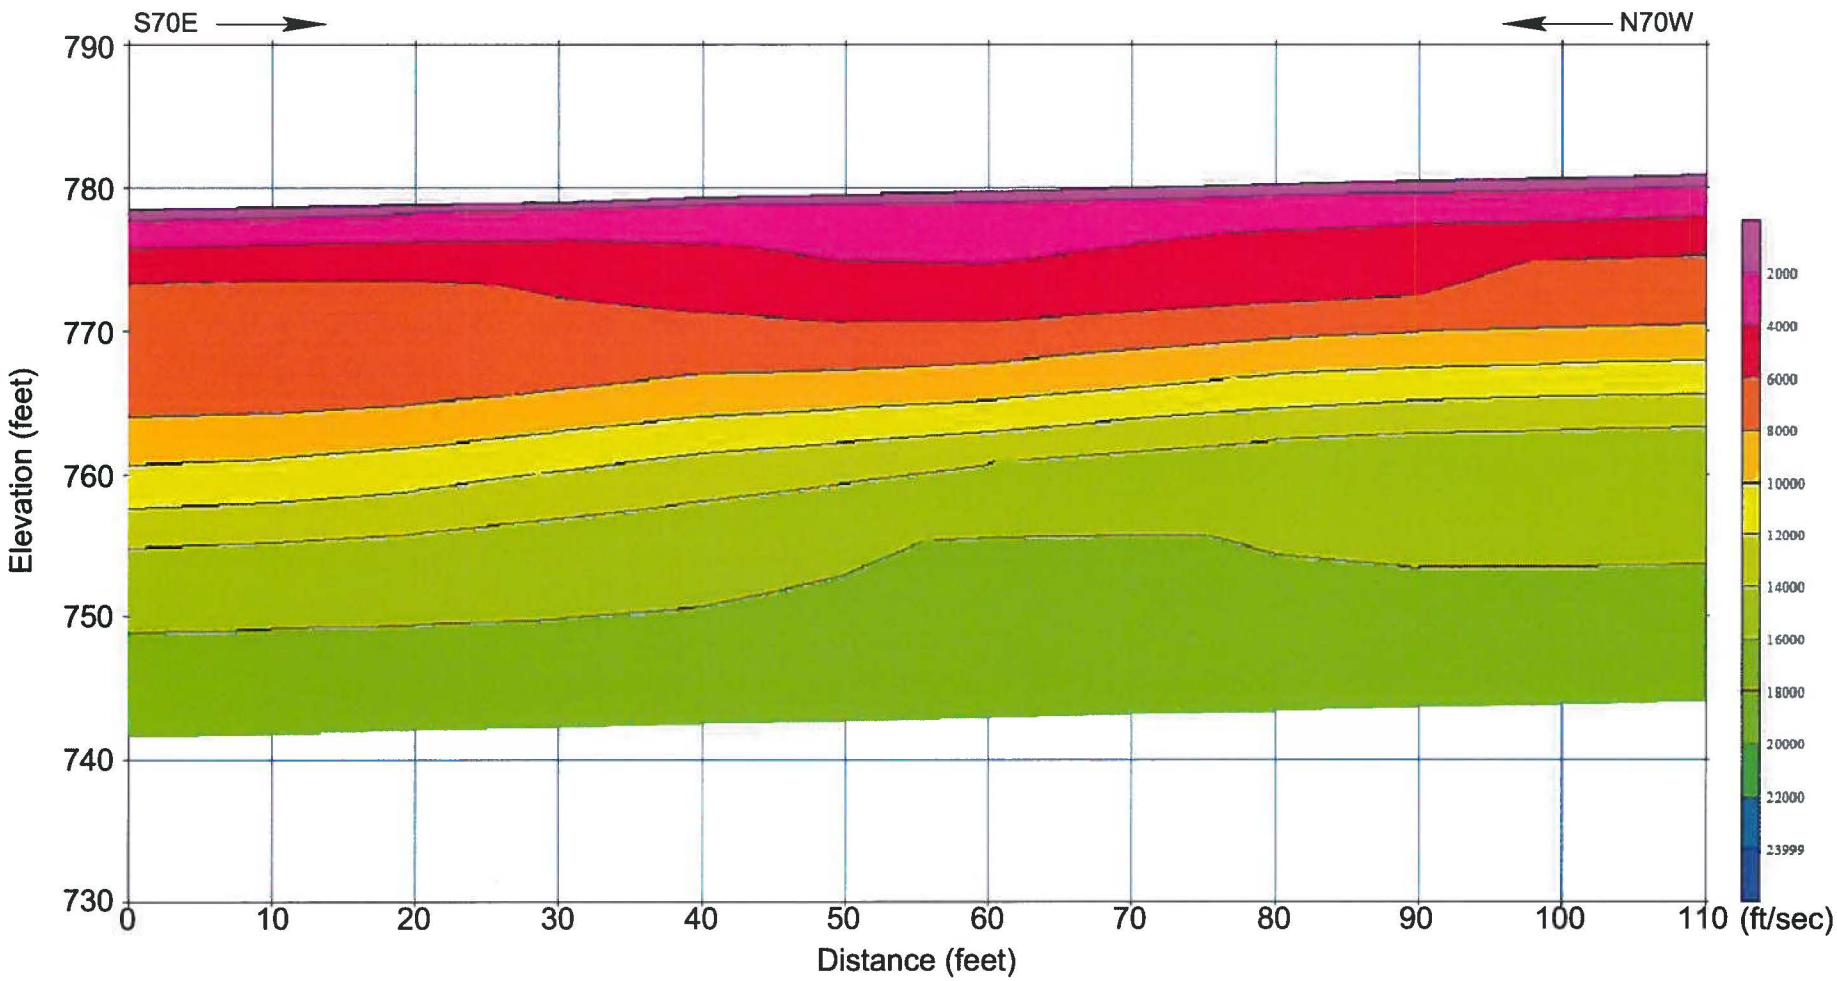
APPENDIX C

Seismic Refraction Notes
Seismic Refraction Profiles (SR1 to SR5)

APPENDIX C – Seismic Refraction Survey Notes and Profiles



Seismic Refraction Survey Notes

Seismic refraction profiling is the process by which seismic waves are produced, recorded and analyzed to determine the seismic velocity of subsurface materials. In general terms, the seismic velocity of the subsurface is derived from the travel time of compressional wave (P-wave) energy over the distance from the source to recording devices. P-wave energy is generated at the surface by an impulsive source. The P-wave energy propagates into the subsurface and is refracted along subsurface interfaces (likely layers) representing an increase in velocity. P-wave energy returns to the surface where it is detected by an array of geophones and recorded by a seismograph. Analysis of this data produces the theoretical depth, thickness, and seismic velocity of the subsurface layers. The seismic velocity of the subsurface materials can be correlated to soil and rock types, and rock weathering and competency.

We performed our seismic refraction fieldwork in January 2013. Refraction work consisted of 5 survey lines, each 110 feet in length. Location of the refraction work is based on the proposed rough grade elevations and location of significant cuts. Our Professional Geologist led the field exercises and monitored the data acquisition. Figure 2 shows the approximate location of each seismic survey. Seismic line locations are based on measurement from features shown on the project base map and are considered approximate.

Each seismic refraction line consists of 5 shot points distributed along a linear array of 12 geophones placed at 10-foot intervals along the array. A multi-channel receiver (seismograph) is located at one end of the array to collect the data. Compressional wave energy (P-wave) is generated at each shot point using multiple impacts with a 20-pound sledge hammer striking a steel and/or aluminum plate placed on the ground surface. A Strataview R48 Seismograph is used to detect, digitize, and record the P-waves.

BCI used the computer program SeisImager by Geometrics, Inc. to analyze the acquired data. The profile of the ground surface at each seismic line location, as seen in the Seismic Profiles, is based on our interpretation of the topography shown on the project topography. Interpreted seismic profiles (subsurface) are attached.

BORING RECORD LEGEND

COUNTY	ROUTE	POSTMILE
El Dorado	50	1.1/R2.4

PROJECT OR BRIDGE NAME: **Silva Valley Parkway Interchange**

PREPARED BY	DATE	SHEET
RCP		1 of 3

CONSISTENCY OF COHESIVE SOILS				
Descriptor	**Unconfined Compressive Strength (tsf)**	**Pocket Penetrometer (tsf)**	**Torvane (tsf)**	**Field Approximation**
Very Soft	< 0.25	< 0.25	< 0.12	Easily penetrated several inches by fist
Soft	0.25 - 0.50	0.25 - 0.50	0.12 - 0.25	Easily penetrated several inches by thumb
Medium Stiff	0.50 - 1.0	0.50 - 1.0	0.25 - 0.50	Can be penetrated several inches by thumb with moderate effort
Stiff	1.0 - 2.0	1.0 - 2.0	0.50 - 1.0	Readily indented by thumb but penetrated only with great effort
Very Stiff	2.0 - 4.0	2.0 - 4.0	1.0 - 2.0	Readily indented by thumbnail
Hard	> 4.0	> 4.0	> 2.0	Indented by thumbnail with difficulty

APPARENT DENSITY OF COHESIONLESS SOILS	
Descriptor	**SPT N_{60} - Value (blows / foot)**
Very Loose	0 - 4
Loose	5 - 10
Medium Dense	11 - 30
Dense	31 - 50
Very Dense	> 50

MOISTURE	
Descriptor	**Criteria**
Dry	Absence of moisture, dusty, dry to the touch
Moist	Damp but no visible water
Wet	Visible free water, usually soil is below water table

PERCENT OR PROPORTION OF SOILS	
Descriptor	**Criteria**
Trace	Particles are present but estimated to be less than 5%
Few	5 to 10%
Little	15 to 25%
Some	30 to 45%
Mostly	50 to 100%

SOIL PARTICLE SIZE		
Descriptor		**Size**
Boulder		> 12 inches
Cobble		3 to 12 inches
Gravel	Coarse	3/4 inch to 3 inches
	Fine	No. 4 Sieve to 3/4 inch
Sand	Coarse	No. 10 Sieve to No. 4 Sieve
	Medium	No. 40 Sieve to No. 10 Sieve
	Fine	No. 200 Sieve to No. 40 Sieve
Silt and Clay		Passing No. 200 Sieve

PLASTICITY OF FINE-GRAINED SOILS	
Descriptor	**Criteria**
Nonplastic	A 1/8-inch thread cannot be rolled at any water content.
Low	The thread can barely be rolled, and the lump cannot be formed when drier than the plastic limit.
Medium	The thread is easy to roll, and not much time is required to reach the plastic limit; it cannot be rerolled after reaching the plastic limit. The lump crumbles when drier than the plastic limit.
High	It takes considerable time rolling and kneading to reach the plastic limit. The thread can be rerolled several times after reaching the plastic limit. The lump can be formed without crumbling when drier than the plastic limit.

CEMENTATION	
Descriptor	**Criteria**
Weak	Crumbles or breaks with handling or little finger pressure.
Moderate	Crumbles or breaks with considerable finger pressure.
Strong	Will not crumble or break with finger pressure.

ROCK GRAPHIC SYMBOLS

IGNEOUS ROCK

SEDIMENTARY ROCK

METAMORPHIC ROCK

BEDDING SPACING

Descriptor	Thickness or Spacing
Massive	> 10 ft
Very thickly bedded	3 to 10 ft
Thickly bedded	1 to 3 ft
Moderately bedded	3-5/8 inches to 1 ft
Thinly bedded	1-1/4 to 3-5/8 inches
Very thinly bedded	3/8 inch to 1-1/4 inches
Laminated	< 3/8 inch

WEATHERING DESCRIPTORS FOR INTACT ROCK

	Diagnostic Features					
	Chemical Weathering-Discoloration-Oxidation		Mechanical Weathering and Grain Boundary Conditions	Texture and Solutioning		
Descriptor	Body of Rock	Fracture Surfaces		Texture	Solutioning	General Characteristics
Fresh	No discoloration, not oxidized	No discoloration or oxidation	No separation, intact (tight)	No change	No solutioning	Hammer rings when crystalline rocks are struck.
Slightly Weathered	Discoloration or oxidation is limited to surface of, or short distance from, fractures; some feldspar crystals are dull	Minor to complete discoloration or oxidation of most surfaces	No visible separation, intact (tight)	Preserved	Minor leaching of some soluble minerals may be noted	Hammer rings when crystalline rocks are struck. Body of rock not weakened.
Moderately Weathered	Discoloration or oxidation extends from fractures usually throughout; Fe-Mg minerals are "rusty"; feldspar crystals are "cloudy"	All fracture surfaces are discolored or oxidized	Partial separation of boundaries visible	Generally preserved	Soluble minerals may be mostly leached	Hammer does not ring when rock is struck. Body of rock is slightly weakened.
Intensely Weathered	Discoloration or oxidation throughout; all feldspars and Fe-Mg minerals are altered to clay to some extent; or chemical alteration produces in situ disaggregation (refer to grain boundary conditions)	All fracture surfaces are discolored or oxidized; surfaces are friable	Partial separation, rock is friable; in semi-arid conditions, granitics are disaggregated	Altered by chemical disintegration such as via hydration or argillation	Leaching of soluble minerals may be complete	Dull sound when struck with hammer; usually can be broken with moderate to heavy manual pressure or by light hammer blow without reference to planes of weakness such as incipient or hairline fractures or veinlets. Rock is significantly weakened.
Decomposed	Discolored of oxidized throughout, but resistant minerals such as quartz may be unaltered; all feldspars and Fe-Mg minerals are completely altered to clay		Complete separation of grain boundaries (disaggregated)	Resembles a soil; partial or complete remnant rock structure may be preserved; leaching of soluble minerals usually complete		Can be granulated by hand. Resistant minerals such as quartz may be present as "stringers" or "dikes".

Note: Combination descriptors (such as "slightly weathered to fresh") are used where equal distribution of both weathering characteristics is present over significant intervals or where characteristics present are "in between" the diagnostic feature. However, combination descriptors should not be used where significant identifiable zones can be delineated. Only two adjacent descriptors shall be combined. "Very intensely weathered" is the combination descriptor for "decomposed to intensely weathered".

RELATIVE STRENGTH OF INTACT ROCK

Descriptor	Uniaxial Compressive Strength (psi)
Extremely Strong	> 30,000
Very Strong	14,500 - 30,000
Strong	7,000 - 14,500
Medium Strong	3,500 - 7,000
Weak	700 - 3,500
Very Weak	150 - 700
Extremely Weak	< 150

ROCK HARDNESS

Descriptor	Criteria
Extremely Hard	Specimen cannot be scratched with pocket knife or sharp pick; can only be chipped with repeated heavy hammer blows
Very hard	Specimen cannot be scratched with pocket knife or sharp pick; breaks with repeated heavy hammer blows
Hard	Specimen can be scratched with pocket knife or sharp pick with heavy pressure; heavy hammer blows required to break specimen
Moderately Hard	Specimen can be scratched with pocket knife or sharp pick with light or moderate pressure; breaks with moderate hammer blows
Moderately Soft	Specimen can be grooved 1/6 in. with pocket knife or sharp pick with moderate or heavy pressure; breaks with light hammer blow or heavy hand pressure
Soft	Specimen can be grooved or gouged with pocket knife or sharp pick with light pressure, breaks with light to moderate hand pressure
Very Soft	Specimen can be readily indented, grooved, or gouged with fingernail, or carved with pocket knife; breaks with light hand pressure

CORE RECOVERY CALCULATION (%)

$$\frac{\Sigma \text{ Length of the recovered core pieces (in.)}}{\text{Total length of core run (in.)}} \times 100$$

RQD CALCULATION (%)

$$\frac{\Sigma \text{ Length of intact core pieces} > 4 \text{ in.}}{\text{Total length of core run (in.)}} \times 100$$

FRACTURE DENSITY

Descriptor	Criteria
Unfractured	No fractures
Very Slightly Fractured	Lengths greater 3 ft
Slightly Fractured	Lengths from 1 to 3 ft, few lengths outside that range
Moderately Fractured	Lengths mostly in range of 4 in. to 1 ft, with most lengths about 8 in.
Intensely Fractured	Lengths average from 1 in. to 4 in. with scattered fragmented intervals with lengths less than 4 in.
Very Intensely Fractured	Mostly chips and fragments with few scattered short core lengths

Kleinfelder Project No. 20193180.001A

Costco Wholesale Corporation
9 Corporate, Suite 230
Irvine, California 92606

Attention: Ms. Michael Okuma, NCARB
Director of Real Estate Development

SUBJECT: Phase I Environmental Site Assessment
Proposed Costco Warehouse and Gas Station
West-Southwest of Silva Valley Parkway
El Dorado Hills, El Dorado County, California
CW: 18-0487

Dear Mr. Okuma:

Enclosed is the Phase I Environmental Site Assessment (ESA) report for the above-referenced property. We trust the information presented in this report meets your needs at this time.

An executive summary is provided. However, we recommend that the report be read in its entirety for a comprehensive understanding of the items contained therein.

We appreciate the opportunity to provide these services to Costco Wholesale Corporation. If you have questions regarding this report or if we can be of further service, please do not hesitate to contact Paolo Dizon at 949.727.4466 or Andy Franks, Kleinfelder's Client Account Manager for Costco, at 480.650.4905.

Sincerely,

KLEINFELDER

1 EXECUTIVE SUMMARY

This report documents a Phase I Environmental Site Assessment (ESA) performed by Kleinfelder for Costco Wholesale Corporation (Costco / Client), of the location of a proposed Costco warehouse and gas station (Site) in the unincorporated El Dorado Hills community of El Dorado County, California (the Site). Kleinfelder understands the Client intends to purchase the Site.

This report was prepared using the ASTM International Designation E 1527-13, *Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process* (the "ASTM Standard Practice"), the All Appropriate Inquiry (AAI) section of the Small Business Liability Relief and Revitalization Act (the Federal Brownfields Law), and Costco's Development Requirements, Version 2018, dated October 26, 2018. The Phase I ESA findings include the following:

- The Site is located on vacant land west-southwest of Silva Valley Parkway and north of United States Highway 50 (US-50) in the unincorporated El Dorado Hills community of El Dorado County, California (see Figure 1). It consists of approximately 17.04 acres of land identified as El Dorado County Assessor's Parcel Numbers (APNs) 122-720-018 and 122-720-002, and portions of two other parcels identified as APNs 122-720-003 and UN384934.
- The Site was historically used as grazing land. Farm/ranch structures occupied the northern portion of the Site from at least 1940 through 1973. Remnants of these structures are still present in the northern portion of the Site. Natural drainage channels cross the northern portion of the Site and the middle of the Site from the northeast to southwest. Remnants of a dam were present across the drainage channel in the middle of the Site. A dirt road extended to the farmhouse along the western Site boundary from US-50, which was constructed south of the Site by 1941. In 1966, US-50 was expanded from a 2-lane highway to a 4-lane highway, and Tong Road was constructed extending east to west through the southwestern portion of the Site. By 2006 the Old Silva Valley Parkway formed the western border of the Site. In 2012, earthwork was being performed on the property to the northeast in preparation of the Silva Valley Parkway/US-50 interchange construction activities, and a dirt road extended across the southern portion of the Site from Tong Road to the main earthwork area. By 2016, the current Silva Valley Parkway/US-50 interchange had been constructed, with Silva Valley Parkway forming the eastern border of the Site

Copyright 2019 Kleinfelder

KLEINFELDER 24411 Ridge Route Drive, Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

and the US-50 on-ramp present south of the Site. A remnant of Tong Road remains in the southwestern portion of the Site.

- During Kleinfelder's Site reconnaissance, the ranch structure remnants and the aforementioned dam were observed on the Site. Standing water was observed up-stream of the dam. In the vicinity of the ranch structures was a pit, approximately 2- to 3-feet deep, and lined with concrete blocks. Other remnants include a watering trough, piles of concrete blocks, and building foundation remnants. An old couch had been dumped on the Site near the old structures. Other than the remnants of the previous ranch activities, the Site is vacant land. Utilities were observed adjoining Old Silva Parkway (also known as Clarksville Crossing), including three transformers and an electrical panel present in the southwestern portion of the Site, south of the old Tong Road, and a water utility vault with standpipes located north of old Tong Road. Evidence of stained soil, discolored water, stressed vegetation, underground storage tanks (USTs), wells, or lagoons was not observed on the Site during the reconnaissance.
- The western portion of the Site is located within an area identified by El Dorado County as considered "more likely to contain asbestos" in soil. Based on a review of the *Asbestos Review Areas, Western Slope, County of El Dorado, State of California* map, dated August 22, 2018, the western portion of the Site is within a quarter mile of an area where naturally-occurring asbestos (NOA) was found. Facilities within this buffer zone would require approval of an Asbestos Dust Mitigation Plan through the El Dorado County Air Quality Management District (AQMD) prior to construction. Therefore, it appears that an "Asbestos Dust Mitigation Plan" will be required for construction activities.
- No off-Site facilities are considered likely to have affected soil, soil vapor or groundwater beneath the Site.

Copyright 2019 Kleinfelder

KLEINFELDER 24411 Ridge Route Drive, Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

Kleinfelder's scope of services included Standard Practice non-scope evaluations of wetlands and surface water; and threatened, endangered, and other protected species that may be required for a Phase I ESA pursuant to Costco's Development Requirements, Version 2018, dated October 26, 2018. Kleinfelder's subcontractor, Moore Biological Consultants (Moore), performed these Standard Practice non-scope evaluations. The findings include the following:

- During Moore's Site reconnaissance, two ephemeral creeks, flowing from the northeast to southwest, and one seasonal wetland swale, located in the creek in the center of the Site, were observed. These may be considered jurisdictional waters.

- No special status wildlife or plant species were observed during the Site reconnaissance. Ten special status plants were identified during database research as potentially occurring at the Site. Due to lack of habitat, it is unlikely these special status plants would occur at the Site. Sixteen special status species were documented in the Site vicinity; however, upon review of the available habitat and distribution of regional occurrences, in Moore's opinion, most of the species are unlikely to occur at the Site.

- Burrowing owls, Swainson's Hawk, and migratory birds have the potential to occur on Site.

Further discussion of the non-scope evaluations is provided in Section 8.3.

This assessment has revealed no evidence of recognized environmental conditions (RECs), historical RECs (HRECs) or controlled RECs (CRECs) associated with the Site. Although not considered RECs pursuant to the Standard Practice, the following environmental conditions were noted because of potential impact to construction activity at the Site.

- Based on the location of the Site within the asbestos buffer zone, preparation of an Asbestos Dust Mitigation Plan for AQMD is recommended prior to construction at the Site.

- Concrete structures, including a pit (unknown use), was observed in the northern portion of the Site. There is the potential for dumping in the pit and in the vicinity of the former structures on the Site. Therefore, Kleinfelder recommends environmental monitoring and observation of the removal of these structures and, if contamination is suspected, collection of soil samples from beneath this structure. Additionally, the concrete remnants from the former structures may contain asbestos. Sampling for asbestos in the concrete is also recommended.

Copyright 2019 Kleinfelder

- Two ephemeral creeks and one seasonal wetland swale were observed on the Site. Kleinfelder recommends that a wetland delineation be performed.

- Burrowing owls, Swainson's hawk, and migratory birds have the potential to occur on Site, therefore, pre-construction surveys for these species are recommended.

Deviations, HRECs, and *de minimis* findings are discussed in Section 8 of this report. This report is subject to the limitations in Section 2.5.

2 INTRODUCTION

This report is a summary of work performed using the guidelines set forth in the Standard Practice, the AAI section of the Federal Brownfields Law, and Costco's Development Requirements, Version 2018, dated October 26, 2018. This report also generally conforms to the Standard Practice's suggested table of contents. Minor format modifications have been made to the Standard Practice's suggested table of contents to assist in better reading and understanding the report findings.

2.1 PURPOSE

The purpose of this Phase I ESA is to identify, to the extent feasible pursuant to the scope of services defined in our Proposal No. 20193180.001A/LH19C99493, dated August 9, 2019, and limitations discussed in this report, RECs and other environmental issues related to the Site.

As defined in the Standard Practice, a REC is:

> *"The presence or likely presence of any hazardous substances or petroleum products in, on or at a property: (1) due to a release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions."*

As defined in the Standard Practice, a *de minimis* condition is:

> *"A condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies."*

The 2013 Standard Practice also introduced the designation of CREC. As defined in the Standard Practice, a CREC is:

> *"… a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the*

Copyright 2019 Kleinfelder

implementation of required controls (for example, property use restrictions, activity and use limitations, institutional controls, or engineering controls).”

The 2013 Standard Practice defines an HREC as:

“…a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to environmental controls.”

The final decision regarding whether a past release is an HREC rests with the environmental professional (EP) and will be influenced by the current impact (if any) of the past release to the Site.

This report describes Kleinfelder’s assessment methodology and documents its findings, subject to the limitations presented in Section 2.5 of this report.

2.2 DETAILED SCOPE OF SERVICES

The following sections describe Kleinfelder’s work scope:

- Section 2, **Introduction**, includes a discussion of the purpose/reason for performing the Phase I ESA, additional services requested by the Client (e.g., an evaluation of business environmental risk factors associated with the Site), significant assumptions (e.g., property boundaries if not marked in the field), limitations, exceptions, special terms and conditions (e.g., contractual), and user reliance parameters.
- Section 3, **Site Description**, is a compilation of information concerning the Site location, legal description (if provided by the Client), current and proposed use of the Site, a description of structures and improvements on the Site at the time of Kleinfelder’s assessment, and adjoining property use.
- Section 4, **Records Review**, is a compilation of Kleinfelder’s review of several databases available from Federal, State, and local regulatory agencies regarding hazardous substance use, storage, or disposal at the Site; and for off-Site facilities within the search distances specified by the Standard Practice. Records provided by the Client are summarized, and copies of relevant documents are included in the appendices of this report. Physical setting sources (including topography and soil and groundwater

Copyright 2019 Kleinfelder

conditions) and typical Client-provided information (e.g., title records, environmental liens, specialized knowledge, valuation reduction for environmental issues, and owner, property manager, and occupant information) are also summarized. Other interviews with people knowledgeable about the Site (including the Client) are included in Section 7.

- Section 5, **History of the Site**, summarizes the history of the Site and adjoining properties. This Site history is based on various sources, which may include a review of historical aerial photographs, Sanborn Fire Insurance Maps, city or suburban directories, historical topographic maps, building department records, and results of previous Site assessments (if any and reasonably ascertainable).
- Section 6, **Site Reconnaissance**, describes Kleinfelder's observations during the Site reconnaissance. The methodology used and limiting conditions are also described.
- Section 7, **Interviews**, is a summary of telephone and personal interviews performed with "Key Site Managers" that may include the Site owner/manager, occupants/tenants, local government officials, and the Client. Additional interview sources may be contacted if Key Site Managers were not available prior to production of this report, and may include adjoining landowners and people with historical knowledge of the area.
- Section 8, **Evaluation**, is a presentation of findings and opinions regarding the information provided in Sections 3 through 7, and presents the conclusions regarding the presence of RECs connected with the Site, and Kleinfelder's recommendations.
- Section 9, **References**, is a summary listing of the resources used to compile this report.

A statement of qualifications of the signatories of this report is provided in Appendix A, and pertinent documentation regarding the Site is included in Appendices B through D.

2.3 ADDITIONAL SERVICES

Kleinfelder's scope of services as part of this Phase I ESA did not include Standard Practice non-scope evaluations of cultural, historic, and archaeological resources; and environmental regulatory compliance that may be required for a Phase I ESA pursuant to Costco's Development Requirements publication (revised October 26, 2018). In addition, the Phase I ESA did not include an assessment for asbestos-containing materials (ACMs), radon, lead-based paint (LBP), lead in drinking water, molds and mildews, indoor air quality, industrial hygiene, health and safety, and other Standard Practice non-scope considerations not described herein.

Copyright 2019 Kleinfelder

The Phase I ESA did, however, include evaluations of wetlands and surface water; and threatened, endangered, and other protected species that are required for a Phase I ESA pursuant to Costco's Development Requirements. No other additional services were provided by Kleinfelder for this Phase I ESA.

2.4 SIGNIFICANT ASSUMPTIONS

Kleinfelder does not guarantee the accuracy of information supplied by its sources, but reserves the right to rely on the information in forming a professional opinion regarding the potential for contamination at the Site. It is assumed the Client provided Kleinfelder all applicable and available environmental records and specialized knowledge in its possession regarding the Site. Kleinfelder has not made other significant assumptions during the performance of this Phase I ESA.

2.5 LIMITATIONS AND EXCEPTIONS

Phase I ESAs are non-comprehensive by nature and may not identify all environmental problems and will not eliminate all risk. This report is a qualitative assessment. Kleinfelder offers a range of investigative and engineering services to suit the needs of its clients, including more quantitative investigations. Although risk can never be eliminated, more detailed and extensive investigations yield more information, which may help the Client understand and better manage risks. Since such detailed services involve greater expense, Kleinfelder asks its clients to participate in identifying the level of service that will provide them with an acceptable level of risk. Please contact the signatories of this report if you would like to discuss this issue of risk further.

Kleinfelder performed this Phase I ESA consistent with the guidelines set forth in the Standard Practice; Costco's Development Requirements, Version 2018 publication (dated October 26, 2018); and the proposed scope of services subsequently approved by Costco. No other warranty, either express or implied, is made. Environmental issues not specifically addressed in this report were beyond the scope of Kleinfelder's services and not included in the evaluation.

This report may be used only by Costco and only for the purposes stated within a reasonable time from its issuance, but in no event later than one year from the date of the report. Land or facility use, on- and off-Site conditions, regulations, or other factors may change over time, and additional work may be required with the passage of time. Since Site activities and regulations beyond Kleinfelder's control may change at any time after the completion of this report, the observations, findings, and opinions provided herein are considered valid only as of the date of the Site visit.

Copyright 2019 Kleinfelder

KLEINFELDER 24411 Ridge Route Drive, Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

Pursuant to Section 4.6 of the Standard Practice, this report should not be relied upon after 180 days from the date of its oldest component. Any party other than the Client who wishes to use this report shall notify Kleinfelder of such intended use. Based on the intended use of the report, Kleinfelder may require that additional work be performed and that an updated report be issued. Non-compliance with any of these requirements by the Client or anyone else will release Kleinfelder from any liability resulting from the use of this report by any unauthorized party, but only to the extent of any such non-compliance by the Client.

The Phase I ESA has been conducted in accordance with, and conforms to the Costco Wholesale Development Requirements Document and the latest edition of ASTM E 1527. This assessment has been prepared for the sole use of Costco Wholesale Corporation. Its contents should not be relied upon by other parties without the express written consent of Costco Wholesale Corporation.

2.6 SPECIAL TERMS AND CONDITIONS

No special terms and conditions were agreed to by the Client and Kleinfelder.

Copyright 2019 Kleinfelder

KLEINFELDER 24411 Ridge Route Drive, Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

3 SITE DESCRIPTION

The Site description is presented in this section and describes the condition of the Site at the time of the Phase I ESA. The Site location is shown on Figure 1. Tables 3-1 through 3-4 summarize the physical characteristics of the Site and adjoining properties.

3.1 LOCATION AND LEGAL DESCRIPTION

The information presented in Table 3-1 denotes the physical location and legal description of the Site. This information was obtained from review of various maps (such as topographic maps and tax assessor maps), aerial photographs, public records at City and/or County offices, interviews, and/or information provided by the Client.

TABLE 3-1

Location and Legal Description

PARAMETER	INFORMATION/COMMENTS
LOCATION	The Site is located west-southwest of Silva Valley Parkway, and north of US-50, in the unincorporated El Dorado Hills community of El Dorado County, California (see Figure 1).
LEGAL DESCRIPTION	A legal description for the Site parcels, and specific description of the larger parcel from which the Site was divided, is presented in the *EDR Environmental Lien and AUL Search* reports (EDR, 2019a) provided in Appendix C.
ASSESSOR'S PARCEL NUMBER	The Site is situated on land identified as El Dorado County APNs 122-720-018, 122-720-002, 122-720-003 (portion), and UN384034 (portion).
ADDRESS(ES)	No address is currently associated with the Site.
SECTION, TOWNSHIP, AND RANGE	Township 9 North, Range 8 East, Section 1, Mt. Diablo Meridian and Baseline.
ZONING	Based on zoning information provided by Costco, the Site APN 122-720-018 is zoned "CR", which indicates Regional Commercial, and the Site APN 122-720-002 is zoned "CL", which means Commercial Limited. APN 122-720-003 is zoned "TC" for Transportation Corridor.

3.2 CURRENT / PROPOSED USE OF THE PROPERTY

Land use in the general vicinity appeared to be either residential or undeveloped at the time of Kleinfelder's assessment. Current and proposed Site uses are described in Table 3-2.

Copyright 2019 Kleinfelder

TABLE 3-2

Current and Proposed Uses

PARAMETER	GENERAL OBSERVATIONS
CURRENT USE	The Site is vacant land.
PROPOSED USE	Costco warehouse and gas station.

3.3 DESCRIPTION OF STRUCTURES / IMPROVEMENTS

Structures and/or improvements observed on the Site at the time of Kleinfelder's reconnaissance are described in Table 3-3.

TABLE 3-3

Structures and Improvements

PARAMETER	GENERAL OBSERVATIONS
STRUCTURES	No structures were present on Site, although remnants of previous structures (concrete foundations, walls, concrete blocks) are still visible.
IMPROVEMENTS	Improvements present on Site include a concrete dam and water trough, chain-link fencing, and utility infrastructure.

3.4 CURRENT USES OF ADJOINING PROPERTIES

Kleinfelder performed a brief drive-by survey of the properties immediately adjoining to the Site on July 29, 2019. A summary of the observations regarding the surrounding properties is presented in Table 3-4 and shown on Figure 2, Site Vicinity Map.

TABLE 3-4

Adjoining Properties

DIRECTION	LAND USE DESCRIPTION
NORTH	Silva Valley Parkway adjoins the Site. Undeveloped land followed by residential development is located north and northeast of Silva Valley Parkway.
WEST	Old Silva Valley Parkway (also known as Clarksville Crossing) adjoins the Site, with undeveloped land further to the west. Serrano Parkway Trail extends through the property west of the Site along the creek bed. A utility structure was present southwest of the Site, west of Old Silva Valley Parkway.
SOUTH	The on-ramp to US-50 and US-50 are located south of the Site.
EAST	Silva Valley Parkway adjoins the Site, with undeveloped land further to the east.

Copyright 2019 Kleinfelder

Hazardous materials and petroleum products were not directly observed to be stored on the properties adjoining the Site. No other environmental conditions were apparent on the adjoining properties at the time of Kleinfelder's Site reconnaissance.

Copyright 2019 Kleinfelder

KLEINFELDER 24411 Ridge Route Drive, Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

4 RECORDS REVIEW

4.1 STANDARD ENVIRONMENTAL RECORD SOURCES

The purpose of the records review is to obtain and review records that would help to evaluate RECs in connection with the Site and bordering properties. Federal, State, and local regulatory agencies publish databases or "lists" of businesses and properties that handle hazardous materials or hazardous waste or are the known location of a release of hazardous substances to soil and/or groundwater. These databases are available for review and/or purchase at the regulatory agencies, or the information may be obtained through a commercial database service. Kleinfelder contracted a commercial database service, EDR, of Shelton, Connecticut, to perform the government database search for listings within the appropriate Standard Practice minimum search distance of the Site, and the distances set forth in Costco's Development Requirements, Version 2018, dated October 26, 2018. Included in the EDR Radius Map™ Report with GeoCheck® (EDR, 2019b) is a listing of specific databases outlined by the Standard Practice. A listing of the search distances, databases evaluated, dates the databases were last updated, and types of information contained in each database are included in the regulatory database search report provided in Appendix B of this report.

EDR utilizes a geographical information system to plot the locations of reported spills, leaks, incidents, etc. Kleinfelder reviews this information to help establish if the Site or nearby properties are listed in the databases and lists. Each of the listings was reviewed by Kleinfelder to assess whether the corresponding property details included in EDR's report revealed a potential environmental impact to the Site. Many listings in the report were concluded not to have the potential to impact the Site based on the following, or a combination thereof:

- The listed property is located at a distance where the facility is unlikely to impact the Site based on Kleinfelder's evaluation of the relevant data in EDR's report and knowledge of the Site vicinity.
- The listed property is located in a down-gradient or cross-gradient direction from the Site, based on the anticipated direction of groundwater flow at the property being evaluated, and is located at a distance such that it is unlikely to impact the Site. Judgements as to down- or cross-gradient direction are best made if groundwater flow direction information is available for a specific property.

Copyright 2019 Kleinfelder

- The listed property is identified in the underground storage tank (UST) or small quantity generator (SQG) databases and does not immediately adjoin the Site. The property is furthermore not listed in other databases that report a release of a hazardous substance or petroleum product and/or is not listed as having environmental violations. The listing of a facility in these databases alone is not indicative of an unauthorized release.
- The listing for the facility suggested a short-term release occurred (e.g., from incidental traffic accidents or involving limited quantities of chemicals from illegal drug labs found at residences), with associated response actions completed.
- The quantity of the hazardous substances or petroleum product released from an off-Site, non-adjoining facility was not judged to have resulted in contamination above the most stringent criteria requiring regulatory action. Therefore, no impact to the Site is anticipated.
- The listed property record indicates that the property was characterized, the reported release affected soil only, the listed property was not on or adjacent to the Site, and the release was not recognized as indicative of area-wide conditions or was characterized as a soil removal action only.
- The listed property record indicates that contamination on the property is limited to relatively non-mobile contaminants, including polyaromatic hydrocarbons (PAHs) and metals, in soil only, on a non-adjacent property.
- The listed property record indicates that the case for the property has been closed to the satisfaction of the designated lead regulatory agency, and residual contamination, if present, is not considered likely to affect the Site based on one or more of the criteria mentioned in the bulleted items above (a condition referred to by the Standard Practice as an HREC).

Based on these criteria indicating no material threat of a release that affected the Site and/or no release that could require future regulatory agency oversight, the listings concluded not to have the potential to impact the Site were not evaluated further and are not discussed in the following sections.

4.2 RESULTS OF DATABASE SEARCH

The remaining property listings, if applicable, were reviewed to assess whether these properties had environmental releases that may have resulted in RECs in connection with the Site. Listed

Copyright 2019 Kleinfelder

properties for which a reported release may have resulted in a REC in connection with the Site were further assessed by performing a review of agency files available through the GeoTracker™ website (https://geotracker.waterboards.ca.gov/) operated by the State Water Resources Control Board (SWRCB), and/or review of other relevant regulatory agency websites, to evaluate whether the listed release represents a potential impact to the Site.

4.2.1 Site Listings

The Site was listed in the California Integrated Water Quality System (CIWQS) database under the name "Tong Road Stockpile" and California Hazardous Material Incident Report System (CHMIRS) database under the name "Silva Valley Road at Tong Road". The CIWQS database indicates storm water construction was occurring at the Site from October 12, 2012 through August 30, 2013. The CHMIRS database listing indicates a surge anticipator at a buster pump station sensed low pressure and opened, and recycled water was released into Carson Creek on August 28, 2012. Neither listing represents a REC to the Site.

4.2.2 Off-Site Listings

Six facilities in the Site vicinity are listed in various databases searched by EDR. Three of the six listings were further reviewed as to the potential to impact the Site as summarized below.

"Serrano Elementary School" (Serrano Parkway/Silva Valley Parkway) – The school is located approximately 2,179 feet north-northwest of the Site. This facility was listed in the Department of Toxic Substance Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's EnviroStor database. The listing indicates that there was the potential for naturally-occurring asbestos, arsenic and lead in soil, and that the former property use was agricultural (livestock). The status of the case was listed as requiring "No Further Action". As no releases to soil or groundwater were reported and the case is closed; this facility is not considered a REC.

"El Dorado Hills Reclamation" (4525 Serrano Parkway) – The school is located approximately 4,026 feet north-northwest of the Site. This facility was listed in the ENF, CIWQS, and CERS databases. This facility handles waste water and storm water. This facility operated under a NPDES permit from 1994 through 2001. The ENF listing is for admin civil liability and violation of WDR. As no releases to soil or groundwater were reported; this facility is not considered a REC.

Copyright 2019 Kleinfelder

"Silver Dove Elementary School" (Silver Dove Way/Bass Lake Road) – This school is located approximately 4,939 east of the Site. This facility was listed in the DTSC EnviroStor database. The listing indicates that there was the potential for naturally-occurring asbestos in soil. The status of the case was listed as requiring "No Further Action". As no releases to soil or groundwater were reported and the case is closed, this facility is not considered a REC.

4.2.3 Orphan List

Facilities not plotted by EDR due to poor or inadequate address information are referred to as orphan facilities. No orphan facilities were listed in the EDR database report.

4.3 OTHER RECORDS REVIEWED / AGENCIES CONTACTED

The following additional sources of environmental records were reviewed during this Phase I ESA for the purposes of meeting the Standard Practice. Local regulatory agencies were contacted for reasonably ascertainable and practically reviewable documentation regarding RECs present at the Site and adjoining facilities. Summaries of interviews with local regulatory agency representatives, when performed, are included in Section 7 of this report (with interview documentation included in Appendix C). Information was obtained or reviewed from the following agencies:

☒ ..... Pipeline and Hazardous Materials Safety Administration (PHMSA), National Pipeline Mapping System (NPMS)
☒ ..... State of California, Division of Oil, Gas and Geothermal Resources (DOGGR)
☒ ..... El Dorado County Building Services
☒ ..... El Dorado County Air Quality Management District
☒ ..... El Dorado County Environmental Management (EDCEM)
☒ ..... State Water Resources Control Board, GeoTracker™ Database
☒ ..... State of California, Department of Toxic Substances Control, EnviroStor Database

Copyright 2019 Kleinfelder

Information/responses from the agencies contacted and agency databases reviewed is presented below:

4.3.1 Pipeline and Hazardous Materials Safety Administration, National Pipeline Mapping System

Pipeline information is available at the PHMSA's online NPMS website (https://www.npms.phmsa.dot.gov). Kleinfelder researched pipeline information on the website on July 19, 2019 for the Site and vicinity. Based on Kleinfelder's review of the NPMS website, no mapped natural gas transmission pipelines or hazardous liquid pipelines are located on Site or in the Site vicinity. The closest pipeline is located approximately 3,800 feet west-southwest of the Site. A copy of the NPMS map is included in Appendix C.

4.3.2 State of California Division of Oil, Gas and Geothermal Resources

Kleinfelder searched the State of California DOGGR website (http://www.conservation.ca.gov/dog) for oil and gas wells at the Site or in the Site vicinity. No oil or gas wells are depicted in the immediate vicinity of the Site. A copy of the DOGGR map results is presented in Appendix C.

4.3.3 El Dorado County Planning and Building Department

Kleinfelder submitted a records request on July 19, 2019 to El Dorado County Planning and Building for current or historical records pertaining to the Site. El Dorado County Planning and Building Department, Planning Services Division responded in an email on July 19, 2019 that there are documents available for the Site parcels. El Dorado County Building Department responded via telephone on August 8, 2019 that there were no permits available for the Site parcels. Planning records included the following:

- A letter from the Community Development Agency, *Approval of Administrative Zoning Map Correction for APN: 122-720-15*, dated October 3, 2016, approved the zone change from One-Family Residential- Planned Development to Commercial-Planned Development.

- El Dorado Planning Services Zone Change & General Plan Amendment Application for APN 122-720-15 dated September 11, 2017. This application included a conditional use permit for self-storage; a tentative parcel map application to subdivide the parcel into 10 lots; a completed Environmental Questionnaire dated September 13, 2017 indicating the project site contains wetlands, and an overall commercial center project description dated

Copyright 2019 Kleinfelder

October 5, 2017. The project area includes 17.07 acres of land northeast of Silva Valley Parkway and 15.73 acres of land southwest of Silva Valley Parkway (including a portion of the Site).

- An approved Zoning Application Package was dated June 20, 2018. The County split APN 122-720-15 into four parcels: three on the northeast side of Silva Valley Parkway and one on the southwest side of Silva Valley Parkway (including a portion of the Site).

- A letter from the Community Development Agency, *Zoning Administrator Approval of P17-0004/EDH 52*, dated July 9, 2018, approved the zone change project. This includes the final findings and conditions of approval, which indicate the project area is suitable for the proposed development.

The El Dorado County Planning Division also indicated in its response that there were four applications still in process: Planned Development PD15-0001/Conditional Use Permit S17-0017/Parcel Map P17-0007/Rezone Z17-0004/EDH 52. A copy of the El Dorado County response is presented in Appendix C.

4.3.4 El Dorado County Air Quality Management District

Kleinfelder submitted a records request to the AQMD on July 19, 2019 for available information pertaining to the Site. No records were available for the Site parcel numbers.

Kleinfelder spoke with Todd from the AQMD on July 30, 2019 and inquired about dust control plans from the Silva Valley Parkway and US-50 interchange. Todd was able to locate the following documents:

- An Asbestos Dust Control Plan for a permanent stockpile issued in May 2012 to "AKT, EDH 52 Partnership", with a 2008 Caltrans report entitled, *Aerially Deposited Lead, Naturally Occurring Asbestos and Lead Containing Paint Site Investigation and Bridge Survey Report, Highway 50 Site Investigation Post Mile 2.90 to 8.79, El Dorado County, California*, attached to this plan. The Caltrans report showed the stockpile locations on the property northeast of the Site and summarized asbestos results for composite soil samples collected from medians and sound wall areas within the Silva Valley Parkway Interchange project area. The sample locations were not shown. Asbestos was not detected in the 30 composite samples collected except for one composite sample, which contained less than 0.25% chrysotile asbestos.

Copyright 2019 Kleinfelder

KLEINFELDER 24411 Ridge Route Drive, Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

- An Asbestos Dust Control Plan Application indicated that a 20,000 cubic yard soil stockpile, and approximately 120,000 cubic yards of soil to be excavated from a 5-acre section ("Borrow Area") on the property northeast of the Site, would be used as fill material for the highway interchange in 2013.
- An Asbestos Dust Control Plan Application, dated December 20, 2013 indicated that 20 acres of soil would be disturbed at the Silva Valley Parkway and US-50 interchange for earthwork, road widening, bridgework, utilities, and paving in 2014 through 2015. The site plan included with the application showed that Old Silva Valley Parkway (referred to as Clarksville Crossing) west of the Site was included in the stage 3 project area. The Asbestos Review Areas Map included with the application showed that the western portion of the Site is within a quarter mile buffer likely to contain asbestos or fault lines.
- An Asbestos Dust Control Plan Application, dated March 1, 2013 indicated that 2.0 acres of soil would be disturbed at the Silva Valley Parkway and US-50 interchange for Pacific Gas and Electric Company electric utility relocation. Most excavation would be used for trenching and some drilling for utility poles, excavated soils were proposed to be placed back in the trenches. Based on the site plan included with the application, areas with short conduit pipe appear to be located in the southwest portion of the Site, south and adjoining the former Tong Road.
- A Geotechnical Report, EDH 52, Silva Valley Parkway at US-50, Rough Site Grading and Preliminary Foundation Design, prepared by Blackburn Consulting and dated March 2013, described a geotechnical investigation performed at the Site. This report is further summarized in Section 4.9. This report indicated that the weathered rock observed during this investigation were metavolcanics and are unlikely to contain asbestos.

The AQMD regulates NOA in El Dorado County. Based on Kleinfelder's review of an El Dorado County *Asbestos Review Areas Map* dated August 22, 2018, the western portion of the Site is located within a quarter mile buffer zone for areas more likely to contain asbestos, and therefore, the potential exists for NOA to be present in soil at the Site. Based on review of the construction dust rules for El Dorado County, which are available on line, https://www.edcgov.us/Government/AirQualityManagement/Pages/construction_dust_rules.aspx, an Asbestos Dust Mitigation plan is required if the construction area is within a NOA area identified by El Dorado County. Copies of the AQMD documents are included in Appendix C.

Copyright 2019 Kleinfelder

KLEINFELDER 24411 Ridge Route Drive, Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

4.3.5 El Dorado County Environmental Management

Kleinfelder submitted a records request to the El Dorado County Environmental Management on July 19, 2019 for well, UST, aboveground storage tank (AST), hazardous materials, and site mitigation documents pertaining to the Site. El Dorado County Environmental Management responded in an email on July 22, 2019 that no records exist for the provided parcel numbers. A copy of the email response is included in Appendix C.

4.3.6 State Water Resources Control Board

Kleinfelder reviewed the SWRCB GeoTracker™ database (http://geotracker.waterboards.ca.gov/) on July 19, 2019 for information pertaining to the Site and adjoining properties. The Site and adjoining properties are not listed in the GeoTracker™ database. A copy of the GeoTracker™ search results map is presented in Appendix C.

4.3.7 Department of Toxic Substances Control

Kleinfelder reviewed the DTSC's EnviroStor website (https://www.envirostor.dtsc.ca.gov/public/) on July 19, 2019, for available files pertaining to the Site and adjoining properties. The Site and adjoining properties are not listed. A copy of the EnviroStor search results is presented in Appendix C.

4.4 PHYSICAL SETTING SOURCE(S)

Table 4-1 presents information concerning the physical setting of the Site. The information was primarily obtained from published maps.

TABLE 4-1

Physical Setting

DATA	GENERAL INFORMATION
USGS TOPOGRAPHIC QUADRANGLE	Based on the United States Geological Survey (USGS) Clarksville Quadrangle 7.5-Minute Series (Topographic) Map, dated 2012, the Site elevation is between approximately 700 and 780 feet above mean sea level (msl). The Site has a general topographical slope towards the southwest.
SOIL TYPE	According to a geotechnical investigation performed by Blackburn Consulting in 2013, the Site in underlain by sandy silt with gravel in the upper 2 feet, with weathered metavolcanic bedrock beneath it (Blackburn, 2013).
OIL AND GAS WELLS	Information concerning oil and gas fields was obtained by Kleinfelder on July 19, 2019 from the DOGGR Well Finder online database (http://www.conservation.ca.gov/dog). Based on Kleinfelder's review, no oil or gas wells are located within the immediate vicinity of the Site. A copy of the Well Finder search results is presented in Appendix C.

Copyright 2019 Kleinfelder

KLEINFELDER 24411 Ridge Route Drive, Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

Table 4-2 presents information concerning regional geology and hydrogeology. The information was obtained from published maps and other sources.

TABLE 4-2

Regional Geology and Hydrogeology

PHYSICAL PARAMETER	INFORMATION/COMMENTS
REGIONAL PHYSIOGRAPHY AND GEOLOGY	The Site is situated between the Great Valley and Sierra Nevada Geomorphic Provinces of California. The Great Valley Geomorphic Province is an alluvial plain about 50 miles wide and 400 miles long that includes the Sacramento Valley as its northern portion, and the San Joaquin Valley as its central and southern portion. The Great Valley is a trough in which sediments have been deposited almost continuously since the Jurassic. The Sierra Nevada Geomorphic Province is a tilted fault block characterized as a high multiple scarp mountain range that slopes gently to the west, and dips under the Great Valley (California Geological Survey [CGS], 2002). The Sierras are characterized by deep cut valleys that drain into the Great Valley. The high Sierras are granitic with the surrounding bedrock being metamorphic. The Site is located on Jurassic-Triassic metavolcanics rocks, which consist of basaltic and andesitic volcanic rocks, tuff, and volcanic breccia. The Bear Mountain Fault Zone is located approximately 1-mile west of the Site and extends northwest to southeast from Folsom Lake along the Sierra Nevada foothills (Strand and Koenig, 1965).
REGIONAL HYDROGEOLOGY	The Site is not located within a groundwater basin or subbasin recognized by the California Department of Water Resources (CDWR) Bulletin 118, last updated in July 2017. The closest groundwater basin is the Sacramento Valley-South American groundwater basin, located approximately 3 miles to the west-northwest of the Site (CDWR, https://gis.water.ca.gov/app/gicima/).
DEPTH TO GROUNDWATER DIRECTION OF ANTICIPATED FLOW [1]	Groundwater information was not available for the Site or Site vicinity. Groundwater is assumed to follow topographic trends and flow to the southwest.
REGIONAL GROUNDWATER QUALITY PROBLEMS	Groundwater information was not available for the Site or Site vicinity.
WATER SUPPLY	The Site is currently not connected to the municipal water system.
FLOOD ZONE DESIGNATION	According to *The EDR Radius Map™ Report with GeoCheck®*, the Site is not located within a 100-year or a 500-year flood zone (EDR, 2019b).

[1] Groundwater flow direction is based on regional information sources. Site-specific conditions may vary due to a variety of factors including geologic anomalies, utilities, nearby pumping wells (if present), and others.

Copyright 2019 Kleinfelder

4.5 USER PROVIDED INFORMATION

Kleinfelder understands that the Client intends to purchase the Site and develop it as a Costco Warehouse and gas station. Information regarding the current owners/occupants of the Site is summarized in Table 4-3.

TABLE 4-3

Owner and Occupant Information

ENTITY	NAME
OWNER	According to the *EDR Environmental Lien and AUL Search* report (EDR, 2019a), the current owner of the Site parcel APN 122-720-018 is "EDH 52, a California General Partnership" and the current owner of the Site parcel APN 122-720-002 is "Mee Capital Investments, LLC". According to the *EDR Environmental Lien and AUL Search* report (EDR, 2019h), the current owner of the Site parcels APN 122-720-003 and UN1384034 is "El Dorado Hills Investors, Inc.".
OCCUPANT(S)	The Site is currently vacant land.

Summaries of interviews of key individuals with knowledge of the Site ("Key Site Managers") are provided in Section 7. The following sections present information provided to Kleinfelder by the Client.

4.6 TITLE RECORDS

Chain-of-title information for the Site was not provided by the Client. Therefore, a review of a chain-of-title report was not reviewed as part of this Phase I ESA.

4.7 ENVIRONMENTAL LIENS AND USAGE LIMITATIONS

According to information provided in EDR's regulatory agency database search report (EDR, 2019b), no known recorded land-use environmental deed restrictions pertaining to the Site are listed in the State Liens Database. Kleinfelder's review of the *EDR Environmental Lien and AUL Search* report (EDR, 2019a) indicated no environmental liens or activity and use limitations (AULs) are associated with the Site parcels (Appendix C).

4.8 VALUE REDUCTION

As part of the Standard Practice process, information is to be gathered regarding the prospective purchase price of the Site relative to its fair market value. If there appears to be a value reduction, that reduction must be identified with respect to whether the difference may be attributed to

Copyright 2019 Kleinfelder

environmental degradation of the property. According to a questionnaire completed by Mr. Michael Okuma of Costco on July 22, 2019, the purchase price of the Site reflects the fair market value. A copy of the questionnaire is provided in Appendix C.

4.9 OTHER INFORMATION / DOCUMENTS PROVIDED

Documents pertaining to the Site that were provided to Kleinfelder for review include the following:

Blackburn Consulting, 2007, *Initial Site Assessment, Silva Valley Pkwy/SR50 Interchange, 03-ED-50, KP 3.1 (PM 1.7), EL Dorado Hills, California,* April 12.

This report identifies the Site as Parcel 1 APN 108-030-1010 EDH 52. This parcel includes the Site and the property northeast of the current Silva Valley Parkway. This investigation was preformed to assess environmental conditions for the proposed US-50 underpass and Silva Valley Parkway interchange improvements. No hazardous material issues were identified in this report. The subject parcel was undeveloped and used for grazing. Concrete structures/ruins (past use unknown) and associated debris were observed on this parcel. This report indicates that archaeological research identifies that this parcel was used as a ranch. Potential issues identified included issues associated with a former farm residence include leach fields/septic tanks and buried heating tanks. This report recommended assessing the concrete structures for potential lead and asbestos. This parcel was identified as being in an area with NOA. A NOA monitoring plan will be required prior to grading including having a geologist intermittently on the parcel to oversee the grading. BMPs for dust control should be practiced.

Blackburn Consulting, 2010, *Updated Initial Site Assessment (ISA), Silva Valley Parkway/State Route 50 Interchange (03-ED-50, KP 3.1, PM 1.7), EL Dorado Hills, California*, February 23.

This update report summarized the following:

- a database search performed in 2010,
- BCI's Initial Site Assessment for US 50/El Dorado Boulevard Interchange (EA 03-2E5100) and Pedestrian Overcrossing Project (EA 03-2E4700) El Dorado Hills, CA BCI File No. 1072.5 dated 2009,
- Geocon's Aerially Deposited Lead, Naturally Occurring Asbestos, and Lead Containing Paint Site Investigation and Bridge Survey/Highway 50 Report, dated March 10, 2008, and
- a site visit performed in 2010.

Copyright 2019 Kleinfelder

This report indicated no significant changes in the project site were identified. The facilities discussed in this report did not include the Site. The lead and asbestos investigation concluded that soil in the upper 3 feet of the investigation area (the center median of the US 50) would not be classified as hazardous waste.

Blackburn Consulting, 2013, *Geotechnical Report, EDH 52 Silva Valley Parkway at US 50, Rough Site Grading and Preliminary Foundation Design, EL Dorado Hills, California*, March 11.

This report summarizes a geotechnical investigation performed at the Site and the land northeast of the Site. Mesozoic-age metavolcanics and metasedimentary rocks were present at shallow depths beneath the project area. Northwest trending faults, fault zones, and foliation characterize the region. NOA is mapped in the project area. Southwest trending drainage was observed at the subject property. An old dam was observed in the drainage feature extending through the center of the subject property (in the center of the Site). Residual structures were also observed in the northern portion of the Site.

Four bores and 11 test pits were advanced during this investigation (one of these bores and six of these test pits are within the Site boundaries). Soils observed included 1 to 2 feet of sandy silt with gravel, over 1.5 to 5 feet of decomposed weathered metavolcanic rock, over weathered metavolcanic rock. Groundwater was not encountered. Blackburn states that asbestos minerals were not present in the rocks observed, but they also indicate that the western portion of the Site falls with the EL Dorado County Environmental Management “Asbestos Review Area”.

5 SITE HISTORY

The history of the Site was researched to identify obvious uses. Historical land use was researched to the first developed use, or back to 1940, whichever was earlier or readily available. Table 5-1 summarizes the availability of information reviewed during this assessment.

TABLE 5-1

Historical Information Sources

SOURCE	YEARS REVIEWED	SOURCE / AVAILABILITY
SANBORN FIRE INSURANCE MAPS	Not available	EDR, 2019c
AERIAL PHOTOGRAPHS	1940, 1952, 1962, 1966, 1972, 1984, 1993, 2006, 2009, 2012, and 2016	EDR, 2019d
CITY DIRECTORIES	1970 through 2014 (select years)	EDR, 2019e
HISTORICAL TOPOGRAPHIC MAP REPORT	1891, 1892, 1893, 1941, 1944, 1953, 1973, 1980, and 2012	EDR, 2019f
BUILDING DEPARTMENT	1980 - 2018	EDR, 2019g
PREVIOUS ASSESSMENT(S)	2007 - 2019	Section 4.9 and Section 5.6.

5.1 SANBORN FIRE INSURANCE MAPS

Sanborn Fire Insurance Maps provide historical land use information for some metropolitan areas and small, established towns. Kleinfelder requested EDR to search its library of Sanborn Fire Insurance Maps for maps of the Site. EDR responded that Sanborn Fire Insurance Maps were not available for the Site (EDR, 2019c) (Appendix D).

5.2 AERIAL PHOTOGRAPHS

A review of historical aerial photography may indicate past activities at a property that may not be documented by other means or observed during a reconnaissance visit. The effectiveness of this technique depends on the scale and quality of the photographs and the available coverage. Aerial photographs were obtained from several historical photograph collections through EDR (2019d) and span a period of 76 years. A tabulation of the aerial photographs reviewed by Kleinfelder is presented in Table 5-2. Copies of the aerial photographs provided by EDR are included in Appendix D.

Copyright 2019 Kleinfelder

TABLE 5-2

Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
1940 1952	1" = 500' 1" = 500'	**Site:** The Site appears to be mostly vacant grazing land with a farmhouse and associated structures present in the north portion of the Site. There are a stand of trees in a rectangular-shaped lot just south of the farmhouse (possible orchard). Although difficult to see based on the resolution of the photo, a structure may be present within that stand of trees. A creek appears to extend northeast to southwest across the middle of the Site. A dirt track extends north through the eastern portion of the Site, then veers northwest, and then west to the farmhouse and structures. **Surrounding Area:** The adjoining properties appear to also be grazing land. Dirt roads are present throughout the grazing lands on the adjoining properties. A dirt road extends north to south along the western border of the Site, and then extends southwest from the southwest corner of the Site towards the US-50 and another farmhouse. Some farmhouses are present east-southeast of the Site along the highway.
1962	1" = 500'	**Site:** The Site appears generally the same, though the trees south of the farmhouse appear less dense. A dirt track runs from the southwest corner of the Site north and then east through the southern portion of the Site. **Surrounding Area:** The adjoining properties appear generally the same.
1966	1" = 500'	**Site:** The Site appears generally the same except a paved road extends through the southwest corner of the Site. **Surrounding Area:** The adjoining properties to the north, west, and east appear generally the same. The paved road that extends through the southwest corner of the Site extends eastward parallel to US-50. The paved road intersects another paved road at the western border of the Site. This paved road extends a couple hundred feet north along the Site border and then connects with the dirt road extending along the western side of the Site. The paved road also extends south under US-50. Highway US-50 appears more developed with westbound and eastbound lanes.
1972 1984 1993	1" = 500' 1" = 500' 1" = 500'	**Site:** The Site appears generally the same, except that the farmhouse is no longer present, though some farm structures may remain. **Surrounding Area:** The adjoining properties appear generally the same, though there appears to be some grading (dirt rings) at the location of the farmhouses east-southeast of the Site along US-50.

Copyright 2019 Kleinfelder

TABLE 5-2 (Continued)

Historical Aerial Photographs Reviewed

YEAR	APPROXIMATE SCALE	SUMMARY
2006 2009	1" = 500' 1" = 500'	**Site:** The Site appears generally the same. Though there are clear dirt tracks extending across the Site. There still appears to be some farm structures or remnants in the northern portion of the Site. There is a graded area in the southwestern portion of the Site adjoining the paved road crossing the southwest corner of the Site. **Surrounding Area:** The properties adjoining to the north and northeast appear generally the same, though residential development is present further to the north and northeast. A paved road is present along the western boundary of the Site, with undeveloped grazing land present beyond the paved road, with residential development present further to the west. Some structures are present southwest of the Site, on the west side of the paved road. US-50 remains south of the Site. The location of the former farmhouses southeast of the Site adjoining US-50 appears to have been developed with a commercial structure and associated parking lot.
2012	1" = 500'	**Site:** The Site appears generally the same, except that the dirt tracks crossing the Site are more apparent and there is a dirt road extending through the southeast of the Site. **Surrounding Area:** The adjoining properties remain generally the same, except that there is a stockpile of soil present on the property northeast of the Site that the dirt road crossing the Site connects with. US-50 appears to have been widened.
2016	1" = 500'	**Site:** The Site appears generally the same, except that the dirt tracks and dirt road is no longer apparent. Additionally, the road that extends through the southwest corner of the Site appears to no longer be in use and ends at the southern border of the Site. **Surrounding Area:** The adjoining properties remain generally the same. Silva Valley Parkway is now present along the north-northeast boundary of the Site. The freeway on and off ramps south of the Site have been reconstructed with a freeway on-ramp present south of the Site.
Note: Aerial photographs only provide information concerning indications of land use, and no conclusions regarding the release of hazardous substances or petroleum products can be drawn from the review of photographs alone.		

5.3 CITY DIRECTORIES

City directories provide information regarding property occupants by address. EDR provided a city directory image report (EDR, 2019e), which included a review of city directories for properties along Silva Valley Parkway for select years between 1970 and 2014. There were no listings reported for the Site. Kleinfelder reviewed the available listings and no RECs were identified.

Copyright 2019 Kleinfelder

5.4 HISTORICAL TOPOGRAPHIC MAP REVIEW

Kleinfelder obtained information regarding historical topographic maps of the Site vicinity from EDR (2019f). The topographic maps reviewed for this assessment are listed in Table 5-3 and copies of the maps are included in Appendix D.

TABLE 5-3

Historical Topographic Maps Reviewed

YEAR	SCALE	SUMMARY
1891 1892 1893	1:125,000 1:125,000 1:125,000	**Site:** The Site is shown as undeveloped land consisting of a hill sloping to the south-southwest. **Surrounding Area:** The immediate Site vicinity is shown as undeveloped land with a road to the south and west of the Site. Clarksville is indicated to be southeast of the Site.
1941 1944	1:62,500 1:62,500	**Site:** The Site remains mostly undeveloped land. A structure is present along the northwest boundary of the Site. **Surrounding Area:** The adjoining properties to the Site remain as undeveloped land. An unimproved road is present along the western Site boundary. US-50 is shown south of the Site.
1953	1:24,000	**Site:** The Site remains mostly undeveloped land. The structure on the Site appears to have been repositioned on the map slightly to the east. **Surrounding Area:** The adjoining properties remain generally the same.
1973 1980	1:24,000 1:24,000	**Site:** The Site remains generally the same, except that a road extends through the southwest corner of the Site on the 1973 topographic map. The structure located in the northern portion of the Site is no longer present on the 1980 topographic map. **Surrounding Area:** The adjoining properties to the Site remain generally the same. A road extends east to west south of the Site, crosses the southwest corner of the Site, and then turns south and extends under the US-50. US-50 has been developed with westbound and eastbound lanes.
2012	1:24,000	**Site:** The 2012 topographic map is similar in appearance and shows physical features (e.g., roads and surface water) with no structures. Therefore, no structures are shown on the Site. **Surrounding Area:** Off-Site roads (Silva Valley Parkway to the west, Tong Road to the south) are shown. However, Silva Valley Parkway and Tong Road do not match their current configurations.

No RECs were identified based on the historical topographic map review.

Copyright 2019 Kleinfelder

5.5 BUILDING PERMITS

EDR provided a Building Permit Report, included in Appendix D, (EDR, 2019g). No building permits were found for the Site. No RECs were identified based on the EDR Building Permit Report review.

5.6 PREVIOUS ASSESSMENTS

Kleinfelder prepared a draft Phase I ESA on the northern portion of APN 122-720-15, northeast of Silva Valley Parkway and north of Tong Road, dated March 15, 2019. No RECs were identified by this Phase I ESA. Findings from this Phase I ESA included the following:

- This property was historically undeveloped, though some earthwork appears to have occurred in the southern portion, northeast of the intersection of Tong Road and Silva Valley Parkway, between 2012 and 2016. This earthwork appears to be related to US-50 construction activities, and realignment of Silva Valley Parkway and Tong Road in 2012 and 2013. Two Asbestos Dust Mitigation Plan Applications were approved by the El Dorado County AQMD in 2012 and 2013 for grading/excavation activities associated with construction of a US-50 off-ramp, south of the Site. A March 2008 Caltrans report, entitled *Aerially Deposited Lead, Naturally Occurring Asbestos and Lead Containing Paint Site Investigation and Bridge Survey Report*, prepared for the US-50 Site Investigation project, was included with one of the Asbestos Dust Mitigation Plan Applications. This report indicated that 30 composite soil samples collected from the median and proposed sound wall areas (sample locations were not identified) were analyzed for the presence of NOA, total lead and chromium. One out of 30 composite soil samples contained less than 0.25% chrysotile asbestos (Composite sample NOA); remaining samples did not contain detectable NOA. Total lead and chromium were detected in soil samples analyzed, but at concentrations reported below California hazardous waste threshold levels. A figure presented in this report indicates that the southern portion of the property was used to temporarily stockpile soil that was to be covered with plastic and surrounded by fiber rolls. Hydroseed was to be planted at the end of the project. A Rough Grading Plan dated August 2013 indicates that 20,000 cubic yards of existing stockpiled soil and an additional 100,000 cubic yards of soil from a “Borrow Area” would be used as part of the construction of a future US-50 off-ramp, and future alignments of Tong Road and Silva Valley Parkway. The “Borrow Area” was shown to be on the southern portion of the property (east of the

Copyright 2019 Kleinfelder

Site and north of Tong Road) with a 10-foot wide maintenance access road to the area. This maintenance road appears to extend through the southern portion of the subject Site.

- A quarter-mile buffer zone pursuant to an *Asbestos Review Areas, Western Slope, County of El Dorado, State of California* map, dated August 22, 2018, is located adjacent to and extends into the westernmost portion of the property. This buffer zone is considered "more likely to contain asbestos" in soil. Facilities within this buffer zone would require approval of an Asbestos Dust Mitigation Plan through the AQMD prior to construction. Kleinfelder's March 15, 2019 Phase I ESA recommended collection and analysis of shallow soil samples for NOA. IF NOA was present in soil samples, then an Asbestos Dust Mitigation Plan was recommended for construction activities.

- An intermittent creek and ephemeral creek were observed flowing from north to south across the property. Two seasonal wetland areas were observed near the southern ends of these waterways. Kleinfelder recommended that a wetland delineation be performed in the spring.

- No special status wildlife or plant species were observed. A blue elderberry shrub was observed near the northern boundary of the property. This shrub can be home to the blue elderberry beetle; however, no sign of the beetle was observed on this shrub and due to the elevation of the location of the shrub it is unlikely the beetle will occur at this location. Two mitigation credits may need to be acquired to move the blue elderberry shrub even though no sign of the beetle was observed.

- Burrowing owls, Swainson's Hawk, and migratory birds have the potential to occur on the property but were not observed. Pre-construction surveys for these species were recommended.

- A concrete structure with a basin in the middle (probably to provide water for grazing livestock) was observed in the north-central portion of the property. Because of the potential for dumping in this structure, Kleinfelder recommended environmental monitoring and observation of the removal of this structure and, if contamination is suspected, collection of soil samples from beneath this structure.

- No off-Site facilities are considered likely to have affected soil, soil vapor or groundwater beneath the Site.

6 SITE RECONNAISSANCE

Kleinfelder's Phase I ESA activities included a Site reconnaissance. This section summarizes the findings from the Site reconnaissance.

6.1 METHODOLOGY AND LIMITING CONDITIONS

Mr. Curtis Conti of Kleinfelder performed a reconnaissance of the Site and vicinity on July 29, 2019. The Site reconnaissance included a visual inspection of the Site to assist in identifying the presence or likely presence of hazardous substances or petroleum hydrocarbons under conditions that indicate an existing release, a past release, or threat of release into structures, soil, groundwater, or surface water at the Site (i.e., RECs). Observations of readily-apparent environmental conditions are summarized in Table 6-1, and color photographs of the Site are presented on Figures 3 through 9. The approximate Site boundaries are shown on Figure 2.

6.2 GENERAL SITE SETTING

The Site is generally located west of Silva Valley Parkway, east of Old Silva Valley Parkway, and north of US-50 in the unincorporated El Dorado Hills community of El Dorado County, California.

6.3 SITE OBSERVATIONS

Kleinfelder's Site observations are summarized in Table 6-1.

TABLE 6-1

Site Observations

GENERAL OBSERVATIONS	REMARKS	OBSERVED	NOT OBSERVED
Current use	Site is currently undeveloped hillside.	X	
Current use likely to indicate RECs			X
Past use	Ranching.		X
Past use likely to indicate RECs			X
Structures	Remnants of concrete structures are located on the northwest side of the Site and northwest of the seasonal creek bisecting the Site. A concrete dam blocking the creek was also observed. The northwest side of the dam had been undermined by water.	X

6.4 RESULTS OF SITE RECONNAISSANCE

The Site currently consists of vacant, undeveloped land, which slopes from the northeast to the southwest. Seasonal streams, flowing from the northeast to the southwest, are located at the northern portion of the Site, as well as the middle of the Site. A concrete dam was observed partially blocking the stream in the middle of the Site, though the northwest side of the dam had been undermined by water. Surface water ponds were observed upstream of the dam. Concrete structures (pillars, remnants of ranch buildings and structures) and pile of concrete blocks were observed on the northwest portion of the Site. A concrete block-lined pit was observed in the northern portion of the Site. The use of this pit is not known. A Pacific Telephone utility marker was observed in the middle-northern portion of the Site. A dumped couch was also observed in the northwestern portion of the Site. A chain-link fence extended across the southern portion of the property north of the former Tong Road, which was present in the southwestern portion of the Site. Three transformers and an electrical panel were present on Site, south of former Tong Road, adjoining Old Silva Valley Parkway (Clarksville Crossing). A utility structure with subsurface vaults and a transformer adjoining the structure was present across Old Silva Valley Parkway (Clarksville Crossing), west of the southwestern portion of the Site. A subsurface utility vault with standpipes was also observed on Site adjoining Old Silva Valley Parkway (Clarksville Crossing). Evidence of stained soil, discolored water, stressed vegetation, USTs, wells, or lagoons was not observed on the Site during the reconnaissance.

7 INTERVIEWS

Key Site Managers are contacted to obtain current and historical environmental information concerning the Site. The following sections highlight information revealed during the interviews.

7.1 INTERVIEW WITH CLIENT/OWNER/MANAGER

A questionnaire completed by Mr. Michael Okuma of Costco on July 22, 2019 indicated the following:

- He is unaware of environmental liens that are filed or recorded against the property.
- He is unaware of AULs that are in place on the property or that have been filed or recorded against the property.
- He has no specialized knowledge or experience related to the property or nearby properties unrelated to the Costco warehouse.
- He indicated that the purchase price of the property reasonably reflects the fair market value of the property.
- He is not aware of commonly known or reasonably ascertainable information about the property that would help Kleinfelder identify conditions indicative of releases or threatened releases.
- He is unaware of obvious indicators that point to the presence or likely presence of releases at the property. He indicated that this Phase I ESA was being performed for due diligence.

The completed questionnaire is included in Appendix C.

7.2 INTERVIEW WITH OWNER/MANAGER

A completed questionnaire from the property owner has not been received to date.

7.3 INTERVIEW WITH OCCUPANT(S)

The Site is vacant land with no occupants present. Therefore, interviews with occupants were not performed as part of this Phase I ESA.

Copyright 2019 Kleinfelder

7.4 INTERVIEWS WITH LOCAL GOVERNMENT OFFICIALS

Kleinfelder spoke with Todd, representative for the El Dorado County AQMD, regarding available AQMD records associated with the Site on July 30, 2019. Kleinfelder inquired about asbestos dust control plans for projects near Silva Valley Parkway and the US-50. Todd indicated that there were no records associated with the Site parcel numbers. When Kleinfelder mentioned the asbestos dust control plans prepared by Caltrans for the Silva Valley Parkway, Todd was able to look them up, and also identify an asbestos dust mitigation plan for a utility conduit on the southwest portion of the Site and a grading plan for the Site (both of which were previously not filed under the Site parcel numbers). A summary of Kleinfelder's review of the documents was included in Section 4.3.4.

KLEINFELDER 24411 Ridge Route Drive, Suite 225, Laguna Hills, CA 92653 p | 949.727.4466 f | 949.727.9242

8 EVALUATION

Kleinfelder performed this Phase I ESA of the Site in conformance with the scope and limitations of the Standard Practice, the scope of services in our Proposal No. 20193180.001A/LH19C99493, dated August 9, 2019, and in accordance with Costco's Development Requirements, Version 2018, dated October 26, 2018. The following sections describe Kleinfelder's findings and provide general background information about the Site. Findings address RECs, HRECs, CRECs, and notation of *de minimis* quantities, as applicable to the Site. In summary, Kleinfelder's assessment revealed the following information concerning the Site:

8.1 BACKGROUND

The following is a summary of the Site background information:

- The Site is located on vacant land west-southwest of Silva Valley Parkway and north of US-50 in the unincorporated El Dorado Hills community of El Dorado County, California (see Figure 1). It consists of approximately 17.04 acres of land identified as El Dorado County APNs 122-720-018 and 122-720-002, and portions of two other parcels identified APNs 122-710-003 and UN1384034.
- The Site was historically used as grazing land. Farm/ranch structures occupied the northern portion of the Site from at least 1940 through 1973. Remnants of these structures are still present in the northern portion of the Site. Natural drainage channels cross the northern and the middle portions of the Site from the northeast to southwest. Remnants of a dam were present across the drainage channel in the middle of the Site. A dirt road extended to the farmhouse along the western Site boundary from US-50, which was constructed south of the Site by 1941. In 1966, US-50 was expanded from a 2-lane highway to a 4-lane highway, and Tong Road was constructed extending east to west through the southwestern portion of the Site. By 2006, the Old Silva Valley Parkway formed the western border of the Site. In 2012, earthwork was being performed on the property to the northeast in preparation of the Silva Valley Parkway/US-50 interchange construction activities, and a dirt road extended across the southern portion of the Site from Tong Road to the main earthwork area. By 2016, the current Silva Valley Parkway/US-50 interchange had been constructed, with Silva Valley Parkway forming the eastern border of the Site and the US-50 on-ramp present south of the Site. A remnant on Tong Road remains in the southwestern portion of the Site.

Copyright 2019 Kleinfelder

8.2 FINDINGS AND OPINIONS

The following is a summary of findings and opinions for the Site:

- During Kleinfelder's Site reconnaissance, the ranch structure remnants and the dam were observed on the Site. Standing water was observed down-stream of the dam. In the vicinity of the ranch structures was a pit, approximately 2- to 3-feet deep, and lined with concrete blocks. Other remnants include a watering trough, piles of concrete blocks, and building foundation remnants. An old couch had been dumped on the Site near the old structures. Other than the remnants of the previous ranch activities, the Site is vacant land. Utilities were observed adjoining Old Silva Parkway (Clarksville Crossing), including three transformers and an electrical panel present in the southwestern portion of the Site south of the old Tong Road, and a water utility vault with standpipes located on Site adjoining Old Silva Parkway (Clarksville Crossing), north of old Tong Road. Evidence of stained soil, discolored water, stressed vegetation, USTs, wells, or lagoons was not observed on the Site during the reconnaissance. No RECs were identified during the Site reconnaissance.
- The western portion of the Site is located within an area identified by El Dorado County as considered "more likely to contain asbestos" in soil. Base on a review of the *Asbestos Review Areas, Western Slope, County of El Dorado, State of California* map, dated August 22, 2018, the western portion of the Site is within a quarter mile of an area where NOA was found. Facilities within this buffer zone would require approval of an Asbestos Dust Mitigation Plan through the AQMD prior to construction. Therefore, it appears that an "Asbestos Dust Mitigation Plan" will be required for construction activities.
- No off-Site facilities are considered likely to have affected soil, soil vapor or groundwater beneath the Site.

8.3 DEVIATIONS AND ADDITIONAL SERVICES

Kleinfelder's scope of services did not include Standard Practice non-scope evaluations of cultural, historic, and archaeological resources and environmental regulatory compliance that may be required for a Phase I ESA pursuant to Costco's Development Requirements publication (revised October 26, 2018). In addition, the Phase I ESA did not include an assessment for ACMs, radon, LBP, lead in drinking water, molds and mildews, indoor air quality, industrial hygiene, health and safety, and other Standard Practice non-scope considerations not described herein.

Copyright 2019 Kleinfelder

Kleinfelder's scope of services included evaluations of wetlands and threatened, endangered, and other protected species pursuant to Development Requirements, Version 2018, revised October 26, 2018. Kleinfelder contracted with Moore to perform these evaluations. A copy of Moore's report is provided in Appendix E. A summary of the results of these evaluations is provided in Sections 8.3.1 and 8.3.2 below.

8.3.1 Protected Plant/Wildlife Assessment

Moore queried relevant agency databases to determine the potential biological constraints that could be imposed on the Site. Additionally, Moore performed visited the Site on July 26 and 29, 2019 to document existing biological conditions at the Site.

At the time of Moore's Site visits, the Site was open hillsides supporting grassland vegetation. The grassland appeared to be moderately to highly disturbed from historic grazing, grading, and construction of adjoining parcels, and discing for weed abatement. Two intermittent creeks were present on the Site. Water for these creeks was received from culverts along Silva Valley Parkway and flow to culverts along Old Silva Valley Parkway (Clarksville Crossing), and then eventually to Carson Creek west of the Site. There are also some areas that can be classified as seasonal wetland swale. There are a few trees and shrubs growing along the intermittent creek including valley oak, blue oak, willows, and California black walnut. No blue elderberry shrubs were observed on or adjacent to the Site. Several bird species were observed. The several large trees in the riparian corridor are suitable for nesting birds. The habitat is suitable for raptors and song birds. No mammals were observed, but the habitat is suitable for coyotes, striped skunks, black-tailed hares, desert cottontails, and Virginia opossum. Several ground squirrel burrows and gophers were observed in the grasslands. Mice and voles are also likely to occur in the grasslands. Of amphibians and reptiles, only the western fence lizard was observed. There is the potential for the Pacific chorus frog, bullfrog, western terrestrial garter snake, and gopher snake to occur.

Moore searched the California Department of Fish and Wildlife's (CDFW) California Natural Diversity Database (CBDDB, 2019) and the USFWS Information, Planning, and Consultation System (IPAC) Trust Report of Federally Threatened and Endangered species for plant and wildlife species that have been documented in the Site vicinity, or have the potential to occur based on suitable habitat. Ten special status plants were identified as potentially occurring at the Site. Due to lack of habitat, it is unlikely these special status plants would occur at the Site. Sixteen special status species were documented in the Site vicinity; however, upon review of the available habitat and distribution of regional occurrences, in Moore's opinion, most of the species are

Copyright 2019 Kleinfelder

unlikely to occur at the Site. The only species with a more than low potential to occur are Swainson's hawk and burrowing owls. Other special status species may forage or migrate through the area.

A preconstruction survey for burrowing owls within 250 feet of the Site is recommended if construction is scheduled between February 1 and August 31. A preconstruction survey for Swainson's hawk within 0.25-mile of the Site is recommended if construction is scheduled between March 1 and September 15.

Migratory birds are protected under the Migratory Bird Treaty Act (MBTA). If tree removal is scheduled between January 1 and July 31, a preconstruction survey for nesting raptors is recommended. If other vegetation is removed between March 1 and July 31, a pre-construction survey for any nesting birds is recommended. If active nests are observed, they are to be avoided until the young birds have been fledged.

8.3.2 Wetland Assessment

During Moore's Site visits, two ephemeral creeks and a seasonal wetland swale were observed. These features were not mapped on the USGS topographic map or the National Wetland Inventory, but are potentially jurisdictional Waters of the United States and wetlands. These features encompass approximately 0.2-acre of the Site. Moore recommends formal wetland delineation to map jurisdictional boundaries and calculate precise acreage. Avoidance of impacting jurisdictional waters is recommended. If avoidance is not feasible, permits would be required from United States Army Corp of Engineers (ACOE), CDFW, and Regional Water Quality Control Board prior to placement of fill material. As the acreage is less than 0.5 acre, ACOE would likely authorize placement of fill under a Nationwide Permit.

8.4 CONCLUSIONS

Kleinfelder has performed a Phase I ESA in conformance with the scope and limitations of ASTM Practice E 1527-13 of the location of a proposed Costco warehouse and gas station (Site) in the unincorporated El Dorado Hills community of El Dorado County, California. Any exceptions to, or deletions from, this practice are described in Section 8.3 of this report. This assessment has revealed no evidence of RECs or CRECs in connection with the Site.

Copyright 2019 Kleinfelder

8.5 RECOMMENDATIONS

Based on the findings and conclusions of this Phase I ESA, Kleinfelder has the following recommendations for further assessment.

- Based on the location of the Site within the asbestos buffer zone, preparation of an Asbestos Dust Mitigation Plan for AQMD is recommended prior to construction at the Site.

- Sampling of concrete remnants for asbestos-containing materials.
- Environmental monitoring and observation of the removal of the concrete block pit structure and, if contamination is suspected, collection of soil samples from beneath it.
- A wetland delineation is recommended.
- Pre-construction surveys for burrowing owls, Swainson's hawk, and migratory birds is recommended.

8.6 DATA GAPS

Data gaps, which may affect the identification of hazardous substances or petroleum products for the evaluation of RECs at the Site, include the following:

- A completed questionnaire from the current owner or the Site has not been received to date.

The absence of information from the property owner is not considered a significant data gap based on other information obtained as part of this Phase I ESA.

STATEMENT OF QUALIFICATIONS

We declare that to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in Section 312.10 of 40 CFR 312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all-appropriate inquiries in conformance with the standards and practices set forth in CFR Part 312.

Lindsey Dandridge-Perry
Project Professional

Lizanne Simmons, PG
Senior Principal Geologist

The resumes of above-listed environmental professionals performing this Phase I ESA are on file at the Kleinfelder office and are available upon request.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

SILVA VALLEY PARKWAY
EL DORADO HILLS, CA 95762

COORDINATES

Latitude (North):	38.6597600 - 38° 39' 35.13''
Longitude (West):	121.0569440 - 121° 3' 24.99''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	669066.9
UTM Y (Meters):	4280605.0
Elevation:	730 ft. above sea level

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/29/2019 has revealed that there are 2 ENVIROSTOR sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
SERRANO ELEMENTARY S Facility Id: 9020004 Status: No Further Action	***SERRANO PARKWAY/SILV***	***NNW 1/4 - 1/2 (0.413 mi.)***	***6***	***15***
SILVER DOVE ELEMENTA Facility Id: 9000003 Status: No Further Action	***SILVER DOVE WAY/BASS***	***E 1/2 - 1 (0.935 mi.)***	***8***	***20***

EXECUTIVE SUMMARY

ADDITIONAL ENVIRONMENTAL RECORDS

Other Ascertainable Records

CUPA Listings: A listing of sites included in the county's Certified Unified Program Agency database. California's Secretary for Environmental Protection established the unified hazardous materials and hazardous waste regulatory program as required by chapter 6.11 of the California Health and Safety Code. The Unified Program consolidates the administration, permits, inspections, and enforcement activities.

A review of the CUPA Listings list, as provided by EDR, has revealed that there are 3 CUPA Listings sites within approximately 0.5 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
PG&E: CLARKSVILLE SU	JOERGER RD	SSW 1/8 - 1/4 (0.224 mi.)	3	10
Database: CUPA EL DORADO, Date of Government Version: 02/27/2019 Status: Active, billable				
NEHEMIAH CONSTRUCTIO	1400 WHITE ROCK RD	S 1/4 - 1/2 (0.260 mi.)	4	10
Database: CUPA EL DORADO, Date of Government Version: 02/27/2019 Status: Inactive, non-billable				
AT&T MOBILITY - LAKE	***7000 ROSSMORE LN***	***SSW 1/4 - 1/2 (0.391 mi.)***	***5***	***11***
Database: CUPA EL DORADO, Date of Government Version: 02/27/2019 Status: Inactive, non-billable Status: Active, billable				

ENF: A listing of Water Board Enforcement Actions. Formal is everything except Oral/Verbal Communication, Notice of Violation, Expedited Payment Letter, and Staff Enforcement Letter.

A review of the ENF list, as provided by EDR, and dated 11/01/2018 has revealed that there is 1 ENF site within approximately 1 mile of the target property.

Description:	The caller is reporting a surge anticipator at a buster pump station sensed low pressure and opened. The water spilled into Carson Creek. The storage tanks have been off line since last Thursday and they have been putting potable water in the tanks. The EC level was 68 micros per centimeter and a chlorine residual of 0.2 milligrams per liter.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Federal Delisted NPL site list

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Federal RCRA generators list

RCRA-LQG: RCRA - Large Quantity Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.

RMP: Risk Management Plans

When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

Next Scheduled EDR Contact: 10/14/2019
Data Release Frequency: Quarterly

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006
Date Data Arrived at EDR: 03/01/2007

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing

In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations
EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

GEOCHECK ®- PHYSICAL SETTING SOURCE ADDENDUM

TARGET PROPERTY ADDRESS

122-720-15
SILVA VALLEY PARKWAY
EL DORADO HILLS, CA 95762

TARGET PROPERTY COORDINATES

Latitude (North):	38.65976 - 38° 39' 35.14''
Longitude (West):	121.056944 - 121° 3' 25.00''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	669066.9
UTM Y (Meters):	4280605.0
Elevation:	730 ft. above sea level

USGS TOPOGRAPHIC MAP

Target Property Map:	5629046 CLARKSVILLE, CA
Version Date:	2012

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

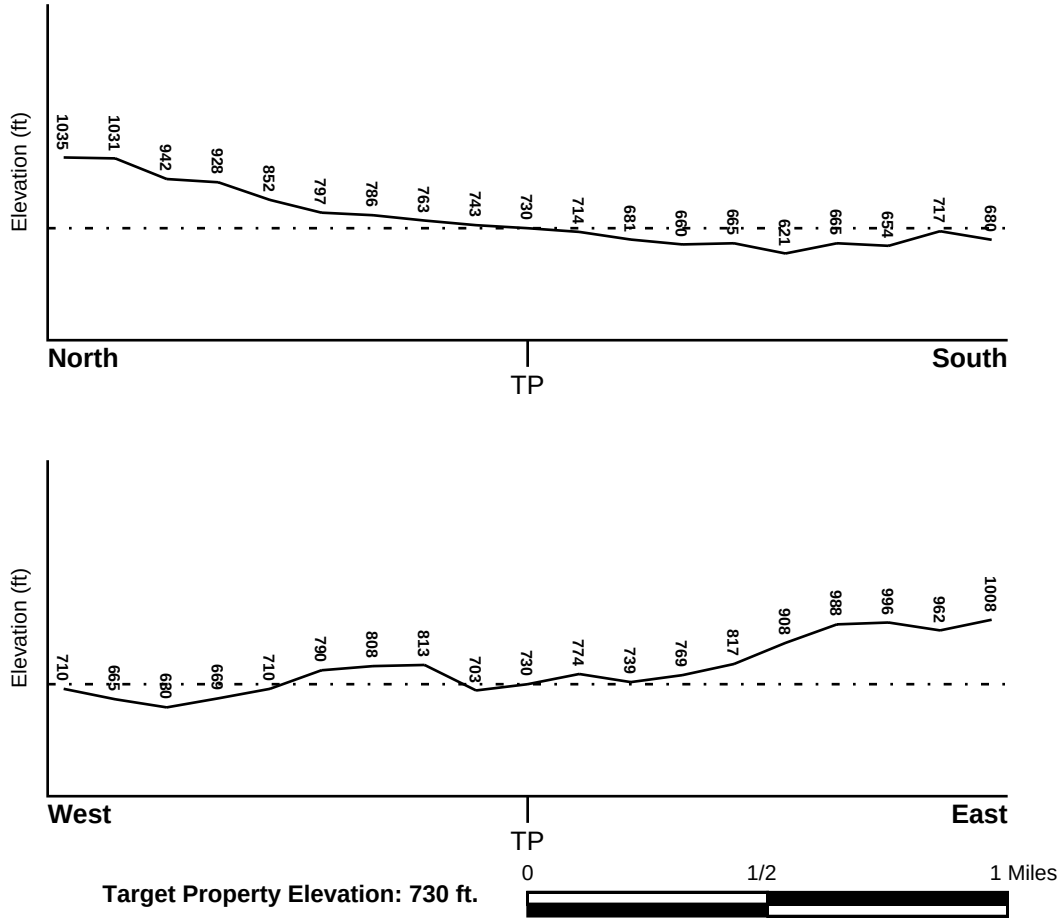
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General SE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 730 ft.

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Flood Plain Panel at Target Property	FEMA Source Type
06017C0725E	FEMA FIRM Flood data

Additional Panels in search area:	FEMA Source Type
06067C0140H	FEMA FIRM Flood data

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
CLARKSVILLE	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site−specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: AUBURN

Soil Surface Texture: silt loam

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Well drained

Hydric Status: Not hydric

Corrosion Potential - Uncoated Steel: Moderate

Depth to Bedrock Min: > 48 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

The Gold Standard in Public Service

Public Records

The Planning and Building Department, Planning Services Division has reviewed its files and has located records responsive to your request. Two projects, Rezone Z16-0008 and Parcel Map P17-0004 were Approved and as your request indicated a preference to receive the records in electronic form, they have been uploaded. These records can be accessed by visiting the Public Record Center.

Four projects, Planned Development PD15-0001/Conditional Use Permit S17-0017/Parcel Map P17-0007/Rezone Z17-0004/EDH 52, are still in processing. The Application Packet that was received from the applicant has been uploaded for your review. However, due to the large size of the project folder, the remaining documents can be viewed by contacting the Planning and Building Department, Planning Services Division at 530-621-5355 to schedule an appointment during normal office hours. This request is now deemed complete and has been closed.

To monitor the progress or update this request please log into the El Dorado County Public Records Center.

Re: Zoning Administrator Approval of P17-0004/EDH 52

Dear Sir or Madam:

On June 20, 2018, the Zoning Administrator considered your project at a publicly noticed hearing and the 10-day appeal period has since ended. The project was approved with the attached Findings and Conditions of Approval. This document is also available on-line at https://edcgov.trakit.net/eTRAKiT/Search/project.aspx.

If you have Conditions of Approval from other departments, please contact your representative in that department to determine the next step in the process.

If you have any questions, please contact Mel Pabalinas in Planning Services at (530) 621-5363.

Sincerely,

Serena Carter

EL DORADO COUNTY PLANNING AND BUILDING DEPARTMENT
ZONING ADMINISTRATOR
STAFF REPORT

Agenda of:	June 20, 2018
Item:	4.c.
Staff:	Mel Pabalinas

TENTATIVE PARCEL MAP

FILE NO.: P17-0004/EDH 52

APPLICANT: RSC Engineering

OWNER: EDH 52 G.P.

REQUEST: Tentative Parcel Map subdividing 41.87-acre property into four commercial parcels ranging in size from 7.69 acres to 17.11 acres for phasing and financing purposes only.

LOCATION: Northeast area of U.S. Highway 50 and Silva Valley Parkway, in El Dorado Hills (Exhibit A); Supervisorial District 1.

APN: 122-720-15 (Exhibit B)

ACREAGE: 41.87 acres

GENERAL PLAN: Commercial (C) (Exhibit C)

ZONING: Commercial, Regional-Planned Development (CR-PD) (Exhibit D)

ENVIRONMENTAL DOCUMENT: Categorical Exemption under California Environmental Quality Act (CEQA) Section 15315 (Minor Land Division)

RECOMMENDATION: Staff recommends the Zoning Administrator take the following actions:

1. Deem Tentative Parcel Map P17-0004 to be Categorically Exempt from CEQA based on Section 15315 (Minor Land Division); and

2. Approve Tentative Parcel Map P17-0004 based on the Findings and subject to the Conditions of Approval as presented.

BACKGROUND

The subject 42-acre property is part of a larger 58-acre parcel that was subject of an acquisition and subsequent construction of the Silva Valley Parkway Interchange project. Following an extended right-of-way negotiation and settlement for portions of the original parcel north of US Highway 50 and a separate condemnation of the portion south of U.S. Highway 50, construction of the interchange project began in 2012, subsequently opening for operation in June 2016.

ANALYSIS

Setting: The vacant property contains moderate topography, sparse tree vegetation, and limited wetland areas. Silva Valley Parkway traverses property diagonally from the southeast to the northwest, while U.S. Highway 50 borders the property along the southern perimeter. Exhibit E depicts the existing uses surrounding the property.

Project Description: This large lot tentative parcel map would divide the property creating a total of four commercial parcels for phasing and financing purposes only. The resulting parcel sizes, which exceed the minimum lot area of 100,000 square feet required by the CR zoning consists of the following: Parcel 1: 17.11 acres, Parcel 2: 8.00 acres, Parcel 3: 9.07, and Parcel 4: 7.69 acres (Exhibit F). Parcels 2 through 4 are located north of the road, while Parcel 1 is located on the south side. No development is proposed with this tentative parcel map application and no development will be allowed until a Development Plan is approved by the Planning Commission. A separate commercial development application is currently in process and is filed under applications Planned Development Permit PD15-0001, Tentative Parcel Map P17-0007, Conditional Use Permit S17-0017, and Rezone Z17-0004.

Consistency: As discussed in further detail in the Findings section below, the proposed tentative parcel map is consistent with the applicable standards General Plan, Zoning Ordinance, and Subdivision Ordinance.

Environmental Review: The tentative parcel map qualifies for a Categorical Exemption status under Section 15315 (Minor Land Division) as the division would result in four commercial parcels consistent with the Commercial General Plan and Commercial Regional zoning. The tentative parcel map application does not include any variances, modifications, or exceptions. The subject property contains an average slope gradient below 20 percent and site access and public services would be available for future development. The property has not been involved in a division of a larger parcel within the past two years. No further environmental analysis is necessary.

In accordance with CEQA, a Notice of Exemption (NOE) is required to be filed, subject to a $50.00 filing fee submitted to Planning Department.

Conditions of Approval: Project conditions of approval are recommended based on the review of the agencies and department. Future access onto Silva Valley Road has been addressed through conditions recommended by the El Dorado County Transportation Department. The conditions involve development restrictions to be included as notes on the Tentative Parcel Map that ensure future access will meet County standards.

FINDINGS

Tentative Parcel Map Time P17-0004/EDH 52
Zoning Administrator/June 20, 2018

1.0 CEQA FINDINGS

1.1 The EDH 52 Tentative Parcel Map qualifies for a Categorical Exemption status under Section 15315 (Minor Land Division) as the division would result in four commercial parcels consistent with the underlying General Plan and zoning. No variances, modifications, or exceptions have been requested. The average slope gradient of the property is below 20% and site access and services would be available if the property is developed. The property has not been involved in a division of a larger parcel within the past two years. No further environmental analysis is necessary.

1.2 The documents and other materials which constitute the record of proceedings upon which this decision is based are in the custody of the Community Development Services-Planning and Building Department-Planning Services Division at 2850 Fairlane Court, Placerville, CA, 95667.

2.0 PARCEL MAP FINDINGS

2.1 **The proposed tentative map, including design and improvements, is consistent with the General Plan.**

The EDH 52 Tentative Parcel Map would result in the creation of four commercial parcels for financing and phasing purposes. The project is compatible with the land use designation.

2.2 **The proposed Parcel Map conforms to the applicable standards and requirements of the County zoning regulations and Minor Land Division Ordinance.**

The EDH 52 Tentative Parcel Map would result in the creation of four commercial parcels consistent with the Zoning Ordinance standards under Chapter 130.22 (Commercial Zones) for the underlying Commercial, Regional (CR) zone district.

2.3 **The site is physically suitable for the proposed type and density of development.**

The resultant commercial parcels are physically suitable for future commercial development. The sizes of the parcels exceed the minimum required lot size, which would enable future development design and improvement to be accommodated through application of Planned Development concepts. The parcels would have direct access along Silva Valley Parkway, a major arterial road in the El Dorado Hills area. The subject is property is surrounded by existing development, where necessary public utilities exists and can be accessed readily.

2.4 **The proposed subdivision is not likely to cause substantial environmental damage.**

The map is consistent with the General Plan and Zoning and no variances, modifications, or exceptions has been requested with this application. The vacant property has average slope gradient below 20%, would have direct access to public infrastructures necessary for subsequent development, and is surrounded by existing residential development and areas identified for future commercial and residential development, and. Though sensitive resources exist on the property, no physical change will occur as a result of this tentative parcel map. The property has not been involved in a division of a larger parcel within the past two years. Therefore, the project is exempt from CEQA pursuant to Section 15315 of the CEQA Guidelines.

CONDITIONS OF APPROVAL

Tentative Parcel Map Time P17-0004/EDH 52
Zoning Administrator/June 20, 2018

1. **Project Description**

This Tentative Parcel Map is based upon and limited to compliance with the project description, Conditions of Approval set forth below, and the hearing exhibits marked:

Exhibit F - EDH 52 Tentative Parcel Map, May 3, 2018

Tentative Parcel Map subdividing a 41.87-acre property into four commercial parcels ranging in size from 7.69 acres to 17.11 acres for phasing and financing purposes only.

The development, use, and maintenance of the property, the size, shape and the protection and preservation of resources shall conform to the project description above and the hearing exhibits and conditions of approval below. The property and any portions thereof shall be sold, leased or financed in compliance with this project description and the approved hearing exhibits and conditions of approval hereto. All plans must be submitted for review and approval and shall be implemented as approved by the County.

Any deviations from the project description, exhibits, or conditions must be reviewed and approved by the County for conformity with this approval. Deviations may require approved changes to the permit and/or further environmental review. Deviations without the above described approval would constitute a violation of permit approval.

Planning Department

2. **Permit Time Limits:** This Tentative Parcel Map shall expire 36 months from the date of approval unless a timely extension has been filed.

3. **Development Restrictions:** The applicant shall record the following note against the Parcel Map imposing development restrictions on the lots designated as Parcels 1 through 4:

"Parcels 1 through 4 are phasing lots only. No building permits shall be issued until future discretionary approvals, including but not limited to, a Planned Development (PD) Permit, have been approved by El Dorado County. Said restrictions shall be binding upon the heirs, assigns, and successors in interest of the grantors, and shall remain in effect until rescinded by El Dorado County. The purpose of the notice is to give constructive notice of the development limitation."

4. **Indemnity:** In the event of any legal action instituted by a third party challenging the validity of any provision of this approval, the developer and landowner agree to be responsible for the costs of defending such suit and shall hold County harmless from any legal fees or costs County may incur as a result of such action.

The developer and land owner shall defend, indemnify, and hold harmless El Dorado County and its agents, officers, and employees from any claim, action, or proceeding against El Dorado County or its agents, officers, or employees to attack, set aside, void, or annul an approval of El Dorado County concerning a Parcel Map.

The County shall notify the applicant of any claim, action, or proceeding, and the County shall cooperate fully in the defense.

Office of County Surveyor

5. All survey monuments shall be set prior to filing the Parcel Map.

6. Situs addressing for the project shall be coordinated the County Surveyors Office prior to filling the Final Map.

7. Prior to filing the Parcel Map, a letter will be required from all agencies that have placed conditions on the map. The letter will state that "all conditions placed on P17-0004 by (that agency) have been satisfied." The letter is to be sent to the County Surveyor and copied to the Consultant and the Applicant.

Transportation Department

8. Prior to filing of Parcel Map, the following note shall be added and verified:

   Parcels 1, 2 and 3 will each be allowed one (1) right-in, right-out only access point onto Silva Valley Parkway at locations determined by the Department of Transportation. Reciprocal access rights shall be provided mutually between Parcels 2, 3 and 4, with an easement shown on the final map from lot 3, through lot 2 to lot 4.

   This condition may be modified to provide enhanced coordinated access to Silva Valley Parkway by a Future Planned Development (PD) approval.

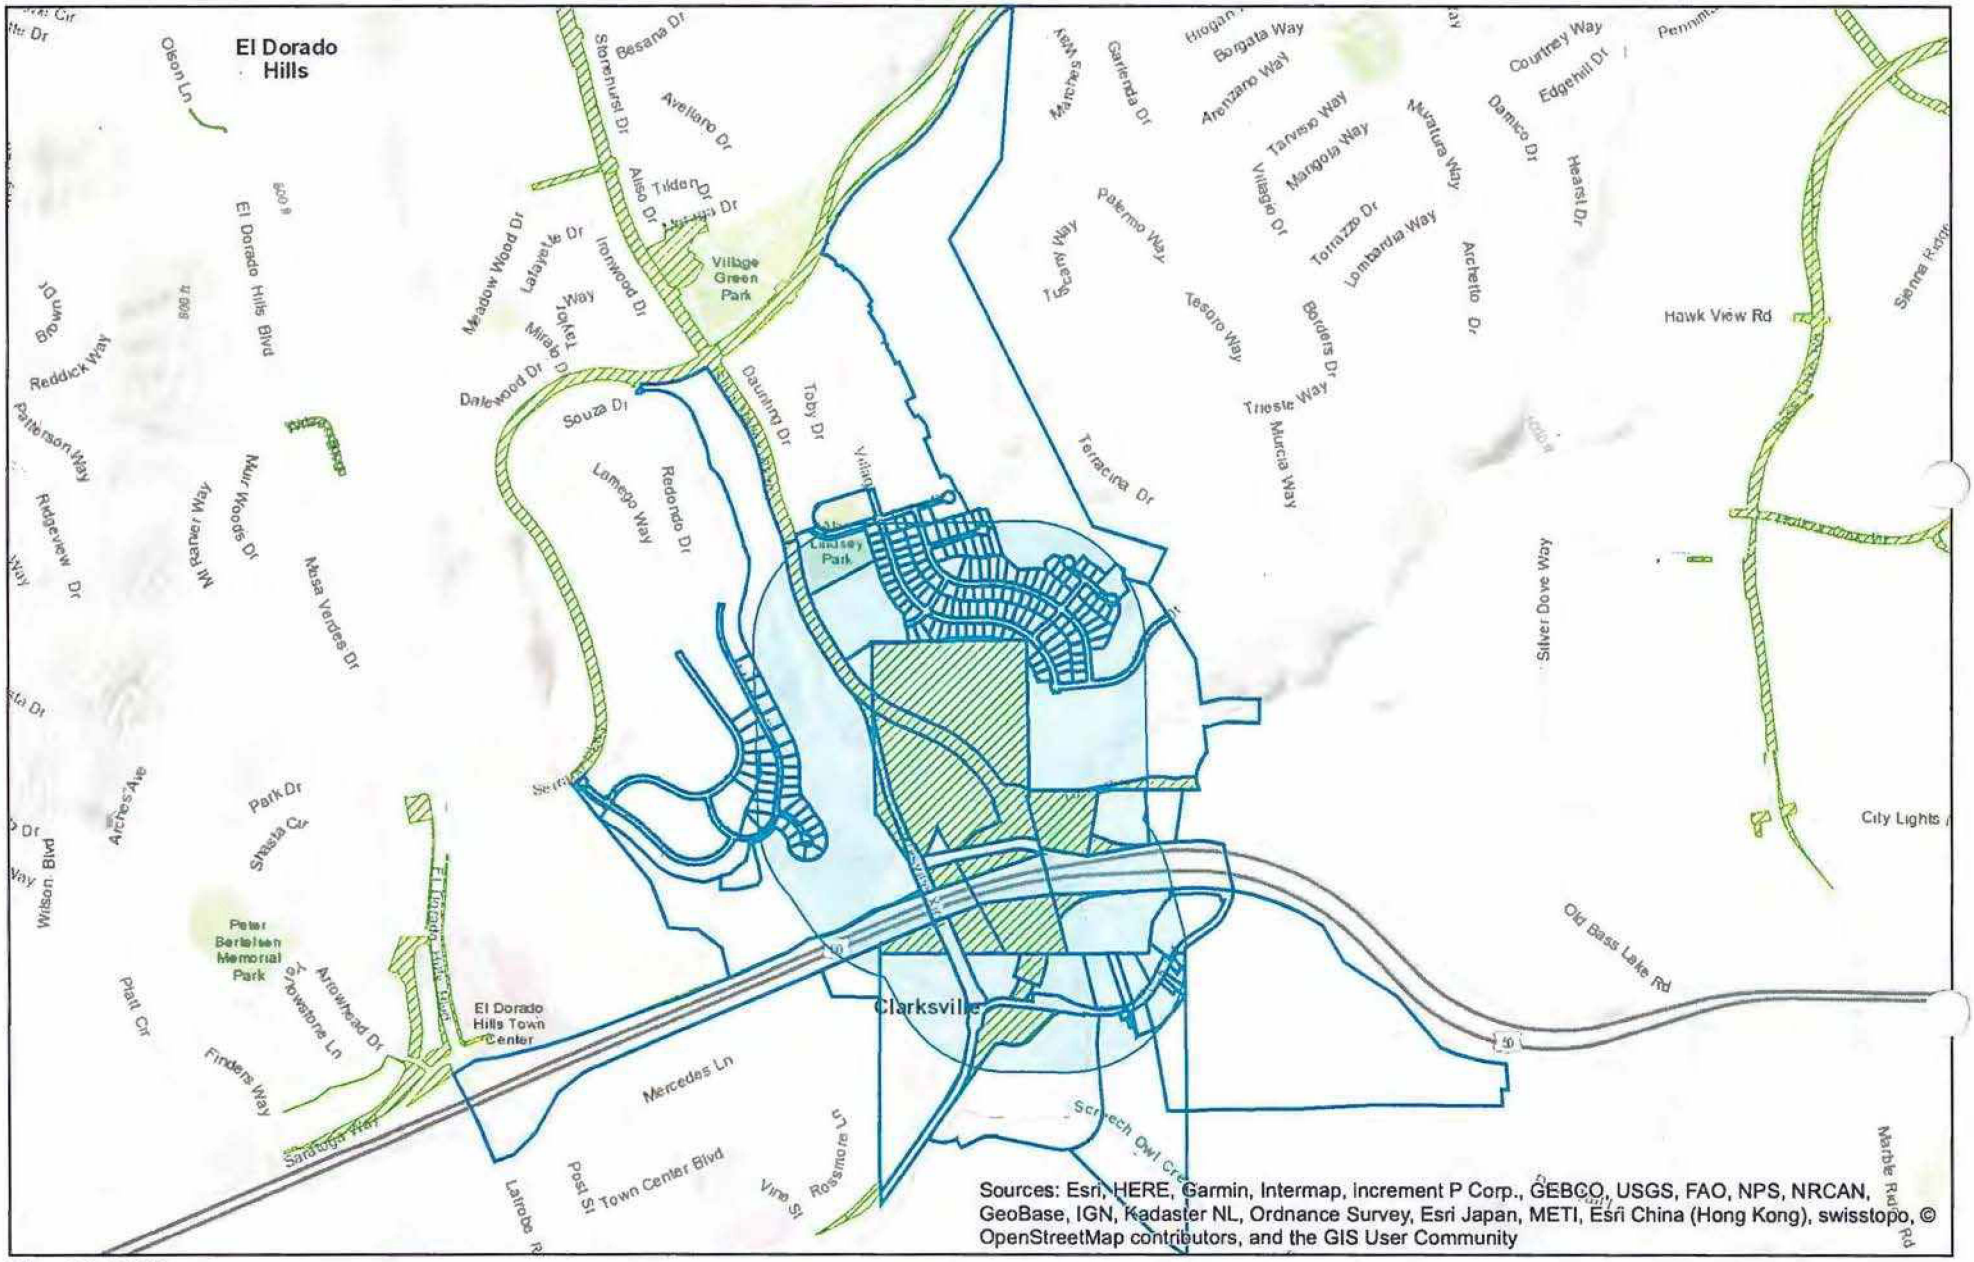
NOTICE OF PUBLIC HEARING

The **County of El Dorado Zoning Administrator** will hold a public hearing in the **Building C Hearing Room**, 2850 Fairlane Court, Placerville, CA 95667 on **June 20, 2018** at **3:00 p.m.**, to consider the following: **Tentative Parcel Map P17-0004/EDH 52** submitted by RSC ENGINEERING to subdivide 41.87-acre property into four commercial parcels ranging in size from 7.69 acres to 17.11 acres for phasing and financing purposes only. The property, identified by Assessor's Parcel Number 122-720-15, consisting of 41.87 acres, is located in the northeast area of U.S. Highway 50 and Silva Valley Parkway, in the El Dorado Hills area, Supervisorial District 1. (County Planner: Mel Pabalinas) (Categorical Exemption pursuant to Section 15315 of the CEQA Guidelines)*



Staff Reports are available two weeks prior at
Staff or at http://edcgov.us/Government/Planning/Zoning_Administrator.aspx

All persons interested are invited to attend and be heard or to write their comments. If you challenge the application in court, you may be limited to raising only those items you or someone else raised at the public hearing described in this notice, or in written correspondence submitted at, or prior to, the public hearing. Any written correspondence should be directed to County of El Dorado, Planning and Building Department, 2850 Fairlane Court, Placerville, CA 95667 or via e-mail: planning@edcgov.us.

*This project is exempt from the California Environmental Quality Act (CEQA) pursuant to the above-referenced section, and it is not subject to any further environmental review.

To ensure delivery prior to the hearing, written information from the public is encouraged to be submitted to Planning Services by Friday the week prior to the meeting. Planning Services cannot guarantee that any FAX or mail received the day of the meeting will be delivered to the Zoning Administrator prior to any action.

RE: Tentative Parcel Map P17-0004/EDH52

Dear Planning and Building Department:

While my family of four and I support economic growth that is done with a careful planning esthetic, we have the following concerns about Tentative Parcel Map P17-0004/EDH52 and recommend that it NOT be subdivided:

1. The safety of our Children: Oak Meadow elementary is located adjacent to this property. Our child is a recent graduate of Oak Meadow and we experienced first-hand the safe and protected environment of the school. It is hard to imagine that culture not being impacted by the adjacent location of a gas station or convenience store. El Dorado Hills has had at least 2 documented cases of child trafficking abductions at retail outlets in recent years and we need to be assured that whatever is developed is safe. Protecting the safety of our children could be difficult if the property is subdivided.
2. The protection of property values: The neighborhood behind this property has very attractive property values and some of us have a view over this property. The construction needs to be done in a way that the buildings are upscale and fit the neighborhood and even the roofing needs to have a positive aesthetic such as is present with terra cotta looking roofing tiles in Serrano. We cannot be looking over flat "big box" or gas station style roofs. It will be more difficult to manage this if the parcels are subdivided. This will be difficult to enforce if the property is subdivided.
3. The development with proper architecture and landscaping to fit with the community: The development needs to be designed with an upscale appearance both front and back that fits with Serrano and the surrounding community. Landscaping needs to be developed around the entire perimeter so that the homes on Village Green are not looking into the back of a loading dock or parking lot. This will be difficult to enforce if the property is subdivided.
4. The avoidance of noise pollution: Any businesses need to close by 7 pm and open no earlier than 10 am in order to protect the families that live nearby. This will be easier to manage if the properties are not subdivided.
5. The protection of Heritage Native Oak Trees: As I look out my rear windows I see at least 2-3 Heritage Native Oak Trees (on the corner near the exit ramp onto Silva Valley).

These trees need to be protected. They would certainly enhance the image of the future development.

6. The protection of area wildlife travel patterns: It is not unusual for us to see Mountain Lions, Hawks, Deer, Rattlesnakes and other wildlife travelling from the hill in Serrano down to the property in question. A significant portion of the 41.87 acre parcel should be maintained as a green space, particularly as a buffer zone with adjacent property. This will be difficult to enforce if the property is subdivided.
7. The safety of residents utilizing Entrada gate: The traffic patterns need to be adjusted so that the developer assists with the cost of improving the traffic flow on Silva and allows for safer exiting from Entrada gate onto Silva Valley. This will be difficult to enforce if the property is subdivided.

While we are unable to attend the public hearing, we ask that these concerns be entered into the planning record. We trust that you will act in a manner that protects the quality of life and property value of existing property owners and residents. Thank you in advance for your review of these concerns.

Sincerely,

Brad Daniel

P17-0004/EDH 52 – As approved by the Zoning Administrator on June 20, 2018.

Findings

1.0 CEQA FINDINGS

1.1 The EDH 52 Tentative Parcel Map qualifies for a Categorical Exemption status under Section 15315 (Minor Land Division) as the division would result in four commercial parcels consistent with the underlying General Plan and zoning. No variances, modifications, or exceptions have been requested. The average slope gradient of the property is below 20% and site access and services would be available if the property is developed. The property has not been involved in a division of a larger parcel within the past two years. No further environmental analysis is necessary.

1.2 The documents and other materials which constitute the record of proceedings upon which this decision is based are in the custody of the Community Development Services-Planning and Building Department-Planning Services Division at 2850 Fairlane Court, Placerville, CA, 95667.

2.0 PARCEL MAP FINDINGS

2.1 **The proposed tentative map, including design and improvements, is consistent with the General Plan.**

The EDH 52 Tentative Parcel Map would result in the creation of four commercial parcels for financing and phasing purposes. The project is compatible with the land use designation.

2.2 **The proposed Parcel Map conforms to the applicable standards and requirements of the County zoning regulations and Minor Land Division Ordinance.**

The EDH 52 Tentative Parcel Map would result in the creation of four commercial parcels consistent with the Zoning Ordinance standards under Chapter 130.22 (Commercial Zones) for the underlying Commercial, Regional (CR) zone district.

2.3 **The site is physically suitable for the proposed type and density of development.**

The resultant commercial parcels are physically suitable for future commercial development. The sizes of the parcels exceed the minimum required lot size, which would enable future development design and improvement to be accommodated through application of Planned Development concepts. The parcels would have direct access along Silva Valley Parkway, a major arterial road in the El Dorado Hills area. The subject is property is surrounded by existing development, where necessary public utilities exists and can be accessed readily.

2.4 **The proposed subdivision is not likely to cause substantial environmental damage.**

The map is consistent with the General Plan and Zoning and no variances, modifications, or exceptions has been requested with this application. The vacant property has average slope gradient below 20%, would have direct access to public infrastructures necessary for subsequent development, and is surrounded by existing residential development and areas identified for future commercial and residential development, and. Though sensitive resources exist on the property, no physical change will occur as a result of this tentative parcel map. The property has not been involved in a division of a larger parcel within the past two years. Therefore, the project is exempt from CEQA pursuant to Section 15315 of the CEQA Guidelines.

Conditions Of Approval

1. **Project Description**

This Tentative Parcel Map is based upon and limited to compliance with the project description, Conditions of Approval set forth below, and the hearing exhibits marked:

Exhibit F - EDH 52 Tentative Parcel Map, May 3, 2018

Tentative Parcel Map subdividing a 41.87-acre property into four commercial parcels ranging in size from 7.69 acres to 17.11 acres for phasing and financing purposes only.

The development, use, and maintenance of the property, the size, shape and the protection and preservation of resources shall conform to the project description above and the hearing exhibits and conditions of approval below. The property and any portions thereof shall be sold, leased or financed in compliance with this project description and the approved hearing exhibits and conditions of approval hereto. All plans must be submitted for review and approval and shall be implemented as approved by the County.

Any deviations from the project description, exhibits, or conditions must be reviewed and approved by the County for conformity with this approval. Deviations may require approved changes to the permit and/or further environmental review. Deviations without the above described approval would constitute a violation of permit approval.

Planning Department

2. **Permit Time Limits:** This Tentative Parcel Map shall expire 36 months from the date of approval unless a timely extension has been filed.

3. **Development Restrictions:** The applicant shall record the following note against the Parcel Map imposing development restrictions on the lots designated as Parcels 1

through 4:

"Parcels 1 through 4 are phasing lots only. No building permits shall be issued until future discretionary approvals, including but not limited to, a Planned Development (PD) Permit, have been approved by El Dorado County. Said restrictions shall be binding upon the heirs, assigns, and successors in interest of the grantors, and shall remain in effect until rescinded by El Dorado County. The purpose of the notice is to give constructive notice of the development limitation."

4. **Indemnity:** In the event of any legal action instituted by a third party challenging the validity of any provision of this approval, the developer and landowner agree to be responsible for the costs of defending such suit and shall hold County harmless from any legal fees or costs County may incur as a result of such action.
The developer and land owner shall defend, indemnify, and hold harmless El Dorado County and its agents, officers, and employees from any claim, action, or proceeding against El Dorado County or its agents, officers, or employees to attack, set aside, void, or annul an approval of El Dorado County concerning a Parcel Map.

The County shall notify the applicant of any claim, action, or proceeding, and the County shall cooperate fully in the defense.

Office of County Surveyor

5. All survey monuments shall be set prior to filing the Parcel Map.

6. Situs addressing for the project shall be coordinated the County Surveyors Office prior to filling the Final Map.

7. Prior to filing the Parcel Map, a letter will be required from all agencies that have placed conditions on the map. The letter will state that "all conditions placed on P17-0004 by (that agency) have been satisfied." The letter is to be sent to the County Surveyor and copied to the Consultant and the Applicant.

Transportation Department

8. Prior to filing of Parcel Map, the following note shall be added and verified:

Parcels 1, 2 and 3 will each be allowed one (1) right-in, right-out only access point onto Silva Valley Parkway at locations determined by the Department of Transportation. Reciprocal access rights shall be provided mutually between Parcels 2, 3 and 4, with an easement shown on the final map from lot 3, through lot 2 to lot 4.

This condition may be modified to provide enhanced coordinated access to Silva Valley Parkway by a Future Planned Development (PD) approval.

Mel,

The surveyor's office has approved the map. We need sign off from Planning on conditions 1-4. Attached is the map and final conditions. The map has not deviated from the approved tentative map and the notice of restriction being currently prepared by the surveyor will record concurrent with the map will address condition 3. The map will be filed prior to the expiration date of 36 months to address condition 2 and no appeals were filed on the project so condition 4 is not applicable. Please provide a letter or email stating the parcel map for EDH 52 has met the Planning Departments conditions 1-4 and that the Planning Department will allow it to record. Thanks.

Good morning John,

Your parcel map check is complete. I have attached the approved monumentation estimate. I have listed the items below that need to be completed before we can record the map.

1. We are now ready for you to work on getting us a conditions binder with the departmental approvals. Please be sure to have back-up documentation for each of the conditions showing they have been met and ask each department to provide a letter describing which conditions have been met and that they approve the map being recorded.

2. Please provide Placer Title a copy of the map. Our office will be providing them a copy of the Owner's Statement and a copy of the Notice of Restriction per condition #3. Both documents will record in conjunction with the map.

3. We require a check or bond to cover the monumentation estimated cost unless you plan on setting these monuments prior to recording the Parcel Map.

4. Taxes will have to be paid per the Tax Collec.. s requirements and an acknowledgement letter completed.

5. Once all of the above are completed we will verify and request the mylar from you.

If you have any questions, please feel free to contact me.

Thank you,

Adam Bishop

Please be sure to have back-up documentation for each of the conditions showing they have been met and ask each department to provide a letter describing which conditions have been met and that they approve the map being recorded.

2. Please provide Placer Title a copy of the map. Our office will be providing them a copy of the Owner's Statement and a copy of the Notice of Restriction per condition #3. Both documents will record in conjunction with the map.

3. We require a check or bond to cover the monumentation estimated cost unless you plan on setting these monuments prior to recording the Parcel Map.

4. Taxes will have to be paid per the Tax Collector's requirements and an acknowledgement letter completed.

5. Once all of the above are completed we will verify and request the mylar from you.

If you have any questions, please feel free to contact me.

Thank you,

Adam Bishop

Tiffany-
I am juggling several projects and assignments at once, including yours. As stated before, I will complete my review of your map by the end of the week.

NOTICE OF RESTRICTION

NOTICE IS HEREBY given that a Development Limitation is imposed on Parcels 1 through 4 of the Parcel Map filed in the Office of the County Recorder of the County of El Dorado, State of California, in Book _____ of Parcel Maps at Page _____.

This Notice of Restriction is imposed as Condition Number #3 of P17-0004, approved by the Zoning Administrator (June 20, 2018). Said development limitation states:

> **"Parcels 1 through 4 are phasing lots only. No building permits shall be issued until future discretionary approvals, including but not limited to, a Planned Development (PD) Permit, have been approved by El Dorado County."**

Said restriction shall be binding upon the heirs, assigns and successor in interest of the grantors, and shall remain in effect until rescinded by El Dorado County. The purpose of this Notice of Restriction is to give constructive notice of this development limitation.

_____ _____
TITLE CO TO SET UP CORRECT SIGNATURE LINE AND NOTARY

P17-0004/EDH 52 – As approved by the Zoning Administrator on June 20, 2018.

Findings

1.0 CEQA FINDINGS

1.1 The EDH 52 Tentative Parcel Map qualifies for a Categorical Exemption status under Section 15315 (Minor Land Division) as the division would result in four commercial parcels consistent with the underlying General Plan and zoning. No variances, modifications, or exceptions have been requested. The average slope gradient of the property is below 20% and site access and services would be available if the property is developed. The property has not been involved in a division of a larger parcel within the past two years. No further environmental analysis is necessary.

1.2 The documents and other materials which constitute the record of proceedings upon which this decision is based are in the custody of the Community Development Services-Planning and Building Department-Planning Services Division at 2850 Fairlane Court, Placerville, CA, 95667.

2.0 PARCEL MAP FINDINGS

2.1 **The proposed tentative map, including design and improvements, is consistent with the General Plan.**

The EDH 52 Tentative Parcel Map would result in the creation of four commercial parcels for financing and phasing purposes. The project is compatible with the land use designation.

2.2 **The proposed Parcel Map conforms to the applicable standards and requirements of the County zoning regulations and Minor Land Division Ordinance.**

The EDH 52 Tentative Parcel Map would result in the creation of four commercial parcels consistent with the Zoning Ordinance standards under Chapter 130.22 (Commercial Zones) for the underlying Commercial, Regional (CR) zone district.

2.3 **The site is physically suitable for the proposed type and density of development.**

The resultant commercial parcels are physically suitable for future commercial development. The sizes of the parcels exceed the minimum required lot size, which would enable future development design and improvement to be accommodated through application of Planned Development concepts. The parcels would have direct access along Silva Valley Parkway, a major arterial road in the El Dorado Hills area. The subject is property is surrounded by existing development, where necessary public utilities exists and can be accessed readily.

2.4 **The proposed subdivision is not likely to cause substantial environmental damage.**

The map is consistent with the General Plan and Zoning and no variances, modifications, or exceptions has been requested with this application. The vacant property has average slope gradient below 20%, would have direct access to public infrastructures necessary for subsequent development, and is surrounded by existing residential development and areas identified for future commercial and residential development, and. Though sensitive resources exist on the property, no physical change will occur as a result of this tentative parcel map. The property has not been involved in a division of a larger parcel within the past two years. Therefore, the project is exempt from CEQA pursuant to Section 15315 of the CEQA Guidelines.

Conditions Of Approval

1. **Project Description**

This Tentative Parcel Map is based upon and limited to compliance with the project description, Conditions of Approval set forth below, and the hearing exhibits marked:

Exhibit F - EDH 52 Tentative Parcel Map, May 3, 2018

Tentative Parcel Map subdividing a 41.87-acre property into four commercial parcels ranging in size from 7.69 acres to 17.11 acres for phasing and financing purposes only.

The development, use, and maintenance of the property, the size, shape and the protection and preservation of resources shall conform to the project description above and the hearing exhibits and conditions of approval below. The property and any portions thereof shall be sold, leased or financed in compliance with this project description and the approved hearing exhibits and conditions of approval hereto. All plans must be submitted for review and approval and shall be implemented as approved by the County.

Any deviations from the project description, exhibits, or conditions must be reviewed and approved by the County for conformity with this approval. Deviations may require approved changes to the permit and/or further environmental review. Deviations without the above described approval would constitute a violation of permit approval.

Planning Department

2. **Permit Time Limits:** This Tentative Parcel Map shall expire 36 months from the date of approval unless a timely extension has been filed.

3. **Development Restrictions:** The applicant shall record the following note against the Parcel Map imposing development restrictions on the lots designated as Parcels 1

through 4:

"Parcels 1 through 4 are phasing lots only. No building permits shall be issued until future discretionary approvals, including but not limited to, a Planned Development (PD) Permit, have been approved by El Dorado County. Said restrictions shall be binding upon the heirs, assigns, and successors in interest of the grantors, and shall remain in effect until rescinded by El Dorado County. The purpose of the notice is to give constructive notice of the development limitation."

Indemnity: In the event of any legal action instituted by a third party challenging the validity of any provision of this approval, the developer and landowner agree to be responsible for the costs of defending such suit and shall hold County harmless from any legal fees or costs County may incur as a result of such action.
The developer and land owner shall defend, indemnify, and hold harmless El Dorado County and its agents, officers, and employees from any claim, action, or proceeding against El Dorado County or its agents, officers, or employees to attack, set aside, void, or annul an approval of El Dorado County concerning a Parcel Map.

The County shall notify the applicant of any claim, action, or proceeding, and the County shall cooperate fully in the defense.

Office of County Surveyor

5. All survey monuments shall be set prior to filing the Parcel Map.

6. Situs addressing for the project shall be coordinated the County Surveyors Office prior to filling the Final Map.

7. Prior to filing the Parcel Map, a letter will be required from all agencies that have placed conditions on the map. The letter will state that "all conditions placed on P17-0004 by (that agency) have been satisfied." The letter is to be sent to the County Surveyor and copied to the Consultant and the Applicant.

Transportation Department

8. Prior to filing of Parcel Map, the following note shall be added and verified:

   Parcels 1, 2 and 3 will each be allowed one (1) right-in, right-out only access point onto Silva Valley Parkway at locations determined by the Department of Transportation. Reciprocal access rights shall be provided mutually between Parcels 2, 3 and 4, with an easement shown on the final map from lot 3, through lot 2 to lot 4.

This condition may be modified to provide enhanced coordinated access to Silva Valley Parkway by a Future Planned Development (PD) approval.

Fwd: VHR Permits / Renewals

1 message

Melanie Shasha <melanie.shasha@edcgov.us> Thu, Dec 13, 2018 at 11:17 AM
To: Tiffany Schmid <tiffany.schmid@edcgov.us>, Michael Nihan <michael.nihan@edcgov.us>, Aaron Mount <aaron.mount@edcgov.us>

Please see below for questions regarding the final transfer of documents and correspondence from the Treasurer's Office for the VHR permits and renewals. As of today they will no longer issue VHR permits through their office.

Perhaps we should meet to discuss the timeline for new fees and changes to the zoning, etc?

Good Morning Melanie -

Thank you for giving me a call.

Just need to know:

1) who is going to be on the group email vhrpermits@edcgov.us so I can complete the IT ticket.
2) what phone number do you wish phone calls to be directed regarding VHR permits & renewals
3) who/what office will we bring the "in process" applications & checks Monday? They will need to be signed for.
4) who/what office will the VHR documents (original application, owner & agent & local contact VHR Acknowledgement & Certification) be delivered to & signed for. It will take several weeks to get these documents pulled from the files.

Also I will scan and email over the applications with permit # later today of the new permits issued the last couple of weeks since the VHR software download was received.

Congratulations on getting the data into TrakIt.

Let me know and thank you.

To Whom it May Concern,

The Most Likely Descendant, Daniel Fonseca would like to initiate consultation process with you in regard to the P17-0004/EDH 52 TENTATIVE PARCEL in El Dorado County. Among other things, we would like this consultation to address the cultural and historic resource issues, pursuant to the regulations implementing Section 106 of the National Historic Preservation Act and Assembly Bill 52.

Prior to meeting we would like to request any and all completed record searches and/or surveys that were done in/around the project area up to and including environmental, archaeological and cultural reports.

Please let this letter serve as a formal request for the Shingle Springs Band Of Miwok Indians to be added as a consulting party in identifying any Tribal Cultural Properties (TCPs) that may exist within the project's Area of Potential Effects (APE).

Please contact Kara Perry, Cultural Outreach Coordinator, (530) 488-4049, kperry@ssband.org, to schedule a consultation pursuant to Section 106 of the NHPA and Assembly 52.

Sincerely,

Daniel Fonseca

RE: AB 52 Consultation Request for the P17-0004/EDH 52 Tentative Parcel Map Project, El Dorado Hills, CA

Dear County of El Dorado Representative,

The United Auburn Indian Community (UAIC) received a letter from the County of El Dorado dated 10/4/2017, formally notifying us of a proposed project, the P17-0004/EDH 52 Tentative Parcel Map Project in El Dorado Hills, and an opportunity to consult under AB 52. This letter is notice that UAIC would like to initiate consultation under AB 52.

This letter is also a formal request to allow UAIC tribal representatives to observe and participate in all cultural resource surveys, including initial pedestrian surveys for the project. Please send us all existing cultural resource assessments, as well as requests for, and the results of, any records searches that may have been conducted prior to our first consultation meeting. If tribal cultural resources are identified within the project area, it is UAIC's policy that tribal monitors must be present for all ground disturbing activities. Finally, please be advised that UAIC's strong preference is to preserve tribal cultural resources in place and avoid them whenever possible. Subsurface testing and data recovery must not occur without first consulting with UAIC and receiving UAIC's written consent.

In the letter, no lead contact person is identified for consultation on the proposed project. Marcos Guerrero, our Cultural Resources Manager, will be UAIC's point of contact for this consultation. Please contact Mr. Guerrero by phone at (530) 883-2364 or email at mguerrero@auburnrancheria.com to begin the consultation process.

Thank you for involving UAIC in the planning process at an early stage. We ask that you make this letter a part of the project record and we look forward to working with you to ensure that tribal cultural resources are protected.

Sincerely,

Gene Whitehouse
Chairman

CC: Matthew Moore, UAIC Tribal Historic Preservation Officer
Marcos Guerrero, UAIC Cultural Resources Manager

Mel,

This is in response to our telephone conversation this morning. We calculated the areas of the various slope categories on the slope exhibit map we prepared (prior to Silva Valley Parkway being constructed) for the original application. According to that exhibit, the area where the percentage of slope is greater than 20% is only 3.6% of the project area (the area with slopes less than 20% is 96.4%). The additional cut slopes due to the Silva Valley Parkway Interchange Project increases the area with slopes greater than 20% to 5.0% (95% of the project area will have slopes less than 20%) so the average slope of the project would still be significantly less than 20%.

We wanted to remind you that public sewer and water to serve the project are located in Old Silva Valley Road and that water and sewer will be extended through proposed Parcel 1 to serve proposed Parcels 2 and 3.

Please call me if you have any questions or need additional information.

Thanks,

Rick

Richard S. Chavez P.E.

RE: Application Completeness Determination
File No. P17-0004

Dear Tiffany:

This office has completed review of the application file contents for Tentative Parcel Map P17-0004 (EDH 52 Tentative Parcel Map) and has determined the application to be **COMPLETE** for processing.

The application will be distributed to affected departments and agencies for review and comment. A Technical Advisory Committee (TAC) meeting may be scheduled to discuss the comments received and any project issues. One or more of the following actions may be taken:

1) Make an environmental determination,
2) Determine project conditions and/or,
3) Estimate a public hearing date.

TAC meetings are for agency discussion and it is recommended that you or your agent be present at the TAC meeting to discuss the progress of your application. Should you have any questions regarding the project or this notice, please feel free to contact me at (530) 621-5363 or email at Rommel.Pabalinas@edcgov.us.

Sincerely,

Rommel (Mel) Pabalinas

RE: Assembly Bill 52 Consultation for **P17-0004/EDH 52 TENTATIVE PARCEL MAP** a Proposed Project within the County of El Dorado

Dear Mr. Yonemura,

This letter is in response to your request received on March 7, 2016 for formal notification of proposed projects within the Ione Band of Miwok Indians Geographic Area of Traditional and Cultural Affiliation.

P17-0004/EDH 52 TENTATIVE PARCEL MAP (EDH 52/RSC Engineering Inc.)
The proposed project will be located on property, identified by Assessor's Parcel Number 122-720-15, consists of 41.87 acres, and is located on the northeast corner of Silva Valley Road and U.S. Highway 50, **in the El Dorado Hills area**.

Project Documentation can be viewed:
http://edcapps.edcgov.us/Planning/ProjectInquiryDisplay.asp?ProjectID=21399

This project is subject to the cultural resources provisions of CEQA Assembly Bill 52 (AB52), which require Native American outreach. Pursuant to AB52, the County is soliciting input from Native American organizations and representatives listed with the Native American Heritage Commission to identify cultural resources and properties of concern to the Native American Community.

Please respond within 30 days of receipt of this letter to provide any information regarding archaeological sites, tribal cultural resources or areas of cultural importance known to occur within or near the project area and/or to request consultation with the County, if desired. In accordance with federal and state laws, information received in response to this letter will be kept confidential. If you have any questions regarding this project or require further information, please do not hesitate to contact us. We can be reached by phone 530-621-5355 or via email at planning@edcgov.us.

RE: Assembly Bill 52 Consultation for **P17-0004/EDH 52 TENTATIVE PARCEL MAP** a Proposed Project within the County of El Dorado

Dear Mr. Cruz,

This letter is in response to your request received on May 2, 2016 for formal notification of proposed projeets within the Washoe Tribe of Nevada and California Geographic Area of Traditional and Cultural Affiliation.

P17-0004/EDH 52 TENTATIVE PARCEL MAP (EDH 52/RSC Engineering Inc.)
The proposed project will be located on property, identified by Assessor's Parcel Number 122-720-15, consists of 41.87 acres, and is located on the northeast corner of Silva Valley Road and U.S. Highway 50, **in the El Dorado Hills area**.

Project Documentation can be viewed:
http://edcapps.edcgov.us/Planning/ProjectInquiryDisplay.asp?ProjectID=21399

This project is subject to the cultural resources provisions of CEQA Assembly Bill 52 (AB52), which require Native American outreach. Pursuant to AB52, the County is soliciting input from Native American organizations and representatives listed with the Native American Heritage Commission to identify cultural resources and properties of concern to the Native American Community.

Please respond within 30 days of reeeipt of this letter to provide any information regarding archaeological sites, tribal cultural resources or areas of cultural importance known to occur within or near the project arca and/or to request consultation with the County, if desired. In accordance with federal and state laws, information received in response to this letter will be kept confidential. If you have any questions regarding this project or require further information, pleasc do not hesitate to contact us. We can be reached by phone 530-621-5355 or via email at planning@edcgov.us.

REQUIRED SUBMITTAL INFORMATION
for
Tentative Parcel Map

The following information must be provided with all applications. **If all the information is not provided, the application will be deemed incomplete and will not be accepted**. For your convenience, please use the check (√) column on the left to be sure you have all the required information. **All plans and maps MUST be folded to 8½" x 11".**

FORMS AND MAPS REQUIRED

Check (√)

	Applicant	County		
	☑	☐	1.	Application Form **and** Agreement for Payment of Processing Fees, completed and signed.
	☑	☐	2.	Letter of authorization from all property owners authorizing agent to act as applicant, when applicable.
N/A	☐	☐	3.	Proof of ownership (Grant Deed), if the property has changed title since the last tax roll.
	☑	☐	4.	A copy of official Assessor's map, showing the property outlined in red.
	☑	☐	5.	An 8 ½" x 11" vicinity map showing the location of the project in relation to the distance to major roads, intersections, and town sites.
	☑	☐	6.	Environmental Questionnaire form, completed and signed.
	☑	☐	7.	Provide name, mailing address and phone number of all property owners and their agents.
N/A	☐	☐	8.	If public sewer or water service is proposed, obtain and provide a Facilities Improvement Letter if the project is located within the EID service area, or a similar letter if located in another sewer/water district.
N/A	☐	☐	9.	If off-site sewer or water facilities are proposed to serve the project, provide four (4) copies of a map showing location and size of proposed facilities. If groundwater is to be used for domestic water, submit a report noting well production data for adjacent parcels, or submit a hydrological report prepared by a geologist noting the potential for water based on the nature of project site geology.
N/A	☐	☐	10.	Four (4) copies of a tree preservation plan. The tree plan shall accurately include the following:
	☐	☐		a) General identification of the tree canopy noting significant tree types (pine, oak, etc.) where such groups are clearly distinguishable. Identification of the tree canopy shall either be determined from base aerial photographs or by an on-site survey performed by a qualified licensed arborist or botanist.

P 17-0004

FORMS AND MAPS REQUIRED

Check (√)

	Applicant	County		
N/A	☐	☐	b)	Parcels having canopy cover of at least ten percent (10%) are subject to canopy coverage retention or replacement standards as follows:

Existing Canopy Cover	Percent of Canopy Cover to be Retained or Replaced
80 - 100 percent	60 percent of existing canopy
60 - 79 percent	70 percent of existing canopy
40 - 59 percent	80 percent of existing canopy
20 - 39 percent	85 percent of existing canopy
19 percent or less	90 percent of existing canopy

N/A	☐	☐	c)	Where item (b) above applies and trees will be removed as the result of project improvements, a replacement plan shall be included with application submittal. The replacement plan shall include a mitigation monitoring plan to ensure that proposed replacement trees survive.
N/A	☐	☐	d)	Identify on the tree canopy map the location and size of all trees with a diameter of twenty inches or greater diameter at breast height, in all of the following situations where trees would likely be removed:
	☐	☐	i)	Within building envelope areas when such are proposed, or on any lot less than twenty thousand (20,000) square feet in area when building envelopes are not proposed.
	☐	☐	ii)	In any situation where the tree or its drip line lie within any proposed road, driveway, leach field area, or cut or fill slope area:
	☐	☐	1)	Provide a count of the total number of trees eight (8) inches or greater in diameter at breast height, that will likely be removed due to proposed construction
	☐	☐	2)	Any provisions for tree preservation, transplanting, or replacement, shall also be noted on the plan.
	☑	☐	11.	Preceding parcel map, final map, or record of survey, if any exists.
N/A	☐	☐	12.	If located within one of the five Ecological Preserve - EP overlay zones (Mitigation Area 0), rare plants may exist on-site. The State Department of Fish & Game will require an on-site biological plant survey to determine the extent and location of rare plants on the project site. Such a survey can only occur from March 15 through August 15 when plants are readily visible. Therefore, if the State Department of Fish & Game requires the plant survey, a substantial delay in the processing of your application could result. To avoid potential delays, you may choose to provide this survey with application submittal. (A list of possible Botanical Consultants is available at Planning Services.)
N/A	☐	☐	13.	Name and address of Homeowners' Association, CSA 9 Zone of Benefit, or other road maintenance entity if it exists in the project area.

FORMS AND MAPS REQUIRED

Check (√)

	Applicant	County		
N/A	☐	☐	14.	Preliminary grading, drainage plan, and report. The plan should be of sufficient detail to identify the scope of grading, including quantities, depths of cut and fills (for roads and driveways where cuts/fills exceed 6 feet, and mass pad graded lots), location of existing drainage, proposed modifications, and impacts to downstream facilities. (See Section 15.14.240 of County Grading Ordinance for submittal detail.)
	N/A		15.	In an accompanying report, provide the following data for area on each proposed parcel which is to be used for sewage disposal:
	☐	☐		a) The percolation rate and location of test on 4.5 acres or smaller
	☐	☐		b) The depth of soil and location of test
	☐	☐		c) The depth of groundwater and location of test
	☐	☐		d) The direction and percent of slope of the ground
	☐	☐		e) The location, if present, of rivers, streams, springs, areas subject to inundation, rock outcropping, lava caps, cuts, fills, and easements
	☐	☐		f) Identify the area to be used for sewage disposal
	☐	☐		g) Such additional data and information as may be required by the Director of Environmental Health to assess the source of potable water, the disposal of sewage and other liquid wastes, the disposal of solid wastes, drainage, and erosion control
	☐	☐		h) In circumstances where there are steep slopes, streams or other constraints as determined by staff, these must be noted on the tentative parcel map
N/A	☐	☐	16.	A record search for archaeological resources shall be conducted through the North Central Information Center located at CSU-Sacramento, 6000 J Street, Adams Building, Suite #103, Sacramento, CA 95819-6100, phone number (916) 278-6217. If the record search identifies a need for a field survey, a survey shall be required. (A list of Archaeological Consultants and survey requirements is available at Planning Services.) Archaeological surveys shall meet the "Guidelines for Cultural Resource Studies" approved by the Board of Supervisors, available at Planning Services.
N/A	☐	☐	17.	A site-specific wetland investigation shall be required on projects with identified wetlands on the Important Biological Resources Map (located in Planning Services), when proposed improvements will directly impact the wetland (reduce the size of the wetland area) or lie near the wetlands. (Available from Planning Services are the U.S. Corps of Engineers requirements for a wetlands delineation study. A list of qualified consultants is also available.)

FORMS AND MAPS REQUIRED

Check (√)

Applicant	County		
N/A ☐	☐	18.	An acoustical analysis shall be provided whenever a noise-sensitive land use (residences, hospitals, churches, libraries) are proposed adjacent to a major transportation source, or adjacent or near existing stationary noise sources. Such study shall define the existing and projected (2015) noise levels and define how the project will comply with standards set forth in the General Plan.
N/A ☐	☐	19.	Where special status plants and animals are identified on the Important Biological Resources Map located in Planning Services, an on-site biological study shall be required to determine if the site contains special status plant or animal species or natural communities and habitats.
N/A ☐	☐	20.	An air quality impact analysis shall be provided utilizing the El Dorado County Air Pollution Control District's "Guide to Air Quality Assessment."
N/A ☐	☐	21.	A traffic study shall be provided utilizing El Dorado County Department of Transportation's "Generic Traffic Study Scope of Work."
		22.	Required maps on 24" x 36" sheets or smaller, drawn to scale, and of sufficient size to clearly show all details and required data. **All maps MUST be folded to 8 ½" inches x 11" prior to submittal. NO ROLLED DRAWINGS WILL BE ACCEPTED.**
☑	☐		a) ~~Twenty-five (25)~~ copies of the tentative map, folded with signature block showing (including one 8½" x 11" reduction). 5 COPIES
☑	☐		b) Four (4) copies of a slope map noting the following slope range categories: 0 to 10%, 11 to 20%, 21 to 29%, 30% to 39%, 40% and over.
N/A ☐	☐		c) Four (4) copies of preliminary grading and drainage plan.

REQUIRED INFORMATION ON TENTATIVE MAP

Check (√)

Applicant	County		
☑	☐	1.	North point and scale
☑	☐	2.	Project boundaries with dimensions
☑	☐	3.	Approximate dimensions and area of all lots
☑	☐	4.	Adjacent ownership with book and page number of recorded deeds or parcel map references
☑	☐	5.	Location, names and right-of-way width of adjacent streets, highways, and alleys. Show access easements to a connection with a public road, together with deed or map reference documenting such access. Also, note all existing encroachments to the public road on adjacent parcels. If a new access is proposed through adjacent parcels, provide letter of authorization and a description of the access easement.

REQUIRED INFORMATION ON TENTATIVE MAP

Check (√)

Applicant	County		
☑	☐	6.	Purpose, width, and approximate location of all proposed and existing easements (other than roads)
☑	☐	7.	Approximate radii of centerline on all street curves
☑	☐	8.	Grades and width of proposed and existing roads or road easements, with typical improvement cross-section
☑	☐	9.	Names of adjacent subdivisions
☑	☐	10.	All structures, buildings, utility, transmission lines and dirt roads, and distances to existing and proposed property lines
N/A ☐	☐	11.	The location of all structures for residential, commercial, industrial or recreational use for which permits have either been applied for or granted, but not yet constructed
N/A ☐	☐	12.	Fire hydrant location, existing and/or proposed
N/A ☐	☐	13.	Existing water and sewer line locations
☑	☐	14.	Contour lines shown at 5-foot intervals if any slopes on the property exceed 10% (contours not required if all slopes are 10% or less). Contours may be shown at 10-foot or 20-foot intervals on parcels of 10 acres or larger (using USGS interpolation or field survey), <u>if said contours reasonably identify significant site features</u>; i.e., benches or abrupt topographical changes, etc.
☑	☐	15.	The location, if present, of rock outcropping, lava caps, drainage courses, lakes, canals, reservoirs, rivers, streams, spring areas subject to inundation, and wetlands, and show respective 100-foot and 50-foot septic system setbacks when a septic system is proposed.
☑	☐	16.	Note any proposed trails within the project, and where applicable, connection to existing or proposed trail systems.
☑	☐	17.	Location, general type (pine, oak, etc.) and size of all existing trees, 8" DBH (Diameter at Breast Height) or greater in those areas that are subject to grading or otherwise may be removed/affected by proposed improvements. Note quantity of trees to be removed.
☑	☐	18.	Identify areas subject to a 100-year flood, perennial streams or creeks, and show high water level (100-year) on map. Where this data is not readily available, January 1997 flood level can be shown if known.
		19.	The following information is to be listed on the tentative parcel map in the following consecutive order:
☑	☐		a) Owner of record (name and address)
☑	☐		b) Name of applicant (name and address)
☑	☐		c) Map prepared by (name and address)
☑	☐		d) Scale
☑	☐		e) Contour interval (if any)

REQUIRED INFORMATION ON TENTATIVE MAP

COMMUNITY DEVELOPMENT AGENCY

AGREEMENT FOR PAYMENT OF PROCESSING FEES

2017 SEP 20 AM 11:30
RECEIVED
PLANNING DEPARTMENT

EDH 52, GP

Business or Name of Financially Responsible Party

P17-0004

Project/Facility Number

the FINANCIALLY RESPONSIBLE PARTY (hereinafter FRP), agrees as follows:

1. This project/facility is subject to time and materials method of billing or raises issues that may require significant staff and/or consultant time which might not be covered by the initial processing deposit/fee detailed in the approved Board of Supervisors Community Development Agency Consolidated Fee Schedule, and other County department fee schedules as applicable, as amended from time to time. Therefore, the FRP for this project will be billed at the approved rate for time and materials for the processing of this project. The fee initially collected will be a deposit toward subsequent billings.

2. Accounting of time spent on the project and/or applicable fees will be detailed in a statement/invoice sent to the FRP.

3. The FRP is responsible for payment of all permit processing costs and/or applicable fees associated with this project/facility. If payment is not received within 90 days of the date of an invoice, the County may elect to stop work and close the file. The County may require a new application and/or new deposit before resuming processing of the project. Projects with an outstanding balance due on their account that are not paid in full by the scheduled appearance on the Planning Commission, Zoning Administrator, or Board of Supervisors agenda will not proceed until after any balance due is paid.

4. If during the course of processing, the FRP changes, the new FRP must complete an Agreement for Payment, which will release the previous FRP from further financial obligations and designate the new FRP.

5. The FRP understands and agrees that if the FRP owes any overdue balance for processing a project/permit of more than 90 days, Community Development Agency will not accept any subsequent applications from the FRP until the outstanding balance due is paid.

6. FRP agrees to pay any and all remaining fees applicable under the approved Board of Supervisors Community Development Agency Consolidated Fee Schedule, and any other fees associated with the processing of the project that may be charged by County Departments outside of the Community Development Agency, prior to map clearance for recordation or clearance for record of survey or issuance of any building or grading permits or any other permits under authority of the Community Development Agency. No clearances or permits will be issued without receipt of full payment of fees applicable under the approved Board of Supervisors Community Development Agency Consolidated Fee Schedule, or any other fees associated with the processing of the project that may be charged by County Departments outside of the Community Development Agency, unless waived or adjusted in accordance with County Board of Supervisors Policy B-2.

P 17-0004

Project/Facility No._____

7. If the FRP appeals a decision on this project/facility, the costs of processing the appeal will be charged to the FRP pursuant to the fees applicable under the approved Board of Supervisors Community Development Agency Consolidated Fee Schedule, and other County department fee schedules as applicable, at the time of Appeal.

8. If payment is not received within 90 days of said statement/invoice, collection will be initiated. Unpaid balances turned over to County Revenue Recovery will be assessed an additional fourteen percent (14%).

9. A processing fee will be charged for any check returned for insufficient funds, up to the maximum allowed by the State of California.

Executed this 13 day of September 20 17

ENVIRONMENTAL QUESTIONNAIRE

Project Title	EDH 52	Lead Agency	El Dorado County
Name of Owner	EDH 52 GP	Telephone	(916) 383-2500
Address	7700 College Town Drive, Ste. 101 Sacramento, CA 95826		
Name of Applicant	RSC Engineering, Inc.	Telephone	(916) 788-2884
Address	2250 Douglas Blvd., Ste. 150 Roseville, CA 95661		
Project Location	NE Corner of old Silva Valley Road and Highway 50		
Assessor's Parcel Number(s)	122-720-15	Acreage 41.87	Zoning PD-CR

Please answer all of the following questions as completely as possible. Subdivisions and other major projects will require a Technical Supplement to be filed together with this form.

1. Type of project and description:
   Four lot tentative parcel map to subdivide single parcel into 4 parcels due to the bifurcation of the property with the Silva Valley Parkway and interchange project. The northern parcel will be subdivided into 3 parcels, one for the future Country Club Dr. extension and 2 additional parcels for finance purpos
2. What is the number of units/parcels proposed? 4

GEOLOGY AND SOILS

3. Identify the percentage of land in the following slope categories:

   ☑ 0 to 10% ☑ 11 to 15% ☑ 16 to 20% ☑ 21 to 29% ☑ over 30%

4. Have you observed any building or soil settlement, landslides, rock falls or avalanches on this property or in the nearby surrounding area? No
5. Could the project affect any existing agriculture uses or result in the loss of agricultural land? No

DRAINAGE AND HYDROLOGY

6. Is the project located within the flood plain of any stream or river? No
   If so, which one? _____
7. What is the distance to the nearest body of water, river, stream or year-round drainage channel? 2/3 miles +/- Name of the water body? Carson Creek

P 17-0004

8. Will the project result in the direct or indirect discharge of silt or any other particles in noticeable amount into any lakes, rivers or streams? No

9. Will the project result in the physical alteration of a natural body of water or drainage way? If so, in what way? not with the map

10. Does the project area contain any wet meadows, marshes or other perennially wet areas? Yes, some wetlands

VEGETATION AND WILDLIFE

11. What is the predominant vegetative cover on the site (trees, brush, grass, etc.)? Estimate percentage of each:
98% grasses, 2% oak woodland

12. How many trees of 6-inch diameter will be removed when this project is implemented? 0 with the map

FIRE PROTECTION

13. In what structural fire protection district (if any) is the project located? El Dorado Hills

14. What is the nearest emergency source of water for fire protection purposes (hydrant, pond, etc.)? Hydrant at Silva Valley Parkway

15. What is the distance to the nearest fire station? 2.25 miles +/- Bass Lake Station

16. Will the project create any dead-end roads greater than 500 feet in length? No

17. Will the project involve the burning of any material including brush, trees and construction materials? No

NOISE QUALITY

18. Is the project near an industrial area, freeway, major highway or airport? Yes
If so, how far? 150' from Highway 50

19. What types of noise would be created by the establishment of this land use, both during and after construction? None with map

AIR QUALITY

20. Would any noticeable amounts of air pollution, such as smoke, dust or odors, be produced by this project? None with map

WATER QUALITY

21. Is the proposed water source ☑ public or ☐ private, ☐ treated or ☐ untreated?
Name the system: EID

22. What is the water use (residential, agricultural, industrial or commercial)? Commercial

AESTHETICS

23. Will the project obstruct scenic views from existing residential areas, public lands, and/or public bodies of water or roads? No

ARCHAEOLOGY/HISTORY

24. Do you know of any archaeological or historical areas within the boundaries or adjacent to the project? (e.g., Indian burial grounds, gold mines, etc.) Yes

SEWAGE

25. What is the proposed method of sewage disposal? ☐ septic system ☑ sanitation district
Name of district: EID

26. Would the project require a change in sewage disposal methods from those currently used in the vicinity? No

TRANSPORTATION

27. Will the project create any traffic problems or change any existing roads, highways or existing traffic patterns? None with map

28. Will the project reduce or restrict access to public lands, parks or any public facilities?
No

GROWTH-INDUCING IMPACTS

29. Will the project result in the introduction of activities not currently found within the community? No

30. Would the project serve to encourage development of presently undeveloped areas, or increases in development intensity of already developed areas (include the introduction of new or expanded public utilities, new industry, commercial facilities or recreation activities)?
N/A

31. Will the project require the extension of existing public utility lines? No
If so, identify and give distances: _____

GENERAL

32. Does the project involve lands currently protected under the Williamson Act or an Open Space Agreement? No

33. Will the project involve the application, use or disposal of potentially hazardous materials, including pesticides, herbicides, other toxic substances or radioactive material?
No

34. Will the proposed project result in the removal of a natural resource for commercial purposes (including rock, sand, gravel, trees, minerals or top soil)?
None with map

35. Could the project create new, or aggravate existing health problems (including, but not limited to, flies, mosquitoes, rodents and other disease vectors)? No

36. Will the project displace any community residents? No

DISCUSS ANY YES ANSWERS TO THE PREVIOUS QUESTIONS (attached additional sheets if necessary)

24. See cultural report from April 2013 by Ric Windmiller previously provided for the overall PD project.

MITIGATION MEASURES (attached additional sheets if necessary)

Proposed mitigation measures for any of the above questions where there will be an adverse impact:

AFFIDAVIT OF PREVIOUS LAND DIVISION ACTIVITY (*)

THE UNDERSIGNED hereby certifies that he is the person who executed the following statements, that he has read the same and knows the contents thereof, and that the facts stated herein are true and correct:

1. Have you at any time owned or held any interest whatsoever in any land which included the parcel proposed for division in this application, or which was contiguous to the parcel proposed for subdivision.

☐ **Yes** ☑ **No**

If "yes", explain and attach copies of the deeds to such property, if available, the Assessor's Parcel Number, and period of ownership.

2. Have you ever proposed, participated in, or been involved in any manner whatsoever in the subdivision or splitting of a parcel of which the present parcel proposed to be subdivided in this application, was a part or contiguous thereto?

☐ **Yes** ☑ **No**

If so, give the relevant details, including date, parcel map number, and your role in the subdivision.

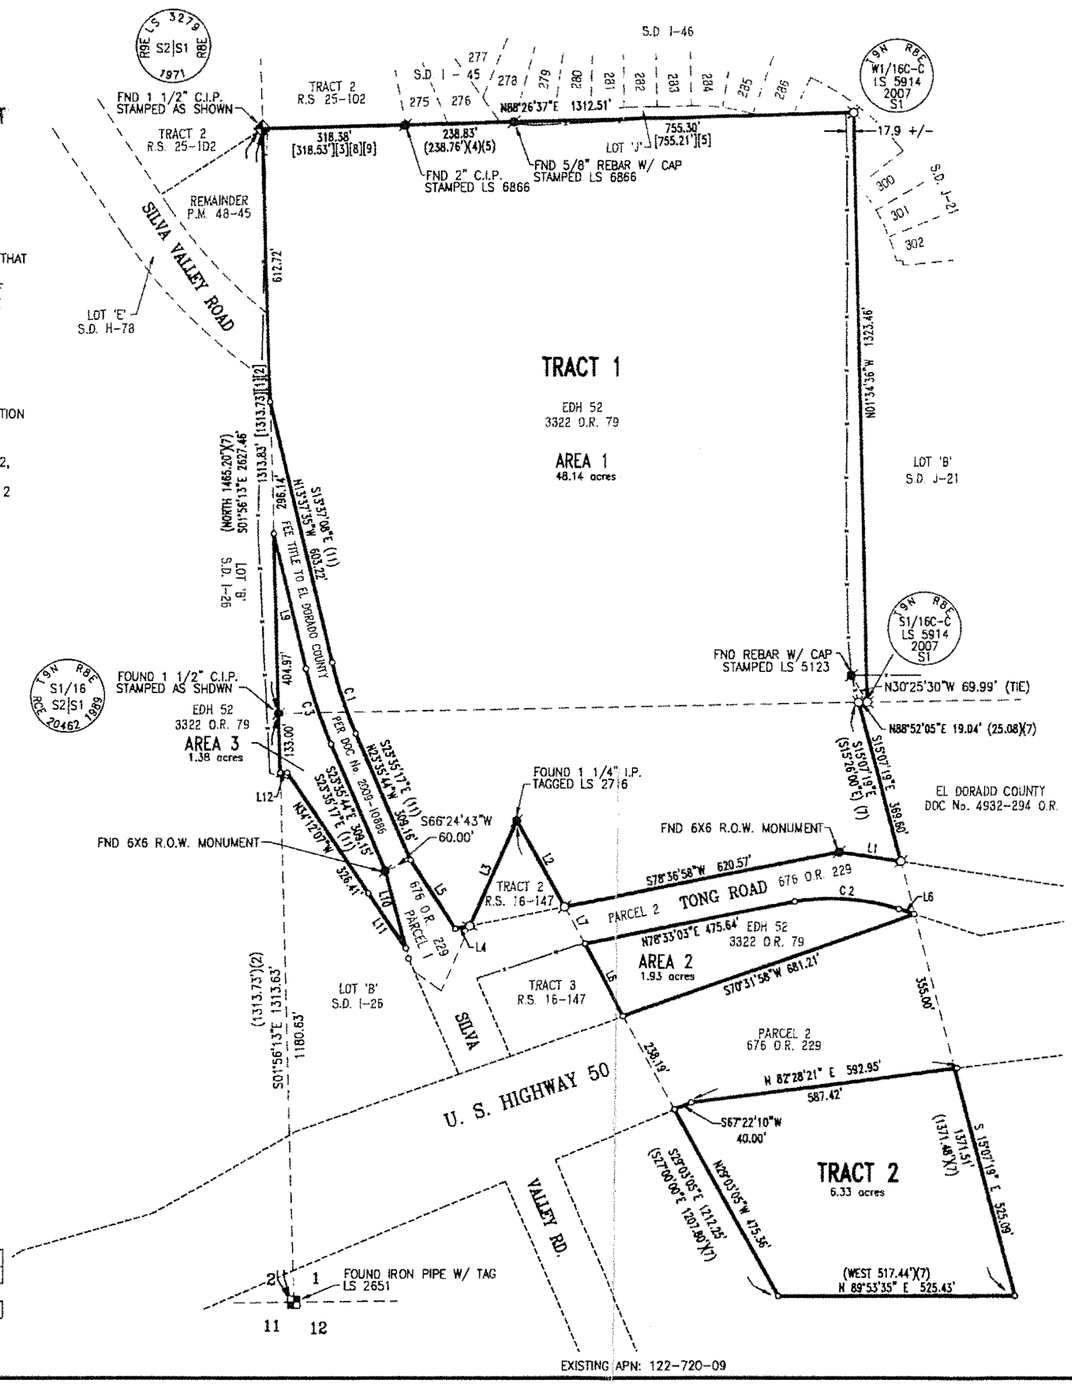
BASIS OF BEARINGS

THE BASIS OF BEARING FOR THIS SURVEY IS IDENTICAL TO THAT CERTAIN RECORD OF SURVEY FILED IN THE OFFICE OF THE COUNTY RECORDER OF EL DORADO COUNTY IN BOOK 16 OF SURVEYS, PAGE 147, WHICH IS THE CALIFORNIA COORDINATE SYSTEM, ZONE II. ALL DISTANCES ARE GROUND DISTANCES. MULTIPLY DISTANCE SHOWN BY 0.99991 TO OBTAIN GRID DISTANCE.



NOTE

1) THE PURPOSE OF THIS SURVEY IS TO COMPLY WITH SECTION 8762(B)(4) OF THE PROFESSIONAL LAND SURVEYORS ACT.

2) TRACT 1 INCLUDES THE LANDS DESCRIBED IN BOOK 3322, PAGE 79, EXCEPTING THOSE PORTIONS GRANTED TO THE COUNTY OF EL DORADO IN DOC. NO. 2009-10886. TRACT 2 REFLECTS THE BALANCE OF ASSESSOR'S PARCEL NO. 122-720-09. IT IS NOT THE INTENT OF THIS SURVEY TO REFLECT LINES OF ACTUAL OWNERSHIP.

Jose Crummett, El Dorado County GIS Manager
360 Fair Lane
Placerville, CA 95667

RE: Approval of Administrative Zoning Map Correction for APN: 122-720-15
File references: Z04-0016 and Z16-0008 (EDH 52 Property)

Mr. Crummett:

This letter is to notify you that the Planning Director has approved on this date the Administrative Zoning Map Correction to add the Planned Development (PD) combining zone to APN 122-720-15.

Please amend the County GIS Zoning maps accordingly.

The PD combining zone for APN 122-720-15 (formerly 122-720-09) was erroneously removed during the Zoning Ordinance Update approved on December 15, 2015. The PD combining zone was approved by Board of Supervisors through Ordinance 4975 on March 13, 2012 and implements General Plan Policy 2.2.6.1, specifically requiring that this property have the PD zone.

The approval of this Zoning Map Correction is based on the following Findings of Approval:

FINDINGS FOR APPROVAL

1. The Administrative Zoning Map Correction is authorized by and complies with Zoning Ordinance Section 130.10.030.D.5 (Map Corrections) (Attachment 1). Approval of the zoning map correction is based on historical data, prior zoning maps, and clear legislative intent.

2. The applicant initiated rezone of the property (Z04-0016) was approved by the Board of Supervisors on March 13, 2012 through Ordinance 4975 which rezoned the property from One-Family Residential-Planned Development (R1) to Commercial-Planned Development (C-PD) (Attachment 2).

3. General Plan Policy 2.2.6.1 provides clear legislative intent in that the lot, identified as Village P of the El Dorado Hills Specific Plan, was to be rezoned to include the Planned Development Overlay (-PD): "Those lands within the El Dorado Hills Specific Plan known as Villages P, Q, and V shall be rezoned to include the Planned Development Overlay (-PD) as part of any development application."

4. The Board's adoption of the Zoning Maps on December 15, 2015 did not intend to remove the PD combining zone because:

    a. there was no specific direction to remove the PD combining zone,
    b. Planning staff had no reason for the removal of the zone, and
    c. the removal of the combining zone conflicts with General Plan Policy 2.2.6.1.

5. Approval of the rezone from R1 to C-PD included adoption of a Negative Declaration. It has been determined that pursuant to the California Environmental Quality Act (CEQA) Guidelines Sections 15162 and 15164, there is no substantial evidence requiring the preparation of a Subsequent Negative Declaration or an Addendum to the existing Negative Declaration, adopted by the Board of Supervisors on March 13, 2012.

Sincerely,

Roger Trout

ROGER P. TROUT
Development Services Director

County to correct any such mapping error within 180 days from the date the inconsistency is discovered. The correction of a mapping error shall be exempt from the County's customary application and processing fees. To ensure timely resolution of mapping errors, the County shall schedule hearings for amendments to the Zoning Ordinance at least quarterly.

130.10.030 Responsibility for Administration

A. Responsible Bodies and Individuals. This Title shall be administered by:

1. The El Dorado County Board of Supervisors, hereafter referred to as the Board;
2. The Planning Commission, hereafter referred to as the Commission;
3. The County Zoning Administrator, hereafter referred to as the Zoning Administrator;
4. The County Agricultural Commission, hereafter referred to as the Ag Commission;
5. The Director of the Development Services Department or designee, hereafter referred to as the Director; and
6. The Development Services Department hereafter referred to as the Department.

B. Advisory Committees. The Board may appoint Advisory Committees to review design review applications, or provide input on other issues of concern to the Board or the Commission. These Advisory Committees include, but are not necessarily limited to, the following:

1. Cameron Park Design Review Committee
2. El Dorado Hills Design Review Committee
3. Pollock Pines Design Review Committee
4. The County's Economic Development Advisory Committee ("EDAC")
5. Diamond Springs-El Dorado Community Advisory Committee
6. Meyers Area Plan Advisory Committee

C. Responsibility and Authority of the Director. The duties and responsibilities of the Director are those enumerated in Article 6 (Zoning Ordinance Administration), in this Title and in other Titles of the County Code of Ordinances. Whenever this Title refers to the Director, it is expressly understood to include Department staff acting under the

direction and control of the Director, and whenever this Title refers to the Department it is expressly understood to describe Department staff acting under the direction and control of the Director.

D. Rules of Application. This Title shall be applied in the following manner:

1. **Minimum Requirements.** The provisions of this Title shall be deemed to be the minimum standards unless stated otherwise (for example, maximum building height or maximum density). These standards shall apply to all buildings, structures and uses, except where this Title provides for the exercise of discretion or where a Variance is granted.

2. **Conflicting Provisions.** If conflicts occur between different requirements of this Title, or between provisions of this Title and requirements imposed by other provisions of the County Code of Ordinances or other laws, and regulations adopted by the County, the more stringent development requirement or greater restriction on the use of land or buildings shall apply.

3. **Single Lot Containing Multiple Zones.** Where the boundaries of the zone designation are not coterminous with the property line boundaries, a single lot will contain multiple zones. In that event, the County shall first determine if the zone boundary appears to be the result of a mapping error. In that case, the mapping error shall be resolved as provided in Subsection D.5 (Map Corrections) below.

   Where the County determines that a mapping error has not occurred, the uses of the lot shall be consistent with the zone as shown for the portion of the lot on which the use is proposed. Multiple uses of a lot with multiple zones are expressly allowed consistent with the requirements of each zone. The precise location of the uses may be modified by a planned development or specific plan. Any uncertainty as to the boundaries of each zone within the lot shall be determined pursuant to Subsection D.4 (Map Boundaries) below.

4. **Map Boundaries.** Where the boundaries of any zone shown on the zoning maps are uncertain, the following rules shall apply to resolve the uncertainty:

   a. Where a zone boundary approximately follows a lot line, or road or street, such lot line or the centerline of the road or street shall be construed to be the boundary.

   b. Where a zone boundary approximately follows a stream or river, ridge line or other distinct geographic or topographic feature, such stream or geographic feature shall be construed to be the boundary.

   c. If a zone divides a lot, and the boundary line location is not otherwise designated, the location of the boundary shall be determined by the use of the scale appearing on the zoning map.

5. **Map Corrections.** Where a zone boundary appears to be in error, the Director may make the correction based on historical data, prior zoning maps, clear legislative intent, and other available information. Where the record is unclear, the zoning shall be reviewed by the Commission to determine if the map is in error. If, after review of the record, the Commission finds that the map is in error, they shall direct the Director to correct said error by revising the official maps accordingly within 30 days of the Commission's review.

130.10.040 Applicability of Zoning Ordinance

A. **Area of Applicability.** The provisions of this Title shall apply to all lands within the unincorporated area of the County of El Dorado except as provided in Subsection B (Exemptions from Zone Ordinance Requirements) below.

B. **Exemptions from Zone Ordinance Requirements.** The provisions of this Title do not apply to the following activities, uses, and structures, except where provisions of a memorandum of understanding between the County and another governmental agency provide for County regulatory authority or otherwise provided by law:

1. Activities of the Federal Government on federally owned or leased land.

2. Activities of the State of California or any agency of the state on state owned or leased land.

3. Activities of a local agency, as defined in California Government Code Section 53090, as provided in Section 53091 et seq.

4. The location and construction of facilities for water and electrical energy as provided in California Government Code Section 53091.

5. Tribal lands which are not subject to the jurisdiction of the County.

6. Existing and future preemptions of local land use authority resulting from State Law.

C. **Effect of Zoning Ordinance Changes on Projects in Progress.** The enactment of this Title or amendments hereto may have the effect of imposing different standards on development or new uses from that which previously applied. Following the effective date of this Title the following provisions shall apply:

1. **Pending Applications.** Applications which have been determined by the Department to be complete and in compliance with California Government Code Section 65943 before the effective date of this Title, or any amendment hereto, shall comply with the provisions of this Title in effect on the date that the application is deemed complete.

ORDINANCE NO. 4975

THE BOARD OF SUPERVISORS OF THE COUNTY OF EL DORADO DOES ORDAIN AS FOLLOWS:

RELATED TO REZONING IN THE EL DORADO HILLS AREA
PETITIONED BY EDH 52 PARTNERS

Section 1. The Official Zoning Map for the El Dorado Hills Area is hereby amended to rezone the following described lands from One-Family Residential (R1) zone to Commercial-Planned Development (C-PD) zone:

El Dorado Hills Area

A portion of Assessor's Parcel No. 122-720-09, being described as a portion of Section 1, Township 9 North, Range 8 East, M.D.M., consisting of 57.78 acres (see Exhibit A Attached hereto)

Section 2. This ordinance shall take effect and shall become effective thirty (30) days following the adoption hereof.

PASSED AND ADOPTED by the Board of Supervisors of the County of El Dorado at a regular meeting of said Board, held on the 13 day of MARCH, 2012, by the following vote of said Board:

Ayes: Ron Briggs, Raymond J. Nutting
John R. Knight, James R. Sweeney

ENVIRONMENTAL QUESTIONNAIRE

Project Title EDH 52

Lead Agency EL DORADO COUNTY

Name of Owner EDH 52, GP Telephone (916) 383-2500

Address 7700 COLLEGE TOWN DR., STE. 101 SACRAMENTO, CA 95826

Name of Applicant RSC ENGINEERING, INC. Telephone (916) 788-2884

Address 2250 DOUGLAS BLVD., STE. 150 ROSEVILLE, CA 95661

Project Location NE CORNER OF OLD SILVA VALLEY ROAD & HIGHWAY 50

Assessor's Parcel Number(s) 122-720-15

Acreage 41.87 AC, Zoning PD-CR

Please answer all of the following questions as completely as possible. Subdivisions and other major projects will require a Technical Supplement to be filed together with this form.

1. Type of project and description: _____

2. What is the number of units/parcels proposed? 11

GEOLOGY AND SOILS

3. Identify the percentage of land in the following slope categories:

X 0 to 10% X 11 to 15% X 16 to 20% X 21 to 29% X over 30%

4. Have you observed any building or soil settlement, landslides, rock falls or avalanches on this property or in the nearby surrounding area? No

5. Could the project affect any existing agriculture uses or result in the loss of agricultural land?
No

DRAINAGE AND HYDROLOGY

6. Is the project located within the flood plain of any stream or river? If so, which one?
No

7. What is the distance to the nearest body of water, river, stream or year-round drainage channel?
2/3 miles Name of the water body? Carson Creek

8. Will the project result in the direct or indirect discharge of silt or any other particles in noticeable amount into any lakes, rivers or streams? No

9. Will the project result in the physical alteration of a natural body of water or drainage way?
If so, in what way? No

10. Does the project area contain any wet meadows, marshes or other perennially wet areas?
Yes, wetlands

VEGETATION AND WILDLIFE

11. What is the predominant vegetative cover on the site (trees, brush, grass, etc.)? Estimate percentage of each: 98% grasses, 2% oak woodland

12. How many trees of 6-inch diameter will be removed when this project is implemented?

FIRE PROTECTION

13. In what structural fire protection district (if any) is the project located? El Dorado Hills

14. What is the nearest emergency source of water for fire protection purposes (hydrant, pond, etc.)?
hydrant on Silva Valley Parkway

15. What is the distance to the nearest fire station? 2.25 miles at Bass Lake Station

16. Will the project create any dead-end roads greater than 500 feet in length?
No

17. Will the project involve the burning of any material including brush, trees and construction materials?
No

NOISE QUALITY

18. Is the project near an industrial area, freeway, major highway or airport? If so, how far?
Freeway approximately 150' south

19. What types of noise would be created by the establishment of this land use, both during and after construction? typical construction of a retail center and typical operation noises like truck traffic and HVAC units during operation

AIR QUALITY

20. Would any noticeable amounts of air pollution, such as smoke, dust or odors, be produced by this project? No

WATER QUALITY

21. Is the proposed water source: X public or ___private, X treated or ___untreated?
Name the system: EID

22. What is the water use (residential, agricultural, industrial or commercial)?
Commercial

AESTHETICS

23. Will the project obstruct scenic views from existing residential areas, public lands, public bodies of water or roads? No

ARCHAEOLOGY/HISTORY

24. Do you know of any archaeological or historical areas within the boundaries or adjacent to the project? (e.g., Indian burial grounds, gold mines, etc.) Yes.

SEWAGE

25. What is the proposed method of sewage disposal? ____ septic system X sanitation district
Name of district: EID

26. Would the project require a change in sewage disposal methods from those currently used in the vicinity? No

TRANSPORTATION

27. Will the project create any traffic problems or change any existing roads, highways or existing traffic patterns? None expected. A traffic study will be prepared.

28. Will the project reduce or restrict access to public lands, parks or any public facilities?
No

GROWTH-INDUCING IMPACTS

29. Will the project result in the introduction of activities not currently found within the community?
No

30. Would the project serve to encourage development of presently undeveloped areas, or increases in development intensity of already developed areas (include the introduction of new or expanded public utilities, new industry, commercial facilities or recreation activities)? No

31. Will the project require the extension of existing public utility lines? If so, identify and give distances:
Yes.

GENERAL

32. Does the project involve lands currently protected under the Williamson Act or an Open Space Agreement? No

33. Will the project involve the application, use or disposal of potentially hazardous materials, including pesticides, herbicides, other toxic substances or radioactive material?
No

34. Will the proposed project result in the removal of a natural resource for commercial purposes (including rock, sand, gravel, trees, minerals or top soil)?
No

35. Could the project create new, or aggravate existing health problems (including, but not limited to, flies, mosquitos, rodents and other disease vectors)?
No

36. Will the project displace any community residents? No

DISCUSS ANY YES ANSWERS TO THE PREVIOUS QUESTIONS (attach additional sheets if necessary)

MITIGATION MEASURES (attach additional sheets if necessary)

Proposed mitigation measures for any of the above questions where there will be an adverse impact:

Attention: Mel Pabalinas

Subject: EDH 52 (PD15-0001)

Dear Mel,

As you are aware this project was put on hold for some time until such time that more specific details could be provided regarding the proposed project. We are resubmitting the PD application package based on the incomplete letter dated August 12, 2015. We also have added 3 new entitlements to the project which include a rezone, tentative parcel map, and conditional use permit. We also prepared an annotated response to your letter, which is attached, explaining how each of the items was addressed.

Forms and Maps (F&M) Required

1. Four copies of a tree preservation plan is provided with this submittal.
2. A preliminary drainage report is included with the submittal.
3. We understand a noise analysis will be prepared as part of the EIR document and will not be required to continue moving the project forward.
4. We understand an air quality impact analysis will be prepared as part of the EIR document and will not be required to continue moving the project forward.
5. We understand a traffic analysis will be prepared as part of the EIR document and will not be required to continue moving the project forward.

Site Plan Requirements

1. The entire parcel of land along with perimeter dimensions are shown on the updated site plan detail sheets.
2. A note has been added on the site plan stating that all existing easements have widths that vary. All existing easements are shown on the site plan

RSC Engineering, Inc.
Consulting Engineers

2250 Douglas Blvd.
Suite 150
Roseville, CA 95661
916.788.2884
Fax 916.788.4408
rsc-engr.com

with their purpose. Proposed easements are not known at this time and will be determined during the improvements plan preparation.

3. Typical parking stall and loading stall dimensions are shown on the site plan. Compact stalls and standard stall depths and widths are also noted in the notes section.
4. Retaining walls are proposed along the roadways due to grade differences. The walls are shown on the site plan and grading plan.
5. Monument signs are proposed at each entry. See project description for details on the proposed freestanding signage.
6. Please see the preliminary utility plan for the proposed fire hydrant locations.
7. All adjacent parcels including parcel owners and APN's are shown on the site plan detail sheets.
8. Location of neighboring school is shown on Sheet SP3.

Plan of Building Elevations

1. Typical elevations for all sides of the proposed building types are provided.
2. Proposed highway signs and monument sign locations are shown on the proposed site plan. See project description for details on the proposed freestanding signage.

Advisories

1. This project will mitigate for oak trees removed as part of the project. A preserve area is available for a portion of the mitigation at the northern corner of the south site. An offsite preserve area will be needed for the remaining mitigation oak trees. A total of 1.18 acres of mitigation planting or 236 oak trees will be planted.
2. Deleted.
3. It is our understanding a FIA is not required with this submittal. A modified scope will be coordinated with the County at a late date.
4. The project description has been updated to reflect the comments listed in the letter.
5. The new project description will be the one used by the EIR Consultant when selected.
6. The site plan and landscape plan have been adjusted to have a single overall sheet and subsequent details sheets for better clarity. The grading and utility plans have one sheet for each project site (north and south)

The project is proposing a rezone from PD-CR to PD-CC. A rezone exhibit and application is provided with this submittal. The project will also include a tentative parcel map to subdivide the property into 12 lots. This will include 8 on the south side and 4 on the north side. This tentative parcel map assumes a large lot 4 parcel map has recorded that separates the north and south lots and creates a

lot of the mini-storage use and future Country Club Drive extension roadway. Finally, a conditional use permit is being requested to allow the mini-storage use as a conditional use within the proposed PD-CC zone.

We look forward to your review of our third submittal and moving forward with the EIR. Please call if there are any questions.

Sincerely,

Tiffany Ann Wilson, AICP
Managing Planner

Angelo Christie

EDH 52

OVERALL COMMERCIAL CENTER

PROJECT DESCRIPTION

October 5, 2017

DESCRIPTION AND PURPOSE OF THE REQUEST

The owner is requesting approval to construct two (2) new commercial centers (collectively, the "Project") in El Dorado County on APN 122-720-15. The property is located north of Highway 50 and Tong Road, east of Old Silva Valley Parkway, and is bisected by Silva Valley Parkway. The northern portion of the property is approximately 17.07 acres (North Site) and the southern portion is approximately 15.73 acres (South Site), net of the right of way for roads. There is a 7.69-acre area on the North Site for the right of way associated with the future extension of Country Club Drive. There is a 1.38-acre open space area west of Old Silva Valley Road that will not be developed.

The County is reviewing the owner's request as a single application and project for local entitlement and California Environmental Quality Act purposes. However, the owner views the North Site and the South Site as two distinct projects, and each constitutes a separate "integrated development" pursuant to El Dorado County Code Section 130.16.120. Accordingly, the owner will seek separate wetlands permits from the Army Corps of Engineers for each. The maximum building area for the South Site will be approximately 110,000 square feet and may include the following uses: hotel, drive through uses, gas station with car wash, grocery, pharmacy, retail, food uses, outdoor patio, medical office, surgery center, office, technical school, outdoor storage and outdoor sales. The maximum building area for the North Site will be approximately 180,000 square feet and may include self-storage, grocery, and other commercial uses.

The Project requires a Planned Development application because the property is zoned PD-CR. A rezone is proposed to PD-CC to allow more uses primarily seen in a shopping center setting and to allow a self-storage use with the approval of a conditional use permit. In addition, a design review permit will be required for signage and a tentative parcel map is proposed to subdivide the parcels further for purposes of sale, lease or financing of the property.

PROJECT OBJECTIVES

- Develop two high-quality planned commercial developments on currently vacant and underutilized land adjacent to Highway 50 adequately served by public services and utilities.
- Promote economic growth and diverse new employment and retail/service opportunities for County residents.
- Develop architectural and landscaping designs that soften the scale and mass of the buildings, create a pleasant and attractive appearance, and complement the surrounding area.

- Develop site plans that minimize potential access and circulation conflicts between automobiles and pedestrians, provide adequate off-street parking for store customers and employees, and minimize impacts to the surrounding area.

SITE INFORMATION

Location

The proposed Project is located in El Dorado County. The Project site is on the north side of Highway 50 and is bisected by Silva Valley Parkway. It is bordered by existing residences and an elementary school to the north, vacant land to the east, Old Silva Valley Road to the west, and Highway 50 to the south.

Site Description

The Project site is currently vacant. The site consists of annual grassland with small oak woodlands throughout the Project. Slivers of wetlands and riparian areas are located on site.

DESCRIPTION OF THE PROPOSED PROJECT

The maximum building area for the South Site will be approximately 110,000 square feet and may include the following uses: hotel, drive through uses, gas station with car wash, grocery, pharmacy, retail, food uses, outdoor patio, medical office, surgery center, office, technical school, outdoor storage and outdoor sales. The maximum building area for the North Site will be approximately 180,000 square feet and may include self-storage, grocery, and other community-serving commercial uses.

Design

The design theme for the Project is based on the existing building design theme of the Serrano area which is a California/Mediterranean style, examples of which are included in the design guidelines proposed for this project.

Where single tenant types (hotel and retail shops) occur, the guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants will use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as shown in the guidelines. No building design for any tenant type shall be repeated.

Each building shall vary in building height to achieve more visual interest and distinct building character, avoiding the monotony of continuous building height. Each building shall combine horizontal and vertical elements to provide variation, interest and rhythm within and among the buildings. In no case shall any roof mounted equipment be higher than the lowest parapet height of the building.

The color and material palette for the project contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the project so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette must be maintained throughout the development.

Within the development all sides of all buildings will be visible from adjacent roadways and properties. The architecture of all sides of all buildings must, therefore, be of equal quality and attention. Screening is required for loading and storage areas, utilities meters and boxes by the use of landscaping, walls, fences in combination.

The use of colored concrete, concrete pavers, accent patterns, etc. shall be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas shall be accomplished by the use of intimate seating areas in near proximity of the building.

Sustainability Features

The proposed Project will incorporate sustainability features per the California Title 24 energy requirements.

SIGNAGE

Proposed highway-oriented and monument sign locations are depicted on the proposed site plan.

One highway-oriented sign is proposed on the South Site within 100 feet of the freeway right of way and therefore requires a Design Review Permit. A second highway-oriented sign is proposed on the North Site greater than 100 feet from the freeway right of way. The owner is requesting certain deviations from Chapter 130.16 of the County Code for the proposed highway-oriented signs, including a reduction in the minimum separation between highway-oriented signs, a reduction in the minimum setback from the adjacent residential district (North Site only), an increase in the maximum allowed area, and an increase in the maximum allowed height. Each highway-oriented sign will be a 75 foot tenant pylon sign allowing advertising from either commercial center and will include one (1) major tenant panel, one (1) junior tenant panel, and eight (8) shop tenant panels. The proposed sign area for each highway-oriented sign is 652 square feet. The highway-oriented signs will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be fabricated aluminum, pan channel construction. Tenant names and logos will be flush mounted to the panel background and internally illuminated with white LED lights. Colors will comply with tenant specifications.

The owner is also requesting certain deviations from Chapter 130.16 of the County Code for the proposed monument signs, including a reduction in the minimum separation between monument signs, an increase in the maximum number of signs allowed per street frontage, an increase in the maximum allowed area, and an increase in the maximum allowed height. The developer is proposing six (6) 28 foot tenant monument signs allowing advertising from either commercial center. Each monument sign will have one (1) featured tenant panel and six (6) shop tenant panels. The proposed area for each monument sign is 242 square feet. The monument signs

will have a stone veneer base, fabricated aluminum panels, and texcote finish to compliment the color scheme of the commercial centers. Tenant names and logos will be routed out with acrylic push-through graphics and vinyl film overlays. Tenant names will be internally illuminated with white LED lights. Colors will comply with tenant specifications.

Building signs will be a part of a separate sign permit and are not proposed at this time.

SITE ACCESS

It is anticipated that the Project site will have multiple points of access. A traffic signal is proposed at the main driveway and Silva Valley Parkway to provide access to both the South Site and the North Site. A right in and right out access driveway is proposed on Silva Valley Parkway north of the signalized driveway and at the old Tong Road location to provide access to the North Site. Two full access driveways are proposed on Old Silva Valley Road to provide additional points of access to the South Site.

LOADING

The North Site includes the potential for a truck dock with up to 4 loading spaces located at the rear of the proposed stores.

PARKING LOT

The North Site proposes a main parking lot area in front of the buildings. The parking lot will provide approximately 204 parking spaces, proposed at 90 degrees to maximize the number of stalls on the site. This number includes 9 accessible parking stalls and 29 compact stalls (14%).

The South Site proposes a main parking lot area in front of the buildings. The parking lot will provide approximately 521 parking spaces, proposed at 90 degrees to maximize the number of stalls on the site. This number includes 16 accessible parking stalls, 24 compact stalls (5%), and 10 RV stalls.

ADA parking will comply with the County Code and Title 24 requirements.

BICYCLE PARKING

The Project will provide bicycle parking spaces (lockers and racks) throughout the site that will meet County and Title 24 requirements.

PEDESTRIAN CIRCULATION

A pedestrian walkway for each portion of the Project will connect the buildings to Silva Valley Parkway.

LANDSCAPING

The Project will include a variety of drought tolerant landscaping options. The landscaping will provide screening along the boundary which will consist of evergreen trees and shrub rows. Shade trees with large canopy coverage will be planted in the parking lot for shade. Planting at the entries will be highlighted and defined by seasonal accented trees and shrubs with the use of colorful plant material. Shrubs will be low growing to maintain line of sight to the street. Along the streets, plantings will incorporate shade trees and mixed species and forms of shrubs to create interest, color, and buffering from the shopping center.

In addition to the proposed shopping center landscaping, this Project will mitigate for oak trees removed as part of the Project. A preserve area is available for a portion of the mitigation oak trees. The preserve area is located at the northwest corner of the southern site. An offsite preserve area will be needed for the remaining mitigation oak trees. Based on the Tree Survey, Preservation, and Replacement Plan dated September 18, 2017 by Foothill Associates, a total of 1.18 acres of mitigation planting or 236 oak trees will be planted. Planting will be according to the planting details provided in the plan.

LIGHTING

The Project will provide various single, two- or four-light fixtures throughout the parking areas and driveways. The overall height of the lighting, including the lighting fixtures and a three foot base, will be 33 feet in the parking lot and 25 feet along the perimeter and main drive aisles. LED luminaires will be used for the parking lot lights.

GRADING

A preliminary grading plan has been prepared for review as part of the application submittals. Each site is designed to balance independently and it is the intent of this application to allow for mass grading of both sites individually.

ON-SITE IMPROVEMENTS

The Project is designed to allow either the North Site or the South Site to develop independent from the other. Mass grading of each site to accommodate future development will occur in the first phase of development, including filling of the permitted wetlands and permitted tree removal. In the event the South Site develops first, utility crossings under Silva Valley Parkway will be constructed as part of the South Site infrastructure work to serve the North Site. In the event the North Site develops first, interim facilities will be constructed on the North Site.

The second phase will include construction of the parking, landscaping, lighting, utility infrastructure, and driveways designed to support the buildings. Site improvements will be constructed in various phases depending on the extent of development occurring at any given time. Buildings can be started once site improvements are sufficiently completed to allow construction and emergency fire access.

As preservation of 90% of the existing oak tree canopy is not feasible, this Project will be requesting relief from General Plan Policy 7.4.4.4 due to topographic constraints and the need to grade the site in relation to Silva Valley Parkway.

OFF-SITE IMPROVEMENTS

A proposed traffic signal and appurtenant facilities will be located on Silva Valley Parkway at the center of the Project to provide a connection to both the South Site and the North Site.

A right in and right out access driveway is proposed on Silva Valley Parkway north of the signalized driveway and at the old Tong Road location to provide access to the North Site. Two full access driveways are proposed on Old Silva Valley Road to provide additional points of access to the South Site. A reservation for 7.65 acres of future right of way is proposed along the outer boundary of the North Site.

UTILITY INFRASTRUCTURE

The property will need to annex into El Dorado Irrigation District (EID) in order to acquire sanitary sewer and water service. EID stated in its August 29, 2014 Facilities Improvement Letter that there should be adequate water supply and sewer capacity available to serve the Project. The Project will tie into the existing 18-inch potable water main and the 21-inch gravity sewer line in Old Silva Valley Road. An updated Facilities Improvement Letter will be requested through EID at the appropriate time.

The property will also annex into the El Dorado Hills County Water District (Fire Protection) prior to building permit issuance.

Sanitary service and potable water for the North Site will be provided by public (EID) sanitary sewer and water lines that cross the South Site. Reclaimed water is available for non-potable irrigation use and will be provided by extending an existing reclaimed line in Silva Valley Parkway north of the Project site.

Dry utilities (electric, gas, telephone and cable TV) will be provided from existing infrastructure located to the north of the Project site in Silva Valley Parkway. Dry utilities will need to be extended along the frontage of both the North Site and the South Site.

STORM DRAINAGE DESCRIPTION

The on-site drainage system will connect to El Dorado County's storm drain infrastructure in Old Silva Valley Road. The Project has typical pollutant sources from parking lot runoff, loading/unloading areas, outdoor storage areas, and a trash compactor. This Project proposes underground water quality vaults as the form of treatment for the site.

A proposed detention basin is located at the southwest corner of the property. It will be sized to serve both the South Site and the North Site. As with sanitary sewer and water, drainage facilities will be constructed on the South Site to transmit storm water runoff from the North Site to the detention basin.

TRUCK CIRCULATION

Truck access will be allowed at all driveway locations depending on the size of the delivery truck and direction of travel.

OTHER GOVERNMENTAL AGENCY APPROVALS

Additional subsequent approvals and permits that may be required from local, regional, state, and federal agencies are identified below.

- El Dorado Irrigation District -Water and Sewer-Annexation and Utility Approval
- El Dorado County Resource Conservation District-Onsite Plan Approval
- El Dorado Hills County Water District (Fire Protection)-Annexation and Fire Approval
- El Dorado County Air Quality Management District-Air Quality Permit
- El Dorado County Department of Transportation -Encroachment Permit/Grading Permit/Onsite Plan Approval
- El Dorado County Building Services-Building Permit/Sign Permit
- Central Valley Regional Water Quality Control Board-NPDES General Permit for Stormwater Discharge
- California Department of Fish and Wildlife-Wetland Approval
- Army Corps-Wetland Approval
- LAFCO-Annexation approval for EID and El Dorado Fire Protection District

STAFFORD
KING

ARCHITECTS

Design Guidelines

ARCHITECTURE

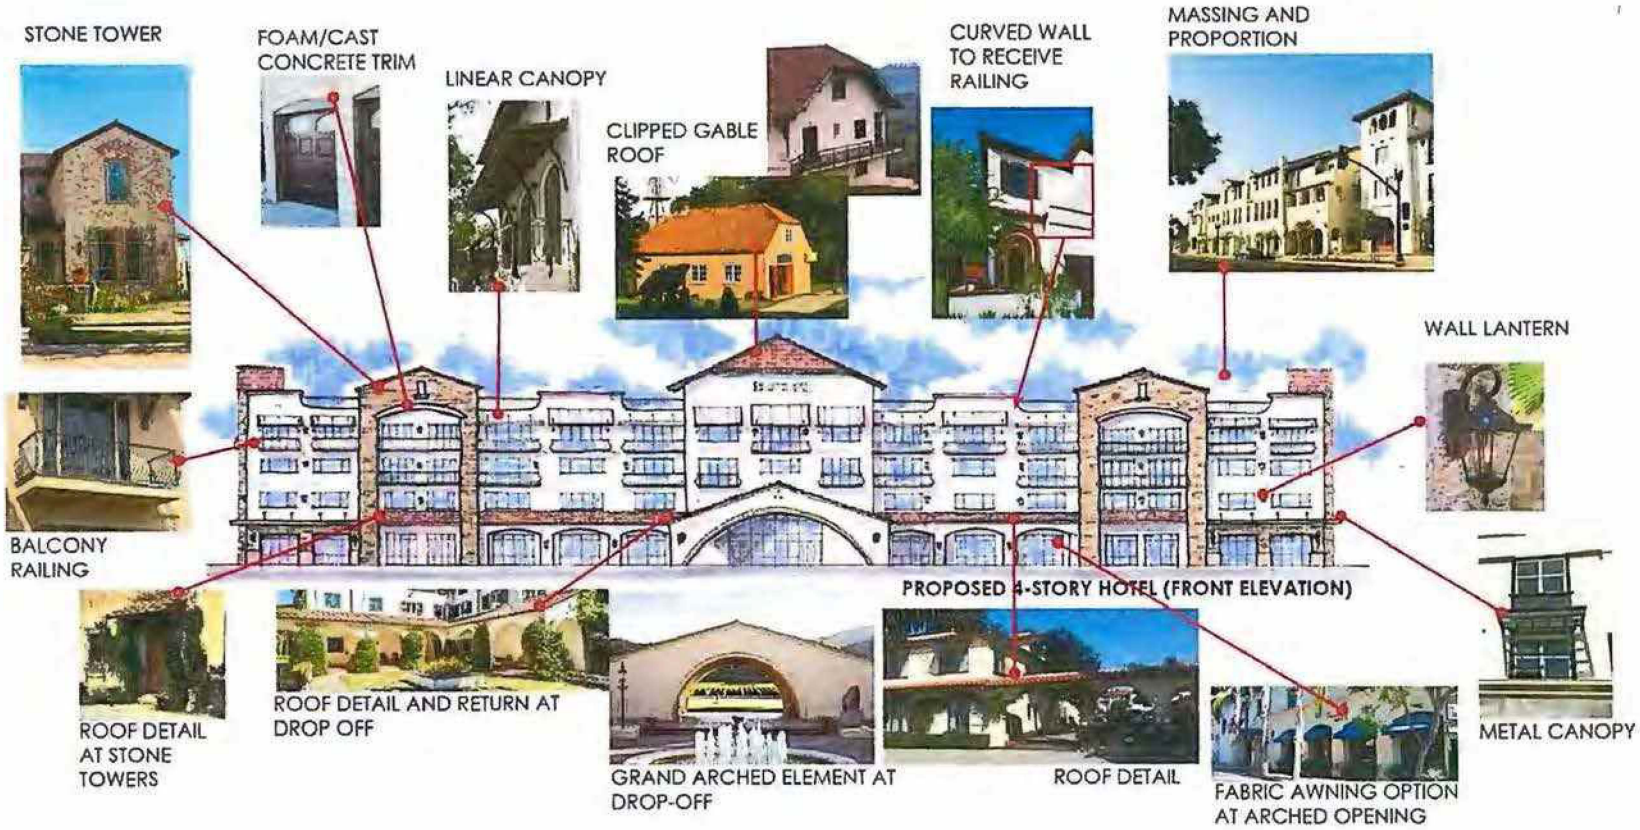
PLANNING

INTERIORS

These Guidelines will serve to further define the design theme and its application to the multiple project buildings. The design theme for the project is based on the existing building design theme of the Serrano area which is a California/Mediterranean style, examples of which are contained in this guideline.

Where single tenant types (hotel and retail shops) occur, the guidelines contain specific architectural design for these buildings. Where multiple tenant types (drive-thru restaurants and fuel stations) occur, the guidelines contain a typical example of the design intent for that tenant type. Each of these specific tenants will use the typical example shown and vary their design to add individuality and yet maintain a common thread of colors, materials, and design elements as shown in this guideline. No building design for any tenant type shall be repeated.

Each building shall vary in building height to achieve more visual interest and distinct building character, avoiding the monotony of continuous building height. Each building shall combine horizontal and vertical elements to provide variation, interest and rhythm within and among the buildings. In no case shall any roof mounted equipment be higher than the lowest parapet height of the building.



The color and material palette for the project contains multiple options for color and materials. The intent is for these options to occur in various combinations throughout the project so that each building is unique in its design and materials while maintaining design continuity among the buildings. The proposed colors and materials of the palette must be maintained throughout the development.

Within the development all sides of all buildings will be visible from adjacent roadways and properties. The architecture of all sides of all buildings must, therefore, be of equal quality and attention. Screening is required for loading and storage areas, utilities meters and boxes by the use of landscaping, walls, fences in combination.

The use of colored concrete, concrete pavers, accent patterns, etc. shall be encouraged in the flatwork areas around the buildings. Provisions for gathering and resting areas shall be accomplished by the use of intimate seating areas in near proximity of the building.

GENERAL PLANTING NOTES

1. ALL PLANTING AREAS SHALL BE IRRIGATED WITH AN AUTOMATIC IRRIGATION SYSTEM.
2. ALL SHRUB AND GROUNDCOVER AREAS SHALL RECEIVE A 2" LAYER OF BARK CHIP MULCH TOP DRESSING.
3. REDWOOD HEADERBOARD SHALL BE INSTALLED BETWEEN LAWN AND SHRUB AREAS.
4. ALL GROUND MOUNTED HVAC UNITS, GAS & ELECTRICAL METERS, AND EQUIPMENT ETC. SHALL RECEIVE SHRUB SCREENING IN SHRUB AND GROUNDCOVER AREAS AROUND BUILDINGS.
5. TRASH ENCLOSURES SHALL BE SCREENED WITH TREES AND SHRUB PLANTING.

PRELIMINARY LANDSCAPE PLAN: OVERALL

SHEET

PL-1

1 OF 4 SHEETS

STREETSCAPE INTENT

AREAS FRONTING THE STREETS WILL INCORPORATE SHADE TREES ALONG WITH MIXED SPECIES AND FORMS OF SHRUBS FOR INTEREST, COLOR, AND BUFFERING OF THE SHOPPING CENTER FROM THE STREETS. SHRUB MASSES WILL UTILIZE DROUGHT TOLERANT SPECIES WHERE APPROPRIATE.

PARKING LOT INTENT

THE PRIMARY TREES WILL PROVIDE A CANOPY OF SHADE. UNDERSTORY PLANTINGS WITHIN THE PARKING LOT WILL CONSIST OF LOW SHRUBS AND/OR GROUNDCOVERS.

SCREENING INTENT

PRIMARY PLANTING ALONG THE PROPERTY BOUNDARIES WILL CONSIST OF EVERGREEN TREES AND SHRUB ROWS TO SCREEN ADJACENT PROPERTIES.

ENTRY TREATMENT INTENT

PLANTING AT THE ENTRIES WILL BE HIGHLIGHTED & DEFINED BY SEASONAL ACCENTED TREES & SHRUBS WITH THE USE OF COLORFUL PLANT MATERIAL. SHRUBS WILL BE LOW TO MAINTAIN SIGHT LINES.

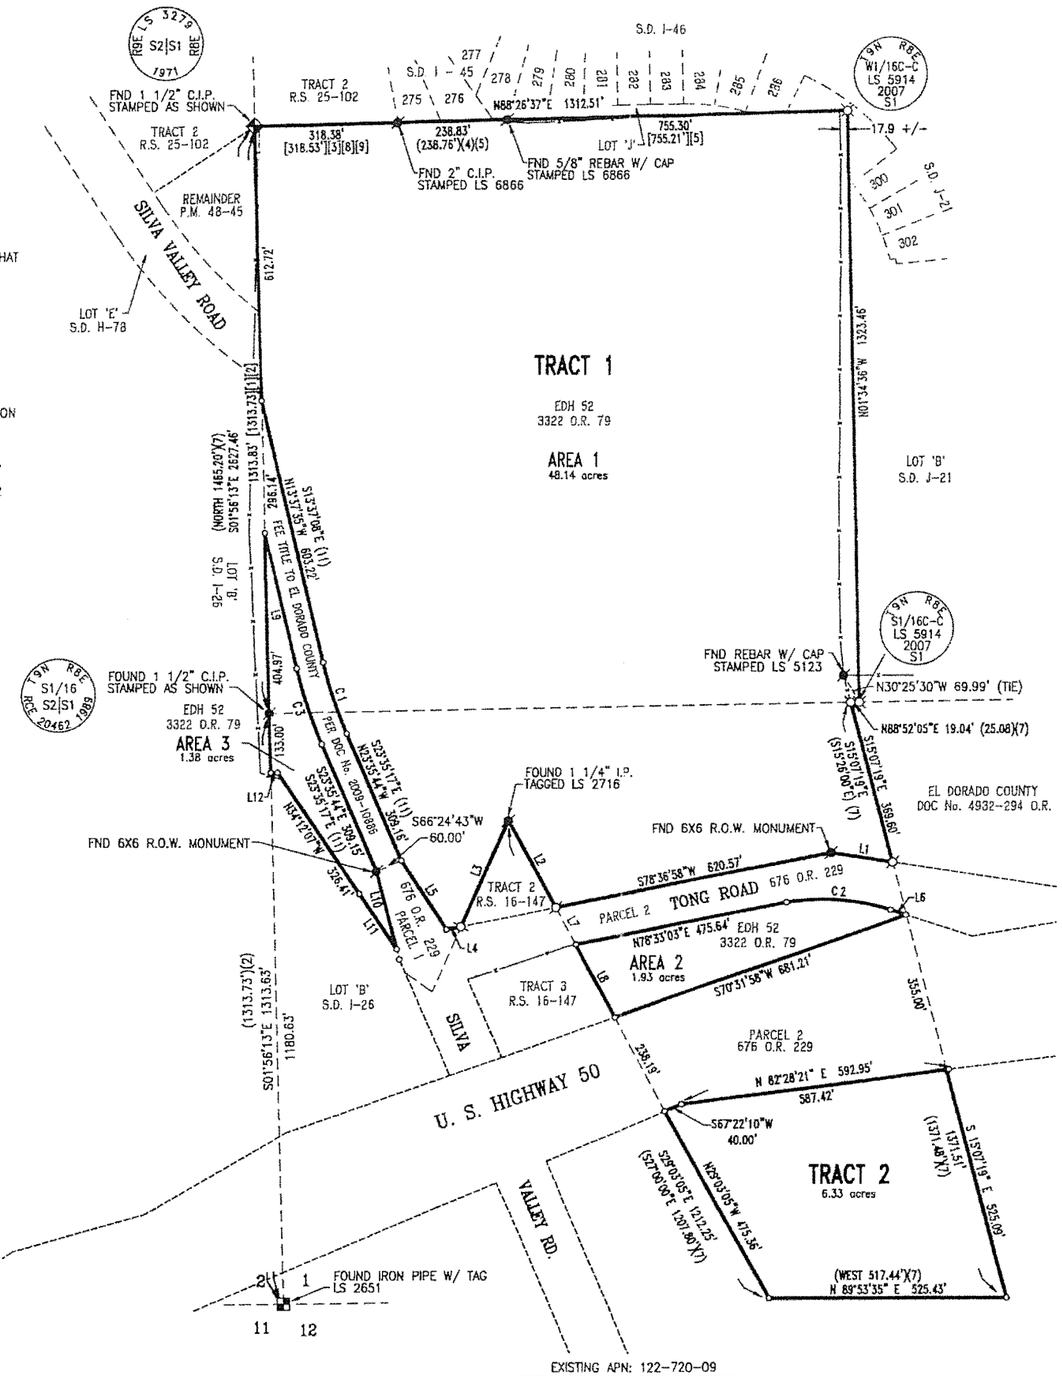
RECORD OF SURVEY

A PORTION OF THE SW 1/4 SECTION 1, T. 9 N., R. 8 E., M.D.M.
County of El Dorado, State of California
APRIL, 2010 PAGE 1 OF 1 SCALE: 1"=200'

cta Engineering & Surveying
Civil Engineering • Land Surveying • Land Planning
3233 Monier Circle, Rancho Cordova, CA 95742

BASIS OF BEARINGS

THE BASIS OF BEARING FOR THIS SURVEY IS IDENTICAL TO THAT CERTAIN RECORD OF SURVEY FILED IN THE OFFICE OF THE COUNTY RECORDER OF EL DORADO COUNTY IN BOOK 16 OF SURVEYS, PAGE 147, WHICH IS THE CALIFORNIA COORDINATE SYSTEM, ZONE II. ALL DISTANCES ARE GROUND DISTANCES. MULTIPLY DISTANCE SHOWN BY 0.99991 TO OBTAIN GRID DISTANCE.



NOTE

1) THE PURPOSE OF THIS SURVEY IS TO COMPLY WITH SECTION 8762(B)(4) OF THE PROFESSIONAL LAND SURVEYORS ACT.

2) TRACT 1 INCLUDES THE LANDS DESCRIBED IN BOOK 3322, PAGE 79, EXCEPTING THOSE PORTIONS GRANTED TO THE COUNTY OF EL DORADO IN DOC. NO. 2009-10886. TRACT 2 REFLECTS THE BALANCE OF ASSESSOR'S PARCEL NO. 122-720-09. IT IS NOT THE INTENT OF THIS SURVEY TO REFLECT LINES OF ACTUAL OWNERSHIP.

Re: Zoning Administrator Approval of P17-0004/EDH 52

Dear Sir or Madam:

On June 20, 2018, the Zoning Administrator considered your project at a publicly noticed hearing and the 10-day appeal period has since ended. The project was approved with the attached Findings and Conditions of Approval. This document is also available on-line at https://edcgov.trakit.net/eTRAKiT/Search/project.aspx.

If you have Conditions of Approval from other departments, please contact your representative in that department to determine the next step in the process.

If you have any questions, please contact Mel Pabalinas in Planning Services at (530) 621-5363.

Sincerely,

Serena Carter

EL DORADO COUNTY PLANNING AND BUILDING DEPARTMENT
ZONING ADMINISTRATOR
STAFF REPORT

Agenda of:	June 20, 2018
Item:	4.c.
Staff:	Mel Pabalinas

TENTATIVE PARCEL MAP

FILE NO.: P17-0004/EDH 52

APPLICANT: RSC Engineering

OWNER: EDH 52 G.P.

REQUEST: Tentative Parcel Map subdividing 41.87-acre property into four commercial parcels ranging in size from 7.69 acres to 17.11 acres for phasing and financing purposes only.

LOCATION: Northeast area of U.S. Highway 50 and Silva Valley Parkway, in El Dorado Hills (Exhibit A); Supervisorial District 1.

APN: 122-720-15 (Exhibit B)

ACREAGE: 41.87 acres

GENERAL PLAN: Commercial (C) (Exhibit C)

ZONING: Commercial, Regional-Planned Development (CR-PD) (Exhibit D)

ENVIRONMENTAL DOCUMENT: Categorical Exemption under California Environmental Quality Act (CEQA) Section 15315 (Minor Land Division)

RECOMMENDATION: Staff recommends the Zoning Administrator take the following actions:

1. Deem Tentative Parcel Map P17-0004 to be Categorically Exempt from CEQA based on Section 15315 (Minor Land Division); and

2. Approve Tentative Parcel Map P17-0004 based on the Findings and subject to the Conditions of Approval as presented.

BACKGROUND

The subject 42-acre property is part of a larger 58-acre parcel that was subject of an acquisition and subsequent construction of the Silva Valley Parkway Interchange project. Following an extended right-of-way negotiation and settlement for portions of the original parcel north of US Highway 50 and a separate condemnation of the portion south of U.S. Highway 50, construction of the interchange project began in 2012, subsequently opening for operation in June 2016.

ANALYSIS

Setting: The vacant property contains moderate topography, sparse tree vegetation, and limited wetland areas. Silva Valley Parkway traverses property diagonally from the southeast to the northwest, while U.S. Highway 50 borders the property along the southern perimeter. Exhibit E depicts the existing uses surrounding the property.

Project Description: This large lot tentative parcel map would divide the property creating a total of four commercial parcels for phasing and financing purposes only. The resulting parcel sizes, which exceed the minimum lot area of 100,000 square feet required by the CR zoning consists of the following: Parcel 1: 17.11 acres, Parcel 2: 8.00 acres, Parcel 3: 9.07, and Parcel 4: 7.69 acres (Exhibit F). Parcels 2 through 4 are located north of the road, while Parcel 1 is located on the south side. No development is proposed with this tentative parcel map application and no development will be allowed until a Development Plan is approved by the Planning Commission. A separate commercial development application is currently in process and is filed under applications Planned Development Permit PD15-0001, Tentative Parcel Map P17-0007, Conditional Use Permit S17-0017, and Rezone Z17-0004.

Consistency: As discussed in further detail in the Findings section below, the proposed tentative parcel map is consistent with the applicable standards General Plan, Zoning Ordinance, and Subdivision Ordinance.

Environmental Review: The tentative parcel map qualifies for a Categorical Exemption status under Section 15315 (Minor Land Division) as the division would result in four commercial parcels consistent with the Commercial General Plan and Commercial Regional zoning. The tentative parcel map application does not include any variances, modifications, or exceptions. The subject property contains an average slope gradient below 20 percent and site access and public services would be available for future development. The property has not been involved in a division of a larger parcel within the past two years. No further environmental analysis is necessary.

In accordance with CEQA, a Notice of Exemption (NOE) is required to be filed, subject to a $50.00 filing fee submitted to Planning Department.

Conditions of Approval: Project conditions of approval are recommended based on the review of the agencies and department. Future access onto Silva Valley Road has been addressed through conditions recommended by the El Dorado County Transportation Department. The conditions involve development restrictions to be included as notes on the Tentative Parcel Map that ensure future access will meet County standards.

FINDINGS

Tentative Parcel Map Time P17-0004/EDH 52
Zoning Administrator/June 20, 2018

1.0 CEQA FINDINGS

1.1 The EDH 52 Tentative Parcel Map qualifies for a Categorical Exemption status under Section 15315 (Minor Land Division) as the division would result in four commercial parcels consistent with the underlying General Plan and zoning. No variances, modifications, or exceptions have been requested. The average slope gradient of the property is below 20% and site access and services would be available if the property is developed. The property has not been involved in a division of a larger parcel within the past two years. No further environmental analysis is necessary.

1.2 The documents and other materials which constitute the record of proceedings upon which this decision is based are in the custody of the Community Development Services-Planning and Building Department-Planning Services Division at 2850 Fairlane Court, Placerville, CA, 95667.

2.0 PARCEL MAP FINDINGS

2.1 **The proposed tentative map, including design and improvements, is consistent with the General Plan.**

The EDH 52 Tentative Parcel Map would result in the creation of four commercial parcels for financing and phasing purposes. The project is compatible with the land use designation.

2.2 **The proposed Parcel Map conforms to the applicable standards and requirements of the County zoning regulations and Minor Land Division Ordinance.**

The EDH 52 Tentative Parcel Map would result in the creation of four commercial parcels consistent with the Zoning Ordinance standards under Chapter 130.22 (Commercial Zones) for the underlying Commercial, Regional (CR) zone district.

2.3 **The site is physically suitable for the proposed type and density of development.**

The resultant commercial parcels are physically suitable for future commercial development. The sizes of the parcels exceed the minimum required lot size, which would enable future development design and improvement to be accommodated through application of Planned Development concepts. The parcels would have direct access along Silva Valley Parkway, a major arterial road in the El Dorado Hills area. The subject is property is surrounded by existing development, where necessary public utilities exists and can be accessed readily.

2.4 **The proposed subdivision is not likely to cause substantial environmental damage.**

The map is consistent with the General Plan and Zoning and no variances, modifications, or exceptions has been requested with this application. The vacant property has average slope gradient below 20%, would have direct access to public infrastructures necessary for subsequent development, and is surrounded by existing residential development and areas identified for future commercial and residential development, and. Though sensitive resources exist on the property, no physical change will occur as a result of this tentative parcel map. The property has not been involved in a division of a larger parcel within the past two years. Therefore, the project is exempt from CEQA pursuant to Section 15315 of the CEQA Guidelines.

CONDITIONS OF APPROVAL

Tentative Parcel Map Time P17-0004/EDH 52
Zoning Administrator/June 20, 2018

1. **Project Description**

This Tentative Parcel Map is based upon and limited to compliance with the project description, Conditions of Approval set forth below, and the hearing exhibits marked:

Exhibit F - EDH 52 Tentative Parcel Map, May 3, 2018

Tentative Parcel Map subdividing a 41.87-acre property into four commercial parcels ranging in size from 7.69 acres to 17.11 acres for phasing and financing purposes only.

The development, use, and maintenance of the property, the size, shape and the protection and preservation of resources shall conform to the project description above and the hearing exhibits and conditions of approval below. The property and any portions thereof shall be sold, leased or financed in compliance with this project description and the approved hearing exhibits and conditions of approval hereto. All plans must be submitted for review and approval and shall be implemented as approved by the County.

Any deviations from the project description, exhibits, or conditions must be reviewed and approved by the County for conformity with this approval. Deviations may require approved changes to the permit and/or further environmental review. Deviations without the above described approval would constitute a violation of permit approval.

Planning Department

2. **Permit Time Limits:** This Tentative Parcel Map shall expire 36 months from the date of approval unless a timely extension has been filed.

3. **Development Restrictions:** The applicant shall record the following note against the Parcel Map imposing development restrictions on the lots designated as Parcels 1 through 4:

"Parcels 1 through 4 are phasing lots only. No building permits shall be issued until future discretionary approvals, including but not limited to, a Planned Development (PD) Permit, have been approved by El Dorado County. Said restrictions shall be binding upon the heirs, assigns, and successors in interest of the grantors, and shall remain in effect until rescinded by El Dorado County. The purpose of the notice is to give constructive notice of the development limitation."

4. **Indemnity:** In the event of any legal action instituted by a third party challenging the validity of any provision of this approval, the developer and landowner agree to be responsible for the costs of defending such suit and shall hold County harmless from any legal fees or costs County may incur as a result of such action.

The developer and land owner shall defend, indemnify, and hold harmless El Dorado County and its agents, officers, and employees from any claim, action, or proceeding against El Dorado County or its agents, officers, or employees to attack, set aside, void, or annul an approval of El Dorado County concerning a Parcel Map.

The County shall notify the applicant of any claim, action, or proceeding, and the County shall cooperate fully in the defense.

Office of County Surveyor

5. All survey monuments shall be set prior to filing the Parcel Map.

6. Situs addressing for the project shall be coordinated the County Surveyors Office prior to filling the Final Map.

7. Prior to filing the Parcel Map, a letter will be required from all agencies that have placed conditions on the map. The letter will state that "all conditions placed on P17-0004 by (that agency) have been satisfied." The letter is to be sent to the County Surveyor and copied to the Consultant and the Applicant.

Transportation Department

8. Prior to filing of Parcel Map, the following note shall be added and verified:

   Parcels 1, 2 and 3 will each be allowed one (1) right-in, right-out only access point onto Silva Valley Parkway at locations determined by the Department of Transportation. Reciprocal access rights shall be provided mutually between Parcels 2, 3 and 4, with an easement shown on the final map from lot 3, through lot 2 to lot 4.

   This condition may be modified to provide enhanced coordinated access to Silva Valley Parkway by a Future Planned Development (PD) approval.

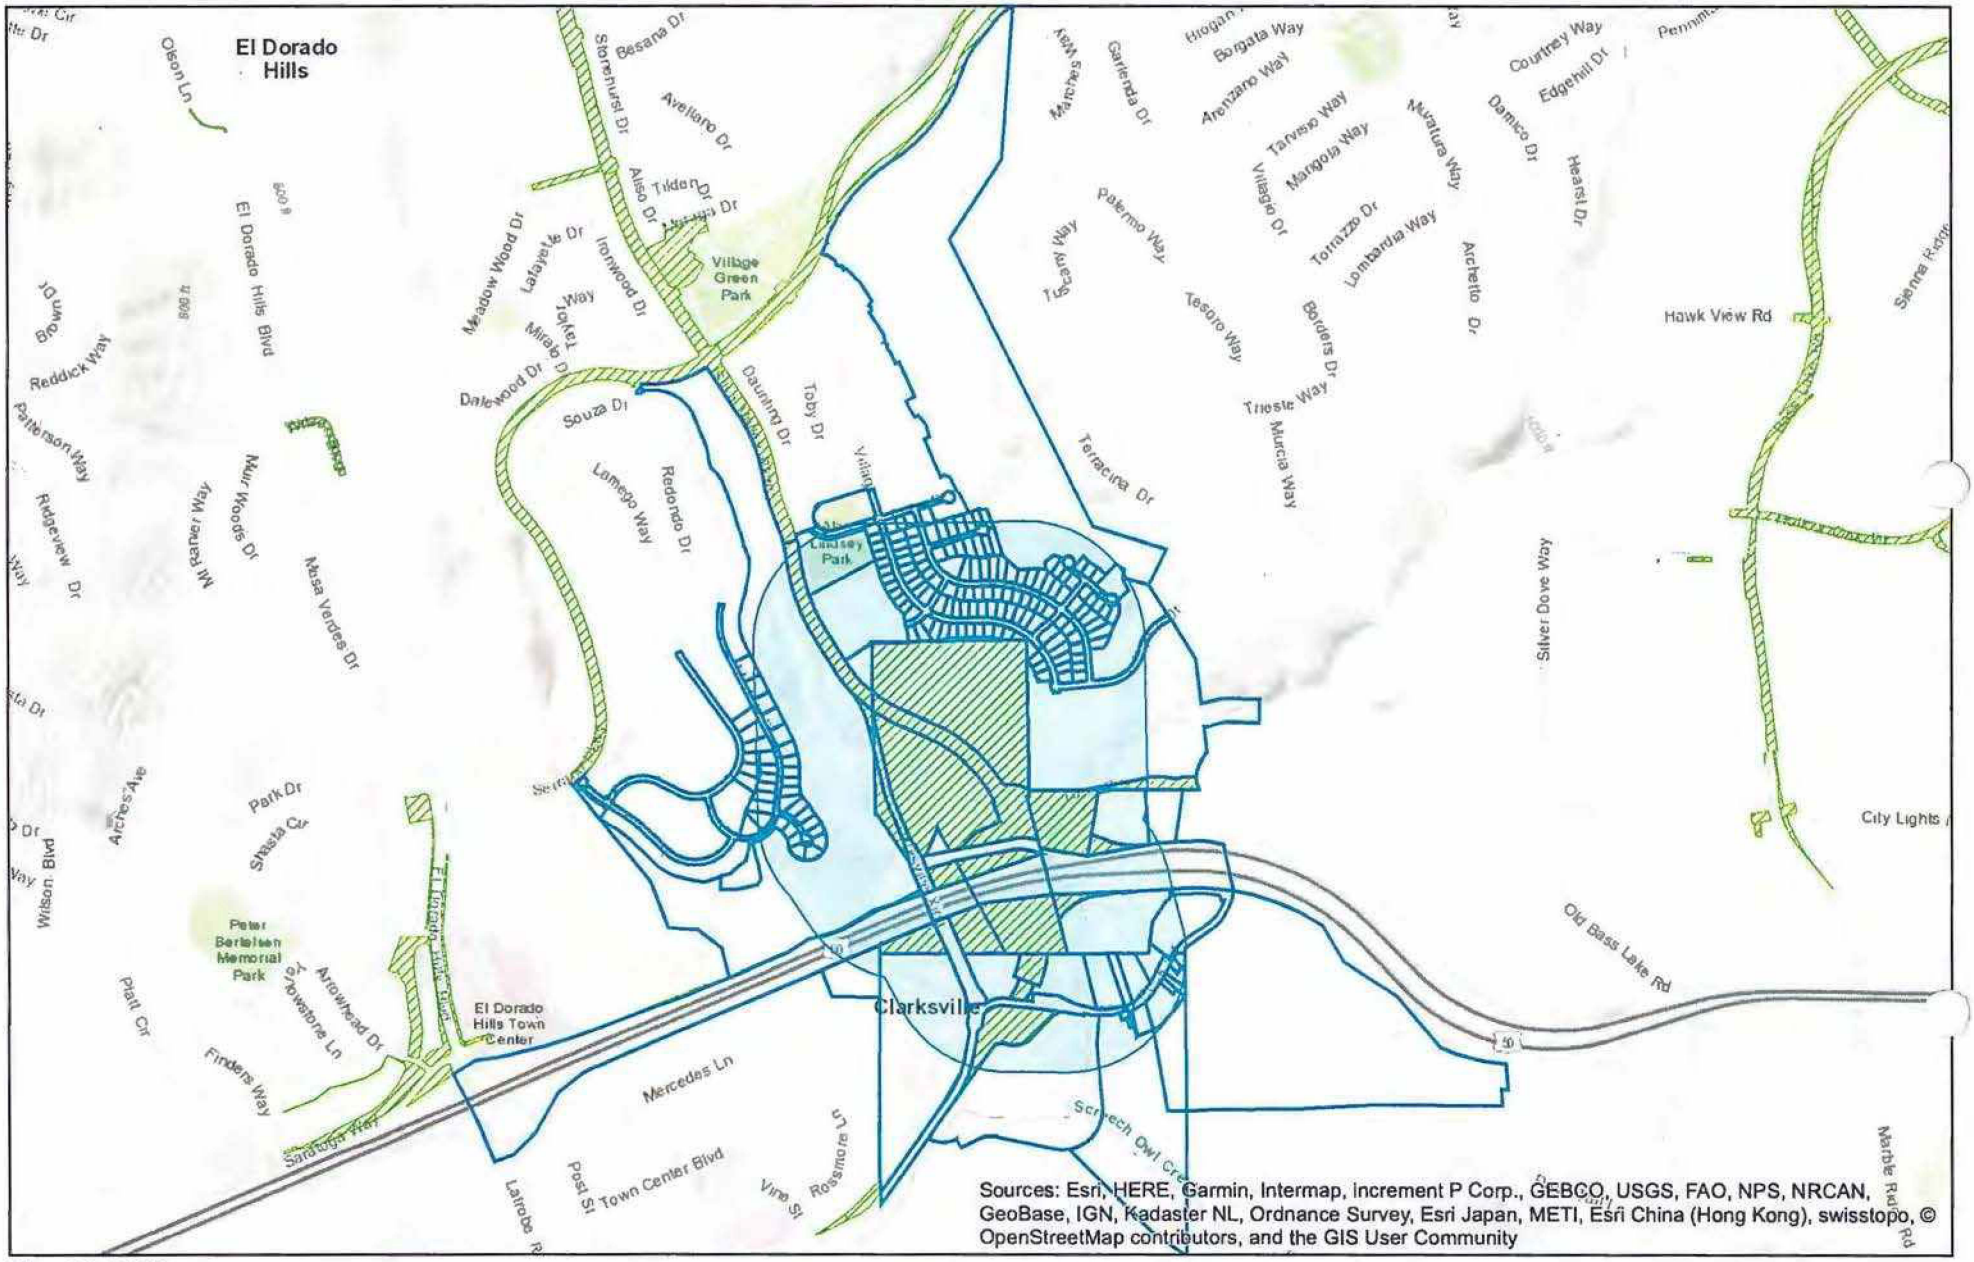
NOTICE OF PUBLIC HEARING

The **County of El Dorado Zoning Administrator** will hold a public hearing in the **Building C Hearing Room**, 2850 Fairlane Court, Placerville, CA 95667 on **June 20, 2018** at **3:00 p.m.**, to consider the following: **Tentative Parcel Map P17-0004/EDH 52** submitted by RSC ENGINEERING to subdivide 41.87-acre property into four commercial parcels ranging in size from 7.69 acres to 17.11 acres for phasing and financing purposes only. The property, identified by Assessor's Parcel Number 122-720-15, consisting of 41.87 acres, is located in the northeast area of U.S. Highway 50 and Silva Valley Parkway, in the El Dorado Hills area, Supervisorial District 1. (County Planner: Mel Pabalinas) (Categorical Exemption pursuant to Section 15315 of the CEQA Guidelines)*



Staff Reports are available two weeks prior at
Staff or at http://edcgov.us/Government/Planning/Zoning_Administrator.aspx

All persons interested are invited to attend and be heard or to write their comments. If you challenge the application in court, you may be limited to raising only those items you or someone else raised at the public hearing described in this notice, or in written correspondence submitted at, or prior to, the public hearing. Any written correspondence should be directed to County of El Dorado, Planning and Building Department, 2850 Fairlane Court, Placerville, CA 95667 or via e-mail: planning@edcgov.us.

*This project is exempt from the California Environmental Quality Act (CEQA) pursuant to the above-referenced section, and it is not subject to any further environmental review.

To ensure delivery prior to the hearing, written information from the public is encouraged to be submitted to Planning Services by Friday the week prior to the meeting. Planning Services cannot guarantee that any FAX or mail received the day of the meeting will be delivered to the Zoning Administrator prior to any action.

Mountain Democrat

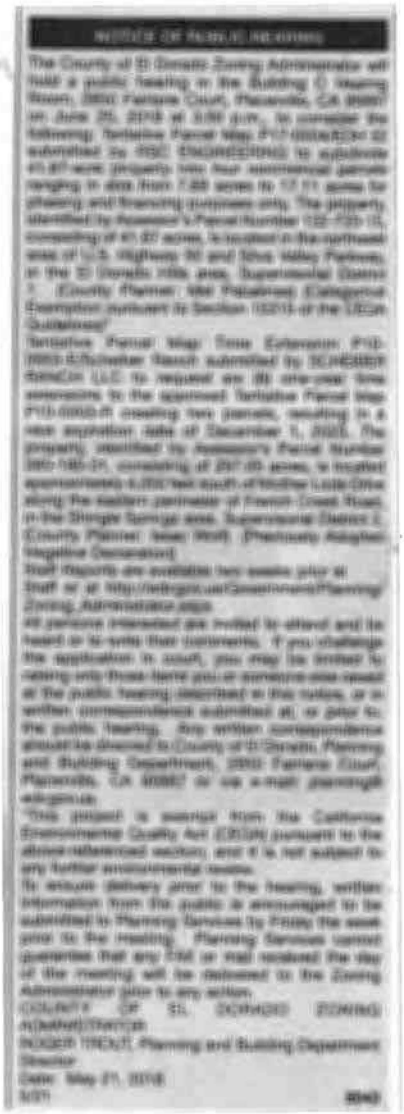
PROOF OF PUBLICATION
(2015.5 C.C.P.)

Proof of Publication of
NOTICE OF PUBLIC HEARING

STATE OF CALIFORNIA
County of El Dorado

I am a citizen of the United States and a resident of the County aforesaid; I'm over the age of eighteen years, and not a party to or interested in the above-entitled matter. I am principal clerk of the printer at the Mountain Democrat, 2889 Ray Lawyer Drive, a newspaper of general circulation, printed and published Monday, Wednesday, and Friday, in the City of Placerville, County of El Dorado, and which newspaper has been adjudged a newspaper of general circulation by the Superior Court to the County of El Dorado, State of California, under the date of March 7, 1952, Case Number 7258; that the notice, of which the annexed is a printed copy (set in type no smaller than non-pareil), has been published in each regular and entire issue of said newspaper and not in any supplement thereof on the following dates, to-wit:

5/21



All in the year 2018.

I certify (or declare) under penalty of perjury that the foregoing is true and correct.

Dated at Placerville, California, this **21st** day of **MAY, 2018**

Allison Rains

Asbestos Dust Mitigation Plan (ADMP) Application

(For projects greater than 20 yd³ and located in NOA(*) designated areas, or where NOA had been discovered)

Please complete every section and initial each page – incomplete applications will be returned.

1. ADMINISTRATIVE INFORMATION

Size of Project

Estimated Size of DISTURBED area (acres) *(Round up to nearest acre)*: 2

NOTE: If size of DISTURBED area exceeds 50 acres, the project is designated as a "Large Operation" and additional requirements apply.

Estimated VOLUME (cubic yards) of graded Material: 20,000

NOTE: If VOLUME of graded material exceeds 20 cubic yards, ADMP must be prepared and submitted.

Will Export Soils be Generated? ☐ YES ☑ NO

If "YES": (1) Exported soil management MUST comply with Rule 223-2.6.D.3. (2) Address of the receiving site MUST be provided in Section 16.

Fees and Checklist

Fees due:

$363.00 ADMP Review Fee

+ 48.00 $24 x DISTURBED Acres (minimum = $24)

$ 411.00 **Total Fees Due**

Checklist:

☑ Fees submitted with ADMP Application

☑ Application signed and initialed by a Responsible Party

☑ Project Map (must be included)

☑ NOA(*) Sampling Reports (if applicable)

Is Project Located In Asbestos Review Area? ☑ YES ☐ NO	Professional Geologist Report Attached? ☑ YES ☐ NO
If "NO", Provide Date of NOA(*) Discovery:	Laboratory Report/Data Sheets Attached? ☑ YES ☐ NO
Has Professional Geologist Evaluated the Site for NOA? ☑ YES ☐ NO (If "NO" Proceed to # 6)	Map Showing Location(s) of NOA(*) (≥ 0.25%) Attached? ☑ YES ☐ NO

5. PROFESSIONAL GEOLOGIST INFORMATION ☐ N/A

Name Geocon Consultants, Inc.		
Address 3160 Gold Valley Dr., Ste #800	City/State Rancho Cordova, CA	Zip 95742
Contact David Bieber	Phone 916-852-9118	Fax 916-852-9132

6. MAP INFORMATION

(11x17 format or smaller preferred)

Map(s) clearly indicating the following MUST be included:

- ☑ Property lines / boundaries
- ☑ Adjacent streets / easements
- ☑ Areas to be disturbed or graded
- ☐ Trenching areas
- ☐ Excavation sites
- ☐ Storage areas / piles
- ☐ Staging areas for removal
- ☐ Truck routes
- ☐ On-site parking lots
- ☑ Landmarks and roads
- ☐ NOA Sampling locations *(Indicate if ≥ 0.25% NOA(*))*
- ☑ Location(s) of placement of NOA(*) containing excavated soils

7. PROJECT TYPE

Activity: (Check all that apply)

- ☐ Residential Construction
- ☐ Grading
- ☐ Road Construction
- ☐ Road Maintenance
- ☐ Housing Development
- ☐ Commercial Property Development
- ☐ Pool Construction
- ☐ Trenching / Utilities Work
- ☐ Landscaping
- ☑ Other (please describe): Permanent Stockpile

8. LARGE OPERATIONS (> 50 acres of DISTURBED surface) ☑ N/A

Additional requirements (Rule 223-2.7):

- Large Operations must include Dust Controls Measures specified in Tables 5-6 of Rule 223-2.
  - ☐ Maintain daily records to document the specific dust control actions taken
  - ☐ Onsite Dust Control Supervisor (available within 30 minutes during working hours):

Name: _____ Phone/Mobile Number: _____

9. POTENTIAL SOURCES OF FUGITIVE DUST EMISSIONS

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Asbestos Warning Signs must be posted at main entrances to the project (Rule 223-2.4.D)

Activity: (Check all that apply)

- ☑ Disturbing Soil
- ☐ Clearing and Grubbing
- ☐ Grading
- ☐ Backfilling
- ☐ Clearing Forms, Foundations and Slabs
- ☐ Demolition – Mechanical/Manual
- ✓ Large Earth-moving Equipment Operations
- ✓ Importing/Exporting of Bulk Materials
- ☐ Landscaping
- ✓ Road Construction / Maintenance
- ✓ Stockpiles/Bulk Material Handling
- ☐ Traffic Areas for Construction Activities
- ☐ Trenching
- ☐ Truck Loading
- ☐ Unpaved Road/Parking Lots
- ☐ Blasting
- ☐ Other: _____

ASBESTOS DUST MITIGATION PLAN APPLICATION

EL DORADO COUNTY AIR QUALITY MANAGEMENT DISTRICT

10. SOIL DISTURBANCE ACTIVITIES

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend soil disturbing activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures

Controls for soil distrurbing activities: (Check all that apply)

- ☑ Application of water, as necessary, prior and during earthmoving or land clearing activities (maintain live perennial vegetation where possible)
- ☐ Pre-wetting the ground to the depth of the anticipated cuts
- ☑ Stabilize soils once soils disturbing activities are complete
- ☑ Any other measure(s) as effective as the measures listed above (please describe)

Permanent erosion control measures.

11. ACTIVE STORAGE PILES ☐ N/A

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

The following control measure MUST be addressed:

- ☑ Keep active storage piles adequately wetted or covered with tarps (please describe):

Stockpile will be watered to control dust

- ☑ When handling bulk material apply water or chemical/organic stabilizers/suppressants
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

Initial: MB

Responsible Person

*: NOA(*) – Naturally Occurring Asbestos (see "Western El Dorado County Asbestos Review Areas" Map)

ASBESTOS DUST MITIGATION PLAN APPLICATION

EL DORADO COUNTY AIR QUALITY MANAGEMENT DISTRICT

12. INACTIVE STORAGE PILES ☐ N/A

(not disturbed for more than 7 consecutive days)

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

Control for disturbed surface areas and storage piles that will remain inactive for more than seven (7) days shall include one or more of the following: (Check all that apply)

- ☑ Keep the surface adequately wetted
- ☐ Establish and maintenance of surface crusting sufficient to satisfy the test in Rule 223-2.10.C or Title 14 subsection §93105(h)(6)
- ☐ Application of chemical dust suppressants or chemical stabilizers according to the manufacturer's recommendations
- ☑ Covering with tarp(s) or vegetative cover
- ☐ Installation of wind barriers of fifty (50) percent porosity around three (3) sides of a storage pile
- ☐ Installation of wind barriers across open areas
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

13. TRACK-OUT PREVENTION

- Any visible track-out on a paved public road where vehicles enter and exit the work area must be **IMMEDIATELY** removed from paved public roads. Removal shall be accomplished by using wet sweeping or a HEPA filter equipped vacuum device or flushing with water (if not in violation of any National Pollutant Discharge Elimination System permit program). Applicable Best Management Practices included in Table 3 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A. ***Note: The use blower devices, or dry rotary brushes, is expressly prohibited!***

Other control measures: (Check all that apply)

- ☑ A gravel pad designed using good engineering practices to clean the tires of exiting vehicles
- ☐ Grizzlies, or similar devices designed to remove mud/dirt from tires
- ☐ A tire shaker
- ☐ A wheel wash system (mechanical or manual)
- ☐ Paving of interior roads
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

14. BLASTING ACTIVITIES ☑ N/A

Must notify AQMD two (2) hours prior to blast!

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend blasting activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures. Consider wind direction with respect to property line and nearby residences

Controls for blasting activities: (Check all that apply)

- ☐ Pre-wetting blast area
- ☐ Place blast mats or soil mounds over charges
- ☐ Stabilize soils once blasting activities are complete
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

15. TRAFFIC CONTROL ON ON-SITE UNPAVED ROADS, PARKING LOTS AND STAGING AREAS ☐ N/A

The following control measure MUST be addressed:

- A maximum speed limit of fifteen (15) miles per hour (mph) or less

Additional control measures: (Check all that apply)

- ☑ Water every two hours of active operation or sufficiently often to keep the area adequately wetted
- ☐ Apply chemical dust suppressants consistent with manufacturer's directions
- ☐ Maintain a gravel cover with a silt content that is less than five (5) percent and asbestos content that is less than 0.25 percent, as determined using an approved asbestos bulk test method, to a depth of three (3) inches on the surface being used for travel
- ☑ Direct construction traffic over established haul routes
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

EL DORADO COUNTY AIR QUALITY MANAGEMENT DISTRICT

16. MANAGEMENT OF EXCAVATED SOILS

The owner and/or operator MUST ensure that procedures and documentation per Rule 223-2.6.D. are obtained and retained.

☑ **On-Site Disposition**. Where feasible, excavated soils should be placed into fills elsewhere on the project.

- **Location**(s) of removal and placement quantities and location(s) of fills must be documented **and records retained for a period of ten (10) years.**
- Fills, with a NOA(*) content ≥ 1.0% or when visually evident fibrous materials likely to be NOA(*) are present, located in residential landscaping areas shall be covered by at least two feet (24 inches) of non-asbestiform cover soil material, or by concrete or asphalt paving.

☐ **Off-Site Disposition**. For any **soils** transported off-site the following information must be documented and retained for a period of at least 3 years (Rule 223-2.6.D.3).

- Originating project information (name, address, location)
- Laboratory results/report for NOA(*) soil testing done at the project location
- Date(s) of off-site transport(s) of excavated soils
- Location(s) where excavated soils were transported to
- Total quantity transported to each location
- Intended usage (fill, surface application), if the final destination is other than Class II or Class III landfill disposal
- **Location to receive exported soils**: _____

_____

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

17. OFF-SITE TRANSPORT ☑ N/A

The owner and/or operator must ensure that no trucks are allowed to transport excavated material off-site unless:

- Trucks are maintained such that no spillage can occur from holes or other openings in cargo compartments
- Loads are adequately wetted

☑ Water applied, if necessary, to the top of load

AND either: (Check all that apply)

☐ Covered with tarps or other suitable cover

☐ Trucks loaded such that the freeboard is not less than six (6) inches (material does not touch the front, back or sides of the cargo compartment at any point less than six inches from the top)

☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

ASBESTOS DUST MITIGATION PLAN APPLICATION

EL DORADO COUNTY AIR QUALITY MANAGEMENT DISTRICT

18. POST CONSTRUCTION STABLIZATION OF DISTURBED AREAS

■ Upon completion of all phases of the project, but **no later than 30 days following the end of soil disturbing activities**, all disturbed surfaces with naturally occurring asbestos content of equal to or greater than 0.25% shall be stabilized using one or more of the following methods:

- [x] Establish a vegetative cover (less than 30% of disturbed ground exposed within 90 days of planting, and at all times thereafter):
- [ ] Placement of at least three (3.0) inches of non-asbestos containing material on disturbed soil areas in residential and nonresidential areas;
- [ ] Placement of a total of at least twelve (12) inches or the maximum depth of irrigation improvements, whichever is higher, of non-asbestos containing material on disturbed soil areas in residential landscaping areas with NOA(*) content greater than 0.25% or when visually evident fibrous materials likely to be asbestos are present;
- [ ] Paving, decking, building foundations, swimming pool structure, flatwork or retaining walls;
- [ ] Other measures approved by the APCO: _____

19. STATEMENT OF PROJECT'S RESPONSIBLE PERSON (Owner or Licensed Contractor acting on behalf of the Owner)

"I am familiar with the Rules and Regulations of the El Dorado County AQMD that are applicable to my project and I certify that the information and the data submitted with the application are true with regards to the project activities and/or equipment which are the subjects of this application". **A copy of this plan must be provided to all contractors and be available on site at all times.**
NOTE: Any changes to this plan MUST be pre-approved by the AQMD.

Sample Population B
(Borings B46 through B49 and B187 through B194 – Soundwall)

SAMPLE INTERVAL (feet)	90% TOTAL LEAD UCL * (mg/kg)	95% TOTAL LEAD UCL * (mg/kg)	TOTAL LEAD MEAN (mg/kg)	MINIMUM VALUE (mg/kg)	MAXIMUM VALUE (mg/kg)
0.0 to 3.0	35.6	38.7	21.7	0.9	95

* UCLs could not be calculated for each sample interval due to insufficient number of data, thus UCLs were calculated using all samples collected from this area.

5.4 NOA Results

Thirty composite soil samples were analyzed by EMSL for asbestos by the PLM method using the CARB 435 sample preparation method. An additional rock chip sample was analyzed by the PLM method and CARB 435 sample preparation. A summary of asbestos analytical results is presented in Table 4. Laboratory reports and COC documentation are presented in Appendix B.

One sample (NOA24) was reported to contain asbestos below the CARB regulatory action limit of 0.25% and the rest were reported as non-detect. TEM analysis was not performed on sample NOA24 because of the low percentage of asbestos reported. Additionally, TEM analysis is primarily used to determine the type of asbestos present and was not deemed necessary for this study.

5.5 Lead-containing Paint Sample Analytical Results

Five paint-chip samples were collected from the yellow median traffic stripe within the project boundaries. Paint-chip samples were analyzed for total lead and chromium. The analytical results of the LCP samples are summarized in Table 5. Laboratory reports and COC documentation are presented in Appendix B.

Total lead and chromium were detected in each sample submitted for analysis. Total lead was reported to range from 290 to 1,000 mg/kg, at or less than the California hazardous waste threshold (TTLC) for lead of 1,000 mg/kg. Total chromium was reported to range from 90 to 240 mg/kg, less than the California hazardous waste threshold (TTLC) for chromium of 2,500 mg/kg. Since the samples were only collected for screening purposes, WET analysis was not performed.

Asbestos Dust Mitigation Plan (ADMP) Application

(For projects greater than 20 yd³ and located in Naturally Occurring Asbestos (NOA) designated areas as shown on the Western El Dorado County Asbestos Review Map, or where NOA had been discovered)

Please complete every section and initial each page – incomplete applications will be returned.

1. ADMINISTRATIVE INFORMATION

Size of Project

Estimated Size of DISTURBED area (acres) *(Round up to nearest acre)*: 5.0 ACRES

NOTE: If size of DISTURBED area exceeds 50 acres, the project is designated as a "Large Operation" and additional requirements apply.

Estimated VOLUME (cubic yards) of graded Material: 120,000 CY

NOTE: If VOLUME of graded material exceeds 20 cubic yards, ADMP must be prepared and submitted.

Will Export Soils be Generated? ☒ YES ☐ NO

If "YES": (1) Exported soil management MUST comply with Rule 223-2.6.D.3.
(2) Address of the receiving site MUST be provided in Section 16.

Fees and Checklist

Fees due:

$380.00 (5) ADMP Review Fee

+ 130.00 $26 x DISTURBED Acres (minimum = $26)

$510.00 **Total Fees Due**

Checklist:

- ☒ Fees submitted with ADMP Application
- ☒ Application signed and initialed by a Responsible Party
- ☒ Project Map (must be included)
- ☐ NOA Sampling Reports (if applicable)

2A. OWNER INFORMATION

Name: EDH 52, GENERAL PARTNERSHIP		
Mailing Address: 7700 COLLEGE TOWN DRIVE, Suite 101		
City/State: SACRAMENTO, CA	Zip: 95826	
Contact Name: ANGELO K. TSAKOPOULOS		
Phone: 916-383-2500	Email/Fax: angelo@aktinvestments.com	

2B. CONTRACTOR INFORMATION

☐ N/A

Name: TBD		
Mailing Address:		
City/State:	Zip:	
Site Contact Name:

3. PROJECT INFORMATION – Part I

Address: HWY 50 & SILVA VALLEY PARKWAY	Project Description: BORROW SITE FOR HIGHWAY INTX
City/State/Zip: EL DORADO HILLS, CA 95762	Est. Project Start Date: TBD
Parcel (APN) Number: 122-720-09	Est. Completion Date of Soil Disturbing Activities: TBD

ADMP MUST BE AVAILABLE ON SITE AT ALL TIMES

ASBESTOS DUST MITIGATION PLAN APPLICATION

COUNTY OF EL DORADO AIR QUALITY MANAGEMENT DISTRICT

4. PROJECT NOA INFORMATION – Part II

Is Project Located In Asbestos Review Area? ☐ YES ☒ NO	Professional Geologist Report Attached? ☒ YES ☐ NO
If "NO", Provide Date of NOA Discovery: See Geotech Report dated 3/11/13; pg 4	Laboratory Report/Data Sheets Attached? ☒ YES ☐ NO
Has Professional Geologist Evaluated the Site for NOA? ☐ YES ☐ NO (If "NO" Proceed to # 6)	Map Showing Location(s) of NOA (≥ 0.25%) Attached? ☒ YES ☐ NO

5. PROFESSIONAL GEOLOGIST INFORMATION ☐ N/A

Name Blackburn Consulting		
Address 11521 Blocker Dr. Ste 110	City/State Auburn, CA	Zip 95603
Contact Patrick Fischer	Phone (530) 887-1494	Fax

6. MAP INFORMATION

(11x17 format or smaller preferred)

Map(s) clearly indicating the following MUST be included:

- ☑ Property lines / boundaries
- ☑ Adjacent streets / easements
- ☑ Areas to be disturbed or graded
- ☐ Trenching areas
- ☒ Excavation sites
- ☐ Storage areas / piles
- ☐ Staging areas for removal
- ☐ Truck routes
- ☐ On-site parking lots
- ☐ Landmarks and roads
- ☐ NOA Sampling locations *(Indicate if ≥ 0.25% NOA)*
- ☐ Location(s) of placement of NOA containing excavated soils

7. PROJECT TYPE

Activity: (Check all that apply)

- ☐ Residential Construction
- ☒ Grading
- ☐ Road Construction
- ☐ Road Maintenance
- ☐ Housing Development
- ☐ Commercial Property Development
- ☐ Pool Construction
- ☐ Trenching / Utilities Work
- ☐ Landscaping
- ☐ Other (please describe): _____

Initial: _____

Responsible Person

COUNTY OF EL DORADO AIR QUALITY MANAGEMENT DISTRICT

8. LARGE OPERATIONS (> 50 acres of DISTURBED surface) ☒ N/A

Additional requirements (Rule 223-2.7):

- Large Operations must include Dust Control Measures specified in Tables 5-6 of Rule 223-2.
  - ☐ Maintain daily records to document the specific dust control actions taken
  - ☐ Onsite Dust Control Supervisor (available within 30 minutes during working hours):

Name: _____ Phone/Mobile Number: _____

9. POTENTIAL SOURCES OF FUGITIVE DUST EMISSIONS

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Tables 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Asbestos Warning Signs must be posted at main entrances to the project (Rule 223-2.4.D)

Activity: (Check all that apply)

- ☑ Disturbing Soil
- ☒ Clearing and Grubbing
- ☒ Grading
- ☐ Backfilling
- ☐ Clearing Forms, Foundations and Slabs
- ☐ Demolition – Mechanical/Manual
- ☒ Large Earth-moving Equipment Operations
- ☒ Importing/Exporting of Bulk Materials
- ☐ Landscaping
- ☐ Road Construction / Maintenance
- ☒ Stockpiles/Bulk Material Handling
- ☒ Traffic Areas for Construction Activities
- ☐ Trenching
- ☒ Truck Loading
- ☒ Unpaved Road/Parking Lots
- ☒ Blasting
- ☐ Other: _____

Initial: _____
Responsible Person

ASBESTOS DUST MITIGATION PLAN APPLICATION

COUNTY OF EL DORADO AIR QUALITY MANAGEMENT DISTRICT

10. SOIL DISTURBANCE ACTIVITIES

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend soil disturbing activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures

Controls for soil distrurbing activities: (Check all that apply)

- [☑] Application of water, as necessary, prior and during earthmoving or land clearing activities (maintain live perennial vegetation where possible)
- [ ] Pre-wetting the ground to the depth of the anticipated cuts
- [x] Stabilize soils once soils disturbing activities are complete
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

11. ACTIVE STORAGE PILES ☐ N/A

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

The following control measure MUST be addressed:

- [X] Keep active storage piles adequately wetted or covered with tarps (please describe):

_____

_____

- [ ] When handling bulk material apply water or chemical/organic stabilizers/suppressants
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

Initial: _____

Responsible Person

ASBESTOS DUST MITIGATION PLAN APPLICATION

COUNTY OF EL DORADO AIR QUALITY MANAGEMENT DISTRICT

12. INACTIVE STORAGE PILES ☐ N/A

(not disturbed for more than 7 consecutive days)

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

Control for disturbed surface areas and storage piles that will remain inactive for more than seven (7) days shall include one or more of the following: (Check all that apply)

- [X] Keep the surface adequately wetted OR
- [X] Establish and maintenance of surface crusting sufficient to satisfy the test in Rule 223-2.10.C or Title 14 subsection §93105(h)(6) OR
- [X] Application of chemical dust suppressants or chemical stabilizers according to the manufacturer's recommendations OR
- [X] Covering with tarp(s) or vegetative cover
- [ ] Installation of wind barriers of fifty (50) percent porosity around three (3) sides of a storage pile
- [ ] Installation of wind barriers across open areas
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

13. TRACK-OUT PREVENTION

- Any visible track-out on a paved public road where vehicles enter and exit the work area must be **IMMEDIATELY** removed from paved public roads. Removal shall be accomplished by using wet sweeping or a HEPA filter equipped vacuum device or flushing with water (if not in violation of any National Pollutant Discharge Elimination System permit program). Applicable Best Management Practices included in Table 3 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A. ***Note: The use of blower devices, or dry rotary brushes, is expressly prohibited!***

Other control measures: (Check all that apply)

- [X] A gravel pad designed using good engineering practices to clean the tires of exiting vehicles OR
- [X] Grizzlies, or similar devices designed to remove mud/dirt from tires OR
- [X] A tire shaker OR
- [X] A wheel wash system (mechanical or manual)
- [ ] Paving of interior roads
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

_____

14. BLASTING ACTIVITIES ☐ N/A

Must notify AQMD two (2) hours prior to blast!

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend blasting activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures. Consider wind direction with respect to property line and nearby residences

Controls for blasting activities: (Check all that apply)

- [x] Pre-wetting blast area
- [x] Place blast mats or soil mounds over charges
- [ ] Stabilize soils once blasting activities are complete
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

15. TRAFFIC CONTROL OF ON-SITE UNPAVED ROADS, PARKING LOTS AND STAGING AREAS ☐ N/A

The following control measure MUST be addressed:

- A maximum speed limit of fifteen (15) miles per hour (mph) or less

Additional control measures: (Check all that apply)

- [x] Water every two hours of active operation or sufficiently often to keep the area adequately wetted OR
- [x] Apply chemical dust suppressants consistent with manufacturer's directions OR
- [ ] Maintain a gravel cover with a silt content that is less than five (5) percent and asbestos content that is less than 0.25 percent, as determined using an approved asbestos bulk test method, to a depth of three (3) inches on the surface being used for travel
- [x] Direct construction traffic over established haul routes
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

16. MANAGEMENT OF EXCAVATED SOILS

The owner and/or operator MUST ensure that procedures and documentation per Rule 223-2.6.D. are obtained and retained.

☒ **On-Site Disposition**. Where feasible, excavated soils should be placed into fills elsewhere on the project.

- **Location**(s) of removal and placement quantities and location(s) of fills must be documented **and records retained for a period of ten (10) years.**
- Fills, with a NOA content ≥ 1.0% or when visually evident fibrous materials likely to be NOA are present, located in residential landscaping areas shall be covered by at least two feet (24 inches) of non-asbestiform cover soil material, or by concrete or asphalt paving.

☒ **Off-Site Disposition**. For any **soils** transported off-site the following information must be documented and retained for a period of at least 3 years (Rule 223-2.6.D.3).

- Originating project information (name, address, location)
- Laboratory results/report for NOA soil testing done at the project location
- Date(s) of off-site transport(s) of excavated soils
- Location(s) of transported soil
- Total quantity transported to each location
- Intended usage (fill, surface application), if the final destination is other than Class II or Class III landfill disposal
- **Location to receive exported soils**: HIGHWAY 50 INTERCHANGE AT SILVA VALLEY PARKWAY AREA POTENTIALLY AREAS WITHIN 122-720-09 & 118-170-01,13,14,16,17 & 121-280-01, 24

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

17. OFF-SITE TRANSPORT ☐ N/A

The owner and/or operator must ensure that no trucks are allowed to transport excavated material off-site unless:

- Trucks are maintained such that no spillage can occur from holes or other openings in cargo compartments
- Loads are adequately wetted

☑ Water applied, if necessary, to the top of load

AND either: (Check all that apply)

☐ Covered with tarps or other suitable cover

☐ Trucks loaded such that the freeboard is not less than six (6) inches (material does not touch the front, back or sides of the cargo compartment at any point less than six inches from the top)

☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

Initial: _____

ASBESTOS DUST MITIGATION PLAN APPLICATION

COUNTY OF EL DORADO AIR QUALITY MANAGEMENT DISTRICT

18. POST CONSTRUCTION STABLIZATION OF DISTURBED AREAS

- Upon completion of all phases of the project, but **no later than 30 days following the end of soil disturbing activities**, all disturbed surfaces with naturally occurring asbestos content of equal to or greater than 0.25% shall be stabilized using one or more of the following methods:

  - [X] Establish a vegetative cover (less than 30% of disturbed ground exposed within 90 days of planting, and at all times thereafter):
  - [ ] Placement of at least three (3.0) inches of non-asbestos containing material on disturbed soil areas in residential and nonresidential areas;
  - [ ] Placement of a total of at least twelve (12) inches or the maximum depth of irrigation improvements, whichever is higher, of non-asbestos containing material on disturbed soil areas in residential landscaping areas with NOA content greater than 0.25% or when visually evident fibrous materials likely to be asbestos are present;
  - [ ] Paving, decking, building foundations, swimming pool structure, flatwork or retaining walls;
  - [ ] Other measures approved by the APCO: _____

19. STATEMENT OF PROJECT'S RESPONSIBLE PARTY
(Owner or Licensed Contractor acting on behalf of the Owner)

"I am familiar with the Rules and Regulations of the County of El Dorado AQMD that are applicable to my project and I certify that the information and the data submitted with the application are true with regards to the project activities and/or equipment which are the subjects of this application". **A copy of this plan must be provided to all contractors and be available on site at all times.**
NOTE: Any changes to this plan MUST be pre-approved by the AQMD.

Asbestos Dust Mitigation Plan (ADMP) Application

(For projects greater than 20 yd^3 and located in NOA(*) designated areas, or where NOA had been discovered)

Please complete every section and initial each page – incomplete applications will be returned.

1. ADMINISTRATIVE INFORMATION

Size of Project

Estimated Size of DISTURBED area (acres) *(Round up to nearest acre)*: 2.0

NOTE: If size of DISTURBED area exceeds 50 acres, the project is designated as a "Large Operation" and additional requirements apply.

Estimated VOLUME (cubic yards) of graded Material: 400

NOTE: If VOLUME of graded material exceeds 20 cubic yards, ADMP must be prepared and submitted. Should be NO - jw

Will Export Soils be Generated? ☑ YES ☑ NO

If "YES": (1) Exported soil management MUST comply with Rule 223-2.6.D.3. (2) Address of the receiving site MUST be provided in Section 16.

Fees and Checklist

Fees due:

$372.00 ADMP Review Fee

+ 50.00 $25 x DISTURBED Acres (minimum = $25)

$ 422.00 **Total Fees Due**

Checklist:

☑ Fees submitted with ADMP Application

☑ Application signed and initialed by a Responsible Party

☑ Project Map (must be included)

☐ NOA(*) Sampling Reports (if applicable)

8. LARGE OPERATIONS (> 50 acres of DISTURBED surface) ☑ N/A

Additional requirements (Rule 223-2.7):

- Large Operations must include Dust Controls Measures specified in Tables 5-6 of Rule 223-2.
  - ☐ Maintain daily records to document the specific dust control actions taken
  - ☐ Onsite Dust Control Supervisor (available within 30 minutes during working hours):

Name: _____ Phone/Mobile Number: _____

9. POTENTIAL SOURCES OF FUGITIVE DUST EMISSIONS

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Asbestos Warning Signs must be posted at main entrances to the project (Rule 223-2.4.D)

Activity: (Check all that apply)

☑ Disturbing Soil	☐ Road Construction / Maintenance
☐ Clearing and Grubbing	☑ Stockpiles/Bulk Material Handling
☐ Grading	☐ Traffic Areas for Construction Activities
☑ Backfilling	☑ Trenching
☐ Clearing Forms, Foundations and Slabs	☐ Truck Loading
☐ Demolition – Mechanical/Manual	☐ Unpaved Road/Parking Lots
☐ Large Earth-moving Equipment Operations	☐ Blasting
☑ Importing/Exporting of Bulk Materials	☑ Other: Most excavation will be trenching, but some drilling for utility poles
☐ Landscaping

ASBESTOS DUST MITIGATION PLAN APPLICATION

EL DORADO COUNTY AIR QUALITY MANAGEMENT DISTRICT

10. SOIL DISTURBANCE ACTIVITIES

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend soil disturbing activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures

Controls for soil distrurbing activities: (Check all that apply)

- [x] Application of water, as necessary, prior and during earthmoving or land clearing activities (maintain live perennial vegetation where possible)
- [ ] Pre-wetting the ground to the depth of the anticipated cuts
- [x] Stabilize soils once soils disturbing activities are complete
- [x] Any other measure(s) as effective as the measures listed above (please describe)

Excavated spoils that are placed back into the trenches will be sufficiently compacted to stabilize them

11. ACTIVE STORAGE PILES [ ] N/A

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

The following control measure MUST be addressed:

- [x] Keep active storage piles adequately wetted or covered with tarps (please describe):

Precautions such as these will be taken if conditions are such that fugitive dust is being generated.

- [ ] When handling bulk material apply water or chemical/organic stabilizers/suppressants
- [ ] Any other measure(s) as effective as the measures listed above (please describe)

12. INACTIVE STORAGE PILES ☑ N/A

(not disturbed for more than 7 consecutive days)

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.

Control for disturbed surface areas and storage piles that will remain inactive for more than seven (7) days shall include one or more of the following: (Check all that apply)

- ☐ Keep the surface adequately wetted
- ☐ Establish and maintenance of surface crusting sufficient to satisfy the test in Rule 223-2.10.C or Title 14 subsection §93105(h)(6)
- ☐ Application of chemical dust suppressants or chemical stabilizers according to the manufacturer's recommendations
- ☐ Covering with tarp(s) or vegetative cover
- ☐ Installation of wind barriers of fifty (50) percent porosity around three (3) sides of a storage pile
- ☐ Installation of wind barriers across open areas
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

13. TRACK-OUT PREVENTION

- Any visible track-out on a paved public road where vehicles enter and exit the work area must be **IMMEDIATELY** removed from paved public roads. Removal shall be accomplished by using wet sweeping or a HEPA filter equipped vacuum device or flushing with water (if not in violation of any National Pollutant Discharge Elimination System permit program). Applicable Best Management Practices included in Table 3 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A. ***Note: The use blower devices, or dry rotary brushes, is expressly prohibited!***

Other control measures: (Check all that apply)

- ☐ A gravel pad designed using good engineering practices to clean the tires of exiting vehicles
- ☐ Grizzlies, or similar devices designed to remove mud/dirt from tires
- ☐ A tire shaker
- ☐ A wheel wash system (mechanical or manual)
- ☐ Paving of interior roads
- ☑ Any other measure(s) as effective as the measures listed above (please describe)

The exact control measure(s) have not been developed, but will be determined in the field based on field conditions and specific equipment

14. BLASTING ACTIVITIES ☑ N/A

Must notify AQMD two (2) hours prior to blast!

- There shall be no visible emissions (0% opacity as determined in accordance with US EPA Method 9) at 25 feet from the point-of-origin and at the property line. Visible emissions shall not exceed 20% opacity as determined in accordance with US EPA Method 9 at the point-of-origin. Applicable Best Management Practices included in Table 1 - 4 of Rule 223-2 or similar effective measures shall be utilized to comply with standards per Rule 223-2.4.A.
- Suspend blasting activities when wind speeds are high enough to result in dust emissions in excess of standards in Rule 223-2.4.A, despite the application of dust mitigation measures. Consider wind direction with respect to property line and nearby residences

Controls for blasting activities: (Check all that apply)

- ☐ Pre-wetting blast area
- ☐ Place blast mats or soil mounds over charges
- ☐ Stabilize soils once blasting activities are complete
- ☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

15. TRAFFIC CONTROL ON ON-SITE UNPAVED ROADS, PARKING LOTS AND STAGING AREAS ☐ N/A

The following control measure MUST be addressed:

- A maximum speed limit of fifteen (15) miles per hour (mph) or less

Additional control measures: (Check all that apply)

- ☐ Water every two hours of active operation or sufficiently often to keep the area adequately wetted
- ☐ Apply chemical dust suppressants consistent with manufacturer's directions
- ☐ Maintain a gravel cover with a silt content that is less than five (5) percent and asbestos content that is less than 0.25 percent, as determined using an approved asbestos bulk test method, to a depth of three (3) inches on the surface being used for travel
- ☐ Direct construction traffic over established haul routes
- ☑ Any other measure(s) as effective as the measures listed above (please describe)

Water or dust suppressants shall be sprayed on unpaved traffic as needed if fugitive dust is generated.

16. MANAGEMENT OF EXCAVATED SOILS

The owner and/or operator MUST ensure that procedures and documentation per Rule 223-2.6.D. are obtained and retained.

☑ **On-Site Disposition**. Where feasible, excavated soils should be placed into fills elsewhere on the project.

- **Location**(s) of removal and placement quantities and location(s) of fills must be documented **and records retained for a period of ten (10) years.**
- Fills, with a NOA(*) content ≥ 1.0% or when visually evident fibrous materials likely to be NOA(*) are present, located in residential landscaping areas shall be covered by at least two feet (24 inches) of non-asbestiform cover soil material, or by concrete or asphalt paving.

Should not be checked ? JW

☑ **Off-Site Disposition**. For any **soils** transported off-site the following information must be documented and retained for a period of at least 3 years (Rule 223-2.6.D.3).

- Originating project information (name, address, location)
- Laboratory results/report for NOA(*) soil testing done at the project location
- Date(s) of off-site transport(s) of excavated soils
- Location(s) where excavated soils were transported to
- Total quantity transported to each location
- Intended usage (fill, surface application), if the final destination is other than Class II or Class III landfill disposal
- **Location to receive exported soils:** Excess spoils shall be disposed of at a location or locations that have not yet been determined. X JW

Fallback location is Recology Hay Rd Landfill, 6426 Hay Rd., Vacaville, CA X JW

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

17. OFF-SITE TRANSPORT ☑ N/A

The owner and/or operator must ensure that no trucks are allowed to transport excavated material off-site unless:

- Trucks are maintained such that no spillage can occur from holes or other openings in cargo compartments
- Loads are adequately wetted

☑ Water applied, if necessary, to the top of load

AND either: (Check all that apply)

☐ Covered with tarps or other suitable cover

☑ Trucks loaded such that the freeboard is not less than six (6) inches (material does not touch the front, back or sides of the cargo compartment at any point less than six inches from the top)

☑ Any other measure(s) as effective as the measures listed above (please describe)

Excavated material in trucks shall be wetted and covered as necessary to prevent fugitive dust.

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

18. POST CONSTRUCTION STABLIZATION OF DISTURBED AREAS

■ Upon completion of all phases of the project, but **no later than 30 days following the end of soil disturbing activities**, all disturbed surfaces with naturally occurring asbestos content of equal to or greater than 0.25% shall be stabilized using one or more of the following methods:

- ☐ Establish a vegetative cover (less than 30% of disturbed ground exposed within 90 days of planting, and at all times thereafter):
- ☑ Placement of at least three (3.0) inches of non-asbestos containing material on disturbed soil areas in residential and nonresidential areas;
- ☐ Placement of a total of at least twelve (12) inches or the maximum depth of irrigation improvements, whichever is higher, of non-asbestos containing material on disturbed soil areas in residential landscaping areas with NOA(*) content greater than 0.25% or when visually evident fibrous materials likely to be asbestos are present;
- ☐ Paving, decking, building foundations, swimming pool structure, flatwork or retaining walls;
- ☐ Other measures approved by the APCO: _____

19. STATEMENT OF PROJECT'S RESPONSIBLE PERSON
(Owner or Licensed Contractor acting on behalf of the Owner)

"I am familiar with the Rules and Regulations of the El Dorado County AQMD that are applicable to my project and I certify that the information and the data submitted with the application are true with regards to the project activities and/or equipment which are the subjects of this application". **A copy of this plan must be provided to all contractors and be available on site at all times.**
NOTE: Any changes to this plan MUST be pre-approved by the AQMD.

16. MANAGEMENT OF EXCAVATED SOILS

The owner and/or operator MUST ensure that procedures and documentation per Rule 223-2.6.D. are obtained and retained.

☒ N/A **On-Site Disposition**. Where feasible, excavated soils should be placed into fills elsewhere on the project.

- **Location**(s) of removal and placement quantities and location(s) of fills must be documented **and records retained for a period of ten (10) years.**
- Fills, with a NOA content ≥ 1.0% or when visually evident fibrous materials likely to be NOA are present, located in residential landscaping areas shall be covered by at least two feet (24 inches) of non-asbestiform cover soil material, or by concrete or asphalt paving.

N/A ☐ **Off-Site Disposition**. For any **soils** transported off-site the following information must be documented and retained for a period of at least 3 years (Rule 223-2.6.D.3). (THIS IS AN IMPORT PROJECT)

- Originating project information (name, address, location)
- Laboratory results/report for NOA soil testing done at the project location
- Date(s) of off-site transport(s) of excavated soils
- Location(s) of transported soil
- Total quantity transported to each location
- Intended usage (fill, surface application), if the final destination is other than Class II or Class III landfill disposal
- **Location to receive exported soils**: _____

N/A

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

17. OFF-SITE TRANSPORT ☐ N/A

DEMOLITION DEBRIS

The owner and/or operator must ensure that no trucks are allowed to transport excavated material off-site unless:

- Trucks are maintained such that no spillage can occur from holes or other openings in cargo compartments
- Loads are adequately wetted

☑ Water applied, if necessary, to the top of load

AND either: (Check all that apply)

☐ Covered with tarps or other suitable cover

N/A ☐ Trucks loaded such that the freeboard is not less than six (6) inches (material does not touch the front, back or sides of the cargo compartment at any point less than six inches from the top)

☐ Any other measure(s) as effective as the measures listed above (please describe)

_____

_____

_____

NOTE: It is the owner/operator responsibility that final disposition (usage or disposal) and transport of excavated materials from the project are in compliance with pertinent federal, state and local rules and regulations, including CA Title 17, Section 93106, Asbestos Airborne Toxic Control Measure for Surfacing Applications.

18. POST CONSTRUCTION STABLIZATION OF DISTURBED AREAS

■ Upon completion of all phases of the project, but **no later than 30 days following the end of soil disturbing activities**, all disturbed surfaces with naturally occurring asbestos content of equal to or greater than 0.25% shall be stabilized using one or more of the following methods:

- ☐ Establish a vegetative cover (less than 30% of disturbed ground exposed within 90 days of planting, and at all times thereafter):
- ☐ Placement of at least three (3.0) inches of non-asbestos containing material on disturbed soil areas in residential and nonresidential areas;
- ☐ Placement of a total of at least twelve (12) inches or the maximum depth of irrigation improvements, whichever is higher, of non-asbestos containing material on disturbed soil areas in residential landscaping areas with NOA content greater than 0.25% or when visually evident fibrous materials likely to be asbestos are present;
- ☐ Paving, decking, building foundations, swimming pool structure, flatwork or retaining walls;
- ☒ N Other measures approved by the APCO: PERMANENT EROSION CONTROL PER PROJECT PLANS

19. STATEMENT OF PROJECT'S RESPONSIBLE PARTY
(Owner or Licensed Contractor acting on behalf of the Owner)

"I am familiar with the Rules and Regulations of the County of El Dorado AQMD that are applicable to my project and I certify that the information and the data submitted with the application are true with regards to the project activities and/or equipment which are the subjects of this application". **A copy of this plan must be provided to all contractors and be available on site at all times.**
NOTE: Any changes to this plan MUST be pre-approved by the AQMD.

County of El Dorado

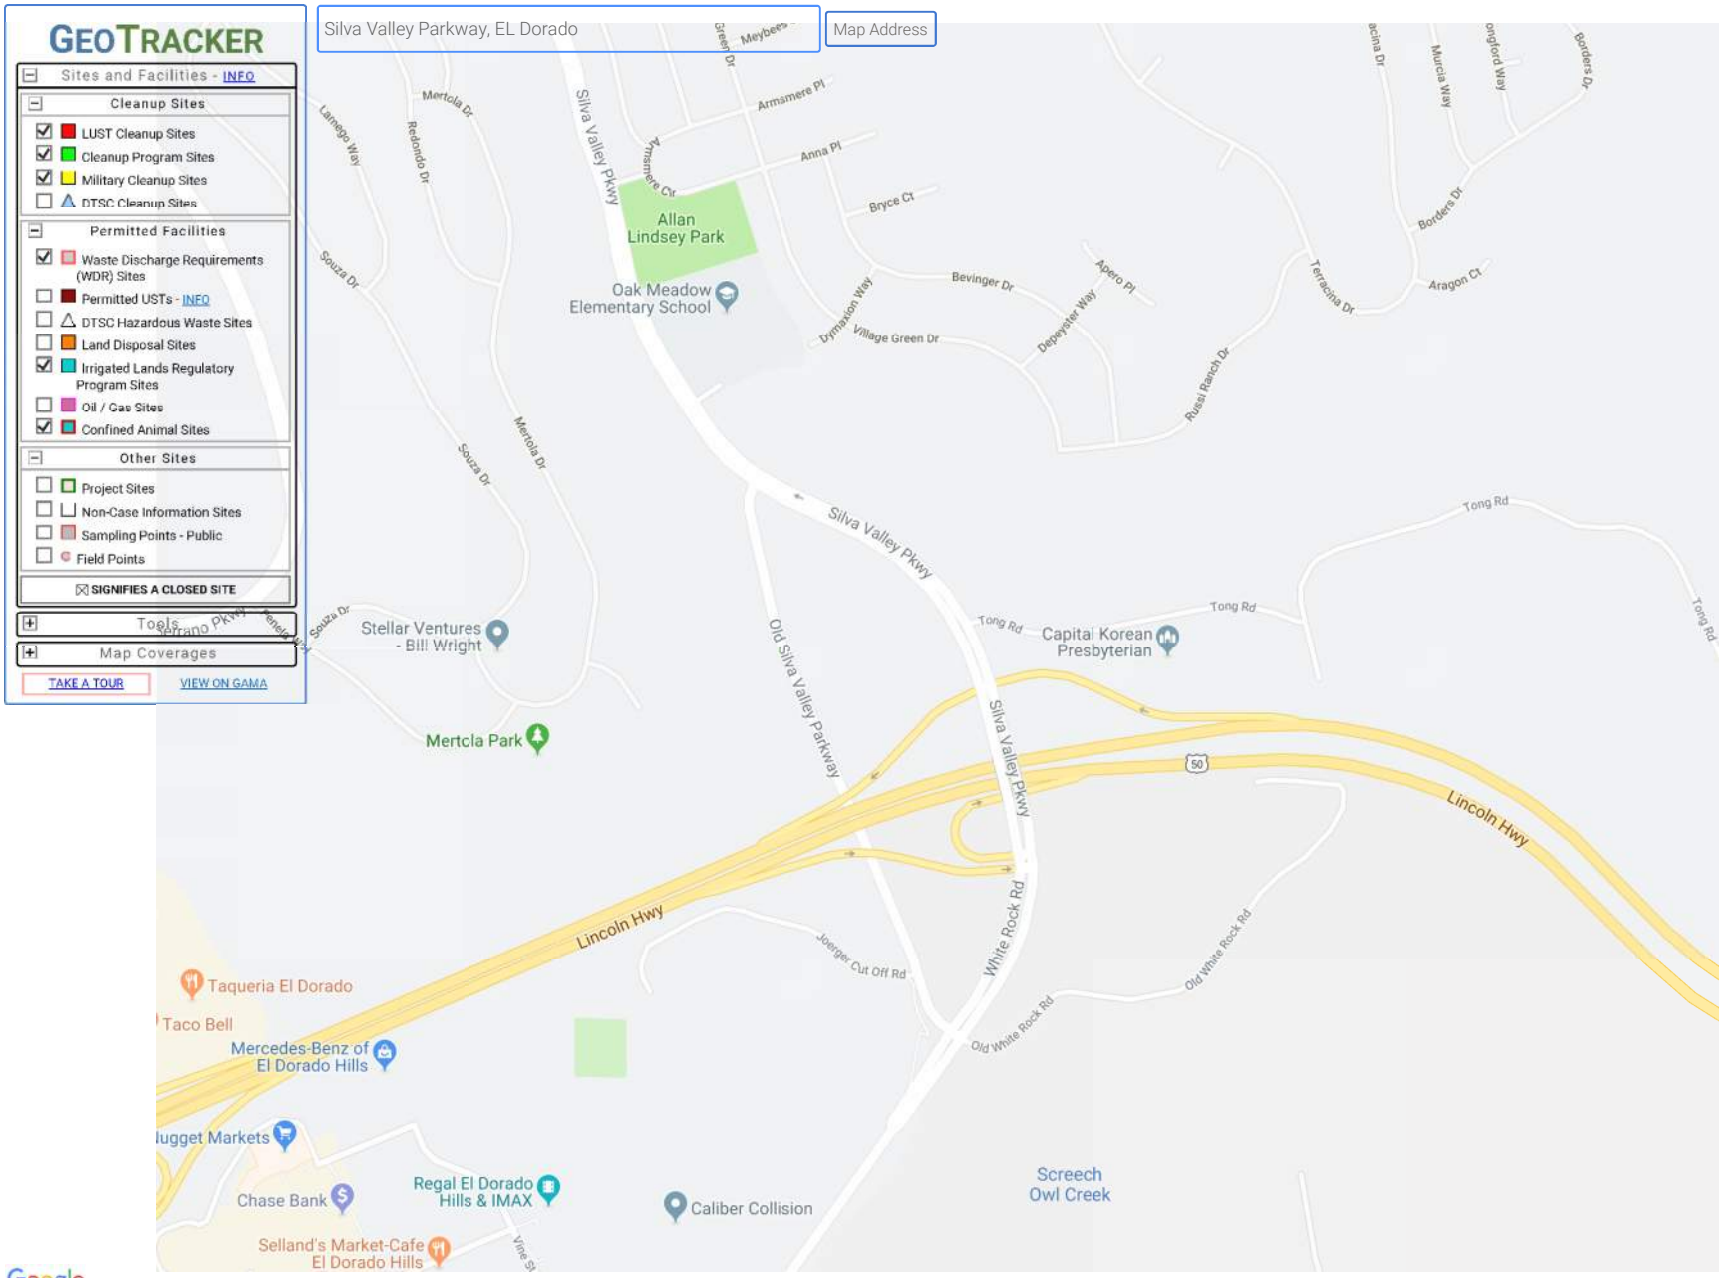
The Gold Standard in Public Service

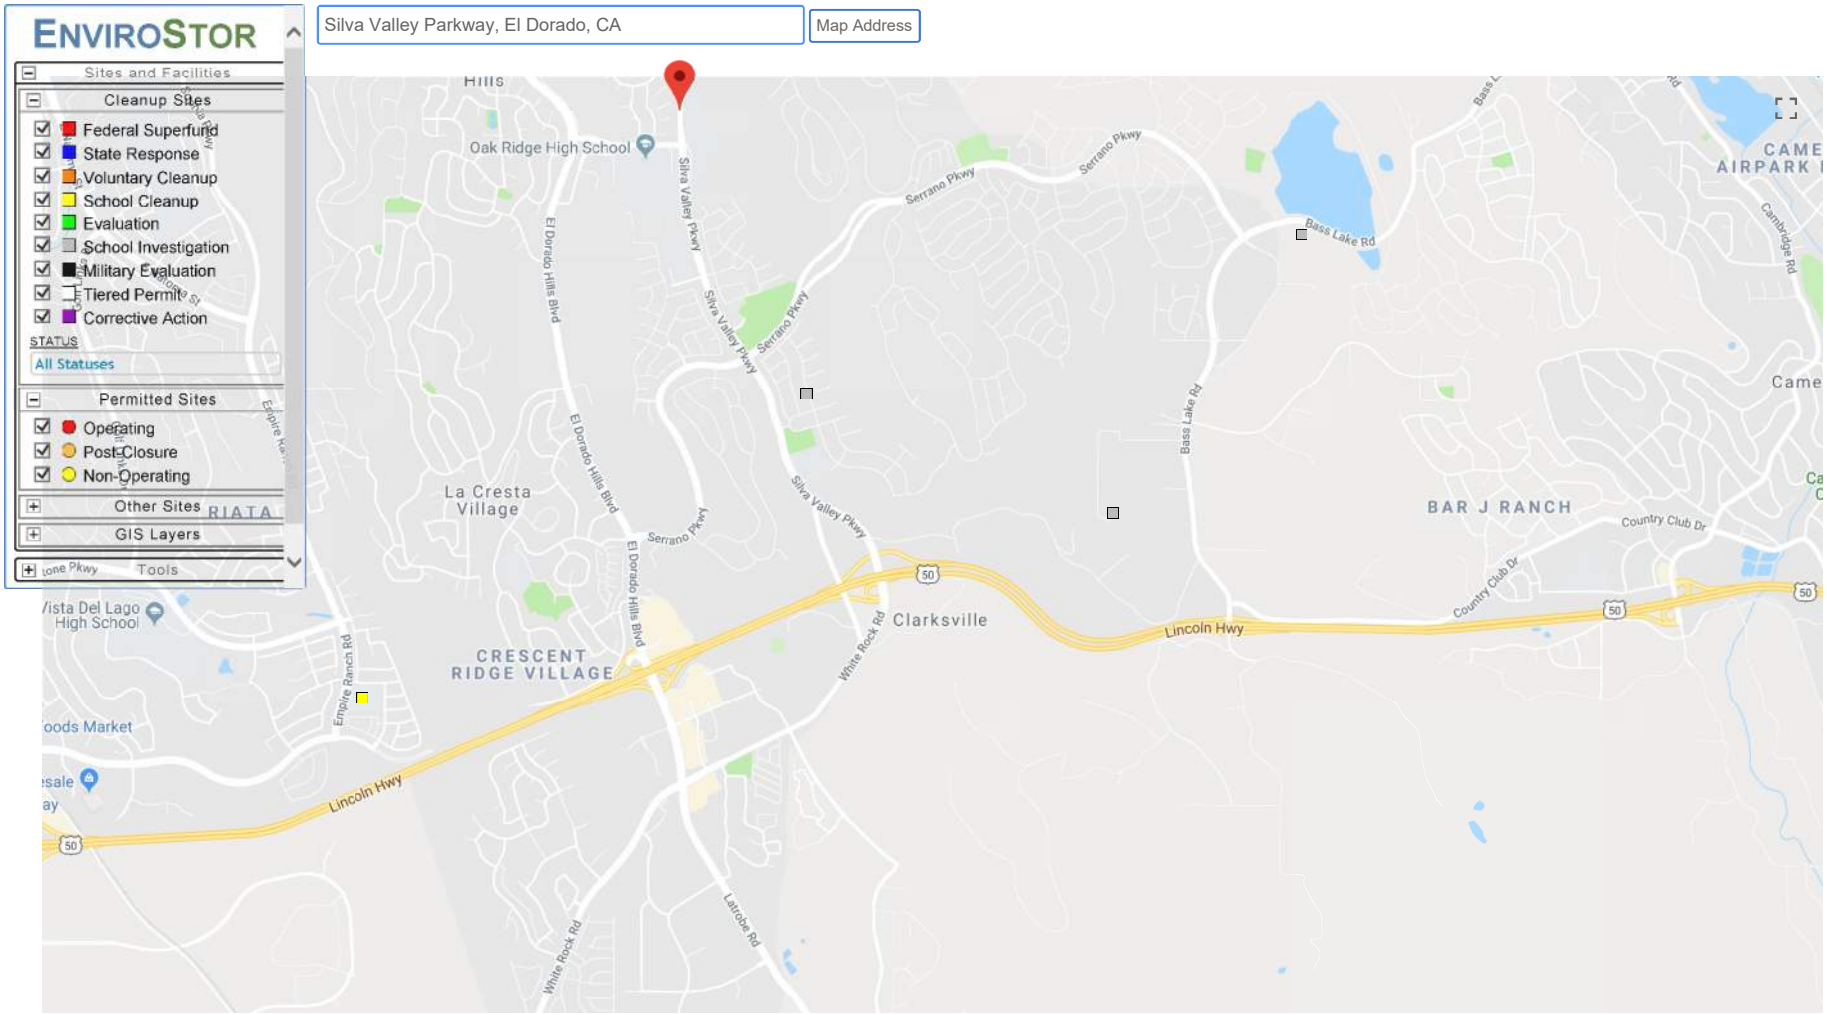
Public Records

Dear Ms. Dandridge-Perry,



The Environmental Management Department has concluded its search and has determined that there are no records available responsive to your public records request P002246-071919 for the vacant properties identified in El Dorado Hills.

This confirms closure of your request. Thank you for using the County's WebQA system.



Regards,

Tom Meyer
Administrative Analyst
Environmental Management Department

To monitor the progress or update this request please log into the El Dorado County Public Records Center.

EDR Environmental Lien and AUL Search

The EDR Environmental Lien Search Report provides results from a search of available current land title records for environmental cleanup liens and other activity and use limitations, such as engineering controls and institutional controls.

A network of professional, trained researchers, following established procedures, uses client supplied address information to:

- search for parcel information and/or legal description;
- search for ownership information;
- research official land title documents recorded at jurisdictional agencies such as recorders' offices, registries of deeds, county clerks' offices, etc.;
- access a copy of the deed;
- search for environmental encumbering instrument(s) associated with the deed;
- provide a copy of any environmental encumbrance(s) based upon a review of key words in the instrument(s) (title, parties involved, and description); and
- provide a copy of the deed or cite documents reviewed.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

Subject: **Initial Site Assessment**
Silva Valley Pkwy/SR50 Interchange
03-ED-50, KP 3.1 (PM 1.7)
El Dorado Hills, California

Dear Mr. Melis:

In accordance with our June 14, 2005, agreement, Blackburn Consulting, Inc. (BCI) prepared this Initial Site Assessment (ISA) for a proposed new interchange located east of the Silva Valley Road underpass on State Route 50 (SR50), near El Dorado Hills, California. The purpose of this assessment is to identify soil and groundwater contamination issues in the area of the proposed interchange.

Our investigation did not reveal the presence of significant hazardous materials impaets to the parcels located within the proposed project limits. Our report presents information about the minor hazardous materials issues noted in the project area.

Thank you for selecting BCI to assist you on this project. Please call if you have questions or require additional information.

Sincerely,

BLACKBURN CONSULTING

INVESTIGATIVE SUMMARY

This section summarizes soil and groundwater contamination issues that could impact land acquisition and/or construction of the proposed improvements for the Silva Valley Parkway/SR50 Interchange project. Contamination and hazardous materials impacts along the proposed roadway widening corridor appear minimal, and are not expected to significantly affect the project. However, the following potential items of concern were identified. Parcels are identified by the Mark Thomas and Company (MTCo) assigned Parcel Number, ("Property Owner Information," Plan Sheet 1, March 22, 2006), followed by the business/owner name and the assessors parcel number (APN).

Sites with Potential Contamination/Hazardous Materials Issues

- PARCEL 10, "PG&E CLARKSVILLE ELECTRICAL SUBSTATION" – APN 107-130-06

Parcel is subject to partial acquisition. No site specific hazardous material issues were identified through the commercial database search. Based on use and age of the site, the substation is considered a potential risk for PCB contamination from older transformers and a risk for potential petroleum hydrocarbon contamination from leaking coolant oils and site maintentance activities. We recommend contacting PG&E and obtain a statement of fact addressing potential contamination/hazardous materials. PG&E needs to provide a "clean site" record. If a statement can not be provided, we recommend limited soil sampling and analysis within the potential acquisistion areas of the Parcel. Associated with Parcel 10 by proximity, we identified a former gas station/commercial structure along the old, two-lane SR50, as shown on the 1952 and 1961 airphotos. Although the structures were removed for the widening of SR50, we can not rule out the potential for petroleum hydrocarbon impacts to the subsurface, in the general area of Joeger Cutoff Rd, between the PG&E substation and SR50.

- PARCEL 5, "LAFONTSEE PROPERTY" – APN 108-070-0310

Parcel is subject to partial acquisition. No specific hazardous material issues were identified in the database search. The site's previous residential structure and outlying storage structures are removed, but many discarded objects, domestic-appearing waste, and smaller wooden-framed, delapidated structures remain. Historical aerial photos exhibited numerous automobiles, trucks, commercial truck trailers, boats, and farm vehicles on the site. Based on airphotos and our site reconnaissance, many of these items appear abandoned.

Common contamination/hazardous materials issues associated with the identified land use include: 1) potential petroleum hydrocarbon (oil) spillage, 2) leach fields and septic tanks, and 3) buried heating oil tanks, 4) asbestos containing building materials (ACM), and 5) lead-containing paint (LCP). Although none of these were positively identified in this ISA, plans for construction, and/or complete or partial site acquisition, should account for the potential of encountering one or more of these issues.

We recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM, and his responsibility to respond accordingly. If potentially hazardous materials are encountered during grading operations, the local environmental health department and fire department should be notified.

- "SHELL", (ADJACENT TO PARCEL 32) - APN UNKNOWN

This is an active, petroleum fuel service station. No specific hazardous material issues were identified in the database and website searches. However, it appears that a Phase II investigation was recently conducted at the site, as indicated by the presence of at least ten, 55-gal drums, each mark as "hazardous waste". To determine the current status of possible clean-up activities, we recommend a review of existing regulatory documentation, which may be obtained from the local environmental health department, the RWQCB, and/or the site owner. Current plans do not include acquisition of this site; however groundwater and/or soil contamination could impact road widening or related project improvement activities at the adjacent properties, which includes Parcels 32 (APN 107-680-0910), 33 (APN 107-680-1010), and 34 (APN 107-680-0810).

- PARCEL 25, WILMINGTON TRUST/TOSCO TRUST" (UNION 76) - APN 107-120-0410

Parcel is subject to partial acquisition. This is an active, petroleum fuel service station. No specific hazardous material issues were identified in the database search. However, this site will require further assessment. Initially, further assessment should include a review of existing documentation from the local environmental health department, the RWQCB, and the site owner. If building demolition is planned, the existing structures need to be assessed for potential hazardous materials, such as LCP and ACM.

- PARCEL 21, "SERRANO ASSOCIATES" - APN 114-160-19

Parcel is subject to partial acquisition. No specific hazardous material issues were identified in the database search. Remnant structures were observed adjacent to the north (west-bound) side of SR50, approximately 600 feet west of the Silva Valley Parkway underpass. A house structure, barns, warehouse and associated improvements are observed in historical air photos. Common contamination/hazardous materials issues associated with the identified land use are: 1) ACM and LCP, 2) unidentified leach fields/septic tanks and buried heating oil tanks, and 3) ADL from the immediately adjacent SR50.

The presence of these one or more of these materials could affect the value of the parcel. If this project includes acquisition and demolition of any of the existing structures, then the structures should be assessed for potential ACM and LCP prior to acquisition. Assessment results will be used to estimate the financial impact to the project. Results of the assessment shall also be included in the plans and specifications (bid documents) so the contractors can plan for worker safety and material handling and disposal issues. Based on the proximity to SR50, some level of ADL may be present in the shallow subsurface soils adjacent to the freeway. ADL recommendations are presented in the section titled "General Contamination/Hazardous Materials Issues" of this report.

- PARCELS 13 AND 14, "KFRD INVESTORS INC. & TONG RANCH LLC" - APN 108-070-0510 AND 108-070-0610

Parcels are subject to partial or complete acquisition. No specific hazardous material issues were identified in the database search. During our site reconnnaissance, we noted poor housekeeping practices along Tong Road, where it passes through the two properties. We observed 55-gal drums, rusting machinery, trash and rubbish, and above ground fuel storage tanks (AST). Existing structures (large barn, mobile home, small sheds, etc.) may present an ACM and LCP issue if demolition is planned. Other issues include encountering unidentified items such as leach fields/septic tanks and buried heating oil tanks. An old cemetary is located in Parcel 13, close to SR50.

Existing structures subject to demolition need to be assessed for LCP and ACM, prior to preparation of construction documents. Additionally, we recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM during grading operations, and his responsibility to respond accordingly.
Based on the proximity to SR50, some level of ADL may be present in the shallow subsurface soils adjaeent to the freeway. ADL may also be present adjacent to White Rock Road. ADL recommendations are presented in the section titled "General Contamination/Hazardous Materials Issues" of this report.

- PARCEL 31, "SYERS PROPERTIES, LLC" (VALERO SERVICE STATION) – APN 107-130-5010

Parcel does not appear to be subject to acquisition. The parcel is known as the "Town Center" shopping area. There is an active, petroleum fuel service station (Valero) located within the shopping center. We found no records of suspected soil and/or groundwater contamination from the searched database. Service stations are a principal concern for subsurface contamination. We recommend a local file search and review for additional environmental records at the EDCEHD and at the RWQCB and an interview with the current site owners.

- PARCEL 1, "EDH 52" - APN 108-030-1010

Parcel is subject to partial or complete acquisition. No specific hazardous material issues were identified at this site through the database search. The parcel consists of undeveloped grazing land that appears unused at the present. We observed remnant, concrete structures (ruins) and associated debris. We were unable to determine the past use of the concrete structure. These "ruins" are located east of Silva Valley Parkway, approximately 1,000 feet north of the existing underpass. The structure consists of a rectangular shaped, three-bin, concrete-walled basins, with concrete columns at the corners of each bin. Other outlying columns are located north and south of the described structure. Archeological research (LSA, 2006) indicates that this site was a ranch, and the owner had a fondness for constructing with concrete.

Issues associated with a former farm residence include leach fields/septic tanks and buried heating oil tanks. The remnant concrete structures need to be assessed for LCP and ACM, prior to demolition and preparation of construction documents. An assessment for the presenee of these materials may materially affect the purchase of the parcel. We recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM during grading operations, and his responsibility to respond accordingly.

General Contamination/Hazardous Materials Issues

- PESTICIDES

The project includes acquisition of former cattle grazing and crop land; however, it appears that most of the open land in the project vicinity was used for grazing. Therefore, there is low to moderate potential for residual pesticides, herbicides, and fungicides. Based on the reviewed data, there is no obvious evidence of pesticide mixing, storage and/or misuse within the proposed right-of-way acquisition areas. Nonetheless, agricultural chemicals are typically used on farm lands. BCI considers it possible that pesticides, herbicides, and fungicides have been applied and used within the properties identified by MTCo as properties of interest.

Residual pesticides from normal agricultural application are generally exempt from mandatory assessment. This does not, however, preclude their existence. For roadway right-of-way acquisition projects, requirements for additional investigation are not clearly established. Therefore, it's important that the County of El Dorado understand the issue so they can make an informed decision on how to proceed. At a minimum, for sites with potential right-of-way acquisition, we recommend the County obtain a statement from the current property owner regarding past agricultural chemical use. If the statement is conclusive and suggests that usage would not result in significant residual pesticides concentrations, then no further action, such as sample collection and analysis, would be required.

- NATURALLY OCCURRING ASBESTOS

The project site is located in a geologic region identified as having at or near surface naturally occurring asbestos (NOA) bearing rocks and soils. Consequently, any development and/or construction in this area must comply with applicable rules and regulations, as written by El Dorado County Environmental Health Department. NOA-bearing rocks and soils potentially affect all parcels.

The contractor shall have experience implementing El Dorado County's special NOA grading requirements. An NOA monitoring plan will be required prior to grading. Some of the plan elements include: 1) a geologist trained in the recognition of NOA should be intermittently present during grading operations, 2) the geologist shall observe site conditions and implement special grading conditions when NOA is present. BMPs for dust control should be practiced during all grading operations in El Dorado County.

- AERIALLY DEPOSITED LEAD

The proposed interchange improvements will include grading within the existing SR50 shoulders and right-of-way (ROW). Caltrans is likely to require an aerially deposited lead (ADL) investigation prior to construction. Soil that is potentially impacted by ADL and disturbed during grading activities is subject to Department of Toxic Substances Control (DTSC) definition for handling hazardous waste. California currently defines material containing lead concentrations above 350 parts per million (ppm) as subject to Class I hazardous waste disposal. If ADL is detected at concentrations requiring hazardous waste handling and disposal, then we recommend that the local Caltrans district office be contacted to determine the applicability of reusing ADL-impacted soil under the terms of the DTSC-issued "Lead-impacted Soil Reuse

Variance". If the variance is not available to this district, then lead containing soils may require disposal at a Class I landfill.

ADL may also be present on privately-owned parcels adjacent to SR50. The potential ADL impact is likely limited to surface and shallow subsurface soils located within 2 feet of the existing ground surface (DTSC, 1995; Caltrans, 1998), and within 150 ft of the existing freeway right-of-way (Caltrans, 1995). The following Parcels are identified as potentially ADL-impacted: Parcels 1, 6, 7, 8, 9, 10, 11, 12, 13, 14, 17, 18, 19, 22, 25, 26, 27, and 28. We recommend a minimum of one surface soil sample be obtained for ADL screening. The assessment should be performed on that portion of the parcel directly adjacent to and within 50 feet of the edge of pavement. Parcels with a long contiguaous portion of property adjacent to the freeway shall be sampled for ADL every 300 feet.

- TRANSFORMERS

The scope of this assessment did not include an inventory of past and present transformers along the alignment. However, BCI observed several pole-mounted transformers and high voltage power lines along the proposed SR 50 widening corridor, and along the existing Silva Valley Parkway, White Rock Road, Tong Road, and Joerger Cutoff Road. Many of these overhead electrical powerlines are located within the proposed right-of-way acquisition areas. The transmission lines and poles appear relatively new, and few of the transformers show signs of external rust or discoloration. The existing pole-mounted transfomers need to be considered potentially impacted if their removal or relocation is required during construction. Existing transformers should be checked for the presence of PCBs, and if present, they should be disposed of in accordance with current regulations. Surface mounted transformers and electrical switeh boxes were also observed within the project area, and may also constitute a potential PCB-impacted risk.

- YELLOW TRAFFIC STRIPES

Yellow traffic stripes are known to contain heavy metals such as lead and chromium at concentrations in excess of the hazardous waste thresholds established by the California Code of Regulations (CCR) and may produce toxic fumes when heated. Consequently, any yellow traffic striping removed from the existing surface streets and SR50 highway will require proper disposal, which may include disposal at a Class 1 disposal facility.

- UNDERGROUND PRODUCT DISTRIBUTION LINES

An assessment of utilities or buried petroleum product distribution lines is not within the scope of this ISA. We did not observe warning signs for petroleum product lines. We observed markings for gas, water, electric, sewer, and storm drain at various locations. A sewer lift-pump station is located along the west side of Silva Valley Road. These and other utilities are present throughout the proposed interchange improvement area. The database records do not indicate contamination resulting from utility spills; however, there is the potential for unidentified leaks.

1 INTRODUCTION

Mark Thomas & Company, Inc. retained Blackburn Consulting (BCI) to perform an Initial Site Assessment (ISA) for the El Dorado County Department of Transportation's proposed Silva Valley Parkway/SR50 Interchange project (03-ED-50, KP 3.1 (PM 1.7). The purpose of this assessment is to identify hazardous and potentially hazardous materials issues for parcels directly impacted by the proposed interchange project.

We show the general location of the project site on Figure 1. The proposed interchange improvements and identification of parcels impacted by the proposed project are shown on Figure 2.

1.1 Scope of Services

The purpose of this ISA is to:

- Identify known contamination as well as hazardous and potentially hazardous materials issues that may influence construction of the project, and
- Identify impacted parcels within the project area and assess the potential impacts to site acquisition and/or construction if all or a part of these must be acquired to facilitate the planned improvements.

To conduct this ISA, BCI:

- Received right-of-entry permits for the majority of parcels within the project area. Permits were obtained from the County of El Dorado, Department of Transportation (ELDOT) right-of-way staff. We provided ELDOT with 48-notice prior to parcel entry.
- Conducted a limited site reconnaissance to observe current land uses and indications of potential contamination on properties subject to partial or complete site acquisition, and to view publicly accessible portions of adjacent properties.
- Reviewed the site geology.
- Reviewed historical aerial photograph coverage and topographic map coverage of the project corridor and surrounding properties for indications of potential sources of contamination.
- Performed federal, state, and county records search for indications of the use, misuse, or storage of hazardous and/or potentially hazardous materials on or near the site. Environmental Data Resources, Inc. (EDR) of Southport, Connecticut, provided the federal, state, and county database search. We provide an electronic copy of EDR's report on a CD in Appendix A.
- Prepared this report to summarize the findings of our review, site reconnaissance, historical photographs, and regulatory records review. We identified potential contamination/hazardous materials impacts and provided recommendations for further investigation where necessary.

2 PROJECT DESCRIPTION AND LOCATION

2.1 Project Description

The interchange will eonnect Silva Valley Parkway, an arterial roadway linking approved development in El Dorado Hills, to State Route (SR) 50. The interchange will provide a needed eonnection, and relieve congestion at the existing El Dorado Hills/Latrobe Road interchange. There are several interchange configurations being evaluated, including variations on a Type L-9 partial cloverleaf interchange and a Type L-2 spread diamond interchange.

According to the preliminary site plan (MTCo, February 2006), this section describes parcels that may require partial or complete site acquisition to accommodate planned improvements. The current improvement plans also identifies parcels that are potentially impacted by the project, but which may not be subject to acquisition. We identify parcels by site name and APN. Each brief site description is followed by corresponding photo numbers. We provide a photograph of individual sites in Appendix B. We identify parcels by APN on Figure 2.

PARCEL 1, "EDH 52", APN 108-030-1010
Current interchange improvement plans require complete acquisition of this parcel. The parcel existing features include old foundations, pilasters, and concrete debris piles. The majority of the site is undeveloped barren land (Photos 15, 16, and 40 through 43).

PARCEL 2, "EL DORADO HILLS INVESTORS", APN 107-130-0110
Proposed for partial or complete site acquisition. Impact may be right-of-way acquisition along the property boundary with Tong Road. This parcel is currently undeveloped (Photo 13).

PARCEL 3, "COUNTY OF EL DORADO", APN 108-070-3210
Currently owned by the County. Proposed plans show an on- and off-ramp through the western part of the site. This parcel is currently undeveloped (Photo 17).

PARCEL 4, "CAPITAL KOREAN PRESBYTERIAN CHURCH", APN 108-070-0210
Proposed for partial site acquisition. Impact may be right-of-way acquisition along the south property boundary with Tong Road. This parcel is developed by a large church structure and parking area (Photo 21).

PARCEL 5, "LAFONTSEE BONNIE L & CHRIS L", APN 108-070-0310
Proposed for partial site acquisition. Impact may be right-of-way acquisition along the south property boundary. This parcel is undeveloped, with remnants of previous structures visible on the ground surface (Photo 21).

PARCEL 6, "TONG ARTHUR D & FAM REV 1999", APN 108-070-0410
Plans appear to indicate partial site acquisition, which shows possible improvements along Tong Road. Impacts may be along Tong Road, which bisects the property. This parcel is undeveloped (Photos 18 through 20).

PARCEL 7, "MOHANNA MOE & NASRIN", APN 108-070-2210
Plans appear to indicate partial site acquisition. Impacts may be along the south property boundary, where SR50 borders the parcel. This parcel is currently undeveloped along the freeway, but improved by a residence on the north side (Photos 69 and 72), away from the freeway.

PARCEL 8, "MOHANNA MOE & NASRIN", APN 108-070-2610
Plans appear to indicate partial site acquisition. Impacts may be along the south property boundary, where SR50 borders the parcel. This parcel is currently undeveloped along the freeway, but improved by a residence on the north side (Photos 69 and 70).

PARCEL 9, "EL DORADO HILLS INVESTORS", APN 107-130-0210
Current interchange improvement plans require complete acquisition of this parcel. This parcel is currently undeveloped and barren (Photo 14).

PARCEL 10, "PG&E CLARKSVILLE SUBSTATION", APN 107-130-0610
Proposed for partial site acquisition. Impacts may be along the north property boundary, where the pareel borders SR50. This parcel is currently used as an electrical transfer and substation (Photo 1).

PARCEL 11, "EL DORADO HILLS INVESTORS", APN 107-130-0510
Proposed for partial or complete site acquisition. Impacts are along the north property boundary, where the site borders SR50. This parcel is currently undeveloped, the majority of which is a marshy, wetland area (Photos 6 & 7).

PARCEL 12, "EL DORADO HILLS INVESTORS", APN 107-130-0410
The site is proposed for partial or complete site acquisition. Impacts may be along White Rock Road, which borders the site on the west, and where the property borders SR50 on the north. This parcel is currently undeveloped and barren (Photos 7 & 10).

PARCELS 13 & 14, "KFRD INVESTORS & TONG RANCH LLC", APN 108-070-0510 and -0610
Proposed for partial site acquisition along the northwest boundary of Parcel 13 with SR50, and partial acquisition where both properties border SR50 on the north. The parcels are mostly undeveloped; however a small residence, rusted farm equipment, debris piles, and a large barn are present along White Rock Road (Photos 30 through 39), which bisects Parcel 14. An old cemetery is also present on Parcel 13.

PARCELS 15 AND16, "HUDDRIDGE PARTNERS ", APN 108-780-0210 & 108-780-0110
Proposed for partial site acquisition. Impacts may occur along White Rock Road, which bisects between the parcels, and where the road is proposed to be re-aligned through both parcels as a part of the new interchange. The parcels are currently undeveloped and barren (Photos 8 & 9).

PARCEL 17, "PEERMAN, JACK & BETTY", APN 107-130-0710
Proposed for partial site acquisition along north boundary with SR50. The parcel is improved by a residential structure, garage, storage barn, pavement, and related improvements. The remainder of the parcel is mostly barren (Photo 3).

PARCEL 18, "EL DORADO HILLS INVESTORS", APN 107-130-0410
Proposed for partial site acquisition. Impacts are predominately along the north property line with SR50. This parcel is currently developed by a Mercedes dealership (Photos 2 and 4).

PARCEL 19, "PHOENIX PACIFIC COMPANY", APN 107-680-1310
May be proposed for partial acquisition. Impacts are likely located along the south property line with the west-bound off-ramp at the SR50/El Dorado Hills Boulevard interchange. This parcel is currently developed by a children's daycare facility (Photos 48 and 49) and associated paved parking improvements.

PARCEL 20, "SERRANO ASSOCIATES", APN 107-660-0310
Proposed for partial site acquisition. Impacts are located along the south property line with SR50. This parcel is currently developed by a country club and golf course (Photo 63).

PARCEL 21, "SERRANO ASSOCIATES", APN 114-160-1910
Proposed for partial site acquisition. Impacts are located along the south property line with SR50 and along the east property boundary with Silva Valley Parkway. This hilly parcel is currently undeveloped (Photos 62, 64, and 65). We note the presence of a former residence, exampled by old foundations.

PARCEL 22, "EL DORADO SAVINGS BANK", APN 107-680-0610
Similar to Parcel 19, may be proposed for partial acquisition. Impacts are likely along the south property line with the west-bound off-ramp at the SR50/El Dorado Hills Boulevard interchange. This parcel is developed by an El Dorado Savings Bank (Photos 49 and 50).

PARCEL 23, "SERRANO ASSOCIATES LLC", APN 114-780-0110
Proposed for partial site acquisition. Potential impacts are located near the west and south property lines, for the proposed Country Club Drive roadway improvements. The proposed road is located along the northern boundary of Parcels 3, 4, 5, and 6. This parcel is currently improved by a dirt road, but is otherwise barren (Photos 22 and 23), with some trees and imported gravel and soil stockpiles along the north boundary.

PARCEL 24, "SERRANO ASSOCIATES LLC", APN 114-150-42100
Proposed for partial site acquisition along the western property line with Silva Valley Parkway. The parcel is currently undeveloped (Photos 24 and 25). The parcel is located next to a sehool. We observed a soil stockpile, which may have been generated during grading for the recently completed, adjacent school.

PARCEL 25, "WILMINGTON TRUST / TOSCO TRUST", APN 107-120-0410
Parcel subject to partial site acquisition. Impacts located along south property line at the west-bound SR50 off-ramp. The site is currently developed by a Union 76 service station (Photo 25).

PARCEL 26, "AHART TRUST / JONES TRUST", APN 107-120-2610
Similar to Parcel 19, may be proposed for partial acquisition. Impact is likely located along the south property line with the west-bound off-ramp at the SR50/El Dorado Hills Boulevard interchange. This parcel is currently developed by a "Taco Bell" (Photo 51).

PARCEL 27, "TOWN CENTER EAST LP", APN 107-130-3610
Proposed for partial site acquisition. Impact is located along the north property line, adjacent to the SR50 eastbound on-ramp from the El Dorado Hills Blvd/Latrobe Road interchange. The parcel is developed as a shopping are and associated paved parking (Photos 56 and 57).

PARCEL 28, "EDH TOWN CNTR EAST OWNERS ASSOC", APN 107-130-4310
Proposed for partial site acquisition along the north property line with the SR50 eastbound on-ramp. This parcel is an undeveloped marshy area next to the "Town Center" (Photo 58).

PARCEL 29, "SYERS PROPERTIES III LLC", APN 107-130-4810
Possible partial site acquisition along western boundary with El Dorado Hills Boulevard. This parcel is developed as a landscaped area (no photo).

PARCEL 30, "SYERS PROPERTIES III LLC", APN 107-130-4910
Possible partial site acquisition along western boundary with El Dorado Hills Boulevard. This parcel is improved by a shopping center (no photo).

PARCEL 31, "SYERS PROPERTIES III LLC", APN 107-130-5010
Based on the current improvement plans, the parcel is identified within the project limits, but does not appear to be proposed for partial acquisition. This parcel is currently improved by a shopping center, which includes a gasoline service station (Photos 59, 60, and 61).

PARCEL 32, "COUNTY OF EL DORADO", APN 107-680-0910
Based on the current improvement plans, the parcel is identified within the project limits, but does not appear to be proposed for partial acquisition. The site is currently developed by a "Taco Bell", and is located adjacent to a "Shell" service station (Photos 53, 54 and 55).

PARCEL 33, "CRISP FAMILY TRUST", APN 107-680-1010
Based on the current improvement plans, the parcel is identified within the project limits, and may be subject to partial acquisition. The potential impact is located along the south boundary line with the paved entrance to the shopping center. The parcel is improved as a landscaped area (no photo) along El Dorado Hills Boulevard.

PARCEL 34, "MCNAN LLC", APN 107-680-0810
Based on the current improvement plans, the parcel is identified within the project limits, and may be subject to partial acquisition. The potential impact is located along the west boundary with El Dorado Hills Boulevard. This parcel is developed as a landscaped area (Photo 53).

2.1.1 Surrounding Area

Current land use surrounding the interchange is generally commercial, rural/urban residential, recreational. Historic uses are similar and include limited agricultural/ranching, and minor surface mining/dredging. In general, high-density residential and commercial uses are beginning to dominate the area. Low density, rural residential and ranch land are located to the south and east. Commercial development is located along El Dorado Hills Boulevard and Latrobe Road, southwest of the proposed Silva Valley interchange.

2.2 Site Conditions and Local Geologic Characteristics

The topography through the corridor is generally mild to moderately sloped, consisting of rolling hills of the western Sierra Nevada Foothills. The average elevation is between 610 to 825 feet above mean sea level (msl), with the proposed interchange at SR50 reaching Elev.736 feet near the Silva Valley/White Rock Road undercrossing. Elevations are based on the USGS 7.5 Minute Topographic Map, Clarksville, CA.

The region surrounding and including this project, is known to be potentially impacted by naturally occuring asbestos (NOA). Geologic maps of the project area (Churchill, 2001[1]) show ultramafic rock with the potential to contain NOA. NOA is typically present within local zones of ultramafic rock, typically serpentinite. In California, ultramafic rocks are often associated with fault complexes like the ones present in this portion of the Western Sierra Nevada Foothills. NOA is a known hazardous material. The following discussion is a summary of the geologic conditions related to the occurance of NOA in the project area.

Our site work and published geologic literature indicate that meta-volcanic, meta-sedimentary, granitic, and gabbroic (igneous) rocks underlie the site at shallow depth. Regionally, these rocks occur within an area that is predominately composed of a northwest trending belt of Mesozoic-age rock that extends along the western slopes of the Sierra Nevada, including most of western El Dorado County. This metamorphic belt is intruded by numerous small to moderately large bodies of mafic and ultra-mafic igneous rock, including the Pine Hills Intrusive complex composed predominately of gabbroic igneous rock. Published geologic literature indicates that the study area is underlain by Mesozoic age metavolcanic rocks of the Copper Hill Formation and metasedimentary rocks of the Salt Springs Slate Formation (CDMG, 1981).

The rock structure is dominated by a series of northwest trending faults and fault zones that mark the boundaries of various rock types. Wagner, 1987[2], and Busch, 2001[3], show the site approximately 1 mile east of the West Bear Mountains Fault Zone. The East Bear Mountains Fault Zone is located approximately 8 miles east of the site. The igneous rocks located between the west and east Bear Mountains Fault Zones are an ophiolitic terrain comprised of altered basic igneous rocks. Amphibolites and serpentinized ultramafic rocks are common alteration products and are present within selected areas of the Pine Hill intrusive complex. Amphibolites and

[1] Churchill, et al., 2001, Areas Most Likely to Contain Natural Occurrences of Asbestos in Western El Dorado County, California, California Geological Survey, OFR 2000-02

[2] Wagner, D.L. et al., 1987, The Geologic Map of the Sacramento Quadrangle, California Geological Survey, Map No. 1A

[3] Busch, 2001, Geologic Map of El Dorado County, California Geological Survey, OFR 2000-03

serpentine are silicate minerals that can occur as both asbestiform (fibrous) and non-asbestiform (platy or blocky) varieties. Exposed rock at the site consists predominantly of rocks identified as the Copper Hill Volcanics Formation. The rocks are moderately to intensely weathered, metamorphosed volcanics, with some metamorphosed sandstone and shale.

Occurrences of naturally occurring asbestos (NOA) are typically associated with local faulting and ultramafic rocks. We observed prominent shear zones along the western road-cut of El Dorado Hills Boulevard and along SR50 road cuts east and west of the El Dorado Hills Boulevard/SR50 interchange. The shear zones are related to faulting and/or compressional stresses from the west spur of the Bear Mountains Fault Zone. The fault trace, bearing approximately north-south, is located 500 feet east of the El Dorado Hills Interchange. Rocks associated with the faulting may contain talc-sericite schist or talc-chlorite schist.

2.3 Current Land Use

Land uses on parcels discussed in this report include:

- Retail gas and petroleum product sales
- Retail Convenience Stores
- "Strip Mall" - Grocers and Retail sales
- Auto Sales and Repair
- Restaurants
- State Route 50 (SR50)
- Dense, urban residential and rural residential
- Commercial Building Supplies
- Undeveloped land

Land use in the surrounding area includes commercial, urban and rural residential, and ranching (agricultural). The most notable surrounding land uses include a large commercial complex at the southeast corner of the El Dorado Hills Boulevard (EDHB) and SR50 interchange, and urban residential development to the north and west of the proposed new interchange. At the proposed interchange site, the predominant land use is rural residential, an electrical switching yard, ranch/farm land, a golf course, and a church. A marshy, wetland area borders two significant drainages that flow from northeast to southwest and beneath SR50, and are located east and west of the Silva Valley Parkway/White Rock Road undercrossing of SR50.

2.4 Historical Land Use

2.4.1 Summary

Prior to 1944, land use in the project area appears as rural residential, ranching, and agriculture. A 1944 topographic map shows SR50 as a two-lane road connecting Scotts Road to the Lake Tahoe area. This portion of the SR50 alignment appears similar to the present alignment of the four lane SR50 highway. The old road alignment passes through the community of Clarksville,

and connects eastward to the town of Shingle Springs. Based on the 1994 topographic map (Folsom Quad, USGS, 1944), Clarksville appears as the only significant residential community in the vicinity of the proposed new interchange.

The alignment of SR50 appears fixed between the years 1944 and 1952. Substantial residential and commercial development did not begin until around 1970, around the time of the improvements of SR50 to a four-lane highway. Residential development north of SR 50 started after construction of the freeway. Dense residential and commerical development north and south of SR50 began to flourish in the late 1990s.

2.4.2 Aerial Photograph Review

BCI's aerial photo review included photos from 1952, 1961, 1971, 1981, 1993, and 1998. For partial or complete acquisition parcels, the following summarizes noteworthy changes in each photo interval. We used the following photos:

1952 Photo by Pacific Air, Scale 1" = 555'
1961 Photo by Cartwright, Scale 1" = 555'
1971 Photo by Cartwright, Scale 1" = 333' and 1" = 666'
1981 Photo by Cartwright, Scale 1" = 333' and 1" = 666'
1993 Photo by USGS, Scale 1" = 666'
1998 Photo by USGS, Scale 1" = 666'

PARCEL 1, "EDH 52", APN 108-030-1010

1952 Predominately barren land, with a farm/ranch improvement at the center of property. The improvements are located on about one (1) acre of the site. Drainage flows from north to south across this site. SR50 borders the south side of the property. An access road connects the farm/ranch to SR50.
1961 The farm/ranch structures are partially removed, and site appears abandoned. A box shaped tower remains on site. Otherwise, the site is unchanged from the previous photograph.
1971 A box-shaped tower removed. SR50 is now a 4-lane freeway immediately adjacent to the south boundary of the site. The Silva Valley undercrossing (UC) of SR50 is present to the southwest of the parcel, and a golf course is present to the west. Residential development begins on the east side of El Dorado Hills Boulevard, directly west of this parcel.
1981 The site is essentially unchanged from the previous photograph.
1993 An east-west oriented dirt access road crosses the middle property. Otherwise, the parcel is essentially unchanged from the previous photograph.
1998 Essentially unchanged from previous photograph.

PARCEL 2, "EL DORADO HILLS INVESTORS", APN 107-130-0110

1952 Bare, unimproved parcel. Site is essentially unchanged from 1952 to the present.

PARCEL 3, "COUNTY OF EL DORADO", APN 108-070-3210

1952 Bare, unimproved parcel. Site is essentially unchanged from 1952 to the present.

PARCEL 4, "CAPITAL KOREAN PRESBYTERIAN CHURCH", APN 108-070-0210

1952 Bare, unimproved parcel. Site is essentially unchanged from 1952 to 1998.

1998 Sometime after 1998, a church structure is built on the parcel.

PARCEL 5, "LAFONTSEE BONNIE L & CHRIS L", APN 108-070-0310

1952 Site appears improved by a rural residential structure. Ancillary storage/barn structures and numerous motor vehicles and farm-type equipment also appear on the site.

1961 Not visible in the photograph.

1971 Not visible in the photograph.

1981 Essentially unchanged from the 1952 photograph.

1993 Essentially unchanged from previous photograph.

1998 Essentially unchanged from previous photograph.

PARCELS 6, 13 & 14, "TONG ARTHUR D & KFRD INVESTORS/TONG RANCH LLC ", APN 108-070-0410, 108-070-0510 & 108-070-0610, (RESPECTIVELY)

1952 White Rock Road/Tong Road bisects the Tong properties along a north-south orientation, and SR50 bisects the Tong properties from east to west. The majority of this large property is barren, unimproved land.

1961 Sometime between 1961 and 1998, residential/farm structure are built along White Rock Road, south of SR50.

1971 Property further bisected by the construction of the 4-lanes of SR50. The site is not visible in the photographs between 1971 and 1998.

1998 Essentially no change in the site from 1971 to 1998.

PARCELS 7 & 8, "MOHANNA MOE & NASRIN", APN 108-070-2210 & 108-070-2610

1952 Barren, undeveloped land in 1952. Essentially no site change from 1952 to 1993.

1993 A residence is present near the north property lines. Except for the construction of SR50, the properties are essentially unchanged.

1998 Essentially unchanged from previous aerial photograph.

PARCELS 9, 11, & 12, "EL DORADO HILLS INVESTORS", APN 107-130-0210, 107-130-0510, & 107-130-0410, (RESPECTIVELY)

1952 Barren, fallow land, covered by grasses. A significant drainage bisects Parcel 11, flowing into a marshy, wetland area just south of SR50. The parcels appear as a single contiguous parcel bisected by the two-lane SR50 highway.

1961 Essentially unchanged from previous aerial photograph.

1971 The existing, individual parcels are formed because of the construction of the 4-lane section of SR50. The White Rock Road/Silva Valley Parkway and the Clarksville undercrossing are constructed between Parcels 11 and 12. A PG&E substation is constructed adjacent and west of Parcel 11.

1981 Essentially unchanged from previous aerial photograph.

1993 Essentially unchanged from previous aerial photograph.

1998 Essentially unchanged from previous aerial photograph.

PARCEL 10, "PG&E CLARKSVILLE SUBSTATION", APN 107-130-0610

1952 *The site is partially improved by structures that appear to be a gas station/commercial building adjacent to eastbound SR50, a 2-lane road at this time.*

1961 *Essentially unchanged from previous aerial photograph.*

1971 *Previously noted structures are removed, and the PG&E "Clarksville" substation constructed.*

1981 *Additional electrical equipment improvements constructed on the substation site. Open space is noted within the station. A single–family residence is present adjacent and west of the PG&E substation.*

1993 *The substation appears to be fully built-out with additional transformers and related electrical equipment occupying the previous open space.*

1998 *Essentially unchanged from previous aerial photograph.*

PARCELS 15 AND16, "HUDDRIDGE PARTNERS ", APN 108-780-0210 & 108-780-0110

1952 *These parcels are located near confluence of Screech Owl Creek, Carson Creek, and an un-named drainage located adjacent to the future White Rock Road. Grasses and a sparse amount of trees cover the parcels. White Rock Road bisects the two parcels in a north-south orientation.*

1998 *White Rock Road is realigned to meet Silva Valley Road at SR50, further bisecting the two parcels. There are no other changes between 1952 and 1998.*

PARCEL 17, "PEERMAN, JACK & BETTY", APN 107-130-0710

1952 *Barren, undeveloped land, covered by low grasses. The Clarksville cemetery is located immediately southwest of the parcel.*

1961 *Essentially unchanged from previous aerial photograph.*

1971 *Essentially unchanged from previous aerial photograph, except for a small unidentified-use structure constructed adjacent and west of the PG&E substation.*

1981 *A residential structure, garage, and small barn are present.*

1993 *Essentially unchanged from previous aerial photograph.*

1998 *Essentially unchanged from previous aerial photograph. The vegetation has matured around the house.*

PARCEL 18, "EL DORADO HILLS INVESTORS", APN 107-130-0410

1952 *Barren, unimproved land, covered by low grasses. Site borders old SR50 on the south.*

1961 *Essentially unchanged from previous aerial photograph.*

1971 *Except for the improvement of SR50 to a 4-lane highway, the site is essentially unchanged from previous aerial photograph.*

1981 *Essentially unchanged from previous aerial photograph.*

1993 *Unchanged from previous aerial photograph. There is some maturation of vegetation.*

1998 *Essentially unchanged from previous aerial photograph.*

PARCEL 19, "PHOENIX PACIFIC COMPANY", APN 107-680-1310

1952 *Barren, unimproved land, covered by grasses.*

1961 *Essentially unchanged from previous aerial photograph.*

1971 The El Dorado Hills Boulevard/SR50 interchange is constructed. Commercial developments begin at the strip mall, where the parcel is located.
1981 The parcel is not located within the boundaries of the photograph.
1993 Other parcels around Parcel 19 are commercially improved. Site is graded, but no structural improvements (buildings) begun.
1998 Unchanged from previous aerial photograph.

PARCEL 20, "SERRANO ASSOCIATES LLC", APN 107-660-0310

1952 Parcel borders old SR50 on the north, and consists of barren, grass-covered, unimproved land.
1961 Essentially unchanged from previous aerial photograph. Grading begun for the construction of the Parcel's golf course and for El Dorado Hills Boulevard (adjacent to the west.
1971 The El Dorado Hills Boulevard/SR50 interchange is complete, and the construction of the golf course is complete.
1981 Aside from general landscaping improvements, the site is essentially unchanged from previous aerial photograph.
1993 Essentially unchanged from previous aerial photograph.
1998 Some vegetation maturation. Otherwise, unchanged from previous photograph.

PARCELS 21 & 24, "SERRANO ASSOCIATES LLC", APN 114-160-1910 & 114-150-42100

1952 Predominately barren, grass-covered land. A single-family residence is present where the property borders old SR50 on the north. Few trees on site.
1961 Essentially unchanged from previous aerial photograph.
1971 The residential foundation is still present, but the house is removed for the widening of SR50.
1981 Essentially unchanged from previous aerial photograph.
1993 Except for some minor dirt roads across the parcels they appear unchanged from previous aerial photograph.
1998 Essentially unchanged from previous aerial photograph.

PARCEL 22, "EL DORADO SAVINGS BANK", APN 107-680-0610

1952 Barren, unimproved land, covered by grasses.
1961 Essentially unchanged from previous aerial photograph.
1971 The El Dorado Hills Boulevard/SR50 interchange is constructed, and the first improvements are started for the commercial development, of which this parcel is a part.
1981 Not located within the boundaries of the photograph.
1993 Commercial structures built around Parcel 22. However, there are no structural improvements (building) on site. Minor grading of parcel is evident.
1998 Essentially unchanged from the previous aerial photograph.

PARCEL 23, "SERRANO ASSOCIATES LLC", APN 114-780-0110

1952 Site consists of barren, unimproved land covered by low grasses.
1961 Essentially unchanged from previous aerial photograph.
1971 Site not visible in the photograph.

1981 The parcel is essentially unchanged from previous 1961 aerial photograph.
1993 Essentially unchanged.
1998 Except for the maturation of trees along existing drainages the site is essentially unchanged from the previous aerial photograph.

PARCEL 25, "WILMINGTON TRUST / TOSCO TRUST", APN 107-120-0410

1952 Barren, unimproved land, covered by grasses.
1961 The El Dorado Hills Boulevard/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.
1971 Not located within the boundaries of the photograph.
1981 Not located within the boundaries of the photograph.
1993 The Union 76 service station is constructed on the parcel.
1998 Essentially unchanged from the previous aerial photograph.

PARCEL 26, "AHART TRUST / JONES TRUST", APN 107-120-2610

1952 Parcel consists of barren, unimproved land, covered by grasses.
1961 The El Dorado Hills Boulevard/SR50 (EDHB/SR50) interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.
1971 Not located within the boundaries of the photograph.
1981 Not located within the boundaries of the photograph.
1993 Site surrounded by commercial development. No structural improvements (building) on site.
1998 The current "Taco Bell" is constructed on the site.

PARCEL 27, "TOWN CENTER EAST LP", APN 107-130-3610

1952 Barren, unimproved land, covered by grasses.
1961 The El Dorado Hills Boulevard/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.
1971 Not located within the boundaries of the photograph.
1981 Not located within the boundaries of the photograph.
1993 The parcel is essentially unchanged from previous improvements to the interchange. Construction of the new "Town Center" commercial development has started to the south.
1998 Parcel 27 is included in the areas developed as the "Town Center" commercial development.

PARCEL 28, "EDH TOWN CNTR EAST OWNERS ASSOC. ", APN 107-130-4310

1952 Barren, unimproved land, covered by grasses. A major drainage runs through the site.
1961 The EDHB/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.
1971 The widening of SR50 to a 4-lane highway is complete. SR50 borders the site on the north.
1981 Property is virtually unchanged from the previous aerial photograph.

1993 *Construction of the new "Town Center" commercial development has begun to the south of the site.*

1998 *The drainage that previously flowed due south from the eastbound SR50 on-ramp has been rerouted, and flows eastward to connect with the drainage flowing through Parcel 28.*

PARCELS 29 & 30, "SYERS PROPERTIES III LLC", APN 107-130-4810 & 107-130-4910

1952 *Barren, unimproved land, covered by grasses.*

1961 *The EDHB/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.*

1971 *Not located within the boundaries of the photograph.*

1981 *Not located within the boundaries of the photograph.*

1993 *The parcels are rough-graded as a part of the improvements for the new "Town Center" commercial development, under construction.*

1998 *New buildings and landscaping are constructed on the Parcel.*

PARCEL 31, "SYERS PROPERTIES III LLC", APN 107-130-5010

1952 *Bare, unimproved land, covered by grasses.*

1961 *The El Dorado Hills Boulevard/SR50 interchange is under construction. Otherwise, site is essentially unchanged from the previous aerial photograph.*

1971 *Predominately unchanged from previous photograph.*

1981 *Not located within the boundaries of the photograph.*

1993 *Roads for the new "Town Center" shopping area are visible. The drainage from a new, south flowing channel crosses diagonally across the site.*

1998 *Drainage re-routed to the north and east of the parcel. Construction of the "Town Center" commercial development is underway, with a new gas station and other structures on the site.*

PARCEL 32, "COUNTY OF EL DORADO", APN 107-680-0910

1952 *Parcel consists of barren, unimproved land, covered by grasses.*

1961 *The EDHB/SR50 interchange is under construction. The entrance road to the future shopping area is rough graded. Otherwise, site is essentially unchanged from the previous aerial photograph.*

1971 *Not located within the boundaries of the photograph.*

1981 *Not located within the boundaries of the photograph.*

1993 *Parcel 32 is graded for new commercial development. No structural improvements (building) on site.*

1998 *A "Jack in the Box" restaurant is constructed on the parcel.*

Parcel 33, "CRISP FAMILY TRUST", APN 107-680-1010

1952 *Parcel consists of narrow strip of barren, unimproved land, covered by grasses.*

1961 *Unchanged from previous aerial photograph.*

1971 *Not located within the boundaries of the photograph.*

1981 *Not located within the boundaries of the photograph.*

1993 Parcel 33 is a part of an existing commercial development, consisting of landscaping and a curb area on the north side of the shopping center's entrance from EDHB.
1998 Unchanged from previous aerial photograph.

Parcel 34, "MCNAN LLC", APN 107-680-0810
1952 Parcel consists of narrow strip of barren, unimproved land, covered by grasses.
1961 Unchanged from previous aerial photograph.
1971 Not located within the boundaries of the photograph.
1981 Not located within the boundaries of the photograph.
1993 Parcel 34 is a part of an existing commercial development, consisting of landscaping and a curb area east of EDHB, and bordering the shopping center on the west.
1998 Unchanged from previous aerial photograph.

2.4.3 Topographic Map Review

BCI's topographic map review includes 7½-minute USGS quad maps from 1944, 1953, and 1973. This summary includes the noted changes within the project area as recorded on the maps:

1944 USGS Folsom Quad, Scale 1:62,500

- SR50 shown along nearly the same alignment it has today. However, it terminates at Scott's Road to the west, where that road runs parallels to the Southern Pacific Railroad tracks, then continues eastward towards Shingle Springs.
- Clarksville/White Rock Road is shown as it exists today. The preliminary alignment of Silva Valley Road is present, and comprises a dirt/gravel road that crosses old SR50 and proceeds in a northerly direction.
- The Tong Road alignment appears on the map as a dirt road. The road has a spur that goes to a cemetery. The Clarksville cemetery is observed on the map.
- We note no other improvements within a one-mile radius of the subject intersection.

1953 USGS Clarksville Quad, Scale 1:24,000

- SR50 exists as a single lane road in each direction. Embankment fill and roadway cuts are visible, based on contours shown on the topographic map.
- There are no significant changes to the topography and road alignments observed in the 1944 map. Clarksville appears as the only concentration of residential and/or commercial structures in the immediate area.

1973 USGS Clarksville Quad, Scale 1:24,000

- SR50 is widened to a 4-lane highway, with a new 2-lane road constructed to the south of the earlier 2-lane alignment.

- The White Rock Road at-grade intersection is converted to an underpass with a concrete deck bridge at SR50. The road continues north of the freeway, where it is renamed Silva Valley Parkway.
- The EDHB/SR50 interchange is constructed, and a new subdivision is present north of the freeway. The map shows the golf course. Between EDHB/SR50 and the Bass Lake/SR50 interchange, all prior at-grade connections of local roads with SR50 are gone.
- Residential subdivision development is present along El Dorado Hills Boulevard.

3 RECORDS REVIEW

3.1 Review of County, State, and Federal Records

We requested EDR to perform a "Radius Search Report" for the Silva Valley Interchange, from roughly west of the El Dorado Hills Boulevard/SR50 interchange to the Bass Lake/SR50 interchange. The study included a search and review of county, state, and federal databases. The following databases were searched:

- National Priorities List (NPL)
- NPL Proposed
- NPL Delisted
- Resource Conservation and Recovery Act information (RCRA-SQG)
- Unconfirmed Properties Referred to Another Agency (REF)
- School Property Evaluation Program (SCH)
- Properties Needing Further Evaluation (NFE)
- Statewide SLIC Cases
- Emissions inventory data (EMI)
- Voluntary Cleanup Program Properties (VCP)
- Indian LUST
- Calsites Database (CAL-SITES)
- Section 7 tracking systems (SSTS)
- Uranium Mill Tailings Sites (UMTRA)
- Open dump inventory (ODI)
- Formerly used deposit sites (FUDS)
- Biennial Reporting systems (BRS)
- Department of defense sites (DOD)
- Deed restriction listing (DEED)
- No further Action determination (NFA)
- Notify 65
- Toxic Pits
- Comprehensive Environmental Response, Compensation, And Liability Information (CERLCIS)

- Comprehensive Environmental Response, Compensation, And Liability Information, No Further Remedial Action Planned (CERC-NFRAP)
- Corrective Action Report (CORRACTS)
- Above Ground Petroleum Storage Tank Facilities (AST)
- Leaking Underground Storage Tank Information System (LUST)
- Hazardous Substance Storage Container Database (UST)
- Cal Sites-AWP
- California Hazardous RCRA Administrative Tracking System (RAATS)
- Hazardous Materials Information Reporting System (HMIRS)
- California State Landfills ((SWF/L)\(SWIS))
- Waste Management Unit Database (WMUDS/SWAT)
- California Hazardous Materials Information Reporting System (CHMIRS)
- PCB Activity Database System (PADS)
- Emergency Response Notification System (ERNS)
- Faeility Index System (FINDS)
- Toxic Chemical Release Inventory System (TRIS)
- Toxic Substances Control Act (TSCA)
- Material Licensing Tracking System (MLTS)
- Federal Superfund Liens (NPL liens)
- CA Bond Exp. Plan (Ca. BEP)
- Records Of Decision (ROD)
- Superfund Consent Decrees (CONSENT)
- Waste Discharge System (CA WDS)
- HAZNET
- Mines Master Index File (MINES)
- Indian RESERV
- FIFRA/TSCA Tracking System (FTTS)
- Historical UST Database
- CLEANERS Drycleaners (Department of Toxic Substance Control)

The EDR reports are included as Appendix A. We requested a two-point search along the a corridor encompasing SR50, from El Dorado Hills Boulevard to west of Bass Lake Road, using a search radius of 1 mile. Figures in the EDR reports shows the approximate search radius of the project. Sites with adequate address information are plotted on EDR's site plan "EDR Radius Map with GeoCheck, Silva Valley Parkway IC, SR50".

Sites with inadequate address information were listed as "orphan sites" and were not plotted on EDR's site plan. Instead of plotting the "orphan sites", EDR provided available address information. BCI reviewed the address infromation for the orphan sites and determined that, with one exception, none of the list sites are located within 1,000 feet of the proposed corridor. The exception is a listing for naturally occurring asbestos in El Dorado Hills. There is no specific address for El Dorado Hills.

3.2 Summary of Records Search

No sites with known contamination or hazardous material leaks, spills, or dumping were noted in the EDR database search.

3.3 Review of Title Documents

BCI's scope did not include a review of title documents for this assessment.

3.4 Prior Environmental Investigations

We did not review any environmental assessment documents conducted for this or other nearby projects. If applicable documents are discovered, they should be reviewed relative to the conclusion and recommendations provided in this report. When available, submit these documents for BCI review during the next phase of the study.

3.5 Well Search

The well search portion of the EDR report did not identify any wells within 1-mile of the proposed interchange improvements. Our review of the Department of Water Resources website did not reveal known, recorded groundwater wells. However, based on our site reconnaissance and historic photo review, we believe that domestic water wells associated with former and current ranch properties are present within the former Clarksville rural residential area. Parcels where wells may be present include Parcels 1, 4, 5, 14, 17 and 21.

4 RECONNAISSANCE INFORMATION

4.1 Visual Observations

BCI staff performed reconnaissance observations from public streets, intersections, driveways, access roads, business parks, sidewalks and other public right-of-way. We also conducted a site inspection of all private properties, where El Dorado County Public Works, Department of Transportation staff, have obtained permission for entry. With the following qualifiers and/or exceptions, our observations generally support the described physical descriptions in Section 2.1 of this report.

PARCEL 1, "EDH 52", APN 108-030-1010
Low grasses, trees, and numerous shallow drainages and seasonal streams cover the majority of the site. Silva Valley Parkway borders the property on the west. Residential development borders the site on the north. Tong Road and SR50 bisect the southern one-third of the property.

Approximately 1,000 feet north of the freeway, and about 100 feet east of Silva Valley Parkway, we identified "ruins", including numerous columnar structures, masonry rubble, a portion of a concrete perimeter foundation, and a concrete box-basin with three separate bins. Over-grown landscaping (trees and brush) surround the "ruins." Our research did not identify specific structures associated with the ruins. It is our opinion that the "ruins" are most likely associated with the former agricultural use (farming and ranching) of the site.

PARCEL 2, "EL DORADO HILLS INVESTORS", APN 107-130-0110
A barbed wire fence borders this small triangular shaped parcel. We did not observe any obvious soil and/or groundwater contamination or hazardous materials issues on the site. However, a soil stockpile of unknown origin covers the majority of the parcel.

PARCEL 3, "COUNTY OF EL DORADO", APN 108-070-3210
Site is unimproved and covered by low grasses. The parcel is located immediately north of Tong Road. We did not identified obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCEL 4, "CAPITAL KOREAN PRESBYTERIAN CHURCH", APN 108-070-0210
A two-story church is on the site. We observed a large parking area and two large propane tanks. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 5, "LAFONTSEE BONNIE L & CHRIS L", PARCEL 5, APN 108-070-0310
We observed the "remains" of a prior residence and/or small business that we identified in air photos. The remains include a perimeter fence, a commercial advertising sign, a gravel access road, a small, abandoned wooden sheds, and similar dilapidated wooden structures. We did not have permission to enter the property. We were not granted site access; therefore, we made all observations from Tong Road.

PARCEL 6, "TONG ARTHUR", APN 108-070-0410
The site is located north of SR50. We were not granted access to this site. We made observations from Tong Road. It comprises bare, unimproved land, covered by low grasses and few trees. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCELS 7 & 8, "MOHANNA MOE & NASRIN", APN 108-070-2210 & 108-070-2610
We did not have permission to enter the properties. We made all observations from publicly accessible roads (SR50, Tong Road, and Bass Lake Road). The two parcels border SR50 on the north. Parcel 7 is improved by a single residential structure, driveway, and related improvements. Parcel 8 appears unimproved at this time. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the two parcels.

PARCEL 9, "EL DORADO HILLS INVESTORS", APN 107-130-0210
The site is unimproved and covered by low grasses. The parcel is located between Tong Road and SR50. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 10, "PG&E CLARKSVILLE SUBSTATION", APN 107-130-0610
The site is an electrical substation located south of SR50, about 500 west of White Rock Road. Improvements include electrical transformers, circuit switchers, regulators, reclosers and control buildings. PG&E did not grant us access to the site. We observed the site from public roads and adjacent Parcel 17. We did not identify obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCELS 11 & 12, "EL DORADO HILLS INVESTORS", PARCELS 11 & 12, APN 107-130-0510 & 107-130-0410
The two sites are bisected by Silva Valley Parkway, and are bordered by SR50 to the north. A perennial stream flows through Parcel 11, creating a marshy area over at least one-third of the parcel. Parcel 12 is east of Parcel 11 and covered by low grasses and a few trees. We did not identify obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCELS 13 & 14, "KFRD INVESTORS & TONG RANCH LLC ", APN 108-070-0510 AND 108-070-0610
The two parcels are adjacent to each other, and are bordered by SR50 on the north. White Rock Road provides access and terminates at SR50. Along White Rock Road, we observed a large barn, fencing, and numerous small wooden storage sheds on Parcel 14. Two significant drainages flow from east to west across the eastern two-thirds of Parcel 14. The majority of Parcel 14 is open land, covered by low grasses. This parcel appears to be used for cattle grazing. Parcel 13 is immediately west of Parcel 14. The "Tong Cemetery" occupies the northwestern corner of Parcel 13, and is located within 100 feet of the freeway. Grasses cover the majority of the remainder of the site, and we observed its use as a horse pasture.

In general, we observed abandoned wooden sheds, miscellaneous trash, and related debris along the road through Parcel 14. The debris included household trash, discarded farm equipment, 55-gal drums, and rusting, above-ground, fuel storage tanks.

PARCELS 15 AND16, "HUDDRIDGE PARTNERS ", APN 108-780-0210 & 108-780-0110
These parcels are separated by White Rock Road. Similar to nearby parcels, they are covered by low grasses and a few trees. Previously described drainages to the north and east converge on Parcel 16, to become Carson Creek flowing south along White Rock Road. Some shrubs and bushes line the drainages, especially on Parcel 16, where the convergence of drainages forms a small wooded area in the north central portion of the parcel. We did not identify obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCEL 17, "PEERMAN, JACK & BETTY", APN 107-130-0710
This parcel has a single family residence. Improvements include two small storage/barn structures, and a paved driveway and parking area. The property is bordered by Parcel 18 on the west, SR50 on the north, the Clarksville cemetery on the southwest, Parcel 15 on the east, and by Parcel 10(the PG&E site) on the northeast. We observed a "Mormon Tavern" historical marker located between Joerger Cutoff Road and SR50. The marker is placed east of the Parcel 17 property line and north of the PG&E substation.

Beyond the residence, the property is bare land covered with variable-height grasses. Overhead electrical lines are located along the north property line, parallel to SR50. We did not identify obvious soil and/or groundwater contamination or hazardous materials issues on this site.

PARCEL 18, "EL DORADO HILLS INVESTORS", APN 107-130-0410
The Von Hausen's Motors auto retail and repair facility occupies this site. Improvements include a large commercial structure and surrounding asphalt-paved parking area. We were able

to observe the site from publicly accessible locations within the shopping center. Access to the site was not granted; therefore, we did not observe any of the operations within the vehicle service area of the dealership. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 19, "PHOENIX PACIFIC COMPANY LL", APN 107-680-1310
We were able to observe the site from public roads within the shopping center. Access to the site was not provided. The shopping center is located at the northeast corner of the El Dorado Hills Boulevard/SR50 interchange. The parcel is a part of the shopping center, and is improved by the "Kinder Kare Learning Center" building. A 10-foot masonry wall surrounds the building on the south and east. A paved parking area is located to the west of the building, and serves both the learning center and other commercial/retail businesses in the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues exterior of the building.

PARCEL 20, "SERRANO ASSOCIATES LLC", APN 107-660-0310
A golf course occupies the parcel. Trees and shrubs line the parcel's south border with SR50. We did not observe significant contamination or hazardous materials issues on the site. We made all observations from public roads adjacent to the parcel, as we were not granted aecess at the time of our site visit.

PARCEL 21, "SERRANO ASSOCIATES LLC", APN 114-160-1910
SR50 borders the site on the south and Parcel 20 is located to the west. Silva Valley Parkway borders the site on the east. This sloping parcel is covered with moderately high grasses. Residential development occupies the top of the hill above the parcel. There is a minor drainage along the eastern property line, adjacent and west of Silva Valley Parkway. The "EID South Boost Pump Station" is located between the drainage and Silva Valley Parkway. We also observed remnant concrete foundations on the site. These structures are located adjacent and north of SR50, nearly opposite of the PG&E substation. Access to the parcel had not been granted at the time of our site visit; therefore, all observations were made from adjacent public roads. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 22, "EL DORADO SAVINGS BANK", PARCEL 22, APN 107-680-0610
We were able to observe the site from publicly accessible locations within the shopping center. The parcel is developed with an "El Dorado Savings Bank," and surrounded by a paved parking lot. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues from the exterior of the parcel's building.

PARCEL 23, "SERRANO ASSOCIATES LLC", APN 114-780-0110
This is a large, undeveloped parcel located to the north of Parcels 3 through 6, and east of Parcel 1. A large, residential subdivision is located along the north property line. Access permission was not provided at the time of our site visit; therefore, we observed the parcel from Tong Road and Parcel 1. We observed imported, soil stockpiles at the northern portion of the site. The "spoils" are composed of processed rock (similar to aggregate baserock) and soil, and based on their location adjacent to the nearby residential streets, it appears that these "spoils" are derived

from recent construction activities at the adjacent residential area. Surface drainage from the residential subdivision (to the north) has created gullying and erosion in the north area of the parcel. The gully slopes to the southeast to a nearby stream channel that eventually becomes a part of Bass Lake Creek. Most of the parcel is gently to moderately sloping to the south and covered by low grasses. A moderate cover of trees is located adjacent to the stream channel. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 24, "SERRANO ASSOCIATES LLC", APN 114-150-42100
Access to the property was not granted; therefore, all observations were made from adjacent public roads. This parcel is relatively small, and bordered by Parcel 1 on the east and by Silva Valley Road on the west and south. A large soil stockpile covered by low grasses is present on the site. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 25, "WILMINGTON TRUST / TOSCO TRUST", APN 107-120-0410
The parcel is located adjacent to the east side of El Dorado Hills Boulevard, and north of SR50. We observed the site from publicly accessible locations within the shopping center. A "Union 76" service station, with dispensing islands, a retail shop, and a service area, occupies the parcel. The station has a paved parking area for both its customers and customers of other commercial/retail businesses in the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 26, "AHART TRUST / JONES TRUST", APN 107-120-2610
Parcel 26 is located in the northeast quadrant of the El Dorado Hills Boulevard/SR50 interchange. We were able to observe the site from publicly accessible locations within the shopping center. The parcel is improved by a "Taco Bell" restaurant. A paved parking area with modest landscaping surrounds the building. We did not observe significant contamination or hazardous materials issues on the site.

PARCEL 27, "TOWN CENTER EAST LP", APN 107-130-3610
Parcel 27 is a narrow (less than 100 ft wide) strip of land located north of Parcel 31 and south of the eastbound SR50 on-ramp. Improvements on the parcel consist of several commercial buildings occupied by retail businesses. We were able to observe the site from publicly accessible locations within the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 28, "EDH TOWN CNTR EAST OWNERS ASSOC. ", APN 107-130-4310
Parcel 28 is a marshy area partially modified into a pond and fountain surrounded by landscaping and sidewalks. The pond is located between Parcels 18 and 27, and bordered by SR50 on the north. Carson Creek flows from the north side of SR50 and through this parcel. We were able to observe the site from publicly accessible locations within the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCEL 29, "SYERS PROPERTIES III LLC", PARCEL 29, APN 107-130-4810
Parcel 29 is a small, less than 1-acre, parcel located east of Latrobe Road, and is a part of the "Town Center" development. The site is used for landscaping, and is located near the entrance to the "Town Center". We were able to observe the site from adjacent El Dorado Hills Boulevard. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

PARCELS 30 & 31, "SYERS PROPERTIES III LLC", APN 107-130-4910 AND 107-130-5010
Parcels 30 and 31 are improved properties for the "Town Center" shopping development. Improvements include a "Valero" service station, paved parking, 2-story shopping structures (strip-mall), and related improvements. A "Chevron" service station is located immediately adjacent to the south side of Parcel 31, just south of the entrance to the shopping center. We were able to observe the development from publicly accessible locations within the "Town Center". We did not observe activities that would indicate that subsurface contamination and/or remediation is occurring at either service station.

PARCEL 32, "COUNTY OF EL DORADO", APN 107-680-0910
A "Jack in the Box" restaurant is present on Parcel 32. The site appeared clean and well maintained. A "Shell" service station occupies the property immediately adjacent and west of the parcel. We observed approximately ten (10), 55-gal drums, marked as hazardous waste on the "Shell" site. We did not observe any monitoring wells. We observe evidence that may indicate an investigation for subsurface soil and/or groundwater contamination or hazardous materials issues is occurring at the "Shell" service station.

Parcel 33, "CRISP FAMILY TRUST", APN 107-680-1010
Parcel 33 is a small, narrow strip of land located along the north curb of the entrance to the shopping center. The shopping cneter is located at the northeast quadrant of the EDHB/SR50 interchange. Parcel 33 is currently used for landscaping along the west side of the previously described "Shell" service station. We were able to observe the site from publicly accessible locations within the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

Parcel 34, "MCNAN LLC", APN 107-680-0810
Parcel 34 is a small, narrow strip of land adjacent to El Dorado Hill Boulevard, north of the entrance to the shopping center. It is currently used for landscaping purposes adjacent to the above described "Shell" service station. We were able to observe the site from publicly accessible locations within the shopping center. We did not observe evidence of soil and/or groundwater contamination or hazardous materials issues on the site.

5 FINDINGS, CONCLUSIONS, & RECOMMENDATIONS

BCI performed an Initial Site Assessment for the Silva Valley Interchange project. Typieal of an Initial Site Assessment, the scope of this assessment was directed at:

- Determining whether there may be hazardous materials on, or near, proposed roadway improvements at levels likely to warrant mitigation pursuant to regulations, and to,

- Identify sites with hazardous material issues that may impact property acquisition and redevelopment, or that will be a significant consideration in determining the final alignment.

Our assessment identified the following environmental conditions that should be considered in present and future planning for the roadway alignment.

5.1 Sites with Potential Contamination/Hazardous Materials Issues

Following is a description of specific parcels within the proposed roadway widening that are identified as having potential soil and/or groundwater contamination or hazardous materials issues that could impact project related land acquisition and/or construction.

- PARCEL 10, "PG&E CLARKSVILLE ELECTRICAL SUBSTATION" – APN 107-130-06

Parcel is subject to partial acquisition. No site specific hazardous material issues were identified through the commercial database search. Based on use and age of the site, the substation is considered a potential risk for PCB contamination from older transformers and a risk for potential petroleum hydrocarbon contamination from leaking coolant oils and site maintentance activities. We recommend contacting PG&E and obtain a statement of fact addressing potential contamination/hazardous materials. PG&E needs to provide a "clean site" record. If a statement can not be provided, we recommend limited soil sampling and analysis within the potential acquisistion areas of the Parcel.

Associated with Parcel 10 by proximity, we identified a former gas station/commercial structure along the old, two-lane SR50, as shown on the 1952 and 1961 airphotos. Although the structures were removed for the widening of SR50, we can not rule out the potential for petroleum hydrocarbon impacts to the subsurface, in the general area of Joeger Cutoff Rd, between the PG&E substation and SR50.

- PARCEL 5, "LAFONTSEE PROPERTY" – APN 108-070-0310

Parcel is subject to partial acquisition. No specific hazardous material issues were identified in the database search. The site's previous residential structure and outlying storage structures are removed, but many discarded objects, domestic-appearing waste, and smaller wooden-framed, delapidated structures remain. Historical aerial photos exhibited numerous automobiles, trucks, commercial truck trailers, boats, and farm vehicles on the site. Based on airphotos and our site reconnaissance, many of these items appear abandoned.

Common contamination/hazardous materials issues associated with the identified land use include: 1) potential petroleum hydrocarbon (oil) spillage, 2) leach fields and septic tanks, and 3) buried heating oil tanks, 4) asbestos containing building materials (ACM), and 5) lead-containing paint (LCP). Although none of these were positively identified in this ISA, plans for construction, and/or complete or partial site acquisition, should account for the potential of encountering one or more of these issues.

We recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM, and his responsibility to respond accordingly. If potentially hazardous materials are encountered during grading operations, the local environmental health department and fire department should be notified.

- "SHELL", (ADJACENT TO PARCEL 32) - APN UNKNOWN

This is an active, petroleum fuel service station. No specific hazardous material issues were identified in the database and website searches. However, it appears that a Phase II investigation was recently conducted at the site, as indicated by the presence of at least ten, 55-gal drums, each mark as "hazardous waste". To determine the current status of possible clean-up activities, we recommend a review of existing regulatory documentation, which may be obtained from the local environmental health department, the RWQCB, and/or the site owner. Current plans do not inelude acquisition of this site; however groundwater and/or soil contamination could impact road widening or related project improvement activities at the adjacent properties, which includes Parcels 32 (APN 107-680-0910), 33 (APN 107-680-1010), and 34 (APN 107-680-0810).

- PARCEL 25, WILMINGTON TRUST/TOSCO TRUST" (UNION 76) - APN 107-120-0410

Pareel is subject to partial acquisition. This is an active, petroleum fuel service station. No specific hazardous material issues were identified in the database search. However, this site will require further assessment. Initially, further assessment should include a review of existing documentation from the local environmental health department, the RWQCB, and the site owner. If building demolition is planned, the existing structures need to be assessed for potential hazardous materials, such as LCP and ACM.

- PARCEL 21, "SERRANO ASSOCIATES" - APN 114-160-19

Parcel is subject to partial acquisition. No specific hazardous material issues were identified in the database search. Remnant structures were observed adjacent to the north (west-bound) side of SR50, approximately 600 feet west of the Silva Valley Parkway underpass. A house structure, barns, warehouse and associated improvements are observed in historical air photos. Common contamination/hazardous materials issues associated with the identified land use are: 1) ACM and LCP, 2) unidentified leach fields/septic tanks and buried heating oil tanks, and 3) ADL from the immediately adjacent SR50.

The presence of these one or more of these materials could affect the value of the parcel. If this project includes acquisition and demolition of any of the existing structures, then the structures should be assessed for potential ACM and LCP prior to acquisition. Assessment results will be used to estimate the financial impact to the project. Results of the assessment shall also be included in the plans and specifications (bid documents) so the contractors can plan for worker safety and material handling and disposal issues.

Based on the proximity to SR50, some level of ADL may be present in the shallow subsurface soils adjacent to the freeway. ADL recommendations are presented in the section titled "General Contamination/Hazardous Materials Issues" of this report.

- PARCELS 13 AND 14, "KFRD INVESTORS INC. & TONG RANCH LLC" - APN 108-070-0510 AND 108-070-0610

Parcels are subject to partial or complete acquisition. No specific hazardous material issues were identified in the database search. During our site reconnnaissance, we noted poor housekeeping practices along Tong Road, where it passes through the two properties. We observed 55-gal drums, rusting machinery, trash and rubbish, and above ground storage tanks (AST). Existing structures (large barn, mobile home, small sheds, etc.) may present an ACM and LCP issue if demolition is planned. Other issues include encountering unidentified items such as leach fields/septic tanks and buried heating oil tanks. An old cemetary is located in Parcel 13, close to SR50.

Existing structures subject to demolition need to be assessed for LCP and ACM, prior to preparation of construction documents. Additionally, we recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM during grading operations, and his responsibility to respond accordingly.
Based on the proximity to SR50, some level of ADL may be present in the shallow subsurface soils adjacent to the freeway. ADL may also be present adjacent to White Rock Road. ADL recommendations are presented in the section titled "General Contamination/Hazardous Materials Issues" of this report.

- PARCEL 31, "SYERS PROPERTIES, LLC" (VALERO SERVICE STATION) – APN 107-130-5010

Parcel does not appear to be subject to acquisition. The parcel is known as the "Town Center" shopping area. There is an active, petroleum fuel service station (Valero) located within the shopping center. We found no records of suspected soil and/or groundwater contamination from the searched database. Service stations are a principal concern for subsurface contamination. We recommend a local file search and review for additional environmental records at the EDCEHD and at the RWQCB and an interview with the current site owners.

- PARCEL 1, "EDH 52" - APN 108-030-1010

Parcel is subject to partial or complete acquisition. No specific hazardous material issues were identified at this site through the database search. The parcel consists of undeveloped grazing land that appears unused at the present. We observed remnant, concrete structures (ruins) and associated debris. We were unable to determine the past use of the concrete structure. These "ruins" are located east of Silva Valley Parkway, approximately 1,000 feet north of the existing underpass. The structure consists of a rectangular shaped, three-bin, concrete-walled basins, with concrete columns at the corners of each bin. Other outlying columns are located north and south of the described structure. Archeological research (LSA, 2006) indicates that this site was a ranch, and the owner had a fondness for constructing with concrete.

Issues associated with a former farm residence include leach fields/septic tanks and buried heating oil tanks. The remnant concrete structures need to be assessed for LCP and ACM, prior to demolition and preparation of construction documents. An assessment for the presence of these materials may materially affect the purchase of the parcel. We recommend that the construction documents include specifications making the contractor aware of the possible presence of LCP and ACM during grading operations, and his responsibility to respond accordingly.

5.2 General Contamination/Hazardous Materials Issues

- PESTICIDES

The project includes acquisition of former cattle grazing and crop land; however, it appears that most of the open land in the project vicinity was used for grazing. Therefore, there is low to moderate potential for residual pesticides, herbicides, and fungicides. Based on the reviewed data, there is no obvious evidence of pesticide mixing, storage and/or misuse within the proposed right-of-way acquisition areas. Nonetheless, agricultural chemicals are typically used on farm lands. BCI considers it possible that pesticides, herbicides, and fungicides have been applied and used within the properties identified by MTCo as properties of interest.

Residual pesticides from normal agricultural application are generally exempt from mandatory assessment. This does not, however, preclude their existence. For roadway right-of-way acquisition projects, requirements for additional investigation are not clearly established. Therefore, it's important that the County of El Dorado understand the issue so they can make an informed decision on how to proceed. At a minimum, for sites with potential right-of-way acquisition, we recommend the County obtain a statement from the current property owner regarding past agricultural chemical use. If the statement is conclusive and suggests that usage would not result in significant residual pesticides concentrations, then no further action, such as sample collection and analysis, would be required.

- NATURALLY OCCURRING ASBESTOS

The project site is located in a geologic region identified as having at or near surface naturally occurring asbestos (NOA) bearing rocks and soils. Consequently, any development and/or construction in this area must comply with applicable rules and regulations, as written by El Dorado County Environmental Health Department. NOA-bearing rocks and soils potentially affect all parcels.

The contractor shall have experience implementing El Dorado County's special NOA grading requirements. An NOA monitoring plan will be required prior to grading. Some of the plan elements include: 1) a geologist trained in the recognition of NOA should be intermittently present during grading operations, 2) the geologist shall observe site conditions and implement special grading conditions when NOA is present. BMPs for dust control should be practiced during all grading operations in El Dorado County.

- AERIALLY DEPOSITED LEAD

The proposed interchange improvements will include grading within the existing SR50 shoulders and right-of-way (ROW). Caltrans is likely to require an aerially deposited lead (ADL) investigation prior to construction. Soil that is potentially impacted by ADL and disturbed during grading activities is subject to Department of Toxic Substances Control (DTSC) definition for handling hazardous waste. California currently defines material containing lead concentrations above 350 parts per million (ppm) as subject to Class I hazardous waste disposal. If ADL is detected at concentrations requiring hazardous waste handling and disposal, then we

recommend that the local Caltrans district office be contacted to determine the applicability of reusing ADL-impacted soil under the terms of the DTSC-issued "Lead-impacted Soil Reuse Variance". If the variance is not available to this district, then lead containing soils may require disposal at a Class I landfill.

ADL may also be present on privately-owned parcels adjacent to SR50. The potential ADL impact is likely limited to surface and shallow subsurface soils located within 2 feet of the existing ground surface (DTSC, 1995; Caltrans, 1998), and within 150 ft of the existing freeway right-of-way (Caltrans, 1995). The following Parcels are identified as potentially ADL-impacted: Parcels 1, 6, 7, 8, 9, 10, 11, 12, 13, 14, 17, 18, 19, 22, 25, 26, 27, and 28. We recommend a minimum of one surface soil sample be obtained for ADL screening. The assessment should be performed on that portion of the parcel directly adjacent to and within 50 feet of the edge of pavement. Parcels with a long contiguaous portion of property adjacent to the freeway shall be sampled for ADL every 300 feet.

- TRANSFORMERS

The scope of this assessment did not include an inventory of past and present transformers along the alignment. However, BCI observed several pole-mounted transformers and high voltage power lines along the proposed SR 50 widening corridor, and along the existing Silva Valley Parkway, White Rock Road, Tong Road, and Joerger Cutoff Road. Many of these overhead electrical powerlines are located within the proposed right-of-way acquisition areas. The transmission lines and poles appear relatively new, and few of the transformers show signs of external rust or discoloration. The existing pole-mounted transfomers need to be considered potentially impacted if their removal or relocation is required during construction. Existing transformers should be checked for the presence of PCBs, and if present, they should be disposed of in accordance with current regulations. Surface mounted transformers and electrical switch boxes were also observed within the project area, and may also constitute a potential PCB-impacted risk.

- YELLOW TRAFFIC STRIPES

Yellow traffic stripes are known to contain heavy metals such as lead and chromium at concentrations in excess of the hazardous waste thresholds established by the California Code of Regulations (CCR) and may produce toxic fumes when heated. Consequently, any yellow traffic striping removed from the existing surface streets and SR50 highway will require proper disposal, which may include disposal at a Class 1 disposal facility.

- UNDERGROUND PRODUCT DISTRIBUTION LINES

An assessment of utilities or buried petroleum product distribution lines is not within the seope of this ISA. We did not observe warning signs for petroleum product lines. We observed markings for gas, water, electric, sewer, and storm drain at various locations. A sewer lift-pump station is located along the west side of Silva Valley Road. These and other utilities are present throughout the proposed interchange improvement area. The database records do not indieate contamination resulting from utility spills; however, there is the potential for unidentified leaks.

6 LIMITATIONS

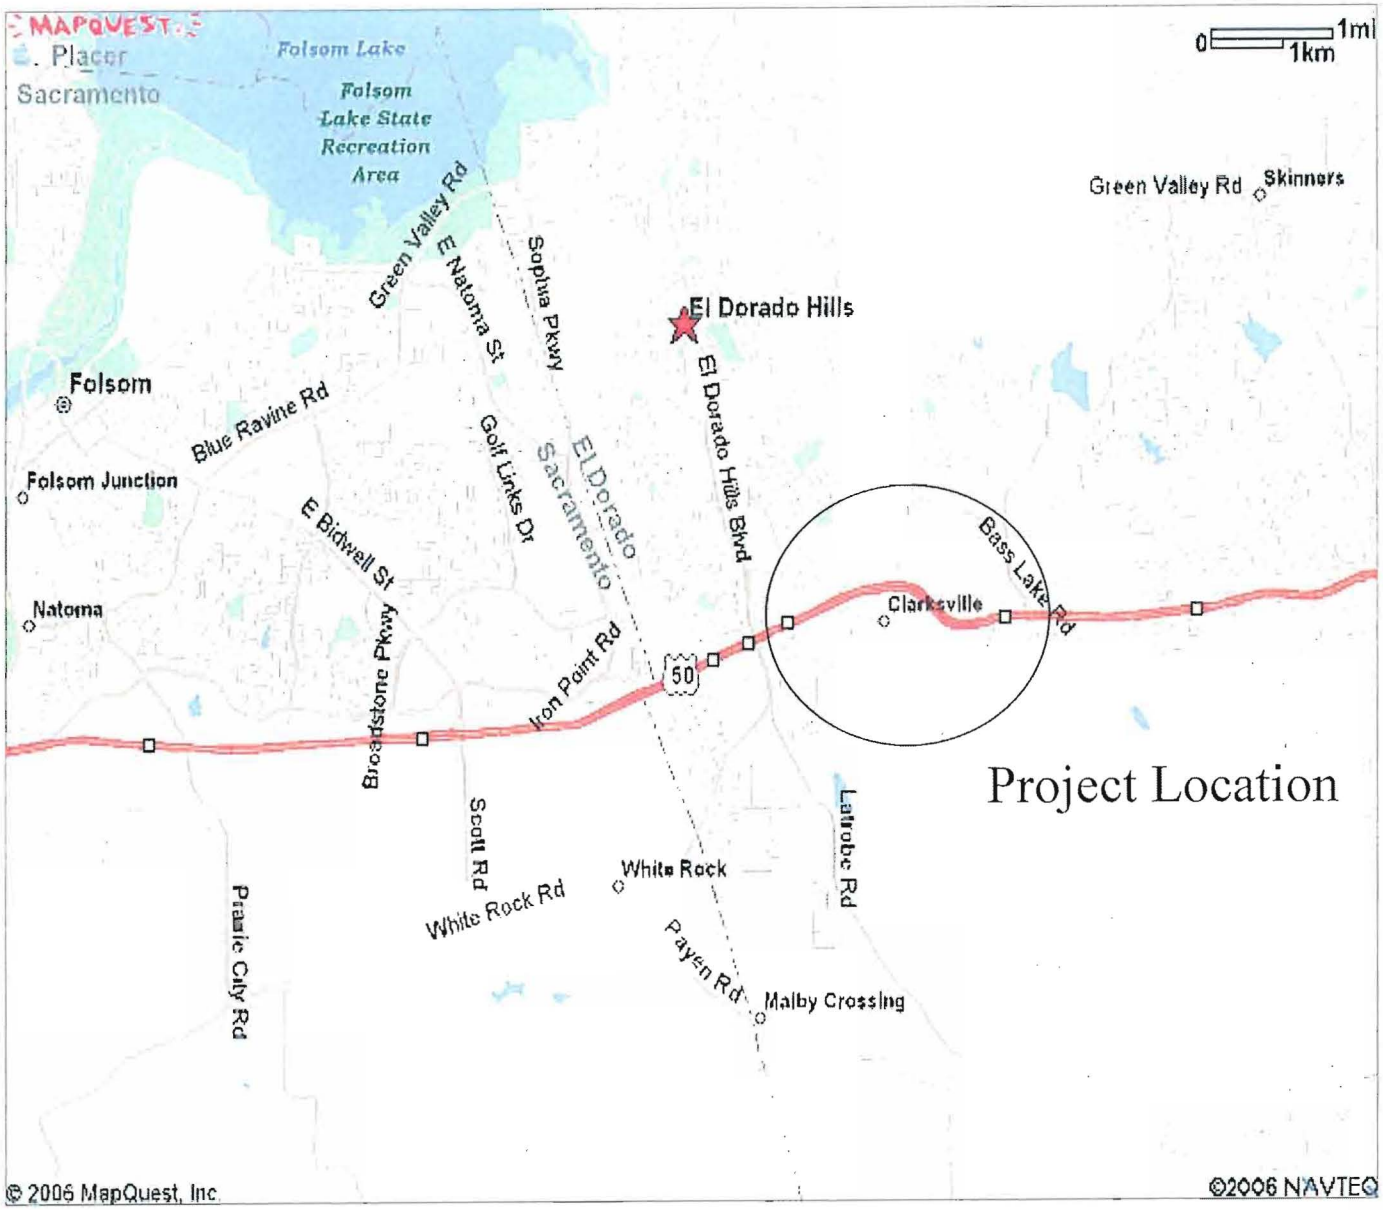
This report summarizes the findings and opinions of Blackburn Consulting, Inc. (BCI), with regard to the potential for contamination/hazardous materials to be present on the subject parcels at concentrations likely to warrant mitigation under current statutes and guidelines. Our findings and opinions are based on information obtained on given dates or provided by specified individuals, through records review, site review, and related activities. Our information is only as good as the information provided to us. Conditions can change after we have made our observations. We cannot warrant or guarantee that hazardous materials do not exist within the study area. To further reduce your risk, an invasive exploration program may be necessary.

Site assessment activities performed, our findings obtained, and our recommendations prepared in accordance with currently and generally accepted principles and practices for this type of Initial Site Assessment. Information in this report does not confirm the presence or absence of hazardous materials within the MTCo-defined project boundaries, but indicates whether the possibility of such materials exists. We performed our on-site observations by reconnaissance of visible surface features only. Site conditions are subject to change. Certain indicators of the presence of hazardous materials may have been latent at the time of our site reconnaissance and may have subsequently become observable. In a similar manner, the research effort conducted for an ISA is limited. Accordingly, it is possible that our research, while fully appropriate, failed to indicate the existence of important information sources. Assuming such sources actually exists, their information is not considered in the formulation of our findings and opinions.

Environmental issues not specifically addressed in the proposal or this report, are beyond the scope of services, and are not included in our evaluation. We base our report upon various selected information sources available to us at the time of our investigation. These sources may not have accurate or complete information. We base our conclusions and recommendations on the information available and our interpretation of this information.
Our communications with selected agency personnel are limited to the information kept on file at the various offices we contacted. Some agencies may not maintain accurate or complete records. Many agencies have only recently developed hazardous materials programs and so historical information may be incomplete. We did not contact owners, property renters, or operators. Our on-site study was limited to a general observation of the property and use. Evidence of hazardous material use or misuse, not observed during our site visit, and may be present.

This report was prepared for the specific use of our client and applies only to the subject project. We are not responsible for interpretations by others of data presented in this report. This report does not represent a legal opinion. No warranty is expressed or implied. We base our conclusions in this report on judgment and experience. This report is not intended to follow the Phase I site assessment guidelines provided by ASTM. Instead, the scope of this report addresses the needs of the project.

The scope of our investigation does not include determining the presence of naturally-occurring asbestos (NOA), radon, lead based paint, or asbestos containing building products. However, this report does identify parcels where these items may be present. Identification of endangered



speeies, geologic hazards, wetlands habitat, archeological sites, or ecologically sensitive areas is also beyond the scope of this assessment. Our site reconnaissance did not include evaluation of possible hidden/buried dumps or pits within the property.

The governmental records portion of this report is derived from public records. The governmental records are updated on a continual basis. For this reason, we do not advise you to use this information to base a decision after 180 days of the issue date of this report. Also, conditions at the site can and will change over time. Please contact BCI to revise this report to reflect new information.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

FEDERAL RECORDS

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 10/14/05
Date Data Arrived at EDR: 11/02/05
Date Made Active in Reports: 12/07/05
Number of Days to Update: 35

Data Release Frequency: Quarterly

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Data Release Frequency: Quarterly

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Data Release Frequency: No Update Planned

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.
