EXECUTIVE SUMMARY

DPIF2 CA 25 Clawiter Road, LLC retained RPS Group, Inc. (RPS) to conduct a Phase I Environmental Site Assessment (ESA) of the Former Berkeley Farms Milk and Juice Processing Plant (Berkeley Farms) facility located at 25500 Clawiter Road in Hayward, Alameda County, California (the site). RPS conducted the Phase I ESA to identify Recognized Environmental Conditions (RECs), as defined by the ASTM International (ASTM) Standard Practice for Environmental Site Assessments – E 1527-13 (ASTM-13). RPS performed the Phase I ESA to constitute all appropriate inquiry consistent with good commercial and customary practice.

The site is a former food production facility previously operated by Berkeley Farms, whose parent company is Dean Foods. Operations previously conducted on site included receiving of raw products (milk and juices), treating and bottling of products, storage and distribution, quality control, truck fueling and maintenance, and wastewater treatment. The majority of the remaining production and maintenance equipment are in the process of being sold and/or removed from the site.

The 20.5-acre site is developed with a 435,600-square-foot main building and a 7,200-square-foot truck maintenance building. The main building, which is located near the center of the site, consists of two floors of administrative offices in the southwestern corner. The remainder of the main building consists of cooler rooms, filling rooms, casing rooms, a laboratory, processing rooms, a shop, a boiler room, an air compressor room, refrigeration equipment rooms (including an ammonia aboveground storage tank [AST]), a case storage room, and other equipment rooms. Immediately south of the main building are several product tank and silo enclosures, an electrical substation (with several diesel-powered generators), and a tank receiving area. The truck maintenance building, which is located southeast of the main building, consists of several offices, a break area, and a repair warehouse. All on-site equipment has been drained of oil and hazardous materials in preparation for removal.

Southeast of the truck maintenance building is a wastewater treatment plant, which includes a 600,000-gallon bioreactor tank and other associated equipment. South of the main building is a canopied fueling station with two pump islands and a 10,000-gallon diesel underground storage tank (UST). The UST, which is a double-walled steel tank with a leak detection system, is currently non-operational and is filled with water. A truck scale is located west of the fueling station. An electrical substation is located on the southwestern corner, immediately west of the security guard shack. The remainder of the site consists of concrete-paved employee and truck/trailer parking (northern portion is gravel-lined), driveway, and exterior storage areas. Dean Foods leases several dozen trucks and trailers, which are currently parked throughout the site.

Since at least 1928 through at least 1950, the site consisted of agricultural land with residential and agricultural structures on the northern and southern portions. Circa 1957, Herrick Steel Corporation (Herrick) began to occupy the southern portion of the site and by the 1970s, began occupying the entire site. Herrick is a steel fabrication company that specializes in erecting steel for skyscrapers and other large buildings. On-site structures included an office building, a vehicle maintenance building, and a fabrication plant building surrounded by a large laydown yard used to store steel. By 1991, Herrick had vacated the site and all on-site structures were demolished. Berkeley Farms acquired the site from Herrick in 1996. From 1995-1997, the site was redeveloped with the current Berkeley Farms facility. Dean Foods acquired Berkeley Farms in 1998. In 2019, Dean Foods declared bankruptcy. In April of 2020, the Berkeley Farms facility ceased operations. Facility closure activities consisting of removing all hazardous materials, decontamination of equipment, and decontamination of facility structures were completed in 2020. This work was supervised by the Hayward Fire Department, which agreed the facility closure work was complete on July 31, 2020.

Findings

Environmental and other conditions associated with the site are characterized as RECs, Controlled RECs (CRECs), Historical RECs (HRECs), de minimis conditions, noteworthy conditions, or other considerations as defined in Section 1.1 of this report. Any exceptions to, or deletions from, this practice are described in Sections 1.2 and 1.3 of this report if not identified below.

This assessment revealed evidence of the following REC in connection with the site:

- **Current UST:** The current 10,000-gallon diesel UST was installed in the southern portion of the site in 1998. The UST is a steel, double-walled tank with a leak detection system. RPS reviewed available regulatory agency records from the Hayward Fire Department (including inspections, testing records, permits, and violations) and there are no indications of any significant releases or outstanding violations. However, there are no records indicating any subsurface investigations have been conducted in the vicinity of the UST and based on age, there is a potential for impacts to exist.

This assessment identified the following HREC in connection with the site:

- **Historical UST:** From 1960-1986, Herrick operated a 2,000-gallon gasoline UST. The UST was removed in 1986. In 1989, soil and groundwater was discovered to be impacted with total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX). Remedial activities included various soil and groundwater investigations, soil excavation and removal, and groundwater extraction and treatment (via activated carbon absorption). The San Francisco Regional Water Quality Control Board (SFBRWQCB) with concurrence by the Hayward Fire Department granted regulatory case closure on December 30, 1993. An additional investigation was conducted in 1995 following a geotechnical investigation that encountered petroleum odors in one of the ten boring locations. Remedial activities included over-excavation in the area of this boring location, the former UST location, and the area of a former sump; removal of impacted soils from the site; and treatment of groundwater encountered in the excavation. Confirmation soil and groundwater samples were below detection limits and also below current SFBRWQCB Environmental Screening Levels (ESLs). The Hayward Fire Department issued a no further action letter on September 29, 1995.

This assessment identified the following CREC in connection with the site:

- **Lead-Impacted Soil:** Soils at the site were found to be impacted with lead, specifically in two areas just south of Herrick's main building (near the south/central portion of the site). The lead was introduced by outdoor spray painting of steel parts during the late 1970s and early 1980s. Soils with elevated levels of leads were excavated and disposed off-site. Groundwater testing identified no detectable concentrations of lead in shallow in groundwater. Residual soils with lead below 100 milligrams per kilogram (mg/kg) were allowed to be left in place. Based on these results, the Alameda County Health Services Agency and Hayward Fire Department granted regulatory case closure on August 31, 1992 and September 4, 1992, respectively.

This assessment identified the following noteworthy conditions in connection with the site:

- **Historical Steel Fabrication Operations:** Herrick operated a steel metal fabrication facility at the site from 1957-1991. As part of a proposed real estate transaction in 1989, an environmental assessment was conducted by a prospective buyer, which included soil and groundwater testing across the site based upon the conditions and operations observed at that time. Soil and groundwater impacts were identified prompting additional investigations and remediation from 1990 to 1995 with regulatory oversight provided by the SFBRWQCB, Hayward Fire Department, and Alameda County Health Services Agency. The site was subsequently acquired by Berkeley Farms in 1996, which constructed the existing dairy processing plant. Nevertheless, there remains the possibility of unknown and/or undiscovered impacts.
- **Surrounding Area Operations:** The site is located in an area that has historically been occupied by various commercial and industrial facilities, including a truck terminal facility to the west and a former bus manufacturing facility to the south. The nature and expected material usage at these facilities suggest a potential for environmental impact; however, a review of regulatory agency records these sites did not identify the potential for impact.

This assessment identified the following other considerations in connection with the site:

- **Asbestos-Containing Materials (ACMs):** In the event of demolition or renovation, National Emissions Standards for Hazardous Air Pollutants (NESHAPs) requirements for the management of suspect ACMs will apply.

1 INTRODUCTION

1.1 Purpose

DPIF2 CA 25 Clawiter Road, LLC retained RPS Group, Inc. (RPS) to conduct a Phase I Environmental Site Assessment (ESA) of the Former Berkeley Farms Milk and Juice Processing Plant (Berkeley Farms) facility located at 25500 Clawiter Road in Hayward, Alameda County, California (the site). The Phase I ESA was conducted to identify Recognized Environmental Conditions (RECs), as defined by the ASTM International (ASTM) Standard Practice for Environmental Site Assessments – E 1527-13 (ASTM-13). RPS performed the Phase I ESA to constitute all appropriate inquiry consistent with good commercial and customary practice.

Based on the Environmental Professional's (EP's) evaluation of available information, findings of this report are classified and defined as follows:

- REC: the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment;
- Controlled REC (CREC): a REC that resulted from a past release that has been addressed to the satisfaction of the applicable regulatory authority, with contamination allowed to remain in place subject to the implementation of required controls;
- Historical REC (HREC): a past release that has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls;
- De minimis condition: a condition that could otherwise be considered a REC but in the EP's opinion does not appear to represent a threat to human health or the environment and/or would not likely be the subject of an enforcement action if brought to the attention of appropriate governmental agencies;
- Noteworthy condition: a contingent site risk that does not clearly fall within the ASTM definition of a REC, HREC, or de minimis condition and/or a risk that can have a material environmental or environmentally-driven impact on the business and;
- Other consideration: an environmental issue or condition (e.g. asbestos, radon, or mold) at a property that falls outside of the scope of the ASTM-13 practice.

1.2 Scope of Work

RPS performed the Phase I ESA site inspection on July 14, 2020. The following site representative provided information regarding the site:

- Mr. David Smydra, Regional Engineering Director for Dean Foods, associated with the site for approximately nine years.

RPS conducted the Phase I ESA in overall accordance with industry standards, including the requirements of ASTM-13 and the federal All Appropriate Inquiries (AAI) standard. The Phase I ESA included the following activities, subject to any limitations noted in this report:

1. Interviews with site owner(s), key site manager(s), and/or major occupant(s) and a review of site records with regard to current and former site operations that may have impacted the site.
2. A comprehensive site inspection to identify and evaluate potential sources of environmental impact, including but not limited to waste and chemical storage areas, underground storage tanks (USTs), aboveground storage tanks (ASTs), equipment containing polychlorinated biphenyls (PCBs), wastewater and stormwater discharges, and air emissions. The inspection included observations for evidence of chemical spills, releases, or on-site waste disposal. A Site Location Map and a Site Layout and Area Map are included in Appendix A. Photographs of the site are included in Appendix B.

3. A review of historical information for potential on- or off-site sources of impact to the site. To the extent feasible under the conditions of the assessment, the historical information obtained included: verbal information and records from site and/or local agency representatives; previous reports; construction plans; building permits; property record cards; topographic maps; fire insurance maps; historical city directories; and aerial photographs. Copies of relevant historical documentation are included in Appendix C.
4. A visual survey of the properties in the vicinity of the site as observed from the site boundaries and public rights-of-way to evaluate the potential for impact to the site from these properties. A Site Layout and Area Map is included in Appendix A.
5. A review of tribal, state, and federal environmental database information, provided by Environmental Risk Information Systems (ERIS) supplemented by agency interviews and record review, where appropriate. The database search was conducted using ASTM designated search parameters; for parameters requiring a search of the site and adjacent properties only, the search radii were extended to ensure that ASTM-required search distances from the property boundary were met. Facilities listed in the database report as “unplottable” were reviewed to evaluate whether any are located in the immediate vicinity of the site, based on field observations. The database search report is included as Appendix D.
6. Supplemental research (potentially including the review of agency files, interviews with agency representatives, or others familiar with surrounding properties) conducted related to adjacent and/or nearby properties, as deemed necessary and beneficial in determining the environmental risk associated with these properties is discussed in relevant sections of this report.
7. Review of public health records and records of institutional and engineering controls pertaining to the site, as available through state listings provided by subscription database providers and, recorded on the current deed, or readily available in land title records.
8. A review of vapor migration associated with on and off-site sources of known and/or potential environmental impact.

RPS also performed the following activity in addition to those activities that comprise the ASTM scope of work:

- A limited visual survey to identify typically suspect asbestos-containing materials (ACMs). No sampling was conducted.

1.3 Project-Specific Limitations

No known project-specific limitations were identified that constitute a data gap or appear likely to affect the ability of the EP to form a conclusion regarding the site.

2 SITE CHARACTERISTICS

2.1 Site Location

The site is located at 25500 Clawiter Road in Hayward, Alameda County, California. The site is located on the eastern side of Clawiter Road at the eastern terminus of Enterprise Avenue. Based on the historical and Alameda County Assessor records reviewed, the following additional address is also associated with the site: 25450 Clawiter Road.

2.2 Site Description

a) Site Ownership

Information obtained through the Alameda County Assessor's Office and confirmed by the site representative indicated that the site consists of two adjoining parcels. The southern parcel (439-80-3-14) was purchased by Berkeley Farms, Inc. from S.G. Herrick Corporation according to a grant deed dated February 1, 1996. The northern parcel (439-80-1) was purchased by Berkeley Land Company, Inc. from S.G. Herrick Corporation according to a grant deed dated February 1, 1996. On September 14, 1998, Dean Foods Company agreed to acquire Berkeley Farms, Inc. BFD Acquisition Co. acquired Berkeley Farms, Inc. and the northern parcel from Berkeley Land Company, Inc., and became a wholly owned subsidiary of Dean Foods Company. As part of the acquisition, BFD Acquisition Co. changed its name to Berkeley Farms Inc. No activity and use limitations (AULs) or environmental liens were attached to either of the Grant Deeds. No AULs were identified in the U.S. Engineering Controls, U.S. Institutional Controls or state AULs databases searched by ERIS.

b) Current Use of the Site

The site is a former food production facility previously operated by Berkeley Farms, whose parent company is Dean Foods. Operations previously conducted on site included receiving of raw products (milk and juices), treating and bottling of products, storage and distribution, quality control, truck fueling and maintenance, and wastewater treatment. The majority of the remaining production and maintenance equipment are in the process of being sold and/or removed from the site.

c) Structures, Improvements, and Other Features

The 20.5-acre site is developed with a 435,600-square-foot main building and a 7,200-square-foot truck maintenance building. The main building, which is located near the center of the site, consists of two floors of administrative offices in the southwestern corner. The remainder of the main building consists of cooler rooms, filling rooms, casing rooms, a laboratory, processing rooms, a shop, a boiler room, an air compressor room, refrigeration equipment rooms (including an ammonia aboveground storage tank [AST]), a case storage room, and other equipment rooms. Immediately south of the main building are several product tank and silo enclosures, an electrical substation (with several diesel-powered generators), and a tank receiving area. The truck maintenance building, which is located southeast of the main building, consists of several offices, a break area, and a repair warehouse. All on-site equipment has been drained of oil and hazardous materials in preparation for removal.

Southeast of the truck maintenance building is a wastewater treatment plant, which includes a 600,000-gallon bioreactor tank and other associated equipment. South of the main building is a canopied fueling station with two pump islands and a 10,000-gallon diesel underground storage tank (UST). The UST, which is a double-walled steel tank with a leak detection system, is currently non-operational and is filled with water. A truck scale is located west of the fueling station. An electrical substation is located on the southwestern corner, immediately west of the security guard shack. The remainder of the site consists of concrete-paved employee and truck/trailer parking (northern portion is gravel-lined), driveway, and exterior storage areas. Dean Foods leases several dozen trucks and trailers, which are currently parked throughout the site.

Landscaped areas are located west of the main building and along the western perimeter of the site. No pits, mounds, or other obvious terrain anomalies were identified. No areas of staining or distressed vegetation were identified.

The building is heated and cooled electrically. Water services are municipally provided. Sanitary waste is discharged to the municipal sewer system.

2.3 Environmental Setting

a) Topography and Drainage

The 7.5-minute topographic map of the area (Hayward, California quadrangle, 2018) indicates that the site is located at an approximate elevation of approximately 28 feet above mean sea level. The site is located in an area characterized by flat terrain. Surface water drainage in the area is toward nearby storm drains that discharge into San Francisco Bay, located approximately 1.8 miles west of the site. The site and surrounding properties are located on a northeast-facing slope. The site is graded to slope to the southeast to a large storm line located near the on-site wastewater treatment plant.

b) Soils, Geology, and Hydrogeology

According to information provided in the ERIS Physical Setting Report, the soils in the site area consist primarily of Danville silty clay loam and Clear Lake clay. The near-surface geology in the site area is comprised of Quaternary-aged alluvium and marine deposits. Depth to bedrock information for the site area was not readily available. According to a geotechnical report provided by the site representative (*Geotechnical Investigation and Terrain Report,* prepared by Harza Consulting Engineers and Scientists, dated March 29, 1996) and a summary of prior groundwater assessments at the site (*Groundwater Remediation Summary Report,* prepared by Decon Environmental Services, dated August 9, 1993), groundwater is present between 9 and 17 feet below ground surface (bgs) and was estimated to flow in a southwesterly direction. Additionally, soils encountered during these assessments consisted of a mixture of clay, gravel, and sand.

c) Water Resources

Potable water is supplied to the site and surrounding properties by the San Francisco Public Utilities Commission (SFPUC) via the City of Hayward. 85% of the SFPUC's potable water from the Hetch Hetchy watershed; the remaining 15% is from the Alameda watershed. The site has been connected to municipal water services since development. Based on information provided in the ERIS Physical Setting Report, no active municipal and/or private water wells were identified within a 1-mile radius of the site, suggesting that groundwater in the site area is not used as a potable resource.

3 SITE HISTORY

3.1 Overview of Site History

Since at least 1928 through at least 1950, the site consisted of agricultural land with residential and agricultural structures on the northern and southern portions. Circa 1957, Herrick Steel Corporation (Herrick) began to occupy the southern portion of the site and by the 1970s, began occupying the entire site. Herrick is a steel fabrication company that specializes in erecting steel for skyscrapers and other large buildings. On-site structures included an office building, a vehicle maintenance building, and a fabrication plant building surrounded by a large laydown yard used to store steel. By 1991, Herrick had vacated the site and all on-site structures were demolished. Berkeley Farms acquired the site from Herrick in 1996. From 1995-1997, the site was redeveloped with the current Berkeley Farms facility. Dean Foods acquired Berkeley Farms in 1998. In 2019, Dean Foods declared bankruptcy. In April of 2020, the Berkeley Farms facility ceased operations. Facility closure activities consisting of removing all hazardous materials, decontamination of equipment, and decontamination of facility structures were completed in 2020. This work was supervised by the Hayward Fire Department, which agreed the facility closure work was complete on July 31, 2020.

From 1960-1986, Herrick operated a 2,000-gallon gasoline UST, which was located next to the vehicle maintenance building near the southeast corner of the site. The UST was removed in 1986. Although a release to soils and groundwater was identified, no further work was conducted at that time. In 1989, Koll Development evaluated the purchase of the site from Herrick Steel. As part of this work, Harding Lawson conducted an environmental assessment, which included groundwater and soil testing across the site. The report (dated July 6, 1989) describing this particular work cannot be located in regulatory agency research but is referenced in other available environmental reports. This investigation included groundwater sampling on February 16, 1989 of wells CW-1, MW-1, MW-2, and MW-4, which were located on the southeast portion of the site. Groundwater samples were analyzed for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) by EPA test methods 624 and 625, and also for California Administrative Manual 17 (CAM-17) Metals. Groundwater depth was approximately 10 feet bgs and the flow direction was to the southwest. Concentrations of benzene, ethylbenzene, toluene and xylenes were detected exceeding maximum contaminant levels (MCLs) at the time. No other VOCs or SVOCs were detected above the laboratory detection limits at that time. However, it should be noted that several the laboratory detection limits exceed several current SFBRWQCB environmental screening levels. Additionally, concentrations of several CAM-17 metals were detected, including concentrations of arsenic, barium, total chromium, cobalt, and nickel that exceed current MCLs.

Soil and groundwater were discovered to be impacted with total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX). Remedial activities included various soil and groundwater investigations, soil excavation and removal, and groundwater extraction and treatment (via activated carbon absorption). Based on results of the last round of groundwater monitoring, San Francisco Regional Water Quality Control Board (SFBRWQCB) with concurrence by the Hayward Fire Department granted regulatory case closure on December 30, 1993.

An additional investigation was conducted in 1995 following a geotechnical investigation that encountered petroleum odors in one of the ten boring locations. Remedial activities included over-excavation in the area of the above boring location, the former UST location, and the area of a former sump; removal of impacted soils from the site; and treatment of groundwater encountered in the excavation. Confirmation soil and groundwater samples were below detection limits and also below current SFBRWQCB Environmental Screening Levels (ESLs). The Hayward Fire Department issued a no further action letter on September 29, 1995.

Soils at the site were found to be impacted with lead, specifically in two areas just south of Herrick's main building (near the south/central portion of the site). The lead was introduced by outdoor spray painting of steel parts during the late 1970s and early 1980s. Soils with elevated levels of leads were excavated and disposed off-site. Groundwater testing identified no detectable concentrations of lead in groundwater. Residual soils with lead below 100 milligrams per kilogram (mg/kg) were allowed to be left in place. Based on these results, the Alameda County Health Services Agency and Hayward Fire Department granted regulatory case closure on August 31, 1992 and September 4, 1992, respectively.

The current 10,000-gallon diesel UST was installed in the southern portion of the site in 1998. RPS reviewed available regulatory agency records from the Hayward Fire Department (including inspections, testing records, permits, and violations) and there are no indications of any significant releases or outstanding violations. However, there are no records indicating any subsurface investigations have been conducted in the vicinity of the UST. Therefore, there is a potential for impacts from the on-site UST.

3.2 Historical Photographs and Maps

RPS reviewed available historical aerial photographs and topographic maps from the sources listed in Section 8. According to ERIS, no Sanborn fire insurance maps were available for the site area. The information from these sources is summarized below.

Period	Description
1928 Aerial	The site appears to be primarily agricultural land with residential/agricultural structures on the northern and southern portions.
1939 Aerial	The agricultural structure near the southeastern corner is no longer on site.
1946 Aerial 1950 Topo 1957 Topo	The residential/agricultural structures near the southwestern corner are no longer on site.
1958 Aerial 1960 Topo 1961 Topo 1966 Aerial 1966 Topo 1968 Aerial 1969 Topo 1974 Aerial 1974 Topo	The southern portion is redeveloped with a large commercial/industrial structure with two smaller structures located near the southwestern and southeastern corners. Adjacent to these buildings are parking and exterior storage areas, and a railroad spur.
1974 Aerial 1974 Topo 1980 Aerial 1980 Topo 1982 Aerial 1987 Aerial	The northernmost residential structures are no longer on site. The central portion of the site is utilized for exterior storage. By 1980, the entire northern portion is utilized for exterior storage.
1993 Aerial	All previous structures appear to have been demolished. The western portion (near Enterprise Avenue) appears to be rows of trees.
2002-2019 Aerials	The current Berkeley Farms facility has been developed, including the main office/production building, the truck maintenance building, wastewater treatment plant, fueling canopy, trailer parking lot, and employee parking lot.

3.3 Interviews and Agency Records

a) Information Provided by Site Representatives, Site Owner, and Report User

Site Owner/Representative

Mr. Smydra of Dean Foods completed an environmental questionnaire for the site and also provided relevant documentation regarding Berkeley Farms' operations, which are discussed in relevant sections of this report. Mr. Smydra is aware of the previous cleanup activities and regulatory closure associated with the previous occupants of the site (Herrick Corporation), although these activities occurred prior to him joining Dean Foods. Mr. Smyrda was not aware of any existing environmental impacts at the site.

User

The questionnaire was completed by Mr. Scott Strine, Senior Vice President with DPIF2 CA 25 Clawiter Road, LLC, and indicates that User representatives are not aware of any environmental cleanup liens filed or recorded against the site; any AULs in place at the site; any specialized knowledge of the site or adjoining properties; any conditions that would affect the fair market value of the site; any knowledge of obvious indicators of the presence or likely presence of contamination at the site; or any other commonly known or reasonably ascertainable information regarding the environmental condition of the site.

b) Agency Interviews and File Review

RPS contacted or filed Freedom of Information Act (FOIA) requests with various agencies to obtain environmentally relevant information regarding the site. A listing of the various agencies contacted is provided in Section 8. At the time this report was issued, the following agency had not responded to FOIA requests:

- Hayward Building Department

Information from these agencies is summarized as follows:

- **Alameda County Assessor's Office**: The Alameda County Assessor's Office provided ownership information for the site, as discussed in Section 2.1. According to the Alameda County Assessor Property Search database, the site is approximately 20.5 acres in size.
- **Alameda County Clerk-Recorder:** Due to COVID-19 restrictions, deed information could not be obtained from the Alameda County Clerk-Recorder office at the issuance of this report. Deed information was provided by the site owner, as discussed in Section 2.1.
- **Department of Toxic Substances Control (DTSC):** Records from the DTSC include various inspections, reports, and correspondences related to a lead-impacted soil cleanup in 1990, which is discussed in Section 3.4.
- **State Water Resources Control Board (SWRCB)/San Francisco Bay Regional Water Quality Control Board (SFBRWQCB):** No records were available from the SFBRWQCB. Records for the site from the SWRCB's GeoTracker database only include a closure letter for the former leaking underground storage tank (LUST) release case from 1993, which is discussed in Section 3.4.
- **Hayward Fire Department:** Records from the Hayward Fire Department included various inspection reports, permits, correspondences, and cleanup investigation reports for Herrick Corporation (1984-1995) and inspection reports, permits, and correspondences for Berkeley Farms (1997-current). The earliest available record was a 1984 hazardous materials management plan for Herrick Corporation which identified the following hazardous materials: oxygen, acetylene gas, diesel (in three ASTs ranging in size from 500 and 3,000 gallons), propane, hexane, hydrochloric acid, phosphoric acid, anhydrous ammonia, motor/gear oil, and Actusol-T-776 (kerosene based solvent). Additionally, Mr. Hugh Murphy, Hazardous Materials Coordinator with the Hayward Fire Department, was interviewed as part of this assessment. Mr. Murphy was not able to provide specific site details regarding the past investigations and cleanups for Herrick Corporation; however, prior reports and correspondences related to these investigations that are maintained by the Hayward Fire Department are discussed in Section 3.4.
- **Alameda County Department of Environmental Health (ACDEH):** According to a response from the ACDEH, no records are available for the site.
- **Bay Area Air Quality Management District (BAAQMD):** According to records provided by the BAAQMD, the site has active permits for the boiler equipment and generators, and a has a complete application for the wastewater treatment plant that is under evaluation. No outstanding violations were identified in the available records.

c) Database Search Report

RPS reviewed a report of federal and state environmental databases in attempt to identify whether the site is listed on databases suggestive of a potential for impact (Appendix D). Detailed descriptions of the databases searched and definitions of acronyms are included within the Database Descriptions appendix of the database report. Pertinent listings for the site are discussed below:

- Herrick Corporation / Former Herrick Fac. (25450 Clawiter Road) previously occupied the site from 1957 through 1993 and is listed on the FINDS/FRS, LUST, HAZNET, HIST MANIFEST, ECHO, HIST TANK, and TRIS databases. Hazardous wastes generated by Herrick from 1986-1990 included liquid with pH less than 2, unspecified solvent mixture, contaminated soil from site clean-up (from 1990), hydrocarbon solvents, other empty containers 30 gallons or more, and unspecified organic liquid mixture. Herrick conducted regular TRI reporting for propylene storage. Herrick previously operated a 2,000-gallon gasoline UST that was installed in 1960 and removed in 1986. The leaking underground storage tank (LUST) case for this UST is discussed in Section 3.4.
- Primms LP (25500 Clawiter Road) is listed on the HAZNET database. However, no manifests are listed for this company.
- Berkeley Farms Inc. / Berkeley Farms LLC (25500 Clawiter Road) has occupied the site since 1996 and is listed on the DELISTED TNK, AST, FINDS/FRS, CHMIRS, HAZNET, OSHA, CERS TANK, UST, EMISSIONS, NPDES, RMP, RCRA NON GEN, and TRIS databases. In 2009, approximately 547 gallons of Mikkron lube soap was accidentally discharged onto a concrete surface. The spill was contained to the area and was promptly cleaned by an outside contractor (NRC). In 2011, approximately 300 gallons of milk was accidentally spilled into a storm drain. In 2015, a water main broke and was discharging into a storm drain. In 2016, milk product waste had overflowed and entered a storm drain. Also in 2016, a semi-truck caught on fire and released approximately 80 gallons of diesel fuel onto soil. Patriot Environmental responded to the spill and conducted the cleanup. The spill did not enter a drain or a waterway. No other details for this spill were available. The site is currently permitted as a hazardous material facility, AST facility (with SPCC plan), UST facility, and small quantity generator. No outstanding compliance violations were identified. The site is listed as having a total AST capacity of 4,870 gallons as permitted by the City of Hayward. Hazardous wastes generated by this facility since 1998 included aqueous solution with total organic residues 10 percent or more, aqueous solution with total organic residues less than 10 percent, unspecified aqueous solution, off-specification, aged, or surplus organics, other inorganic solid waste, hydrocarbon solvents, unspecified solvent mixture, waste oil and mixed oil, oil/water separation sludge, unspecified oil-containing waste, latex waste, unspecified organic liquid mixture, empty containers 30 gallons or more, laboratory waste chemicals, liquids with halogenated organic compounds, and liquids with pH less than 2. A Risk Management Plan (RMP) is in place for this facility for the ammonia storage. Berkeley Farms conducted regular TRI reporting for ammonia, phosphoric acid, nitrate compounds, and nitric acid storage.
- Environmental Logistics (25500 Clawiter Road) is listed on the CHMIRS database. In 2016, an unknown of sewage was discharged into a storm drain due to an overfilling of a tank. The cleanup was conducted by the reporting party. No other information for this spill was available. The potential for impact to the site is expected to be low.
- Epic Contracting, Modern Air Mechanical, Harris Construction Company, UCI Construction, Inc., Blocka Construction Inc. are listed at 25450 Clawiter Road on the OSHA database. These listings are not indicative of potential impacts to the site.

3.4 Prior Environmental Reports

Several prior environmental reports for the site were provided for RPS's review from the site owner and from regulatory agency reviews (primarily the Hayward Fire Department). The reports are discussed below.

- *Pre-Remediation Investigation, Feasibility Study, and Implementation Plan, Former Herrick Fabrication Facility, Hayward, California*, prepared by Harding Lawson Associates (HLA), dated January 15, 1990.

- *Ground-Water Treatment System Plan, Former Herrick Fabrication Facility, Hayward, California,* prepared by HLA, dated March 7, 1990.
- *Lead Contamination from Spray Painting Operation at Herrick Corporation*, 25450 Clawiter Road, Hayward, letter prepared by Hayward Fire Department, dated October 5, 1990.
- *Groundwater Remediation Summary Report, Former Hayward Fabrication Facility, Herrick Steel Corporation, 25450 Clawiter Road, Hayward, California*, prepared by Decon Environmental Services (Decon), dated August 9, 1993.
- *Project Summary for Soil Remediation Project, Former Herrick Steel Corp.,* prepared by Decon, dated October 26, 1993.
- *Phase I Environmental Site Assessment, 25450 Clawiter Road, Hayward, California,* prepared by Mittelhauser Corporation, dated July 1995.
- *Final Report Herrick Steel Corporation*, prepared by Decon, dated August 28, 1995
- *Geotechnical Investigation and Terrain Report, New Dairy Facility, Berkeley Farms, Hayward, California,* prepared by Harza Consulting Engineers and Scientists (Harza), dated March 29, 1996
- *Phase I Environmental Site Assessment, Dean Foods Company, Berkeley Farms, 25500 Clawiter Road, Hayward, CA 94545*, prepared by Antea Group (Antea) for Dean Foods Company, dated June 5, 2020
- *Facility Closure Report, Dean Foods/Berkeley Farms Dairy and Juice Processing Facility, 25500 Clawiter Road, Hayward, CA 94545,* prepared by RPS Group, dated June 24, 2020.

According to available historical records, Herrick Corporation operated as a steel fabrication facility at the site from 1957 to 1991, when on-site structures were demolished. In 1960, a 2,000-gallon gasoline UST was installed next to a vehicle maintenance garage along the eastern edge of the site. This UST was removed from the site in 1986 when it was discovered that soil and groundwater were impacted by TPHg and BTEX. Although a release to soils and groundwater was identified, no further work was conducted at that time. In 1989, Koll Development evaluated the purchase of the site from Herrick Steel. As part of this work, Harding Lawson conducted an environmental assessment, which included groundwater and soil testing across the site. The report (dated July 6, 1989) describing this particular work cannot be located in regulatory agency research but is referenced in other available environmental reports. This investigation included groundwater sampling on February 16, 1989 of wells CW-1, MW-1, MW-2, and MW-4, which were located on the southeast portion of the site. Groundwater samples were analyzed for volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs) by EPA test methods 624 and 625, and also for California Administrative Manual 17 (CAM-17) Metals. Groundwater depth was approximately 10 feet bgs and the flow direction was to the southwest. Groundwater concentrations of benzene, ethylbenzene, and xylenes were detected exceeding maximum contaminant levels (MCLs) at the time. No other VOCs or SVOCs were detected above the laboratory detection limits at that time. However, it should be noted that several the laboratory detection limits exceed several current SFBRWQCB environmental screening levels. Additionally, concentrations of several CAM-17 metals were detected, including concentrations of arsenic, barium, total chromium, cobalt, and nickel that exceed current MCLs.

From 1989-1993, remedial activities for the leaking underground storage tank (LUST) case included various soil and groundwater investigations, soil excavation and removal, and groundwater extraction and treatment (via activated carbon absorption). This included the regular monitoring of eight on-site groundwater monitoring wells. Approximately 15,000 cubic yards of soil was excavated, 10,000 cubic yards of which was below the level designated as hazardous and set aside. The remaining 5,000 cubic yards of contaminated soil was aerated on-site. During the last groundwater monitoring event from June 1993, analysis of all groundwater samples collected from the on-site monitoring wells were below laboratory detection limits for TPHg and BTEX. Based on these groundwater results, the SFBRWQCB, with concurrence by the Hayward Fire Department, granted regulatory case closure on December 30, 1993. It should be noted that subsurface sampling did not analyze for methyl tert-butyl ether (MTBE). Additionally, the laboratory detection limit for benzene for the 1993 investigation (0.50 micrograms per liter [µg/L]) is slightly above the current SFBRWQCB Environmental Screening Level (ESL) for benzene (0.42 µg/L).

In January of 1995, Harza conducted a geotechnical investigation for the site in preparation for future construction activities. During this geotechnical investigation, petroleum odors were encountered in one of the ten boring locations. This boring was located southwest and downgradient of the former UST location. From January to May 1995, Decon conducted remedial activities that included over-excavation in the area of the above boring location, the former UST location, and the area of a former sump; removal of impacted soils from the site; and treatment of groundwater encountered in the excavation. Confirmation soil and groundwater samples were below detection limits and also below current SFBRWQCB ESLs. The Hayward Fire Department issued a no further action letter on September 29, 1995.

Soils at the site were also found to be impacted with lead, specifically in two areas just south of Herrick's main building (near the south/central portion of the site). The lead was introduced by outdoor spray painting of steel parts during the late 1970s and early 1980s. In 1991 and 1992, groundwater samples collected from monitoring wells located downgradient of the impacted areas in the area were analyzed for lead. None of the groundwater samples collected showed detectable concentrations of lead; therefore, the remediation efforts were confined to soils. In 1990, approximately 100 cubic yards of lead-containing soil was excavated by Decon from these two areas and disposed off-site. Confirmation groundwater samples were non-detect for lead; confirmation soil samples were below 100 milligrams per kilogram (mg/kg), which was below the established cleanup level at the time (250 mg/kg). The Alameda County Health Services Agency and the Hayward Fire Department determined that there was "no threat to human health and groundwater from residual lead concentrations at the site. Therefore this office has no further requirements related to soil lead contamination at this time." The Alameda County Health Services Agency and the Hayward Fire Department granted regulatory case closure on August 31, 1992 and September 4, 1992, respectively.

Facility hazardous material closure activities began at the site on April 22, 2020 and concluded on June 12, 2020. The closure activities consisted and removal of all hazardous materials, decontamination of equipment, and decontamination of facility structures. While draining the gear oil reservoirs for four wastewater treatment plan piston air blowers (located north of the bioreactor tank), gear oil was spilled onto the secondary containment. However, due to the faulty concrete expansion joints in the secondary containment, the gear oil spill impacted the soil immediately beneath the blowers. RPS oversaw the over-excavation of the concrete and soils in this area (approximately 25 feet by 30 feet) at a depth of 5 feet bgs. This soil excavation and confirmation sampling was overseen by the Hayward Fire Department. Analysis of soil samples collected from the bottom and side walls of the excavation revealed TPH as oil (TPHo) concentrations ranging between 0 to 50 mg/kg of TPH as oil, which is well below the ESL for residential shallow soil exposure. The excavation was backfilled with clean aggregate base and capped with asphalt. A final facility closure inspection was conducted by the Hayward Fire Department on June 24, 2020. The results of the inspection confirm that the residual amount of hazardous materials remaining at the facility pose no threat to human health or the environment.

3.5 City Directories and Other Historical Sources

a) City Directories

RPS reviewed historical city directory data provided by ERIS that included information between 1962 and 2018 at approximately five-year intervals. From 1962-1990, the Herrick Corp. was listed at the site under 25450 Clawiter Road. In 2001-2002, Harris Construction Co. Inc. (likely related to the construction of the Berkeley Farms facility) was listed at the site under 25450 Clawiter Road. From 2010-2018, Berkeley Farms was listed at the site under 25500 Clawiter Road. Previous and current operations at the site are discussed in Section 3.1.

b) Other Historical Sources

According to Herrick Steel's website, Herrick Steel was founded in 1921. Herrick moved their fabrication plant from Oakland to Hayward in 1957.Herrick's operations at the site ceased in 1990. Herrick's current Northern California fabrication plant is located in Stockton, California.

No additional historical resources were identified or reviewed for the site.

4 SURROUNDING PROPERTIES

4.1 Surrounding Property Overview

Since at least 1899, Clawiter Road and railroad tracks have been adjacent to the west and east of the site, respectively. Since at least 1928, the surrounding area has primarily been agricultural land with sparse residential development. Circa 1939, a plant nursery was located to the southeast of the site. From the 1960s-1980s, the current west, north, and south adjacent commercial/industrial structures were developed. By 2002, the east and southeast commercial/industrial park was developed bringing the surrounding properties to their current configuration.

The site is located in an area that has historically been occupied by various commercial and industrial facilities, including a truck terminal facility to the west and a former bus manufacturing facility to the south. The nature and expected material usage at these facilities suggest a potential for environmental impact; however, a review of regulatory agency records these sites did not identify the potential for impact.

4.2 Area Observations

The use of the properties surrounding the site is summarized below.

North: The site is bordered to the north by railroad tracks, followed by Life Chiropractic College West, R&B Wholesale Dist., and Pucci Foods.

East: The site is bordered to the east by railroad tracks, followed by East Bay Logistics and Mt. Eden Business Park.

South: The site is bordered to the south by a vacant industrial property, which was previously occupied by Gillig, a bus manufacturer.

West: The site is bordered to the west by Clawiter Road, followed by Fremont Bank Operations Center, a vacant commercial/industrial property, YRC (truck terminal), an industrial property (no signage), and JJJR's Truck Repair and Maintenance.

Several of the surrounding light industrial and commercial facilities were identified in the environmental database report reviewed, as discussed further in Section 4.4.

4.3 Historical Photographs and Maps

RPS reviewed readily available historical topographic maps and aerial photographs obtained from the sources listed in Section 8. According to ERIS, no Sanborn fire insurance maps were available for the site area. The information from these sources is summarized below.

Period	Description
1899-1915 Topos	West-adjacent Clawiter Road and the east-adjacent railroad tracks are depicted. Sparse residential development is depicted in surrounding areas.
1928 Aerial	The surrounding areas are primarily agricultural land with sparse residential development.
1939 Aerial 1946 Aerial 1950 Topo 1957 Topo 1958 Aerial	Southeast of the site are several commercial structures (according to other city directories and other historical sources, this was the Mt. Eden Nursery).
1960 Topo 1961 Topo 1966 Aerial 1966 Topo	West of the site are several of the current commercial/industrial structures

1968 Aerial 1969 Topo	South, east, and northwest of the site are several of the current commercial/industrial structures.
1974 Aerial 1974 Topo	North and northeast of the site are several of the current commercial/industrial structures.
1980 Aerial 1980 Topo 1982 Aerial 1987 Aerial 1993 Aerial	West of the site are the current commercial structures (under construction in 1980; constructed by 1982).
2002-2019 Aerials	East and southeast of the site several of the current commercial/industrial structures. By this time, the surrounding areas appear as currently configured.

4.4 Environmental Database Review

RPS reviewed the database search report discussed in Section 3.3 to evaluate the potential for surrounding properties to impact the site. This evaluation also included an assessment of vapor migration using available historical, subsurface, and regulatory information, as well as published regulatory guidance, industry standards (including critical screening distances) and professional experience.

Detailed descriptions of the databases that were searched and definitions of database acronyms are included within the Executive Summary Section and the Government Records Section of the database search report included as Appendix D. Relevant listings for surrounding properties are discussed below. Note that groundwater gradient discussions presented in this section are based on information described in Section 2.3.

- Yellow Freight Lines/YRC Worldwide (25555 Clawiter Road) is located to the west of the site across Clawiter Road (hydrologically cross-gradient) and is listed on the CLEANUP SITES and LUST databases. This facility is an active truck terminal (since 1969) and previously operated seven USTs containing motor oil, waste oil, diesel and gasoline (ranging in size from 550 to 10,000 gallons). This facility is associated with a Site Cleanup Program (SCP) case and a LUST case due to releases from these former USTs. The SCP case was closed in 2011 upon removal of the USTs at this facility. The LUST case received regulatory closure in 2013. According to a review of available groundwater data (from 2013) on the SWRCB's GeoTracker database, the nearest monitoring wells to the site (approximately 325 feet to the west of the site) were non-detect for petroleum constituents. Based on the hydrologic position relative to the site and the sampling data from the nearest wells to the site, the potential for impact is expected to be low.
- Gillig Corporation/Clawiter Innovation (25800 Clawiter Road) is located to the south of the site (hydrologically down-gradient) and is listed on the CLEANUP SITES and LUST databases. This facility previously operated as a bus manufacturing facility from 1969 through 2017. According to prior environmental reports for this facility on the GeoTracker database and provided by the site owner, this facility previously conducted vehicle maintenance, parts fabrication, and spray painting operations. The LUST case refers to the removal of three diesel USTs (two 1,000-gallon and one 10,000-gallon USTs; located on the south end of this property) from this facility in 2007, the subsequent cleanup, and regulatory closure in 2010. In 2019 and 2020 several subsurface assessments have been conducted for this facility in preparation for redevelopment. During the most recent subsurface assessment for this facility (*Data Gap Investigation Completion Report, 25800 and 25858 Clawiter Road, Hayward, California,* prepared by RMD Environmental Solutions Inc., dated March 27, 2020), concentrations of metals (arsenic, cobalt, lead, and nickel) in soil, volatile organic compounds (benzene, naphthalene, chloroform, vinyl chloride) in soil gas, and TPH as diesel (TPHd) in groundwater were detected above their respective ESLs. However, the consultant determined that these concentrations did not warrant active remediation or mitigation. Given the hydrologic position of this property relative to the site, the potential for impact to the site is expected to be low.

Although other facilities were identified in the database search report, due to gradient, status, distance and/or the type of the listing, no additional properties of potential environmental significance were identified. Details regarding these facilities are presented in the database search report.

4.5 Other Environmental and Historical Sources

a) Information from Site Representatives

The site representatives were not aware of potential or known environmental impacts associated with the neighboring properties.

b) City Directories

In the city directory review discussed in Section 3.5, Clawiter Road was first identified in the 1956 city directory with residential listings. Since 1962, Clawiter Road has been occupied by various commercial and industrial businesses, most notably the following businesses:

25555 Clawiter Road – Yellow Freight System Inc./YRC/Yellow Transportation (1969-current)

25800 Clawiter Road – Gillig Bros./Gillig Corporation (1969-2006)

Regulatory database listings for these businesses are discussed in Section 4.4.

c) Other Sources

Regulatory agency records (via the SWRCB's GeoTracker database) were reviewed for the west and south adjacent properties, as discussed in Section 4.4.

5 SITE INSPECTION

5.1 Materials Use and Storage

Based on information provided by the site representative and RPS's field observations, the primary materials used and stored include the following:

- *Diesel fuel:* 350-gallon diesel belly tank within an emergency generator located in an enclosed area south of main building. The diesel fuel has been emptied from other on-site generators and the UST (discussed in Section 5.2).

The site previously stored and utilized ammonia, alcohols, acids, flammable and non-flammable gases, hydraulic oil, insulating oil, lubricant oil, motor oil, glycol, and cleaning chemicals – these chemicals have been removed from the site during the facility closure activities. All remaining processing and mechanical equipment have been drained of oils and other hazardous materials in preparation to be sold and/or removed from the site.

Minor oil staining was observed throughout the site, most notably in the vicinity of an air compressor in wastewater treatment plant area. The oil staining was localized and did not appear to have impacted the subsurface.

The site representative was not aware of other spills or releases since site operations began. RPS did not observe obvious visual indications of spills or releases, with the exception of the minor staining discussed above. Previous releases and subsequent cleanups at the site are discussed in Section 3.0.

5.2 Storage Tanks

a) Underground Storage Tanks (USTs)

A 10,000-gallon diesel UST is located along the southern edge of the site, west of the wastewater treatment plant. The UST, which was originally installed in 1998, is located adjacent to a canopied fueling station with two fuel pump islands. The UST is a double-walled steel tank with a leak detection system. The UST was previously used for fueling Berkeley Farms delivery trucks. As of May 18, 2020, the UST has been granted temporarily closure by the Hayward Fire Department. The diesel fuel has been removed from the UST, was triple rinsed with water and cleaner, and replaced with tap water (for inerting tank). RPS also reviewed available regulatory agency records from the Hayward Fire Department (including inspections, testing records, permits, and violations) and there are no indications of any significant releases or outstanding violations. However, there are no records indicating any subsurface investigations have been conducted in the vicinity of the UST. Therefore, there is a potential for impacts from the on-site UST.

A 2,000-gallon gasoline UST was previously located on site during Herrick Corporation's operations. This UST, which was installed in 1960 and removed from the site in 1986, is discussed in Section 3.4.

b) Aboveground Storage Tanks (ASTs)

The site currently utilizes an emergency generator with a 350-gallon diesel belly tank. No other ASTs are currently being utilized on site. Berkeley Farms previously operated several emergency generators (each with their own integral diesel AST), and utilized several new and used oil ASTs, milk/juice/ingredient ASTs/silos, two ammonia ASTs, and a glycol AST. The wastewater treatment system also utilized several ASTs, including the 600,000-gallon bioreactor. These ASTs have been emptied and are in the process of being sold and/or removed from the site. Several diesel ASTs and an oxygen AST were utilized by Herrick Corporation, whose operations are discussed in Section 3.0.

5.3 Waste Generation

The following wastes are generated at the site:

- General waste and recyclables: collected in dumpsters and compactors located east of the main building; removed by Waste Management weekly
- Scrap metal: collected in dumpsters located east of the main building; removed by a metal recycler as needed.

Based on RPS's observations and information from the site representative, the site does not currently generate hazardous waste. Berkeley Farms previously generated used oil (from routine truck and equipment maintenance) and wastewater solids (from wastewater treatment plant operations). Historical operations are discussed in Section 3.0.

5.4 Wastewater Discharges

Sanitary wastewater is discharged to the municipal sewer system. Wastewater previously generated by the on-site milk and juice processing operations, as well as wastewater that drained into interior on-site floor drains, all discharged via underground piping and a lift station to a wastewater treatment system, which is located on the southeastern portion of the site. The wastewater treatment system consisted of a 600,000-gallon bioreactor tank, two feed tanks, and other associated equipment. Solids from the treatment activities would then be removed by a specialized waste hauler. Treated wastewater was discharged into the municipal sanitary sewer line running along the south end of the site. The wastewater treatment system equipment is in the process of being decommissioned and will be removed from the site.

No other process wastewater discharges are generated at the site.

5.5 Stormwater Discharges

Stormwater runoff sheet flows to grated drains connected to underground storm pipes located in the paved parking, driveway, and exterior storage areas outside the building. No visual indications of oil or other pollutants were noted in the vicinity of the drains.

5.6 Air Emissions

RPS did not identify obvious air emission sources with a potential to physically impact the site.

5.7 Polychlorinated Biphenyls (PCBs)

Several pad-mounted transformers and hydraulic equipment are located on site. Based on the construction date of the current structures, this equipment is not likely to contain PCBs.

5.8 Asbestos-Containing Materials (ACMs)

The site representative was not aware of asbestos surveys for the site and none were identified in available site records. RPS identified suspect ACMs in the form of drywall and associated joint compound, vinyl floor tile and associated mastic, and drop ceiling tiles. The suspect ACMs that were observed were in good condition. It should be noted that additional suspect ACMs may be present in inaccessible areas of the site structure, such as above fixed ceilings, behind walls or in roofing systems, and were therefore not observed during the site reconnaissance. In the event of demolition or renovation, National Emissions Standards for Hazardous Air Pollutants (NESHAPs) requirements for the management of suspect ACMs will apply.

6 FINDINGS AND CONCLUSIONS

Environmental and other conditions associated with the site are characterized as RECs, CRECs, HRECs, de minimis conditions, noteworthy conditions, or other considerations as defined in Section 1.1 of this report. Any exceptions to, or deletions from, this practice are described in Sections 1.2 and 1.3 of this report if not identified below.

This assessment revealed evidence of the following REC in connection with the site:

- **Current UST:** The current 10,000-gallon diesel UST was installed in the southern portion of the site in 1998. The UST is a steel, double-walled tank with a leak detection system. RPS reviewed available regulatory agency records from the Hayward Fire Department (including inspections, testing records, permits, and violations) and there are no indications of any significant releases or outstanding violations. However, there are no records indicating any subsurface investigations have been conducted in the vicinity of the UST and based on age, there is a potential for impacts to exist.

This assessment identified the following HREC in connection with the site:

- **Historical UST:** From 1960-1986, Herrick operated a 2,000-gallon gasoline UST. The UST was removed in 1986. In 1989, soil and groundwater was discovered to be impacted with total petroleum hydrocarbons as gasoline (TPHg), benzene, toluene, ethylbenzene, and xylenes (BTEX). Remedial activities included various soil and groundwater investigations, soil excavation and removal, and groundwater extraction and treatment (via activated carbon absorption). The San Francisco Regional Water Quality Control Board (SFBRWQCB) with concurrence by the Hayward Fire Department granted regulatory case closure on December 30, 1993. An additional investigation was conducted in 1995 following a geotechnical investigation that encountered petroleum odors in one of the ten boring locations. Remedial activities included over-excavation in the area of this boring location, the former UST location, and the area of a former sump; removal of impacted soils from the site; and treatment of groundwater encountered in the excavation. Confirmation soil and groundwater samples were below detection limits and also below current SFBRWQCB Environmental Screening Levels (ESLs). The Hayward Fire Department issued a no further action letter on September 29, 1995.

This assessment identified the following CREC in connection with the site:

- **Lead-Impacted Soil:** Soils at the site were found to be impacted with lead, specifically in two areas just south of Herrick's main building (near the south/central portion of the site). The lead was introduced by outdoor spray painting of steel parts during the late 1970s and early 1980s. Soils with elevated levels of leads were excavated and disposed off-site. Groundwater testing identified no detectable concentrations of lead in shallow in groundwater. Residual soils with lead below 100 milligrams per kilogram (mg/kg) were allowed to be left in place. Based on these results, the Alameda County Health Services Agency and Hayward Fire Department granted regulatory case closure on August 31, 1992 and September 4, 1992, respectively.

This assessment identified the following noteworthy conditions in connection with the site:

- **Historical Steel Fabrication Operations:** Herrick operated a steel metal fabrication facility at the site from 1957-1991. As part of a proposed real estate transaction in 1989, an environmental assessment was conducted by a prospective buyer, which included soil and groundwater testing across the site based upon the conditions and operations observed at that time. Soil and groundwater impacts were identified prompting additional investigations and remediation from 1990 to 1995 with regulatory oversight provided by the SFBRWQCB, Hayward Fire Department, and Alameda County Health Services Agency. The site was subsequently acquired by Berkeley Farms in 1996, which constructed the existing dairy processing plant. Nevertheless, there remains the possibility of unknown and/or undiscovered impacts.
- **Surrounding Area Operations:** The site is located in an area that has historically been occupied by various commercial and industrial facilities, including a truck terminal facility to the west and a former bus manufacturing facility to the south. The nature and expected material usage at these facilities suggest a

potential for environmental impact; however, a review of regulatory agency records these sites did not identify the potential for impact.

This assessment identified the following other considerations in connection with the site:

- **Asbestos-Containing Materials (ACMs):** In the event of demolition or renovation, National Emissions Standards for Hazardous Air Pollutants (NESHAPs) requirements for the management of suspect ACMs will apply.

7 ENVIRONMENTAL PROFESSIONAL STATEMENT

We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in 40 CFR Part 312, and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

9 LIMITATIONS, EXCEPTIONS, AND SIGNIFICANT ASSUMPTIONS

RPS performed this Phase I ESA on behalf of and exclusively for DPIF2 CA 25 Clawiter Road, LLC. This report and the findings shall not be relied upon, in whole or in part, by any other party, except by or with the express consent of RPS and an authorized representative of DPIF2 CA 25 Clawiter Road, LLC.

This assessment is subject to the stated limitations of ASTM-13 or the federal AAI standard, as applicable, and other qualifications as described within the report. Any reliance upon this report by third parties without RPS's written authorization shall be at such parties' sole risk. In the event reliance on this report is extended to additional parties, those parties may become "users" as defined by ASTM-13 and should independently confirm that they have addressed the User requirements outlined in ASTM-13 and that their use of the report is consistent with the purposes for which it was prepared.

This review was based on the time frame, budget and scope of the project. The review was intended to identify issues of relevance to the contemplated transaction that this report was prepared to support.

This assessment was conducted by or under the supervision of an individual(s) meeting the definition of an Environmental Professional under ASTM-13 and the federal AAI standard. Tasks not performed by an Environmental Professional were performed by individuals qualified based on education, training and experience to conduct such tasks for a property of the nature, history and setting of the site.

ASTM defines "data gaps" as an inability to obtain information required for the review despite good faith efforts (such as the lack of historical information back to 1940 or to the first developed use of the property [whichever is earlier]) or as an incompleteness in any of the activities required for the review (such as limited site accessibility or the inability to interview a key site representative). Unless otherwise described in the body of this report, if any one or more of the standard sources under ASTM-13 was not reviewed, this was due to information from the source not being readily available or a determination by the Environmental Professional that the standard source was not likely to be useful. Similarly, unless otherwise noted in this report, an incompleteness in connection with the review was determined not to affect the Environmental Professional's ability to form conclusions regarding the site.

Unless otherwise indicated herein, RPS was not made aware of any specialized knowledge of the landowner or client, any relationship of the purchase price to the fair market value of the site that may be indicative of an environmental concern, or any environmental liens or other activity and use limitations known by the client or user of the report. In the absence of this information, RPS is not able to form conclusions about the environmental condition of the site that may otherwise have been evident had any such information been made available. Unless otherwise indicated herein, the reason for performing this Phase I ESA is assumed to be (at least in part) to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser liability defense under the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA).

It should be noted that past agricultural use is considered a developed use under ASTM; any past use of the site for agricultural purposes suggests a potential for residual agricultural chemicals. Unless otherwise stated in this report, no evidence or reports of chemical spills or misuses of agricultural chemicals were identified.

During this Phase I ESA, RPS relied upon the information provided by site representatives, regulatory officials, and other informed individuals and reports and documents generated by other consultants. RPS has assumed, where reasonable, that the information reviewed is true and accurate but assumes no responsibility or liability for its accuracy or completeness.

RPS's site observations are of the conditions observed at the time of the assessment. RPS did not observe areas of the site or features of the site where that inspection would have interfered with operations. Additionally, RPS did not enter confined spaces. Pits, trenches or other subsurface features were inspected as thoroughly as possible from access points, vault openings, and through grated drains/lids. RPS did not test the integrity or engineering adequacy of subsurface pits, trenches, sewers, or containment features, aboveground containment

systems or tanks. RPS's observation of such equipment/systems is limited to visual evidence of releases or significant deterioration.

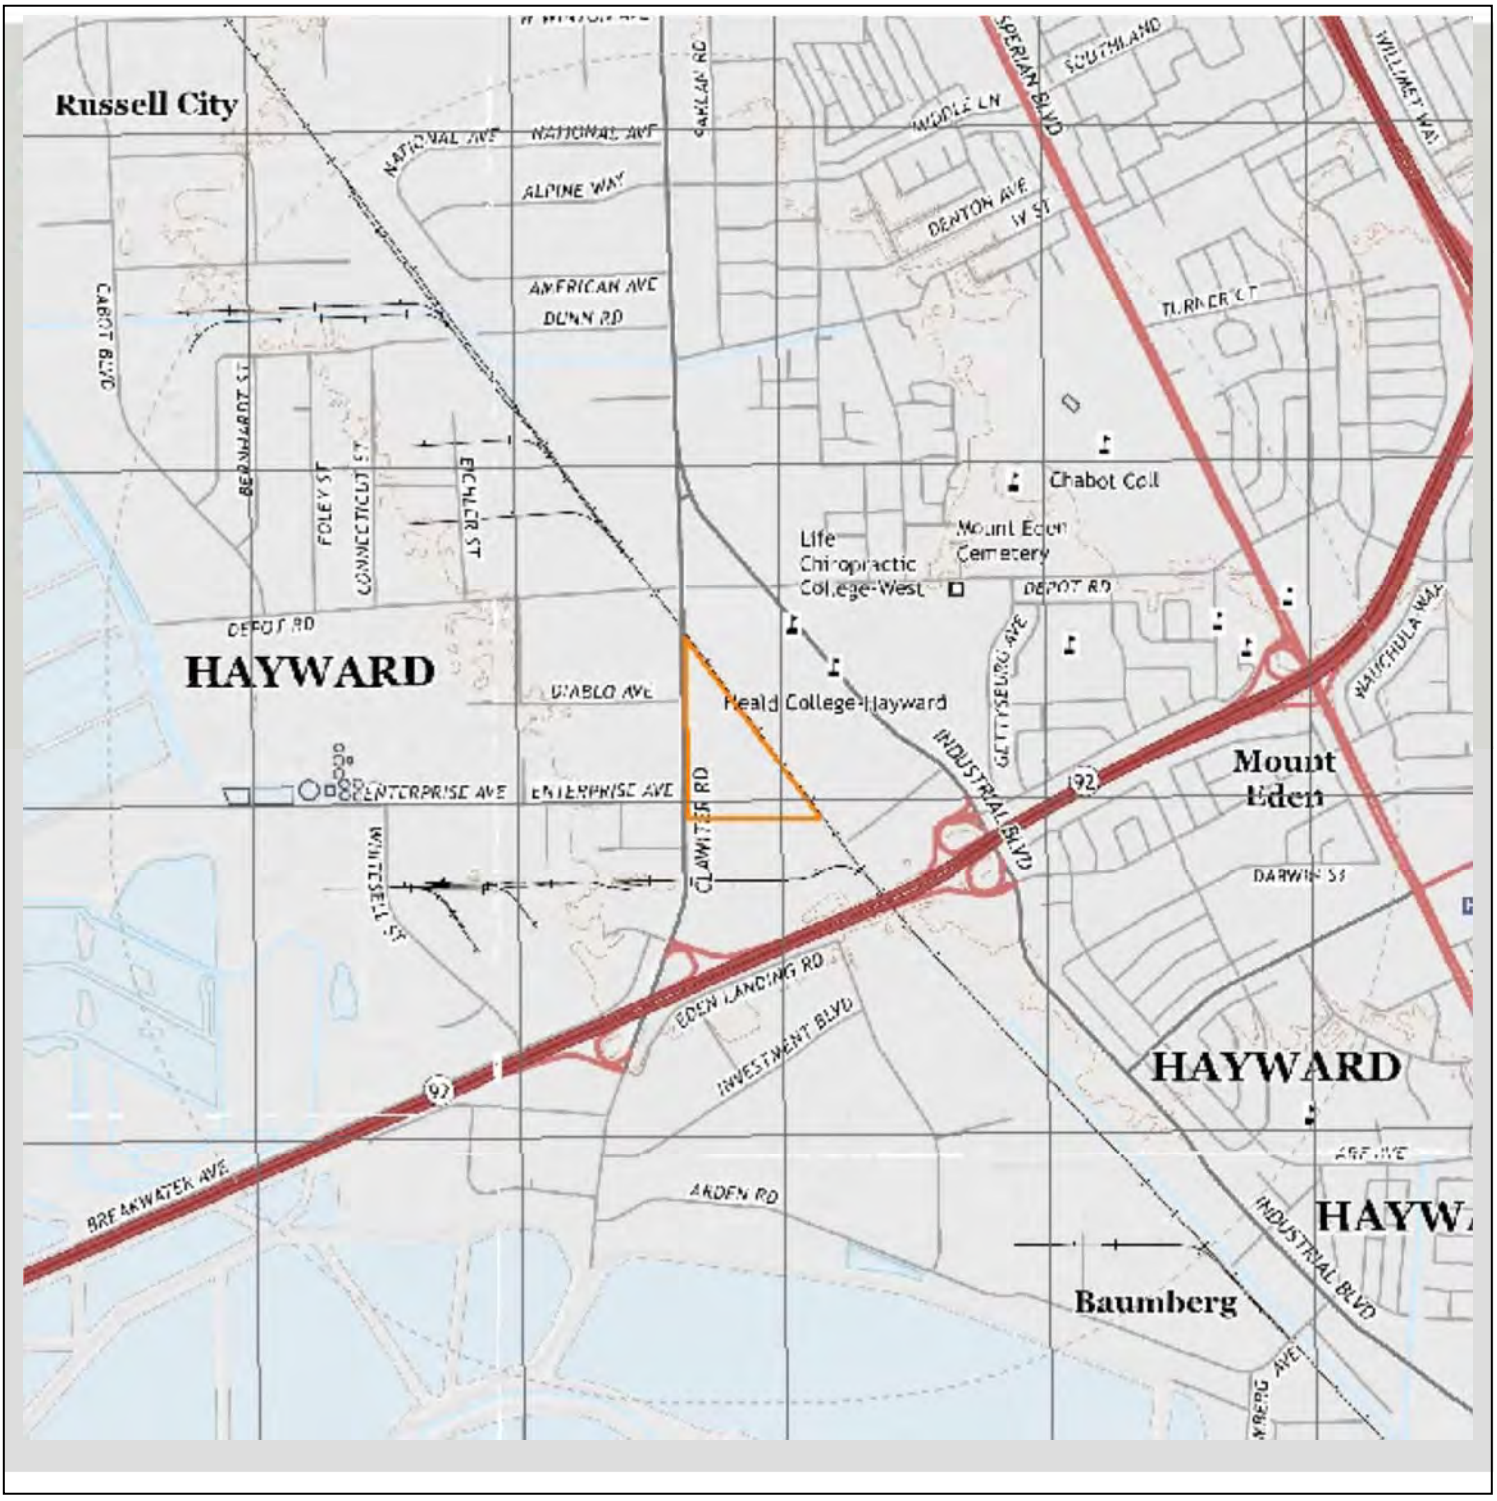
RPS reviewed an environmental database search report. RPS's conclusions based on the search report are limited to the accuracy of that report. To the extent practicable, RPS's field observations were used to verify the information or identify errors and inconsistencies in the search report regarding the listed facilities in the immediate vicinity of the site, consistent with the federal AAI standard.

RPS evaluates environmental database listings and the potential for additional documentation maintained by regulatory agencies to materially alter the Environmental Professional's opinion with regard to the environmental condition of the site. Except where otherwise described in this report, the pursuit of additional documentation either through regulatory agency file reviews or requests for additional information from the site operator, site owner or the owners/operators of nearby properties, was determined to be unnecessary as it would not be expected to alter the findings of the assessment.

Conclusions provided with regard to subsurface soil and groundwater impacts are limited to those that can be formed based on a non-intrusive investigation. RPS has considered all the information collected during this assessment to ascertain the potential presence of a release or threatened release of hazardous substances at the property. Based on the totality of information, RPS has assessed whether or not an obvious conclusion may be drawn that there are conditions indicative of a release or threatened release, and considered whether the parties should be able to detect the release by conducting a subsurface investigation. Where RPS concludes that the potential for impact is present, it should be understood that such impact can only be identified or ruled out through subsurface investigation. The absence of environmental hazards in the subsurface cannot be guaranteed based on conditions observed on the surface. The scope of this project did not include subsurface soil or groundwater sampling.

RPS evaluates the potential for the presence or likely presence of contaminant of concern (COC) vapors in the subsurface of the site using our professional judgment and evaluation of the available information and may use portions of ASTM E2600-15 as a guide. Note that this evaluation is not a full Vapor Encroachment Screen (VES) pursuant to ASTM E2600-15. The vapor evaluation is not exhaustive and cannot wholly eliminate uncertainty regarding the presence or potential presence of COC vapors in the subsurface of the site.

The estimated groundwater gradients (flow directions) referenced throughout this report are based on field observations of the topography of the area, review of topographic map(s), information in the database search report, and other information as available. It should be noted that groundwater flow directions can be highly variable in neighboring areas, and can be influenced by factors such as water production wells or re-grading or development in the area.



The review of available wetlands information, if performed, was intended for purposes of evaluating risks associated with potential on-site impacts and does not represent a jurisdictional wetlands delineation. A certified wetlands delineation may be necessary prior to further site development.

If conducted as part of this review, the visual inspection for potential ACM included materials that have historically been shown to have a potential to contain asbestos. Unless otherwise noted in this report, RPS's review of ACM is limited to interior building materials. The limited visual survey for potential ACM is intended to provide an indication of the potential for significant environmental issues associated with ACM and should not be regarded as a comprehensive survey for demolition or other purposes. Testing should generally be conducted to identify regulated ACM prior to remodeling or demolition of the site structures.

The scope of this report is limited to matters expressly covered. Implementation or use of the recommendations, findings or conclusions of this report does not preclude the potential for present or future environmental liability or ensure the fulfillment of a property owner's obligation to provide full environmental disclosure in accordance with any local, state or federal laws.

RE: CITY DIRECTORY RESEARCH
Former Berkeley Farms - Phase I ESA
25450-25500 Clawiter Road Hayward, CA

Thank you for contacng ERIS f or an City Directory Search for the site described above. Our staff has conducted a reverse lisng City Dir ectory search to determine prior occupants of the subject site and adjacent properes. W e have provided the nearest addresses(s) when adjacent addresses are not listed. If we have searched a range of addresses, all addresses in that range found in the Directory are included.

Note: Reverse Lisng Dir ectories generally are focused on more highly developed areas. Newly developed areas may be covered in the more recent years, but the older directories will tend to cover only the "central" parts of the city. To complete the search, we have either uliz ed the ACPL, Library of Congress, State Archives, and/or a regional library or history center as well as mulple digiz ed directories. These do not claim to be a complete collecon of all r everse lisng city dir ectories produced.

ERIS has made every effort to provide accurate and complete informaon but shall not be held liable f or missing, incomplete or inaccurate informaon. To complete this search we used the general range(s) below to search for relevant findings. If you believe there are addional addr esses or streets that require searching please contact us at 866-517-5204.

Search Criteria:
25000-26000 of Clawiter Road
25000-26000 of Industrial Boulevard

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages.

(2) DATE – Enter the date of the application.

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below **and** report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S
Corrosive Liquid	CORR-L	Irritant – Solid	IRR-S	Poison A-Gas	POIS-G
Corrosive Solid	CORR-S	Nonflammable Gas	NFG	Poison A-Liquid	POIS-L
Etiological Agent	ETI	Organic Peroxide – Liquid	PEROX-L	Poison B-Liquid	POIS-L
Explosives A	EXP A	Organic Peroxide – Solid	PEROX-S	Poison B-Solid	POIS-S
Explosives B	EXP B	Other Regulated		RADIOACTIVE	RAD
Explosives C	EXP C	Materials – Liquid	ORM-L	CRYOGENS	CRYO
Flammable Gas	FG	Other Regulated			
Flammable Liquid	FL	Materials – Solid	ORM-S		

(6) CHEMICAL NAME, TRADE NAME – For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is "Quantity Range No. 1" (see chart below) i.e., **less** than 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet (STP) for gases, the exact chemical name for each chemical is **not** required. Summarize these individual small quantity chemicals by the DOT class name and report as a single line with the DOT class name preceded by the word "Assorted." Example: "Assorted Flammable Liquids."

For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is Quantity Range Nos. 2 through 5 i.e., **greater** than 55 gallons, 500 pounds, or 200 cubic feet, provide the chemical name, proprietary name, or chemical name of major constituents for mixtures; followed by a slash and then the applicable trade name. Example: trichlorotrifluoroethane, Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated **total** quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the storage facility.

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

HAZARDOUS MATERIALS MANAGEMENT METHODS

Please describe for each storage area by code or codes. If more than one code applies, list all codes. If you have marked "OTHER" in any of the categories, please specify the method used.

ADDITIONAL INFORMATION TO BE SUBMITTED:

1. Monitoring Program - Please submit information on the location, type, manufacture, specifications of all electronic monitoring equipment or monitoring wells (if you have any).

2. Recordkeeping Form - Please submit a filled out copy of the recordkeeping forms used by your facility. (For gas stations, please submit copies of your last three months inventory control records.)

3. Emergency Equipment - Please provide a testing and maintenance schedule for the emergency equipment that needs to be serviced.

4. Contingency Plan - Please submit a copy of your procedures to respond to emergencies, including spills, fires and catastrophic events. Also submit a copy of your training plan for personnel to respond to these emergencies.

I declare under penalty of perjury that the foregoing information is true and correct.

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages.

(2) DATE – Enter the date of the application.

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below **and** report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S

Example: trichlorotrifluoroethane/Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated **total** quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the "storage facility."

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

HAZARDOUS MATERIALS MANAGEMENT METHODS

Please describe for each storage area by code or codes. If more than one code applies, list all codes. If you have marked "OTHER" in any of the categories, please specify the method used.

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages.

(2) DATE – Enter the date of the application.

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below **and** report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S
Corrosive Liquid	CORR-L	Irritant – Solid	IRR-S	Poison A-Gas	POIS-G
Corrosive Solid	CORR-S	Nonflammable Gas	NFG	Poison A-Liquid	POIS-L
Etiological Agent	ETI	Organic Peroxide – Liquid	PEROX-L	Poison B-Liquid	POIS-L
Explosives A	EXP A	Organic Peroxide – Solid	PEROX-S	Poison B-Solid	POIS-S
Explosives B	EXP B	Other Regulated		RADIOACTIVE	RAD
Explosives C	EXP C	Materials – Liquid	ORM-L	CRYOGENS	CRYO
Flammable Gas	FG	Other Regulated			
Flammable Liquid	FL	Materials – Solid	ORM-S		

(6) CHEMICAL NAME, TRADE NAME – For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is "Quantity Range No. 1" (see chart below) i.e., **less** than 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet (STP) for gases, the exact chemical name for each chemical is **not** required. Summarize these individual small quantity chemicals by the DOT class name and report as a single line with the DOT class name preceded by the word "Assorted." Example: "Assorted Flammable Liquids."

For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is Quantity Range Nos. 2 through 5 i.e., **greater** than 55 gallons, 500 pounds, or 200 cubic feet, provide the chemical name, proprietary name, or chemical name of major constituents for mixtures; followed by a slash and then the applicable trade name. Example: trichlorotrifluoroethane/Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated **total** quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the "storage facility."

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages

(2) DATE – Enter the date of the application

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below and report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S
Corrosive Liquid	CORR-L	Irritant – Solid	IRR-S	Poison A-Gas	POIS-G
Corrosive Solid	CORR-S	Nonflammable Gas	NFG	Poison A-Liquid	POIS-L
Etiological Agent	ETI	Organic Peroxide – Liquid	PEROX-L	Poison B-Liquid	POIS-L
Explosives A	EXP A	Organic Peroxide – Solid	PEROX-S	Poison B-Solid	POIS-S
Explosives B	EXP B	Other Regulated		RADIOACTIVE	RAD
Explosives C	EXP C	Materials – Liquid	ORM-L	CRYOGENS	CRYO
Flammable Gas	FG	Other Regulated			
Flammable Liquid	FL	Materials – Solid	ORM-S		

(6) CHEMICAL NAME, TRADE NAME – For each hazardous material (includes both non-waste and waste materials) where the quantity stored is "Quantity Range No. 1" (see chart below) i.e., less than 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet (STP) for gases, the exact chemical name for each chemical is not required. Summarize these individual small quantity chemicals by the DOT class name and report as a single line with the DOT class name preceded by the word "Assorted." Example: "Assorted Flammable Liquids."

For each hazardous material (includes both non-waste and waste materials) where the quantity stored is Quantity Range Nos. 2 through 5 i.e., greater than 55 gallons, 500 pounds, or 200 cubic feet, provide the chemical name, proprietary name, or chemical name of major constituents for mixtures; followed by a slash and then the applicable trade name. Example: trichlorotrifluoroethane/Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated total quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the storage facility.

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

HAZARDOUS MATERIALS MANAGEMENT METHODS

INDIVIDUAL STORAGE AREA CHEMICAL LISTING
(see back of sheet for instructions)

FIRE PREVENTION BUREAU
22300 Foothill Blvd.
Hayward CA 94541

(1) Page 1 of Pages 1

Official Use Only

(2) Date

(3) Storage Facility #5

(4) Business Name: THE HERRICK CORPORATION

Faciltiy Street Number | Street Name

DOT CLASS (5)	Chemical Name/Trade Name (6)	Maximum Quantity Anticipated Gas (Cu Ft) (7)	Liquid (Gal) (8)	Solid (lbs) (9)	Tank (10)	Waste (11)	Quantity Range (12)
FG	PROPANE		1200Gal		X		3

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages

(2) DATE – Enter the date of the application.

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below and report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S
Corrosive Liquid	CORR-L	Irritant – Solid	IRR-S	Poison A-Gas	POIS-G
Corrosive Solid	CORR-S	Nonflammable Gas	NFG	Poison A-Liquid	POIS-L
Etiological Agent	ETI	Organic Peroxide – Liquid	PEROX-L	Poison B-Liquid	POIS-L
Explosives A	EXP A	Organic Peroxide – Solid	PEROX-S	Poison B-Solid	POIS-S
Explosives B	EXP B	Other Regulated		RADIOACTIVE	RAD
Explosives C	EXP C	Materials – Liquid	ORM-L	CRYOGENS	CRYO
Flammable Gas	FG	Other Regulated			
Flammable Liquid	FL	Materials – Solid	ORM-S		

(6) CHEMICAL NAME, TRADE NAME – For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is "Quantity Range No. 1" (see chart below) i.e., **less** than 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet (STP) for gases, the exact chemical name for each chemical is **not** required. Summarize these individual small quantity chemicals by the DOT class name and report as a single line with the DOT class name preceded by the word "Assorted." Example: "Assorted Flammable Liquids."

For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is Quantity Range Nos. 2 through 5 i.e., **greater** than 55 gallons, 500 pounds, or 200 cubic feet, provide the chemical name, proprietary name, or chemical name of major constituents for mixtures; followed by a slash and then the applicable trade name. Example: trichlorotrifluoroethane/Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated **total** quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the "storage facility."

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

HAZARDOUS MATERIALS MANAGEMENT METHODS

Please describe for each storage area by code or codes. If more than one code applies, list all codes. If you have marked "OTHER" in any of the categories, please specify the method used.

(see back of sheet for instructions)

Page 1 of Pages 1

(1)

Official Use Only

(2) Date

(3) Storage Facility #6

(4) Business Name: THE HERRICK CORPORATION

Facilty Street Number | Street Name

DOT CLASS (5)	Chemical Name/Trade Name (6)	Maximum Quantity Anticipated Gas (Cu Ft) (7)	Liquid (Gal) (8)	Solid (lbs) (9)	Tank (10)	Waste (11)	Quantity Range (12)
FL	HEXANE		330		X		2

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages

(2) DATE – Enter the date of the application.

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below **and** report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S
Corrosive Liquid	CORR-L	Irritant – Solid	IRR-S	Poison A-Gas	POIS-G
Corrosive Solid	CORR-S	Nonflammable Gas	NFG	Poison A-Liquid	POIS-L
Etiological Agent	ETI	Organic Peroxide – Liquid	PEROX-L	Poison B-Liquid	POIS-L
Explosives A	EXP A	Organic Peroxide – Solid	PEROX-S	Poison B-Solid	POIS-S
Explosives B	EXP B	Other Regulated		RADIOACTIVE	RAD
Explosives C	EXP C	Materials – Liquid	ORM-L	CRYOGENS	CRYO
Flammable Gas	FG	Other Regulated			
Flammable Liquid	FL	Materials – Solid	ORM-S		

(6) CHEMICAL NAME, TRADE NAME – For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is "Quantity Range No. 1" (see chart below) i.e., **less** than 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet (STP) for gases, the exact chemical name for each chemical is **not** required. Summarize these individual small quantity chemicals by the DOT class name and report as a single line with the DOT class name preceded by the word "Assorted." Example: "Assorted Flammable Liquids."

For each hazardous material (includes both non-waste and waste materials) where the quantity stored is Quantity Range Nos. 2 through 5 i.e., **greater** than 55 gallons, 500 pounds, or 200 cubic feet, provide the chemical name, proprietary name, or chemical name of major constituents for mixtures; followed by a slash and then the applicable trade name. Example: trichlorotrifluoroethane/Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated **total** quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the "storage facility."

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages.

(2) DATE – Enter the date of the application.

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below **and** report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S
Corrosive Liquid	CORR-L	Irritant – Solid	IRR-S	Poison A-Gas	POIS-G
Corrosive Solid	CORR-S	Nonflammable Gas	NFG	Poison A-Liquid	POIS-L
Etiological Agent	ETI	Organic Peroxide – Liquid	PEROX-L	Poison B-Liquid	POIS-L
Explosives A	EXP A	Organic Peroxide – Solid	PEROX-S	Poison B-Solid	POIS-S
Explosives B	EXP B	Other Regulated		RADIOACTIVE	RAD
Explosives C	EXP C	Materials – Liquid	ORM-L	CRYOGENS	CRYO
Flammable Gas	FG	Other Regulated			
Flammable Liquid	FL	Materials – Solid	ORM-S		

(6) CHEMICAL NAME, TRADE NAME – For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is "Quantity Range No. 1" (see chart below) i.e., less than 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet (STP) for gases, the exact chemical name for each chemical **is not** required. Summarize these individual small quantity chemicals by the DOT class name and report as a single line with the DOT class name preceded by the word "Assorted." Example: "Assorted Flammable Liquids."

For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is Quantity Range Nos. 2 through 5 i.e., **greater** than 55 gallons, 500 pounds, or 200 cubic feet, provide the chemical name, proprietary name, or chemical name of major constituents for mixtures; followed by a slash and then the applicable trade name. Example: trichlorotrifluoroethane/Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated **total** quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the storage facility.

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

HAZARDOUS MATERIALS MANAGEMENT METHODS

Please describe for each storage area by code or codes. If more than one code applies, list all codes. If you have marked "OTHER" in any of the categories, please specify the method used.

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages.

(2) DATE – Enter the date of the application.

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below **and** report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S
Corrosive Liquid	CORR-L	Irritant – Solid	IRR-S	Poison A-Gas	POIS-G
Corrosive Solid	CORR-S	Nonflammable Gas	NFG	Poison A-Liquid	POIS-L
Etiological Agent	ETI	Organic Peroxide – Liquid	PEROX-L	Poison B-Liquid	POIS-L
Explosives A	EXP A	Organic Peroxide – Solid	PEROX-S	Poison B-Solid	POIS-S
Explosives B	EXP B	Other Regulated		RADIOACTIVE	RAD
Explosives C	EXP C	Materials – Liquid	ORM-L	CRYOGENS	CRYO
Flammable Gas	FG	Other Regulated			
Flammable Liquid	FL	Materials – Solid	ORM-S		

(6) CHEMICAL NAME, TRADE NAME – For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is "Quantity Range No. 1" (see chart below) i.e., less than 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet (STP) for gases, the exact chemical name for each chemical is not required. Summarize these individual small quantity chemicals by the DOT class name and report as a single line with the DOT class name preceded by the word "Assorted." Example: "Assorted Flammable Liquids."

For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is Quantity Range Nos. 2 through 5 i.e., greater than 55 gallons, 500 pounds, or 200 cubic feet, provide the chemical name, proprietary name, or chemical name of major constituents for mixtures; followed by a slash and then the applicable trade name. Example: trichlorotrifluoroethane, Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated **total** quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the "storage facility."

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages

(2) DATE – Enter the date of the application.

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below **and** report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S
Corrosive Liquid	CORR-L	Irritant – Solid	IRR-S	Poison A-Gas	POIS-G

Explosives C	EXP C	Materials – Liquid	ORM-L	CRYOGENS	CRYO
Flammable Gas	FG	Other Regulated			
Flammable Liquid	FL	Materials – Solid	ORM-S		

(6) CHEMICAL NAME, TRADE NAME – For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is "Quantity Range No. 1" (see chart below) i.e., **less** than 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet (STP) for gases, the exact chemical name for each chemical is **not** required. Summarize these individual small quantity chemicals by the DOT class name and report as a single line with the DOT class name preceded by the word "Assorted." Example: "Assorted Flammable Liquids."

For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is Quantity Range Nos. 2 through 5 i.e., **greater** than 55 gallons, 500 pounds, or 200 cubic feet, provide the chemical name, proprietary name, or chemical name of major constituents for mixtures; followed by a slash and then the applicable trade name. Example: trichlorotrifluoroethane/Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated **total** quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the "storage facility."

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

HAZARDOUS MATERIALS MANAGEMENT METHODS

Please describe for each storage area by code or codes. If more than one code applies, list all codes. If you have marked "OTHER" in any of the categories, please specify the method used.

ADDITIONAL INFORMATION TO BE SUBMITTED:

1. Monitoring Program - Please submit information on the location, type, manufacture, specifications of all electronic monitoring equipment or monitoring wells (if you have any).

2. Recordkeeping Form - Please submit a filled out copy of the recordkeeping forms used by your facility. (For gas stations, please submit copies of your last three months inventory control records.)

3. Emergency Equipment - Please provide a testing and maintenance schedule for the emergency equipment that needs to be serviced.

4. Contingency Plan - Please submit a copy of your procedures to respond to emergencies, including spills, fires and catastrophic events. Also submit a copy of your training plan for personnel to respond to these emergencies.

I declare under penalty of perjury that the foregoing information is true and correct.

FL	MOTOR OIL + GEAR OIL		440		X		2

INSTRUCTIONS

(1) When more than one page is used for a storage facility, enter the page number and total number of pages.

(2) DATE – Enter the date of the application.

(3) STORAGE FACILITY – A "storage facility" means an individual building, outside storage area, and/or other outside structure that is used to store hazardous materials. When there is more than one storage facility being used by a business at a single location, enter a number(s) or letter(s) that is used to identify each building or area being reported. NOTE: Use a separate form for reporting each building or storage area. A simple line drawing of the facility on 8½"x11" size paper showing the building(s) and outside storage area(s) with their assigned designation number or letter should be submitted to help identify where each storage facility is on the property in relation to other storage facilities. General Facility Map, may be used for completing this requirement. If you are a tenant or corporate division and occupy only a portion of a building, you **must** submit a General Facility Map showing the portion of the building(s) you occupy.

(4) BUSINESS NAME – Enter business name and the street address for the specific "facility" for which the application applies and do not use general mailing addresses. A "facility" means a building or buildings, appurtenant structures and surrounding land used by a single business entity at a single location or site.

(5) DOT CLASS – Enter the Department of Transportation (DOT) hazard class using the abbreviations shown below **and** report the hazardous materials stored using the DOT hazard class in the same sequence as shown below i.e., the first DOT class that may be reported would be "BLST" (Blasting Agent) followed by "CL" (Combustible Liquid), and so on. These same abbreviations are shown again in the same order on the Facility Permit Fee Worksheet, Form HM-3. NOTE: After all the entries for the DOT class have been made, draw a line across the page before starting the next DOT class as listed above. Use as many additional pages of this form as necessary to complete the report for each storage facility.

DOT HAZARD CLASSES AND ABBREVIATIONS

Blasting Agent	BLST	Flammable Solid	FS	Oxidizer – Liquid	OXY-L
Combustible Liquid	CL	Irritant – Liquid	IRR-L	Oxidizer – Solid	OXY-S
Corrosive Liquid	CORR-L	Irritant – Solid	IRR-S	Poison A-Gas	POIS-G
Corrosive Solid	CORR-S	Nonflammable Gas	NFG	Poison A-Liquid	POIS-L
Etiological Agent	ETI	Organic Peroxide – Liquid	PEROX-L	Poison B-Liquid	POIS-L
Explosives A	EXP A	Organic Peroxide – Solid	PEROX-S	Poison B-Solid	POIS-S
Explosives B	EXP B	Other Regulated Materials – Liquid	ORM-L	RADIOACTIVE	RAD
Explosives C	EXP C	Other Regulated Materials – Solid	ORM-S	CRYOGENS	CRYO
Flammable Gas	FG				
Flammable Liquid	FL				

(6) CHEMICAL NAME, TRADE NAME – For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is "Quantity Range No. 1" (see chart below) i.e., **less** than 55 gallons for liquids, 500 pounds for solids, or 200 cubic feet (STP) for gases, the exact chemical name for each chemical is **not** required. Summarize these individual small quantity chemicals by the DOT class name and report as a single line with the DOT class name preceded by the word "Assorted." Example: "Assorted Flammable Liquids."

For **each** hazardous material (includes both non-waste and waste materials) where the quantity stored is Quantity Range Nos. 2 through 5 i.e., **greater** than 55 gallons, 500 pounds, or 200 cubic feet, provide the chemical name, proprietary name, or chemical name of major constituents for mixtures; followed by a slash and then the applicable trade name. Example: trichlorotrifluoroethane/Freon 113.

NOTE: All radioactive, cryogenic and compressed gases must be reported even though they may not be listed as a regulated hazardous material.

All transformers and capacitors with polychlorinated biphenyls contents over 7 ppm must be specifically reported using the DOT class abbreviation ORM-L and the abbreviation PCB for the chemical name.

(7-9) QUANTITY AND PHYSICAL STATE – Enter the maximum anticipated **total** quantity of hazardous material that is normally stored in the storage facility for each chemical and/or DOT class when summarizing small items, using Columns 7, 8 and 9, depending upon the physical state of the material. Round off the quantities to the nearest whole gallon, pound or cubic foot. When the material is stored in a tank, the quantity reported shall be the capacity limit of the tank.

(10) TANK – Mark an X in the column if the material is stored in an above-ground or underground tank.

(11) WASTE – Mark an X in the column if the material is a waste.

(12) QUANTITY RANGE – Using the Quantity Range Numbers shown below, enter the Quantity Range Number for the corresponding quantity recorded in Columns 7, 8 and 9 for each chemical and/or DOT class when used to summarize small quantity items. The quantity ranges shown will be the "permit quantity limit" for the hazardous materials that may be stored in the storage facility.

QUANTITY RANGE NUMBERS

Range Number	Solid (Pounds)	Liquid (Gallons)	Gas (Cu. Ft. STP)
1	Up to 500	Up to 55	Up to 200
2	500 - 5,000	55 - 550	200 - 2,000
3	5,000 - 25,000	550 - 2,750	2,000 - 10,000
4	25,000 - 50,000	2,750 - 5,000	10,000 - 20,000
5	More than 50,000	More than 5,000	More than 20,000

EMERGENCY RESPONSE PROCEDURES

The material contained herein is for the use of The Herrick Corporation only. This material was compiled from procedures outlined in the following Government Publications:

1. In Time of Emergency - A Citizen's Handbook H-14/April 83

2. Accident Prevention Manual for Industrial Operations - National Safety Council

3. CAL-OSHA Publications

PROCEDURES FOR RESPONDING TO FIRES

1. NOTIFICATION OF KEY PERSONNEL.
2. RESPONSE TEAM NOTIFIED.
3. EVALUATION OF EVENT ONCE ON SCENE.
4. CORRECTIVE ACTION.
5. LOCAL AGENCIES NOTIFIED (FIRE, POLICE, AMBULANCE).

The following safety equipment is issued to shop personnel as needed:

1. RUBBER BOOTS.
2. PROTECTIVE TROWSERS AND TOP WITH HOOD.
3. SAFETY GLASSES.
4. FACE SHIELD.
5. GLOVES.
6. TOOL'S AVAILABLE.

PROCEDURES FOR RESPONDING TO SPILLS

1. NOTIFICATION OF KEY PERSONNEL.
2. RESPONSE TEAM NOTIFIED.
3. EVALUATION OF EVENTS ONCE ON SCENE.
4. CORRECTIVE ACTION TAKEN.
5. LOCAL AGENCIES NOTIFIED IF NEEDED.

Regardless of size of spill, safety personnel and response personnel must wear protective clothing and have fire extinguishers ready for use.

SMALL SPILL'S PROCEDURES:

1. IDENTIFY SUBSTANCE, EVACUATE AREA IF NEEDED.
2. DAM UP SURROUNDING AREA WITH DIRT OR ABSORBENT MATERIAL.
3. CLEAN UP AND DISPOSE AS NECESSARY.

MEDIUM AND LARGE SPILL PROCEDURES:

1. NOTIFY FIRE DEPARTMENT TO HANDLE THIS TYPE OF EMERGENCY.

Disposal of by-product will be handled in accordance with standards set by Government agencies.

PROCEDURES FOR RESPONDING TO EARTHQUAKES

1. NOTIFICATION OF KEY PERSONNEL.
2. RESPONSE TEAM NOTIFIED.
3. EVALUATION OF EVENT ONCE ON SCENE.
4. CORRECTIVE ACTION TAKEN.

Regardless of the size and intensity of the earthquake the following must be done to ensure safety:

1. INSURE SAFETY OF PERSONNEL IN ALL AREA'S.
2. CHECK FOR FIRES, SPILLS, AND ELECTRICAL HAZARDS, AND WATER AND GAS LEAKS.
3. SHUT DOWN FAULTY SYSTEMS. (RUN SYSTEM CHECK BEFORE BRINGING ANY SYSTEM BACK ON LINE).
4. RENDER MEDICAL ASSISTANCE IF NEEDED.
5. CALL LOCAL AGENCIES, IF ASSISTANCE IS NEEDED.
6. WORK WILL RESUME AT SUPERVISOR'S DISCRETION.

PROCEDURES FOR RESPONDING IN EMERGENCY SHUTDOWNS

1. NOTIFICATION OF KEY PERSONNEL.
2. RESPONSE TEAM NOTIFIED.
3. FOLLOW ALL ORDERS AS DIRECTED AND MAKE EVALUATION OF EVENT ONCE ON SCENE.
4. CORRECTIVE ACTION TAKEN.

MAJOR SHUTDOWN OF ALL SYSTEMS

1. TURN OFF MAIN SWITCH GEAR TO AREA.
2. TURN OFF MAIN VALVE TO CITY GAS LINES OR AREA.
3. TURN OFF MAIN VALVES TO OXYGEN TANK.
4. TURN OFF MAIN VALVES TO ACETYLENE TANK.
5. TURN OFF MAIN VALVES TO PROPANE TANKS.
6. TURN OFF MAIN VALVES TO WATER SYSTEM. ONLY IF NEEDED.

MINOR SHUTDOWN

1. TURN OFF MAIN OR SECONDARY VALVE SWITCHES AND CIRCUIT BREAKERS TO AREA AFFECTED.

NOTE: Emergency shutdowns will be adhered to only if directed by supervisor. In life threatening situations response team members have authority.

May 11, 1983

The following employees are members of our safety committee:

DAY SHIFT	SWING SHIFT
Heinz Stamm	Leo Soukup
Fred Howe	Clarence Pennyman
Louis Foglia	Siegfried Lapre
Allen Bernardini	
Leonard Gaines	
Steve Drouin	

The following employees have successfully completed a first aid course with the American Red Cross and are hereby assigned as First Aid Attendants:

DAY SHIFT	SWING SHIFT	GRAVE YARD	SOUTH YARD
Fred Cole	Leo Soukup	Noel Stigge	Robert Gori
Heinz Stamm			Richard Medeiros
Dominic Difabio			
Louie Foglia			

INDUSTRIAL INJURY PROCEDURE

All injuries must be reported to the foreman and First Aid.

Minor injuries are given first aid and logged in a weekly report which is reviewed by the Plant Superintendent each Monday.

All injuries requiring doctor's attention are referred to:

Day Shift - California Industrial Medical Clinic
33560 Alvarado-Niles Rd
Union City, California 94587
489-8700

* Swing Shift - California Industrial Medical Clinic
7817 Oakport Street
Oakland, California 94621
638-0701

Grave Shift - St. Rose Hospital
27200 Calaroga Avenue
Hayward, California
782-6200

All ambulance cases (major injuries) are sent to St. Rose Hospital.

Using his best judgement, the first aid attendant will allow the injured to drive himself to the doctor. The company's shop car is used to transport the injured to the doctor. If the shop car is not available, request a car through Heinz Stamm. If there is no car available:

1. A taxi cab can be called.
2. Employee can drive his own car if the nature of the injury does not limit the ability of the injured to safely drive (driver must have a driver's license.) Mileage will be reimbursed by the company.

In case of major injuries (ambulance cases) the following steps should be followed:

1. Render first aid and comfort the injured.
2. Call an ambulance and post men at the shop entrances to guide the ambulance into the shop.
3. Notify the Superintendent and President of the injury.
4. The Superintendent will handle and determine the need to notify the injured's family.

An injury report must be filed for every case sent to the doctor or hospital.

* The Clinic on Oakport Street in Oakland closes at 10 p.m. If an injury occurs after 10 p.m. the injured individual should be sent to St. Rose Hospital, 27200 Calaroga Avenue, Hayward.

AMBULANCE 911

INDUSTRIAL INJURIES REQUIRING AMBULANCE SEND DIRECTLY TO:

ST. ROSE HOSPITAL
27200 Calaroga Avenue
Hayward, CA
782-6200

FIRE: To report a fire call:

911 or 581-3636

POLICE: Emergency only 911
Or 881-7000

OTHER INJURIES:

DAY SHIFT - California Industrial Medical Clinic
33560 Alvarado-Niles Road
Union City, CA 94587
489-8700

SWING - California Industrial Medical Clinic
7817 Oakport Street
Oakland, CA 94621

"FIRE TRIANGLE"

THE THREE ELEMENTS ON THE SIDES OF THE TRIANGLE ARE NECESSARY TO PRODUCE ORDINARY BURNING. THE ELIMINATION OF ONE ELIMINATES THE FIRE.

FIRE CLASSIFICATION

CLASS-A

FIRES IN ORDINARY MATERIAL SUCH AS WOOD - PAPE - RAGS - RUBBISH

THE QUENCHING AND COOLING EFFECT OF "WATER" ARE OF FIRST IMPORTANCE IN EXTINGUISHING THESE FIRE's - IF NOT PRACTICAL USE CO_2

FIRE CLASSIFICATION

CLASS-B

FIRES IN SUCH FLAMMABLE LIQUIDS AS GASOLINE - OIL - GREASE - DIESEL - THINNER - SPRAY CAN OILS - KEROSAN.

A BLANKETING OR SMOTHERING IS NEEDED— USE CO^2 FIRE EXTINGUISHERS AND MOVE THEM FROM SIDE TO SIDE AT THE BASE OF THE FIRE IF OUTSIDE AND WINDY. STAY UP STREAM OF FIRE - THIS WILL AID IN PUTTING THE FIRE OUT. THE CO^2 WILL GO ON THE FIRE NOT ON YOU.

FIRE CLASSIFICATION

CLASS - "C"

FIRE'S IN OR NEAR ELECTRICAL EQUIPTMENT

TURN POWER OFF FIRST

DO NOT USE WATER.

DO NOT USE WATER WATER IS A CONDUCTOR OF ELECTRIC POWER - USE NON CONDUCTING PRODUCTS DRY CHEMICAL - CO^2 IN SHORT BURST OR EARTH DIRT (IF NOT WET)

FACTORS CONTRIBUTING TO INDUSTRIAL FIRES

MATCHES AND SMOKING ... HOUSEKEEPING --- OVERHEATED SURFACES --- SPONTANEOUS IGNITION -- HAZARDOUS CHEMICALS AND METALS - LIGHTNING STATIC ELECTRICITY --- ELECTRICAL EQUIPMENT --- EXPLOSIVE ATMOSPHERES ---

ARE YOU DOING YOUR SHARE.

REPORT ANY "WHICH"* SITUATIONS YOU SEE IN YOU WORK AREA. BETTER NOW THAN WHEN ITS TO LATE.

* WHY HAVENT I CALLED HELP?

FLAMMABILITY LIMITS OF VARIOUS GASES

GAS	FLAMMABILITY LIMITS % OF GAS IN MIXTURE	
	IN AIR	IN OXYGEN
Hydrogen	4.1% - 75%	5.0% - 95%
Methane (Natural Gas)	5.3% - 14%	5.0% - 59%
Propane	2.3% - 9.5%	2.4% - 57%
Acetylene	2.5% - 80%	3.0% - 93%
Ethylene	3.2% - 34%	3.5% - 62%
MAPP	3.4% - 10.8%	2.5% - 60%

SPECIFIC GRAVITY

Oxygen	1.105	MAPP	1.48
Air	1.0	Methane	0.554
Acetylene	0.907	Propane	1.56

SECTION IX - SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING
NONE

OTHER PRECAUTIONS
NONE

*NOTE: SINCE THIS PRODUCT IS ALWAYS DILUTED 1 PART WITH 60 PARTS OF WAT EFFECTS OF OVEREXPOSSURE OF THIS MATERIAL IS NEGLIGIBLE.

TESTED AND APPROVED

FORMULA 750

CONCENTRATED
INHIBITED CHEMICAL CLEANER

DISSOLVES SCALE — LIME
MINERAL DEPOSITS
HARMLESS TO MOST PAINTS

DIRECTIONS

Water Meters: Submerge parts to be cleaned in concentrate. Let parts soak until clean. Rinse thoroughly with clear water.

De-Scaling Boilers: Use 1 part to 5 to 10 parts water, depending upon scale and speed required to perform the job.

Cooling Tower Systems: Use 1 part concentrate to 5 to 10 parts of water. This formula will apply to condensers and heat exchangers. CIRCULATE solution thru system for approximately 4 hours.

Before disposing of empty bottle, rinse out with water.

POISON

(Contains Dilute Solution Hydrochloric Acid)

WARNING: CORROSIVE: Keep out of reach of children. May be fatal if swallowed. Do not breathe vapor or fumes. May produce chemical burns. Do not get in eyes, on skin, or on clothing.

ANTIDOTE: Internal — Drink a teaspoonful or more of magnesia, chalk, or small pieces of soap, softened with water in milk or raw egg white. In case of ingestion or injury, get medical attention.

External: Wipe off the acid gently, immediately flood the surface with water, using soap freely; then cover with moist magnesia or baking soda.

WARNING:

CORROSIVE • KEEP OUT OF REACH OF CHILDREN

See Side Panel for Additional Cautions & Antidotes

SECTION V HEALTH HAZARD DATA

THRESHOLD LIMIT VALUE

EFFECTS OF OVEREXPOSURE

Slightly irritating to eyes and skin.

EMERGENCY AND FIRST AID PROCEDURES

Eyes - wash with copious quantity of water.

Skin - wash with soap and water.

Ingestion - do not induce vomiting. Guard against aspiration into lungs.

SECTION VI REACTIVITY DATA

STABILITY	UNSTABLE		CONDITIONS TO AVOID
	STABLE	x	Product is stable but combustible.

INCOMPATABILITY *(Materials to avoid)*

HAZARDOUS DECOMPOSITION PRODUCTS

Carbon monoxide may be formed during combustion.

HAZARDOUS POLYMERIZATION	MAY OCCUR		CONDITIONS TO AVOID
	WILL NOT OCCUR	x	

SECTION VII SPILL OR LEAK PROCEDURES

STEPS TO BE TAKEN IN CASE MATERIAL IS RELEASED OR SPILLED

Absorb with clay, diatomaceous earth, or similar inert material. Treat as combustible material.

WASTE DISPOSAL METHOD

Controlled burning.

SECTION VIII SPECIAL PROTECTION INFORMATION

RESPIRATORY PROTECTION *(Specify type)*

No special protection normally required.

VENTILATION	LOCAL EXHAUST: As required if mist is generated.	SPECIAL
	MECHANICAL *(General)*	OTHER

PROTECTIVE GLOVES

EYE PROTECTION Goggles (if product is being sprayed or splashed)

OTHER PROTECTIVE EQUIPMENT

SECTION IX SPECIAL PRECAUTIONS

PRECAUTIONS TO BE TAKEN IN HANDLING AND STORING Keep away from heat and open flames.

OTHER PRECAUTIONS Avoid breathing of mist or vapor. Avoid prolonged or repeated contact with skin.

PRODUCT: Hexane

COMMON NAME: AMSCO Solv 1487

GENERIC NAME: Volatile Solvent

CHEMICAL NAME: Hexane

CHEMICAL FAMILY: Hydrocarbon Mixture

DOT PROPER SHIPPING NAME:

Hexane

WARNING STATEMENT:

Danger Extremely Flammable.
DO NOT induce vomiting if swallowed.
For industrial use only.

Section I - - INGREDIENTS

	TLV*	This product is a petroleum hydrocarbon distillate containing the following percentages of ingredients tabulated to the left:	TLV*
n-Hexane	500A (50B)	35 - 55% range	
Cyclohexane	300A	0 - 1% "	
C_6 Isomers	500B	44 - 65% "	

*Threshold Limit Value A. OSHA [X] B. ACGIH [X] C. See Section III [ ] D. Other [ ]

Section IV -- SPECIAL PROTECTION INFORMATION

Respiratory Protection (Specify Type)	The use of respiratory protection depends on vapor concentration above the time-weighted TLV: use a NIOSH approved cartridge respirator or gas mask.		
Ventilation	General mechanical ventilation may be sufficient to keep product vapor concentrations within specified time-weighted TLV ranges. If general ventilation proves inadequate to maintain safe vapor concentrations, supplemental local exhaust may be required. Other special precautions such as respiratory masks or environmental containment devices may be required in extreme cases.		
Protective Gloves	The use of impermeable gloves is advised to prevent skin irritation in sensitive individuals.	Eye Protection	Safety glasses, chemical goggles and/or face shields are recommended to safeguard against potential eye contact, irritation, or injury.
Other Protective Equipment	Impermeable aprons are advised when working with this product. The availability of eye washes and safety showers in work areas is recommended.		

Section V -- REACTIVITY DATA

Stability	Unstable		Conditions to Avoid:
	Stable	X	
Incompatibility (Materials to Avoid)	This product is incompatible with strong oxidizing agents strong acids or bases selected amines		
Hazardous Decomposition Products	Thermal decomposition in the presence of air may yield carbon monoxide and/or carbon dioxide.		
Hazardous Polymerization	May Occur		Conditions to Avoid:
	Will Not Occur	X	

Section VI -- SPILL OR LEAK PROCEDURES

HIGHWAY OR RAILWAY SPILLS - CALL CHEMTREC 800/424-9300

Precautions In Case of Release or Spill	Keep sources of ignition and hot metal surfaces isolated from the spill. Flush spilled material into suitable retaining areas or containers with large quantities of water. Small amounts of spilled material may be absorbed into an appropriate absorbant.
Reportable Quantity	Notify Coast Guard National Response Center; Phone No. 800-424-8802, If Spill Is Greater Than ____ lbs (Kilograms)
Waste Disposal Method	Dispose of product in accordance with applicable local, county, state and federal regulations.

EXECUTIVE SUMMARY

Introduction

This document, prepared by Harding Lawson Associates (HLA), presents the results of pre-remediation site investigation activities, an evaluation (feasibility study) of remedial alternatives, and the proposed plan for remediation of soil and ground-water contamination at the former Herrick Corporation (Herrick) steel fabrication facility, 25450 Clawiter Road, Hayward, California.

The Herrick property is approximately 1-1/2 miles southwest of the intersection of Highways 880 and 92 on Clawiter Road, Hayward (Plate 1). The property is a triangular-shaped 25-acre parcel bounded by Clawiter Road to the west, a Southern Pacific Railroad easement to the east, and a Gillig bus manufacturing facility to the south. The site was formerly used for the modification of rolled steel used in the construction of skyscrapers, and is no longer in use. Plate 2 shows the general layout of the site.

Previous investigations by HLA and others have identified several environmental concerns on the property: 1) the presence of elevated concentrations of lead in surface and near-surface soil south and southeast of the fabrication bays at locations used for painting of steel (designated Areas 1 and 2 and shown on Plate 2), and 2) residual light-fraction petroleum hydrocarbons present in soil and ground water near the location of former underground fuel storage tanks (designated as Area 3 and shown on Plate 2).

Pre-Remediation Investigation

To characterize the extent of these areas prior to identification of remedial technologies and selection of remedial alternatives, HLA collected 33 soil samples in Areas 1 and 2 for lead analysis, conducted cone penetrometer tests in Area 3, drilled and sampled 11 soil borings in Area 3, installed four piezometers and two monitoring wells, and sampled the new wells and piezometers. Soil and ground-water samples were analyzed for petroleum hydrocarbons and purgeable aromatic compounds. Aquifer testing was conducted at new and existing wells at the site to characterize hydraulic properties of geologic materials.

Results

Results of this and previous investigations are summarized below.

Site Geology and Hydrogeology

Fill at the site occurs to depths of 1 to 3 feet below ground surface (bgs). Clays and silty clays with some occurrences of silts underlie the fill to depths ranging from 4 to greater than 20 feet bgs. Below this horizon at most locations, a sequence of sands and silts with interbedded fine-grained materials is encountered to depths of 12 to 20 feet bgs. At most locations, olive-brown clay sand silty clays were found below the sands and silts to the maximum depth of investigation, which ranged from 17 to 33.5 feet bgs.

Ground water occurs at a depth of about 10 to 12 feet bgs. Saturated conditions occur in the sand and silt sequence. Ground-water flow in the shallow sands and silts is generally southwest with a hydraulic gradient of approximately 0.0022 feet/feet. Values of hydraulic conductivity are typical of silts and sand.

Lead in Surface Soils - Areas 1 and 2

Measured concentrations of total lead in surface soil samples ranged from 31 milligrams per kilogram (mg/kg) to 28,000 mg/kg. An estimated 80 yd^3 of soil have lead concentrations exceeding 1,000 mg/kg, a level used by the California Department of Health services (DHS) to designate hazardous waste.

Hydrocarbons in Soils in Area 3

Soils with elevated levels of petroleum hydrocarbons indicative of gasoline occur in an elliptical area hydraulically downgradient of the former location of the underground fuel storage tank and at depths of 10 to 12 feet bgs.

Hydrocarbons in Ground Water in Area 3

Concentrations of benzene, ethylbenzene, toluene, and xylenes (BTEX) in ground water exceed state or federal regulatory standards at one or more locations in Area 3. BTEX and other petroleum hydrocarbons occur in ground water in areas hydraulically downgradient of the former location of the underground fuel storage tank.

Feasibility Study

A feasibility study was conducted to identify, screen, and develop technologies appropriate for remediation of environmental problems at the site. This provided the basis for selection of the remedial alternatives to meet cleanup objectives. Cleanup objectives for evaluating remedial technologies were based on regulatory standards and agency guidelines for lead, petroleum hydrocarbons and BTEX in soil, ground water, and surface water.

For cleanup of soil with elevated lead concentrations, remedial alternatives developed from the initial screening were: capping with deed and access restrictions,

and excavation and off-site disposal. The recommended alternative for these soils is excavation and off-site disposal.

For cleanup of soils with elevated TPH levels, remedial alternatives developed from the initial screening were: soil vapor extraction, and excavation and aeration in conjunction with several soil disposal options. The recommended alternative for these soils is excavation, aeration of contaminated soils to reduce concentrations of volatile organic compounds, and replacing the clean, aerated soil in the excavation.

For remediation of ground water with elevated concentrations of petroleum hydrocarbons and BTEX compounds, treatment technologies passing the initial screening were liquid-phase carbon adsorption, air stripping, and biodegradation. The recommended alternative for ground-water cleanup is extraction, treatment by biodegradation followed by carbon adsorption, and either discharge to the storm drain system or reinjection to the subsurface.

Implementation Plan

Conceptual plans and tentative schedules for implementation of alternatives recommended for remediation of identified environmental concerns at the site are presented in the implementation plan. Remediation of soils with elevated lead concentrations is in progress. For hydrocarbons in ground water, an estimated three to four months will be required after agency approval of the plan to design, construct, and start up the ground-water treatment system. For remediation of hydrocarbons in soil, an estimated seven months will be required after agency approval of the plans to complete excavation, aeration, and backfill activities.

1.0 INTRODUCTION

This document, prepared by Harding Lawson Associates (HLA), presents the results of pre-remediation site investigation activities, an evaluation (feasibility study) of remedial alternatives, and the proposed plan for remediation of soil and ground-water contamination at the former Herrick Corporation (Herrick) steel fabrication facility, 25450 Clawiter Road, Hayward, California.

1.1 Facility Description

The Herrick property is northeast of the intersection of Highways 880 and 92 on Clawiter Road, Hayward (Plate 1). The property is a triangular-shaped 25-acre parcel bounded by Clawiter Road to the west, a Southern Pacific Railroad easement to the east, and a Gillig bus manufacturing facility to the south. Improvements to the site include an office building, four large steel fabrication work bays, a vehicle maintenance garage, paved parking areas, and steel storage areas. The site was formerly used for the modification of rolled steel used in the construction of skyscrapers. The site is no longer in use. Plate 2 shows the general layout of the site and the location of pertinent features discussed in this report.

1.2 Previous Investigations

As part of the removal of underground fuel storage tanks adjacent to the vehicle maintenance garage on the eastern boundary of the property (Plate 2), Herrick retained McKesson Environmental Services to assess the presence of petroleum hydrocarbons in soil and ground water in the vicinity of the tanks. Analysis of soil samples indicated values of total petroleum hydrocarbons (TPH) in excess of 1,000 parts per million (ppm). Results of analysis of ground-water samples collected from a monitoring well installed in excavation backfill indicated elevated TPH levels in at least one sample.

HLA conducted an environmental assessment of the property as part of a real estate transaction between the Koll Company of Pleasanton, California, and Herrick. The intent of HLA's work was to identify and assess potential or existing environmental concerns on the Herrick property or surrounding properties that could affect the transaction. As part of this assessment, previously identified concerns were investigated to determine their extent and to assess potential mitigation alternatives.

Results of HLA's environmental assessment are presented in the *Final Report, Environmental Assessment, Herrick Fabrication Facility, Hayward, California* (*HLA, 1989*). The report identified several areas of environmental concern on the property: 1) the presence of elevated concentrations of lead in surface and near-surface soil south and southeast of the fabrication bays at locations designated Areas 1 and 2 (Plate 2), and 2) residual light fraction petroleum hydrocarbons present in soil and ground water near the location of the former underground fuel storage tanks designated as Area 3 (Plate 2).

2.0 PRE-REMEDIATION INVESTIGATION

2.1 Soil Investigation

2.1.1 Surface Soil Sampling

Results of soil sample analysis conducted as part of the environmental assessment (*HLA, 1989*) identified elevated levels of lead at two former painting locations, designated Areas 1 and 2 (Plate 3). In this phase of work, 33 soil samples were collected to define the lateral extent of soil containing lead at concentrations greater than 1,000 ppm.

why 1000ppm

On June 29, 1989, 10 surface soil samples were collected at locations designated SS-43 through SS-52. Samples were collected from the upper 6 inches of soil and placed in widemouthed glass jars. On September 8, 1989, an additional 23 samples were collected at locations designated SS-53 through SS-75. These samples were also collected from the upper 6 inches of soil and were placed in plastic bottles.

Sampling equipment was washed with deionized water and Alconox soap and rinsed with deionized water between collection of samples.

All samples were submitted under chain of custody to NET Pacific, Inc., a state-certified laboratory in Santa Rosa, California, for total lead analysis by EPA Test Method 6010.

2.1.2 Cone Penetration Testing

On May 25 and 26, 1989, cone penetration testing (CPT) was conducted to better define subsurface stratigraphic conditions in Area 3. A Hogentogler electric cone penetrometer with a 1.4-inch-diameter rod was advanced using a hollow-stem auger drill rig operated by Weeks Drilling and Pump Company, Inc., Sebastopol, California. Equipment used also included an electronic data acquisition system. The work was

performed under the supervision of an HLA geologist. Seventeen locations were tested (Plate 4) to depths ranging from 23 to 24 feet below ground surface.

2.1.3 Soil Borings

To better define the lateral and vertical extent of petroleum hydrocarbons in shallow soil, 11 borings were drilled and sampled in Area 3 on August 11, 14, and 15, 1989 (Plate 5). Borings are designated B-21 through B-24, B-26 through B-31, and MW-6. The boring at MW-6 was completed as a monitoring well. Drilling was performed by Bay Area Exploration, Inc., Suisun, California, using a hollow-stem auger rig. An HLA geologist supervised the drilling and well installation and collected soil samples for lithologic characterization and chemical analyses. Logs of the borings are presented in Appendix A. Borings were logged using the Unified Soil Classification System (USCS) (Plate A1) and Munsell Color Index Chart.

Soil samples were collected at intervals of approximately 5 feet from ground surface to the total depth of the borings, with sampling intervals generally reduced in the vicinity of the water table to provide additional characterization at the depths of known contamination. Samples were collected with a modified California split-barrel sampler lined with 2.5-inch-diameter stainless steel tubes. The ends of the sample tubes were sealed with foil-lined plastic caps taped to the tubes. Soil samples were screened in the field for volatile organic compounds by taking headspace readings using a Century portable organic vapor analyzer (OVA) and checking for the presence of hydrocarbon odors and evidence of staining. One to two soil samples from each boring were selected for chemical analysis, depending on the results of initial field screening.

To minimize the potential for cross-contamination between sampling locations, all downhole boring equipment was steam cleaned before drilling and between each

boring. All sampling equipment was decontaminated between sampling efforts using deionized water.

All samples were stored on ice until delivery with completed chain of custody forms to NET Pacific, Inc., Santa Rosa, California, for analysis. Soil samples were analyzed for TPH as gasoline and diesel by EPA Test Method 5030/Modified 8015 and EPA Test Method 3550/Modified 8015, respectively, and for the purgeable aromatic compounds benzene, toluene, ethylbenzene, and xylenes (BTEX) by EPA Test Method 8020.

Borings not completed as monitoring wells were grouted to the surface with neat cement.

2.2 Ground-Water Investigation

2.2.1 Monitoring Well and Piezometer Installation

Four piezometers, designated P-1 through P-4, and one monitoring well, designated MW-5, were installed May 30 to June 1, 1989, to depths ranging from 17 to 20 feet below ground surface. Piezometer and well locations are shown on Plate 5. Drilling was performed by Weeks Drilling and Pump Co., Inc., Sebastopol, California, using a Mobile B-53 hollow-stem auger rig. An HLA geologist supervised the drilling and collected soil samples for lithologic characterization. Logs of borings and well completion details are presented in Appendix A. Borings were logged using the USCS (Plate 1) and Munsell Color Index Chart.

The piezometers and monitoring well were terminated at or slightly below the top of the clay unit underlying the uppermost aquifer. The piezometer borings were drilled using an 8-inch-diameter bit. The piezometers are constructed of 2-inch-diameter Schedule 40 PVC casing and machine-slotted 0.020-inch screen. The boring for Well

MW-5 was drilled to a depth of 17 feet bgs using an 11-inch-diameter bit. The well is constructed of 4-inch-diameter PVC casing and machine-slotted 0.020-inch screen.

Monitoring Well MW-6 (Plate 5) was installed August 15, 1989, in conjunction with completion of soil borings, using the drilling procedures described in Section 2.1.3. The boring for the well was drilled to a depth of 19 feet bgs using a 10-inch-diameter bit and was terminated slightly below the top of the clay underlying the uppermost aquifer. The well is constructed of 4-inch-diameter Schedule 40 PVC casing and machine-slotted 0.020-inch screen.

The annulus of each well and piezometer was packed with Monterey #3 sand from the bottom of the borings to approximately 1 to 2 feet above the top of the well screen. A 1- or 2-foot thick bentonite pellet seal was placed above the sand. Cement-bentonite grout was used to grout the remaining annulus to ground surface. The wells and piezometers were completed below grade in traffic boxes.

2.2.2 Development and Sampling of Monitoring Wells and Piezometers

The four piezometers and Well MW-5 were developed on June 1 and 2, 1989, by surging with a bailer and pumping a minimum of 100 gallons or until the discharge water was clear. Well MW-6 was developed on August 21, 1989, by pumping 10 well casing volumes from the well.

Samples were collected for chemical analysis from the four piezometers and Well MW-5 on June 19, 1989, and from Wells MW-5 and MW-6 and Piezometer P-1 on August 21, 1989. Ground-water sampling methods followed standard HLA protocol. A duplicate sample was included with each sampling round. A trip blank was included with the first round.

Depth to water prior to the purging of each well was measured using a graduated steel tape and chalk until two measurements with a difference of no more than 0.02 foot were obtained. Water elevations were calculated using depth-to-water data and surveyed top-of-casing elevations.

After water levels were measured, each well was purged using a stainless steel or PVC bailer. Well MW-6 was purged using a submersible pump in conjunction with well development. During purging, a volume of water equal to at least three times the static-water volume in the casing was removed. Indicator parameters (pH, conductivity, and temperature) were monitored during purging.

All development and purge water was collected in 55-gallon drums and discharged to the sanitary sewer, under authority of a permit from the City of Hayward Department of Public Works.

Ground-water samples were collected using a stainless steel bailer. All ground-water samples were analyzed for BTEX by EPA Test Method 8020 and for TPH by EPA Test Method 8015. Samples were stored on ice and submitted under chain of custody to NET Pacific, Inc., Santa Rosa, California.

2.2.3 Aquifer Testing

Hydraulic parameters of the shallow aquifer zone at the Herrick site were estimated using slug test and pumping test procedures. Slug tests provide estimates of aquifer hydraulic conductivity (permeability) and transmissivity in the immediate vicinity of the well tested, and are generally performed by rapidly adding a mass of constant volume (a slug) to a well or rapidly removing such a mass from a well. Water-level changes in response to slug placement or removal are recorded and analyzed according to established methods. Pumping tests provide estimates of hydraulic

conductivity, transmissivity, and storativity over larger regions than slug tests, and are performed by pumping water from one well and monitoring the response to the pumping stress at nearby wells.

Slug tests were performed on May 18, 1989, at Monitoring Wells CW-1, MW-1, and MW-2 (Plate 5). Water-level responses during the tests were monitored with a 0 to 10-pound/in^2 (psi) pressure transducer connected to a Hermit Model SE1009 datalogger that recorded water-level changes at specified time intervals. Slug testing was conducted using a closed-volume capped and weighted PVC cylinder. Water-level changes resulting from the instantaneous placement and removal of the slug were recorded until the water level in the well returned to the initial, static condition. Several tests were conducted at each of the three wells. Slug test data were analyzed using the methods described by Bouwer and Rice (*1976*) and Bouwer (*1989*).

Pumping tests were performed June 14 and 15, 1989, at Monitoring Well MW-5 and Piezometer P-1. Water levels were monitored in the pumping well (MW-5 or P-1) and five observation wells (MW-1, P-2, P-3, P-4, and either P-1 or MW-5). Water-level responses during the tests were monitored with 0 to 10 psi pressure transducers connected to a Hermit Model SE1009 datalogger that recorded water-level changes at specified time intervals. Water levels at other wells and piezometers were measured by hand with a steel tape. Constant-rate aquifer tests were performed by pumping Well MW-5 at 2.2 gallons per minute (gpm) for 7 hours and Piezometer P-1 at 5.25 gpm for 1 hour. Water from the pumping tests was discharged to the sanitary sewer under authority of a permit from the City of Hayward Department of Public Works. Pumping test data were analyzed using the computer code GWAP (*Dansby and Price, 1986*). The

code was used for curve matching methods of Hantush (*1956*) for confined leaky conditions and of Neuman (*1975*) for unconfined elastic conditions.

2.3 Survey

Kier & Wright Civil Engineers & Surveyors, Inc., Santa Clara, California, surveyed horizontal coordinates and ground surface elevations for test pit and soil boring locations in Areas 1, 2, and 3 completed as part of the environmental assessment, soil borings completed as part of this investigation, CPT locations, all piezometers, and Monitoring Well MW-6. Kier & Wright also surveyed top-of-casing elevations for all piezometers and Wells MW-5 and MW-6.

3.0 INVESTIGATION RESULTS

3.1 Site Geology

The understanding of site geologic conditions presented in HLA (*1989*) was generally confirmed and extended as a result of the pre-remediation investigation, which focused on further definition of subsurface conditions in Area 3. Fill occurs to depths of 1 to 3 feet below ground surface (bgs). Clays and silty clays with some occurrences of silts underlie the fill to depths ranging from 4 to greater than 20 feet bgs.

Below this horizon at most locations, a sequence of sands and silts with interbedded fine-grained materials is encountered to depths of 12 to 20 feet bgs. At one location, Boring B-31, no sands were encountered, although silts were observed from approximately 6 to 12 feet bgs. At Boring B-23, occurrences of sand were limited to several thin (less than 2 inches) lenses at 13 and 14.5 feet bgs.

At most locations, olive-brown clays and silty clays were found below the sands and silts to the maximum depth of investigation, which ranged from 17 to 33.5 feet bgs. At Boring B-25, clay was encountered from depths of 20 feet bgs to the bottom of boring at 33.5 feet bgs.

3.2 Occurrence of Chemicals in Soil

3.2.1 Surface Soils - Areas 1 and 2

Results of total lead analysis of surface soil samples from Areas 1 and 2 are presented in Table 1. Measured concentrations of total lead ranged from 31 milligrams per kilogram (mg/kg) to 1,900 mg/kg. Total lead results from these samples are plotted together with results of analysis of samples collected as part of the environmental assessment (*HLA, 1989*) on Plates 6 and 7. The estimated lateral extent of soil in Areas 1 and 2 with lead concentrations exceeding 1,000 mg/kg is also presented on

Plates 6 and 7. Soil with lead concentrations exceeding 1,000 mg/kg is considered hazardous by the California Department of Health Services (DHS). Total volume of soil with lead concentrations exceeding 1,000 mg/kg is estimated to be 80 yd^3.

3.2.2 Subsurface Soils - Area 3

Results of analysis of soil samples for TPH and BTEX are presented in Table 2. TPH values ranged from nondetectable to 230 mg/kg. Of the 13 samples analyzed, petroleum hydrocarbons as gasoline or diesel were identified in 3 samples: B-22 at 10.5 feet, B-23 at 11.5 feet, and B-24 at 10.5 feet. BTEX compounds were also identified in these samples. Also, benzene was measured at 68 μg/kg in a sample from B-22 at 15.0 feet. No other BTEX compounds were identified in any other samples.

Samples collected from below the water table at Borings B-22 and B-24, in the area of known elevated TPH values, did not indicate the presence of petroleum hydrocarbons. Samples collected from the depth intervals of 10 to 12 feet outside the previously characterized area of elevated TPH values also did not show the presence of petroleum hydrocarbons.

TPH values and BTEX concentrations from this investigation phase and the environmental assessment are plotted on Plates 8 and 9, respectively.

3.3 Hydrogeology

3.3.1 Aquifer Properties

Results of aquifer testing are presented in Table 3. Calculated average values of hydraulic conductivity measured by slug testing at CW-1, MW-1, and MW-2 ranged from 31 to 49 ft/day. These values are consistent with published values for sands and silty sands (*Freeze and Cherry, 1979*).

Values for hydraulic conductivity calculated from pumping tests conducted at Piezometer P-1 and Well MW-5 ranged from 2.6 to 488 ft/day. These values are consistent with published values for materials ranging from silt to sand (*Freeze and Cherry, 1979*). Comparison of water-level elevations with the elevation of uppermost sand and silt horizons at MW-5 and P-1 indicates that the aquifer at MW-5 was unconfined, while the aquifer at P-1 was confined at the time that the pumping tests were conducted. Because of the uncertainty with respect to the extent of confined and unconfined conditions in the vicinity of these wells, each set of data from the two pumping tests was analyzed using methods based on the Theis equation for confined (*Hantush, 1956*) and unconfined conditions (*Neuman, 1975*).

Values calculated from observations at MW-5 are consistently lower than values calculated from observations at P-1. These calculated values agree with semi-quantitative observations of pumping rates and associated drawdowns at the two pumping wells, in that pumping at P-1 produced higher yields with less drawdown than pumping at Well MW-5, indicating more transmissive materials in the vicinity of P-1.

3.3.2 Ground-Water Movement

Table 4 summarizes water-level elevations calculated from measurements of depth to water at monitoring wells and piezometers. Estimated water-level contours are plotted with well locations and water levels on Plate 10.

Between February 16 and August 21, 1989, a period of approximately 6 months, water levels at Wells CW-1, MW-1, and MW-2 declined from 0.78 to 0.83 feet.

Ground-water flow in the shallow sands and silts is generally southwest with a hydraulic gradient of approximately 0.0022 feet/feet (Plate 10).

3.3.3 Occurrence of Chemicals in Ground Water

Results of analysis of ground-water samples for TPH and BTEX are presented in Table 5, and shown on Plate 11. TPH was detected in samples from monitoring well MW-5 ranging from 1,800 to 11,000 micrograms per liter (μg/l), and in samples from MW-6 and P-2 at concentrations of 120 μg/l and 200 μg/l, respectively. BTEX compounds were detected only in samples from MW-5 and MW-6. Detectable concentration ranges for each BTEX compound at MW-5 include 130 to 140 μg/l (benzene); 230 to 250 μg/l (toluene); 110 to 130 μg/l (ethylbenzene); and 110 to 1,200 μg/l (xylenes). Xylenes were detected in a sample from MW-6 at 6.3 μg/l.

TPH and BTEX were not detected in ground-water samples from Piezometers P-1, P-3, and P-4.

Previous investigation (*HLA, 1989*) indicates the presence of benzene in a ground-water sample from Well CW-1 at a concentration of 180 μg/l.

4.0 DISCUSSION OF RESULTS

4.1 Soil

4.1.1 Surface Soils

California waste management regulations establish concentration levels called total threshold limit concentrations (TTLC) for various chemicals above which a material is considered a hazardous waste. The TTLC for lead has been set at 1,000 ppm because of its ability to persist and accumulate in humans. According to this criterion, soils having lead concentrations above 1,000 ppm are classified as hazardous.

Lead concentrations in surface soil samples SS-78, SS-43, B-19, SS-45, SS-79, and SS-80 (Area 1, Plate 6) and SS-40, SS-17, SS-74, SS-75, TP-15, and SS-72 (Area 2, Plate 7) are greater than 1,000 mg/kg (equivalent to ppm). These soils are therefore classified as hazardous and will require remediation.

4.1.2 Subsurface Soils

In general, state regulatory agencies classify soils containing petroleum hydrocarbons as hazardous waste if the concentrations are greater than 1,000 ppm, as designated waste if concentrations are between 100 and 1,000 ppm, and as nonhazardous if concentrations are less than 100 ppm. These classifications apply whether the hydrocarbons are light (gasoline) or heavy (diesel) fractions, or oil and grease. Petroleum hydrocarbons occur in soils in Area 3 at levels above the regulatory guideline of 1,000 ppm and will require remedial action.

Petroleum hydrocarbons were detected in soil samples collected at depths between 10 and 12 feet bgs from B-22, TP-13, B-24, and TP-25 at concentrations that classify these soils as designated waste, and from TP-21 and TP-23 at concentrations that classify the soils as hazardous waste. The location of these hydrocarbon-containing soils is generally hydraulically downgradient of the former underground fuel storage tank.

4.2 Ground Water

The DHS has established two sets of cleanup standards for chemicals in ground water. Maximum contaminant levels (MCLs) are established for benzene (1 ppb), ethylbenzene (680 ppb), and xylenes (1750 ppb) (*California Code of Regulations, Title 22, Section 64444.5*). An MCL has not been established for toluene; the Drinking Water Action Level for toluene is 100 ppb (*Marshack, 1988*). These standards are included in Table 5.

Petroleum hydrocarbon constituents occur in the ground water in Area 3 at levels above the regulatory cleanup standards or action levels and will require remediation. Benzene, ethylbenzene, and toluene concentrations in ground-water samples from Well MW-5 exceed their respective MCLs and action levels. A benzene concentration from Well CW-1 exceeding the MCL was previously identified (*HLA, 1989*).

5.0 FEASIBILITY STUDY

5.1 Introduction

The objectives of the feasibility study (FS) are to identify technologies appropriate for remediation of environmental problems at the site, to screen technologies and develop them into remedial alternatives, and to provide the basis for selection of remedial alternatives to solve the site's environmental problems.

The following discussion of remedial alternatives describes methods commonly applied for the type of environmental problems found at the site. Selection of an alternative or combination of alternatives for each operable unit depends on potential impacts to the human health and the environment, regulatory requirements, effectiveness, implementability and the relative cost of particular technologies, long-term liability, and land use plans for the site.

Data collected during the environmental assessment and pre-remedial investigations at the site were used to identify the following environmental concerns:

- Surface and near-surface soil containing elevated concentrations of lead in Areas 1 and 2,
- Soil and ground water containing light fraction petroleum hydrocarbons (gasoline) in Area 3.

The analysis of remedial alternatives presented here addresses both the lead and petroleum hydrocarbon problems. Each of these problem areas is designated as an operable unit (OU), an area or problem that may require a separate remedial action. For this analysis, soil with elevated lead concentrations in Areas 1 and 2 is designated as OU-1. In Area 3, soil containing light fraction petroleum hydrocarbons is designated OU-2, and ground water containing light fraction petroleum hydrocarbons is designated OU-3. These three units are shown on Plates 3, 8 and 11, respectively.

During initial screening of alternative remedial measures, evaluations are performed to identify appropriate general response actions, remedial technologies, and process options potentially applicable to remediation of the three operable units.

After the initial screening, remedial technologies and process options are developed separately into alternatives for cleanup of the soil and cleanup of the ground water. Preliminary cost estimates are presented for each alternative, and the advantages and disadvantages of the various alternatives are discussed. Preliminary cost estimates are based on available data and may change as a result of additional data collection, method of remediation, application of cleanup standards, regulatory requirements, and actual amount of contaminated soil or ground water requiring remediation or handling.

5.2 Cleanup Objectives

Screening of remedial technologies and evaluation of remedial alternatives require establishing goals for cleanup of both soil and ground water. For purposes of this evaluation, the cleanup objective for OU-1, soil containing elevated concentrations of lead, is to reduce total lead concentrations to less than 1,000 parts per million (ppm), the value used by the DHS to designate hazardous waste. The cleanup goal for OU-2, soil with elevated levels of petroleum hydrocarbons, is to reduce petroleum hydrocarbon levels measured as TPH to below 100 parts per million (ppm). This values represents a guideline used by the California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB), for disposal of soil to Class III landfills. For OU-3, ground water containing elevated levels of petroleum hydrocarbons, the goal is to reduce concentrations of the individual BTEX constituents to less than DHS MCLs or action levels, as appropriate. DHS MCLs for benzene, ethylbenzene, and xylenes are 1 ppb, 680 ppb and 1,750 ppb, respectively. A DHS MCL has not been established for toluene.

The DHS Drinking Water Action Level for toluene, 100 ppb, will be used as a cleanup goal for this evaluation.

For treated water discharged to storm drains, the goal is to reduce petroleum hydrocarbon concentrations measured as TPH to less than 50 ppb, and individual constituent concentrations to less than 5 ppb.

5.3 Identification Of General Response Actions, Remedial Technologies, And Process Options

The remedial alternatives development process may be viewed as consisting of steps that involve making successively more specific definitions of potential remedial activities. The first step in the evaluation process is to identify "general response actions." General response actions describe those activities that may broadly satisfy the objectives of site remediation. General response actions include: no action, institutional actions, containment, excavation, extraction, treatment, disposal, or combinations of these.

The next step in the process is to identify potentially applicable remedial technologies and process options. A list of identified remedial technologies and process options is reviewed by evaluating the options with respect to effectiveness, implementability, and relative cost. The technologies remaining after this preliminary screening are then developed into alternatives for further analysis.

A list of general response actions and remedial technologies is presented in Table 6. For each of the treatment technologies a number of process options exist. Process options are identified and evaluated on a case-by-case basis for each remedial technology. The list of remedial technologies and process options has been developed from three U.S. Environmental Protection Agency (EPA) reports (*Remedial Action at*

Waste Disposal Sites [U.S. EPA, 1985], *Draft Technology Screening Guide for Treatment of Contaminated Soils and Sludges* [U.S. EPA, 1987], *Mobile Treatment Technologies for Superfund Wastes* [U.S. EPA, 1986]), and from a list of technologies being evaluated by the California Department of Health Services (DHS).

5.4 Initial Screening Of Remedial Technologies And Process Options

The screening of remedial technologies and process options is performed separately for each of the three operable units being evaluated: soil with elevated lead levels in Areas 1 and 2, soil with elevated hydrocarbon levels in Area 3, and ground water with elevated hydrocarbon levels in Area 3. This section presents the basis for the initial screening and summarizes the screening results for each of the operable units.

5.4.1 Basis for Screening

Preliminary screening of alternatives emphasizes effectiveness, implementability, and to a lesser extent, cost. Presented below is a description of each of these screening criteria.

Effectiveness

Specific technology processes that have been identified are evaluated for effectiveness on the following bases: 1) the potential effectiveness of process options in handling the estimated areas or volumes of media and meeting the contaminant reduction goals; 2) the effectiveness of the process options in protecting human health and the environment during the construction and implementation phase; and 3) how proven and reliable the process is with respect to the contaminants and conditions at the site.

Implementability Evaluation

Implementability encompasses both the technical and institutional feasibility of implementing a technology process. Technical implementability is used as an initial

screen of technology types and process options to eliminate those that are clearly ineffective or unworkable at the site. Therefore, subsequent and more detailed evaluation of process options places greater emphasis on the institutional aspects of implementability, such as the ability to obtain necessary permits for off-site actions, the availability of treatment, storage, and disposal services (including capacity), and the availability of necessary equipment and skilled workers to implement the technology.

Cost Evaluation

Cost plays a limited role in the screening of process options. Relative capital and operation and maintenance (O&M) costs are used rather than detailed estimates. At this stage in the process, the cost analysis is based on engineering judgment, and each process is evaluated as to whether costs are high, low, or moderate relative to other process options in the same technology type. The greatest cost consequences in site remediation are usually associated with the degree to which different general technology types (e.g., containment, treatment, excavation, etc.) are used. Using different process options within a technology type usually has a lesser effect on cost.

5.4.2 Soil in Areas 1 and 2 (Operable Unit 1): Screening Results

The initial screening for the contaminated soil in Areas 1 and 2 was first performed on the general response actions and remedial technologies listed in Table 6. Results of this screening are presented in Table 7. This table indicates whether the general response action or remedial technology type passes or fails the screening on the basis of effectiveness, implementability, or cost. The treatment and in situ treatment options are generally not cost-effective for volumes of soil less than approximately 1,000 yd^3. Therefore, because of the relatively small quantity of soil requiring

remediation, treatment and in situ treatment options have been eliminated from further consideration.

The no action alternative involves leaving the residual soils intact with long-term ground-water monitoring and no remediation. This alternative may not be acceptable to the regulatory agencies because of the hazardous classification of the soil, and may not reduce long-term liability to the property owner. At a minimum, DHS would probably impose deed restrictions on the use of the property that could reduce its value. Additionally, the RWQCB would probably require ground-water monitoring to evaluate transport of lead to shallow ground water at the site. A minimum of one monitoring well would be required in each area with elevated lead concentrations.

Containment by horizontal barriers such as asphalt parking (i.e., capping) may be an acceptable technology to the regulatory agencies. Capping does not eliminate the source, reduce lead concentrations, or significantly reduce the long-term liability associated with the lead contamination in the soil. However, it is likely to be a cost-effective solution. A cap would isolate the soil from human exposure, thereby reducing the risk to human health and welfare, and would minimize environmental risks by reducing surface water infiltration and the potential for lead to migrate into the underlying shallow ground water. However, capping the lead-containing soils classified as hazardous waste on site will most likely require the placement of deed restrictions on the property that are acceptable to DHS and long-term ground-water monitoring. Deed restrictions can have the negative impacts of decreased property value, restricted clientele for future sales, and continued long-term liability.

Excavation and landfill disposal are both effective and implementable remedial technologies for soil with elevated lead levels. These two technologies are considered

together in one alternative. The excavation and landfill disposal alternative consists of removing the contaminated soil with lead concentrations in excess of 1,000 ppm and transporting it to a permitted Class I landfill. This is a costly alternative because of relatively high disposal costs, and tax disincentives to limit disposal of hazardous waste. However, removal eliminates long-term liability at the property.

5.4.3 Soil in Area 3 (Operable Unit 2): Screening Results

The initial screening of general response actions and remedial technology types for the contaminated soil in Area 3 is presented in Table 8. Although remediation of the soil contamination in Area 3 is anticipated to be required by regulatory agencies, the minimum actions expected would include monitoring and deed and access restrictions. These institutional actions would also likely be required for any remediation that allows contamination to remain on site, or that takes a considerable period of time.

Containment of the contaminated materials would likely require both capping and vertical barriers, such as a slurry wall. A vertical barrier, however, would likely not be cost-effective. Horizontal barriers (i.e., below contamination) have been eliminated from further consideration because they are only marginally effective, and vertical migration of the contaminants is not a significant concern at the site. Capping is being eliminated on the basis of implementability. Discussions with regulatory agencies indicate that containment actions are not likely to be acceptable since other alternatives that remove the hydrocarbons are readily available.

Surface water and ground-water collection actions are not considered effective for this operable unit, which considers contaminated soils only. Soil gas removal, also considered as physical treatment/vapor extraction, is considered effective if conducted in

conjunction with dewatering, because some of the hydrocarbons are present at and below the ground-water surface.

Waste removal is applicable to drummed or containerized wastes, while soil excavation is considered the first step to either off-site disposal or several on-site treatment options.

Of the treatment actions considered, thermal treatment (oxidation, not volatilization) is considered to be exceedingly expensive. In addition, as there are no permitted incinerators in California which process contaminated soils, on-site thermal treatment is not considered to be implementable because of permitting constraints and obstacles.

A chemical oxidation process is being developed for treating hydrocarbon contaminated soils; however, initial tests of the process indicate that it is only slightly more effective than aeration alone. Since the soil does not contain heavy fraction petroleum hydrocarbons, chemical oxidation would not be necessary and would be much more costly than aeration. Therefore, on the basis of relative cost, chemical treatment has been eliminated from further consideration.

Immobilization has been eliminated from further consideration because the technologies being developed for petroleum hydrocarbons are relatively unproven and have only marginal effectiveness. Off-site treatment is eliminated from further consideration on the basis of relative cost. Specifically, any treatment actions applicable to the soils in Area 3 can be performed on site at a lower cost than off-site treatment.

Similar to the screening of general response actions and remedial technology types, the treatment process options listed in Table 9, physical, biological, and in situ treatment, have been screened on the bases of effectiveness, implementability, and cost.

Presented below is a brief discussion of the rationale developed in screening a few of the process options which are commonly applied to hydrocarbon-contaminated soils.

Steam stripping and low temperature thermal stripping have been eliminated because, for light fraction petroleum hydrocarbons, these technologies may be only slightly more effective than vacuum extraction alone, and these technologies are much more expensive to implement. Identical reasoning has been used to eliminate soil flushing/soil washing, solvent extraction, and supercritical extraction.

Aboveground biodegradation options have been eliminated because for the contaminated soils in Area 3, aeration is equally effective, easier to implement, and less expensive.

In situ biodegradation requires the addition of nutrients and oxygen to the soil to stimulate the growth of hydrocarbon-utilizing microorganisms. This technology was rejected because of implementation difficulties associated with maintaining elevated water-table levels required for this approach to be successful.

In situ radio heating and in situ steam stripping have been eliminated because they have not been proven effective for contaminated soils at or below the elevation of the ground-water table.

Two treatment process options passed the screening: soil aeration and soil vapor extraction. Soil aeration requires excavating and moving the affected soil to a treatment site where it is spread to a depth of up to 3 feet and periodically mixed by mechanical equipment such as a rototiller. The volatile organics in the soil are released to the atmosphere during the treatment period. The treated soils can then be backfilled in the excavated area. Volatilization rates can be calculated and treatment periods estimated

based upon the chemical types and concentrations present in the soil. The BAAQMD must be notified and approve of the proposed aeration.

Soil vapor extraction removes volatile hydrocarbons from soil by applying a vacuum below ground surface. Air that has been in contact with volatile compounds in the soil contains vapors in proportion to the saturation vapor pressure of the compounds. Applying a vacuum below ground surface extracts the hydrocarbon-bearing soil vapor which is then passed through an emission control system (e.g., vapor-phase carbon treatment) to meet air emission criteria. A permit from BAAQMD would be required to operate a soil vapor extraction system.

5.4.4 Ground Water in Area 3 (Operable Unit 3): Screening Results

The initial screening of general response actions and remedial technologies for remediation of the contaminated ground water in Area 3 is presented in Table 10. As with the contaminated soil in Area 3, the minimum actions anticipated to be required include monitoring and deed and access restrictions. Because of favorable site characteristics, containment of the ground water would be effective; however, it is anticipated that containment alone would not be acceptable to the regulatory agencies. Ground-water collection actions, i.e., extraction by pumping, meets the initial screening criteria. Excavation actions are applicable to containerized or solid wastes and are not considered effective for ground water. Thermal treatment and chemical treatment are not considered cost-effective for treating the contaminated ground water. Immobilization is not considered effective for hydrocarbons or implementable for the dilute concentrations present.

The screening of the physical, biological, and in situ treatment process options applicable to the ground water in Area 3 is presented in Table 11. Those process

options that passed the screening are air stripping, carbon adsorption, and in situ biodegradation.

Air stripping has successfully been applied in treatment systems at many sites to remove petroleum hydrocarbons from ground water. To remove or strip volatile compounds from ground water, the extracted water is introduced at the top of a tower filled with a high surface area plastic packing medium. Water is sprayed down over the packing medium while air is blown up from the bottom of the tower to transfer the hydrocarbons from an aqueous phase into a vapor phase. Hydrocarbons present in the influent ground water are removed by the air stripping process. Air pollution control devices may be required to remove the stripped hydrocarbons from the off-gas before it is discharged to atmosphere; if so, emission from the air stripper typically would be passed through contactors containing granular activated carbon which would adsorb the vapor-phase hydrocarbons. Activated carbon contactors saturated with hydrocarbons would have to be regenerated or disposed at a Class I landfill.

The BAAQMD requires permits to construct and operate an air stripper and also regulates the amount of hydrocarbons that may be discharged into the atmosphere.

With a liquid-phase activated carbon treatment system, extracted ground water is passed directly through granular activated carbon contactors for adsorption of hydrocarbons. This method produces no off-gas; therefore, BAAQMD-required air pollution controls or permits are not needed. Monitoring of the treated effluent water is necessary to determine breakthrough of hydrocarbons.

Spent carbon can be regenerated either on site or off site. On-site regeneration increases capital investment and operation and maintenance costs and is usually economical only for sites with high carbon usage.

Biological treatment systems have been successfully applied at numerous sites to effectively remove gasoline hydrocarbons from ground water. The removal of organic compounds from ground water is accomplished by enhancement of indigenous microorganisms that will metabolize the organic compounds (gasoline). Biological enhancement involves the addition of nutrients such as nitrogen, phosphorus, and oxygen to the contaminated ground water. These constituents are required by the microorganisms to accelerate the rate of biological degradation of the organic compounds. Biodegradation of the organic compounds usually results in the formation of carbon dioxide, water, and nonhazardous cellular constituents.

Ground-water disposal options include discharge to the municipal sanitary sewer, discharge to the storm drain system, or transport and off-site disposal. Ground water may be transported and disposed off site without on-site treatment through use of private treatment facilities. This method, while effective and implementable, is generally not cost-effective for large volumes of water and was not considered.

5.5 Development Of Alternatives Passing The Initial Screening

After the initial screening of remedial technology types and process options, the ones that pass are then developed into alternatives for detailed analysis.

5.5.1 Alternatives for Operable Unit 1: Soil in Areas 1 and 2

The soil in these areas contains elevated concentrations of lead. The alternatives that have been developed for remediation of soil in Areas 1 and 2 are based on those remedial technology types that meet the initial screening criteria (Table 12).

The individual soil remedial technologies are combined into two alternatives:

- Capping with deed and access restrictions and monitoring
- Excavation and off-site disposal

5.5.2 Alternatives for Operable Unit 2: Soil in Area 3

Remedial alternatives for Operable Unit 2, the soil in Area 3 that has elevated levels of light fraction petroleum hydrocarbons, have been developed on the basis of the initial screening presented in Tables 8 and 9 and summarized in Table 12.

The individual soil remedial technologies discussed above were combined into four alternatives for soil remediation:

- Excavation, aeration, and on-site disposal (designated Alternative I)
- Excavation, aeration, and off-site disposal at a Class III landfill (Alternative II)
- Excavation and off-site disposal at a Class II landfill (Alternative III)
- Soil vapor extraction (SVE), with treatment of soil vapors by carbon adsorption (Alternative IV)

5.5.3 Alternatives for Operable Unit 3: Ground Water in Area 3

The ground-water remedial technology types and process options that passed the initial screening (Tables 10 and 11) were air stripping, carbon adsorption, and biodegradation, as summarized in Table 12. These technologies are effective for removal of petroleum hydrocarbons from water and are implementable at the site.

The three ground-water treatment technologies retained for evaluation were developed into three alternatives for ground-water remediation:

- Pumping, treatment by carbon adsorption, and discharge to the storm drain system (Alternative V).
- Pumping, treatment by air stripping with polishing by liquid-phase carbon adsorption, and discharge to the storm drain system (Alternative VI).
- Pumping, treatment by biodegradation, polishing by liquid-phase carbon adsorption, injection of a portion of treated water, and discharge of the remainder into the storm drain system (Alternative VII).

5.6 Cost Evaluation

Costs of excavation, transportation, disposal, verification sampling and analysis, and taxes for the estimated 80 cubic yards of soil with elevated lead concentrations in Areas 1 and 2 are estimated to be $500-600 per cubic yard. Costs for access control and monitoring would be less initially, but could continue indefinitely.

Preliminary cost estimates for the four soil and two ground-water remediation alternatives retained for Area 3 were developed as a means of evaluating the most cost-effective combination of soil and ground-water remedial alternatives. Cost estimates for each of the four soil remediation alternatives are presented in Tables 13 through 16. These estimates are based on the following assumptions:

- Total area of gasoline contamination is an elliptical area approximately 260 feet by 130 feet.
- The upper 10 feet of soil in this area is clean and does not require treatment. Volume of clean soil to be excavated is approximately 13,000 cubic yards.
- Soil at depths of 10 to 15 feet contains gasoline and requires treatment. Volume of soil containing elevated hydrocarbon levels is approximately 5,000 cubic yards.
- For both excavation and soil venting, lowering the water table from depths approximately 12 feet below ground surface (bgs) to 15 feet bgs is required.
- No shoring is required during excavation.
- Soil vapor extraction has an assumed duration of one year.
- Adequate space is available at the site for stockpiling and aerating excavated soil.

Cost estimates for Alternatives I, II, and III are an average of quotes obtained from two contractors with qualifications in these types of site remediation activities. For these alternatives, ranges based on these quotes are included parenthetically, when mentioned in the text.

Cost estimates for the three ground-water treatment alternatives are presented in Tables 17, 18 and 19. Costs for a collection system applicable to all treatment technologies are presented in Table 20. Costs are based on the following assumptions:

- Total number of ground-water extraction wells is three.
- Estimated ground-water flow rate is 10 gallons per minute (gpm).
- Ground water will be treated to remove gasoline contamination only. Ground water will not be treated to remove metals or other inorganics.
- There is no mobile, separate-phase gasoline at the water table.
- Maximum and average dissolved concentrations of gasoline hydrocarbons are 10 ppm and 1 ppm, respectively.
- Ground-water treatment will begin after the source of hydrocarbons in the soil is removed.
- Biological treatment accompanied by injection of a portion of treated water will reduce the time to complete ground-water remediation by a factor of two because of in situ degradation of hydrocarbons dissolved in ground water.

Costs for soil and ground-water remediation do not include permitting, reporting, or other regulatory compliance costs, with the exception of laboratory analytical costs.

For each of the seven soil and ground-water remediation alternatives, capital and operation and maintenance (O&M) costs are summarized in Table 21. Finally, in Table 22, the soil and ground-water alternatives are combined to arrive at estimated costs for remediation of hydrocarbons in soil and ground water in Area 3.

5.7 Results and Recommendations

5.7.1 Operable Unit 1: Soils in Areas 1 and 2

Excavation and disposal to a Class I landfill is the recommended alternative for remediation of soils with elevated lead concentrations in Areas 1 and 2. Sampling and analysis conducted since the completion of the Final Report, Environmental Assessment

(*HLA, 1989*) has substantially reduced the estimate of the volume of soil requiring excavation. This solution has the advantage of minimizing long-term liability at the property.

5.7.2 Operable Unit 3: Ground Water in Area 3

Treatment of ground water by biodegradation (Alternative VII) is recommended for OU-3. Estimated capital costs are slightly higher for Alternative VII than for Alternative V (carbon adsorption). Howver, because the operational period for Alternative VII is assumed to be half that of the other alternatives, total costs for treatment by biodegradation are less than Alternative V after a year of operation.

5.7.3 Soil and Ground-Water Remedial Alternative Combinations: Area 3

The shortest duration remedial solution is soil excavation with off-site disposal to a Class II landfill, in combination with ground-water treatment by carbon adsorption (Alternatives III and V). This is also the least cost-effective solution, with an estimated cost of $1,640,000 (range from $1,560,000 to $1,800,000). Because the project duration to complete site cleanup is controlled by the ground-water cleanup, and because the time savings gained by Class II soil disposal are marginal compared to the increase in cost over aeration and Class III disposal, this combination is not recommended.

Solutions with nearly equally short durations include the two soil alternatives involving excavation and aeration (Alternatives I and II). The estimated duration for either of these combinations is approximately one year, assuming one year is required to complete the ground-water cleanup.

For those solutions that include disposal of aerated soil to a Class III landfill (Alternative II), lowest costs are for the combination of Alternative II with Alternative VII (biotreatment of ground water), and are approximately $750,000 (range

from $620,000 to $950,000). These costs include, in addition to Class III disposal of aerated soils, import and placement of off-site soil to return the excavated area to existing grade.

The lowest estimated costs for any combination relying on aeration are approximately $580,000 (range from $480,000 to $650,000), for the combination of Alternative I and Alternative VII, which includes disposal of aerated soil on site as backfill and biotreatment of ground water.

The lowest estimated costs for any combination of soil and ground-water cleanup alternatives are approximately $580,000 (range from $480,000 to $650,000), for the combination of Alternative I and Alternative VII (soil disposal on site and biotreatment of ground water). The next most cost-effective remedial combination is soil vapor extraction in conjunction with biotreatment of ground water, with an estimated cost for a 2-year project duration of approximately $610,000.

Because costs of excavation, aeration and replacement of soil (Alternatives I and II) are similar to costs of soil vapor extraction (Alternative IV), and because there is less uncertainty associated with excavation-based solutions than with SVE-based solutions, excavation and aeration are recommended as the soil remediation alternative, and biological treatment is recommended as the ground-water remediation alternative.

6.0 IMPLEMENTATION PLAN

6.1 Introduction

As discussed in the FS, three different problem areas at the site, designated as "Operable Units" (OU) have been identified: OU-1 has soil with elevated lead concentrations; OU-2 has soil with elevated petroleum hydrocarbon concentrations; and OU-3 contains ground water with elevated concentrations of dissolved gasoline constituents.

In the FS, a number of remedial alternatives for these operable units were identified and screened. Based on a detailed technical and cost screening, the following remedial alternatives have been identified as technically feasible, easily implementable, institutionally acceptable, and cost effective:

OU-1: Excavation followed by disposal of soils in a permitted Class I hazardous waste landfill.

OU-2: Excavation, aeration of contaminated soil on site, followed by backfill with aerated and native clean soil.

OU-3: Extraction and collection of ground water, biodegradation of gasoline compounds in an Aboveground bioreactor, followed by carbon adsorption, and disposal of treated water to a storm drain or injection to the subsurface.

The objectives of this section are to:

- Describe briefly each selected remedial alternative to be implemented at the three operable units.
- Provide a conceptual work plan to implement the selected remedial alternatives at the three operable units.
- Outline a tentative implementation schedule.

6.2 Implementation of Remedial Action for OU-1

The *Final Report, Environmental Assessment (HLA, 1989)* identified soils with elevated levels of lead at two former painting locations, designated Areas 1 and 2 on

Plate 3 and considered together as OU-1. In the feasibility study, the recommended method for remediation of these areas is removal of soil with lead concentrations in excess of 1,000 mg/kg and transport to a permitted Class I landfill for disposal.

As an interim remedial measure, to minimize the potential for transport of lead in soils during the rainy season, soil with lead at concentrations of 1,000 mg/kg or greater was excavated in two phases during November 1989 and January 1990. The lateral and vertical boundaries of the excavations were based on results of analysis of surface and shallow-depth soil samples (Plates 6 and 7). Vertical excavation boundaries were established at one foot below the deepest sample with lead concentrations greater than 1,000 mg/kg.

Soil within established boundaries was excavated with a Case Model 580 backhoe. The excavated soil was stockpiled on a concrete surface in the covered work bays. A composite sample of the soil was collected and shipped to Chemical Waste Management's (CWM) Kettleman Hills treatment and disposal facility for characterization. The stockpile was covered pending CWM acceptance of the waste for disposal. After acceptance was received from the disposal site operator, the soil was manifested, loaded into lined trucks operated by licensed hazardous waste haulers and transported to the CWM facility. Personal protective equipment, tarps, decontamination liquids, and truck liners were disposed with the soil.

After completion of excavation, confirmation samples were collected with a clean trowel within and near the excavated areas to determine if soil with lead concentrations greater than 1,000 mg/kg had been removed. Confirmation samples were transported with appropriate chain of custody to NET Pacific Laboratories in Santa Rosa, California. The samples were analyzed for total lead using EPA Method 7420.

Once all soil showing lead concentrations above 1,000 mg/kg has been removed and regulatory agency approval of this plan is received, the excavations will be backfilled and a closure report will be prepared.

6.3 Implementation of Remedial Action for OU-2

The investigation of Area 3 identified approximately 5,000 cubic yards of soil containing elevated levels of petroleum hydrocarbons in the eastern portion of the site. The total area of the gasoline-contaminated soil occupies an elliptical area approximately 260 feet by 130 feet. Within this area, soil to an estimated depth of 10 feet bgs is clean and does not require treatment. The soil between 10 and 15 feet bgs contains elevated levels of petroleum hydrocarbons and will require treatment. The recommended remedial alternative for this soil is excavation, aeration of the soil to remove volatile organics; and emplacement of clean and treated soil into the excavated area.

Prior to excavation, the work area will be staked with suitable offsets to allow for mobility of the equipment. Areas for stockpiling and aeration of the contaminated soil will be underlain with asphalt, plastic, or concrete to prevent infiltration of precipitation. If work is conducted in the rainy season (October-April), stockpile and aeration areas will be bermed to prevent runoff of precipitation and migration of petroleum hydrocarbons. If possible, the parking lot west of the bays, an area of the site that is currently paved, will be used for aeration.

A trained environmental technician will monitor the excavation to identify soil with elevated levels of hydrocarbons using a hand-held organic vapor analyzer (OVA) and the sensory cues of discoloration and odor. Soil samples collected at the site indicate a correlation between discolored soil and elevated concentrations of hydrocarbons. Because of the ample available working space at the site, excavating with scrapers is

feasible and cost-effective. Scrapers will remove the clean overburden soil at the direction of the technician. The clean overburden will be stockpiled in a designated area. A backhoe will be used to excavate Soil with elevated levels of petroleum hydrocarbons. The backhoe will load the scrapers with the contaminated soil for stockpiling in a separate designated area. This stockpile will be covered.

The environmental technician will direct the removal of soil with elevated levels of petroleum hydrocarbons on the basis of OVA readings and sensory cues. Samples of the bottom and sides of the excavation will be collected to confirm that soil with concentrations of petroleum hydrocarbons greater than 100 mg/kg has been removed. The samples will be analyzed by a state-certified mobile laboratory for total petroleum hydrocarbons using EPA Test Method 8015 (Modified). The clean soil stockpile will also be sampled to confirm the absence of elevated levels of petroleum hydrocarbons.

Once soil with elevated levels of petroleum hydrocarbons has been removed, the excavation will be backfilled in maximum 2-foot lifts and compacted with a sheep-foot compactor to 90 percent compaction or greater. Compaction will be tested with a nuclear density gauge.

The soil requiring treatment will be sampled in accordance with the Bay Area Air Quality Management District (BAAQMD) Regulation 8 Rule 40, which states that, prior to aeration, four samples for each 50 cubic yards of soil will be collected and composited into one sample for analysis. The amount of soil which can be aerated daily will be based on these analytical results, and will be conducted in accordance with Table 1 of Regulation 8 Rule 40 (Section 8-40-301).

Daily allowable amounts of soil requiring treatment will be removed from the stockpile and placed in the aeration area with a loader. The soil will be spread into a

6-inch lift and disked with a small dozer. Once the soil is removed from the stockpile, the cover will be replaced and secured to prevent aeration of the stockpiled soil.

For each 100 cubic yards of aerated soil, four samples will be collected and composed into one sample for laboratory analysis. If the results of soil sample analysis indicates TPH values below 100 mg/kg, the treated soil will be replaced in the excavated area using standard construction techniques as described above.

6.4 Implementation of Remedial Action for OU-3

6.4.1 Design Criteria for Ground-Water Treatment System

The following design criteria for implementation of remedial actions for OU-3 have been developed based on previous investigations of soil and ground water at the site, results of the FS, expected flow rate of ground water, and applicable regulations:

- The treatment system design flow rate is 10 gpm.
- The maximum and average dissolved concentrations of gasoline hydrocarbons are 10 ppm and 1 ppm, respectively.
- The treatment system will be designed for continuous operation.
- Mobile separate-phase gasoline is not present in the subsurface.
- For ground water containing elevated levels of petroleum hydrocarbons, the goal is to reduce concentrations of the individual BTEX constituents to less than DHS MCLs or action levels, as appropriate. DHS MCLs for benzene, ethylbenzene, and xylenes are 1 ppb, 680 ppb, and 1750 ppb, respectively. An MCL has not been established for toluene. The DHS drinking water action level for toluene, 100 ppb, will be used as a cleanup goal for this evaluation.
- Ground water will not be treated for inorganics or heavy metals.
- The treatment system will be equipped with necessary instruments and controls for automatic and continuous operations.
- The treatment system will be built in accordance with applicable local, state, and federal regulations.

6.4.2 Conceptual Design of Ground-Water Treatment System

The selected remedial alternative for OU-3 consists of the following basic components:

- Ground-Water Extraction Wells
- Extraction Well Pumps
- Collection System
- Ground-Water Treatment System
- Treated Effluent Disposal System.

A brief description of each of these components is given below.

Ground-Water Extraction Wells

Three ground-water extraction wells are proposed for hydraulic control and capture of the ground-water plume; locations of the wells are shown on Plate 12. The number and locations of wells were estimated using available site data including aquifer hydraulic conductivity, hydraulic gradient, saturated thickness, known distribution of dissolved gasoline constituents, in conjunction with the ground-water flow code CAPTURE (Data Services, 1985). CAPTURE calculates flowlines and can be used to delineate capture areas associated with extraction wells, based on the assumption of a homogeneous and isotropic aquifer and a unidirectional ground-water flow field. Each well will be designed for below-grade construction in a concrete vault. Pump controls and flowmeters will be located in each vault and will include a flow totalizing meter and discharge pressure gauge. The number of wells and well construction details will be finalized during the preliminary design phase of the remedial action.

Extraction Well Pumps

The ground-water extraction wells will be equipped with electric 1/2 to 1-HP submersible pumps. The specific pump will be selected after well development. Pump

controls will include high and low water-level sensors, a run-time indicator, a totalizing flowmeter, and an automatic shut-off to the treatment system.

Collection System

The proposed locations of the treatment system, the injection trench, and collection system piping are shown on Plate 12. The pipe alignment and sizing will be finalized during the preliminary design task. The collection system design will comprise aboveground PVC pipes.

Ground-Water Treatment System

Biological treatment, followed by carbon adsorption, has been identified in the FS as the most appropriate technology to implement at the site. Previous laboratory and field studies have shown that natural ground-water microorganisms have the metabolic capacity to effectively degrade gasoline hydrocarbons when the proper environment (adequate nutrients and oxygen) is provided. However, because of the variability associated with each contaminated ground-water situation, a bench scale bioreactor process study needs to be performed to evaluate and optimize the biodegradation rate.

The bench scale bioreactor process study will be conducted at HLA's microbiological laboratory. The objectives of the process study are:

- Determine nutrient requirements to optimize biological degradation.
- Determine biological degradation of indicator compounds (BTEX) in native ground water.
- Establish approximate retention times for sizing of the above biological treatment reactor.
- Determine final effluent concentrations of indicator compounds in treated water.

- Determine organic loading rates for post-treatment carbon adsorption module.

Treated Effluent Disposal System

A portion of the treated water will be injected into the subsurface to promote in situ biodegradation of residual organics present in the saturated zone. The rest of the treated water will be discharged to a nearby storm drain. A National Pollutant Discharge Elimination System (NPDES) permit will be obtained in order to discharge the treated water into the storm drain.

6.4.3 Preliminary Design of the Ground-Water Treatment System

A conceptual process flow diagram for the treatment system is shown on Plate 13. The ground-water treatment system will comprise the following modules:

Pretreatment Module: The pretreatment module consists of the following elements:

- Equalization tank: A holding tank will be used to equalize the fluctuating ground-water flow from the extraction wells. This serves two purposes by: a) providing a constant flow to the treatment unit, and b) allowing settling of larger particulates that may be in the ground water.

- Filtration system: A 100-micron strainer will remove particulates before ground water enters the treatment system.

Treatment Module: The treatment module will include a bioreactor, a sand filter, and appurtenances required for the addition of required nutrients. The system will be designed for a 10 gpm combined flow from the extraction wells. The reactor vessel will be sized on the basis of microbial degradation kinetics determined from the bioreactor process study discussed in Section 6.4.2.

Contaminated ground water will be pumped into the bioreactor from the pretreatment module. The ground water will be supplemented with the required inorganic nutrients by an automated metering system and will remain in the reactor for a specified residence time. The treated ground water will then pass through a sand filter to reduce the quantity of biomass.

Post Treatment Module: The post treatment module will consist of two liquid-phase polishing carbon beds in series, and will be used to remove residual organics from the bioreactor effluent. The treated ground water will be stored in a holding tank before discharge to a storm sewer or injection into the saturated zone.

6.5 System Startup, Maintenance, and Operation

This section describes the technical approach to startup and operation of the ground-water treatment system.

6.5.1 System Startup

Following construction of the treatment facility, the following activities will be performed:

- Pump ground water from extraction wells through the collection system into the treatment unit and then into the discharge line.
- Read and regulate flow rates as required to calibrate the system.
- Monitor and regulate system performance.
- Collect and analyze samples according to RWQCB NPDES permit requirements.
- Collect samples for analysis of TPH and BTEX from each well, the inlet and outlet of the bioreactor, and the inlet and outlet of the polishing carbon module.

6.5.2 System Operation

After successful startup, the treatment system will be considered operational. An operations plan will be developed that addresses manufacturer's operating instructions, recommended maintenance procedures, manual startup and shutdown procedures, troubleshooting advice, contingency plans for automatic shutdowns, accidental spills, equipment failure, sampling procedures, and sample analysis. The activities to be performed during this period shall include:

- Continued monitoring of the bioreactor influent and effluent streams.

- Regularly scheduled inspection and monitoring of system parameters including flows, pressures, control settings, and water levels.
- Collection and analysis of samples from extraction wells at regular intervals.
- Preparation of a monthly operation report that summarizes O&M activities for the previous month.
- Preparation of monitoring reports for NPDES permit compliance.

6.6 Project Schedule

The proposed schedule for implementation of remedial actions at OU-1, OU-2, and OU-3 is shown on Plate 14. Interim remediation of soil at OU-1 is already in progress and expected to be completed by the end of January 1990. Assuming timely regulatory approval and work authorization for remedial actions at OU-2 and OU-3 as indicated in the implementation schedule (Plate 14), the ground-water treatment system is planned for startup by the end of May 1990. Initiation of remedial action for OU-2 depends on successful startup of the ground-water treatment system and is tentatively scheduled for June 1990 when the weather will permit successful soil aeration.

6.7 Permit Requirements

It is known that the following permits will be required:

- NPDES Permit - Allows for discharge of treated water to surface-water bodies. Issued by the RWQCB.
- Permit to discharge to storm drain. Issued by Alameda County Flood Control District.
- Well Permits - Allows for installation of ground-water monitoring and extraction wells. Issued by Alameda County Flood Control and Water Conservation District.
- Building Permits - Allows for general construction of the treatment system. Issued by City Building Department.

Overall approval of the cleanup approach and implementation plan will be required from DHS and the RWQCB or their designees (e.g., Alameda County Health Care Services Agency). In addition, the BAAQMD requires written notification prior to commencement of aeration activities.

MAJOR DIVISIONS					TYPICAL NAMES
COARSE–GRAINED SOILS MORE THAN HALF IS COARSER THAN NO. 200 SIEVE	GRAVELS MORE THAN HALF COARSE FRACTION IS LARGER THAN No 4 SIEVE SIZE	CLEAN GRAVELS WITH LITTLE OR NO FINES	GW		WELL GRADED GRAVELS WITH OR WITHOUT SAND, LITTLE OR NO FINES
			GP		POORLY GRADED GRAVELS WITH OR WITHOUT SAND, LITTLE OR NO FINES
		GRAVELS WITH OVER 12% FINES	GM		SILTY GRAVELS, SILTY GRAVELS WITH SAND
			GC		CLAYEY GRAVELS, CLAYEY GRAVELS WITH SAND
	SANDS MORE THAN HALF COARSE FRACTION IS SMALLER THAN NO 4 SIEVE SIZE	CLEAN SANDS WITH LITTLE OR NO FINES	SW		WELL GRADED SANDS WITH OR WITHOUT GRAVEL, LITTLE OR NO FINES
			SP		POORLY GRADED SANDS WITH OR WITHOUT GRAVEL, LITTLE OR NO FINES
		SANDS WITH OVER 12% FINES	SM		SILTY SANDS WITH OR WITHOUT GRAVEL
			SC		CLAYEY SANDS WITH OR WITHOUT GRAVEL
FINE–GRAINED SOILS MORE THAN HALF IS FINER THAN NO. 200 SIEVE	SILTS AND CLAYS LIQUID LIMIT 50% OR LESS		ML		INORGANIC SILTS AND VERY FINE SANDS, ROCK FLOUR, SILTS WITH SANDS AND GRAVELS
			CL		INORGANIC CLAYS OF LOW TO MEDIUM PLASTICITY, CLAYS WITH SANDS AND GRAVELS, LEAN CLAYS
			OL		ORGANIC SILTS OR CLAYS OF LOW PLASTICITY
	SILTS AND CLAYS LIQUID LIMIT GREATER THAN 50%		MH		INORGANIC SILTS, MICACEOUS OR DIATOMACIOUS, FINE SANDY OR SILTY SOILS, ELASTIC SILTS
			CH		INORGANIC CLAYS OF HIGH PLASTICITY, FAT CLAYS
			OH		ORGANIC SILTS OR CLAYS OF MEDIUM TO HIGH PLASTICITY
HIGHLY ORGANIC SOILS			Pt		PEAT AND OTHER HIGHLY ORGANIC SOILS

UNIFIED SOIL CLASSIFICATION - ASTM D2487-85

Perm	—	Permeability
Consol	—	Consolidation

KEY TO ABBREVIATIONS

mean	:	Average; the sum of the measurements divided by the total number of measurements.
mg/Kg (ppm)	:	Concentration in units of milligrams of analyte per kilogram of sample, wet-weight basis (parts per million).
mg/L	:	Concentration in units of milligrams of analyte per liter of sample, unless noted otherwise.
mL/L/hr	:	Milliliters per liter per hour.
MPN/100 mL	:	Most probable number of bacteria per one hundred milliliters of sample.
N/A	:	Not applicable.
ND	:	Not detected; the analyte concentration is less than the listed reporting limit.
NR	:	Not requested.
NTU	:	Nephelometric turbidity units.
RL	:	Reporting limit.
RPD	:	Relative percent difference, $[V^1-V^2/V$ mean$]$x100.
SNA	:	Standard not available.
ug/Kg (ppb)	:	Concentration in units of micrograms of analyte per kilogram of sample, wet-weight basis (parts per billion).

KEY TO ABBREVIATIONS and METHOD REFERENCES

Abbreviations

mean : Average; sum of measurements divided by number of measurements.

mg/Kg (ppm) : Concentration in units of milligrams of analyte per kilogram of sample, wet-weight basis (parts per million).

mg/L : Concentration in units of milligrams of analyte per liter of sample.

mL/L/hr : Milliliters per liter per hour.

MPN/100 mL : Most probable number of bacteria per one hundred milliliters of sample.

N/A : Not applicable.

NA : Not analyzed.

ND : Not detected; the analyte concentration is less than applicable listed reporting limit.

NR : Not requested.

NTU : Nephelometric turbidity units.

RPD : Relative percent difference, 100 [Value 1 - Value 2]/mean value.

SNA : Standard not available.

ug/Kg (ppb) : Concentration in units of micrograms of analyte per kilogram of sample, wet-weight basis (parts per billion).

ug/L : Concentration in units of micrograms of analyte per liter of sample.

umhos/cm : Micromhos per centimeter.

Method References

Methods 601 through 625: see "Guidelines Establishing Test Procedures for the Analysis of Pollutants" U.S. EPA, 40 CFR, Part 136, rev. 1988.

Methods 1000 through 9999: see "Test Methods for Evaluating Solid Waste", U.S. EPA SW-846, 3rd edition, 1986.

* Reporting Limits are a function of the dilution factor for any given sample. To obtain the actual reporting limits for this sample, multiply the stated reporting limits by the dilution factor.

KEY TO ABBREVIATIONS and METHOD REFERENCES

Abbreviations

mean : Average; sum of measurements divided by number of measurements.

mg/Kg (ppm) : Concentration in units of milligrams of analyte per kilogram of sample, wet-weight basis (parts per million).

mg/L : Concentration in units of milligrams of analyte per liter of sample.

mL/L/hr : Milliliters per liter per hour.

MPN/100 mL : Most probable number of bacteria per one hundred milliliters of sample.

N/A : Not applicable.

NA : Not analyzed.

ND : Not detected; the analyte concentration is less than applicable listed reporting limit.

NR : Not requested.

NTU : Nephelometric turbidity units.

RPD : Relative percent difference, 100 [Value 1 - Value 2]/mean value.

SNA : Standard not available.

ug/Kg (ppb) : Concentration in units of micrograms of analyte per kilogram of sample, wet-weight basis (parts per billion).

ug/L : Concentration in units of micrograms of analyte per liter of sample.

umhos/cm : Micromhos per centimeter.

1.0 INTRODUCTION

This plan presents the background, design basis, process description, operations plan, and monitoring schedule for a ground-water extraction and treatment system proposed for the former Herrick Corporation steel fabrication facility, 25450 Clawiter Road, Hayward, California (Plate 1). Ground water at this site contains elevated concentrations of several volatile petroleum hydrocarbons typical of gasoline. The proposed treatment system will pump extracted water through a microbial bioreactor and a carbon adsorption unit prior to reinjecting a portion of the treated water and discharging the remainder to a storm drain. The plan is submitted in support of an application to the California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB), for a National Pollution Discharge Elimination System (NPDES) permit.

1.1 Facility Description

As shown on Plates 1 and 2, the subject property is southwest of the intersection of Highways 880 and 92 on Clawiter Road in Hayward, California. The property consists of a triangular-shaped parcel that encompasses approximately 25 acres, bounded by Clawiter Road to the west, a Southern Pacific Railroad easement to the east, and a Gillig bus manufacturing facility to the south. Improvements to the site include an office building, four large fabrication work bays, a maintenance garage, and paved parking areas (Plate 2). The facility was formerly used for the modification of rolled steel shapes used in the construction of skyscrapers; it is no longer in use.

1.2 Site History and Previous Investigations

As part of the removal in 1986 of underground fuel storage tanks adjacent to the vehicle maintenance garage on the eastern boundary of the property (Plate 2), Herrick retained McKesson Environmental Services to assess the presence of petroleum hydrocarbons in soil and ground water in the vicinity of the tanks. Analysis of soil samples indicated values of total petroleum hydrocarbons (TPH) in excess of 1,000 parts per million (ppm). Results of analysis of ground-water samples collected from a monitoring well installed in excavation backfill indicated elevated TPH levels in at least one sample.

HLA conducted an environmental assessment of the property as part of a real estate transaction between the Koll Company of Pleasanton, California, and Herrick. The intent of HLA's work was to identify and assess potential or existing environmental concerns on the Herrick property or surrounding properties that could affect the transaction. As part of this assessment, previously identified concerns were investigated to determine their extent and to assess potential mitigation alternatives.

Results of HLA's environmental assessment are presented in the *Final Report, Environmental Assessment, Herrick Fabrication Facility, Hayward, California* (*HLA, 1989*). The report identified several areas of environmental concern on the property: 1) the presence of elevated concentrations of lead in surface and near-surface soil south and southeast of the fabrication bays (Plate 2), and 2) the presence of residual light fraction petroleum hydrocarbons in soil and ground water in the southeastern corner of the site, apparently originating from underground fuel storage tanks formerly located near the vehicle maintenance garage (Plate 2). This report and permit application describe the remediation proposed to address petroleum hydrocarbons in ground water in this latter area.

1.3 Environmental Setting

The project site is in a light industrial, partially developed area of Hayward (Plate 1). The nearest surface water body is the Alameda County Flood Control District (ACFCD) flood control channel, approximately 4,500 feet east of the site. Ground-water flow in the shallow aquifer on site is generally toward the southwest.

Treated effluent will be discharged to the City of Hayward storm sewer system, which flows west to the ACFCD channel, which in turn discharges to San Francisco Bay approximately 2.5 miles northeast of the site (Plate 1).

1.4 Regulatory Setting

Because of soil and ground-water contamination detected during removal of underground tanks from the site in 1986, the Herrick facility is included on the RWQCB fuel leaks list. The RWQCB has given the City of Hayward Fire Department oversight responsibilities for fuel leak cases in Hayward. HLA's implementation plan for remediation of soil and ground-water contamination at the site (*HLA, 1990*) has been submitted to the Fire Department for review.

This report is submitted in support of an application to the RWQCB for an NPDES permit for surface water discharge of treated ground water. The RWQCB has established effluent limitations for certain inorganic constituents and for several classes of organic constituents (e.g., phenols and polynuclear aromatic hydrocarbons) in discharges to surface water (*RWQCB, 1986*). Effluent limitations for benzene, toluene, ethylbenzene, and xylenes (BTEX), which have been detected in ground-water samples collected on site, have not been established by the RWQCB. Maximum contaminant levels (MCLs) for benzene, ethylbenzene, and xylenes in drinking water have been set by the California Department of Health Services (DHS) and the U.S. Environmental

Protection Agency (EPA) and are presented in Table 1. MCLs have not been established for toluene. DHS drinking water action levels for the four compounds are also represented in Table 1.

The discharge will also require the approval of the Alameda County Flood Control District (ACFCD) with regard to the ability of existing physical structures (e.g., storm drains and flood control channels) to accept the discharge.

2.0 GROUND-WATER REMEDIATION SYSTEM

The goal of the ground-water extraction, treatment and reinjection system is to reduce concentrations of petroleum hydrocarbons in ground water to acceptable levels. The principal components of the ground-water remediation system are ground-water extraction wells and pumps, a water collection piping system, a biological reactor, polishing carbon adsorption units, and a reinjection trench. The system is designed to reinject a portion of the treated effluent via a trench as a means of enhancing biological degradation of hydrocarbons in situ. The remaining portion of the effluent will be discharged to existing storm drains.

2.1 Treatment System Design Basis

The proposed ground-water treatment system design is based on the estimated distribution of petroleum hydrocarbons in ground water, flow rates derived from modeling the ground-water flow regime of the proposed injection/extraction system, estimated chemical concentrations in extracted water, and chemical removal calculations developed from laboratory bench-scale bioreactor studies.

Distribution of chemicals in ground water was estimated on the basis of results of analyses of ground-water samples from monitoring wells. Samples were collected on January 18, 1990, from eight wells in the vicinity of the former underground storage tank locations near Well CW-1 (Plate 3). Samples from Wells CW-1, MW-1, MW-5, MW-6, P-1, P-2, P-3, and P-4 (Plate 3) were analyzed for total petroleum hydrocarbons (TPH) as gasoline by EPA Test Method 5030, and for BTEX by EPA Test Method 602. Samples from Wells CW-1 and MW-5 were also analyzed for California Assessment Manual (CAM) metals. Analyses were performed by NET Pacific, Inc., a state-certified laboratory in Santa Rosa, California.

Samples collected February 16, 1989, from Wells CW-1, MW-1, MW-2, and MW-4 during previous site characterization activities (*HLA, 1989*) were analyzed for volatile and semivolatile organic compounds by EPA Test Methods 624 and 625. Samples were analyzed by NET Pacific, Inc.

Results of analysis of samples collected February 16, 1989, and January 18, 1990 are included in Appendix A.

Samples from Wells CW-1, P-2, P-4, and MW-5 showed benzene concentrations in excess of state or federal MCLs (Table 1). Concentrations of ethylbenzene, toluene, and xylenes also exceeded MCLs or action levels in the sample from Well MW-5.

Barium, a CAM metal, was detected in the samples from Wells CW-1 and MW-5. Concentrations were less than the applicable MCL of 1 milligram per liter (mg/l).

Analysis for volatile and semivolatile organics by EPA Test Methods 624 and 625 detected benzene and ethylbenzene at Well CW-1; no other volatile or semivolatile compounds were detected in the samples from the four wells.

Based on results of chemical analyses, concentrations of petroleum hydrocarbons in extracted water are estimated to have a maximum value of 10 milligrams/liter (mg/l) TPH, and an average value of 1 mg/l TPH.

Extraction well locations and pumping rates were selected on the basis of estimated hydrogeologic conditions, ground-water flow directions, and distribution of petroleum hydrocarbons in ground water. Ground-water flow is toward the southwest.

Extraction well pumping rates were estimated on the basis of available site hydrogeologic data and the results of analytical flow modeling conducted to evaluate the

proposed extraction system. Two models were developed: flow lines were estimated using the computer code CAPTURE (*Data Services, 1985*) and ground-water potentials were estimated using the code EQUIPLOT (*Data Services and HLA, 1986*). The modeling indicates that two wells, each pumping at 2 gpm, will capture the entire on-site chemical-bearing plume (Plate 4). The modeling included reinjection of approximately half (2 gpm) of the extracted water at an injection trench on the eastern boundary of the property near the former tank location. Results indicate that all injected water is within the capture area of the extraction wells and that injected water does not travel off site during passage from the injection trench to the extraction wells.

To allow for higher flow rates at early stages of pumping, and to account for uncertainties in the ground-water flow system, it is proposed to design the treatment system to accommodate flows up to 10 gpm.

2.2 Extraction Well and Collection System

Two wells, each pumping at 2 gallons per minute (gpm), are proposed to provide hydraulic control and capture of the ground-water plume. Each well will be designed for below-grade construction in a traffic-rated utility type vault. Pump controls and flowmeters located in each vault will include a flow totalizing meter and discharge pressure gauge.

The specific pump to be installed in each well will be sized on the basis of well yield determined when the well is installed. Pump controls will include a pump cycling control, a run-time indicator, and an automatic shutoff to the treatment system.

The piping system will be constructed using polyvinyl chloride (PVC) pipe. Preliminary pipe sizing is 2-inch I.D. Proposed locations of the extraction wells and collection and distribution system piping are shown on Plates 3 and 4.

2.3 Process Description and Control

The proposed treatment system includes three main components: (1) ground-water feed and pretreatment filters; (2) a bioreactor; and (3) carbon adsorption unit for effluent polishing. A process schematic for the treatment system is presented on Plate 5. The pretreatment system will consist of an equalization tank and a 100-micron (μm) strainer. The equalization tank will be used as a reservoir for water from the extraction collection system. Ground-water pumping rates may vary over time; the equalization tank will allow a relatively constant flow to the bioreactor. The strainer will remove particulates before ground water enters the treatment system.

The bioreactor unit will include a reactor tank, pH controls, a nutrient tank, metering pumps, and a blower. The bioreactor tank will be sized to provide a specified retention time, currently anticipated to be approximately 12 hours. Tank size will be selected based on results of a bench-scale bioreactor process study currently in progress. The blower will provide oxygen to the bioreactor. Metering pumps will automatically deliver inorganic nutrients to enhance microbial growth and provide pH control.

The treated ground water will pass through a sand filter to reduce the quantity of biomass prior to passage through the carbon polishing unit.

The effluent polishing system will include a bioreactor effluent pump, and primary and secondary liquid carbon adsorption units (modular prefabricated canister-type carbon units with inlet and outlet piping and forklift skid channels). Carbon usage will be minimal under normal conditions because it is anticipated that the chemical loading from the bioreactor will be low. Under normal conditions, it is estimated that carbon changeout may be required approximately once every 12 months.

2.4 Process Waste Streams

The only liquid process effluent from the system is treated water. Upon exiting the carbon units, the treated water is expected to contain BTEX concentrations less than applicable standards, and at most times, nondetectable levels of these constituents. Applicable federal and state water quality criteria for BTEX are listed in Table 1.

Solid wastes generated by the process include spent carbon, used filter elements, and sediment removed by the filters. Carbon partially or fully saturated with adsorbed hydrocarbons will be removed periodically from the site for regeneration by a carbon regeneration firm and replaced with fresh carbon. Sediment on used filter elements will be tested at the first filter change event for the presence of petroleum hydrocarbons. Sediment and filter elements will be properly disposed based on results of the initial laboratory analysis.

Should backwashing of a carbon vessel be necessary, backwash water will be directed to the influent equalization tank (Plate 4) for treatment prior to discharge.

2.5 Treated Water Injection, Discharge, and Outfall Locations

Reinjection of a portion of the treated ground water and discharge of the remaining portion to the local storm drain are the proposed options for disposal.

The disposal options were reviewed for consistency with the RWQCB policy for disposal of extracted ground water set forth in Resolution No. 88-160, *Regional Board Position on the Disposal of Extracted Ground Water from Ground-Water Cleanup Projects*, and is considered to be consistent with the policy. Options considered for disposal of the treated ground water included: discharge to surface water, injection, discharge to the local publicly-owned treatment works (POTW), and agricultural use.

It is proposed to reinject approximately one-half of the treated water, primarily as a means of enhancing microbial growth in situ and thus accelerating the rate of ground-water cleanup.

The local POTW, the City of Hayward Department of Public Works, was contacted about discharge of the effluent from the treatment system to the sanitary sewer. In a letter dated March 1, 1990, from Mr. Joseph Lucia, Senior Wastewater Source Control Inspector for the City of Hayward, to David Leland of HLA, HLA was informed that the city does not accept discharges from ground-water treatment systems. The letter is included as Appendix B.

Letters have been sent to neighboring property owners and other potential users including the City of Hayward and Caltrans informing them of the availability of treated ground water. No agricultural uses in the vicinity of the site have been identified.

As described previously, the treated effluent will be discharged to the city storm drain. The drain flows to the west into an ACFCD flood control channel. The channel flows to the north and west and ultimately discharges to San Francisco Bay at a point approximately 1 mile north of Johnson Landing (Plate 1).

3.0 TREATMENT SYSTEM OPERATIONS PLAN

3.1 Monitoring

The monitoring schedule for the treatment system is presented in Table 2. Samples will be collected according to this schedule from the bioreactor influent, bioreactor effluent, a sampling port placed between the carbon units, and discharge effluent. On Plate 5, the sampling location for influent to the bioreactor is designated "Sample Port S-1," the bioreactor effluent sampling location is designated "Sample Port S-2," the intermediate carbon units sampling location is designated "Sample Port S-3," and the system effluent sampling location is designated "Sample Port S-4."

Samples will be analyzed for petroleum hydrocarbons by EPA Test Methods 5030 and 602. An initial round of influent and effluent samples will be analyzed for priority pollutant metals, total suspended solids (TSS), and chemical oxygen demand (COD).

3.2 Startup Procedures

Treatment plant effluent will be sampled approximately 2 hours and 8 hours after initial system startup, and daily for 4 days thereafter. The effluent will be analyzed for petroleum hydrocarbons by EPA Test Methods 5030 and 602 on a 24-hour turnaround basis.

To ensure that the system is functioning properly and meeting effluent limits, the system will be shut down after 8 hours of operation and the effluent stored on site until analytical results from the first round of samples are received.

If initial analytical results during startup show levels of constituents in excess of effluent limits, the system will be shut down until any performance problems are identified and corrected.

After startup is complete, monthly sampling of the system and quarterly reporting of results are proposed.

3.3 Responses to Effluent Limit Exceedences

The following features have been incorporated into the treatment system to maintain discharge concentrations within applicable limits. These features include design measures to prevent exceedences from occurring and provisions in the event that exceedences are detected.

- Series Treatment Modules. The system incorporates two carbon treatment modules, arranged in series. Should any hydrocarbons pass the first module, the second module will always be on line to adsorb them prior to discharge. Samples will be collected from a sampling location between modules to identify the occurrence of breakthrough from the lead module.

- Backwash. Carbon vessels will be backwashed as necessary to minimize flow channeling and consequent short-circuiting of water contact with the carbon.

- Carbon Changeout. In the event that sampling data indicate exhaustion of the adsorption capacity of the carbon, the lead module of carbon vessels will be changed, and flow through the modules will be reversed.

Subject: Analytical Results for Five Water Samples Identified as "Koll Property" Received 02-17-89.

Dear Mr. Dunn:

Analysis of the samples referenced above has been completed. This report is written in confirmation of results telefaxed on Marach 3, 1989. Results are presented on the following pages.

Please feel welcome to contact us should you have questions regarding procedures or results.

KEY TO ABBREVIATIONS

mean	:	Average; the sum of the measurements divided by the total number of measurments.
mg/Kg (ppm)	:	Concentration in units of milligrams of analyte per kilogram of sample, wet-weight basis (parts per million).
mg/L	:	Concentration in units of milligrams of analyte per liter of sample, unless noted otherwise.
mL/L/hr	:	Milliliters per liter per hour.
MPN/100 mL	:	Most probable number of bacteria per one hundred milliliters of sample.
N/A	:	Not applicable.
NA	:	Not analyzed; see cover letter for details.
ND	:	Not detected; the analyte concentration is less than the listed reporting limit.
NR	:	Not requested.
NTU	:	Nephelometric turbidity units.
RL	:	Reporting limit.
RPD	:	Relative percent difference, $[V^1-V^2/V$ mean$]$x100.
SNA	:	Standard not available.
ug/Kg (ppb)	:	Concentration in units of micrograms of analyte per kilogram of sample, wet-weight basis (parts per billion).
ug/L	:	Concentration in units of micrograms of analyte per liter of sample.
ug/filter	:	Concentration in units of micrograms of analyte per filter.
umhos/cm	:	Micromhos per centimeter.
*	:	See cover letter for details.

RESPONSE FROM CITY OF HAYWARD TO REQUEST FOR PERMISSION TO DISCHARGE TREATED GROUND WATER

CITY OF HAYWARD. DEPT. OF PUBLIC WORKS

22300 FOOTHILL BOULEVARD, HAYWARD, CA 94541 • (415) 581-2345

HEARING IMPAIRED . TDD 537-7593

March 1, 1990

Mr. David Leland
Harding Lawson Associates
Post Office Box 578
Novato, California 94948

Dear Mr. Leland:

In response to your letter of February 9, 1990 regarding treated groundwater discharge from the former Herrick fabrication facility at 25450 Clawiter Road, this letter is to inform you that the City of Hayward does not currently permit the discharge into the wastewater collection/treatment system of treated or untreated groundwater from contaminated site remediation projects.

The primary reason for this policy is that our current NPDES permitted capacity is insufficient to provide both for moderate growth of the City and for groundwater discharges, especially considering the potential for relatively long-term and numerous remediation projects. Secondarily, Section 2.02 of our Wastewater Discharge Regulations prohibits our acceptance of groundwater except in circumstances where no reasonable alternative exists.

Although it will not be of help to you in this case, we would like to take this opportunity to make you aware of the fact that we do permit, on a case-by-case basis, the discharge of treated and/or untreated ground- water generated in the course of site evaluation work (well purgings, etc.) or very short term construction. In these cases, the discharge term and volume does not currently compromise our reserve capacity and no contravention of the provisions of Section 2.02 occurs since we do not consider, in these circumstances, that NPDES permitting or off-hauling are reasonable alternatives.

We are sorry that we are unable to be of assistance to you or your client. However, if you have questions or require assistance in the future, please feel free to call on us.

Sincerely,

Joseph A. Lucia
Senior Wastewater Source
Control Inspector

Region: 2

Document: LETTER TO ALAMEDA CNTY PLUS ATTACHMENTS
Document From: CITY OF HAYWARD FIRE DEPT.
To: ED HOWELL - ALAMEDA CNTY CC's: DICK JONES - DHS
CC's:
Date staff recv'd: OCT. 25, 1990
Proposed staff action: PEA - LOW

Responsible Party: HERRICK CORPORATION

ResponseType/Date:

Site Summary: THE SITE HAS LEAD CONTAMINATION RESULTING FROM A SPRAY PAINT OPERATION. LEAD LEVELS FOUND ONSITE RANGE FROM 110 PPM TO 28,000 PPM. THE CONTAMINATED SOIL WAS REMOVED TO LEVELS BELOW 1000 PPM, THE CONSULTING FIRM ASSUMED THAT SINCE THIS LEVEL IS BELOW THE TTLC, THE SITE WOULD NO LONGER BE HAZARDOUS. THE CITY OF HAYWARD FIRE DEPT. DOES NOT APPROVE OF THIS REMOVAL ACTION. ELEVATED LEAD LEVELS JUST BELOW THE TTLC MAY STILL POSE ENVIRONMENTAL AND HEALTH HAZARDS. THE FACILITY HAS CHOSEN THE OPTION TO REMOVE THE CONTAMINATED SOIL TO BACKGROUND LEVELS. BACKGROUND LEVELS OF TOTAL LEAD IN SOILS IN THE SITE VICINITY RANGE FROM 410 PPM TO 610 PPM. THE REGULATORY AGENCIES AND FACILITY HAVE AGREED TO A CLEAN-UP LEVEL OF 600 PPM, ENCAPSULATION AND NOTICE IN DEED.

Recommendation:
PEA - LOW

Subject: Lead Contamination from Spray Painting Operation at Herrick Corporation, 25450 Clawiter Road, Hayward.

Dear Ed:

This letter is to confirm our telephone conversation regarding a request for assistance in determining whether the level of lead to remain in place at the subject location would pose a threat to human or environmental health.

Background:

Lead contamination was discovered during a site assessment conducted on the subject site and was attributed by Herrick Corporation's consultants to a spray painting operation that occurred during the lifetime of the facility. The site assessment was conducted in response to a property sale to a developer who will be constructing an industrial park. In this assessment, the levels of lead on the subject site ranged from 110 ppm to 28,000 ppm (see attachment A). The company who did the assessment removed soil to levels below 1000 ppm assuming that this level was considered non-hazardous. Soil samples were taken by the consultant to confirm lead levels were below 1000 ppm (see attachment B).

The criteria used for determining clean up level at that time was Section 22-66699 (a)(2) of the California Code of Regulation (Persistent and Bioaccumulative Toxic Substance). It was determined by this department that the criteria used was not appropriate since it only focused on whether the material was a hazardous waste and not that it was a threat to humans, the environment, or the groundwater resource. Additionally, if the noted section was to be considered only under the criteria of a hazardous waste, the Soluble Threshold Limit Concentration (S.T.L.C.) should have been considered as indicated in Section 22-66699 (a)(1). As a result of this information and discussions with representatives from your department, the Department of Health Services (DOHS), and the Regional Water Quality Control Board (RWQCB) staff, I sent a letter to Herrick Corporation outlining three options for sufficiency of the clean up (see attachment 'C).

In response to my letter, Herrick Corporation chose Option 1 in which they would clean up lead contamination to background levels in the area. Herrick's consultant, DECON Environmental Services, obtained two soil samples from the excavation and did analysis to determine the solubility

of the lead remaining in the soil. Based upon these results and RWQCB staff has verbally communicated to me that the levels of soluble lead are not an issue to groundwater as a resource. In addition, DECON Environmental has taken samples from areas off the subject site and analyzed them for total lead. Soil sample results indicated a range between 410 ppm and 610 ppm in the immediate off site area. DECON Environmental has determined and presented in the attached proposal that a clean up level of 600 ppm is adequate to bring levels of lead on the property to those that are occurring in background soils in the area. A certified engineering geologist hired by DECON Environmental has reviewed their work and has supplied a cover letter of that review (see attachment D).

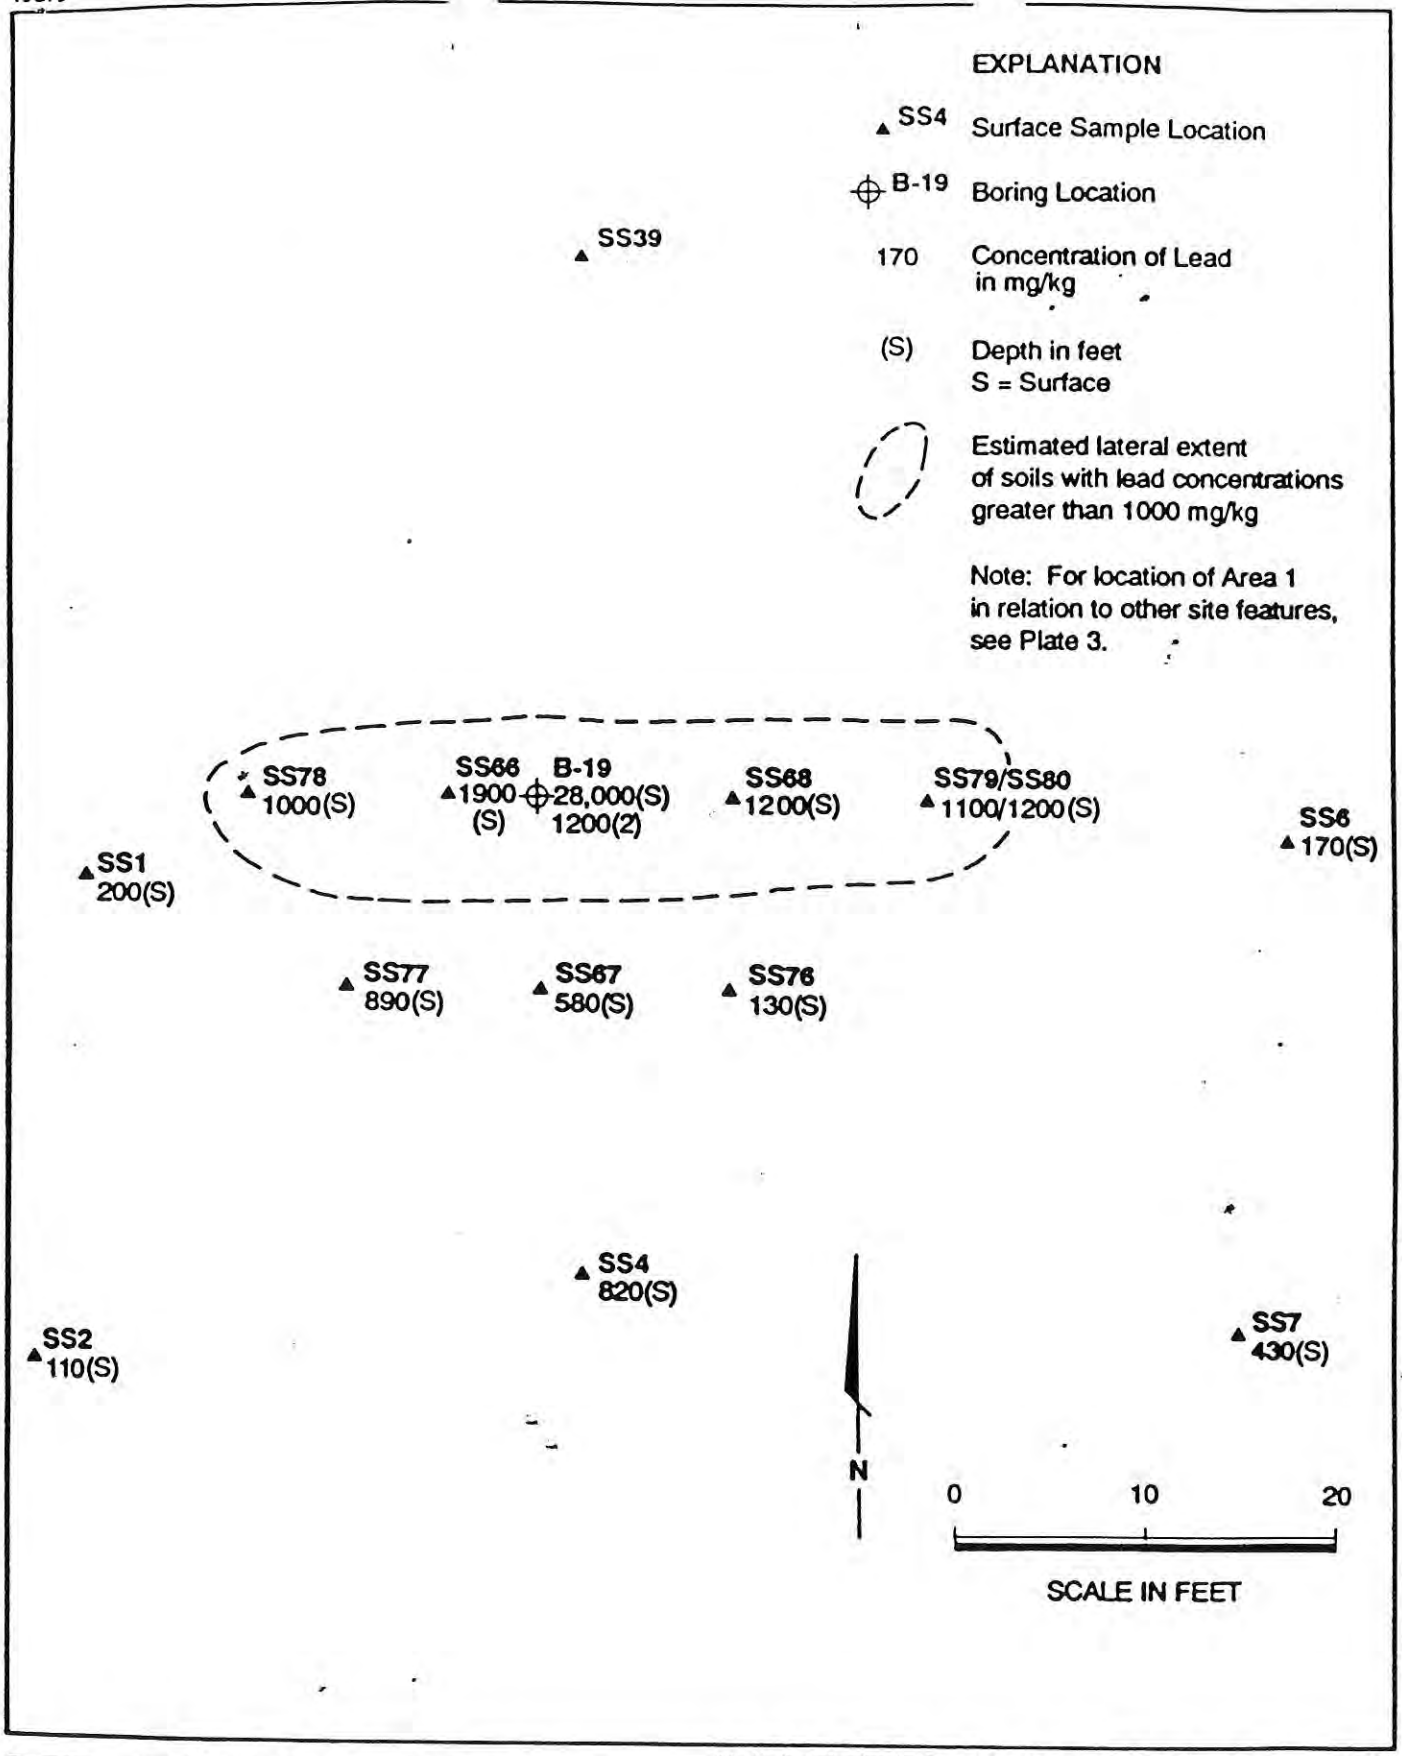
Request:

I am requesting a review of DECON Environmental's Proposal and the attached information. Specifically, I am requesting a written response from your agency's review that states whether a threat to public health or the environment would exist at the Herrick Property if contamination was cleaned up to background levels of 600 ppm as indicated in research and interpretation done by DECON Environmental and ENGEO. Additionally, I would like to know whether any conditions should be set on the work to be performed or on the development of the land once lead levels have been reduced to 600 ppm. (Please note: the area is currently zoned industrial and the property is to be developed into an industrial park.)

If I can be of assistance, please feel free to give me a call at 784-8695.

Sincerely,

for



Hugh Murphy
Environmental Specialist

CITY OF HAYWARD · FIRE DEPARTMENT

June 19, 1990

Mr. Roger Schwaub
Herrick Corporation
P.O. Box 3007
Hayward, CA 94540

Dear Mr. Schwaub:

Subject: Herrick Contamination Case (Lead) - 25450 Clawiter Road

This letter constitutes a response, from the City of Hayward and Alameda County Health Care Services Agency, to your request to obtain an official closure for lead contamination at your site. At the end of last month we met and consulted with the Department of Health Services on your case. It was concluded that;

- the level of 1000 ppm of lead contamination in soil used by your consultant was not acceptable as a cleanup level for your site. 1000 ppm is a level which is set in Title 22 of the California Code of Regulations as the point at which this material is defined as a hazardous waste; it does not define a material as being nonhazardous to the environment or human health. These levels do not exist in the case of pollution of the environment, instead the level of contamination cleanup must be set to the normal background levels found in the area or if background levels cannot be attained through some limitation, then the level will be set through an approved risk assessment or Preliminary Endangerment Assessment.

- Additionally, it was concluded that Herrick's Consultant has not yet ascertained whether a threat to groundwater exists from lead found in the soil. No analysis has been conducted to determine whether the nature of the lead contaminants is mobile or whether it has been bound to the soil. This investigation must include a determination of whether groundwater has been impacted and whether the lead has the potential of leaching into surface or groundwater. This determination can be done by surveying water from on-site wells and using a leachability test approved by the Regional Water Quality Control Board and the Department of Health Services.

As a further result of this meeting and our conversation, I have summarized three acceptable alternatives to determining cleanup levels for lead contamination at Herrick's property on 25450 Clawiter Road. These alternatives are based on conversations with the Alameda County Health

Care Services Agency, the Department of Health Services, and the Regional Water Quality Control Board.

Please note: The agencies encourage complete investigations and remediation of contaminated areas. Any risk which results from insufficiant investigation shall continue to be the responsiblity of the property owner and/or developer.

Option 1

- Cleanup lead contamination to natural background levels. In reviewing the contention that native background levels of lead have been obtained, it is the consensus of all the above agencies that it is unlikely that those have been obtained due to decreasing levels of contamination away from indicated sources and the uncontrolled nature of the release activity. To determine the native background level of lead, off site sampling must be conducted in undisturbed areas. Determination of whether groundwater has been impacted is a part of this cleanup requirement. The City of Hayward will act to facilitate the requirements for this option.

Option 2

- If native background levels of lead cannot be attained due to financial or technical limitations, then a risk assessment should be done by a qualified individual which reviews the health and environmental impacts of the contaminants. The assessment must be made in conjunction with the proposed use of the property and any construction or other related activities which may expose people or the environment to the contamination. This risk assessment must be submitted to and approved by the Department of Health Services' agent, the Alameda County Health Care Services Agency, as well as the City of Hayward Fire Department. A portion of this risk assessment must include a review of possible impact to groundwater from lead. If there is any potential or actual impact to groundwater, Herrick will need to work with the City of Hayward to meet requirements of the RWQCB.

Option 3

- In this option, the Herrick Corporation may work directly with the Department of Health Services (DOHS) to prepare a Preliminary Endangerment Assessment (PEA). In this process the DOHS, will give several hours of free screening to Herrick Corporation after which a non refundable reviewing fee of $7500 must be submitted to the DOHS. The City and County must be kept informed and be copied all reports, letters and other correspondence by Herrick and the DOHS. A portion of the PEA must include a review of potential impact to groundwater. If there is any impact to groundwater, Herrick will need to work with the City of Hayward to meet requirements of the RWQCB.

If you have any questions or would like to set up a meeting regarding the content of this letter, please contact me at 784-8695.

Sincerely,

Hugh Murphy
Environmental Specialist

Hayward, CA 94545

Attention: Mr. Chris Kwoka

Subject: Herrick Facility - 25450 Clawiter Road, Hayward, California

REVIEW OF PROPOSED APPROACH TO SITE REMEDIATION

Reference: DECON Environmental Services letter to Hugh Murphy, Environmental Specialist, City of Hayward dated September 7, 1990.

Gentlemen:

As requested we reviewed the referenced letter regarding the proposed approach for remediation of the lead contaminated soil at the Herrick facility, 25450 Clawiter Road in Hayward, California. Our purpose was to determine if the recommendations were in compliance with the standard of practice for environmental consultants in the San Francisco Bay Area.

Lead contaminated soil has been identified at the subject property. Soils with lead concentrations in excess of 1,000 ppm have been excavated and removed to a Class I disposal facility.

Background levels of total lead in soils in the site vicinity were found to range from 410 to 610 ppm. Laboratory testing of these soil samples by the Cal WET Method found soluble lead concentrations on the order of 0.046 ppm and 0.072 ppm, respectively. A cleanup level of 600 ppm is proposed for the soils remaining on the subject parcel.

Soils with lead concentrations between 600 and 1,000 ppm will be excavated and transported to an appropriate disposal facility by DECON Environmental Services. The soils not excavated will be sampled and tested to confirm that the total lead concentrations are less than 600 ppm.

Based on our review of the referenced letter the proposed work plan appears to be in general compliance with the standard of practice for environmental consultants working in the Bay Area.

Very truly yours,

ENGEO INCORPORATED

Brian Flaherty, CEG 1256

Mr. Hugh Murphy
Environmental Specialist
City of Hayward - Hazardous Materials Group
22300 Foothill Blvd.
Hayward, CA 94541

Dear Mr. Murphy:

This letter summarizes our proposed approach for final remediation of lead-contaminated soil at the Herrick facility, 25450 Clawiter Road, Hayward, California. We have elected to pursue Option 1, cleanup of lead to natural background levels, as defined in your letter to Herrick dated June 19, 1990.

Please call me if you have any questions regarding this letter or other aspects of the Herrick project.

We would appreciate your assistance on this project and look forward to a quick resolution of the lead-contamination issue.

Sincerely,

Bruce Jacobsen

1.0 Executive Summary

We plan to remediate the lead contamination present in the surface soils at this facility to natural background levels. Our rationale for this remediation program is as follows:

- As summarized in Harding Lawson Associates' letter report dated May 18, all soil with concentrations of lead greater than 1,000 ppm has already been excavated and transported to the Class I disposal facility at Kettleman Hills, California;

- Two samples were collected from areas known to contain 600 to 800 ppm total lead and were analyzed for soluble lead by the Cal WET method. The concentrations of soluble lead were 0.046 and 0.072 ppm, which is well within established guidelines for soluble lead in a solid matrix;

- Two background samples were collected from surface soils in the vicinity of the Herrick property and were found to contain 410 and 610 ppm of total lead. Based on these results, we propose to establish the cleanup level at 600 ppm of total lead for this project;

- DECON will excavate and transport soil containing 600 to 1,000 ppm of total lead to an appropriate disposal facility;

- The remaining soil in the excavated areas will be sampled and analyzed to confirm that the total lead concentrations are less than 600 ppm;

- A project summary report will be submitted to Herrick and the Hayward Fire Department Hazardous Materials Group upon completion of the final lead remediation activities at this site.

2.0 Background

The Herrick facility on Clawiter Road has been the subject of remedial investigation and site remediation activities associated with the closure of manufacturing operations and proposed sale of the property. Based on a review of the unit manufacturing operations conducted at this site, Herrick's consultant (Harding Lawson Associates) sampled the surface soils throughout the facility for total lead.

As described in their report dated May 18, 1990 soil containing lead at concentrations greater than 1,000 ppm was excavated and transported to a Class I disposal facility. This soil was found in two "hot spots" associated with former painting operations at the facility.

The soil remaining in the vicinity of the two hot spots excavated under HLA's direction contains lead at concentrations ranging from 200 to just under 1,000 ppm. In addition, there are several other sampling locations that were found to have lead at similar concentrations in the surface soils. The presence of lead at these locations does not correspond to any manufacturing operations conducted at the facility. Herrick has proposed (in their letter of April 11, 1990) that these be considered natural background levels and that all soil containing lead at concentrations less than 1,000 ppm be allowed to remain in place.

In your letter to Herrick dated June 19, you indicated that this was insufficient justification for considering the lead remediation to be complete. This letter describes additional work performed by DECON Environmental to establish a cleanup level as well as our proposed approach for completing the lead remediation at the Herrick facility.

3.0 Lead Cleanup Level Determination

In order to establish a cleanup level for lead at this facility, DECON collected background samples from two locations adjacent to Herrick's property. These samples were collected from surface soils near the intersections of Clawiter at Depot and Clawiter at Highway 92 (see figure 1). Analysis of these two samples revealed total lead concentrations of 410 and 610 ppm, respectively. The Certificates of Analysis and Chain of Custody forms for these samples are attached to this report (Appendix A).

Based on the fact that two random samples of surface soils in the vicinity have lead concentrations ranging up to 600 ppm, we propose that the cleanup standard for lead at the Herrick facility be set at 600 ppm for total lead.

4.0 Soluble Lead Concentrations

In order to determine the potential for migration of the lead present in the surface soils, DECON measured the soluble lead concentrations in two soil samples known to contain 600 to 800 ppm of total lead. These were found to contain 0.046 ppm and 0.072 ppm of soluble lead, respectively, based on analysis by the Cal WET Method. The Certificates of Analysis and Chain of Custody forms for these samples are attached (Appendix B).

The soluble fraction of the lead remaining in surface soils at Herrick's facility represents less than 0.1% of the total lead present. The concentrations present in these two samples are well within all established guidelines for soluble lead in soil, both in terms of potential exposure as well as groundwater protection.

These results further substantiate the argument for establishing a lead cleanup level at 600 ppm, since the soluble fraction of this lead will not present a health hazard or impact groundwater beneath the site.

5.0 Proposed Remediation for Lead-Contaminated Soil

DECON Environmental proposes to excavate the surface and near-surface soils at Herrick's facility which contain lead at concentrations between 600 and 1,000 ppm (see Figure 2). This soil will then be transported to an appropriate disposal facility. We plan to use Forward Landfill in Stockton as the receiving facility for this soil since it meets their acceptance criteria for both total and soluble lead concentrations (1,000 ppm and 0.5 ppm, respectively).

Confirmation samples will be collected from the bottom and sidewalls of each excavated area and analyzed for total lead.

If any of these samples contain more than 600 ppm of total lead, additional soil will be excavated until this cleanup standard has been achieved.

RE: CLOSURE CERTIFICATION REQUEST, HERRICK STEEL

Dear Mr. Duazo:

On behalf of Herrick Steel Corporation, DECON Environmental Services, Inc. is requesting closure certification for the gasoline hydrocarbon groundwater remediation system at their former Hayward Fabrication Facility. As documented in the accompanying summary report, gasoline hydrocarbon remediation is complete. Influent groundwater BTEX concentrations have been below drinking water standards for over one year. Gasoline hydrocarbons have been below (one value slightly above) for essentially one year. Groundwater from all peripheral monitoring wells have been below these limits since completion of soil remediation and most of the monitoring wells have been below the indicated limits for over one year.

Please call me if you have any questions regarding this report or other aspects of the project.

Sincerely,

Bruce Jacobsen

GROUNDWATER REMEDIATION
SUMMARY REPORT
TO ACCOMPANY
REQUEST FOR CLOSURE CERTIFICATION
GROUNDWATER REMEDIATION
FORMER HAYWARD FABRICATION FACILITY
HERRICK STEEL CORPORATION

For ease of review this summary report is formatted according to the applicable portions of the "Attachment" to an April, 1992 memorandum from the California Regional Water Quality Control Board - San Francisco Bay Region (RWQCB) to the Alameda County, Health Care Services Agency, Hazardous Materials Program staff. The attachment title is "Proposed Contents of Letter of Recommendation for UST Case Closure (not applicable to Case 2 Type)).

1.0 Introduction

This summary report is presented in support of the Request of Closure Certification for gasoline contaminated groundwater remediation at the former Hayward Fabrication Facility of the Herrick Steel Corporation (Herrick) located at 25450 Clawiter Road in Hayward, California. On behalf of Herrick Corporation, DECON Environmental Services, Inc. has been conducting remediation of gasoline in groundwater since December 21, 1990.

2.0 Site Description

The former Herrick steel fabrication facility (Herrick) is located about 1.5 miles southwest of the intersection of State Highways 880 and 92 (Figure 1). The property is 25 acres in extent and is triangular shaped with one apex pointing north (Figure 2). The northeastern property line is bounded by a Southern Pacific Railroad easement. The south property line is shared with Gillig Corporation, a bus manufacturer. The western property boundary is formed by Clawiter Road, from which the property is accessed. The portion of the property in which the groundwater remediation has been occurring is restricted to the southernmost third (Figure 3).

The former facility features included a vehicle maintenance garage that included underground fuel tanks. This garage and the tanks were located along the southernmost third of northeastern property line (Figure 2). Leaks associated with the underground fuel storage and distribution system was the source of petroleum hydrocarbons in soil (remediation completed and addressed elsewhere) and in groundwater (remediated and the subject if this Site Cleanup Certification Request).

3.0 Previous Work

In addition to DECON, several corporate entities have performed consulting and related services at the Herrick property. This summary report incorporates, to the extent possible, information from these earlier investigations. The earlier investigations include:

11-26-90	ENGEO Incorporated (ENGEO, 1990) Limited Subsurface Investigation
10-01-90	DECON Environmental Services, Inc. (DECON, 1990) Work Plan for Ground Water Remediation
01-15-90	Harding-Lawson Associates (HLA, 1990) Pre-Remediation Investigation, Feasibility Study and Implementation Plan
Mar. 1989	Harding-Lawson Associates (HLA, 1989) Exact date uncertain. Final Report Environmental Assessment, Not reviewed, referenced in HLA, 1990.
08/16/89	Applied Soil Mechanics, Inc. (ASMI, 1989) Soil Investigation and Pavement Design.
Pre-1989	McKesson Environmental Services, Inc. (MES, 1989) Not reviewed, referenced in HLA, 1990

HLA (1990) identified the presence of residual light-fraction petroleum hydrocarbons in soil and groundwater near the location of former underground fuel storage tanks as an area of environmental concern.

According to HLA, 1990, as a part of the removal of the underground fuel storage tanks, Herrick retained McKesson Environmental Services to assess the presence of gasoline in soil and groundwater in the vicinity of the tanks. The McKesson report (not reviewed), the two HLA reports (only 01-15-90 report reviewed), and the ENGEO report identified the distribution of soil contamination by petroleum hydrocarbons. This soil hydrocarbon contamination has been remediated, through excavation and aeration (see Figure 2 for location of soil excavation areas). Site closure with respect to former soil hydrocarbon contamination is not the focus of this summary report. These investigations also identified the distribution of groundwater hydrocarbon contamination which is being remediated and is the subject of this summary report.

ok but need to be done for case closure

4.0 Investigative Methods

This report is a summary report. The investigations that are being summarized (Section 3.0) all generated reports. The individual investigation reports discussed or otherwise mentioned, their investigative methods. In addition, each investigation is required

to have been conducted following approval of a work plan, wherein the proposed investigative methods were set forth. Therefore, the investigative methods of the several previous investigators are not reviewed here.

5.0 Extent of Hydrocarbon Presence in (Soil and) Groundwater

5.1 Hydrocarbons in Soil

This report is prepared to support the closure of a groundwater remediation system. The former presence of hydrocarbons in soil was addressed in the reports listed in Section 3.0. Accordingly, a table listing results of analyses of soil samples is not provided.

5.2 Hydrocarbons in Groundwater

5.2.1 Floating Product

Floating product was not reported, or cross referenced from earlier reports, in HLA, 1990 or in ENGEO, 1990. DECON has not observed the presence of floating product.

5.2.2 Dissolved Hydrocarbons

Table 1 provides a listing of the cumulative results of analysis of groundwater samples for hydrocarbons from monitoring wells and extraction wells. Table 1 includes analyses for gasoline (also referred to as light-fraction, or total purgable, petroleum hydrocarbons, (TPH-G), and the gasoline derived aromatic hydrocarbons benzene (B), ethylbenzene (E), toluene (T), and total xylene isomers (X), all four of which are collectively referred to as BTEX.

Monitoring well MW-1 has been sampled on three occasions (Table 1) and was below the laboratory detection limit on each occasion.

Monitoring well P-1 has been sampled on seven occasions during the last three years (Table 1). The May 1991 sample contained 0.36 ug/L benzene, well below the Tri-Regional Guidelines Practical Quantitation Reporting Limit (PQRL) of 0.5 ug/L (only 0.06 ug/L above the laboratory sample detection limit). This concentration is only about one third of the California Primary Maximum Contaminant Level (MCL) of 1.0 ug/L. The mean benzene concentration at well P-1 has been only 0.22 ug/L, well below all published regulatory thresholds.

Hydrocarbon concentrations in well MW-5 were persistently high prior to remediation of the soil adjacent to the monitoring well. During soil remediation, monitoring well MW-5 was excavated out of existence and was replaced with extraction well EW-2. The concentrations of hydrocarbons in groundwater at this locality diminished considerably following soil remediation. The gasoline hydrocarbon concentrations in groundwater from well EW-2 have been below the applicable PQRLs and other published regulatory thresholds.

Hydrocarbons at monitoring well MW-6 have generally reflected a declining concentration over the last three years. The mean benzene concentration has been 0.64 ug/L, which is below the State MCL of 1.0 ug/L. The TPH-G concentrations have been below the Tri-Regional Guidelines PQRL of 50 ug/L for the last two years. All of the gasoline petroleum hydrocarbons have been below the applicable detection limits over the last two and one half years.

Hydrocarbon concentrations from extraction well EW-1 are discussed in Section 8.2.

6.0 Hydrology

6.1 Regional Hydrogeology

The Herrick site is located on the San Lorenzo alluvial cone, a groundwater producing area that, in conjunction with the San Leandro cone, covers about 50 square miles of the bayward-sloping alluvial plain in Alameda County known as the Bay Plain. The cones consist of coalescing alluvial fans whose deposits, in general, are derived from the drainage basins of San Leandro and San Lorenzo Creeks.

The aquifer sequence in the San Leandro and San Lorenzo cones contain water-bearing deposits to a depth of 400 feet, with deeper aquifers below that. The aquifers consist of discontinuous beds of sand and gravel which extend westward under San Francisco Bay and are capped by confining clay layers. The lower zone, which occurs below a depth of 400 feet, contains considerably more water-bearing deposits than the upper zone.

Recharge to the aquifers is from percolation of streamflow, primarily from hills to the east, and groundwater leakage through the confining clay bed. Recharge to the shallowest aquifer is through local streams, ditches, sewers, and possibly some upward leakage from deeper aquifers.

6.2 Local Hydrogeology

Groundwater was encountered at depths ranging from 10 to 14 feet below ground surface in the investigations listed in Section 3.0. Above the depth of first encountered groundwater, clays and silty clays with some silts occur from a depth of about 1 to 3 feet to a depth of about 20 feet, which is below the depth of first encountered groundwater. Artificial fill occurs above a depth of from 1 to 3 feet.

Below the clay to silty clay with some silt unit lies a unit with more sands and silts with some clays and silty clays. This very heterogeneous unit ranges in depth from about 12 to 20 feet beneath the ground surface. Another clay and silty clay dominated unit underlies the heterogeneous sand and silt unit.

6.3 Groundwater Gradient

Table 2 lists cumulative results of groundwater elevation and flow direction. In all of these instances the groundwater flow direction has been south-southwest to west-southwest in orientation and the gradient has ranged from 0.0022 to 0.0038 vertical feet/ horizontal foot.

6.4 Seasonal Variations of Groundwater

Groundwater levels have been measured in the winter (02/16/89, 01/15/92), in the late spring (06/19/89), and in the mid-summer (08/21/89). The groundwater flow direction was southwesterly in each season.

6.5 Aquifer Characteristics

During geotechnical investigation reported by ASMI (1989) boreholes encountered groundwater at a depth ranging from 9.5 to 16.5 feet. The depth to groundwater was later measured and found not to have changed. Investigation performed by HLA (1990) first encountered groundwater within a silty sand to sand unit that occurs at the approximate depth of the first static water level measurement. The boreholes and monitoring well installed by ENGEO (1992) also generally encountered first groundwater within a silty sand to clayey sand unit. These conditions indicate that the first aquifer occurs under unconfined to partially confined conditions.

Aquifer hydraulic characterization tests were performed by Harding-Lawson Associates and are reported in HLA, 1990, Table 3. Single well hydraulic conductivity (slug) tests yielded results ranging from 31 to 49 feet/day. Multiple well hydraulic conductivity (pump) test results ranged from 2.6 to 488 feet/day. The reported range of hydraulic conductivities also is indicative of the heterogeneous nature of the shallow aquifer.

7.0 Beneficial Uses of Groundwater Water

7.1 Well Inventory

A well inventory of Section 31 of Township 3 South, Range 2 West Mount Diablo Base & Meridian was obtained from ZONE 7 of the Alameda County Flood Control and Water Conservation District. This well inventory is contained in Appendix B. The Herrick property is in the northeast 1/4 of the northeast 1/4 of Section 31. This 40 acre subdivision of Section 31 is designated as "A" in the well inventory numbering system. This Public Land Survey section includes downgradient and crossgradient properties within one half mile of the Herrick property. There are 11 wells within about one half mile in Section 31 listed as domestic, irrigation, or industrial wells. These 11 wells are listed in Table 3.

TABLE 3

Wells Within One Half Mile Radius
(in the downgradient and crossgradient directions)

3S/2W 31L02	Eden Landing & W Jackson	----	-------	Domestic
3S/2W 31L80	3871 Breakwater Drive	1972	-------	Domestic

Well inventories were not requested for Sections 29, 30, and 32 because the groundwater flow direction has been consistently to the southwest and because the groundwater contaminant plume is confined to the Herrick property and lies to the southwest of the tank location.

7.2 Contaminant Fate Transport

Harding Lawson Associates determined the appropriate downgradient location for installing three groundwater extraction wells in a linear array. The number and locations of these wells were determined using aquifer hydraulic conductivity data, groundwater hydraulic gradients, saturated thickness information, and the known distribution of dissolved hydrocarbon contaminants. HLA verified the suitability of the well locations using the groundwater flow computer code CAPTURE to determine flowlines and to delineate capture areas associated with the extraction wells. DECON substituted a groundwater interceptor trench and extraction sump (extraction well EW-1) to accommodate aquifer heterogeneities.

7.3 Sources of Drinking Water Policy Determination

The Herrick property is located in the City of Hayward which is fully serviced by a municipal water system. In a fully serviced area the use of groundwater as a drinking water supply by individuals is not required. The California Department of Health Services administers drinking water policy encoded in the California Code of Regulations, Title 22, Division 4, Chapters 15, 16, and 17. The use of private domestic wells is an individual choice, with health standards administered by the Alameda County Health Care Services Agency.

According to RWQCB Order No. 91-056, NPDES No. CA0029815 - "Drinking water areas are defined as surface waters used for municipal and domestic supply; they also include groundwater recharge areas....". The NPDES discharge authorization letter for the Herrick groundwater treatment system; File No. 2199.9275(JMJ), dated September 27, 1991, defines the discharge "effluent limitations as appropriate to a non-drinking water area".

As indicated in Section 6.1 recharge to the shallowest aquifer is through local streams, ditches, sewers, and possibly some upward leakage from deeper aquifers. Therefore, according to the Order No. 91-056 definition the Herrick property is in a groundwater recharge area.

The hydrocarbon contaminant plume at the Herrick property occurred at a depth of less than 20 feet below ground surface. The California water well standards require a minimum well seal depth of 20 feet for individual domestic wells and 50 feet for community and industrial wells. These well seal requirements are in part necessary because shallow groundwater is usually effected by general urban activity, e.g., groundwater recharge through sewer leakage.

8.0 Remediation Activities and Effectiveness

8.1 Soil Remediation

Remediation of hydrocarbon soil contamination has been accomplished but is not addressed in this summary report covering groundwater remediation.

8.2 Groundwater Remediation

The groundwater treatment system (GTS) was constructed as stated in the work plan (DECON, 1990). The GTS consists of a groundwater interceptor trench and a centrally positioned extraction well (EW-1). The trench is located in the approximate position and orientation of the three extraction well linear array system designed by HLA (1990) that was referred to in Section 7.2. Groundwater is pumped from EW-1 into a surge tank. From the surge tank the groundwater is pumped through two 2,000 pound activated carbon adsorption canisters plumbed in series. Effluent from the second carbon canister is discharged to a storm sewer under NPDES Permit CA0029815, File No. 2199.9275(JMJ).

The gasoline hydrocarbon concentrations from groundwater samples collected at a sampling tap upstream from (influent to) the first carbon canister are reported monthly as part of the NPDES Permit. Table 1 lists these data for well EW-1. The TPH-G concentrations are plotted in Figure 4. The influent benzene, toluene, and ethylbenzene concentrations have generally been below the detection limit and have always been below the NPDES direct discharge limits of 5.0 ug/L each. Total xylenes in the influent groundwater have also generally been below the detection limit but were above the discharge limit on three occasions early in the remediation program. The effluent concentrations for petroleum hydrocarbons have never exceeded the NPDES permit discharge limits.

Examination of Figure 4 shows that the influent TPH-G concentrations have shown a seasonal pattern, with a late winter (rainy season) peak (high) during 1991 and 1992. The TPH-G concentration was at the detection limit during the remainder of the monitoring period. The winter increase in TPH-G concentration probably represents an increase in dissolved gasoline resulting from a rise in water levels accompanying the rainy season. The winter 1992 concentration peak was about one fifth of the winter 1991 concentration peak, demonstrating the effectiveness of the GTS.

The winter 1992 influent TPH-G concentration peak of 62 ug/L was only slightly above the NPDES direct discharge limits of 50 ug/L, whereas the three month running average was below this value. The June 1992 apparent concentration rise is due to an elevated laboratory detection limit (from 30 ug/L up to 50 ug/L).

8.3 Impact of Residual Hydrocarbons on Beneficial Uses

The existing and potential beneficial uses of groundwater are listed in Board Order No. 91-056 as:

Municipal and Domestic Supply
Industrial Process Supply
Industrial Service Supply
Agricultural Supply

The California State well sealing requirements discussed in Section 7.3 indicate that the shallow groundwater has no direct use potential. However, the shallow groundwater may be in hydraulic connection with surface waters and deeper groundwaters. The surface waters in the area of the Herrick property have already been mentioned (Section 7.3) to comprise a "non-drinking water area." The deeper groundwater aquifers have a potential for supplying drinking water.

The NPDES Permit No. CA0029815 instantaneous maximum limits for discharges in drinking water areas as follows:

Benzene	1.0 ug/L
Toluene	5.0 ug/L
Ethylbenzene	5.0 ug/L

Total Xylenes	5.0 ug/L
Total Petroleum Hydrocarbons	50.0 ug/L

None of the seven wells monitored have TPH-G or BTEX exceeding these limits since March of 1992. Only well MW-5 (which was subsequently excavated away in the course of remediating soil contamination) showed BTEX above these limits going back to December of 1991. Following the excavation of MW-5 area soils the replacement well EW-2 has not shown BTEX above these limits. This suggests that there will be no impact to beneficial uses from residual BTEX.

9.0 Summary and Conclusions

High levels of gasoline hydrocarbons identified in groundwater downgradient of former underground fuel tanks were centered around former monitoring well MW-5. Low level (1% +/- of the MW-5 concentrations) and non-detectable concentrations of gasoline hydrocarbons were present peripheral to the former location of MW-5. Remediation of the soil at and around the location of MW-5 resulted in the effective elimination of gasoline hydrocarbons from groundwater at this location in the replacement well, EW-2.

Low level concentrations of gasoline hydrocarbons in groundwater have been remediated through operation of the GTS.

10.0 Recommendations

Operation of the groundwater treatment system should be suspended because influent concentrations are at acceptable levels. BTEX have been below drinking water standards since May, 1991, and below detection limits since April, 1992. One (February, 1992) total gasoline hydrocarbon concentration value was only slightly above the Practical Quantitation Reporting Limit since July 1991. All of the other monthly values have been below this limit or not detectable.

SUMMARY REPORT CERTIFICATION

This summary report covering gasoline hydrocarbon remediation is a compilation of information contained in the reviewed references listed in Section 3.0, monthly NPDES reports, the laboratory reports contained in Appendix A, and of conversations with the staff of DECON Environmental Services, Inc. There is no other warranty either expressed or implied.

GROUNDWATER REMEDIATION
SUMMARY REPORT
FORMER HAYWARD FABRICATION FACILITY
HERRICK STEEL CORPORATION
25450 CLAWITER ROAD
HAYWARD, CALIFORNIA

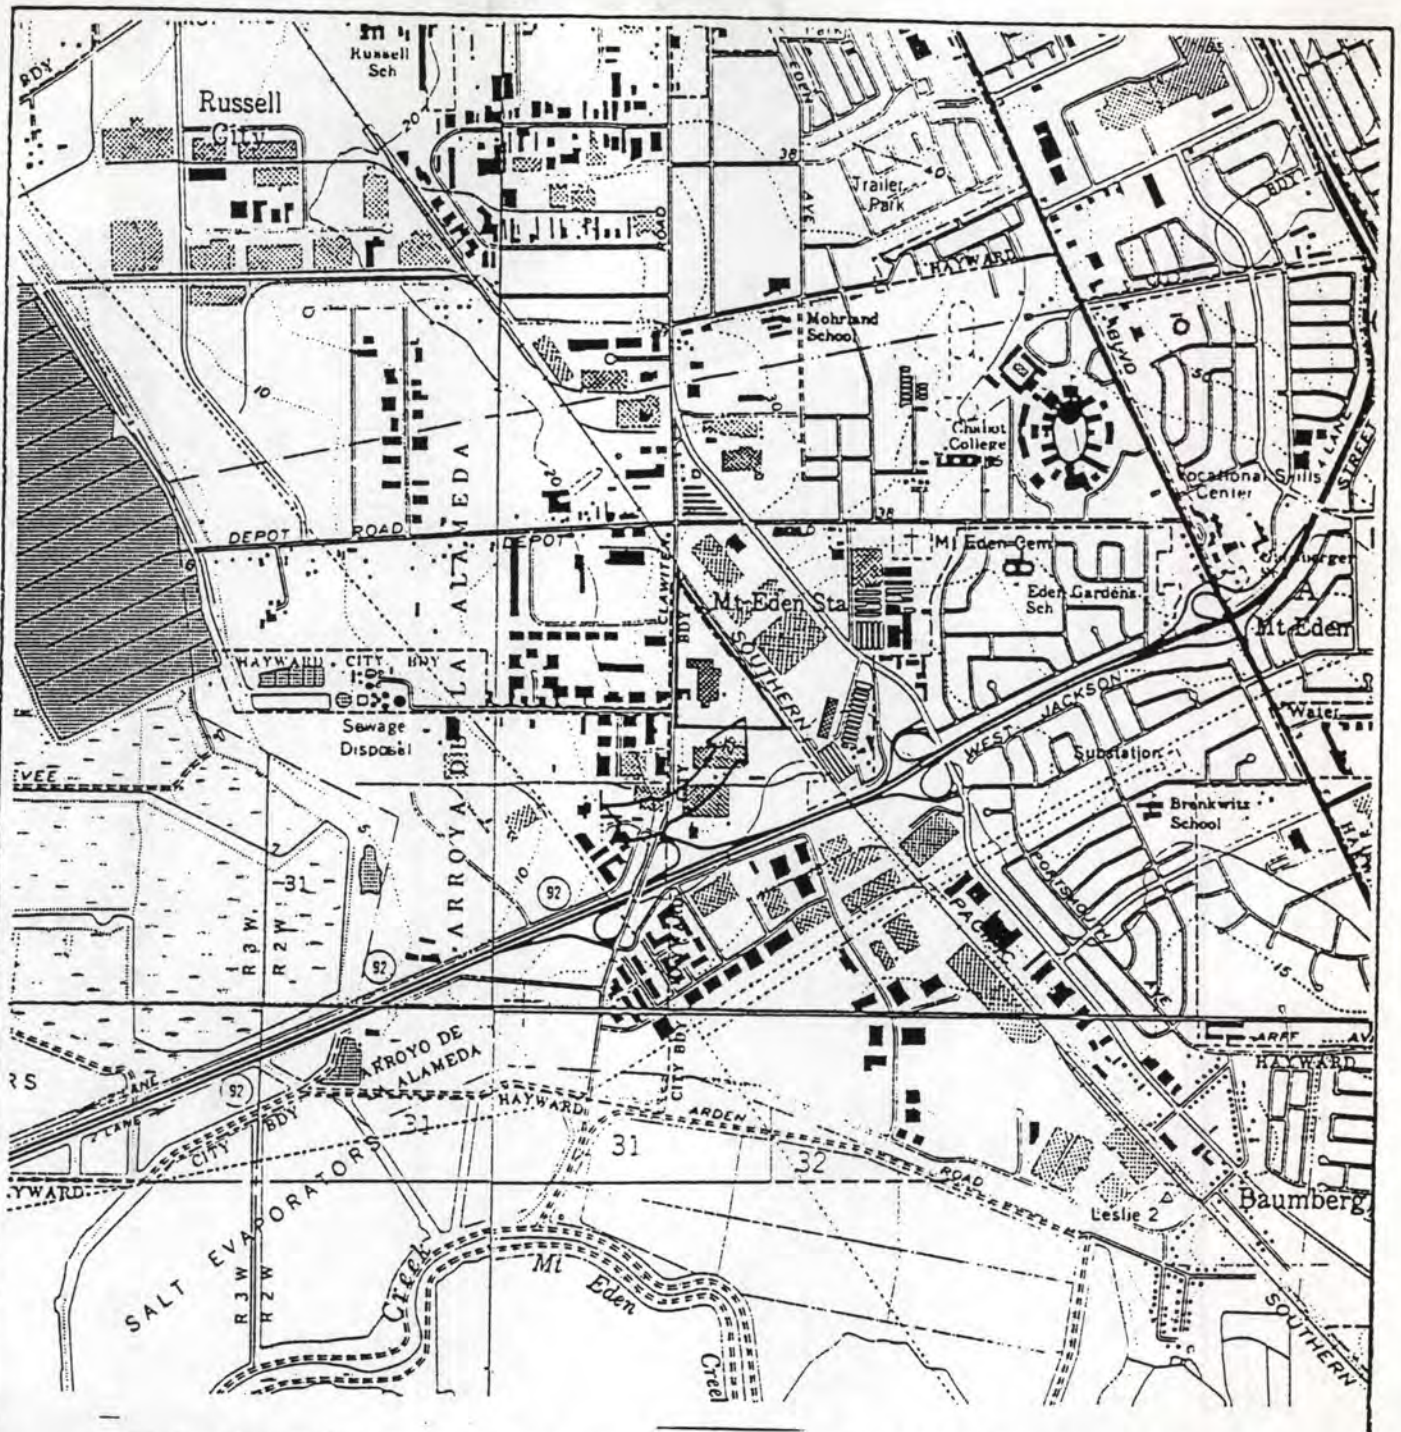
For ease of review this summary report is formatted according to the applicable portions of the "Attachment" to an April, 1992 memorandum from the California Regional Water Quality Control Board - San Francisco Bay Region (RWQCB) to the Alameda County, Health Care Services Agency, Hazardous Materials Program staff. The attachment title is "Proposed Contents of Letter of Recommendation for UST Case Closure {not applicable to Case 2 Type}).



1.0 Introduction

This summary report is presented in support of the Request of Closure Certification for gasoline contaminated groundwater remediation at the former Hayward Fabrication Facility of the Herrick Steel Corporation (Herrick) located at 25450 Clawiter Road in Hayward, California. On behalf of Herrick Corporation, DECON Environmental Services, Inc. has been conducting remediation of gasoline in groundwater since December 21, 1990.

2.0 Site Description

The former Herrick steel fabrication facility (Herrick) is located about 1.5 miles southwest of the intersection of State Highways 880 and 92 (Figure 1). The property is 25 acres in extent and is triangular shaped with one apex pointing north (Figures 1 and 2). The northeastern property line is bounded by a Southern Pacific Railroad easement. The south property line is shared with Gillig Corporation, a bus manufacturer. The western property boundary is formed by Clawiter Road, from which the property is accessed. The portion of the property in which the groundwater remediation has been occurring is restricted to the southernmost third (Figure 3).

The former facility features included a vehicle maintenance garage that included underground fuel tanks. This garage and the tanks were located along the southernmost third of the northeastern property line (Figure 2). Leaks associated with the underground fuel storage and distribution system was the source of petroleum hydrocarbons in soil (remediation completed and addressed in a separate report titled "Soil Remediation Report, Former Hayward Fabrication Facility, Herrick Steel Corporation, 25450 Clawiter Road, Hayward, California: December 31, 1992) and in groundwater (remediated and the subject of this Site Cleanup Certification Request).

3.0 Previous Work

In addition to DECON, several corporate entities have performed consulting and related services at the Herrick property. This summary report incorporates, to the extent possible, information from these earlier investigations. The earlier investigations include:

11-26-90	ENGEO Incorporated (ENGEO, 1990) Limited Subsurface Investigation
10-01-90	DECON Environmental Services, Inc. (DECON, 1990) Work Plan for Ground Water Remediation
01-15-90	Harding-Lawson Associates (HLA, 1990) Pre-Remediation Investigation, Feasibility Study and Implementation Plan
Mar. 1989	Harding-Lawson Associates (HLA, 1989) Exact date uncertain. Final Report Environmental Assessment, Not reviewed, referenced in HLA, 1990.
08/16/89	Applied Soil Mechanics, Inc. (ASMI, 1989) Soil Investigation and Pavement Design.
Pre-1989	McKesson Environmental Services, Inc. (MES, 1989) Not reviewed, referenced in HLA, 1990

HLA (1990) identified the presence of residual light-fraction petroleum hydrocarbons in soil and groundwater near the location of former underground fuel storage tanks as an area of environmental concern.

According to HLA, 1990, as a part of the removal of the underground fuel storage tanks, Herrick retained McKesson Environmental Services to assess the presence of gasoline in soil and groundwater in the vicinity of the tanks. The McKesson report (not reviewed), the two HLA reports (only 01-15-90 report reviewed), and the ENGEO report identified the distribution of soil contamination by petroleum hydrocarbons. This soil hydrocarbon contamination has been remediated, through excavation and aeration. Site closure with respect to former soil hydrocarbon contamination is not the focus of this summary report. These investigations also identified the distribution of groundwater hydrocarbon contamination which is being remediated and is the subject of this summary report.

4.0 Investigative Methods

This report is a summary report. The investigations that are being summarized (Section 3.0) all generated reports. The individual investigation reports discussed or otherwise mentioned, their

investigative methods. In addition, each investigation is required to have been conducted following approval of a work plan, wherein the proposed investigative methods were set forth. Therefore, the investigative methods of the several previous investigators are not reviewed here. Procedures used by DECON during quarterly groundwater monitoring is mentioned in the field notes included in Appendix A1.

5.0 Extent of Hydrocarbon Presence in (Soil and) Groundwater

5.1 Hydrocarbons in Soil

This report is prepared to support the closure of a groundwater remediation system. The former presence of hydrocarbons in soil was addressed in the reports listed in Section 3.0. Accordingly, a table listing results of analyses of soil samples is not provided. Soil remediation is addressed in a separate report titled "Soil Remediation Report, Former Hayward Fabrication Facility, Herrick Steel Corporation, 25450 Clawiter Road, Hayward, California: December 31, 1992.

5.2 Hydrocarbons in Groundwater

5.2.1 Floating Product

Floating product was not reported, or cross referenced from earlier reports, in HLA, 1990 or in ENGEO, 1990. DECON has not observed the presence of floating product.

5.2.2 Dissolved Hydrocarbons

Table 1 provides a listing of the cumulative results of analysis of groundwater samples for hydrocarbons from monitoring wells and extraction wells. Table 1 includes analyses for gasoline (also referred to as light-fraction, or total purgable, petroleum hydrocarbons, (TPH-G), and the gasoline derived aromatic hydrocarbons benzene (B), ethylbenzene (E), toluene (T), and total xylene isomers (X), all four of which are collectively referred to as BTEX. Copies of the laboratory analytical reports and appropriate chain-of-custody forms for the samples on which Table 1 is based are contained in Appendix A2.

Monitoring well CW-1 has been sampled on four occasions: February 1989, November 1992, March 1993, and June 1993. Benzene was detected in all but the final occasion. In the early sample 180 ug/L was detected and in the March 1993 sample only 2.6 ug/L was detected, a reduction of 2 to 3 orders of magnitude. The November 1992 sample was near the detection limit and the June 1993 sanple was below detection.

Monitoring well MW-1 has been sampled on eight occasions (Table 1) and was below the laboratory detection limit on each occasion.

1 Laboratory reports included in Appendix A
2 ENGEO, 1990
3 HLA, 1990
4 Chain-of-Custody indicates only MW as designation. Job file suggests MW-5
5 Monthly reports filed with RWQCB under File No. 2199.9275(JMJ) for NPDES Permit No. CA0029815, Order No. 91-056. Influent may include water from EW-2 after 03/20/92.

Monitoring well P-1 has been sampled on ten occasions during the last three years (Table 1). The May 1991 sample contained 0.36 ug/L benzene, below the Tri-Regional Guidelines Practical Quantitation Reporting Limit (PQRL) of 0.5 ug/L (only 0.06 ug/L above the laboratory sample detection limit). This concentration is only about one third of the California Primary Maximum Contaminant Level (MCL) of 1.0 ug/L. All of the remaining analytes have persistently been "ND".

Hydrocarbon concentrations in well MW-5 were persistently high prior to remediation of the soil adjacent to the monitoring well. During soil remediation, monitoring well MW-5 was excavated out of existence and was replaced with extraction well EW-2. (A permit is not required for abandonment through total excavation and Appendix B contains the ZONE 7 permit for the installation for extraction well EW-2). The concentrations of hydrocarbons in groundwater at this locality diminished considerably following soil remediation.

The gasoline hydrocarbon concentrations in groundwater from well EW-2 were below the applicable PQRLs and other published regulatory thresholds during operation of the groundwater treatment system, with the exception of xylenes (0.80 ug/L, compared to the PQRL of 0.5 ug/L) in the June 11, 1992 sample. The November 11, 1992 sample, collected after the treatment system was shut down, contained 0.76 ug/L benzene, 2.7 ug/L ethylbenzene, and 3.6 ug/L xylenes. The March 1993 sample results were less than the laboratory detection limits. The sample collected in June 1993 contained 250 µg/L TPH-G, 2.6 µg/L benzene, 8.2 µg/L ethylbenzene, and 5.0 µg/L xylenes. Verification sampling on July 14th failed to confirm the presence of any of these constituents.

Hydrocarbons at monitoring well MW-6 have generally reflected a declining concentration over the last three years with nearly static conditions since May 1991. The mean benzene concentration has been less than 0.6 ug/L, which is below the State MCL of 1.0 ug/L and the Action Level of 0.7 ug/L. The TPH-G concentrations have been below the Tri-Regional Guidelines PQRL of 50 ug/L for the most of the last two years. All of the gasoline derived aromatic hydrocarbons have been below the applicable maximum contaminant levels over the last two and one half years.

Hydrocarbons at monitoring well MW-7 have persistently below the detection limit since its installation in October, 1990.

Hydrocarbon concentrations from extraction well EW-1 are discussed in Section 8.2.

6.0 Hydrology

6.1 Regional Hydrogeology

The Herrick site is located on the San Lorenzo alluvial cone, a groundwater producing area that, in conjunction with the San Leandro cone, covers about 50 square miles of the bayward-sloping alluvial

plain in Alameda County known as the Bay Plain. The cones consist of coalescing alluvial fans whose deposits, in general, are derived from the drainage basins of San Leandro and San Lorenzo Creeks.

The aquifer sequence in the San Leandro and San Lorenzo cones contain water-bearing deposits to a depth of 400 feet, with deeper aquifers below that. The aquifers consist of discontinuous beds of sand and gravel which extend westward under San Francisco Bay and are capped by confining clay layers. The lower zone, which occurs below a depth of 400 feet, contains considerably more water-bearing deposits than the upper zone.

Recharge to the aquifers is from percolation of streamflow, primarily from hills to the east, and groundwater leakage through the confining clay bed. Recharge to the shallowest aquifer is through local streams, ditches, sewers, and possibly some upward leakage from deeper aquifers.

6.2 Local Hydrogeology

Lithologic logs of 26 boreholes drilled at the site by previous investigators are contained in Appendix C. Five of these are from a geotechnical investigation for foundation design prepared by Applied Soil Mechanics, Inc. Sixteen borehole logs were presented in HLA, 1990, including the boreholes for wells P-1, MW-5, and MW-6. Four borehole logs were provided in ENGEO, 1990, including that for MW-7. The borehole for well EW-2 was logged by Alisto Engineering Group. Reports prepared following installation of wells CW-1, MW-1, and MW-2 were not available for review.

As recorded on the lithologic logs, groundwater was encountered at depths ranging from 10 to 14 feet below ground surface, in those logs where this information was noted. Above the depth of first encountered groundwater, clays and silty clays with some silts were logged from a depth of about 1 to 3 feet to a depth of up to about 20 feet, which is below the depth of first encountered groundwater. Artificial fill occurs above a depth of from 1 to 3 feet.

Below the clay to silty clay with some silt unit lies a unit with more sands and silts with some clays and silty clays. This very heterogeneous unit ranges in depth from about 12 to 20 feet beneath the ground surface. Another clay and silty clay dominated unit underlies the heterogeneous sand and silt unit.

Figure 4 presents the distribution of sand/silt thickness as reported on the lithologic logs contained in Appendix C. The sands/silt thickness shown on Figure 4 were defined as sum of silts and sands encountered between the noted water level and total borehole depth. Where water levels were not noted on the logs (HLA, 1990 B- series boreholes) the water level was estimated from nearby boreholes.
The sand/silt thickness map shows a sand channel extending from the northeastern property line toward the extraction trench shown on

FIGURE 4

Figure 4. The position of this extraction system was selected by HLA, 1990 and later constructed and operated by DECON (see Section 8.2). This sand channel constitutes the aquifer contributing groundwater to the extraction system. The surrounding areas are relatively lower permeability clay dominated material.

6.3 Groundwater Gradient

Appendix D provides potentiometric surface maps for ten water level measurement events. These figures illustrate the directional component of the water table surface for each measurement event. Each figure in Appendix D lists the groundwater elevation and flow direction for each well triangle and the average flow direction and gradient. The simple average the groundwater flow direction has been south-southwest to west-southwest in orientation and the gradient has ranged from 0.0021 to 0.0063 vertical feet per horizontal foot.

The average groundwater flow direction and gradient for each measurement event are as follows:

FIGURE	DATE	AVERAGE FLOW DIRECTION	AVERAGE GRADIENT
D1	02/16/89	S 39.2° W	0.0021
D2	06/19/89	S 40.6° W	0.0024
D3	08/21/89	S 50.3° W	0.0029
D4	02/22/91	S 47.9° W	0.0036

D8	11/04/92	S 35.3° W	0.0040
D9	03/03/93	S 74.4° W	0.0035
D10	06/03/93	S 35.3° W	0.0040

6.4 Seasonal Variations of Groundwater

Groundwater levels have been measured in the winter (02/16/89, 02/22/91, 01/15/92, and 03/03/93), in the spring (06/19/89, 03/24/92, 06/11/92, 06/03/93), in the summer (08/21/89), and in the fall (11/04/92). The groundwater flow direction was southwesterly in each season.

Hydrographs of the eight wells extant at the site are presented in Appendix E. There is a trend toward the wet season high water levels and dry season low water levels typical of California's Mediterranean climate. The pattern is obscured through operation of the treatment system and an incomplete record.

6.5 Aquifer Characteristics

During geotechnical investigation reported by ASMI (1989) boreholes encountered groundwater at a depth ranging from 9.5 to 16.5 feet. The depth to groundwater was later measured and found not to have changed. Investigation performed by HLA (1990) first encountered groundwater within a silty sand to sand unit that occurs at the approximate depth of the first static water level measurement. The boreholes and monitoring well installed by ENGEO (1992) also generally encountered first groundwater within a silty sand to clayey sand unit. These conditions indicate that the first aquifer occurs under unconfined to partially confined conditions.

Aquifer hydraulic characterization tests were performed by Harding-Lawson Associates and are reported in HLA, 1990, Table 3. Single well hydraulic conductivity (slug) tests yielded results ranging from 31 to 49 feet/day. Multiple well hydraulic conductivity (pump) test results ranged from 2.6 to 488 feet/day. The reported range of hydraulic conductivities also is indicative of the heterogeneous nature of the shallow aquifer.

7.0 Beneficial Uses of Groundwater Water

7.1 Well Inventory

A well inventory of Section 31 of Township 3 South, Range 2 West Mount Diablo Base & Meridian was obtained from ZONE 7 of the Alameda County Flood Control and Water Conservation District. This well inventory is contained in Appendix F. The Herrick property is in the northeast 1/4 of the northeast 1/4 of Section 31. This 40 acre subdivision of Section 31 is designated as "A" in the well inventory numbering system. This Public Land Survey section includes downgradient and crossgradient properties within one half mile of the Herrick property. There are 11 wells within about one half mile in Section 31 listed as domestic, irrigation, or industrial wells. These 11 wells are listed in Table 2.

Well inventories were not requested for Sections 29, 30, and 32 because the groundwater flow direction has been consistently to the southwest and because the groundwater contaminant plume is confined to the Herrick property and lies to the southwest of the tank location.

7.2 Contaminant Fate Transport

Harding Lawson Associates determined the appropriate downgradient location for installing three groundwater extraction wells in a linear array. The number and locations of these wells were determined using aquifer hydraulic conductivity data, groundwater hydraulic gradients, saturated thickness information, and the known distribution of dissolved hydrocarbon contaminants. HLA verified the suitability of

the well locations using the groundwater flow computer code CAPTURE to determine flowlines and to delineate capture areas associated with the extraction wells. DECON substituted a groundwater interceptor trench and extraction sump (extraction well EW-1) to accommodate aquifer heterogeneities.

7.3 Sources of Drinking Water Policy Determination

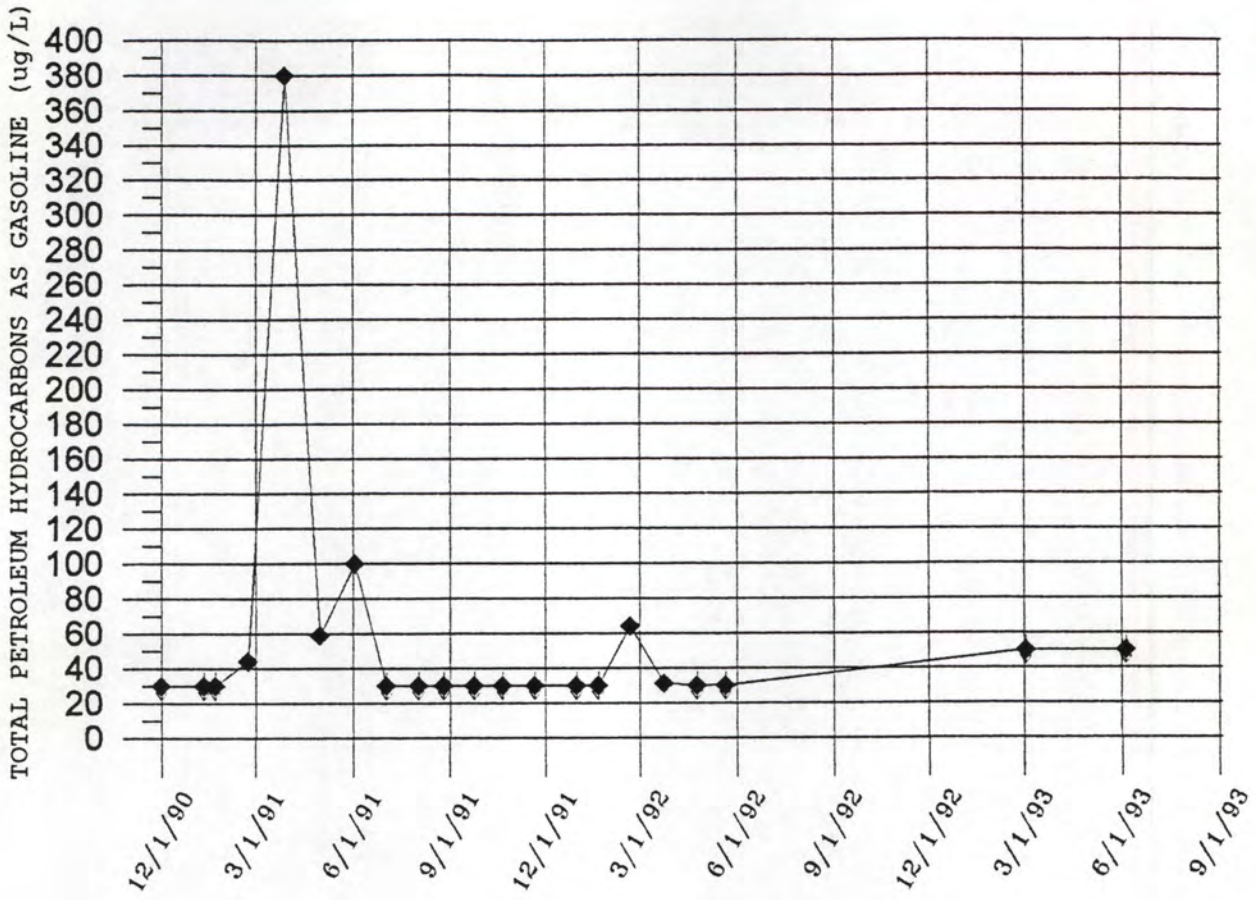
The Herrick property is located in the City of Hayward which is fully serviced by a municipal water system. In a fully serviced area the use of groundwater as a drinking water supply by individuals is not required. The California Department of Health Services administers drinking water policy encoded in the California Code of Regulations, Title 22, Division 4, Chapters 15, 16, and 17. The use of private domestic wells is an individual choice, with health standards administered by the Alameda County Health Care Services Agency.

According to RWQCB Order No. 91-056, NPDES No. CA0029815 - "Drinking water areas are defined as surface waters used for municipal and domestic supply; they also include groundwater recharge areas....". The NPDES discharge authorization letter for the Herrick groundwater treatment system; File No. 2199.9275(JMJ), dated September 27, 1991, defines the discharge "effluent limitations as appropriate to a non-drinking water area".

As indicated in Section 6.1 recharge to the shallowest aquifer is through local streams, ditches, sewers, and possibly some upward leakage from deeper aquifers. Therefore, according to the Order No. 91-056 definition the Herrick property is in a groundwater recharge area.

The hydrocarbon contaminant plume at the Herrick property occurred at a depth of less than 20 feet below ground surface. The California water well standards require a minimum well seal depth of 20 feet for individual domestic wells and 50 feet for community and industrial wells. These well seal requirements are in part necessary because shallow groundwater is usually effected by general urban activity, e.g., groundwater recharge through sewer leakage.

8.0 Remediation Activities and Effectiveness



8.1 Soil Remediation

Remediation of hydrocarbon soil contamination has been accomplished but is not addressed in this summary report covering groundwater remediation. Soil remediation is addressed in a separate report titled "Soil Remediation Report, Former Hayward Fabrication Facility, Herrick Steel Corporation, 25450 Clawiter Road, Hayward, California: December 31, 1992.

8.2 Groundwater Remediation

The groundwater treatment system (GTS) was constructed as stated in the work plan (DECON, 1990). The GTS consists of a groundwater interceptor trench and a centrally positioned extraction well (EW-1). The trench is located in the approximate position and orientation of the three extraction well linear array system designed by HLA (1990) that was referred to in Section 7.2. Groundwater is pumped from EW-1 into a surge tank. From the surge tank the groundwater is pumped through two 2,000 pound activated carbon adsorption canisters plumbed in series. Effluent from the second carbon canister is discharged to a storm sewer under NPDES Permit CA0029815, File No. 2199.9275(JMJ).

The gasoline hydrocarbon concentrations from groundwater samples collected at a sampling tap upstream from (influent to) the first carbon canister are reported monthly as part of the NPDES Permit. Table 1 lists these data for well EW-1. The TPH-G concentrations are plotted in Figure 5. The influent benzene, toluene, and ethylbenzene concentrations have generally been below the detection limit and have always been below the NPDES direct discharge limits of 5.0 ug/L each. Total xylenes in the influent groundwater have also generally been below the detection limit but were above the discharge limit on three occasions early in the remediation program. The effluent concentrations for petroleum hydrocarbons have never exceeded the NPDES permit discharge limits.

■ Numerical value or detection limit.

↓ Less than the indicated value.

DECON ENVIRONMENTAL SERVICES, INC.	**TPH-G IN TREATMENT INFLUENT OR WELL EW-1** **FORMER HAYWARD FABRICATION FACILITY** **HERRICK STEEL CORPORATION** **25450 CLAWITER ROAD, HAYWARD, CALIFORNIA**	**FIGURE** **5**

Examination of Figure 5 shows that the influent TPH-G concentrations have shown a seasonal pattern, with a late winter (rainy season) peak (high) during 1991 and 1992. There was no concentration peak during the extreamily wet winter of 1993. The TPH-G concentration was at the detection limit during the remainder of the monitoring period. The winter increase in TPH-G concentration probably represents an increase in dissolved gasoline resulting from a rise in water levels accompanying the rainy season. The significantly increased water levels during March 1993, however did not result in a significantly increased TPH-G concentration, supporting the throughness of the soil remediation. The winter 1992 concentration peak was about one fifth of the winter 1991 concentration peak and the winter and spring 1993 concentration was below the detection limits, thus demonstrating the effectiveness of the GTS.

The winter 1992 influent TPH-G concentration peak of 62 ug/L was only slightly above the NPDES direct discharge limits of 50 ug/L, whereas the three month running average was below this value. The June 1992 apparent concentration rise is due to an elevated laboratory detection limit (from 30 ug/L up to 50 ug/L).

8.3 Impact of Residual Hydrocarbons on Beneficial Uses

The existing and potential beneficial uses of groundwater are listed in Board Order No. 91-056, summarizing the "Water Quality Control Plan for the San Francisco Bay Region (Basin Plan), as:

Municipal and Domestic Supply
Industrial Process Supply
Industrial Service Supply
Agricultural Supply

The California State well sealing requirements discussed in Section 7.3 indicate that the shallow groundwater has no direct use potential. However, the shallow groundwater may be in hydraulic connection with surface waters and deeper groundwaters. The surface waters in the area of the Herrick property have already been mentioned (Section 7.3) to comprise a "non-drinking water area." The deeper groundwater aquifers have a potential for supplying drinking water.

The NPDES Permit No. CA0029815 instantaneous maximum limits for discharges in drinking water areas as follows:

Benzene	1.0 ug/L
Toluene	5.0 ug/L
Ethylbenzene	5.0 ug/L
Total Xylenes	5.0 ug/L
Total Petroleum Hydrocarbons	50.0 ug/L

Since March of 1992 the above limits have been slightly exceeded on two occassions. The March 1993 TPH-G minimally exceeded these limits in monitoring well MW-6 and benzene exceeded these limits in well CW-1 ugrgadient of the soil remediation area. Well MW-5 (which was subsequently excavated away in the course of remediating soil contamination) showed BTEX above these limits going back to December of 1991. Following the excavation of MW-5 area soils the replacement well EW-2 has shown TPH-G, ethylbenzene, and toluene above these limits only for the June 1993 samples, and these was not confirmed on verification sampling.

9.0 Summary and Conclusions

High levels of gasoline hydrocarbons identified in groundwater downgradient of former underground fuel tanks were centered around former monitoring well MW-5. Low level (1% +/- of the MW-5 concentrations) and non-detectable concentrations of gasoline hydrocarbons were present peripheral to the former location of MW-5. Remediation of the soil at and around the location of MW-5 resulted in the effective elimination of gasoline hydrocarbons from groundwater at this location in the replacement well, EW-2.

Persistent low level concentrations of gasoline hydrocarbons in groundwater have been remediated through operation of the GTS.

10.0 Recommendations

Operation of the groundwater treatment system has been suspended because influent concentrations are at acceptable levels. This report is accompanied by a request for permanent shotdown and dismantling of the groundwater tratment system.

SUMMARY REPORT CERTIFICATION

This summary report covering gasoline hydrocarbon remediation at the former Herrick Steel Corporation Hayward Fabrication Facility, located at 25450 Clawiter Road in Hayward, California, is a compilation of information contained in the reviewed references listed in Section 3.0, monthly NPDES reports, the field notes in Appendix A1 and the laboratory reports contained in Appendix A2, and of conversations with the staff of DECON Environmental Services, Inc. Parties conducting said investigations are solely responsible for their own endeavors. There is no other warranty either expressed or implied.

I hereby agree to comply with all requirements of this permit and Alameda County Ordinance No. 73-68.

APPLICANT'S SIGNATURE Brad Neo Date 3/18/92

FOR OFFICE USE

PERMIT NUMBER 92127
LOCATION NUMBER

PERMIT CONDITIONS

Circled Permit Requirements Apply

(A.) GENERAL
1. A permit application should be submitted so as t arrive at the Zone 7 office five days prior t proposed starting date.
2. Submit to Zone 7 within 60 days after completic of permitted work the original Department c Water Resources Water Well Drillers Report c equivalent for well projects, or drilling log and location sketch for geotechnical projects.
3. Permit is void if project not begun within 9 days of approval date.

(B.) WATER WELLS, INCLUDING PIEZOMETERS
1. Minimum surface seal thickness is two inches c cement grout placed by tremie.
2. Minimum seal depth is 50 feet for municipal an industrial wells or 20 feet for domestic and irrigation wells unless a lesser depth i specially approved. Minimum seal depth fo monitoring wells is the maximum depth practicabl or 20 feet.

C. GEOTECHNICAL. Backfill bore hole with compacted cut tings or heavy bentonite and upper two feet with com pacted material. In areas of known or suspecte contamination, tremied cement grout shall be used i place of compacted cuttings.

D. CATHODIC. Fill hole above anode zone with concret placed by tremie.

E. WELL DESTRUCTION. See attached.

APPENDIX F

WELL INVENTORY
Section 31
Township 3 South
Range 2 West

Well Inventory Report

The information presented in the Well Inventory Report has been obtained mainly from Water Well Drillers Reports (DWR Form No. 188). The Alameda County Flood Control and Water Conservation District (ACFC & WCD) assumes no responsibility for the accuracy of the data presented.

Definitions and abbreviations for items listed in the Well Inventory Report are as follows:

WELL NUMBER - Wells are numbered according to their location in the rectangular system of the Public Land Survey. The part of the number preceding the slash indicates the township; the part following the slash indicates the range and section number; the letter following the section number indicates the 40-acre subdivision; and the final digit is a serial number for wells in each 40-acre subdivision.

DATE (MO/YR) - The month and year when drilling or boring was completed. A "?" indicates that the date is unknown.

SURFACE ELEV. (FT) - The surface elevation of the well, if known, in feet above mean sea level. A "0" designates an unknown elevation.

TOTAL WELL DEPTH (FT) - The depth of the well. This usually designates the completed well depth. If the well has a well log available on file, then the total drilled depth of the well is given. The Well Inventory Report does not show total depth data for geotechnical borings. This is because only one state well number is assigned to one boring at a site, and there usually are several borings of different depth.

DEPTH TO WATER (FT) - This category usually indicates the standing groundwater level in the well on the date of well completion. The "depth to first water encountered" is recorded in the Well Inventory Report when it is the only water level data reported on the Well Drillers Report.

DTW (MSL) - The elevation of the standing groundwater level in the well on the date of well completion (in feet) relative to Mean Sea Level. This is calculated by the equation: DTW (MSL) = SURFACE ELEV. (FT) - DEPTH TO WATER (FT). If the surface elevation is unknown (as indicated by a "0" in the SURFACE ELEV. column) a "0" will also appear in this column.

USE - The well use (or in the case of cathodic protection wells and geotechnical borings, the reason for the excavation) as indicated in the Well Drillers Report or data sheets. A plus sign (+) after the well use indicates a well in the current ACFC&WCD monitoring network.

ABN - Abandoned well. A well whose use has been permanently discontinued or which is in such a state of disrepair that no water can be produced. In the Well Inventory Report, this may include wells which are covered or capped but not properly destroyed.

DES - Destroyed well. A well that has been properly filled so that it cannot produce water nor act as a vertical conduit for the movement of groundwater.

DOM - Domestic well. A water well which is used to supply water for the domestic needs of an individual residence or systems of four or less service connections or "hook-ups".

INA - Inactive well. A well not routinely operating but capable of being made operable with a minimum effort. Also called a "standby well".

IND - Industrial well. A water well used to supply industry on an individual basis.

IRR - Irrigation well. A water well used to supply water only for irrigation or other agricultural purposes. In the Well Inventory Report, this category includes large capacity wells as well as small capacity wells for lawn irrigation.

MON - Monitoring or observation well. Wells constructed for the purpose of observing or monitoring groundwater conditions. (See "PIE" below).

MUN - Municipal well. A water well used to supply water for domestic purposes in systems subject to Chapter 7, Part 1, Division 5 of the California Health and Safety Code. Included, are wells supplying public water systems classified by the Department of Health Services. Also referred to as community water supply wells.

PIE - Piezometer. A piezometer is a well specially designated to measure the hydraulic head within a zone small enough to be considered essentially a point as contrasted with a well that reflects the average head of the aquifer for the screened interval.

STO - Stock. A water well used primarily for livestock.

TES - Test well and test hole. A test well is constructed for the purpose of obtaining the information needed to design a well prior to its construction. Such wells are not to be confused with "test holes" which are temporary in nature (i.e., uncased excavations whose purpose is the immediate determination of existing geologic and hydrologic conditions). Test wells are cased and can be converted to observation or monitor wells and, under certain circumstances, to production wells. In the inventory, "TES", includes both test wells and test holes.

CAT - Cathodic protection well. Any artifical excavation constructed by any method for the purpose of installing equipment or facilities for the protection from corrosion by electrochemical methods of metallic equipment (usually piping) in contact with the ground; commonly referred to as cathodic protection.

GEO - Geotechnical boring. A temporary boring made to determine certain engineering properties of soils. An asterisk (*) indicates that the state well number assigned to the boring represents more than one boring at a particular site.

"?" - Unidentified use. This indicates that the use of these water wells could not be determined from the available well data.

LOG - This category indicates the nature of the geologic record, or log, for the well or boring available in the ACFC & WCD files. Abbreviations are as follows:

D - well driller's log
G - geotechnical boring log
E - electric (resistivity) log or other subsurface geophysical logs.
? - no log available

WQ - This category indicates which wells have water quality data available in ACFC & WCD files. The numbers 1 through 9 signify the number of sets of water quality data available. A plus sign (+) indicates that 10 or more sets of data are available for that well. A "0" indicates that no water quality data is available.

WL - This category indicates which wells have water level data other than the data reported on the Well Drillers Reports. The numbers 1 through 9 signify the number of water level measurements available. A plus sign (+) indicates that 10 or more measurements are available for that well. A "0" indicates that no data is available.

YIELD (GPM) - The maximum pumping rate in gallons per minute that can be supplied by a well without lowering the water level in the well below the pump intake. This information is taken from pump test data recorded in the Well Drillers Reports. Some of the yield data indicates current production rates and does not reflect maximum yield values determined in a capacity test. A "0" indicates that the yield is unknown.

DIA (IN) - The diameter (in inches) of the main casing in a well. May also indicate the diameter of a hand-dug well. Diameter data is not recorded for geotechnical borings. A "0" indicates that the diameter is unknown.

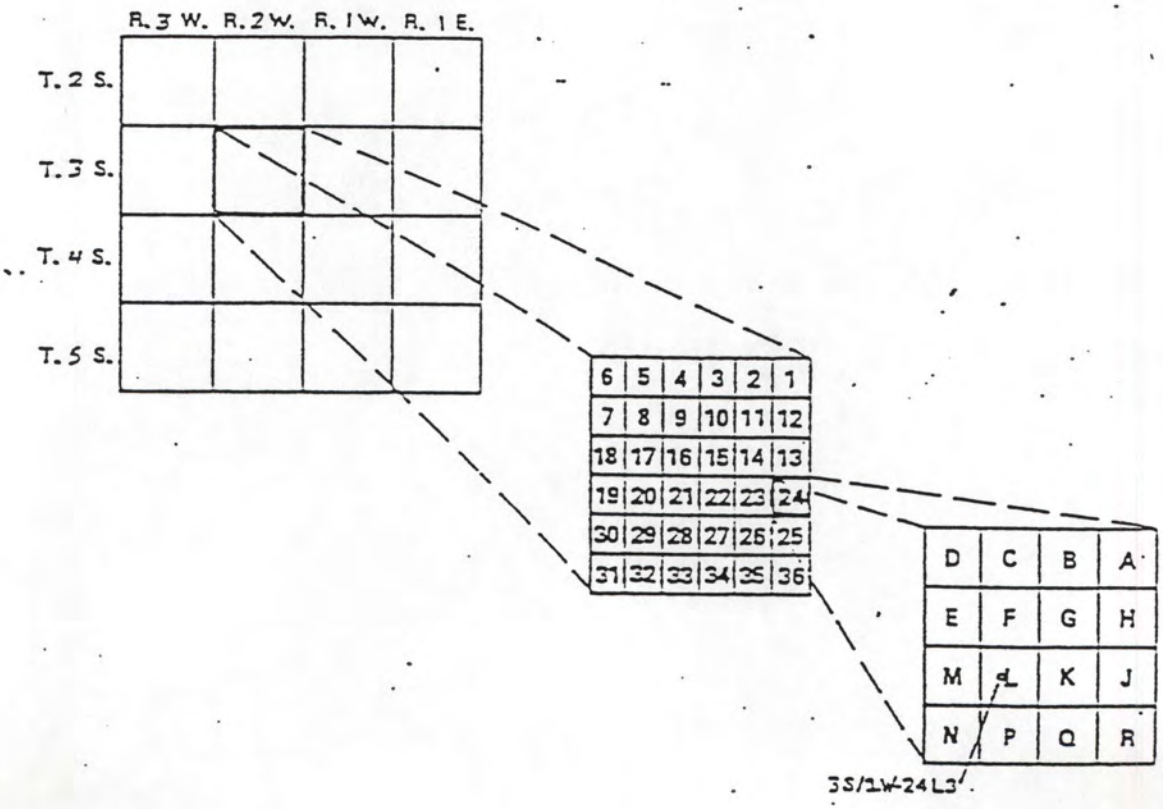

Figure 1: Well numbering system.

Please Note:
The LCS is a control sample of known, interferent free matrix that is analyzed using the same reagents, preparation and analytical methods employed for the samples. The LCS % recovery data is used for validation of sample batch results. Due to matrix effects, the QC limits for MS/MSD's are advisory only and are not used to accept or reject batch results.

PROJECT SUMMARY

FOR

HERRICK STEEL CORPORATION
SOIL REMEDIATION PROJECT
23450 CLAWITER ROAD
HAYWARD, CALIFORNIA

October 26, 1993

DECON Environmental Services, Inc. (DECON) was contracted by Herrick Steel Corporation to perform soil remediation services at their former manufacturing facility located at 23450 Clawiter Road, Hayward, California. These services included excavating approximately 15,000 cubic yards of soil, aeration of approximately 5,000 cubic yards of soil contaminated with gasoline, and backfilling and compacting the excavation. Site Map 1 shows the location of the excavations and aeration piles with respect to the rest of the property.

DECON began excavation activities on June 4, 1990. The top ten feet of soil over an area approximately 275 feet long by 130 feet wide was excavated and stockpiled. This soil, approximately 10,000 cubic yards, was not contaminated, as stated in the Harding Lawson Site Assessment Report. The remaining soil from ten feet below grade to the top of the groundwater table (approximately 12 feet below grade) was excavated, spread out on visqueen in a relatively thin layer for aeration, and covered with plastic. The excavation was dewatered to assist in soil removal below the standing water table. Approximately 2,000 cubic yards of soil were excavated and spread for aeration. The basic excavation work was completed on June 26, 1990.

Soil and water samples were collected on June 29, 1990. Fifteen soil samples were collected from the bottom of the excavation to determine if the soil removal from the excavation had been completed. Two water samples were collected to quantify the concentration of petroleum hydrocarbons in the groundwater. Locations and results of sampling in the excavation zone are depicted in Figure 1a. Thirty soil samples were collected from the soil aeration piles in order to comply with the Bay Area Air Quality Management District's (BAAQMD) requirement to determine the average concentration of petroleum contaminants in the soil and the rate at which the soil piles could be uncovered and aerated. Figures 2 and 3 show the sample locations and

analytical results of aeration piles produced during initial excavation activities. All of the samples were analyzed by Superior Analytical Services, a State of California certified analytical laboratory.

Results of the laboratory analysis from the samples collected from the soil aeration piles showed only six samples with detectable levels of total petroleum hydrocarbons (TPH). The six samples had TPH concentrations ranging from 90 parts per million (ppm) to 600 ppm. The average TPH concentration from all the samples that were collected, using a value of 1 ppm (the detection limit) as the TPH concentration for all non-detected (ND) values, was 59 ppm. (Note: EPA uses 1/2 the detection limit for quantification of non-parametric data.) Based upon these analytical results, and approval from BAAQMD, the soil piles were uncovered and the soil aeration process was started.

The analytical results of the two water samples showed no detectable levels of TPH.

The analytical results of the fifteen soil samples collected from the bottom of the excavation showed only two of the samples with detectable levels of TPH. These two samples, located in the far northwest and southwest corners of the excavation, had levels of 97 and 400 ppm, respectively. All of the other samples were below the detection limit.

Based on these results, additional excavation was done in the areas where the two samples showing high TPH concentration were collected. Areas approximately 15 feet by 15 feet were excavated to an additional depth of three feet. These excavations were resampled on July 9, 1990. Two samples were collected from each excavation. Figure 1b shows the location of additional excavation and respective sampling. The analytical results of these four samples showed only one sample with levels of TPH above 100 ppm. This sample, from the west side of the northwest corner excavation, had a TPH concentration of 190 ppm.

All of the contamination had been removed from the southwest corner excavation. Additional soil removal was conducted in the northwest corner excavation. An area approximately 10 feet by 10 feet by three feet deep was excavated and two soil samples were collected from the new hole on July 17, 1990. See Figure 1c for exact locations. The analytical results of these two samples showed levels of TPH at 2 and 11 ppm.

Spoils generated during additional excavation activities were placed in Aeration Pile Two.

Representatives of the Herrick Corporation, DECON, and the City of Hayward Fire Department met at the site on Friday, August 3, 1990. All of the analytical results were reviewed and the City of Hayward Fire Department gave the authorization to backfill the excavation with the stockpiled clean fill.

Backfilling operations commenced on Wednesday, August 8, 1990. Approximately 1,600 tons of crushed rock was imported from the Dumbarton Quarry to bridge the bottom of the excavation containing free-standing groundwater and provide a solid base for compaction, see attached weigh tickets. Placement and compaction of the rock was completed on Friday, August 10, 1990. The rest of the excavation was filled and compacted with onsite fill (clean spoils generated during original excavation activities and clean aerated soil). This activity commenced on Monday, August 13, 1990 and was completed on Tuesday, August 21, 1990.

Testing and inspection of backfill operations was performed by United Soil Engineering (USE). A summary of the field density tests showed values in excess of 90% relative compaction. A copy of the report outlining the results of the soil density testing performed by USE is attached.

Due to high TPH concentrations inexplicably remaining in monitoring well MW-5 groundwater, exploratory excavation commenced around the well on August 7, 1991. A pocket of TPH contaminated soil was encountered and soil was removed until August 13, 1991. Approximately 90 cubic yards of soil were removed and spread on visqueen awaiting analysis, west of Aeration Pile Two. The final dimensions of the kidney-shaped excavation were approximately 40 feet long by 20 feet wide and 10 feet deep (to groundwater).

As a result of these excavation activities, monitoring well MW-5 was left free-standing. It was removed with the intent to install a new monitoring well once the excavation was recompacted.

Confirmatory soil sampling was performed on September 20, 1991. Samples were collected from Aeration Pile Two, the new Soil Pile One, and from the walls of the new excavation. Twenty-one soil samples were collected from original Aeration Pile 2 and the spoils generated during excavation activities around MW-5. Four soil samples were collected from the four walls of the excavation where TPH contaminated soils had been encountered. Samples were analyzed for TPH-gasoline and BTEX parameters. Samples were submitted to Sequoia Analytical, a State of California certified analytical laboratory, for analysis. Analytical results showed non-detected levels for TPH in Aeration Pile 2 and the walls of the new excavation. Two samples in Spoils Pile 1 showed levels of TPH less than 2 ppm, see Figure 4 for locations and TPH concentrations. These latter two soil piles remain onsite undisturbed.

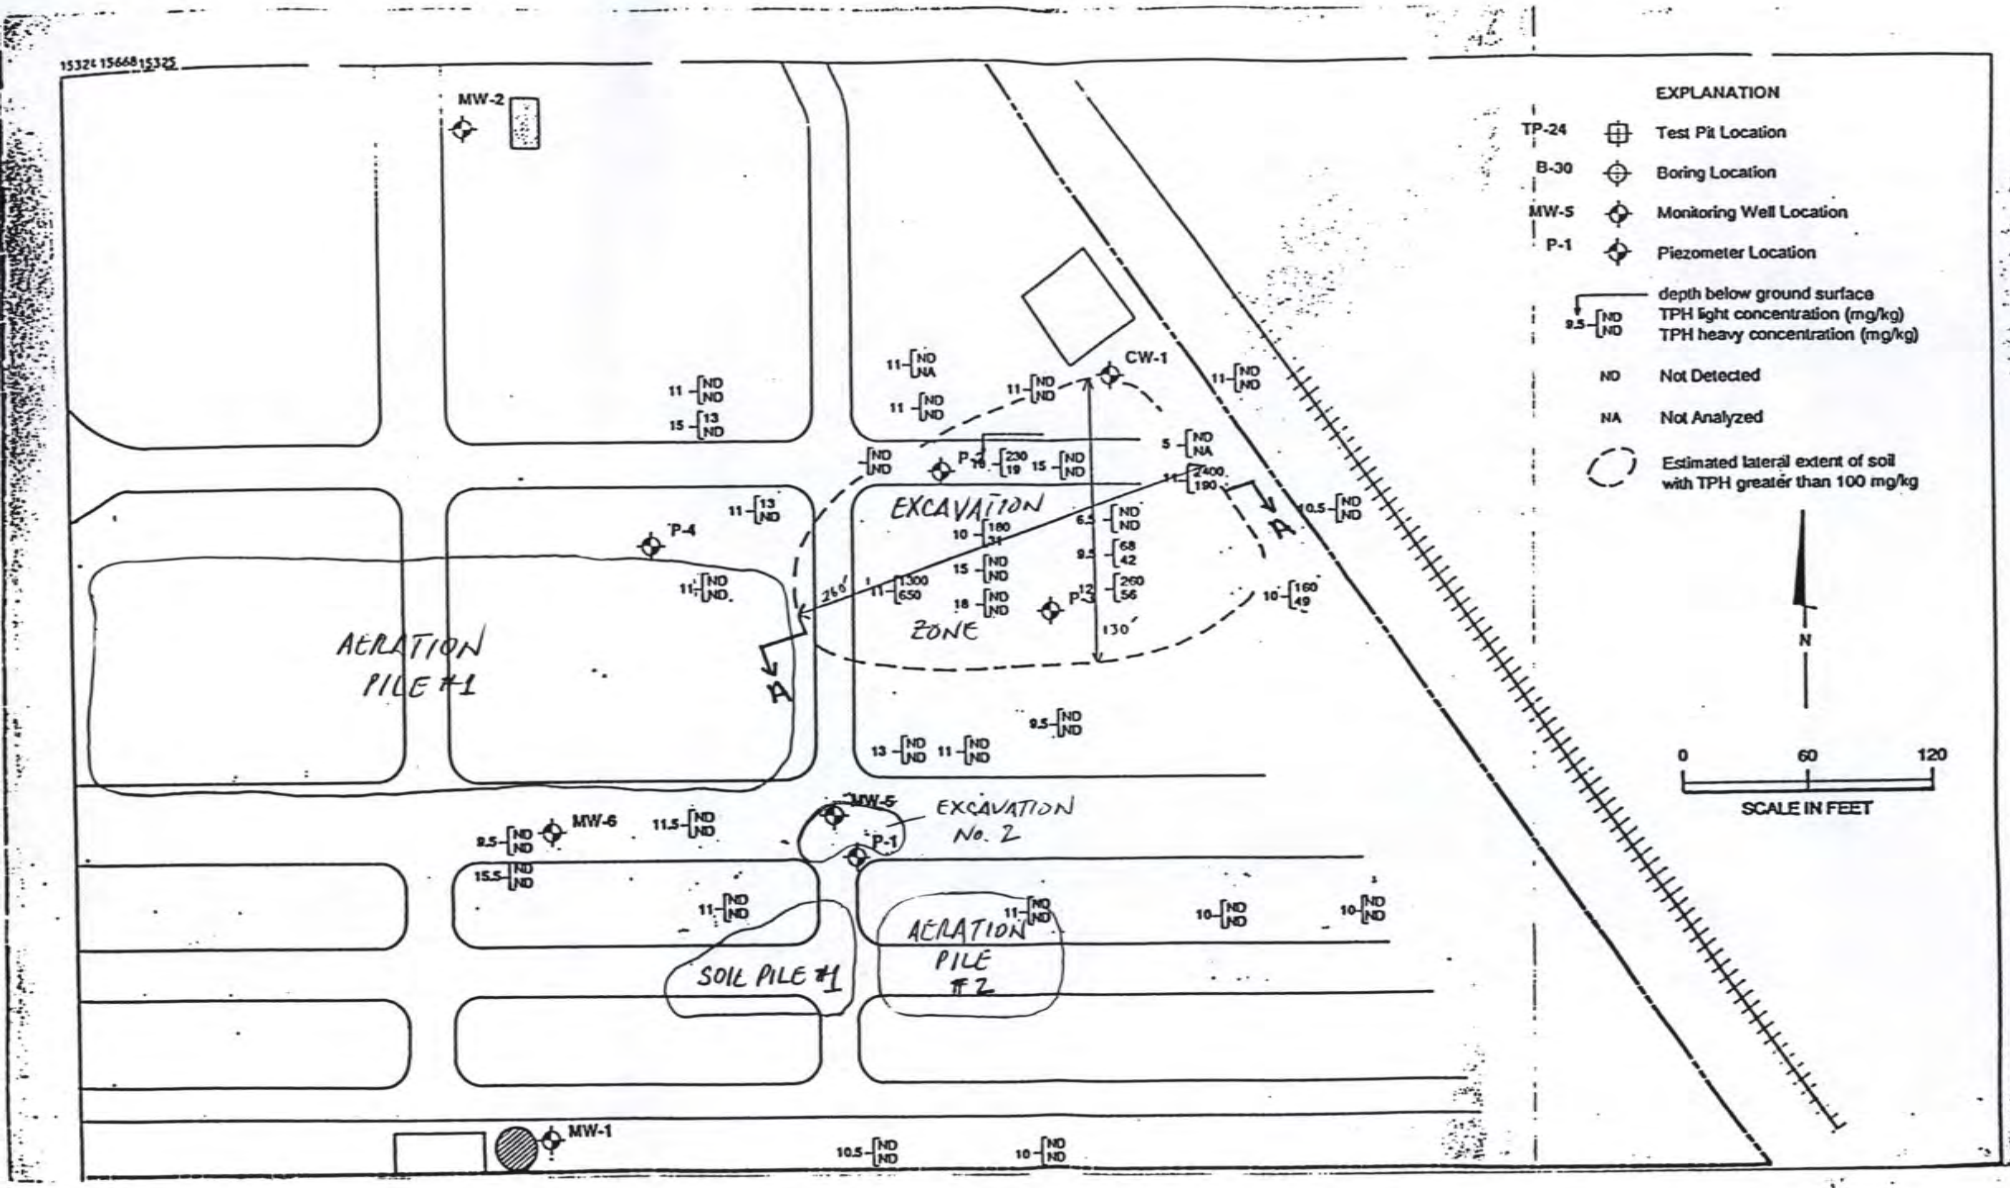
The excavation around MW-5 was backfilled and compacted on January 23, 1992. Approximately 24 tons of crushed rock was imported from the Kaiser Sand & Gravel Radum Plant to provide a solid base for compaction. The rest of the excavation was

filled and compacted with approximately 100 tons of 3/4" Class III aggregate base imported from La Vista Quarry. Placement and compaction of the Class III aggregate commenced on January 23, 1992 and was completed on January 25, 1992. Please see attached weigh tickets for confirmation of source and quantity of backfill materials.

REPORT CERTIFICATION

This soil remediation summary report for Herrick Steel Corporation's former Hayward Fabrication Facility, located at 25450 Clawiter Road in Hayward, California, was prepared by Mr. Peter Schoen, B.A., Chemistry, an employee of DECON Environmental Services, Inc. Mr. Schoen performed many of the soil sampling activities described herein and supervised the excavations. He compiled this report from the information contained in the attachments hereto, and from his notes and recollections, and through conversations with other DECON Staff. The personnel familiarity of the undersigned with Mr. Schoen's professional ethics leaves no doubt as to the credibility of this soil remediation summary report.

This report was prepared to document soil remediation activities performed based on site characterization efforts conducted by Harding-Lawson Associates. Furthermore, this report is a discussion of the contained information and as such there is no other warranty, either expressed or implied.



This report was prepared by DECON Environmental Services, Inc. and was reviewed by

CERTIFICATE OF ANALYSIS

LABORATORY NO.: 81140
CLIENT: Decon Environmental Services
CLIENT JOB NO.: 285

DATE RECEIVED:07/09/90
DATE REPORTED:07/11/90

ANALYSIS FOR TOTAL PETROLEUM HYDROCARBONS
by Modified EPA SW-846 Method 8015

LAB #	Sample Identification	Concentration(mg/kg) Gasoline Range
1	629H285EZ01-2	ND<1
2	629H285EZ11-2	1
3	629H285EZ01-2B	190
4	629H285EZ11-2B	ND<1

mg/kg - parts per million (ppm)

Method Detection Limit for Gasoline in Soil: 1 mg/Kg

QAQC Summary:

Daily Standard run at 2mg/L: RPD Gasoline = <15%
MS/MSD Average Recovery = 103%: Duplicate RPD = <4%

Subject: 25450 Clawiter Road
Hayward, California
TESTING AND INSPECTION DURING
BACKFILLING OPERATION OF
EXCAVATED AREA

Gentlemen:

Pursuant to your request, we have provided testing and inspection services during backfilling operation of the pit area on the subject project. This project is located at 25450 Clawiter Road in Hayward, California.

The pit area was about 130 feet by 260 feet and 15 feet deep. On-site material was used to backfill the pit area and this material was clean and free of debris and organics. This backfilling operation was done in lifts and each lift was compacted properly.

Field density tests performed by our firm show values in excess of 90% relative compaction. These tests are performed in accordance with laboratory compaction test procedure ASTM D1557-85.

Summarized in Table I are the results of the field density tests performed by our firm to date. Approximate location of these tests are shown on Figure 2 - Site Plan.

File No. 90-3881-S2

If you have any questions or require additional information, please feel free to contact our office at your convenience.

Very truly yours,

UNITED SOIL ENGINEERING, INC.

1.0 INTRODUCTION

As requested by the Herrick Corporation (the Client), Mittelhauser Corporation (Mittelhauser) conducted a Phase I Environmental Site Assessment (ESA) of property located at 25450 Clawiter Road in Hayward, California (the Site). The Site is approximately 25 acres in size and is currently vacant land. The Site location is shown in Figure 1 and is described in Table 1.

The purpose of this ESA was to identify evidence of potential adverse environmental conditions at the Site related to the use, handling, and/or disposal of hazardous substances which could impact site soil or groundwater quality. This ESA included a review of past and present land use and operations at the Site and evaluated the potential for chemicals to migrate onto the Site from reported releases at nearby facilities.

This ESA was initiated in late 1994. The majority of the tasks for this project were conducted from December 1994 through February 1995. In January 1995, petroleum odors were detected in one area of the Site during a geotechnical investigation. The ESA was temporarily placed on hold until the source of the odors could be investigated and addressed. This issue is currently being addressed as described in Section 4.4.3.

2.0 SCOPE OF WORK

The scope of work for this ESA included the activities summarized below. Descriptions of these activities and the information collected are presented in the remaining sections of this report and its appendices. This ESA included:

- reviewing historical aerial photographs of the Site and surroundings,
- reviewing pertinent environmental regulatory agency databases and selected files along with personal communications with regulatory personnel,

- inspecting the Site and conducting a drive-by surveillance of adjacent properties,
- interviewing the Client and other persons with knowledge of the Site and site activities,
- evaluating the information collected, and
- preparing this report.

The scope of work did not include the following: (1) assessment of the potential presence of polychlorinated biphenyls (PCBs) in electrical equipment or asbestos in buildings which may have been located onsite; (2) assessment of naturally occurring hazards such as radon gas, asbestos, methane gas, or radionuclides; (3) assessment of non-chemical hazards such as earthquakes or floods; (4) evaluation of the presence of endangered species or wildlife habitats; or (5) collection of environmental samples.

3.0 SITE DESCRIPTION

3.1 PHYSICAL SETTING

The Site is approximately 25 acres in size, triangular in shape, and is currently vacant land. The Site is located among commercial properties, industrial properties, and vacant land. The Site is bounded to the east by railroad tracks owned by Southern Pacific Transportation Company (SP), to the west by Clawiter Road, and to the south by Gillig Corporation. The San Francisco Bay is located approximately two miles to the west of the Site (see Figure 1).

3.2 GEOLOGICAL SETTING

A subsurface investigation of the Site was conducted by Harding Lawson Associates in 1989 (HLA, 1989). Information from this report is summarized below. The Site is located on the San Lorenzo alluvial cone, itself located on the Bay Plain, which slopes westward toward San Francisco Bay from the Diablo Highlands. The Bay Plain

is divided into two distinct geological areas. The eastern alluvial area comprises unconsolidated, interbedded gravels, sands, silts and clays. The site is located on the bayward margin of these alluvial deposits. The western, marshland area is proximal to bay and is made up of fine-grained sediments occupying a 3-mile strip between the bay and the alluvium.

Below the three foot sandy gravel fill now covering the area are black, olive-green, and yellow-brown silty clays. The clays form a resistant and fairly impermeable barrier at depths of 4 to 10 feet below ground surface. Below the fine-grained silts and clays to depths of 17 to 20 feet are yellow-brown sands with variable amounts of fines intermixed. At the maximum depth of investigation, which was not specified in the HLA report, a dark gray-brown clay was encountered (HLA, 1989).

3.3 HYDROGEOLOGIC SETTING

The Site hydrogeology was described in a report prepared by DECON in October 1993, as follows. The San Lorenzo alluvial cone is a groundwater-producing area. The aquifer sequence, consisting of discontinuous sand and gravel beds capped by confining clays, contains water-bearing deposits to a depth of 400 feet, with deeper aquifers below. Percolation of stream flow from eastern hills and groundwater leakage from the confining clay beds provides recharge to all but the shallowest aquifers. The shallowest aquifers are recharged by precipitation, local streams, ditches, sewers, and possibly from some upward leakage from deeper aquifers (DECON, 1993B).

In the available literature reviewed for this ESA, there was no mention of evidence of tidal influence on the site hydrology. Based on Mittelhauser experience with other sites in the area, tidal influence at this distance from the bay would not be observed. Information gathered from nearby investigations suggests that the shallow groundwater gradient is generally toward the southwest.

4.0 REVIEW OF EXISTING INFORMATION

4.1 SITE HISTORY

This ESA included reviews of the following: historical aerial photographs; building permits; and a Prior Use Report which included a review of historical insurance maps, historical city directories, and interviews with local agency personnel. The Prior Use Report was prepared by EDR (Environmental Data Resources) for Mittelhauser. These information sources provided an indication of possible environmental concerns which may be inferred from past uses of the Site and surrounding properties. To the extent information was available, the types of operations conducted at the Site were reviewed to better determine the types of hazardous materials which may have been used at the Site.

4.1.1 Historical Aerial Photographs

An historical aerial photograph review was conducted by Mr. Dwight Hoenig of Mittelhauser at Pacific Aerial Surveys in Oakland, California. Photographs with potentially significant observations are summarized as follows:

Photo Date	Observations
04-20-92	The site is vacant land. In the central portion of the Site, soils display a change in color; a dark color spot or stain is noticeable near the south central property line. The darker soil is in three distinct locations.
03-30-88	Four large buildings exist in the central portion of the Site, along with a large lay-down area apparently used for materials storage. There is apparent debris adjacent to the SP railroad tracks at the north end of the Site. There is no apparent staining on property. A nursery occupies the area to south and east across the SP tracks.
10-03-86	The appearance is the same as the 1988 (03-30-88) photograph.
05-15-85	The appearance is the same as the 1988 (03-30-88) photograph, with evidence of road oiling in the northern third of the Site.

07-18-77 Staining from what appears to be road oiling was observed extensively throughout the property.

04-24-73 The appearance is the same as the 1971 (05-19-71) photograph.

05-19-71 The appearance is the same as the 1959 (07-003-59) photograph, except the northern third of the triangular Site appears to be in agricultural use.

07-03-59 The main plant site occupies the central third of the facility. The southern third shows a row configuration. All surrounding properties appear to be in agricultural use.

05-03-57 The fabrication plant appears to be under construction and appears to be partially complete. The southern third of the Site is agricultural; the northern third of the Site is vacant land.

10-02-53 These photos show only agricultural usage on the entire property.

4.1.2 Building Permit Review

Building permits were reviewed on December 22, 1994, at the Building Department of the city of Hayward. Of the permits on file, 16 were non-electrical and not superficial (e.g., interior office partitions) in nature. Of the 16, 11 were construction permits, including equipment storage, office buildings and additions, industrial building, sign tower, and a block wall shield for an oxygen tank.

Two permits which initially appeared to be of potential environmental interest were permits to install sanitary sewer laterals, one of which was to have been constructed of asbestos cement. There were no "as-builts" available, and it was not possible to determine whether such pipes were installed. However, the remaining three permits were demolition permits for nonresidential buildings (dated May 23, 1991); these demolition permits did not include any reference to asbestos cement piping.

4.1.3 Prior Use Report

A Prior Use Report was prepared for Mittelhauser by EDR. (see Appendix A). The report summarizes the results of the EDR review of fire insurance maps, city directories, and EDR contacts with local and regional officials.

Sanborn/Fire Insurance maps were requested but were not available for the area. There were no business licenses available, and city directories were not reviewed prior to 1964. It should be noted that, for the time period prior to the Herrick Corporation ownership of the property, information was not available regarding previous tenants' names, periods of occupancy, or the type of operations conducted. The information in the Prior Use Report was consistent with the other information reviewed for this ESA.

4.2 REGULATORY DATABASE REVIEW

Mittelhauser requested that EDR conduct a Radius Map Review and prepare a report of the findings. Such a review includes accessing state and federal agency databases. The review included sites within a 1-mile radius of the Site (referred to as the target property by EDR), listing known hazardous waste generators, leaking underground storage tanks (LUSTS), or other environmental concerns. The complete EDR report of the database search document is included as Appendix A to this ESA report.

Within the 1-mile radius, 108 sites were identified with possible environmental concerns. All except three of these sites were downgradient or crossgradient from the Site. The three upgradient sites were designated by EDR as sites 56, X97, and X98. Site 56, located approximately one half mile northeast of the Site, is Van Den Broek Inc., at 24941 Monte Vista Drive, Hayward, California. This facility was included in the Cal/SITES list, which includes sites with releases as well as sites with the potential to release. Its status was shown as "no further action" for Department of Toxic Substances Control (DTSC) in January 1981.

EDR sites X97 and X98 are approximately 1-mile upgradient from the Site. These two sites appear in the EDR report map (see Appendix A) as a single site; they are two locations on Hesperian Boulevard. Site number X97 is Chabot College, Hesperian Boulevard, Hayward. It is included on the state LUST listing and on the Cortese list. Though included on the LUST list, the EDR summary of information from that list indicates there may not have been a release. It appears that site X97 may have been included on the Cortese list due to its inclusion on the LUST list. The second site, X98, is South County Community College, Hesperian Boulevard, Hayward. It is included on the Cortese list; the EDR report indicated that the site was originally listed on the Cal/SITES list.

4.3 RECORDS REVIEW

The offices of city of Hayward and Alameda County were contacted to review available records for the site as they might relate to this ESA. Table 2 shows a list of the local agency offices contacted. The information obtained is summarized in the remainder of this section.

4.3.1 City of Hayward, Fire Department

The Hazardous Material Management Plan (HMMP), Hazardous Materials Inventory, Acutely Hazardous Materials Registration, hazardous materials storage, permit history, and other information summarized below were on file in the Hazardous Materials Division of the City of Hayward Fire Department.

Underground Storage Tanks There were no permits on file for the installation of underground storage tanks. The single tank which had been on the property was installed in 1960 prior to permitting records. The permit for its removal in 1986 and subsequent documentation are discussed below.

Review of a 1960 Registration Form in regulatory records showed one 2,000-gallon underground storage tank, permitted for removal April 15, 1986, and removed April 17, 1986, by Exceltech. SWEEPS documentation also showed the removal of the 2,000-gallon motor fuel tank (regular unleaded). This information is consistent with the Harding Lawson report of 1989.

Industrial Waste Generation/ Storage/ Disposal There were no records of industrial waste generation, storage, or disposal for the site on file with the City of Hayward Fire Department.

Hazardous Materials and Hazardous Waste Inventory The Hazardous Materials section of the City of Hayward Fire Department maintains records of hazardous materials, sumps, lagoons, ponds, and trenches. Included in their records is a hazardous materials inventory as well as a facilities map showing the site locations of stored materials and type(s) of containment. Each of the 10 storage facilities on the property were individually listed, with enlargements of each storage area or building, indicating the following:

- Chemical storage areas, identified by hazard class
- Exits/entrances
- Locations of emergency exits
- General use of rooms (machinery, paint mixing, office, etc.)
- Chemical listing (including Department of Transportation class, chemical name/ trade name, maximum quantity anticipated, presence of tank or waste, and the quantity range)
- Container type
- Separation of materials
- Hazardous waste disposal description and code
- Monitoring program description and code
- Record keeping
- Earthquake protection

The only potential for hazardous waste generation listed in the HMMP was at two of the 10 storage locations. The HMMP states that the material generated at one

location (hydrochloric acid) was recycled, while material at the second location (oxygen) was vented/vaporized to air.

Incident Reports The only incident report in this file was for a fire, which was reported as electrical in origin.

Hazardous Materials Inspection Forms (HMIFs) The HMIFs on file did not indicate any current concerns. All previous inspection issues have been addressed and corrected. Earlier reports of soil contamination (8,000 parts per million (ppm) and 32,000 ppm hydrocarbons) were remediated to the satisfaction of the Hazardous Materials Division of the City of Hayward Fire Department; this is more fully discussed in Section 4.4.1.

A Hazardous Materials Inspection Checklist, dated March 4, 1987, showed compliance for every item except secondary containment for surface tanks. Those tanks are no longer in existence, and there is no record of spills from these tanks. Further, the parcel of property on which these tanks were located is now owned by the Gillig Corporation and is not covered by this ESA.

Letters from the Regional Water Quality Control Board (RWQCB)/SWEEPS Letters of closure from the RWQCB are discussed in Section 4.4 and presented in Appendix B.

Methane Zones There was no information on methane zones on file. Hugh Murphy, City of Hayward Fire Department - Hazardous Materials Division Manager, stated that none of these zones are known to exist anywhere within the jurisdiction of the Hayward Fire Department. Review of historical aerial photographs revealed no evidence of dumps or other producers of methane at the site.

Sumps, Trenches, and Discharge Points There is a record, in the City of Hayward Fire Department 1989 annual inspection and preliminary closure inspection, of a concrete sump used for oil for machinery and of several sumps showing a residue of oils. These sumps, according to Mr. Rich Barbour of Herrick Corporation, were very shallow in nature (estimated at 6 inches in depth), and they were located within the plant itself. At the direction of Mr. Hugh Murphy, the gear oil in the sumps was pumped out, and the sumps were removed.

Acutely Hazardous Materials Although an Acutely Hazardous Materials Registration Form from March 1988 was on file, the chemicals/processes are designated as "not applicable."

4.3.2 Alameda County Department of Environmental Health

Mittelhauser contacted the County Department of Environmental Health, requesting any available records for the Site address. The Department had no record on file of solid waste at the site, and no record of hazardous waste at the site. Because the property lies within Hayward city limits, the county does not maintain the records, but rather defers to the jurisdiction of the city of Hayward. The county records were checked to minimize the possibility of overlooking files in case the Site had previously been considered to be within the County's jurisdiction.

4.3.3 Sewer District

The County Environmental Services Inspectors were contacted on December 22, 1994, to check for industrial waste discharge permits, plans, or limitations thereof. There was no documentation of any kind in the files for the Site address. Further inquiry was referred to city of Hayward (see Section 4.3.4).

4.3.4 Wastewater/Department of Source Control

Ms. Kim Cosby, Wastewater - Department of Source Control, reported no active files on the site. Ms. Cosby then reviewed inactive files back to 1992, and provided the following information:

- There was no record of known groundwater contamination.
- There was a hazardous materials permit issued to the Herrick Group in March 1990. This permit is reportedly valid until 1995 although the property is vacant.

Further inquiries were directed to the Hazardous Materials Division (Section 4.3.1).

4.3.5 County Department of Public Works

All inquiries to the County Department of Public Works were deferred to the City of Hayward Fire Department, Hazardous Materials Division.

4.3.6 Municipal Water Management Board (MWMB)

Mrs. Edith Jacklin, of the MWMB, referred all inquiries to the City of Hayward Fire Department - Hazardous Materials Division, (Section 4.3.1). There was no record of concerns on file at the MWMB.

4.3.7 Revenue Water Office

All inquiries to the Revenue Water Office were directed to the City of Hayward Fire Department - Hazardous Materials Division (see Section 4.3.1.) and to the Department of Source Control (see Section 4.3.4).

4.4 ENVIRONMENTAL INVESTIGATIONS

There have been several investigations performed at the site. A list of key reports associated with these investigations is presented in Table 3.

Initial environmental investigations and remediation were conducted on the site after the removal of the single 2,000-gallon UST from the property in April 1986 and the discovery of hydrocarbons in surrounding soil and groundwater. Additionally, the potential for the presence of agricultural compounds due to previous Site use was addressed in this investigation. This potential issue was dismissed, with the results of the soil sampling presented by Harding Lawson Associates (HLA, 1989) which showed no evidence of the presence of agricultural chemicals.

An additional investigation and remediation was related to lead in surface and near-surface soil. The lead was reportedly introduced by outdoor spray painting of steel. DECON was retained to cleanup up the lead in soil. DECON also collected groundwater samples in October 1991 through June 1992, and from downgradient monitoring wells in July 1992. None of the groundwater samples collected showed the presence of lead; therefore, the remediation efforts were confined to soils.

In January 1995, petroleum odors were detected in one location on the Site during a geotechnical investigation. The source of those odors is being investigated and is currently being addressed.

These three investigations and subsequent remediation efforts are discussed in Sections 4.1.1 through 4.1.3 below.

4.4.1 Remediation Related to UST

The RWQCB was the lead agency for the UST remediation activity. The significant activities associated with that project included the following:

- Excavation of 15,000 cubic yards of soil; 10,000 of which was below the level designated as hazardous.
- In-situ aeration of soils which had lead concentrations below that considered hazardous.
- Removal of soils with lead concentrations above that considered hazardous.
- Installation of a groundwater interceptor trench and extraction well.
- Groundwater treatment via two 2,000-pound activated carbon absorption canisters plumbed in series.
- Effluent discharge to storm sewer.

According to the DECON 1993 report, groundwater monitoring consisted of sampling for TPH-G and BTEX in 8 wells at regular intervals between February 1989 and June 1993.

RWQCB issued a letter of closure on December 30, 1993 (see Appendix B). Having considered the Hayward Fire Department report which summarized the investigation and cleanup of hydrocarbon pollution resulting from leaks associated with a 2,000-gallon gasoline UST (which recommended closure on the case), RWQCB concurred that the case be closed. The RWQCB letter stated in part:

> ". . . based on the available information for the above site, no further investigation or cleanup of the hydrocarbon pollution associated with the tank is required. Further work may be required if conditions change or a water quality threat is discovered at the site."

4.4.2 Remediation Related to Lead in Soil

The lead contamination issue was under the jurisdiction of the Hazardous Materials Division of the Hayward Fire Department and the Alameda County Health Care Services. According to a letter dated May 18, 1990, from Harding Lawson Associates to City of Hayward Fire Department, the remediation conducted by DECON consisted of excavation of approximately 100 cubic yards (315,000 pounds) of lead-containing soil and removal and offsite disposal of the excavated soil (DECON, 1993B).

A letter from the Alameda County Health Care Services Agency, dated August 31, 1992, reviewed the prior use, post-remediation soil and groundwater sampling results, and post-remediation monitoring from the extraction well and down-gradient monitoring wells from October 1991 through June 1992 (see Appendix B). The letter granted closure with the following statement:

> "This office is satisfied with the remediation activities performed by DECON Environmental Services, Inc., to reclaim this site suitable for future human activities. The soil lead contamination has been cleaned up to below 100 mg/kg level, which is well below the current soil cleanup level for lead (250 mg/kg) recommended by Cal-EPA using the UBK model. The residual soil lead concentrations at this site dose (sic) not pose any threat to public health and therefore no further remedial actions are necessary at this time....Please be aware that this letter is limited only to the issues relating to soil lead contamination at this site. Further action may be required if information received subsequent to this letter indicates a need for it."

Based on the above information, the City of Hayward Fire Department issued a letter on September 4, 1992 to Mr. Rich Barbour at Herrick Corporation (see Appendix B). The letter stated that the Hazardous Materials Office concurred with the Alameda County Health Services Agency that:

> ". . . based on remediation done and the subsequent confirmation analytic and sampling methods, there is no threat to human health and groundwater from residual lead concentrations on site. Therefore this office has no further requirements related to soil lead contamination at this time. Should additional information be available in the future that would warrant another look at this case, this office, in conjunction with the Alameda County Health Care Services Agency, may ask Herrick Corporation to undertake further corrective action."

Confirmatory soil samples analyzed for soluble lead (WET test) were reported at 0.046, 0.07, 1.5 and 0.52 milligrams per liter. The letter went on to require that DECON furnish copies of all documents relevant to the case.

At the time the file review was conducted in December 1994, the above-referenced letters indicating satisfactory completion of remediation and subsequent closure were the most current correspondence in the file.

4.4.3 Remediation Related to Petroleum Odors - January 1995

In January 1995, Harza Corporation conducted a geotechnical investigation of the site and noticed petroleum odors from soil at a depth of approximately 11 feet below ground surface (bgs) in one of ten boring locations. The soil boring at which the petroleum odors were noticed was located toward the eastern boundary in the southern third of the Site.

DECON was retained to investigate and address the source of the odors. DECON prepared an Interim Status Report on July 11, 1995, describing activities conducted from January through June 1995, and which included excavating and segregating potentially contaminated soil, aerating soil to volatilize gasoline compounds, and removing gasoline compounds from groundwater in the area of the soil excavation. Information presented in that report is summarized below.

DECON excavated test pits to depths of 8 to 11 feet bgs at 25 foot intervals in each direction from the geotechnical soil boring location. Test pits were dug until gasoline compounds were not present in the soil and, according to DECON, a "clean sample was obtained in each direction." The final dimensions of the excavated area (or the west pit) was 60 feet x 125 feet by 12 feet deep with 1 to 2 feet of standing water. Gasoline compounds were also detected in the groundwater.

The west pit was located southwest of the former underground storage tank area which prompted DECON to review information related to the tank removal. DECON conducted test pit sampling in the vicinity of the former tank. DECON's field observations indicated gasoline compounds may be present and the area was excavated. This area was referred to as the "east pit". The concentrations of

gasoline compounds in the soil were detectable but were below the clean-up levels that were required in the UST remediation presented in Section 4.4.1 of this report. Excavation continued in the east pit until samples from the walls of the excavation showed no detectable gasoline compounds. The groundwater from the east pit showed no detectable concentrations of gasoline compounds.

The gasoline-impacted soil was aerated and the gasoline-impacted groundwater at the west pit was air sparged in the pit. With approval from the city of Hayward, the pits were, or are being, backfilled after confirmation that soil used for backfilling had no detectable concentrations of gasoline compounds (DECON 1995).

The city of Hayward has reviewed the DECON Interim Status Report. In a letter dated July 19, 1995, the city of Hayward indicated that, while they were not reopening the previous gasoline case for this site, they require that the following actions be taken: 1) backfilling must meet city of Hayward requirements, 2) soils identified with detectable concentrations of gasoline constituents cannot not be returned to the excavation until a plan of confirmation sampling is approved, 3) a temporary well that was installed by DECON must be destroyed under permit, and 4) a final report must be submitted to the city of Hayward summarizing all activities and disposal of wastes. As indicated in a letter dated July 20, 1995, from DECON to Herrick Corporation, the four issues listed above are being addressed and will be described in a final report. The final report is currently expected to be completed in early August 1995.

4.5 CURRENT COMPLIANCE STATUS

Currently, there are no compliance requirements applicable as there are no operations on Site. Because there is currently no industrial activity or construction at the Site, a Storm Water Pollution Prevention Plan (SWPPP) is also not required.

Historical compliance status on storage tanks, hazardous materials, sumps, trenches and discharge points, and other site operations are discussed in Section 4.3.1.

5.0 SITE INSPECTION

5.1 THE SITE

Site inspections were conducted on December 30, 1994, and January 19, 1995, to delineate any visually identifiable environmental concerns or impairments. At the Site, Mittelhauser interviewed Mr. Rich Barbour of the Herrick Corporation. Photographs of the Site are described below and shown in Appendix C; they are referenced as P1, P2, P3, et. cetera. Figure 2 is a site plan. Figure 3 is a sketch of the locations (shown as P1, P2, P3, et. cetera) at which the corresponding photographs were taken.

At the time of the inspections, the Site was vacant; there were no structures on the Site. The Site surface included vegetated areas, puddled water and mud; concrete slabs; cracked asphalt; and portions of old roadbed, soil, and gravel. The site vegetation appeared healthy (eucalyptus trees, ice plant, grass, and briars), except for dead weeds, particularly in the north end of the Site. Mr Barbour reported that, at the request of the city of Hayward, the weeds had been treated with the herbicides, Roundup and Oust. As the site inspection occurred during the rainy season, there were several puddles of standing water on the Site such as that shown in P1. Only one of the puddles was observed to have any type of surface film; this occurred in a small puddle near one of the sumps, discussed below.

Surface runoff from the Site was accommodated by a trench between the Site boundary and the railroad tracks, running parallel to the tracks, on the east boundary. To the west, there is a slight drop to the roadway at Clawiter Road. To the south, a large ditch has been excavated to accommodate a major sewer line being installed by the city of Hayward in a right-of-way granted by Herrick Corporation. It appeared unlikely that there would be storm water flow onto the property from adjacent properties.

P2 shows concrete grids which were reportedly used as patterns during steel fabrication. P3 shows one of six similar gaps in the cement through which weeds had grown. These gaps were in a linear array, and as shown in P3, were accessed by a pipe; the pipe follows the seam in the concrete. Mr. Barbour indicated those pipes were electrical conduits.

The area shown in P4 is just north of the site of the former underground storage tank. Mr. Barbour indicated that this pad may have been broken in the remediation process in order to better determine the extent of soil contamination. Adjacent to P4 was P5, where there was minor staining of the concrete surface, which was very localized (most of the staining is shown in the photograph.)

Two subsurface structures that appeared to be sumps were observed on the property. The structure shown in P6 was approximately 18 inches to 20 inches deep, as measured by Mr. Barbour, and contained an oily substance. He reported that the structure was used for water runoff from a plate shear machine. Next to P6 was a grate, at P7. It was near these two structures that very minor (less than 3 centimeters in diameter) "rainbow" sheens were observed in puddles on the Site. It should be noted that since the time of the site inspections, the sump in P6 has been removed and a soil sample was collected from beneath the removed sump by DECON (as part of their field work described in Section 4.4.3). The soil sample was analyzed for total oil and grease; results showed 740 mg/kg of oil and grease. In March 1995, approximately 20 cubic yards of soil were excavated; the final DECON report (expected in early August 1995) should include results of confirmation sampling from this excavation. According to Mr. Barbour, the grate in P7 has also been removed.

The structure shown in P8 was under approximately 6 inches of water at the time of the Site inspection. According to Mr. Barbour, the steel plates shown in P8 covered a concrete sump which was constructed at the low point in the property to control storm water. Water was collected in the sump and then pumped out. According to

Mr. Barbour, this structure has also been removed since the time of the site investigations.

Debris was observed along the SP rail tracks in two areas, at P9 and P10. At the location of P9 at the time of the inspection, Mr. Barbour indicated that this debris was attributable to the current storm sewer activity along the city of Hayward right-of-way, discussed below. At P10, there was gravel with metal debris ("shavings"), truck tires, and some partially crushed containers (approximately a 15-gallon volume). According to Mr. Barbour, it was common practice to intermix steel shavings off the shop floor with gravel, to cope with muddy ground. To the best of his knowledge, the metal debris seen is all from the shop floor. At the time of the site inspections, the truck tires and container debris were scheduled for removal in the near future.

P11 shows the eastern margin of the Site, adjacent to Clawiter Road. Just east of this field of view, debris and construction materials were observed. Near the Enterprise Road access gate to the property, debris dumped on the Site included a refrigerator, window valances, a child's plastic pool, carpet remnants, and other miscellaneous debris. At the site inspection on January 17, 1995, Mr. Barbour indicated that these would be removed in the near future.

One aspect of the site inspection was to observe, if possible, anomalous conditions identified in the review of historical aerial photographs. The historical aerial photographs showed debris by the SP tracks, localized changes in soil color, and what appeared to be road oiling that merited attention during the site inspection. The debris was observed in the site inspection and is discussed above. Based on the site inspection, differences in soil color observed in aerial photographs could be attributed in part to thin veneers of asphalt applied locally and in part to road oiling. According to Mr. Barbour, road oiling for dust-settling purposes was conducted on the Site on numerous occasions throughout Herrick's ownership. Road oiling activities are generally not considered to pose a significant threat to health or environment. In addition to road oiling on the site, there were also some areas where roadbeds were

installed as shown by the remnant in P5. A second possible cause of the color variation observed during the site investigations is the presence of narrow drainage ditches which are found in a somewhat random pattern on the southern third of the property (see P12 and P13).

While this ESA did not address PCBs and asbestos during the site inspections, no transformers were seen on the site. High power lines were not observed at or adjacent to the Site. There was no visible evidence of pipe casings, remnants or insulation, or demolition debris which would be expected to contain asbestos. The two locations of aboveground storage tanks identified in the HMMP are no longer within the Site boundary.

5.2 ADJACENT PROPERTIES

To the east, the entire site boundary is parallelled by the SP railroad tracks. To the south is the Gillig Corporation, manufacturers of buses. To the west, across Clawiter Road, are office buildings, including City Hall. Mittelhauser saw no visible indication of significant hazardous materials use or storage on properties adjacent to the Site. There were no visible indications of USTs adjacent to the property.

While there was some debris along the SP rail tracks, the general appearance of the adjacent properties did not suggest any environmental concerns. To the south, the sewer line construction did not suggest environmental concerns within the scope of this ESA.

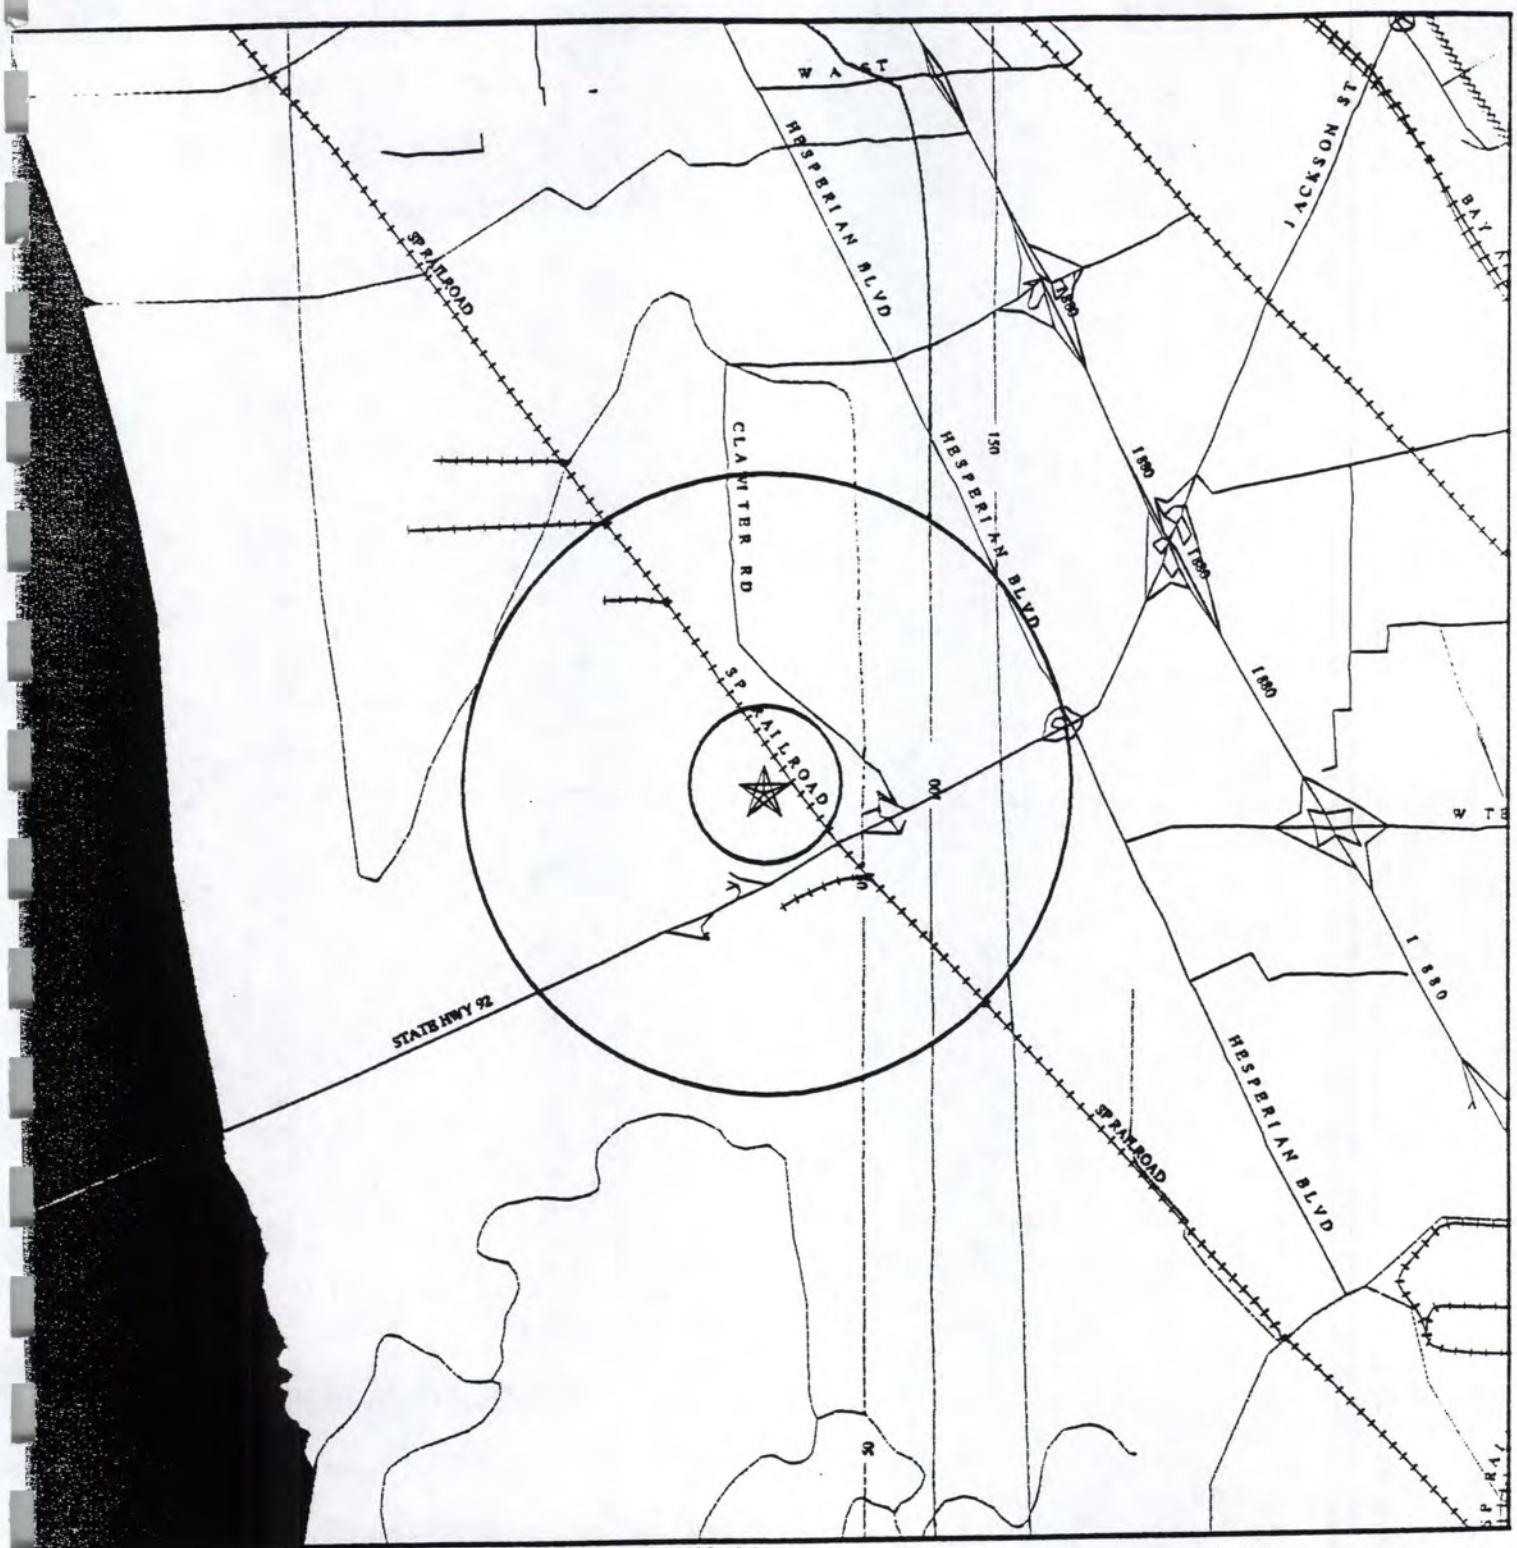
It should be noted that even though there was no obvious significant hazardous waste activity observed on the immediately adjacent properties, this region of the city of Hayward is known to have a number documented releases of chlorinated solvents and fuel leaks which have impacted shallow soil and groundwater. Some of the sources of these releases have been positively identified and some have not.

In an effort to ascertain the source of solvent and hydrocarbon releases on the property which lies to the immediate west of the Site, Mittelhauser, working for a nearby property owner, conducted a soil gas survey which focused on the occurrence of several solvents and hydrocarbons. That survey, which used buried, passive soil gas collection devices, suggested that soil gas anomalies for benzene and tetrachloroethylene existed in the vicinity of the Hayward City Hall, which is located on the other side of Clawiter Road, to the west of the Site. Based on information available from other nearby studies, this area is generally expected to be in a downgradient direction from the Site. Tests for these substances at the Site showed no traces of the constituents.

It should be further noted that passive soil gas readings are not "direct reading indicators" of contamination. The anomalies noted may, or may not, correlate to positive findings of these compounds in soil or groundwater. An actual investigation to confirm or refute the presence of these compounds, either on the Site, or from sources upgradient from this Site, is beyond the scope of this ESA.

6.0 CONCLUSIONS

The following environmental concerns were noted in conducting this ESA.



- The three presumably upgradient sites reported in the EDR Radius Map report could have the potential to impact the Site if a release(s) had occurred at any of these sites. The scope of this study did not allow a detailed assessment of the likelihood that soil and/or groundwater at the Site has been or could be impacted by possible releases at these offsite locations.
- Localized staining was observed at the Site, such as that shown in P5. Although this appears to be localized and possibly minor in nature, sampling was not conducted at this Site for this ESA to assess the possible impact.
- A soil gas survey, conducted on the west side of Clawiter Road suggests that local spillage along that roadway or the possible presence of onsite or offsite upgradient releases.

7.0 LIMITATIONS

This report was prepared for the use of Edward Pike and the Herrick Corporation. The content and conclusions provided by Mittelhauser in this assessment are based on information collected during our investigation, including, but not limited to, visual site inspections; interviews with site owners/knowledgeable individuals; inquiries of regulatory agencies at local, state and federal levels; and review of existing investigative reports and other public documents. Subsurface exploration and laboratory testing of soil and groundwater samples and evaluation and sampling of building materials for asbestos was not included in this project's scope of work. The determination of potential impact to the subject site through surface or groundwater flow is based on the presumed direction of groundwater flow. If future subsurface or other conditions are revealed which vary from these presumptions, the newly-revealed conditions must be evaluated and may invalidate the conclusions of this report.

This report has been prepared in accordance with generally accepted practices, using ASTM standards as guidelines for scope of due diligence, normally practiced by recognized consulting firms performing services of a similar nature. Mittelhauser is not responsible for the accuracy and completeness of information provided by other individuals or entities which are used in this report. This report presents our professional judgement based upon data and findings identified in this report and the interpretation of such data based upon our experience and background, and no warranty, or prediction of future conditions, either expressed or implied, is made.

TABLES

TABLE 1
FACT SHEET

SITE: Property at 25450 Clawiter Road, Hayward California

Address: 25450 Clawiter Road, Hayward, California 94540

County: Alameda

Parcel #: A.P.N. 439-008-001, A.P.N. 439-0080-02, A.P.N. 0080-003-11
Current Owner: Herrick Corporation

Site contact: Mr. Rich Barbour

Current Property Use: Vacant

Total # of acres: Approximately 25

Total # of buildings: 0

Date buildings were originally constructed: 1957

Date buildings were destroyed: 1991

The subject property obtains its potable water from municipal sources

The subject property disposed of its sewage through use of the city system.

Mittelhauser CORPORATION

TABLE 2
LIST OF AGENCIES CONTACTED

The following local agencies' records were reviewed:

CITY OF HAYWARD

• Fire Department, Hazardous Materials Division, Located at City Hall, Hayward, CA Hugh Murphy, Mgr.	(510) 293-8695
• Building Dept. Located at City Hall, Hayward, CA Ms. Terry Collins	(510) 293-5250
• Source Control Wastewater Dept. Enterprise Ave., Hayward, CA Ms. Kim Cosby	(510) 293-8699
• Sanitation Agency	(510) 293-8650
• Municipal Water Management Board Edith Jacklin	(510) 293-5134
• Revenue Water Office/Source Control	(510) 293-8699

COUNTY OF ALAMEDA

• Dept. of Environmental Health Services	(510) 567-6790
• County Sanitation District Environmental Services Inspectors	(510) 567-6700
• Operations Division	(510) 670-5275
• Dept. of Public Works	(510) 670-5480
transferred to Hazardous Waste Mgmt	(510) 639-2481
# changed to	(510) 614-1699
deferred to (disconnected #)	(510) 464-1255
deferred to	(510) 639-2481
That # changed to	(510) 614-1699
transferred to Permit Section	(510) 670-5430
transferred to John Rogers	(510) 670-5429
transferred to City Of Hayward.	
• Public Health- Deferred to: Dept. of Environmental Health Services	(510) 567-6790

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Elapsed ASTM days: Provides confirmation that this EDR report meets or exceeds the 90-day updating requirement of the ASTM standard.

FEDERAL ASTM RECORDS:

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System
Source: EPA/NTIS
Telephone: 703-416-0702
CERCLIS: Comprehensive Environmental Response, Compensation and Liability Information System. CERCLIS contains information on sites identified by the USEPA as abandoned, inactive or uncontrolled hazardous waste sites which may require cleanup.

Date of Government Version: 06/30/94
Date Made Active at EDR: 09/20/94
Date of Data Arrival at EDR: 07/19/94
Elapsed ASTM days: 63

ERNS: Emergency Response Notification System
Source: EPA
Telephone: 202-260-2342
ERNS: Emergency Response Notification System. ERNS records and stores information on reported releases of oil and hazardous substances.

Date of Government Version: 04/01/94
Date Made Active at EDR: 05/25/94
Date of Data Arrival at EDR: 04/11/94
Elapsed ASTM days: 44

NPL: National Priority List
Source: EPA
Telephone: 703-603-8852
NPL: National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program.

Date of Government Version: 08/23/94
Date Made Active at EDR: 11/28/94
Date of Data Arrival at EDR: 10/17/94
Elapsed ASTM days: 42

RCRIS: Resource Conservation and Recovery Information System
Source: EPA/NTIS
Telephone: 202-260-3393
RCRIS: Resource Conservation and Recovery Information System. RCRIS includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA).

Date of Government Version: 07/01/94
Date Made Active at EDR: 11/02/94
Date of Data Arrival at EDR: 10/05/94
Elapsed ASTM days: 28

STATE OF CALIFORNIA ASTM RECORDS:

CAL-SITES (AWP): Annual Workplan
Source: California Environmental Protection Agency
Telephone: 916-255-2002
CAL-SITES (AWP): Known Hazardous Waste Sites. California DTSC's Annual Workplan (AWP), formerly BEP, identifies known hazardous substance sites targeted for cleanup.

Date of Government Version: 06/30/93
Date Made Active at EDR: 01/19/94
Date of Data Arrival at EDR: 12/27/93
Elapsed ASTM days: 23

CAL-SITES (ASPIS): Calsites
Source: Department of Toxic Substance Control
Telephone: 916-323-3400
CAL-SITES (ASPIS): Known and Potential Hazardous Waste Sites. CAL-SITES, formerly ASPIS, contains both known and potential hazardous substance sites.

Date of Government Version: 08/29/94
Date Made Active at EDR: 11/28/94
Date of Data Arrival at EDR: 09/20/94
Elapsed ASTM days: 69

CHMIRS: California Hazardous Material Incident Report System
Source: Office of Emergency Services
Telephone: 916-262-2868
CHMIRS: California Hazardous Material Incident Reporting System. CHMIRS contains information on reported hazardous material incidents (accidental releases or spills).

Date of Government Version: 12/31/91
Date Made Active at EDR: 11/05/92
Date of Data Arrival at EDR: 08/08/92
Elapsed ASTM days: 89

CORTESE: Cortese
Source: CAL EPA/Office of Emergency Information
Telephone: 916-327-1848
CORTESE: Identified Hazardous Waste and Substance Sites. The database identifies public drinking water wells with detectable levels of contamination, hazardous substance sites selected for remedial action, sites with known toxic material identified through the abandoned site assessment program, sites with USTs having a reportable release and all solid waste disposal facilities from which there is known migration.

Date of Government Version: 07/31/92
Date Made Active at EDR: 08/02/93
Date of Data Arrival at EDR: 05/06/93
Elapsed ASTM days: 88

LUST: Leaking Underground Storage Tank Information System
Source: State Water Resources Control Board
Telephone: 916-445-6532
LUST: Leaking Underground Storage Tank Incident Reports. LUST records contain an inventory of reported leaking underground storage tank incidents. Not all states maintain these records, and the information stored varies by state.

Date of Government Version: 05/31/94
Date Made Active at EDR: 08/17/94
Date of Data Arrival at EDR: 08/01/94
Elapsed ASTM days: 16

NOTIFY 65: Proposition 65
Source: State Water Resources Control Board
Telephone: 916-657-0696
NOTIFY 65: Proposition 65 Notification Records. NOTIFY 65 contains facility notifications about any release which could impact drinking water and thereby expose the public to a potential health risk.

Date of Government Version: 10/21/93
Date Made Active at EDR: 11/19/93
Date of Data Arrival at EDR: 11/01/93
Elapsed ASTM days: 18

SWAT: Solid Waste Assessment Test Program
Source: State Water Resources Control Board
Telephone: 916-227-4448
SWAT: Solid Waste Activity Tracking. SWAT contains information on ground water monitoring of sanitary landfills.

Date of Government Version: 08/19/94
Date Made Active at EDR: 11/02/94
Date of Data Arrival at EDR: 09/01/94
Elapsed ASTM days: 62

FEDERAL NON-ASTM RECORDS:

FINDS: Facility Index System
Source: EPA/NTIS
Telephone: 800-908-2493
FINDS: Facility Index System. FINDS contains both facility information and "pointers" to other sources that contain more detail. These include: RCRIS, PCS (Permit Compliance System), AIRS (Aerometric Information Retrieval System), FATES (FIFRA [Federal Insecticide Fungicide Rodenticide Act] and TSCA Enforcement System, FTTS [FIFRA/TSCA Tracking System]), CERCLIS, DOCKET (Enforcement Docket used to manage and track information on civil judicial enforcement cases for all environmental statutes), FURS (Federal Underground Injection Control), FRDS (Federal Reporting Data System), SIA (Surface Impoundments), CICIS (TSCA Chemicals in Commerce Information System), PADS, RCRA-J (medical waste transporters/disposers), TRIS and TSCA.

Date of Government Version: 09/14/93 Date of Next Scheduled Update: 03/13/95

PADS: PCB Activity Database System
Source: EPA
Telephone: 202-260-3992
PADS: PCB Activity Database. PADS identifies generators, transporters, commercial storers and/or brokers and disposers of PCB's who are required to notify the EPA of such activities.

Date of Government Version: 07/11/94 Date of Next Scheduled Update: 12/19/94

RAATS: RCRA Administrative Action Tracking System
Source: EPA
Telephone: 202-260-2810
RAATS: RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA.

Date of Government Version: 04/06/94 Date of Next Scheduled Update: 04/01/95

TRIS: Toxic Chemical Release Inventory System
Source: EPA/NTIS
Telephone: 202-260-2320
TRIS: Toxic Release Inventory System. TRIS identifies facilities which release toxic chemicals to the air, water and land in reportable quantities under SARA Title III Section 313.

Date of Government Version: 12/31/91 Date of Next Scheduled Update: 10/02/95

TSCA: Toxic Substances Control Act
Source: EPA/NTIS
Telephone: 202-260-1444
TSCA: Toxic Substances Control Act. TSCA identifies manufacturers and importers of chemical substances included on the TSCA Chemical Substance Inventory list. It includes data on the production volume of these substances by plant site. USEPA has no current plan to update and/or re-issue this database.

Date of Government Version: 05/15/86 Date of Next Scheduled Update: 03/13/95

HMIRS: Hazardous Materials Information Reporting System
Source: U.S. Department of Transportation
Telephone: 202-366-4555
HMIRS: Hazardous Materials Incident Report System. HMIRS contains hazardous material spill incidents reported to DOT.

Date of Government Version: 06/30/93 Date of Next Scheduled Update: 05/02/95

NPL LIENS: Federal Superfund Liens
Source: EPA
Telephone: 202-260-3733
NPL LIENS: Federal Superfund Liens. Under the authority granted the USEPA by the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA) of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner receives notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Date of Government Version: 10/15/91 Date of Next Scheduled Update: 04/18/95

SWF/LS (SWIS): Solid Waste Information System
Source: Integrated Waste Management Board
Telephone: 916-255-2248
SWF/LS (SWIS): Active, Closed and Inactive Landfills. SWF/LS records typically contain an inventory of solid waste disposal facilities or landfills. These may be active or inactive facilities or open dumps that failed to meet RCRA Section 2004 criteria for solid waste landfills or disposal sites.

Date of Government Version: 03/01/93
Date Made Active at EDR:
Date of Data Arrival at EDR: 04/27/93
Elapsed ASTM days: 62

TOXIC PITS: Toxic Pits
Source: State Water Resources Control Board
Telephone: 916-227-4396
TOXIC PITS: Toxic PITS Cleanup Act Sites. TOXIC PITS identifies sites suspected of containing hazardous substances where cleanup has not yet been completed.

Date of Government Version: 09/15/94
Date Made Active at EDR: 12/30/94
Date of Data Arrival at EDR: 09/27/94
Elapsed ASTM days: 94

UST: Hazardous Substance Storage Container Database
Source: State Water Resources Control Board
Telephone: 916-227-4319
UST: Registered Underground Storage Tanks. UST's are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA) and must be registered with the state department responsible for administering the UST program. Available information varies by state program.

Date of Government Version: 10/15/90
Date Made Active at EDR: 02/12/91
Date of Data Arrival at EDR: 01/25/91
Elapsed ASTM days: 18

BEP: Bond Expenditure Plan
Source: Department of Health Services
Telephone: 916-255-2002

Date of Government Version: 01/01/89
Date Made Active at EDR: 08/02/94
Date of Data Arrival at EDR: 07/27/94
Elapsed ASTM days: 6

STATE OF CALIFORNIA NON-ASTM RECORDS:

HWIS: Hazardous Waste Information System
Source: California Environmental Protection Agency
Telephone: 916-324-0659
HWIS: Hazardous Waste Information System. HWIS identifies hazardous waste generators and hazardous waste treatment, storage, and disposal facilities in the state of California.

Date of Government Version: 12/31/93
Date of Next Scheduled Update: 06/19/95

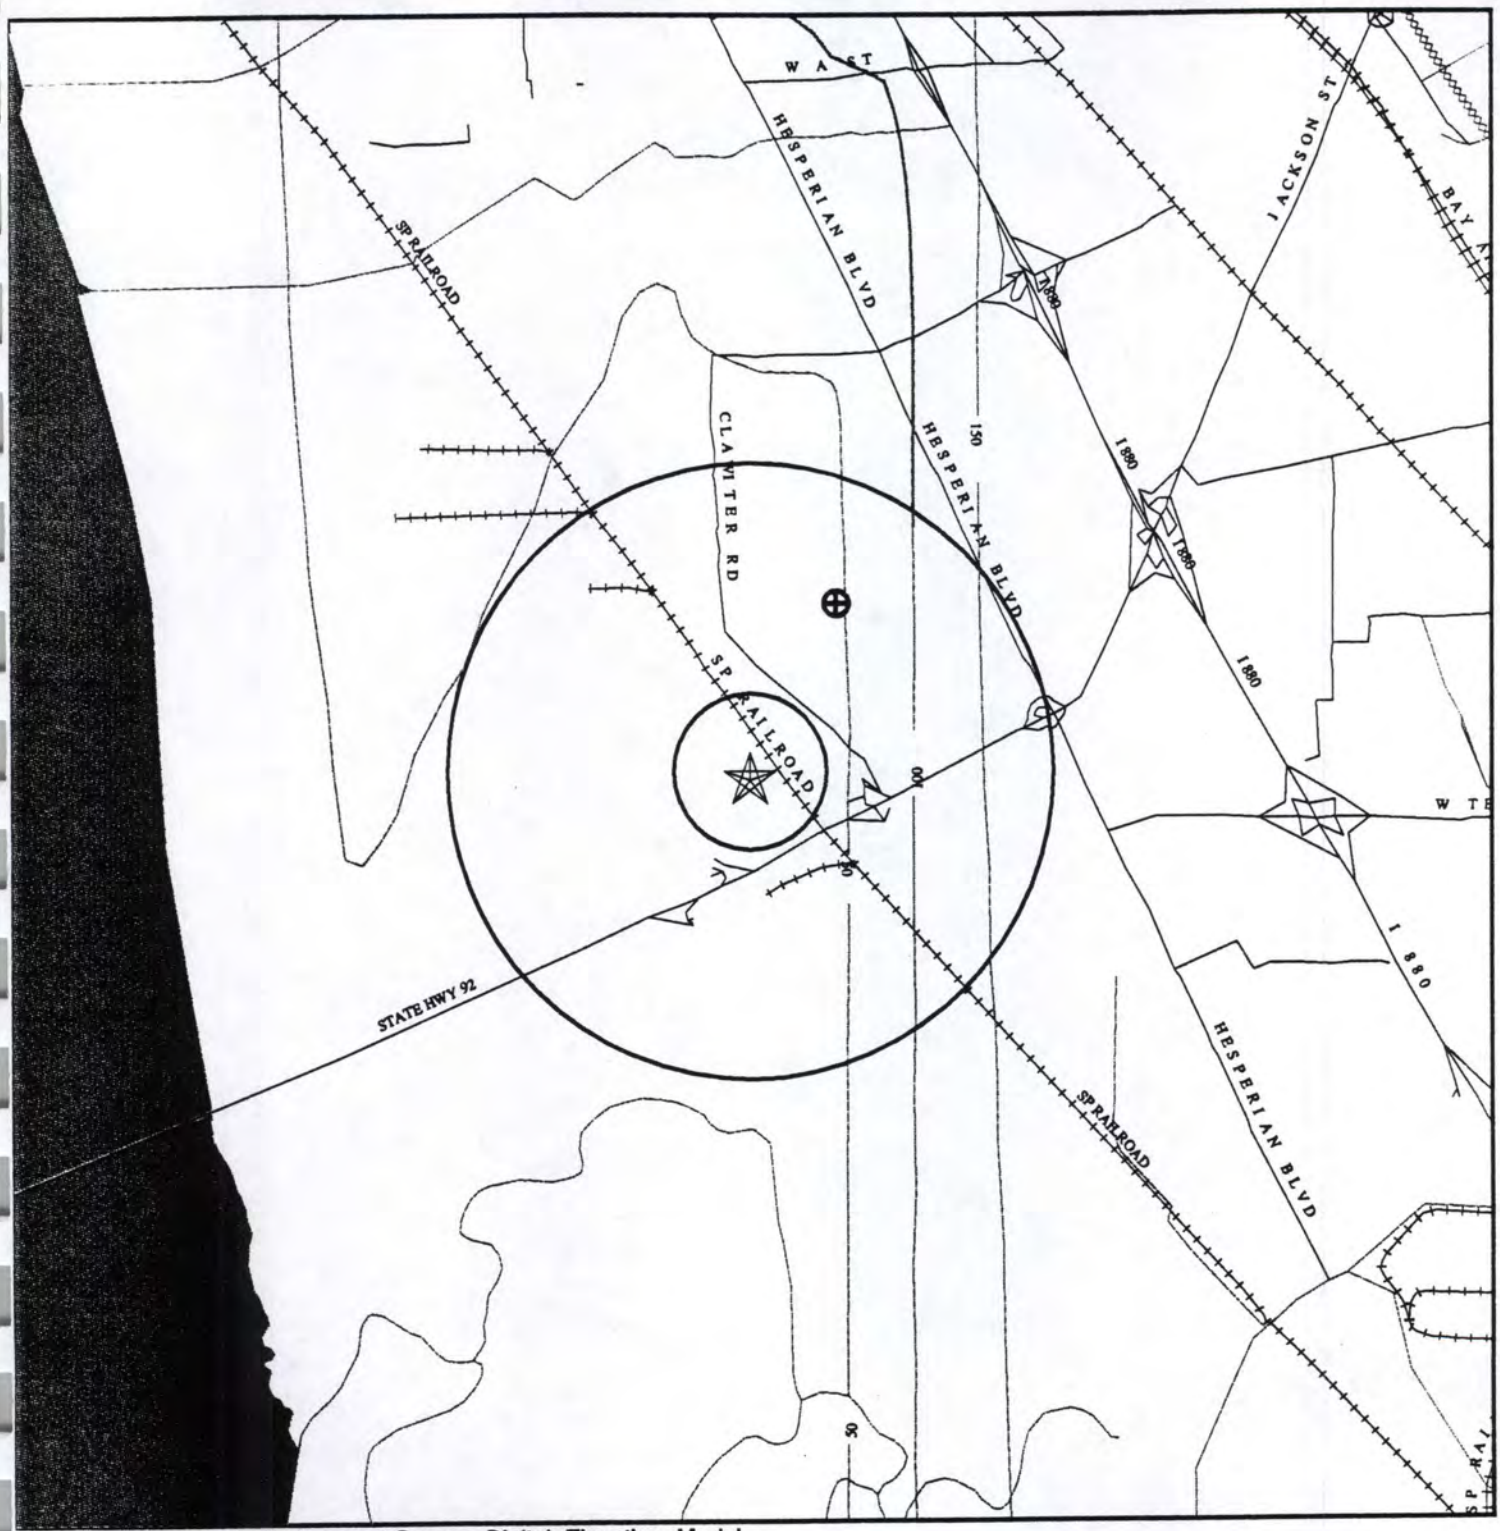
Historical and Other Database(s)

Former Manufactured Gas (Coal Gas) Sites: The existence and location of Coal Gas sites is provided exclusively to EDR by Real Property Scan, Inc. ©Copyright 1993 Real Property Scan, Inc. For a technical description of the types of hazards which may be found at such sites, contact your EDR customer service representative.

Disclaimer Provided by Real Property Scan, Inc.

The information contained in this report has predominantly been obtained from publicly available sources produced by entities other than Real Property Scan. While reasonable steps have been taken to insure the accuracy of this report, Real Property Scan does not guarantee the accuracy of this report. Any liability on the part of Real Property Scan is strictly limited to a refund of the amount paid. No claim is made for the actual existence of toxins at any site. This report does not constitute a legal opinion.



Area Radon Information: The National Radon Database has been developed by the U.S. Environmental Protection Agency (USEPA) and is a compilation of the EPA/State Residential Radon Survey and the National Residential Radon Survey. The study covers the years 1986 - 1992. Where necessary data has been supplemented by information collected at private sources such as universities and research institutions.

FRDS: Federal Reporting Data System
Source: EPA/Office of Drinking Water
FRDS provides information regarding public water supplies and their compliance with monitoring requirements, maximum contaminant levels (MCL's), and other requirements of the Safe Drinking Water Act of 1986.

Oil/Gas Pipelines/Electrical Transmission Lines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines and electrical transmission lines.

Earthquake Fault Lines in California: The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines, prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

EPA Waste Codes Addendum

Code	Description
D001	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.
D002	A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.
F003	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
F005	THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

P. O. Box 3007
Hayward, CA 94540

Subject: UST case closure for Herrick Corporation, 25450 Clawiter Road, Hayward, California.

Dear Mr. Barbour:

The Hayward Fire Department (HFD) has submitted a report which summarizes the investigation and cleanup of hydrocarbon pollution resulting from leaks associated with a 2000 gallon gasoline Underground Storage Tank (UST) at the above mentioned site. The HFD recommends that the case be closed. Regional Board staff have reviewed the report and concur with the recommendation. Therefore, based on the available information for the above site, no further investigation or cleanup of the hydrocarbon pollution associated with the Tank is required. Further work may be required if conditions change or a water quality threat is discovered at the site.

Please contact Sumadhu Arigala at (510)-286-0434, if you have any questions.

Sincerely,

Lawrence P. Kolb
for
Steven R. Ritchie,
Executive Officer.

P.O. Box 9125
Pleasanton, CA 94566

Dear Mr. Barbour:

Subject: Final Report, Lead Remediation Project
Herrick Corporation, 25450 Clawiter Road, Hayward

I have reviewed the subject lead contamination case with Dr. Ravi Arulanantham of the Alameda County Health Care Services Agency. I have also received Dr. Arulanantham's letter dated August 31, 1992. The Hazardous Materials Office concurs with Dr. Arulanantham that based on remediation done and the subsequent confirmation analytic and sampling methods, there is currently no threat to human health and groundwater from residual lead concentrations on site. Therefore, this office has no further requirements related to soil lead contamination on this site, at this time.

Should additional information be available in the future that would warrant another look at this case, this office, in conjunction with the Alameda County Health Care Services Agency, may ask Herrick Corporation to undertake further corrective action.

To complete our records of activities on this site, to date, Decon Environmental must provide this office with copies of all documents they may have related to this case.

If you have any questions, please call me at (510) 293-5454. Once again, thank you for your efforts on this matter.

Sincerely,

Hugh Murphy
Environmental Specialist

**RE: FINAL REPORT, LEAD REMEDIATION PROJECT
HERRICK FABRICATION FACILITY, HAYWARD, CALIFORNIA**

Dear Mr. Jacobsen:

This office has reviewed your final report on lead remediation at the Herrick facility located at 25450 Clawiter Road, Hayward. The Herrick Corporation used this site for the storage of steel beams, steel cutting, welding and machining. The site was also used for outdoor spray painting of steel during the late 1970's and early 1980's which resulted in surface and near-surface soil contamination with lead.

This office is satisfied with the remediation activities performed by DECON Environmental Services, Inc., to reclaim this site suitable for future human activities. The soil lead contamination has been cleaned to below 100 mg/kg level, which is well below the current soil cleanup level for lead (250 mg/kg) recommended by Cal-EPA using the UBK model. The residual soil lead concentrations at this site dose not pose any threat to public health and therefore no further remedial actions are necessary at this time.

The four confirmatory soil samples analyzed for soluble lead (WET test) were 0.046, 0.07, 1.5 and 0.52 mg/L. Groundwater samples collected from the extraction well from October 1991 through June 1992 and from the down-gradient monitoring wells in July 1992 did not show the presences of any lead in the shallow groundwater. Considering both the chemical properties of lead in soils and that this was an open site for over a decade and exposed to natural conditions it is reasonable to assume that the residual lead may not be a threat to the groundwater quality.

Please be aware that this letter is limited only to the issues relating to soil lead contamination at this site. Further action may be required if information received subsequent to this letter indicates a need for it.

HERRICK STEEL CORPORATION
FINAL REPORT
AUGUST 28, 1995

1.0 Executive Summary

The Herrick Steel Corporation property in Hayward, California had been the subject of a major soil and groundwater remediation program from 1990 to 1992. Early in 1995, one soil sample that appeared to contain petroleum odors was encountered during a geotechnical investigation at the subject site.

Soil in the vicinity of this boring was excavated, sampled and aerated as necessary to reduce the concentrations of gasoline compounds to below detectable levels (i.e., below the method detection limits for TPH gasoline and BTEX compounds). Groundwater entering the open excavation was treated by in situ air sparging to non-detect levels and discharged into the Hayward sanitary sewer system.

A second area, adjacent to the former underground gasoline tank, was also excavated and treated as described above. All final confirmation samples from this area (called the east pit) were also found to contain no detectable concentrations of TPH-Gasoline or BTEX compounds.

Both excavations were backfilled to grade in accordance with a grading permit obtained from the City of Hayward Public Works Department.

2.0 Background

The former Herrick Steel Corporation fabrication facility (Herrick) in Hayward, California, was the subject of an environmental remediation project to remove gasoline compounds from soil and groundwater beneath a portion of the property identified by Harding Lawson Associates. This work, performed by DECON Environmental Services, Inc. (DECON) from 1990 to 1992, involved the on-site cleanup of soil by excavation/aeration and of groundwater by extraction/carbon adsorption. DECON's work is summarized in a report prepared by Gary D. Lowe, a California Registered Geologist and Certified Engineering Geologist (C.E.G.), doing business as H_20GEOL A Groundwater Consultancy, dated December 14, 1992. This report was reviewed and approved by the Hayward Fire Department and the Regional Water Quality Control Board (RWQCB). Case closure for this site was granted by the RWQCB in February of 1993.

On January 18, 1995, DECON was informed by Herrick that a potential "hot spot" was discovered by Harza Corporation while an investigation was being performed to facilitate sale of the property to a developer. Harza's field notes indicated that a soil sample with "petroleum odors" was collected from one of the 10 boring locations at a depth of 11 feet below ground surface (bgs), i.e., near the groundwater interface. Based on the fact that a "hot spot" of 20 feet by 25 feet was discovered around one of the monitoring wells (MW-5) during the original groundwater remediation program, DECON elected to excavate and "chase" the potential contamination in the same manner that worked well to clean up the area surrounding MW-5.

This report is presented in three sections (including the Introduction). Section 2.0 describes the field work performed, under the direction of Gary D. Lowe, C.E.G., by DECON. Section 3 describes the activities performed in conjunction with Mittelhauser Corporation, consultant to the bank that will finance the developer. Appendix A contains the interim and final confirmation sampling data, certificates of analysis, and chain of custody documentation for the soil and groundwater samples collected during

the additional gasoline odor remediation aspect of this project. Appendix B contains Sewer Discharge Permits. Appendix C contains soil compaction reports. Appendix D contains laboratory reports and chain of custody documentation for the soil samples collected in conjunction with activities performed by Mittelhauser Corporation.

3.0 Description of Field Work

This section describes the activities performed to excavate and segregate potentially contaminated soil, aerate the soil to volatilize any gasoline compounds that may be present, and remove any gasoline compounds that may be present in the groundwater.

3.1 Initial "Hot Spot" Excavation

DECON mobilized a backhoe to the Herrick site on January 25, 1995, and began excavating at the location identified by Harza as "EB-1." Excavated soil was placed in two separate stockpiles (Figure 1), one for clean soil and one for soil that smelled of fuel compounds and/or appeared greenish. No soil exhibiting any evidence of petroleum contamination was placed in the clean stockpile. Soil from the top 8 feet of the excavation was clean; soil from depths greater than 8 feet below ground surface (bgs) appeared to contain fuel compounds and was stockpiled on visqueen. Groundwater was encountered at approximately 9 feet bgs.

The original excavation covered an area approximately 20 feet x 25 feet x 11 feet deep. Groundwater collecting in the excavation was pumped into a 6500-gallon poly storage tank to facilitate excavation of soil beneath the current water table. On January 26 four soil samples and one water sample were collected and submitted to a state-certified laboratory for analysis of TPH-Gasoline (TPH-G) and BTEX.

The soil samples were found to contain TPH-G at concentrations ranging from ND (<0.5 ppm) to 33 ppm and BTEX compounds at concentrations ranging from ND (at variable detection limits, see table) up to 1.4 ppm xylene. The water sample collected from the

poly tank contained TPH-G at 5 ppm and BTEX compounds at ND, ND, 0.14, and 0.21 ppm (respectively). The locations of these (and other) samples collected during the project are shown in Figures 2, 3, and 4. Certificates of analysis and chain of custody documentation for this sampling event are included in Appendix A.

3.2 Test Pit Sampling

The results of this sampling event and our field observations indicated that low levels of gasoline compounds were present in the soil at depths of 8 to 11 feet bgs over a larger area than originally anticipated. The depths appear to correlate with the seasonal fluctuations of the water table, indicating that the gasoline compounds may have been carried by groundwater and deposited in the "smear zone" between the high and low water levels. The affected area is generally down gradient but tangential to the area excavated during the soil remediation project in 1990.

In order to gather some information on the lateral extent of the affected area, DECON used the backhoe to collect samples of soil from the "smear zone" at 25-foot intervals surrounding the open excavation. Test pits were dug down to the saturated soil on February 8 at locations determined by "stepping out" from the excavated area 25 feet in each direction. If field observations indicated the presence of gasoline compounds in a given sample, the backhoe would move out an additional 25 feet in the same direction and dig another test pit. This process was continued until a clean sample was obtained in each direction.

Figure 2 shows the locations of these test pits in relation to the original excavation and the ensuing larger excavation. The test pit results defined an affected area that was approximately 50 feet x 125 feet.

Based on this information, DECON reviewed the original site investigation reports for this facility dating back to the tank removal in 1986. Although these reports did not yield any conclusive information regarding the discovery of this new area, they did suggest that it would be prudent ot investigate the area

surrounding the original underground tank pit in a similar fashion. This work is described below in Section 2.4.

3.3 Expanded Excavation/Standing Water Sparging

Based on the information gathered from excavating ten test pits as described above, DECON developed a modified approach for cleanup of soil and groundwater in the affected 50 foot x 125 foot area. This approach involved excavating the entire area down to two feet below the current level at which groundwater is first encountered (i.e., 10 to 11 feet bgs), segregating the soil into two stockpiles using field observations as described above. This approach is the same as that originally developed for soil remediation, only on a larger scale.

The approach for groundwater cleanup changed based on the significant increase in the volume of water involved. In order to treat the 50,000 or more gallons of water potentially containing gasoline compounds while meeting the objectives listed in Section 1, DECON recommended air sparging to strip the gasoline compounds from the groundwater residing in the open excavation. The treated water would be sampled and analyzed to confirm that it was clean and would then remain in the excavation while it was being backfilled. Crushed rock would be used at the base of the excavation to create a stable platform from which the clean soil could be properly compacted to backfill the remainder of the excavation.

This approach was presented to and approved by Herrick on February 14 and February 16, 1995, respectively. DECON began to expand the excavated area as described above on February 20. Excavation and segregation of the soil continued until March 3, when field observations indicated that no gasoline compounds remained in the soil. This excavation (called the west pit) measured approximately 60 feet x 125 feet x 12 feet deep and contained one to two feet of standing groundwater. Figure 1 shows the locations of the excavation, stockpile of clean overburden, and stockpiles of soil that appeared to contain gasoline compounds.

Six soil samples were collected from the sidewalls of the excavation at 8 to 11 feet bgs on April 18. All six samples were

analyzed for gasoline compounds and found to contain ND <1 ppm, i.e., <1000 *ug*/kg (ppb) for TPH-G and ND <5 *ug*/kg for all BTEX compounds. The locations of these samples are shown on Figure 3.

DECON began air sparging of the groundwater collecting in the open excavation on March 17, 1995. Sparging was performed by lowering perforated PVC piping into the standing water and connecting this piping to an air compressor capable of generating 180 CFM. This piping was moved daily to ensure that all groundwater in the open excavation was treated by the sparging process.

Sparging of the groundwater continued until April 3. A sample of the groundwater was collected on April 4 and analyzed for TPH-G and BTEX compounds. This sample contained no detectable concentrations of any gasoline compounds, i.e., ND <50 *ug*/kg (ppb) for TPH-G and ND < 0.5 *ug*/kg for all BTEX compounds.

At this point DECON and Herrick wanted to make certain that the groundwater downgradient from the former gasoline tank was clean. In order to confirm this without installing a new series of monitoring wells, DECON recommended removing treated water from the open excavation (west pit) and sampling groundwater that subsequently filled the pit from surrounding upgradient areas. Based on the fact that the groundwater in the west pit contained no detectable gasoline compounds, DECON applied to the Hayward Public Works Department for a batch discharge permit into the sanitary sewer system. This application was submitted on April 24, and the permit was received on May 12 (Appendix B). DECON began pumping treated groundwater from the open excavation on May 15 and completed this operation on May 22. A sample of groundwater was collected from the open excavation on May 23 and analyzed for TPH-G and BTEX. This sample contained no detectable concentrations of gasoline compounds, indicating that groundwater from the area between the former gasoline tank (including the 1990 excavation) and the current excavation is clean.

3.4 Small Excavation Near Former Gasoline Tank

Based on reviewing the reports generated at the time the

gasoline tank was removed (i.e., 1986), DECON recommended that some test pit sampling be performed in the vicinity of the original tank removal project (i.e., upgradient from the large excavation performed in 1990). DECON used a backhoe to dig test pits down to the saturated soil in this area on March 21, 1995. Field observations suggested that gasoline compounds may be present in some of these samples, i.e., those taken from the area southeast of the former gasoline tank.

DECON then excavated soil from this area, stockpiling the clean overburden separately from the soil at 8 to 11 feet bgs that appeared to contain gasoline compounds. This excavation (known as the east pit) was performed with backhoe from March 30 to April 5. Sidewall and bottom samples were collected from the locations shown in Figure 4 during the April 18 sampling event (sample numbers 1436/0418-7 through 11). Two of these samples, taken from the southeast wall of the east pit at 9 and 10 feet bgs, contained TPH-G at 13,000 *ug*/kg (13,000 ppb or 13 ppm) and 87,000 *ug*/kg (87,000 ppb or 87 ppm), respectively.

DECON proceeded to expand the east pit toward the southwest until field observations indicated that all gasoline compounds had been removed. Additional samples were collected on May 23, including 4 soil samples from the new southeast wall of the east pit and one water sample from the east pit. All five samples were clean, i.e., no TPH-G or BTEX compounds were detected at the method detection limits in any of the five samples.

3.5 Aeration

Soil containing hydrocarbon odors when excavated has been placed on visqueen and stockpiled to a height of two to three feet. The Bay Area Air Quality Management District notice regarding aeration of soil potentially containing gasoline compounds was submitted at the beginning of February, 1995. These soil stockpiles were covered whenever it was raining and uncovered during periods of good weather from February through May. The stockpiles were turned over to promote aeration three times during the month of June. They were turned over two more times during the

first part of July and then sampled and analyzed for TPH-G and BTEX compounds at the rate of one sample per 50 cubic yards of soil. Twenty-one discrete soil samples were collected on August 08, 1995 from the aerated soil at the approximate locations shown on Figure 5. Twenty of these samples were composited in the laboratory into five 4-part composites, each representing one section of the aerated soil. The final sample (named Pile #1 on the Chain-of-Custody) was taken from a separate small soil stockpile that had been placed alond the south edge of the West Pit to dry. The sample Pile #1 was analyzed individually. The analytical results for TPH-Gasoline from these samples are as follows:

Sample number(s)	Concentration (mg/kg)
1-4	ND < 0.5
5-8	0.82
9-12	1.70
13-16	ND < 0.5
17-20	ND < 0.5
Pile #1	ND < 0.5

No BTEX compounds were detected in any of the samples.

The soil stockpiles represented by samples 5-8 and 9-12 were turned over one more time on August 15, 1995 and resampled on August 24 for TPH-G analysis (see Figure 5). Both August 24th composite samples were reported to contain no TPH-G (i.e. ND < 0.5 mg/kg).

The certificates of analysis and chain-of-custody documentation for these samples are included in Appendix A.

3.6 Backfilling

On May 2, 1995, DECON was notified that a backfill plan would have to be submitted to and approved by the City of Hayward before backfilling could begin at the Herrick site. DECON submitted a backfill plan to the Hayward Engineering Department on May 10. The main concern expressed by their representatives was based on the fact that a new sanitary sewer line was schedule to be installed beneath the southern edge of the west pit at 20-22 feet bgs during

the summer of 1995. If the west pit were to be backfilled with two to four feet of rock, the contractor would not be able to install this sewer line without incurring substantial additional costs. These costs would then be passed on to the City of Hayward in the form of a change order. The Hayward Public Works Department hoped to avoid this situation by minimizing or eliminating the use of rock at the base of the west pit (at least on the southern portion of the west pit).

DECON requested permission to backfill the east pit prior to receiving formal approval of the backfill plan. This request was based on the fact that the east pit is well away from the planned sanitary sewer line route and therefore, not subject to the same concerns. This permission was granted by Jim Lear of the Hayward Engineering Department on June 2.

DECON began backfilling the east pit on June 6 by bridging the base of the excavation (from 11 feet bgs to 8 feet bgs) with crushed rock. The upper 8 feet of the east pit were then backfilled with soil from the clean overburden stockpile and compacted using a Sheepsfoot roller. Backfilling of the east pit was completed on June 9.

In order to confirm that the clean overburden stockpiles shown on Figure 1 was analytically "ND", DECON collected 12 discrete samples from various locations throughout the stockpile on June 28. These samples were combined into three four-part composites and analyzed for TPH-G and BTEX compounds. All three composite samples were found to contain no detectable concentrations of TPH-G or BTEX compounds, verifying the field observations that justified the placement of this soil in the clean stockpile in the first place. The West pit was dewatered and backfilled to five feet below ground surface (bgs) using soil from the clean stockpile. This work was performed from July 17 to July 28, 1995. Compaction testing performed by Robert Chew and Associates Geotechnical Engineering indicated that all areas were compacted to greater than 90% of the maximum density for this soil.

After receiving analytical results indicating that the remaining soil had been effectively aerated, DECON backfilled the upper five feet of the West pit with this soil. Compaction testing

confirmed that all areas were compacted to greater than 90% and the upper two feet to greater than 95% of the maximum density.

The compaction testing report prepared by Robert Chew Geotechnical Associates is included in Appendix C.

4.0 Mittelhauser Corporation's Activities

During the course of this project DECON was informed by Herrick that the developer's bank was having a Phase I Environmental Assessment performed by Mittelhauser Corporation. After reviewing previous environmental reports and other pertinent information, Mittelhauser recommended that two soil samples be collected and analyzed for oil and grease by EPA Method 5520 D & F. One of these samples was taken beneath a former 2 foot by 2 foot concrete sump; the other was taken in the vicinity of the former gasoline tank. This sampling was performed by DECON and Mittelhauser on February 16, 1995.

The sample taken beneath the former sump contained 740 mg/kg (ppm) of oil and grease. Based on this result, Herrick directed DECON to excavated soil surrounding the sump and resample. On March 1, 1995, DECON excavated 15 to 20 cubic yards of soil and stockpiled this soil on visqueen.

Three confirmation samples were collected on July 13 and analyzed for oil and grease by EPA Method 5520 D & F. Two of these samples contained significant concentrations of oil and grease, so additional soil was excavated and the area resampled. The composite sample collected on July 27, 1995 contained no detectable oil and grease at a detection limit of 50 mg/kg.

Copies of the certificates of analysis and chain-of-custody documentation for these samples are included in Appendix D..

The soil excavated from this area was loaded into an end dump truck and transported to DECON's soil treatment facility in Oakland where it will be treated to non-detect levels using the x-19 bioremediation process.

Once confirmation samples indicate that the treatment process has reduced the concentrations of petroleum compounds to non-detect levels, the clean soil will be transported to a nearby

sanitary landfill for use as clean cover. A certificate of Bioremediation will be provided as documentation of these activities.

This August, 1995, Final Report concerning the former Herrick Steel fabrication facility (Herrick) was prepared by

Dear Mr. Reese:

Trace Analysis Laboratory received one soil sample on January 25, 1995 for your project No. 1436, Herrick (our custody log number 5138).

This sample was analyzed for Total Petroleum Hydrocarbons Gasoline, Benzene, Tolunene, Ethylbenzene, and Xylenes. Our analytical report and the completed chain of custody form are enclosed for your review.

Trace Analysis Laboratory is certified under the California Environmental Laboratory Accreditation Program. Our certification number is 1199.

If you should have any questions or require additional information, please call me.

Sincerely yours,

Scott T. Ferriman

Hayward, California 94545

SUBJECT: Field Density Testing
Backfill of Treatment Area Excavations
Former Herrick Steel Corp. Fabrication Facility
25450 Clawiter Road
Hayward, California

Dear Mr. Jacobsen:

As requested, we have performed field density testing of the backfill for the 2 treatment area excavations located at the subject site. The 2 areas were excavated to facilitate the cleanup of hydrocarbon contamination that existed at the site. Recommendations for backfilling the 2 areas were provided in our Grading Recommendations report, dated May 12, 1995. Area 1 is located at the southern property boundary (immediately north of the adjacent Gillig Corporation), while Area 2 is located adjacent to the railroad tracks which run along the outside of the northeast property boundary (See Figure 1).

Prior to backfilling, the excavations were approximately 14 feet deep with the groundwater level at an approximate depth of 12 feet. We recommended that the excavations be dewatered first to facilitate the removal of the wet soil at the bottom of the excavations. Following the removal of the wet soil, we recommended that the excavations be backfilled with ¾- to 1½-inch crushed or drain rock to at least 2 feet above the groundwater level and geofabric placed over the rock. The remaining backfill should consist of on-site and or imported fill material compacted to at least 90 percent of the maximum dry density, as determined by the ASTM D-1557 test method.

The scope of our services included laboratory compaction testing (ASTM D-1557) of the on-site backfill material, and field density testing of the backfill placed in the 2 treatment areas.

Our field staff made site visits on June 7-9, 1995, between July 18 to July 28, 1995, and August 23-25 and 31, 1995. During these visits, we met with your foreman to discuss the compaction and testing requirements and backfilling procedures, obtained bulk samples of the on-site backfill materials for laboratory compaction testing, and performed field density testing. The on-site backfill was tested for 90 percent relative compaction. Our field density testing should only be considered as a verification of the degree of compaction achieved.

Work at the site began with the dewatering of Area 2. Following the dewatering and removal of wet material, backfill of Area 2 consisted of ¾-inch drain rock up to approximately 7 to 9 feet below existing grade with filter fabric over the rock and on-site material compacted over the filter fabric. The on-site material was placed in lifts and compacted to at least 90 percent of the maximum dry density up to approximate rough existing grade.

Drain rock was not used to backfill Area 1 because a proposed utility trench will be excavated adjacent to the southern edge of Area 1. Subsequently, dewatering and removal of wet soil was performed in stages. On-site material was placed and compacted in the bottom of the excavation as the dewatering and removal of wet soil was performed. On-site material was then placed in lifts, moisture-conditioned and compacted to at least 90 percent relative density up to approximately rough existing grade.

The results of the laboratory compaction testing are presented in Table 1. The results of the field density testing are presented in Table 2. The approximate locations of the field density tests are shown on the Treatment Area Plan, Figure 2.

During our field density testing, Nuclear Gauge Test Method (ASTM D-2922) was used to measure the degree of compaction relative to the maximum dry density, as determined by the ASTM D-1557 Test Method.

In an area where the required 90 percent compaction was not achieved, the area was additionally compacted and retested. A retest is indicated on Table 2 and the Treatment Area Plan (Figure 2) as an "R".

Based upon the results of our field density testing, we verify that the degree of compaction for the backfill of the 2 treatment areas at the tested locations met the specified requirements.

If you have any questions regarding the information contained herein, please contact us.

**RE: FINAL REPORT, LEAD REMEDIATION PROJECT
HERRICK FABRICATION FACILITY, HAYWARD, CALIFORNIA**

Dear Mr. Jacobsen:

This office has reviewed your final report on lead remediation at the Herrick facility located at 25450 Clawiter Road, Hayward. The Herrick Corporation used this site for the storage of steel beams, steel cutting, welding and machining. The site was also used for outdoor spray painting of steel during the late 1970's and early 1980's which resulted in surface and near-surface soil contamination with lead.

This office is satisfied with the remediation activities performed by DECON Environmental Services, Inc., to reclaim this site suitable for future human activities. The soil lead contamination has been cleaned to below 100 mg/kg level, which is well below the current soil cleanup level for lead (250 mg/kg) recommended by Cal-EPA using the UBK model. The residual soil lead concentrations at this site dose not pose any threat to public health and therefore no further remedial actions are necessary at this time.

The four confirmatory soil samples analyzed for soluble lead (WET test) were 0.046, 0.07, 1.5 and 0.52 mg/L. Groundwater samples collected from the extraction well from October 1991 through June 1992 and from the down-gradient monitoring wells in July 1992 did not show the presences of any lead in the shallow groundwater. Considering both the chemical properties of lead in soils and that this was an open site for over a decade and exposed to natural conditions it is reasonable to assume that the residual lead may not be a threat to the groundwater quality.

Please be aware that this letter is limited only to the issues relating to soil lead contamination at this site. Further action may be required if information received subsequent to this letter indicates a need for it.

Rich Barbour
Herrick Corporation
P.O. Box 9125
Pleasanton, CA 94566

Dear Mr. Barbour:

Subject: Final Report, Lead Remediation Project
Herrick Corporation, 25450 Clawiter Road, Hayward

I have reviewed the subject lead contamination case with Dr. Ravi Arulanantham of the Alameda County Health Care Services Agency. I have also received Dr. Arulanantham's letter dated August 31, 1992. The Hazardous Materials Office concurs with Dr. Arulanantham that based on remediation done and the subsequent confirmation analytic and sampling methods, there is currently no threat to human health and groundwater from residual lead concentrations on site. Therefore, this office has no further requirements related to soil lead contamination on this site, at this time.

Should additional information be available in the future that would warrant another look at this case, this office, in conjunction with the Alameda County Health Care Services Agency, may ask Herrick Corporation to undertake further corrective action.

To complete our records of activities on this site, to date, Decon Environmental must provide this office with copies of all documents they may have related to this case.

If you have any questions, please call me at (510) 293-5454. Once again, thank you for your efforts on this matter.

Sincerely,

Hugh Murphy
Environmental Specialist

Hayward, CA 94540

Subject: UST case closure for Herrick Corporation, 25450 Clawiter Road, Hayward, California.

Dear Mr. Barbour:

The Hayward Fire Department (HFD) has submitted a report which summarizes the investigation and cleanup of hydrocarbon pollution resulting from leaks associated with a 2000 gallon gasoline Underground Storage Tank (UST) at the above mentioned site. The HFD recommends that the case be closed. Regional Board staff have reviewed the report and concur with the recommendation. Therefore, based on the available information for the above site, no further investigation or cleanup of the hydrocarbon pollution associated with the Tank is required. Further work may be required if conditions change or a water quality threat is discovered at the site.

Please contact Sumadhu Arigala at (510)-286-0434, if you have any questions.

Sincerely,

Lawrence P. Kolb

Rich Barbour
Herrick Corporation
P.O. Box 9125
Pleasanton, CA 94566

Dear Mr. Barbour:

Subject: No further action letter for the former Herrick facility, 25450 Clawiter Road, Hayward

I have reviewed the final report by Decon Environmental Services (dated August 28, 1995) and the Phase 1 Environmental Assessment by Mittelhauser Corporation (dated July 1995). Based on my review, site visit and understanding of the site conditions; I have no outstanding issues that would require further investigatory or remedial actions for this industrially zoned site. I also have no issues related to the remediated contamination that would limit an industrial development on the site.

I have received and reviewed your letter dated today. I understand that the items listed will be taken care of as a condition of sales of the property and documentation will be submitted to this office.

If you have any questions, please call me at (510) 293-5454. Thank you for your environmental site restoration efforts and increasing the environmental quality of Hayward.

Sincerely,

Hugh Murphy

Alonzo Granados, Vice President
RPS Group, North America
1814 Franklin Street, Suite 505
Oakland, CA 94612

Subject: Facility Closure of Former Berkeley Farms, 25800 Clawiter Road, Hayward, CA

Dear Mr. Smydra and Mr. Granados,

Thank you for the final closure report and all associated documentation provided, as well as the relevant activities, as part of the closure of the former Berkeley Farms Facility located at 25500 Clawiter Road. Per our discussion on July 1, 2020 with Alonzo Granados of RPS Group, Hazardous Materials Inspector Steve Lowe and I have reviewed the closure information provided and conducted multiple verification walkthrough visits to the former facility. We are also in receipt of the additional documentation requested since July 1, 2020. Based on the closure report and associated documentation, as well as our verification walkthrough inspections, no further actions associated with the overall closure of the hazardous materials/wastes facilities for the site are required, with the exception of those listed below in the "Excluded Items.." and "Additional Conditions..." sections.

List of major documents, meetings and field verification inspections associated with the site closure:

- Closure-related documents submitted to the Hayward Fire Department's Hazardous Materials Office:
    - Facility Closure Work Plan Dean Foods/Berkeley Farms Dairy and Juice Processing Facility, 25500 Clawiter Road, Hayward, CA 94545" dated April 14, 2020.
    - Hill Brothers Bill of Lading for 19566 Pounds (3873 gallons) of anhydrous ammonia dated May 6, 2020.
    - Underground Storage Tank (UST) Temporary Closure Permit Application Package for a 10,000-gallon diesel fuel UST dated May 11, 2020.
    - Facility Closure Notification Form dated May 12, 2020.
    - "Facility Closure Report Dean Foods/Berkeley Farms Dairy and Juice Processing Facility, 25500 Clawiter Road, Hayward, CA 94545" dated June 24, 2020.
    - CalARP deregistration letter and documentation dated June 1, 2020, for the anhydrous ammonia associated with the facilities refrigeration system (note: documents also appear in the final closure report).

- Underground Storage Tank (UST) Temporary Closure Fire quarterly inspection report by RPS Group dated May 29, 2020.
- Final updates to the California Environmental Reporting System (CERS) associated with chemical inventory, site maps, contacts and the underground storage tank system, which Steve Lowe and Gloria Arredondo have reviewed and approved since July 1, 2020.

- Site closure meetings attended by Hayward Fire Department's Hazardous Materials Office:

  - Process Hazard Analysis (PHA) and Decommissioning Meeting - April 16, 2020 (On-line/Skype Meeting).
  - Berkeley Farms Closure Plan Review Meeting – April 21, 2020 (On-line/Skype Meeting).

- Hayward Fire Department verification walk through inspections at the facility on the following dates:

  - May 5, 2020 – Initial walkthrough and anhydrous ammonia removal start date).
  - May 18, 2020 – Secondary walkthrough after removal of majority of hazardous materials.
  - May 26, 2020 – Follow up walkthrough of remaining materials.
  - May 29, 2020 – Facility walkthrough of additional minor materials/UST Temporary Closure.
  - June 9, 2020 – Signage Inspection and verification of waste disposal.
  - June 24, 2020 – Final verification inspection.

Excluded Items to the overall closure:

- Underground Storage Tank - Dean Foods has chosen to retain the underground storage tank onsite and has placed it in temporary closure status for a period not to exceed one year. We are also in receipt of the initial required temporary closure inspection conducted by RPS Group dated May 29, 2020. As an overall condition of temporary closure, Dean Foods shall:

  - Keep the tank continuously monitored as prescribed by State Law and the Hayward Fire Department, including maintaining the system with all required safeguards.
  - Maintain the annual underground storage tank operation permit.
  - Maintain the annual consolidated hazardous materials permit with associated fees.
  - Submit quarterly inspection reports on the temporarily closed tank.
  - Submit required annual updates into the California Environmental Reporting System (CERS).

- Diesel Emergency Generator – One of the emergency generators (Tank #E location marker Number 4 on closure plan) still has fuel in it and is to remain in operation to maintain emergency life safety systems at the facility. The emergency generator will remain as operational and shall be transferred to the new owner.

- Glycol Cooling System associated with milk/juice processing equipment – System was drained, but not triple rinsed in order to prevent corrosion in the system.

- Building, Structures and Equipment – There are currently remains two (2) main buildings, along with other accessory structures, tanks and equipment left on site. At the time of demolition these shall be properly evaluated, managed, and disposed by either Dean Foods or the new owner.

- Subsurface investigation of potential contaminants – Per Dean Foods, an overall Phase I Environmental Site Assessment of the facility/property was conducted to facilitate the sale of the property. According to Dean Foods, the Phase I Environmental Site Assessment Report was completed on June 5, 2020. Since the Phase I was not received by our agency, it was not considered as part of the facility closure. No subsurface investigations were conducted as part of the facility closure activities, except for an area next to the Wastewater Treatment Plant where gear oil had penetrated into concrete joints, resulting in soil contamination. That contamination was identified and remediated as per Section 9, Response to Spilled Gear Oil, and Appendix G and H of the Closure Report. Per discussions with Dean Foods and their agents, any additional Phase I Environmental Site Assessment or additional investigation will be done as part of the due diligence by the buyer with the transfer of ownership and redevelopment of the site. We ask that Dean Foods share the results of any subsurface investigation related to potential contamination. Depending on the findings of subsurface investigations, should they be conducted, Dean Foods may be liable for cleanup of those materials.

Additional Conditions Required (based on the remaining hazardous materials storage and the vacant status of premises):

- Annual Permits/CERS – The Annual Consolidated Permit and Underground Storage Tank Operating Permit and submittals into the California Environmental Reporting System (CERS) shall be maintained.

- Fire Department Operational Permits – All operational permits, specifically High Piled Storage will be closed out. If this condition changes, please contact the Fire Prevention Office at (510) 583-4900.

- Notification of Change of Ownership – When the property ownership changes, please notify our office with the new owners contact information, so that permits and CERS can be transferred to the new owner.

- Life Safety Systems – Even though the facility is closed, all access and designed life safety systems/features shall be maintained as required by law, regulations, ordinances, standards and applicable codes, including the California Fire Code (CFC) as adopted by the City of Hayward. This includes Section 311 (Vacant Premises) in the 2019 California Fire Code.

- Site Security/Maintenance – Per our conversation the premises currently have and will continue to have a site security company to ensure the property is secure. Additionally, security measures and facility maintenance shall be provided as per the Hayward Police Department, Hayward Building Division, Hayward Code Enforcement Division, Hayward Water Pollution Source Control, and other applicable agencies.

On behalf of our office, I want to thank you for the cooperation and professionalism associated with the closure of the Berkeley Farms facility. Please extend our thanks to your staff and contractors. If you have any questions, please give Steve Lowe (phone - 510 583-4961) or me a call (phone - 510 583-4924).

Best Regards,

Hugh Murphy
Hazardous Materials Program Coordinator

cc: Steve Lowe, Hazardous Materials Inspector

Measure 3:		**Fatality:**	No

Incident Location: 25500 Clawiter Rd, Berkeley Farms
Reported Cause: Other
Description for Other : Operator Error.
Amount 1: 455
Substance 1: Lube Soap
Substance 2:
Substance 3:
Waterway:
Contained: Yes
Known Impact: Unknown
Other 1:
Detail for Other:
Site: Other
Description for Other :
On Scene:
Other on Scene:
Other Notified:
Evacuation: No
Cleanup By: Contractor
Agency: NRC
PRS Agency: Berkeley Farms
Admin Agency: Hayward Fire Department
Sec Agency: Alameda County Environmental Health
Additional County:
Admin Agency 2:
Description: Per NRC Report, "caller is reporting a discharge of a lube product named Mikkron. The discharge was caused when a shut off valve was left open position. 445 gallons discharged onto a concrete surface at the facility, and remained contained to the area. Clean up is underway."
Remedial Actions: "Material contained, clean up crew on-site, contractor has been hired."

Description: RP states that waste water tank foam filters failed causing the levels in the tank to over flow resulting in the release of 100-200 gallons of milk product waste into a storm drain and approx 10 gallons of the release impacted Alameda Creek. The release is contained and cleanup is underway. Alameda Creek has been impacted.

Regulated Programs

EI ID: 10314985 **EI Description:** Hazardous Waste Generator

EI ID: 10314985 **EI Description:** Chemical Storage Facilities

Violations

Violation Date: 12/08/2015
Violation Program: HW
Violation Source: CERS
Violation Division: Hayward City Fire Department
Citation: 22 CCR 15 66265.193 - California Code of Regulations, Title 22, Chapter 15, Section(s) 66265.193
Violation Notes:

Returned to compliance on 01/04/2016.

Violation Description:

Failure of the LQG and/or TP generator, on all new and existing hazardous waste tank systems and ancillary equipment, to meet the following secondary containment requirements:
1) Designed, installed, and operated to prevent any migration of wastes or accumulated liquid out of the system to the soil, ground water, or surface

water at any time during the use of the tank system; and
2) Capable of detecting and collecting releases and accumulated liquids until the collected material is removed.
3) Constructed of or lined with materials that are compatible with the waste(s) to be placed in the tank system and shall have sufficient strength and thickness to prevent failure due to pressure gradients (including static head and external hydrological forces), physical contact with the waste to which they are exposed, climatic conditions, the stress of installation, and the stress of daily operation (including stresses from nearby vehicular traffic);
4) Placed on a foundation or base capable of providing support to the secondary containment system and resistance to pressure gradients above and below the system and capable of preventing failure due to settlement, compression, or uplift;
5) Provided with a leak detection system that is designed and operated so that it will detect the failure of either the primary and secondary containment structure or any release of hazardous waste or accumulated liquid in the secondary containment system within 24 hours, or at the earliest practicable time if the existing detection technology or site conditions will not allow detection of a release within 24 hours;
6) Sloped or otherwise designed or operated to drain and remove liquids resulting from leaks, spills, or precipitation. Spilled or leaked waste and accumulated precipitation shall be removed from the secondary containment system within 24 hours, or in as timely a manner as is possible to prevent harm to human health or the environment, if removal of the released waste or accumulated precipitation cannot be accomplished within 24 hours.
7) Secondary containment for tanks shall include one or more of the following devices:
a) A liner (external to the tank); b) a vault; c) a double-walled tank; or d) an equivalent device as approved by the Department.
8) The secondary containment systems shall satisfy the following requirements:
a) External liner systems shall be designed or operated to contain 100 percent of the capacity of the largest tank within its boundary; or
b) Designed or operated to prevent run-on and infiltration of precipitation into the secondary containment system unless the collection system has sufficient excess capacity to contain run-on and infiltration. Such additional capacity shall be sufficient to contain run-on and infiltration of precipitation from a 25-year, 24-hour rainfall event;
c) Free of cracks or gaps; and
d) Designed and installed to completely surround the tank and to cover all surrounding earth likely to come into contact with the waste if released from the tank(s) (i.e., capable of preventing lateral as well as vertical migration of the waste).
9) Vault systems shall be:
a) Designed or operated to contain 100 percent of the capacity of the largest tank within its boundary;
b) Designed or operated to prevent run-on and infiltration of precipitation into the secondary containment system unless the collection system has sufficient excess capacity to contain run-on and infiltration. Such additional capacity shall be sufficient to contain run-on and infiltration of precipitation from a 25-year, 24-hour rainfall event;
c) Constructed with chemical-resistant water stops in place at all joints (if any);
d) Provided with an impermeable interior coating or lining that is compatible with the waste being transferred, stored or treated and that will prevent migration of waste into the concrete;
e) Provided with a means to protect against the formation of and ignition of vapors within the vault, if the w; Note: data in [Violation Description] field for some records is truncated from the source.

Violations

Violation Date: 12/08/2015
Violation Source: CERS
Violation Program: HW
Violation Division: Hayward City Fire Department
Citation: 22 CCR 12 66262.34(f) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.34(f)
Violation Notes:

Returned to compliance on 01/04/2016.

Violation Description:

Failure to properly label hazardous waste accumulation containers with the following requirements: "Hazardous Waste", name and address of the generator, physical and chemical characteristics of the Hazardous Waste, and starting accumulation date.

Cleanup Sites from GeoTracker Cleanup Sites Data Download - Facilities Detail

RB Case No: 01S0056
Local Case No: 01S0056
Begin Date: 8/29/1985
Stop Method:
CUF Case: NO
Case Worker:
File Location:
Lead Agency: SAN FRANCISCO BAY RWQCB (REGION 2)
Local Agency: HAYWARD, CITY OF
Potential COC: Waste Oil / Motor / Hydraulic / Lubricating
Potential Media of Concern: Other Groundwater (uses other than drinking water)

How Discovered: Tank Closure
How Discovered Description:
Stop Description:
Calwater Watershed Name: South Bay - East Bay Cities (204.20)
DWR GW Subbasin Name: Santa Clara Valley - East Bay Plain (2-009.04)
Disadvantaged Community:
Site History:

The Yellow Freight facility is associated with both a SCP case (01S0056) and a UST case (01-1688). On 6/20/2011 the SCP case was closed administratively becasue all USTs involved petroleum storage, including waste oils. The UST case remains open (Case # 01-1688).

Violation Source: CERS
Violation Program: HW
Violation Division: Hayward City Fire Department
Citation: HSC 6.5 25123.3(h)(1) - California Health and Safety Code, Chapter 6.5, Section(s) 25123.3(h)(1)
Violation Notes:

Returned to compliance on 05/31/2018. failed to ID accumulation date

Violation Description:

Failure to send hazardous waste offsite for treatment, storage, or disposal within 180 days (or 270 days if waste is transported over 200 miles) for a generator who generates less than 1000 kilogram per month if all of the following conditions are met:
(1) The quantity of hazardous waste accumulated onsite never exceeds 6,000 kilograms.

(2) The generator complies with the requirements of 40 Code of Federal Regulations section 262.34(d), (e) and (f).

(3) The generator does not hold acutely hazardous waste or extremely hazardous waste in an amount greater than one kilogram for more than 90 days.

Violations

Violation Source: CERS
Violation Program: UST
Violation Division: Hayward City Fire Department
Citation: HSC 6.7 25284.2 - California Health and Safety Code, Chapter 6.7, Section(s) 25284.2
Violation Notes:

Returned to compliance on 07/12/2019. direct burial spill bucket failed leak test - replaced new spill bucket installed and approved

Violation Description:

"Failure to meet one or more of the following requirements:

Install or maintain a liquid-tight spill container.

Have a minimum capacity of five gallons.

Have a functional drain valve or other method for the removal of liquid from the spill container.

Be resistant to galvanic corrosion.

Perform a tightness test at installation, every 12 months thereafter, or within 30 days after a repair to the spill container.

Tested using applicable manufacturer guidelines, industry codes, engineering standards, or a method approved by a professional engineer.

Tested by a certified UST service technician.

Maintain records of spill containment testing for 36 months.

"

Description of Events: WHILE UNLOADING A TRAILER, IT WAS DETERMINED THAT ONE PLASTIC DRUM WAS LEAKING AT THE LID. THE DRUM WAS ISOLATED IN THE HAZARDOUS MATERIAL BAY. THE DRUM WAS PROPERLY RECOOPERED AND OVERPACKED INTO A NEW D.O.T APPROVED SALVAGE DRUM, WITH PROPER MARKINGS AND LABELS APPLIED. THE SHIPPER WAS NOTIFIED OF THE INCIDENT AND REQUESTED THAT THE SALVAGE DRUM BE RETURNED FOR CLAIM CREDIT.

Description of Events: EMPLOYEE WAS UNLOADING A FIBER DRUM WITH A FORKLIFT AND THE DRUM STRUCK ANOTHER PIECE OF FREIGHT, RIPPING A HOLE IN THE BOTTOM OF THE DRUM. THE SPILLAGE WAS NEUTRALIZED AND CLEANED UP. THE DRUM WAS PATCHED AND OVERPACKED INTO A NEW D.O.T.-APPROVED SALVAGE DRUM WITH APPROPRIATE LABELS AND MARKINGS. THE EMPLOYER RUBBED SOME OF THE MATERIAL INTO HIS EYES. HE WAS TREATED AND RELEASED AT THE CLINIC. THE SHIPMENT WAS RETURNED TO THE SHIPPER FOR CLAIM CREDIT.

Description of Events: DURING UNLOADING A RELEASE WAS DISCOVERED BY DOCK PERSONNEL. FURTHER INVESTIGATION REVEALED THE CORNER OF A PALLET HAD BEEN CRUSHED DUE TO HEAVY FREIGHT BEING LOADED ON TOP. DOCK PERSONNEL CLEANED UP THE SPILL AND PUT THE AFFECTED MATERIALS INTO A PROPERLY MARKED AND LABELED RECOVERY DRUM. SHIPPER HAS BEEN CONTACTED FOR DISPOSITION.

Recommend Actions Taken: PROPER TRAILER LOADING PROCEDURES SHOULD BE REVIEWED WITH RESPONSIBLE INDIVIDUAL.

Description of Events: DURING THE UNLOADING PROCESS IT WAS DISCOVERED THAT ONE CARTON APPEARED TO HAVE BEEN WET AT ONE TIME. THIS CARTON WAS PLACED INTO A LINED 35 GALLON SALVAGE DRUM PENDING NOTIFICATION AND DISPOSITION FROM THE SHIPPER.

Recommend Actions Taken: A CONTINUED EDUCATION PROGRAM TO HELP ENSURE PROPER LOADING PRACTICES. A REINTRODUCTION OF THE PRACTICE OF USING DUNNAGE TO BLOCK AND BRACE FREIGHT. SUPERVISORS INVOLVEMENT DURING THE ENTIRE. LOADING PROCESS TO HELP ENSURE THE

FREIGHT WILL ARRIVE AT THE DESTINATION IN A SAFE MANNER. A FOCUS ON PROPER EQUIPMENT USAGES (FORKLIFT) SO THAT THE AWARENESS LEVEL FOR THE LOCATION AND LENGTH OF THE FORKLIFT BLADES IS CONSTANTLY ENFORCED.

Description of Events: ONE PAIL WAS DAMAGED WHEN FREIGHT SHIFTED. THE RELEASE WAS PROPERLY MANAGED. THE DAMAGED FREIGHT WAS PLACED INTO A LINED SALVAGE DRUM PENDING DISPOSITION FROM THE SHIPPER.

Recommend Actions Taken: LOADERS SHOULD ALWAYS BLOCK AND BRACE FREIGHT TO PREVENT MOVEMENT.

Description of Events: DURING THE UNLOADING PROCESS THE EMPLOYEE WAS USING A FORKLIFT TO REMOVE A SKID OF PRODUCT. IN THE PROCESS HE ACCIDENTLY POKED A CARTON OF MATERIAL. IN THAT CARTON WHERE 4 ONE GALLON JUGS, ONE OF THE JUGS WAS DAMAGED AND LEAKED IN THE BOX AND ON THE OTHER THREE. THE AFFECTED MATERIAL WAS PLACED INTO A PROPERLY MARKED, LABELED AND LINED SALVAGE DRUM PENDING DISPOSITION.

Recommend Actions Taken: A CONTINUED EDUCATION PROGRAM TO HELP ENSURE PROPER LOADING PRACTICES. A REINTRODUCTION OF THE PRACTICE OF USING DUNNAGE TO BLOCK AND BRACE FREIGHT. SUPERVISORS INVOLVEMENT DURING THE ENTIRE LOADING PROCESS TO HELP ENSURE THE FREIGHT WILL ARRIVE AT THE DESTINATION IN A SAFE MANNER. A FOCUS ON PROPER EQUIPMENT USAGES (FORKLIFT) SO THAT THE AWARENESS LEVEL FOR THE LOCATION AND LENGTH OF THE FORKLIFT BLADES IS CONSTANTLY ENFORCED.

Description of Events: ONE BOX WAS PUNCTURED BY A FORKLIFT WHILE UNLOADING. THE RELEASE WAS PROPERLY MANAGED. THE DAMAGED BOX WAS PLACED INTO A LINED SALVAGE DRUM PENDING DISPOSITION FROM THE SHIPPER.

Recommend Actions Taken: USE PROPER METHODS WHEN LOADING. DO NOT DRIVE FORKLIFT BLADES ALL THE WAY IN SKID ON FIRST MOVEMENT OF THE PALLET AS THIS WILL PREVENT BLADES DAMAGING SHIPMENTS IN THE BACK OF THE PALLET.

Description of Events: WHILE LOADED ON A TRAILER, THE MECHANIC INSTALLING A PLACARD HOLDER DRILLED THROUGH THE SIDE OF THE TRAILER AND INTO THE TOTE TANK. THE RELEASE WAS PROPERLY MANAGED BY AN EMERGENCY RESPONSE CONTRACTOR. THE DAMAGED TOTE WAS TRANSFERRED INTO A NEW TOTE AND HELD PENDING DISPOSITION FROM THE SHIPPER.

Recommend Actions Taken: NEVER DRILL INTO A TRAILER WITHOUT REMOVING THE HAZARDOUS MATERIALS FIRST.
