DATE: October 14, 2021

TO: Office of Planning and Research - State Clearinghouse, Responsible or Trustee Agency, and Interested Parties

SUBJECT: Notice of Preparation (NOP) of Environmental Impact Report (EIR) and Scoping Meeting

PROJECT TITLE: Ontario International Airport South Airport Cargo Center Project

The Ontario International Airport Authority (OIAA) will be the Lead Agency and will prepare a Project EIR for the Proposed South Airport Cargo Center Project (Project). The OIAA requests comments from responsible and trustee agencies as to the scope and content of the Draft EIR germane to each agency's statutory responsibilities related to the Project.

The OIAA was formed in August 2012 by a Joint Powers Agreement between the City of Ontario and the County of San Bernardino to provide overall direction for the management, operations, development, and marketing of the Ontario International Airport (Airport) for the benefit of the Southern California economy and the residents of the four-county area served by the Airport. One of the objectives of the OIAA is to plan for the highest and best use of all Airport property and facilities in a manner consistent with available infrastructure and compatible with surrounding land uses.

The OIAA is required to assess the potential environmental effects of the Project in compliance with the California Environmental Quality Act (CEQA) (Public Resources Code §§21000 et seq.) and State Guidelines for the Implementation of the CEQA of 1970 (CEQA Guidelines), as amended (California Code of Regulations, §§15000 et seq.). After completing preliminary review of the proposed Project, the OIAA has determined that an EIR will be required for the Project. Pursuant to CEQA Guidelines §§ 15060 (d) and 15063(a), an Initial Study was not prepared as the determination was made that an EIR is required.

In accordance with §15082 of the CEQA Guidelines, the OIAA has issued this Notice of Preparation (NOP) to provide responsible agencies, trustee agencies, and other interested parties with information describing the Project and its potential environmental effects.

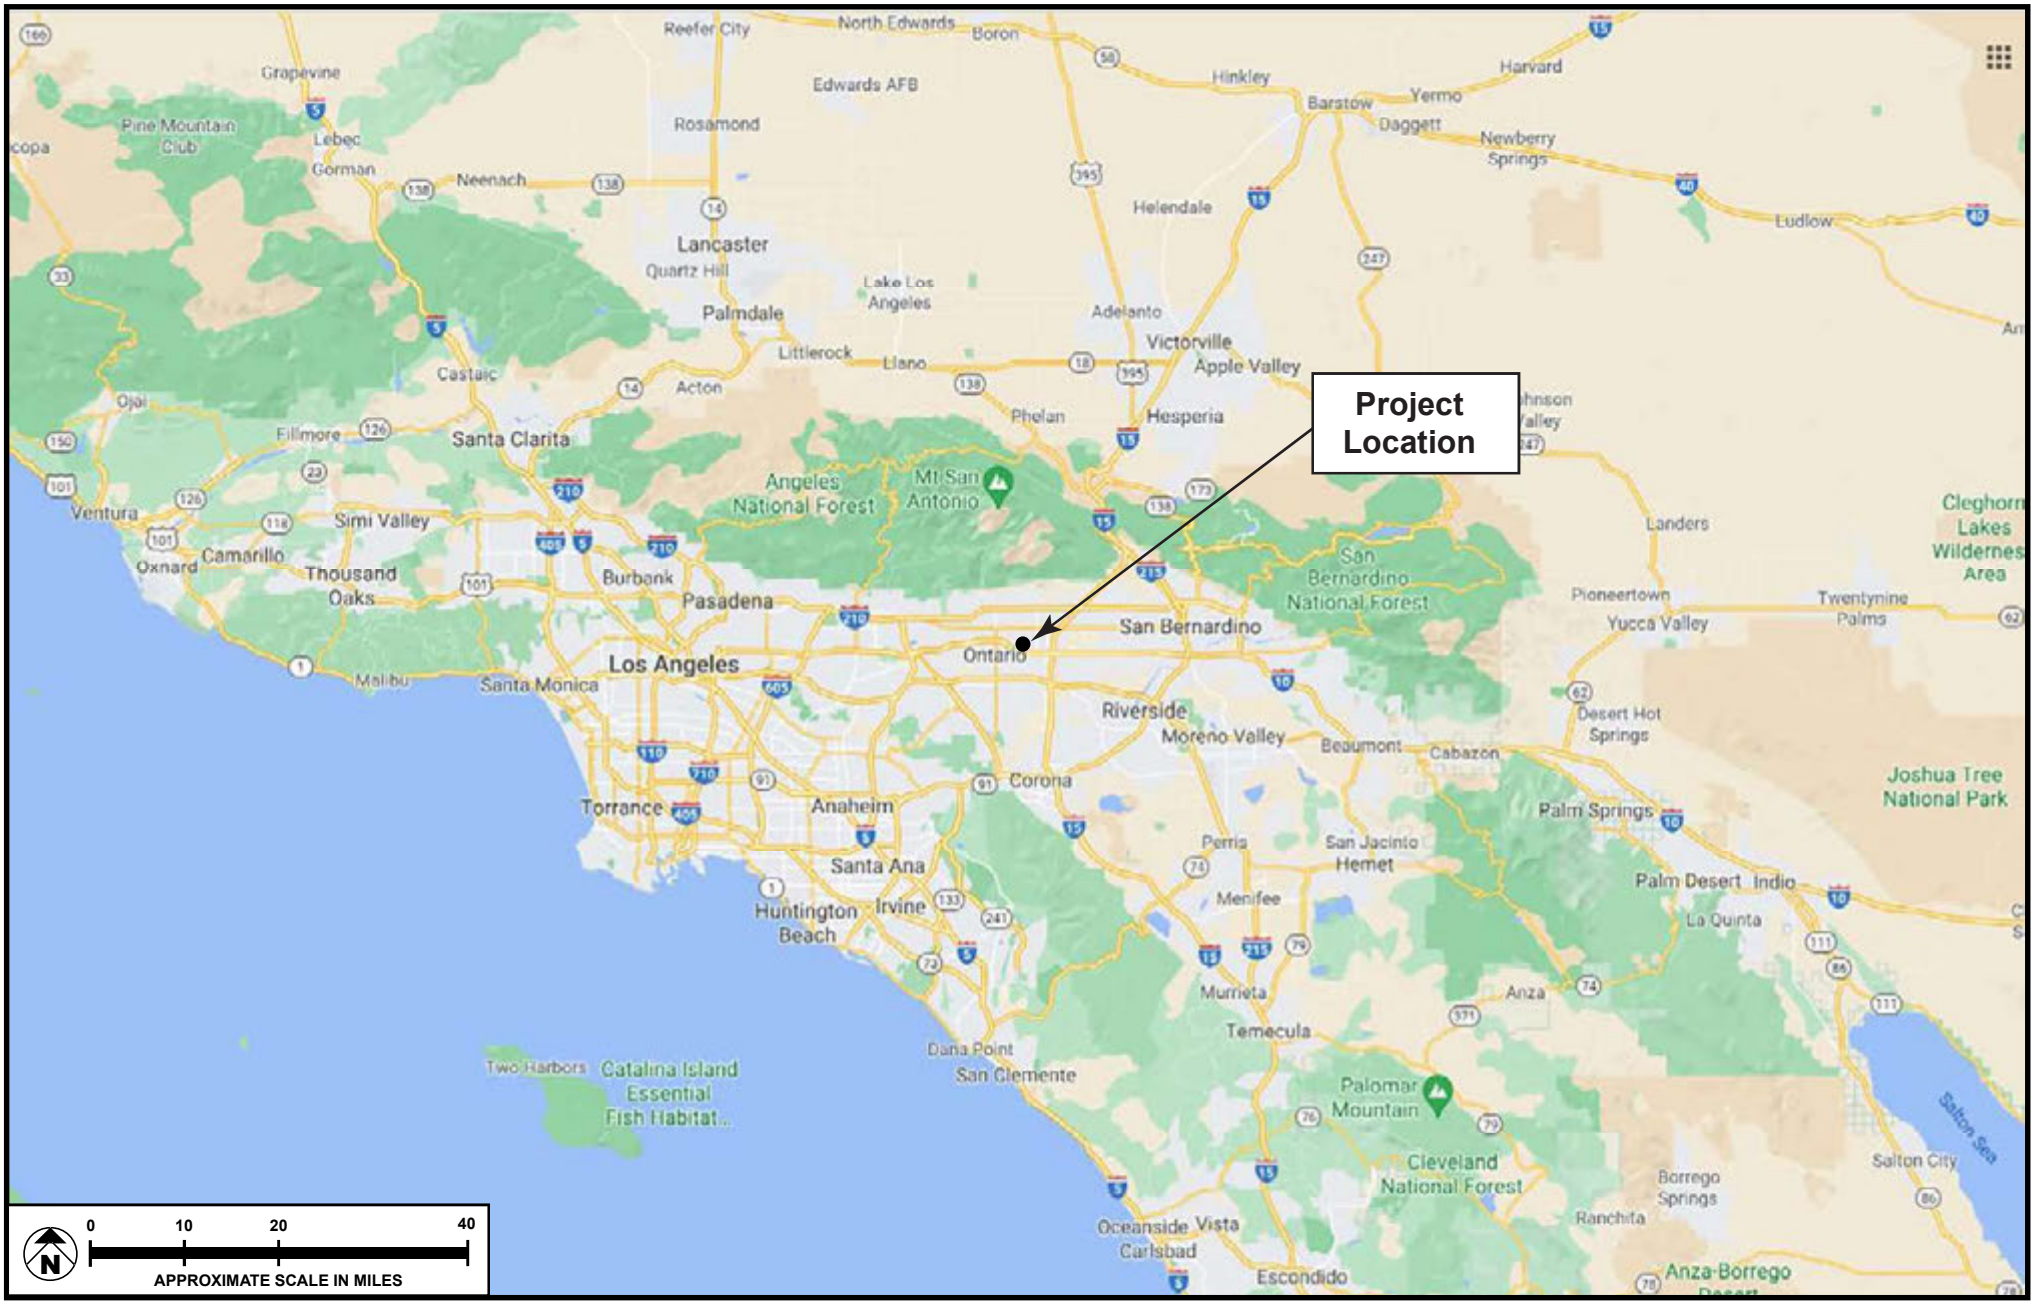
PROJECT LOCATION: The Project site includes portions of Assessor's Parcel Numbers (APN) 11326106, 11326107, 11326108, 11327101, and 11327102 in the City of Ontario, southwest San Bernardino County. The Project site encompasses approximately 76 acres and is south of the Airport airfield and west of the Cucamonga Canyon Channel. The majority of the Project site is located north of East Avion Street with the remainder of the site located south of East Avion Street and east of South Hellman Avenue. The portion of East Avion Street east of South Hellman Avenue will be realigned to meet East Jurupa Avenue This realignment is a previously planned project undergoing separate environmental review. Regional access is provided by State Route 60 (SR-60), approximately 1.25 mile to the south; Interstate 10 (I-10), one-mile to the north, and I-15 approximately 2.75 miles to the east. Figure 1, *Regional Location,* and Figure 2, *Project Site Location,* illustrate the location of the Project.

APPLICABLE LAND USE CONTROLS: The City of Ontario General Plan land use designation for the Project site is Airport and the site is zoned ONT, Ontario International Airport.[1, 2] The ONT zoning district allows airport terminals (including commercial and service uses related to the terminals), car rental agencies, and airport related industrial, and delivery uses at a maximum intensity of 0.55 floor to area ratio (FAR).

Use of the Project site is also controlled by the Federal Aviation Agency (FAA) and the-approved Ontario International Airport Layout Plan (ALP). The ALP serves as a guide for the Airport's future development and designates the Project site as "Airport Development Areas."[3]

ENVIRONMENTAL SETTING: Figure 3, *Existing Conditions*, provides an aerial view of the Project site and surrounding areas. The Project site is developed with 10 buildings, 6 of which are currently vacant, and includes paved and landscaped areas. The remaining buildings are occupied by the OIAA Administrative Offices, the Airport South Secured Area Access Point (SAAP), and aviation support businesses.

Airport land uses surround the Project site on all four sides. Farther south is the Union Pacific Railroad/Metrolink right-of-way and Mission Boulevard, beyond which are industrial land uses.



PROJECT DESCRIPTION: The Project includes the proposed relocation of the OIAA Administrative Offices and the South SAAP to other locations at the Airport, demolition of the existing buildings, site improvements on the Project site, and development of an air cargo facility, as illustrated in Figure 4, *Project Site Plan.* The Project includes the development of a main cargo building, aircraft apron improvements, parking structure, roadway improvements, and site improvements, including landscaping and utility improvements.

Project Site Plan

332-001-21

Development of the Project is proposed in two phases, dependent on demand and economic conditions. Phase 1 would include the development of the Project on the eastern two-thirds of the Project site, and Phase 2 would include development on the remainder of the site as shown in Figure 4. Completion of Phase 1 by 2024 is proposed. Completion of Phase 2 is anticipated 3-5 years after the opening of Phase 1.

Additional description of the characteristics of each of the components of the Project is provided on the following pages.

a. **Main Cargo Building.** A 60-foot tall, 345,400 square-foot building including material handling equipment and office space for the following functions and activities:

- Material/Cargo Handling Equipment – The building would include mechanized and automated equipment to sort cargo. The equipment would process air-to-air, air-to-ground, and ground-to-air shipments. There would also be equipment for the handling, loading, and unloading of structured aircraft containers.

- Administrative Offices – The building would include 70,000 square feet of office space for operations and management personnel, pilot support, aviation support personnel, and other supporting organizations. The building would also include support rooms for IT and data functions. Washrooms, breakrooms, and a small café would be included in the office environment.

- U.S. Customs and Border Protection (USCBP) – The facility would include areas for USCBP to perform immigration functions for arriving international pilots/crews and customs inspection/clearance activities for importing and exporting cargo. The facility would include equipment for the detection of illicit materials in international cargo.

- Cooler – The main cargo building would have a cargo cooler for temperature sensitive in-transit cargo.

- Airline Support/Line Maintenance – Office areas for airline support personnel and warehouse storage for aircraft line maintenance parts / equipment would be provided.

- Cargo Holding – Areas for short-term storage of cargo related to importing and exporting operations would be constructed.

- Maintenance – Areas for maintenance of the building and material/cargo handling equipment would be provided. This would include both offices, spare parts storage, and mechanical shops.

- Security – Areas for facility security would include offices, building access systems, and physical/ electronic equipment to perform security functions related to airport level security and international cargo processing.

- Forklifts – Areas for charging electrical forklifts would be provided.

- Support Areas – Various support functions for employee welfare would be constructed.

b. **Aircraft Apron.** Existing aircraft pavement and developed areas, totaling approximately 2,600,000 square feet would be redeveloped adjacent to the main cargo building for aircraft parking and circulation and to connect the apron via three taxiway connectors to Taxiway "S". The aircraft apron has been designed for the Project's two largest design aircrafts (B747-800 and B767-300). Twenty-three aircraft parking stalls would be provided, including six spaces that would accommodate B747-800 aircraft and 17 spaces that would accommodate B767-300 aircraft. Other aircraft types can park on the apron within the designated 23 parking stalls. The apron would be secured with physical and electronic methods to meet the security requirements of the Transportation Security Administration (TSA), USCBP, Transported Asset Protection Association (TAPA), and OIAA. The apron improvements include the following components:

- Aircraft Parking Stalls – The aircraft parking apron and taxiway connectors would support international and domestic cargo aircraft. The aircraft parking area would be connected to Taxiway "S" and constructed to FAA standards and guidelines. Each gate and aircraft stand would include fixed point-of-use power supply to the aircraft and areas for unloading and loading the aircraft. The apron would include a stormwater collection system with oil/water separators sized to the fueling operation. Aircraft maintenance activities would also occur in these areas.
- Aircraft In-Ground Fuel System – The aircraft apron would include underground infrastructure and piping for fueling jet aircraft with hydrants at each gate.
- Ground Service Equipment (GSE) – The aircraft would be serviced by GSE that would be powered by battery, hydrogen, and/or petroleum fuels. Parking areas, including areas for maintenance and GSE charging/fueling would be provided adjacent to the aircraft parking apron.
- Apron Lighting – The aircraft parking apron would include site lighting to support nighttime loading and unloading of aircraft and other aircraft servicing functions.
- Universal Load Device (ULD) Handling and Staging – A multistory racking system for short-term storage and staging of structured ULDs (which are the pallets and containers to transport large freight in and out of aircrafts) would be constructed adjacent to the aircraft apron.

c. **Vehicle Parking and Roadway Improvements.** A 104,300 square-foot, three-story (35-foot tall) parking structure is proposed south of East Avion Street, which is currently planned for realignment as a separate project. The parking garage would accommodate 775 automobile parking spaces and would include a pedestrian bridge over East Avion Street to connect the garage to the eastern wing of the main cargo building. An additional 125 surface parking spaces are proposed adjacent to the eastern wing of the building, north of East Avion Street.

d. **Truck Yard.** A 217,000 square-foot truck yard with up to 43 trailer truck spaces is proposed between the main cargo building and East Avion Street, on the south side of the facility, to accommodate multi-modal shipping operations. The truck yard would include 55 truck docks and allow for the staging, parking, loading, and unloading of vans and trucks. The vehicles would support the ground-to-air and air-to-ground cargo operations.

e. **Utility Improvements.** The following utility improvements are proposed:

- Stormwater – A stormwater collection and conveyance system would be designed for stormwater processing and detention to control the release of stormwater to the Cucamonga Canyon Channel.
- Water/Sewer – Water and sewer service would be sized to support employee welfare and operations of the facility. The proposed cargo operations would not require process water.
- Gas Service – A natural gas service would be supplied to the Project site and sized to support building operations.
- Electric Service – Electric service would be provided to support the Project. A standby generator system would be installed to ensure continuous operation in the event of a loss of utility power supply.
- Data/Communication – Fiber, data, and communication lines would be provided to support the Project.

PROBABLE ENVIRONMENTAL EFFECTS: The OIAA has determined based on preliminary review that a Project EIR will be prepared in accordance with CEQA Guidelines §15183, which "mandates that projects consistent with the development density established by existing zoning, community plan or general plan policies for which an EIR was certified shall not require additional environmental review, except as might be necessary to examine whether there are project-specific significant effects which are peculiar to the project or its site." The City's General Plan and zoning were evaluated in The Ontario Plan Final EIR (State Clearinghouse No. 2008101140), which was certified by the City of Ontario. The Project proposes 449,700 square feet of buildings and structures on the 76-acre site, which results in a FAR of approximately 0.14, under the maximum development intensity of 0.55 FAR allowed in the City's ONT zoning district, and in accordance with §15183(d), the proposed Project is consistent with the development density established by the ONT zoning district and The Ontario Plan.

Accordingly, the EIR will evaluate the potential for short- and long-term significant environmental effects specific to the Project. Analysis of the following environmental topics is proposed in the EIR:

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology/Soils
- Greenhouse Gas Emissions
- Hazards/Hazardous Materials
- Hydrology/Water Quality
- Noise
- Public Services (Fire and Police)
- Transportation
- Tribal Cultural Resources
- Utilities/Service Systems

Based on preliminary review, the OIAA has determined the Project will not result in significant environmental effects related to the topics identified below. The Project site includes property at Ontario Airport that has been developed with airport-related uses for decades. The site is developed with existing buildings and site improvements, including paved areas and ornamental landscaping, aircraft taxiway, apron areas, and aircraft and vehicle parking areas, which are similar to those of the proposed Project. For these reasons, detailed analysis of the following topics below is not proposed in the EIR.

- **Agriculture and Forestry Resources** – The Project site is not designated farmland or under a Williamson Act contract.[4] The California Department of Conservation designates the site Urban and Built-Up Land.[5] The site is developed with, and surrounded by, airport related and industrial uses. Due to its location within the Airport and its developed condition, the Project site is not suitable for agricultural and timberland production. Based on these characteristics, the Project would not impact agricultural and timberland resources.

- **Land Use and Planning** – The Project site is designated Airport and zoned ONT, Ontario International Airport. Additionally, the Airport Layout Plan identifies the site as "Airport Development Area," which is the designation for future development.[6] The Project would be consistent with the ALP and ONT zoning district, which would allow development of the proposed cargo facility uses. As the Project would be developed entirely within Airport property and is adjacent to other Airport uses, the Project would not physically divide an established community. The Project would not change land uses on or off Airport property. The Project would conform with applicable OIAA, City of Ontario, and FAA-adopted plans, policies, and regulations. Additionally, as described above, the intensity of development proposed is less than the maximum development intensity of 0.55 FAR allowed in the City's ONT zoning district. Based on this information, the Project would have less-than-significant effects related to Land Use and Planning.

- **Mineral Resources** – According to the Ontario General Plan Final EIR, the City contains no mineral resources of Statewide significance. There are, however, a few sites in the City, the closest of which is approximately one mile to the north, that contain regionally significant mineral resources deposited by the Deer and Day Creek alluvial fan with potential aggregate resources, commonly known as gravel.[7] Project implementation would not impact these sites or result in the loss of regionally and locally-important mineral resources. Based on this information, the Project would have a less than significant effect on mineral resources.

- **Population and Housing** – The Project site contains airport office buildings and support facilities. Therefore, Project implementation would not displace people or result in the demolition of existing housing that would require the construction of replacement housing, and the Project would not impact housing stock. The Project would include utility improvements; however, these would be designed to serve the Project and would not directly or indirectly result in unplanned population growth.

  The Project would increase employment opportunities in the region. Using Southern California Association of Governments' employment generation factor of 1,195 square feet of light industrial space per employee,[8] the Project would create approximately 289 jobs. According to the US Bureau of Labor Statistics, in June 2021, there was an unemployment rate

4 City of Ontario. Status of Williamson Act Contracts. 2017, September 28. http://www.ontarioca.gov/sites/default/files/Ontario-Files/Planning/Ontario-Ranch/williamson_act_status_map_sept._2017.pdf.

5 California Department of Conservation. California Important Farmland: 1984-2018. Site Accessed: 2021, August 20. https://maps.conservation.ca.gov/dlrp/ciftimeseries/.

6 Ontario International Airport Authority. Airport Layout Plan Narrative Report. Future Land Use, Sheet 16. 2021, April.

7 City of Ontario. The Ontario Plan Draft EIR. Figure 5.11-1, Mineral Resource Zones. Accessed: 2021, August 20. https://www.ontarioplan.org/wp-content/uploads/sites/4/2016/05/32084.pdf.

8 Southern California Association of Governments. Employment Density Study Summary Report. 2021, October 31. Prepared by: Natelson Company, Inc.

of 7.9 percent (or 165,600 people were unemployed) in the Riverside-San Bernardino-Ontario area.[9] Accordingly, the Project demand for 289 employees could be met by existing residents in the Riverside-San Bernardino-Ontario area. For this reason, it is not anticipated that the Project would result in unplanned population growth by generating new jobs, and the Project would not trigger the need for new housing. The Project would result in less-than-significant effects related to population and housing.

- **Parks/Recreation** – The City of Ontario contains a variety of recreational opportunities, including regional and City parks, school recreation facilities, private parks and golf courses, and recreational trails for bicycles, horses, and hiking. Park and recreation facilities closest to the Project site include a bicycle corridor along Mission Boulevard and the Cucamonga Creek Multipurpose Trail. Project construction and operation would not directly affect these or other recreation facilities. Therefore, the Project would not result in significant effects on parks and recreation facilities.

- **Public Services (Schools and Other Public Facilities)** – The Project site is within the boundaries of the Ontario-Montclair Elementary School District and Chaffey Joint Union High School District. The Project does not include residential development and would not generate students that would need to be housed at public school facilities. Nevertheless, the Project would comply with applicable laws and regulations, including the payment of school impact fees for the proposed commercial/industrial development that would reduce potential impacts to school facilities to less than significant. The Project would not require any other government services, such as library and public health services; therefore, effects on these other public facilities would not be significant.

- **Wildfire** – The Project site is in a Local Responsibility Area and classified by CAL FIRE as non-VHFHSZ (non-very high fire hazard severity zone).[10] The site and surrounding areas are flat and developed with urban uses that would not contribute to the uncontrolled spread of wildfire or exacerbate potential wildfire risks, including downslope flooding and landslides caused by runoff, slope instability, or drainage changes from wildfire. Furthermore, the Project would not impair adopted emergency response and evaluation plans. The Project would not result in, or be subject to, significant effects related to wildfire risk.

NOP RESPONSE PERIOD: This NOP is being circulated from October 15, 2021, to November 15, 2021. Pursuant to CEQA Guidelines §15082(b), responsible and trustee agencies and other interested parties must submit any comments in response to this notice no later than 30 days after receipt of the notice. Please indicate a contact person for your agency or organization if your agency or organization will be a responsible or trustee agency for this Project and provide input in accordance with CEQA Guidelines §15096(b). Please address your response to:

Ontario International Airport Authority
c/o: Nicole Walker, Environmental Planning Manager
1923 East Avion Street
Ontario, CA 91761
nwalker@flyontario.com

SCOPING MEETING: The Project meets the definition of a project of Statewide, regional, or areawide significance as defined in §15206(b)(2)(E). Therefore, pursuant to State CEQA Guidelines §15082(c)(1), the OIAA will conduct a scoping meeting for the Project to solicit comments of adjacent cities, responsible agencies, trustee agencies, and interested parties as to the appropriate scope and content of the Draft EIR. The meeting details are as follows:

DATE: ~~Thursday~~ Wednesday, November 10, 2021
TIME: 2:00 p.m. (Pacific Time)
PLACE: Ontario International Airport Authority Board Room (1923 E. Avion Street, Room 100, Ontario)

Signature | Environmental Planning Manager | 11.08.2021
Title | Date

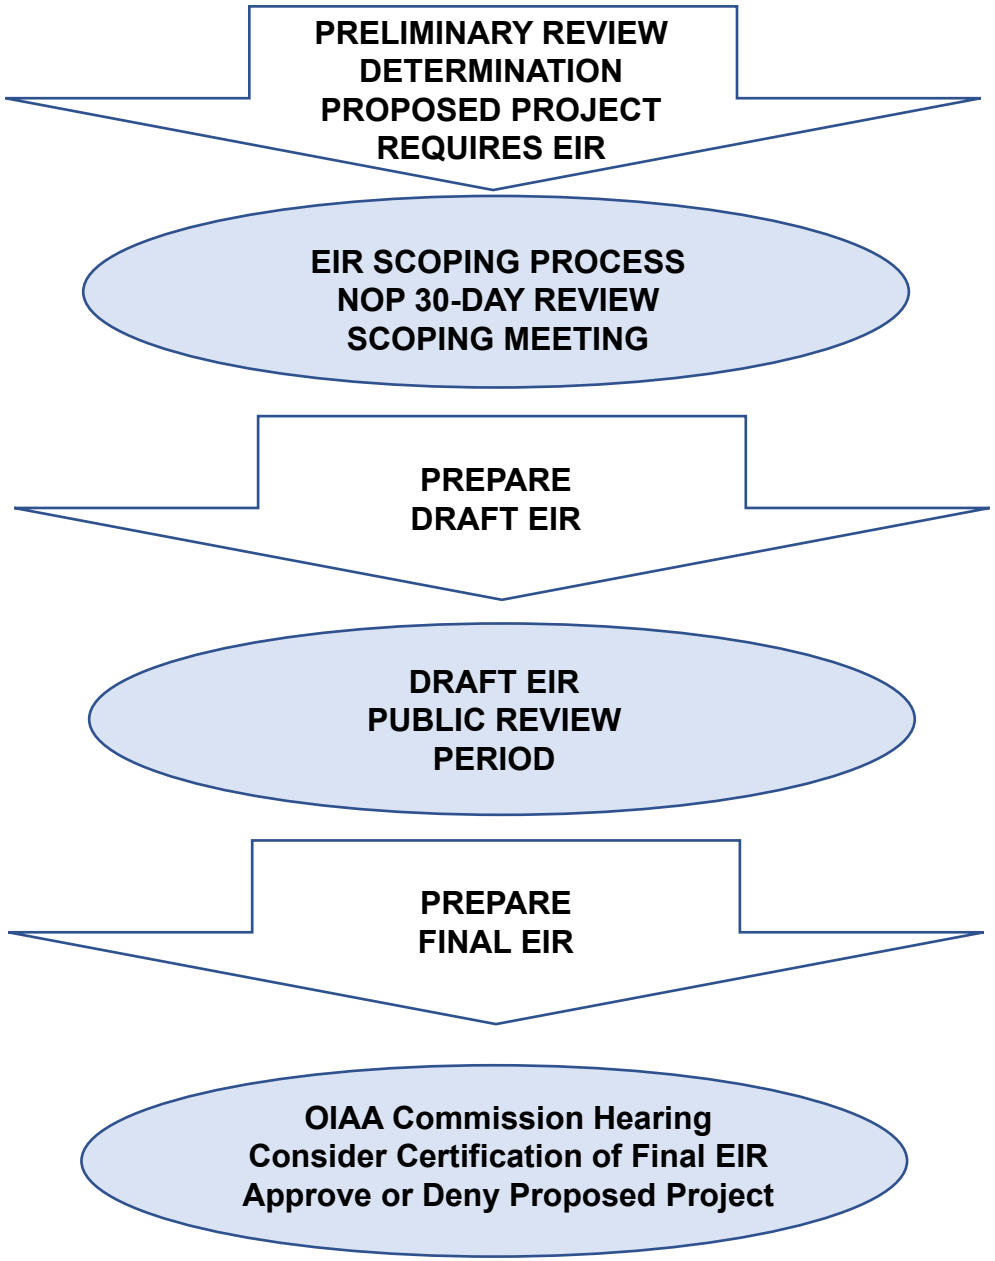
Purpose of Meeting



- Allow for input on scope of topics to be analyzed in Draft EIR
- Comments may include:
  (1) Potential environmental effects to be addressed in Draft EIR
  (2) Alternatives to be evaluated in Draft EIR
- Methods for Comments:
  - Verbal at Scoping Meeting
  - Mail or email to OIAA
- Comments must be received no later than November 15, 2021

Meridian Consultants

- The South Airport Cargo Center project is proposed on Ontario International Airport property in the City of Ontario
- Project site is approximately 76 acres
- Airport related land uses surround the Project Site
- South is the Union Pacific Railroad/Metrolink right-of-way and Mission Boulevard, beyond which are industrial land uses

- The Project site is south of the Airport airfield and west of the Cucamonga Canyon Channel
- Majority of site is north of East Avion Street with small portion south of East Avion Street

- Two Development Phases: 2024 and 2029
- Project includes development of
  - Main Cargo Building
  - Aircraft Apron Improvements
  - Parking Structure
  - Internal Roadway Improvements and Site Improvements (Landscaping and Utilities)
- Main Cargo Facility is north of East Avion Street; parking garage is south of East Avion Street, east of South Hellman Avenue

EIR Topics

- Aesthetics
- Air Quality
- Biological Resources
- Cultural Resources
- Energy
- Geology & Soils
- Greenhouse Gas Emissions
- Hazards & Hazardous Materials
- Hydrology & Water Quality
- Noise
- Public Services (Fire & Police)
- Transportation & Traffic
- Tribal Cultural Resources
- Utilities & Service Systems

Re: 2021100226, Ontario International Airport South Airport Cargo Center Project, San Bernardino County

Dear Ms. Walker:

The Native American Heritage Commission (NAHC) has received the Notice of Preparation (NOP), Draft Environmental Impact Report (DEIR) or Early Consultation for the project referenced above. The California Environmental Quality Act (CEQA) (Pub. Resources Code §21000 et seq.), specifically Public Resources Code §21084.1, states that a project that may cause a substantial adverse change in the significance of a historical resource, is a project that may have a significant effect on the environment. (Pub. Resources Code § 21084.1; Cal. Code Regs., tit.14, §15064.5 (b) (CEQA Guidelines §15064.5 (b)). If there is substantial evidence, in light of the whole record before a lead agency, that a project may have a significant effect on the environment, an Environmental Impact Report (EIR) shall be prepared. (Pub. Resources Code §21080 (d); Cal. Code Regs., tit. 14, § 5064 subd.(a)(1) (CEQA Guidelines §15064 (a)(1)). In order to determine whether a project will cause a substantial adverse change in the significance of a historical resource, a lead agency will need to determine whether there are historical resources within the area of potential effect (APE).

CEQA was amended significantly in 2014. Assembly Bill 52 (Gatto, Chapter 532, Statutes of 2014) (AB 52) amended CEQA to create a separate category of cultural resources, "tribal cultural resources" (Pub. Resources Code §21074) and provides that a project with an effect that may cause a substantial adverse change in the significance of a tribal cultural resource is a project that may have a significant effect on the environment. (Pub. Resources Code §21084.2). Public agencies shall, when feasible, avoid damaging effects to any tribal cultural resource. (Pub. Resources Code §21084.3 (a)). **AB 52 applies to any project for which a notice of preparation, a notice of negative declaration, or a mitigated negative declaration is filed on or after July 1, 2015.** If your project involves the adoption of or amendment to a general plan or a specific plan, or the designation or proposed designation of open space, on or after March 1, 2005, it may also be subject to Senate Bill 18 (Burton, Chapter 905, Statutes of 2004) (SB 18). **Both SB 18 and AB 52 have tribal consultation requirements.** If your project is also subject to the federal National Environmental Policy Act (42 U.S.C. § 4321 et seq.) (NEPA), the tribal consultation requirements of Section 106 of the National Historic Preservation Act of 1966 (154 U.S.C. 300101, 36 C.F.R. §800 et seq.) may also apply.

The NAHC recommends consultation with California Native American tribes that are traditionally and culturally affiliated with the geographic area of your proposed project as early as possible in order to avoid inadvertent discoveries of Native American human remains and best protect tribal cultural resources. Below is a brief summary of portions of AB 52 and SB 18 as well as the NAHC's recommendations for conducting cultural resources assessments.

Consult your legal counsel about compliance with AB 52 and SB 18 as well as compliance with any other applicable laws.

AB 52

AB 52 has added to CEQA the additional requirements listed below, along with many other requirements:

1. Fourteen Day Period to Provide Notice of Completion of an Application/Decision to Undertake a Project: Within fourteen (14) days of determining that an application for a project is complete or of a decision by a public agency to undertake a project, a lead agency shall provide formal notification to a designated contact of, or tribal representative of, traditionally and culturally affiliated California Native American tribes that have requested notice, to be accomplished by at least one written notice that includes:

- **a.** A brief description of the project.
- **b.** The lead agency contact information.
- **c.** Notification that the California Native American tribe has 30 days to request consultation. (Pub. Resources Code §21080.3.1 (d)).
- **d.** A "California Native American tribe" is defined as a Native American tribe located in California that is on the contact list maintained by the NAHC for the purposes of Chapter 905 of Statutes of 2004 (SB 18). (Pub. Resources Code §21073).

2. Begin Consultation Within 30 Days of Receiving a Tribe's Request for Consultation and Before Releasing a Negative Declaration, Mitigated Negative Declaration, or Environmental Impact Report: A lead agency shall begin the consultation process within 30 days of receiving a request for consultation from a California Native American tribe that is traditionally and culturally affiliated with the geographic area of the proposed project. (Pub. Resources Code §21080.3.1, subds. (d) and (e)) and prior to the release of a negative declaration, mitigated negative declaration or Environmental Impact Report. (Pub. Resources Code §21080.3.1(b)).

- **a.** For purposes of AB 52, "consultation shall have the same meaning as provided in Gov. Code §65352.4 (SB 18). (Pub. Resources Code §21080.3.1 (b)).

3. Mandatory Topics of Consultation If Requested by a Tribe: The following topics of consultation, if a tribe requests to discuss them, are mandatory topics of consultation:

- **a.** Alternatives to the project.
- **b.** Recommended mitigation measures.
- **c.** Significant effects. (Pub. Resources Code §21080.3.2 (a)).

4. Discretionary Topics of Consultation: The following topics are discretionary topics of consultation:

- **a.** Type of environmental review necessary.
- **b.** Significance of the tribal cultural resources.
- **c.** Significance of the project's impacts on tribal cultural resources.
- **d.** If necessary, project alternatives or appropriate measures for preservation or mitigation that the tribe may recommend to the lead agency. (Pub. Resources Code §21080.3.2 (a)).

5. Confidentiality of Information Submitted by a Tribe During the Environmental Review Process: With some exceptions, any information, including but not limited to, the location, description, and use of tribal cultural resources submitted by a California Native American tribe during the environmental review process shall not be included in the environmental document or otherwise disclosed by the lead agency or any other public agency to the public, consistent with Government Code §6254 (r) and §6254.10. Any information submitted by a California Native American tribe during the consultation or environmental review process shall be published in a confidential appendix to the environmental document unless the tribe that provided the information consents, in writing, to the disclosure of some or all of the information to the public. (Pub. Resources Code §21082.3 (c)(1)).

6. Discussion of Impacts to Tribal Cultural Resources in the Environmental Document: If a project may have a significant impact on a tribal cultural resource, the lead agency's environmental document shall discuss both of the following:

- **a.** Whether the proposed project has a significant impact on an identified tribal cultural resource.
- **b.** Whether feasible alternatives or mitigation measures, including those measures that may be agreed to pursuant to Public Resources Code §21082.3, subdivision (a), avoid or substantially lessen the impact on the identified tribal cultural resource. (Pub. Resources Code §21082.3 (b)).

7. Conclusion of Consultation: Consultation with a tribe shall be considered concluded when either of the following occurs:

a. The parties agree to measures to mitigate or avoid a significant effect, if a significant effect exists, on a tribal cultural resource; or

b. A party, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached. (Pub. Resources Code §21080.3.2 (b)).

8. Recommending Mitigation Measures Agreed Upon in Consultation in the Environmental Document: Any mitigation measures agreed upon in the consultation conducted pursuant to Public Resources Code §21080.3.2 shall be recommended for inclusion in the environmental document and in an adopted mitigation monitoring and reporting program, if determined to avoid or lessen the impact pursuant to Public Resources Code §21082.3, subdivision (b), paragraph 2, and shall be fully enforceable. (Pub. Resources Code §21082.3 (a)).

9. Required Consideration of Feasible Mitigation: If mitigation measures recommended by the staff of the lead agency as a result of the consultation process are not included in the environmental document or if there are no agreed upon mitigation measures at the conclusion of consultation, or if consultation does not occur, and if substantial evidence demonstrates that a project will cause a significant effect to a tribal cultural resource, the lead agency shall consider feasible mitigation pursuant to Public Resources Code §21084.3 (b). (Pub. Resources Code §21082.3 (e)).

10. Examples of Mitigation Measures That, If Feasible, May Be Considered to Avoid or Minimize Significant Adverse Impacts to Tribal Cultural Resources:

a. Avoidance and preservation of the resources in place, including, but not limited to:

i. Planning and construction to avoid the resources and protect the cultural and natural context.

ii. Planning greenspace, parks, or other open space, to incorporate the resources with culturally appropriate protection and management criteria.

b. Treating the resource with culturally appropriate dignity, taking into account the tribal cultural values and meaning of the resource, including, but not limited to, the following:

i. Protecting the cultural character and integrity of the resource.

ii. Protecting the traditional use of the resource.

iii. Protecting the confidentiality of the resource.

c. Permanent conservation easements or other interests in real property, with culturally appropriate management criteria for the purposes of preserving or utilizing the resources or places.

d. Protecting the resource. (Pub. Resource Code §21084.3 (b)).

e. Please note that a federally recognized California Native American tribe or a non-federally recognized California Native American tribe that is on the contact list maintained by the NAHC to protect a California prehistoric, archaeological, cultural, spiritual, or ceremonial place may acquire and hold conservation easements if the conservation easement is voluntarily conveyed. (Civ. Code §815.3 (c)).

f. Please note that it is the policy of the state that Native American remains and associated grave artifacts shall be repatriated. (Pub. Resources Code §5097.991).

11. Prerequisites for Certifying an Environmental Impact Report or Adopting a Mitigated Negative Declaration or Negative Declaration with a Significant Impact on an Identified Tribal Cultural Resource: An Environmental Impact Report may not be certified, nor may a mitigated negative declaration or a negative declaration be adopted unless one of the following occurs:

a. The consultation process between the tribes and the lead agency has occurred as provided in Public Resources Code §21080.3.1 and §21080.3.2 and concluded pursuant to Public Resources Code §21080.3.2.

b. The tribe that requested consultation failed to provide comments to the lead agency or otherwise failed to engage in the consultation process.

c. The lead agency provided notice of the project to the tribe in compliance with Public Resources Code §21080.3.1 (d) and the tribe failed to request consultation within 30 days. (Pub. Resources Code §21082.3 (d)).

The NAHC's PowerPoint presentation titled, "Tribal Consultation Under AB 52: Requirements and Best Practices" may be found online at: http://nahc.ca.gov/wp-content/uploads/2015/10/AB52TribalConsultation_CalEPAPDF.pdf

SB 18

SB 18 applies to local governments and requires local governments to contact, provide notice to, refer plans to, and consult with tribes prior to the adoption or amendment of a general plan or a specific plan, or the designation of open space. (Gov. Code §65352.3). Local governments should consult the Governor's Office of Planning and Research's "Tribal Consultation Guidelines," which can be found online at: https://www.opr.ca.gov/docs/09_14_05_Updated_Guidelines_922.pdf.

Some of SB 18's provisions include:

1. Tribal Consultation: If a local government considers a proposal to adopt or amend a general plan or a specific plan, or to designate open space it is required to contact the appropriate tribes identified by the NAHC by requesting a "Tribal Consultation List." If a tribe, once contacted, requests consultation the local government must consult with the tribe on the plan proposal. **A tribe has 90 days from the date of receipt of notification to request consultation unless a shorter timeframe has been agreed to by the tribe.** (Gov. Code §65352.3 (a)(2)).
2. No Statutory Time Limit on SB 18 Tribal Consultation. There is no statutory time limit on SB 18 tribal consultation.
3. Confidentiality: Consistent with the guidelines developed and adopted by the Office of Planning and Research pursuant to Gov. Code §65040.2, the city or county shall protect the confidentiality of the information concerning the specific identity, location, character, and use of places, features and objects described in Public Resources Code §5097.9 and §5097.993 that are within the city's or county's jurisdiction. (Gov. Code §65352.3 (b)).
4. Conclusion of SB 18 Tribal Consultation: Consultation should be concluded at the point in which:
    a. The parties to the consultation come to a mutual agreement concerning the appropriate measures for preservation or mitigation; or
    b. Either the local government or the tribe, acting in good faith and after reasonable effort, concludes that mutual agreement cannot be reached concerning the appropriate measures of preservation or mitigation. (Tribal Consultation Guidelines, Governor's Office of Planning and Research (2005) at p. 18).

Agencies should be aware that neither AB 52 nor SB 18 precludes agencies from initiating tribal consultation with tribes that are traditionally and culturally affiliated with their jurisdictions before the timeframes provided in AB 52 and SB 18. For that reason, we urge you to continue to request Native American Tribal Contact Lists and "Sacred Lands File" searches from the NAHC. The request forms can be found online at: http://nahc.ca.gov/resources/forms/.

NAHC Recommendations for Cultural Resources Assessments

To adequately assess the existence and significance of tribal cultural resources and plan for avoidance, preservation in place, or barring both, mitigation of project-related impacts to tribal cultural resources, the NAHC recommends the following actions:

1. Contact the appropriate regional California Historical Research Information System (CHRIS) Center (http://ohp.parks.ca.gov/?page_id=1068) for an archaeological records search. The records search will determine:
    a. If part or all of the APE has been previously surveyed for cultural resources.
    b. If any known cultural resources have already been recorded on or adjacent to the APE.
    c. If the probability is low, moderate, or high that cultural resources are located in the APE.
    d. If a survey is required to determine whether previously unrecorded cultural resources are present.

2. If an archaeological inventory survey is required, the final stage is the preparation of a professional report detailing the findings and recommendations of the records search and field survey.
    a. The final report containing site forms, site significance, and mitigation measures should be submitted immediately to the planning department. All information regarding site locations, Native American human remains, and associated funerary objects should be in a separate confidential addendum and not be made available for public disclosure.

b. The final written report should be submitted within 3 months after work has been completed to the appropriate regional CHRIS center.

3. Contact the NAHC for:

a. A Sacred Lands File search. Remember that tribes do not always record their sacred sites in the Sacred Lands File, nor are they required to do so. A Sacred Lands File search is not a substitute for consultation with tribes that are traditionally and culturally affiliated with the geographic area of the project's APE.

b. A Native American Tribal Consultation List of appropriate tribes for consultation concerning the project site and to assist in planning for avoidance, preservation in place, or, failing both, mitigation measures.

4. Remember that the lack of surface evidence of archaeological resources (including tribal cultural resources) does not preclude their subsurface existence.

a. Lead agencies should include in their mitigation and monitoring reporting program plan provisions for the identification and evaluation of inadvertently discovered archaeological resources per Cal. Code Regs., tit. 14, §15064.5(f) (CEQA Guidelines §15064.5(f)). In areas of identified archaeological sensitivity, a certified archaeologist and a culturally affiliated Native American with knowledge of cultural resources should monitor all ground-disturbing activities.

b. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the disposition of recovered cultural items that are not burial associated in consultation with culturally affiliated Native Americans.

c. Lead agencies should include in their mitigation and monitoring reporting program plans provisions for the treatment and disposition of inadvertently discovered Native American human remains. Health and Safety Code §7050.5, Public Resources Code §5097.98, and Cal. Code Regs., tit. 14, §15064.5, subdivisions (d) and (e) (CEQA Guidelines §15064.5, subds. (d) and (e)) address the processes to be followed in the event of an inadvertent discovery of any Native American human remains and associated grave goods in a location other than a dedicated cemetery.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

Notice of Preparation of Environmental Impact Report for the Ontario International Airport South Airport Cargo Center Project

South Coast Air Quality Management District (South Coast AQMD) staff appreciates the opportunity to comment on the above-mentioned document. Our comments are recommendations on the analysis of potential air quality impacts from the Proposed Project that should be included in the Environmental Impact Report (EIR). Please send a copy of the EIR upon its completion and public release directly to South Coast AQMD as copies of the EIR submitted to the State Clearinghouse are not forwarded. **In addition, please send all appendices and technical documents related to the air quality, health risk, and greenhouse gas analyses and electronic versions of all emission calculation spreadsheets, and air quality modeling and health risk assessment input and output files (not PDF files). Any delays in providing all supporting documentation for our review will require additional review time beyond the end of the comment period.**

CEQA Air Quality Analysis

Staff recommends that the Lead Agency use South Coast AQMD's CEQA Air Quality Handbook and website[1] as guidance when preparing the air quality and greenhouse gas analyses. It is also recommended that the Lead Agency use the CalEEMod[2] land use emissions software, which can estimate pollutant emissions from typical land use development and is the only software model maintained by the California Air Pollution Control Officers Association.

South Coast AQMD has developed both regional and localized significance thresholds. South Coast AQMD staff recommends that the Lead Agency quantify criteria pollutant emissions and compare the emissions to South Coast AQMD's CEQA regional pollutant emissions significance thresholds[3] and localized significance thresholds (LSTs)[4] to determine the Proposed Project's air quality impacts. The localized analysis can be conducted by either using the LST screening tables or performing dispersion modeling.

The Lead Agency should identify any potential adverse air quality impacts that could occur from all phases of the Proposed Project and all air pollutant sources related to the Proposed Project. Air quality impacts from both construction (including demolition, if any) and operations should be calculated. Construction-related air quality impacts typically include, but are not limited to, emissions from the use of heavy-duty equipment from grading, earth-loading/unloading, paving, architectural coatings, off-road

[1] South Coast AQMD's CEQA Handbook and other resources for preparing air quality analyses can be found at: http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook.
[2] CalEEMod is available free of charge at: www.caleemod.com.
[3] South Coast AQMD's CEQA regional pollutant emissions significance thresholds can be found at: http://www.aqmd.gov/docs/default-source/ceqa/handbook/scaqmd-air-quality-significance-thresholds.pdf.
[4] South Coast AQMD's guidance for performing a localized air quality analysis can be found at: http://www.aqmd.gov/home/regulations/ceqa/air-quality-analysis-handbook/localized-significance-thresholds.

mobile sources (e.g., heavy-duty construction equipment) and on-road mobile sources (e.g., construction worker vehicle trips, material transport trips, and hauling trips). Operation-related air quality impacts may include, but are not limited to, emissions from stationary sources (e.g., boilers and air pollution control devices), area sources (e.g., solvents and coatings), and vehicular trips (e.g., on- and off-road tailpipe emissions and entrained dust). Air quality impacts from indirect sources, such as sources that generate or attract vehicular trips, should be included in the analysis. Furthermore, emissions from the overlapping construction and operational activities should be combined and compared to South Coast AQMD's regional air quality CEQA *operational* thresholds to determine the level of significance.

If the Proposed Project generates diesel emissions from long-term construction or attracts diesel-fueled vehicular trips, especially heavy-duty diesel-fueled vehicles, it is recommended that the Lead Agency perform a mobile source health risk assessment[5].

In the event that implementation of the Proposed Project involves the use of stationary equipment (e.g., emergency generator and fire pump) that requires a permit from South Coast AQMD, South Coast AQMD should be identified as a Responsible Agency for the Proposed Project in the EIR. The assumptions in the air quality analysis in the EIR will be the basis for evaluating the permit under CEQA and imposing permit conditions and limits. Questions on permits should be directed to South Coast AQMD's Engineering and Permitting staff at (909) 396-3385.

Mitigation Measures

In the event that the Proposed Project results in significant adverse air quality impacts, CEQA requires that all feasible mitigation measures that go beyond what is required by law be utilized to minimize these impacts. Any impacts resulting from mitigation measures must also be analyzed. Several resources to assist the Lead Agency with identifying potential mitigation measures for the Proposed Project include South Coast AQMD's CEQA Air Quality Handbook[1], South Coast AQMD's Mitigation Monitoring and Reporting Plan for the 2016 Air Quality Management Plan[6], and Southern California Association of Government's Mitigation Monitoring and Reporting Plan for the 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy[7].

South Coast AQMD staff is available to work with the Lead Agency to ensure that air quality, greenhouse gas, and health risk impacts from the Proposed Project are accurately evaluated and mitigated where feasible. If you have any questions regarding this letter, please contact me at lsun@aqmd.gov.

Sincerely,

Lijin Sun

RE: CEQA –NOTICE OF PREPARATION (NOP) OF A DRAFT ENVIRONMENTAL IMPACT REPORT AND NOTICE OF A PUBLIC SCOPING MEETING FOR THE ONTARIO INTERNATIONAL AIRPORT SOUTH AIRPORT CARGO CENTER PROJECT

Dear Ms. Walker:

Thank you for allowing the San Bernardino County Department of Public Works the opportunity to comment on the above-referenced project. **We received this request on October 25, 2021** and pursuant to our review, we have the following comments:

Permits/Operations Support Division (Sameh Basta, Chief, 909-387-7995):

1. Portions of the Project are adjacent to the San Bernardino County Flood Control District (SBCFCD) right-of-way and facility. Any encroachments on the District's right-of-way or facilities, including but not limited to access, fencing and grading, utility crossings, landscaping, new and/or alteration to drainage connections will require a permit from the SBCFCD prior to start of construction. The necessity for permits, and any impacts associated with them, should be addressed in the EIR prior to adoption and certification. If you have any questions regarding this process, please contact the FCD Permit Section at (909) 387-1863

BOARD OF SUPERVISORS
Col. Paul Cook (Ret.) First District | Janice Rutherford Second District | Dawn Rowe Vice Chair, Third District | Curt Hagman Chairman, Fourth District | Joe Baca, Jr. Fifth District
Leonard X. Hernandez Chief Executive Officer

Environmental Management Division (Jonathan Dillon, PWE III, Stormwater Program, 909-387-8119):

1. The project should follow the requirements laid out in the most current MS4 permit and Construction General Permit, compliance measure should be laid out in the EIR section for hydrology/water quality. Impacts to Hydrology/Water Quality and proposed mitigation for those impacts should be disclosed in the EIR prior to certification or adoption.

We respectfully request to be included on the circulation list for all project notices, public reviews, or public hearings. In closing, I would like to thank you again for allowing the San Bernardino County Department of Public Works the opportunity to comment on the above-referenced project. Should you have any questions or need additional clarification, please contact the individuals who provided the specific comment, as listed above.

Sincerely,

Michael Perry

Ontario International Airport South Airport Cargo Center (SCH No. 2021100226)- Project Notice of Preparation (NOP) of Environmental Impact Report (EIR) and Scoping Meeting

Ms. Walker,

The City of Ontario Planning Department appreciates the opportunity to comment on the above-mentioned project. The project proposes demolition of existing buildings, site improvements, and development of an air cargo facility. We offer the following comments and recommendations regarding the analysis of potential cultural resource impacts from the proposed project that should be included in the project Draft EIR. Please send with the Draft EIR, all appendices or technical documents related to cultural resources.

In 2016, the City of Ontario received a Certified Local Government (GLG) grant to *develop a historic context statement for the Ontario International Airport (ONT)* and *conduct an intensive level survey of aviation related properties older than 45 years* located within the bounds of ONT properties. City staff and ASM Affiliates, architectural preservation consultants, partnered with local non-profit preservation advocacy group, Ontario Heritage, and staff members from the Ontario International Airport Authority (OIAA) on the project. As a result of the survey, 3 historic districts (containing 18 contributors) and 9 individual buildings were identified as "Eligible" for local, state, and national registers based on local historic significance. Seven of the individually "Eligible" buildings were also found to be contributors to their perspective historic district. All other buildings within the survey boundary were determined to be ineligible for listing, and therefore, not historic. The table below summarizes historic resource eligibility findings and the local government action taken to list properties to local inventory. Once these properties were added to the inventory, they were then "ranked" based on Tier criteria contained in Section 4.02.040, Historic Preservation- Local Historic Landmark and Local District Designation, Historic Resource Tiering and Architectural Conservation Areas, of the Ontario Development Code.

Reconnaissance and intensive level survey record for each potential historic resource is attached to the ONT Historic Context (link below). The project also delivered a short history video with interviews with Ron Smith (Retired Tech Sargent Metal Shop for Air National Guard), Don Davidson (former Head of

Quality for GE Aviation in Ontario), Skip Bowling (President of Lockheed Aircraft Services in Ontario), Bill Wheeler (Air Traffic Controller at ONT), and Richard Delman (Local historian, pilot and owner of Otto Instruments). Please let me know if you have interest in the viewing the footage which served to inform the development of the historic context.

Air National Guard Hangar	Aviation and Architecture, 1942-1975/ Developments in Construction Technology, 1942-1975	C	3	Individual d, f-h	Tier II File No. PHP17-028
Lockheed Hangar 2	Aviation and Architecture, 1942-1975/ Developments in Construction Technology, 1942-1975	C	3	Individual d, f-h	Tier I
Lockheed Hangar 4	Aviation and Architecture, 1942-1975/ Developments in Construction Technology, 1942-1975	C	3	Individual d, f-h	Tier I
Lockheed Hangar 6	Aviation and Architecture, 1942-1975/ Developments in Construction Technology, 1942-1975	C	3	Individual d, f-h	Tier I

Aerojet-General Hangar	Aviation and Architecture, 1942-1975/ Developments in Construction Technology, 1942-1975	C	3	Individual d, f-h	Tier II File No. PHP17-030

Within the project site are 2 historic resources, *the Air National Guard Hangar* (individual landmark) and *the GE Aircraft Engines Historic District* (4 contributing buildings), that are eligible for listing on the National Register of Historic Places and are listed on the Ontario Register of Historic Resources (local inventory) pursuant to Section 7.0.010, the Ontario Register of Historic Resources, and Section .

The Planning Department recommends the environmental documentation (CEQA and NEPA) analyze alternatives to demolition which includes project avoidance, adaptive reuse of historic buildings, and relocation of buildings with the intent to minimize significant impacts to historic resources. If determined that alternatives to demolition are not feasible, then the project will result in significant and unavoidable impacts that will require mitigation measures.

Mitigation measures for the loss of historic resources may include Historic American Building Survey (HABS) documentation, salvage of architectural features and material, interpretative history or museum located within the airport boundary that is easily accessible to the public, historic context, payment of mitigation fees, naming streets/buildings after GE Aviation and the Air National Guard within project site, adaptive reuse study of airport hangars, and any other measure deemed appropriate.

If you should have any questions, please contact Diane Ayala, Senior Planner at (909) 395-2428 or myself at (909) 395-2422.

Sincerely,

Rudy Zeledon, Planning Director

RE: SCAG Comments on the Notice of Preparation of a Draft Environmental Impact Report for the Ontario International Airport South Airport Cargo Center Project [SCAG NO. IGR10499]

Dear Ms. Walker,

Thank you for submitting the Notice of Preparation of a Draft Environmental Impact Report for the Ontario International Airport South Airport Cargo Center Project ("proposed project") to the Southern California Association of Governments (SCAG) for review and comment. SCAG is responsible for providing informational resources to regionally significant plans, projects, and programs per the California Environmental Quality Act (CEQA) to facilitate the consistency of these projects with SCAG's adopted regional plans, to be determined by the lead agencies.[1]

Pursuant to Senate Bill (SB) 375, SCAG is the designated Regional Transportation Planning Agency under state law and is responsible for preparation of the Regional Transportation Plan (RTP) including the Sustainable Communities Strategy (SCS). SCAG's feedback is intended to assist local jurisdictions and project proponents to implement projects that have the potential to contribute to attainment of Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) goals and align with RTP/SCS policies. Finally, SCAG is also the authorized regional agency for Inter-Governmental Review (IGR) of programs proposed for Federal financial assistance and direct Federal development activities, pursuant to Presidential Executive Order 12372.

SCAG staff has reviewed the Notice of Preparation of a Draft Environmental Impact Report for the Ontario International Airport South Airport Cargo Center Project in San Bernardino County. The proposed project includes the relocation of the airport's administrative offices and South Secured Area Access Point to other locations at the airport; demolition of existing buildings; and development of a 345,400 square foot (SF) cargo building, 2,600,000 SF aircraft apron with 23 aircraft parking stalls, a 104,300 SF parking structure and surface parking lot totaling 900 spaces, a 217,000 SF truck yard with 55 docks, and utility improvements on 76 acres.

When available, please email environmental documentation to *IGR@scag.ca.gov* providing, at a minimum, the full public comment period for review.

If you have any questions regarding the attached comments, please contact the Intergovernmental Review (IGR) Program, attn.: Anita Au, Senior Regional Planner, at (213) 236-1874 or IGR@scag.ca.gov. Thank you.

Sincerely,

Frank Wen, Ph.D.
Manager, Planning Strategy Department

[1] Lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with the 2020 RTP/SCS (Connect SoCal) for the purpose of determining consistency for CEQA.

COMMENTS ON THE NOTICE OF PREPARATION OF A DRAFT ENVIRONMENTAL IMPACT REPORT FOR THE ONTARIO INTERNATIONAL AIRPORT SOUTH AIRPORT CARGO CENTER PROJECT [SCAG NO. IGR10499]

CONSISTENCY WITH CONNECT SOCAL

SCAG provides informational resources to facilitate the consistency of the proposed project with the adopted 2020-2045 Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS or Connect SoCal). For the purpose of determining consistency with CEQA, lead agencies such as local jurisdictions have the sole discretion in determining a local project's consistency with Connect SoCal.

CONNECT SOCAL GOALS

The SCAG Regional Council fully adopted Connect SoCal in September 2020. Connect SoCal, also known as the 2020 – 2045 RTP/SCS, builds upon and expands land use and transportation strategies established over several planning cycles to increase mobility options and achieve a more sustainable growth pattern. The long-range visioning plan balances future mobility and housing needs with goals for the environment, the regional economy, social equity and environmental justice, and public health. The goals included in Connect SoCal may be pertinent to the proposed project. These goals are meant to provide guidance for considering the proposed project. Among the relevant goals of Connect SoCal are the following:

SCAG CONNECT SOCAL GOALS	
Goal #1:	*Encourage regional economic prosperity and global competitiveness*
Goal #2:	*Improve mobility, accessibility, reliability and travel safety for people and goods*
Goal #3:	*Enhance the preservation, security, and resilience of the regional transportation system*
Goal #4:	*Increase person and goods movement and travel choices within the transportation system*
Goal #5:	*Reduce greenhouse gas emissions and improve air quality*
Goal #6:	*Support healthy and equitable communities*
Goal #7:	*Adapt to a changing climate and support an integrated regional development pattern and transportation network*
Goal #8:	*Leverage new transportation technologies and data-driven solutions that result in more efficient travel*
Goal #9:	*Encourage development of diverse housing types in areas that are supported by multiple transportation options*
Goal #10:	*Promote conservation of natural and agricultural lands and restoration of habitats*

For ease of review, we encourage the use of a side-by-side comparison of SCAG goals with discussions of the consistency, non-consistency or non-applicability of the goals and supportive analysis in a table format. Suggested format is as follows:

SCAG CONNECT SOCAL GOALS		
	Goal	Analysis
Goal #1:	*Encourage regional economic prosperity and global competitiveness*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
Goal #2:	*Improve mobility, accessibility, reliability and travel safety for people and goods*	*Consistent: Statement as to why;* *Not-Consistent: Statement as to why;* *Or* *Not Applicable: Statement as to why;* *DEIR page number reference*
etc.		etc.

Connect SoCal Strategies

To achieve the goals of Connect SoCal, a wide range of land use and transportation strategies are included in the accompanying twenty (20) technical reports. Of particular note are multiple strategies included in Chapter 3 of Connect SoCal intended to support implementation of the regional Sustainable Communities Strategy (SCS) framed within the context of focusing growth near destinations and mobility options; promoting diverse housing choices; leveraging technology innovations; supporting implementation of sustainability policies; and promoting a Green Region. To view Connect SoCal and the accompanying technical reports, please visit the Connect SoCal webpage. Connect SoCal builds upon the progress from previous RTP/SCS cycles and continues to focus on integrated, coordinated, and balanced planning for land use and transportation that helps the SCAG region strive towards a more sustainable region, while meeting statutory requirements pertinent to RTP/SCSs. These strategies within the regional context are provided as guidance for lead agencies such as local jurisdictions when the proposed project is under consideration.

DEMOGRAPHICS AND GROWTH FORECASTS

A key, formative step in projecting future population, households, and employment through 2045 for Connect SoCal was the generation of a forecast of regional and county level growth in collaboration with expert demographers and economists on Southern California. From there, jurisdictional level forecasts were ground-truthed by subregions and local agencies, which helped SCAG identify opportunities and barriers to future development. This forecast helps the region understand, in a very general sense, where we are expected to grow, and allows SCAG to focus attention on areas that are experiencing change and may have increased transportation needs. After a year-long engagement effort with all 197 jurisdictions one-on-one, 82 percent of SCAG's 197 jurisdictions provided feedback on the forecast of future growth for Connect SoCal. SCAG also sought feedback on potential sustainable growth strategies from a broad range of stakeholder groups – including local jurisdictions, county transportation commissions, other partner agencies, industry groups, community-based organizations, and the general public. Connect SoCal utilizes a bottom-up approach in that total projected growth for each jurisdiction reflects feedback received from jurisdiction staff, including city managers, community development/planning directors, and local staff. Growth at the neighborhood level (i.e., transportation analysis zone (TAZ) reflects entitled projects and adheres to current general and specific plan maximum densities as conveyed by jurisdictions (except in cases where entitled projects and development agreements exceed these capacities as calculated by SCAG). Neighborhood level growth projections also feature strategies that help to reduce greenhouse gas emissions (GHG) from automobiles and light trucks to achieve Southern California's GHG reduction target, approved by the California Air Resources Board (CARB) in accordance with state planning law. Connect SoCal's Forecasted Development Pattern is utilized for long range modeling purposes and does not supersede actions taken by elected bodies on future development, including entitlements and development agreements. SCAG does not have the authority to implement the plan -- neither through decisions about what type of development is built where, nor what transportation projects are ultimately built, as Connect

SoCal is adopted at the jurisdictional level. Achieving a sustained regional outcome depends upon informed and intentional local action. To access jurisdictional level growth estimates and forecasts for years 2016 and 2045, please refer to the Connect SoCal Demographics and Growth Forecast Technical Report. The growth forecasts for the region and applicable jurisdictions are below.

	Adopted SCAG Region Wide Forecasts				Adopted San Bernardino County Forecasts			
	Year 2020	**Year 2030**	**Year 2035**	**Year 2045**	**Year 2020**	**Year 2030**	**Year 2035**	**Year 2045**
Population	19,517,731	20,821,171	21,443,006	22,503,899	2,249,744	2,473,709	2,594,733	2,814,941
Households	6,333,458	6,902,821	7,170,110	7,633,451	667,637	750,565	792,938	874,796

MITIGATION MEASURES

SCAG staff recommends that you review the Final Program Environmental Impact Report (Final PEIR) for Connect SoCal for guidance, as appropriate. SCAG's Regional Council certified the PEIR and adopted the associated Findings of Fact and a Statement of Overriding Considerations (FOF/SOC) and Mitigation Monitoring and Reporting Program (MMRP) on May 7, 2020 and also adopted a PEIR Addendum and amended the MMRP on September 3, 2020 (please see the PEIR webpage and scroll to the bottom of the page for the PEIR Addendum). The PEIR includes a list of project-level performance standards-based mitigation measures that may be considered for adoption and implementation by lead, responsible, or trustee agencies in the region, as applicable and feasible. Project-level mitigation measures are within responsibility, authority, and/or jurisdiction of project-implementing agency or other public agency serving as lead agency under CEQA in subsequent project- and site- specific design, CEQA review, and decision-making processes, to meet the performance standards for each of the CEQA resource categories.

RE: City of Chino Comments on Proposed South Airport Cargo Center Project (Project)

Dear Ms.Walker:

Please find the following in response to Ontario International Airport Authority's (OIAA) request for comments from responsible agencies on the proposed South Airport Cargo Center Project (Project). These comments address the scope and content of the Notice of Preparation (NOP) of an Environmental Impact Report (EIR) relevant to potential impacts on the City of Chino (City) from the proposed Project.

The City understands that the OIAA is the Lead Agency and will prepare an EIR in compliance with the California Environmental Quality Act (CEQA). Given the scope and potential impacts of the Project and proposed actions, we stress the applicability of the National Environmental Policy Act (NEPA), which would also prepare an Environmental Impact Statement (EIS) to include a noise study (per 14CFR PART 150) of ground, air, and land use for future environmental impacts to the Project area and surrounding communities. This study would also facilitate federal programs to mitigate noise, water, and air quality issues while utilizing a professional third-party expert to conduct the needed analyses per Federal Aviation Administration (FAA) Order 1050.1.

During the November 10, 2021 Scoping Meeting, Project Consultants and OIAA staff stressed that the proposed Project is in preliminary stages and discussions with FAA are just beginning. Based on the information provided to date, the City believes the EIR must evaluate both the long term and short-term, as well as cumulative environmental impacts of the Project, with emphasis placed on noise, air quality, traffic and safety. Specific requirements include:

- Comprehensive computer modeling using the FAA standard Aviation Environmental Design Tool (AEDT), a software system that dynamically models aircraft performance in space and time to produce fuel burn, air emissions, and noise. The AEDT must evaluate various project alternatives and a no-project alternative to enable quantitative assessment of the impacts.

13220 Central Avenue, Chino, California 91710
Mailing Address: P.O. Box 667, Chino, California 91708-0667
(909) 334-3250 • (909) 334-3720 Fax
Web Site: www.cityofchino.org

- A sleep interference assessment is required to determine the degree of awakenings and other effects upon the residential communities from the increased aircraft operations.
- Revision of air traffic patterns for arrivals and departures to limit the low-flying aircraft currently awakening neighbors near the airport. The sleep interference study must assess the effects of this mitigation program.
- With the increased noise impact on surrounding communities, criteria must be developed for noise mitigation of residences, schools, and health care facilities. One likely mitigation plan is a sound insulation program (SIP) like that already affected for homes near Ontario International Airport (ONT).
- A separate noise study is also necessary to determine the noise impact of additional car and heavy truck traffic generated by the proposed Project.
- A study is required for the traffic effects on surrounding communities from increased surface traffic, for automobile and heavy truck transport to and from the proposed cargo facilities.
- The specific effects on climate change, due to emission of CO2 and methane from aircraft taxiing, takeoffs and landings, surface vehicular traffic, and fuel storage must be quantified.
- A crash hazard potential study is required to determine the potential for aircraft crashes in the surrounding communities and the possible effects on insurance rates for homeowners.
- Mitigation measures must be evaluated and assessed for all environmental effects.

Please address and/or notify our contact person for any/or all information or notices relative to your project:

Warren Morelion, AICP
City Planner
City of Chino
13220 Central Avenue
Chino, CA 91710

We urge the Federal Aviation Administration to prepare an EIS to comply with obligations under NEPA. The EIS should contain comprehensive analyses of alternatives and mitigation measures for the significant impacts of the proposed actions. Fulfilling the FAA's obligation under NEPA to fully evaluate the potential to significantly affect the quality of the human environment will also provide an extended opportunity to work with the local community to jointly develop mitigation measures to improve the Project and reduce its effects on the community.

The City appreciates this opportunity to comment on the proposed Project and looks forward to working with OIAA and the FAA toward a legally supportable environmental review and successful implementation of an environmentally compliant and properly mitigated Ontario International Airport South Airport Cargo Center Project.

We look forward to working with you to ensure that mitigation, avoidance, and minimization measures that protect our residents are implemented as a condition of approval of EIR and EIS approval.

Sincerely,

Eunice M. Ulloa
Mayor

1.0 INTRODUCTION

This document presents the Air Quality Technical Report associated with the proposed Ontario International Airport (Airport or ONT) Cargo Development (Proposed Project, South Airport Cargo Center, or SACC) in Ontario, California.

To support the Ontario International Airport Cargo Development Environmental Impact Report (EIR), three analyses were conducted: construction and operational emissions inventories, dispersion modeling to support an ambient air quality standards analysis, and a health risk assessment (HRA). The emission inventories, ambient air quality standards analysis, and HRA results are presented. The potential air quality and health impacts that would result from construction and operation of the Proposed Project have been identified.

To evaluate the potential impacts of the change in air quality conditions that would result from the Proposed Project, the following conditions were analyzed:

- No Project
- With Project

Three timeframes will be evaluated:

- Baseline Condition (2021)[1]
- Phase 1 (2025)
- Phase 2 (2029)[2]

1 The Baseline Condition accounts for aviation activity levels that are historically representative of operations at ONT and, as such, has been "normalized" to eliminate short-term depressions in activity levels attributable to the COVID-19 pandemic. To more accurately represent historically consistent existing conditions at ONT, and to avoid a potentially misleading comparison of project impacts, the air quality and GHG emissions are described and compared using a hybrid of 2019 and 2020 operations. The Baseline Conditions air quality impacts were developed using calendar year 2019 aircraft operations with modifications to reflect increased cargo operations experienced during 2020 and continuing into 2021. The existing/base year fleet mix is a hybrid of 2019 and 2020 operations and was based on the ONT ANOMS radar data from 2019 and 2020, and FAA Traffic Flow TFMSC and OSPNET. Specifically, passenger air carriers, air taxi, and GA operations were obtained from the 2019 ANOMS data and the all-cargo operations were obtained from the 2020 ANOMS data. The military operations were obtained from the FAA TFMSC data. This approach serves to normalize operations to represent Baseline Conditions recognizing that the temporary reduction in passenger air carrier and air taxi operations, due to the COVID-19 pandemic, is not indicative of baseline/existing conditions at ONT.

2 Operational conditions during Phase 2 include Proposed Project activities from both Phase 1 and 2.

The supporting information, methodology, and assumptions used in the construction air emissions inventory, operational air emissions inventory, air quality dispersion modeling, and health risk assessment (including supporting project data and assumptions) are provided in the following:

- **Attachment A: Emissions Inventory and Dispersion Modeling Methodology and Assumptions**
- **Attachment B: Construction and Operational Air Emissions Inventory**
- **Attachment C: Health Risk Assessment Methodology and Assumptions**

Air quality impacts were determined for United States Environmental Protection Agency (USEPA) criteria pollutants and their precursors such as carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter less than 10 micrometers (coarse particulate or PM_{10}), and particulate matter less than 2.5 micrometers (fine particulate or $PM_{2.5}$). The air quality analysis was developed based on the South Coast Air Quality Management District (SCAQMD) Modeling Guidance for AERMOD,[3] the USEPA *Guideline on Air Quality Models,*[4] and the SCAQMD *Air Quality Handbook*.[5] The air quality analyses were conducted to determine the air quality impacts, in terms of air emissions and ambient pollutant concentrations, using the significance levels identified by SCAQMD.[6]

The HRA focuses on impacts on existing residences, offsite workers, and other sensitive populations (including onsite workers within the passenger terminal and other areas within the Airport) from emissions of air toxics or toxic air contaminants (TAC)[7] such as diesel particulate matter (DPM)[8] emissions from construction equipment and haul trucks associated with the Proposed Project construction activities and other air toxics emissions during aircraft operations. The HRA was conducted to determine the health impacts, in terms of excess cancer risk and noncancer hazards, using the significance levels identified by

3 South Coast Air Quality Management District, SCAQMD Modeling Guidance for AERMOD, https://www.aqmd.gov/home/air-quality/meteorological-data/modeling-guidance

4 United States Environmental Protection Agency, Guideline on Air Quality Models (Revised), 40 Code of Federal Regulations, Part 51, Appendix W, November 2005.

5 South Coast Air Quality Management District, CEQA Air Quality Handbook, http://www.aqmd.gov/home/rules-compliance/ceqa/air-quality-analysis-handbook

6 South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019, http://www.aqmd.gov/ceqa/hdbk.html.

7 Toxic air contaminants (TAC) are a broad class of compounds known to cause morbidity or mortality. TAC are found in ambient air, especially in urban areas, and are caused by industry, agriculture, fuel combustion, and commercial operations (e.g., gasoline service stations, dry cleaners). TAC are typically found in low concentrations, even near their source (e.g., diesel particulate matter near a freeway). Because chronic exposure can result in adverse health effects, TAC are regulated at the regional, state, and Federal level.

8 In 1998, the California Air Resources Board classified diesel particulate matter as a toxic air contaminant, citing its potential to cause cancer and other health problems. The United States Environmental Protection Agency concluded that long-term exposure to diesel engine exhaust is likely to pose a lung cancer hazard to humans and can also contribute to other acute and chronic health effects.

the SCAQMD.[9] The HRA was prepared based on the California Office of Environmental Health Hazard Assessment (OEHHA)'s *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[10] and SCAQMD's *Risk Assessment Procedures for Rule 1401, 1401.1* and *212.*[11]

2.0 PROJECT OVERVIEW

The City of Ontario and San Bernardino County formed the Ontario International Airport Authority (OIAA) in August 2012 by enacting a Joint Powers Agreement. The OIAA provides overall direction for the ownership, management, operations, development, and marketing of Ontario International airport (ONT or Airport) for the benefit of the Southern California economy and the residents of the airport's four-county catchment area.

ONT is located in San Bernardino County, approximately 35 miles east of Downtown Los Angeles in the center of Southern California and is considered part of the Inland Empire. The Airport resides on 1,757 acres of land with an established airport elevation of 944 feet above mean sea level. ONT is within the South Coast Air Basin.

Facilities on the Airport include two passenger terminals, general aviation facilities, air freight buildings, parking lots, and numerous airport and aircraft maintenance and support services. ONT has two parallel runways that are oriented in the east-west direction, Runways 8L-26R and 8R-26L. There are also two commercial terminal aprons, a general aviation apron and two primary air cargo ramps. UPS facilities are located in the southeast quadrant of the Airport (with most of their facilities outside of and adjacent to Airport property) and FedEx facilities are in the northwest quadrant of the Airport.

The three primary runway use configurations at ONT are (1) West Flow (depart and arrive on Runways 26L and 26R), (2) East Flow (depart and arrive on Runways 8L and 8R), and (3) Contra Flow (depart Runways 8L and 8R and arrive Runways 26L and 26R). Contra Flow is an operational noise mitigation strategy to minimize noise over residential areas to the west of the Airport at night and thus occurs daily between 10:00 PM and 7:00 AM when weather and wind conditions allow. The use of Contra Flow at ONT provides for noise abatement.

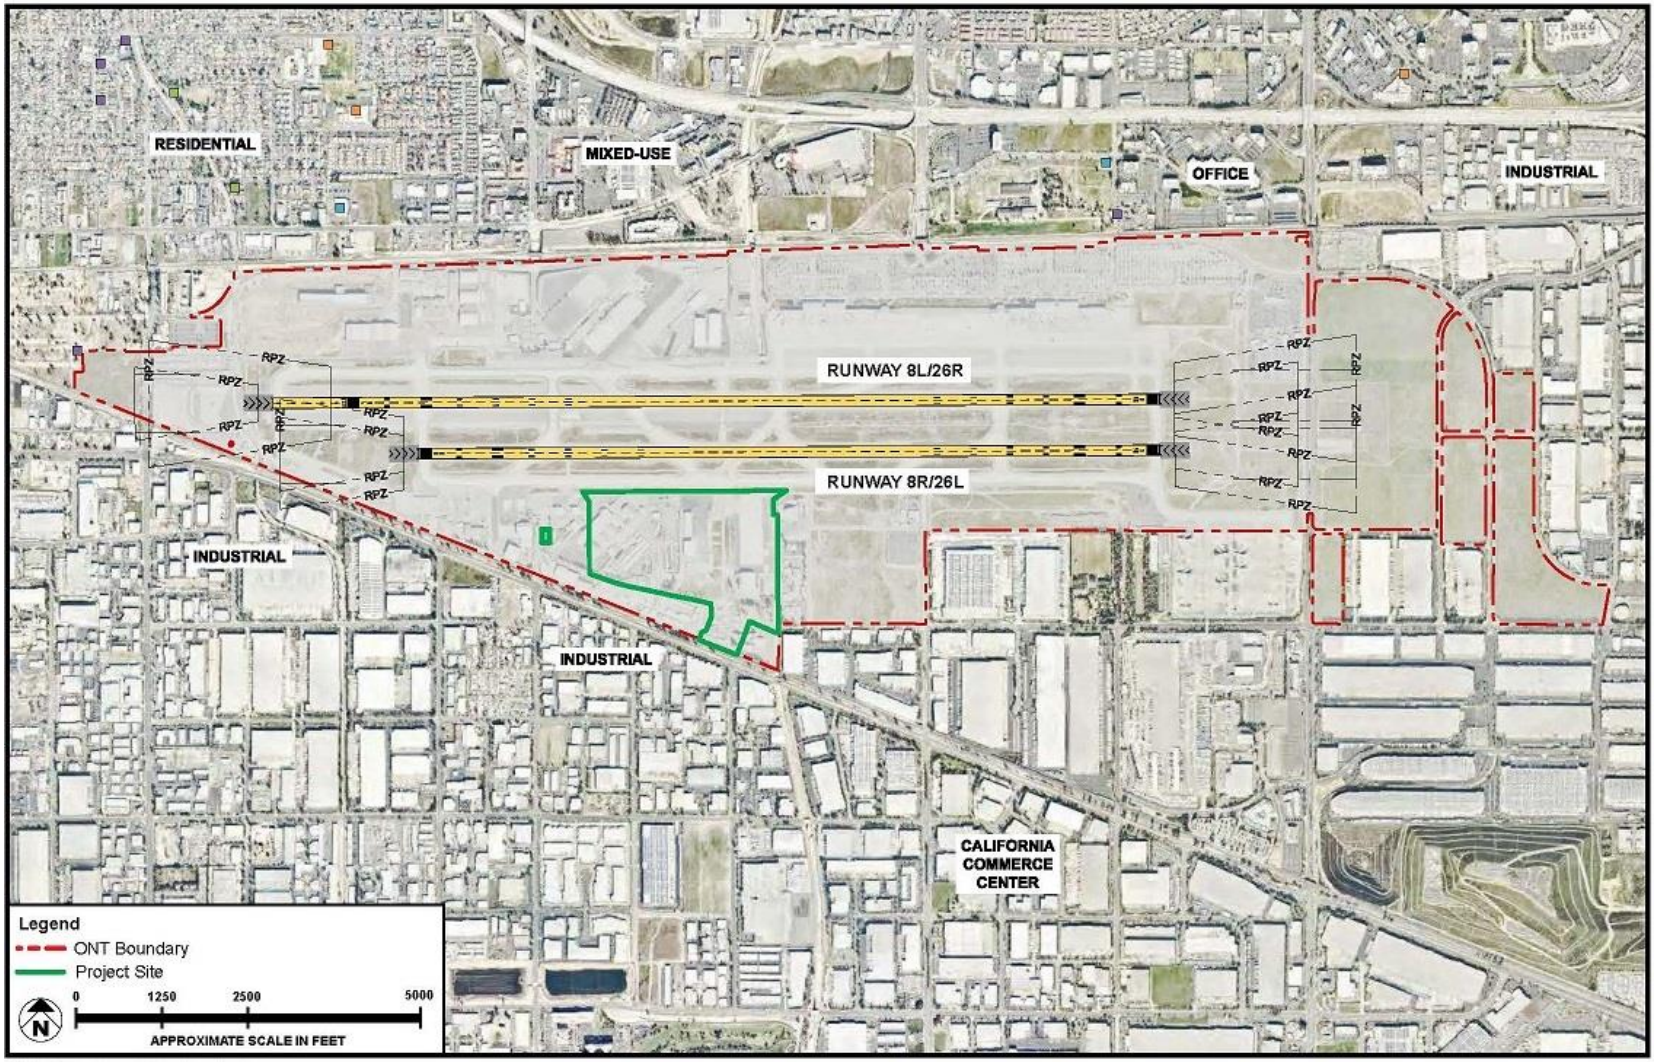
11 South Coast Air Quality Management District, Risk Assessment Procedures for Rule 1401, 1401.1 and 212, September 1, 2017, http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12

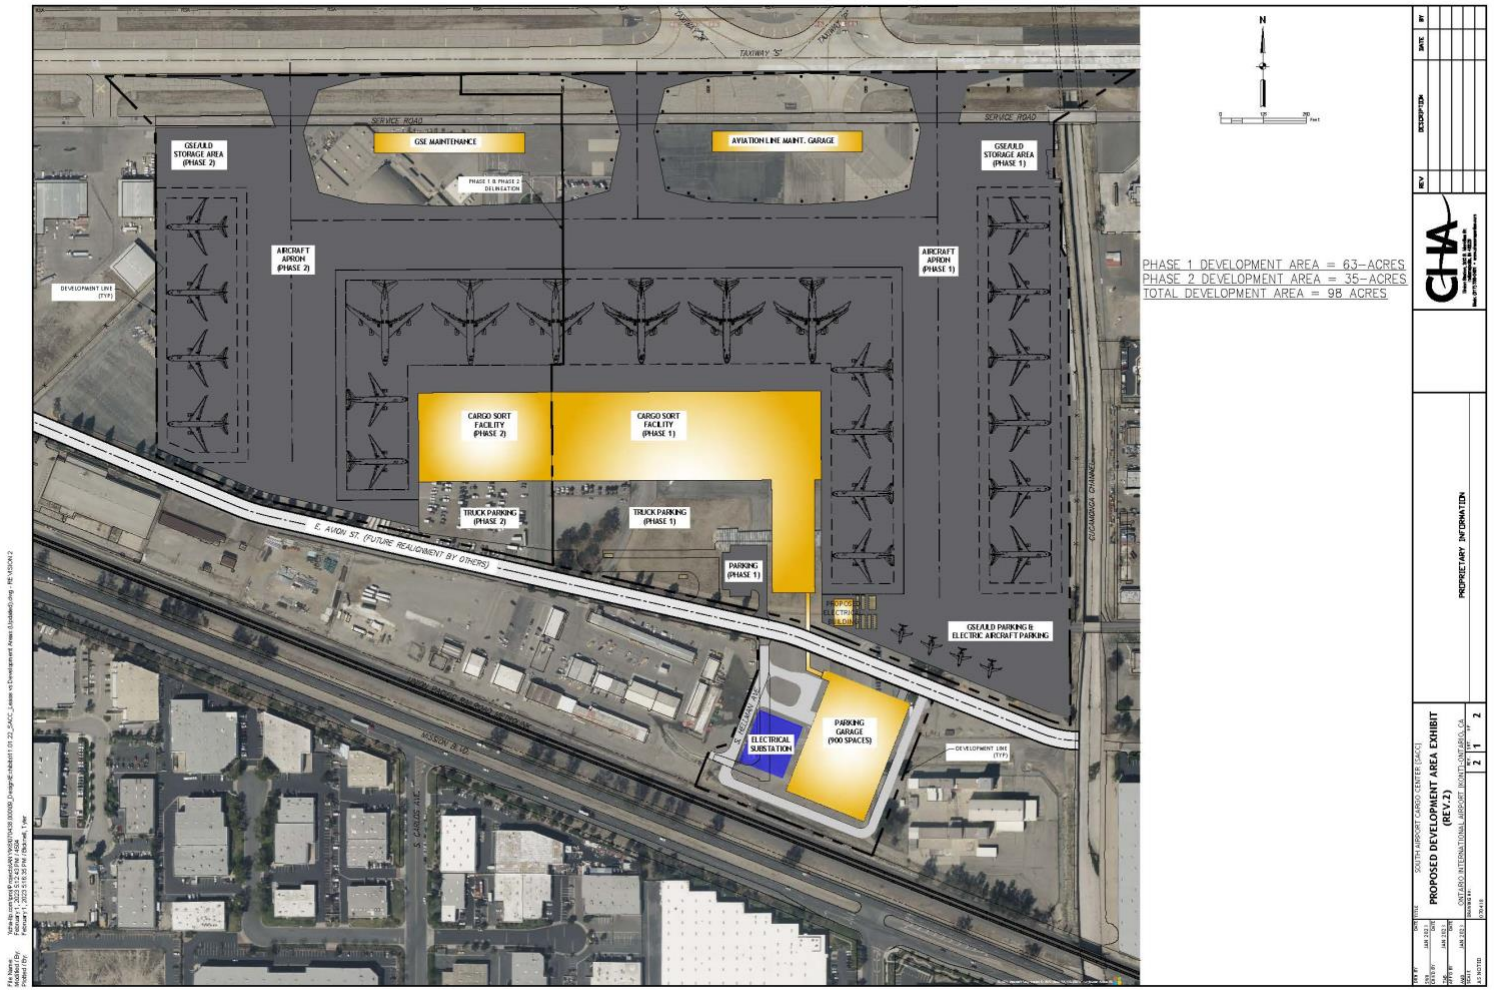
The project site consists of approximately 97 acres located within the south-central portion of ONT. The proposed air cargo center, illustrated in **Figure 1: Project Location Map** and **Figure 2: Project Site Plan**, includes a Cargo Sorting Building, truckyard, parking facilities, aircraft parking apron improvements, ground service equipment (GSE) parking, and aviation support facilities. The Cargo Sorting Building, proposed north of East Avion Street, would contain a sorting facility and office spaces. The aircraft parking apron would surround the building to the west, north, and east. A ground-level visitor parking lot and truckyard are proposed on the south side of the cargo building, with access from East Avion Street. A parking garage for employees is proposed south of East Avion Street with a pedestrian bridge connecting the parking garage to the office building.



The Proposed Project would be implemented in two phases. Phase 1 construction would include the demolition of existing structures and site improvements in the Phase 1 area, site preparation, and construction of all proposed improvements on the eastern 60 acres of the Project site, including the Cargo Sorting Building, aircraft apron improvements, and parking garage. Phase 2 would occur on the western 30 acres of the Project Site and include the demolition of structures and site improvements in the Phase 2 area, site preparation, and construction of the remaining improvements, including the expansion of the Cargo Sorting Building and aircraft apron improvements.

The Proposed Project would include a 857,000-square-foot Cargo Sorting Building and office spaces. A 210,000 square-foot truckyard would be located between the Cargo Sorting Building and East Avion Street and service 150 truck trips per day at Phase 1 (plus 24 fuel truck trips per day) and 224 truck trips per day at Phase 2. The project would include 933 automobile parking stalls, including 900 employee stalls in a parking garage and 2,531 employee trips per day.

The Proposed Project would introduce new flights to the Airport. At its opening in 2025, the Proposed Project would operate 44 daily flights (22 arrivals and 22 departures) at the Airport (with an annual average of 38 flights per day). These flights would arrive and depart throughout the day, every day of the week. By 2029, 22 daily flights (11 arrivals and 11 departures) would be added (with an annual average of 18 flights per day). At the buildout of Phase 2, the Proposed Project would operate 66 daily flights (33 arrivals and 33 departures) (with an annual average of 56 flights per day).



Construction of Phase 1 is projected to start in March of 2023 and be completed in December of 2024. Construction of Phase 2 is estimated to begin in September of 2025 (demolition), December of 2026 (site preparation), and August of 2027 (building construction), with completion in August of 2028, and would become operational in January of 2029. Typically, construction activities would occur between 5 a.m. and 3 p.m. (ten hours per day), on Monday through Friday.

Figure 1
Project Location Map

Source: Meridian Consultants, February 2023

Figure 2
Project Site Plan

Source: CHA, February 2023

The following project design feature (PDF) would be implemented during construction activities to reduce emissions and are quantified within the air quality analysis:

PDF AQ-1: The Applicant shall use equipment that meets the USEPA's Tier 4 emissions standards for offroad diesel-powered construction equipment with 50 horsepower (hp) or greater, for all phases of construction activity. To ensure that Tier 4 or the cleanest construction equipment available would be used during the Project's construction, the OIAA shall confirm that the Applicant includes this requirement in applicable bid documents, purchase orders, and contracts. Additionally, the OIAA shall confirm that the Applicant also requires periodic reporting and provision of written construction documents by construction contractor(s) and conducts regular inspections to the maximum extent feasible to ensure and enforce compliance.

This PDF results in the avoidance of 1.5 tons of VOC, 16.3 tons of NO_x, 0.8 tons of PM_{10}, and 0.7 tons of $PM_{2.5}$ during the entire construction period.

PDF AQ-2: The Applicant shall conduct concrete/asphalt demolition on-site to reuse concrete/asphalt generated during construction. During Phase 1, demolition would involve removal of approximately 2,047,320 square feet of asphalt/concrete, which would be recycled within the project site and not require offsite haul truck trips (i.e., avoiding 2,616 haul truck trips). During Phase 2, demolition would involve removal of approximately 1,045,440 square feet of asphalt/concrete, which would be recycled within the project site and not require offsite haul truck trips (i.e., avoiding 910 haul truck trips).

This PDF results in the avoidance of 0.1 tons of CO and 0.2 tons of NO_x during the entire construction period.

The following PDFs would be implemented during operation to reduce emissions and are quantified within the air quality analysis:

PDF AQ-3: The Ground Support Equipment (GSE), including (but not limited to) aircraft tugs, baggage tugs, belt loaders, cargo loaders, forklifts, and ground power units, ramp support carts/vans, servicing aircrafts shall be electric by Phase 2.

This PDF results in the avoidance of 0.7 tons of VOC, 1.7 tons of CO, 1.6 tons of NO_x, and 0.1 tons of PM_{10} and $PM_{2.5}$ compared to the use of diesel fueled ground support equipment.

PDF AQ-4: A portion of the proposed Project's aircraft fleet shall include electric cargo aircraft. (See **Table 3.4** in **Section 3.0: Project Description.**)

This PDF results in the avoidance of 3.8 tons of VOC, 23.0 tons of CO, 25.5 tons of NO_x, and 0.2 tons of PM_{10} and $PM_{2.5}$ compared to the use of jet-fueled aircraft similar to the project fleet.

PDF AQ-5: All new aircraft parking positions shall be equipped with ground power and pre-conditioned air, therefore reducing the need to operate auxiliary power units.

This PDF results in the avoidance of 0.2 tons of VOC, 2.7 tons of CO, 3.3 tons of NO_x, and 0.5 tons of PM_{10} and $PM_{2.5}$ compared to without the gate infrastructure.

PDF AQ-6: The Applicant shall conduct maintenance and/or testing on each of the seven standby generators on separate days to limit daily emissions from maintenance/testing activities.

This PDF results in the avoidance of 13.5 pounds of VOC, 185 pounds of CO, 35.5 pounds of NO_x, and 2.1 pounds of PM_{10} and $PM_{2.5}$ when compared to testing all seven generators on the same day.

Moreover, additional PDFs not quantified within the air quality analysis include:

PDF AQ-7: The Air Cargo Sort Building shall meet Leadership in Energy and Environmental Design (LEED) certification standards, shall include enhanced building automation systems, and shall utilize advanced low energy HVAC systems.

PDF AQ-8: The visitor parking lot shall include 29 parking stalls, 6 of which shall have access to electric charging points. The employee parking structure shall include 932 parking stalls, 300 of which shall have access to electric charging points.

It should be noted that, over time new technologies or systems will emerge, or will become more cost-effective or user-friendly, which will further reduce the reliance upon nonrenewable natural resources. For example, future implementation of the Clean Fuel Standard and the Renewable Portfolio Standard are expected to decrease the use of nonrenewable fossil fuels. Similarly, efforts made by the FAA and SFO to increase usage of alternative jet fuels are expected to occur during the lifetime of the Proposed Project.

As discussed above, air quality emissions from construction would not result in any significant impacts. However, the Proposed Project's operational emissions during Phase 1 and Phase 2 would exceed SCAQMD significance thresholds for CO, VOC, NO_x and SO_2 (Phase 2 only), primarily due to aircraft, followed by employee vehicles, delivery trucks, and emergency generators. There are no feasible

mitigation measures that would reduce operational emissions to below significant thresholds. However, the Proposed Project would incorporate the following mitigation measures to reduce air quality emissions:

While not quantifiable, the following mitigation measures would reduce air quality emissions during construction.

MM AQ-1: The Applicant shall require that construction vendors, contractors, and/or haul truck operators commit to using 2010 model year trucks (e.g., material delivery trucks and soil import/export with a gross vehicle weight rating of at least 14,001 pounds), that meet CARB's 2010 engine emissions standards or newer, cleaner trucks. The OIAA shall confirm that the Applicant includes this requirement in applicable bid documents, purchase orders, and contracts. Operators shall maintain records of all trucks associated with Project construction to document that each truck used meets these emission standards and make the records available for inspection.

MM AQ-2: The Applicant shall require that construction equipment such as concrete/industrial saws, pumps, aerial lifts, light stands, air compressors, and forklifts be electric or alternative-fueled (i.e., non-diesel), where feasible. Pole power shall be utilized at the earliest feasible point in time and shall be used to the maximum extent feasible in lieu of generators.

MM AQ-3: The Applicant shall support and encourage ridesharing and transit incentives for the construction crew by providing crews with the resources needed to organize rideshares, such as bulletin boards or email announcements. The Applicant shall also partially subsidize transit fares or passes for the construction crew members who can feasibly use transit. The Applicant shall set a goal to achieve ten percent total construction worker participation in ridesharing programs and transit use.

While not quantifiable, the following mitigation measures as well as mitigation measures **TRANS-1** through **TRANS-5** in Section 5.12, Transportation of this Draft EIR would reduce air quality emissions during operation.

MM AQ-4: The Applicant shall require, in addition to the GSE noted within **PDF AQ-3**, all other on-site cargo-handling equipment, such as yard trucks, holsters, yard goats, pallet jacks, and similar equipment, to be electric, with the necessary electrical charging stations provided.

MM AQ-5: The Applicant shall require, where feasible, the use of zero-emission Project-related delivery trucks as part of business operations beginning in 2025 (within at least 25 percent of the Project fleet).

The Applicant also shall require, where feasible, the use of zero-emission Project-related delivery trucks as part of the business operations beginning in 2029 (within at least 50 percent of the Project fleet).

MM AQ-6: The Applicant shall include in the design requirements for the Project that a cool roof be installed at the parking structure to reduce energy use and urban heat island effects. This requirement shall not apply if solar panels are installed on the parking structure.

MM AQ-7: The Applicant shall encourage the use of single engine taxi operations for Project aircraft.

3.0 ANALYSIS METHODOLGY

Regulatory models used to estimate air quality and health impacts from construction and operations include:

- California Air Pollution Officers Association (CAPCOA) CalEEMod (California Emissions Estimator Model Version 2020.4.0)[12] land use emissions model estimates emissions due to demolition and construction activities and operations for land use development. A newer version of CalEEMod, Version 2022 was fully released in December 22 of 2022. CalEEMod Version 2020 was used for the air quality analysis, as it was the available model version on issue of the Notice of Preparation.

- California Air Resources Board's (CARB) EMFAC[13]emissions inventory model. EMFAC is the latest emission inventory model that calculates emission inventories and emission rates for motor vehicles operating on roads in California. This model reflects CARB's current understanding of how vehicles travel and how much they emit. EMFAC can be used to show how California motor vehicle emissions have changed over time and are projected to change in the future.

- CARB OFFROAD[14] emissions inventory model. OFFROAD is the latest emission inventory model that calculates emission inventories and emission rates for off-road equipment such as loaders, excavators, and off-road haul trucks operating in California. This model reflects CARB's current understanding of how equipment operates and how much they emit. OFFROAD can be used to show how California off-road equipment emissions have changed over time and are projected to change in the future.

12 California Air Pollution Officers Association, *California Emissions Estimator Model User's Guide*, May 2021, http://www.aqmd.gov/docs/default-source/caleemod/user-guide-2021/01_user-39-s-guide2020-4-0.pdf?sfvrsn=6

13 California Air Resources Board, EMFAC2021 User's Guide, January 15, 2021, https://ww2.arb.ca.gov/sites/default/files/2021-01/EMFAC202x_Users_Guide_01112021_final.pdf

14 California Air Resources Board, OFFROAD Instructions, http://www.arb.ca.gov/msprog/ordiesel/info_1085/oei_write_up.pdf

- United States Environmental Protection Agency (USEPA) AP-42, Compilation of Air Pollutant Emission Factors, has been published since 1972 as the primary compilation of USEPA's emission factor information. It contains emission factors and process information for more than 200 air pollution source categories. A source category is a specific industry sector or group of similar emitting sources. The emission factors have been developed and compiled from source test data, material balance studies, and engineering estimates.[15] Fugitive dust emissions from project onsite asphalt/concrete recycling were based on AP-42.

  FAA's Aviation Environmental Design Tool (AEDT, Version 3d) was used to prepare airport operational emission estimates for aircraft, auxiliary power units (APU), GSE, and stationary sources.[16] [17] Since the Notice of Preparation, the FAA released an updated version of AEDT (Version 3e, released May 9 of 2022). A review of the new features of Version 3e indicates that the updated model would not provide aircraft air quality results that would differ greatly from those derived using Version 3d. AEDT uses airport-specific information and aircraft fleet databases. The aircraft fleet database contains more than 3,000 aircraft (airframe and engine combinations).

- American Meteorological Society/USEPA Regulatory Model (AERMOD). AERMOD (Version 21112, released April 22 of 2021) is an atmospheric dispersion model which can simulate point, area, volume, and line emissions sources and has the capability to include simple, intermediate, and complex terrain along with meteorological conditions and multiple receptor locations.[18] [19] AERMOD is commonly executed to yield 1-hour maximum and annual average concentrations (in parts per million or ppm and micrograms per cubic meter or µg/m^3) at each receptor. AERMOD is used to estimate air concentrations at nearby receptors resulting from the activities associated with an air emission source. Plot files from AERMOD using unitized emissions (one gram per second) for each air toxics source category were imported into CARB's Hotspots Analysis and Reporting Program (HARP), Risk Assessment Standalone Tool (RAST, Version 22118). Using the AERMOD plot files and the emissions

inventory, the ADMRT calculates ground-level concentrations of air toxics.[20] For this analysis, HARP2 equations and calculation methods were used to address project-specific impacts.

4.0 EXISTING CONDITIONS

The Proposed Project is in San Bernardino County within the South Coast Air Basin (SCAB or Basin). The Basin is bounded by the Pacific Ocean to the west and the San Gabriel, San Bernardino, and San Jacinto Mountains to the north and east. The Basin includes all of Orange County and the non-desert portions of Los Angeles, Riverside, and San Bernardino counties.

Regional Meteorology

Air quality is affected by the rate, amount, and location of pollutant emissions and the associated meteorological conditions that influence pollutant movement and dispersal. Atmospheric conditions, including wind speed, wind direction, stability, and air temperature, in combination with local surface topography (i.e., geographic features such as mountains, valleys, and Pacific Ocean), determine the effect of air pollutant emissions on local air quality.

In general, Southern California has a warm, dry Mediterranean climate; hot in the summer and mild in the winter. Temperatures are cooler near the coast and hotter near inland areas. Most of the precipitation occurs as rain during the winter months, although rain showers are common during the summer in higher-elevation desert areas. Average annual precipitation is approximately 19 inches and temperatures reach 90 degrees Fahrenheit 100 days of the year on average. August daily highs average 95 degrees while daily lows average 64 degrees Fahrenheit. January typically exhibits average daily highs of 68 degrees and average daily lows of 43 degrees Fahrenheit. The predominant wind directions are either out of the southwest or northeast. Gusts greater than 15 miles per hour occur infrequently, approximately two percent of the time.

Basin climate increases the potential to create air pollution problems. Air quality within the Basin generally rates from fair to poor. Sinking or subsiding air from the Pacific High-Pressure System creates a temperature inversion (known as a subsidence inversion), which acts as a lid to vertical movement of air masses and dispersion of pollutants. The lower bound of this inversion at any given time is known as the "mixing height." Restricted maximum mixing heights are 3,500 feet above sea level or less. Weak summertime pressure gradients suppress winds and further limit horizontal dispersion of pollutants in the mixed layer below the subsidence inversion. Poorly dispersed anthropogenic (human-made) emissions, combined with strong sunshine, lead to photochemical reactions that create ozone (O_3) in this surface

20 California Air Resources Board, HARP Risk Assessment Standalone Tool, Released April 28, 2022, https://ww2.arb.ca.gov/resources/documents/harp-risk-assessment-standalone-tool

layer. Daytime onshore air flow (i.e., sea breeze) and nighttime offshore flow (i.e., land breeze) are quite common in Southern California. The sea breeze helps to moderate daytime temperatures and leads to air pollutants being blown out to sea at night and returning to land the following day. A mixing height of 2,402 feet was used for the air quality analysis.[21]

Sensitive Receptors

Land uses such as schools, children's daycare centers, hospitals, and convalescent homes are considered to be more sensitive than the general public to poor air quality because the population groups associated with these uses have increased susceptibility to respiratory distress. Persons engaged in strenuous work or exercise also have increased sensitivity to poor air quality. The CARB and SCAQMD has identified the following people as most likely to be affected by air pollution: children less than 14 years of age, the elderly over 65 years of age, athletes, and those with cardiovascular and chronic respiratory diseases. These groups are classified as sensitive population groups.

Residential areas are considered more sensitive to air quality conditions than commercial and industrial areas because people generally spend longer periods of time at their residences, resulting in greater exposure to ambient air quality conditions. Recreational uses are also considered sensitive, due to the greater exposure to ambient air quality conditions and because the presence of pollution detracts from the recreational experience. Offsite workers are also considered sensitive receptors by the SCAQMD.

Local Air Quality

The SCAQMD maintains a network of monitoring stations within the Air Basin that monitor air quality and compliance with applicable ambient standards. The nearest air monitoring station which measures CO, NO_2, and PM_{10} is located at 1350 San Bernardino Road in Upland (Northwest San Bernardino Valley, Station # 5175), four miles to the north of the project site. The nearest air monitoring station which measures SO_2 and $PM_{2.5}$ is located at 14360 Arrow Boulevard in Fontana (Central San Bernardino Valley 1, Station # 5197), seven miles to the northeast of the project site.

21 2016 AQMP Draft Aircraft Emissions Inventory for South Coast Air Quality Management District, August 2016, https://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan/final-2016-aqmp

Table 1: **Air Quality Data Summary** summarizes the most recent three years of data (2018 through 2020) from the nearby air monitoring stations; reported in parts per million (ppm) or micrograms per cubic meter (μg/m³). The ozone standard was exceeded in 2018, 2019, and 2020. The State annual PM_{10} standard was exceeded in 2018, 2019, and 2020 and the State 24-hour PM_{10} standard was exceeded in 2018, 2019, and 2020. CO, NO_2, and $PM_{2.5}$ standards were not exceeded during 2018, 2019, and 2020. As of July of 2022, the CARB had not published air monitoring results for 2021.

Table 1
Air Quality Data Summary (2018 - 2020)

Pollutant	Monitoring Data by Year			
	Standard	***2018***	***2019***	***2020***
Ozone				
Highest 1-Hour Average (ppm)	0.09	**0.141**	**0.131**	**0.158**
Days over State Standard	—	**38**	**41**	**82**
Highest 8-Hour Average (ppm)	0.070	**0.111/0.106**	**0.109/0.097**	**0.123/0.116**
Days over State/National Standard	—	**52**	**67**	**114**
Nitrogen Dioxide				
Highest 1-Hour Average (ppm)	0.180/0.100	0.063/0.056	0.076/0.058	0.066/0.058
Days over State Standard	—	0	0	0
Annual Average (ppm)	0.030/0.053	0.018	0.017	0.019
Carbon Monoxide				
Highest 1-Hour Average (ppm)	20.0	1.9	2.7	1.5
Days over State Standard	—	0	0	0
Highest 8-Hour Average (ppm)	9.0	1.2	1.1	1.1
Days over State Standard	—	0	0	0
Particulate Matter (PM10)				
Highest 24-Hour Average (μg/m³)	50/150	**73**	**125**	**63**
Days over State Standard	—	**14**	**7**	**12**
Days over National Standard		0	0	0
State Annual Average (μg/m³)	20	**34.1**	**34.8**	**30.5**
Particulate Matter (PM2.5)				
Highest 24-Hour Average (μg/m³)	35	29.2/26.8	46.5/29.7	46.1/27.4
Days over National Standard	—	0	0	0
State Annual Average (μg/m³)	12	14.3	12.7	14.4

*Notes: Values in **bold** are in excess of at least one applicable standard.*
Generally, State and national standards are not to be exceeded more than once per year.
ppm = parts per million; μg/m³ = micrograms per cubic meter.
PM_{10} is not measured every day of the year. Number of estimated days over the standard is based on 365 days per year.
Source: South Coast Air Quality Management District, Annual Air Quality Summaries, http://www.aqmd.gov/home/air-quality/air-quality-data-studies/historical-data-by-year

The air monitoring data from 2018 through 2020 indicates as follows:

- CO: No exceedances of federal or state standards (1-hour and 8-hour).
- Ozone: On average between 2018 and 2020, the 2015 federal and state 8-hour standard is exceeded 20 percent of the time (14 to 31 percent). On average between 2018 and 2020, the state 1-hour standard is exceeded 13 percent of the time (7 to 22 percent). Exceedances of all ozone standards more than doubled in 2020 as compared to 2018 and 2019 (likely due to the extensive wildfires in San Bernardino and neighboring counties in 2020).
- NO_2: Exceedance of federal 1-hour standard (100 ppb) in 2020 and exceedance of state annual standard (30 ppb) in 2018.
- PM_{10}: No exceedances of the federal 24-hour standard. Exceedance of state annual standard (20 µg/m^3) each year and minimal exceedances of the state 24-hour standard each year.
- $PM_{2.5}$: Minimal exceedance of the federal 24-hour standard (35 µg/m^3), and exceedance of the federal and state annual standard (12 µg/m^3) each year.

5.0 REGULATORY CONTEXT

United States Environmental Protection Agency (USEPA) has established the National Ambient Air Quality Standards (NAAQS) under the Clean Air Act (CAA) for six common air pollutants known as "criteria pollutants."[22] These air pollutants consist of CO, NO_2, ozone (O_3), particulate matter (PM_{10} and $PM_{2.5}$), SO_2, and lead (Pb). An ambient air quality standard establishes the concentration above which the pollutant is known to cause adverse health effects to sensitive groups within the population such as children and the elderly. Ambient air quality standards are classified as either "primary" or "secondary" standards. Primary standards define levels of air quality, including an adequate margin of safety, necessary to protect public health. Secondary ambient air quality standards define levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant. The ambient air quality standards are shown in **Table 2: State and National Criteria Air Pollutant Standards, Effects, and Sources**.

22 United States Environmental Protection Agency, Six Common Air Pollutants, https://www.epa.gov/criteria-air-pollutants

Table 2
State and National Criteria Air Pollutant Standards, Effects, and Sources

Pollutant	Averaging Time	State Standard	National Standard	Pollutant Health and Atmospheric Effects	Major Pollutant Sources
Ozone	1 Hour 8 Hour	0.09 ppm 0.07 ppm	– 0.070 ppm	High concentrations can directly affect lungs, causing irritation. Long–term exposure may cause damage to lung tissue.	Formed when reactive organic gases and nitrogen oxides react in the presence of sunlight. Major sources include on–road motor vehicles, solvent evaporation, and commercial / industrial mobile equipment.
Carbon Monoxide (CO)	1 Hour 8 Hour	20 ppm 9.0 ppm	35 ppm 9.0 ppm	Classified as a chemical asphyxiant, carbon monoxide interferes with the transfer of fresh oxygen to the blood and deprives sensitive tissues of oxygen.	Internal combustion engines, primarily gasoline–powered motor vehicles.
Nitrogen Dioxide (NO_2)	1 Hour Annual	0.18 ppm 0.03 ppm	0.10 ppm 0.053 ppm	Irritating to eyes and respiratory tract. Colors atmosphere reddish–brown.	Motor vehicles, petroleum–refining operations, industrial sources, aircraft, ships, and railroads.
Sulfur Dioxide (SO_2)	1 Hour 3 Hour 24 Hour Annual	0.25 ppm – 0.04 ppm –	0.075 ppm 0.5 ppm 0.14 ppm 0.030 ppm	Irritates upper respiratory tract; injurious to lung tissue. Can yellow the leaves of plants, destructive to marble, iron, and steel. Limits visibility and reduces sunlight.	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
Respirable Particulate Matter (PM_{10})	24 Hour Annual	50 µg/m^3 20 µg/m^3	150 µg/m^3 –	May irritate eyes and respiratory tract, decreases in lung capacity, cancer and increased mortality. Produces haze and limits visibility.	Dust and fume–producing industrial and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind–raised dust and ocean sprays).
Fine Particulate Matter ($PM_{2.5}$)	24 Hour Annual	– 12 µg/m^3	35.0 µg/m^3 12.0 µg/m^3	Increases respiratory disease, lung damage, cancer, and premature death. Reduces visibility and results in surface soiling.	Fuel combustion in motor vehicles, equipment, and industrial sources; residential and agricultural burning; Also, formed from photochemical reactions of other pollutants, including nitrogen oxides, sulfur oxides, and organics.
Lead (Pb)	Month Rolling 3 Month	1.5 µg/m^3 –	– 0.15 µg/m^3	Disturbs gastrointestinal system, and causes anemia, kidney disease, and neuromuscular and neurological dysfunction.	Present sources: lead smelters, battery manufacturing & recycling facilities. Past source: combustion of leaded gasoline.

Source: Air Quality Standards, https://ww2.arb.ca.gov/resources/background-air-quality-standards

Under the federal CAA, USEPA designates air basins where NAAQS are exceeded as "nonattainment" areas. If standards are met, the area is designated as an "attainment" area. If there are inadequate or inconclusive data to make a definitive attainment designation, they are considered "unclassified." Areas where air pollution levels persistently exceed the State or national ambient air quality standards are designated "nonattainment." Federal nonattainment areas are further designated as marginal, moderate, serious, severe, or extreme as a function of deviation from standards. The South Coast Air Basin portion of San Bernardino County is in nonattainment status for the federal ozone and $PM_{2.5}$; and in attainment for the federal CO, lead, NO_2, SO_2, and PM_{10}.[23]

CARB manages air quality, regulates mobile emissions sources, and oversees the activities of county and regional Air Pollution Control Districts and Air Quality Management Districts. CARB regulates local air quality indirectly by establishing State ambient air quality standards and vehicle emissions and fuel standards; and by conducting research, as well as planning and coordinating activities. California has adopted ambient standards (known as California Ambient Air Quality Standards or CAAQS) that are more stringent than the federal standards for some criteria air pollutants. Under the California Clean Air Act patterned after the CAA, areas have been designated as attainment or nonattainment with respect to the State standards. The South Coast Air Basin portion of San Bernardino County is in nonattainment status for the State ozone, PM_{10}, and $PM_{2.5}$; and is in attainment status for CO, NO_2, and SO_2.[24, 25]

The SCAQMD has jurisdiction over an area of approximately 10,743 square miles. The South Coast Air Basin is a sub-region of the SCAQMD jurisdiction. While air quality in this area has improved, the Basin requires continued diligence to meet air quality standards. The SCAQMD has adopted a series of Air Quality Management Plans to meet the CAAQS and NAAQS. These plans require control technology for existing sources, control programs for area sources and indirect sources, a SCAQMD permitting system designed to allow no net increase in emissions from any new or modified permitted emission sources and transportation control measures.

On March 3, 2017, the SCAQMD adopted the 2016 Air Quality Management Plan (AQMP) which includes strategies and measures needed to meet the CAAQS and NAAQS. The AQMP demonstrates attainment of the ozone CAAQS and NAAQS as well as the latest $PM_{2.5}$ standards.[26] The SCAQMD also adopts rules and

23 United States Environmental Protection Agency, The Green Book Nonattainment Areas for Criteria Pollutants, https://www.epa.gov/green-book

24 California Air Resources Board, Area Designations Maps/State and National, http://www.arb.ca.gov/desig/adm/adm.htm

25 South Coast Air Quality Management District, NAAQS and CAAQS Attainment Status for the South Coast Air Basin, February 2016, http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/naaqs-caaqs-feb2016.pdf

26 South Coast Air Quality Management District, 2016 Air Quality Management Plan, March 1, 2017, http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan

regulations to implement portions of the AQMP. The 2016 AQMP is the applicable State Implementation Plan. On October 1, 2015, the USEPA strengthened the NAAQS for ground-level ozone, lowering the primary and secondary ozone standard levels to 70 ppb. The South Coast Air Basin is classified as an "extreme" nonattainment area and the Coachella Valley is classified as a "severe-15" nonattainment area for the 2015 Ozone NAAQS. In May of 2022, the SCAQMD released the Draft 2022 AQMP to address the requirements for meeting this standard. In October of 2022, the SCAQMD released the Revised Draft 2022 AQMP.

In 2019, the Airport developed a voluntary Air Quality Improvement Plan (AQIP)[27] as part of a collaborative effort between SCAQMD and other airports in the South Coast Air Basin to minimize and reduce emissions from mobile source activities at the Airport. The AQIP was developed to address a measure presented in the 2016 AQMP, Facility- Based Measure for Mobile Sources Measure for the Emissions Reductions at Commercial Airports (MOB-04). MOB-04 requires Basin airports to reduce non-aircraft emission sources at their facilities. The Airport's AQIP identifies efforts related to MOB-04 and programs to address air quality at the Airport. As it relates to construction projects, the AQIP includes a Construction Equipment Policy (RM7), which requires contractors under contract with OIAA to utilize Tier 4 Final construction equipment. Use of Tier 4 Final construction equipment would result in a reduction in NOx and PM emissions from construction activities.

In December 2019, SCAQMD and the Airport signed a Memorandum of Understanding (MOU) which outlines how the Airport will quantify NOx emission reductions through implementation measures outlined in ONT's AQIP.

SCAQMD adopts rules and regulations to implement portions of the AQMP. For the Proposed Project, the relevant SCAQMD rules and regulations include:

- **Rules 201 and 203 (Permits to Construct and Operate**): These rules require that owners of applicable construction or operation equipment obtain written permits from the SCAQMD prior to construction and operation.

- **Rule 402 (Nuisance):** This rule states that a person shall not discharge from any source whatsoever such quantities of air contaminants or other material which cause injury, detriment, nuisance, or annoyance to any considerable number of persons or to the public, or which endanger the comfort,

27 Alta Environmental, Air Quality Improvement Plan, Ontario International Airport, September 17, 2019, https://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/facility-based-mobile-source-measures/draft-aqip-ont.pdf?sfvrsn=7

repose, health or safety of any such persons or the public, or which cause, or have a natural tendency to cause, injury or damage to business or property.

- **Rule 403 (Fugitive Dust):** This rule requires fugitive dust sources to implement Best Available Control Measures for all sources, and all forms of visible particulate matter are prohibited from crossing any property line. SCAQMD Rule 403 is intended to reduce PM_{10} emissions from any transportation, handling, construction, or storage activity that has the potential to generate fugitive dust. A fugitive dust control program pursuant to the provisions of SCAQMD Rules 402 and 403 shall be implemented. This program shall include, but not be limited to the following:

    - Prior to start of the initial on-site construction, the City Engineer shall confirm that the proposed construction plan follows SCAQMD Rule 403, and fugitive dust shall be controlled by the applicable best available control measures listed in Table 1 of Rule 403.

    - Water or a stabilizing agent shall be applied at least three times daily, preferably in the mid-morning, afternoon, and after work is done for the day, to exposed surfaces including graded and disturbed areas in enough quantity to prevent generation of dust plumes.

    - Track-out shall not extend 25 feet or more from an active operation and track-out shall be removed at the conclusion of each workday. The contractor shall use a gravel apron, 25 feet long by road width, or a pipe-grid track-out control device to reduce mud/dirt track-out from active operations and unpaved truck exit routes.

    - A wheel washing system shall be installed and used to remove bulk material from tires and vehicle undercarriages before vehicles exit the project alignment.

    - All trucks hauling dirt, sand, soil, or other loose materials are to be covered (e.g., with fabric tarps or other enclosures that would reduce fugitive dust emissions) and maintain a freeboard height of 12 inches, in accordance with California Vehicle Code Section 23114 (freeboard means vertical space between the top of the load and top of the trailer).

    - Traffic speeds on unpaved roads shall be limited to 15 miles per hour.

    - Operations on unpaved surfaces shall be suspended when winds exceed 25 miles per hour.

    - On-site stockpiles shall be covered or watered at least twice per day.

    - A publicly visible sign shall be posted with the telephone number and person to contact at the City of Ontario regarding dust complaints. This person shall respond and take corrective action

within 24 hours. The SCAQMD's phone number shall also be visible to ensure compliance with applicable regulations.

- **Rule 1110.2 (Emissions from Gaseous- and Liquid-Fueled Engines):** This rule was adopted to reduce NO_x, VOC, and CO emissions from stationary and portable engines over 50 horsepower, including standby generators. All standby generators used for Project operations would be selected from the SCAQMD certified generators list and meet applicable federal standards for diesel emissions. For after-treatment of engine exhaust air, a diesel particulate filter shall be provided to meet the emission level requirements of SCAQMD.

- **Rule 1113 (Architectural Coatings):** This rule requires manufacturers, distributors, and end-users of architectural and industrial maintenance coatings to reduce volatile organic compounds (VOC) emissions from the use of these coatings, primarily by placing limits on the VOC content of various coating categories. Per Rule 1113 no person shall apply or solicit the application of any architectural coating within the SCAQMD with VOC content in excess of the values specified in a table incorporated in Rule 1113. All paints shall be applied using either high-volume low-pressure spray equipment or by hand application.

- **Rule 2202 (Employee Commute Reduction Program Guidelines)**: This rule is designed to assist employers in understanding the development and implementation requirements of the Employee Commute Reduction Program (ECRP) at their worksites. The ECRP focuses on reducing work related vehicle trips and vehicle miles traveled to a worksite with the purpose of achieving and maintaining the employers' designated average vehicle ridership targets.

- **Rule 2305 (Warehouse Indirect Source Rule)**: In May of 2021, SCAQMD adopted Rule 2305 to reduce emissions associated with warehouses and mobile sources attracted to warehouses. This rule applies to all existing and proposed warehouses over 100,000 square feet located in SCAQMD. Rule 2305 requires warehouse operators to track annual vehicle miles traveled associated with truck trips to and from the warehouse. These trip miles are used to calculate the warehouses' WAIRE (Warehouse Actions and Investments to Reduce Emissions) Points Compliance Obligation. WAIRE Points are earned based on emission reduction measures and warehouse operators are required to submit an annual WAIRE Report which includes truck trip data and emission reduction measures. Reduction strategies listed in the WAIRE menu include acquire zero emission (ZE) or near zero emission (NZE) trucks; require ZE/NZE truck visits; require ZE yard trucks; install on-site ZE charging/fueling infrastructure; install on-site energy systems; and install filtration systems in residences, schools, and other buildings in the adjacent community. Warehouse operators that do not earn enough WAIRE

points to satisfy the WAIRE Points Compliance Obligation are required to pay a mitigation fee. This Proposed Project would comply with the adopted Rule 2305 (Warehouse Indirect Source Rule).

The Applicant shall also require construction contractors to implement the following regulatory compliance measures during construction to reduce exhaust emissions:

- Idling times shall be minimized either by shutting equipment off when not in use or reducing the maximum idling time to five minutes (as required by the California airborne toxics control measure Title 13, Section 2485 of California Code of Regulations). Clear signage shall be provided for construction workers at all access points.

- All construction equipment must be properly tuned and maintained in accordance with the manufacturer's specifications and documentation demonstrating proper maintenance, in accordance with the manufacturer's specifications, shall be maintained on site. Tampering with construction equipment to increase horsepower or to defeat emission control devices must be prohibited.[28]

- All streets located within the construction site area shall be swept at least once a day using SCAQMD Rule 1186 certified street sweepers if visible soil materials are carried to adjacent streets.

- The Applicant would require construction contractors to recycle or salvage a minimum of 65 percent of the non-hazardous construction and demolition waste generated directly from construction and demolition of the Project per CalGreen Construction Waste Management Requirements.

Criteria Air Pollutants

The following provides a summary of the potential health and welfare effects and typical sources of each of the criteria air pollutants.

Ozone

Ozone is a respiratory irritant and an oxidant that increases susceptibility to respiratory infections and that can cause substantial damage to vegetation and other materials. O_3 is not emitted directly into the atmosphere but is a secondary air pollutant produced in the atmosphere through a complex series of photochemical reactions involving VOC and NO_x. VOC and NO_x are known as precursor compounds for O_3. Substantial ozone production generally requires O_3 precursors to be present in a stable atmosphere with strong sunlight for approximately three hours. O_3 is a regional air pollutant because it is not emitted directly by sources but is formed downwind of sources of VOC and NO_x under the influence of wind and

28 Code of Federal Regulations, Part 1068 – General Compliance Provisions for Highway, Stationary, and Nonroad Programs, https://www.ecfr.gov/current/title-40/chapter-I/subchapter-U/part-1068.

sunlight. O_3 concentrations tend to be higher in the late spring, summer, and fall, when long sunny days combine with regional air subsidence inversions to create conditions conducive to the formation and accumulation of secondary photochemical compounds.

Carbon Monoxide

CO is a nonreactive pollutant that is a product of incomplete combustion of organic material, and is mostly associated with motor vehicle traffic, and in wintertime, with wood–burning stoves and fireplaces. High CO concentrations develop primarily during winter when periods of light winds combine with the formation of ground–level temperature inversions (typically from the evening through early morning). These conditions result in reduced dispersion of vehicle emissions. Motor vehicles also exhibit increased CO emission rates at low air temperatures.

When inhaled at high concentrations, CO combines with hemoglobin in the blood and reduces its oxygen-carrying capacity, resulting in reduced levels of oxygen reaching the brain, heart, and other body tissues. This condition is especially critical for people with cardiovascular diseases, chronic lung disease, or anemia. CO measurements and modeling were important in the early 1980s when CO levels were regularly exceeded throughout California, but in more recent years, CO measurements and modeling are not a priority in most California air districts due to the retirement of older vehicles, fewer emissions from new vehicles, and improvements to fuels.

Nitrogen Oxides

When combustion temperatures are extremely high, as in aircraft, truck and automobile engines, atmospheric nitrogen combines with oxygen to form various oxides of nitrogen. Nitric oxide (NO) and NO_2 are the most significant air pollutants generally referred to as NO_x. Nitric oxide is a colorless and odorless gas that is relatively harmless to humans, quickly converts to NO_2 and can be measured. Nitrogen dioxide has been found to be a lung irritant capable of producing pulmonary edema. Inhaling NO_2 can lead to respiratory illnesses such as bronchitis and pneumonia.

Volatile Organic Compounds

VOC means any compound of carbon, excluding carbon monoxide, carbon dioxide (CO_2), carbonic acid, metallic carbides or carbonates, and ammonium carbonate, which participates in atmospheric photochemical reactions and thus, a precursor of ozone formation. VOC are any reactive compounds of carbon, excluding methane, CO, CO_2, carbonic acid, metallic carbides or carbonates, ammonium carbonate, and other exempt compounds.

VOC includes a variety of chemicals, some of which may have short- and long-term adverse health effects. VOC are emitted by a wide array of products numbering in the thousands. Examples include paints and lacquers, paint strippers, cleaning supplies, building materials and furnishings, as well as fuel storage and use.

VOC can cause eye, nose, and throat irritation; headaches, loss of coordination, nausea; and damage to liver, kidney, and central nervous system. Some organics can cause cancer in animals; some are suspected or known to cause cancer in humans. The ability of organic chemicals to cause health effects varies greatly from those that are highly toxic, to those with no known health effect. As with other pollutants, the extent and nature of the health effect would depend on many factors including level of exposure and length of time exposed. Eye and respiratory tract irritation, headaches, dizziness, visual disorders, and memory impairment are among the immediate symptoms that some people have experienced soon after exposure to some organics.

Particulate Matter

PM_{10} and $PM_{2.5}$ consist of airborne particles that measure 10 micrometers or less in diameter and 2.5 micrometers or less in diameter, respectively. PM_{10} and $PM_{2.5}$ represent fractions of particulate matter that can be inhaled into the air passages and the lungs, causing adverse health effects. Particulate matter in the atmosphere results from many kinds of dust- and fume-producing industrial and agricultural operations, fuel combustion, wood burning stoves and fireplaces, and atmospheric photochemical reactions. Some sources of particulate matter, such as demolition, construction activities and mining, are more local in nature, while others such as vehicular traffic and wood burning stoves and fireplaces, have a more regional effect.

Very small particles of certain substances (e.g., sulfates and nitrates) can cause lung damage directly, or can contain adsorbed gases (e.g., chlorides or ammonium) that may be injurious to health. Particulates can also damage materials and reduce visibility. Dust comprised of large particles (diameter greater than 10 micrometers) settles out rapidly and is easily filtered by human breathing passages. This dust is of concern more as a soiling nuisance rather than a health hazard. The remaining fractions, PM_{10} and $PM_{2.5}$, are a health concern particularly at levels above the federal and California ambient air quality standards. $PM_{2.5}$ (including diesel exhaust particles) is thought to have greater effects on health, because these particles are so small and thus penetrate to the deepest parts of the lungs.

Acute and chronic health effects associated with high particulate levels include the aggravation of chronic respiratory diseases, heart and lung disease, coughing, bronchitis, and respiratory illnesses in children. Mortality studies since the 1990s have shown a statistically significant direct association between mortality (premature deaths) and daily concentrations of particulate matter in the air. Despite important

gaps in scientific knowledge and continued reasons for some skepticism, a comprehensive evaluation of the research findings provides persuasive evidence that exposure to fine particulate air pollution has adverse effects on cardiopulmonary health. The CARB has estimated that achieving the ambient air quality standards for PM_{10} could reduce premature mortality rates by 6,500 cases per year.

While current regulations are focused on both PM_{10} and $PM_{2.5}$, there has been growing concern in the public health community about the contribution of ultrafine particles (UFP) to the overall health impacts of PM. These very minute particles (consisting primarily of organic material, soot, and trace elements) have a different chemical composition than the larger PM fractions ($PM_{2.5}$ and PM_{10}). UFP are emitted from almost every fuel combustion process, including diesel, gasoline, and jet engines. Although there are many sources of UFP in the atmosphere, vehicle exhaust is the major contributor to UFP concentrations in urban areas, particularly in proximity to major roads. Consequently, there is growing concern that people living near roadways with high traffic volumes and other sources of combustion-related pollutants (e.g., airports, refineries, and railyards) may be exposed to high levels of UFP.[29]

Sulfur Dioxide

SO_2 is a combustion product of sulfur or sulfur–containing fuels such as coal and diesel. SO_2 is also a precursor to the formation of atmospheric sulfate and particulate matter and contributes to potential atmospheric sulfuric acid formation that could precipitate downwind as acid rain.

Lead

Ambient lead concentrations meet both the federal and State standards in the Project area. Lead has a range of adverse neurotoxin health effects and was released into the atmosphere via leaded gasoline products. The phase-out of leaded gasoline in California has resulted in dramatically decreased levels of atmospheric lead. Metal processing is currently the primary source of lead emissions in the SCAB. The highest concentrations of lead in air are generally found near lead smelters and general aviation airports, where piston aircraft use leaded fuel. Other stationary sources that generate lead emissions include waste incinerators, utilities, and lead-acid battery manufacturers. The maximum lead concentrations recorded in the Project area are below federal and California standards. Notably, diesel fuel does not contain lead emissions and gasoline fuel is unleaded. Although lead is a criteria air pollutant, it was not evaluated because the Proposed Project would not involve piston aircraft and the use of aviation gasoline (avgas), a common source of lead emissions and therefore, would have a negligible impact on ambient lead levels in the South Coast Air Basin.

29 South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-V) in the South Coast Air Basin, August 2021, http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-v

Toxic Air Contaminants

Non-criteria air pollutants or toxic air contaminants are airborne substances that can cause short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). TAC includes both organic and inorganic chemical substances. They may be emitted from a variety of common sources including gasoline stations, automobiles, dry cleaners, industrial operations, and painting operations. The current California list of TAC includes approximately 240 compounds, including particulate emissions from diesel-fueled engines and asbestos.

In August of 1998, CARB identified particulate emissions from diesel-fueled engines as TAC. CARB developed the *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles*[30] and *Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines.*[31] The document represents a proposal to reduce diesel particulate emissions, with the goal to reduce emissions and the associated health risk by 75 percent in 2010 and 85 percent in 2020.[32] The program aims to require the use of state-of-the-art catalyzed diesel particulate filters and ultra-low sulfur diesel fuel on diesel-fueled engines.

DPM is the most complex of diesel emissions. Diesel particulates, as defined by most emission standards, are sampled from diluted and cooled exhaust gases. This definition includes both solid and liquid material that condenses during the dilution process. The basic fractions of DPM are elemental carbon; heavy hydrocarbons derived from the fuel and lubricating oil and hydrated sulfuric acid derived from the fuel sulfur. DPM contains a large portion of the polycyclic aromatic hydrocarbons (PAH) found in diesel exhaust. Diesel particulates include small nuclei particles of diameters below 0.04 micrometers (µm) and their agglomerates of diameters up to 1 µm. DPM is a major factor in total TAC exposure in California.

California State law defines TAC as air pollutants having carcinogenic effects. A total of 243 substances have been designated as TAC under California law; they include the 187 (federal) hazardous air pollutants (HAP) adopted in accordance with AB 2728. The Air Toxics "Hot Spots" Information and Assessment Act of 1987 (AB 2588) seeks to identify and evaluate risk from air toxics sources, but AB 2588 does not regulate air toxics emissions. TAC emissions from individual facilities are quantified and prioritized. Depending on the risk levels, emitting facilities are required to implement varying levels of risk reduction measures.

30 California Air Resources Board, *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel-Fueled Engines and Vehicles,* October 2000, http://www.arb.ca.gov/diesel/documents/rrpfinal.pdf

31 California Air Resources Board, Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines, October 2000.

32 Generally, there was a 60 percent reduction in health risks from 2005 through 2015, based on the SCAQMD Multiple Air Toxics Exposure Study.

The FAA's Aviation Emissions and Air Quality Handbook, Chapter 6,[33] lists potential HAP to be included in an airport emissions inventory. Typically, aircraft HAP emissions include formaldehyde in the greatest amount, followed by acetaldehyde, acrolein, benzene, methyl alcohol, and 1,3-butadiene. **Attachment C: Health Risk Assessment Methodology and Assumption** contains further information on the development of the aircraft HAP emissions inventory.

In 2005, the SCAQMD conducted a comprehensive study on air toxics in the SCAB called the Multiple Air Toxics Exposure Study (MATES-III). The monitoring program measured more than 30 air pollutants, including both gas and particulates. The monitoring study was accompanied by a computer modeling study in which SCAQMD estimated the risk of cancer from breathing toxic air pollution throughout the region based on emissions and weather data. MATES-III found that the average cancer risk in the region from carcinogenic air pollutants ranges from approximately 870 in a million to 1,400 in a million, with an average regional risk of approximately 1,200 in a million.[34]

In 2015, the Multiple Air Toxics Exposure Study IV (MATES IV) is a follow up to previous air toxics studies in the Basin. The MATES IV Study includes an updated emissions inventory of toxic air contaminants and a modeling effort to characterize risk across the SCAB. The study focuses on the carcinogenic risk from exposure to air toxics but does not estimate mortality or other health effects from particulate exposures. An additional focus of MATES IV is the inclusion of measurements of ultrafine particle concentrations. Results for MATES-IV show that trends in monitored levels air toxics continue to decline, modeled exposures and risks were substantially lower compared to MATES III (approximately 60 percent decrease), and DPM remains the largest component of air toxics estimated risk, at approximately 68 percent of the South Coast Air Basin wide cancer risk of 418 per million persons, ranging from 320 to 480 per million persons. Based on data within MATES-IV, the Proposed Project is within an area with an estimated cancer risk of 1,000 to 1,200 per million persons.[35]

In August of 2021, the Multiple Air Toxics Exposure Study V (MATES V)[36] was released. MATES V focuses on measurements during 2018 and 2019 with a comprehensive modeling analysis and emissions inventory based on 2018 data. In addition to new measurements and updated modeling results, several key updates were implemented in MATES V. First, MATES V estimates cancer risks by considering multiple exposure

33 Federal Aviation Administration, Aviation Emissions and Air Quality Handbook, January 2015, https://www.faa.gov/regulations_policies/policy_guidance/envir_policy/airquality_handbook

34 South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-III) in the South Coast Air Basin, September 2008, https://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iii

35 South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-IV) in the South Coast Air Basin, May 1, 2015, http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-iv

36 South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-V) in the South Coast Air Basin, August 2021, http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-v

pathways, which includes inhalation and non-inhalation pathways. Previous MATES studies quantified the cancer risks based on the inhalation pathway only. Second, along with cancer risk estimates, MATES V includes information on the chronic non-cancer risks from inhalation and non-inhalation pathways for the first time. As in previous MATES iterations, DPM is the largest contributor to overall air toxics cancer risk. However, the average levels of DPM in MATES V are 50 percent lower at the ten monitoring sites compared to MATES IV and 86 percent lower since MATES II based on monitored data. According to the MATES-V Data Visualization interactive tool, the area around Ontario International Airport has a cumulative cancer risk ranging from 560 to 625 per million persons.[37]

6.0 THRESHOLDS OF SIGNIFICANCE

Because of the SCAQMD's regulatory role in the Air Basin, the significance thresholds and analysis methodologies in the SCAQMD's *CEQA Air Quality Handbook* were used in evaluating project impacts for construction, operations, and air toxics.[38] These significance thresholds, under which the Proposed Project was evaluated, are described within the following section.

SCAQMD has identified thresholds to determine the significance of regional air quality emissions for construction activities and project operation, as shown in **Table 3: Mass Daily Emissions Thresholds**.

Table 3
Mass Daily Emissions Thresholds (pounds)

Pollutant	Construction	Operation
VOC	75	55
NO_x	100	55
CO	550	550
SO_2	150	150
PM_{10}	150	150
$PM_{2.5}$	55	55
Lead	3	3

Source: South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019, http://www.aqmd.gov/ceqa/hdbk.html

37 South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-V) in the South Coast Air Basin, August 2021, http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-v

38 South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019, http://www.aqmd.gov/ceqa/hdbk.html

Secondly, the Proposed Project would result in a significant construction and/or operational air quality impact if the Project exceeds the ambient concentration significance thresholds set forth in **Table 4: Ambient Air Quality Significance Thresholds for Criteria Pollutants**.

Table 4
Ambient Air Quality Significance Thresholds for Criteria Pollutants

Pollutant	Averaging Period	Pollutant Concentration Threshold
CO	1-hour /8-hour	SCAQMD is in attainment (federal and state); project is significant if it causes or contributes to an exceedance of the attainment standards of 20 ppm (1-hour) and 9 ppm (8-hour)
NO_2	1-hour	SCAQMD is in attainment (federal and state); project is significant if it causes or contributes to an exceedance of the following attainment standard 0.18 ppm (state)
	Annual	0.03 ppm (state) and 0.0534 ppm (federal)
PM_{10}	24-hour	10.4 µg/m^3 (construction) and 2.5 µg/m^3 (operation)
	Annual	1.0 µg/m^3 (construction and operation)
$PM_{2.5}$	24-hour	10.4 µg/m^3 (construction) and 2.5 µg/m^3 (operation)
SO_2	1-hour	0.25 ppm (State) and 0.075 ppm (federal)
	24-hour	0.04 ppm (State)
Lead	30-day Average	1.5 µg/m^3 (State)
	Rolling 3-month Average	0.15 µg/m^3 (federal)

Source: South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019, http://www.aqmd.gov/ceqa/hdbk.html

Per SCAQMD guidance, the evaluated concentrations of CO, NO_2, and SO_2 included both the Project contribution plus background concentrations. The total concentration is then compared to the significance thresholds. For CO, NO_2, and SO_2, these significance thresholds are reflective of the CAAQS and NAAQS. Per SCAQMD guidance, the Project contribution of PM_{10} and $PM_{2.5}$ is compared to the significance thresholds without adding background concentrations. Further information on the background concentrations is provided in **Attachment A: Emissions Inventory and Dispersion Modeling Methodology and Assumptions**.

The Proposed Project would also result in a significant health impact if the carcinogenic or toxic air contaminants individually or cumulatively are equal to or exceed the maximum individual cancer risk of

ten in one million persons or a chronic and acute hazard index of 1.0 or the cancer burden of 0.5 excess cancer cases (in areas greater than or equal to one in one million).[39]

7.0 CONSTRUCTION EMISSIONS INVENTORY

Intermittent (short-term construction emissions that occur from activities, such as site-grading, paving, and building construction) air quality impacts related to the construction of the Proposed Project were evaluated. The air quality analysis focuses on daily emissions from construction (mobile, area, stationary, and fugitive sources) activities. CARB's CalEEMod and AP-42 (for asphalt/concrete recycling plant fugitive dust emissions) was used to quantify construction-related emissions. CalEEMod output worksheets are included in **Attachment B: Construction and Operational Air Emissions Inventory**. The emissions generated from these construction activities include:

- Dust (including PM_{10} and $PM_{2.5}$) primarily from "fugitive" sources (i.e., emissions released through means other than through a stack or tailpipe) such as material handling for demolition and soil movement and travel on unpaved surfaces; and

- Combustion exhaust emissions of criteria air pollutants and their precursors (ROG, NO_x, CO, PM_{10}, and $PM_{2.5}$) primarily from operation of heavy off-road construction equipment, haul trucks, (primarily diesel-operated), and construction worker automobile trips (primarily gasoline-operated).

- VOC as ROG primarily from "fugitive" sources such as architectural coating and paving.

Construction-related fugitive dust emissions would vary from day to day, depending on the level and type of activity, silt content of the soil, and the weather. High winds (greater than 10 miles per hour) occur infrequently in the area, less than two percent of the time. In the absence of mitigation, construction activities may result in significant quantities of dust, and as a result, local visibility and PM_{10} concentrations may be adversely affected on a temporary and intermittent basis during construction. In addition, the fugitive dust generated by construction would include not only PM_{10}, but also larger particles, which would fall out of the atmosphere within several hundred feet of the Project site and could result in nuisance-type impacts.

Erosion control measures and water programs are typically undertaken to minimize these fugitive dust and particulate emissions. A dust control efficiency of over 50 percent due to daily watering and other

39 South Coast Air Quality Management District, Risk Assessment Procedures for Rule 1401, 1401.1 and 212, September 1, 2017, http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12

measures (e.g., limiting vehicle speed to 15 mph, management of stockpiles, screening process controls, etc.) was used. Based on CalEEMod, one water application per day reduces fugitive dust by 34 percent, two water applications per day reduces fugitive dust by 55 percent, and three water applications per day reduces fugitive dust by 61 percent.

Construction worker trips were modeled using the light-duty auto/truck classification. Construction worker trips are a composite of gasoline and diesel vehicles. Construction worker vehicles were assumed to be 14.7 miles per one-way trip per CalEEMod. Haul trucks were modeled as diesel combination long-haul trucks, which is a heavy-heavy duty truck emission factor for public vehicles. Distance traveled was assumed to be 20 miles per one-way trip for construction haul trucks per CalEEMod. The particulate emissions include paved road dust, brake wear, and tire wear particulate emissions. For haul trucks, exhaust particulate emissions are approximately 15 percent of the total particulate emissions.

An on-site asphalt/concrete recycling operation would be expected to be located on the south side of East Avion Street on a partially paved and flat parcel that is, flanked by East Mission Boulevard (and railroad tracks) to the south, and industrial abandoned (industrial) uses on either side (which is within the project site). The recycling operations would reduce the total vehicle miles traveled needed for asphalt/concrete delivery trucks but would require delivery of some raw materials (i.e., asphalt, Portland cement, and aggregate) to mix the materials on-site. The construction emissions inventory includes an analysis of fugitive dust emissions associated with asphalt/concrete recycling operation (i.e., cold milling machine for asphalt and crushing processing equipment for concrete) as well as the exhaust emissions associated with the equipment engines (approximately 170 horsepower) and haul trucks (approximately 20 miles per trip). The asphalt/concrete recycling operation would contain various crusher, conveyors, and screens. These emissions were summed with the construction emissions developed in CalEEMod to represent the total construction emissions for the Proposed Project.

During Phases 1 and 2, the on-site asphalt/concrete recycling operation would have a capacity rating of 650 tons per hour (325 cubic yards per hour) with asphalt recycling at 200 cubic yards per hour and concrete recycling at 125 cubic yards per hour. Recycling would occur over approximately 23 and 8 days during Phase 1 and 2, respectively; processing a total of 119,600 and 41,600 tons during Phase 1 and 2, respectively.

The following provides the estimated construction schedule and associated emissions. Notably, project delays that affect the corresponding time period in which construction of Phase 1 and Phase 2 would occur would result in lower emission factors due to regulatory requirements and greater engine efficiencies, and thus, lower emission estimates.

During Phase 1, construction activities are estimated to begin in March of 2023, completion in September of 2024, and after Material Handling Equipment (MHE) testing, would become operational in January of 2025. **Table 5: Estimated Construction Schedule – Phase 1** provides the estimated construction schedule during Phase 1. Typically, construction activities would occur between 5 a.m. and 3 p.m. (ten hours per day), on Monday through Friday.

Table 5
Estimated Construction Schedule – Phase 1

Phase	Start	End	Working Days
Demolition	03/01/2023	06/29/2023	87
Site Preparation	05/26/2023	11/13/2023	122
Garage Construction	07/03/2023	02/01/2024	154
Building Construction	09/01/2023	09/04/2024	264

Demolition would involve removal of approximately 192,484 square feet of buildings requiring approximately 875 haul truck trips (or approximately ten haul truck trips per day) per CalEEMod. Demolition would also involve removal of approximately 2,047,320 square feet of asphalt/concrete, which would be recycled within the project site and not require offsite haul truck trips (i.e., avoiding 2,616 haul truck trips).[40] Site preparation would consist of land clearing and grading resulting in approximately 107,000 cubic yards of import materials requiring approximately 13,375 haul truck trips (or approximately 102 haul truck trips per day) based on a haul truck capacity of eight cubic yards. Phase 1 would require a maximum of 280 construction employee trips and 100 vender trips per day during building construction and less trips during the other phases. The estimated construction equipment associated with the Proposed Project along with the number of pieces of diesel equipment, daily hours of operation, horsepower (hp), and load factor (i.e., percent of full throttle) are shown in **Table 6: Estimated Construction Equipment Usage – Phase 1**. Phase 1 would include construction of the following component details of the Proposed Project:

- 508,675 square feet within Cargo Sort Facility
- 27,000 square feet within Aviation Line Maintenance Garage
- 101,500 square feet within Cargo Sort Facility Office

40 Assuming asphalt depth of four inches and concrete depth of eight inches; resulting in 30,510 cubic yards and based on eight cubic yards of haul truck capacity per CalEEMod.

- 7,000 square feet within South Secure Airport Access Point
- 2,047,320 square feet of aircraft apron
- 900 parking spaces and 271,000 square feet within parking garage
- 33 parking spaces and 15,300 square feet within surface parking lot
- 39 truck docks and 122,200 square feet within truck yard area
- Project area of 62 acres (including parking garage of four acres)

During Phase 2, construction activities are estimated to begin in September of 2025 (demolition), December of 2026 (site preparation), and August of 2027 (building construction), with completion in August of 2028, and would become operational in January of 2029. **Table 7: Estimated Construction**

Schedule – Phase 2 provides the estimated construction schedule during Phase 2. Typically, construction activities would occur between 5 a.m. and 3 p.m. (ten hours per day), on Monday through Friday.

Table 7
Estimated Construction Schedule – Phase 2

Demolition would involve removal of approximately 432,295 square feet of buildings requiring approximately 1,966 haul truck trips (or approximately 23 haul truck trips per day). Demolition would also involve removal of approximately 1,045,440 square feet of asphalt/concrete, which would be recycled within the project site and not require offsite haul truck trips (i.e., avoiding 910 haul truck trips).[41] Site preparation would consist of land clearing and grading resulting in approximately 50,000 cubic yards of import materials requiring approximately 6,250 haul truck trips (or approximately 51 haul truck trips per day) based on a haul truck capacity of eight cubic yards. Phase 2 would require a maximum of 240 construction employee trips and 100 vender trips per day during building construction and less trips during the other phases. The estimated construction equipment associated with the Proposed Project along with the number of pieces of diesel equipment, daily hours of operation, horsepower (hp), and load factor (i.e., percent of full throttle) are shown in **Table 8: Estimated Construction Equipment Usage – Phase 2**. Phase 2 would include construction of the following elements of the Proposed Project:

- 246,825 square feet within Cargo Sort Facility
- 27,000 square feet within GSE Maintenance Building
- 1,045,440 square feet of aircraft apron
- 28 truck docks and 87,800 square feet within truck yard area
- Project area of 35 acres

41 Assuming asphalt depth of four inches and concrete depth of eight inches; resulting in 12,800 cubic yards and based on eight cubic yards of haul truck capacity per CalEEMod.

Basically, construction emission estimates are a function of the type of equipment, an emission factor (typically in grams per horsepower-hour), its horsepower, and the number of hours it is used. Construction emissions from onroad vehicles are a function of the type of vehicle, an emission factor (typically in grams per mile), and the estimated number of miles traveled. The maximum daily construction emissions represent the maximum values from CALEEMOD for either summer or winter time periods.

Table 9: Estimated Maximum Daily Construction Emissions (pounds) – Phase 1 shows the estimated maximum daily emissions for construction related activities (including combustion engine and fugitive dust emissions) for the Proposed Project. For Phase 1, the maximum daily construction emissions would not exceed the SCAQMD thresholds of significance.

Table 9
Estimated Maximum Daily Construction Emissions (pounds) – Phase 1

Construction Year	VOC	CO	NO_x	PM_{10}	$PM_{2.5}$	SO_2
2023	3.67	114	30.0	35.8	8.38	0.31
2024	3.53	96.9	17.9	7.15	2.13	0.22

Significant?	No	No	No	No	No	No

Source: RCH Group, 2022

Based on the CalEEMod and using standard fuel consumption estimates, construction activities during Phase 1 would require approximately 241,710 gallons of diesel fuel (onsite equipment) and approximately 87,625 gallons of diesel fuel (offsite haul/vender trucks) along with 62,415 gallons of gasoline fuel (employee trips) while during Phase 2 would require approximately 219,540 gallons of diesel fuel (onsite equipment) and approximately 62,820 gallons of diesel fuel (offsite haul/vender trucks) along with 54,220 gallons of gasoline fuel (employee trips).[42]

42 Fuel usage is estimated using the CalEEMod output for CO2, and a 10.15 kgCO2/gallon conversion factor for diesel fuel and 8.91 kgCO2/gallon conversion factor for gasoline fuel, https://www.epa.gov/sites/production/files/2018-03/documents/emission-factors_mar_2018_0.pdf

Summary of Construction Emissions Inventory Results

The following concluding statements can be made about the construction emissions inventory results:

- The construction emissions would not exceed the significance threshold and would be a *less than significant impact for all pollutants.*

8.0 OPERATIONAL EMISSIONS INVENTORY

The sources of airport-related air pollutant emissions are aircraft, APU, GSE, stationary sources such as emergency generators, and motor vehicles (employee and deliveries), as well as area sources (consumer products and landscaping), and energy usage (natural gas and electrical). For aircraft, APU, and GSE, the operational emission inventories were prepared using Version 3d of the Federal Aviation Administration's (FAA's) Aviation Environmental Design Tool (AEDT).[43] For employee vehicles and delivery trucks, the operational emission inventories were prepared using CARB's EMFAC emissions model. The air quality analysis of operations includes a review of criteria pollutant emissions such as CO, NO_x, SO_x, VOC as ROG, coarse particulate or PM_{10}, and fine particulate or $PM_{2.5}$. AEDT output worksheets are included in **Attachment B: Construction and Operational Air Emissions Inventory**. The following describes each emission source associated with the Proposed Project:

- **Aircraft** – Exhaust gases from aircraft engines are predominantly comprised of nitrogen, oxygen, and water vapor, compounds not normally considered air pollutants. Aircraft also emit CO, VOC, NO_x, SO_x, PM_{10}, and $PM_{2.5}$. The amount of pollutant emitted depends on factors such as engine type, aircraft type, and operational mode (i.e., taxi/idle, approach, climb-out, or takeoff).

  The aircraft activities comprising a landing/take-off cycle produce ground-based emissions (i.e., emissions in aircraft taxi/idle mode) and emissions that occur above ground level (i.e., during aircraft modes of approach, climb-out, and takeoff). While the taxi/idle mode and portions of the approach and climb-out modes occur within the immediate area—for the purpose of estimating the level of emissions that could impact air pollutants—extends beyond the area described up to the atmospheric mixing height (i.e., the height above ground in which a pollutant disperses). In the Ontario area, the atmospheric mixing height is 2,402 feet above ground level.[44] To be at this altitude, arriving aircraft would be approximately six miles from the Airport (i.e., the evaluation

43 Federal Aviation Administration, Aviation Environmental Design Tool (AEDT) Users Guide, September 2017, https://aedt.faa.gov/

44 South Coast Air Quality Management District, Draft Aircraft Emissions Inventory for South Coast Air Quality Management District, August 2016, http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/aircraft-emissions-inventory-for-the-south-coast-air-quality-management-district.pdf

includes all aircraft activity occurring approximately six miles from the end of any of the airport's runways).

The number of annual aircraft operations and the aircraft fleet mix for the Baseline (2021) and future conditions (2025 and 2029) was used in the air quality analysis.[45] AEDT default emission factors were used to estimate aircraft emissions for all aircraft. The factors are provided by aircraft engine type and operational mode (i.e., take-off, climb out, approach, and taxi/idle).[46] Aircraft emissions are described within several operational modes: engine startup, taxi in and taxi out, climb (aboveground within takeoff and climb-out) and descend (aboveground within approach and landing). AEDT default times were used for each mode except for ground taxi/delay movements. Times in mode for taxi-in (for arrivals) and taxi-out (for departures) were based on airfield simulation modeling using AirTOP.[47] Of note, the Proposed Project anticipates some operation of electric cargo aircraft.[48] **Attachment A: Emissions Inventory and Dispersion Modeling Methodology and Assumptions** provides information related to aircraft operations used in the air quality analysis.

Notably, the Proposed Project would increase the taxi-in times and taxi-out times associated with non-project aircraft operations. This is a result of the greater number of aircraft operations which decreases airfield taxi efficiency. Therefore, the air quality analysis includes the impacts due to project-related and non-project related aircraft operations.

- **APU** – APU are small turbine engines on an aircraft that are used to start the main engines; provide electrical power to aircraft radios, lights, and other equipment; and power the onboard air conditioning (heating and cooling) system.

  Use of a GPU or gate connections eliminates the need for aircraft to use their own power at the gate except for short periods of time during engine start-up and shut-down. Terminal gates/aprons without pre-conditioned air (PCA)/ground power typically assume an APU operating

45 Aircraft operations which are not directly part of the proposed project are included in the analysis because the project aircraft results in changes in taxi movements and speeds for all airport aircraft (passenger and other cargo operations).

46 For the purposes of the emissions inventories, a landing and take-off cycle is comprised of the following AEDT operational mode categories:

- *Descend Below Mixing Height*: The modes in this category are associated with an aircraft's arrival, beginning at the atmospheric mixing height, and including descend emissions below 1,000 feet, the landing ground roll, and arrival taxi (i.e., taxi-in) emissions.
- *Climb Below Mixing Height:* The modes in this category are associated with an aircraft's departure, beginning with startup and including climb taxi (i.e., taxi-out), takeoff ground roll, climb below 1,000 feet and climb to the atmospheric mixing height.

47 Transoft Solutions, AirTOP, https://www.airtop-software.com/

48 Eviation Aircraft, https://www.eviation.com/

time of 26 minutes (13 minutes during taxi in and 13 minutes during taxi out). Terminal gates/aprons with PCA/ground power typically assume an APU operating time of seven minutes (3.5 minutes during taxi in and 3.5 minutes during taxi out).[49] All of the passenger terminal gates at Ontario International Airport provide PCA and gate power to aircraft.[50] The Proposed Project would provide aircraft parking position power within the Project site which would reduce APU operating times from 26 to seven minutes.

- **GSE** – GSE are equipment used to service aircraft between flights (e.g., cargo loaders, baggage tugs, tow tugs, belt loaders).[51] GSE emissions depend on the level of fuel consumption and distance traveled/operating time. The Proposed Project would include the use and operation of electric-powered equipment, including forklifts, loaders, tugs, ground power units, and ramp support (vans/carts) that would be stored and charged in designated areas in the cargo building and aircraft apron.[52] For the preparation of emissions for GSE, default AEDT emission factors were used and default AEDT operating times were used. The estimated annual fuel usage for the GSE is approximately 8,000 gallons of diesel during Phase 1 while no fuel is used for GSE in Phase 2. The following provides a list of expected GSE associated with the Proposed Project:

Ground Support Equipment	Fuel Type	Number of Units
Loaders (Commander 30)	Electric	12
Belt Loaders	Electric	8
Ground Power Units	Electric	8
Push back Tugs	Electric	5
Stairs (B737)	None	3
Stairs (B747/B767)	None	8
Tugs	Electric	25
Dollies	None	450
Tow bars	None	15
Ramp Support (Vans/Carts)	Electric	5
Large Dollies	None	10
Forklifts	Electric	27

- **Stationary sources** – Airports have a variety of stationary sources, including heating and refrigeration plants, boilers, generators, aircraft engine testing, and fuel storage/transfer

49 Federal Aviation Administration, *Aviation Emissions and Air Quality Handbook Version 3 Update 1, January 2015,* https://www.faa.gov/regulations_policies/policy_guidance/envir_policy/airquality_handbook/

50 APU/GSE associated with passenger, FedEx and UPS aircraft and other similar activities are not affected by the proposed project and therefore, were not included in the analysis.

51 APU/GSE associated with passenger, FedEx and UPS aircraft and other similar activities are not affected by the proposed project and therefore, were not included in the analysis.

52 Diesel-powered fuel trucks would be used during Phase 1 and replaced with electric hydrant carts within Phase 2.

facilities. Emission levels from some stationary sources are regulated through regulatory permits. The Proposed Project includes seven 2.0-megawatt (MW) diesel-engine driven emergency generators; five generators during Phase 1 and an additional two generators within Phase 2.[53] The Applicant shall comply with Rule 201 and 203 (Authority to Construct and Permit to Operate) which require that owners of applicable construction or operation equipment obtain air quality permits from the SCAQMD prior to construction and operation. The facility is being designed to not use any natural gas.

Phase 1 of the proposed Project would require approximately 8.5 MW of power with Phase 2 requiring another 4 MW of power. At full development, the Proposed Project would require approximately 12.5 MW of power.

The Proposed Project would include a 1.5-MW Solar PV Panel system on the rooftop of the Cargo Sorting Building and Parking Structure. Approximately 20 percent of the electrical usage (2,378,973 kilowatts)[54] would be generated by the Solar PV Panel system.

The estimated annual fuel usage, assuming each generator operates 50 hours per year (2 hours per day) is approximately 34,760 gallons of diesel fuel during Phase 1 and approximately 48,660 gallons of diesel fuel during Phase 2.[55]

Motor vehicles – Project-related motor vehicle activity includes employee and delivery trucks.[56] Emissions factors for these sources were obtained from the EMFAC model. For the Proposed Project, electric charging stations would be provided in the employee and visitor parking lots, and truckyard. The motor vehicle fleet mix and fuel type were based on information within EMFAC. Employees would conduct 2,531 trips per day resulting in 35,402 miles per day during Phase 1 and 35,540 miles per day during Phase 2. Delivery trucks would conduct 150 trips per day resulting in 9,889 miles per day during Phase 1 and 224 trips per day resulting in 14,623 miles per day during Phase 2. Employee vehicles would travel 14 miles per trip. Full delivery trucks would travel 90.6 miles per trip during Phase 1 and 88.3 miles per trip during Phase 2. Empty delivery trucks would travel 14 miles per trip.

---

53 Passenger terminal (as well as FedEx and UPS) boilers, generators, and other stationary sources are not affected by the proposed project and therefore, were not included in the analysis.

55 Vender Specifications for Standby Generator, https://www.cat.com/en_US/products/new/power-systems/electric-power.html

56 Airport passenger associated motor vehicles, terminal deliveries, FedEx and UPS delivery trucks, and other similar activities are not affected by the proposed project and therefore, were not included in the analysis.

To evaluate the potential impacts of the change in air quality conditions that would result from the Proposed Project, the following conditions were be analyzed:

- No Project
- With Project

Three timeframes will be evaluated:

- Baseline Condition (2021)
- Phase 1 (2025)
- Phase 2 (2029)[57]

The following provides the estimated operational emissions. Notably, project delays that affect the corresponding time period in which Phase 1 and Phase 2 would become operational would likely result in lower emission due to regulatory requirements and greater aircraft engine efficiencies and changes in aircraft fleet mix.

Table 11: Estimated Annual Operational Emissions (tons) – Baseline presents the annual criteria air pollutant emissions for the Baseline Condition (2021).

Table 11
Estimated Annual Operational Emissions (tons) – Baseline

CO	VOC	NO_x	SO_2	PM_{10}	PM_{10}

For the emissions inventory, in order to determine the Proposed Project-related operational impacts associated with air pollutant emissions, the total emissions associated with the Proposed Project that would occur in Phase 1 and Phase 2 including other aircraft operations not associated with the project were compared to the Baseline emissions. The difference between these two conditions was used to determine the significance of the Proposed Project when compared to the SCAQMD thresholds.

- Phase 1 With Project operations compared to the Baseline Condition
- Phase 2 With Project operations compared to the Baseline Condition

Table 14: Estimated Daily Operational Emissions (pounds) – Phase 1 With Project Compared to Baseline presents the daily criteria air pollutant emissions when compared With Project to the Baseline Condition during Phase 1. As shown, the Proposed Project operational emissions during Phase 1 would exceed SCAQMD significance thresholds for CO, VOC, and NO_x, primarily due to aircraft, followed by employee vehicles, delivery trucks, and emergency generators.

Table 14
Estimated Daily Operational Emissions (pounds) – Phase 1 With Project Compared to Baseline

Emission Source	CO	VOC	NO_x	SO_2	PM_{10}	PM_{10}
Aircraft	1,438	238	1,421	97.9	6.58	6.58

Table 15: Estimated Daily Operational Emissions (pounds) – Phase 2 With Project Compared to Baseline presents the daily criteria air pollutant emissions when compared With Project to the Baseline Condition. As shown, the Proposed Project operational emissions during Phase 2 would exceed SCAQMD significance thresholds for CO, VOC, NO_x, and SO_2, primarily due to aircraft, followed by employee vehicles, delivery trucks, and emergency generators. Notably, Phase 2 operations would not require fuel trucks and thus, the GSE emissions would be zero.

Table 15
Estimated Daily Operational Emissions (pounds) – Phase 2 With Project Compared to Baseline

Emission Source	CO	VOC	NO_x	SO_2	PM_{10}	PM_{10}

However, this comparison of the project to the Baseline is influenced by factors that are not attributable to the Project itself. Specifically, the comparison contains future aircraft operations from background growth that are projected to occur with or without the Proposed Project. In order to remove the contribution of background aircraft growth, for CEQA purposes, a second comparison was provided for the Proposed Project and without Proposed Project. This comparison was made for informational purposes only.

- Phase 1 With Project operations compared to the Phase 1 Without Project operations
- Phase 2 With Project operations compared to the Phase 2 Without Project operations

Table 16: Estimated Daily Operational Emissions (pounds) – Phase 1 With Project Compared to Phase 1 Without Project presents the daily criteria air pollutant emissions when compared With Project to the Without Project during Phase 1. As shown, the Proposed Project operational emissions during Phase 1 would exceed SCAQMD significance thresholds for CO, VOC, and NO_x, primarily due to aircraft, followed by employee vehicles, delivery trucks, and emergency generators.

Table 16
Estimated Daily Operational Emissions (pounds) – Phase 1 With Project Compared to Without Project

Emission Source	CO	VOC	NO_x	SO_2	PM_{10}	PM_{10}

The values comparing the With Project to the Without Project are lower than the previously compared With Project to the Baseline Condition; accountable to the baseline aircraft growth which is not related to the Proposed Project.

Standby Generators

The Proposed Project requires that the entire facility be backed up on generator power to provide emergency power primarily for lighting and other emergency building systems. To accomplish this, it is estimated that seven 2.0-megawatt diesel-engine driven generators are required.

Emergency generator emissions were calculated based on compliance with applicable federal emissions standards and compliance with SCAQMD Rule 1470 (Requirements for Stationary Diesel-Fueled Internal Combustion and Other Compression Ignition Engines) mandated emission limits and operating hour constraints. This analysis also assumed that the standby generators would operate up to two hours per day and a total of 50 hours per year for testing and maintenance (per SCAQMD Rule 1470 limit). SCAQMD requires that all internal combustion engines (ICE) greater than 50 brake horsepower (bhp) and gas turbines greater than 2,975,000 Btu per hour obtain a permit to construct prior to installation of the engines at a site.

SCAQMD defines a standby ICE or turbine for non-utility power generation as one that does not operate more than 200 hours a year and is only operated in the event of an emergency power failure or for routine testing and maintenance is considered a standby backup generator for power generation. Operators should petition the SCAQMD's Hearing Board for a variance to operate in excess of the allowed 200 hours before it is anticipated that the hours may be exceeded.

- The internal combustion engines must meet SCAQMD's BACT requirements.
- It is advisable before purchasing any equipment to consult with the SCAQMD and apply for approval of a Permit to Construct from the SCAQMD prior to installation of the engine. Typically, the SCAQMD either issues a Permit to Construct or a Permit to Construct/Operate.
- The Applicant would conduct maintenance and/or testing on each of the seven standby generators on separate days to limit daily emissions from maintenance/testing activities.

Summary of Operational Emissions Inventory Results

The following concluding statements can be made about the operational emissions inventory results:

- The operational emissions would exceed the significance threshold for CO, VOC, NOx, and SO_2 and would be a *significant and unavoidable impact on regional air quality.*

9.0 AMBIENT AIR CONCENTRATION IMPACTS

Dispersion is the process by which atmospheric pollutants spread due to wind and vertical stability. The base data for this type of analysis is emissions inventories. A dispersion model uses an emissions inventory to estimate concentrations of pollutants at specific locations. Dispersion models use hourly average meteorological data, terrain elevation data, and source emission release characteristics to compute downwind pollutant concentrations over periods that can range from one hour to one year.

The dispersion model used for the air quality analysis, USEPA's AERMOD (Version 21112), is state-of-the-art. Given the accuracy of the input data, the model results offer the best available estimates with which to predict ambient concentrations of air pollutants. AERMOD simulates point, area, volume, and line emissions sources. AERMOD was executed using regulatory default options for stack-tip downwash, buoyancy-induced dispersion, and final plume rise, default wind speed profile categories, default potential temperature gradients, and—except for an analysis that was performed to convert predicted concentrations of NO_x to concentrations of NO_2 —no pollutant decay.

A dispersion modeling analysis was conducted to assess project-related impacts to local air concentrations of CO, NO_2, PM_{10}, $PM_{2.5}$, and SO_2. Concentrations were compared to SCAQMD's significance thresholds and California/National Ambient Air Quality Standards (CAAQS/NAAQS). The Proposed Project would result in a significant construction and/or operational air quality impact if concentrations from the Proposed Project exceed the significance concentration and operational thresholds set forth in **Table 2: Ambient Air Quality Standards for Criteria Pollutants**.

The SCAQMD's recommended thresholds are based on the difference between the maximum monitored ambient pollutant concentrations in the area and the CAAQS and NAAQS. Therefore, the thresholds depend upon the concentrations of pollutants monitored locally with respect to the Project site. For pollutants that already exceed the CAAQS and NAAQS (e.g., PM_{10} and $PM_{2.5}$), the thresholds are based on SCAQMD Rule 403 for construction and Rule 1303 for operations. Because the concentration thresholds are designed to attain or maintain the CAAQS and NAAQS, they are set at levels that would protect human health.

Attachment A: Emissions Inventory and Dispersion Modeling Methodology and Assumptions provides documentation of the Ontario International Airport Cargo Development Air Quality Modeling Protocol, which has been reviewed by the SCAQMD, and describes the data used within the air quality modeling and how the air quality modeling would be performed.

The methodology for CO, NO_2, and SO_2 requires that the project-related contributions for these pollutants be added to existing background concentrations and the summation be compared to the appropriate

threshold. The significance thresholds for PM_{10} and $PM_{2.5}$ represent the allowable increase in concentrations above background levels that would not cause or contribute to an exceedance of the CAAQS and NAAQS.

For the air quality analysis, the construction and operational emissions due to the Proposed Project were assessed with respect to the thresholds using dispersion modeling:

- CO – The significance thresholds for CO are the 1-hour and 8-hour CAAQS of 23 milligrams per cubic meter (mg/m^3) and 10 mg/m^3, respectively (or 20 and 9 ppm). For CO, the CAAQS are at least as stringent as the NAAQS, therefore, compliance with CAAQS indicates compliance with NAAQS. The project incremental concentrations were added to background concentrations before comparison to the ambient standards.

- NO_2 – The significance thresholds for the 1-hour NO_2 concentration is the 1-hour NO_2 CAAQS of 339 $\mu g/m^3$ (0.18 ppm). The significance thresholds for the 1-hour NO_2 concentration is the 1-hour NO_2 CAAQS of 57 $\mu g/m^3$ (0.03 ppm), which is more stringent than the annual NO_2 NAAQS of 100 $\mu g/m^3$ (0.053 ppm), therefore, compliance with CAAQS indicates compliance with NAAQS. The project incremental concentrations were added to background concentrations before comparison to the ambient standards.

- SO_2 - The significance thresholds for the 1-hour SO_2 concentration is the 1-hour SO_2 CAAQS of 655 $\mu g/m^3$ (0.25 ppm) and the 1-hour SO_2 NAAQS of 196 $\mu g/m^3$ (0.075 ppm). The significance thresholds for the daily SO_2 concentration is the 24-hour SO_2 CAAQS of 105 $\mu g/m^3$ (0.04 ppm). The 3-hour NAAQS for SO_2 is 1,300 $\mu g/m^3$ (0.5 ppm), which is double the value of the 1-hour SO_2 CAAQS, therefore, the significance determination for the 1-hour SO_2 CAAQS represents the significance determination of the 3-hour SO_2 for NAAQS. The project incremental concentrations were added to background concentrations before comparison to the ambient standards.

- PM_{10} and $PM_{2.5}$ – The significance thresholds for PM_{10} and $PM_{2.5}$ concentrations ate the CEQA thresholds developed by the SCAQMD. For both PM_{10} and $PM_{2.5}$, SCAQMD develop separate daily thresholds for construction (10.4 $\mu g/m^3$) and operations (2.5 $\mu g/m^3$). SCAQMD also developed an annual threshold for PM_{10} of 1.0 $\mu g/m^3$ applicable to both construction and operations. These thresholds are relative to the project incremental impacts; thus, project-related concentrations were not added to background constriction before comparing to these thresholds.

Table 18: Estimated Concentration Impacts from Construction Activities – Phase 1 provides the Proposed Project air concentrations from construction activities for nearby receptors.

Ambient Air Quality Concentrations Due to Construction Activities

An air quality analysis was conducted to determine the ambient concentrations at nearby receptors which would result from project construction activities. **Attachment A: Emissions Inventory and Dispersion Modeling Methodology and Assumptions** provides detailed information about the location of air quality receptors used in the dispersion modeling analysis of criteria pollutants (NO_2, CO, SO_2, PM_{10}, and $PM_{2.5}$). These receptors are designed to represent offsite locations where a person has access and can be situated for an hour or longer at a time (which is different from the HRA receptors which are designed to represent specific residences, schools, daycares, and offsite worker locations). The ambient air quality standards analysis results are presented for Phase 1 and 2. The maximum impacts due to construction activities occur near the Project site along the Airport boundary and dissipate moderately within 1,000 feet of the Project site. Phase 1 construction activities would occur during 2023 and 2024 while Phase 2 construction activities would occur from 2025 through 2029.

As shown in **Table 18: Estimated Concentration Impacts from Construction Activities – Phase 1**, for the air quality receptors during project construction during Phase 1, the maximum incremental 1-hour NO_2 impacts, including background concentrations, would be 0.09 ppm, which is below the State threshold of 0.18 ppm. The maximum project construction incremental annual NO_2 impacts including background concentrations would be 0.02 ppm, which is below the thresholds of 0.03 ppm (state) and below the threshold of 0.053 ppm (federal). Therefore, construction activities would not exceed the 1-hour and annual NO_2 thresholds and would be a *less than significant air quality impact of NO_2 due to construction activities during Phase 1*.

As shown in **Table 18: Estimated Concentration Impacts from Construction Activities – Phase 1**, for the air quality receptors during Project construction during Phase 1, the maximum incremental 24-hour and annual PM_{10} impacts would be 3.67 µg/m^3 and 0.09 µg/m^3, respectively. Impacts would be below the 24-hour PM_{10} threshold of 10.4 µg/m^3 and the annual PM_{10} threshold of 1.0 µg/m^3. The Project construction maximum incremental 24-hour $PM_{2.5}$ impacts would be 0.97 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 10.4 µg/m^3. Therefore, construction activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ due to construction activities Phase 1*. The PM_{10} and $PM_{2.5}$ concentrations include construction exhaust and fugitive dust.

Additionally, as shown in **Table 18: Estimated Concentration Impacts from Construction Activities – Phase 1**, for the air quality receptors during project construction, the maximum incremental SO_2 and CO impacts including background concentrations would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO due to construction activities during Phase 1*.

Table 19: Estimated Concentration Impacts from Construction Activities – Phase 2 provides the Proposed Project air concentrations from construction activities for nearby receptors.

As shown in **Table 19: Estimated Concentration Impacts from Construction Activities – Phase 2**, for the air quality receptors during project construction during Phase 2, the maximum incremental 1-hour NO_2 impacts, including background concentrations, would be 0.09 ppm, which is below the State threshold of 0.18 ppm. The maximum project construction incremental annual NO_2 impacts including background concentrations would be 0.02 ppm, which is below the thresholds of 0.03 ppm (state) and below the threshold of 0.053 ppm (federal). Therefore, construction activities would not exceed the 1-hour and annual NO_2 thresholds and would be a *less than significant air quality impact of NO_2 due to construction activities during Phase 2*.

For the air quality receptors during project construction during Phase 2, the maximum incremental 24-hour and annual PM_{10} impacts would be 3.66 µg/m^3 and 0.11 µg/m^3, respectively. The project construction maximum incremental 24-hour $PM_{2.5}$ impacts would be 0.65 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 10.4 µg/m^3. Therefore, construction activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ due to construction activities during Phase 2*. The PM_{10} and $PM_{2.5}$ concentrations include construction exhaust and fugitive dust.

Additionally, as shown in **Table 19: Estimated Concentration Impacts from Construction Activities – Phase 2**, for the air quality receptors during project construction during Phase 2, the maximum incremental SO_2 and CO impacts including background concentrations would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO due to construction activities during Phase 2*.

As discussed previously, the federal and State standards have been set at levels considered safe to protect public health, including the health of "sensitive" populations, such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings. Based on the results shown in **Table 18: Estimated Concentration Impacts from Construction Activities – Phase 1** and **Table 19: Estimated Concentration Impacts from Construction Activities – Phase 2**, construction of the proposed Project is not likely to result in adverse health effects as a result of its criteria air pollutant emissions.

Ambient Air Quality Concentrations Due to Operational Activities

An air quality analysis was conducted to determine the ambient concentrations at nearby receptors which would result from project operations. Proposed Project includes the operation of aircraft, APU, GSE, stationary sources, and employee vehicles and delivery trucks. For the air dispersion modeling, to evaluate

impacts associated with the Proposed Project in isolation (i.e., without including impacts associated with existing airport operations), concentrations associated with the Baseline Condition was subtracted from future year with project concentrations (i.e., project-related concentrations). Then, to determine the total concentrations for CO, SO_2, and NO_2, these project-related concentrations were added to a background concentration (i.e., representing other nearby emission sources not associated with the airport or the project) based on nearby existing ambient monitoring station(s). For 1-hour NO_2 concentrations, the background concentrations were based on seasonal/temporal computations. For CO, SO_2, and NO_2, these total concentrations were compared to the California and National AAQS. Per SCAQMD guidance, the project-related concentrations of PM_{10} and $PM_{2.5}$ were compared to the SCAQMD significance thresholds for PM_{10} and $PM_{2.5}$ (without adding background concentrations). Further information on the background concentrations is provided in **Attachment A: Emissions Inventory and Dispersion Modeling Methodology and Assumptions**.

- Phase 1 With Project operations compared to the Baseline Condition
- Phase 2 With Project operations compared to the Baseline Condition

Table 20: Estimated Operational Concentration Impacts – Phase 1 With Project Compared to Baseline provides the Proposed Project air concentrations during Phase 1 With Project compared to the Baseline Condition.

Table 21: Estimated Operational Concentration Impacts – Phase 2 With Project Compared to Baseline provides the Proposed Project air concentrations during Phase 2 With Project compared to the Baseline Condition.

As shown in **Table 20: Estimated Operational Concentration Impacts – Phase 1 With Project Compared to Baseline**, for the air quality receptors during project operations, the incremental 1-hour NO_2 impacts, including background concentrations, would be a maximum of 0.13 ppm, which is below the State threshold of 0.18 ppm. The maximum project operation incremental annual NO_2 impacts, including background concentrations, would be 0.02 ppm, which is below the thresholds of 0.03 ppm (state) and below the threshold of 0.053 ppm (federal). Therefore, operation activities would not exceed the 1-hour and annual NO_2 thresholds and would result in a *less than significant air quality impact of 1-hour and annual NO_2 due to operation activities during Phase 1.*

The incremental peak concentration was determined by calculating the difference between the With Project and the Baseline Condition at each receptor, then selecting the maximum value across all receptors. Total concentrations reflect rounding of values. Per SCAQMD guidance, PM_{10} and $PM_{2.5}$ impacts do not include background concentrations.
Background NO2 concentrations were included in the AERMOD (as seasonal/temporal values); thus, AERMOD directly calculated the total Project plus background.

As shown in **Table 20: Estimated Operational Concentration Impacts – Phase 1 With Project Compared to Baseline**, for the air quality receptors during project operation, the maximum incremental 24-hour and annual PM_{10} impacts would be 0.64 µg/m^3 and 0.20 µg/m^3, respectively; impacts would be below the 24-hour PM_{10} threshold of 2.5 µg/m^3 and below the annual PM_{10} threshold of 1.0 µg/m^3. The project operation maximum incremental 24-hour $PM_{2.5}$ impacts would be 0.39 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 2.5 µg/m^3. Therefore, operation activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ due to operation activities during Phase 1*.

Additionally, as shown in **Table 20: Estimated Operational Concentration Impacts – Phase 1 With Project Compared to Baseline**, for the air quality receptors during project operation, the maximum incremental SO_2 and CO impacts including background concentrations would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO due to operation activities during Phase 1*.

As shown in **Table 21: Estimated Operational Concentration Impacts – Phase 2 With Project Compared to Baseline**, for the air quality receptors during project operations, the incremental 1-hour NO_2 impacts, including background concentrations, would be a maximum of 0.16 ppm, which is below the State threshold of 0.18 ppm. The maximum project operation incremental annual NO_2 impacts, including background concentrations, would be 0.02 ppm, which is below the thresholds of 0.03 ppm (state) and below the threshold of 0.053 ppm (federal). Therefore, operation activities would not exceed the 1-hour and annual NO_2 thresholds and would result in a *less than significant air quality impact of 1-hour and annual NO_2 due to operation activities during Phase 2.*

As shown in **Table 21: Estimated Operational Concentration Impacts – Phase 2 With Project Compared to Baseline**, for the air quality receptors during project operation, the maximum incremental 24-hour and annual PM_{10} impacts would be 0.98 µg/m^3 and 0.22 µg/m^3, respectively; impacts would be below the 24-hour PM_{10} threshold of 2.5 µg/m^3 and below the annual PM_{10} threshold of 1.0 µg/m^3. The project operation maximum incremental 24-hour $PM_{2.5}$ impacts would be 0.83 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 2.5 µg/m^3. Therefore, operation activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ due to operation activities during Phase 2*.

Additionally, as shown in **Table 21: Estimated Operational Concentration Impacts – Phase 2 With Project Compared to Baseline**, for the air quality receptors during project operation, the maximum incremental SO_2 and CO impacts including background concentrations would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO due to operation activities during Phase 2*.

As with the emissions inventory results, a second comparison was made in order to remove the influence of background airport growth by comparing the concentrations from future year with Proposed Project and the future year without Proposed Project. This comparison was made for informational purposes only.

- Phase 1 With Project operations compared to the Phase 1 Without Project operations
- Phase 2 With Project operations compared to the Phase 2 Without Project operations

Table 22: Estimated Operational Concentration Impacts – Phase 1 With Project Compared to Without Project provides the Proposed Project air concentrations during Phase 1 With Project compared to Without Project.

Table 23: Estimated Operational Concentration Impacts – Phase 2 With Project Compared to Without Project provides the Proposed Project air concentrations during Phase 2 With Project compared to Without Project.

As shown in **Table 22: Estimated Operational Concentration Impacts – Phase 1 With Project Compared to Without Project**, for the air quality receptors during project operations, the incremental 1-hour NO_2 impacts, including background concentrations, would be a maximum of 0.08 ppm, which is below the State threshold of 0.18 ppm. The maximum project operation incremental annual NO_2 impacts, including background concentrations, would be 0.02 ppm, which is below the thresholds of 0.03 ppm (state) and 0.053 ppm (federal). Therefore, operation activities would not exceed the 1-hour and annual NO_2 thresholds and would result in a *less than significant air quality impact of 1-hour and annual NO_2 due to operation activities during Phase 1.*

As shown in **Table 22: Estimated Operational Concentration Impacts – Phase 1 With Project Compared to Without Project**, for the air quality receptors during project operation, the maximum incremental 24-hour and annual PM_{10} impacts would be 0.65 µg/m^3 and 0.20 µg/m^3, respectively; impacts would be below the 24-hour PM_{10} threshold of 2.5 µg/m^3 and below the annual PM_{10} threshold of 1.0 µg/m^3. The project operation maximum incremental 24-hour $PM_{2.5}$ impacts would be 0.40 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 2.5 µg/m^3. Therefore, operation activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ due to operation activities during Phase 1*.

Table 22
Estimated Concentration Impacts from Operational Activities – Phase 1 With Project Compared to Without Project

Criteria	CAAQS 1-Hour NO_2 (ppm)	CAAQS Annual NO_2 (ppm)	NAAQS Annual NO_2 (ppm)	24-Hour PM_{10} ($\mu g/m^3$)	Annual PM_{10} ($\mu g/m^3$)	24-Hour $PM_{2.5}$ ($\mu g/m^3$)	CAAQS 1-Hour SO_2 (ppm)	NAAQS 1-Hour SO_2 (ppm)	24-Hour SO_2 (ppm)	1-Hour CO (ppm)	8-Hour CO (ppm)

The incremental peak concentration was determined by calculating the difference between the With Project and the Without Project at each receptor, then selecting the maximum value across all receptors. Total concentrations reflect rounding of values. Per SCAQMD guidance, PM_{10} and $PM_{2.5}$ impacts do not include background concentrations.
Background NO2 concentrations were included in the AERMOD (as seasonal/temporal values); thus, AERMOD directly calculated the total Project plus background.

Additionally, as shown in **Table 22: Estimated Operational Concentration Impacts – Phase 1 With Project Compared to Without Project**, for the air quality receptors during project operation, the maximum incremental SO_2 and CO impacts including background concentrations would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO due to operation activities during Phase 1*.

Table 23: Estimated Operational Concentration Impacts – Phase 2 With Project Compared to Without Project provides the Proposed Project air concentrations during Phase 2 With Project compared to Without Project.

As shown in **Table 23: Estimated Operational Concentration Impacts – Phase 2 With Project Compared to Without Project**, for the air quality receptors during project operations, the incremental 1-hour NO_2 impacts, including background concentrations, would be a maximum of 0.09 ppm, which is below the State threshold of 0.18 ppm. The maximum project operation incremental annual NO_2 impacts, including background concentrations, would be 0.02 ppm, which is below the thresholds of 0.03 ppm (state) and 0.053 ppm (federal). Therefore, operation activities would not exceed the 1-hour and annual NO_2 thresholds and would result in a *less than significant air quality impact of 1-hour and annual NO_2 due to operation activities during Phase 2.*

As shown in **Table 23: Estimated Operational Concentration Impacts – Phase 2 With Project Compared to Without Project**, for the air quality receptors during project operation, the maximum incremental 24-hour and annual PM_{10} impacts would be 0.96 µg/m^3 and 0.21 µg/m^3, respectively; impacts would be below the 24-hour PM_{10} threshold of 2.5 µg/m^3 and below the annual PM_{10} threshold of 1.0 µg/m^3. The project operation maximum incremental 24-hour $PM_{2.5}$ impacts would be 0.82 µg/m^3, which would be below the 24-hour $PM_{2.5}$ threshold of 2.5 µg/m^3. Therefore, operation activities would result in a *less than significant air quality impact of PM_{10} and $PM_{2.5}$ due to operation activities during Phase 2*.

Additionally, as shown in **Table 23: Estimated Operational Concentration Impacts – Phase 2 With Project Compared to Without Project**, for the air quality receptors during project operation, the maximum incremental SO_2 and CO impacts including background concentrations would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO due to operation activities during Phase 2*.

As discussed previously, the federal and State standards have been set at levels considered safe to protect public health, including the health of "sensitive" populations, such as asthmatics, children, and the elderly with a margin of safety; and to protect public welfare, including protection against decreased visibility and damage to animals, crops, vegetation, and buildings. Based on the results shown in **Table 20** through **Table**

23, operation of the Proposed Project is not likely to result in adverse health effects as a result of its criteria air pollutant emissions.

Ambient Air Quality Concentrations Associated with Roadway Intersections

Localized CO concentrations associated with motor vehicle travel on area roadways were evaluated using a screening method based on the California Line Source Dispersion Model (CALINE-4) microscale dispersion model, developed by Caltrans, in combination with EMFAC2021 emission factors. In traffic studies, the term "level of service" (LOS) describes traffic performance at roadway intersections and is generally expressed as a letter grade (A through F, with an F grade reflecting highly congested traffic conditions).

To establish a more accurate record of baseline CO concentrations affecting the Basin, a CO "hot spot" analysis was conducted in 2003 for four busy intersections in Los Angeles at the peak morning and afternoon time periods. The busiest intersection evaluated was at Wilshire Boulevard and Veteran Avenue, which has a daily traffic volume of approximately 100,000 vehicles per day. The SCAQMD 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 ppm, which indicates that the most stringent 1-hour CO standard (20.0 ppm) would likely not be exceeded until the daily traffic at the intersection exceeded more than 400,000 vehicles per day.[58] Additionally, the SCAQMD also recommends an evaluation of potential localized CO impacts when a project causes the LOS at a study intersection to worsen from C to D, or if a project increases the V/C ratio at any intersection rated D or worse by 2 percent or more.

None of the Project's studied intersections would exceed 400,000 vehicles per day. Additionally, none of the Project's study intersections worsen from C to D or increase the V/C ratio at any intersection rated D or worse by two percent or more. As such, the Project would not produce the volume of traffic required to generate a CO hot spot in the context of the 2003 AQMP hot spot study.

To further support this conclusion, CO concentration levels were forecasted at the Project's three most potentially impacted intersections using the CALINE-4 dispersion model developed by Caltrans, peak-hour traffic volumes, and conservative meteorological assumptions. The following intersections were evaluated because the Proposed Project's transportation study found that they would operate below LOS standards (i.e., LOS E/F):

1. Euclid Avenue/SR-83 at Mission Boulevard

58 South Coast Air Quality Management District, 2003 AQMP Appendix V, August 2003.

2. Bon View Avenue at Mission Boulevard

3. Airport Drive at Haven Avenue

Project-generated traffic volumes are forecasted to have a negligible effect on the projected 1-hour and 8-hour CO concentrations at each of the three intersection locations analyzed. Thus, the project would not cause any new or exacerbate any existing CO hot spots, and, as a result, health impacts related to localized mobile-source CO emissions would not be considered significant. **Attachment A: Emissions Inventory and Dispersion Modeling Methodology and Assumptions** contains a memorandum concerning the CO intersection analysis and detailed results.

Summary of Air Quality Concentration Assessment Results

The following concluding statements can be made about the ambient air quality analysis results:

- The maximum concentrations of the 1-hour and annual NO_2 impacts including background concentrations would not exceed the significance threshold and would be a *less than significant impact for all offsite receptors due to construction and operational activities during Phase 1 and 2*.

- The maximum concentrations of 24-hour and annual PM_{10} and 24-hour $PM_{2.5}$ would not exceed the significance threshold and would be *less than significant impact for all offsite receptors due to construction and operational activities during Phase 1 and 2*.

- The maximum concentrations of SO_2 and CO including background concentrations would be well below the significance thresholds and would be a *less than significant air quality impact of SO_2 and CO on all nearby receptors due to construction and operational activities during Phase 1 and 2*.

10.0 HEALTH RISK ASSESSMENT

The Proposed Project is expected to emit a variety of air toxics and a health risk assessment (HRA) was completed to evaluate the health impacts of the Proposed Project as required by the SCAQMD. The Proposed Project would constitute a new emission source of diesel particulate matter (DPM) due to its construction activities and haul trucks. Studies have demonstrated that DPM from diesel-fueled engines is a human carcinogen and that chronic (long-term) inhalation exposure to DPM poses a chronic health risk. Secondly, various air toxics would be emitted by the aircraft during operations.[59] The HRA focuses on

59 Toxic air contaminants are a broad class of compounds known to cause morbidity or mortality. TAC are found in ambient air, especially in urban areas, and are caused by industry, agriculture, fuel combustion, and commercial operations (e.g., gasoline service stations, dry cleaners). TAC are typically found in low concentrations, even near their source (e.g., diesel particulate matter near a freeway). Because chronic exposure can result in adverse health effects, TAC are regulated at the regional, state, and federal level.

impacts on existing residences, schools, offsite workers, and other sensitive populations (including onsite workers within the passenger terminal and other areas within the Airport).

Health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. Individual cancer risk is the likelihood that a person exposed to air toxic concentrations over a 30-year lifetime will contract cancer, based on the use of standard risk-assessment methodology. The maximally exposed individual (MEI) represents the worst–case risk estimate, based on a theoretical person continuously exposed for a lifetime at the point of highest compound concentration in the air. This is a highly conservative assumption since most people do not remain at home all day and on average residents change residences every 11 to 12 years. In addition, this assumption assumes that residents are experiencing outdoor concentrations for the entire exposure period.

The HRA was conducted following methodologies in OEHHA's *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[60] and SCAQMD's *Risk Assessment Procedures for Rule 1401, 1401.1 and 212*.[61] This was accomplished by applying the estimated concentrations at the receptors analyzed to the established cancer risk estimates and acceptable reference concentrations for noncancer health effects.

Recent OEHHA's revisions to its Guidance Manual were primarily designed to ensure that the greater sensitivity of children to cancer and other health risks is reflected in the HRA. For example, OEHHA now recommends that risks be analyzed separately for multiple age groups, focusing especially on young children and teenagers, rather than the past practice of analyzing risks to the general population, without distinction by age. OEHHA also now recommends that statistical "age sensitivity factors" be incorporated into an HRA, and that children's relatively high breathing rates be accounted for. On the other hand, the Guidance Manual revisions also include some changes that would reduce calculated health risks. For example, under the former guidance, OEHHA recommended that residential cancer risks be assessed by assuming 70 years of exposure at a residential receptor; under the Guidance Manual, this assumption is lessened to 30 years.

CARB and OEHHA have identified the following groups of individuals as the most likely to be affected by air pollution: the elderly over 65, children under 14, infants (including in utero in the third trimester of pregnancy), and persons with cardiovascular and chronic respiratory diseases such as asthma,

60 Office of Environmental Health Hazard Assessment, Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments, February 2015, http://oehha.ca.gov/air/hot_spots/hotspots2015.html

61 South Coast Air Quality Management District, Risk Assessment Procedures for Rule 1401, 1401.1 and 212, September 1, 2017, http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12

emphysema, and bronchitis. Some land uses are considered more sensitive to air pollution than others due to the types of population groups or activities involved and are referred to as sensitive receptors. Examples of these sensitive receptors are residences, schools, hospitals, and daycare centers. For health risk assessments, the health impacts are analyzed for individual residents assumed to be standing in their primary outdoor spaces closest to the source of air toxics and for individual offsite workers assumed to be standing outside of a commercial or industrial building.

Land uses surrounding the Airport are primarily industrial/commercial. Distances from the Airport boundary to residential zoned areas are approximately 1,200 feet (0.23 miles) to the northwest, 1,300 feet (0.25 miles) to the southwest, 2,800 feet (0.53 miles) to the north, 3,600 feet (0.68 miles) to the west, and 6,500 feet (1.2 miles) to the south. However, there also are some residences located within the industrial/ commercial areas to the west and south. The closest existing sensitive receptor to the project is a single-family residence on South Grove Avenue, approximately 200 feet north of the airport boundary (approximately 2,000 feet northwest of Runway 8L – 26R). The closest school is the Mariposa Elementary School, approximately 2,000 feet (0.38 miles) north of the airport boundary. The closest hospital is the Kaiser Permanente Ontario Vineyard hospital, approximately 5,300 feet (one mile) south of the airport boundary. Notably, the typical emission sources associated with the Proposed Project are located well within the Airport boundary and are generally located within the southern portion of the Airport (Runway 8R – 26L and south), therefore, the distances from the project emission sources and the receptors are further than noted.

Attachment C: Health Risk Assessment Methodology and Assumptions provides additional methodologies and assumptions.

Health Impacts

Health risks were not quantified for Existing Conditions as the specific health risks associated with the Airport cannot be assessed independent of all sources of pollutants which contribute to the community's overall risk. However, SCAQMD has conducted studies on carcinogenic risk from exposure to air toxics in the SCAB. The most recent is the Multiple Air Toxics Exposure Study V (MATES V). According to the MATES Data Visualization interactive tool, the area around Ontario has a cumulative cancer risk of 600 per million persons.[62]

The Proposed Project would constitute a new emission source of DPM due to its construction activities. Studies have demonstrated that DPM from diesel-fueled engines is a human carcinogen and that chronic

62 South Coast Air Quality Management District, Multiple Air Toxics Exposure Study (MATES-V) in the South Coast Air Basin, August 2021, http://www.aqmd.gov/home/air-quality/air-quality-studies/health-studies/mates-v

(long-term) inhalation exposure to DPM poses a chronic health impact. Health effects from carcinogenic air toxics are usually described in terms of individual cancer risk. Individual cancer risk is the likelihood that a person exposed to air toxic concentrations over a 70-year lifetime will contract cancer, based on the use of standard risk-assessment methodology and a 30-year exposure duration. The maximally exposed individual (MEI) represents the worst–case risk estimate, based on a theoretical person exposed for a period of 30 years at the highest concentration. This is a highly conservative assumption since most people do not remain in place all day and on average residents change residences every 11 to 12 years and do not stay in the same place of work for 25 years. In addition, this assumes that individuals are experiencing outdoor concentrations for the entire exposure period (even when indoors). A school child exposure duration is between ages 2 and 16 years old, which again, is conservative because the elementary, middle, and high school are not often located at the same location.

The Proposed Project would also constitute a new emission source of DPM due to its delivery truck activities and air toxics due to aircraft operations.

A further description of the sensitive receptors included in the dispersion modeling analysis is provided in **Attachment A: Emissions Inventory and Dispersion Modeling Methodology and Assumptions**.

Peak daily emission estimates were used to estimate short-term air concentrations (1-hour, 8-hour, and 24-hour) while annual emission estimates were used to estimate annual air concentrations. DPM (reported as exhaust emissions of $PM_{2.5}$) and other air toxics emission rates were utilized along with derived concentrations from USEPA's AERMOD atmospheric dispersion model (using a unit emission rate of 1) to calculate air concentrations at receptors in the Project vicinity. The HRA is intended to provide a worst–case estimate of the increased exposure by employing a standard emission estimation program, an accepted pollutant dispersion model, approved toxicity factors, and conservative exposure parameters.

In accordance with OEHHA *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments,* this HRA was accomplished by applying the highest estimated concentrations of specific air toxics at the receptors analyzed to the established cancer potency factors and acceptable reference concentrations for noncancer health effects. Increased cancer risks were calculated using the modeled concentrations and OEHHA-recommended methodologies for both child exposure (3rd trimester through two years of age and ages two through 16 years) and adult exposure (16 to 30 years). The cancer risk calculations were based on applying the OEHHA-recommended age sensitivity factors and breathing rates, as well as the fraction of time at home (100 percent for child and 73 percent for adult), and an exposure duration of 30 years, to the concentration exposures; over a 70-year lifetime. As a conservative assumption, children are assumed to attend a daycare or school near their home and no discount should be taken for time spent outside of the area (i.e., 100 percent fraction of time) affected by the project's

emissions. For worker exposures, it is assumed that the working age begins at 16 years, and that exposures to Project emissions occur during the work shift which is typically up to eight hours per day during workdays. Age-sensitivity factors reflect the greater sensitivity of infants and small children to cancer causing air pollutants.

Per Education Code Section 17213 (School Site Selection and Approval Guide), a school shall only be located where, "the health risks from the facilities or other pollution sources do not and will not constitute an actual or potential endangerment of public health to persons who would attend or be employed at the school." Projects located within ¼ mile of a school that involve the construction or alteration of a facility that might reasonably be anticipated to emit hazardous air emissions, or the handling of an extremely hazardous substance or mixture containing extremely hazardous substances in a quantity equal to or greater than the state threshold quantity specified in subdivision (j) of HSC Section §25532, and that may impose a health or safety hazard to persons who would attend or would be employed at the school, must meet all requirements per CEQA Guidelines §15186 (b)(1)(2*).*

These conservative methodologies overestimate both noncarcinogenic and carcinogenic health risk, possibly by an order of magnitude or more. Therefore, for carcinogenic risks, the actual probabilities of cancer formation in the populations of concern due to exposure to carcinogenic pollutants are likely to be lower than the risks derived using the HRA methodology. The extrapolation of toxicity data in animals to humans, the estimation of concentration prediction methods within dispersion models; and the variability in lifestyles, fitness and other confounding factors of the human population also contribute to the overestimation of health impacts. Therefore, the results of this HRA, although conducted in accordance with all regulatory agency protocols, are highly overstated. Cancer risk estimates do not mean, and should not be interpreted to mean, that a person will develop cancer from estimated exposures to toxic air pollutants.

SCAQMD currently does not require the evaluation of long-term cancer risk or chronic health impacts for a short-term construction project.[63] The Proposed Project's construction activities would occur over six years (2023 through 2028). The relatively short duration when compared to the 30-year exposure duration would limit exposures to offsite receptors. Secondly, exhaust emissions associated with the construction activities would not exceed the air concentrations significance thresholds (see **Section 10**) and thus, it is anticipated that construction emissions would not pose a threat to health impacts at nearby receptors. Nevertheless, a construction-related health risk assessment was completed.

63 SCAQMD is currently reviewing and developing guidance for the health risk assessment of construction activities.

For the residential cancer risk, each year of Proposed Project implementation was evaluated separately with an exposure duration of one year, starting with the age bin for infants in utero in the third trimester of pregnancy. The cancer risk results for each year were summed to calculate the total cancer risk during the Proposed Project construction period. The Proposed Project's incremental increase in cancer risk is based on the emissions associated with the Proposed Project's implementation. For non-cancer chronic and acute health risks, the maximum hazard index (HI) was calculated for each year of construction for the Proposed Project. The highest HI for all years would be the maximum HI during the Proposed Project construction period. The Proposed Project's incremental increase in non-cancer chronic and acute health risks is based on the emissions associated with the Proposed Project's implementation. The model conservatively assumes that residents would be standing and breathing outdoors at the location of the property line or primary outdoor space closest to the airport or flight paths between 17 and 21 hours per day (depending on the age group), starting with infants in utero in the third trimester of pregnancy for the first year of Proposed Project implementation. For offsite worker cancer risk, an exposure duration of one year was selected with an assumption of eight hours per day, five days per week of exposure while standing outside, in accordance with the OEHHA guidelines.

The SCAQMD thresholds of significance applied to assess project-level health impacts are the exposure of persons to substantial levels of air toxics resulting in (a) a cancer risk level greater than 10 per one million persons or (b) a noncancerous risk (chronic or acute) hazard index greater than 1 or (c) a cancer burden of greater than 0.5 excess cancer cases.[64]For this threshold, sensitive receptors include residential uses, schools, daycare centers, nursing homes, medical centers, and offsite workers.

Health Impacts for Construction Activities

The SCAQMD currently does not require a HRA to be conducted for short-term emissions from construction equipment. Nevertheless, an analysis was conducted for the proposed project. **Table 24: Estimated Health Impacts from Construction Activities** provides the Proposed Project's health impacts from construction activities for nearby sensitive receptors (i.e., onsite workers, offsite workers, and residence at Hofer Ranch). Notably, the construction health impacts are very low and the influence area is very small, due in large part to the size of construction and the implementation of emissions reduction measures. There is very little geographical overlap between construction health impacts and the operational health impacts.

64 South Coast Air Quality Management District, Risk Assessment Procedures for Rule 1401, 1401.1 and 212, September 1, 2017, http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12

Table 24
Estimated Health Impacts from Construction Activities

Criteria	Cancer Risk	Chronic Impact
Offsite Worker	0.06	<0.01
Onsite Worker	0.58	0.01
Residence	0.06	<0.01
Significance Threshold	10	1.0
Potentially Significant (Yes or No)?	No	No

*Note: Values in **bold** are in excess of applicable standard.*
Source: RCH Group, 2022

As shown **in Table 24: Estimated Health Impacts from Construction Activities**, the maximum cancer risk from Proposed Project construction emissions would be 0.6 per one million persons for the onsite worker (located to the west of the project site) and less than 0.1 per one million persons for the offsite worker and residence. The maximum chronic health impact modeled would be 0.01.

Health Impacts for Operational Activities

The HRA focuses on impacts on existing residences, offsite workers, and other sensitive populations (including onsite workers within the passenger terminal and other areas within the Airport) from emissions of air toxics during aircraft operations. Typically, aircraft HAP emissions include formaldehyde in the greatest amount, followed by acetaldehyde, acrolein, benzene, methyl alcohol, and 1,3-butadiene. **Attachment C: Health Risk Assessment Methodology and Assumption** contains further information on the development of the aircraft HAP emissions inventory and detailed results.

As with the previous air quality dispersion modeling analyses, the project-related health impacts were compared to the SCAQMD significance thresholds:

- Phase 1 With Project operations compared to the Baseline Condition
- Phase 2 With Project operations compared to the Baseline Condition

However, this comparison of the Project to the Baseline is influenced by factors that are not attributable to the Project itself. Specifically, the comparison contains future aircraft operations from background growth that are projected to occur with or without the Proposed Project.[65]

65 Concentrations increase between Phase 1 and 2, due to the difference between Phase 1 and Phase 2 emissions. Due to the increase of concentrations in later years, the HRA was conducted for a receptor exposed starting with Phase 1 and starting with Phase 2; each for 30 years.

Table 25: Estimated Health Impacts from Operational Activities – With Project Compared to Baseline provides the Proposed Project's health impacts from operational activities for nearby sensitive receptors.

Table 25
Estimated Health Impacts from Operational Activities – With Project Compared to Baseline

Criteria	Cancer Risk	Acute Impact	Chronic Impact
		Phase 1	
Residence	2.52	0.30	0.02
Offsite Worker	0.24	0.25	0.02
Onsite Worker (non-Terminal)	1.98	0.40	0.19
Onsite Worker (Terminal)	0.86	0.24	0.08
School	0.33	0.05	<0.01
Significance Threshold	10	1.0	1.0
Potentially Significant (Yes or No)?	No	No	No
		Phase 2	
Residence	4.66	0.22	0.03
Offsite Worker	0.43	0.27	0.04
Onsite Worker (non-Terminal)	3.22	0.66	0.31
Onsite Worker (Terminal)	0.91	0.21	0.09
School	0.57	0.03	0.01
Significance Threshold	10	1.0	1.0
Potentially Significant (Yes or No)?	No	No	No

*Note: Values in **bold** are in excess of applicable standard.*
Source: RCH Group, 2022

As shown, the maximum cancer risk from project operations for residence, offsite worker (such as office buildings, retail centers, hotels, hospitals), onsite worker, and school would be 2.5, 0.2, 2.0, and 0.3 per one million persons, respectively (Phase 1) and would be 4.7, 0.4, 3.2, and 0.6 per one million persons, respectively (Phase 2). The maximum exposed residence is located at Hofer Ranch (receptor 1) and secondarily, is located north of the terminal complex (receptor 18). The maximum exposed onsite worker is located to the west of the project site. Thus, the cancer risk for sensitive receptors due to operational activities would be below the SCAQMD threshold of 10 per one million persons and would be *less than significant health impacts for all sensitive receptors due to operational activities*.

Attachment A: Emissions Inventory and Dispersion Modeling Methodology and Assumptions describes and displays the receptors used within the HRA.

The maximum acute health impact modeled to occur at a residence, offsite worker, onsite worker, and school would be less than 0.4 (Phase 1) and 0.7 (Phase 2). The maximum chronic health impact (Phase 1)

modeled to occur at a residence, offsite worker, onsite worker, and school would be less than 0.2 (Phase 1) and 0.3 (Phase 2). Thus, the acute and chronic health impact due to operational activities at all sensitive receptors would be below the project-level threshold of 1 and would be *less than significant for all sensitive receptors due to operational activities*.

Notably, a portion of the health impacts, especially associated with the onsite terminal worker receptor, are attributed to airport growth which would occur with or without the Proposed Project. As shown in **Table 25: Estimated Health Impacts from Operational Activities – With Project Compared to Baseline**, the cancer risk associated with offsite worker and school receptors are less than one per million. However, the cancer risk associated with residence and onsite worker receptors would be greater than one per million, although in only a limited geographical area. The cancer burden is the estimated increase in the occurrence of cancer cases in a population as a result of exposures to air toxics emissions from the project source over a 70-year exposure duration. The cancer burden for a population unit (city, census tract, sub-area or grid) is the product of the number of persons in the population and the estimated individual risk from TAC. The cancer burden only needs to be calculated if the resulting cancer estimates from a 30-year exposure duration is greater than one in one million. For the cancer risks from operational activities compared to baseline, the zone of impact is approximately 2,520 meters (or 7.7 square miles) from the center of the airport (Phase 1) and 3,400 meters (or 13.9 square miles) (Phase 2). The respective population within the zone impact areas are 5,530 and 41,200, respectively, or 722 and 2,966 persons per square mile.[66] Generally, the residential population in the Air Basin is less than 10,360 persons per square mile, but some areas are as high as 18,130 persons per square mile. However, the population density is lower surrounding the project site given the open space and industrial land uses. In general, the population density in Ontario is 3,576 people per square mile. The cancer burden due to operations would be 0.02 (Phase 1) and 0.22 (Phase 2) and therefore, below the SCAQMD threshold of 0.5 excess cancer cases and would therefore be *less than significant due to operational activities.*

A second comparison was made to remove the influence of background airport growth by comparing the health impacts from future year with Proposed Project and the future year without Proposed Project. This comparison was made for informational purposes only and in which the significance of the Project impacts is not based.

- Phase 1 With Project operations compared to the Phase 1 Without Project operations

66 Center for International Earth Science Information Network - CIESIN - Columbia University. 2018. Population Estimation Service, Version 3 (PES-v3). Palisades, NY: NASA Socioeconomic Data and Applications Center, https://sedac.ciesin.columbia.edu/data/collection/gpw-v4/population-estimation-service

- Phase 2 With Project operations compared to the Phase 2 Without Project operations

Generally, it would be expected that the impacts when comparing the With Project to Without Project would be less than the impacts when comparing the With Project to Baseline and that Phase 2 impacts would be greater than Phase 1 impacts.

Table 26: Estimated Health Impacts from Operational Activities – With Compared to Without Project provides the Proposed Project's health impacts from operational activities for nearby sensitive receptors.

Table 26
Estimated Health Impacts from Operational Activities – With Project Compared to Without Project

Criteria	Cancer Risk	Acute Impact	Chronic Impact
	Phase 1		
Residence	2.02	0.09	0.01
Offsite Worker	0.32	0.21	0.03
Onsite Worker (non-Terminal)	2.34	0.56	0.23
Onsite Worker (Terminal)	0.21	0.09	0.02
School	0.34	0.04	<0.01
Significance Threshold	10	1.0	1.0
Potentially Significant (Yes or No)?	No	No	No
	Phase 2		
Residence	3.20	0.13	0.02
Offsite Worker	0.52	0.46	0.05
Onsite Worker (non-Terminal)	3.38	0.73	0.32
Onsite Worker (Terminal)	0.02	<0.01	<0.01
School	0.56	0.02	0.01
Significance Threshold	10	1.0	1.0
Potentially Significant (Yes or No)?	No	No	No

*Note: Values in **bold** are in excess of applicable standard.*
Source: RCH Group, 2022

As shown, the maximum cancer risk from project (Phase 1) operations for residence, offsite worker (such as office buildings, retail centers, hotels, hospitals), onsite worker, and school would be 2.0, 0.3, 2.3, and 0.3 per one million persons, respectively (Phase 1) and would be 3.2, 0.5, 3.4, and 0.6 per one million persons, respectively (Phase 2). The maximum exposed residence is located at Hofer Ranch (receptor 1) and secondarily, is located south-southwest of the airport (receptor 5). The maximum exposed onsite worker is located to the west of the project site. Thus, the cancer risk for sensitive receptors due to operational activities would be below the SCAQMD threshold of 10 per one million persons and would be *less than significant health impacts for all sensitive receptors due to operational activities*.

The maximum acute health impact modeled to occur at a residence, offsite worker, onsite worker, and school would be less than 0.6 (Phase 1) and 0.7 (Phase 2). The maximum chronic health impact (Phase 1) modeled to occur at a residence, offsite worker, onsite worker, and school would be less than 0.2 (Phase 1) and 0.3 (Phase 2). Thus, the acute and chronic health impact due to operational activities at all sensitive receptors would be below the project-level threshold of 1 and would be *less than significant for all sensitive receptors due to operational activities*.

As shown in **Table 26: Estimated Health Impacts from Operational Activities – With Project Compared to Without Project**, the cancer risk associated with offsite worker and school receptors are less than one per million. However, the cancer risk associated with residence and onsite worker receptors would be greater than one per million, although in only a very limited geographical area. The maximum exposed residence is at the Hofer Ranch and all other residence cancer risk is less than one per million over a 70-year exposure duration. Therefore, the cancer burden due to operations would be less than 0.01 and below the SCAQMD threshold of 0.5 excess cancer cases and would therefore be *less than significant due to operational activities.*

Summary of Health Risk Assessment Results

The following concluding statements can be made about the health risk assessment results:

- The cancer risk for offsite worker receptors due to construction activities would be below the SCAQMD threshold of 10 per one million persons and would be l*ess than significant health impacts for all offsite worker receptors due to construction activities*.

- The cancer risk for all sensitive receptors due to operational activities would be below the SCAQMD threshold of 10 per one million persons and would be l*ess than significant health impacts for all sensitive receptors due to operational activities*.

- The acute and chronic health impacts for offsite worker receptors due to construction activities would be below the SCAQMD threshold of 1 and would be l*ess than significant health impacts for all offsite worker receptors due to construction activities*.

- The acute and chronic health impacts for all sensitive receptors due to operational activities would be below the SCAQMD threshold of 1 and would be l*ess than significant health impacts for all sensitive receptors due to operational activities*.

11.0 GREENHOUSE GAS EMISSIONS

"Global warming" and "global climate change" are the terms used to describe the increase in the average temperature of the earth's near-surface air and oceans since the mid-20th century and its projected continuation. Warming of the climate system is now considered to be unequivocal (IPCC, 2007), with global surface temperature increasing approximately 1.33 degrees Fahrenheit (°F) over the last 100 years. Continued warming is projected to increase global average temperature between 2 and 11°F over the next 100 years.

Natural processes and human actions have been identified as the causes of this warming. The International Panel on Climate Change (IPCC) concludes that variations in natural phenomena such as solar radiation and volcanoes produced most of the warming from pre-industrial times to 1950 and had a small cooling effect afterward. After 1950, however, increasing GHG concentrations resulting from human activity such as fossil fuel burning, and deforestation have been responsible for most of the observed temperature increase.[67] These basic conclusions have been endorsed by more than 45 scientific societies and academies of science, including all of the national academies of science of the major industrialized countries. Since 2007, no scientific body of national or international standing has maintained a dissenting opinion.

Increases in GHG concentrations in the earth's atmosphere are thought to be the main cause of human-induced climate change. GHG naturally trap heat by impeding the exit of solar radiation that has hit the earth and is reflected back into space. Some GHG occur naturally and are necessary for keeping the earth's surface inhabitable. However, increases in the concentrations of these gases in the atmosphere during the last 100 years have decreased the amount of solar radiation that is reflected back into space, intensifying the natural greenhouse effect and resulting in the increase of global average temperature.[68]

Gases that trap heat in the atmosphere are referred to as GHG because they capture heat radiated from the sun as it is reflected back into the atmosphere, much like a greenhouse does. The accumulation of GHG has been implicated as the driving force for global climate change. The primary GHG are carbon dioxide (CO_2), methane (CH_4), and nitrous oxide (N_2O), ozone, and water vapor.

68 International Panel on Climate Change, 2014: Climate Change 2014: Synthesis Report. Contribution of Working Groups I, II and III to the Fifth Assessment Report of the Intergovernmental Panel on Climate Change [Core Writing Team, R.K. Pachauri and L.A. Meyer (eds.)]. IPCC, Geneva, Switzerland, 151 pp. https://www.ipcc.ch/site/assets/uploads/2018/05/SYR_AR5_FINAL_full_wcover.pdf

While the presence of the primary GHG in the atmosphere are naturally occurring, CO_2, CH_4, and N_2O are also emitted from human activities, accelerating the rate at which these compounds occur within earth's atmosphere. Emissions of CO_2 are largely by-products of fossil fuel combustion, whereas methane results from off-gassing associated with agricultural practices and landfills. Other GHG include hydrofluorocarbons, perfluorocarbons, and sulfur hexafluoride, and are generated in certain industrial processes. Greenhouse gases are typically reported in "carbon dioxide-equivalent" measures (CO_2e).[69]

There is international scientific consensus that human-caused increases in GHG have and will continue to contribute to global warming. Potential global warming impacts may include, but are not limited to, loss in snowpack, sea level rise, more extreme heat days per year, more high ozone days, more large forest fires, and more drought years. Secondary effects are likely to include a global rise in sea level, impacts to agriculture, changes in disease vectors, and changes in habitat and biodiversity.

City of Ontario Climate Action Plan

The City of Ontario prepared and adopted a Climate Action Plan (CAP).[70] The City prepared the CAP to achieve compliance with State mandates and focus on feasible actions the City can take to minimize adverse impacts on growth and development on global climate change. The CAP contains detailed strategies and measures that will be implemented to reduce GHG emissions. The City's CAP proposes a 2020 emissions reduction target equivalent to 15 percent below 2005 emissions levels and a 2035 emissions reduction target equivalent to 50 percent below 2005 emissions levels.

The City's GHG Emissions Inventory shows building energy use, transportation, commercial and industrial uses, residential uses, waste/wastewater and water use in the city generated 2,503,816 metric tons of CO_2e in 2008 and 3,127,987 metric tons of CO_2e in 2020 (projected). Of the sources in this total, the largest contributors include building energy use, transportation, and agriculture sector emissions, which contribute approximately 40 percent, 39 percent, and 10 percent, respectively.

GHG emission reduction measures specified in the CAP include performance standards for projects emitting more the 3,000 metric tons of CO_2e, building energy efficiency programs, renewable energy requirements, waste diversion, and transportation management.

---

69 Because of the differential heat absorption potential of various GHG, GHG emissions are frequently measured in "carbon dioxide-equivalents," which present a weighted average based on each gas's heat absorption (or "global warming") potential.

70 City of Ontario, *Climate Action Plan*, Adopted November 2014, https://www.ontarioca.gov/sites/default/files/Ontario-Files/Planning/Applications/Community%20Climate%20Action%20Plan.pdf

California Green Building Standards Code

The California Green Building Standards Code or CALGreen is a regulatory code for all residential, commercial, and school buildings to meet uniform standards in building design intended to minimize impacts on climate change.

CALGreen does not prevent a local jurisdiction from adopting a more stringent code, as State law provides methods for local enhancements. CALGreen recognizes that many jurisdictions have developed existing construction and demolition ordinances, and defers to them as the ruling guidance provided, they provide a minimum 50-percent diversion requirement. CALGreen also provides exemptions for areas not served by construction and demolition recycling infrastructure. State building code provides the minimum standard, which buildings need to meet in order to be certified for occupancy. Enforcement is generally done by the local building official.

The development of CALGreen is intended to cause a reduction in GHG emissions from buildings; promote environmentally responsible, cost-effective, healthier places to live and work; reduce energy and water consumption; and respond to directives issued by the Governor, such as Assembly Bill 32, calling for the reduction of Statewide GHG emissions to 1990 levels by 2020. In short, CALGreen was established to reduce construction waste; make buildings more efficient in the use of materials and energy; and reduce environmental impacts during and after project construction.

CALGreen contains requirements for construction site selection, storm water control during construction, construction waste reduction, indoor water use reduction, material selection, natural resource conservation, site irrigation conservation, and more. CALGreen provides design options allowing a project designer to determine how best to achieve compliance for a given site or building condition. CALGreen also requires building commissioning, which is a process for verifying that all building systems, like heating and cooling equipment and lighting systems, are functioning at their maximum efficiency. The 2023 CALGreen code went into effect January 1, 2023.

California Environmental Quality Act and Climate Change

Under CEQA, lead agencies are required to disclose the reasonably foreseeable adverse environmental effects of projects they are considering for approval. GHG emissions have the potential to affect the environment because they contribute to global climate change. In turn, global climate change has the potential to cause sea level rise, alter rainfall and snowfall patterns, and affect habitat.

Executive Order S-3-05

Governor Schwarzenegger established Executive Order S-3-05 in 2005, in recognition of California's vulnerability to the effects of climate change. Executive Order S-3-05 set forth a series of target dates by which Statewide emissions of GHG would be progressively reduced, as follows:

- By 2010, reduce GHG emissions to 2000 levels;
- By 2020, reduce GHG emissions to 1990 levels; and
- By 2050, reduce GHG emissions to 80 percent below 1990 levels.

The executive order directed the Secretary of the CalEPA to coordinate a multiagency effort to reduce GHG emissions to the target levels. The Secretary will also submit biannual reports to the governor and California Legislature describing the progress made toward the emissions targets, the impacts of global climate change on California's resources, and mitigation and adaptation plans to combat these impacts. To comply with the executive order, the secretary of CalEPA created the California Climate Action Team, made up of members from various State agencies and commissions. The team released its first report in March 2006. The report proposed to achieve the targets by building on the voluntary actions of California businesses, local governments, and communities and through State incentive and regulatory programs.

Assembly Bill 32 (California Global Warming Solutions Act of 2006)

California passed the California Global Warming Solutions Act of 2006 (AB 32; California Health and Safety Code Division 25.5, Sections 38500 - 38599). AB 32 establishes regulatory, reporting, and market mechanisms to achieve quantifiable reductions in GHG emissions and establishes a cap on Statewide GHG emissions. AB 32 requires that Statewide GHG emissions be reduced to 1990 levels by 2020. This reduction will be accomplished by enforcing a Statewide cap on GHG emissions that will be phased in starting in 2012. To effectively implement the cap, AB 32 directs CARB to develop and implement regulations to reduce Statewide GHG emissions from stationary sources. AB 32 specifies that regulations adopted in response to AB 1493 should be used to address GHG emissions from vehicles. However, AB 32 also includes language stating that if the AB 1493 regulations cannot be implemented, then CARB should develop new regulations to control vehicle GHG emissions under the authorization of AB 32.

AB 32 requires CARB to adopt a quantified cap on GHG emissions representing 1990 emissions levels and disclose how it arrived at the cap; institute a schedule to meet the emissions cap; and develop tracking, reporting, and enforcement mechanisms to ensure that the State reduces GHG emissions enough to meet the cap. AB 32 also includes guidance on instituting emissions reductions in an economically efficient manner, along with conditions to ensure that businesses and consumers are not unfairly affected by the

reductions. Using these criteria to reduce Statewide GHG emissions to 1990 levels by 2020 would represent an approximate 25 to 30 percent reduction in current emissions levels. However, CARB has discretionary authority to seek greater reductions in more significant and growing GHG sectors, such as transportation, as compared to other sectors that are not anticipated to significantly increase emissions. Under AB 32, CARB must adopt regulations to achieve reductions in GHG to meet the 1990 emissions cap by 2020.

Climate Change Scoping Plan

AB 32 required CARB to develop a Scoping Plan that describes the approach California will take to reduce GHG to achieve the goal of reducing emissions to 1990 levels by 2020. The Scoping Plan was first approved by CARB in 2008 and must be updated every five years. The initial AB 32 Scoping Plan contains the main strategies California will use to reduce the GHG that cause climate change. The initial Scoping Plan has a range of GHG reduction actions which include direct regulations, alternative compliance mechanisms, monetary and nonmonetary incentives, voluntary actions, market-based mechanisms such as a cap-and-trade system, and an AB 32 program implementation fee regulation to fund the program. In August 2011, the initial Scoping Plan was approved by CARB.

The 2013 Scoping Plan Update builds upon the initial Scoping Plan with new strategies and recommendations. The 2013 Update identifies opportunities to leverage existing and new funds to further drive GHG emission reductions through strategic planning and targeted low carbon investments. The 2013 Update defines CARB climate change priorities for the next five years and sets the groundwork to reach California's long-term climate goals set forth in Executive Orders S-3-05 and B-16-2012. The 2013 Update highlights California progress toward meeting the near-term 2020 GHG emission reduction goals defined in the initial Scoping Plan. In the 2013 Update, nine key focus areas were identified (energy, transportation, agriculture, water, waste management, and natural and working lands), along with short-lived climate pollutants, green buildings, and the cap-and-trade program. On May 22, 2014, the First Update to the Climate Change Scoping Plan was approved by the Board, along with the finalized environmental documents. The 2017 Scoping Plan, approved on December 14, 2017, outlines options to meet California's aggressive goals to reduce GHGs by 40 percent below 1990 levels by 2030.

In November of 2022, CARB released the Final 2022 Scoping Plan Update to provide a path to achieving carbon neutrality no later than 2045.[71]

71 California Air Resources Board, *Draft 2022 Scoping Plan Update*, May 10, 2022, https://ww2.arb.ca.gov/our-work/programs/ab-32-climate-change-scoping-plan#:~:text=The%20Draft%202022%20Scoping%20Plan,neutrality%20no%20later%20than%202045

Executive Order No. B-30-15

On April 29, 2015, Executive Order No. B-30-15 was issued to establish a California GHG reduction target of 40 percent below 1990 levels by 2030. Executive Order No. B-30-15 sets a new, interim, 2030 reduction goal intended to provide a smooth transition to the existing ultimate 2050 reduction goal set by Executive Order No. S-3-05 (signed by Governor Schwarzenegger in June 2005). It is designed so State agencies do not fall behind the pace of reductions necessary to reach the existing 2050 reduction goal. Executive Order No. B-30-15 orders "All State agencies with jurisdiction over sources of GHG emissions shall implement measures, pursuant to statutory authority, to achieve reductions of GHG emissions to meet the 2030 and 2050 targets." The Executive Order also states that "CARB shall update the Climate Change Scoping Plan to express the 2030 target in terms of million metric tons of carbon dioxide equivalent." The CARB is currently moving forward with a second update to the Climate Change Scoping Plan to reflect the 2030 reduction target. The updated Scoping Plan will provide a framework for achieving the 2030 target. In September of 2016, the AB 32 was extended to achieve reductions in GHG of 40 percent below 1990 levels by 2030. The new plan, outlined in SB 32, involves increasing renewable energy use, putting more electric cars on the road, improving energy efficiency, and curbing emissions from key industries.

Federal Vehicle Standards

In addition to the regulations applicable to cars and light-duty trucks described above, in 2011, the USEPA and NHTSA announced fuel economy and GHG standards for medium- and heavy-duty trucks for model years 2014 through 2018. The standards for CO_2 emissions and fuel consumption are tailored to three main vehicle categories: combination tractors, heavy-duty pickup trucks and vans, and vocational vehicles. According to the USEPA, this regulatory program will reduce GHG emissions and fuel consumption for the affected vehicles by 6 to 23 percent over the 2010 baselines.

In August 2016, the USEPA and NHTSA announced the adoption of the phase two program related to the fuel economy and GHG standards for medium- and heavy-duty trucks. The phase two program will apply to vehicles with model year 2018 through 2027 for certain trailers, and model years 2021 through 2027 for semi-trucks, large pickup trucks, vans, and all types and sizes of buses and work trucks. The final standards are expected to lower CO_2 emissions by approximately 1.1 billion metric tons and reduce oil consumption by up to 2 billion barrels over the lifetime of the vehicles sold under the program. On September 27, 2019, the USEPA and the NHTSA published the "Safer Affordable Fuel-Efficient (SAFE) Vehicles Rule Part One: One National Program." (84 Fed. Reg. 51,310 (Sept. 27, 2019.) The Part One Rule revokes California's authority to set its own GHG emissions standards and set zero-emission vehicle mandates in California. On March 31, 2020, the USEPA and NHTSA finalized rulemaking for SAFE Part Two, which sets CO_2 emissions standards and corporate average fuel economy (CAFE) standards for passenger vehicles and light duty trucks, covering model years 2021 through 2026.

Federal Aviation Standards

The USEPA and the FAA traditionally work within the standard setting process of the International Civil Aviation Organization's (ICAO's) Committee on Aviation Environmental Protection (CAEP). The ICAO/CAEP leads the effort to establish international emission standards and related requirements that individual nations later adopt into domestic law.

In 2016, the ICAO/CAEP agreed on the first-ever international standards to regulate CO_2 emissions from aircraft. In the same year, the USEPA formally announced that GHG emissions from certain classes of aircraft engines contribute to climate change.[72] In 2017, the ICAO adopted a new aircraft CO_2 emission standard intended to reduce the impact of aviation GHG emissions on the global climate. The USEPA adopted the same GHG emissions standard on January 11, 2021, the first aircraft GHG-related standard in U.S. history.[73] The standard applies to civil subsonic jet aircraft and larger civil subsonic propeller-driven aircraft designed after January 2020 or in production by 2028.

On November 15, 2021, the USEPA filed a motion to govern in the litigation on a rule that put in place commercial aircraft GHG emission standards, which USEPA promulgated in early 2021. That rule implemented the historic international agreement the Obama Administration negotiated in 2016 through ICAO to set the first-ever GHG emission standards for airplanes.

At the same time, in order to effectively address the climate crisis, the Biden Administration recognizes more action is necessary across the transportation sector and in the aviation sector specifically to significantly reduce GHG emissions. As such, the U.S. will press for ambitious new international CO_2 standards at the upcoming round of ICAO negotiations. The Biden Administration announced a series of actions aimed at boosting the development of sustainable aviation fuel and released the U.S. Aviation Climate Action Plan at COP26.[74]

Greenhouse Gas Regional Emission Estimates

In 2019, the United States emitted about 6,558 million metric tons of CO_2e. Emissions increased from 2018 to 2019 by 1.7 percent. This decrease was driven largely by a decrease in emissions from fossil fuel

72 United States Environmental Protection Agency, Final Rule for Finding That Greenhouse Gas Emissions From Aircraft Cause or Contribute to Air Pollution That May Reasonably Be Anticipated To Endanger Public Health and Welfare, (August 15, 2016), https://www.epa.gov/regulations-emissions-vehicles-and-engines/final-rule-finding-greenhouse-gas-emissions-aircraft

73 United States Environmental Protection Agency, Control of Air Pollution From Airplanes and Airplane Engines: GHG Emission Standards and Test Procedures, (January 11, 2021), https://www.epa.gov/regulations-emissions-vehicles-and-engines/control-air-pollution-airplanes-and-airplane-engines-ghg

74 United States Environmental Protection Agency, Statement on Airplane Greenhouse Gas Emissions Standards Litigation, https://www.epa.gov/regulations-emissions-vehicles-and-engines/statement-airplane-greenhouse-gas-emissions-standards

combustion resulting from a decrease in total energy use in 2019 compared to 2018 and a continued shift from coal to natural gas and renewables in the electric power sector.[75] GHG emissions in 2018 (after accounting for sequestration from the land sector) were 10.2 percent below 2005 levels. GHG emissions in 2019 (after accounting for sequestration from the land sector) were 13 percent below 2005 levels.

According to the USEPA, a shift from coal to natural gas and the use of renewables in the electric power sector largely drove the reduction. In 2019, the transportation sector (i.e., motor vehicles, aircraft, trains, and ships/boats) contributed 1,876 million metric tons (approximately 29 percent of total emissions) of CO_2e to those 6,558 million metric tons, with aircraft emissions representing approximately ten percent of the transportation sector's emissions (i.e., approximately 188 million metric tons of CO_2e).[76]

In 2019, California emitted approximately 418.2 million metric tons of CO_2e, 7.0 million metric tons of CO_2e lower than 2018 levels and 12.8 million metric tons of CO_2e below the 2020 GHG Limit of 431 million metric tons of CO_2e).[77] Consistent with recent years, these reductions have occurred while California's economy has continued to grow and generate jobs. The transportation sector remains the largest source of GHG emissions in the state with 40 percent of the emissions in 2019 but saw a decrease in emissions compared to 2018.[78]

Emissions from the electricity sector account for 14 percent of the inventory and showed a decrease. California in 2019 used more electricity from zero-GHG sources (for the purpose of the GHG inventory, these include hydro, solar, wind, and nuclear energy) than from GHG-emitting sources for both in-state generation and total (in-state plus imports) generation. The industrial sector has seen steady emissions in the past few years and remains at 21 percent of the inventory.[79]

Thresholds of Significance

To date, national standards have not been established for nationwide GHG reduction targets, nor have any regulations or legislation been enacted specifically to address climate change and GHG emissions

75 United States Environmental Protection Agency, *Inventory of U.S. Greenhouse Gas Emissions and Sinks*, April 2021, https://www.epa.gov/ghgemissions/inventory-us-greenhouse-gas-emissions-and-sinks-1990-2019

reduction at the Project level. Various efforts have been promulgated at the federal level to improve fuel economy and energy efficiency to address climate change and its associated effects.

The standards of significance applied to the analysis of potential GHG impacts are based on Appendix G of the *CEQA Guidelines.* According to Appendix G evaluation thresholds, the Proposed Project would be considered to have significant air quality impacts if it were to:

- Generate greenhouse gas emissions, either directly or indirectly, that may have a significant effect on the environment; or
- Conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of greenhouse gases.

The City of Ontario has not adopted a numerical significance threshold for assessing impacts related to GHG emissions and has not formally adopted a qualified local plan for reducing GHG emissions. Nor have SCAQMD, OPR, CARB, CAPCOA, or any other State or regional agency adopted a numerical significance threshold for assessing GHG emissions that is applicable to the Proposed Project. Assessing the significance of a project's contribution to cumulative global climate change involves: (1) developing pertinent inventories of GHG emissions, and (2) considering project consistency with applicable emission reduction strategies and goals.

To identify if the Proposed Project would "generate GHG, either directly or indirectly, that may have a significant impact on the environment" this analysis looks at whether the Proposed Project would result in a net increase in GHG emissions. This approach reflects the fact that neither USEPA nor CARB nor SCAQMD have established a numeric threshold for determining the significance of GHG emissions.

The estimated construction GHG emissions for the Proposed Project are 7,248 metric tons of CO_2e. Given the six years of construction, the annual construction GHG emissions for the Proposed Project are 1,208 metric tons of CO_2e. As indicated, the 30-year amortized construction related GHG emissions would be approximately 242 metric tons of CO_2e per year. The results of the comparison are presented in **Table 27: Estimated Construction Greenhouse Gas Emissions for the Proposed Project (metric tons of CO_2e).**

Table 27
Estimated Construction Greenhouse Gas Emissions for the Proposed Project (metric tons of CO_2e)

Construction Year	metric tons of CO_2e
2023	2,161
2024	1,737
2025	469
2026	166
2027	1,213
2028	1,501
Total Construction Emissions	**7,248**
Total 30-Year Amortized Construction Emissions	**242**

Table 30: Estimated Annual Operational GHG Emissions (metric tons of CO_2e) – With Project presents the GHG emissions from aircraft and other project-related sources with the Proposed Project.

Table 30
Estimated Annual Operational GHG Emissions (metric tons of CO_2e) – With Project

Condition	metric tons of CO_2e
Phase 1	195,289
Phase 2	243,548

Source: RCH Group, 2022

As with the criteria air pollutant emissions inventory, in order to determine the Proposed Project-related operational impacts associated with GHG emissions, the total emissions associated with the Proposed Project that would occur in Phase 1 and Phase 2 including other aircraft operations not associated with the project were compared to the Baseline emissions. The difference between these two conditions was used to determine the significance of the Proposed Project.

- Phase 1 With Project operations compared to the Baseline Condition
- Phase 2 With Project operations compared to the Baseline Condition

Table 31: Estimated Annual Operational GHG Emissions (metric tons of CO_2e) – With Project Compared to Baseline presents the annual GHG emissions during Phase 1 and 2 when comparing the With Project and Baseline. The Proposed Project operations would result in an increase in GHG emissions of 79,556 metric tons of CO_2e annually for Phase 1 and 127,815 metric tons of CO_2e annually for Phase 2 when compared to the Baseline. A majority of the Proposed Project GHG emissions are related to aircraft operations. Based on FAA's AEDT and when comparing With Project to Baseline, the estimated aircraft fuel usage for Phase 1 is 6,437,288 gallons and for Phase 2 is 10,642,404 gallons.

Therefore, the Proposed Project would result in a significant and unavoidable impact from operational GHG emissions.

Table 31
Estimated Annual Operational GHG Emissions (metric tons of CO_2e) – With Project Compared to Baseline

Source	Phase 1	Phase 2
Aircraft	62,283	103,019
APU	994	1,592
GSE	82	-
Employee Motor Vehicles	3,902	3,622
Delivery Trucks	1,528	2,064
Emergency Generators	353	494
Area Sources	<1	<1
Electrical	9,525	15,770
Waste	317	446
Water	574	807
Total Operational Emissions	**79,556**	**127,815**

Source: RCH Group, 2022

However, this comparison of the project to the Baseline is influenced by factors that are not attributable to the Project itself. Specifically, the comparison contains future aircraft operations from background growth that are projected to occur with or without the Proposed Project. In order to remove the contribution of background aircraft growth, for CEQA purposes, a second comparison was provided for the Proposed Project and without Proposed Project. This comparison was made for informational purposes only.

- Phase 1 With Project operations compared to the Phase 1 Without Project operations
- Phase 2 With Project operations compared to the Phase 2 Without Project operations

Table 32: Estimated Annual Operational GHG Emissions (metric tons of CO_2e) – With Project Compared to Without Project presents the annual GHG emissions during Phase 1 and 2 when comparing the With Project and Without Project. The Proposed Project operations would result in an increase in GHG emissions of 66,232 metric tons of CO_2e annually for Phase 1 and 101,096 metric tons of CO_2e annually for Phase 2 when compared to the Without Project. Based on FAA's AEDT and when comparing With Project to Without Project, the estimated aircraft fuel usage for Phase 1 is 5,081,761 gallons and for Phase 2 is 7,924,196 gallons.

The employee vehicles and delivery trucks would use approximately 437,890 gallons of gasoline and 150,560 gallons of diesel during Phase 1, respectively. The employee vehicles and delivery trucks would use approximately 406,610 gallons of gasoline and 203,380 gallons of diesel during Phase 2, respectively.

The estimated annual fuel usage for the GSE is 7,975 gallons of diesel during Phase 1. The estimated annual fuel usage, assuming each generator operates of 50 hours per year (2 hours per day) is approximately 34,760 gallons of diesel fuel during Phase 1 and approximately 48,660 gallons of diesel fuel during Phase 2.[80] Phase 1 of the proposed Project would require approximately 8.5 MW of power with Phase 2 requiring another 4 MW of power. At full development, the Proposed Project would require approximately 12.5 MW of power.

Table 32
Estimated Annual Operational GHG Emissions (metric tons of CO_2e) – With Project Compared to Without Project

The Proposed Project would include a 1.5-MW Solar PV Panel system on the rooftop of the Cargo Sorting Building and Parking Structure. Approximately 20 percent of the electrical usage (2,378,973 kilowatts)[81] would be generated by the Solar PV Panel system.

12.0 ODOR IMPACTS

The potential for the Proposed Project to generate objectionable odors has also been considered. Land uses generally associated with odor complaints include agricultural uses (livestock and farming), wastewater treatment plants, food processing plants, chemical plants, composting operations, refineries, landfills, dairies, and fiberglass molding facilities. The Proposed Project does not contain land uses typically associated with emitting objectionable odors. Potential odor sources associated with the Proposed Project may result from construction equipment exhaust and the application of asphalt and

80 Vender Specifications for Standby Generator, https://www.cat.com/en_US/products/new/power-systems/electric-power.html

81 Igssolar, Solar Energy Analysis for DHL Southern California, December 15, 2021.

architectural coatings during construction activities and the temporary storage of typical solid waste (refuse) associated with the Proposed Project's (long-term operational) uses. Standard construction requirements would minimize odor impacts. The construction odor emissions would be temporary, short-term, and intermittent in nature and would cease upon completion of the respective phase of construction and is thus considered less than significant. It is expected that Project-generated refuse would be stored in covered containers and removed at regular intervals in compliance with the City's solid waste regulations. The Proposed Project would also be required to comply with SCAQMD Rule 402 to prevent occurrences of public nuisances. Therefore, odors associated with the Proposed Project construction and operations would be less than significant and no mitigation is required.

13.0 CUMULATIVE IMPACTS

The Airport serves an important role in Southern California's supply chain network. The Airport has been modernizing and implementing infrastructure upgrades to meet local and regional demands.

The SCAQMD *CEQA Air Quality Handbook* states: "[f]rom an air quality perspective, the impact of a project is determined by examining the types and levels of emissions generated by the project and its impact on factors that affect air quality. As such, projects should be evaluated in terms of air pollution thresholds established by the District." According to the SCAQMD, if an individual project results in air emissions of criteria pollutants that exceed the SCAQMD's recommended daily thresholds for project specific impacts, then the project would also result in a cumulatively considerable net increase of these criteria pollutants.

The OIAA recently published a Draft SEIR for the rehabilitation of ONT's Runway 8R-26L and associated airfield improvements. These improvements are proposed so that the airfield meets current FAA standards, safety is improved, and the efficiency of the airfield is enhanced. To implement the improvements, temporary runway closures would be required and the only change in the use of the airfield would result from FAA Air Traffic Control imposed restrictions on the use of Contra Flow operations during nighttime hours (10 p.m. to 7 a.m.).

The Runway 8R-26L runway rehabilitation/reconstruction project is scheduled to begin in 2023 and end in 2025, one of the same years for which the Proposed Project was evaluated. The Runway 8R-26L runway rehabilitation/reconstruction project would not increase operational activities at the Airport and would result in a less than significant impact from construction emissions.

Generally, cumulative air quality conditions in the South Coast Air Basin are considered significant, as the Air Basin is in nonattainment with certain federal and state ambient air quality standards. SCAQMD has provided guidance on an acceptable approach to addressing the cumulative impacts issue for air quality. This guidance states as follows: "As a lead agency, the SCAQMD uses the same significance thresholds for

project-specific and cumulative impacts for all environmental topics analyzed in an Environmental Assessment or Environmental Impact Report … Projects that exceed the project-specific significance thresholds are considered by the SCAQMD to be cumulatively considerable … Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant.

During construction, the Proposed Project's daily criteria pollutant emissions would not exceed SCAQMD thresholds. Implementation of emission reduction measures would further reduce potential construction-related Proposed Project's daily emissions. As such, air quality impacts from the construction of the Proposed Project would be less than significant and would not result in a cumulatively considerable increase of air emissions during the construction period. Construction activities would not exceed the ambient air quality standards at nearby receptors and cumulative impacts would be less than significant.

During operations, the Proposed Project's daily criteria pollutant emissions would exceed SCAQMD thresholds for CO, VOC, SO_2, and NO_x. As such, impacts from the Proposed Project would be significant and unavoidable and would result in a cumulatively considerable increase of air emissions during operations. Operations would not exceed the ambient air quality standards at nearby receptors. The maximum cancer risk from construction and operations for existing sensitive receptors would be less than the SCAQMD threshold of 10 per one million persons. The Proposed Project would result in a significant and unavoidable impact from operational GHG emissions.

Based on SCAQMD methodology, the Proposed Project's operational emissions would represent a cumulatively considerable contribution, and thus the Project would also result in a cumulatively significant impact.

14.0 SUMMARY

In summary, daily construction emissions would not exceed the SCAQMD significance thresholds, as described in **Section 7**. These impacts are largely due to off-road construction equipment and to a much lesser degree due to offsite construction haul trucks. As shown in **Section 8**, operational emissions would exceed the SCAQMD significance thresholds for CO, VOC, NOx, and SO_2. However, as presented in **Section 9**, the ambient air concentration impacts due to project construction and operations would be less than significant at all nearby receptors for all pollutants. As shown in **Section 10**, the incremental health impacts associated with construction activities and operations would not exceed significance thresholds at residences, offsite worker, and onsite worker locations. As shown in **Section 11**, the GHG emissions associated with construction and operational activities would be significant and unavoidable.

Attachment A

Emissions Inventory and Dispersion Modeling Methodology and Assumptions

The information in this attachment supplements the air quality analysis and is comprised of the following:

- **Operational Emissions Inventory and Dispersion Modeling Supporting Data** – Describes the data and methodologies used to prepare emission inventories and perform air pollutant dispersion analysis to evaluate the Proposed Project on the criteria air pollutants/pollutant precursors.

- **Air Quality Modeling Protocol** – Provides documentation of the Ontario International Airport Cargo Development Air Quality Modeling Protocol, which has been reviewed by the South Coast Air Quality Management District (SCAQMD).

Emission Inventories

For the assessment of the Proposed Project, daily and annual emissions of carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter less than 10 micrometers in diameter (coarse or PM_{10}), and particulate matter less than 2.5 micrometers in diameter (fine or $PM_{2.5}$) were prepared. Although lead is a criteria pollutant, it was not evaluated because the Proposed Project would not involve piston aircraft and the use of aviation gasoline (avgas), a common source of lead emissions and would have a negligible impact on lead levels in the South Coast Air Basin. To evaluate O_3, estimates of volatile organic compounds (VOC) and nitrogen oxides (NO_x)—the precursors to the air pollutant O_3—were prepared. Emission inventories were also prepared for hazardous air pollutants (HAP) and greenhouse gases (GHG).

The operational emissions inventories were evaluated using the following regulatory models:

- California Air Resources Board's (CARB) EMFAC[1] emissions inventory model. EMFAC is the latest emission inventory model that calculates emission inventories and emission rates for motor vehicles operating on roads in California. This model reflects CARB's current understanding of how vehicles travel and how much they emit. EMFAC can be used to show how California motor vehicle emissions have changed over time and are projected to change in the future.

1 California Air Resources Board, EMFAC2021 User's Guide, January 15, 2021, https://ww2.arb.ca.gov/sites/default/files/2021-01/EMFAC202x_Users_Guide_01112021_final.pdf

- CARB OFFROAD[2] emissions inventory model. OFFROAD is the latest emission inventory model that calculates emission inventories and emission rates for off-road equipment such as loaders, excavators, and off-road haul trucks operating in California. This model reflects CARB's current understanding of how equipment operates and how much they emit. OFFROAD can be used to show how California off-road equipment emissions have changed over time and are projected to change in the future.

- United States Environmental Protection Agency (USEPA) AP-42, Compilation of Air Pollutant Emission Factors, has been published since 1972 as the primary compilation of USEPA's emission factor information. It contains emission factors and process information for more than 200 air pollution source categories. A source category is a specific industry sector or group of similar emitting sources. The emission factors have been developed and compiled from source test data, material balance studies, and engineering estimates.[3]

The aircraft emission inventories were prepared using Version 3d of the Federal Aviation Administration's (FAA's) Aviation Environmental Design Tool (AEDT, Version 3c).[4] The following describe the data used to prepare the emission estimates for aircraft, ground support equipment (GSE), auxiliary power units (APU), motor vehicles (i.e., employee vehicles and delivery trucks), and stationary sources (i.e., emergency generators).

Aircraft Fleet Mix

The number of aircraft operations and the aircraft fleet mix for the Baseline Condition (2021), Phase 1 (2025) and Phase 2 (2029) are presented in **Table A-1**.[5] In addition to the number of aircraft operations, aircraft fleet mix, and engine assignments, AEDT uses departure stage lengths (manifested as departure aircraft weight). The stage lengths assumed in the air quality analysis were a weighted average of the stage lengths used to prepare the aircraft noise analysis.[6]

3 United States Environmental Protection Agency, AP 42, Compilation of Air Pollutant Emission Factors, Fifth Edition, Volume I, https://www.epa.gov/air-emissions-factors-and-quantification/ap-42-compilation-air-emissions-factors

4 Federal Aviation Administration, Aviation Environmental Design Tool (AEDT) Users Guide, September 2017, https://aedt.faa.gov/.

5 An aircraft operation is either a landing or a takeoff; a landing/takeoff cycle or LTO equals 2 operations

6 Aircraft operations which are not directly part of the proposed project are included in the analysis because the project aircraft results in changes in taxi movements and speeds for all airport aircraft (passenger and other cargo operations).

With the exception of the number of operations, and for consistency, the aircraft operational data (i.e., fleet, aircraft engine assignments, and runway use) input to the AEDT were data developed in support of the noise analysis. Aircraft with at least 183 operations annually (more than 0.5 operations daily) were retained in the fleet mix for air quality analysis as they represent most of the operations. The retained operations were scaled up to match the total number of operations developed in the fleet mix. The average weighted departure stage lengths were applied. Default GSE and APU assignments in AEDT were applied. Because it is customary for criteria air pollutant and pollutant precursor inventories to be reported in tons on an annual basis, the number of operations were factored to reflect the actual annual (year 2019/2020) and future forecast (year 2023, 2024, and 2025) level of operations for the air quality analysis.

Table A-2 presents the aircraft operations (i.e., aircraft type, engine assignments[7], stage lengths[8], and daily/annual operations), associated with Phase 1 (2025) of the Proposed Action. **Table A-3** presents the aircraft operations associated with Phase 2 (2029) of the Proposed Action.

Aircraft Emission Factors

AEDT default emission factors were used to estimate aircraft emissions for all aircraft.

Aircraft Time-in-Mode

Aircraft have four operational modes—approach, taxi, takeoff, and climbout. AEDT default times in mode were assumed for the approach, takeoff, and climbout modes. Times in mode for taxi-in (for arrivals) and taxi-out (for departures) for the Baseline Condition were obtained from the FAA's Aviation System Performance Metrics (ASPM) database. The taxi times for Phase 1 and Phase were developed by HNTB using airfield simulation models.

Except for ground-based taxi-in/taxi-out, including apron idling and departure runway queue delay, the default aircraft operating times in AEDT by aircraft mode (e.g., approach, take-off, climbout) were used. For the Baseline Conditions, airport-specific times-in-mode for taxi-in and taxi-out were obtained from the FAA Aviation System Performance Metrics (ASPM) database. It was determined that the Baseline Conditions airfield-wide average taxi-in time was 5 minutes and 17 seconds, and the average taxi-out time was 12 minutes and 11 seconds.

Future scenario taxi-in/taxi-out times were obtained through simulations using AirTOP. AirTOP is a gate-to-gate air traffic and airport simulation and assessment software. Future scenario simulations were set up in a way that was consistent with taxiway improvements in the future years. The taxi time outputs from future scenario simulations were compared with the Baseline Conditions simulation output and adjustment factors were calculated. The adjustment factors were applied to the Baseline Conditions annual average taxi times from FAA ASPM database to obtain the future scenario taxi times.[9]

[9] AirTOP is a planning tool used to recreate air traffic operations for the Terminal Control Area and the airfield system. It is an advanced network-based model in which the airspace and ground structures are defined with a respective sequence of waypoints and taxiway points. Aircraft movements are then conducted over the points and segments that make up the

Table A-4 provides the taxi-in/taxi-out time inputs to AEDT by year and alternative. As shown, the Proposed Project would increase the taxi-in times and taxi-out times. This is a result of the greater number of aircraft operations which decreases airfield taxi efficiency.

Table A-4
Aircraft Taxi Times

Condition	Alternative	Taxi Time (Minutes)	
		Taxi In (Arrivals)	Taxi Out (Departures)
Baseline		5:17	12:11
Phase 1 (2025)	No Action	5:20	13:36
	No Action with SACC	5:26	14:26
Phase 2 (2029)	No Action	5:21	13:39
	No Action with SACC	5:26	14:23
Source: FAA's Aviation System Performance Metrics (ASPM) database and HNTB, 2022			

Ground Support Equipment (GSE)/Auxiliary Power Units (APU)

GSE includes ground equipment essential for passenger and aircraft services, such as aircraft tractors, baggage tractors, belt loader, cargo loader, fuel hydrant cart. and various service trucks. APU provides power to sufficiently large commercial aircraft. In addition to aircraft emissions, GSE and APU are also sources of CO, VOC, NOx, SO_2, PM_{10}, and $PM_{2.5}$, among other pollutants.[10]

GSE/APU Emission Factors

Default AEDT emission factors were used to prepare emissions for GSE and APU.

GSE/APU Operating Time

Default AEDT operating times were used to prepare emissions for GSE and APU.

The Proposed Project would use electric GSE. The Proposed Project would provide aircraft gate power within the Project site which would reduce APU operating times to less than 26 minutes.

airspace and ground networks. Travel time and delay information is recorded by AirTOP as the input flights traverse the points and segments. To develop the baseline conditions, OIAA worked closely with FAA to accurately represent operations at ONT, which included many meetings with FAA Air Traffic Control Tower staff and ONT Operations staff to review assumptions on taxi routes, speeds, runway occupancy times, in-trail separations, use of airspace routes, runway operating configurations, and specific pilot behaviors. The baseline conditions simulation was calibrated by sharing simulation animations and output statistics with stakeholders for review and comment. Following several rounds of review, a well-calibrated model was established. Future scenario simulations were set up while incorporating potential future ONT projects (e.g., runway closures, temporary suspension of contra flow during construction, and taxiway improvements) in the future years.

10 APU/GSE associated with passenger, FedEx and UPS aircraft and other similar activities are not affected by the proposed project and therefore, were not included in the analysis.

Ground Access Vehicles

Project-related ground access vehicles include employee-owned vehicles and delivery trucks.[11] Emissions factors for this airport source were obtained from the EMFAC model. For the proposed project, electric charging stations would be provided in the employee and visitor parking lots, and truckyard. The motor vehicle fleet mix and fuel type were based on information within EMFAC. Employees would conduct 2,531 trips per day resulting in 35,402 miles per day during Phase 1 and 35,540 trips per day during Phase 2. Delivery trucks would conduct 150 trips per day resulting in 9,889 miles per day during Phase 1 (excluding fuel trucks during Phase 1 which were includes as ground support equipment with 48 trips per day at three miles per trip) and 224 trips per day resulting in 14,623 trips per day during Phase 2. Employee vehicles would travel 14 miles per trip. Full delivery trucks would travel 90.6 miles per trip during Phase 1 and 88.3 miles per trip during Phase 2. Empty delivery trucks would travel 14 miles per trip.

Project-related employee and delivery truck volumes per intersection/roadway segment were used to estimate the air quality impacts along nearby intersections/roadways

Stationary Sources

The Proposed Project requires that the entire facility be backed up on generator power to provide emergency power primarily for lighting and other emergency building systems. To accomplish this, it is estimated that seven 2.0-megawatt diesel-engine driven generators are required.[12]

Aircraft Engine Run-ups

Airlines routinely inspect and maintain their aircraft to ensure the safety of the traveling public. Each aircraft is on a stringent maintenance schedule based on its number of hours in operation. As part of this regularly scheduled maintenance, the FAA requires aircraft engine ground run-ups. Run-ups are routine aircraft engine maintenance tests that require the operation of an engine at various power settings for several minutes on the ground. The Airport provided detailed engine 2019 run-up logs. There were less than 100 run-ups during 2019. No Proposed Project aircraft operations would be expected to conduct engine run-up maintenance, and therefore, were not included in the analysis.

[11] Airport passenger associated motor vehicles, terminal deliveries, FedEx and UPS delivery trucks, and other similar activities are not affected by the proposed project and therefore, will not be included in the analysis.

12 Passenger terminal (as well as FedEx and UPS) boilers, generators, and other stationary sources are not affected by the Proposed Project and therefore, were not included in the analysis.

Dispersion Modeling

Dispersion is the process by which atmospheric pollutants spread due to wind and vertical stability. The base data for this type of analysis is emissions inventories. A dispersion model uses an emissions inventory to estimate concentrations of pollutants at specific locations. Dispersion models use hourly average meteorological data, terrain elevation data, and source emission release characteristics to compute downwind pollutant concentrations over periods that can range from one hour to one year.

The dispersion model used for the air quality analysis, USEPA's AERMOD (Version 21112), is state-of-the-art. Given the accuracy of the input data, the model results offer the best available estimates with which to predict ambient concentrations of air pollutants. AERMOD simulates point, area, volume, and line emissions sources. AERMOD was executed using regulatory default options for stack-tip downwash, buoyancy-induced dispersion, and final plume rise, default wind speed profile categories, default potential temperature gradients, and—except for an analysis that was performed to convert predicted concentrations of NO_x to concentrations of NO_2 —no pollutant decay.

The selection of the appropriate dispersion coefficients depends on the land use within three kilometers (km) of the project site. The types of land use were based on the classification method defined by Auer (1978), using pertinent United States Geological Survey (USGS) 1:24,000 scale (7.5 minute) topographic maps of the area. If the Auer land use types of heavy industrial, light-to-moderate industrial, commercial, and compact residential account for 50 percent or more of the total area, the USEPA *Guideline on Air Quality Models.*[13] recommends using urban dispersion coefficients; otherwise, the appropriate rural coefficients can be used. Per SCAQMD guidance, urban dispersion coefficients were applied within AERMOD. For this Proposed Project, all emissions sources were modeled with urban effects using the population of 2,035,210 for San Bernardino County.[14]

Aircraft Emission Release Characteristics

As stated previously, AERMOD simulates point, area, volume, and line emissions sources. AEDT was used to prepare the AERMOD input files and was used to develop the aircraft operational emissions sources as area sources.

AEDT aligns the y axis of the surface voxel grid[15] with the runway. The x spacing of the surface voxel grid is set to 20 meters and corresponds to the width of each area source. The y spacing of the voxel grid is

15 A unit of graphic information that defines a point in three-dimensional space.

calculated based on the runway length and corresponds to the length of each area source. The result is a series of area sources along the runway and taxiways.

AEDT aligns the y axis of the three-dimensional voxel grid with the runway. The x spacing of the three-dimensional voxel grid is set to 20 meters and corresponds to the width of each airborne area source. The y spacing of the three-dimensional voxel grid is set to 200 meters and corresponds to the length of each airborne area source. AEDT then sets the emissions release height (12 meters) of the runway and airborne area sources. The result is a series of area sources along the airborne flight paths extending for miles beyond the runway ends.

The initial vertical dispersion parameter, Sigma-z describes the vertical concentration distribution at the source. The initial distribution is a Gaussian "bell-curve" whose meaning is the release height and whose standard deviation is equal to the Initial Sigma-z (4.1 meters). In dispersion, this provides the model with an initial finite concentration of pollutant.

AEDT produces raw hourly emissions (HRE files) for airborne operations, taxi operations, ground (runways) operations, and gate/apron operations. These hourly emissions are a function of the aircraft operations, operational profiles, runway usage, assigned taxiways, and meteorological data. AEDT also produces an AERMOD input file; the hourly emissions, input, and meteorological data are then used by AERMOD to estimate ambient concentrations at a select list of receptors.

Figure A-1 displays the modeling emission sources associated with aircraft operations, including gate/apron positions, taxiways, and airborne approach/climb out/takeoff. The airborne approach/climb out/takeoff elements extend well beyond the airport boundary and above the ground.

Meteorological Data

AERMOD uses both surface and upper air meteorological conditions. The dispersion modeling analysis used hourly meteorological data collected at Ontario International Airport for a five-year period (2012 through 2016) and provided by SCAQMD.[16] **Figure A-2** provides the wind rose for this time period. As shown, wind directions are dominantly from the west-southwest with average wind speed conditions of 6.4 miles per hour (2.9 meters per second). **Figure A-3** provides the wind speed distribution showing a large percentage of calm or light wind speeds.

The term "atmospheric mixing height" generally describes the height above ground level where the mixing of most air pollutants in the ambient (i.e., outdoor) air occurs. Within the atmosphere, this height is determined by an assortment of environmental factors including temperature, humidity, solar radiation, wind speed, and topographic features on the ground (i.e., valleys, mountains, water bodies, etc.). The atmospheric mixing height is dynamic and moves up or down both spatially and temporally throughout the day, season, and year with corresponding changes in these abovementioned factors. The mixing height (i.e., the top of the layer of unstable or neutral air above ground) determines the limits of vertical transport and diffusion of pollutants. A value of 2,402 feet was used for the mixing height.[17] Notably, the mixing height is used by AEDT in the calculation of air pollutant/pollutant precursor emissions inventories. The mixing height value is not specifically used within the AERMOD dispersion model.

To determine the year of meteorological data that would result in the greatest predicted pollutant concentrations, a screening analysis was performed. Because it was anticipated that the predicted concentrations of NO_2 would be closest to the National Ambient Air Quality Standard (NAAQS), the screening analysis was performed for one-hour and annual NO_2 concentrations. The meteorological year resulting in the highest one-hour and annual NO_2 concentrations was the year 2013. This year was used to evaluate all pollutants and averaging periods for Baseline Condition, Phase 1, and Phase 2.[18]

Receptors

For the air quality dispersion analysis, concentrations were predicted at enough locations (referred to as receptors)[19] to identify maximum concentrations. Because the AEDT/AERMOD run time is significant when many receptors are evaluated, a strategy was developed to balance the number of receptors while optimizing the fidelity of the results. The following lists the types of receptors that were evaluated:

- **Boundary and Cartesian receptors** – Boundary receptors were in areas along the Airport boundary at a spacing of approximately 10 degrees. This distribution of receptors is standard when conducting an airport air quality assessment. Additionally, evenly receptors (known as Cartesian receptors) were placed beyond the boundary. **Figure A-4** displays the boundary and Cartesian

17 South Coast Air Quality Management District, Draft Aircraft Emissions Inventory for South Coast Air Quality Management District, August 2016, http://www.aqmd.gov/docs/default-source/planning/fbmsm-docs/aircraft-emissions-inventory-for-the-south-coast-air-quality-management-district.pdf

18 The emission distribution for NOx is like the emission distribution for CO, SO_2, PM_{10}, and $PM_{2.5}$ because most of the emissions result from aircraft and the temporal operational profiles for aircraft are the same regardless of pollutant. The one-hour and annual NO_2 concentration is worst-case for the same meteorological year. As such, the worst-case concentrations of CO, SO_2, PM_{10}, and $PM_{2.5}$ for both short- and long-term averaging periods occur in the same year. Of note, based on experience, the percentage of the airport/project contribution to the total concentration (airport/project plus background) are highest for NO_2 and the closest to the NAAQS compared to the other pollutants. Therefore, it is unlikely that use of a different year of meteorological data would substantially change the resulting conclusions for CO, SO_2, PM_{10}, or $PM_{2.5}$.

19 The term *receptor* generically describes outdoor land uses or activities which it can be reasonably expected that the public would occupy for a period ranging from one hour to one year.

receptors used in the ambient air quality standards analysis. Additional receptors may be assigned surrounding the location of the maximum concentration to further augment the receptor grid and in-line with the runway ends/beyond the Airport boundary at a spacing recommended within the Modeling Guidance for AERMOD.

- **Sensitive receptors** – Sensitive receptors include schools, parks, residential areas, and health-/day-care centers located in the vicinity of the Airport. **Figure A-5** displays the off-site worker receptors. Receptors were also placed to represent onsite workers within the passenger terminal areas), as shown in **Figure A-6**. **Figure A-7** displays the residential areas surrounding the Airport. **Figure A-8** displays the residential and school receptors used in the health risk assessment.

- **Worst-case receptors** – Worst-case receptors were also selected near air emissions sources such as near runway ends. These receptors represent sites where the pollutant concentrations are expected to be the highest and the public would reasonably be expected to occupy the area for a period of one hour or more.

The maximum project-related concentrations occur in-line and directly beyond the runway ends and nearest to the project site and along the Airport boundary. As such, receptors were generally limited to within two miles of the Airport boundary, in-line with the runway ends, and near the project site (i.e., on the south side of the Airport).

For the ambient air quality dispersion modeling, the height of each receptor was assumed to be ground level consistent with SCAQMD modeling guidance.

Operational Profile

An operational profile, which is comprised of temporal factors, were used to describe the relationship of one period to another period of time (i.e., the relationship of the activity during one-hour to the activity during a 24-hour period). In AEDT, temporal factors are applied to represent varying levels of activity as a fraction of a peak hour. The use of temporal factors gives the model the ability to more accurately reflect real world conditions during an entire year.

To represent actual aircraft activity at the Airport throughout the entire calendar year, hour-of-day, day-of-week, and month-of-year operational profiles were used in the air quality analysis. These profiles were used by AEDT in its dispersion mode to calculate concentrations for each hour of the evaluated years at each receptor location.

The hour of the day, day of the week, and monthly operational profiles for the Baseline Condition were developed using airport-specific activity data from FAA's Operations and Performance Data (OPSNET) for the years of 2018 through 2020 (**Table A-5)**. As shown, the peak aircraft operations not associated with the Proposed Project would occur during 7 am (departures) and 7 pm (arrivals) during Tuesday in December. Future year operational profiles for non-project aircraft operations were assigned as the same as for the Baseline Condition. Project aircraft operational profiles were based on anticipated operating schedules and reflective of a greater number of nighttime/early morning operations for the project compared to non-project aircraft operations (**Tables A-6 and A-7**). As shown, peak Proposed Project aircraft operations would occur during the early morning/noon/nighttime on a Thursday in December.

Nitrogen Oxides (NO_x) to Nitrogen Dioxide (NO_2) Conversion

The results of the dispersion modeling provide predicted concentrations of NO_x which, for comparison to the ambient air quality standards, were converted to concentrations of NO_2. While AERMOD is generally considered a non-chemistry model, it offers three methods for modeling NO_2 formation from NO_x emissions: (i) the Ambient Ratio Method (ARM-2), (ii) the Ozone Limiting Method (OLM), and (iii) the Plume Volume Molar Ratio Method (PVMRM). As discussed in USEPA's Appendix W, PVMRM is most appropriate for analyses with relatively isolated and elevated sources. OLM is more appropriate for analyses with area sources, near-surface releases, or where plume overlap from multiple sources would occur. Moreover, USEPA's *Guideline on Air Quality Models*[20], recommends a three-tiered screening approach to estimate ambient concentrations of NO_2:

20 Appendix W to Part 51 – Guideline on Air Quality Models, http://www.ecfr.gov/cgi-bin/text-idx?SID=e6a5b817b94abf58460f48c032d9a39c&node=40:2.0.1.1.2.23.11.5.37&rgn=div9

- *Tier 1* – Assumes complete (100 percent) conversion of all emitted NO_x to NO_2 based on application of an appropriate refined modeling technique under *Section 4.2.2 of Appendix W* (of the USEPA's Guideline) to estimate ambient NO_x concentrations.

- *Tier 2* – Ambient Ratio Method (ARM-2), where model predicted NO_x concentrations are multiplied by a NO_2/NO_x ambient ratio, derived from ambient monitoring data.

  ARM-2 incorporates a variable ambient ratio that is a function of model predicted one-hour NO_x concentration, based on an analysis of nationwide hourly ambient NO_x monitoring data from approximately 580 stations over the period 2001 through 2010.

- *Tier 3* – Performs a detailed analysis on a case-by-case basis by employing the OLM or PVMRM. These methods require the most detailed level of analysis and produce the least conservative, and presumably the most representative results. Tier 3 requires information such as in stack NO_2/NO_x ratio and ambient ozone concentrations.

The dispersion modeling was performed using the ARM-2 and using the USEPA default NO_2 to NO_x minimum and maximum ambient ratios of 0.5 to 0.9 per SCAQMD and USEPA guidance.[21] The dispersion modeling was also performed using NO_2 to NO_x ambient ratios of 0.2 to 0.9 (for informational purposes only); as several studies have shown that a minimum ambient ratio of 0.2 better represents aircraft exhaust environments, which tend to be at higher exhaust temperature.

Extensive emission testing has been conducted on a wide range of aircraft engines in the last decade. This research has shown that the aircraft-related NO_2/NO_x emission ratio differs markedly from most other NO_x sources.[22] For aircraft, the NO_2 fraction of NO_x decreases with power, from over 98 percent at the lowest power setting (four percent rated thrust or taxi/idle) to under 10 percent at higher power settings (65 to 100 percent rated thrust for climb out/takeoff).[23] Overall, the amount of NO_x emissions emitted by aircraft was assumed to be 3.3 kilogram (kg) per engine per LTO, of which 0.8 kg is emitted in the form of NO_2.[24] **Table A-8** lists the NO_2/NO_x emission ratios for each aircraft operating mode. As shown, aircraft emissions tend to range with an emissions ratio of 0.1 to 0.9, therefore, ambient ratios within airport environments have shown within ambient monitoring data to range from 0.2 to 0.9. As a result, the air

Runways

AEDT requires that the runway layout be defined, usually in the form of points of latitude and longitude. The runway layout was set up in AEDT using current runway coordinates. **Table A-9** provides the runway end locations for the airfield. There are no differences in the runways for the Baseline Condition and future year alternatives.

Table A-9
Runway Coordinates

Runway Endpoint	Centerline Endpoint		Threshold Crossing height (feet)	Arrival Displaced Threshold (feet)
	Latitude (deg)	Longitude (deg)

Background Concentrations

Because the dispersion modeling addresses emissions from project-related sources only, background concentrations were added to the results to account for air emission sources not included in the dispersion modeling.

The SCAQMD maintains a network of monitoring stations within the Air Basin that monitor air quality and compliance with applicable ambient standards. The nearest air monitoring station which measures CO, NO_2, and PM_{10} is located at 1350 San Bernardino Road in Upland (Northwest San Bernardino Valley, Station

5175), four miles to the north of the project site. The nearest air monitoring station which measures SO_2 and $PM_{2.5}$ is located at 14360 Arrow Boulevard in Fontana (Central San Bernardino Valley 1, Station # 5197), seven miles to the northeast of the project site.

As shown in **Table A-10**, the background concentrations were derived from air monitoring data collected in 2018, 2019, and 2020 as the maximum values within the last three years.

Table A-10
Background Concentrations

Pollutant	2018	2019	2020
Nitrogen Dioxide (NO_2)			
Highest 1-Hour Average (ppm)[b]	0.063	0.076	0.066
Highest 98th% 1-Hour Average (ppm)[b]	0.056	0.058	0.058

To account for the variance in background NO_2 concentrations over time, seasonal/temporal background concentrations for NO_2 from the Northwest San Bernardino Valley monitoring station from 2018 through 2020 were derived following USEPA guidance.[25] As shown in **Table A-11**, the estimated NO_2 1-hour background concentrations vary by season and by time of day with a tendency for higher concentrations during fall and winter and nighttime periods. These seasonal/temporal NO_2 background concentrations were used for the 1-Hour NO_2 dispersion analysis. Notably, SCAQMD defines seasons as calendar quarters; Winter is January through March, Spring is defined as April through June, Summer is defined as July through September, and Fall is defined as October through December.[26] **Figure A-9** displays the hourly 1-hour NO_2 background concentrations by season for CAAQS.

Figure A-9
One-Hour NO_2 Seasonal/Temporal Background Concentration ($\mu g/m^3$)

Airfield Capacity and Operating Configurations

In AEDT, the capacity of the airfield, which can affect emissions via ground travel delay, is defined as the highest number of hourly departures, which can occur during the peak hour of arrivals and the highest number of hourly arrivals, which can occur during the peak hour of departures.

Operating configurations specify the pattern of aircraft arrivals and departures on specific runways over the course of a year, depending on weather conditions and airfield capacity. Specifying configurations allows for aircraft to be assigned to runways based on aircraft size (i.e., small, large, and heavy), a similar method to that employed in an actual airport operating environment. For the air quality analysis, the day/evening and night configurations were included to account for airport operating conditions representing non-contra flow and contra flow to model real-world conditions. Day is defined as between the hours of 7 a.m. and 7 p.m., evening is defined as between the hours of 7 p.m. and 10 p.m., and night is defined as between the hours of 10 p.m. and 7 a.m.

This information is used to distribute aircraft arrival and departure operations to each runway end. As required by AEDT, the runway usage by aircraft size (small, large, and heavy), flow (non-contra and contra) and time of day (day/evening and night) were used for the air quality analysis. The day/evening and night flow runway use data for arrivals and departures, used in the air quality

analysis is provided in **Tables A-12 and A-13** for the Baseline Condition, **Table A-14 and A-15** for the Phase 1 Without Project, **Table A-16 and A-17** for the Phase 1 With Project, **Table A-18 and A-19** for the Phase 2 Without Project, and **Table A-20 and A-21** for the Phase 2 With Project.

Gate Assignments, Taxiways, and Taxipaths

Within AEDT, each aircraft is assigned a terminal/apron location (i.e., Terminal 1, 2, or 4 as well as FedEx, UPS, or SACC) to which the aircraft proceeds after landing and where servicing (e.g., baggage handling, fueling, catering, etc.) is conducted. The aircraft then departs from the same terminal/apron for a takeoff runway end. For the air quality analysis, the taxiway assignments were based on the common and forecast routing paths that ground traffic controllers are known to assign and airfield simulation modeling. The series of assigned taxiways is called the taxipath. The aircraft speed for most taxiways was set at 15 knots, some of the acute angle taxiways allow for a higher taxi speed (45 knots). In addition, the speed for the apron taxi lanes (within the non-movement area boundary) was set at 5 knots.

Construction Activities

The construction emissions inventories and dispersion modeling were evaluated using the following regulatory model:

- California Air Pollution Officers Association (CAPCOA) CalEEMod (California Emissions Estimator Model Version 2020.4.0)[27] land use emissions model estimates emissions due to demolition and construction activities and operations for land use development.

- California Air Resources Board's (CARB) EMFAC[28] emissions inventory model. EMFAC is the latest emission inventory model that calculates emission inventories and emission rates for motor vehicles operating on roads in California. This model reflects CARB's current understanding of how vehicles travel and how much they emit. EMFAC can be used to show how California motor vehicle emissions have changed over time and are projected to change in the future.

- CARB OFFROAD[29] emissions inventory model. OFFROAD is the latest emission inventory model that calculates emission inventories and emission rates for off-road equipment such as loaders, excavators, and off-road haul trucks operating in California. This model reflects CARB's current understanding of how equipment operates and how much they emit. OFFROAD can be used to show how California off-road equipment emissions have changed over time and are projected to change in the future.

28 California Air Resources Board, EMFAC2021 User's Guide, January 15, 2021, https://ww2.arb.ca.gov/sites/default/files/2021-01/EMFAC202x_Users_Guide_01112021_final.pdf

29 California Air Resources Board, OFFROAD Instructions, http://www.arb.ca.gov/msprog/ordiesel/info_1085/oei_write_up.pdf

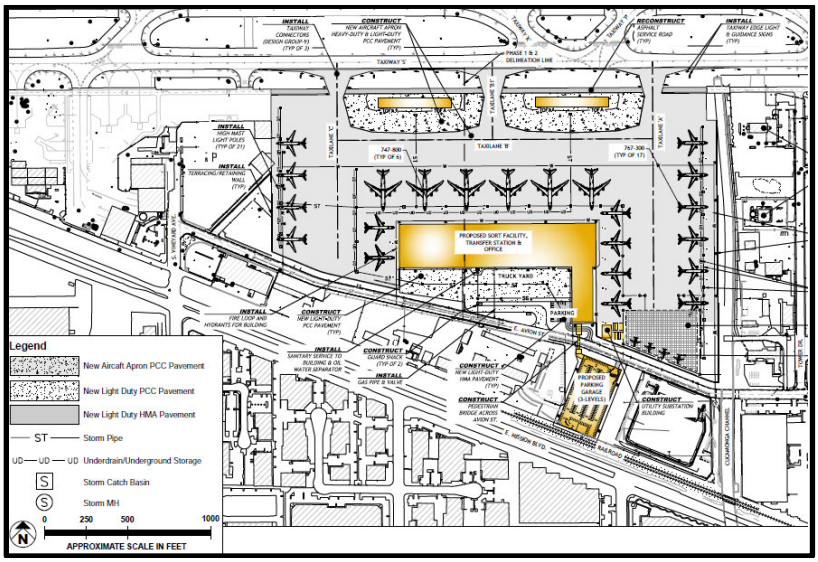
Construction equipment activities were treated as an area source. The release height of the off-road equipment exhaust was 5.0 meters (16.4 feet) and an initial vertical dimension of 1.4 meters 4.6 feet), which reflects the height of the equipment plus an additional height of the exhaust plume above the exhaust point to account for plume rise due to buoyancy and momentum. Fugitive dust-generating activities were treated as an area source. The release height of the fugitive dust was 0.0 meters (0.0 feet) and an initial vertical dimension of 1.0 meter (3.3 feet). Haul trucks were treated as a line source (i.e., volume sources placed at regular intervals) located along an access road. The haul trucks were assigned a release height of 5.0 meters (16.4 feet) and an initial vertical dimension of 1.4 meters (4.6 feet), which accounts for dispersion from the movement of vehicles.[30] [31] The on-site asphalt/concrete recycling operations were treated as a circular area source with a release height of 12 meters (39.4 feet) and a radius of 100 meters (330 feet). Typically, construction activities would occur between 5 a.m. and 3 p.m. (ten hours per day), on Monday through Friday.

An on-site asphalt/concrete recycling operation would be expected to be located on the south side of East Avion Street on a partially paved and flat parcel that is, flanked by East Mission Boulevard (and railroad tracks) to the south, and industrial abandoned (industrial) uses on either side (which is within the project site). The recycling operations would reduce the total vehicle miles traveled needed for asphalt/concrete delivery trucks but would require delivery of some raw materials (i.e., asphalt, Portland cement, and aggregate) to mix the materials on-site. The construction emissions inventory includes an analysis of fugitive dust emissions associated with asphalt/concrete recycling operation (i.e., cold milling machine for asphalt and crushing processing equipment for concrete) as well as the exhaust emissions associated with the equipment engines (approximately 170 horsepower) and haul trucks (approximately 20 miles per trip). The asphalt/concrete recycling operation would contain various crusher, conveyors, and screens. These emissions were summed with the construction emissions developed in CalEEMod to represent the total construction emissions for the Proposed Project.

During Phases 1 and 2, the on-site asphalt/concrete recycling operation would have a capacity rating of 650 tons per hour (325 cubic yards per hour) with asphalt recycling at 200 cubic yards per hour and concrete recycling at 125 cubic yards per hour.

30 While haul truck emissions contribute substantially to overall project emissions, they are spread over many miles. Hence, the portion of trucking emissions that would impact one receptor is much smaller than the emissions that the clustered off-road activity at the project site would impact a receptor near the site. For example, the DPM emissions from truck travel within 1,000 feet of the project are less than 1 percent of the total off-road DPM emissions.

31 South Coast Air Quality Management District, Final Localized Significance Threshold Methodology. July 2008, http://www.aqmd.gov/docs/default-source/ceqa/handbook/localized-significance-thresholds/final-lst-methodology-document.pdf?sfvrsn=2



During Phase 1, demolition would involve removal of approximately 2,047,320 square feet of asphalt/concrete, a portion of which would be recycled within the project site and not require offsite haul truck trips (i.e., avoiding up to 2,616 haul truck trips).[32] During Phase 1, the on-site asphalt/concrete recycling operation would be expected to operate for eight hours per day and a total of 23 days.

During Phase 2, demolition would involve removal of approximately 1,045,440 square feet of asphalt/concrete, a portion of which would be recycled within the project site and not require offsite haul truck trips (i.e., avoiding up to 910 haul truck trips).[33] During Phase 2, the on-site asphalt/concrete recycling operation would be expected to operate for eight hours per day and a total of eight days.

[32] Assuming asphalt depth of four inches and concrete depth of eight inches; resulting in 30,510 cubic yards and based on eight cubic yards of haul truck capacity per CalEEMod.

[33] Assuming asphalt depth of four inches and concrete depth of eight inches; resulting in 12,800 cubic yards and based on eight cubic yards of haul truck capacity per CalEEMod.

1. INTRODUCTION

The Ontario International Airport Authority (OIAA) is preparing an Environmental Impact Report (EIR) for the Proposed South Airport Cargo Center Project (proposed project) at Ontario International Airport (Ontario or Airport). In accordance with the California Environmental Quality Act (CEQA), the EIR will address the potential impacts to environmental factors associated with the proposed project, including potential impacts to air quality.

This *Air Quality Modeling Protocol* provides an overview of the technical approach for conducting the air quality analysis in support of the EIR. Notably, the information provided in this protocol is a synopsis of the technical approach to the air quality analysis, which will be expanded upon in the EIR and supporting documentation.

The focus of the air quality analysis will be the air pollutants for which there are ambient air quality standards and for which there are reasonable methods of deriving predicted concentrations of these pollutants. These air pollutants are carbon monoxide (CO), nitrogen dioxide (NO_2), sulfur dioxide (SO_2), particulate matter less than 10 micrometers (coarse particulate or PM_{10}), particulate matter less than 2.5 micrometers (fine particulate or $PM_{2.5}$), and lead (Pb).

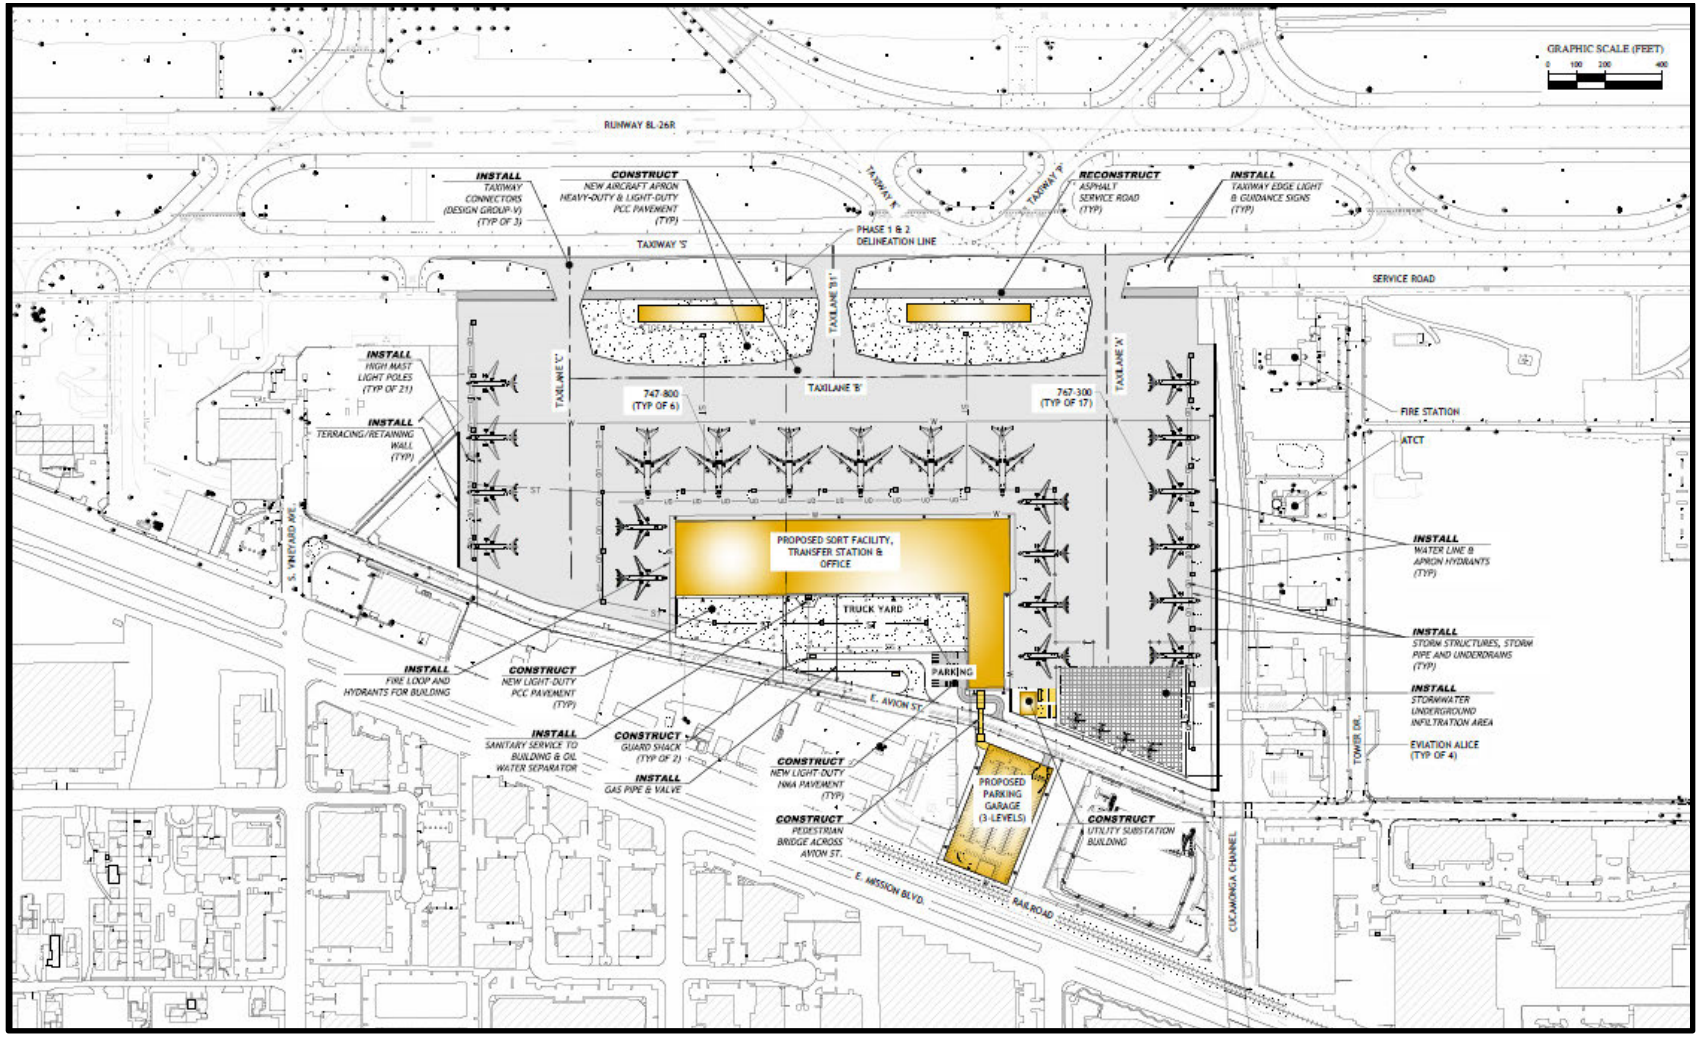
Impact Analysis Overview

To evaluate the potential impacts of the change in conditions at Ontario that would result from the project, the following conditions will be analyzed:

- No Project
- With Project

Three timeframes will be evaluated:

- Baseline Condition (2021)[1]
- Phase 1 (2025)
- Phase 2 (2029)



When appropriate, the concurrent construction plus operational impacts will be addressed.

2. PROJECT OVERVIEW

The project site consists of approximately 97 acres located at Ontario International Airport in the City of Ontario, San Bernardino County. The proposed project would replace existing, underutilized airport related buildings and site improvements with an air cargo center. The proposed air cargo center includes a Cargo Sorting Building, truckyard, parking facilities, aircraft parking apron improvements, ground service equipment parking, and aviation support facilities, as shown in **Figure 1**.

[1] The Baseline Condition accounts for aviation activity levels that are historically representative of operations at the Airport and, as such, has been "normalized" to eliminate short-term depressions in activity levels attributable to the COVID-19 pandemic.

Figure 1
Site Plan

Source: CHA, February 2022

The project would include a 857,000-square-foot Cargo Sorting Building and office spaces. A 210,000 square-foot truckyard would be located between the Cargo Sorting Building and East Avion Street and service 224 truck trips per day and 2,520 employee trips per day at Phase 2. The project would include 933 automobile parking stalls, including 900 employee stalls in a parking garage.

The project would introduce new flights to the Airport. At its opening in 2025, the Proposed Project would operate 44 daily flights (22 arrivals and 22 departures) at the Airport (with an annual average of 38 flights per day). These flights would arrive and depart throughout the day, every day of the week. By 2029, 22 daily flights (11 arrivals and 11 departures) would be added (with an annual average of 18 flights per day). At the buildout of Phase 2, the Proposed Project would operate 66 daily flights (33 arrivals and 33 departures) (with an annual average of 56 flights per day).

Construction of Phase 1 is projected to start in March of 2023 and be completed in December of 2024. Construction of Phase 2 is estimated to begin in September of 2025 (demolition), December of 2026 (site preparation), and August of 2027 (building construction), with completion in August of 2028, and would become operational in January of 2029. Typically, construction activities would occur between 5 a.m. and 3 p.m. (ten hours per day), on Monday through Friday.

3. REGULATORY BACKGROUND

This section describes existing air quality conditions in the South Coast Air Basin and identifies the regulatory criteria that will be applied to the results of the air quality analysis.

Attainment / Nonattainment Designations

The South Coast Air Basin is in nonattainment status for the State ozone, PM_{10}, and $PM_{2.5}$; and is in attainment status for CO, NO_2, and SO_2.[2] [3] The South Coast Air Basin is in nonattainment status for the federal ozone, lead (Pb), and $PM_{2.5}$; and in attainment for the federal CO, NO_2, SO_2, and PM_{10}.[4]

Regulatory Standards and Criteria for Air Quality

The regulatory standards and criteria that are relevant to the air quality analysis are discussed in the following sections of this protocol.

Federal and State Standards

Ambient air quality standards are classified as either "primary" or "secondary" standards. Primary standards define levels of air quality, including an adequate margin of safety, necessary

[2] California Air Resources Board, Area Designations Maps/State and National, http://www.arb.ca.gov/desig/adm/adm.htm

[3] South Coast Air Quality Management District, NAAQS and CAAQS Attainment Status for the South Coast Air Basin, February 2016, http://www.aqmd.gov/docs/default-source/clean-air-plans/air-quality-management-plans/naaqs-caaqs-feb2016.pdf

[4] United States Environmental Protection Agency, The Green Book Nonattainment Areas for Criteria Pollutants, https://www.epa.gov/green-book

to protect the public health. Secondary ambient air quality standards define levels of air quality necessary to protect the public welfare from any known or anticipated adverse effects of a pollutant. California and National Ambient Air Quality Standards (CAAQS and NAAQS) are shown in **Table 1**.

Applicable SCAQMD Regulatory Actions and Requirements

On March 3, 2017, the SCAQMD adopted the 2016 Air Quality Management Plan (AQMP) which includes strategies and measures needed to meet the NAAQS. The AQMP demonstrates attainment of the ozone NAAQS as well as the latest $PM_{2.5}$ standards.[5] Potentially relevant SCAQMD rules and regulations include (but not limited to):

- Rules 201 and 203 (Permits to Construct and Operate)
- Rule 402 (Nuisance)
- Rule 403 (Fugitive Dust)
- Rule 1113 (Architectural Coatings)
- Rule 2202 (Employee Commute Reduction Program Guidelines)
- Rule 2305 (Warehouse Indirect Source Rule)

[5] South Coast Air Quality Management District, 2016 Air Quality Management Plan, March 1, 2017, http://www.aqmd.gov/home/air-quality/clean-air-plans/air-quality-mgt-plan.

Table 1
California and National Criteria Air Pollutant Standards, Effects, and Sources

Pollutant	Averaging Time	State Standard	National Standard	Pollutant Health and Atmospheric Effects	Major Pollutant Sources
Ozone	1 Hour 8 Hour	0.09 ppm 0.07 ppm	– 0.070 ppm	High concentrations can directly affect lungs, causing irritation. Long–term exposure may cause damage to lung tissue.	Formed when reactive organic gases and nitrogen oxides react in the presence of sunlight. Major sources include on–road motor vehicles, solvent evaporation, and commercial / industrial mobile equipment.
Carbon Monoxide (CO)	1 Hour 8 Hour	20 ppm 9.0 ppm	35 ppm 9.0 ppm	Classified as a chemical asphyxiant, carbon monoxide interferes with the transfer of fresh oxygen to the blood and deprives sensitive tissues of oxygen.	Internal combustion engines, primarily gasoline–powered motor vehicles.
Nitrogen Dioxide (NO_2)	1 Hour Annual	0.18 ppm 0.03 ppm	0.10 ppm 0.053 ppm	Irritating to eyes and respiratory tract. Colors atmosphere reddish–brown.	Motor vehicles, petroleum–refining operations, industrial sources, aircraft, ships, and railroads.
Sulfur Dioxide (SO_2)	1 Hour 3 Hour 24 Hour Annual	0.25 ppm – 0.04 ppm –	0.075 ppm 0.5 ppm 0.14 ppm 0.030 ppm	Irritates upper respiratory tract; injurious to lung tissue. Can yellow the leaves of plants, destructive to marble, iron, and steel. Limits visibility and reduces sunlight.	Fuel combustion, chemical plants, sulfur recovery plants, and metal processing.
Respirable Particulate Matter (PM_{10})	24 Hour Annual	50 µg/m^3 20 µg/m^3	150 µg/m^3 –	May irritate eyes and respiratory tract, decreases in lung capacity, cancer and increased mortality. Produces haze and limits visibility.	Dust and fume–producing industrial and agricultural operations, combustion, atmospheric photochemical reactions, and natural activities (e.g., wind–raised dust and ocean sprays).
Fine Particulate Matter ($PM_{2.5}$)	24 Hour Annual	– 12 µg/m^3	35.0 µg/m^3 12.0 µg/m^3	Increases respiratory disease, lung damage, cancer, and premature death. Reduces visibility and results in surface soiling.	Fuel combustion in motor vehicles, equipment, and industrial sources; residential and agricultural burning; Also, formed from photochemical reactions of other pollutants, including nitrogen oxides, sulfur oxides, and organics.
Lead (Pb)	Month Rolling 3 Month	1.5 µg/m^3 –	– 0.15 µg/m^3	Disturbs gastrointestinal system, and causes anemia, kidney disease, and neuromuscular and neurological dysfunction.	Present sources: lead smelters, battery manufacturing & recycling facilities. Past source: combustion of leaded gasoline.

SCAQMD Thresholds of Significance

SCAQMD has identified thresholds to determine the significance of regional air quality emissions for construction activities and project operation, as shown in **Table 2**.

Table 2
Mass Daily Emissions Thresholds (pounds/day)

Pollutant	Construction	Operation
VOC	75	55
NOx	100	55
CO	550	550
SOx	150	150
PM10	150	150
PM2.5	55	55
Lead	3	3

Source: South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019, http://www.aqmd.gov/ceqa/hdbk.html

Secondly, the proposed project would result in a significant construction and/or operational air quality impact if the project emissions exceed the South Coast Air Quality Management District (SCAQMD) concentration significance thresholds set forth in **Table 3**.[6] For CO, NO_2, SO_2, and Pb[7], these significance thresholds are reflective of the CAAQS and NAAQS. Background concentrations will be based on existing air monitoring stations near the project site. The project contribution of PM_{10} and $PM_{2.5}$ will be compared to the significance thresholds without adding background concentrations.

The proposed project would also result in a significant health impact if the carcinogenic or toxic air contaminants individually or cumulatively are equal to or exceed the maximum individual cancer risk of ten in one million persons or a chronic and acute hazard index of 1.0.

[6] South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019, http://www.aqmd.gov/ceqa/hdbk.html

[7] Airport sources of lead emissions include the use of avgas within piston aircraft. Although Ontario does have piston aircraft operations, the proposed project does not include piston aircraft operations and thus, project impacts of lead would be expected to be minimal. Approximately three percent of the existing airport operations are piston aircraft and therefore, lead emission would be expected to be less than 0.1 tons per year, which is well below the USEPA's ambient monitoring threshold of one ton.

Table 3
Ambient Air Quality Significance Thresholds for Criteria Pollutants

Pollutant	Averaging Period	Pollutant Concentration Threshold
CO	1-hour /8-hour	SCAQMD is in attainment (federal and State); project is significant if it causes or contributes to an exceedance of the attainment standards of 20 ppm (1-hour) and 9 ppm (8-hour)
NO_2	1-hour	SCAQMD is in attainment (federal and State); project is significant if it causes or contributes to an exceedance of the following attainment standard 0.18 ppm (state)
	Annual	0.03 ppm (state) and 0.0534 ppm (federal)
PM_{10}	24-hour	10.4 µg/m^3 (construction) and 2.5 µg/m^3 (operation)
	Annual	1.0 µg/m^3 (construction and operation)
$PM_{2.5}$	24-hour	10.4 µg/m^3 (construction) and 2.5 µg/m^3 (operation)
SO_2	1-hour	0.25 ppm (State) and 0.075 ppm (federal)
	24-hour	0.04 ppm (State)
Lead	30-day Average	1.5 µg/m^3 (State)
	Rolling 3-month Average	0.15 µg/m^3 (federal)

Source: South Coast Air Quality Management District, SCAQMD Air Quality Significance Thresholds, April 2019, http://www.aqmd.gov/ceqa/hdbk.html

4. AIR QUALITY ASSESSMENT METHODOLOGY

Implementation of the proposed project would result in both short-term and long-term air quality impacts. Over the short-term, local air quality conditions could be temporarily affected due to construction activities. Over the long-term, implementation has the potential to affect air quality due to an increase in aircraft and motor vehicle operations. To evaluate the effect of these changes on local and regional air quality conditions, two types of air quality analyses will be performed - emission inventories and dispersion modeling. The emission inventories provide an indication of the change in the amount of air pollutant and pollutant precursor emissions that will be produced with the project. Dispersion modeling provides predicted concentrations of ambient pollutant levels that can be directly compared to the CAAQS and NAAQS.

The air quality analysis will evaluate the potential for air quality impacts in accordance with Federal Aviation Administration (FAA)'s *Aviation Emissions and Air Quality Handbook*,[8] the

[8] Federal Aviation Administration, *Aviation Emissions and Air Quality Handbook Version 3 Update 1, January 2015,* https://www.faa.gov/regulations_policies/policy_guidance/envir_policy/airquality_handbook/

SCAQMD *Modeling Guidance for AERMOD*,[9] the SCAQMD *Air Quality Handbook*.[10] and the United States Environmental Protection Agency (USEPA) *Guideline on Air Quality Models*.[11]

Emission and Dispersion Models

The analysis will be performed using the FAA *Aviation Environmental Design Tool* (AEDT, Version 3d)[12] and USEPA's American Meteorological Society/USEPA Regulatory Model (AERMOD, Version 21112).

AEDT is a software system that dynamically models aircraft performance to compute emissions, fuel burn, and noise and assess their interdependencies. The FAA-requires that the AEDT be used to assess the potential for airport-related air quality impacts. The AEDT will be used to prepare emissions inventories of CO, NOx, SO_2, PM_{10}, $PM_{2.5}$, Pb, and VOC.

Other models that will be used to evaluate the proposed project include the USEPA AERMOD dispersion model for air pollutant concentrations. [13, 14] AERMOD is an atmospheric dispersion model which simulates point, area, volume, and line sources and has the capability to include simple, intermediate, and complex terrains. It also predicts both short-term (1 to 24 hours) and long-term (quarterly or annual) average concentrations of air pollutants. AERMOD is commonly executed to yield one-hour, 24-hour, and annual average concentrations (in micrograms per cubic meter or $\mu g/m^3$) at designated receptors.

The emission sources that will be included in AEDT are aircraft, auxiliary power units (APU), ground support equipment (GSE), motor vehicles, and various stationary sources (e.g., standby generators).

The following models will be used to estimate construction and motor vehicle emissions:

- California Air Pollution Officers Association (CAPCOA) CalEEMod (California Emissions Estimator Model Version 2020.4.0)[15] land use emissions model estimates emissions due to demolition and construction activities and operations for land use development.

- CARB EMFAC[16] emissions inventory model. EMFAC is the latest emission inventory model that calculates emission inventories and emission rates for motor vehicles operating on roads in California. This model reflects CARB's current understanding of how vehicles travel and how much they emit. EMFAC can be used to show how California motor vehicle emissions have changed over time and are projected to change in the future.
- CARB OFFROAD[17] emissions inventory model. OFFROAD is the latest emission inventory model that calculates emission inventories and emission rates for off-road equipment such as loaders, excavators, and off-road haul trucks operating in California. This model reflects CARB's current understanding of how equipment operates and how much they emit. OFFROAD can be used to show how California off-road equipment emissions have changed over time and are projected to change in the future.

Emissions Inventory

In general terms, an emissions inventory is a quantification of the amount, or weight, of pollutants emitted from a source (or combination of sources) over a period of time. The outcome is a product of source activity levels (i.e., aircraft operations) combined with appropriate emission factors (i.e., grams of pollutant per operation). The results are segregated by pollutant type (i.e., CO, NO_x, SO_2, PM_{10}, $PM_{2.5}$, and VOC), emission source, and project milestone years. Emission inventory results are commonly reported in units of pounds per day and tons per year.

Using AEDT, emission inventories will be prepared for each condition. The aircraft fleet mix, annual operations, runway assignment, gate assignment, taxipath and other modeling parameters used to prepare the inventories will be consistent with the data generated by an airfield simulation model and noise analyses that are also being prepared in support of the EIR.

The emission inventories will be prepared to estimate emissions for the following project-related sources:

- Aircraft (arrivals, departures, ground taxi, and engine startup)
- Ground Support Equipment (GSE) / Auxiliary Power Units (APU
- Stationary sources
- Motor vehicles
- Construction activities

The following highlight certain assumptions and/or methodologies that will be used to prepare the emission inventories.

[16] California Air Resources Board. Mobile Source Emissions Inventory – Modeling Tools, https://ww2.arb.ca.gov/our-work/programs/mobile-source-emissions-inventory/msei-modeling-tools

[17] California Air Resources Board, *Mobile Source Emissions Inventory Documentation – Off Road Diesel Equipment*, https://ww2.arb.ca.gov/our-work/programs/mobile-source-emissions-inventory/road-documentation/msei-documentation-road and https://ww3.arb.ca.gov/msei/ordiesel/ordas_ef_fcf_2017.pdf

Aircraft

The number of annual aircraft operations and the aircraft fleet mix for the Existing and Future conditions will be used in the air quality analysis.[18] AEDT default emission factors were used to estimate aircraft emissions for all aircraft. The factors are provided by aircraft engine type and operational mode (i.e., take-off, climbout, approach, and taxi/idle).[19] Aircraft emissions are described within several operational modes: engine startup, taxi in and taxi out, climb (aboveground within takeoff and climb-out), and descend (aboveground within approach and landing). AEDT default times will be used for each mode except for ground movements. Times in mode for taxi-in (for arrivals) and taxi-out (for departures) will be based on airfield simulation modeling. The proposed project anticipates some operation of electric cargo aircraft.

Ground Support Equipment (GSE) / Auxiliary Power Units (APU)

GSE is a term used to describe the equipment and vehicles that service aircraft after arrival and before departure at an airport.[20] Emissions from these sources are based on the number and type of equipment used to service each aircraft along with the amount of time the equipment is in use per aircraft LTO and the fuel type. The proposed project would include the use and operation of electric-powered equipment, including forklifts, loaders, tugs, ground power units, and ramp support (vans/carts) that would be stored and charged in designated areas in the cargo building and aircraft apron.[21]

APU are small turbine engines used by commercial jet aircraft to start the main engines; provide electrical power to aircraft radios, lights, and other equipment; and to power the onboard air conditioning (heating and cooling) system. When an aircraft arrives at a terminal gate, the pilot has the option of shutting off power to the main jet engines and operating the onboard APU, which is fueled by the aircraft's jet fuel. Alternately, an aircraft can receive electrical power and pre-conditioned air (PCA) from a mobile GPU and air conditioning equipment or receive electrical power (400 Hertz (Hz) and PCA from connections at the gate. Where available, gate power connections are built into the passenger loading bridge used to connect the terminal building to the aircraft for loading and unloading passengers.

[18] Aircraft operations which are not directly part of the proposed project are included in the analysis because the project aircraft results in changes in taxi movements and speeds for all airport aircraft (passenger and other cargo operations).

[19] For the purposes of the emissions inventories, a landing and take-off cycle is comprised of the following AEDT operational mode categories:

- *Descend Below Mixing Height*: The modes in this category are associated with an aircraft's arrival, beginning at the atmospheric mixing height and including descend emissions below 1,000 feet, the landing ground roll, and arrival taxi (i.e., taxi-in) emissions.
- *Climb Below Mixing Height:* The modes in this category are associated with an aircraft's departure, beginning with startup and including climb taxi (i.e., taxi-out), takeoff ground roll, climb below 1,000 feet and climb to the atmospheric mixing height.

[20] APU/GSE associated with passenger, FedEx and UPS aircraft and other similar activities are not affected by the proposed project and therefore, will not be included in the analysis.

[21] Diesel-powered fuel trucks would be used during Phase 1 and replaced with electric hydrant carts within Phase 2.

Use of a GPU or gate connections eliminates the need for aircraft to use their own power at the gate except for short periods of time during engine start-up and shut-down. Terminal gates without PCA/ground power typically assume an APU operating time of 26 minutes (13 minutes during taxi in and 13 minutes during taxi out). Terminal gates with PCA/ground power typically assume an APU operating time of seven minutes (3.5 minutes during taxi in and 3.5 minutes during taxi out).[22] All of the passenger terminal gates at Ontario provide PCA and power to aircraft. Therefore, APU operating times will be assumed to be seven minutes at all passenger terminal gates. Operations involving non-project cargo or general aviation aircraft will be assumed to require an APU operating time of 26 minutes, where applicable. The proposed project would provide gate power which would reduce APU operating times.

Ground Access Vehicles

Project-related ground access vehicles include employee-owned vehicles and delivery trucks.[23] Emissions factors for this airport source will be obtained from the EMFAC model. For the proposed project, electric charging stations would be provided in the employee and visitor parking lots, and truckyard. The motor vehicle fleet mix and fuel type would be based on information within EMFAC.

Stationary Sources

The proposed project includes several emergency generators.[24] The proposed project would include a 1.5-Megawatt Solar PV Panel system on the rooftop of the Cargo Sorting Building and the option to construct an additional 0.75-Megawatt rooftop system on the parking garage.

Construction

The proposed project would generate additional pollutant emissions as a result of construction activities. An emissions inventory for the proposed project construction period will be prepared. Project construction has the potential to generate air contaminants through the demolition, excavation, and grading of the proposed project site, the use of heavy-duty construction equipment, and through vehicle trips generated by construction workers, as well as construction haul trips traveling to the proposed project site.

The emissions inventory will include CO, NO_x, SO_2, PM_{10}, $PM_{2.5}$, and VOC (as ROG) for each year of construction. The air emission inventory for construction activities will be conducted using CalEEMod, CARB's OFFROAD (nonroad equipment), and EMFAC (motor vehicles) emission models and will incorporate CARB and SCAQMD guidelines of fugitive dust and entrained roadway dust; based on the equipment schedule, number of pieces of equipment, the types and sizes of equipment, estimation of disturbed area, and the construction duration. If applicable,

[22] Federal Aviation Administration, *Aviation Emissions and Air Quality Handbook Version 3 Update 1, January 2015,* https://www.faa.gov/regulations_policies/policy_guidance/envir_policy/airquality_handbook/

[23] Airport passenger associated motor vehicles, terminal deliveries, FedEx and UPS delivery trucks, and other similar activities are not affected by the proposed project and therefore, will not be included in the analysis.

[24] Passenger terminal (as well as FedEx and UPS) boilers, generators, and other stationary sources are not affected by the proposed project and therefore, will not be included in the analysis.

information associated with onsite processing plants such as concrete batch plant would be included.

5. DISPERSION MODELING

Atmospheric dispersion modeling will be conducted to predict the effects of the proposed project on local air quality conditions. The dispersion modeling analysis will be completed in accordance with the FAA's *Aviation Emissions and Air Quality Handbook*[25] and USEPA's *Guideline on Air Quality Models*.[26]

A dispersion analysis will be performed to predict ambient (i.e., outdoor) pollutant concentrations of CO, NO_2, SO_2, PM_{10}, $PM_{2.5}$, and Pb both on and off the airport (i.e., public access) for each alternative. The results of the dispersion analysis will be used to indicate whether airport-related emissions would cause or contribute to violations of the CAAQS and NAAQS for these pollutants. The analysis will be performed using USEPA's AERMOD dispersion model for the following pollutants and averaging times:

- CO – 1-hour and 8-hour
- NO_2 – 1-hour and annual
- SO_2 – 1-hour and 24-hour
- PM_{10} – 24-hour and annual
- $PM_{2.5}$ – 24-hour
- Pb – 30-day average and three-month rolling average

All standard approaches to the dispersion modeling will be used except where project-specific conditions and inputs are more appropriate and allowable under SCAQMD and USEPA guidance. Because O_3 is a regional pollutant and emissions and concentrations of O_3 cannot be computed directly using AEDT, AERMOD, or other conventional models[27], VOC and NO_x (the primary precursors to O_3 formation) will be used as surrogates for this pollutant. Specifically, the results of the emissions inventories for VOC and NO_x will be compared to the appropriate emission thresholds.

American Meteorological Society/USEPA Regulatory Model (AERMOD) Options

AERMOD will be executed using the regulatory default options (e.g., stack-tip downwash, elevated terrain effects, calm wind speeds processing routine, missing data processing routine, buoyancy-induced dispersion, and final plume rise), default wind speed profile categories, default potential temperature gradients, and, with the exception of the NO_x to NO_2 analysis, no

[25] Federal Aviation Administration, *Aviation Emissions and Air Quality Handbook Version 3 Update 1, January 2015,* https://www.faa.gov/regulations_policies/policy_guidance/envir_policy/airquality_handbook/

[26] United States Environmental Protection Agency, 40 CFR Part 51 Revision to the Guideline on Air Quality Models: Adoption of a Preferred General Purpose (Flat and Complex Terrain) Dispersion Model and Other Revisions; Final Rule, November 9, 2005, https://www3.epa.gov/scram001/guidance/guide/appw_05.pdf

[27] The complexity of O_3 formation and the health implications of O_3 warrant evaluation on a regional basis using a regional model and cannot be meaningfully addressed on a project-specific level.

pollutant decay. AERMOD is the appropriate model for this analysis based on the model's coverage of simple (i.e., flat), intermediate, and complex (i.e., above emission-source elevation) terrain. For this evaluation, the terrain will be assumed to be flat.

When executing AERMOD, the selection of appropriate dispersion coefficients depends on the land use within three kilometers (km) of a source. This land-use typing is based on a classification method defined by Auer,[28] using pertinent U.S. Geological Survey (USGS) 1:24,000 scale (7.5 minute) topographic maps of the area. If the Auer land use types of heavy industrial, light-to-moderate industrial, commercial, and compact residential account for 50 percent or more of the total area, the USEPA Guideline on Air Quality Models[29] recommends using urban dispersion coefficients; otherwise, using the appropriate rural coefficients is advised. Ontario International Airport in an urban area, therefore, urban dispersion coefficients will be used for this analysis. For this project, all emissions sources were modeled with urban effects using the population of 2,035,210 for San Bernardino County.[30]

Background Concentrations

Because the dispersion modeling will address emissions from project-related sources only, background concentrations will be added to the results to account for air emission sources not included in the dispersion modeling.

The SCAQMD maintains a network of monitoring stations within the Air Basin that monitor air quality and compliance with applicable ambient standards. The nearest air monitoring station which measures CO, NO_2, and PM_{10} is located at 1350 San Bernardino Road in Upland (Northwest San Bernardino Valley, Station # 5175), four miles to the north of the project site. The nearest air monitoring station which measures SO_2 and $PM_{2.5}$ is located at 14360 Arrow Boulevard in Fontana (Central San Bernardino Valley 1, Station # 5197), seven miles to the northeast of the project site. These background concentrations will be derived from existing air monitoring data collected in 2018, 2019, and 2020 as the maximum values within the last three years.

To account for the variance in background NO_2 concentrations over time, seasonal/temporal background concentrations for NO_2 from the Northwest San Bernardino Valley monitoring station from 2018 through 2020 were derived following USEPA guidance.[31] As shown in **Table 4**, the estimated NO_2 one-hour background concentrations vary by season and by time of day with a tendency for higher concentrations during fall and winter and nighttime periods. These

Meteorological Data

AERMOD uses both surface and upper air meteorological conditions. The dispersion modeling analysis will use hourly meteorological data collected at Ontario International Airport by the National Weather Service for a five-year period (2012 through 2016) and provided by SCAQMD.[32] **Figure 2** provides the wind rose for this time period. As shown, wind directions are predominately from the west-southwest with light or moderate wind speed condition of 6.4 miles per hour (2.9 meters per second). A value of 2,402 feet will be used for the mixing height.[33] Notably, the mixing height is used by AEDT in the calculation of air pollutant/pollutant precursor emissions inventories. The mixing height value is not specifically used within the AERMOD dispersion model.

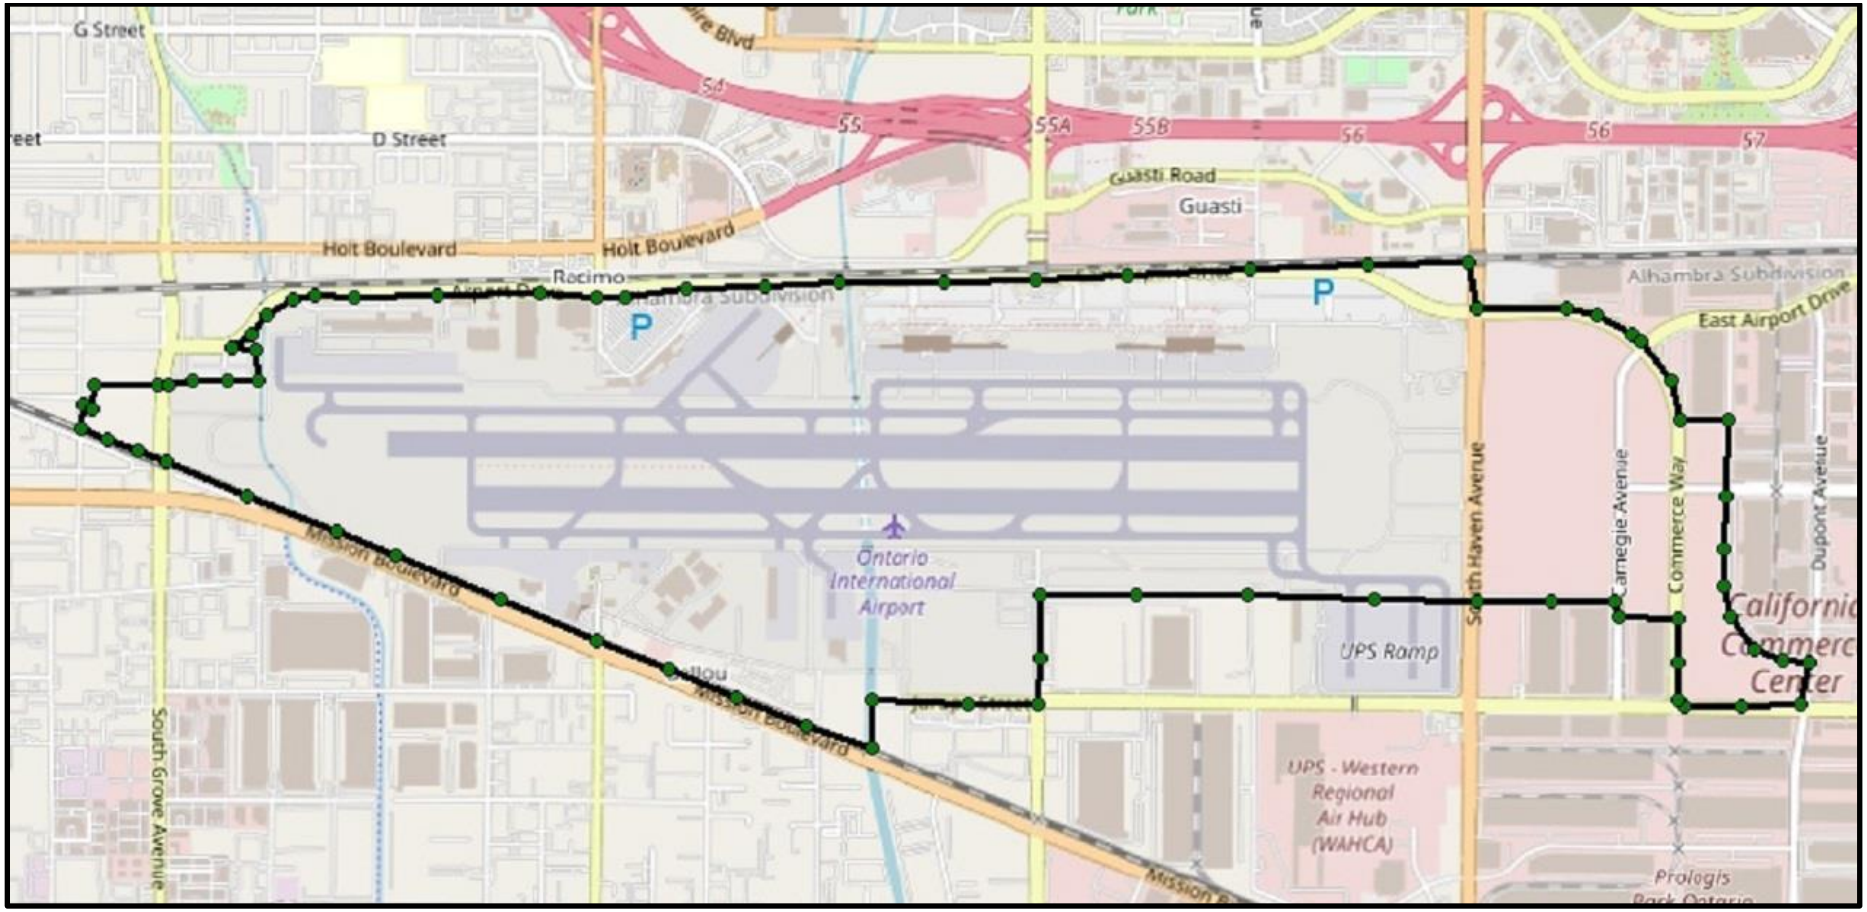
A screening analysis will be conducted to determine which year of meteorological data will result in the greatest predicted pollutant concentrations. Because it is anticipated that the predicted concentrations of NO_2 will be closest to the CAAQS and NAAQS for this pollutant, the screening analysis will be performed for the proposed project during Phase 2 for both the determination of the one-hour and annual NO_2 concentrations. The meteorological year resulting in the highest NO_2 concentrations will then be used to evaluate all other pollutants/averaging periods and alternatives.[34]

[34] The emission distribution for NOx will be similar to the emission distribution for CO, SO_2, PM_{10}, and $PM_{2.5}$ because the majority of the emissions result from aircraft and the temporal operational profiles for aircraft are the same regardless of pollutant. It is also anticipated that both the 1-hour and annual NO_2 concentration will be worst-case

Receptors

For the air quality dispersion analysis, concentrations will be predicted at a sufficient number of locations (referred to as receptors)[35] to identify maximum concentrations. Because the AEDT/AERMOD run time is significant when a large number of receptors are evaluated, a strategy will be developed to balance the number of receptors while optimizing the fidelity of the results. The following lists the types of receptors that will be evaluated:

- **Boundary receptors —** Boundary receptors will be located in areas along the Airport boundary at a spacing of approximately 10 degrees. This distribution of receptors is standard when conducting an airport air quality assessment. **Figure 3** displays the boundary receptors. Additional receptors may be assigned surrounding the location of the maximum concentration to further augment the receptor grid and in-line with the runway ends/beyond the Airport boundary at a spacing recommended within the Modeling Guidance for AERMOD.
- **Sensitive receptors —** Sensitive receptors will include schools, parks, residential areas and health-/day-care centers located in the vicinity of the Airport. Sensitive receptors also include offsite workers as well as onsite workers which are not located within secured areas such as the passenger terminals.
- **Worst-case receptors —** Worst-case receptors will also be selected in close proximity to air emissions sources such as near runway ends. These receptors represent sites where the pollutant concentrations are expected to be the highest and the public would reasonably be expected to occupy the area for a period of one hour or more.



The maximum project-related concentrations are expected to occur in-line and directly beyond the runway ends and nearest to the project site and along the Airport boundary. As such, receptors will generally be limited to within ½ mile of the Airport boundary, in-line with the runway ends, and near the project site (i.e., on the south side of the Airport). There are no residential receptors within ½ miles of the eastern Airport boundary and within ½ miles of the project site.

For the AAQS, the height of each receptor will be assumed to be ground level consistent with SCAQMD modeling guidance. For the health risk assessment, the height of each receptor will be assumed to be 1.8 meters above ground (average breathing height) consistent with OEHHA guidance.

for the same meteorological year. As such, the worst-case concentrations of CO, SO_2, PM_{10}, and $PM_{2.5}$ for both short- and long-term averaging periods would occur in the same year. Of note, based on experience, the percentage of the airport/project contribution to the total concentration (airport/project plus background) will be highest for NO_2 and the closest to the AAQS compared to the other pollutants. Therefore, it is unlikely that use of a different year of meteorological data would substantially change the resulting conclusions for CO, SO_2, PM_{10}, $PM_{2.5}$, or Pb.

[35] The term *receptor* generically describes outdoor land uses or activities which it can be reasonably expected that the public would occupy for a period ranging from one hour to one year.

Figure 3
Air Dispersion Modeling Boundary Receptors

Operational Profile

An operational profile, which is comprised of temporal factors, will be used to describe the relationship of one period of time to another period of time (i.e., the relationship of the activity during one-hour to the activity during a 24-hour period). In AEDT, temporal factors are applied to represent varying levels of activity as a fraction of a peak hour. The use of temporal factors gives the model the ability to more accurately reflect real world conditions.

To represent actual aircraft activity at the Airport throughout the entire calendar year, hour-of-day, day-of-week, and month-of-year operational profiles will be used in the analysis. These profiles will be used by AEDT in its dispersion mode to calculate concentrations for each hour of the evaluated years at receptor locations.

The hour of the day, day of the week, and monthly operational profiles for the Existing Condition were developed using airport-specific activity data from FAA's Operations and Performance Data (OPSNET) for the years of 2018 through 2020 (**Table 5)**. Future year operational profiles for non-project aircraft operations will be assigned as the same as for the Existing Condition. Project aircraft operational profiles will be based on anticipated operating schedules and reflective a greater number of nighttime/early morning operations for the project compared to non-project operations.

Nitrogen Oxides (NO_x) to Nitrogen Dioxide (NO_2) Conversion

The results of the dispersion modeling will provide predicted concentrations of NO_x which, for comparison to the NAAQS, will be converted to concentrations of NO_2. While AERMOD is generally considered a non-chemistry model, it offers three methods for modeling NO_2 formation from NO_x emissions: (i) the Ambient Ratio Method (ARM-2), (ii) the Ozone Limiting Method (OLM), and (iii) the Plume Volume Molar Ratio Method (PVMRM). As discussed in USEPA's Appendix W, PVMRM is most appropriate for analyses with relatively isolated and elevated sources. OLM is more appropriate for analyses with area sources, near-surface releases, or where plume overlap from multiple sources will occur. Moreover, USEPA's *Guideline on Air Quality Models*[36], recommends a three-tiered screening approach to estimate ambient concentrations of NO_2:

- *Tier 1* – Assumes complete (100 percent) conversion of all emitted NO_x to NO_2 based on application of an appropriate refined modeling technique under *Section 4.2.2 of Appendix W* (of the USEPA's Guideline) to estimate ambient NO_x concentrations.
- *Tier 2* – Ambient Ratio Method (ARM-2), where model predicted NO_x concentrations are multiplied by a NO_2/NO_x ambient ratio, derived from ambient monitoring data.

  ARM-2 incorporates a variable ambient ratio that is a function of model predicted one-hour NO_x concentration, based on an analysis of nationwide hourly ambient NO_x monitoring data from approximately 580 stations over the period 2001 through 2010.
- *Tier 3* – Performs a detailed analysis on a case-by-case basis by employing the OLM or PVMRM. These methods require the most detailed level of analysis and produce the least conservative, and presumably the most representative results. Tier 3 requires information such as in stack NO_2/NO_x ratio and ambient ozone concentrations.

The dispersion modeling will be performed using the ARM-2 and using the USEPA default NO_2 to NOx ambient ratios of 0.5 to 0.9 per SCAQMD and USEPA guidance. The dispersion modeling will also be performed using NO_2 to NOx ambient ratios of 0.2 to 0.9 (for informational purposes only); as several studies have shown that a minimum ambient ratio of 0.2 better represents aircraft exhaust environments.

Gate Assignments, Runways, Taxiways, Taxipaths, Airfield Capacity, and Operating Configurations

In AEDT, the capacity of the airfield, which can affect emissions via ground travel delay, is defined as the highest number of hourly departures, which can occur during the peak hour of arrivals and the highest number of hourly arrivals, which can occur during the peak hour of departures. Airfield capacity values will be incorporated in AEDT.

The runway use percentages will be based on the airfield simulation modeling. This information is used to distribute aircraft arrival and departure operations to each runway end. As required by AEDT, the runway usage by aircraft size (small, large, and heavy) and configuration (day/evening and night) will be used for the air quality analysis. Operating

[36] Appendix W to Part 51 – Guideline on Air Quality Models, http://www.ecfr.gov/cgi-bin/text-idx?SID=e6a5b817b94abf58460f48c032d9a39c&node=40:2.0.1.1.2.23.11.5.37&rgn=div9

configurations specify the pattern of aircraft arrivals and departures on specific runways over the course of a year, depending on weather conditions and airfield capacity. Specifying configurations allows for aircraft to be assigned to runways based on aircraft size (i.e., small, large, and heavy), a similar method to that employed in an actual airport operating environment.

The runway usage, terminal/apron assignment, and taxiway assignment define the taxipath that aircraft take while traveling on the ground. AEDT uses input data to develop an aircraft taxipath and, along with aircraft travel speeds, the corresponding ground taxi times. Each aircraft is assigned a terminal/apron location to which the aircraft proceeds after landing and where servicing (e.g., baggage handling, fueling, catering, etc.) is conducted. The aircraft then departs from the same terminal/apron for a takeoff runway end. For the air quality analysis, the taxiway assignments will be based on the common and forecast routing paths that ground traffic controllers are known to assign and airfield simulation modeling.

Analysis Scenarios

For the emissions inventory, in order to determine the proposed project-related operational impacts associated with air pollutant emissions, the total emissions associated with the proposed project that will occur in Phase 1 and Phase 2 including other aircraft operations not associated with the project will be compared to the 2021 baseline emissions. The difference between these two conditions will be used to determine the significance of the proposed project when compared to the SCAQMD thresholds.

- Year 2025 with project operations compared to the 2021 baseline condition
- Year 2029 with project operations compared to the 2021 baseline condition

However, this comparison will be influenced by factors that are not attributable to the project itself. Specifically, the comparison will contain future aircraft operations from background growth that are projected to occur with or without the proposed project. In order to remove the contribution of background growth, for CEQA purposes, a second comparison will be provided for the proposed future project and the proposed future without project. This comparison will be made for informational purposes only and in which the significance of the project impacts will not be based.

- Year 2025 with project operations compared to the Year 2025 without project operations
- Year 2029 with project operations compared to the Year 2029 without project operations

For the air dispersion modeling, in order to evaluate impacts associated with the proposed project in isolation (i.e., without including impacts associated with existing airport operations), concentrations associated with the 2021 baseline condition will be subtracted from future year with project concentrations (i.e., project-related concentrations). Then, in order to determine the total concentrations for CO, SO_2, and NO_2, these project-related concentrations will be added to a background concentration (i.e., representing other nearby emission sources not associated with the airport or the project) based on nearby existing ambient monitoring station(s). For CO, SO_2, and NO_2, these total concentrations will be compared to the California and National AAQS. Per SCAQMD guidance, the project-related concentrations of PM_{10} and $PM_{2.5}$ will be compared to the

SCAQMD significance thresholds for PM_{10} and $PM_{2.5}$ (without adding background concentrations).

- Year 2025 with project operations compared to the 2021 baseline condition
- Year 2029 with project operations compared to the 2021 baseline condition

As with the emissions results, a second comparison will be made in order to remove the influence of background airport growth by comparing the concentrations from future year with proposed project and the future year without proposed project. This comparison will be made for informational purposes only and in which the significance of the project impacts will not be based.

- Year 2025 with project operations compared to the Year 2025 without project operations
- Year 2029 with project operations compared to the Year 2029 without project operations

Under SCAQMD's guidance, "projects that exceed the project-specific significance thresholds are considered by SCAQMD to be cumulatively considerable. Conversely, projects that do not exceed the project-specific thresholds are generally not considered to be cumulatively significant." Consistent with this guidance, the potential for the proposed project to results in cumulative impacts from regional emissions will be assessed based on SCAQMD thresholds through a qualitative discussion.

6. HEALTH RISK ASSESSMENT

Hazardous Air Pollutants (HAP) comprise gaseous organic and inorganic chemicals and particulate matter with known or suspected potential to cause cancer (carcinogenic) or other serious health effects (non-carcinogenic). They are commonly emitted by a wide range of airport and non-airport sources, including aircraft, ground support equipment, motor vehicles, home furnaces, evaporating fuel and paints, wood burning, carpets, dry-cleaning of clothing, and industrial facilities.

For most airport emission inventories, formaldehyde occurs in the greatest amounts followed by acetaldehyde, acrolein, and 1,3-butadiene. These compounds are emitted in the exhaust of aircraft, APU, GSE, and ground access vehicles and, to a lesser extent, from boilers, fuel facilities, and other stationary sources. Compounds such as benzene, ethylbenzene, naphthalene, toluene, hexane, styrene, and xylene also occur, but in far lesser amounts.

The USEPA and the FAA developed organic gas speciation profiles and best practices for use in HAP emission inventories of aircraft equipped with turbofan, turbojet, and turboprop engines fueled with kerosene-based jet-A fuel. The development of these profiles and guidance was the combined work of both agencies, taking into account the most recent data and information available.

- *Recommended Best Practice for Quantifying Speciated Organic Gas Emissions from Aircraft Equipped with Turbofan, Turbojet, and Turboprop Engines.*[37]

  The aircraft-related speciation profile developed from this initiative was used to update the organic gas profile for aircraft in the USEPA SPECIATE database – the agency's multi-sector repository for such data. In this application, a *speciation profile* is the amount of organic gases emitted based on the amount of VOC emitted by an emission source.

The FAA also published a document providing an approach to, and technical guidance for, preparing speciated organic gas emission inventories for airport sources.

- *Guidance for Quantifying Speciated Organic Gas Emissions from Airport Sources.*[38]

  This guidance is intended to help ensure that OG/HAPs emission inventories prepared in support of environmental documents prepared by, or on behalf of, the FAA are done so consistently. Importantly, it points out that emission inventories of aviation-related organic gases; which include the organic gases identified by the USEPA to be HAP and the organic gases listed in the USEPA Integrated Risk Information System, are not required by current USEPA regulations. However, in those cases where it is necessary to prepare an aviation-related HAP emissions inventory, the inventory must be prepared following this guidance and using AEDT.

AEDT calculates emissions for approximately 400 different air toxics. Of these air toxics approximately 45 compounds are classified as HAP.

The health risk assessment will focus on potential impacts on any existing residences and other sensitive populations located near to the Project site from emissions of toxic air contaminants (TAC)[39] such as diesel particulate matter (DPM)[40] emissions from construction equipment and haul trucks associated with the proposed project construction activities as well as air toxics emissions from aircraft. The HRA will be conducted to determine the health impacts, in terms of excess cancer risk and noncancer hazards, using the significance levels identified by the

[37] Federal Aviation Administration and United States Environmental Protection Agency, *Recommended Best Practice for Quantifying Speciated Organic Gas Emissions from Aircraft Equipped with Turbofan, Turbojet, and Turboprop Engines (Version 1.0)*, May 2009, http://www.epa.gov/nonroad/aviation/420r09901.pdf

[38] Federal Aviation Administration, *Guidance for Quantifying Speciated Organic Gas Emissions from Airport Sources,* Version 1, September 2, 2009, http://www.faa.gov/regulations_policies/policy_guidance/envir_policy/media/Guidance%20for%20Quantifying%20Speciated%20Organic%20Gas%20Emissions%20from%20Airport%20Sources.pdf

[39] Toxic air contaminants (TAC) are a broad class of compounds known to cause morbidity or mortality. TAC are found in ambient air, especially in urban areas, and are caused by industry, agriculture, fuel combustion, and commercial operations (e.g., gasoline service stations, dry cleaners). TAC are typically found in low concentrations, even near their source (e.g., diesel particulate matter near a freeway). Because chronic exposure can result in adverse health effects, TAC are regulated at the regional, state, and Federal level.

[40] In 1998, the California Air Resources Board classified diesel particulate matter as a toxic air contaminant, citing its potential to cause cancer and other health problems. The United States Environmental Protection Agency concluded that long-term exposure to diesel engine exhaust is likely to pose a lung cancer hazard to humans and can also contribute to other acute and chronic health effects.

SCAQMD.[41] The HRA will be prepared based on the California Office of Environmental Health Hazard Assessment (OEHHA)'s *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*.[42]

7. GREENHOUSE GAS EMISSIONS

GHG emissions associated with aviation are principally in the form of CO_2 and are generated by aircraft, APU, GSE, motor vehicles and an assortment of stationary sources. For the most part, CO_2 emissions from these sources arise from the combustion of fossil fuels (e.g., jet fuel, avgas, diesel, gasoline, and compressed natural gas) and are emitted as by-products contained in the engine exhausts. Other GHG associated with airport operations include methane and nitric oxides, water vapor, soot, and sulfates - but are emitted by airports to a far lesser extent than CO_2.

Fuel burn and GHG emissions will be calculated in much the same way as criteria air pollutants using AEDT. Input data included activity levels or material throughput (i.e., fuel use, vehicle miles traveled, electrical consumption, etc.). Appropriate emission factors will be applied to the input data (i.e., in units of GHG emissions per gallon of fuel).

Subject: South Airport Cargo Center Project – Mobile Carbon Monoxide Hot Spot Analysis

INTRODUCTION

This memorandum provides a mobile carbon monoxide (CO) analysis for the proposed South Airport Cargo Center Project (Project) to be incorporated into the Project's air quality impact report. Specifically, this analysis determines whether the Project will have a significant impact due to release of emissions from motor vehicles. These releases may create localized concentrations or air toxics "hot spots" where emissions from specific sources may expose individuals and population groups to elevated risks of adverse health effects, including, but not limited to, cancer and contribute to the cumulative health risks of emissions from other sources in the area.

The Project Site consists of approximately 97 acres located at Ontario International Airport (Airport) in the City of Ontario, San Bernardino County. The Project Site includes portions of Assessor Parcel Numbers (APN) 11326106, 11326107, 11326108, 11327101, and 11327102, located in the southern half of the Airport, immediately west of the Cucamonga Canyon Channel and north of Mission Boulevard. The Project would replace existing, underutilized airport related buildings and site improvements with an air cargo center. The Project would include demolition of the existing buildings, site improvements, and the development of a new air cargo center in two phases. Phase 1 would take place on the easternmost 60 acres of the Project site, and Phase 2 would occur on the remaining western 30 acres. A transportation study was prepared for the Project and identified 36 study intersections within the vicinity of the Project Site.[1]

A CALINE Modeling Results

[1] Fehr and Peers, Ontario International Airport Cargo Center Draft Transportation Impact Study, June 2022.

METHODOLOGY

Localized CO concentrations associated with motor vehicle travel on area roadways were evaluated using a screening method based on the California Line Source Dispersion Model (CALINE-4) microscale dispersion model, developed by Caltrans, in combination with EMFAC 2021 emission factors for future year (2040). In traffic studies, the term "level of service" (LOS) describes traffic performance at roadway intersections and is generally expressed as a letter grade (A through F, with an F grade reflecting highly congested traffic conditions).

To establish a more accurate record of baseline CO concentrations affecting the Basin, a CO "hot spot" analysis was conducted in 2003 for four busy intersections in Los Angeles at the peak morning and afternoon time periods. The busiest intersection evaluated was at Wilshire Boulevard and Veteran Avenue, which has a daily traffic volume of approximately 100,000 vehicles per day. The SCAQMD 2003 AQMP estimated that the 1-hour concentration for this intersection was 4.6 ppm, which indicates that the most stringent 1-hour CO standard (20.0 ppm) would likely not be exceeded until the daily traffic at the intersection exceeded more than 400,000 vehicles per day.[2] Additionally, the SCAQMD also recommends an evaluation of potential localized CO impacts when a project causes the LOS at a study intersection to worsen from C to D, or if a project increases the V/C ratio at any intersection rated D or worse by 2 percent or more.

As provided in the Projects Draft Transportation Impact Study[3], the following traffic forecasts for each scenario, with and without project alternatives, were prepared and LOS was calculated to identify intersection operational deficiencies:

- Under Existing (2021) Conditions, the intersection of Mission Boulevard and Bon View Avenue operates below acceptable LOS policies.
- Under Opening Year (2024) plus Phase 1 Project Conditions, two intersections are forecast to operate below acceptable LOS per City's policies. Although these intersections would operate below LOS standards, the Project will not degrade the intersections or add additional delay to those intersections.
- Under Opening Year (2029) plus Phase 1 and Phase 2 Project Conditions, two intersections are forecast to operate below acceptable LOS. The addition of Project traffic was forecast to add delay to one intersection already operating at LOS E or worse. Infrastructure improvements are recommended to bring operations at that location to better than pre-Project conditions.
- Under Cumulative Year (2040) plus Phase 1 and Phase 2 Project Conditions, three intersections are forecast to operate below acceptable LOS. The addition of project traffic was forecast to add delay at three intersections already operating at LOS E or worse. Infrastructure improvements are recommended to bring operations at that location to better than pre-Project conditions.

None of the Project's studied intersections would exceed 400,000 vehicles per day. Additionally, none of the Project's study intersections worsen from C to D or increase the V/C ratio at any intersection

[3] Fehr and Peers, Ontario International Airport Cargo Center Draft Transportation Impact Study, June 2022.

rated D or worse by 2 percent or more. As such, the Project would not produce the volume of traffic required to generate a CO hot spot in the context of the 2003 AQMP hot spot study.

To further support this conclusion, CO concentration levels were forecasted at the Project's three most potentially impacted intersections using the CALINE-4 dispersion model developed by Caltrans, peak-hour traffic volumes, and conservative meteorological assumptions. The following intersections were evaluated because the Project's transportation study found that they would operate below LOS standards (i.e. LOS E/F):

1. Euclid Avenue/SR-83 at Mission Boulevard
2. Bon View Avenue at Mission Boulevard
3. Airport Drive at Haven Avenue

RESULTS

As mentioned previously, the three most potentially impacted intersections based on the SCAQMD criteria described above were forecasted using the CALINE-4 dispersion model. As shown in the table below, Project-generated traffic volumes are forecasted to have a negligible effect on the projected 1-hour and 8-hour CO concentrations at each of the three intersection locations analyzed. Thus, the Project would not cause any new or exacerbate any existing CO hot spots, and, as a result, health impacts related to localized mobile-source CO emissions would not be considered significant.

	PM	2.9	2.9	**No**	1.4	1.4	**No**

*Source: Emission factor and dispersion modeling output sheets are provided in **Attachment A***

[a] *Project contribution to local CO impacts were calculated based on peak hour trip generation rates provided in the Ontario International Airport South Airport Cargo Center Draft Transportation Impact Study for both the future and future plus Project AM and PM peak hours.*

[b] *SCAQMD 1-hour ambient background concentration (2.7 ppm) + 2040 Future No Project Conditions.*

[c] *SCAQMD 1-hour ambient background concentration (2.7 ppm) + 2040 Future Plus Phase 1 and Phase 2 Project Conditions.*

[d] *The most restrictive standard for 1-hour CO concentrations is 20 ppm and for 8-hour concentrations is 9.0 ppm.*

[e] *SCAQMD 8-hour ambient background concentration (1.2 ppm) + 2040 Future No Project Conditions.*

[f] *SCAQMD 8-hour ambient background concentration (1.2 ppm) + 2040 Future Plus Phase 1 and Phase 2 Project Conditions.*

Note: ppm = parts per million.

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Off-road Equipment - Project proponent, December 15, 2021

Off-road Equipment - Project proponent, December 15, 2021

Off-road Equipment - Project proponent, December 15, 2021

Off-road Equipment - Project proponent, December 15, 2021

Trips and VMT - Project Description

Demolition - CHA, November 22, 2021, Updated November 10, 2022

Grading - Project Description

Vehicle Trips - Motor vehicle emissions estimated externally

Energy Use - Calculations due to electrical usage are performed outside of the model and project would not use natural gas.

Construction Off-road Equipment Mitigation - Basic and Enhanced Emission Reduction Measures

Energy Mitigation -

Trips and VMT - Project Description

Ontario International Airport South Airport Cargo Center Project - Phase 2 - South Coast Air Basin, Summer

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Demolition - CHA, November 22, 2021, Updated November 10, 2022

Grading - Project Description

Vehicle Trips - Motor vehicle emissions estimated externally

Energy Use - Calculations due to electrical usage are performed outside of the model and project would not use natural gas.

Construction Off-road Equipment Mitigation - Basic and Enhanced Emission Reduction Measures

Energy Mitigation -

Off-road Equipment - Project proponent, December 15, 2021

Trips and VMT - Project Description

Ontario International Airport South Airport Cargo Center Project - Phase 2 - South Coast Air Basin, Winter

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Demolition - CHA, November 22, 2021, Updated November 10, 2022

Grading - Project Description

Vehicle Trips - Motor vehicle emissions estimated externally

Energy Use - Calculations due to electrical usage are performed outside of the model and project would not use natural gas.

Construction Off-road Equipment Mitigation - Basic and Enhanced Emission Reduction Measures

Energy Mitigation -

Attachment C

Health Risk Assessment Methodology and Assumptions

A health risk assessment (HRA) is accomplished in four steps: 1) hazards identification, 2) exposure assessment, 3) toxicity assessment, and 4) risk characterization. These steps cover the estimation of air emissions, the estimation of the air concentrations resulting from a dispersion analysis, the incorporation of the toxicity of the pollutants emitted, and the characterization of the risk based on exposure parameters such as breathing rate, age adjustment factors, and exposure duration; each depending on receptor type (i.e., residence, school, daycare centers, hospitals, senior care facilities, recreational areas, adult, infant, child, including onsite workers within the passenger terminal areas).

This HRA was conducted in accordance with technical guidelines developed by federal, state, and regional agencies, including United States Environmental Protection Agency (USEPA) *Guideline on Air Quality Models*[1], California Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[2], the South Coast Air Quality Management District (SCAQMD) *AB 2588 and Rule 1402 Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics "Hot Spots" Information and Assessment Act,*[3] and SCAQMD's *Risk Assessment Procedures for Rule 1401, 1401.1 and 212.*[4] This HRA addresses the emissions from construction activities (nonroad equipment at the project site and off-site truck travel along nearby roadways) with a specific focus is on diesel particulate matter (DPM) emissions. This HRA also addresses air toxic emissions from aircraft operations.

An HRA should not be interpreted as the expected rates of cancer or other potential human health effects, but rather as estimates of potential risk or likelihood of adverse effects based on current knowledge, under several highly conservative assumptions and the best assessment tools currently available.

TERMS AND DEFINITIONS

As the practice of conducting an HRA is particularly complex and involves concepts that are not altogether familiar to most people, several terms and definitions are provided that are considered essential to the understanding of the approach, methodology and results:

Acute effect – a health effect (non-cancer) produced within a short period of time (few minutes to several days) following an exposure to toxic air contaminants (TAC).

Cancer risk – the probability of an individual contracting cancer from a lifetime (i.e., 70 year) exposure to TAC such as DPM in the ambient air based on an exposure duration of 30 years.

Chronic effect – a health effect (non-cancer) produced from a continuous exposure occurring over an extended period of time (weeks, months, years).

Hazard Index (HI) – the unitless ratio of an exposure level over the acceptable reference dose. The HI can be applied to multiple compounds in an additive manner.

Hazard Quotient (HQ) – the unitless ratio of an exposure level over the acceptable reference dose. The HQ is applied to individual compounds.

Toxic Air Contaminants – any air pollutant that can cause short-term (acute) and/or long-term (chronic or carcinogenic, i.e., cancer causing) adverse human health effects (i.e., injury or illness). The current California list of TAC identify approximately 200 compounds, including particulate emissions from diesel-fueled engines.

Human Health Effects - comprise disorders such as eye watering, respiratory or heart ailments, and other (i.e., non-cancer) related diseases.

Health Risk Assessment – an analysis designed to predict the generation and dispersion of TAC in the outdoor environment, evaluate the potential for exposure of human populations, and to assess and quantify both the individual and population-wide health risks associated with those levels of exposure.

Incremental – under CEQA, the net difference (or change) in conditions or impacts when comparing the baseline to future year project conditions.

Maximum exposed individual (MEI) – an individual assumed to be located at the point where the highest concentrations of TAC, and therefore, health risks are predicted to occur.

Non-cancer risks – health risks such as eye watering, respiratory or heart ailments, and other non-cancer related diseases.

Receptors – the locations where potential health impacts or risks are predicted (i.e., schools, residences, and recreational sites).

LIMITATIONS AND UNCERTAINTIES

There are several important limitations and uncertainties commonly associated with a HRA due to the wide variability of human exposures to TAC, the extended timeframes over which the exposures are evaluated, and the inability to verify the results. Limitations and uncertainties associated with a HRA include: (a.) lack of reliable monitoring data; (b.) extrapolation of toxicity data in animals to humans; (c.) estimation errors in calculating TAC emissions; (d.) concentration prediction errors with dispersion models; and (e.) the variability in lifestyles, fitness and other confounding factors of the human population. This HRA was performed in accordance with USEPA, OEHHA, and SCAQMD guidance and requirements, notwithstanding the following uncertainties:

- There are uncertainties associated with the estimation of emissions from project activities. Where project-specific data, such as emission factors, are not available, default assumptions in emission models were used.

- The limitations of the air dispersion model provide a source of uncertainty in the estimation of exposure concentrations. According to USEPA, errors due to the limitation of the algorithms implemented in the air dispersion model in the highest estimated concentrations of +/- 10 percent to 40 percent are typical.[5]

- The source parameters used to model emission sources add uncertainty. For all emission sources, the source parameters used source-specific, recommended as defaults, or expected to produce more conservative results. Discrepancies might exist in actual emissions characteristics of an emission source and its representation in the dispersion model.

- The exposure duration estimates do not consider that people do not usually reside at the same location for 30 years and that other exposures (i.e., school children) are also of much shorter durations than was assumed in this HRA. This exposure duration is a highly conservative assumption since most people do not remain at home all day and on average residents change residences every 11 to 12 years. In addition, this assumption adopts that residents are experiencing outdoor concentrations for the entire exposure period. A school child exposure

[5] United States Environmental Protection Agency, *Guideline on Air Quality Models (Revised), 40 Code of Federal Regulations, Part 51, Appendix W,* November 2005.

duration is between ages 2 and 16 years old, which again is conservative because the elementary, middle, and high school are not often located at the same location.

- For the risk and hazards calculations as well as the cumulative health impact, numerous assumptions must be made to estimate human exposure to pollutants. These assumptions include parameters such as breathing rates, exposure time and frequency, exposure duration, and human activity patterns. While a mean value derived from scientifically defensible studies is the best estimate of central tendency, most of the exposure variables used in this HRA are high-end estimates. The combination of several high-end estimates used as exposure parameters may substantially overestimate pollutant intake. The excess lifetime cancer risks calculated in this HRA are therefore likely to be higher than may be required to be protective of public health.

- The OEHHA cancer potency factor for DPM was used to estimate cancer risks associated with exposure to DPM emissions from construction activities. However, the cancer potency factor derived by OEHHA for DPM is highly uncertain in both the estimation of response and dose. In the past, due to inadequate animal test data and epidemiology data on diesel exhaust, the International Agency for Research on Cancer (IARC), a branch of the World Health Organization, had classified DPM as Probably Carcinogenic to Humans (Group 2); the USEPA had also concluded that the existing data did not provide an adequate basis for quantitative risk assessment.[6] However, based on two recent scientific studies,[7] IARC recently re-classified DPM as Carcinogenic to Humans to Group 1,[8] which means that the agency has determined that there is "sufficient evidence of carcinogenicity" of a substance in humans and represents the strongest weight-of-evidence rating in IARC carcinogen classification scheme. This determination by the IARC may provide additional impetus for the USEPA to identify a quantitative dose-response relationship between exposure to DPM and cancer.

In summary, the estimated health impacts are based primarily on a series of conservative assumptions related to predicted environmental concentrations, exposure, and chemical toxicity. The use of conservative assumptions tends to produce upper-bound estimates of risk. The USEPA notes that the conservative assumptions used in a HRA are intended to assure that the estimated risks do not

underestimate the actual risks posed by a site and that the estimated risks do not necessarily represent actual risks experienced by populations at or near a site.[9]

HAZARDS IDENTIFICATION

Diesel exhaust is a complex mixture of numerous individual gaseous and particulate compounds emitted from diesel-fueled combustion engines. Diesel particulate matter is formed primarily through the incomplete combustion of diesel fuel. DPM is removed from the atmosphere through physical processes including atmospheric fall-out and washout by rain. Humans can be exposed to airborne DPM by deposition on water, soil, and vegetation, although the main pathway of exposure is inhalation. Cal/EPA has concluded that potential cancer risk from inhalation exposure to whole diesel exhaust outweigh the multi-pathway cancer risk from the speciated components.

In August 1998, the CARB identified DPM as an air toxic. CARB developed the *Risk Reduction Plan to Reduce Particulate Matter Emissions from Diesel- Fueled Engines and Vehicles* and *Risk Management Guidance for the Permitting of New Stationary Diesel-Fueled Engines* and approved these documents on September 28, 2000.[10,11] The documents represent proposals to reduce DPM emissions, with the goal of reducing emissions and the associated health risk by requiring the use of state-of-the-art catalyzed DPM filters and ultra-low-sulfur diesel fuel.

In 2001, CARB assessed the state-wide health risks from exposure to diesel exhaust and to other toxic air contaminants. It is difficult to distinguish the health risks of diesel emissions from those of other air toxics, since diesel exhaust contains approximately 40 different air toxics. The CARB study detected diesel exhaust by using ambient air carbon soot measurements as a surrogate for diesel emissions. The study reported that the state-wide cancer risk from exposure to diesel exhaust was about 540 per million population as compared to a total risk for exposure to all ambient air toxics of 760 per million. This estimate, which accounts for about 70 percent of the total risk from TAC, included both urban and rural areas in the state. The estimate can also be considered an average worst-case for the state, since it assumes constant exposure to outdoor concentrations of diesel exhaust and does not account for expected lower concentrations indoors, where most of time is spent. DPM is estimated to increase statewide cancer risk by 520 cancers per million residents exposed over a lifetime.[12]

Exposure to DPM results in a greater incidence of chronic non-cancer health effects, such as cough, labored breathing, chest tightness, wheezing, and bronchitis. Individuals particularly vulnerable to DPM are children, whose lung tissue is still developing, the elderly and people with illnesses who may have other serious health problems that can be aggravated by exposure to DPM. In general, children are more vulnerable than adults to air pollutants because they have higher inhalation rates, narrower airways, and less mature immune systems. In addition, children with allergies may have an enhanced allergic response when exposed to diesel exhaust.

The FAA's Aviation Emissions and Air Quality Handbook, Chapter 6,[13] lists potential HAP included in the aircraft emissions inventory. Formaldehyde is emitted in the greatest amount, followed by acetaldehyde, acrolein, benzene, methyl alcohol, and 1,3-butadiene.

EXPOSURE PARAMETERS

Exposure to airborne chemicals occurs through inhalation and subsequent absorption into the body, potentially resulting in adverse health effects depending on toxicological properties of the chemical and other exposure parameters. This HRA was conducted in accordance with technical guidelines developed by federal, state, and regional agencies, including U.S. Environmental Protection Agency (USEPA), California Environmental Protection Agency (CalEPA), California Office of Environmental Health Hazard Assessment (OEHHA) *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*[14], the SCAQMD *AB 2588 and Rule 1402 Supplemental Guidelines for Preparing Risk Assessments for the Air Toxics "Hot Spots" Information and Assessment Act,*[15] and SCAQMD's *Risk Assessment Procedures for Rule 1401, 1401.1 and 212*.[16]

OEHHA's revisions to its *Guidance Manual* were primarily designed to ensure that the greater sensitivity of children to cancer and other health risks is reflected in HRAs. For example, OEHHA now recommends that risks be analyzed separately for multiple age groups, focusing especially on young children and teenagers, rather than the past practice of analyzing risks to the general population, without distinction by age. OEHHA also now recommends that statistical "age sensitivity factors" be incorporated into a HRA, and that children's relatively high breathing rates be accounted for. On the other hand, the

[16] South Coast Air Quality Management District, *Risk Assessment Procedures for Rule 1401, 1401.1 and 212*, September 1, 2017, http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12

Guidance Manual revisions also include some changes that would reduce calculated health risks. For example, under the former guidance, OEHHA recommended that residential cancer risks be assessed by assuming 70 years of exposure at a residential receptor; under the *Guidance Manual*, this assumption is lessened to 30 years. This is based on studies showing that 30 years is a reasonable estimate of the 90th to 95th percentile of residency duration in the population. Therefore, the health risk assessment provides that a receptor's exposure to a project's emissions for up to 30 years and that the cancer rick is then determined based on a 30-year lifetime for that receptor.

Scientific data have shown that young animals are more sensitive than adult animals to exposure to many carcinogens. Therefore, OEHHA developed age sensitivity factors (ASF) to consider the increased sensitivity to carcinogens during early-in-life exposures. OEHHA recommends that cancer risks be weighted by a factor of 10 for exposures that occur from the third trimester of pregnancy to 2 years of age, by a factor of 3 for exposures from 2 years through 16 years of age, and by a factor of 1 for exposures from 16 years through 30 years of age.

OEHHA and SCAQMD have developed exposure factors (e.g., daily breathing rates) for four age groups including the third trimester to birth, birth to 2 years, 2 to 16 years, and 16 to 30 years. These age bins allow for more refined exposure information to be used when estimating exposure and the potential for developing cancer over a lifetime. This means that exposure variates are needed for the third trimester, ages zero to less than two, ages two to than 16, and ages 16 to 30. Residential receptors utilize the 95th percentile breathing rate values. For residential exposures, the high-end daily breathing rates (e.g., 95th percentile) for children from the third trimester through age 2, and 80th percentile daily breathing rates for all other ages are recommended. The age-specific breathing rates for the four age groups are 361 liters per kilogram-day for third trimester, 1,060 liters per kilogram-day for ages less than 2 years, 572 liters per kilogram-day for ages 2 to 16 years, and 261 liters per kilogram-day for ages 16 to 30 years. A school child (age 2 to 9 years) breathing rate is 631 liters per kilogram-day and an off-site and onsite worker breathing rate is 230 liters per kilogram-day.[17] [18]

Based on OEHHA recommendations, the cancer risk to residential receptors assumes exposure occurs 24 hours per day for 350 days per year while accounting for a percentage of time at home. OEHHA evaluated information from activity pattern databases to estimate the fraction of time at home (FAH) during the day.

---

[17] Office of Environmental Health Hazard Assessment, *Air Toxics Hot Spots Program Guidance Manual for Preparation of Health Risk Assessments*, March 6, 2015, http://oehha.ca.gov/air/hot_spots/hotspots2015.html.

[18] South Coast Air Quality Management District, *Risk Assessment Procedures for Rule 1401, 1401.1 and 212*, September 1, 2017, http://www.aqmd.gov/docs/default-source/permitting/rule-1401-risk-assessment/riskassessproc-v8-1.pdf?sfvrsn=12.

This information is used to adjust cancer risk from a project's emissions, assuming that exposure to the project's emissions is not occurring away from home. A FAH factor of 1.0 applies for the offsite workers since the offsite worker is assumed to be present for a typical eight-hour workday compared to the 8-hour construction schedule. In general, the FAH factors are age-specific and are 0.85 for ages less than 2 years, 0.72 for ages 2 to 16 years, and 0.73 for ages 16 to 30 years. However, SCAQMD recommends the FAH is assumed to be 1 for ages third trimester to age 16. As a conservative assumption, children are assumed to attend a daycare or school near their home and no discount should be taken for time spent outside of the area affected by the project's emissions.[19] [20]

Based on OEHHA recommendations, for children at school sites, exposure is assumed to occur 10 hours per day for 180 days (or 36 weeks) per year. Cancer risk estimates for children at school sites are calculated based on nine-year exposure duration. School sites also include teachers and other adult staff which are treated as off-site workers. For occupational receptors, SCAQMD guidance suggests that the exposure be based on 8 hours per day, 5 days per week, 250 working days per year, and a 25-year working lifetime. This is a conservative assumption since most people do not remain at the same job for 25 years. For worker exposures, it is assumed that the working age begins at 16 years, and that exposures to project emissions occur during the work shift which is typically up to eight hours per day during workdays. Given the exposure durations of less than 24 hours, sensitive recreational receptors were evaluated for acute impacts only.[21] [22]

Table C-1 presents a summary of the health risk assessment exposure factors.

RECEPTOR LOCATIONS

Some receptors are considered more sensitive to air pollutants than others, because of preexisting health problems, proximity to the emissions source, or duration of exposure to air pollutants. Land uses such as primary and secondary schools, hospitals, and convalescent homes are considered to be relatively sensitive to poor air quality because the very young, the old, and the infirm are more susceptible to respiratory infections and other air quality-related health problems than the general public. **Attachment A** of this technical report provides detailed information about receptor locations.

RISK CHARACTERIZATION

Cancer risk is defined as the lifetime probability of developing cancer from exposure to carcinogenic substances. Cancer risks are expressed as the chance in one million of getting cancer (i.e., number of cancer cases among one million people exposed). The cancer risks are assumed to occur exclusively through the inhalation pathway. The cancer risk can be estimated by using the cancer potency factor (milligrams per kilogram of body weight per day [mg/kg-day]), the 30-year annual average concentration (microgram per cubic meter [µg/m^3]), and the lifetime exposure adjustment based on a 30-year exposure duration.

Following guidelines established by OEHHA, the incremental cancer risks attributable to the proposed project were calculated by applying exposure parameters to modeled DPM concentrations in order to determine the inhalation dose (mg/kg-day) or the amount of pollutants inhaled per body weight mass per day. The cancer risks occur exclusively through the inhalation pathway; therefore, the cancer risks can be estimated from the following equation:

$$\text{Dose-inh} = \underline{C_{air} * \{DBR\} * A * ASF * FAH * EF * ED * 10^{-6}}$$

AT

where:

Dose-inh = Dose of the toxic substance through inhalation in mg/kg-day

10^{-6} = Micrograms to milligrams conversion, Liters to cubic meters conversion

C_{air} = Concentration in air in microgram (µg)/cubic meter (m^3)

DBR = Daily breathing rate in liter (L)/kg body weight – day

A = Inhalation absorption factor, 1.0

ASF = Age Sensitivity Factor

EF = Exposure frequency (days/year)

ED = Exposure duration (years)

FAH = Fraction of Time at Home

AT = Averaging time period over which exposure is averaged in days (25,550 days based on a 30-year exposure duration)

To determine incremental cancer risk, the estimated inhalation dose attributed to the proposed project was multiplied by the cancer potency slope factor (cancer risk per mg/kg-day). The cancer potency slope factor is the upper bound on the increased cancer risk from a lifetime exposure to a pollutant. These slope factors are based on epidemiological studies and are different values for different pollutants. This allows the estimated inhalation dose to be equated to a cancer risk.

Non-cancer adverse health impacts, acute (short-term) and chronic (long-term), are measured against a hazard index (HI), which is defined as the ratio of the predicted incremental exposure concentration from the proposed project to a published reference exposure level (REL) that could cause adverse health effects as established by OEHHA. The ratio (referred to as the Hazard Quotient [HQ]) of each non-carcinogenic substance that affects a certain organ system is added to produce an overall HI for that organ system. The overall HI is calculated for each organ system. If the overall HI for the highest-impacted organ system is greater than one, then the impact is significant.

The HI is an expression used for the potential for non-cancer health effects. The relationship for the non-cancer health effects is given by the annual concentration (in µg/m^3) and the REL (in µg/m^3). The acute

hazard index was determined using the "simple" concurrent maximum approach, which tends to be conservative (i.e., overpredicts).

The relationship for the non-cancer health effects is given by the following equation:

$$HI = C/REL$$

Where:

HI = Hazard index; an expression of the potential for non-cancer health effects.

C = Annual average concentration ($\mu g/m^3$) during the 30-year exposure period.

REL = Concentration at which no adverse health effects are anticipated.

The concentration level at or below which no adverse non-cancer health effects are anticipated for a specified exposure duration is termed the REL. REL are based on the most sensitive, relevant, adverse health effect reported in the medical and toxicological literature. REL are designed to protect the most sensitive individuals in the population by the inclusion of margins of safety. Since margins of safety are incorporated to address data gaps and uncertainties, exceeding the REL does not automatically indicate an adverse health impact.[23] **Table C-2** displays the toxicity values for the pollutants of concern associated with the proposed project construction (as in diesel particulate matter) and operations (other air toxics).

Table C-2
Health Risk Assessment Toxicity Values

Compound	Inhalation Slope Factor $(mg/kg\text{-}day)^{-1}$	Acute REL ($\mu g/m^3$)	Chronic REL ($\mu g/m^3$)
DPM	1.1	-	5.0

The USEPA and FAA developed organic gas speciation profiles and best practices for use in preparing HAP emission inventories of aircraft with turbofan, turbojet, and turboprop engines fueled with kerosene-based jet-A fuel. These profiles and guidance were developed in tandem by both agencies, considering the most recent data and information available.

> Recommended Best Practice for Quantifying Speciated Organic Gas Emissions from Aircraft Equipped with Turbofan, Turbojet, and Turboprop Engines.[24]
>
> The aircraft-related speciation profile developed from this initiative was used to update the organic gas profile for aircraft in the USEPA SPECIATE database—the agency's multi-sector repository for such data. In this application, a *speciation profile* is the amount of organic gases emitted based on the amount of VOC emitted by an emission source.

FAA also published a document providing an approach to, and technical guidance for, preparing speciated organic gas emissions inventories for airport sources.

> Guidance for Quantifying Speciated Organic Gas Emissions from Airport Sources.[25]
>
> This guidance is intended to help ensure that OG/HAP emission inventories prepared in support of environmental documents prepared by, or on behalf of, the FAA are done so consistently. Importantly, it points out that emission inventories of aviation-related organic gases, which include the organic gases identified by the USEPA to be HAP and the organic gases listed in the USEPA's Integrated Risk Information System, are not

---

24 Federal Aviation Administration, Recommended Best Practice for Quantifying Speciated Organic Gas Emissions from Aircraft Equipped with Turbofan, Turbojet, and Turboprop Engines (Version 1.0), May 2009, http://www.epa.gov/nonroad/aviation/420r09901.pdf

25 Federal Aviation Administration, Guidance for Quantifying Speciated Organic Gas Emissions from Airport Sources, Version 1, September 2, 2009, http://www.faa.gov/regulations_policies/policy_guidance/envir_policy/media/Guidance%20for%20Quantifying%20Speciated%20Organic%20Gas%20Emissions%20from%20Airport%20Sources.pdf

required by current USEPA regulations. However, in those cases where it is necessary to prepare such an aviation-related HAP emissions inventory, the inventory must be prepared following this guidance and using AEDT.

Aircraft emissions for each phase of aircraft movement and each year/scenario for the proposed project using the FAA's AEDT. Emissions of air toxics from jet/turbine powered aircraft were calculated from the VOC emissions and the speciated fraction of air toxics in jet/turbine VOC in the USEPA's *Recommended Best Practice for Quantifying Speciated Organic Gas Emissions from Aircraft Equipped with Turbofan, Turbojet, and Turboprop Engines*. The aircraft mass fraction of each evaluated air toxics is shown in **Table C-3**. The values are the mass fraction for total hydrocarbon (THC) emissions. For the health risk assessment, the VOC concentrations were determined using AEDT/AERMOD. Therefore, to convert to VOC emissions multiple by 0.8534 (or THC to TOG of 1.16 and TOG to VOC of 0.99).[26] HAP emissions were determined via AEDT and VOC mass fraction are based on the AEDT VOC emissions and the individual HAP emissions.

Table C-3
Aircraft Air Toxics Emissions Mass Fraction for Turbofan, Turbojet, and Turboprop Engines

Compound	Aircraft Emission THC Mass Fraction	Aircraft Emission VOC Mass Fraction
Acetaldehyde	0.04272	0.03646

26 Federal Aviation Administration, Recommended Best Practice for Quantifying Speciated Organic Gas Emissions from Aircraft Equipped with Turbofan, Turbojet, and Turboprop Engines (Version 1.0), May 2009, http://www.epa.gov/nonroad/aviation/420r09901.pdf

Source: Federal Aviation Administration, Recommended Best Practice for Quantifying Speciated Organic Gas Emissions from Aircraft Equipped with Turbofan, Turbojet, and Turboprop Engines (Version 1.0), May 2009, http://www.epa.gov/nonroad/aviation/420r09901.pdf and Federal Aviation Administration, Aviation Environmental Design Tool (AEDT) User's Manual, March 29, 2021, https://aedt.faa.gov/Documents/AEDT3d_UserManual.pdf

A brief description of the air toxics of concern (those with toxicity values and aircraft emissions mass fractions) is provided within the following:

1,3-Butadiene

1,3-butadiene is a colorless gas. At room temperature, it has a gasoline-like odor. This pollutant is a byproduct of petroleum processing and is used in the production of synthetic rubber and plastics. It is also found in automobile exhaust, gasoline vapor, fossil fuel incineration products, and cigarette smoke. Most 1,3-butadiene is released into the air and humans are typically exposed to the pollutant via inhalation. Breathing very high levels of 1,3-butadiene, even for a short time, may cause central nervous system damage, blurred vision, nausea, fatigue, headache, decreased blood pressure and pulse rate, and unconsciousness. Breathing lower levels of this pollutant may cause irritation of the eyes, nose, and throat.[27]

Acetaldehyde

Acetaldehyde is a colorless, volatile liquid with a characteristic pungent, fruity odor. Acetaldehyde is used primarily as a chemical intermediate in the production of acetic acid and as a synthetic flavoring agent. Acetaldehyde is released to the environment in vehicle exhaust and as a product of open burning of gas, fuel oil, and coal. Acute exposure to acetaldehyde can cause eye, nose, and throat irritation and subsequent inflammation of the eyes and coughing.[28]

Acrolein

Acrolein is a clear or yellow liquid with a disagreeable odor. Acrolein is used as an intermediate in the production of acrylic acid, as well as a pesticide to control algae, weeds, bacteria, and mollusks. Small amounts of acrolein can be formed and emitted into the air when trees, tobacco, other plants, gasoline, and oil are burned. Acrolein may also be released into the environment in emissions and effluents from manufacturing and use facilities and in emissions from combustion. Exposure to high concentrations of acrolein may damage the lungs and could cause death. Breathing lower amounts may cause watery eyes, burning of the nose and throat, and decreased breathing rate.[29]

29 Agency for Toxic Substance and Disease Registry ToxFAQ for Acrolein, https://www.atsdr.cdc.gov/substances/indexAZ.asp

Benzene

Benzene is a volatile, colorless, flammable liquid that has a sweet odor. It is a chemical intermediate in the synthesis of compounds such as plastics, resins, nylon, synthetic fibers, synthetic rubber, lubricants, dyes, detergents, drugs, and pesticides. Major sources of atmospheric releases include vehicle exhaust emissions, evaporative gasoline fumes, emissions from vehicle service stations, and industrial emissions. Other sources of atmospheric benzene include cigarette smoke and landfill emissions. Acute inhalation exposure to benzene can result in death, while high levels can cause drowsiness, dizziness, rapid heart rate, headaches, tremors, confusion, and unconsciousness. Eating or drinking foods containing high levels of benzene can cause vomiting, irritation of the stomach, dizziness, sleepiness, convulsions, rapid heart rate, and death.[30]

Ethyl Benzene

Ethylbenzene is a colorless, flammable liquid that smells like gasoline. It is found in natural products such as coal tar and petroleum and is also found in manufactured products such as inks, insecticides, and paints. Ethylbenzene is used primarily to make styrene, another chemical. Other uses include as a solvent, in fuels, and to make other chemicals. You can smell ethylbenzene in the air at two parts of ethylbenzene per million parts of air (2 ppm). It evaporates at room temperature and burns easily. The median levels of ethylbenzene in air are 0.62 ppb in city and suburban locations.[31]

Formaldehyde

At room temperature, formaldehyde is a colorless, flammable gas with a distinct, pungent smell. Formaldehyde is a product of incomplete combustion and is emitted into the air by burning wood, coal, kerosene, and natural gas, by automobiles, and by cigarettes; it is also a naturally occurring substance. Formaldehyde can be released to soil, water, and air by industrial sources and can off-gas from materials made with it. Humans can be exposed to formaldehyde through inhalation of contaminated air and smog. Low levels of formaldehyde can cause irritation of the eyes, nose, throat, and skin. Some epidemiological studies found an increased incidence of nose and throat cancer in exposed individuals, but other studies could not confirm this finding.[32]

31 Agency for Toxic Substance and Disease Registry ToxFAQ for Ethyl Benzene, https://www.atsdr.cdc.gov/substances/indexAZ.asp

32 Agency for Toxic Substance and Disease Registry ToxFAQ for Formaldehyde, https://www.atsdr.cdc.gov/substances/indexAZ.asp

Methyl Alcohol

Methyl alcohol, or methanol, is a colorless, flammable liquid used to manufacture formaldehyde and acetic acid, in chemical synthesis, in antifreeze, and as a solvent. Methanol is released to the environment during industrial use and naturally from volcanic gases, vegetation, and microbes. Acute (short-term) or chronic (long-term) exposure of humans to methanol by inhalation of ingestions may result in blurred vision, headache, dizziness, and nausea. Methyl Alcohol is used as a solvent and as an intermediate in chemical synthesis.[33]

Naphthalene

Naphthalene is a white solid with the odor of mothballs or tar and is found naturally in fuels when they are burned. Burning tobacco or wood also produces naphthalene. The major commercial use of naphthalene is in the manufacture of polyvinyl chloride plastics. Naphthalene is released into the air through the burning of tobacco, wood, oil, and coal. Exposure to large amounts of naphthalene may damage or destroy some red blood cells. This condition is called hemolytic anemia, with symptoms including fatigue, lack of appetite, restlessness, and pale skin. Exposure to large amounts of naphthalene may also cause nausea, vomiting, diarrhea, blood in the urine, and a yellow color to the skin.[34]

Phenol

Phenol is both a manufactured chemical and a natural substance. It is a colorless-to-white solid when pure. Phenol has a distinct sickeningly sweet and tarry odor. You can taste and smell phenol at levels lower than those that are associated with harmful effects. Phenol evaporates more slowly than water, and a moderate amount can form a solution with water. Phenol is used primarily in the production of phenolic resins and in the manufacture of nylon and other synthetic fibers. It is also used in silicide's (chemicals that kill bacteria and fungi in slimes), as a disinfectant and antiseptic, and in medicinal preparations such as mouthwash and sore throat lozenges.[35]

Styrene

Styrene is primarily a synthetic chemical. It is a colorless liquid that evaporates easily and has a sweet smell. It often contains other chemicals that give it a sharp, unpleasant smell. It dissolves in some liquids but does not dissolve easily in water. It is used to make rubber, plastic, insulation, fiberglass, pipes,

automobile parts, food containers, and carpet backing. Low levels of styrene also occur naturally in a variety of foods such as fruits, vegetables, nuts, beverages, and meats.[36]

Toluene

Toluene is a colorless, clear liquid that occurs naturally in crude oil. It is also produced in the manufacturing of gasoline and other fuels from crude oil. Airport-related sources of toluene include aircraft, ground service equipment, motor vehicles, heating plants, and gasoline fuel storage tanks. Low to moderate levels of toluene can affect the nervous system and cause tiredness, confusion, weakness, memory loss, nausea, loss of appetite, and hearing and color vision loss. Inhaling high levels of toluene in a short time can make a person feel light-headed, dizzy, or sleepy, and can cause unconsciousness and death.[37]

Xylenes

There are three forms of xylene in which the methyl groups vary on the benzene ring: meta-xylene, ortho-xylene, and para-xylene (m-, o-, and p-xylene). These different forms are referred to as isomers. Xylene is a colorless, sweet-smelling liquid that catches on fire easily. It occurs naturally in petroleum and coal tar. Chemical industries produce xylene from petroleum. It is one of the top 30 chemicals produced in the United States in terms of volume. Xylene is used as a solvent and in the printing, rubber, and leather industries. It is also used as a cleaning agent, a thinner for paint, and in paints and varnishes. It is found in small amounts in airplane fuel and gasoline.[38]

Attachment D

Electronic Modeling Files (upon request)

Two types of air quality analysis were performed in support of the SACC Project – emission inventories and dispersion analysis. The emission inventories provide an indication of total air pollutant emissions (carbon monoxide, nitrogen oxides, sulfur oxides, volatile organic compounds, particulate matter less than or equal to 10 micrometers, and particulate matter less than or equal to 2.5 micrometers) with the Baseline Condition, 2025 (Phase 1), and 2029 (Phase 2) for construction and aircraft operations.

The dispersion modeling analysis evaluates local criteria pollutant concentrations due to aircraft-related emission sources for direct comparison to the Ambient Air Quality Standards for carbon monoxide, nitrogen dioxide, sulfur oxides, particulate matter less than or equal to 10 micrometers, and particulate matter less than or equal to 2.5 micrometers on and in the vicinity of the Airport.

Appendix D Proposed Project Site Photographs

Section 1 Introduction and Background

The purpose of this Biological Assessment (BA) is to address potential construction and operational effects of the proposed South Airport Cargo Center Project (Proposed Project), within the Ontario International Airport (ONT or Airport) property boundaries, on species listed as endangered or threatened under the Endangered Species Act (ESA), or their designated critical habitat. The U.S. Department of Transportation, Federal Aviation Administration (FAA) must approve revisions to the ONT Airport Layout Plan (ALP). As such, the FAA's approval of revisions to the ALP constitutes a federal action, which the FAA must demonstrate compliance with the National Environmental Policy Act (NEPA). The proposed project would develop facilities at the Airport to meet the Project Proponent's need for an additional US hub facility to accommodate increasing cargo volumes in the Project Proponent's Network System.

The entirety of the proposed project's construction footprint exists within ONT property and has been previously developed with aviation support facilities consisting of pavement or gravel, and/or maintained on a routine basis through disking and mowing activities.

1.1 GENERAL LOCATION OF OIAA AND DESCRIPTION OF THE PROPOSED PROJECT

Ontario International Airport is a public commercial service airport located south of Interstate 10, west of Interstate 15 and north of State Route 60 in the City of Ontario, San Bernardino County, California (Exhibit 1 and Exhibit 2). Ontario International Airport covers approximately 1,741 acres (705 ha) and has two parallel runways, oriented east to west. Ontario International Airport currently accommodates general aviation, passenger, cargo, and military operations.

The Proposed Project involves development of an air cargo facility and supporting infrastructure on an approximate 97-acre site located south of the runways on existing Airport property (refer to Appendix B, *Proposed Project Site Plan*). The Proposed Project includes:

- Construction of a multi-level 857,000-square-foot cargo sort, distribution, and office building (the Air Cargo Sort Building) with a height of approximately 60 feet in height. The building would include 755,500 square feet of cargo sorting area and 101,500 square feet of office space on 3 floors. The ground floor would include 348,505 square feet, the second floor would include 347,370 square feet, and the mezzanine third floor would include 161,125 square feet. The building would include 21 service doors on the north, west, and east sides of the building to accommodate Unit Load Devices (ULDs) and 67 trailer dock doors on the south and east sides of the building facing the truckyard and truck parking/staging area. A truck yard constructed of light-duty concrete would be located on the southside of the building.
- Construction of a parking structure with 900 parking stalls for employee use would be on the south side of East Avion Street. Depending on the final design of this parking structure, it would contain three or four levels. A pedestrian bridge would connect the parking garage to the east wing of the Air Cargo Sort Building. Thirty-three additional at-grade visitor parking spaces are proposed next to the main entrance to the Air Cargo Sort Building.

- Construction of heavy-duty concrete taxilanes, Taxilanes A, B1 and C, and approximately 2,514,000 square-feet of heavy-duty concrete aircraft apron on the west, north, and east sides of the Air Cargo Sort Building. A total of 26 aircraft parking positions would be provided on the apron. The length of these taxilanes from Taxiway S to the apron would be 420 feet. The width of the taxilane connections to Taxiway S would 75 feet with the width of the taxilanes on the apron at 258 feet.
- Two aviation support buildings: A GSE Maintenance Building and an Aviation Line Maintenance Building. Each building would be approximately 27,000 square feet in size. The GSE Maintenance Building would have a maximum height of 20 feet and the Aviation Line Maintenance Building would have a maximum height of 18 feet.
- Installation of new security fencing, vehicle and pedestrian gates, and a guard shack.
- Installation of pole-mounted and/or building-mounted exterior lights for vehicle and truck parking lots, the Air Cargo Sort Building, and aircraft parking apron.
- Installation of appropriate airfield lights and signage for the aircraft parking apron and taxilanes.
- Demolition of existing structures and site improvements and relocation of existing uses and facilities in the Phase 2 portion of the Proposed Project Site to other locations at ONT.
- Extension of utilities to the Proposed Project site including electrical, natural gas, water, sanitary sewer, communications, and other related infrastructure.
- Installation of stormwater management systems and infrastructure.
- Landscaping.

1.2 PROPOSED PROJECT IMPLEMENTATION SCHEDULE

The proposed Project would be implemented in two phases anticipated to be initiated in 2023 and completed by 2029. Construction of Phase 1 of the Project is planned to start in the third quarter of 2023 on the eastern portion of the Proposed Project Site and be completed by the third quarter of 2025. Phase 1 construction would include the demolition of existing structures and site improvements in the Phase 1 area, site preparation and grading, and construction of all proposed improvements in the eastern 60 acres of the Proposed Project Site, including the Air Cargo Sort Building, aircraft apron improvements, and parking garage.

After completion of Phase 1, relocation of existing uses and facilities in the Phase 2 area on the western portion of the Proposed Project Site would occur, followed by the demolition of existing structures and site improvements in the Phase 2 area including site preparation and grading. Construction of the remaining improvements, including the expansion of the Air Cargo Sort Building and aircraft apron improvements, would begin in the third quarter of 2027, after site preparation activities, and be completed by 2029.

1.3 PROPOSED PROJECT PURPOSE AND NEED

The purpose of the Proposed Project is to develop and provide facilities to support large-scale air cargo operations. The OIAA and the Project Proponent have identified a need for this facility

to accommodate projected growth in cargo volumes and increase service reliability. The Project Proponent's US hub facility is operating at maximum capacity. Based on projected growth in cargo volumes over the next 3-5 years, the capacity of the existing hub facility will be exceeded.

1.4 DESCRIPTION OF THE PROPOSED PROJECT LAYOUT

OIAA, in conjunction with the Project Proponent propose to develop the Proposed Project on an approximate 97-acre site owned by OIAA within the airport property (Exhibit 3). The Proposed Project would be located south of Taxiway 'S'. An aircraft apron would be located adjacent to Taxiway 'S' with three new taxilanes connecting to Taxiway 'S' and containing 26 aircraft parking positions. The Air Cargo Sort Building would be located adjacent to the aircraft apron with the employee parking garage located south of E. Avion Street.

Section 2 Proposed Project Location and Action Area (AA)

2.1 PROPOSED PROJECT LOCATION

The Proposed Project is located on an approximate 97-acre portion of the Airport, south of Taxiway 'S', north of East Mission Boulevard and west of the Cucamonga Canyon Channel in the City of Ontario, San Bernardino County, California. More specifically, the Proposed Project is located within the *Ontario* quadrangle of the United States Geological Survey's (USGS) 7.5-minute topographic map series within Township 1 South, Range 7 West, Sections 27, and 34. The majority of the Proposed Project is located north of East Avion Street with the remainder of the Proposed Project Site located between East Avion Street and Mission Boulevard west of South Hellman Avenue. The Proposed Project Site includes portions of Assessor's Parcel Numbers (APN) 11326106, 11326107, 11326108, 11327101, and 11327102. Refer to Exhibits 1-3 in Appendix A.

The Proposed Project is located within an almost entirely developed area in the City of Ontario, San Bernardino County. Primary land uses surrounding the Proposed Project Site include airport land uses, and industrial development. Airport land uses surround the Proposed Project Site on all four sides. Farther south is the Union Pacific Railroad/Metrolink right-of-way and Mission Boulevard, beyond which are industrial land uses.

2.2 IDENTIFICATION OF THE ACTION AREA

The Proposed Project's Action Area (AA) encompasses all areas that may be affected directly or indirectly by the proposed project encompassing the construction footprint, as well as immediate adjacent areas outside of the Proposed Project Site.

The *direct* AA is the area proposed for development and is comprised of pavement and buildings (10 buildings), parking facilities, and landscaped/graded areas.

The *indirect* AA includes an approximate 200-foot buffer, adjacent area that border the Proposed Project's AA but are not anticipated to be impacted directly by the Proposed Action. These *indirect* areas include: airport infrastructure such as: a concrete runway, operation facilities, existing buildings and security fencing structures, as well as disturbed land that is routinely disked/graded as part of normal airport operations but will not be directly impacted by the Project construction or staging. For this BA, the AA comprises the *direct* and *indirect* AAs depicted in Exhibit 3**.**

Section 3 Listed Species and Critical Habitat in the Action Area

The objectives of this BA are to determine whether the AA supports federally listed threatened and endangered species or their habitat, and to address the potential effects associated with the proposed project on federally listed species and critical habitat.

3.1 METHODOLOGY- DATABASE REVIEW

"Listed species" are defined as those plant and animal species currently listed by the USFWS under the ESA as threatened, endangered, or proposed as such (Endangered Species Act [16 U.S.C. Sections 1531-1544]). The list of ESA-listed species to be addressed in this BA is based on various databases searches within the USGS 7.5-minute Topographic Map for the *Guasti and Ontario* Quadrangle and a field study. The database searches included the following:

- USFWS threatened and endangered species occurrence GIS data overlay;
- USFWS Information, Planning, and Conservation System (IPaC);
- California Natural Diversity Database (CNDDB);
- California Native Plant Society Electronic Inventory (CNPSEI) database;
- Calflora Database; and
- Biogeographic Information & Observation System (BIOS).

3.2 METHODOLOGY – FIELD REVIEW

A field survey of the AA and buffer, where applicable, was conducted on September 29, 2021, by ELMT Consulting biologist Travis J. McGill. Mr. McGill is a biologist with 15 years of experience and a Bachelor of Science degree in Biology from the University of California – San Diego.

Mr. McGill's field survey of the AA was systematic and comprehensive with complete coverage of the AA along with a 200-foot survey buffer area, when appropriate and feasible (refer to Exhibit 3). The field surveys were designed to focus attention on the specific sensitive species that have been documented in the vicinity and/or whose habitat requirements may be present within the AA.

General wildlife species were detected during field surveys by sight, calls, tracks, scat, or other sign. In addition to species observed, expected wildlife usage of the Proposed Project Site was determined according to known habitat preferences of regional wildlife species and knowledge of their relative distributions in the area. The main focus of the assessment was to identify potential habitat for special status wildlife within the project area.

The entire land identified within the AA includes developed areas with pavement or gravel, or maintained land that is graded and mowed on a routine basis. There is no potential for any ESA species listed as endangered or threatened or their designated critical habitat to occur as none exist within the AA.

3.3 LISTED SPECIES – UNITED STATES FISH AND WILDLIFE SERVICE

The Proposed Project Site is located within an almost entirely developed area in the City of Ontario, San Bernardino County. Primary land uses surrounding the Proposed Project Site include airport land uses, and industrial development. Airport land uses surround the Proposed Project Site on all four sides. Farther south is the Union Pacific Railroad/Metrolink right-of-way and Mission Boulevard, beyond which are industrial land uses.

Table 2 represents a compiled list of results from the USFWS's Information, Planning and Consultation (IPaC) database of species which have been documented within the general vicinity of the AA and/or have the potential to be present within the AA based on proximity of the occurrence and potential for suitable habitat adjacent to or within the AA as documented by the CNDDB. The full results of the IPaC Database are provided in Appendix C.

Table 2 also provides a potential to occur assessment based on the database literature and the field surveys of the AA. Based on the USFWS IPaC database and field reconnaissance by qualified biologists that occurred on both September 29, 2021, suitable habitat and foraging potential for endangered, threatened or sensitive species do not exist within the AA due to the heavy level of existing development, disturbance and routine maintenance activities. Exhibit 4 depicts federally listed species, and burrowing owl, previously documented in proximity to the Project Site.

3.4 CRITICAL HABITAT

Under the federal Endangered Species Act, "Critical Habitat" is designated at the time of listing of a species or within one year of listing. Critical Habitat refers to specific areas within the geographical range of a species at the time it is listed that include the physical or biological features that are essential to the survival and eventual recovery of that species. Maintenance of these physical and biological features requires special management considerations or protection, regardless of whether individuals or the species are present or not. All federal agencies are required to consult with the United States Fish and Wildlife Service (USFWS) regarding activities they authorize, fund, or permit which may affect a federally listed species or its designated Critical Habitat. The purpose of the consultation is to ensure that projects will not jeopardize the continued existence of the listed species or adversely modify or destroy its designated Critical Habitat. The designation of Critical Habitat does not affect private landowners, unless a project they are proposing is on federal lands, uses federal funds, or requires federal authorization or permits (e.g., funding from the Federal Highways Administration or a CWA Permit from the Corps). If a there is a federal nexus, then the federal agency that is responsible for providing the funding or permit would consult with the USFWS.

The AA is not located within federally designated Critical Habitat. The nearest Critical Habitat to the AA occurs approximately 7.0 miles to the east for coastal California gnatcatcher (*Polioptila californica californica*), 7.0 miles to the north for San Bernardino kangaroo rat (*Dipodomys merriami parvus*), and approximately 7.5 miles southeast for least Bell's vireo (*Vireo bellii pusillus*), Santa Ana sucker (*Catostomus santaanae*), and southwestern willow flycatcher (*Empidonax traillii extimus*). Therefore, no impacts to federally designated Critical Habitat will occur from implementation of the proposed project.

Table 1: Federally Listed Species in the Action Area

Scientific Name Common Name	**Status**	**Habitat**	**Observed On-site**	**Potential to Occur**
WILDLIFE SPECIES				
Danaus plexippus monarch butterfly	Candidate	Occurs in open fields and meadows dominated by milkweed (*Asclepias* sp.). In winter, species can be found on the coast of southern California in Eucalyptus groves and at high altitudes in central Mexico.	No	**Presumed absent** The AA does not contain or occur within proximity of suitable habitat. Adequate forage is not available within the AA.
Dipodomys merriami parvus San Bernardino kangaroo rat	Endangered	Primarily found in Riversidean alluvial fan sage scrub (RAFSS) and sandy loam soils, alluvial fans and flood plains, and along washes with nearby sage scrub. May also occur at lower densities in Riversidean upland sage scrub, chaparral and grassland in uplands and tributaries in proximity to RAFSS habitat. Tends to avoid rocky substrates.	No	**Presumed absent** The AA does not contain or occur within proximity of suitable habitat. Adequate forage and suitable soils for burrowing are not within the AA.
Polioptila californica coastal California gnatcatcher	Threatened	Common yearlong resident of southern California in sage scrub habitats that are dominated by California sagebrush (*Artemisia californica*). Prefers scrub habitat with more low-growing vegetation. Species generally occurs below 750 feet above mean sea level (msl) along the coast and below 1,500 feet above msl within inland regions.	No	**Presumed Absent** The AA does not contain or occur within proximity of suitable habitat. Adequate forage and nesting sites are not available within the AA.
Rhaphiomidas terminatus abdominalis Delhi Sands flower-loving fly	Endangered	DSF habitat is limited to areas that include Delhi fine sand, an aeolian (wind-deposited) soil type. The highest density of DSF have been found in habitat that includes a variety of plants including California buckwheat, California croton, deerweed, and telegraph weed.	No	**Presumed Absent** The AA does not contain or occur within proximity of suitable habitat. Adequate forage and aeolian soils are not present within the AA.
PLANT SPECIES				
Ambrosia pumila San Diego ambrosia	Endangered	Occurs in open habitats in coarse substrates near drainages, and in upland areas on clay slopes or on the dry margins of vernal pools. This species occurs in a variety of associations that are dominated by sparse grasslands or marginal wetland habitats such as river terraces, pools, and alkali playas. Found at elevations ranging from 66 to 1,362 feet. Blooming period is from April to October.	No	**Presumed Absent** The AA does not support any of the required habitats and is not in proximity to any of these native habitats. The AA does not support upland habitats on clay soils or marginal wetland habitats such as vernal pools.

Since the AA for the proposed project, is not occupied or provides suitable habitat for any federally listed species, a determination of "***no effect on federally listed species or designated critical habitat***" is recommended.

Section 4 Migratory Bird Treaty Act Bird Species

4.1 MIGRATORY BIRD TREATY ACT (MBTA) LISTED SPECIES

The IPaC also lists migratory birds of concern that have been documented in the vicinity of the project. However, the proposed project AA is completely disturbed and void of any vegetation or natural features that could potentially provide suitable nesting or foraging habitat capable of supporting any of the migratory bird species identified in the IPaC list.

The complete list of migratory bird species identified by the USFWS IPaC is provided in Appendix C. The following does not represent the complete listing of MBTA species potentially affected by the proposed action. The following species were included in this BA based on regional and local significance.

4.1.1 Burrowing Owl

Status, Natural History and Distribution

Although not a federally listed species, the burrowing owl (*Athene cunicularia* [BUOW]) is protected under the MBTA and is listed as a *Migratory Birds of Conservation Concern (BCC)* by the USFWS and, therefore, also recognized by the CNDDB.

The burrowing owl (BUOW) is a ground dwelling owl typically found in arid prairies, fields, and open areas where vegetation is sparse and low to the ground. BUOW is heavily dependent upon the presence of mammal burrows, with ground squirrel burrows being a common choice, in its habitat to provide shelter from predators, inclement weather and to provide a nesting place (Coulombe 1971). They are also known to make use of human created structures, such as cement culverts and pipes, for burrows. BUOW spend a great deal of time standing on dirt mounds at the entrance to a burrow, or perched on a fence post or other low to the ground perch from which they hunt for prey. They feed primarily on insects such as grasshoppers, June beetles and moths, but will also take small rodents, birds, and reptiles. They are active during the day and night, but are considered a crepuscular owl; generally observed in the early morning hours or at twilight. The BUOW maintains a burrow year-round and is typically monogamous, generally raising 2-3 chicks during the springtime breeding season recognized as between February 1 and August 31.

While the BUOW is distributed throughout North America, local subpopulations within California are declining. Throughout its range, the BUOW is vulnerable to habitat loss, predation, vehicular collisions, destruction of burrow sites, and poisoning of ground squirrels (Grinnell and Miller 1944, Zarn 1974, Remsen 1978). BUOW have disappeared from significant portions of their range in the last 15 years and, overall, nearly 60% of the breeding groups of owls known to have existed in California during the 1980s had disappeared by the early 1990s (Burrowing Owl Consortium 1993).

BUOW do migrate but are year-round residents in the southern California region. They are most likely to be observed during the breeding season, recognized by the CDFW as between February 1 and August 31 when they are actively foraging and feeding chicks. BUOW are primarily crepuscular and active in the daylight hours but can also be nocturnal especially if a nocturnal prey species is seasonally present.

Potential to Occur

BUOWs have been documented approximately 900 feet east of the Proposed Project Site in a large undeveloped area south of the airport runway (Helix 2019), but no BUOW were observed within the undeveloped portions of the Proposed Project Site during the field survey.

No BUOWs or recent sign (i.e., pellets, feathers, castings, or whitewash) were observed during the field investigation. Portions of the Proposed Project Site, primarily the undeveloped areas on the eastern portion of the Proposed Project Site, are unvegetated and/or vegetated with a variety of low-growing plant species that allow for line-of-sight observation favored by BUOWs. However, no suitable burrows (>4 inches in diameter) capable of providing roosting and nesting opportunities were observed onsite. Further, the Proposed Project Site supports and is surrounded by tall structures, light poles, and fences that offer perching opportunities for larger raptor species (i.e., red-tailed hawk) that prey on BUOWs. In addition, due to the predominance of developed land in the immediate vicinity of the Proposed Project Site, the site is fairly isolated from suitable habitat nearby. Further, the intensity and frequency of existing routine anthropogenic disturbance associated with onsite weed abatement activities (i.e., mowing) are likely to preclude BUOWs from occurring onsite.

Based on the results of the field investigation, it was determined that Proposed Project Site has a low potential to support BUOWs. Due to existing routine anthropogenic disturbances onsite and lack of undeveloped land on and immediately surrounding the Proposed Project Site, a focused survey for BUOWs is not recommended.

Section 5 Existing Conditions

The Proposed Project is located within an almost entirely developed area in the City of Ontario, San Bernardino County. Primary land uses surrounding the Proposed Project Site include airport land uses, and industrial development. Airport land uses surround the Proposed Project Site on all four sides. Farther south is the Union Pacific Railroad/Metrolink right-of-way and Mission Boulevard, beyond which are industrial land uses.

The Proposed Project Site is almost entirely developed and currently supports aviation support facilities The Proposed Project Site is predominately covered by existing pavement and buildings (10 buildings), parking facilities, and landscaped areas. A small graded, disturbed, undeveloped area occurs on the eastern portion of the Proposed Project Site. Refer to Appendix D, *Site Photographs*, for representative site photographs. The Airport implements an active Wildlife Hazard Management Plan (WHMP) program that includes keeping grasses below 6 inches and routine disking

The onsite surface elevation ranges from approximately 890 to 920 feet above mean sea level, and slightly slopes from northwest to southeast, according to the USGS topographic map. Due to existing onsite development, the Proposed Project Site is relatively flat with no areas of topographic relief.

According to the NRCS Custom Soil Resource Report, the Proposed Project Site is underlain by Tujunga loamy sand (0 to 5 percent slopes). The Tujunga soil series consists of very deep, somewhat excessively drained soils that formed in alluvium from granitic sources. They are found on alluvial fans and floodplains, including urban areas. Soils within the Proposed Project Site have been heavily disturbed and compacted by the existing development which primarily include concrete and pavement over nearly the entire project site. The eastern portion of the Proposed Project Site includes an undeveloped area, but this area is heavily disturbed and routinely subject to weed abatement activities.

Along the eastern boundary of the Proposed Project Site, outside of the prosed limits of disturbance, Cucamonga Creek Channel is channelized and flows from north to south within a concrete lined box-culvert.

5.1 HABITAT

The majority of the AA is developed with no native habitat or soil. As a result, no plant communities were observed on the AA. However, two (2) land cover types that would be classified as disturbed and developed, are found within the AA (refer to Exhibit 5, *Vegetation*). These areas are not plant community classifications, but rather land cover types and are described in further detail below.

5.1.1 Disturbed

Disturbed areas are generally areas that are unpaved, have been subject to a high level of human disturbances from anthropogenic activities, support minimal vegetation, and no longer comprise a native plant community. Within the boundaries of the Proposed Project Site, disturbed areas occur on the eastern portion of the Proposed Project Site. These areas are routinely subject to weed abatement activities and

used as storage for cargo containers. Plant species occurring in disturbed areas onsite are composed of a mix of non-native and early successional plant species. Plant species observed within the disturbed area include cheeseweed (*Malva parviflora*), ragweed (*Ambrosia psilostachya*), doveweed (*Croton setigerus*), Russian thistle (*Salsolus tragus*), golden crownbeard (*Verbesina encelioides*), puncture vine (*Tribulus terrestris*), short-podded mustard (*Hirschfeldia incana*), red brome (*Bromus rubens*), Mediterranean grass (*Schismus barbatus*), Spanish lotus (*Acmispon americanus*), and prickly lettuce (*Lactuca serriola*).

5.1.2 Developed

Developed areas generally encompass all buildings/structures, ornamental landscaping, and other paved, impervious surfaces; such areas are dominant throughout the Proposed Project Site. The majority of the Proposed Project Site consists of developed areas that are devoid of vegetation, and/or support landscaped areas. Ornamental landscaping accounts for the majority of vegetation found in developed areas, and includes plant species such as liquid amber (*Liquidamber styraciflua*), silk oak (*Grevillea robusta*), jacaranda (*Jacaranda mimosifolia*), eucalyptus (*Eucalyptus sp*.), pine (*Pinus sp.*) and planted western sycamore (*Platanus racemosa*).

5.2 WILDLIFE

Plant communities provide foraging habitat, nesting and denning sites, and shelter from adverse weather or predation. This section provides a discussion of those wildlife species that were observed during the field survey and common species that are expected to occur within the Proposed Project Site based on the literature reviews. The discussion is to be used as a general reference and is limited by the season, time of day, and weather condition in which the field survey was conducted. Wildlife detections were based on calls, songs, scat, tracks, burrows, and direct observation.

5.2.1 Fish

No fish or hydrogeomorphic features (e.g., perennial creeks, ponds, lakes, reservoirs) that would provide suitable habitat for fish were observed on or within the vicinity of the Proposed Project Site. Therefore, no fish are expected to occur and are presumed absent from the Proposed Project Site.

5.2.2 Amphibians

No amphibians or hydrogeomorphic features (e.g., perennial creeks, ponds, lakes, reservoirs) that would provide suitable habitat for amphibian species were observed on or within the vicinity of the Proposed Project Site. Therefore, no amphibians are expected to occur on the Proposed Project Site and are presumed absent.

5.2.3 Reptiles

The disturbed area on the eastern portion of the Proposed Project Sitehas the potential to provide suitable foraging and cover habitat for a variety of reptilian species adapted to significant anthropogenic disturbance. No reptiles were observed during the field investigation. Common reptilian species that may occur on-site

include common side-blotched lizard (*Uta stansburiana elegans*), San Diego alligator lizard (*Elgaria multicarinata webbii*), and Great Basin fence lizard (*Sceloporus occidentalis longipes*).

5.2.4 Birds

The disturbed area on the eastern portion of the Proposed Project Site and ornamental landscaping found onsite have the potential to provide suitable foraging and nesting habitat for a variety of resident and migrant bird species adapted to significant anthropogenic disturbance. Avian species observed during the field investigation include house finch (*Haemorhous mexicanus*), Anna's hummingbird (*Calypte anna*), northern mockingbird (*Mimus polyglottos*), black phoebe (*Sayornis nigricans*), American kestrel (*Falco sparverius*), lesser goldfinch (*Spinus pstalria*), Say's phoebe (*Sayornis saya*), mourning dove (*Zenaida macroura*), European starling (*Sturnus vulgaris*), Eurasian collared-dove (*Streptopelia decaocto*), common raven (*Corvus corax*), red-tailed hawk (*Buteo jamaicensis*), and Cassin's kingbird (*Tyrannus vociferans*).

5.2.5 Mammals

The disturbed area on the eastern portion of the Proposed Project Site has the potential to provide suitable foraging and denning habitat for a limited amount of mammalian species adapted to significant anthropogenic disturbance. Most mammal species are nocturnal and are difficult to observe during a diurnal field visit. The only mammalian species observed during the field investigation were cottontail (*Sylvilagus audubonii*) and California ground squirrel (*Otospermophilus beecheyi*). Common mammalian species that have potential to occur on-site include opossum (*Didelphis virginiana*), raccoon (*Procyon lotor*), and coyote (*Canis latrans*). Structures and ornamental tree species may provide suitable roosting opportunities for local common bat species (i.e., California myotis (*Myotis californicus*), Mexican free-tailed bat (*Tadarida brasiliensis*), and little brown bat (*Myotis lucifugus*)), but the degree and frequency of existing and routine disturbance from existing onsite activities likely precludes them from roosting on-site. Additionally, most of these bats roost in caves, rock crevices, buildings, and sometimes dead trees, and the ornamental plant species found in the area do not typically provide suitable long-term roosting or maternity habitat. None of the sensitive bat species known to occur in the area are expected to occur onsite.

5.3 SENSITIVE SPECIES

No other State and/or federally listed threatened or endangered species, or other sensitive species were observed within or adjacent to the subject properties during the field survey, and no habitat exists on the Proposed Project Site that would be suitable to support any of the State and/or federally listed species that occur within the region.

Of all of the sensitive species identified in the database searches, only BUOW has a low potential to occur in the AA.

5.3.1 Burrowing Owl

This Biological Assessment is including information about BUOW based on previous requests by various offices of the U.S. Fish and Wildlife Service to the FAA to include information at various other airports

within Arizona and California. According to the CNDDB, there are two documented occurrences of BUOW within the Redlands quad.

Based on a literature review, a couple occurrences of BUOW have been document near the AA, within the undeveped instetial areas assocated with the airport runway. These observations were documeted during the non-breeding season, when migrate BUOW occur in the area. No breeding pairs of BUOW have been observed wihtin or immediately adjacent to the AA. Breeding pairs of BUOW were observed in 2022 approxiamtly 1.75 mile east of the project site, east of Haven Avenue at the runway approach.

During the field survey, no BUOW individuals were observed, nor were any BUOW signs, such as molted feathers, cast pellets, prey remains, or owl white wash found.

Potential to Occur

Per the definition provided in the *2012 CDFG Staff Report on Burrowing Owl Mitigation*, "Burrowing owl habitat generally includes, but is not limited to, short or sparse vegetation (at least at some time of year), presence of burrows, burrow surrogates or presence of fossorial mammal dens, well-drained soils, and abundant and available prey." Even though the undevelped portions of the the AA support low growign vegetation and friable soils, no suitable burrows (>4 inches in diameter) capable of providing roosting and nesting opportunities were observed onsite. Further, no BUOW individuals or signs were identified within the undeveloped portions of the AA. Due to the implementation of the WHMP, as discussed further below, the likelihood of the undeveloped areas within the AA being utilized by BUOW is unlikely. As previously mentioned, BUOW individuals or signs, such as signs including: molted feathers, cast pellets, prey remains, and owl white wash, were not observed during the site surveys.

Section 6 Effects of the Proposed Action

The proposed AA is almost entirely developed with existing Airport facilities. The Airport implements a WHMP, developed with the U.S. Department of Agriculture's Wildlife Services and approved by the FAA, throughout the Airport property to deter birds and other wildlife from nesting, foraging and loafing throughout the Airport property in order to maintain safe aircraft operations.

The Proposed Project Site is generally covered by existing pavement and buildings (10 buildings), parking facilities, and landscaped areas. A small undeveloped area is present on the eastern portion of the Proposed Project Site.

6.1 SENSITIVE PLANTS AND WILDLIFE

Based on habitat requirements for sensitive species and the availability and quality of habitats needed by the sensitive plant and wildlife species documented to occur within the vicinity, the undeveloped portions of the AA do not have the potential to support federally listed threatened, endangered or sensitive species, therefore, focused surveys for these species are not warranted or recommended.

6.2 CRITICAL HABITAT

The AA is not located within federally designated Critical Habitat. The nearest Critical Habitat to the AA occurs approximately 7.0 miles to the east for coastal California gnatcatcher, 7.0 miles to the north for San Bernardino kangaroo rat, and approximately 7.5 miles southeast for least Bell's vireo, Santa Ana sucker, and southwestern willow flycatcher.

Therefore, there is no impact to critical habitat as none exists within the AA, and there are no primary constituent elements for and of the aforementioned species within the AA. Therefore, no impacts to federally designated Critical Habitat will occur from implementation of the proposed project.

6.3 MIGRATORY BIRDS

Although not a federally listed species, BUOW's are protected under the MBTA and are listed as a *Migratory Birds of Conservation Concern (BCC)* by the USFWS and therefore also recognized as a sensitive migratory bird by the CNDBB.

6.3.1 Mitigation Measures

Even though the undeveloped portions of the AA did not support any suitable burrows for BUOW, out of abundance of caution, and to ensure no BUOW will be impacted from project implementation, the following mitigation measure will be implemented to reduce impacts to less than significant:

- A pedestrian survey for BUOW will be conducted prior to the start of construction activities, generally within 30 days of the start of construction. If BUOW's are found, the CDFW and USFWS should be consulted to determine the appropriate action to remove any BUOW from the AA before

construction. Any BUOW that are found would not be disturbed without CDFW and USFWS consultation as it may violate the MBTA and CDFW guidelines. Mitigation may include flushing owls prior to grading, removal of BUOW from the Proposed Project Site, and/or deferment of grading until artificial can be constructed, in accordance with CDFW and USFWS consultation. BUOW removal and artificial burrow construction can be facilitated through the San Diego Zoo, which conducts passive relocation under authorization from the CDFW.

Assuming the above mitigation measure is implemented, direct and indirect potential Project impacts are anticipated to be reduced. The mitigation measure is not likely to impact local populations because BUOW are presumed to be absent from the AA, based the results of the field surveys, which observed no BUOW individuals or BUOW sign.

Section 7 Conclusions

7.1 LISTED SPECIES AND CRITICAL HABITAT

The Proposed Action will **not affect** any federally listed endangered, threatened, or species of special concern, because there is no habitat to support these species within the AA. In addition, the Proposed Project will **not affect** any designated critical habitat as none exists within the AA, and no primary constituent elements of critical habitat exists within the AA or its buffer.

7.2 BURROWING OWL

Although not a federally listed species, BUOW is protected under the MBTA and is listed as a *Migratory Birds of Conservation Concern (BCC)* by the USFWS and also recognized by the CDFW as a migratory bird for protection. A mitigation measure to conduct a pre-construction burrowing owl and nesting bird clearance survey prior to project implementations in accordance with CDFW guidelines will reduce impacts to less than significant.

The Airport implements an active WHMP program that includes keeping grasses below 6 inches and routine disking. This deters the use of the bare areas by small mammals, which provide food sources for BUOW and other species. Implementation of the WHMP and the proposed mitigation measure, along with the fact that no BUOW individuals or sign have been observed on the Proposed Project Site results in the conclusion that the Proposed Action is not likely to adversely affect BUOW.

7.2.1 Summary of Mitigation Measures

Mitigation measures include the following:

- A pedestrian survey for BUOW will be conducted prior to the start of construction activities, generally within 30 days of the start of construction. If BUOW's are found, the CDFW and USFWS should be consulted to determine the appropriate action to remove any BUOW from the AA before construction. Any BUOW that are found would not be disturbed without CDFW and USFWS consultation as it may violate the MBTA and CDFW guidelines. Mitigation may include flushing owls prior to grading, removal of BUOW from the Proposed Project Site, and/or deferment of grading until artificial can be constructed, in accordance with CDFW and USFWS consultation. BUOW removal and artificial burrow construction can be facilitated through the San Diego Zoo, which conducts passive relocation under authorization from the CDFW.

Subject: List of threatened and endangered species that may occur in your proposed project location or may be affected by your proposed project

To Whom It May Concern:

The enclosed species list identifies threatened, endangered, proposed and candidate species, as well as proposed and final designated critical habitat, that may occur within the boundary of your proposed project and/or may be affected by your proposed project. The species list fulfills the requirements of the U.S. Fish and Wildlife Service (Service) under section 7(c) of the Endangered Species Act (Act) of 1973, as amended (16 U.S.C. 1531 *et seq.*).

New information based on updated surveys, changes in the abundance and distribution of species, changed habitat conditions, or other factors could change this list. Please feel free to contact us if you need more current information or assistance regarding the potential impacts to federally proposed, listed, and candidate species and federally designated and proposed critical habitat. Please note that under 50 CFR 402.12(e) of the regulations implementing section 7 of the Act, the accuracy of this species list should be verified after 90 days. This verification can be completed formally or informally as desired. The Service recommends that verification be completed by visiting the ECOS-IPaC website at regular intervals during project planning and implementation for updates to species lists and information. An updated list may be requested through the ECOS-IPaC system by completing the same process used to receive the enclosed list.

The purpose of the Act is to provide a means whereby threatened and endangered species and the ecosystems upon which they depend may be conserved. Under sections 7(a)(1) and 7(a)(2) of the Act and its implementing regulations (50 CFR 402 *et seq.*), Federal agencies are required to utilize their authorities to carry out programs for the conservation of threatened and endangered species and to determine whether projects may affect threatened and endangered species and/or designated critical habitat.

A biological assessment is required for construction projects (or other undertakings having similar physical impacts) that are major Federal actions significantly affecting the quality of the human environment as defined in the National Environmental Policy Act (42 U.S.C. 4332(2)(c)). For projects other than major construction activities, the Service suggests that a biological

evaluation similar to a biological assessment be prepared to determine whether the project may affect listed or proposed species and/or designated or proposed critical habitat. Recommended contents of a biological assessment are described at 50 CFR 402.12.

If a Federal agency determines, based on the Biological Assessment or biological evaluation, that listed species and/or designated critical habitat may be affected by the proposed project, the agency is required to consult with the Service pursuant to 50 CFR 402. In addition, the Service recommends that candidate species, proposed species and proposed critical habitat be addressed within the consultation. More information on the regulations and procedures for section 7 consultation, including the role of permit or license applicants, can be found at the Fish and Wildlife Service's Endangered Species Consultation website at:

https://www.fws.gov/endangered/what-we-do/faq.html

Migratory Birds: In addition to responsibilities to protect threatened and endangered species under the Endangered Species Act (ESA), there are additional responsibilities under the Migratory Bird Treaty Act (MBTA) and the Bald and Golden Eagle Protection Act (BGEPA) to protect native birds from project-related impacts. Any activity, intentional or unintentional, resulting in take of migratory birds, including eagles, is prohibited unless otherwise permitted by the U.S. Fish and Wildlife Service (50 C.F.R. Sec. 10.12 and 16 U.S.C. Sec. 668(a)). For more information regarding these Acts see https://www.fws.gov/birds/policies-and-regulations.php.

The MBTA has no provision for allowing take of migratory birds that may be unintentionally killed or injured by otherwise lawful activities. It is the responsibility of the project proponent to comply with these Acts by identifying potential impacts to migratory birds and eagles within applicable NEPA documents (when there is a federal nexus) or a Bird/Eagle Conservation Plan (when there is no federal nexus). Proponents should implement conservation measures to avoid or minimize the production of project-related stressors or minimize the exposure of birds and their resources to the project-related stressors. For more information on avian stressors and recommended conservation measures see https://www.fws.gov/birds/bird-enthusiasts/threats-to-birds.php.

In addition to MBTA and BGEPA, Executive Order 13186: *Responsibilities of Federal Agencies to Protect Migratory Birds*, obligates all Federal agencies that engage in or authorize activities that might affect migratory birds, to minimize those effects and encourage conservation measures that will improve bird populations. Executive Order 13186 provides for the protection of both migratory birds and migratory bird habitat. For information regarding the implementation of Executive Order 13186, please visit https://www.fws.gov/birds/policies-and-regulations/executive-orders/e0-13186.php.

We appreciate your concern for threatened and endangered species. The Service encourages Federal agencies to include conservation of threatened and endangered species into their project planning to further the purposes of the Act. Please include the Consultation Code in the header of this letter with any request for consultation or correspondence about your project that you submit to our office.

Project Summary

Project Code: 2022-0083193
Project Name: Ontario International Airport South Airport Cargo Center
Project Type: Airport - Maintenance/Modification
Project Description: The Project includes the proposed relocation of the Ontario International Airport Authority (OIAA) Administrative Offices to existing facilities both on and off-airport and the Airport South Secured Area Access Point (SAAP) to a 2.5 acre site located at the north end of South Vineyard Avenue, adjacent to Taxiway 'S', approximately one-quarter mile west of its current location and approximately 270 feet west of the western boundary of the Project site. The Project would demolish the existing buildings, site improvements on the project site, and develop a new air cargo facility into two phases. The proposed air cargo center includes a Cargo Sorting Building, truckyard, parking facilities, aircraft parking apron improvements, ground service equipment (GSE) parking, and aviation support facilities.

Project Location:

Approximate location of the project can be viewed in Google Maps: https://www.google.com/maps/@34.050939299999996,-117.60456014815804,14z

Counties: San Bernardino County, California

Endangered Species Act Species

There is a total of 5 threatened, endangered, or candidate species on this species list.

Species on this list should be considered in an effects analysis for your project and could include species that exist in another geographic area. For example, certain fish may appear on the species list because a project could affect downstream species.

IPaC does not display listed species or critical habitats under the sole jurisdiction of NOAA Fisheries[1], as USFWS does not have the authority to speak on behalf of NOAA and the Department of Commerce.

See the "Critical habitats" section below for those critical habitats that lie wholly or partially within your project area under this office's jurisdiction. Please contact the designated FWS office if you have questions.

---

1. NOAA Fisheries, also known as the National Marine Fisheries Service (NMFS), is an office of the National Oceanic and Atmospheric Administration within the Department of Commerce.

MANAGEMENT SUMMARY

The Ontario International Airport Authority (OIAA), in cooperation with the Federal Aviation Administration (FAA), proposes the Ontario International Airport (ONT Airport) South Cargo Center Project (Project). The proposed Project is a facility expansion project that includes the redevelopment of existing underutilized parcels on the south side of the ONT Airport in the city of Ontario, San Bernardino County, California. PaleoWest, LLC (PaleoWest) was contracted by Meridian Consultants, LLC, to conduct an archaeological resource assessment for the Project in compliance with the California Environmental Quality Act (CEQA). The OIAA is acting as the lead CEQA agency.

This report summarizes the methods and results of the archaeological resource assessment of the approximately 97-acre Project area. The investigation included a record search and background research, communication with the Native American Heritage Commission (NAHC), a reconnaissance pedestrian survey of the Project area, and the preparation of this report. The purpose of the investigation was to consider the effects of the undertaking on significant archaeological resources that are considered *historical resources* under CEQA.

PaleoWest reviewed existing cultural resource records on file at the South Central Coastal Information Center of the California Historical Resources Information System. In addition, historical maps and aerial photographs of the Project area were examined. Although one historic period archaeological resource has been previously recorded within 0.5-mile of the Project, no archaeological resources have been documented in the Project area.

As part of the background research, PaleoWest also requested a search of the Sacred Lands File (SLF) from the NAHC. The results of the records review and SLF search were negative. The NAHC suggested contacting 18 individuals representing 12 Native American tribal groups to find out if they have additional information about the Project area. It is assumed that the OIAA will be responsible for conducting Assembly Bill 52 consultation with local Native American groups.

On September 29, 2021, PaleoWest conducted a reconnaissance pedestrian survey of the Project area. The reconnaissance survey found that most of the Project area is hardscaped with no exposed native sediments present in the area. No archaeological resources were identified during the survey effort.

A buried site sensitivity analysis of the Project area indicates that surficial sediments have been extensively disturbed by the construction of extant buildings, structures, roadways, and airport features, as well as the installation of underground utilities associated with the ONT Airport. Additionally, there appears to be a layer of artificial fill covering the native surface sediments. Despite the disturbance and fill layer, the assessment found that there is a moderate potential for buried prehistoric and historic archaeological deposits immediately below the artificial fill layer. The analysis suggests that the potential for buried archaeological deposits decreases with depth and the likelihood of encountering deeply buried cultural remains in the Project area is low.

PaleoWest recommends that initial Project-related ground disturbing activities be observed by an archaeological monitor. If archaeological resources are encountered during ground disturbing activities, work in the immediate area shall halt and the find shall be evaluated for listing in the California Register of Historical Resources. If monitoring of the initial ground disturbing

activities finds that there is a low potential for encountering intact archaeological remains within the Project area, monitoring activities may be reduced or halted at the discretion of the qualified archaeologist.

Based on these findings, PaleoWest recommends a finding of *less than significant impacts to historical resources with mitigation incorporated* under CEQA.

1 INTRODUCTION

The Ontario International Airport Authority (OIAA), in cooperation with the Federal Aviation Administration (FAA), proposes the Ontario International Airport (ONT Airport) South Cargo Center Project (Project). The proposed Project is a facility expansion project at the ONT Airport that includes the redevelopment of existing underutilized parcels on the south side of the ONT Airport. PaleoWest, LLC (PaleoWest) was contracted by Meridian Consultants, LLC, to conduct an archaeological resource assessment for the Project in compliance with the California Environmental Quality Act (CEQA). The OIAA is acting as the lead CEQA agency.

1.1 PROJECT LOCATION AND DESCRIPTION

The proposed Project is a facility expansion project at the ONT Airport that includes the redevelopment of approximately 97 acres of existing underutilized parcels, including Assessor's Parcel Numbers (APNs) 11326106, 11326107, 11326108, 11327101, and 11327102 on the south side of the ONT Airport in the city of Ontario, San Bernardino County, California (Figure 1-1). The majority of the Project is located north of East Avion Street with the remainder located between East Avion Street and Mission Boulevard west of South Hellman Avenue. More specifically, the Project area is within Sections 27 and 34, Township 1 South, Range 7 West, San Bernardino Baseline and Meridian (SBBM), as depicted on the Guasti, CA 7.5' U.S. Geological Survey (USGS) topographic quadrangle (Figure 1-2). The elevation of the Project area ranges from approximately 886–915 feet (ft) above mean sea level (amsl).

The purpose of the Project is to develop and operate an air cargo facility at the ONT Airport to meet increased regional cargo volumes and customer needs. The proposed Project would replace existing, underutilized airport related buildings and site improvements with an air cargo center. The Project would include demolition of the existing buildings, site improvements, and the development of a new air cargo center in two phases. Phase 1 would take place on the easternmost 62 acres of the Project site, and Phase 2 would occur on the remaining western 35 acres.

The Project will be composed of the construction of four primary elements: (1) a cargo sorting building; a 60-ft tall, approximately 857,000 ft^2 facility that will house a sorting facility and office spaces; (2) a 210,000 ft^2 truck yard and visitor parking area that will include ground-to-air and air-to-ground cargo operations and trailer truck parking/staging stalls; (3) visitor and employee parking that would include 933 automobile parking stalls; approximately 930 employee stalls in an approximately 271,000 ft^2 parking garage on 3 acres and 30 at-grade, visitor parking stalls; and (4) an aircraft apron with approximately 26 aircraft parking stalls/gates, comprising 2,900,000 ft^2 and ground service equipment maintenance building, garage, and parking area. In addition, the Project requires infrastructural improvements including construction of internal roadways, an aircraft fuel system, substation and substation building, a stormwater drainage/detention system, security systems, utility services, and related developments.

Project Area

The Project footprint includes all construction areas and staging areas (Figure 1-3). It encompasses the proposed cargo sorting building, the aircraft apron and ground service equipment support infrastructure, the employee parking structure and visitor parking area, and the truck yard as well as the internal roadways, an aircraft fuel system, substation and substation building, the stormwater drainage/detention system, security systems, utility services and all related developments. In total, the Project covers an area of approximately 97 acres.

The depth of ground disturbance for the Project will range from 3 ft to approximately 20 ft below the current ground surface (bgs). Installation of the stormwater drainage system piping and associated structures, as well as other utilities are expected to extend up to 20 ft in depth; however, the apron pavement and parking garage foundations are anticipated to only reach up to 2-4 ft and between 5–7 ft bgs, respectively. The extent of the building foundation is not known at this time, but it is not anticipated to extend below 20 ft.

1.2 REPORT ORGANIZATION

This report documents the results of an archaeological resource investigation conducted for the proposed undertaking. Section 1 has introduced the Project location and description. Section 2 states the regulatory context for the Project. Section 3 synthesizes the natural and cultural setting of the Project area and surrounding region. The results of the previous cultural investigations and the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) search is presented in Section 4. The field methods employed during this investigation and findings are outlined in Section 5. Management recommendations are provided in Section 6. This is followed by bibliographic references and appendices.

2 REGULATORY CONTEXT

2.1 STATE

2.1.1 California Environmental Quality Act

The proposed Project is subject to compliance with CEQA, as amended. Compliance with CEQA statutes and guidelines requires both public and private projects with financing or approval from a public agency to assess the project's impact on cultural resources (Public Resources Code Section 21082, 21083.2 and 21084 and California Code of Regulations 10564.5). The first step in the process is to identify cultural resources that may be impacted by the Project and then determine whether the resources are "historically significant" resources.

CEQA defines historically significant resources as "resources listed or eligible for listing in the California Register of Historical Resources (CRHR)" (Public Resources Code Section 5024.1). A cultural resource may be considered historically significant if the resource is 45 years old or older, possesses integrity of location, design, setting, materials, workmanship, feeling, and association, and meets any of the following criteria for listing on the CRHR:

A. Is associated with events that have made a significant contribution to the broad patterns of California's history and cultural heritage;

B. Is associated with the lives of persons important in our past;

C. Embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of an important creative individual, or possesses high artistic values; or,

D. Has yielded, or may be likely to yield, information important in prehistory or history (Public Resources Code Section 5024.1).

Cultural resources are buildings, sites, humanly modified landscapes, traditional cultural properties, structures, or objects that may have historical, architectural, cultural, or scientific importance. CEQA states that if a project will have a significant impact on important cultural resources, deemed "historically significant," then project alternatives and mitigation measures must be considered. Additionally, any proposed project that may affect historically significant cultural resources must be submitted to the State Historic Preservation Officer (SHPO) for review and comment prior to project approval by the responsible agency and prior to construction.

2.1.2 California Assembly Bill 52

Signed into law in September 2014, California Assembly Bill 52 (AB 52) created a new class of resources—tribal cultural resources—for consideration under CEQA. Tribal cultural resources may include sites, features, places, cultural landscapes, sacred places, or objects with cultural value to a California Native American tribe that are listed or determined to be eligible for listing in the CRHR, included in a local register of historical resources, or a resource determined by the lead CEQA agency, in its discretion and supported by substantial evidence, to be significant and eligible for listing in the CRHR. AB 52 requires that the lead CEQA agency consult with California Native American tribes that have requested consultation for projects that may affect tribal cultural resources. The lead CEQA agency shall begin consultation with participating

Native American tribes prior to the release of a negative declaration, mitigated negative declaration, or environmental impact report. Under AB 52, a project that has potential to cause a substantial adverse change to a tribal cultural resource constitutes a significant effect on the environment unless mitigation reduces such effects to a less than significant level.

2.2 LOCAL

2.2.1 City of Ontario's Development Code

Initially adopted in 1991 and subsequently amended in the following decades, the City of Ontario (City) enacted a Historic Preservation Ordinance that provides the framework for preserving the character and history of the city. Now organized in Chapters 4 and 7 of the City's Development Code, the historic preservation section contains the following purpose and goals (Ontario Development Code §7.01.000):

A. Safeguarding the character and history of the City which is reflected in its unique cultural, historical, and architectural heritage, with emphasis on the "Model Colony" as recognized by an Act of Congress and presented at the St. Louis World's Far in 1904;

B. Encourage and promote the adaptive reuse of the City's historic resources;

C. Enhance, perpetuate, and preserve architecturally and historically significant structures and promote revitalization of historic neighborhoods and commercial areas;

D. Ensure that the rights of the owners of historic resources are safeguarded;

E. Foster civic pride in the beauty and noble accomplishments of the past by promoting private stewardship of historic resources that represent these accomplishments;

F. Fulfill the City's responsibilities as a Certified Local Government under Federal preservation laws;

G. Promote the identification, documentation, and evaluation of the significance of individual historic resources and districts;

H. Implement the historic preservation goals, policies, and programs of the Policy Plan (General Plan) component of the Ontario Plan;

I. Promote the City as a destination for tourists and as a desirable location for business;

J. Promote public awareness of the value of rehabilitation, restoration, and maintenance of the existing building stock as a means to conserve reusable material and energy resources;

K. Recognize the City's historic resources as economic assets and provide economic financial incentives for historic preservation;

L. Stabilize and improve property values, and enhance the aesthetic and visual character, place making, diversity, and environmental amenities of the City's historic properties and areas;

M. Promote public knowledge, appreciation, and understanding of the City's past, and foster civic and neighborhood pride in the beauty and accomplishments of the past;

N. Promote the enjoyment and use of historic resources appropriate for the education and recreation of the people of the City'

O. Recognize historic resources and protect areas of historic structures from encroachment of incompatible design;

P. Promote public awareness of the benefits of preservation; and

Q. Encourage public participation in historic preservation, thereby increasing civic pride in the City's heritage.

To accomplish these goals, the City oversees multiple incentive programs and approval frameworks for projects that involve historic resources, many of which involve review by the City's Historic Preservation Commission/Subcommittee. Additionally, the ordinance outlines conditions and penalties for those in violation of the development code as it pertains to historic resources.

Ontario Register of Historic Resources

The Ontario Register of Historic Resources (ORHR), as outlined in Section 7.01.010 of the City's Development Code, creates a local register and inventory of "buildings, structures, sites, objects and districts worthy of preservation due to their significance in history, architecture, archaeology, engineering, and/or culture within the City." The ORHR includes a list of designated local Historic Landmarks and Districts that exhibit historical significance, as determined through an established set of eligibility criteria. Based upon the NRHR and CRHR significance criteria and identified in §4.02.040(B)(2) of Ontario's Development Code, a local Historic Landmark may qualify for designation if it exhibits significance under one more of the following criteria:

A. The historic resource exemplifies or reflects special elements of the City's history;

B. The historic resource is identified with persons or events significant in local, state, or national history;

C. The historic resource is representative of the work of a notable builder, designer, architect, or artist;

D. The historic resource embodies distinguishing architectural characteristics of a style, type, period, or method of construction;

E. The historic resource is a noteworthy example of the use of indigenous materials or craftsmanship;

F. The historic resource embodies elements that represent a significant structural, engineering, or architectural achievement or innovation

G. The historic resource has a unique location, a singular physical characteristic, or is an established and familiar visual feature of a neighborhood, community, or the City;

H. The historic resource is one of the few remaining examples in the City, region, state or nation, possessing distinguishing characteristics of an architectural or historical type or specimen;

I. The historic resource has yielded, or is likely to yield, information important to the City's history or prehistory.

The designation of local Historic Districts has its own set of eligibility criteria outlined under §4.02.040(B)(3). To qualify as eligible, a Historic District may either meet the criteria for listing in the NRHP or CRHR, or meet one or more of the following local criteria:

A. The historic resource is a geographically definable area possessing a concentration of historic resources or a thematically related grouping of structures that contribute to each other and are unified by plan, style, or physical development, and embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values;

B. The historic resource reflects significant geographical patterns, including those associated with different eras of settlement and growth, particular transportation modes, or distinctive examples of a park landscape, site design, or community planning;

C. The historic resource is associated with, or the contributing resources are unified by, events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or

D. The historic resource is, or the contributing resources are, associated with the lives of persons important to the City, State, or National history.

In instances of potential Historic Landmarks and Districts, the resource must also retain sufficient historical integrity dating to the established "period of significance" in order to qualify for listing in the ORHR. The relevant aspects of integrity for listing in the ORHR include design, setting, materials and workmanship, location, feeling, and association.

Historic Resource Tiering System

In addition to listing Historic Landmarks and Districts to the ORHR, the Ontario Historic Preservation Commission/Subcommittee manages a Historic Resource Tier Designation List, which essentially categorizes the level of historical significance of a resource based upon a rank of "Tier I, Tier II, or Tier III," which are defined as follows (Ontario Development Code §4.02.040(G)):

- Tier I consists of historic resources that should not be demolished or significantly altered under any circumstances, regardless of their designation status. Resources within this tier are determined to be the City's most significant historical or cultural resources.
- Tier II consists of historic resource wherein demolition of these properties should be avoided.
- Tier III consists of historic resources that are designated local Historic Landmarks, are contributing properties within designated local Historic Districts, or are eligible historic resources. Demolition of these resources should be avoided where possible, but may be appropriate under certain circumstances.

The Historic Resource Tier a resource is determined by using an additional set of criteria that examines a properties Architecture/Form and its History. All of these criteria specific to Historic

Landmarks and Districts are outlined under the City's Development Code§4.02.040(H)(1) and §4.02.040(H)(2), respectively.

3 NATURAL AND CULTURAL SETTING

This section of the report summarizes information regarding the physical and cultural setting of the Project area, including the prehistoric, ethnographic, and historic contexts of the general area. Several factors, including topography, available water sources, and biological resources, affect the nature and distribution of prehistoric, ethnographic, and historic-period human activities in an area. This background provides a context for understanding the nature of the cultural resources that may be identified within the region.

3.1 ENVIRONMENTAL SETTING

The Project area is south of the San Gabriel Mountains, which are part of the Transverse Ranges that separate the Los Angeles Basin and the Mojave Desert. More specifically, the Project area is within the western part of the San Bernardino Basin between the Santa Ana River to the south and San Gabriel Range to the north. The alluvial valley was formed by the Santa Ana River and its tributaries. The Santa Ana River originates on the northern and eastern slopes of Mount San Gorgonio and is the largest hydrological feature near the Project area, approximately 7 miles (mi) away. The natural course of Cucamonga Creek flanks the eastern Project boundary and the San Antonio Creek, which crosses the western portion of the valley and runs along the Los Angeles County and San Bernardino County border, is approximately 5 mi away. Other notable tributaries emerging from the southern slopes of the San Gabriel Mountains include Lytle Creek, Cajon Wash, Deer Canyon Wash, and Etiwanda Creek.

As the climate of the region is largely determined by topographic features, climate, in turn, largely dictates the character of the biotic environment exploited by native populations. The climate of the Project area is characterized as Mediterranean, with hot, dry summers and cool, moist winters. It has a semi-arid precipitation regime; significant changes in temperature and moisture occur based on elevation and exposure, particularly in the nearby mountains.

Prior to historical development of the Project vicinity, vegetation in the area included representative species of the valley grassland plant community. Indigenous species present may have included rye grass (*Leymus condensatus*), blue grass (*Poa secunda*), bent grass (*Agrostis* spp.), needlegrass (*Stipa* spp.), three-awn (*Aristida divaricata*), and members of the sunflower family (Asteraceae). Additionally, restricted riparian communities also occurred near springs and along watercourses. Various floral species were available from early spring until winter, and the leaves, stems, seeds, fruits, roots, and tubers from many of these plant species formed an important subsistence base for the Native American inhabitants of the region (Bean and Saubel 1972; Hyde and Elliot 1994).

3.2 PREHISTORIC SETTING

Prehistoric occupation of the inland valleys of Southern California can be divided into seven cultural periods: Paleoindian (circa [ca.] 12,000–9,500 years before present [B.P.]), Early Archaic (ca. 9,500–7,000 B.P.), Middle Archaic (ca. 7,000–4,000 B.P.), Late Archaic (ca. 4,000–1,500 B.P.), Saratoga Springs (ca. 1,500–750 B.P.), Late Prehistoric (ca. 750–410 B.P.), and Protohistoric (ca. 410–180 B.P.), which ended in the Ethnographic Period. These periods are structured based on the archaeological research conducted at Diamond Valley Lake as part of the Eastside Reservoir Project (ESRP), approximately 36 mi southeast of the Project area (Goldberg et al. 2001; McDougall et al. 2003). Prior to the work conducted for the Eastside

Reservoir Project, no comprehensive context had been developed specifically for the interior valley and mountain localities of Southern California that distinguished the region from the nearby desert and coastal regions. Due to the nature and temporal association of the archaeological resources identified within a one-mile radius of the Project area, the prehistoric cultural setting discussed below begins at the Protohistoric Period. The following has been adapted from Horne and McDougall (2003).

3.2.1 Late Prehistoric Period (ca. 750–410 B.P.)

The Medieval Warm Period extended into the Late Prehistoric Period, ending about 575 B.P. A period of lower temperatures and increased precipitation, known as the Little Ice Age, resulted in increased resource productivity in the inland region. Population increased in the region of the Project study area during this wet interval. In the ESRP area, several small, but apparently semisedentary occupations, date to this period. Cottonwood Triangular points began to appear in inland assemblages at this time, and Obsidian Butte obsidian became much more common (Goldberg et al. 2001).

By about 500 B.P., strong ethnic patterns developed among native populations in Southern California. This may reflect accelerated cultural change brought about by increased efficiency in cultural adaptation and diffusion of technology from the central coastal region of California and the southern Great Basin (Douglas 1981).

Also during this period, Lake Cahuilla began to recede (Waters 1983) and the large Patayan populations occupying its shores began moving westward into areas such as Anza Borrego, Coyote Canyon, the Upper Coachella Valley, the Little San Bernardino Mountains, and the San Jacinto Plain (Wilke 1976). The final desiccation of Lake Cahuilla, which had occurred by approximately 400 B.P. (A.D. 1640), resulted in a population shift away from the lakebed into the Peninsular Ranges to the west, and the Colorado River regions to the east.

3.2.2 Protohistoric Period (ca. 410–180 B.P.)

The improved and dynamic conditions of the Little Ice Age continued throughout the Protohistoric Period. Use of the bow and arrow promoted an increase in hunting efficiency and a renewed abundance of mortars and pestles indicates extensive exploitation of various hard nuts and berries. As a result of the increased resource use of the area, sedentism intensified with small, fully sedentary villages forming during the Protohistoric Period. This is evidenced by sites containing deeper middens, suggesting more permanent habitation. These would have been the villages, or rancherias, noted by the early nonnative explorers (True 1966, 1970).

The cultural assemblage associated with the Protohistoric Period included the introduction of locally manufactured ceramic vessels and ceramic smoking pipes, an abundance of imported Obsidian Butte obsidian, Cottonwood Triangular points, and Desert Side-notched points as well as the addition of European trade goods, such as glass trade beads, late in the period (Meighan 1954).

3.3 ETHNOGRAPHIC SETTING

Archival research and published reports suggest the Project area is where three traditional use territories of Native American groups meet. The traditional use territories of the Serrano, Cahuilla, and Gabrielino come together just southwest of the present-day city of San Bernardino, which is very near the Project area. These cultural groups all spoke languages

belonging to the Takic branch of the Shoshonean family, a part of the larger Uto-Aztecan language stock (Bean 1978:576; Geiger and Meighan 1976:19). In the following section, a brief synopsis of Serrano, Cahuilla, and Gabrielino ethnography is presented. This information has been summarized from Bean and Vane (2001) and McCawley (1996).

The Cahuilla and Serrano belonged to nonpolitical, nonterritorial patrimoieties that governed marriage patterns as well as patrilineal clans and lineages. Each clan—or "political-ritual-corporate units"—was composed of 3 to 10 lineages, owned a large territory in which each lineage owned a village site with specific resource areas. Clan lineages cooperated in defense, in large communal subsistence activities, and in performing rituals. Clans were apt to own land in the valley, foothill, and mountain areas, providing them with the resources of many different ecological niches. Unlike their Cahuilla and Serrano neighbors, the Gabrielino had a hierarchically ordered social class that included groupings of elite, middle class, and commoners. Class membership played a major role in determining individual lifestyles, as it depended upon both ancestry and wealth (Bean and Smith 1978:543).

In prehistoric times Cahuilla, Gabrielino, and Serrano shelters are believed to have been dome shaped; after contact they tended to be rectangular in shape. Cahuilla and Serrano shelters were often made of brush, palm fronds, or arrowweed while the Gabrielino used reed. Most of the Serrano and Cahuilla domestic activities were performed outside the shelters within the shade of large, expansive ramadas; windbreaks, made of vertical poles covered with rush mats, provided open-air food preparation and cooking areas at Gabrielino settlements.

The Cahuilla, Gabrielino, and Serrano were, for the most part, hunting, collecting, harvesting, and protoagricultural peoples. As in most of California, acorns were a major staple, but the roots, leaves, seeds, and fruit of many other plants also were used. Fish, birds, insects, and large and small mammals were also available.

To gather and prepare these food resources, the Cahuilla, Gabrielino, and Serrano had an extensive inventory of equipment including bows and arrows, traps, nets, disguises, blinds, spears, hooks and lines, poles for shaking down pine nuts and acorns, cactus pickers, seed beaters, digging sticks and weights, and pry bars. In addition, the Cahuilla also had an extensive inventory of food processing equipment including hammers and anvils, mortars and pestles, manos and metates, winnowing shells and baskets, strainers, leaching baskets and bowls, knives (made of stone, bone, wood, and carrizo cane), bone saws, and drying racks made of wooden poles to dry fish.

Mountain tops, unusual rock formations, springs, and streams are held sacred to the Cahuilla, Gabrielino, and Serrano, as are rock art sites and burial and cremation sites. In addition, various birds are revered as sacred beings of great power and sometimes were killed ritually and mourned in mortuary ceremonies similar to those for important individuals. As such, bird cremation sites are sacred.

3.4 HISTORICAL SETTING

3.4.1 San Bernardino County

The earliest recorded historic period use of the lands within the San Bernardino Valley began in the 1770s, following establishment of the Mission San Gabriel approximately 40 mi west of the Project area. Euro-American settlement in San Bernardino began in the early 1800s through the establishment of Politana and the Asistencia, but was largely fostered by the establishment of a

Mormon colony under the leadership of Amasa Lyman and Charles Rich. Brothers Lyman and Rich bought the San Bernardino Rancho from Jose and Maria Armenta Lugo in 1851. The other large land grant, Cucamonga Rancho, remained largely undeveloped, although the landowner, Tiburcia Tapia, had developed several outposts in failed attempts to lure perspective buyers in the 1840s (Gentlcore 1960). Tapia had acquired the 13,000-acre rancho—which encompasses modern day Fontana, Rancho Cucamonga, Ontario, and Upland—in 1839. He used the land to run 1,500 head of cattle along with raising other livestock; however, due to the arid nature of the land, very little crops were grown. Cattle ranching would remain the dominant economic driver in the region until 1865 when disease, famine, and price competition largely ended the industry across the county (Gentlcore 1960).

San Bernardino County was established on April 26, 1853 and subsequently ceded a portion of its territory to the formation of Riverside County in 1893 (Chasteen 2015). By the time California had formed and the counties were established, those in the area had begun experimenting with new crops including barley and wheat, which could be dry farmed. However, these endeavors proved fruitless due to a lack of transport, lack of labor, and small profit margins. The introduction of the orange fundamentally changed the landscape of the region. The first orange trees in San Bernardino were planted by Anson Van Leuven in 1857. This variety proved perfect for the region as it prospered on foothills. Citrus quickly became the largest industry in Southern California, including growing, packing, and shipping. Growth of the region accelerated following completion of the Southern Pacific Railroad in 1876. By 1885, the region was synonymous with the growth of oranges (Gentlcore 1960).

Starting in the 1860s and 1870s, companies began to form across California with the intent of purchasing readily available land (much of it owned by railroad companies) to redevelop into land colonies. These land colonies were pivotal in the rapid development of regions across the West and specifically in San Bernardino County. The companies purchased the land, acquired water rights, established lots, and built infrastructure such as roads and water irrigation lines. These land colonies were key to agricultural growth in the region (Gentlcore 1960). In 1881, George and William Chaffey purchased 6,200 acres of land in what is today considered Upland for the formation of the Ontario Colony. The land provided was ideal for the growing of oranges. Happening concurrently, the Semi-Tropic Land and Water Company formed. The company purchased 28,000 acres and the water rights to Lytle Creek. The company laid out the townsites of Rosena (now known as Fontana), Rialto, Bloomington, and San Sevaine. The Semi-Tropic Land and Water Company, though ultimately unsuccessful in its attempts, initiated early residential and commercial development in San Bernardino County (Chasteen 2015).

3.4.2 City of Ontario

The city of Ontario was founded in 1882 as agricultural colony, which was a model of development used in California as a promotional tool and early co-operative system for creating irrigation developments and marketing infrastructure. The Ontario Colony recognized the areas potential for the development of agricultural products—namely citrus fruit and grapes—due to the Mediterranean climate and rich soils of the surrounding valley. The colony itself featured a patchwork of agricultural land centered around a subdivided townsite in a one-square-mile area, all of which was supported by water conveyance infrastructure from the nearby mountains. With immediate proximity to the Southern Pacific Railroad and the aggressive promotion of the romanticized Southern California landscape and lifestyle, the colony attracted new residents from throughout the United States (U.S.) to come and establish their own farms and orchards. The boost to agricultural productivity, particularly with orange groves, led to the creation of

numerous packing houses and other agricultural-based industries that allowed for the marketing and shipment of these products. The influx of people also spurred development in the townsite with new hotels, schools, commercial blocks, and churches. In 1891, the colony was officially incorporated as the city of Ontario (Davis and Novell 2017:15).

During the turn of the century, the Ontario Land and Improvement Company continued attract additional residents and provide a framework for further growth. By the 1920s, the city was a bustling regional center with a developed downtown, residential neighborhoods, and an industrial center that largely catered to the exporting of the citrus fruit and other agricultural products of the area. Most notably, the California Fruit Growers Exchange and its subsidiary Sunkist was one of the largest employers in the city during this period. Although the Great Depression and the economic uncertainties drastically affected much of the U.S., the city continued to prosper in relative terms. With the outbreak of World War II, the U.S. Army established the Ontario Army Air Field in support of the war effort in the Pacific Theater. This became the crucial foundations for the modern ONT (Davis and Novell 2017:15–16).

During the post-war period, the population of California increased exponentially, which led to an expansive period of residential, commercial, and industrial development. Similar to many other areas in Southern California, the city experienced the construction of large tract house developments, which came to reflect the new post-war suburban model for living. This development led to acres of agricultural land, including the previously defining citrus groves, being removed and redeveloped for housing and commercial purposes. With increased commerce and industry, new business and industrial parks were established, reflecting the increasing shift from agricultural industries in the area to a more manufacturing and services-based economy. This shift in industry would continue to define the city throughout the remainder of the twentieth century (Davis and Novell 2017:16)

3.4.3 Ontario International Airport

Early Aviation and Ontario Municipal Airport (1923–1939)

Aviation in the area began in 1923 when a local flying club constructed a simple landing strip near downtown. The landing area was set between the Union Pacific (south) and Southern Pacific (north) railroad lines and Mountain Avenue (west) and San Antonio Avenue (east). Known as "Latimer Field" from the nearby Latimer Packing House, this simple air strip would serve as the center for aviation in the area for the following decade (Davis and Novell 2017:17).

In 1929, the City purchased approximately 30 acres of agricultural land southwest of downtown for the construction of an airport. Located between the Southern Pacific and Union Pacific railroad lines, near the southwest corner of present-day ONT Airport, the land that became known as the Ontario Municipal Airport was not developed until 1935, when a flight instructor leased the land from the City and began operating a flight school at the property. This involved the construction of simple infrastructure, including a modest wood framed hangar and 1,200-ft-long runway landing strip that was graded using an automobile pulling a series of weights across the property (Davis and Novell 2017:17).

Federal Buildup and Ontario Army Airfield (1940–1945)

By the late 1930s, the flight school at Ontario Municipal Airport was being funded in part by the U.S. Civil Aeronautic Authority (CAA). At this time, the Roosevelt administration was discretely building up U.S. military capabilities as World War II unfolded around the world. As part of this

effort, the CAA began a program for training potential military pilots. Federal involvement at the Ontario Municipal Airport increased in 1940 as the CAA and Works Progress Administration proposed to drastically expand the airfield. The following year, the City annexed over 400 acres of ranchland west adjacent to the airport. With the U.S. entering World War II, the WPA began a rapid expansion campaign at the airport with the construction of two new concrete runways, a control tower, and support infrastructure. The U.S. Army Air Corps, later known as the U.S. Air Force, began operating at Ontario Municipal Airport by leasing it from the City. This was supplemented by an additional several hundred acres purchased to accommodate the ramp up in wartime operations, which included fighter pilot training and mission facilities (Davis and Novell 2017:17). The facility became known as Ontario Army Airfield during this period.

Post-war Period (1946–1966)

At the end of World War II, the City reasserted the airport's use for civilian aviation purposes. In 1946, the Ontario Municipal Airport was officially designated an international port of entry, creating the foundation for modern ONT. In the early 1950s, a new terminal building and air traffic control tower were constructed. However, the terminal was quickly determined to be obsolete and ultimately replaced in 1959.

The airfield, and much of the U.S. Air Force land, continued to be used for military purposes during this post-war period, primarily due to the readily available land for expansion, as well as the runway infrastructure that was capable of handling heavy military aircraft. In 1949, a training station for the California Air National guard (CA ANG) was established at the southern edge of ONT. The Ontario Air National Guard Station (ANGS) would continue to be expanded over the following decades with new facilities being constructed on the southern side of the airfield. The CA ANG operations also had resounding impacts on the development of the ONT airfield, primarily through the expansion of the runway network in 1952, 1956, and 1962, all of which were necessitated by the exponential improvement in military aircraft capabilities during this period (Davis and Novell 2017).

Industrial and aviation support services also increased at ONT during the post-war period. This included the introduction of major aviation companies, such as Lockheed, Aerojet, and General Electric (GE) Aviation Services. These companies provided both commercial and military-based aviation support services during the second half of the twentieth century.

Modern Ontario International Airport (1967–Present)

In 1967, the City entered into a Joint Powers Agreement with the City of Los Angeles' Department of Airports (LADoA) to manage ONT as part of the Los Angeles regional airport system. With increased passenger traffic to ONT during the 1970s as part of the Los Angeles regional airport system, the airport was expanded to increase its capacity. In 1981, the second east-west runway was constructed. Both this runway and the pre-existing were expanded throughout the 1980s to accommodate increased traffic and the larger aircraft that were becoming more common during this period (Los Angeles World Airports [LAWA] 2014).

By the 1980s, military operations at ONT were decreasing. In 1983, one of the last fighter squadrons at Ontario ANGS was transferred to March Air Force Base in nearby Riverside County. Over the next decade, the ANGS facilities were used by a combat communications squadron and its radar operations. The Ontario ANGS was ultimately decommissioned following the 1995 Base Realignment and Closure Commission.

In 1998, a new passenger terminal was constructed at ONT. In addition to passenger traffic, ONT became an increasingly important center for cargo and air freight services. This largely coincided with the decommissioning of the pre-existing aviation support services under Lockheed and eventually GE, who ceased operations at the airfield. With the readily available land and capacity for flights, especially with a reduction in passenger traffic during the Great Recession of 2008, air cargo and freight services have become an important aspect of the operations at ONT (LAWA 2014).

In 2015, LAWA, the successor agency to the LADoA, relinquished control of ONT to OIAA and San Bernardino County after concerns of how ONT was being operated were voiced. Since then, the airport has been administered by the OIAA. Today, the airport continues to serve as critical aviation infrastructure, both as a center for passenger traffic in the Inland Empire and east Los Angeles area, as well as a center for cargo and shipping operations with key on-site operations from FedEx, United Parcel Service, and Amazon among others.

4 CULTURAL RESOURCES INVENTORY

A literature review and records search were conducted at the South Central Coastal Information Center (SCCIC), housed at California State University, Fullerton, on November 17, 2021. This inventory effort included the Project area and a one-half-mile radius around the Project area, collectively termed the Project study area. The objective of this records search was to identify prehistoric or historical cultural resources that have been previously recorded within the study area during prior cultural resource investigations.

As part of the cultural resources inventory, PaleoWest staff also examined historical maps and aerial images to characterize the developmental history of the Project area and surrounding area. Finally, PaleoWest contacted the NAHC to request a review of the SLF to identify any known Native American cultural resources that may be present in the Project area. A summary of the results of the record search and background research are provided below.

4.1 PREVIOUS CULTURAL RESOURCE INVESTIGATIONS

The records search indicates that five previous investigations have been conducted the Project study area since 1976 (Table 4-1). One of these studies (SB-05358) includes a small portion of the Project area. This study involved the compilation of historical research on the development of the flood control channel along Cucamonga Creek. No archaeological survey was completed as part of this project.

Table 4-1. Previous Cultural Studies within the Project Study Area

Report No.	Date	Author(s)	Title
SB-03586	2000	Love, Bruce	Ontario To Colton Pipeline, San Bernardino County, California
SB-04674	2004	Bonner, Wayne H. and Christeen Taniguchi	Records Search Results and Site Visit for Cingular Wireless Telecommunications Facility Candidate SB-476-01 (Villa Park Trucking) 2301 East Francis Street, Ontario, San Bernardino County, California
SB-05358	*1976*	*Sider, W.A.*	*Cucamonga Creek 1776-1976 After 200 Years*
SB-05367	2004	Marvin, Judith and Riordan Goodwin	Cultural Resource Assessment: Hofer Ranch Airport Business Park Specific Plan Amendment, City of Ontario, San Bernardino County, California
SB-05814	2007	Bonner, Wayne H. and Marnie Aislin-Kay	Cultural Resource Records Search Results and Site Visit for Royal Street Communications, LLC Candidate LA-730C (Carlos Ct), 2001 Elm Court, Ontario, San Bernardino County, California

Italics indicate previous projects that include portions of the current Project area.

4.2 CULTURAL RESOURCES REPORTED WITHIN THE STUDY AREA

The records search indicated that two cultural resources have been previously documented within Project study area (Table 4-2). These resources include one historic period building, the Ontario International Airport Terminal (36-012630), and one historic period archaeological site, the remains of an abandoned irrigation system (36-007096). Neither of these resources are within the Project area. A description of each resource is provided below.

Table 4-2 Cultural Resources Recorded within the Project Study Area

Primary No.	Trinomial	Type	Age	Description
P-36-007096	CA-SBR-7096H	Site	Historic	Remnants of an abandoned irrigation system
P-36-012630	–	Building	Historic	Ontario International Airport Terminal

4.2.1 P-36-007096/CA-SBR-7096H

This resource consists of an abandoned irrigation system made up of a precast concrete valve gate and standpipes that was originally recorded in 1991 (Hampson et al. 1991). The resource is 427 ft × 7 ft and includes a linear arrangement of formed concrete standpipes. The standpipes run parallel to Mission Avenue and a transmission line. It does not appear that this resource has been evaluated for listing in the NRHP or CRHR.

4.2.2 P-36-012630 (Ontario International Airport Terminal)

The Ontario International Airport Terminal is a one- to two-story passenger terminal building that was originally constructed in 1959–1960 with additions made in the 1970s (Taniguchi and Taniguchi 2005). It was originally documented in 2005. The floor plan of the building is irregular and has a northwest facing façade (Taniguchi and Taniguchi 2005). The building has a steel frame structural system with a concrete foundation and a rolled composite material roof. The original building was constructed in the International style; however, the additions are in a Modern style. The building is part of the larger Ontario International Airport property.

The terminal was evaluated for listing in the NRHP in 2005 and not recommended eligible for listing under any criteria. The property was not evaluated for listing in the CRHR.

4.3 ADDITIONAL SOURCES

4.3.1 Historic Maps and Aerial Images

Historical maps consulted include Southern California Sheet No. 1 (1901) and San Bernardino, CA (1952 and 1958) 60-minute, Cucamonga (1894), Guasti and Vicinity (1941), and Ontario, CA (1954) 15-minute, and Guasti, CA (1953, 1966, and 1973) 7.5-minute USGS quadrangles. Historical aerial images from NETROnline dated to 1938, 1948, 1959, and 1966 were also reviewed. Results of the archival research indicate that the area was used for agricultural purposes before the airport was constructed with the Cucamonga Creek running along the eastern side of the Project area. By the late 1940s, the Project area began to be built up with the construction of the airport and the channelization of the creek. By 1959, the GE buildings and the ANG hangar had been built in the area. Over the subsequent years, additional buildings, structures, roadways, and associated airport features were constructed in the area.

4.3.2 Buried Archaeological Site Sensitivity Assessment

The Project area is on a series of broad coalescing alluvial fans in the western part of the San Bernardino Basin between the Santa Ana River to the south and San Gabriel Range to the north. Fan sediments are sourced from creeks draining the San Gabriel Range flowing south toward the Santa Ana River. The historic period course of Cucamonga Creek flanks the eastern Project boundary and San Antonio Creek is five miles to the west and deposits from both

creeks form a very low rise on the fan surface in Project vicinity. Cox and Morton (1978) have mapped underlying sediments as Holocene alluvium consisting of unconsolidated deposits of fine- to coarse-grained sand with dispersed thin beds of pebble gravel or silt, indicative of stream channels. Subsequent geological mapping by Morton and Miller (2006) indicates the mid-eastern side of the Project area is underlain by late Pleistocene to early Holocene alluvial fan deposits and middle Holocene alluvial fan deposits on the far eastern side, both of which are slightly to moderately consolidated. Soils mapping suggests that native soils were sandy to sandy loams, relatively fine grained, and relatively young (Bureau of Soils 1915; Soil Survey Staff 2021). Native sediments across the Project area appear to be overlaid by artificial fill (Morton and Miller 2006).

As previously stated, a review of aerial imagery (NETROnline 2021) indicates that in the early part of the twentieth century, the Project area consisted of plowed fields and the natural (or minimally altered) course of Cucamonga Creek ran along the eastern side of the Project, incised into the native surface. Evidence that the creek consisted of a broader braided stream bed extending farther east merging into a single channel to the south is visible in a 1938 image (NETROnline 2021). Currently, the locus of deposition of the creek appears to be south of the Project area. No abandoned creek channels or fluvial features are mapped within the Project, indicating recent surface stability. With the construction of the airport and channelizing of the Cucamonga Creek in the late 1940s, the landscape appears to have further stabilized with minimal deposition or erosion. Although geological mapping by Morton and Morton (2006) indicate artificial fill covers the Project area, no indication was seen in the historic aerial imagery of either the emplacement of fill or its potential depth.

This review suggests that there is moderate potential for buried archaeological sites within the Project area. The former historic period surface appears to have been relatively stable through the latter half of the Holocene having formed on material deposited between the late Pleistocene and middle Holocene. During this time, the surface may have been used prehistorically. As such, there is potential that artifacts associated with prehistoric occupation of the area could be present in the Project area. Farming in the in early twentieth century may have led to surface disturbances and deposition of historic period artifacts. If intact, there is moderate potential for buried prehistoric and historic deposits to be present in the native sediments underlying the artificial fill layer. There is a low potential for more deeply buried archaeological deposits associated with the early Holocene and late Pleistocene.

4.4 NATIVE AMERICAN COORDINATION

PaleoWest contacted the NAHC, as part of the cultural resource assessment, on August 26, 2021, for a review of the SLF. The objective of the SLF search was to determine if the NAHC had any knowledge of Native American cultural resources (e.g., traditional use or gathering area, place of religious or sacred activity, etc.) within the immediate vicinity of the Project area. The NAHC responded on September 30, 2021, stating that the SLF was completed with negative results (Appendix C). However, NAHC noted that the absence of specific site information in the SLF does not indicate the absence of cultural resources within the Project area. The NAHC requested that 18 individuals representing 12 Native American tribal groups be contacted to elicit information regarding cultural resource issues related to the proposed Project. No additional outreach was conducted. It is assumed that the OIAA will be responsible for conducting Assembly Bill 52 consultation with local Native American groups.

5 FIELD INVESTIGATION

5.1 FIELD METHODS

A reconnaissance survey of the Project area was completed by PaleoWest's Dan Herrick on September 29, 2021. The fieldwork effort included an inspection of the entire Project area, which involved locations on the controlled air-side portion of ONT, as well as the publicly accessible area along East Avion Street. All areas likely to contain or exhibit sensitive cultural resources were carefully inspected to ensure discovery and documentation of any visible, potentially significant cultural resources within the Project area.

Prehistoric site indicators may include areas of darker soil with concentrations of ash, charcoal, bits of animal bone (burned or unburned), shell, flaked stone, ground stone, or even human bone. Historical site indicators may include fence lines, ditches, standing buildings, objects or structures such as sheds, or concentrations of materials at least 45 years in age, such as domestic refuse (e.g., glass bottles, ceramics, toys, buttons or leather shoes), refuse from other pursuits such as agriculture (e.g., metal tanks, farm machinery parts, horse shoes) or structural materials (e.g., nails, glass window panes, corrugated metal, wood posts or planks, metal pipes and fittings, railroad spurs, etc.).

5.2 FIELD RESULTS

The Project area is in a flat area that is largely developed with expanses of paved surfaces used for aircraft circulation on the air-side portion of the Project area, and airfield support operations and automobile circulation on the publicly accessible portion. The Project area features two primary collections of buildings, the former ANG facilities in the eastern half of the Project area, and the former GE maintenance complex in the western half of the Project area. The former GE maintenance complex is currently integrated into the ONT Airport office and operations facilities at 1923 East Avion Street. The Project area features multiple buildings, structures, and landscape features, which obscure the ground surface. As such, ground visibility was poor (0–5%). The rare exposures of surficial sediments exhibit a low degree of disturbance as they are between paved roadways and runway aprons (Figure 5-1 to Figure 5-4). However, the built nature of most of the Project area, as well as the assumed placement of underground utilities associated with the extant buildings and structures, suggests subsurface sediments have also been extensively disturbed.

No archaeological resources were identified within the Project area during the survey.

Figure 5-2. Overview of the former ANG aircraft parking apron, facing north.

Figure 5-3. Overview of the former ANG complex and service yard south of Avion Street, facing north.

Figure 5-4. Overview of the former ANG complex and service yard south of Avion Street, facing east.

6 RECOMMENDATIONS AND SUMMARY

The results of the literature review and records search, archival research, Native American outreach, and reconnaissance survey did not identify any archaeological resources within the Project area.

Surficial sediments throughout the Project area have been disturbed by the construction of extant buildings, structures, roadways, and airport features, as well as the installation of underground utilities associated with the ONT Airport. Despite the high level of existing ground disturbance, there is a moderate potential for buried prehistoric and historic archaeological deposits to be encountered immediately below a layer of artificial fill in the Project area. The buried site sensitivity analysis conducted for this study indicates that the uppermost stratum of native sediments has been relatively stable through the latter half of the Holocene. As such, if the area was used prehistorically, there is potential that artifacts associated with this early period of occupation may be present. Additionally, farming in the in early twentieth century may have also resulted in the deposition of historic period artifacts. Results of the analysis suggests that the sensitivity of the Project area deceases with depth with a low potential for archaeological deposits to be encountered in deeply buried contexts.

PaleoWest recommends that initial Project-related ground disturbing activities be observed by an archaeological monitor. If archaeological resources are encountered during ground disturbing activities, work in the immediate area shall halt and the find shall be evaluated for listing in the CRHR. If monitoring of the initial ground disturbing activities finds that there is a low potential for encountering intact archaeological remains within the Project area, monitoring activities may be reduced or halted at the discretion of the qualified archaeologist.

Based on these findings, PaleoWest recommends a finding of *less than significant impacts to historical resources with mitigation incorporated* under CEQA.

Re: Ontario Airport South Cargo Center Project, San Bernardino County

Dear Ms. Thomas:

A record search of the Native American Heritage Commission (NAHC) Sacred Lands File (SLF) was completed for the information you have submitted for the above referenced project. The results were negative. However, the absence of specific site information in the SLF does not indicate the absence of cultural resources in any project area. Other sources of cultural resources should also be contacted for information regarding known and recorded sites.

Attached is a list of Native American tribes who may also have knowledge of cultural resources in the project area. This list should provide a starting place in locating areas of potential adverse impact within the proposed project area. I suggest you contact all of those indicated; if they cannot supply information, they might recommend others with specific knowledge. By contacting all those listed, your organization will be better able to respond to claims of failure to consult with the appropriate tribe. If a response has not been received within two weeks of notification, the Commission requests that you follow-up with a telephone call or email to ensure that the project information has been received.

If you receive notification of change of addresses and phone numbers from tribes, please notify me. With your assistance, we can assure that our lists contain current information.

If you have any questions or need additional information, please contact me at my email address: Andrew.Green@nahc.ca.gov.

Sincerely,

Andrew Green

EXECUTIVE SUMMARY

The Ontario International Airport Authority (OIAA) proposes the Ontario International Airport (ONT Airport) South Airport Cargo Center Project (Project). The Project requires approval of the Airport Layout Plan (ALP) from the Federal Aviation Administration (FAA). The Project is an undertaking as defined by Section 106 of the National Historic Preservation Act (NHPA). It is also subject to compliance with the California Environmental Quality Act (CEQA). The FAA is the lead agency for Section 106 compliance; the OIAA is the lead agency for CEQA compliance.

The purpose of this Historic Property Evaluation Report is to comply with the requirements of Section 106 of the NHPA related to built environment historic properties. It also fulfills requirements under CEQA related to built environment historical resources. This report identifies built environment cultural resources within the Project's Area of Potential Effect (APE), determines if any are known historic properties as defined by Section 106 or known historical resources as defined by CEQA, evaluates those that require evaluation as potential historic properties or historical resources, and makes recommendations regarding resource eligibility and Project effects.

Laura O'Neill, Architectural Historian at the Desert Research Institute (DRI) who meets the Secretary of the Interior's Professional Qualifications Standards (PQS) in Architectural History and Historic Architecture (36 CFR §61) prepared this report. Jeffrey Wedding, Archaeologist at DRI who meets the PQS in Archaeology, assisted with research efforts.

Research, records searches, fieldwork, and review of applicable cultural resource laws and guidelines revealed that the APE included properties requiring evaluation for the National Register of Historic Places (NRHP), California Register of Historic Resources (CRHR), and as potential City of Ontario Landmarks/Historic Districts to comply with Section 106 and CEQA. The following properties were evaluated as a result: the Ontario Air National Guard (ANG) hangar and the General Electric (GE) maintenance facility. The Ontario ANG hangar was evaluated as a potential individual resource; the GE maintenance facility was evaluated as a potential historic district consisting of nine buildings. Both properties were found to be ineligible for listing in the NRHP, CRHR, and as potential Ontario Landmarks/Historic Districts. DPR forms are located in Appendix B.

Identification efforts also revealed that one previously evaluated district overlapped part of the APE: the Ontario ANG Station. It was evaluated as ineligible for listing in the NRHP and CRHR in 1998 and again in 2017. Review of the previous evaluations in comparison with the independent research completed for this report confirmed the conclusions of ineligibility. Re-evaluation was determined to be unnecessary. A DPR Update form was prepared to provide additional historical narratives and information about the current undertaking. See Appendix B.

In summary. this report concludes that none of the built environment resources in the APE appear eligible for listing in the NRHP. They are not historic properties as defined by Section 106 of the NHPA. The recommended Section 106 finding for the undertaking for built environment resources is No Historic Properties Affected pursuant to 36 CFR §800.4(d)(1). Likewise, this report concludes that none of the resources in the APE appear eligible for listing in the CRHR or as Ontario Landmarks/Historic Districts. They are not historical resources as defined by CEQA, and no further cultural resources compliance analysis or review is recommended.

The recommended California Historical Resource Status Code for all built environment resources in the APE is 6Z: found ineligible for NRHP, CRHR, or local designation through survey evaluation. See DPR forms in Appendix B for detailed evaluations and property data.

I. INTRODUCTION

The Ontario International Airport Authority (OIAA), the owner and operator of Ontario International Airport (ONT or Airport), is proposing to develop a new air cargo facility at ONT. The Proposed Project includes the development of a cargo sorting building (Air Cargo Sort Building), truck yard, employee parking structure, two aviation support buildings (ground service equipment [GSE] and aircraft line maintenance buildings), and aircraft apron improvements. The OIAA seeks unconditional approval of the Proposed Project on the Airport Layout Plan (ALP) from the Federal Aviation Administration (FAA).

The Proposed Project is an undertaking as defined by Section 106 of the National Historic Preservation Act (NHPA). It is also subject to compliance with the California Environmental Quality Act (CEQA). The FAA is the lead agency for Section 106 compliance; the OIAA is the lead agency for CEQA compliance.

Objectives

The purpose of this Historic Property Evaluation Report is to comply with the requirements of Section 106 of the NHPA related to the built environment historic properties. It also fulfills requirements under CEQA related to the built environment historical resources. The objectives of the report are to identify built environment cultural resources within the Project's Area of Potential Effect (APE), determine if any are known historic properties as defined by Section 106 or known historical resources as defined by CEQA, evaluate those that require evaluation as potential historic properties or historical resources, and make recommendations regarding resource eligibility and Project effects.

Preparer's Qualifications

Laura O'Neill, Architectural Historian at the Desert Research Institute (DRI) who meets the Secretary of the Interior's Professional Qualifications Standards (PQS) in Architectural History and Historic Architecture (36 CFR §61) prepared this report. Ms. O'Neill's résumé is available at https://www.dri.edu/directory/laura-oneill. Jeffrey Wedding, Archaeologist at DRI who meets the PQS in Archaeology, assisted with research efforts.

II. REGULATORY SETTING

Section 106 of the National Historic Preservation Act

In general, Section 106 of the NHPA requires that federal agencies take into account the effect of undertakings on historic properties. Undertakings are projects, activities, or programs funded in whole or in part under the direct or indirect jurisdiction of a federal agency [36 CFR §800.16(y)]. Historic properties are those that are included in or are eligible for listing in the National Register of Historic Places (NRHP) [36 CFR §800.16(l)(1)].

National Register of Historic Places

Following the standards issued by the Secretary of the Interior, cultural resources are eligible for listing in the NRHP if they meet the registration requirements (NPS *National Register Bulletin #15*). According to the requirements, the resource must be eligible under at least one of the four significance criteria (A, B, C, or D, defined below). Eligibility for listing in the NRHP also depends on the integrity of the property. Thus, a property must have both significance and integrity to be considered eligible.

Significance Criteria

Federal regulation 36 CFR §60.4 outlines the significance criteria a property must meet to be eligible for listing in the NRHP. To be eligible for listing in the National Register, a property must be at least 50 years of age (unless the property is of "exceptional importance") and possess significance in American history, architecture, archaeology, engineering, and/or culture. Significant properties are those that:

A. Are associated with events that have made a significant contribution to the broad patterns of our history; or
B. Are associated with the lives of persons significant in our past; or
C. Embody the distinctive characteristics of a type, period, or method of construction, or that represent the work of a master, or that possess high artistic values, or that represent a significant and distinguishable entity whose components may lack individual distinction; or
D. Yield or may likely to yield, information important in prehistory or history.

Physical Integrity

Integrity is the ability of a property to convey its significance, and its assessment consists of a consideration of the seven aspects listed in 36 CFR §60.4: location, design, setting, workmanship, materials, feeling, and association.

Historic Context

To be eligible for listing in the NRHP, a property must be significant within a historic context. *National Register Bulletin #15* states that the significance of a historic property can be judged only when it is evaluated within its historic context. Historic contexts are "those patterns, themes, or trends in history by which a specific...property or site is understood and its meaning...is made clear" (NPS 7).

Historical Resources under the California Environmental Quality Act

Generally, a lead agency must consider a property a historical resource under CEQA if it is eligible for listing in the California Register of Historical Resources (CRHR). The CRHR is modeled after the NRHP. Furthermore, a property is presumed to be historically significant if it is listed in a local register of historic resources or has been identified as historically significant in a historic resources survey (provided certain criteria and requirements are met, see below), unless a preponderance of evidence demonstrates that the property is not historically or culturally significant (PRC Section 5024.1 and 14 CCR Section 4850).

California Register of Historical Resources

The CRHR is an authoritative guide used by state and local agencies, private groups, and citizens to identify historic resources and to indicate what properties are to be protected, to the extent prudent and feasible, from substantial adverse impacts [PRC Section 5024.1(a)]. The CRHR consists of properties that are listed automatically as well as those that must be nominated through an application and public hearing process. The CRHR automatically includes the following [PRC Section 5024.1(d)]:

- California properties listed in the NRHP and those formally determined eligible for the NRHP;
- State Historical Landmarks from No. 0770 onward; and
- Those California Points of Historical Interest that have been evaluated by the State Office of Historic Preservation (SOHP) and have been recommended to the State Historical Resources Commission for inclusion on the CRHR.

Significance Criteria

The criteria for eligibility of listing in the CRHR are based upon NRHP criteria, but are identified as 1-4 instead of A-D. To be eligible for listing in the CRHR, a property must possess significance at the local, state, or national level. Significant properties are those that:

1. Are associated with events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States; or
2. Are associated with the lives of persons important to local, California, or national history; or
3. Embody the distinctive characteristics of a type, period, or method of construction or represents the work of a master, or possesses high artistic values; or
4. Yield, or have the potential to yield, information important in the prehistory or history of the local area, California, or the nation.

Physical Integrity

While the enabling legislation for the CRHR is less rigorous with regard to the issue of integrity, there is the expectation that properties reflect their appearance during their period of significance (PRC Section 5024.1).

Properties Identified in Surveys

Properties identified during historic resource surveys may be considered historical resources under CEQA only if the survey meets all of the following criteria (PRC Section 5024.1 and 14 CCR Section 15064.5):

1. The survey has been or will be included in the State Historic Resources Inventory;
2. The survey and the survey documentation were prepared in accordance with office (OHP) procedures and requirements;
3. The resource is evaluated and determined by the office (OHP) to have a significance rating of Category 1 to 5 on a DPR Form 523; and
4. If the survey is five or more years old at the time of its nomination for inclusion in the CRHR, the survey is updated to identify historical resources which have become eligible or ineligible due to changed circumstances or further documentation and those which have been demolished or altered in a manner that substantially diminishes the significance of the resource.

Ontario Historic Landmarks and Historic Districts

The City of Ontario's Designation Criteria for Historic Landmarks and Historic Districts are codified in Section 9-1.2615 of the City's Development Code. A property may be designated a Historic Landmark if (Section 9-1.2615.A):

1. It meets the criteria for listing in the National Register of Historic Places; or
2. It meets the criteria for listing in the California Register of Historic Resources; or
3. It meets one or more of the following criteria:
    a. It exemplifies or reflects special elements of the City's history;
    b. It is identified with persons or events significant in local, state, or national history;
    c. It is representative of the work of a notable builder, designer, architect, or artist;
    d. It embodies distinguishing architectural characteristics of a style, type, period, or method of construction;
    e. It is a noteworthy example of the use of indigenous materials or craftsmanship;

f. It embodies elements that represent a significant structural, engineering, or architectural achievement or innovation;
g. It has a unique location, a singular physical characteristic, or is an established and familiar visual feature of a neighborhood, community or the City; or,
h. It is one of the few remaining examples in the City, region, state, or nation possessing distinguishing characteristics of an architectural or historical type or specimen.

A neighborhood or area may be designated a Historic District if (Section 9-1.2615.B):

1. It meets the criteria for listing in the National Register of Historic Places; or
2. It meets the criteria for listing in the California Register of Historic Resources; or
3. It meets one or more of the following criteria:
    a. Is a geographically definable area possessing a concentration of Historical Resources or thematically related grouping of structures which contribute to each other and are unified by plan, style, or physical development; and embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values; or
    b. Reflects significant geographical patterns, including those associated with different eras of settlement and growth, particular transportation modes, or distinctive examples of a park landscape, site design, or community planning.
    c. Is associated with, or the contributing resources are unified by, events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;
    d. Is or the contributing resources are, associated with the lives of persons important to Ontario, California, or national history.

In addition to meeting one or more of the criteria above, Ontario Landmarks and Historic Districts must also possess integrity (Section 9-1.2615.E). Ontario recognizes the same seven aspects of integrity as the NRHP.

III. PROJECT DESCRIPTION

The OIAA, the owner and operator of Ontario International Airport, is proposing to develop a new air cargo facility at ONT. The Proposed Project includes the development of a cargo sorting building (Air Cargo Sort Building), truck yard, employee parking structure, two aviation support buildings (ground service equipment [GSE] and aircraft line maintenance buildings), and aircraft apron improvements.

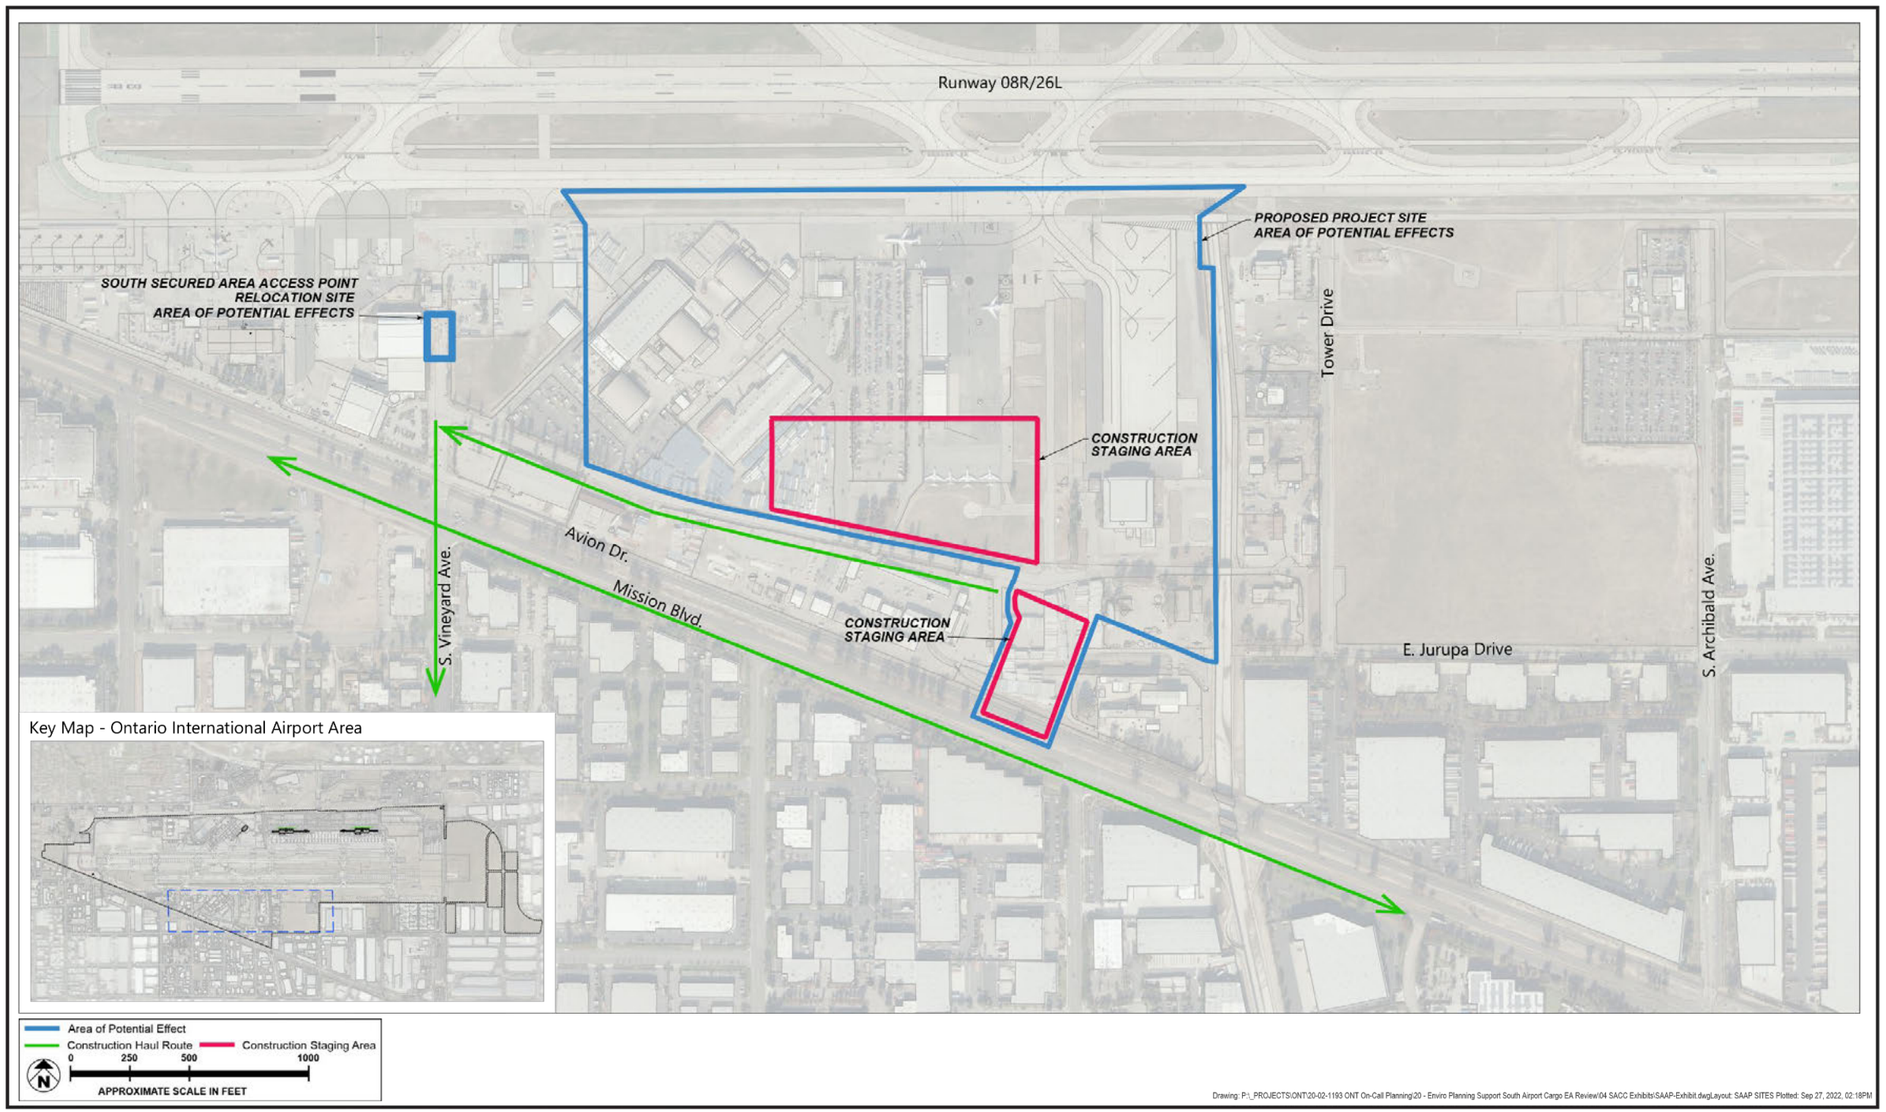
The Proposed Project involves development of facilities and supporting infrastructure in two phases on the approximate 97-acre site on the southern side of the Airport. The Proposed Project involves approximately 2,514,000 square feet of airfield improvements, including three taxi lanes, an aircraft parking apron, and GSE and Aviation Line Maintenance Buildings.

Construction of the proposed Project would include excavation and grading of the Project site. In the aircraft apron area, which is the majority of the Project site, the Project site would be excavated approximately two feet with stabilization of the subgrade with undercuts of up to two feet. Trenches would be required for the installation of stormwater piping and structures, as well as other utilities (sanitary, water, electric, communications and hydrant fueling). These improvements would require trenching with depths up to 20 feet in limited areas. The parking garage foundations would reach an approximate depth of five (5) to seven (7) feet below grade.

Project Location

The Project site includes portions of Assessor's Parcel Numbers (APN) 11326106, 11326107, 11326108, 11327101, and 11327102 in the City of Ontario, in southwest San Bernardino County. The Project site encompasses approximately 97 acres and is south of the Airport airfield and west of the Cucamonga Canyon Channel. The majority of the Project site is located north of East Avion Street with the remainder of the site located south of East Avion Street and east of South Hellman Avenue. See Appendix A, Maps 1.1 and 1.2.

Area of Potential Effects (APE)



The Area of Potential Effect (APE) for the undertaking was delineated to include all areas that could be affected, both directly and indirectly, by the undertaking. See Figure 1, below. The horizontal APE encompasses the 97-acre Project site located on East Avion Street, all under the current ownership of the OIAA, and includes all construction areas and staging areas. Specifically, the horizontal APE includes the proposed air cargo sort building, the aircraft apron with parking stands, the parking structure, the truck yard, the relocated secure access point, the stormwater drainage/detention system, security systems, utility services and all related developments.

In terms of the vertical APE, the depth of ground disturbance for the Project will range from 3 ft to approximately 20 ft below the current ground surface (bgs). Installation of the stormwater drainage system piping and associated structures, as well as other utilities are expected to extend up to 20 ft in depth; however, the apron pavement and parking garage foundations are anticipated to only reach up to 3 ft and between 5 to 7 ft bgs, respectively. The extent of the building foundation is not known at this time, but it is not anticipated to extend below 20 ft.

The topography of the APE is flat, and the land is mostly paved, except for limited areas of grass and trees in medians and along facility perimeters. The APE includes buildings and structures from a range of time periods, constructed for a variety of occupants. The oldest buildings date from the late 1940s; the newest are circa 2006. Building types include large hangars, office buildings, maintenance facilities, security facilities, and support buildings. Chain-link fencing delineates secure and public areas.

The APE contains three distinct areas in terms of general characteristics and development patterns amid large areas of vacant land and surface parking lots as shown in Figure 2, below. All three are located north of East Avion Street. They include: the former General Electric (GE) maintenance facility at the west end; a portion of the former Ontario Air National Guard (ANG) Station at the east end; and a 1980s-era private jet center between the two.

IV. METHODOLOGY

Research

Records Search Results and Previous Evaluations

PaleoWest (Project archaeologists) conducted a literature review and records search at the South Central Coastal Information Center (SCCIC), housed at California State University, Fullerton, on November 17, 2021, and provided a copy of the results for review. This inventory effort included the Project APE and a one-half-mile radius around the Project area, collectively termed the records search area. The objective of this records search was to identify prehistoric or historical cultural resources that have been previously recorded within the study area during prior cultural resource investigations.

The records search indicated that five previous investigations have been conducted within the records search area since 1976 (Table 1). One of these studies (SB-05358) includes a small portion of the Project APE.

Table 1: Previous Cultural Studies within the Records Search Area.

Report No.	Date	Author(s)	Title
SB-03586	2000	Love, Bruce	Ontario To Colton Pipeline, San Bernardino County, California
SB-04674	2004	Bonner, Wayne H. and Christeen Taniguchi	Records Search Results and Site Visit for Cingular Wireless Telecommunications Facility Candidate SB-476-01 (Villa Park Trucking) 2301 East Francis Street, Ontario, San Bernardino County, California
SB-05358	*1976*	*Sider, W.A.*	*Cucamonga Creek 1776-1976 After 200 Years*
SB-05367	2004	Marvin, Judith and Riordan Goodwin	Cultural Resource Assessment: Hofer Ranch Airport Business Park Specific Plan Amendment, City of Ontario, San Bernardino County, California
SB-05814	2007	Bonner, Wayne H. and Marnie Aislin-Kay	Cultural Resource Records Search Results and Site Visit for Royal Street Communications, LLC Candidate LA-730C (Carlos Ct), 2001 Elm Court, Ontario, San Bernardino County, California

Italics indicate previous projects that include portions of the current Project APE.

The records search indicated that two cultural resources have been previously documented within the records search area (Table 2). These resources include one historic period building, the Ontario International Airport Terminal (36-012630), and one historic period archaeological site, the remains of an abandoned irrigation system (36-007096). Neither of these resources are within the Project APE.

Primary No.	Trinomial	Type	Age	Description
P-36-012630	(none)	Building	Historic	Ontario International Airport Terminal

In summary, the records search did not reveal any known, previously evaluated built historic properties within the APE.

Consultation with Interested Parties

The following is a summary of public outreach and interested party consultation completed to date as part of OIAA's CEQA obligations. Section 106 requires that lead agencies consult with interested parties regarding historic properties and the potential effects of undertakings. The FAA, as the federal lead agency, is required to conduct interested party consultation to meet its Section 106 obligations, and consultation with any interested parties will be conducted as part of the Environmental Assessment (EA) process.

OIAA CEQA Consultation

A Notice of Preparation (NOP) of Environmental Impact Report (EIR) for the Project was circulated for public comment from October 15 through November 15, 2021, in accordance with the CEQA Guidelines. The NOP was provided to the State of California Office of Planning and Research State Clearinghouse for distribution for review by state agencies and was also distributed to other local public agencies and other parties by the OIAA. The NOP was also available on the OIAA website. A scoping meeting was held on November 10, 2021 by the OIAA.

The OIAA received one letter regarding the undertaking's potential to affect historic properties from the City of Ontario Planning Department (City). The City informed OIAA that the City had received a federal grant through the Certified Local Government (CLG) Program administered by the California State Parks Office of Historic Preservation (OHP) to prepare a Historic Context Statement (HCS) for Ontario Airport in 2017. This HCS, prepared by ASM Affiliates (Davis and Novell), contained preliminary eligibility determinations for buildings and other resources. This HCS was reviewed with other literature as part of this built environment report, as described below.

Further consultation between OIAA and the City resulted in clarifying that OIAA is the responsible public agency with the authority to prepare and evaluate historic context statements/surveys and to determine the historic significance of structures on airport property.

No other responses to the NOP or scoping meeting were received regarding historical resources.

Additional Research

In addition to the records search and interested party consultation, several other sources were consulted to develop the appropriate historic contexts for the properties in the APE. Laura O'Neill, Architectural Historian with the Desert Research Institute (DRI), visited the City of Ontario's Ovitt Family Library on March 23, 2022, to review relevant local history sources, including histories of the airport and previous environmental documents. Newspaper articles from online databases were also reviewed. Other research resources consulted include the 2017 HCS and survey, a recent survey of eight buildings that overlapped the APE for the current undertaking (Reed and Harris 2022), general histories of Ontario and the airport, previous technical and environmental studies, historic aerial photographs and maps, county assessor data, the California Built Environment Resources Directory (BERD), and credible online sources.

The Reed and Harris survey did not appear in the SCCIC records search results, because it was completed after the search was conducted; however, it included former Ontario ANG Station buildings and former GE facilities outside the APE for the current undertaking. It concluded that none were eligible for listing in the NRHP; it did not identify any eligible historic properties or historical resources.

Field Survey

Ms. O'Neill surveyed the APE on March 24, 2022. Photographs and notes were taken during the field survey. The purpose of the field survey was to document the condition and physical integrity of the potential historic properties in the APE and to confirm dates of construction and alterations.

Resources Requiring Evaluation as Potential Historic Properties/Historical Resources

Based on the records search, research, field survey, and applicable cultural resource codes and regulations, the following resources required evaluation to determine if they are eligible for listing in the NRHP, CRHR, or as local Ontario Landmarks/Historic Districts and should be considered historic properties as defined by Section 106 or historical resources as defined by CEQA:

- Former Ontario ANG hangar – The hangar is over 50 years old and located within the APE. It was evaluated as an individual property in the 2017 HCS and survey of the airport (Davis and Novell). The evaluation was reviewed as part of the research conducted for this report. The review revealed that the previous survey did not meet the requirements in PRC Section 5024.1 and 14 CCR Section 15064.5. It is not included in the State Historical Resource Inventory, and it does not appear that the SHPO ever concurred with the findings. It did not come back in the records search results, nor does it appear in the BERD. Furthermore, review of the evaluation revealed that it is incomplete by current industry standards. It lacks a detailed explanation of potential significance, an outline of character-defining features, and comparison with other examples of its type.

  As a result, new DPR 523 forms were prepared for the current undertaking to evaluate the hangar as an individual resource. See Appendix B.

- Former GE maintenance facility – The facility includes four hangars, an administration building, and ancillary buildings and structures. Five of the nine buildings surveyed are over 50 years old. Parts of the facility were evaluated as a historic district in the 2017 HCS and survey (Davis and Novell). The evaluation was reviewed as part of the research conducted for this report. The review revealed that the previous survey did not meet the requirements in PRC Section 5024.1 and 14 CCR Section 15064.5. It is not included in the State Historical Resource Inventory, and it does not appear that the SHPO ever concurred with the findings. It did not come back in the records search results, nor does it appear in the BERD. Furthermore, review of the evaluation revealed that the analysis is incomplete by current industry standards. It lacks a detailed explanation of potential significance, supporting evidence for the facility's association with important trends or themes in history, and an analysis of the facility's physical integrity.

  As a result, new DPR 523 forms were prepared for the current undertaking to evaluate the facility as a potential historic district. See Appendix B.

Resources Requiring Updated Documentation

Based on the records search, research, field survey, and applicable cultural resource codes and regulations, the following resources do not require re-evaluation to determine if they are eligible for listing in the NRHP, CRHR, or as local Ontario Landmarks/Historic Districts. They are not considered

historic properties for the purposes of Section 106 compliance or historical resources for the purposes of CEQA compliance. These resources were documented and evaluated previously, and their findings remain valid.

- Former Ontario ANG Station – The majority of the former Ontario ANG Station is outside the APE. It was previously determined ineligible for the NRHP as a potential historic district in two separate recordings (Department of the Air Force 1998; Davis and Novell 2017). Fieldwork and research conducted for the current undertaking confirmed the ineligibility findings in the prior evaluations and did not reveal any reason to re-evaluate them from scratch.

  Based on the records search and BERD, it does not appear that the SHPO ever concurred with the DPR forms prepared for the prior evaluations. Because the station does not warrant full re-evaluation and to minimize duplication of effort, a new DPR 523 Update form for the station was prepared to add to the existing documentation and provide information pertinent to the current undertaking. See Appendix B. Determinations regarding which DPR forms to prepare for which resources were based on the California Office of Historic Preservation's *Instructions for Recording Historical Resources* publication, pp. 23-24.

Resources Not Requiring Documentation or Evaluation

Based on the records search, research, field survey, and applicable cultural resource codes and regulations, the following resources do not require evaluation to determine if they are eligible for listing in the NRHP, CRHR, or as local Ontario Landmarks/Historic Districts. They are not considered historic properties for the purposes of Section 106 compliance or historical resources for the purposes of CEQA compliance:

- 1980s-era private jet center – These buildings date from 1985 and later according to the San Bernardino County Assessor and historic aerials. They are typical hangar and office buildings from the 1980s. Research did not reveal any potentially exceptionally significant associations that would warrant evaluation under NRHP Criteria Consideration G.

V. HISTORIC CONTEXT

To consider properties for the NRHP, CRHR or as local landmarks or districts, they must be evaluated within appropriate historic contexts and themes. The historic context presented below is based on the records search and research completed for this report and is scaled to the size and complexity of the proposed undertaking, the APE, and the extant resources therein. The APE includes part of an airport. The general historic context for the properties in the APE is airport development. An understanding of the local setting is also important for evaluating significance. Consequently, the following narratives relevant to the properties in the APE include Airport Development in the 20th Century America and Aviation in Ontario.

Focused theme narratives and property-specific historical information, such as information regarding General Electric's aviation division and the Air National Guard, are included on the DRP forms for each evaluated resource in Appendix B and are not repeated in this report.

Airport Development in 20th Century America[1]

On December 17, 1903, the Wright Brothers embarked on the historic, inaugural flight that would usher in the Air Age and change the world. The American fascination with aviation had begun. In the decades that followed, an entire new industry developed for aircraft development, production, and service. Airshows, showcasing aviators and aircraft, became popular recreational events.

The U.S. Army took early notice of the potential of powered flight in its missions, and incorporated pilot training and airplanes by 1909 (39). The Navy was not far behind, ordering its first aircraft in 1911 (41). The military used aviation in its missions as early as 1913, at the beginning of the Mexican Revolution amid rising tensions at the border. The U.S. Army Signal Corps sent the 1st Aero Squadron to Texas to respond, becoming the first air service unit of its kind ever organized (46).

Despite the early incorporation of aviation into its military, U.S. investment in aerial military components lagged behind the rest of the world's major nations leading up to its entry into WWI (48, 52). A major increase in aircraft production was ordered in 1917 to meet the needs of not only the Army and Navy, but of the country's allies, as well (52). Pressure mounted for increased research and development of aircraft technology as the war continued. This resulted in increased demand for flying fields – ground installations for training, aircraft manufacturing, testing, and repair. A large and widespread network would be required. The federal government appropriated hundreds of millions of dollars to the effort, and an extensive program of temporary wartime construction quickly expanded at airfields around the country. In May 1917, master architect Albert Kahn designed the basic airfield plan using a one-square-mile section that would be replicated and customized for local conditions (54-55).

Airfields took over prairies, farmlands, and coastlines all over the country, in part as a mechanism for recruiting pilots. Flying fields and training schools were also added to existing Army posts, such as Camp Bragg, Camp Knox, and Aberdeen Proving Ground. Facility construction was most often temporary, consisting of wood-frame buildings and steel-frame hangars. On November 11, 1918, the end of WWI yielded an immediate halt to airfield construction in the U.S. The majority of the airfields were leased properties, so the government either immediately vacated them or retained them temporarily for storage (55).

The end of the war may have led to abandoned airfields, but it also led to the beginning a new era in aviation. As expressed in *American Aviation Heritage* (NPS 60):

> When the war ended, dozens of innovative designs were on the drawing boards, thousands of trained pilots, and a surplus of airplanes set the stage for continued advances and new uses for aircraft. All of this technology along with trained aviators and support personnel fueled a race to break speed, altitude, distance, and duration records. These advances would make possible the development of airline routes, global exploration, and a new economic sector with potential for changing the lives of ordinary citizens. America's fledgling aviation industry had been transformed from a haphazard infancy into a vibrant manufacturing enterprise that would spark a national passion for flying and mark the beginning of a "golden age" of flight.

One of the major domestic advances to come out of WWI aviation efforts was airmail. The first regularly scheduled airmail route began in 1918 under the direction of the Army. It was quickly turned over to the Post Office Department. The first transcontinental route from New York to San Francisco was in service

[1] This section was compiled using NPS's *American Aviation Heritage.* Specific page references for dates, figures, and quotes are provided in parentheses.

by 1920. By 1921 in response to Congress' hesitation to fund airmail services, the Post Office demonstrated just how fast mail could be carried by aircraft by flying both day and night across the country in a total of 33 hours and 20 minutes, compared to 4.5 days by rail (63-66).

In the early 1920s, there were no lighted airways for safe night travel and navigating poor visibility due to weather. Bonfires were used to light the way for the 1921 day-and-night airmail flight. Congress funded the first lighted airway to remedy the problem in 1923. A prototype, 72-mile lighted route was established in Ohio. It utilized rotating beacons and field floodlights and became the model for the entire transcontinental airmail route. Expanding airmail service would require more than a lighted airway, however. Significant investment would be necessary. By 1925, Congress passed the Air Mail Act of 1925, transferring airmail operations to private companies. In effect, this pivotal act helped launch the U.S. commercial aviation industry (67-68).

Airmail also led directly to the establishment of many municipal airports. Initial federal budgets for airmail services included monies for pilots, planes, navigational aids, and some emergency fields, but not for a system of federally owned and operated airports. The Post Office campaigned around the country for local communities to build permanent landing facilities. Cities, local landowners, and aviation enthusiasts in places like Atlanta and Chicago heeded the call, initiating the developments that would later become Hartsfield-Jackson International Airport and Midway International Airport, respectively (70).

The Post Office was the most aggressive promoter of local airport construction in the early 1920s, but not the only. The Army, too, through the Army Air Service actively tried to persuade communities to build airfields via the Model Airway Program. The goal was to ensure an adequate number of intermediate landing areas existed for training. They were successful in their efforts, until 1926 when the Air Commerce Act transferred responsibility for airway establishment to the Aeronautics Branch of the Department of Commerce (71).

In the same period, the Army also instituted the Air Service Reserve Flying Field Program to help reserve pilots keep and hone their skills. The program used War Department funds to construct training facilities without purchasing land. Instead, the Air Service leased land from local interests for one dollar per year and resulted in the construction of airports in numerous cities from coast to coast. Additionally, the Air Service developed and distributed a manual titled "Airways and Landing Fields" that served as a how-to guide for airport construction and became one of the first works on airport design. Disseminating this information made local airport construction easier and more accessible. Military offices also published articles extolling the need for a national network of airports, the undoubted benefits for local communities, and even argued that constructing local airports was a civic duty (71-72).

In addition to the influences of the military and Post Office, the role of private industry in airport development cannot be overlooked. Private citizens, often through chambers of commerce and local aviation groups, took the lead in their community airfields through sponsorship and proactive construction. City governments took on greater roles in the early 1920s. State governments became involved in airport operations as early as 1920, but the majority of states did not officially authorize cities to own and operate municipal airports until the latter half of the decade (72). Between 1927 and 1929, 33 states created such legislation (86).

Also in the late 1920s, emphasis on safety increased, as did public support for airports. Cities across the country responded accordingly and airport development accelerated in its shift from the private to the public sector. A major factor in the shift was the Air Commerce Act of 1926. The act gave responsibility for the development of airways and supporting systems to the federal government, but local governments

would have to build and maintain the airports. Federal funding for local airports was prohibited; however, federal regulation of them was not (86-87).

Loose regulation of airport design began with the Air Commerce Act of 1926, but compliance was voluntary. Construction boomed between 1926 and 1930, yet airport development varied widely through the early 1930s. Western cities were far more proactive in setting up airports than cities in other parts of the country, leading to regional disparity. In the early 1930s, airport construction waned due to the Great Depression, lack of municipal funds, and the rise of liability and nuisance lawsuits (90-91).

It was also clear by the early 1930s that airport construction was neither cheap nor simple. Constant improvements in aviation technology meant the constant need for improvements to airport facilities. Better lighting, more durable landing surfaces, new technological devices, and customer amenities all drove up costs at local airports. Worsening the problem, most airports were not profitable. Along came President Roosevelt's New Deal in 1933 and with it came much-needed federal assistance for local airports (113-114).

The New Deal's Civil Works Administration (CWA) yielded work on 808 landing fields and airports by 1934, most of which were in small communities. The Works Progress Administration (WPA) replaced the CWA in 1935 and continued expanding airports and improving airways. The enabling legislation required that cities own, rather than lease, their airports to qualify for assistance, prompting cities like Los Angeles to purchase land they had previously been leasing (115-116). In 1938, the Civil Aeronautics Act removed some of the existing restrictions on federal direct funding for airports. In effect, it "recognized that U.S. commercial aviation had come of age" (120). A year later, in 1939, New York's LaGuardia Airport opened. Sometimes called the first modern airport, LaGuardia became home to four commercial airlines, American, TWA, United, and Eastern. It was followed in 1941 by Washington's National Airport, another example of a model modern airport.

All of this was happening on the brink of WWII, and once the U.S. entered the war, it needed airports. The Army, Navy, and Army Air Force (AAF) all utilized civilian airports to fill this need. They leased, purchased, or developed agreements with local governments to use existing airports throughout the country with the promise of returning them following the war. The War Department began investigating the possibility of using civilian airports as early as 1939. They developed a list of 4,000 airports for potential use, though ultimately programmed improvements at 250 (167).

The program was called the Development of Landing Areas for National Defense (DLAND). By 1941, 17 airport improvement projects were underway in California, with others in Florida, Maine, Texas, Washington, and Massachusetts. Florida had the most with 31. DLAND funding yielded lasting improvements to municipal airports in the form of extended and new runways and lighting and drainage systems. Many of the buildings and structures constructed by the military during the war, however, were temporary and removed after its conclusion (167-168).

By the end of WWII, many cities throughout the country had improved airfield facilities and were well-prepared for the expansion of civilian air travel in the postwar era. Both private flying and commercial aviation were poised to boom with hundreds of thousands of trained pilots and a new generation of willing passengers. Federal funding for airport improvements continued with an emphasis on funding smaller airports. There were competing interests inherent in the legislation, on the one hand separating the legislation from national defense interests and on the other using defense as a justification. During the Korean War, for example, Congress appropriated $500 million for airport improvements for military use (200-201).

Airplanes, like airports, benefited from the extensive research, development, and mass production of the war years. The development of jet engines, in particular, would prove to be world changing. Though commercial airlines in the U.S. were hesitant to invest too much in jet technology in the early postwar years, by the late 1950s, the jet age had officially begun. National Airlines became the first in the U.S. to offer jet service, using leased Boeing 707s, on December 10, 1958. Other major carriers followed, offering transcontinental and international flights to a rapidly increasing consumer base (219-221).

Jets required much larger runways and served many more passengers than their predecessors. Airports required numerous upgrades to both infrastructure and passenger facilities, accordingly. At existing airports, runways were extended and reinforced. At new airports, such as the groundbreaking Dulles International Airport, they were built to new, massive specifications. Terminals were either significantly upgraded or replaced. Terminal architecture took on new importance as designs had to be more than just functional and efficient; they had to be aesthetically appealing and comfortable, as well (225-227).

By the 1970s, air travel had become a component of the nation's mass transit. After 40 years of federal regulation, Congress deregulated it in 1978. Airlines were free to set their own fares, determine their own routes, and the like (228). This has had both positive and negative effects on U.S. air travel that continue to the present day. As summarized in *American Aviation Heritage* (NPS 230):

> Through regulation and deregulation, the introduction of jet airliners, battles over noise, the vast expansion of passenger air traffic, and myriad new technologies that support the air traffic system in the United States, major airports have become far more complex and expensive than the first enthusiastic generation of airport boosters could have imagined. Particularly due to the expansion of air passenger traffic since World War II, airports throughout the United States, and throughout the world, have struggled to keep up with the growth. As a result, it may seem to observers that the nation's airports are in a perpetual state of change and renewal as construction projects, large and small, seem a constant.

Aviation in Ontario[2]

Aviation in Ontario and the corresponding development of the Ontario airport followed the basic nationwide trends throughout the 20th century. It started as a result of local group of pilots, expanded through the efforts of the local government, benefited from improvements made with federal funds through the Great Depression, WWII, and Cold War, reorganized a number of times, and responded to changing needs and demands fueled by technological advances and consumer demand.

In 1923, airplane enthusiasts known as the First Friends of the Ontario Airport landed a Curtiss JN 4 "Jenny" aircraft on a dirt patch near San Antonio Avenue and the Union Pacific railroad tracks (Watson 2). The strip became known as Latimer Field. It was Ontario's first airfield and initiated the city's association with the aviation industry. The location was three miles west of the current airport, on land leased from the Union Pacific. Increased land development demands pushed aviators to the east. Six years later, the city purchased 30 acres at the airport's current location for a total of $12,000 to create the Ontario Municipal Airport. In 1941, in the runup to the U.S. entry into WWII, the city purchased an additional 470 acres and began constructing new runways.

[2] Dates and figures in this section are from LAWA, "History of LA/Ontario International Airport," unless otherwise cited. A review of historical literature regarding aviation in Ontario presented numerous examples of conflicting information. The information presented herein represents a best practices effort to provide as accurate as possible historical narrative under the circumstances.

In 1942, the U.S. Army Air Corps (AAC), a predecessor of the U.S. Air Force, took over the municipal airport for military operations and called it Ontario Army Airfield (OAAF). The AAC used the airport as a P-38 training base and a P-59 operating base. They built 215 buildings and structures on the grounds to accommodate pilots training and stationed at the temporary base. The military presence also coincided with the transition from dirt to concrete runways (Watson 3). The Works Progress Administration (WPA) completed the engineering project in 1942, resulting in a 6,200-foot east-west runway and a 4,700-foot northwest-southwest runway at a cost of $350,000 (Watson 4). In 1947, following the end of the war, the military demolished most, if not all, of the buildings and structures and returned the airport to the city (UCSB historic aerials; NETROnline). The military use of municipal airports during WWII and subsequent return to local governments was common practice nationwide (Denfield 2012).

Toward the end of the AAC's tenure in Ontario, in 1946, the airport was renamed the Ontario International Airport to reflect the transpacific cargo flights originating there. By 1949, the airport hosted commercial airline service, and a new terminal building was constructed in 1951 to meet growing demand. A new air traffic control tower was added in 1953 (Watson 4). Three major aircraft plants had facilities at the airport in the 1950s, including Lockheed, Douglas, and Northrop (Watson 4), as did General Electric (GE) Aviation (Neward 38). Lockheed had the largest presence with facilities on both the north and south sides of the runways (Neward 67). GE appears to have taken over some of Lockheed's facilities on the south side of the runways c. 1955 (Neward 38, 59, 67; Davis and Novell 27).

In addition to the expansion of commercial and passenger activities, the 1950s witnessed the return of the military to the Ontario International Airport. The California Air National Guard established an armory at the airport in 1949. In 1952, the ANG approached the city about forming a station at the airport but required a longer runway for its fighter jets (Neward 37-38). The city purchased the additional land for the runway, and the Ontario ANG Station followed. The ANG required two additional runway extensions in 1956 and 1962, both times to accommodate faster aircraft (Watson 5). The ANG's facilities were concentrated in the southwest corner of the airport and included a maintenance hangar, dining hall, administrative buildings, training facilities, maintenance shops, and storage facilities (Department of the Air Force 3-54).

By 1964, the airport's two original runways had reached their final lengths. A new passenger terminal was added in the 1960s as air travel increased in popularity (Watson 6). The airport became part of the Los Angeles regional airport system in 1967 via a joint-powers agreement between the City of Ontario and the Los Angeles City Department of Airports (predecessor to the current Los Angeles World Airports [LAWA]). Three years later, in 1970, the airport implemented a major expansion, adding 300 acres of land and expanding the terminal facilities by 22,500 square feet. Passenger service continued to grow with one million annual travelers in 1972 and two million by 1979 (Watson 7).

In 1982, Ontario transferred the airport's title to the City of Los Angeles. Throughout the 1980s, the airport experienced significant increases in passenger volumes, hitting five million per year by 1989. New facilities constructed in the decade included a new 10,200-foot runway for wide-body jets to the south of the original east-west runway and a new air traffic control tower.

By 1990, it was becoming clear that cargo operations would be a significant part of the airport's future. United Parcel Service (UPS) broke ground on a new cargo hub that year. Passenger service continued to grow at the same time, and a $270 million new terminal complex was approved to meet demand. The new facilities broke ground in 1995 and opened in 1998. Incidentally, the Ontario ANG Station officially closed the same year, in 1998 (Air Force Civil Engineer Center). Also in the mid-1990s, a new, longer, 12,200-foot runway was added to the north of the original east-west runway. By 2005, passenger service

reached a peak volume of seven million and then began to decline. Freight service declined for a brief period before steadily increasing. The airport continued to make physical improvements to its facilities, including airfield enhancements and transportation improvements.

Los Angeles transferred ownership and control of the airport in 2015 to the OIAA after years of negotiations and a lawsuit. The OIAA was formed in 2012 by a joint-powers agreement between Ontario and San Bernardino County. It retains control over the airport to the present day (ONT 2022). The Ontario International Airport is the only airport in the City of Ontario. Smaller, regional, general aviation airports exist in nearby cities, such as Redlands, Chino, and Upland. San Bernardino International Airport is the closest international airport; it offers mostly cargo service with only one commercial passenger airline.

VI. BUILT RESOURCE EVALUATIONS

Table 3 provides a summary of the results of the evaluations completed as part of the cultural resource compliance efforts for the proposed Project. Brief discussions of the resources follow the table. See the DPR forms in Appendix B for full resource descriptions, applicable theme narratives, detailed NRHP, CRHR, and local evaluations, and numerous photographs of each resource.

Table 3. Summary of Evaluation Recommendations.

Name	Type	NRHP Recommendation	CRHR Recommendation	Ontario Recommendation
Ontario ANG hangar	Former military maintenance hanger	Ineligible. Though it retains integrity, it does not possess significance under any of the established criteria.	Ineligible. Though it retains integrity, it does not possess significance under any of the established criteria.	Ineligible. Though it retains integrity, it does not possess significance under any of the established criteria.
GE maintenance facility	District of maintenance hangars and associated buildings and structures	Ineligible. The potential district lacks both significance and integrity.	Ineligible. The potential district lacks both significance and integrity.	Ineligible. The potential district lacks both significance and integrity.

Ontario ANG Hangar

History and Description

The Ontario ANG hangar was built in 1955 and used as a California ANG facility until 1995. The Ontario ANG Station officially closed in 1998 (Air Force Civil Engineer Center). Based on its intact features, it was designed and constructed according to the U.S. Air Force (USAF) standard plan for hangar type H-2. This standard plan dates to 1951 and is attributed to Mills & Petticord (Weitze 65). Type H-2 hangars were maintenance hangars. They featured a large central hangar with multi-leaved, telescoping doors, surrounded on two or three sides by two-story lean-tos for shop space. This hangar type was built at USAF and ANG installations all over the country in the Cold War era, as evidenced in Appendix D, "Representational Hangars" of *Historical and Architectural Overview of Aircraft Hangars of the Reserves and National Guard Installations from World War I through the Cold War* (Aaron) and in numerous other historic context statements on U.S. Cold War military resources.

The Ontario example is nearly identical to many of its extant contemporaries (see Figure 3). It is composed of a steel-frame central hangar with concrete block lean-tos on three sides faced with brick and corrugated metal siding. It has bands of multi-light metal windows on both the lean-tos and the hangar. Original doors are also metal, some with single lights. The hangar's multi-leaved doors include eight total leaves with tall multi-light windows on all leaves and pilot doors in the end leaves. The hangar elevations are clad with corrugated metal siding. There is no tail cut in the primary elevation, indicating that the Ontario ANG Station did not service planes with high tails. This is also evident from the relatively low bottom chords on its interior steel trusses. The building has one-story additions on its rear elevation and some of the windows have been painted over, glazing and all. Otherwise, the building remains intact from its 1955 construction.

Figure 3: Ontario ANG hangar, looking south, March 2022.

Air National Guard groups stationed at Ontario while the hangar was in use as part of the Ontario ANG Station included: the 196th Tactical Air Support Group and the 163rd Tactical Support Group from July 1952 until 1983, and the 148th Combat Communications Squadron (CCS) from 1984 to1995. During the 196th and 163rd tenures, the station was used as an operations area in support of the California ANG's air training mission. Both jet and propeller aircraft were taxied, parked, and maintained at the station. During the 148th period, the CCS conducted radar operations, maintenance, and training on the property (California Military Department). Missions attributed to the groups and squadrons at the station included fighter-interceptor, air defense, tactical air support, tactical reconnaissance, air refueling, and communications.

NRHP Evaluation Summary

Research into the defense missions and their fulfillment at the Ontario ANG Station did not reveal any direct associations with important events or trends. The missions and activities were typical of ANG installations throughout California and the United States. No significant missions or activities originated at the station, and the groups and squadrons were not directly related to any significant military events. As a result, the hangar does not appear significant under NRHP Criterion A for direct association with important historical trends or events.

The Ontario ANG hangar was associated with numerous members of the California ANG. Research did not reveal a direct association with any specific, important individuals in local, state, or national history. The collective contributions of the many Air National Guard personnel stationed at the hangar over time is best understood and evaluated under NRHP Criterion A. Therefore, the hangar does not appear significant under NRHP Criterion B for direct associations with important individuals.

To be eligible under NRHP Criterion C, the hangar would have to be an outstanding example of its type in comparison with its peers. There are numerous extant H-2 type hangars across the country. Every intact example is not eligible for listing in the NRHP. In order to be eligible under this criterion, a hangar would have to be an early prototype or display some unique adaptations to suit a particular mission, aircraft type, or local conditions. This is not the case for the Ontario ANG hangar. It followed standard design plans and served standard missions and aircraft. It is nearly identical to other ANG hangars from the mid-1950s, many of which have been determined ineligible for the NRHP, including others in California. Building 100 at the Fresno ANG Station is a good example of a very similar hangar determined ineligible in 2005 (Aaron D-9). In fact, a review of the representational hangars provided in Aaron's Appendix D found that no ANG maintenance hangars had been previously determined eligible for the NRHP. Eligible hangars were limited to those with other functions, such as aerial ports and first-generation alert hangars. Following the guidance in Aaron's ANG-specific historic context statement, the Ontario ANG hangar does not appear significant under NRHP Criterion C.

Criterion D generally applies to archaeological resources that have the potential to yield significant information for the study of history or pre-history. As pointed out in Aaron, it would be unlikely that a military aircraft hangar would meet Criterion D. Drawings for standard plans and specific hangars exist that provide adequate information for understanding the technologies and designs of the buildings. As a standard plan hangar, the Ontario ANG hangar is not significant under NRHP Criterion D.

In summary, although the hangar is intact and retains physical integrity, it is not significant under any of the established NRHP Criteria for Significance. It does not appear to be eligible for listing in the NRHP.

CRHR Evaluation Summary

The CRHR criteria for significance are nearly identical to the NRHP criteria. As such, the Ontario ANG hangar does not appear to be eligible for the listing in the CRHR for the same reasons outlined above in the NRHP evaluation.

Ontario Historic Landmark Evaluation Summary

Most of the Ontario Historic Landmark Criteria are nearly identical to the NRHP and CRHR criteria. Criteria 1 and 2 relate to meeting the NRHP or CRHR criteria, respectively. Per the NRHP and CRHR evaluation summaries above and detailed on the DPR forms in Appendix B, the Ontario ANG hangar is not eligible for either, so it does not meet local Criteria 1 and 2. Criterion 3 has eight subparts (a through h). Criteria 3(a) through 3(f) restate the NRHP and CRHR criteria. Thus, the Ontario ANG hangar is not eligible under local Criteria 3(a) through 3(f).

Criteria 3(g) applies to properties with unique locations, singular physical characteristics, and those that are established and familiar visual features. The Ontario ANG hangar does not meet this Criterion. It is an aviation property in an airport location. It is a standard plan hangar made of typical materials applied in a typical manner, so it does not possess any singular distinguishing physical characteristic. Lastly, it is not a familiar visual feature in the City as it is only highly visible from restricted access locations within the Airport.

Criteria 3(h) applies to properties that are one of the few remaining examples in a geographic area possessing distinguishing characteristics of an architectural or historical type or specimen. The Ontario ANG hangar is not one of the few remaining examples of an H-2 maintenance hangar on the regional or national scale. Dozens remain nationwide, including others in California. It is the only ANG hangar in Ontario, but as outlined under the NRHP summary above and in detail on the DRP forms in Appendix B, it does not possess distinguishing characteristics. It is an example of its type, but it is not an important example. Therefore, it is not one of the few remaining examples possessing distinguishing characteristics of an architectural or historical type or specimen.

In summary, although the hangar is intact and retains physical integrity, it is not significant under any of the established Ontario Historic Landmarks Criteria. It does not appear to be eligible for listing as an Ontario Historic Landmark.

GE Maintenance Facility

History and Description

The former GE maintenance facility consists of three former maintenance hangars (Buildings 1-3), a storage hanger (Building 4), an administration building connected to one of the maintenance hangars (Building 6), and support buildings (Buildings 5 and 7-9). See Figure 4. The facility developed over a period of time starting in 1946 and extending to around 1994, according to historical records and aerial photographs (UCSB and NETROnline). The first buildings were Buildings 1 and 2, two Army surplus World War II hangars. The City of Ontario acquired them in 1946 from an offsite location; they are not original to the Ontario airport ("Ontario Acquires Plane Hangars"). By 1952, a third, very similar hangar, Building 3 was added. The three hangars are metal-framed with metal siding and have arched roofs. They originally all had multi-leaved, multi-light doors with pocket extensions on their runway-facing elevations, but only one such door remains on the northwest elevation of Building 3.

By 1959, Building 4, a double-gabled metal hangar, and Building 5, a small gabled building, were added to the facility, along with a few smaller buildings. By 1966, multiple large additions were added to Buildings 1 and 2. By 1980, several new buildings existed, including Building 6 parallel to Buildings 1 and 2, Building 7, and more additions to Buildings 1 and 2. Building 6 was extended by 1985 to physically adjoin Building 2 and to create administrative office space. By 1994, Buildings 8 and 9 had been completed. The resulting composition of the facility is an assortment of buildings and myriad additions from five decades of development.

In the late 1940s, it appears that the original three hangars functioned as municipal airport facilities (UCSB). They were later used by Northrop and Douglas Aircraft. The City leased the buildings to GE in either 1954 (Neward 38) or 1956 (Davis and Novell 27), depending on the source, and GE remained at the site until 2010 ("GE Aviation closing California facility"). GE used the buildings for aircraft engine maintenance activities. They are currently occupied by the OIAA as offices, maintenance, and storage facilities.

There is little cohesion in the facility at present. Though it started out primarily as three, nearly identical arched-roof hangars organized on a northeast-southwest axis, numerous additions and alterations have substantially diminished visual connection and continuity. Perimeter fencing composed of concrete block and chain link is a unifying element, though Building 4 is cutoff from the other buildings by an interim fence. Materials vary based on period of original construction and alterations. They include smooth stucco, corrugated metal, standing seam metal, and concrete block. Building forms include rectangular plans with arched, gabled, shed, and flat roofs. There is no landscaping within the district boundary;

however, there is a row of trees along E. Avion Street, outside the facility's perimeter fence. The overall character of the facility is industrial.

Figure 4: GE maintenance facility map.

NRHP Evaluation Summary

GE Aviation is a well-known, widely recognized pioneer in aviation history with numerous significant achievements, including: the first airplane engine "booster" known as the turbosupercharger; America's first jet engine; the first turbojet engines to power flights at two and three times the speed of sound; and the world's first high bypass turbofan engine to enter service (Weber; GE Aviation). The company is undoubtedly important within the context of aviation. Facilities associated with its important achievements include its large research and manufacturing facilities, like the plants in Lynn, Massachusetts and Evendale, Ohio. Research did not reveal any evidence to suggest that important developments in the field of aviation or in the history of GE Aviation occurred at the Ontario maintenance facility. Engine maintenance was a routine operation and maintenance facilities were standard airport fixtures.

Numerous aviation-related companies had facilities at the Ontario International Airport in the postwar era, in addition to GE. Lockheed, Northrop, Douglas, Otto Instrument Service, and Aerojet-General Corporation are some examples. Among the group, Lockheed had the biggest impact on the airport and its development. The Lockheed Airport Services (LAS) division occupied a 70-acre area and built more than 25 structures over a 46-year period. LAS's domestic and international operations were headquartered at the facility. It encompassed a large area and created a purpose-built campus. Its activities extended beyond routine maintenance to production of specialized devices and systems and modification of specialized aircraft (Davis and Novell 23-26). While it is clear that LAS impacted the airport and

surrounding communities and that it was an important aspect of Lockheed's operations, the same cannot be said of the GE facility in comparison.

The GE facility provided typical maintenance services. It developed by occupying existing buildings and adding additions and new buildings on what appears to have been on an as-needed basis. It does not appear to have generated independent growth of the airport or surrounding communities. As a result, it does not appear to possess significance under NRHP Criterion A for direct, important association with historical trends or events.

The former GE maintenance facility was associated with numerous GE employees. Research did not reveal a direct association with any specific, important individuals in local, state, or national history. The collective contributions of the many employees working in the facility over time is best understood and evaluated under NRHP Criterion A. Therefore, the facility does not appear significant under NRHP Criterion B for direct associations with important individuals.

Under Criterion C, the facility lacks a cohesive, discernable site plan and design program. It is a hodgepodge grouping of buildings added and modified over a long period of time. It does not embody the distinctive characteristics of a type, period, or method of construction, or represent the work of a master, or that possess high artistic values. It does not represent a significant and distinguishable entity whose components may lack individual distinction principally because it lacks historic or architectural significance. The facility's most interesting buildings are its World War II-era hangars, but they have all been altered to the point of no longer retaining integrity. Additions, multi-leaf door removals, siding changes, window removals, and door replacements are all evident. In fact, even if the facility possessed significance under one of the other NRHP Significance Criteria, it would likely not retain sufficient integrity to convey such significance and would not be eligible for listing in the NRHP.

Criterion D generally applies to archaeological resources that have the potential to yield significant information for the study of history or pre-history. As a collection of altered, standard plan hangars, pre-fabricated buildings, and construction as recent as 1994, the GE maintenance facility has no such information potential and is not significant under NRHP Criterion D.

In summary, the GE maintenance facility is not significant under any of the established NRHP Criteria for Significance. Even if it were significant, the buildings and structures would not retain sufficient integrity to qualify for the NRHP. It does not appear to be eligible for listing in the NRHP.

CRHR Evaluation

The CRHR criteria for significance are nearly identical to the NRHP criteria. As such, the former GE maintenance facility does not appear to be eligible for the listing in the CRHR for the same reasons outlined above in the NRHP evaluation.

Ontario Historic District Evaluation Summary

Most of the Ontario Historic District Criteria are nearly identical to the NRHP and CRHR criteria. Criteria 1 and 2 relate to meeting the NRHP or CRHR criteria, respectively. Per the NRHP and CRHR evaluation summaries above and detailed on the DPR forms in Appendix B, the former GE maintenance facility is not eligible for either, so it does not meet local Criteria 1 and 2. Criterion 3 has four subparts (a through d). Criteria 3(a), 3(c), and 3(d) restate the NRHP and CRHR criteria. Thus, the Ontario ANG hangar is not eligible under local Criteria 3(a), 3(c), and 3(d).

Criteria 3(b) applies to properties that reflect significant geographical patterns, including those associated with different eras of settlement and growth, particular transportation modes, or distinctive examples of a park landscape, site design, or community planning. The GE maintenance facility does not meet this Criterion. It developed over several decades in an as-needed manner. Buildings and additions were built essentially wherever there was space. It does not reflect any clear development pattern as a result, nor does it reflect a distinctive example of park landscape, site design, or community planning.

In summary, the GE maintenance facility is not significant under any of the established Ontario Historic District Criteria. Even if it were significant, the buildings and structures would not retain sufficient integrity to qualify for the NRHP. It does not appear to be eligible for listing as an Ontario Historic District.

VII. CONCLUSIONS AND RECOMMENDED FINDINGS

None of the resources in the APE appear eligible for listing in the NRHP. They are not historic properties as defined by Section 106 of the NHPA. The recommended Section 106 finding for the undertaking for built environment resources is No Historic Properties Affected pursuant to 36 CFR §800.4(d)(1). Likewise, none of the resources in the APE appear eligible for listing in the CRHR or as Ontario Landmarks/Historic Districts. They are not historical resources as defined by CEQA, and no further cultural resources compliance analysis or review is recommended.

The recommended California Historical Resource Status Code for all built environment resources in the APE is 6Z: found ineligible for NRHP, CRHR, or local designation through survey evaluation. See DPR forms in Appendix B for detailed evaluations and property data.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Ontario ANG hangar is composed of a steel-frame central hangar with concrete block lean-tos on three sides faced with brick and corrugated metal siding. It has bands of multi-light metal windows on both the lean-tos and the hangar. Original doors are also metal, some with single lights. The hangar's multi-leaved doors include eight total leaves with tall multi-light windows on all leaves and pilot doors in the end leaves. The hangar elevations are clad with corrugated metal siding. There is no tail cut in the primary elevation, indicating that the Ontario ANG Station did not service planes with high tails. This is also evident from the relatively low bottom chords on its interior steel trusses. The building has a couple of one-story additions on its rear elevation and some of the windows have been painted over, glazing and all. Otherwise, the building remains intact from its 1955 period of construction.

Period of Significance 1955-1995 **Property Type** Hangar **Applicable Criteria** N/A
(Discuss importance in terms of historical or architectural context as defined by theme, period, and geographic scope. Also address integrity.)

The Ontario ANG hangar was evaluated for individual NRHP and CRHR eligibility within the general context of aviation. The applicable themes include military aviation within the Air National Guard and hangar design. Although it retains integrity, the hangar is not significant under any of the established criteria. As a result, it does not appear to be eligible for listing in the NRHP or CRHR. The information and registration requirements in *Historical and Architectural Overview of Aircraft Hangars of the Reserves and National Guard Installations from World War I through the Cold War* (Aaron) served as the framework for the evaluation. See Continuation sheets.

The hangar is within the boundary of the larger Ontario ANG Station. The station was evaluated as a potential district in 1998 and 2017 and found to be ineligible both times. The 2017 District Record and a current Update form for the district are included with this individual evaluation for reference.

B11. Additional Resource Attributes: (List attributes and codes) None.

B10. Significance, continued.

History of the Air National Guard

The following narrative was compiled using the Military Network's "Air National Guard History" and Susan Rosenfield and Charles J. Goss's *Air National Guard at 60: A History*, as cited in parentheses. Full citations are located in the References section.

The Air National Guard was established as a separate reserve component of the U.S. Air Force in September 1947, but it traces its roots to the 1st Aero Company, New York National Guard. In July 1916, the 1st Aero Company mobilized during the border crisis with Mexico. It trained at Mineola Field, New York (Military Network).

During WWI, the War Department decided that it would not mobilize National Guard air units. Instead, individual volunteers provided a major pool of Army Air Force (AAF) pilots. They were required to leave the Guard and enter the Signal Corps Reserve if they wished to fly in the war. During WWII, Guardsman served in every major combat theater during the war. The most significant wartime contribution of National Guard aviators was to train and lead the large numbers of volunteer airmen who had entered the AAF (Military Network).

The National Guard Association of the United States compelled the AAF to plan for a significant dual-component reserve force including an Air National Guard once the overseas fighting ended. General George C. Marshall, Army Chief of Staff, also pressured the AAF to revise its ambitious plans for a large postwar active-duty force. When President Harry S. Truman instituted dramatic postwar military budget cuts, he split defense dollars evenly among the Army, Navy, and Air Force. That move also required the Air Force to plan for a far smaller active-duty service than it had envisaged. As a result, the Air Force needed the reserve components to help fill the gap (Rosenfield and Gross).

The Air Force of the mid-to-late 1940s included the 58,000 members of what became the Air National Guard. Its primary units were 84 flying squadrons, mostly fighters with air defense of the continental United States as their main mission. In 1946, as individual units began obtaining federal recognition, a separate Air Guard began to emerge. September 18, 1947, however, is considered the ANG's official birth date, the same day the Air Force became a separate service under the 1947 National Security Act (Rosenfield and Gross).

The Korean War was a turning point for the Air Guard. Some 45,000 Air Guardsmen, 80 percent of the force, were mobilized. Once in federal service, they proved to be unprepared for combat. Many key Air Guardsmen were used as fillers elsewhere in the Air Force. It took three to six months for some ANG units to become combat ready. Some never did. Eventually, they made substantial contributions to the war effort and the Air Force's global buildup. Largely as a result of the Korean War experience, senior ANG and Air Force leaders became seriously committed to building the Air Guard as an effective reserve component (Military Network).

Although flying units garnered most of the attention during the Korean War, 11,000 of the 45,000 mobilized Air Guardsmen belonged to the organization's aircraft control and warning as well as its radar calibration units. Their organizations either strengthened American air defenses or were converted to tactical air control units that directed Air Force fighter aircraft in the continental United States, Alaska, Newfoundland, Europe, and French Morocco (Rosenfield and Gross).

During and after the conflict in Korea, Congress played a key role in securing reserve programs. Congress was much more willing than either the Department of Defense or the military services to fund the reserves properly.

Moreover, beginning with the passage of the Armed Forces Reserve Act of 1952, a series of key laws fostered the development of more effective reserve components (Rosenfield and Gross).

Although Korean War hostilities ended in July 1953, the Cold War persisted. Georgia Air Guard Major General George G. Finch, former Air Division chief at the National Guard Bureau, wanted to find an innovative way to provide additional training for fighter pilots after their units were demobilized. At the same time, the Air Defense Command could not call upon sufficient active-duty Air Force units to defend the continental United States against the Soviet air threat. General Finch proposed to employ pilots full time from "strategically placed" Air Guard units to perform "air intercept missions" against unidentified aircraft entering U.S. air space. In addition, they would "provide simulated fighter attacks against the Strategic Air Command's [SAC's] nuclear-capable bombers" (Rosenfield and Gross).

Using Air Guardsmen from the 138th Fighter Interceptor Squadron in Syracuse, New York, and the 194th Fighter Bomber Squadron in Hayward, California, the experiment, which began on March 1, 1953, proved a great success—except that it had to remain a secret at least for the time being. Brigadier General Curtis J. Irwin, the 138th commander, later recalled trying to obtain the services of his pilots from their civilian employers but not being able to tell them why. "But with Cold War tensions remaining high, employers were eager to help" (Rosenfield and Gross).

By October 1954, nine fighter interceptor squadrons respectively began "standing alert" using volunteer aircrews on a rotating basis for 14 hours a day. The ANG runway alert program required some planes and pilots to be available around-the-clock to become airborne within minutes of being notified to scramble. At its peak, in the mid-1950s, all 70 Air Guard fighter squadrons participated in that program. That number was reduced to 25 by 1961. Most of the runway alert exercises involved SAC bombers; the few actual scrambles turned out to be late or off-course commercial airliners. The runway alert experiment in 1953 marked the beginning of the Air Guard's modern homeland defense role. Moreover, it was the first broad effort to integrate reserve units into a major Air Force combat mission in peacetime on a continuing basis using volunteers (Rosenfield and Gross).

Throughout the rest of the 20th century and into the 21st, the Air National Guard remained important to U.S. military operations at home and abroad. Guardsman participated in major historical events, including the Bay of Pigs, Berlin Crisis, Cuban Missile Crisis, the Vietnam War, the Persian Gulf Crisis, Iraq, and Afghanistan. They also provided critical natural disaster assistance and continue to do so to the present day, in addition to their defense missions.

California Air National Guard

The California ANG traces its history back to the 115th Aero Squadron during WWI. It was re-established as the 115th Observation Squadron in 1924. The squadron met at a variety of locations in the Los Angeles area. It was ordered into active duty for WWII in 1941. Following the war, as part of the National Security Act of 1947, the modern California ANG was formed. The 62nd Fighter Wing/115th Bombardment Squadron were the first to receive federal recognition in the state. They were located in Van Nuys. By 1949, California had 41 Air National Guard units. The major units were the 62nd and 61st Fighter Wings. The 62nd's mission was the air defense of Southern California. The 61st was located at Hayward Municipal Airport and its mission was the air defense of Northern California (California Military Museum "Outline History").

California ANG units performed missions typical of units throughout the country and participated in major historical events at the call of the governor or president. Today, there are nine ANG bases in the state: Fresno,

Lompoc, Marysville, Mountain View, Oxnard, Riverside, San Diego, Sacramento, and Van Nuys. They perform "twenty-one unique missions, training and preparing the citizen-airmen to respond to the Governor of California for state emergencies or to the call of the President in times of crisis" (ANG).

History and Missions of the Ontario ANG Hangar

The Ontario ANG hangar was built in 1955 and in use as a California ANG facility until 1995. Based on its intact features, it was designed and constructed according to the U.S. Air Force (USAF) standard plan for hangar type H-2. This standard plan dates to 1951 and is attributed to Mills & Petticord (Weitze 65). Type H-2 hangars were maintenance hangars. They featured a large central hangar with multi-leaved, telescoping doors, surrounded on two or three sides by two-story lean-tos for shop space. This hangar type was built at USAF and ANG installations all over the country in the Cold War era, as evidenced in Appendix D, Representational Hangars, of *Historical and Architectural Overview of Aircraft Hangars of the Reserves and National Guard Installations from World War I through the Cold War* (Aaron) and in numerous other historic context statements on U.S. Cold War military resources. The Ontario example is nearly identical to many of its contemporaries.

Air National Guard groups stationed at Ontario while the hangar was in use as part of the Ontario ANG Station included: the 196th Tactical Air Support Group and the 163rd Tactical Support Group from July 1952 until 1983, and the 148th Combat Communications Squadron (CCS) from 1984 and 1995. During the 196th and 163rd tenures, the station was used as an operations area in support of the California ANG's air training mission. Both jet and propeller aircraft were taxied, parked, and maintained at the station. During the 148th period, the CCS conducted radar operations, maintenance, and training on the property (California Military Department "Ontario Air National Guard Station"). Missions attributed to the groups and squadrons at the station included fighter-interceptor, air defense, tactical air support, tactical reconnaissance, air refueling, and communications.

NRHP Evaluation

Criterion A

To be significant under Criterion A, a property must be associated with events that have made a significant contribution to the broad patterns of our history. The mere fact of association is not sufficient for a property to possess significance. Rather, the association itself must be direct and important. Research into the defense missions and their fulfillment at the Ontario ANG Station did not reveal any direct and significant associations with important events or trends. The missions and activities were typical of ANG installations throughout California and the United States. As opposed to the bases at Van Nuys and Hayward, for example, no significant missions or activities originated at the station, and the groups and squadrons were not directly related to any significant military events. As a result, the hangar does not appear significant under NRHP Criterion A for direct association with important historical trends or events.

Criterion B

To be significant under Criterion B, a property must be associated with the lives of persons significant in our past. The Ontario ANG hangar was associated with numerous members of the California ANG. Research did not reveal a direct association with any specific, important individuals in local, state, or national history. The collective contributions of the many Air National Guard personnel stationed at the hangar over time is best understood and evaluated under NRHP Criterion A. Therefore, the hangar does not appear significant under NRHP Criterion B for direct associations with important individuals.

Criterion C

Properties significant under Criterion C must embody the distinctive characteristics of a type, period, or method of construction, or represent the work of a master, or possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction.

To be eligible under NRHP Criterion C as embodying distinguishing characteristics of a type, period, or method of construction, the hangar would have to be an outstanding example of its type in comparison with its peers. The Ontario ANG hangar is a USAF standard plan H-2 hangar. There are numerous H-2 type hangars across the country. Every intact example is not eligible for listing in the NRHP. In order to be eligible under this criterion, a hangar would have to be an early prototype or display some unique adaptations to suit a particular mission, aircraft type, or local conditions. An example of a hangar that meets Criterion C is Building 3 at the Kulis Air National Guard Base in Alaska. It was the earliest building constructed for the entire Alaska ANG and the hangars in Building 3 were adapted to meet specific mission requirements. Furthermore, the missions themselves were unique and important, and the Kulis base was the only ANG unit nationwide with C-123J aircraft (Aaron D3-D5).

The Ontario ANG hangar, by comparison, followed standard design plans and served standard missions and aircraft. It is nearly identical to other ANG hangars from the mid-1950s, many of which have been determined ineligible for the NRHP, including others in California. Building 100 at the Fresno ANG Station is a good example of a very similar hangar determined ineligible in 2005 (Aaron D-9). In fact, a review of the representational hangars provided in Aaron Appendix D found that no ANG maintenance hangars had been previously determined eligible for the NRHP. Eligible hangars were limited to those with other functions, such as aerial ports and first-generation alert hangars.

As a standard plan building, the Ontario ANG hangar is not the work of a master, nor does it possess high artistic values. As an individual building, it is not a significant and distinguishable entity whose components may lack individual distinction. Furthermore, consideration of the Ontario ANG Station as a potential historic district was completed in both 1998 and 2017, and it was found ineligible in both cases.

Following the guidance in Aaron's ANG-specific historic context statement, the Ontario ANG hangar does not appear significant under NRHP Criterion C.

Criterion D

Criterion D generally applies to archaeological resources that have the potential to yield significant information for the study of history or pre-history. As pointed out in Aaron, it would be unlikely that a military aircraft hangar would meet Criterion D. Drawings for standard plans and specific hangars exist that provide adequate information for understanding the technologies and designs of the buildings. As a standard plan hangar, the Ontario ANG hangar is not significant under NRHP Criterion D.

Integrity

The hangar retains integrity of location, design, materials, workmanship, feeling, and association as it has not been altered, except for some relatively small rear additions. Its setting has been somewhat compromised by changes to the runways to its north.

NRHP Summary

In summary, although the hangar is intact and retains physical integrity, it is not significant under any of the established NRHP Criteria for Significance. It does not appear to be eligible for listing in the NRHP.

CRHR Evaluation

The CRHR criteria for significance are nearly identical to the NRHP criteria. As such, the Ontario ANG hangar does not appear to be eligible for the listing in the CRHR for the same reasons outlined above in the NRHP evaluation.

Ontario Air National Guard Station Update Form - 2022

THIS PAGE INTENTIONALLY LEFT BLANK

UPDATE

Purpose

This DPR 523L is being prepared to update the previous evaluation of the Ontario Air National Guard (ANG) Station, listed on the original DPR 523D as "Air National Guard Area, Ontario International Airport."

A portion of the station is located within the Area of Potential Effect (APE) for the Ontario International Airport (ONT Airport) South Cargo Center Project (Project). The Project is an undertaking as defined by Section 106 of the National Historic Preservation Act (NHPA). It is also subject to compliance with the California Environmental Quality Act (CEQA). The Federal Aviation Administration (FAA) is the lead agency for Section 106 compliance; the Ontario International Airport Authority (OIAA) is the lead agency for CEQA compliance.

The majority of the former Ontario ANG Station is outside the APE for the undertaking. It was previously determined ineligible for the National Register of Historic Places (NRHP), California Register of Historical Resources (CRHR), and as a local historic district in two separate recordings: first, as part of an Environmental Assessment (EA) for the disposal of the station in 1998 (Department of the Air Force); second, as part of the 2017 Historic Context Statement (HCS) and survey (Davis and Novell). Fieldwork and research conducted for the current undertaking confirmed the ineligibility findings in the prior evaluations and did not reveal any reason to re-evaluate them or reconsider potential significance.

It was unclear from the HCS, records search, and California Built Environment Resources Directory (BERD) if the the State Historic Preservation Officer ever concurred with the DPR forms prepared for the past evaluations. Because the station dose not warrant full re-evaluation and to minimize duplication of effort, this new DPR 523L/Update form for the station was prepared to add to the existing documentation and provide information pertinent to the current undertaking. The 2017 DPR 523D form for the ANG station follows this Update. The 2017 DPR 523A forms for the buildings in the district boundary are also attached, with the exception of the maintenance hangar.

The maintenance hangar in the station was excluded from the 1998 district evaluation as it was outside the study area for that undertaking, but it was recommended individually eligible under NRHP Criterion C in the 2017 HCS and survey without adequate justification and analysis. It was the only building in the Ontario ANG Station requiring full re-evaluation as part of the current undertaking as a result. A new full set of DPR 523 forms for this resource are attached in lieu of its 2017 forms.

Determinations regarding which forms to prepare for which resources were based on the California Office of Historic Preservation's *Instructions for Recording Historical Resources* publication, pp. 23-24.

Preparer's Information

Laura O'Neill, Architectural Historian at the Desert Research Institute (DRI) in Las Vegas, Nevada, who meets the Secretary of the Interior's Professional Qualifications Standards (PQS) in Architectural History and Historic Architecture (36 CFR §61) prepared this report. Ms. O'Neill's résumé is available at https://www.dri.edu/directory/laura-oneill. Jeffrey Wedding, Archaeologist at DRI who meets the PQS in Archaeology, assisted with research efforts.

Field Survey

Ms. O'Neill surveyed the APE for the undertaking on March 24, 2022. Photographs and notes were taken during the field survey. The purpose of the field survey was to document the condition and physical integrity of the potential historic properties in the APE, to confirm dates of construction and alterations, and to examine the recommended findings in the 2017 HCS.

Ontario ANG Station Buildings Summary

The following buildings were documented as part of the station in the 2017 HCS and survey. DPR 523A forms attached.

Building ID	2017 Finding/Status Code	Current Recommendation
Bldg 1	6Z	6Z
Bldg 2	6Z	6Z
Bldg 3	6Z	6Z
Bldg 4	6Z	6Z
Bldg 5	6Z	6Z
Bldg 6	6Z	6Z
Bldg 7	6Z	6Z
Bldg 10 (Dining Hall)*	6Z	6Z
Bldg 11 (Training)*	6Z	6Z
Bldg 12	6Z	6Z
Building 109*	6Z	6Z
Crash Truck Station*	6Z	6Z
Maintenance Hangar*	3S	6Z

* Building is located in the APE for the current undertaking and proposed for demolition. DPR 523A forms attached.

Updated Information

Extensive research was completed to re-evaluate the Ontario ANG hangar. The research helped to confirm the 1998 and 2017 ineligibility findings for the potential ANG district. It also generated additional context and theme narratives related to the station. Those narratives are included in this Update form to create a more complete historical record.

History of the Air National Guard

The following narrative was compiled using the Military Network's "Air National Guard History" and Susan Rosenfield and Charles J. Goss's *Air National Guard at 60: A History*, as cited in parentheses. Full citations are located in the References section.

The Air National Guard was established as a separate reserve component of the U.S. Air Force in September 1947, but it traces its roots to the 1st Aero Company, New York National Guard. In July 1916, the 1st Aero Company mobilized during the border crisis with Mexico. It trained at Mineola Field, New York (Military Network).

During WWI, the War Department decided that it would not mobilize National Guard air units. Instead, individual volunteers provided a major pool of Army Air Force (AAF) pilots. They were required to leave the Guard and enter the Signal Corps Reserve if they wished to fly in the war. During WWII, Guardsman served in every major combat theater during the war. The most significant wartime contribution of National Guard aviators was to train and lead the large numbers of volunteer airmen who had entered the AAF (Military Network).

The National Guard Association of the United States compelled the AAF to plan for a significant dual-component reserve force including an Air National Guard once the overseas fighting ended. General George C. Marshall, Army Chief of Staff, also pressured the AAF to revise its ambitious plans for a large postwar active-duty force. When President Harry S. Truman instituted dramatic postwar military budget cuts, he split defense dollars evenly among the Army, Navy, and Air Force. That move also required the Air Force to plan for a far smaller active-duty service than it had envisaged. As a result, the Air Force needed the reserve components to help fill the gap (Rosenfield and Gross).

The Air Force of the mid-to-late 1940s included the 58,000 members of what became the Air National Guard. Its primary units were 84 flying squadrons, mostly fighters with air defense of the continental United States as their main mission. In 1946, as individual units began obtaining federal recognition, a separate Air Guard began to emerge. September 18, 1947, however, is considered the ANG's official birth date, the same day the Air Force became a separate service under the 1947 National Security Act (Rosenfield and Gross).

The Korean War was a turning point for the Air Guard. Some 45,000 Air Guardsmen, 80 percent of the force, were mobilized. Once in federal service, they proved to be unprepared for combat. Many key Air Guardsmen were used as fillers elsewhere in the Air Force. It took three to six months for some ANG units to become combat ready. Some never did. Eventually, they made substantial contributions to the war effort and the Air Force's global buildup. Largely as a result of the Korean War experience, senior ANG and Air Force leaders became seriously committed to building the Air Guard as an effective reserve component (Military Network).

Although flying units garnered most of the attention during the Korean War, 11,000 of the 45,000 mobilized Air Guardsmen belonged to the organization's aircraft control and warning as well as its radar calibration units. Their organizations either strengthened American air defenses or were converted to tactical air control units that directed Air Force fighter aircraft in the continental United States, Alaska, Newfoundland, Europe, and French Morocco (Rosenfield and Gross).

During and after the conflict in Korea, Congress played a key role in securing reserve programs. Congress was much more willing than either the Department of Defense or the military services to fund the reserves properly.

Moreover, beginning with the passage of the Armed Forces Reserve Act of 1952, a series of key laws fostered the development of more effective reserve components (Rosenfield and Gross).

Although Korean War hostilities ended in July 1953, the Cold War persisted. Georgia Air Guard Major General George G. Finch, former Air Division chief at the National Guard Bureau, wanted to find an innovative way to provide additional training for fighter pilots after their units were demobilized. At the same time, the Air Defense Command could not call upon sufficient active-duty Air Force units to defend the continental United States against the Soviet air threat. General Finch proposed to employ pilots full time from "strategically placed" Air Guard units to perform "air intercept missions" against unidentified aircraft entering U.S. air space. In addition, they would "provide simulated fighter attacks against the Strategic Air Command's [SAC's] nuclear-capable bombers" (Rosenfield and Gross).

Using Air Guardsmen from the 138th Fighter Interceptor Squadron in Syracuse, New York, and the 194th Fighter Bomber Squadron in Hayward, California, the experiment, which began on March 1, 1953, proved a great success—except that it had to remain a secret at least for the time being. Brigadier General Curtis J. Irwin, the 138th commander, later recalled trying to obtain the services of his pilots from their civilian employers but not being able to tell them why. "But with Cold War tensions remaining high, employers were eager to help" (Rosenfield and Gross).

By October 1954, nine fighter interceptor squadrons respectively began "standing alert" using volunteer aircrews on a rotating basis for 14 hours a day. The ANG runway alert program required some planes and pilots to be available around-the-clock to become airborne within minutes of being notified to scramble. At its peak, in the mid-1950s, all 70 Air Guard fighter squadrons participated in that program. That number was reduced to 25 by 1961. Most of the runway alert exercises involved SAC bombers; the few actual scrambles turned out to be late or off-course commercial airliners. The runway alert experiment in 1953 marked the beginning of the Air Guard's modern homeland defense role. Moreover, it was the first broad effort to integrate reserve units into a major Air Force combat mission in peacetime on a continuing basis using volunteers (Rosenfield and Gross).

Throughout the rest of the 20th century and into the 21st, the Air National Guard remained important to U.S. military operations at home and abroad. Guardsman participated in major historical events, including the Bay of Pigs, Berlin Crisis, Cuban Missile Crisis, the Vietnam War, the Persian Gulf Crisis, Iraq, and Afghanistan. They also provided critical natural disaster assistance and continue to do so to the present day, in addition to their defense missions.

California Air National Guard

The California ANG traces its history back to the 115th Aero Squadron during WWI. It was re-established as the 115th Observation Squadron in 1924. The squadron met at a variety of locations in the Los Angeles area. It was ordered into active duty for WWII in 1941. Following the war, as part of the National Security Act of 1947, the modern California ANG was formed. The 62nd Fighter Wing/115th Bombardment Squadron were the first to receive federal recognition in the state. They were located in Van Nuys. By 1949, California had 41 Air National Guard units. The major units were the 62nd and 61st Fighter Wings. The 62nd's mission was the air defense of Southern California. The 61st was located at Hayward Municipal Airport and its mission was the air defense of Northern California (California Military Museum "Outline History").

California ANG units performed missions typical of units throughout the country and participated in major historical events at the call of the governor or president. Today, there are nine ANG bases in the state: Fresno,

Lompoc, Marysville, Mountain View, Oxnard, Riverside, San Diego, Sacramento, and Van Nuys. They perform "twenty-one unique missions, training and preparing the citizen-airmen to respond to the Governor of California for state emergencies or to the call of the President in times of crisis" (ANG).

History and Missions of the Ontario ANG Station

Air National Guard groups stationed at Ontario included: the 196th Tactical Air Support Group and the 163rd Tactical Support Group from July 1952 until 1983, and the 148th Combat Communications Squadron (CCS) from 1984 and 1995. During the 196th and 163rd tenures, the station was used as an operations area in support of the California ANG's air training mission. Both jet and propeller aircraft were taxied, parked, and maintained at the station. During the 148th period, the CCS conducted radar operations, maintenance, and training on the property (California Military Department "Ontario Air National Guard Station"). Missions attributed to the groups and squadrons at the station included fighter-interceptor, air defense, tactical air support, tactical reconnaissance, air refueling, and communications.

Update Summary

Research into the defense missions and their fulfillment at the Ontario ANG Station did not reveal any direct and significant associations with important events or trends. The missions and activities were typical of ANG installations throughout California and the United States. As opposed to the bases at Van Nuys and Hayward, for example, no significant missions or activities originated at the station, and the groups and squadrons were not directly related to any significant military events. Though the station is a distinguishable entity whose components lack individual distinction, it does not possess the necessary significance under any of the other established criteria. In accordance with the 1998 and 2017 evaluations for the potential district, Ontario ANG Station does not appear significant under any of the NRHP or CRHR criteria. It does not appear eligible for listing in the NRHP, CRHR, or as a local historic district.

Ontario Air National Guard Station DPR Forms - 2017

THIS PAGE INTENTIONALLY LEFT BLANK

State of California — The Resources Agency
DEPARTMENT OF PARKS AND RECREATION
DISTRICT RECORD

Primary #
HRI #
Trinomial

Page 1 of 4 ***Resource Name or #:** Air National Guard Area
D1. Historic Name: Air National Guard, California Air National Guard, 149th Control and Warning Squadron
D2. Common Name: Air National Guard, California Air National Guard

***D3. Detailed Description:** (Describe overall coherence of the district, its setting, visual characteristics, and minor features. List all elements of district.)

The Air National Guard (ANG) area is a complex of military buildings comprising the former operations of the California Air National Guard, which operated at Ontario International Airport from 1956 to 2010, providing aircraft maintenance facilities, as well as jet engine testing at a nearby site. In addition to a large front-gabled roof hangar with "lean-to" offices and shops around its perimeter, the ANG area retains a complex of buildings that served various functions for the reserve units stationed at Ontario. Buildings remaining include a dining hall, training facilities, maintenance shops, warehouses, a munitions building, and motor pool buildings.

Throughout World War II, Ontario Army Air Field was taken over for military use for the war effort, declaring it surplus in 1945 at the conclusion of the war. In 1949, the military's use of the airport recommenced when a California Air National Guard (CA ANG) training station was established at the airport under a lease from the City of Ontario. An armory for the 149th Control and Warning Squadron was constructed, and in the following years, ANG activities contributed significantly to further construction at the airport.

Bids for construction of an armory for the 149th Aircraft Control and Warning Squadron of the CA ANG were opened in April 1949. The main armory was to be one of three buildings comprising the installation on 9.5 acres adjacent to the airport east of Cucamonga Creek and north of the Union Pacific railroad tracks paralleling Mission Boulevard on the south. A subsequent construction phase was to involve a motor service shop and warehouse buildings ("Open Bids for Armory at Airport." *Daily Report,* April 28, 1949).

***D4. Boundary Description**: (Describe limits of district and attach map showing boundary and district elements.)

The area considered for a potential historic district for the Air National Guard Area is bounded by the main runways at ONT on the north, Tower Drive on the east, East Avion Street on the south, and just west of the Air National Guard Hangar on the west.

***D5. Boundary Justification**:

The area considered for a potential historic district for the Air National Guard Area encompasses the buildings and structures of the former Air National Guard facilities.

D6. Significance: Theme n/a **Area** n/a
Period of Significance n/a **Applicable Criteria** N/A
(Discuss district's importance in terms of its historical context as defined by theme, period of significance, and geographic scope. Also address the integrity of the district as a whole.)

The Air National Guard Area was evaluated as a potential historic district under the context of Aviation in Ontario, and Theme: Military Aviation, 1942–1991, according to the guidelines established in the *Ontario International Airport Historic Context Statement*, prepared by ASM Affiliates, Inc., for the City of Ontario, June 2017. Although the Air National Guard Area, and the buildings and structures comprising it, played a role in military operations from WWII through the Cold War, the function of the CA ANG facility does not appear to have to have been associated with important patterns and trends in military operations. As such, the Air National Guard Area is recommended not eligible as a historic district as it does not meet the registration requirements for the theme of Military Aviation, 1942–1991. Furthermore, no individually eligible properties within this area were identified that meet the requirements for the theme of Military Aviation, 1942–1991. One building, the Air National Guard Hanger, was found to meet the registration requirements under the theme of Aviation and Architecture, 1942–1975, and the sub-theme of Developments in Construction Technology, 1942–1975 (see separate 523BSO form).

D7. References (Give full citations including the names and addresses of any informants, where possible.):

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Dining Hall is located within a group of ancillary Air National Guard buildings south of the hangar and south of E. Avion St. at Ontario International Airport. The building is horizontally oriented and sits on a poured-concrete foundation. It has a rectangular plan and is capped with a very slightly sloped front-gabled roof that is flush with the exterior walls at the gable ends and has a moderate overhang on the other two sides. Utilities such as HVAC systems are visible on the roof. Exterior walls are clad in vertical wood boards. The primary entrance at the north façade is a set of flat double doors with decorative wood panels and a fixed-glass transom above. The entrance is recessed at the center of the façade. Additional fenestration includes several flat metal doors and regular spaced horizontally oriented windows placed high on the side walls. At the south façade is a low poured-concrete dock. The interior of the building was not accessible at the time of the survey.

The Maintenance Shop (Building 109) is located in a group of ancillary Air National Guard (ANG) buildings south of the ANG hangar and south of E. Avion St. at Ontario International Airport. It is a horizontally oriented single-story building generally rectangular in plan with a small lower wing at the north façade, a second small shed-roofed addition at the west façade, and a shed-roofed shelter attached to the south façade. It has a very slightly gabled roof that is flush with the exterior walls. The exterior is clad in smooth stucco. Fenestration consists of a personnel door and two windows that have been covered over at the south façade. At the east (primary) façade are two large panels covered with wood shingles, with a door inset into each panel, and a large bay with a metal door. The interior of the building was not accessible at the time of the survey.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

The Crash Truck Station is an industrial building with a rectangular plan set on a poured-concrete foundation located to the west of the Air National Guard hangar at Ontario International Airport. The shed roof slopes with a narrow overhang slightly toward the front of the building, capping a one-and-a-half story space. A single-story flat-roofed addition is located at the south of the building. The exterior walls are clad in smooth stucco. Fenestration consists of three roll-up metal vehicle doors with a horizontal row of windows at the north (primary façade). Multi-light sash windows are distributed on the three remaining façades. Concrete bollards at the corners of the vehicle bays protect the building from entering vehicles. The interior of the building was not accessible at the time of the survey. Original architectural drawings are attributed to the California Department of Public Works (April 7, 1953).

***Resource Name or # (Assigned by recorder)**

D1. Historic Name: General Electric (GE) Maintenance Facility

D2. Common Name: Ontario International Airport Authority (OIAA) Headquarters

***D3. Detailed Description** (Discuss overall coherence of the district, its setting, visual characteristics, and minor features. List all elements of district.):

The former GE maintenance facility consists of three former maintenance hangars (Buildings 1-3), a storage hanger (Building 4), an administration building connected to one of the maintenance hangars (Building 6), and support buildings (Buildings 5 and 7-9). The site plan is generally oriented along a northeast-southwest axis and has an irregular shape bounded by perimeter fencing. The facility is located south of the Ontario International Airport's runways and north of E. Avion Street. The area is completely paved with large parking lots in the southwest portion. Buildings are densely developed, with the exception of Building 4, with little space between them. See Figure 1.

Figure 1: GE maintenance facility map.

The facility developed over a period of time starting in 1946 and extending through around 1994, according to historical records and aerial photographs (UCSB and NETROnline). The first buildings were Buildings 1 and 2, two Army surplus World War II hangars. The City of Ontario acquired them in 1946; they are not original to the Ontario airport ("Ontario Acquires Plane Hangars"). By 1952, a third, very similar hangar, Building 3 was added. The three hangars are metal-framed with metal siding and have arched roofs. They originally all had multi-leaved, multi-light doors with pocket extensions on their runway-facing elevations, but only one such door remains on the northwest elevation of Building 3.

By 1959, Building 4, a double-gabled metal hangar, and Building 5, a small gabled building, were added to the facility, along with a few smaller buildings. By 1966, multiple large additions were added to Buildings 1 and 2. By 1980, several new buildings existed, including Building 6 parallel to Buildings 1 and 2, Building 7, and more additions to Buildings 1 and 2. Building 6 was extended by 1985 to physically adjoin Building 2 and to create administrative office space. By 1994, Buildings 8 and 9 had been completed. The resulting composition of the facility is an assortment of buildings and myriad additions from five decades of development.

In the late 1940s, it appears that the original three hangars functioned as municipal airport facilities (UCSB). They were later used by Northrop and Douglas Aircraft. The City leased the buildings to GE in either 1954 (Neward 38) or 1956 (Davis and Novell 27), depending on the source, and GE remained at the site until 2010 ("GE Aviation closing California facility"). GE used the buildings for aircraft engine maintenance activities. They are currently occupied by the OIAA as offices, maintenance, and storage facilities.

There is little cohesion in the facility at present. Though it started out primarily as three, nearly identical arched-roof hangars organized on a northeast-southwest axis, numerous additions and alterations have substantially diminished visual connection and continuity. Perimeter fencing composed of concrete block and chain link is a unifying element, though Building 4 is cutoff from the other buildings by an interim fence. Materials vary based on period of original construction and alterations. They include smooth stucco, corrugated metal, standing seam metal, and concrete block. Building forms include rectangular plans with arched, gabled, shed, and flat roofs. There is no landscaping within the district boundary; however, there is a row of trees along E. Avion Street, outside the facility's perimeter fence. The overall character of the facility is industrial. See Continuation sheets for photographs.

The following table lists the extant buildings in the evaluated district:

Building No.	Est. Year Built	Description	Recommended Status Code
Building 1	1946 – erected at current location. Original location unknown.	Army surplus hangar, numerous additions, non-original cladding, original multi-leaved doors removed.	6Z
Building 2	1946 – erected at current location. Original location unknown.	Army surplus hangar, numerous additions, physically connected to Building 5 c. 1985, some original cladding and windows remain, original multi-leaved doors removed.	6Z
Building 3	1952 – erected at current location. Original location unknown.	Army surplus hangar, intact on three of four sides, only hangar with original multi-leaved doors remaining, original siding and windows replaced on fourth elevation.	6Z
Building 4	1959	Metal, double-gabbed storage hangar, third smaller gabled section added later, multi-leaved door remains on middle gabled bay.	6Z
Building 5	1959; major additions by 1980.	Originally front-gabled with smooth stucco walls, but later enveloped by concrete block and metal-clad additions.	6Z

D1. Historic Name: General Electric (GE) Maintenance Facility
D2. Common Name: Ontario International Airport Authority (OIAA) Headquarters

Building No.	Est. Year Built	Description	Recommended Status Code
Building 6	1980; major additions in 1985.	Originally a long warehouse, office additions to the southwest and southeast created administration wing and connected it to Building 2.	6Z
Building 7	1980	Warehouse, rectangular plan, flat roof	6Z
Building 8	1994	Warehouse, rectangular plan, flat roof	6Z
Building 9	1994	Compound of small buildings and open sheds, part of it may date to 1980 with other pieces added by 1994	6Z

Buildings 1-5 were documented on DPR 523 A forms, attached to this DPR 523 D form, because they are all over 45 years of age.

***D4. Boundary Description** (Describe limits of district and attach map showing boundary and district elements.):
The boundary follows fence lines around the facility. See Figure 1.

***D5. Boundary Justification:**
The boundary utilizes the current fence lines which correspond to historic patterns of use on the site. The buildings and structures within the boundary share an association with GE from c. 1955 to 2010.

D6. Significance: Theme Commercial Aviation **Area** U.S., Ontario **Period of Significance** 1955-1977
Applicable Criteria N/A (Discuss district's importance in terms of its historical context as defined by theme, period of significance, and geographic scope. Also address the integrity of the district as a whole.)

The GE maintenance facility was evaluated within the theme of commercial aviation for the period of 1955, the approximate year when the company reportedly began leasing the complex, to 1977, 45 years ago from the present year. GE occupied the facility until 2010. Fifty years old is the threshold for historic properties under National Register of Historic Places (NRHP) requirements (without invoking Criteria Consideration G for exceptional significance). Forty-five years is utilized herein to account for the amount of time it can take for complex projects to complete the Section 106 and California Environmental Quality Act (CEQA) processes.

Commercial Aviation in Ontario in the Postwar Era

Commercial aviation developed as an industry in the early 20th century and followed trends in aircraft technology and civil and military aviation. The industry includes not just commercial airlines, but also the private companies that developed, manufactured, serviced, and maintained airplanes, aircraft components, and other components of aviation technology. As demand for air travel increased in both the public and private sectors, the aviation industry grew and adapted. After WWII, in particular, there was a dramatic increase in passenger demand. Companies like Lockheed, Douglas, and Boeing led the way in meeting demand by developing larger, faster planes for transcontinental and transoceanic flight (NPS 196-197).

Numerous aviation-related companies had facilities at the Ontario International Airport in the postwar era. Lockheed, Northrop, Douglas (Watson 4), GE, Otto Instrument Service, and Aerojet-General Corporation (Davis and Novell) are some examples. Among the group, Lockheed had the biggest impact on the airport and its development. The Lockheed Airport Services (LAS) division occupied a 70-acre area and built more than 25 structures over a 46-year

period (Davis and Novell 23).

The LAS facility was established in 1952 and lasted until 1998. It developed to serve as a major LAS division's domestic and international headquarters (Davis and Novell 23 and 26). By 1966, the facility reportedly consisted of 160,000 square feet of hangar space, 24,000 square feet of machine shop, and 12,000 square feet of storage space, and the division employed 2,700 people (Neward 37). LAS encompassed a large area and created a purpose-built campus. Its activities extended beyond routine maintenance to production of specialized devices and systems and modification of specialized aircraft (Davis and Novell 26). The facility reportedly hosted "scores of employees" (Watson 5). Newspapers from the mid-1950s display numerous LAS job advertisements, confirming its status as a major employer in the Ontario area (*San Bernardino Daily Sun*).

Northrop established a facility at the airport in 1950. Its main operations involved delivering F-89 Scorpion fighter planes (Neward 35). The company occupied the area that would eventually become the GE maintenance facility in approximately 1955. Douglas may also have utilized buildings in the area prior to GE's arrival (Davis and Novell 27). It is unclear if Northrop moved to another part of the Ontario airport or if its operations moved to an entirely new location when GE entered into its lease.

Workers at the GE maintenance facility performed tests on engines after they were overhauled and repaired before being sent back to customers. They also completed minor repairs. At its peak, the facility employed 700 people ("GE Aviation closing"). One source notes that by 1966, the facility occupied 53 acres (Neward 38). However, other sources list the facility as only 22 acres (Davis and Novell 27, citing Dames & Moore 1992). Twenty-two acres matches the current size of the facility. The 22 acres included "administrative offices, an executive office building, a cafeteria building, a shipping building, a machine shop, engine overhaul hangar, a parts repair and assembly hangar, final assembly hangar, warehouses, and other offices and ancillary buildings" by 1992 (Davis and Novell 27). The three hangars in the list are presumably Buildings 1, 2, and 3. GE Aviation also had a an engine test cell area at the Ontario airport, separate from the main 22 acres. It was located southeast of the main facility at Mission Boulevard and Cucamonga Creek. GE closed is Ontario facility in 2010, citing decreasing cargo traffic at the airport ("GE Aviation closing").

Otto Instrument Service (OIS) and Aerojet-General Corporation set up operations at the Ontario airport in 1950 and 1958, respectively. Both companies constructed purpose-built facilities at the airport. OIS maintains aircraft instruments for private aircraft, commercial aircraft, and the U.S. government. It has continued to grow into the 21st century and maintains headquarters in Ontario to the present day (OIS). Aerojet-General used its Ontario facility to service its corporate aircraft (Davis and Novell 31), not for its well-known rocket and missile operations. The company was headquartered in Rancho Cordova, California. It merged with Rocketdyne in 2013.

GE Aviation

GE Aviation traces its roots to WWI (GE Aviation). General Electric was already well-established as a manufacturer of compressors and steam turbines in 1917, when the federal government reached out to the company about the possibility of developing an airplane engine booster for its warplanes. GE accepted the assignment and worked in secrecy, ultimately developing the turbo supercharged Liberty V-12 aircraft engine. This first military contract put GE Aviation on a path to become one of the world's leading aerospace suppliers (Weber).

GE manufactured superchargers at its River Works factory in Lynn, Massachusetts for more than 20 years. During

WWII, the company supplied 300,000 turbo superchargers for use in fighter and bomber planes. Also during WWII at the Lynn facility, GE Aviation began work on America's first jet engine. Another top-secret military project, it proved successful in less than one year and was used in the launch of the XP-59, America's first jet, in 1942 (Weber; GE Aviation).

Jet engine research became a major part of GE Aviation's operations during and after WWII. By 1945, the Lynn supercharger manufacturing unit was disbanded and replaced with a gas turbine division. Large portions of the Lynn facility were converted for jet engine production and the nearby Everett facility began to focus on jet engine components. In 1948, the first jet engine rolled off the Lynn assembly line (Weber).

The customer base for GE Aviation's jet engines was largely the military. The dawn of the Cold War and the onset of the Korean War escalated demand (GE Aviation). To keep pace, GE opened a second manufacturing plant. Now known as the Evendale facility, the Lockland Plant near Cincinnati, Ohio opened in 1949. It is currently GE Aviation's world headquarters.

GE Aviation continued to develop new engine technology and improve upon past accomplishments. The company relied heavily on military contracts in the 1950s and early 1960s, but toward the end of the 1960s and early 1970s, began to move aggressively into the commercial space. Its commercial engines would become the popular choice for common passenger aircraft, such as the Airbus 300 and Boeing 747. GE Aviation also expanded internationally in the early 1970s, collaborating with a French manufacturer in the hugely successful joint venture, CFM International. GE Aviation continues to innovate in the realm of aerospace technology to the present day (Weber).

NRHP Evaluation

Criterion A

To be significant under Criterion A, a property must be associated with events that have made a significant contribution to the broad patterns of our history. The mere fact of association is not sufficient for a property to possess significance. Rather, the association itself must be direct and important. The former GE maintenance facility at the Ontario International Airport is associated with GE Aviation and commercial aviation in Ontario.

GE Aviation is a well-known, widely recognized pioneer in aviation history, responsible for numerous significant achievements, including: the first airplane engine "booster" known as the turbosupercharger; America's first jet engine; the first turbojet engines to power flights at two and three times the speed of sound; and the world's first high bypass turbofan engine to enter service (GE Aviation; Weber). The company is undoubtedly important within the context of commercial aviation nationwide. Its greatest accomplishments were in the fields of research and manufacturing. Facilities associated with these important achievements include its large research and manufacturing facilities, like the plants in Lynn, Massachusetts and Evendale, Ohio. These facilities hosted technological breakthroughs and massive manufacturing efforts.

The Ontario facility, by comparison, was a maintenance facility. It was not directly or importantly associated with any of GE Aviation's significant achievements. Instead, it provided routine maintenance service for the continued, safe operations of GE engines. As a utilitarian maintenance facility, the former GE complex at the Ontario airport does not appear to have been directly and importantly associated with the significant events in aviation history pioneered by GE Aviation.

The former GE maintenance facility was part of Ontario's commercial aviation industry. However, unlike LAS and OIS, which were headquartered in Ontario, the GE facility was a satellite operation. Of all of the commercial enterprises at the airport in the postwar period, LAS appears to have had the biggest impact on the airport and the surrounding area due to its size and the complexity of its operations. Research did not reveal any evidence that the GE facility had a major impact on the airport development or the surrounding communities. It initially developed by leasing and occupying existing buildings and adding additions and new buildings on what appears to have been an as-needed basis. The facility does not appear to have generated independent growth. As a result, the former GE maintenance facility appears to be an example of a commercial aviation property in Ontario, but not a significant one. The facility does not appear to be significant under Criterion A.

Criterion B

To be significant under Criterion B, a property must be associated with the lives of persons significant in our past. The former GE maintenance facility was associated with numerous GE employees. Research did not reveal a direct association with any specific, important individuals in local, state, or national history. The collective contributions of the many employees working in the facility over time is best understood and evaluated under NRHP Criterion A. Therefore, the facility does not appear significant under NRHP Criterion B for direct associations with important individuals.

Criterion C

Properties significant under Criterion C must embody the distinctive characteristics of a type, period, or method of construction, or represent the work of a master, or possess high artistic values, or represent a significant and distinguishable entity whose components may lack individual distinction.

The former GE maintenance facility lacks a cohesive, discernable site plan and design program. It is a hodgepodge grouping of buildings added and modified over a long period of time. Most of what might have been considered its distinctive characteristics, such as the original multi-leaved doors, original metal siding, and original metal windows, have been removed. It does not embody the distinctive characteristics of a type, period, or method of construction as a result.

Three of the buildings are Army surplus hangars. The rest are basic, altered buildings. Architects, if any, are unknown, and there is no discernable site plan. Thus, the facility does not represent the work of a master. It also does not possess high artistic values, as it is completely devoid of ornamentation.

Lastly, the facility does not represent a significant and distinguishable entity whose components lack individual distinction. While it can be identified as an entity through its perimeter fencing and history of use, it lacks historical and architectural significance, as described in detail above. In short, the former GE maintenance facility does not appear to be significant under Criterion C.

Criterion D

Criterion D generally applies to archaeological resources that have the potential to yield significant information for the study of history or pre-history. As a collection of altered, standardized hangars, prefabricated buildings, and construction as recent as 1994, the GE maintenance facility has no such information potential and is not significant under Criterion D.

Integrity

The former GE maintenance facility lacks integrity. Four of the nine buildings date from 1980 or later; the other five have all been substantially altered. Many of the additions to the five earlier buildings also date from 1980 or later. The facility's most interesting buildings are its World War II-era Army surplus hangars, but they have all been altered to the point of no longer retaining integrity. Additions, multi-leaf door removals, siding changes, window removals, and door replacements are all evident. Some of the alterations occurred during the period of significance considered herein, but many major ones, such as connecting Building 2 to Building 6, occurred after. In fact, even if the facility possessed significance under one of the other NRHP Significance Criteria, it would likely not retain sufficient integrity to convey such significance and would not be eligible for listing in the NRHP. Overall, the facility lacks setting, design, materials, workmanship, feeling, and association.

NRHP Evaluation Summary

In summary, the former GE maintenance facility is not significant under any of the established NRHP Criteria for Significance. Even if it were significant, the buildings and structures would not retain sufficient integrity to qualify for the NRHP. It does not appear to be eligible for listing in the NRHP.

CRHR Evaluation

The CRHR criteria for significance are nearly identical to the NRHP criteria. As such, the former GE maintenance facility does not appear to be eligible for the listing in the CRHR for the same reasons outlined above in the NRHP evaluation.

Ontario Historic District Evaluation

A neighborhood or area may be designated a Historic District in the City of Ontario if (Municipal Code Section 9-1.2615.B):

1. It meets the criteria for listing in the National Register of Historic Places; or
2. It meets the criteria for listing in the California Register of Historic Resources; or
3. It meets one or more of the following criteria:
    a. Is a geographically definable area possessing a concentration of Historical Resources or thematically related grouping of structures which contribute to each other and are unified by plan, style, or physical development; and embodies the distinctive characteristics of a type, period, region, or method of construction, or represents the work of a master or possesses high artistic values; or
    b. Reflects significant geographical patterns, including those associated with different eras of settlement and growth, particular transportation modes, or distinctive examples of a park landscape, site design, or community planning.
    c. Is associated with, or the contributing resources are unified by, events that have made a significant contribution to the broad patterns of local or regional history, or the cultural heritage of California or the United States;
    d. Is or the contributing resources are, associated with the lives of persons important to Ontario, California, or national history.

In addition to meeting one or more of the criteria above, Ontario Historic Districts must also possess integrity (Section

9-1.2615.E). Ontario recognizes the same seven aspects of integrity as the NRHP.

Most of the Ontario Historic District Criteria are nearly identical to the NRHP and CRHR criteria. Criteria 1 and 2 relate to meeting the NRHP or CRHR criteria, respectively. Per the NRHP and CRHR evaluation summaries above, the former GE maintenance facility is not eligible for either, so it does not meet local Criteria 1 and 2. Criterion 3 has four subparts (a through d). Criteria 3(a), 3(c), and 3(d) restate the NRHP and CRHR criteria. Thus, the Ontario ANG hangar is not eligible under local Criteria 3(a), 3(c), and 3(d).

Criteria 3(b) applies to properties that reflect significant geographical patterns, including those associated with different eras of settlement and growth, particular transportation modes, or distinctive examples of a park landscape, site design, or community planning. The GE maintenance facility does not meet this Criterion. It developed over several decades in an as-needed manner. Buildings and additions were built essentially wherever there was space. It does not reflect any clear development pattern as a result, nor does it reflect a distinctive example of park landscape, site design, or community planning.

In summary, the GE maintenance facility is not significant under any of the established Ontario Historic District Criteria. Even if it were significant, the buildings and structures would not retain sufficient integrity to qualify for the NRHP. It does not appear to be eligible for listing as an Ontario Historic District.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 1 is a standard plan Army surplus hangar from the WWII era. It was relocated to its current location in 1946. The steel-framed hangar has an arched roof and a mix of original and non-original metal siding. All of its original doors, including its multi-leaved sliding doors and door pockets, are gone. Non-original metal roll-up doors are located on its northwest-facing elevation. Some original metal windows are barely visible on its southeast-facing elevation, around numerous additions. Large, metal-clad additions are located on the southeast and northeast sides, nearly covering them completely. The largest addition is on the southeast elevation and dates to c. 1966. The other additions date from 1980 and later. For additional photos, see Continuation sheets attached to the District Record.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 3 is a standard plan Army surplus hangar from the WWII era. It was relocated to its current location by 1952. The steel-framed hangar has an arched roof and a mix of original and non-original metal siding. Its southeast elevation has been completely altered with new cladding and metal roll-up doors. Its northwest elevation remains intact and reflects not only its original design but likely the original design of Buildings 1 and 2, as well. It exhibits original metal siding, a multi-leaved door with ten leaves, door pockets, and metal multi-light windows. Building 6, to Building 3's northwest, nearly touches Building 3's intact northwest elevation due to the c. 1985 addition of office space. For additional photos, see Continuation sheets attached to the District Record.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 4 is a large storage hangar. The steel-framed hangar originally had a double-gabled roof and two main storage bays. A third gabled bay was added c. 1969 to the northwest. The building has corrugated metal siding. Original multi-leaf doors are present in all three bays on the southwest elevation and in the center bay on the northeast elevation. The center bay has the widest door opening of the three bays and the longest track accordingly. Metal pilot doors with glazed top panels are located at both ends of its multi-leaf doors. The building has no windows. Large exhaust fans line the roof gables. The building is surrounded by a chain-link and barb wire fence. For additional photos, see Continuation sheets attached to the District Record.

***P3a. Description:** (Describe resource and its major elements. Include design, materials, condition, alterations, size, setting, and boundaries)

Building 5 is a composite of multiple additions. It was originally a relatively small, wood framed, rectangular building with a gabled roof, wood-frame windows, and smooth stucco siding. Parts of the original building are visible on the northwest and southwest elevations. In place of the original southeast elevation is a high-bay addition c. 1969 made of concrete block with a shed-roofed loading dock. To the northeast is another high-bay, concrete block addition, also c. 1969. Building 5 is situated in very close proximity to Building 2 to the northeast and Building 6 to the northwest. For additional photos, see Continuation sheets attached to the District Record.

APPENDIX 5.5-1

Vehicle Fuel Energy Calculations

Table 1: On road Vehicles - Operational				
		Fuel Consumption (gal)		
Scenario	Annual VMT	Gasoline	Diesel	Total
Phase 1 (2025)	16,575,015	510,762	472,431	**983,194**
Phase 2 (2029)	18,309,495	416,958	633,980	**1,050,938**
Cumulative (2040)	18,419,725	419,468	637,797	**1,057,266**

Table 2: Fuel Consumption Summary		
Phase 1		
Fuel	Fuel Efficiency (MPG)	%Fleet
Gasoline	25.4	78.2%
Diesel	7.6	21.8%
Phase 2		
Fuel	Fuel Efficiency (MPG)	%Fleet
Gasoline	27.5	70.8%
Diesel	8.0	29.2%
Cumulative		
Fuel	Fuel Efficiency (MPG)	%Fleet
Gasoline	31.2	71.0%
Diesel	8.4	29.0%

Table 3: Operational VMT Breakdown								
	Daily VMT					Annual VMT	% Fleet	
Scenario	Employees, Guests, Deliveries	Trucks	Empty Trucks	Fuel Trucks	Total Daily	Total Annual	Gasoline	Diesel
Phase 1 (2025)	35,402	9,240	649	120	45,411	16,575,015	78%	22%
Phase 2 (2029)	35,540	13,690	933	-	50,163	18,309,495	71%	29%
Cumulative (2040)	35842	13690	933	-	50,465	18,419,725	71%	29%

SUBJECT: **Geotechnical Investigation**
RE: South Airport Cargo Center (SACC) at Ontario International Airport
Ontario, California

Dear Mr. Winters:

Cotton, Shires and Associates, Inc. (CSA) is pleased to present you with the following geotechnical investigation report for design of the new South Airport Cargo Center at Ontario International Airport in Ontario, California. Geotechnical consulting services for this project were provided in accordance with our proposal dated November 1, 2021 (revised December 27, 2021) and authorized under Purchase Order #3004262836 dated December 29, 2021.

In this report, we characterize the geotechnical conditions underlying the subject site and provide geotechnical conclusions and recommendations to aid the project team's design of the site improvements. We appreciate the opportunity to have been of service to you on this project. If you have any questions regarding this report, please feel free to contact us.

Sincerely,
COTTON, SHIRES AND ASSOCIATES, INC.

Gerardo Hernandez
Staff Geologist

GEOTECHNICAL INVESTIGATION
South Airport Cargo Center (SACC)
Ontario International Airport, Ontario, California

1.0 INTRODUCTION

Cotton, Shires and Associates, Inc. (CSA) is pleased to present this geotechnical investigation report for design of the new South Airport Cargo Center at Ontario International Airport in Ontario, California. Geotechnical consulting services for this project were provided in accordance with our proposal dated November 1, 2021 (revised December 27, 2021) and authorized under Purchase Order #3004262836 dated December 29, 2021.

1.1 Project Description

Our understanding of the proposed project and the general scope of geotechnical services are based on: SACC Subsurface Investigation Scope of Work (Rev 1) dated September 2021, prepared by CHA Consulting, Inc. (CHA); Drainage Plan dated September 9, 2021, prepared by CHA; Geotech Information Checklist dated August 2018, prepared by Walker Consultants; Preliminary Structural Concept plans prepared by HSA & Associates, Inc.; and correspondence with the project team from November 2021 through April 2022.

Based on our review of the referenced plans and correspondence with the project team, we understand that the proposed South Airport Cargo Center (SACC) will consist of: a new 204,320-square-foot, three-story cargo sort facility warehouse; a new 41,250-square-foot, three-story office building; and a new three- to four-level, at-grade vehicle parking garage connected to the office building via a pedestrian bridge over East Avion Street. Maximum column and wall foundation loads for the cargo sort facility will be about 970 kips (dead and live load) and 22 kips (dead and live load), respectively. Interior and exterior garage column foundation loads for the vehicle parking garage will be 450 kips and 22 kips, respectively; anticipated vehicle parking column loads will increase by up to 50 percent if the structure is designed for four levels.

A new airfield apron will be constructed on the east, west, and north sides of the cargo sort facility, truck parking will be located on the south side of the cargo sort facility, and an approximately 250-foot-wide x 500-foot-long x 16-foot-deep infiltration basin will be located at the southeast corner of the airfield apron. Other improvements will include up to 15-foot high perimeter retaining walls to accommodate grade changes adjacent to existing offsite

improvements, and associated utilities. We understand that airfield pavement will be designed in accordance with the U.S. Department of Transportation Federal Aviation Administration's Advisory Circular No. AC 150/5320-6G. Site grade will be increased by about 1 to 10 feet in elevation to achieve minimum drainage requirements, with the largest grade increase (i.e., addition of compacted fill) occurring at the southeastern portion of the proposed airfield apron proximal to the infiltration basin.

General project site limits are delineated on Figure 1 – Site Vicinity Map. The proposed site improvements are shown on Figure 2 – Site Exploration Map. Subsurface profiles through the proposed improvements are presented on Figure 3 – Engineering Geologic Cross Sections.

1.2 Purpose and Scope of Work

The purpose of our investigation was to explore and generally characterize the earth materials at the site and to develop preliminary geotechnical recommendations and design criteria for the proposed improvements. A summary of the work we performed is outlined below.

1.2.1 Research and Review of Available Data – We researched, reviewed, and compiled data from available historic aerial photographs and readily available published documents, including previous geotechnical investigations on and near the site in order to gain background information regarding previous site uses and geotechnical conditions.

1.2.2 Subsurface Exploration – Field exploration consisted of excavating eighty-six (86) exploratory hollow-stem auger borings to depths of about 6.0 to 51.5 feet below ground surface (bgs), including two (2) percolation test holes that were each excavated to a depth of 11.5 feet bgs, in the location shown on Figure 2. Summaries of field exploration procedures and boring and percolation test logs are presented in Appendix A – Field Exploration.

1.2.3 Geotechnical Laboratory Testing – Laboratory tests were performed on selected soil samples obtained from the borings. A summary of the laboratory testing program is presented in Appendix B – Laboratory Testing.

1.2.4 Geotechnical Evaluation and Reporting – Geotechnical evaluation of the subject site consisted of characterizing field and laboratory test data and developing conclusions and recommendations regarding geotechnical and seismic hazards, foundation type and design criteria. Based on data obtained from our subsurface exploration and geotechnical laboratory

testing programs, we have provided geotechnical opinions regarding site conditions and geotechnical hazards, and provided recommendations for the proposed improvements, including:

- Soil and groundwater conditions at the site;
- Site seismicity, including potential for liquefaction and seismic induced dry densification;
- Seismic design parameters based on the 2019 California Building Code/ASCE 7-16;
- Site preparation and grading and compaction requirements for fill placement below structures and within other proposed development areas;
- Evaluation of onsite materials for use as compacted fill;
- Import fill recommendations;
- Construction considerations including excavatability of the onsite materials;
- Surface drainage;
- Allowable bearing pressures for shallow foundations;
- Allowable adhesion (skin friction) for deep foundations;
- Resistance to sliding and passive pressure;
- Estimated total and differential settlements of foundations;
- Construction of slabs-on-grade;
- Utility trench backfill;
- General corrosion potential of soil encountered in foundation areas (limited soil chemistry testing for pH, resistivity, chloride and sulfate content);
- Active, passive, and seismic retaining wall lateral earth pressures;
- Airfield pavement geotechnical design parameters;
- Non-airfield heavy-duty traffic asphalt and concrete pavement areas; and
- Percolation test results and design infiltration rates.

2.0 SITE CONDITIONS

2.1 Surface Conditions

The project site is currently occupied by one- to two-story administrative/commercial buildings with surrounding hangers, airfield and landside pavement, other concrete and asphalt paved access roads and intermittent areas of exposed graded soil. The overall site appears to slope gently to the south and west with elevations within the areas of the proposed improvements ranging from about +894 feet on the south end of the site, near East Avion Street, to about +919 feet on the north end near the airport's southernmost taxiway.

2.2 Geologic Setting

The subject site is located in the San Bernardino Valley, which lies in the southern part of the Transverse Range geomorphic province of California. The Transverse Range geomorphic province is an east-west trending province that extends westward from the eastern margin of the San Bernardino Mountains to Point Arguello on the California coast and the Channel Islands off the coast in the Santa Barbara Channel. The San Bernardino Valley is bounded by the San Gabriel Mountains to the north and the Santa Ana Mountains to the south.

Surficial geology at the subject site consists of recent Holocene-age alluvial fan deposits (Qf), as shown on Figure 4 – Regional Geologic Map. Alluvial deposits were encountered below the surficial fill across the site to the depth explored during the subsurface exploration program.

2.3 Subsurface Exploration

We explored subsurface conditions at the site from January 18 through January 27, 2022, by means of eighty-six (86) exploratory hollow-stem auger borings excavated to depths of about 6.0 to 51.5 feet bgs, including two (2) percolation test holes that were each excavated to depths of 11.5 feet bgs. Drilling and percolation services were provided by Choice Drilling of Sylmar, California. Summaries of field exploration procedures and boring and percolation test logs are presented in Appendix A.

2.4 Laboratory Testing

We performed laboratory tests on disturbed and undisturbed soil samples obtained from the borings. Laboratory tests consisted of moisture content, wet and dry unit weight determinations, particle size analysis, #200 sieve wash analysis, direct shear strength, collapse potential, California Bearing Ratio (CBR), R-value, permeability, general corrosion (resistivity, pH, sulfates and chlorides), and maximum unit weight/optimum moisture content. The results of the laboratory tests are presented in Appendix B.

2.5 Subsurface Conditions

Subsurface conditions encountered during the field exploration program generally consisted of shallow artificial fill underlain by coarse-grained alluvium.

2.5.1 Artificial Fill – Artificial fill (Qaf) was generally encountered in the upper 0 to 4.5 feet of the borings and generally consisted of loose to dense silty sand, and medium stiff sandy silt.

Moisture contents of the artificial fill were generally close to or below optimum proctor moisture content.

2.5.2 Coarse-Grained Alluvium – Generally coarse-grained alluvium was encountered in the borings below the artificial fill to the maximum depth explored of about 51.5 feet bgs. The upper 30 feet of alluvium generally consists of loose to medium dense silty sand and sand with varying amounts of silt and gravel, and non-continuous layers of medium stiff sandy silt. Standard Penetration Test (SPT) blow counts in the upper alluvium generally ranged from about 7 to 30 blows per foot (bpf). Fines contents of the upper alluvium ranged from about 3.9 to 54 percent.

Generally, medium to very dense silty sand and sand with varying amounts of silt and gravel were encountered below a depth of about 30 feet. SPT blow counts in the deeper alluvium generally ranged from about 22 to 50+ blows per foot (bpf). Fines contents of the deeper alluvium ranged from about 29 to 56 percent.

2.6 Groundwater Conditions

Groundwater was not encountered in any of the borings performed for this study. Fluctuations in groundwater levels may occur from variations in rainfall, flooding and other factors, and groundwater levels may be different at different times and locations. However, groundwater is not anticipated to rise to a level that would adversely impact the proposed improvements over their expected design life.

3.0 SEISMICITY

The seismicity evaluation for the project consisted of the assessment of earthquake hazards such as seismic setting and nearby faults, CBC/ASCE 7-16 seismic design criteria and estimated strong ground motion, as summarized below.

3.1 Site-Specific Ground Motion Response Analysis

Based on our geotechnical investigation, the site location (latitude N 34.0506° and longitude W 117.6050°) and our interpretation of the 2019 CBC and ASCE 7 Hazards Report for ASCE/SEI 7-16 related to Earthquake Loads and using the online tool, a site-specific ground motion analysis is presented in Appendix C – Site-Specific Ground Motion Response Analysis.

4.0 SEISMIC GEOHAZARDS

In the following sections, we discuss potential seismic geohazards that may impact the subject site along with the corresponding degrees of estimated potential risk.

4.1 Ground Rupture Potential

The subject site is not located within a designated Alquist-Priolo Earthquake Hazard Zone (CGS, 1998). Active or potentially active faults are not known to exist on or trend toward the site. As such, the potential for primary ground surface rupture due to faulting is considered to be low.

4.2 Tsunami and Seiche Hazard

Based on the general site elevation (+894 to +919 feet) and distance to the Pacific Ocean, potential impacts from a tsunami appear to be very low. There are also no large landlocked bodies of water proximal to the subject site. Therefore, we conclude that the potential for earthquake-induced seiche effects to adversely impact the subject site is nil.

4.3 Liquefaction Potential and Seismic Related Settlement

4.3.1 Liquefaction Potential – Liquefaction occurs when saturated, loose to medium dense, sands and low-plasticity silts and clays are subjected to seismically-induced strong shaking. Liquefiable soils typically lose a portion or all of their shear strength and regain strength sometime after the shaking stops. Soil movements, both vertical and lateral, can occur as a result of liquefaction and ground shaking.

The site is not located within a Liquefaction Hazard Zone as mapped by the State of California (CGS, 2002) under the Seismic Hazards Mapping Act of 1990. Site-specific subsurface exploration and data research have shown that generally medium dense to very dense silty sands, sandy silts, and sands are present beneath the subject site, and static groundwater levels are not anticipated to rise within 50 feet of the ground surface. We therefore conclude that the potential for liquefaction to adversely impact the subject site is very low.

4.3.2 Seismic Settlement of "Dry" Sandy Soils – Dry seismic settlement at the site was estimated using procedures outlined in Pradel (1998a and 1998b), which is a simplified procedure based on Tokimatsu and Seed (1987). Due to the previously discussed upper loose to medium dense silty sands and sands present at the subject site, seismic settlement for "dry" sandy soils within the upper 40 feet of alluvium is estimated to be about 2 to 4 inches. Recommended

measures to mitigate the effects of dry seismic settlement (i.e., dynamic densification) on foundations are presented later in this report.

4.3.3 Lateral Movements and Spreading – The estimation of lateral movements resulting from seismic events is highly uncertain. However, based on empirical procedures presented by Bartlett and Youd (1995), deep groundwater, and relatively level site grade, the potential for large lateral movements caused by post-seismic residual shear strength reduction is considered to be nil.

5.0 CONCLUSIONS AND RECOMMENDATIONS

The conclusions and recommendations for site grading and foundation design, as presented below, are based on our subsurface exploration and supporting laboratory testing for the subject site performed from January through March 2022. Overexcavation and recompaction of artificial fill and upper alluvial soil materials, or ground improvement, are recommended to reduce the potential for settlement and to improve foundation and pavement bearing conditions. The recommendations presented below should be incorporated into the project plans and specifications and should be adhered to during construction. Prior to contract bidding, site grading and foundation plans should be reviewed by Cotton, Shires and Associates, Inc. for consistency with our recommendations.

Based on review of the HSA plans and communication with the project team, we understand that Rammed Aggregate Piers (RAP) are being considered to support the foundations of the cargo sort facility and possibly the parking structure. Consequently, we have included recommendations for the RAP design-build contractor to consider.

5.1 Site Development and Grading

5.1.1 Site Preparation – Prior to commencing grading operations, soil materials containing debris, organics, pavement, or other unsuitable materials should be stripped from the building areas. Demolition of on-grade improvements should include removal of old foundations, pavements, slabs, abandoned utilities, and soils disturbed during the demolition process. Depressions or disturbed areas left from the removal of such material should be replaced with compacted, engineered fill.

In areas that are proposed for shallow bearing such as pavements, sidewalks, retaining walls and other improvements that could be adversely impacted by differential settlement, we

recommend further removal of the existing artificial fill material and replacement with compacted, engineered fill as described in Sections 5.1.9 through 5.1.12 below.

5.1.2 Excavation Considerations – The artificial fill and alluvium encountered during field exploration were drilled with light to moderate effort. We anticipate that excavation of earth materials at the site can be performed using conventional earth excavation equipment.

5.1.3 Temporary Excavation Considerations – Sloped excavations may be used as temporary access in areas with enough room to accommodate the slopes. Temporary slopes should be monitored continuously by the contractor. Loose or unstable soil should be removed immediately. Temporary slopes and excavations should conform to Federal Occupational Safety and Health Administration (OSHA) and/or California Division of Occupational Safety and Health (DOSH) regulations and other applicable local ordinances and building codes, as required. However, the contractor should be made responsible for all safety issues regarding open excavations. The contractor should consider an OSHA soil Type C designation for the near-surface material in designing shoring.

5.1.4 Soil Expansiveness – The artificial fill and alluvial subsurface materials encountered during exploration across the site were primarily coarse-grained with varying amounts of silt and little to no clay. As such, the expansion potential of the onsite soils is considered very low.

5.1.5 Cut/Fill Slope Design – Any new permanent cut slopes should not exceed an inclination of 2:1 (H:V). During the dry season, temporary cut slopes of 1.5:1 (H:V) should generally be satisfactory for construction purposes, provided that they are inspected and approved by our field representative at the time of construction and monitored daily during construction. Excavation methods, shoring, bracing and safety of excavations are the responsibility of the contractor. All excavations should comply with applicable local, State and Federal safety regulations.

All permanent fill slopes constructed with onsite excavated earth materials should have a maximum inclination of 2:1 (H:V).

5.1.6 Airfield Apron Area Over-Excavation – Over-excavation and recompaction of artificial fill and upper alluvial materials in the apron area are recommended in some areas to reduce the potential for settlement and to provide uniform bearing conditions. Over-excavation recommendations presented below are based on the boring data obtained from our geotechnical exploration and laboratory testing.

Based on plans provided by CHA, we understand that site grade will be increased by about 1 to 10 feet in elevation to achieve minimum drainage requirements, with the largest grade increase (i.e., addition of compacted fill) occurring at the southeastern portion of the proposed airfield apron proximal to the infiltration basin. In areas where the finished subgrade elevation is less than 2 feet above existing grade, the artificial fill and upper alluvial materials within the apron areas should be over-excavated, as needed, to achieve at least 2 feet of compacted fill beneath finish subgrade elevation. For example, if finish subgrade elevation is 1 foot above existing grade, then the artificial fill and upper alluvial materials should be over-excavated at least 1 foot prior to the placement of compacted fill.

Depressions or disturbed areas left from the removal of such material should be replaced with compacted fill. Following observation of the over-excavation bottom by CSA, the exposed surface should be scarified 8 inches, moisture-conditioned to within 2 percent of optimum moisture content and compacted to at least 90 percent of the maximum dry unit weight, determined using test method ASTM D1557 (current version).

5.1.7 Truck Area and Retaining Wall Shallow Foundation Over-excavation – Artificial fill and upper alluvial materials within the truck area south of the cargo facility and site retaining walls with shallow foundations should be over-excavated to a depth of at least 2 feet below existing grade, 1 foot below proposed finish subgrade elevation, or at least 1 foot below foundation bottom, whichever is deeper. Depressions or disturbed areas left from the removal of such material should be replaced with compacted engineered fill. Following observation of the over-excavation bottom by CSA, the exposed surface should be scarified 8 inches, moisture-conditioned to within 2 percent of optimum moisture content and compacted to at least 90 percent of the maximum dry unit weight, determined using test method ASTM D1557 (current version).

5.1.8 Special Subgrade Stabilization Measures – Yielding or pumping subgrades may develop depending on material type, moisture content, and applied equipment. Unsuitable subgrade conditions can range in severity and often require a trial-and-error procedure to determine the appropriate remedial method. Special stabilization measures may be required to provide a firm and unyielding subgrade surface if loose or pumping subgrade is encountered or created during grading activities. Special subgrade stabilization measures that have been successfully used on other projects consist of:

- Placing a 1- to 2-foot-thick layer of 3- to 4-inch rock on the excavation bottom;

- Placing a 1-foot thick layer of ½-inch to ¾-inch clean crushed drain rock sandwiched by two layers of filter fabric;
- Use of a geosynthetic placed beneath a minimum 1-foot lift of gravel or rock or gravel fill; and/or
- Mixing cement into the subgrade.

Whether these measures are required will depend on the condition of the subgrade at the time of construction, the density and moisture content of the subgrade materials, and the nature of the construction activities (e.g., earthmoving equipment type and loading, number of equipment passes, etc.).

An alternative to use of rock or gravel for excavation bottom stabilization is the treatment of subgrade materials with cement to effect "bridging" over yielding, unstable excavation bottoms. Cement should be thoroughly mixed into the upper 12 inches of the excavation bottom in accordance with Sections 301-3.1 through 301-3.1.6 of the "Greenbook." A "mellowing" period of 16 to 48 hours is required before compacting. After "mellowing," the soil-cement mixture should be moisture-conditioned and compacted according to Section 301-3.1.8. The compacted soil-cement mixture should be cured according to Section 301-3.1.9. At least 2 days of curing time should be allowed, prior to placement of general, select, or treated fill materials.

5.1.9 Compacted Fill in Apron Areas – Following compaction of the scarified excavation bottoms, apron area excavations may be backfilled with engineered, compacted onsite excavated materials or imported granular select fill materials. We recommend that, unless otherwise noted, fill materials placed within 2 feet of finished subgrade elevation should be moisture-conditioned to within 2 percent of optimum moisture content and compacted to at least 90 to 95 percent of the maximum dry unit weight, depending on the design California Bearing Ratio. Refer to Section 5.7 below for California Bearing Ratio recommendations. Compacted fill extending deeper than 2 feet below finished subgrade should be compacted to at least 90 percent of the maximum dry unit weight, determined using test method ASTM D1557 (current version).

Fill materials should be placed and compacted at a moisture content within 2 percent of optimum moisture. Each layer should be spread evenly and should be thoroughly blade-mixed during the spreading to provide relative uniformity of material within each layer. Soft or yielding materials should be removed and be replaced with properly compacted fill material, prior to placing the next layer.

When the moisture content of the fill material is below optimum moisture content, water should be added to the fill. While water is being added, the soil should be bladed and mixed to provide relatively uniform moisture content throughout the material. When the moisture content of the fill material is excessive, excavated materials should be spread and disced or scarified to aerate. Compacted fill materials should be spread in lifts no thicker than approximately 8 inches prior to being compacted. Fill and backfill materials may need to be placed in thinner lifts to achieve the recommended compaction with the equipment being used.

Rocks, gravel and other oversized material, greater than 4 inches in diameter, should be removed from the fill material being placed. Rocks less than 4 inches in diameter should not be nested and voids caused by inclusion of rock in the fill should be filled with sand or other approved material.

5.1.10 General Fill – General fill should be free of organics, oversize material (e.g., greater than 4 inches in diameter), trash and debris, and other deleterious material. General fill materials should have an expansion index no greater than 30, a plasticity index no greater than 15, and a percentage finer than the No. 200 sieve (fines content) of no more than 35 percent.

5.1.11 Import Fill – Import fill, if required for the project, should be well-graded granular materials with the following characteristics:

- Non-expansive (EI ≤ 20);
- Friction angle ≥ 30 degrees;
- Maximum particle size < 2 inches;
- Percentage passing the No. 4 sieve between 60 and 100;
- Percentage passing the No. 200 sieve between 10 and 30; and
- Plasticity Index < 10.

5.1.12 Recycled Onsite Fill Materials – We understand that existing concrete and asphalt demolished at the site may be pulverized and re-used as general compacted fill. These recycled materials should be prepared and placed separately from the other onsite sandy fill and alluvial materials that will be used as compacted fill. The recycled materials used as general compacted fill (i.e., not a part of pavement sections) should meet all grading and compaction requirements in accordance with Section 30 of Caltrans Standard Specifications, or Section 200-2 of the Standard Specifications for Public Works Construction ("Greenbook", 2021), as applicable.

5.1.13 Site Drainage – Positive drainage should be developed and maintained away from overexcavated and foundation areas. Water should not be allowed to pond near foundations or on-grade improvements. All roof drainage should be conveyed away from the structures via surface drainage device (non-erosive, hardscape, ribbon gutter, etc.) or via a subsurface area drain system, to an acceptable location. Surface drainage should be directed away from the structures at a minimum 5 percent gradient for at least 10 feet beyond the building footprint for exposed soil conditions, and 2 percent gradient for paved surfaces. If obstructions or lot lines prohibit the 10-foot horizontal distance, the ground surface should be sloped as recommended above to an alternative method of diverting water away from foundations.

Landscaped areas adjacent to the structures should be avoided or should be planted in watertight planter boxes that effectively separate irrigated areas from foundation soils to reduce fluctuations in moisture content. A system of catch basins/area drains in low areas should be implemented and collected drainage should be directed away from the structures to the nearest street, driveway, or drainage structure.

5.2 Foundation Design Considerations

The principal factors affecting foundation type selection include acceptable magnitudes of differential settlement from static loading, and the potential for dry seismic settlement (i.e., dynamic densification) of the upper 25 to 30 feet of loose to medium dense alluvial deposits. The new structures may be supported on deep or shallow (i.e., spread) foundations. The advantages of deep foundations include: 1) deep foundations extending below the zone of dynamic densification should not be susceptible to minor differential settlement; and 2) under static loading, deep foundations should tend to settle less than shallow foundations. If these advantages of a deep foundation are not deemed significant enough to the project team to justify potential cost increases associated with deep foundations, then the proposed structures could be supported on shallow foundations bearing on soil improved by rammed aggregate piers. Recommendations for deep foundations, and shallow foundations with soil improvement, are presented in the following sections of this report.

5.2.1 Cast-in-Drilled Hole (CIDH) Piles – Based on the Walker Consultants Geotech Information Checklist (2018), we understand that the vehicle parking garage may be supported by a reinforced concrete cast-in-drilled-hole (CIDH) pile and grade beam foundation system, and we concur that CIDH piles are a logical foundation type for this structure. CIDH piles should derive vertical support from adhesion (skin friction) below the artificial fill and upper alluvium, in dense

undisturbed alluvial material as determined in the field by the project geotechnical engineer at the time of construction. Note that these pressures have not been factored for a Factor of Safety or Resistance Factor. Piles should be sized according to the following criteria:

Vertical Capacity - minimum three (3) pile diameter spacing
Minimum pile diameter…….24 inches
Minimum pile penetration……Elevation 850
(At least 10 feet into dense sand layer)

Allowable adhesion (skin friction), for dead plus live loads:
0 to up to 4.5 feet fill material…….0 psf
0 to 5 feet into alluvial material…….0 psf
Below 5 feet into alluvial material……500 psf

Lateral Passive Resistance - piles [equivalent fluid pressure applied over an effective width of two (2) pile diameters]
0 to up to 4.5 feet fill material…….0 pcf
0 to 5 feet into alluvial material……..……0 pcf
Below 5 feet into alluvial material…….……...400 pcf

The above adhesion value (skin friction) can be increased by 1/3 for seismic loading and should be decreased by 1/3 for uplift. The upper portion of the piles should be formed to create vertical surfaces, and "mushrooming" of pile tops and over-pours around grade beams should be prevented. Drilled pile holes should be machine cleaned of all loose material prior to the placement of steel and concrete. Piles should be steel-reinforced with a cage including a minimum of 4, No. 5 bars vertical (with greater reinforcement as required by the project Structural Engineer).

Due to the presence of sandy and gravelly soil material, many or all pile holes will likely require temporary casing to prevent caving and to keep the holes open. If water is present in the pile holes (which we do not anticipate) prior to placing concrete, the water should be pumped out until the pile holes are dry, or the concrete should be poured by the tremie method to displace the water. All piles should be connected at their tops by continuous grade beams. The grade beams should be embedded at least 9 inches below pad grade.

If CIDH piles become the preferred foundation alternative for the parking garage, then CSA should perform L-Pile analysis on the CIDH piles to evaluate top deflections based on parameters provided by the Project Structural Engineer.

5.2.2 Shallow Foundations Bearing on Rammed Aggregate Piers

Rammed Aggregate Piers (RAP). If a shallow foundation system is selected, then the soil below the shallow foundations may be improved with a rammed aggregate pier (RAP) system. RAP systems provide increased bearing capacity, reduce dynamic densification and differential settlement potential, and enhance settlement control by delivering composite stiffened bearing materials to reduce the matrix soil compressibility. The construction process typically consists of utilizing pre-augered or displacement methods. The augered or displaced cavities are backfilled with aggregate that is compacted in place using a high frequency, low amplitude, vibratory hammer. The impact hammer densifies aggregate vertically while the tamper foot forces aggregate laterally into cavity sidewalls resulting in stiff RAP elements and a stiffened matrix/soil. Constructed diameters typically range from 18 to 30 inches depending on the method of installation.

RAP systems may be used as foundation support for the new structures if the systems extend a sufficient depth below the upper loose to medium dense sand layers. RAP design and construction is typically performed by a specialty ground improvement contractor who should be consulted to provide further analysis and recommendations. The specialty contractor shall make their own interpretation of strength parameters and soil characteristics from the boring logs and laboratory testing presented in Appendix A and B of this report. The specialty contractor should determine the diameter and depths of the RAP system based on the subsurface conditions in conjunction with the differential static and seismic settlement tolerances provided by the Project Structural Engineer. The RAP design should be reviewed by CSA prior to submittal to the permitting agencies.

Shallow Foundations. If RAP foundation systems are considered for the project, the proposed structures may be supported on shallow foundations. Shallow foundations bearing on a RAP system should be at least 24 inches wide (or wider as determined by the Project Structural Engineer) and founded at least 24 inches below the lowest adjacent final grade. Typically, shallow foundations bearing on a RAP-improved pad may be designed for an allowable bearing capacity of up to 6,000 pounds per square foot (psf) for dead-plus-live loads, including wind or seismic forces; however, the design/build RAP contractor should provide the recommended allowable bearing capacity for the structure. Resistance to lateral loads may be computed using a concrete/soil base friction coefficient of 0.35 and 400 pcf equivalent fluid passive resistance

beginning below an embedment depth of 1 foot, but these values should be verified or amended by the design/build RAP contractor, as appropriate.

Estimated Settlement. Based on input from HSA, we understand that foundation design should accommodate a differential settlement of about 1/2 inch between adjacent columns (at 50-foot spacing) or over a 50-foot length of wall (distortion ratio of 1/1200) for static settlement, and a differential settlement of about 1/2 inch over 35 feet (distortion ratio of 1/420) for seismically induced settlement (e.g., dry seismic settlement).

5.3 Interior Slab-on-Grade Design

The interior slab-on-grade should be designed by the Project Structural Engineer to support the anticipated floor loads. To evaluate the pressure distribution beneath a slab-on-grade floor or rigid mat, we recommend using a Modulus of Subgrade Reaction equal to 150 pounds-per cubic-inch (pci), which is considered a long term load for compacted, coarse-grained subgrade.

As heavy equipment (i.e., fire engines) is likely planned in selected interior slab areas, we recommend that the slab have a minimum thickness of 8 inches and minimum strength of 4,000 psi. Crack control joints should be spaced at a maximum spacing of 12 feet in both directions. Although the Project Structural Engineer should design the slab reinforcement, interior slab-on-grade floors supporting heavy equipment should be reinforced with a minimum of No. 3 steel reinforcing bars at 16 inches on centers both ways. In moisture sensitive areas, the slab may be underlain by a minimum 15 mil vapor barrier. In accordance with ACI recommendations, no sand or gravel should be placed over the vapor barrier prior to the placement of concrete.

5.4 Retaining Wall Design

The following sections provides our recommendations for site retaining walls up to 15 feet in height.

5.4.1 Pile Supported Retaining Walls – If site constraints, compressible near-surface fill and alluvium, and/or wall heights preclude the use of shallow foundations, then pile foundations should be designed according to the Cast-in-Drilled Hole (CIDH) Piles section above. Retaining walls that are free to rotate should be designed to resist an active lateral fluid pressure of 35 pounds per cubic foot (pcf) for horizontal backfill. The above active lateral fluid pressures should be increased by 50% for walls that are restrained from rotation (building walls). The lateral loads on

the retaining wall can be resisted by passive pressure against the side of the piles using the lateral passive resistance provided in Cast-in-Drilled Hole (CIDH) Piles section above.

Retaining walls retaining over 6 feet of earth material should be designed to also resist a seismic load (in addition to the active load), equal to an equivalent fluid pressure of $17H^2$ pcf (where H is the height of the retaining wall).

If retaining walls are planned adjacent to ground level parking or used to support the driveway entrance, a uniform lateral traffic surcharge load of 100 psf should be included and applied against the top 10 feet of the retaining walls.

5.4.2 Shallow Foundation Supported Retaining Walls – If site constraints and/or wall heights permit the use of shallow foundations, then shallow foundations bearing on compacted, engineered fill that is bearing directly on scarified and compacted alluvium per Section 5.1 should be at least 18 inches wide (or wider as determined by the Project Structural Engineer) and founded at least 18 inches below the lowest adjacent final grade. Shallow retaining wall foundations may be designed for an allowable bearing capacity of 2,000 pounds per square foot (psf). Resistance to lateral loads should be computed using a concrete/soil base friction coefficient of 0.35 and 400 pcf equivalent fluid passive resistance beginning below an embedment depth of 1 foot.

Site retaining walls free to rotate should be designed to resist an active lateral fluid pressure of 35 pounds per cubic foot (pcf). The above active lateral fluid pressures should be increased by 50% for walls that are restrained from rotation (building walls). The foundation resistance to lateral loads on the retaining wall should be computed using the lateral passive resistance provided in the Shallow Foundations section above. If additional lateral resistance is required, and as an alternative to excavating a deep, continuous foundation key, shallow piles can be used to support the wall, using the same passive resistance criteria acting over two pile diameters.

Retaining walls retaining over 6 feet of earth material, should be designed to also resist a seismic load (in addition to the active load), equal to an equivalent fluid pressure of $17H^2$ pcf (where H is the height of the retaining wall).

If retaining walls are planned adjacent to ground level parking or used to support the driveway entrance, a uniform lateral traffic surcharge load of 100 psf should be included and applied against the top 10 feet of the retaining walls.

Lower terraced walls should be designed to resist the combined heights of all walls that are bearing within an imaginary 1(H):1(V) line extended up from their base.

5.4.3 Backdrains – Backdrains should be constructed behind all retaining walls regardless of the foundation type. The backdrain should be a minimum 12-inch-wide continuous blanket of either Caltrans Class 2 Permeable Material or 3/4-inch x 1/2-inch clean crush drainrock enclosed in Mirafi 140N (or approved equivalent) filter fabric, and extended to within 1 to 1-½ feet of the ground surface where an impervious fill and/or asphaltic concrete cap should be placed. A minimum 4-inch-diameter PVC Schedule 40 perforated drain pipe should be placed near the bottom of the drainrock (perforations down), surrounded by a minimum of 4 inches of drainrock with at least 2 inches of drainrock underlying the pipe. All backdrain pipes should be sloped to drain at a minimum of 1/2 percent and collected in 4-inch diameter non-perforated Schedule 40 PVC pipes that are sloped a minimum of 2 percent and discharged into the site or airport storm drainage system. The exterior retaining wall backdrains should also discharge to a suitable location away from structures, into the storm drain system, or onto an impermeable surface.

Waterproofing of retaining walls will depend on the type of wall constructed and should be designed by a Waterproofing Specialist to meet the project needs of the owner.

5.5 Utility Trenches, Pipe Bedding, and Trench Backfill

Utilities at the site are likely to include water, sewer, gas, electrical and communication. Utility trenches greater than 5 feet deep should be braced and shored in accordance with good construction practices and all applicable safety ordinances, including OSHA requirements. Pipe bedding for utilities should consist of sand having a minimum sand equivalent of 30. The sand should be placed in a zone that extends from a minimum of 6 inches below to 12 inches above the pipe for the full trench width. Bedding materials should be compacted to a minimum of 90 percent relative compaction.

The trench width should be sufficient to allow compaction equipment to operate between the pipe springline and trench wall. Jetting of trench backfill materials should not be permitted. Trench backfill materials and their placement above the pipe bedding should be in accordance with the local governing authority. At a minimum, trench backfill should be compacted to the standard of surrounding soils (e.g., 90 percent relative compaction for general fill, 95 percent relative compaction for pavement subgrade fill, etc.).

5.6 General Corrosivity Considerations

Bulk samples of the near-surface soils obtained from Borings B-38 and B-61 were tested for resistivity, pH, sulfates, and chlorides. The results are presented in the following Table 1.

Table 1. Summary of Corrosivity Test Results

Boring/Sample Depth	Soil Description	Resistivity (ohm)	pH	Sulfates (%)	Chlorides (%)
B-38 @ 1-5 feet	SM	14,000	7.36	0.001	0.00245
B-38 @ 0-8 feet	SM	30,000	7.46	0.001	0.00275

The resistivity values presented above suggest that onsite soil materials are mildly corrosive to underground steel. Tests results for chlorides indicate that onsite soils may be classified as C0 per ACI 318 Table 19.3.1.1. Tests results for sulfates indicate that onsite soils may be classified as S0 per ACI 318 Table 19.3.1.1. On the basis of sulfate concentration, we recommend that Type II cement be used for concrete in contact with earth materials, in accordance with CBC Chapter 19A (2019).

CSA does not practice in the field of corrosion engineering and the test results presented herein are preliminary. Test results should be evaluated by a corrosion engineer to assess how concrete structures and underground utilities should be protected from anticipated subsurface materials.

5.7 Airfield (Apron) Pavement Design

We understand that airfield (apron) pavement will be designed in accordance with the U.S. Department of Transportation Federal Aviation Administration's (FAA) Advisory Circular Nos. AC 150/5320-6G and 150/5370-10H.

5.7.1 California Bearing Ratio – Bulk samples of the near-surface soils obtained from Borings B-15, B-57, and B-85 were tested for California Bearing Ratio (CBR). The results are presented in the following Table 2.

Table 2. Summary of California Bearing Ratio Test Results

Boring/Sample Depth	Soil Description	CBR for 90% RC	CBR for 95% RC
B-15 @ 1-5 feet	SM	31.8	112.6
B-57 @ 1-6 feet	SM	26.6	66.3
B-85 @ 1-5 feet	SM	16.3	65.1

Based on the laboratory testing results presented above, we recommend that a design CBR of 20 be implemented for the upper 2 feet of apron subgrade materials that are compacted to 90 percent of the maximum dry unit weight, determined using test method ASTM D1557 (current version). If the upper 2 feet of apron subgrade materials are compacted to 95 percent of the maximum dry unit weight, then the CBR may be increased to 30.

5.7.2 Apron Modulus of Subgrade Reaction (k-value) – AC 150/5320-6G permits the modulus of subgrade reaction, k-value, to be determined based on the following equation:

$$\text{k-value} = 28.6926 \times \text{CBR}^{0.7788} \text{ (FAA, 2021, page 3-34)}$$

Based on the above equation, a k-value of 295 pounds per cubic inch (pci) may be used for a design CBR of 20, and a k-value of 405 pci may be used for a design CBR of 30.

5.7.3 Apron Elastic Subgrade Modulus (E value) – AC 150/5320-6G permits the elastic subgrade modulus, E value, to be evaluated in a number of ways. One such method is to determine E value based on the CBR as follows:

$$\text{E value} = 1500 \times \text{CBR (FAA, 2021, page 3-34)}$$

Based on the above equation, an E value of 30,000 pounds per square inch (psi) may be used for a design CBR of 20, and an E value of 45,000 psi may be used for a design CBR of 30.

5.7.4 Recycled Aggregate Base for Apron – We understand that existing concrete and asphalt demolished at the site may be pulverized and re-used as aggregate base in the proposed apron section. The recycled asphalt aggregate base should meet all grading and compaction requirements in accordance with AC 150/5320-6G, 150/5370-10H, Section 30 of Caltrans Standard Specifications, or Section 200-2 of the Standard Specifications for Public Works Construction ("Greenbook", 2021), as applicable.

5.8 Truck Area and Other Light Traffic Pavement Design

Either flexible pavement such as asphaltic concrete or rigid pavement such as reinforced concrete, or both, will be used in the truck area and other parking areas and driveways within the improvement areas. Flexible pavement sections consisting of asphaltic concrete and aggregate base were evaluated using the methods recommended by Caltrans Highway Design Manual Section 630 (2020a). Rigid pavement consisting of concrete and aggregate base was evaluated according to Caltrans Highway Design Manual Section 620 (2020b).

The results of the laboratory testing indicate that the near surface soils have an R-value of 73 based on a representative sample of onsite sandy materials collected from Boring B-41. A Traffic Index (TI) range of 7 to 9 was used for design; if design TI values are different from the assumed values, CSA should be notified so that we can reevaluate the recommended pavement section thickness.

5.8.1 Flexible Pavement – Recommended minimum flexible pavement sections, comprising asphaltic concrete over aggregate base, for the assumed TI range and design R-value of 50 (for conservatism), are presented in the following Table 3.

Table 3. Summary of Minimum Flexible Pavement Sections

Traffic Index	Asphalt Thickness (in)	Aggregate Base Thickness (in)
7	4.0	4.5
8	5.0	5.0
9	5.5	6.5

5.8.2 Rigid Pavement – Recommended minimum rigid pavement sections, comprising concrete over aggregate base, for the assumed TI range and Type II subgrade soil, are presented in the following Table 4.

Table 4. Summary of Minimum Rigid Pavement Sections

Traffic Index (TI)	Concrete Thickness (in)	Aggregate Base Thickness (in)
7	6.5	8.0
8	7.0	8.0
9	7.0	12.0

Concrete should have a minimum 28-day compressive strength of 3,500 pounds per square inch (psi). Reinforcement, if required by the design engineer, should not be less than structural requirements for shrinkage and temperature. Crack control joints should be placed every 12 to 15 feet in each direction. The modulus of rupture for the pavement sections listed in Table 4, assuming normalweight concrete per ACI 318 Table 19.2.4.2 (i.e., $\lambda = 1.0$), may be estimated at 450 psi. As an alternative, if a modulus of rupture of 530 psi is used, then an 8-inch-thick concrete truck apron underlain by 6 inches of aggregate base may be used.

Aggregate base materials placed beneath flexible and rigid pavement should meet the requirements for Processed Miscellaneous Base presented in Section 200 of the Standard Specifications for Public Works Construction ("Greenbook", 2021), and be placed on a subgrade prepared according to the recommendations in Section 5.1.

5.8.3 Pavement Construction Considerations

Subgrade. After removal of the existing fill, the upper 1 foot of pavement subgrade should be compacted to a minimum of 95 percent of maximum dry unit weight as determined using test method ASTM D1557 (current version).

Aggregate Base. Aggregate base material should be compacted in lifts not exceeding 6 to 8 inches in thickness and to at least 95 percent of maximum dry unit weight as determined using test method ASTM D1557 (current version). As-compacted moisture contents for aggregate base materials should be within 2 percent of the optimum moisture, as determined using test method ASTM D1557 (current version).

Drainage. Proper drainage of the paved and surrounding unpaved areas is essential. Grades should be established to expedite runoff away from pavements and reduce moisture infiltration into the base and subgrade.

5.9 Infiltration Basin Design

In accordance with the CHA's request, we conducted soil percolation testing at the subject site as part of the field exploration program. The purpose of our investigation was to calculate an estimated infiltration rate to be utilized in the design of an infiltration basin that will be constructed in the southeastern portion of the airfield apron. Percolation testing was conducted in 8-inch diameter Borings B-9 and B-13. The maximum BMP depth is estimated to be about 9 and 16 feet from existing and finished grade, respectively (CHA, 2021b). We recommend that the civil

designer apply the appropriate modifiers, reductions, and factors of safety based on the reviewing jurisdiction's requirements. The percolation test hole location is shown on Figure 2. Percolation test method and procedure and logs are presented in Appendix A.

5.9.1 Soil and Groundwater Conditions – Percolation test zone materials ranged in depth from 0 to 10 feet below existing grade and generally consist of loose to medium dense silty sand and sand with varying amounts of silt. Groundwater was not encountered within the percolation test holes. Furthermore, groundwater is not anticipated to adversely impact performance of the infiltration basin during the design life of the BMP.

5.9.2 Field Percolation Rate – Measured percolation rates (inch/hour) from the field testing are presented in the following Table 5.

Table 5. Summary of Field Measured Percolation Rates

Boring / Percolation No.	Location	Percolation Test Zone Depth (ft)	Field Percolation Rates (in/hr.)*
B-9	Southeast area of subject site (see Figure 2)	0 to 10	Reading 1: 3,660 Reading 2: 3,540 Reading 3: 3,480 Reading 4: 2,880 **Average: 3,390**
B-13	Southeast area of subject site (see Figure 2)	0 to 10	Reading 1: 3,960 Reading 2: 3,480 Reading 3: 3,240 Reading 4: 3,420 **Average: 3,525**

*For all readings, the 10-foot deep test holes completely drained in less than two minutes. The field percolation rate was then converted to an estimated drop over a 1-hour period.

Hydraulic conductivities (cm/sec) measured during laboratory falling head testing are presented in the following Table 6.

Table 6. Summary of Hydraulic Conductivity Test Results

Boring / Percolation No.	Depth Below Existing Grade (ft)	Effective Confined Pressure (psi)	Saturated Hydraulic Conductivity (cm/sec.)
B-9	6.0	3.2	1.1×10^{-4}
B-9	8.0	4.1	2.2×10^{-4}
B-13	3.0	3.0	2.5×10^{-4}
B-13	6.0	3.0	6.3×10^{-5}

5.9.3 Design Infiltration Rate – Based on the field and laboratory testing results presented above, we recommend a design infiltration rate of 10 in/hr for the proposed basin. The design infiltration rate is consistent with the soil types encountered within the basin limits.

5.9.4 Geotechnical Considerations – Infiltration will result in wetting of the generally loose to medium dense sandy alluvial soil materials. Water infiltration can cause or exacerbate geotechnical issues, including collapse potential, expansive soil movement, and increased liquefaction hazard. Consolidation testing performed on near surface sandy soils similar to those encountered within the percolation test holes generally showed less than 1/2 percent collapse upon inundation with water, and at a higher overburden stress than should be experienced by the basin soils. The collapse potential of the basin soils is therefore considered to be low.

Saturation of the subsurface soils above the existing groundwater table may occur due to stormwater infiltration. However, due to the primarily loose to medium dense nature and high percolation rates of the sandy alluvial soils adjacent to and below the basin, the potential for localized liquefaction to occur above the groundwater table is low. Please refer to Section 4.3 for a further discussion regarding liquefaction potential at the project site.

5.9.5 Geotechnical Conclusions – Based on the tested percolation rates and deep groundwater, it is our opinion that infiltration onsite should be considered feasible. However, the feasibility of infiltration onsite should be evaluated by the Project Civil Engineer. The field test results are not considered to be design rates; they are specific to the test hole location. Percolation rates may vary in other locations within the infiltration basin footprint.

In our opinion, the subsurface conditions encountered within the current infiltration area should not differ significantly from the conditions encountered in the percolation test holes. However, if the Project Civil Engineer determines that a percolation test should be performed within the current infiltration area, then we will prepare a proposal to conduct additional percolation testing as required.

Long-term sustainable infiltration rates may be affected by several factors, including the degree of saturation of the adjacent ground and the infiltration of potentially finer grained soils into the system. To account for these factors, an appropriate factor of safety should be considered in the application of these rates. The development of the factor of safety should be based upon the more conservative rate obtained and include consideration of the impacts of deteriorated performance, life/health safety issues and should anticipate that the rates established in these tests

may be reduced over time. Final selection of the appropriate reduction coefficients and factors of safety should be made by the Project BMP Designer based on the local laws and ordinances and desired level of conservatism.

Based on the soils encountered in our test holes, we expect that the percolation rates of the soils could be different than measured in the field due to variations in fines content. This expected variability in infiltration rates should be accounted for in determining the design elevation and size of the proposed infiltration system.

Infiltration testing should be performed after construction of the infiltration system to verify the design infiltration rates. Siltation and vegetation growth, along with other factors, may affect the infiltration rates of the basin area. Actual infiltration rates may vary from the values reported here. Infiltration systems should be located at least 10 feet from any existing or proposed foundation system.

5.10 Technical Review

Supplemental geotechnical design recommendations should be provided by our firm based on specific design needs developed by the other project design professionals. This report, and any supplemental recommendations, should be reviewed by the contractor as part of the bid process. It is strongly recommended that no construction be started nor grading undertaken until the final drawings, specifications, and calculations have been reviewed and approved in writing by a representative of our firm.

5.11 Earthwork Construction Inspection and Testing

All excavations including foundations and pier drilling should be inspected by a representative of our firm prior to placing rebar, backfilling, and/or pouring concrete foundations. Any grading should also be inspected and tested as appropriate to confirm adequate stripping, subgrade preparation, and compaction. Our office should be contacted with a minimum of 48 hours advance notice of construction activities requiring inspection and/or testing services.

6.0 INVESTIGATION LIMITATIONS

Our services consist of professional opinions and recommendations made in accordance with generally accepted engineering geology and geotechnical engineering principles and practices. No warranty, express or implied, of merchantability or fitness, is made or intended in connection with our work, by the proposal for consulting or other services, or by the furnishing of oral or written reports or findings.

This report has been prepared for the exclusive use of the South Airport Cargo Center and their authorized agents for design considerations for the proposed South Airport Cargo Center at Ontario International Airport in Ontario, California. This report is issued with the understanding that it is the responsibility of the owner, or of their representative, to ensure that the information and recommendations contained herein are called to the attention of the project architect and/or engineer and incorporated into the design plans, as appropriate.

APPENDIX A
FIELD EXPLORATION

APPENDIX A – FIELD EXPLORATION

HOLLOW-STEM AUGER BORINGS

CSA performed a subsurface exploration program in January 2022 consisting of eighty-six (86) exploratory hollow-stem auger borings within the proposed improvement areas. The borings were excavated by means of truck-mounted drill rig equipped with 8-inch diameter hollow-stem augers provided by Choice Drilling of Sylmar, California. The existing concrete apron was cored prior to excavation of borings B-15 and B-16 by United Coring of Riverside, California. The locations of the borings are shown on Figures 2 and 3. A CSA staff geologist logged the borings under the direct supervision of a registered geotechnical engineer and visually classified the soils in accordance with ASTM D-2487. Both bulk and relatively undisturbed and disturbed samples were obtained of the materials encountered at selected depths. The undisturbed samples were obtained in brass liners that were 2.5 inches in outside diameter and 6 inches long; the liners were inside a 3-inch diameter modified split-barrel California Sampler. The disturbed samples were obtained with an SPT sampler that was 2 inches in outside diameter. Both samplers were driven by an automatic, 140-pound hammer that was dropped 30 inches.

The borings were excavated between January 18 and January 27, 2022 and ranged in depths from about 6 to 51.5 feet bgs. Logs of the borings are presented as Figures A-1 through A-86. The logs depict our interpretation of the subsurface conditions at the date and location indicated based on representative samples collected at roughly two- to five-foot sampling intervals. It is not warranted that they are representative of subsurface conditions at other times and locations. The contacts on the log represent the approximate boundaries between earth materials, and the transitions between these materials may be gradual.

PERCOLATION TESTING

To measure field percolation rate, two 8-inch diameter percolation test holes (B-9) and (B-13) were excavated between January 18 and January 24, 2022, utilizing a truck-mounted hollow-stem-auger drill rig to a depth of 11.5 feet bgs. Each percolation test hole was backfilled with cuttings to a depth of 10 feet, and then slotted PVC pipe and #3 washed sand between 10 feet and the ground surface. Prior to field testing, each percolation test hole was pre-soaked, and the water completely drained from each hole within two minutes. Following the pre-soak, each test hole was filled to the top of the testing zone and the drop in water was measured until there was no water left in the hole. After every reading, the water level was refilled to the top of the testing zone. A total of four (4) readings were conducted for each test hole. Water depth

measurements were taken to the nearest 0.01-inch increment using an electronic water sounder. Upon completion of testing, the PVC casing was removed, and the test hole was backfilled with soil cuttings to the ground surface. The percolation test hole locations are shown on Figures 2 and 3. The logs of the percolation test holes B-9 and B-13 are presented as Figures A-9 and A-13. Measured percolation rates (inch/hour) from the field testing are presented in the Infiltration Basin Design section of the main report.

APPENDIX B
LABORATORY TESTING

APPENDIX B - LABORATORY TESTING

INTRODUCTION

The laboratory analysis performed for the geotechnical investigation consisted of limited testing of the principal soil types sampled during the field investigation to evaluate index properties of subsurface materials. Laboratory tests were performed on selected driven ring or SPT and bulk soil samples to estimate engineering characteristics of the various earth materials encountered. Testing was performed in general accordance with ASTM Standards for Soil Testing and Caltrans, latest revision. The soil descriptions and the field and laboratory test results were used to assign parameters to the various materials at the site. Testing procedures are presented below, and results of the laboratory testing program are presented in Table B-1 and Figures B-1a through B-8 included in this appendix, and the boring and percolation test logs included in Appendix A.

Laboratory Moisture and Unit Weight Determinations

Moisture content and dry unit weight determinations were performed on selected driven ring samples collected to evaluate the natural water content and dry unit weight of the various soils encountered in accordance with ASTM D7263. In addition, moisture contents were determined on selected SPT or bulk samples in accordance with ASTM D2216. The results are presented on Table B-1 and on the respective boring and percolation test logs (attached).

Grain Size Distribution

Grain size distribution was determined for 31 soil samples in accordance with standard test method ASTM D422. Grain-size curves are presented on Figures B-1a through B-2e – Grain Size Distribution Curve, and the results of percent passing No. 200 Sieve are shown on Table B-1 and on the respective boring logs.

Percent Passing No. 200 Sieve

The percent passing no. 200 sieve was determined for 42 soil samples in accordance with standard test method ASTM D1140. The results of percent passing the No. 200 sieve are shown on Table B-1 and on the respective boring logs.

Direct Shear Tests

Seven multistage direct shear tests were performed on representative driven ring samples to evaluate the shear strength of earth materials. The tests were performed in accordance with standard test method ASTM D3080. Summary plots of the direct shear data are presented on Figures B-3a through B-3g – Direct Shear.

Collapse Potential Tests

Ten collapse potential tests were performed selected driven ring samples of the near surface earth material. The tests were conducted in general accordance with standard test method ASTM D5333. The results of the collapse potential test are presented on Figures B-4a through B-4j – Collapse Potential.

Maximum Unit Weight/Optimum Moisture Content Tests

Seven maximum unit weight and optimum moisture content test were performed on a selected sample of the near surface onsite soils to assess compaction characteristics. The test was performed in accordance with standard test method ASTM D1557 and the results are presented on Figures B-5a through B-5g – Modified Proctor.

R-Value Tests

One R-value test was performed on a select sample of surficial earth material. The test was performed in accordance with standard test method Caltrans Test NO. 301 and test results are presented on Figure B-6 – R-Value Test Report.

California Bearing Ratios

Three California Bearing Ratio tests were performed on selected samples of surficial earth material. The tests were performed in accordance with standard test method ASTM D1883 and test results are presented in Figures B-7a through B-7c – California Bearing Ratio.

Soil Chemistry Tests/Corrosion Tests

Two soil chemistry tests were performed on a sample to evaluate resistivity, pH, sulfate, and chloride. The results of the testing and an analysis of the corrosivity to pipe and concrete materials are summarized in the main report. Test results are presented in Table B-1.

Falling Head Permeability Tests

Four falling head permeability tests were performed on select samples of surficial earth materials. The tests were performed in accordance with standard test method ASTM D5084 and test results are presented in Figure B-8 – Summary of Permeability Test Results.

TABLE B-1 SUMMARY OF LABORATORY TEST RESULTS

APPENDIX C
SITE-SPECIFIC GROUND MOTION RESPONSE ANALYSIS

APPENDIX C – SITE-SPECIFIC GROUND MOTION RESPONSE ANALYSIS

INTRODUCTION

CSA was requested to conduct site-specific ground motion response analysis for the proposed cargo sort facility warehouse. Based on our interpretation of the 2019 CBC/ASCE 7-16 code (ASCE 7-16, Chapter 20), structures on site class D sites with S_1 greater or equal to 0.2 require a site-specific ground motion hazard analysis (GMHA). However, there is an exception where a GMHA is not required if the structural design uses a seismic response coefficient, Cs, determined by Eq. 12.8-3 and 12.8-4 and multiplying by a factor of 1.5. This approach adds conservatism and increases the seismic design loads. We understand the planned warehouse will have fundamental period of 1.6 seconds. This appendix presents the methodology and results of our GMHA per ASCE 7-16, Chapter 21.

Per ASCE 7-16, ground motions should be calculated using probabilistic seismic hazard assessment (PSHA) based Maximum Considered Earthquake (MCE_R) and deterministic seismic hazard assessment (DSHA) based Maximum Considered Earthquake (MCE_R), and the selected spectral response acceleration (S_{aM}) shall be the lesser of the probabilistic and deterministic response spectra at any point.

CODE-BASED RESPONSE SPECTRA

We have included the ASCE/SEI 7-16 seismic design parameters (for location latitude, longitude: 34.0506, -117.6050) for reference in Table C-1.

TABLE C-1 - Seismic Design Parameters

Parameter	Value
Site Classification	D
Mapped Spectral Acc. 0.2 Sec. (g)	S_S = 1.578
Mapped Spectral Acc. 1 Sec. (g)	S_1 = 0.578
Fa – Site Coefficient	1.0
F_V – Site Coefficient	1.7
S_{MS} = Fa*Ss	1.578
S_{M1} = F_V*S_1	0.983
S_{DS} = 2/3*S_{MS}	1.052
S_{D1} = 2/3*S_{M1}	0.655
T_L	12
F_{PGA}	0.659
Ie	1
Cv	1.416
PGA_M	0.725

This design presented in Table C-1 produce the design and MCE response spectra presented in Graph C-1. The use of these parameters is only permitted if the seismic response coefficient, Cs, is multiplied by a factor of 1.5 for periods greater than $T_S = S_{D1}/S_{DS} = 0.62$.

GRAPH C-1 – Code Based Design and MCE Response Spectra

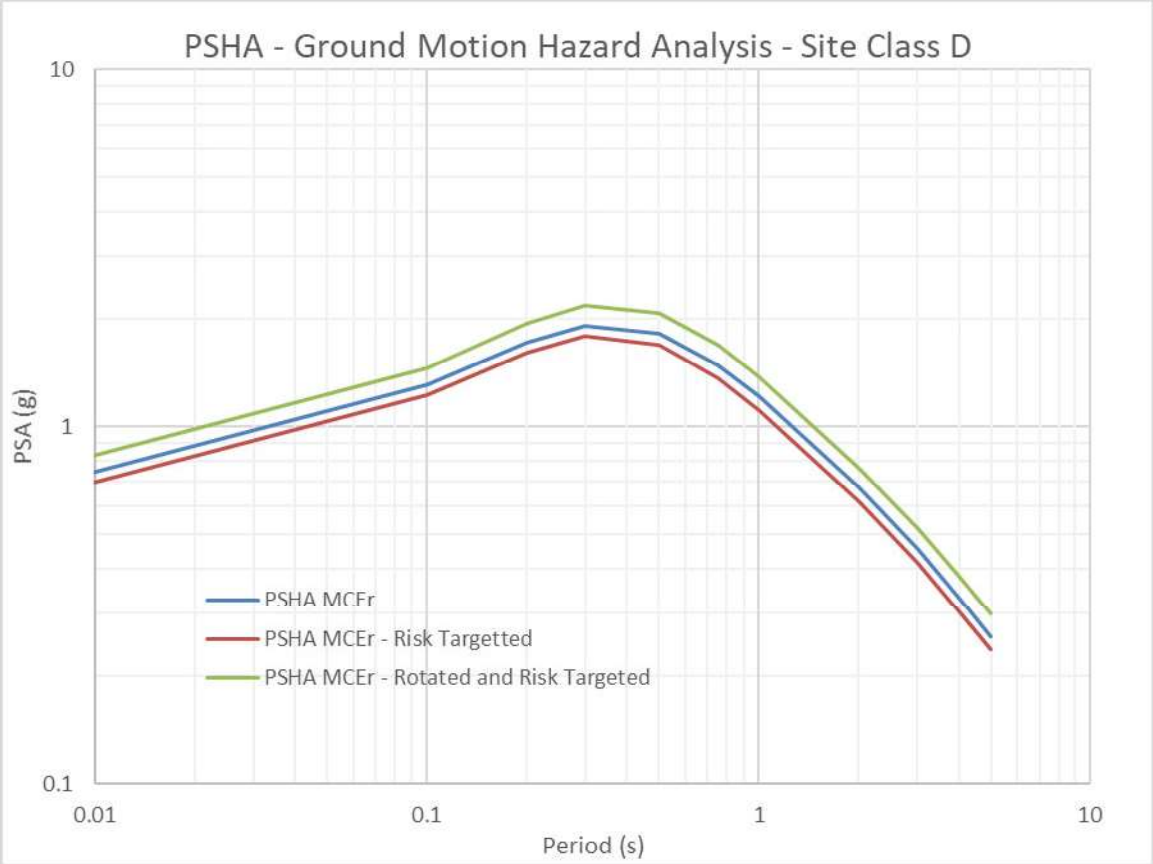
GROUND MOTION HAZARD ANALYSIS

Following Section 11.4.8 of ASCE 7-16, we completed a GMHA in accordance with Chapter 21, Section 21.2. As part of performing the GMHA, we developed a target MCE_R response spectrum. We evaluated both Probabilistic MCE_R spectral response accelerations utilizing Method 1 (ASCE7-16 Ch. 21.2.1.1), and Deterministic MCE_R spectral response accelerations to generate our target response spectrum for ground motion matching.

We utilized the USGS Unified Hazard Tool (UHT) based on UCERF 3 Data Set, and the Building Seismic Safety Council (BSSC) Scenario Catalog 2014 event set (BSSC 2014), which provides several nearby seismic scenarios.

Our analysis utilized the following Next Generation Attenuation West 2 (NGA-West 2) relationships: Abrahamson & Silva & Kamai (2014), Boore & Stewart & Seyhan & Atkinson (2014), Campbell & Bozorgnia (2014), and Chiou & Youngs (2014). We did not use the Idriss (2014) model because the site shear wave velocity profile is below the Idriss model limit (i.e., Idriss model is only valid when $V_{S30} > 450$ m/s). The spectral acceleration profiles for the various scenarios are presented in Graph C-3 below, with the largest acceleration calculated for the characteristic earthquakes used to determine the site specific MCE_R.

We applied rotation factors (scale factors) based on Shahi and Baker (2014) as opposed to the factors specified in ASCE 7-16 Chapter 21, Section 21.2, to calculate the maximum rotated component of the response spectra (RotD100). The rotation factors are shown in Table C-3 and Table C-4.



PROBABILISTIC SEISMIC HAZARD ASSESSMENT

We conducted a PSHA as outlined in ASCE 7-16 Section 21.2.1.1 (method 1). ASCE 7-16 Section 21.2.1 defines the Probabilistic MCE_R as "*the spectral response accelerations in the direction of maximum horizontal response represented by a 5% damped acceleration response spectrum that is expected to achieve a 1% probability of collapse within a 50-year period.*" The probabilistic MCE spectrum was provided using the UHT referenced above for a site class D site (Vs_{30} = 259 m/s). Results from the UHT including input parameters and deaggregation of the seismic sources are attached to this appendix. The probabilistic MCE spectrum was multiplied by Risk Coefficients (C_R) to determine the probabilistic MCE_R. The C_R values, C_{Rs} and C_{R1}, are based on ASCE 7-16 Section 21.2.1.1 (Method 1) and determined using ASCE 7-16 Figures 22-18 and 22-19, respectively. The values for C_{Rs} and C_{R1} are 0.938 and 0.915, respectively. Risk coefficients for various periods are shown in Table C-2. The resulting probabilistic MCE_R values are shown in Table C-2 and presented graphically in Graph C-2.

TABLE C-2 – Probabilistic MCE_R Values

Period	PSHA MCE_R from UHT Spectral Accel.	Risk Coefficient, Cr	Shahi and Baker RotD100/RotD50 scale factors	PSHA MCE_R Rotated and Risk Targeted
0.01	0.7479	0.938	1.19	0.835

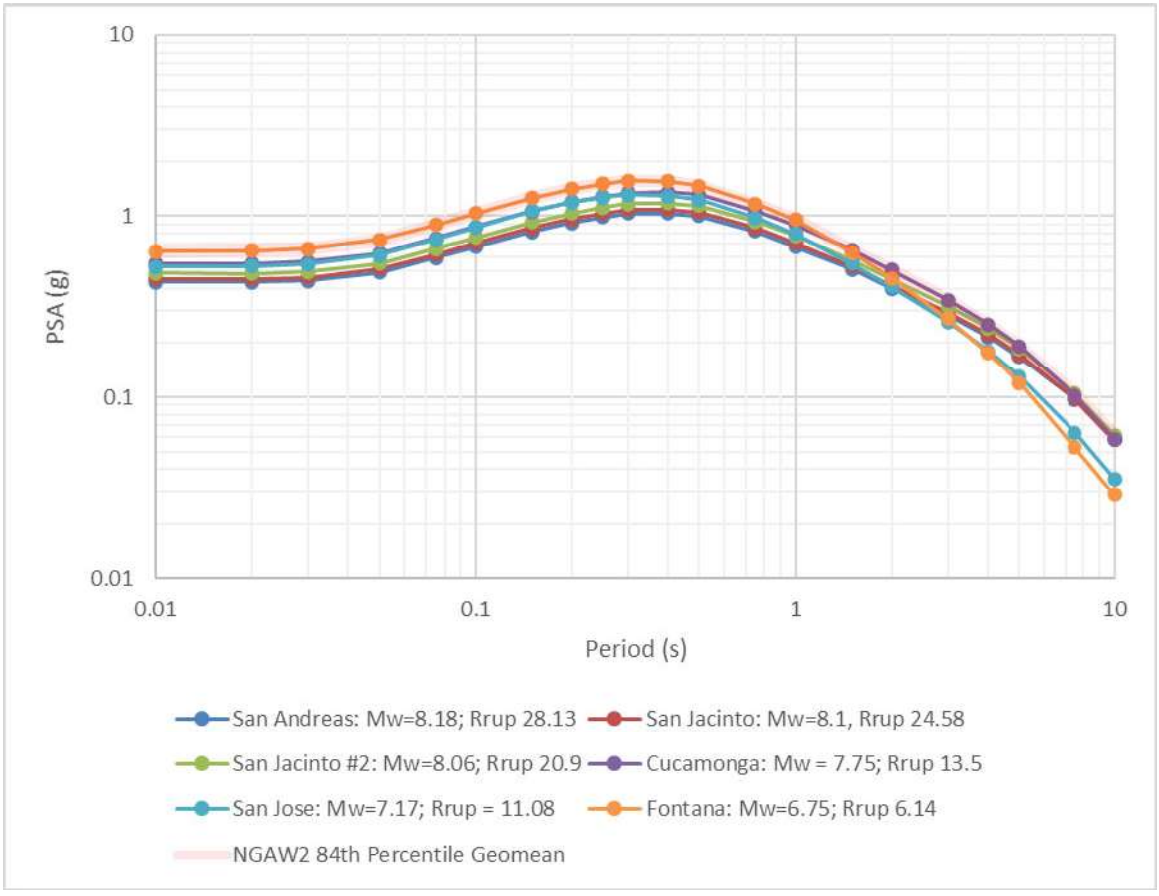
5	0.2583	0.915	1.26	0.298

GRAPH C-2 – Probabilistic MCER

DETERMINISTIC SEISMIC HAZARD ASSESSMENT



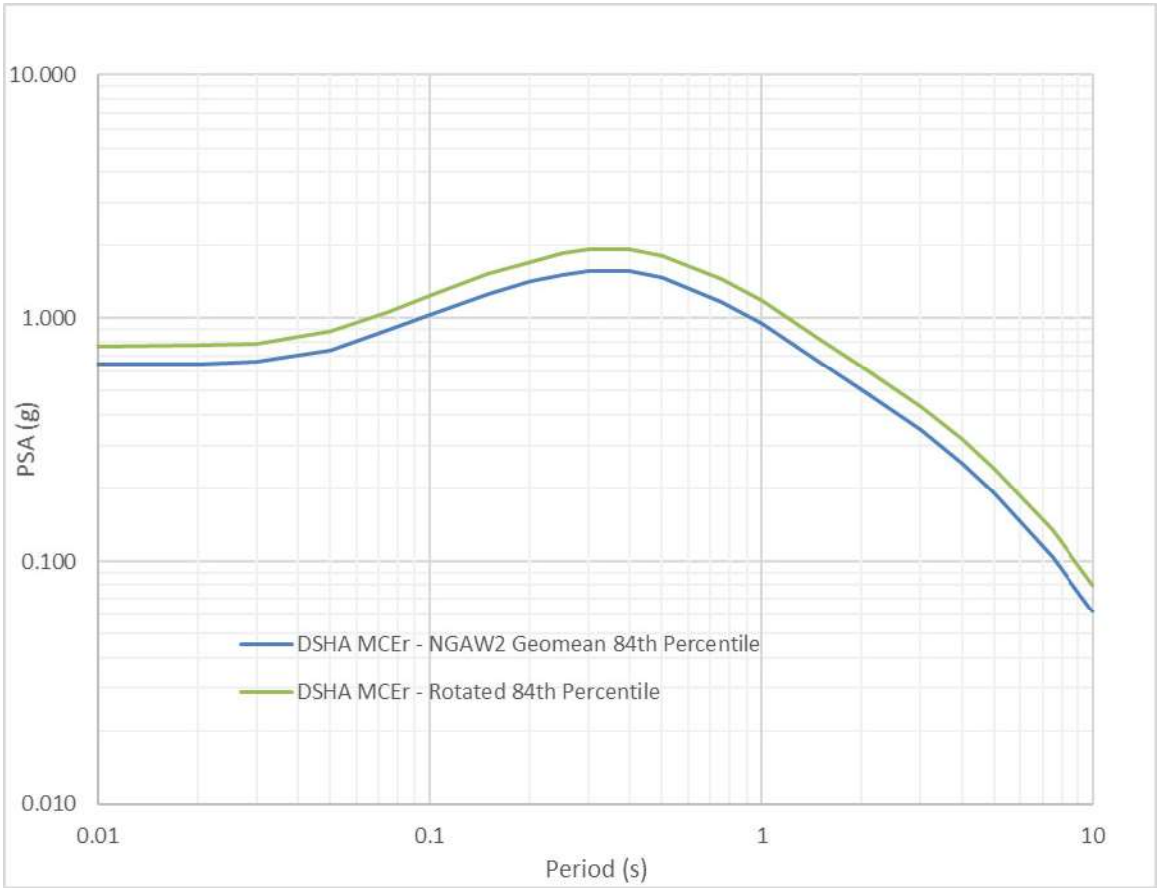
We conducted a DSHA as outlined in ASCE 7-16 Section 21.2.2, and ASCE 7-16 Supplement No. 1. ASCE 7-16 Section 21.2.2 defines the Deterministic MCER as "*the deterministic spectral response acceleration at each period shall be calculated as an 84-th-percentile 5% damped spectral response acceleration in the direction of maximum horizontal response computed at that period. The largest such acceleration calculated for the characteristic earthquakes on all known active faults within the region shall be used.*" The deterministic design event was determined using the results of the deaggregation using the UHT and the BSSC2014 Scenario Catalog. The controlling scenarios are summarized in Table C-3 below. The pertinent parameters used to develop the deterministic MCE spectrum with the NGA-West 2 GMPEs are: Moment Magnitude (Mw); Rrup, Rjb and Rx; V_{S30} = 293.5 m/s; default parameters were utilized for the remaining inputs. The median-plus-one-standard deviation estimates from the NGA-West2 GMPEs for each of the scenarios in Table C-3 are presented in Graph C-3. A printout of the NGA-West2 spreadsheet with all input parameters is provided in the appendices.

Supplement No. 1 of ASCE 7-16 has modified additional criteria for establishing the deterministic MCE_R spectrum. When the largest spectral response acceleration of the resulting deterministic ground motion response spectrum is less than $1.5F_a$, then the largest 84th percentile rotated response spectrum shall be scaled by a single factor such that the maximum response spectral acceleration equals $1.5F_a$. For Site Classes A, B, C, and D, F_a is determined using Table 11.4.1 with the value of S_s taken as 1.5; for Site Class E, F_a shall be taken as 1.0.

TABLE C-3 - Seismic Scenarios

Fault Name	Scenario	Distance, R (km)	Moment Magnitude, Mw	Reference	Controls
San Andreas	PK+CH+CC+BB+NM+SM+NSB+SSB+BG+CO	28.13	8.18	BSSC2014	--
San Jacinto	San Bernardino	24.58	8.1	UCERF3	--
San Jacinto	Lytle Creek	20.93	8.06	UCERF3	T > 5
Cucamonga		13.48	7.75	UCERF3	1.5 ≤ T ≤ 5
San Jose		11.08	7.17	UCERF3	--
Fontana		6.14	6.75	BSSC2014	T < 1.5

GRAPH C-3 – Deterministic NGA-W2 GMPE



The largest maximum spectral acceleration from the 84th percentile rotated response spectrum is greater than $1.5F_a$, so no scale factor is required. The resulting deterministic MCE_R values are shown in Table C-4 and presented graphically in Graph C-4.

TABLE C-4 – Deterministic MCE_R Values

Period	NGAW2 84th Percentile Geomean	Shahi and Baker RotD100/RotD50	DSHA MCE_R Rotated 84th Percentile

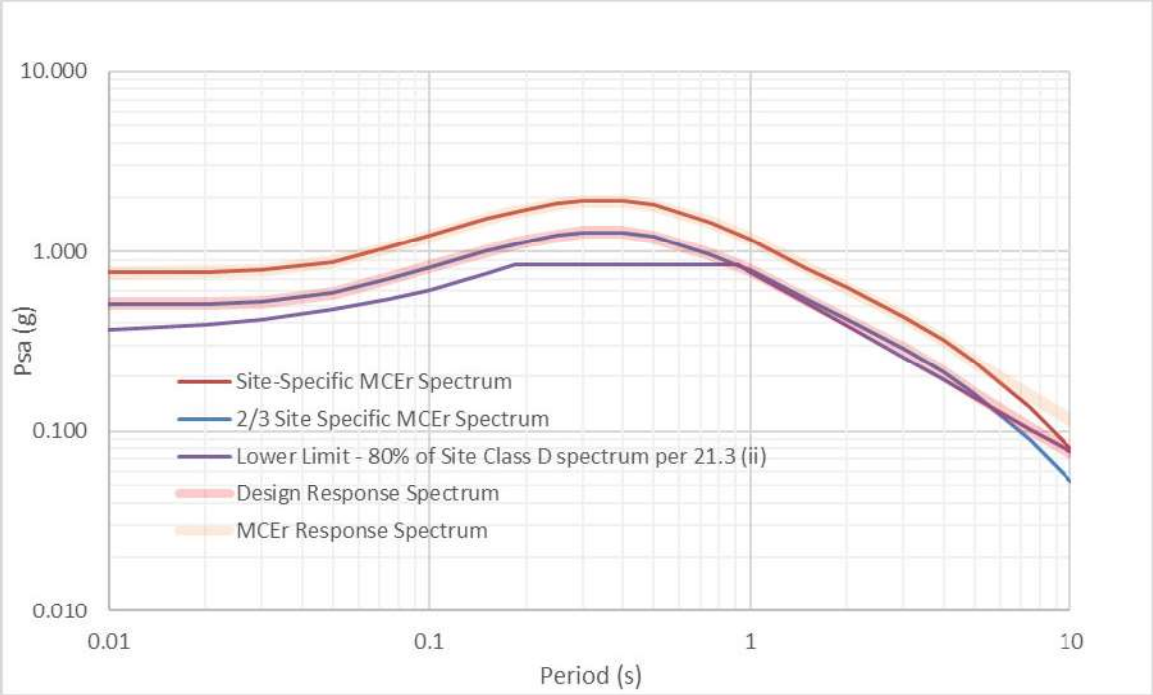
GRAPH C-4 – Deterministic MCE$_R$

SITE-SPECIFIC MCE$_R$

The site-specific MCE$_R$ is defined by ASCE 7-16 Section 21.2.3 as "*spectral response acceleration at any period, S_{aM}, shall be taken as the lesser of the spectral response accelerations from the probabilistic ground motions of Section 21.2.1 and the deterministic ground motions of Section 21.2.2.*" In this case, the DSHA is lower throughout, as shown in Graph C-5.

GRAPH C-5 – Site Specific Deterministic and Probabilistic MCER Response Spectra



DESIGN RESPONSE SPECTRUM

The design response spectrum is defined in ASCE 7-16 Section 21.3 as two-thirds of the site-specific MCER, and for sites classified as Site Class D requiring site-specific analysis in accordance with 11.4.8, the design spectral response acceleration at any period shall not be less than 80% of S_a determined in accordance with Section 11.4.6 using the F_a and F_v values specified in 21.3 (ii). Table C-5 below provides the site-specific MCER at the ground surface and reduced by two-thirds. We also show the 80% Site Class D response spectrum in accordance with 21.3(ii). Graph C-6 presents the design response spectrum.

TABLE C-5 – Design Response Spectrum

Period	80% of General Design Spectrum from 21.3(ii)	2/3 DSHA MCEr	Design Response Spectrum	MCEr Response Spectrum

GRAPH C-6 – Design Response Spectra

DESIGN ACCELERATION PARAMETERS

Design acceleration parameters (S_{DS} and S_{D1}) were computed in accordance with ASCE 7-16 Section 21.4. S_{DS} is defined as 90% of the maximum spectral acceleration, S_a, obtained from the site-specific spectrum, at any period within the range from 0.2 to 5 seconds, inclusive. S_{D1} shall be taken as the maximum value of the product, T^*S_a, for periods from 1 to 2 seconds, for sites with V_{S30} >1,200 ft/s, and for periods from 1 to 5 seconds for sites with $V_{S30} \leq$ 1,200 ft/s. The parameters S_{MS} and S_{M1} shall be taken as 1.5 times S_{DS} and S_{D1}, respectively. These values shall not be less than 80% of the values presented in Table C-1 above. Table C-6 below contains the Design Acceleration Parameters:

TABLE 6 – Design Acceleration Values

Parameter	Value
S_{DS}	1.149
S_{D1}	0.867
S_{MS}	1.724
S_{M1}	1.301

MAXIMUM CONSIDERED EARTHQUAKE GEOMETRIC MEAN (MCE_G) PGA

The site-specific PGA_M shall be taken as the lesser of the probabilistic and deterministic geometric mean PGAs of Section 21.5.1 and 21.5.2, and shall not be less than 80% of the PGA_M determined from Eq. 11.8-1. The probabilistic PGA is 0.748g, the deterministic PGA is 0.639g, and 80% of the PGA_M from Section 11.8-1 is 0.580g. Thus, the site-specific PGA_M is 0.639g.

Definition of Parameters

Damping ratio = Viscous damping ratio (%) See Sanaz et al. (2012) PEER Report
PSA = Pseudo-absolute acceleration response spectrum (g)
PGA = Peak ground acceleration (g)
PGV = Peak ground velocity (cm/s)
S_d = Relative displacement response spectrum (cm)
M_w = Moment magnitude
R_{RUP} = Closest distance to coseismic rupture (km), used in ASK13, CB13 and CY13. See Figures a, b and c for illustation
R_{JB} = Closest distance to surface projection of coseismic rupture (km). See Figures a, b and c for illustation
R_X = Horizontal distance from top of rupture measured perpendicular to fault strike (km). See Figures a, b and c for illustation
R_{Y0} = The horizontal distance off the end of the rupture measured parallel to strike (km)
V_{S30} = The average shear-wave velocity (m/s) over a subsurface depth of 30 m
U = Unspecified-mechanism factor: 1 for unspecified; 0 otherwise
F_{RV} = Reverse-faulting factor: 0 for strike slip, normal, normal-oblique; 1 for reverse, reverse-oblique and thrust
F_{NM} = Normal-faulting factor: 0 for strike slip, reverse, reverse-oblique, thrust and normal-oblique; 1 for normal
F_{HW} = Hanging-wall factor: 1 for site on down-dip side of top of rupture; 0 otherwise
Dip = Average dip of rupture plane (degrees)
Z_{TOR} = Depth to top of coseismic rupture (km)
Z_{HYP} = Hypocentral depth from the earthquake
$Z_{1.0}$ = Depth to Vs=1 km/sec
$Z_{2.5}$ = Depth to Vs=2.5 km/sec
W = Fault rupture width (km)
$V_{s30flag}$ = 1 for measured, 0 for inferred Vs30
F_{AS} = 0 for mainshock; 1 for aftershock
Region = Specific regions considered in the models, Click on Region to see codes
ΔDPP = Directivity term, direct point parameter; uses 0 for median predictions
PGA$_r$ (g) = Peak ground acceleration on rock (g), this specific cell is updated in the cell for BSSA14 and CB14, for others it is taken account for in the macros
Z_{BOT} *(km)* = The depth to the bottom of the seismogenic crust
Z_{BOR} *(km)* = The depth to the bottom of the rupture plane
SS = 1 for strike slip, automatically updated in the cell

Input variables with defaults (If entered 999 as input):

Red colored value: The value is used in the code when input is unknown

DEFAULTs	USER defined	ASK14	BSSA14	CB14	CY14	I14
W (km)	999.00			15.000		
$Z_{1.0}$ (km)	999.000	0.457			0.464	
$\delta Z_{1.0}$ (km)	0.000		0.000			
$Z_{2.5}$ (V_{S30}=1100)(km)	999.000			0.398		
$Z_{2.5}$ (V_{S30})(km)	999.000			1.802		
Z_{TOR} (km)	999.00			10.227		
Z_{HYP} (km)	999.00			0.000	0.000	
Z_{BOR} (km)	-			15.000		

ACKNOWLEDGEMENTS

S_d = Relative displacement response spectrum (cm)
M_w = Moment magnitude
R_{RUP} = Closest distance to coseismic rupture (km), used in ASK13, CB13 and CY13. See Figures a, b and c for illustation
R_{JB} = Closest distance to surface projection of coseismic rupture (km). See Figures a, b and c for illustation
R_X = Horizontal distance from top of rupture measured perpendicular to fault strike (km). See Figures a, b and c for illustation
R_{Y0} = The horizontal distance off the end of the rupture measured parallel to strike (km)
V_{S30} = The average shear-wave velocity (m/s) over a subsurface depth of 30 m
U = Unspecified-mechanism factor: 1 for unspecified; 0 otherwise
F_{RV} = Reverse-faulting factor: 0 for strike slip, normal, normal-oblique; 1 for reverse, reverse-oblique and thrust
F_{NM} = Normal-faulting factor: 0 for strike slip, reverse, reverse-oblique, thrust and normal-oblique; 1 for normal
F_{HW} = Hanging-wall factor: 1 for site on down-dip side of top of rupture; 0 otherwise
Dip = Average dip of rupture plane (degrees)
Z_{TOR} = Depth to top of coseismic rupture (km)
Z_{HYP} = Hypocentral depth from the earthquake
$Z_{1.0}$ = Depth to Vs=1 km/sec
$Z_{2.5}$ = Depth to Vs=2.5 km/sec
W = Fault rupture width (km)
$V_{s30flag}$ = 1 for measured, 0 for inferred Vs30
F_{AS} = 0 for mainshock; 1 for aftershock
Region = Specific regions considered in the models, Click on Region to see codes
ΔDPP = Directivity term, direct point parameter; uses 0 for median predictions
PGA$_r$ (g) = Peak ground acceleration on rock (g), this specific cell is updated in the cell for BSSA14 and CB14, for others it is taken account for in the macros
Z_{BOT} (km) = The depth to the bottom of the seismogenic crust
Z_{BOR} (km) = The depth to the bottom of the rupture plane
SS = 1 for strike slip, automatically updated in the cell

RE: Paleontological Resource Assessment for Ontario Airport South Cargo Center Project, City of Ontario, San Bernardino County, California

Dear Mr. Locacciato,

At the request of Meridian Consultants, LLC (Meridian), PaleoWest, LLC (PaleoWest) conducted a paleontological resource assessment for the Ontario Airport (ONT Airport) South Cargo Center project (Project), in the city of Ontario, San Bernardino County, California.The goal of the assessment is to identify the geologic units that may be impacted by development of the Project, determine the paleontological sensitivity of geologic units within the Project area, assess potential for impacts to paleontological resources from development of the Project, and recommend mitigation measures to avoid or mitigate impacts to scientifically significant paleontological resources, as necessary.

This paleontological resource assessment included a fossil locality records search conducted by the Natural History Museum of Los Angeles County (NHMLAC). The records search was supplemented by a review of existing geologic maps and primary literature regarding fossiliferous geologic units within the proposed Project vicinity and region. This technical memorandum, which was written in accordance with the guidelines set forth by the Society of Vertebrate Paleontology (SVP) (2010), has been prepared to support environmental review under the California Environmental Quality Act (CEQA).

PROJECT LOCATION AND DESCRIPTION

The proposed Project is a facility expansion project at the ONT Airport that includes the redevelopment of approximately 97 acres of existing underutilized parcels, including Assessor's Parcel Numbers (APN) 11326106, 11326107, **11326108, 11327101, and 11327102**, located on the south side of the ONT Airport in San Bernardino County, California (Figure 1). More specifically, the Project area is situated within Sections 27 and 34, Township 1 South, Range 7 West, San Bernardino Baseline and Meridian (SBBM), as depicted on the Guasti, CA 7.5' U.S. Geological Survey (USGS) topographic quadrangle (Figure 2). The elevation of the Project area ranges from approximately 886 to 915 feet below mean sea level.

NAD 83 SBBM

Project Area

The Project will be composed of the construction of four primary elements: (1) a cargo sorting building; a 60-ft tall, approximately 857,000 ft^2 facility that will house a sorting facility and office spaces; (2) a 210,000 ft^2 truck yard and visitor parking area that will include ground-to-air and air-to-ground cargo operations and trailer truck parking/staging stalls; (3) visitor and employee parking that would include 933 automobile parking stalls; 900 employee stalls in an approximately 271,000 ft^2 parking garage on 3 acres and 33 at-grade, visitor parking stalls; and (4) an aircraft apron with approximately 26 aircraft parking stalls/gates, comprising 2,900,000 ft^2 and ground service equipment maintenance building, garage, and parking area. In addition, the Project requires infrastructural improvements including internal roadways, an aircraft fuel system, substation and substation building, a stormwater drainage / detention system, security systems, utility services and related developments. The Project would include demolition of the existing buildings and will be constructed in two phases.

REGULATORY CONTEXT

Paleontological resources (i.e., fossils) are considered nonrenewable scientific resources because once destroyed, they cannot be replaced. As such, paleontological resources are afforded protection under various federal, state, and local laws and regulations. Laws pertinent to this Project are discussed below.

STATE LAWS AND REGULATIONS

California Environmental Quality Act

CEQA requires that public agencies and private interests identify the potential environmental consequences of their Projects on any object or site of significance to the scientific annals of California (Division I, California Public Resources Code [PRC] Section 5020.1 [b]). Appendix G in Section 15023 provides an Environmental Checklist of questions (PRC 15023, Appendix G, Section VII, Part f) that includes the following: "Would the project directly or indirectly destroy a unique paleontological resource or site or unique geological feature?"

CEQA does not define "a unique paleontological resource or site." However, the Society of Vertebrate Paleontology (SVP) has provided guidance specifically designed to support state and Federal environmental review. The SVP broadly defines significant paleontological resources as follows (SVP 2010, page 11):

> "Fossils and fossiliferous deposits consisting of identifiable vertebrate fossils, large or small, uncommon invertebrate, plant, and trace fossils, and other data that provide taphonomic, taxonomic, phylogenetic, paleoecologic, stratigraphic, and/or biochronologic information. Paleontological resources are considered to be older than recorded human history and/or older than middle Holocene (i.e., older than about 5,000 radiocarbon years)."

Significant paleontological resources are determined to be fossils or assemblages of fossils that are unique, unusual, rare, diagnostically important, or are common but have the potential to provide valuable scientific information for evaluating evolutionary patterns and processes, or which could improve our understanding of paleochronology, paleoecology, paleophylogeography, or depositional histories. New or unique specimens can provide new

insights into evolutionary history; however, additional specimens of even well represented lineages can be equally important for studying evolutionary pattern and process, evolutionary rates, and paleophylogeography. Even unidentifiable material can provide useful data for dating geologic units if radiometric dating is possible. As such, common fossils (especially vertebrates) may be scientifically important, and therefore considered significant.

California Public Resources Code

Section 5097.5 of the Public Resources Code (PRC) states:

> "No person shall knowingly and willfully excavate upon, or remove, destroy, injure or deface any historic or prehistoric ruins, burial grounds, archaeological or vertebrate paleontological site, including fossilized footprints, inscriptions made by human agency, or any other archaeological, paleontological or historical feature, situated on public lands, except with the express permission of the public agency having jurisdiction over such lands. Violation of this section is a misdemeanor."

As used in this PRC section, "public lands" means lands owned by, or under the jurisdiction of, the state or any city, county, district, authority, or public corporation, or any agency thereof. Consequently, public agencies are required to comply with PRC 5097.5 for their own activities, including construction and maintenance, as well as for permit actions (e.g., encroachment permits) undertaken by others.

LOCAL

Impact 5.5.2 of The Ontario Plan (City of Ontario 2009) states the following:

> "5-2 In areas of documented or inferred archaeological and/or paleontological resource presence, City staff shall require applicants for development permits to provide studies to document the presence/absence of such resources. On properties where resources are identified, such studies shall provide a detailed mitigation plan, including a monitoring program and recovery and/or in situ preservation plan, based on the recommendations of a qualified cultural preservation expert. The mitigation plan shall include the following requirements:
>
> a) Archaeologists and/or paleontologist shall be retained for the project and will be on call during grading and other significant ground-disturbing activities.
>
> b) Should any cultural/scientific resources be discovered, no further grading shall occur in the area of the discovery until the Planning Director is satisfied that adequate provisions are in place to protect these resources.
>
> c) Unanticipated discoveries shall be evaluated for significance by a San Bernardino County Certified Professional Archaeologist/Paleontologist. If significance criteria are met, then the project shall be required to perform data recovery, professional identification, radiocarbon dates, and other special studies; submit materials to a museum for permanent curation; and provide a comprehensive final report including catalog with museum numbers."

PALEONTOLOGICAL RESOURCE POTENTIAL

Absent specific agency guidelines, most professional paleontologists in California adhere to the guidelines set forth by SVP (2010) to determine the course of paleontological mitigation for a given project. These guidelines establish protocols for the assessment of the paleontological resource potential of underlying geologic units and outline measures to mitigate adverse impacts that could result from project development. Using baseline information gathered during a paleontological resource assessment, the paleontological resource potential of the geologic unit(s) (or members thereof) underlying a Project area can be assigned to one of four categories defined by SVP (2010). While these standards were written specifically to protect vertebrate paleontological resources, all fields of paleontology have adopted the following guidelines:

HIGH POTENTIAL (SENSITIVITY)

Rock units from which significant vertebrate or significant invertebrate fossils or significant suites of plant fossils have been recovered have a high potential for containing significant non-renewable fossiliferous resources. These units include but are not limited to, sedimentary formations and some volcanic formations which contain significant nonrenewable.

LOW POTENTIAL (SENSITIVITY)

Sedimentary rock units that are potentially fossiliferous but have not yielded fossils in the past or contain common and/or widespread invertebrate fossils of well documented and understood taphonomic, phylogenetic species and habitat ecology. Reports in the paleontological literature or field surveys by a qualified vertebrate paleontologist may allow determination that some areas or units have low potentials for yielding significant fossils prior to the start of construction. Generally, these units will be poorly represented by specimens in institutional collections and will not require protection or salvage operations. However, as excavation for construction gets underway it is possible that significant and unanticipated paleontological resources might be encountered and require a change of classification from Low to High Potential and, thus, require monitoring and mitigation if the resources are found to be significant.

UNDETERMINED POTENTIAL (SENSITIVITY)

Specific areas underlain by sedimentary rock units for which little information is available have undetermined fossiliferous potentials. Field surveys by a qualified vertebrate paleontologist to specifically determine the potentials of the rock units are required before programs of impact mitigation for such areas may be developed.

NO POTENTIAL

Rock units of metamorphic or igneous origin are commonly classified as having no potential for containing significant paleontological resources.

METHODS

In order to assess whether or not a particular area has the potential to contain significant fossil resources at the subsurface, it is necessary to review published geologic mapping to determine the geology and stratigraphy of the area. Geologic units are considered to be "sensitive" for paleontological resources if they are known to contain significant fossils anywhere in their extent. Therefore, a search of pertinent local and regional museum repositories for

paleontological localities within and nearby the Project area is necessary to determine whether or not fossil localities have been previously discovered within a particular rock unit. For this Project, a formal museum records search was conducted at the NHMLAC, as the San Bernardino County Museum is currently not accepting paleontological records search requests. Informal records searches were also conducted of the online University of California Museum of Paleontology Collections and San Diego Natural History Museum Collections, the online Paleobiology Database and FAUNMAP, and other published and unpublished geological and paleontological literature of the area.

RESOURCE CONTEXT

GEOLOGIC SETTING

The Project area is located in the northwestern portion of the Peninsular Ranges geomorphic province. Northwest trending mountain ranges and valleys following faults branching from the San Andreas Fault distinguish the Peninsular Ranges province. The Peninsular Ranges are bound to the east by the Colorado Desert and extend north to the San Bernardino – Riverside County line, west into the submarine continental shelf, and south to the California state line (Norris and Webb 1976). Locally, the Project is located in the Fontana Plain, an alluvial fan originating in Lytle Creek canyon in the foothills of the San Bernardino Mountains to the north and extending south to the Jurupa Mountains (Dutcher and Garrett 1963). The Fontana plain is divided by Lytle Creek into an eastern section that is dominated by deposits of the late Holocene Epoch (11,700 years ago to today), and a western portion that contains deposits of the Pleistocene (2.6 million years ago to 11,700 years ago) and Holocene Epochs (Dutcher and Garrett 1963).

SITE SPECIFIC GEOLOGY AND PALEONTOLOGY

According to Morton and Miller (2006), the majority of the Ontario Airport, including the majority ofthe Project area, is built on artificial fill (Qaf), deposited during the late Holocene Epoch (11,700 years ago to today). The Qaf was deposited on Very young alluvial-fan deposit Unit 1 (Qyf_1) and Young alluvial-fan deposit Unit 3 (Qyf_3), both of which were deposited during the late Pleistocene Epoch (2.6 million years ago to 11,700 years ago) and Holocene Epoch (Figure 3). The artificial fill extends to an unknown depth under the Project area, and the Young alluvial-fan units are mapped at the surface immediately outside the airport. The eastern edge of the Project area is underlain by Very young alluvial fan deposits (Qyf) of the late Holocene Epoch. Locally, the alluvial fans are sourced from the San Bernardino Mountains to the north. Due to its artificial nature and *ex situ* context, artificial fill has no paleontological sensitivity. Holocene units are typically considered to have a low paleontological sensitivity, as they are too young to have accumulated and preserved significant biologic material, but often transition with depth into high sensitivity Pleistocene deposits. Elsewhere in San Bernardino County, Pleistocene deposits have produced remains of a diverse terrestrial fauna, including ground sloth, deer, mammoth, camel, horse, bison, badger, mole, rabbit, gray fox, coyote, snake (Jefferson 1991a, 1991b; Miller 1971; NHMLAC 2021).

RECORDS SEARCH RESULTS

The NHMLAC records search did not produce any fossil localities from within the Project area, nor within one mile, but did produce several fossil localities in deposits of Pleistocene sediment in the region (NHMLAC 2021) (Table 1). Searches of online databases and other literature did not produce any additional fossil localities within one mile of the Project.

Table 1
Fossil Localities in the Project Vicinity[1]

Locality No.	Geologic Unit	Age	Taxa	Depth
LACM VP 7811	Unknown eolian tan silt	Pleistocene	Whip snake (*Masticophis*)	9-11 feet bgs
LACM VP 7268, 7271	Unknown	Pleistocene	Horse (*Equus*)	Unknown
LACM VP 7508	Unknown	Pleistocene	Ground sloth (*Nothrotheriops*), proboscid (Proboscidea), horse (*Equus)*	Unknown
LACM VP 1728	Unknown light brown shale with interbeds of very coarse brown sand	Pleistocene	Horse (*Equus*), camel (*Camelops*)	15 – 20 ft bgs
LACM VP 1207	Unknown	Pleistocene	Bovidae	Unknown

FINDINGS

This memorandum utilizes the SVP system (2010) to assess paleontological sensitivity and the level of effort required to manage potential impacts to significant fossil resources. Using this system, the sensitivity of geologic units was determined on the basis of the relative abundance and risk of adverse impacts to vertebrate fossils and significant invertebrates and plants.

Information provided by Meridian indicated that Project-related ground disturbance would reach a maximum of 20 feet below ground surface (bgs) for utilities trenching, with most of the ground disturbance reaching less than seven feet bgs. In most of the Project area, shallow excavation (less than nine feet bgs) will likely impact only artificial fill (Qaf), while deeper excavation (greater than nine feet bgs) may impact underlying Very young alluvial-fan deposits (Qyf_1 or Qyf_3). Excavation into Qaf and upper levels of Qyf_1 or Qyf_3 are unlikely to yield any significant paleontological resources, as late Holocene deposits are too young to contain fossils, and therefore possess low sensitivity. Along the eastern edge, ground disturbance will impact Very young alluvial fan deposits (Qyf) at the surface; these late Holocene deposits also possess low sensitivity near the surface. As a result, no impacts to paleontological resources would occur from earth-moving activities less than nine feet bgs within the Project area. Excavations deeper than nine feet bgs may extend down into older, high sensitivity Pleistocene sediments, which are considered to have a high paleontological sensitivity because they have proven to

yield significant paleontological resources (i.e., identifiable vertebrate fossils) in San Bernardino County. As such, ground disturbing activities in the Project area below nine feet bgs could potentially impact paleontological resources and should be monitored by a qualified paleontological monitor under direction of a Principal Paleontologist to identify and effectively salvage any recovered resources while minimizing discovery-related delays.

RECOMMENDATIONS

In general, the potential for a given project to result in negative impacts to paleontological resources is directly proportional to the amount of ground disturbance associated with the project; thus, the higher the amount of ground disturbances within geological deposits with a known paleontological sensitivity, the greater the potential for negative impacts to paleontological resources. Since this Project entails excavation for a cargo building, airport gates, truck yard, roadway, and other infrastructure, new ground disturbances are anticipated. Geologic units in the Project area have a high paleontological sensitivity below nine feet bgs. Ground disturbing activities in the Project area may result in significant impacts under CEQA to paleontological resources, such as destruction, damage, or loss of scientifically important paleontological resources. A qualified paleontologist should be retained to develop and implement the measures recommended below. These measures have been developed in accordance with SVP guidelines; if implemented, these measures will satisfy the requirements of CEQA.

WORKER'S ENVIRONMENTAL AWARENESS PROGRAM (WEAP)

Prior to the start of the proposed Project activities, all field personnel will receive a worker's environmental awareness training on paleontological resources. The training will provide a description of the laws and ordinances protecting fossil resources, the types of fossil resources that may be encountered in the Project area, the role of the paleontological monitor, outline steps to follow in the event that a fossil discovery is made and provide contact information for the Project-qualified Paleontologist. The training will be developed by the Project-qualified Paleontologist and can be delivered concurrent with other training including cultural, biological, safety, etc.

PALEONTOLOGICAL MITIGATION MONITORING

Prior to the commencement of ground-disturbing activities, a professional paleontologist will be retained to prepare and implement a Paleontological Resources Mitigation and Monitoring Plan (PRMMP) for the proposed Project. The PRMMP will describe the monitoring required during excavations that extend into Pleistocene sediment (at nine feet bgs), and the location of areas deemed to have a high paleontological resource potential. It is recommended that the results of the geotechnical investigation conducted for the Project are consulted to determine the approximate depth of Pleistocene sediment in the Project area. Monitoring will entail the visual inspection of excavated or graded areas and trench sidewalls. If the Project-qualified Paleontologist determines full-time monitoring is no longer warranted, based on the geologic conditions at depth, he or she may recommend that monitoring be reduced or cease entirely.

FOSSIL DISCOVERIES

In the event that a paleontological resource is discovered, the monitor will have the authority to temporarily divert the construction equipment around the find until it is assessed for scientific significance and, if appropriate, collected. If the resource is determined to be of scientific significance, the Project-qualified Paleontologist shall complete the following:

1. Salvage of Fossils. If fossils are discovered, all work in the immediate vicinity should be halted to allow the paleontological monitor, and/or Project-qualified Paleontologist to evaluate the discovery and determine if the fossil may be considered significant. If the fossils are determined to be potentially significant, the Project-qualified Paleontologist (or paleontological monitor) should recover them following standard field procedures for collecting paleontological as outlined in the PRMMP prepared for the project. Typically, fossils can be safely salvaged quickly by a single paleontologist and not disrupt construction activity. In some cases, larger fossils (such as complete skeletons or large mammal fossils) require more extensive excavation and longer salvage periods. In this case the paleontologist should have the authority to temporarily direct, divert or halt construction activity to ensure that the fossil(s) can be removed in a safe and timely manner.

2. Fossil Preparation and Curation. The PRMMP will identify the museum that has agreed to accept fossils that may be discovered during project-related excavations. Upon completion of fieldwork, all significant fossils collected will be prepared in a properly equipped laboratory to a point ready for curation. Preparation may include the removal of excess matrix from fossil materials and stabilizing or repairing specimens. During preparation and inventory, the fossils specimens will be identified to the lowest taxonomic level practical prior to curation at an accredited museum. The fossil specimens must be delivered to the accredited museum or repository no later than 90 days after all fieldwork is completed. The cost of curation will be assessed by the repository and will be the responsibility of the client.

FINAL PALEONTOLOGICAL MITIGATION REPORT

Upon completion of ground disturbing activity (and curation of fossils if necessary) the Project-qualified Paleontologist should prepare a final mitigation and monitoring report outlining the results of the mitigation and monitoring program. The report should include discussion of the location, duration and methods of the monitoring, stratigraphic sections, any recovered fossils, and the scientific significance of those fossils, and where fossils were curated.

It has been a pleasure working with you on this Project. If you have any questions, please do not hesitate to contact us.

Sincerely,

Benjamin Scherzer, M.S. | Senior Paleontologist

PHASE I ENVIRONMENTAL SITE ASSESSMENT
Proposed 97-Acre Project Magellan Airport Cargo Distribution Center
Ontario, California

FINDINGS, OPINIONS, AND CONCLUSIONS

At the request of Mr. Winters, GSI Environmental Inc. (GSI) has performed a Phase I Environmental Site Assessment (ESA) in conformance with the scope and limitations of the American Society for Testing and Materials (ASTM) International, Inc. Standard E 1527-13, Standard Practice for Environmental Site Assessments: Phase I Environmental Assessment Process (ASTM Standard) for the 97-acre property identified below and shown on Figures 1A, 1B, and Figure 2 (Site). Any exceptions to, or deletions from, this practice are described in Section 8.0 of this report.

SITE IDENTIFICATION	
Name:	Proposed 97-Acre Project Magellan Airport Cargo Distribution
Address:	97-Acre Portion of the Ontario International Airport
City:	Ontario
County:	San Bernardino County
State:	California
Assessor Parcel Number(s):	*Parcels are identified on Figure 1B.* Parcel 61: 011326106 (approximately 48 acres) Parcel 62: 011326107 (approximately 21 acres) Parcel 63: 011326108 (approximately 2 acres) Parcel 67: 011327101 (approximately 12 acres) Parcel 68: 011327102 (approximately 14 acres)

The purpose of the Phase I ESA was to identify Recognized Environmental Conditions (RECs) as defined in the ASTM Standard. It is our understanding that this Phase I ESA has been solicited as part of environmental due diligence activities in connection with the land lease and redevelopment of the Site.

This report presents the results of the Phase I ESA and is based on the following:

- Review of the physical setting and Site reconnaissance;
- Review of historical information from Sanborn fire insurance maps, topographic maps, aerial photographs, and city directories;
- Review of prior Site reports provided to GSI or obtained from regulatory agencies;
- Information obtained from owner and/or user interviews;
- Review of available agency files including the following;
    - City of Ontario Building Department,
    - City of Ontario Fire Department,
    - South Coast Air Quality Management District (SCAQMD),
    - City of Ontario Public Works Department,
    - San Bernardino Fire Department-Hazardous Materials,
    - Department of Toxic Substances Control (DTSC)-Cypress,
    - Department of Toxic Substances Control (DTSC)-Cypress,
    - Office of the State Fire Marshal,
    - Santa Ana Regional Water Quality Control Board (SARWQCB),

- County Assessor's Office website,
- California State Water Resources Control Board (SWRCB) Deed Restrictions website,
- SWQCB GeoTracker website,
- DTSC Envirostor website,
- DTSC Land Use Restrictions website,
- National Pipeline Mapping System (NPMS),
- California Geologic Energy Management Division (CalGEM) website; and

- Review of regulatory agency database information for the Site and surrounding properties.

The Site is located in Ontario, California and comprises of approximately 97 acres of the Ontario International Airport that was previously agricultural property or vineyards until the mid to late 1950's. The Site consists of 24 buildings and Hangars, ancillary structures, and parking facilities. The Site is located north of East Avion Street and west of the Cucamonga Creek with a small portion connecting to South Hellman Avenue. The Site is broken down into five parcels, Parcel 61, Parcel 62, Parcel 63, Parcel 67, and Parcel 68.

Historically, Parcel 61 was occupied by Northrop Aircraft Company and Douglas Aircraft in the 1950s. Lockheed Aircraft occupied Hangar 4 between 1955 and 1980. In 1955, GE Engine Services, Inc. moved their operations to the Site and Northrop vacated. The former Los Angeles Police Department (LAPD) Emergency Vehicle Operations Course (EVOC) was previously located in the center of the Site along the western border of Parcel 62. Historical use on Parcel 61 has included the use of chlorinated solvents, the storage and dispensing of fuel, fire suppression chemical storage, and hazardous waste storage and waste treatment (including clarifiers, wash racks, and sumps). Multiple underground storage tanks (USTs) have been documented at the Site and documentation of removal was not identified during this investigation.

Parcel 62 was primarily agricultural until the 1950s. In 1983, the main Hangar and office building were developed, and by 1987, the second Hangar was in use. In 1994, an outbuilding maintenance area was constructed and put into service. A fuel farm was located on the southwestern corner of the Site and two clarifiers, and a maintenance shop have been documented on the Parcel. Historical use of chemicals at Parcel 62 has included chlorinated solvents, and fire suppression chemical storage. Poor housekeeping was identified in the vicinity of unmarked drums and stained concrete around the fire suppressant storage area within the Guardian Jet Center. Multiple USTs have been documented at the Site. Although it appears that the USTs located on Parcel 62 have been removed, closure documentation was not identified, and some impacted soil from at least one leaking UST remains in place at the Site.

Parcels 67 and 68 historically included the Ontario Air National Guard Station (ANGS) with ancillary structures to the south and east. In the 1950s, a Hangar, fire station, fueling station, and wash rack were constructed at the Site. In 1952, the 196th Tactical Air Support Group was assigned to the Ontario Airport. During this time, the facilities were updated, and operations included the maintenance of aircraft vehicles and aerospace ground equipment. A munitions bunker was constructed in the 1950s and later used by Lockheed in the 1990s for storage of ammunition and explosives. The 196th vacated the Site in 1983 and the 148th Combat Communications Squadron (CBCS) occupied the Site from 1984 through 1998. The ANGS was closed in September 1998. Historical use on Parcels 67 and 68 has included the use of clarifiers,

Above ground storage tanks (ASTs), and USTs. Although USTs have been removed, documentation of regulatory closure was not identified and there is reference to one UST that was not accounted for during the removal process. Poor housekeeping was identified in the vicinity of a leaking waste drum.

The southern portion of the Site is comprised of Parcel 63 and a small portion of Parcel 61. This location has been primarily agricultural and historically stored a bunker. These parcels are currently utilized for parking and include a large storm drain outlet.

During the three-day Site reconnaissance, many of the features identified in the Parcel descriptions above were identified and added to Table 1 and Figure 3. Historic UST areas were identified next to the former California Air National Guard (CANG) Hangar and southwest of the current Guardian Jet Center Hangars. Three concrete secondary containment structures were observed at 61W-29 where aboveground storage tanks used to be held. Two clarifiers were observed east of the Guardian Jet Center Hangars as well. A wash rack and backfilled clarifier was identified northeast of the CANG Hangar as well as a former fueling station. Multiple locations across the Site were identified to have staining. A concrete pad with red staining was observed to the east of the Guardian Jet Center Hangars. Inside of the Guardian Jet Center southern Hangar, staining was observed around the aqueous film forming foam (AFFF) suppression system. The large hydraulic jacks adjacent to Hangar 1 were observed to be leaking oil that had stained the asphalt underneath them. Two above ground fuel tanks were observed in secondary containers inside a shed at the former CANG maintenance yard. AFFF fire suppression tanks were observed inside the Guardian Jet Center Hangars. A shed to the northeast of Hangar 3 and the ancillary structure next to Hangar 4 were observed to have hazardous waste storage signs. Multiple drums and drains were located throughout the Site.

This assessment has revealed no RECs, controlled RECs (CRECs), historical RECs (HRECs), or *de minimis* conditions in connection with the Site except for those described below.

Recognized Environmental Conditions (RECs)

RECs are defined in the ASTM Standard as "*the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that pose a material threat of a future release to the environment. De minimis conditions are not recognized environmental conditions."*

This Phase I ESA has revealed no evidence of RECs in connection with the Site with the exception of those identified in Table 1 and on Figures 3 and 4. RECs identified in Table 1 are summarized on the following pages.

Parcel	Map Feature Number	Description	Explanation of REC
61W	1	**General Electric Hangar 4 Area** - This area has been indentified as part of the General Electric (GE) Leasehold and is also identified as Hangar 4. GE Engine Services Facility Equipment Report has record of permits (1980s and 1990s) for degreasers that used 1,1,1-trichloroethane (1,1,1-TCA), abrasive blasting, spray booths, amine (or DEA) regeneration, service stations for dispensing and storing gasoline, storage tank 1,1,1 - TCA, miscellaneous inorganic stripping, tank chemical milling, and canceled permits for gasoline storage tanks, fuel oil storage tank, jet engine test cell facility, degreaser 1,1,1-TCA, and tank surface preparation-other acids. According to a historical Phase I ESA for Hangar 4, a septic tank/leach field was utilized from approximately 1956 to 1990, when the building was connected to a sanitary sewer system. The historical septic tank/leach field location has not been identified and closure or sampling data is not available (Mactec, 2003). Waste removed from GE in 1993 reportedly included spent batteries, waste water pretreatment sludge, aluminum oxide grit residue, oil soaked materials, epoxy resin, corrosive mixtures, flammabile liquid, soil contaminated with Stoddard Solvent (likey from UST removal), medal oxide powder, fiberglass with bentonite, RCRA empty drums contaminated with solvents, soil contaminated with jet fuel (likely from UST 11 removal), water and jet fuel, bulked solvents, solvents, waste oil, 1,1,1-TCA distillation sludge, bottom sludge from cooling tower, "Poison B liquid", oil-soaked materials, machine coolant.	Historical use, including the use of chlorinated solvents as well as storage and dispensing of fuel in the vicinity of the GE Leasehold througout the 1980's and early 1990's was likely to have released contaminants to the environment. Historical use of this area is indicative of a release to the environment and is considered a REC.
		Hangar 4 (Outside): Hangar 4 is constructed of corrugated steel (with flaking paint), steel framing, roll up and sliding doors. A truck scale is located north of the hangar. A maintenance/storage shed is located in the northwest corner of the building that is surrounded with a chain-link fence. Electrical transformers/substation is located west of the hangar. An asphalt patch was observed that contained a sewer vault west of the hangar. Fire supression piping and valves are located west of the hangar and east of a chain-linked fence.	It is GSI's experience that historical maintenance/storage sheds can often store leaking and damaged equipment that release contaminants to the environment. This area is considered part of Hangar 4. Historical use of this area is indicative of a release to the environment and is considered a REC.
		Hangar 4 (Inside): Furniture and office equipment storage, Delcrete/Delpatch-5 gallon buckets (x3), a large electrical box, fire hoses, Flynn scales, fire extinguishers, ash trays, and pallets of leaking of 5 gallon buckets were observed. Buckets: BioSolve pink water (56, 5-gallon capacity; several leaking); AMEREX BC Purple K dry chemical (9, 5-gallon capacity; several leaking); Winsol (13, 5-gallon capacity) containing fire supression "training foam"; Blue Stx adhesive (1, 5-gallon capacity; one leaking); MET LX (7, 5-gallon capacity), Super Market Wax Stripper (8, 5-gallon capacity), American Traffic Products Inc.-red fast dry paint (1, 5-gallon capacity), Ennis paint-white traffic paint (1, 5-gallon capacity; 7 empty), Ecomate MTC degreaser (1, 5-gallon capacity). The buckets containing fire suppression chemicals may contain PFAS.	GSI observed release of chemicals to the environment from multiple stored chemical buckets, including buckets that may contain PFAS chemicals that are commonly used in AFFF fire suppression foam. This area is considered part of Hangar 4. Observed release to the environment is considered a REC.
		Hangar 4 Inside Haz Storage Building (61W-23): A hazardous waste storage label was located on the exterior door to the hangar. Observations include: an empty flammable liquid cabinet, Genlabs Lemon Cleaner (1, 5-gallon capacity), traffic paint buckets (9, 5-gallon capacity), International Coatings Traffic Paint (32, 5-gallon capacity), overhead fire suppression system (water only), light bulbs, wood pallets, electronics, electrical meters, fuse boxes, circuit boards, a portable eye wash, station, an empty 55-gallon drum labeled 1A2/Y1.2/100, 2 pallets full of cleaning supplies (approximately 72 boxes), cleaning pads and sweepers, and overhead lighting.	This area is considered part of Hangar 4. It is GSI's experience that historical drum storage areas are indicative of sources of contaminant release to the environment. Historical use of this area for hazardous waste storage is indicative of a release to the environment and is considered a REC.
61W	10	**Hazardous waste storage structure:** Concrete slab with concrete secondary containment berm, concrete ramp leading into the containment area, chain-linked perimeter fence, central floor drain, and corrugated steel roof. Several concrete patches (possibly former boring/sampling locations) observed in the conrete slab near the floor drain, and several outside the hazardous waste storage structure. A hazardous yard and EHS sticker was observed on the window of a storage shed located northwest of the hazardous waste storage structure.	It is GSI's experience that historical hazardous waste storage buildings often have stored damaged containers that release contaminants to the environment are indicative of sources of contaminant release to the environment. This structure has a drain located in the middle of the concrete slab, which may have provided a direct path to the subsurface for any hazardous waste that was released within the structure. Historical use of this area for hazardous waste storage is indicative of a release to the environment and is considered a REC.
61W	10	**Second storage awning:** Concrete slab with concrete secondary containment berm, desk supplies, e-waste, office furniture, computer equipment, a water dispenser unit, printers, ink cartridges, keyboards, fluorescent light bulb housing, water bottles and a mini-fridge. A 1993 figure from SBFD agency records identifies this area as the "Expanded Drum Storage Area (HWMU No. 5)"	This drum storage area was identified as a Hazardous Waste management Unit (HWMU) in historical documents. It is GSI's experience that historical drum storage areas are indicative of sources of contaminant release to the environment. Historical use of this area for hazardous waste storage is indicative of a release to the environment and is considered a REC.
61W	17A	**Hangar 5** - Hangar 5 was historically utilized to repair, overhaul, and clean jet engines and parts. Routine inspection records from the SBFD and DTSC in 2005 identified several violations. Photographs of the violations included oil spillage around a grinding machine and oil leakage around a machine in the Machine shop. Large pit in northwest corner of Hangar 5 containing floor drain.	It is GSI's experience that facilities utilized to repair and clean parts are often sources of contaminant release to the environment. Historical records have identified poor housekeeping with chemicals spilled to the ground surface. Historical use and documentation of relase to the environment is considered a REC.
61W	23	**Hazardous Waste Storage Building -** Included in 61W-1	See 61W-1
61W	24	**Maintenance/storage Shed** - Included in 61W-1	See 61W-1
61W	26	**Hazardous Waste Storage Area** - Historical reports identified that this area was used for hazardous waste storage. There was no access to this area as it is leased (part of 61W-15). What appears to be a hazardous waste storage area was observed northwest of the building. This shed is covered and is constructed out of corrugated steel (painted).	A hazardous waste storage area was identified in historical reports, but was not observed during the Site Reconnaissance. It is GSI's experience that historical hazardous waste storage buildings often have stored damaged containers that release contaminants to the environment. Documented historical use of this area for hazardous waste storage is indicative of a release to the environment and is considered a REC.

Parcel	Map Feature Number	Description	Explanation of REC
61W	29	**Historical AST and Waste Treatment Area** - This building is located northeast of Hangar 11 and feature 61W-28. Reportedly the location of former GE office space constructed of corrugated steel. No access during the Site reconnaissance. Secondary concrete enclosures were located to the north and east of the building where ASTs were formerly located. One of the enclosures is currently labeled "T23 containment area." Documents identify One 50,000-gallon rinse water storage tank, one 2,000-gallon H_2SO_4 AST and one 3,000-gallon KCL. A 1995 inspection includes a drawing that identifies the ASTs and layout of the area. A sump was present within the building and waste was piped to a treatment and containment area. Waste types treated included waste water from the oil-water separator at the test-cell facility and waste water from tanks at the cleaning line and steam cleaning units located at he EHS department and at Hangar 11. The wastewater treatment system was removed in 2006.	A historical AST and waste treatment area was identified in historical documents but the ASTs were not observed during the Site Reconnaissance. It is GSI's experience that historical ASTs and the associated waste treatement area could be a source of contaminant release to the environment. Documented historical use of this area for waste and the presence of a sump is indicative of a release to the environment and is considered a REC.
61W	30	**Hangar 1** - Corrugated steel (painted) containing air conditioning units, and rolling track hangar doors retrofitted to rollup doors. Large leaking portable airplane hydraulic lifts located outside Hangar 1 and next to a large concrete pad (61W-36). Shed next to the hangar has a "no smoking" and fire extinguisher sign and a concrete perimeter slab containing a berm. Observed in the hangar are a water heater, overhead power and HVAC, a possible drainage sump with missing grates on top in the northeast corner, two long floor drains near the room with sump, electrial rooms, and a room containing an overhead crane in the northwest corner. An inspection report from SBFD from 5 October 2005 indicates that drums of used oil, waste fuel, oily rags, used oil filters, and used absorbent were present on the Site. An inspection report from SBFD from 6 October 2006 indicates the following: cleaning line room: dark purplish color staining from J-88 Cleaner (contains potassium permanganate); concrete beneath Versene cleaning tank (acid) had some corrosion; previous storage locations for T-20 and T-21 - permanganate staining. The report	This area has histirically been used for hazardous waste storage, and evidence of relase to the environment has been identified. A sump is present in the vicinity of the area of release. It is GSI's experience that historical sumps and drains often funnel waste and contaminants and release contaminants to the environment, and the presence of hydraulic oil leaking from equipment in the area is indicative of a release to the environment and is considered a REC.
61W	30	**4 Garages North of Hangar 1** - The garages are constructed of corrugated steel containing rollup doors. An overhead crane was present. The garage contains floor drains and may be connected to a sump feature associated with Hangar 1 (61W-30). There appears to be a patch around center and western garage. Steam cleaning room: contained grit blast machine used to clean parts (waste collected in baghouses and stored), drum-rinsing area (waste water collected and pumped to T-23). Photographs of the steam cleaning room and drum rinsing area are included in a 2005 Hazardous Waste Generator and Hazardous Materials handler Inspection	It is GSI's experience that parts cleaning equipment and drum rinsing area and associated sump are indicative of a release to the envionment and are considered a REC.
61W	32	**Building 5 - Structure 4:** Batteries, scissor lifts, golf carts, a leaking aircraft cart, a power pack cart leaking oil, 3 totes of empty lubricant oil in the back of a golf cart, an anti-freeze container open with contents inside, file boxes, portable airplane hydraulic repair lifts, stands, welders, and aviation electronic equipment.	The observed release to the environment of hazardous substances or petroleum products is a REC.
61W	32	**Building 5 - Outside storage area:** A continuation of the inside contents. Trailers, portable airplane hydraulic repair lifts, ducting, crane lifts, airplane equipment, batteries, possible oil tank trailer, and Air Force portable air conditioner trailers with air compressors inside.	The observed release to the environment of hazardous substances or petroleum products within Building 5, Structure 4 is a REC.
61W	37	**Historical USTs** Historical documentation identifies this as the approximate historical location of USTs: -One (1) 8,000-gallon stoddard solvent UST (UST 1) -One (1) 8,000-gallon stoddard solvent UST (UST 2) with oil/water separator.	Documentation of the removal and/or subsurface sampling in the vicinity of the USTs has not been identified. It is GSI's experience that subsurface USTs often leak and are inidicative of a release to the environment. The historial presence of USTs with no closure documentation is a REC.
61W	38	**Historical USTs-** Historical documentation identifies this as the approximate historical location of USTs: -One (1) 8,000-gallon calibration fluid UST (UST 3) -One (1) 3,000-gallon calibration fluid waste UST (UST 4)	Documentation of the removal and/or subsurface sampling in the vicinity of the USTs has not been identified. It is GSI's experience that subsurface USTs often leak and are inidicative of a release to the environment. The historical presence of USTs with no closure documentation is a REC.
61W	39	**Historical USTs-** Historical documentation identifies this as the approximate historical location of USTs: -One (1) 6,000-gallon gasoline UST (UST 5) -One (1) 6,000-gallon diesel UST (UST 6) -One (1) 6,000-gallon diesel UST (UST 7)	Documentation of the removal and/or subsurface sampling in the vicinity of the USTs has not been identified. It is GSI's experience that subsurface USTs often leak and are inidicative of a relese to the environment. The historial presence of USTs with no closure documentation is a REC.
61W	40	**Historical USTs-** Historical documentation identifies this as the approximate historical location of USTs: -One (1) 250-gallon calibration fluid waste UST (UST 8)	Documentation of the removal and/or subsurface sampling in the vicinity of the USTs has not been identified. It is GSI's experience that subsurface USTs often leak and release contaminants to the environment.
61W	41	**Historical USTs-** Historical documentation identifies this as the approximate historical location of USTs: -One (1) 6,000-gallon calibration Fluid UST (UST 9) excavated and removed in 1992. -One (1) 2,000-gallon calibration fluid waste UST (UST 10)	Documentation of the removal and/or subsurface sampling in the vicinity of the USTs has not been identified. It is GSI's experience that subsurface USTs often leak and are inidicative of a relese to the environment. The historial presence of USTs with no closure documentation is a REC.
61W	43	**Historical USTs -** Historical documentation identifies this as the approximate historical location of "Tank 12 and Tank 13 (removed)" was identified during this investigation. SBCFD records include "Figure 1" identifying "Underground Storage Tank Locations." Historical documentation identifies 14 USTs total in the area.	Documentation of the removal and/or subsurface sampling in the vicinity of the USTs has not been identified. It is GSI's experience that subsurface USTs often leak and are inidicative of a relese to the environment. The historial presence of USTs with no closure documentation is a REC.
61W	44	**Historical USTs-** Historical documentation identifies this as the approximate historical location of "Tank 14 (removed)". No additional information was identified during this investigation,	Documentation of the removal and/or subsurface sampling in the vicinity of the USTs has not been identified. It is GSI's experience that subsurface USTs often leak and are inidicative of a relese to the environment. The historial presence of USTs with no closure documentation is a REC.

Parcel	Map Feature Number	Description	Explanation of REC
61C	4	**Historical Clarifier with Wash Racks and Surface Staining -** Concrete pad with former tracks for sliding doors to possibly a small former aircraft hangar. Drainage channel around the concrete pad (former wash rack) with red staining and the outline of ASTs. Nearby drain inlet may be connected to a possible 3-stage clarifier.	It is GSI's experience that clarifiers and wash racks are known to leak contents to the subsurface and impact the vadose zone with petroleum products. Additionally, red staining indicates that fire retardent was released to the environment from historical ASTs. An observed release to the environment and conditions indicative of a release to the environment are a REC.
61C	8	**Historical Clarifier-** Possible former clarifier. A long trench appears to extend from a drain inlet that it may have been connected to.	It is GSI's experience that clarifiers are known to leak contents to the subsurface and impact the vadose zone with petroleum products or other waste. The former presence of the clarifier is indicative of a possible release to the environment and is a REC
62	2	**Historical Clarifier-** Historical documents and Site reconnaissance identified a four stage clarifier to the north of 62-8. SBFD records from 23 October 2002 indicate that the "sumps" were tested and "spill boxes - visual fail due to extreme rust and corrosion as per inspectors orders".	It is GSI's experience that clarifiers are known to leak contents to the subsurface and impact the vadose zone with petroleum products. Evidence of rust or corrosion to the clarifiers indicates that these may have released contaminants to the environment. The presence of a clarifier is indicative of a release to the environment and is a REC.
62	5	**Guardian Jet Center East** - Corrugated steel and stucco structure containing a concrete slab. Office space, a reception desk, restrooms, kitchen, and conference room are present within the northern portion of the hangar. Inside the hangar were a machine shop, Amazon aircraft pods, propane bottles, tools, air compressor, circuit breakers, a water heater, oil cans, and an IT room. Within the northwestern portion of the hangar and adjacent to the office space were an above ground AFFF-fire supression tank and three, 250-gallon capacity Ansulite totes that contain AFFF. The	It is GSI's experience that AFFF Fire Suppresssion chemicals and equipment may release PFASs to the environment. The observation of fire suppression equipment is a condition indicative of a release to the environment and is a REC.
62	8	**Guardian Jet Center (southern building)** - Corrugated steel structure, concrete slab, floor drains, overhead fire water lines connected to an AFFF fire supression system, overhead electrical, and floor drains. The hangar is used for storage and maintenance. Other observations include a sand blast machine, six (6) oxygen tanks, four (4) oil drums (for waste and Jet-A), one (1) drum containing a gasoline label and one (1) drum containing an oil label - both partially filled. Used oil filters and absorbant pads present on the lid of the drums (not contained). Other features include a fammable container locker, grease guns, absorbent on the ground, a nitrogen tank, a jet oil cabinent with oil and filters, and a poly drum with unknown liquid is full. One AFFF fire suppression system above ground storage tank, a portable fire extinguisher, a motorized hangar doors, and 4-deep cycle batteries. The AFFF suppression tank contains a label indicating a construction date of 1988. Staining/residue present on the outside of the tank. Batteries contained inside a plastic box, a lavatory service cart, and shop sinks with household cleaners and a washing washine also were observed. One storage room was located upstairs containing computer equipment/parts, files, empty boxes, packaging, printers, office furniture, and aircraft tires. Fire supression piping inside the upstairs room appears to have leaked from fittings onto plywood flooring. Office space is located along the west side of the hangar. The office spaces contain a restroom, a storage room, an IT room and empty storage room.	Unmarked drums, drums that were missing screw caps, used oil filters, general staining on the foor, and staining on the AFFF AST were observed at the Site. It is GSI's experience that AFFF Fire Suppresssion chemicals and equipment will release PFAS to the environment and generally poor housekeeping is a source of impact to the enviroment. The observation of fire suppression equipment as well as generally poor housekeepig in the vicinity of waste storage are conditions indicative of a release to the environment and considered a REC.
62	9	**Historical Clarifier -** Historical documents and Site reconnaissance identified a four-stage clarifier to the south of 62-8. SBFD records from 23 October 2002 indicate that the "sumps" were tested and "spill boxies - visual fail due to extreme rust and corrosion as per inspectors orders"	It is GSI's experience that clarifiers are known to leak contents to the subsurface and impact the vadose zone with petroleum products. Evidence of rust or corrosion to the clarifiers indicates that these may have released contaminants to the environment. The presence of a clarifier is indicative of a release to the environment and is a REC.
62	13	**Former Beechcraft West Fuel Farm where seven USTs were historically located** - Currently a large gravel patch at the southern border of the UPS parking lot (62-15). Historical documents identify the former Beechcraft West fuel farm at the southern border of 2161 East Avion. The fuel farm contained seven USTs with a capacity of 88,000 gallons. The USTs were reported to have been removed in May 2013. Soil samples collected during the excavation were all non-detect except for the samples collected beneath UST T7. Hydrocarbon odors and stained soil were noted in the samples. The area under the UST was excavated to a depth of 21 feet with lateral dimensions of 10 feet by 7 feet, until stained soil was no longer visible. It was	Some remaining impact appears to have been left below the area of UST T7. No closure documents were identified during this investigation. The removal of USTs without closure documentation and documented impact remaining in the subsurface beneath a former UST is a REC.
68	2	**Historical Clarifier and Wash Rack -** A former wash rack containing a large concrete pad and former drain inlet were observed. The drain inlet appears to be backfilled and may have been connected to a former clarifier to the south.	It is GSI's experience that clarifiers and wash racks are known to impact the subsurface with the chemicals washed from equipment. The presence of a wash rack and potential clarifier is indicative of a release to the environment and is a REC.
68	6	**Historical USTs** - Two rectangular concrete pads separated by a gravel field were observed. The southern most patch is next to a panel labeled "control switch for north east floodlights is located at N.E. corner of fuel dump fence." A 1995 UST Closure Report (El Capitan) indicates that the USTs were removed, and impacted soil was excavated and removed. Confirmation samples from the USTs and fueling pad area were collected and "no further action" was recommended for the former USTs. However, no documenation of regulatory closure of the UST area was identified	The USTs were closed and no further action was recommended. However, no documenation of regulatory closure of the UST area was identified during this investigation, so this area is considered a REC.
68	7	**Historical USTs** - The Site reconnaissance and historical documentation identifies a large gravel area near 68-6 which is a former UST area that has been backfilled. A 1995 UST Closure Report (El Capitan) indicates that the USTs were removed, and impacted soil was excavated and removed. Confirmation samples from the USTs and fueling pad area were collected and "no further action" was recommended for the former USTs. However, no documenation of regulatory closure of the UST area was identified during this investigation.	
68	12	**Historical Autoshop and Fire House -** A former Autoshop (1997) and Fire House (2001) - The building is constructed of concrete (painted), containing a concrete floor slab.	Although documented use of Fire Suppresion chemcials was not observed during the reconnaissance, it is GSI's experience that Fire Suppresssion chemicals are a source of contaminant release to the environment. The observation of fire suppression equipment is a condition indicative of a release to the environment and is a REC.

Parcel	Map Feature Number	Description	Explanation of REC
68	17	**Boiler room** - Construction materials appear to be brick exterior walls and a concrete floor slab. The boilers appear to have been constructed in 1952 (placard present). Other equipment/materials observed in the boiler room include a hot water tank, electrical main circuit breaker, air compressors, a water heater, and associated electrical panels and plumbing for the boilers. A waste oil drum (<55-gallon capacity) with a secondary containment drip pan is present. The drip pan appears to contain oil. An additional 55-gallon capacity drum (appears to be full) and 5-gallon capacity bucket (1/3 full) were present. A larger blue drum (approximately 85 gallons) is 1/4 full that is connected to an "ultrafilter" system.	An observed leaking waste drum located within a containment drip pan is representative of historical use and indicative of release to the environment and is a REC.
68	20	**Historical USTs -** A 1995 Report (El Capitan, 1995 - Figure 3) indicates that one UST was removed from this area. However, a 2001 Phase I ESA (CTL Environmental Services) indicates that two USTs were located in this area and the second UST was not identified. A backfilled asphalt patch is located to the west of the boiler room. This is the location of a possible former diesel UST. A trench connects to this patch from 68-25. A 1995 UST Closure Report (El Capitan) indicates that these USTs were removed, and impacted soil was excavated and removed. Confirmation samples were collected and "no further action" was recommended for the former USTs. However, no documenation of regulatory closure was identified during this investigation. In adddition, a 2001 Phase I ESA indicates that a second UST was present in this area and was not accounted for during the removal of the USTs.	The USTs were closed and no further action was recommended. However, no documenation of regulatory closure of the UST area was identified during this investigation. In adddition, a 2001 Phase I ESA indicates that a second UST was present in this area and was not accounted for during the removal of the USTs. The potential presence of a remaining UST as well as the lack of documented closure for the UST that was removed in this area is a REC.
68	22-1	**Historicial Clarifier -** Building #1 contains block walls, HVAC system, a collapsed roof, deteriorated wood roof, and a concrete floor. There are five rooms within the building and a possible clarifier located south of the building.	It is GSI's experience that clarifiers are known to leak contents to the subsurface and impact the vadose zone with petroleum products or or other waste. The former presence of the clarifier is indicative of a release to the environment and is a REC.

Controlled Recognized Environmental Conditions (CRECs)

CRECs are defined in in the ASTM Standard as *"a recognized environmental condition resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls. (for example, property use restrictions, or engineering controls)."*

This Phase I ESA has revealed no evidence of CRECs in connection with the Site with the exception of those identified in Table 1 and on Figure 3. CRECs included in Table 1 are summarized below.

Parcel	Map Feature Number	Description	Explanation of REC
61W	8 and 42	**Historical USTs with Removal documentation-** Historical documentation identifies this as the approximate historical location of USTs: -One (1) 2,000-gallon Jet A UST (UST 11) excavated and removed in 1992.	Dames and Moore (1992) collected samples during UST removal and identified Jet-A fuel impacts that decreased with depth to the total depth of the excavation of 14 feet. A 2 April 1992 letter from the County of San Bernardinno EHS indicates that UST 11 was removed and soil impacted with Jet-A was identified to attenuate to a depth of 14 feet bgs. It appears that the impacted soil was left in place and the SBDEH noted that it was "unlikely that existing contamination poses a threat to the local evironment." Additional reference to the "excavation of the Calibration Fluid" notes that the actual extend of affected soil "will be more thoroughly defined after removal activities recommence for Tank 9 and the adjacent Tank 10 (also containing Calibration Fluid)." The remaining impacted soil with documented approvel from SBDEH is a CREC.
61W	42 and 8	Same as 61W-8	Same as 61W-8

Historical Recognized Environmental Conditions (HRECs)

HRECs are defined in in the ASTM Standard as *"a past release of any hazardous substances or petroleum products that has occurred in connection with the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, property use restrictions, or engineering controls)."* [1]

This Phase I ESA has revealed no evidence of HRECs in connection with the Site.

De minimis Conditions

De minimis conditions are defined in in the ASTM Standard as: *"a condition that generally does not present a threat to human health or the environment and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be de minimis conditions are not recognized environmental conditions or controlled recognized environmental conditions."*

This Phase I ESA has revealed no evidence of *de minimis* conditions in connection with the Site with the exception of those identified in Table 1 and on Figure 3. De minimus conditions identified in Table 1 are summarized below.

Parcel	Map Feature Number	Description	Explanation of de minimus Condition
Site-Wide	Site-Wide	**Historical Agriculture -** According to documented history of the Site, until the mid to late 1950's the Site was primarily agricultural with some vineyards.	Pesticides and arsenic are often present in shallow soil at properties that have documented historical agricultural practices. As the Site will remain paved and residential use of the Site is not planned, the potential for these contaminants of concern in shallow soil is unlikely to be the subject of an enforcement action if brought to the attention of appropriate governmental agencies and is considered a *de minimus* conditon.
61W	11	**Hanger 3** - Constructed of painted corrugated steel, epoxy coating on the roof, a concrete slab, trench drains in front of the roll-up doors, transformers, a fire line, fire exinguishers, overhead lighting and HVAC, restrooms, false walls, water heaters, a 5 gallon paint bucket, a circuit board, a server room, and broken glass windows. Historical records identify this building as the former "Machine Shop and Heat Treat" (Canonie Environmenta, 1993).	It is GSI's experience that machine shops are often sources of contaminant release to the environment, however, the Site reconnaissance did not identify anything that would be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. As such, the historical use of Hangar 3 is considered a *de minimus* conditon.
67	5	**Shooting Rage** - Historical documents identify that the area around Parcel 67 and 68 included a skeet shooting range in the mid-1940's.	Shooting ranges are often sources of subsurface impact to soil from metals such as lead. However, the location of the shooting range was not identified during this investigation and the entire area is covered with concrete and asphalt. As such, the historical use of the area as a shooting range is subject of an enforcement action if brought to the attention of appropriate governmental agencies and is considered a *de minimus* conditon.

Conclusion and Opinion

GSI has evaluated the information collected during the course of this Phase I ESA. Historical Site use indicates the presence or likely presence of hazardous substances or petroleum products that are indicative of a release to the environment at several areas across the Site. It is GSI's understanding that the potential redevelopment of the Site will likely include demolition of existing structures and excavation of shallow vadose zone soils prior to redevelopment of the of the Site. As such, it is GSI's opinion that a baseline understanding of the existing subsurface conditions will be necessary to assess the potential risk to human health in the proposed structures, and to document the conditions present at the Site prior to Site redevelopment and reuse. In addition, a

[1] If the Site has received closure in the past, but a review of the closure information indicates that Site conditions do not meet unrestricted/residential land use standards, the Site is no longer considered an HREC, and must be identified as a REC.

Soil Management Plan (SMP) should be implemented during Site redevelopment as a best management practice.

PHASE I ENVIRONMENTAL SITE ASSESSMENT
Magellan Airport Cargo Distribution Center
97-Acre Portion of the Ontario International Airport, Ontario, California

1.0 INTRODUCTION

This Phase I environmental site assessment (ESA) was conducted to fulfill American Society for Testing and Materials (ASTM) International, Inc. Standard E 1527-13, Standard practice for Environmental Site Assessments (ESAs): Phase I Environmental Site Assessment Process (ASTM Standard) and the EPA Standards and Practices for All Appropriate Inquiries ([AAI] 40 CFR Part 312) for the property identified below (Site; Figures 1 and 2).

SITE IDENTIFICATION	
Name:	Proposed 97-Acre Project Magellan Airport Cargo Distribution
Address:	97-Acre Portion of the Ontario International Airport
City:	Ontario
County:	San Bernardino County
State:	California
Assessor Parcel Number(s):	Parcel 61: 011326106 (approximately 48 acres) Parcel 62: 011326107 (approximately 21 acres) Parcel 63: 011326108 (approximately 2 acres) Parcel 67: 011327101 (approximately 12 acres) Parcel 68: 011327102 (approximately 14 acres)

1.1 Purpose of the ESA

The purpose of the ESA was to identify Recognized Environmental Conditions (RECs) as defined in the ASTM Standard. It is our understanding that this Phase I ESA has been solicited as part of environmental due diligence activities in connection with the land lease and redevelopment of the Site.

1.2 Significant Assumptions

Significant assumptions include the following:

- During the Site Reconnaissance, several unknown patches were observed throughout the Site. Due to the quantity and size of the Site, these unknown patches are assumed to be a result of historical airport maintenance and improvements and are assumed to not be a threat or future threat to the environment.
- Based on the age of the buildings and features observed during the Site Reconnaissance, it is assumed that asbestos-containing building materials (ACBM), and lead-based paint are present throughout buildings at the Site.
- In many cases, records that were obtained from agency sources or historical reports did not include detailed figures or included figures that were either scaled too large or without details to accurately identify sampling locations. As such, the locations of some features were estimated based on correlating descriptions with observations during the reconnaissance. As a result, it was not possible to positively identify or match several of the identified features in the historical reports.

1.3 Limitations

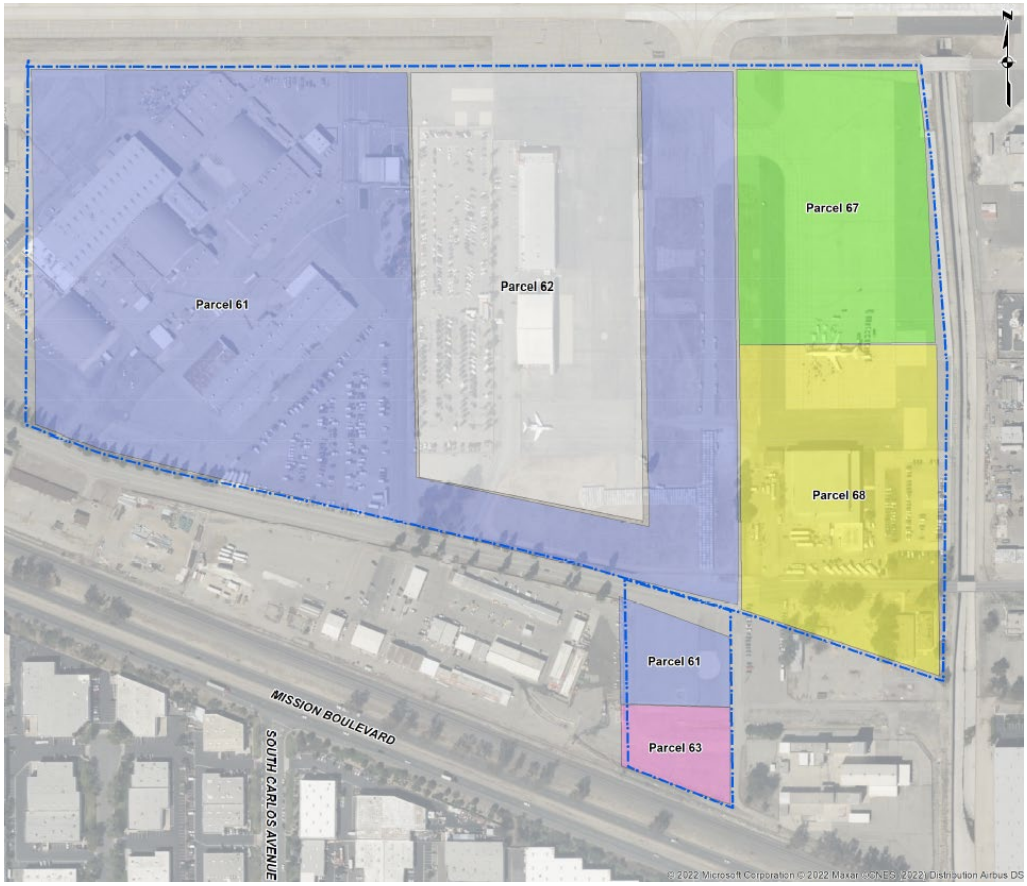
GSI has completed this Phase I ESA in accordance with generally accepted environmental property assessment practices applicable at the time and location of the assessment. This Phase I ESA is not and should not be construed as a warranty or guarantee, expressed or implied, regarding the presence or absence of environmental contaminants that may affect the Site. All findings, opinions, and conclusions reported in this Phase I ESA are based on conditions and available information existing at the time of the assessment. No independent verification of the information provided to GSI was made. While GSI has no reason to doubt the accuracy of the information provided, this report is accurate and complete only to the extent that information provided to GSI was itself accurate and complete. Site conditions and regulations (local, state, tribal, and federal) can change over time. Therefore, changes in Site conditions, available information, and/or regulations may alter the findings, opinions, and conclusions of this Phase I ESA.

1.4 Non-Scope Considerations

Non-scope considerations include environmental issues or conditions that may warrant additional assessment but are outside the scope of the ASTM Standard. Environmental issues that are considered non-scope considerations are summarized in the ASTM standard and include but are not limited to; ACBM, indoor air quality, lead-based paint, mold, and radon. GSI was not retained to evaluate non-scope considerations as part of this ESA.

1.5 User Reliance

This report and all related correspondence have been prepared exclusively for use by Mr. Winters and may not be relied upon by any other person or entity without the express written permission of GSI and Mr. Winters. Without express written permission of both GSI and Mr. Winters, no third parties shall have any rights of recourse or recovery under course of action against GSI, its officers, employees, subcontractors, vendors, or successors.



2.0 SITE DESCRIPTION

GSI contracted with Environmental Risk Information Service (ERIS) to compile a physical setting report (Appendix A) that was used in combination with information obtained during Site reconnaissance, historical document review, interviews with the Site owner representatives during reconnaissance, review of regulatory agency records, and review of prior Site reports provided to GSI (if applicable) to produce a description of the Site and its physical setting.

2.1 Current and Past Site Use

The Site is comprised of portions of five parcels on the Ontario Airport property.

- Parcel 61/APN 011326106 (approximately 48 acres)
- Parcel 62/APN 011326107 (approximately 21 acres)
- Parcel 63/APN 011326108 (approximately 2 acres)
- Parcel 67/APN 011327101 (approximately 12 acres)
- Parcel 68/APN 011327102 (approximately 14 acres)

Operations at the Ontario Airport began in 1921 when the Ontario Aircraft Corporation was organized. In 1929 it moved to a 30-acre parcel near the corner of Mission Boulevard and Grove Avenue in the southwestern corner of the final airport. In 1940 an additional 405 acres were added to the airport property. Until the mid to late 1950's the Site was primarily agricultural with some vineyards. In the 1940's some vineyards were removed to construct portions of the airport. The Ontario Airport was utilized in support of World War II and after the war it was returned to the City of Ontario.

2.1.1 Parcel 61 History

Hangars 1 through 5 exist on the western portion of Parcel 61. Hangars 1 and 2 were constructed in the late 1940's and in 1950 Northrop Aircraft Company reportedly began manufacturing operations in Hangar 1. Hangar 3 was constructed in 1951 and some time before 1953 Douglas Aircraft began operations in Hangar 2 or 3. In 1953 Hangar 4 was constructed and Lockheed Aircraft occupied Hangar 4 between 1955 and 1980. Hangar 5 is currently utilized for storage and administration. In approximately 1955, GE Engine Services, Inc. (GEES) moved operations to the Site and Northrop vacated the Hangar 1. GEES moved to Hangar 4 once Lockheed vacated the building in 1980. The former LAPD Emergency Vehicle Operations Course (EVOC) was previously located in the center of the Site along the western border of Parcel 62.

2.1.2 Parcel 62 History

This portion of the Site was primarily agricultural through the 1970s. In 1983 the main Hangar and office building were developed, and by 1987 the second Hangar was in use. By 1994 the

outbuilding maintenance area was constructed and put into service. A fuel farm existed on the southwestern corner of the Site and at least two clarifiers and a maintenance shop have been documented at the Site. The former LAPD EVOC was previously located in the center of the Site along the western border of Parcel 62. Between 2002 and 2008 Parcel 62 did not change significantly (CTL, 2008). Parcels 67 and 68 History

The area around Parcel 67 and 68 included a skeet range in the mid-1940's. The Ontario Air National Guard Station (ANGS) was located on Parcel 68 with ancillary structures to the south and east. From 1943 to 1948 the army maintained the area and in 1952 the 196th Tactical Air Support Group was assigned to Ontario Airport. The facilities were updated at this time and the operations included maintenance of aircraft vehicles, and aerospace ground equipment. In the 1950's, a Hangar, fire station, fueling station, and wash rack were constructed over the skeet range. A munitions bunker was constructed in the 1950s and later used by Lockheed in the 1990s for storage of ammunition and explosives. The 196th vacated the Site in 1983 and the 148th Combat Communications Squadron (CBCS) occupied the Site from 1984 through 1998. The ANGS was closed in September 1998.

2.1.3 Southern Parcels 61 and 63 Parcel History

The southern portion of the Site is comprised of small portions of Parcel 61 and Parcel 63. This location has been agricultural and utilized for parking. It includes a large storm drain outlet.

2.1.4 Parcels 67 and 68 Parcel History

Parcels 67 and 68 historically included the Ontario ANGS with ancillary structures to the south and east. In the 1950s, a Hangar, fire station, fueling station, and wash rack were constructed at the Site. In 1952, the 196th Tactical Air Support Group was assigned to the Ontario Airport. During this time, the facilities were updated, and operations included the maintenance of aircraft vehicles and aerospace ground equipment. A munitions bunker was constructed in the 1950s and later used by Lockheed in the 1990s for storage of ammunition and explosives. The 196th vacated the Site in 1983 and the 148th Combat Communications Squadron (CBCS) occupied the Site from 1984 through 1998. The ANGS was closed in September 1998.

2.2 Site Physical Description

SITE DETAILS	
Physical Description:	Large airport facility consisting of 24 buildings and Hangars, ancillary structures, and parking facilities. The Site is north of East Avion Street and to the west of the Cucamonga Creek.
Roads:	The Site is located along East Avion Street and ends before reaching the Cucamonga Creek channel. A small portion of the Site connects to South Hellman Avenue.
Parking Facilities:	The Site is utilized for parking large trucks, storage containers, planes, and employee's cars. The primary parking facilities are next to the Ontario International Airport Authority Offices, Guardian Jet Center Hangars, and UPS parking lots. A ramp space on the eastern side of the Site is also used to park planes on.
Site Zoning:	Airport and Industrial
Vicinity Zoning:	Industrial
Site Size (acres):	97 acres
Current Property Use:	Airport maintenance, storage, administration, and filming.
Surface Drainage Direction:	Towards storm drains located on the Site, and then southeast towards the Cucamonga Creek on the eastern side of the Site.

BUILDING DESCRIPTION – Parcel 61	
Number of Buildings:	Fourteen buildings and ancillary structures present.
Building Age:	The first two Hangars were built between 1938 and 1958 based on aerial photographs. The third Hangar was built between 1948 and 1952 based on aerial photographs. Ancillary buildings next to Hangar 1 were built in 1953 based on USGS Topographic maps. According to aerial photos and USGS topographic maps, between 1953 and 1960, the fourth Hangar and ancillary structures next to Hangar 2 are built. Based on aerial photos, between 1960 and 1966 more ancillary structures next to Hangars 1 and 2 are built, including 61W-18 and 61W-22. Between 1966 and 1974 building 61W-32 was built to the north of Hangar 1, according to aerial photographs. Between 1977 and 1980, the large administration building was built and then expanded to connect to Hangar 2 between 1980 and 1985, according to aerial photos.
Building Details	Most buildings were observed to be vacant or used for storage and filming purposes. Building 61W-17 is connected to 61W-18 and the Ontario International Authority Offices building. Buildings 61W-14 and 61W-16 were observed to be connected. Buildings 61W-30 and 61W-22 were also connected.
Basements:	None.
Building Square footage:	Hangars 1, 2, and 3 are approximately 24,000 sf (sf). The large building connected to Hangar 2 is approximately 78,000 sf. The small building connected to the south of Hangar 2 (61W-18) is approximately 6,000 sf. The building to the east of Hangar 2 (61W-20) is approximately 6,500 sf. The structure to the south of Hangar 1 (61W-22) is approximately 27,500 sf. The building to the north of Hangar 1 (61W-32) is approximately 27,000 sf. Hangar 4 is approximately 70,000 sf. The air museum (61W-13) is approximately 7,000 sf. The former N.D.T Lab (61W-16) is approximately 6,800 sf, and 61W-15 is approximately 2,850 sf. Building 61W-29 is approximately 3,000 sf.
Building Occupants:	Airport personnel.
Building Operations:	Airport offices, storage, maintenance, museum, filming.
Building Interior Hazardous Substance Use or Presence:	Leaking 5-gallon buckets of fire suppression chemicals inside Hangar 4 (61W-1). Hazardous Substance Storage building (61W-23). Cleaning sump inside Hangar 1.
Building Exterior Hazardous Substance Use or Presence:	Former USTs and ASTs. Hazardous Substance Storage awnings.
Other:	No access was granted inside of 61W-15, 61W-26, 61W-29, 61W-30A, 61W-30B.

BUILDING DESCRIPTION – Parcel 62	
Number of Buildings:	Two Hangars.
Building Age:	Guardian Jet Center East was built between 1981 and 1985 based on aerial photographs and USGS topographic maps. The southern Hangar was built between 1985 and 1994 based on aerial photographs.
Building Details	Each building was observed to be an airplane Hangar used for storage and maintenance of small planes with office spaces surrounding the main Hangar space.
Basements:	None.
Building Square footage:	The Guardian Jet Center East Hangar is approximately 38,000 sf. The Guardian Jet Center southern Hangar is approximately 21,000 sf.
Building Occupants:	Guardian Jet Center.
Building Operations:	Airplane maintenance and storage. Office spaces.
Building Interior Hazardous Substance Use or Presence:	AFFF suppression system. Petroleum products.
Building Exterior Hazardous Substance Use or Presence:	Clarifiers. Former wash rack with staining and drainage channel observed.
Other:	The former Beechcraft West fuel farm is located at the southern end of Parcel 62.

BUILDING DESCRIPTION - Parcel 63	
Number of Buildings:	None, the area is currently vacant.

BUILDING DESCRIPTION – Parcel 67	
Number of Buildings:	None, the area is currently used as a ramp space for airplanes to park on.

BUILDING DESCRIPTION – Parcel 68	
Number of Buildings:	Five buildings are present at the former National Guard Hangar. The former Cal Air National Guard maintenance yard contains three more buildings.
Building Age:	The former National Guard Hangar, the former Auto shop/Fire House, and boiler room next to the Hangar were built between 1953 and 1960 based on aerial photos and USGS topographic maps. The motorcycle shop was built between 1960 and 1966 according to aerial photos and USGS topographic maps. The ancillary structure to the west of the motorcycle shop was built between 1966 and 1977 according to aerial photos. The remaining buildings within the maintenance yard were built between 1960 and 1966 according to aerial photographs.
Building Details	All buildings were observed to be vacant and deteriorating besides the former Cal Air National Guard Hangar. The Hangar itself is used for filming purposes. A deteriorating U-shaped building surrounds the main Hangar that was formerly used for maintenance and operations.
Basements:	None.
Building Square footage:	The former National Guard Hangar is approximately 45,000 sf and the Auto shop/Fire House is approximately 2,500 sf. The motorcycle shop is approximately 5,000 sf. The boiler room and ancillary structure are approximately 1,000 sf each. The largest building in the maintenance yard is approximately 7,700 sf. The building directly east to that is approximately 4,000 sf. The largest building in the maintenance yard is approximately 7,700 sf. The building directly east to that is approximately 4,000 sf. The third building is approximately 3,000 sf.
Building Occupants:	Vacant.
Building Operations:	The former National Guard Hangar is used for filming.
Building Interior Hazardous Substance Use or Presence:	Boiler room contains petroleum products. Possible AFFF associated with former Fire House operations.
Building Exterior Hazardous Substance Use or Presence:	Former USTs. Historical clarifier.
Other:	Two sheds were present at the maintenance yard.

SITE UTILITIES	
Sewage:	City of Ontario
Electricity:	Southern California Edison Electric
Potable Water:	City of Ontario
Heating System:	Unidentified
Cooling System:	Unidentified
Gas:	Southern California Edison Gas
Other:	None

2.3 Surrounding Properties

SURROUNDING PROPERTIES	
Direction	**Address and Use**
North:	Runways used by the Ontario International Airport, former Southern Pacific Railroad tracks, airport terminals, parking lots, Prime Flight Aviation Services, Airline Cargo Hangars, commercial facilities
Northeast:	Car rental businesses, commercial facilities
East:	Dirt lot, Industrial and some commercial facilities, large warehouses (WAHCA UPS), UPS Airlines
Southeast:	Heavy industrial facilities
South:	East Ontario Metrolink, airport maintenance, industrial and commercial facilities
Southwest:	Heavy industrial, commercial facilities
West:	Guardian Jet Center, FedEx facilities, industrial and some commercial
Northwest:	Residential and commercial, car rental businesses, light industrial on airport grounds, FedEx facility

2.4 Geologic, Hydrogeologic, Hydrologic, and Topographic Conditions

The Site lies within the Chino Basin, a managed groundwater basin that supplies groundwater for municipal, industrial, and agricultural uses. The Chino Basin is an adjudicated basin, with water rights controlled by the Chino Basin Watermaster, in accordance with the Chino Basin Master Plan. The Inland Empire Utility Agency and the Chino Basin Watermaster manage the Chino Basin water supply through a network of stormwater management channels and percolation basins developed to enhance groundwater recharge. The Ely Basins, located southwest of the Site (Figure 1), are a component of this recharge system (Wood, 2019).

Groundwater elevations across the Site have historically ranged between 600 and 645 feet above mean sea level. From 1990 through around 2010, groundwater elevations were generally in a decline with a seasonal variation. Between 2010 and 2015, groundwater elevations increased about 15 feet. This increase is tribute to increased recharge and decreased municipal pumping in the vicinity of the Site. Since 2016, groundwater elevations appear to have stabilized. Groundwater flow direction is predominantly to the southwest near the Site and west-southwest downgradient of the Site.

The Site is located in the Upper Santa Ana Valley, which is bounded by the San Gabriel Mountains and the Cucamonga fault to the north, the Colton-Rialto fault to the east, the Puente Hills and Chino fault to the west, and the Chino Hills, Chino fault, and Santa Ana River to the south-southwest (CDWR, 2006). From the surface to approximately 45 feet below ground surface (bgs) are well graded sand with some fines and gravel. Sandy silt and silt are present beneath the Site

at depths between 45 and 57 feet bgs followed by grained sand to approximately 80 feet bgs (Burns & McDonnell, 2014). Based on observations during Alta's investigation, soil beneath the Site generally consisted of silty sand from the surface to depths explored (10 feet bgs) (Alta, 2020).

Based on the most recent groundwater monitoring data available for the General Electric (GE) Company – Jet Engine Test Cell Facility, located adjacent to the Site, depth to groundwater ranges between 229.61 feet and 265.27 feet below top of casing (TOC) with a groundwater flow direction to the southwest (Wood, 2019).

The Site is located approximately 910 feet above mean seal level (msl) according to the United States Geological Survey (Ontario) 7.5 Minute Topographic Quadrangle map. The Site and surrounding topography slope to the southeast. Surface drainage at the Site currently flows to the south towards catch basins which discharge into three drainage area channels, the West Cucamonga Channel Drainage Area, the Cucamonga Channel Drainage Area, and the Deer Creek Drainage Area. The water is then discharged into the Cucamonga Creek, located on the eastern border of the Site.

Groundwater in the Chino-San Bernardino Basin at the former Ontario ANGS is bounded by the impermeable rock of mountains and hills to the north, west, and south, the Rialto-Colton barrier fault on the east, and the San Jose fault on the northwest. Groundwater occurs primarily within the confined, permeable alluvial sediments interbedded with discontinuous lenses of fine-grained material. The water table in the area of the station is approximately 250 feet bgs and groundwater flow is generally to the west-southwest. Recharge occurs primarily at the northern margin of the basin via infiltration of runoff from the San Gabriel Mountains. Discharge occurs from pumping of wells for agricultural and municipal use and as outflow to the Santa Ana River (Earth Technology Corporation, 1993).

Soils at the former Ontario ANGS are of the Tujunga soil series, which are characterized as nearly level to moderately sloping (0 to 5 percent) soil that formed on alluvial fans in granitic alluvium. The surface layer, which can be up to 10 inches in thickness, is a slightly acidic, brown, loamy sand. The substratum, which can be up to 54 inches in thickness, is a pale brown, coarse sand that is slightly acidic. In some areas, the substratum is composed of gravel that may range from 0 to 30 percent by volume (Science & Technology, Inc. 1990).

Surface drainage is controlled by curbs, gutters and drain inlets and is discharged to the municipal storm drain system. Drain towards the south

SITE DATA	CURRENT AVAILABLE INFORMATION (with Source)
Depth to Groundwater:	229 to 265 below grade (Alta, 2020)
Closest Surface water:	Cucamonga Creek
Groundwater Gradient:	Southwest and west-southwest

3.0 SITE RECONNAISSANCE

A Site reconnaissance was performed on 20, 21, and 22 October 2021 to observe current Site conditions and identify and document potential notable environmental conditions. GSI representatives Vincent Robino and Erika Anderson were accompanied by Nicole Walker, Environmental Planning Manager for Ontario International Airport Authority (OIAA), Cedric Sampson, Airport Security Consultant, and Dan LeBouf of Guardian Jet Center on 20 October 2021. On 21 and 22 October, GSI representatives were escorted by Elisa Grey, Director of

Commercial Real Estate for OIAA, and David Becerril, OIAA Facilities Supervisor. Observations during the reconnaissance are summarized in the table below. Photographs taken during the Site reconnaissance are included in Appendix B.

Observations of Site conditions that may indicate the likelihood of an REC in connection with the Site are discussed in the following Sections. If the observation is indicated with a "yes", a summary of information related to that item is included below, with more detailed information included in Table 1.

GENERAL OBSERVATIONS	Unknown	YES	NO
Heating/Cooling System		X	
Hazardous Substances and Petroleum Products in Connection with Identified Uses		X	
Storage Tanks (current or removed)		X	
Wells (dry, irrigation, injection, monitoring, abandoned, etc.)		X	
Drains, Sumps, Clarifiers		X	
Odors		X	
Pools of Liquid	X		
Drums		X	
Hazardous Substance and Petroleum Products Containers (Not Necessarily in Connection with Identified Uses)	X		
Unidentified Substance Containers	X		
Air Emissions	X		
Equipment that may Contain PCBs		X	
Soil Stockpiles		X	
Pits, Ponds, or Lagoons (Site or adjoining)	X		
Stained Soil or Pavement		X	
Stressed Vegetation from Something other than Insufficient Water	X		
Solid Waste, Construction Debris, Trash Mounds		X	
Wastewater, Storm Water, Discharged Water	X		
Septic Systems or Cesspools	X		

Heating/Cooling System

Heating, ventilation, and air conditioning (HVAC) units were observed along the outside of the former National Guard Hangar, adjacent Motorcycle Shop, Hangar 1, Hangar 2, Hangar 3, and ancillary structures.

Hazardous Substances and Petroleum Products in Connection with Identified Uses

A shed to the northeast of Hangar 3 was identified as a hazardous waste storage shed. This structure was empty during the Site reconnaissance but contained a hazardous yard sign. Historical documents have also identified this location as a hazardous waste storage area. The ancillary structure next to Hangar 4 was observed to be a hazardous waste storage structure. A label on the sliding door read "hazardous waste storage." Flammable Material storage cabinets were observed throughout the three-day Site visit.

Storage Tanks

Historical documents identified and reported the removal of multiple ASTs and USTs. A 1990 Phase I ESA indicated that there were seven USTs associated with the Beechcraft West fuel farm. This area was observed on the Site reconnaissance to be backfilled with soil and gravel. A 1995 Underground Storage Tank Closure report identifies the removal of five USTs adjacent to the former National Guard Hangar. This area was observed to be backfilled with soil and gravel. Three concrete secondary containment structures were observed where aboveground storage tanks used to be held. A UST closure report from 1992 identified five USTs to the west of where the OIAA administration building is, two USTs to the north of Hangar 1 and its ancillary structures, one UST to the northeast of Hangars 1 and 2, two USTs to the southwest of Hangar 2, and one UST to the south of the current Air Museum. Two ASTs were observed in secondary containers inside a shed at the former CANG maintenance yard. AFFF fire suppression tanks were observed inside the Guardian Jet Center Hangars.

Wells

One ground water monitoring well box was observed at the former National Guard maintenance yard but was not accessed during the Site reconnaissance. Based on the figure from a 2021 Work Plan for Soil Vapor and Groundwater Investigation provided by Wood, the monitoring well is from the former GE Engine Services Test Cell facility and is a destroyed monitoring well (Wood, 2021).

Drains, Sumps, Clarifiers

Storm drains were present throughout the Site and water collected from the ground surface is expected to drain towards the Cucamonga Creek. Trench drains were present along the sliding/roll up Hangar doors as well as floor drains inside the Hangars, buildings, and storage sheds.

Multiple clarifiers were present at the Site. Historical documents confirm the presence of these clarifiers. A 1990 and 2001 Phase I ESA identified a 2-stage clarifier on the eastern side of the former National Guard Hangar (Encorp, 1990 & CTL, 2001). A 2008 Phase I ESA identified two clarifiers adjacent to the Guardian Jet Center Hangars (CTL, 2008).

Drums

Multiple drums were observed throughout the Site. A waste oil drum (<55-gallon) within a secondary containment drip pan was observed as well as a larger drum (approximately 85 gallons) inside the boiler room. A 55-gallon drum labeled EA-200 was observed inside a shed within the former maintenance yard. Four oil drums for waste and Jet-A fuel, two gas and oil drums with absorbent pads on top, and a poly drum with unknown liquid was observed inside the Guardian Jet Center southern building. An empty 55-gallon drum labeled 1A2/Y1.2/100 was observed inside the hazardous storage Hangar adjacent to Hangar 4. Two diesel 55-gallon drums and one 55-gallon waste coolant drum in secondary containers was observed inside Building 5.

Equipment that may Contain Polychlorinated Biphenyl (PCBs)

Based on the age of the existing buildings, it is possible that PCBs were used at the Site, including in electrical transformers. Based on a 1997 Phase I ESA conducted by Encorp, PCBs were identified in the lighting fixtures at the former National Guard Hangar. A 1990 Phase I by CDM recommended the sampling of soil around the former transformer pad near the Beechcraft West Fuel Farm for PCBs, as well as the sampling of soil at a former electrical box on the eastern edge of the National Guard lease area. However, no PCBs were reported. The observed exterior transformers did not show indications of spillage or staining during the Site reconnaissance.

Soil Stockpiles

Soil stockpiles were observed at the former National Guard maintenance yard.

Stained Soil or Pavement

Multiple locations across the Site were identified to have staining. A concrete pad with red staining was observed to the east of the Guardian Jet Center Hangars. Inside of the Guardian Jet Center southern Hangar, staining was identified around the AFFF suppression system. The large hydraulic jacks adjacent to Hangar 1 were observed to be leaking oil that had stained the asphalt underneath them.

Solid Waste, Construction Debris, Trash Mounds

The former National Guard maintenance yard was observed to contain stockpiles of cobbles, gravel, asphalt, and mixed contents from previous construction activities.

4.0 HISTORICAL INFORMATION

GSI contracted with ERIS to compile historical documents for the Site and surrounding area to develop an understanding of the history of the Site. The following historical data sources were compiled and are included in the Appendices:

- Sanborn fire insurance maps (Appendix C),
- United States Geological Survey (USGS) topographic maps (Appendix D),
- Aerial photographs (Appendix E), and
- City directories (Appendix F)

Historical Source	Available Dates
Sanborn Fire Insurance Maps (SFIM)	No SFIM were found for the Site or surrounding areas
USGS Topographic Maps (USGS)	Either 7.5- or 15-minute topographic maps were available for 1987, 1900, 1903, 1953, 1954, 1966, 1973, 1981, 2015. Most topographic maps available between 1897 and 1903 were large scale and do not provide detail to decipher changes in the Site use.
Aerial Photographs (AP)	Aerial Photographs were available from 1933, 1938, 1948, 1952, 1960, 1966, 1974, 1977, 1980, 1985, 1994, 2002, 2005, 2006, 2009, 2010, 2012, 2018, and 2020.
City Directories (CD)	City Directories are available for the years 1951, 1965, 1970, 1988, 1998, 2001, 2004, 2008, 2012, 2016, and 2020.

Historical Summary (SFIM, USGS, and AP)			
Year	**Source**	**Site Description**	**Adjacent Site Description**
1897, 1900 and 1903	USGS	Site is vacant with paved and unpaved roads intersecting with the Site. No detailed information is shown.	North: Railroad tracks spanning from the west to east, roads Northeast: Unpaved roads and paved roads East: Sparse buildings/tanks Southeast: Building and tanks, roads South: Two buildings, boundary line Southwest: Roads West: Tank, roads Northwest: Oil tanks/buildings, roads
1933	AP	The Site appears to be vacant.	Northeast: Vineyards, creek flows south East: Creek Southeast: Creek continues, vineyards Southwest: Orchards
1938	AP	No significant change. Potential watermark stain in the middle of the vacant Site.	Northeast: Creek mark has expanded, and vineyards have almost gone away East: Creek mark expanded
1948	AP	Development on the Site has occurred. Two airplane Hangars are present in the northwest corner as well as ancillary taxiways throughout the Site.	North: Runways developed Southeast: Partial loss of vineyards and grading of land West: Development of roadways/taxiways Northwest: Airplanes are present
1952	AP	Another airplane Hangar has been built next to the others.	Southeast: Further grading of the land and loss of vineyards
1953	USGS	Map identifies three large buildings in the northwest portion of the Site. Multiple ancillary buildings are present in the northwest corner of the Site, as well as the symbol for third-order or better elevation, with tablet of 916.	North: Continuation of the Ontario International Airport; landing strips, Southern Pacific Train track running from the west to east, San Bernardino Freeway under construction, airport runways, elevation of 933 labeled in middle of runways Northeast: Building labeled winery and surrounding compound of buildings East: water tanks, structures labeled Air National Guard Southeast: Creek, well, Mountain View School in the corner South: Pacific Union railroad tracks running from the southwest to southeast, Highway 60 running along the railroad, Ontario-Upland Sewage Disposal, wells, Grant boundary line labelled Southwest: Wells at southwest corner, vineyard West: Wells and tanks, ancillary airport structures Northwest: More buildings
1954	USGS	No Significant Changes	Northeast: Winery label gone
1960	AP	Another large building is present on the Site. A parking lot has been developed. Site grounds are further paved and developed for airplane use. A large taxiway was created in the northwest portion of the site where airplanes are parked. Ancillary buildings built in the southwest portion of the Site and northwest corner.	East: Multiple structures have developed Southeast: Orchard size has decreased; building present bordering the Site South: Structures present bordering the Site

1966	AP	Two small buildings are built next to the larger one seen in 1960 and more containers are parked in the southeast and northwest corners of the Site.	East: More structures built Southeast: More buildings present
1966	USGS	No Significant Changes. Elevation of 910 recorded on contour going through the Site.	North: Parking area identified, 2 lane and 3 lane freeway intersecting Northeast: Water tank in the corner, well, borrow pit, Percolation Basin East: Structures labeled Air National Guard, well, creek that flows down from Percolation Basin Southeast: More Wells South: Wells Southwest: Percolation basins, Wells, more structures present West: Structure labeled Fire Station, intermittent stream/river that leads to Percolation Basins Northwest: Factories, Air Museum labeled, school in northwest corner of map, San Bernardino Freeway no longer under construction
1973	USGS	Structures added to already existing buildings on the Site.	Northeast: Ponds located where Percolation Basin used to be East: Air national Guard Station, secondary highway South: Highway 60 running west to east across the bottom of the map, 60 removed from highway next to railroad tracks Southwest: Increase in buildings, possible athletic field West: Fire station, railroad, increase in buildings, well Northwest: Increase in buildings
1974	AP	No detailed information is shown.	No detailed information is shown
1977	AP	More activity on Site with an increase in cars or shipping containers parked. Dark, newly paved, rectangular area in the middle of the Site.	No significant changes
1980	AP	Another building added to the upper northwest corner on the Site.	East: Land has been graded Southwest: Buildings developed Northwest: More buildings developed
1981	USGS	No Significant Changes.	Northeast: Borrow pit removed, dry ponds, wells, water tank above San Bernardino Freeway West: Fire Station removed, levee around part of intermittent stream
1985	AP	The Site has added another building in the upper-middle part.	West: More structures added directly next to the Site
1994	AP	The Site has been further developed with another building added in the middle and paved pathways	East: More buildings developed Southeast: More buildings developed South: More structures developed Southwest: More buildings have been developed
2002	AP	More activity present at the Site.	Southeast: Land is further developed South: More structures have been developed Southwest: land has been further developed
2005	AP	Parking lot developed in southern most portion of the Site.	No Significant Changes.

2006	AP	No Significant Changes.	No Significant Changes.
2009	AP	Parking lot developed in middle of the Site. Small structure removed in the middle-southern part of the Site-staining is noted where structure was removed. Staining also present in southernmost parking lot.	South: Staining present at parking spaces bordering the Southernmost part of the Site Southwest: Staining observed on property next to the Site's main facilities
2010	AP	Parking lot removed from southern most part of the Site.	South: Faint staining still present Southwest: Faint staining still present
2012	AP	No significant changes, except for small structure in northwest corner removed.	No significant changes.
2015	USGS	No detailed information is shown.	No detailed information is shown.
2018	AP	Increased activity on Site. Parked containers especially present in the middle of the Site.	South: Increased activity on surrounding structures-staining possibly covered by parked cars and containers Southwest: Old stain has darkened, and new stain has developed next to it
2020	AP	Continued increase in activity with cars replacing parked containers in the middle of the Site.	South: Faint staining is visible Southwest: Old stain is still present and new stain has been covered by parked containers

5.0 OWNER/USER PROVIDED INFORMATION AND INTERVIEWS

Several reports have been supplied to GSI. A short summary of relevant reports is included below.

5.1 1990 Phase I - Phase II ESAs

CDM, 1990, Portions of Parcels 61, 62, 67, and 68

The Phase I ESA includes four areas *(*"Site 1 through 4"*)* located on the south side of Ontario Airport. Sites 1 and 2 are outside of the South Airport Cargo Center proposed lease area. "Site 3" includes portions of Parcels 61 and 62 and "Site 4" includes portions of Parcels 67 and 68.

Site 3 (Parcels 61 and 62)

Site 3 was covered with vineyards until the early 1940's when they were removed for aircraft tie downs and a taxiway. During the 1990 Site inspection, Site 3 was used as a high-speed driver training area for the San Bernardino County Sheriff's Department. No structures were present, but evidence of previous structures is identified in aerial photographs. Some dark areas on pavement were observed.

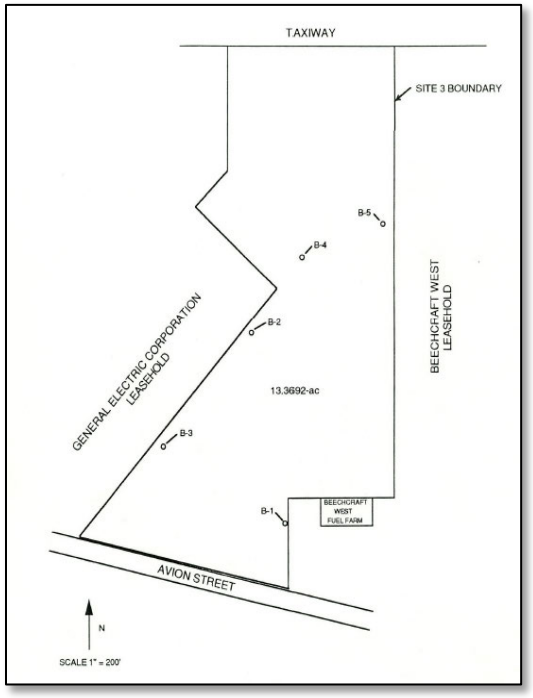
Site 3 is bordered to the south by a Beechcraft West fuel farm that included seven USTs with a total capacity of 88,500-gallons. These USTs were reportedly installed in 1983. To the west is the General Electric Test Cell Facility (General Electric) which is noted to use "significant amounts of several hazardous materials."

In the 1990 report, it is indicated that potential sources of impact to Site 3 may include the Beechcraft West fuel farm, a former electric box, discolored asphalt areas in the north-central part of the Site, and the border of General Electric, where drums of hazardous materials were stored.

Site 4 (Parcels 67 and 68)

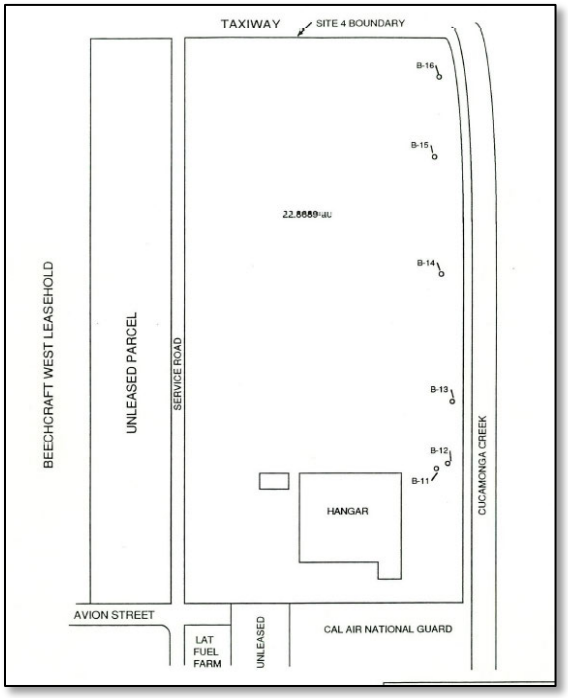
Site 4 was primarily covered with vineyards until the mid-1940's, when a dirt access road was added, and a skeet range was developed. Much of the vineyards remained until the late 1950's. During the 1990 Site inspection, Site 4 was utilized for storage that included "some light water mix (3-6%), which is used as a fire-fighting agent." Police vehicle and training equipment are stored in the Hangar located at the Site and a 2-stage clarifier was present on the eastern side of the Hangar which included a dark fluid. A former electrical box is located along the eastern edge of the Site and a pad for a former above-ground storage tank (AST) is identified along the eastern border. No documentation of the AST contents was available for review.

Site 4 is bordered to the south by a fuel farm operated by Lockheed. It is noted that fuel spills have occurred at this location and were under investigation at the time of the 1990 report. An inactive UST is located south of the CANG Site near Jurupa Road. Cucamonga Creek is present as the eastern border of the Site and is a concrete lined channel.



The report notes that potential sources of impact to Site 4 may include soil contamination near the former AST, a Test Cell, a former electrical box, and the 2-stage clarifier. In addition, it was noted that some imported soil was stored in the northeast corner of Site 4.

Recommended Phase II Investigation



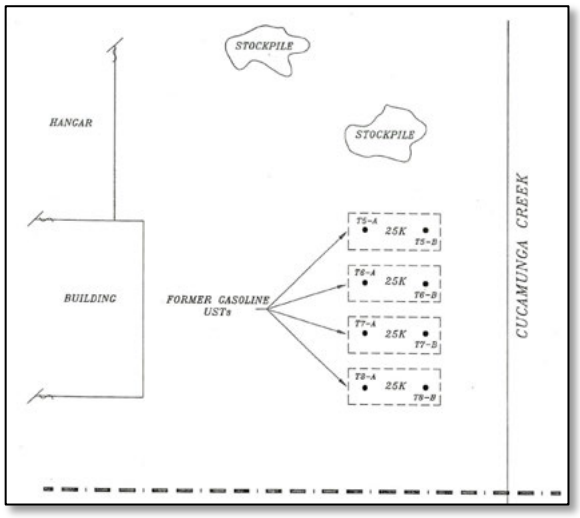
The following investigation was recommended for Sites 3 and 4 based on the results of the Phase I investigation.

Site 3) Sampling of soils around the transformer pad for possible polychlorinated biphenyls (PCBs). This pad is located along the eastern edge of the property.
Site 3) Soil/Gas survey on different colored areas, north end of Site.
Site 3) Soil/Gas survey along General Electric border near storage area.
Site 3) Soil/Gas survey near Beechcraft West fuel farm.
Site 4) Sampling, characterization, and proper disposal of clarifier fluid.
Site 4) Soil/Gas survey near clarifier.
Site 4) Sampling at electrical station on eastern border for possible PCBs.
Site 4) Soil/Gas survey near former Engine Test Cell location.
Site 4) Soil/Gas survey at former AST location along eastern edge of property.
Site 4) Soil boring at northeast corner at the former disposal site.

Site 3 (Parcel 61 & 62) Sample Locations

Site 4 (Parcel 67 & 68) Sample Locations

Results of sampling and analysis did not show significant subsurface impact from on-Site sources and no further action was recommended other than the removal of clarifier fluid from the 2-stage clarifier in Site 4.



5.2 1995 Underground Storage Tank Closure Report

El Capitan Environmental Services, 1995, Portions of Parcel 68
