Appendix D

Noise Data

Construction Source Noise Prediction Model

	Distance to Nearest	Combined Predicted		Reference Noise Levels	Usage
Location	Receptor in feet	Noise Level (L _{eq} dBA)	Equipment	(L _{max}) at 50 feet ¹	Factor ¹
			Dump Truck	84	0.4
Nearby Receptors	50	85.2	Flat Bed Truck	84	0.4
			Excavator	85	0.4

Ground Type	hard
Source Height	8
Receiver Height	5
Ground Factor ²	0.00

Predicted Noise Level ³	L _{eq} dBA at 50 feet ³
Dump Truck	80.0
Flat Bed Truck	80.0
Excavator	81.0

Combined Predicted Noise Level (L_{eq} dBA at 50 feet) 85.2

Sources:

¹Obtained from the FHWA Roadway Construction Noise Model, January 2006. Table 1.

² Based on Table 4-26 from the Federal Transit Noise and Vibration Impact Assessment, 2018 (pg 86).

³ Based on the following from the Federal Transit Noise and Vibration Impact Assessment, 2018 (pg 176 and 177).

 $L_{eq}(equip) = E.L.+10*log (U.F.) - 20*log (D/50) - 10*G*log (D/50)$

Where: E.L. = Emission Level;

U.F.= Usage Factor;

G = Constant that accounts for topography and ground effects (FTA 2018: pg 86); and

D = Distance from source to receiver.

Construction Source Noise Prediction Model

FHWA Roadway Construction Noise Model, January 2006. Table 9.1

U.S. Department of Transportation

CA/T Construction Spec. 721.560

KEY: Orange cells are for input.

Grey cells are intermediate calculations performed by the model.

Green cells are data to present in a written analysis (output).

STEP 1: Determine units in which to perform calculation.

- If vibration decibels (VdB), then use Table A and proceed to Steps 2A and 3A.
- If peak particle velocity (PPV), then use Table B and proceed to Steps 2B and 3B.

STEP 2A: Identify the vibration source and enter the reference vibration level (VdB) and distance.

STEP 3A: Select the distance to the receiver.

Table A. Propagation of vibration decibels (VdB) with distance

Noise Source/ID	Reference Noise Level]	Attenuated Noi	se Le	vel at Receptor
	vibration level		distance		vibration level		distance
	(VdB)	@	(ft)		(VdB)	@	(ft)
NA]			

The Lv metric (VdB) is used to assess the likelihood for vibration to result in human annoyance.

STEP 2B: Identify the vibration source and enter the reference peak particle velocity (PPV) and distance.

STEP 3B: Select the distance to the receiver.

Table B. Propagation of peak particle velocity (PPV) with distance

Noise Source/ID	Reference Noise Level			Attenuated Noi	se Lev	vel at Receptor
	vibration level		distance	vibration level		distance
	(PPV)	@	(ft)	(PPV)	@	(ft)
large bull dozer	0.089	@	25	0.305	@	11

The PPV metric (in/sec) is used for assessing the likelihood for the potential of structural damage.

Notes:

Computation of propagated vibration levels is based on the equations presented on pg. 185 of FTA 2018. Estimates of attenuated vibration levels do not account for reductions from intervening underground barriers or other underground structures of any type, or changes in soil type.
