Executive Summary

Roux Associates, Inc. (Roux), on behalf of BTC III San Jose Logistics Center LP (BTC III), prepared this *Preliminary Environmental Assessment Equivalent Report* (PEA-E Report) for the Former Frito Lay Facility, located at 650 North King Road in the City of San Jose, County of Santa Clara, California (Site; Figures 1 and 2). The Site consists of an approximately 8.95-acre parcel developed with four commercial buildings (an approximately 120,000 square-foot [SF] building [Buildings 2 and 3, which are connected], an approximately 7,800 SF building [Building 1], and an approximately 950 SF building [Building 4]) and asphalt-paved parking areas, identified as the main parcel. The Site also includes an approximately 1.76-acre linear strip of land that formerly operated as railroad right-of-way (RR ROW) along the northern portion of the Site. The 8.95-acre developed portion of the Site is bounded by Las Plumas Avenue to the south, King Road to the west, and commercial properties to the north and east and is currently occupied by various non-manufacturing tenants. The 1.76-acre former RR ROW portion of the Site is bounded by King Road to the west, Educational Park Drive to the east; commercial/industrial properties to the south; and commercial/industrial and residential properties to the north.

Based on topographic maps and aerial photographs, the Site was used for agricultural purposes from at least 1939 through 1963. By 1975, Building 1 was constructed. Building 2 was constructed by 1968 and Frito-Lay occupied the Site from at least 1966 through 1996. Building 3 was constructed in the southeast portion of the Site by 1982 and Building 4 was constructed to the west of Building 2 by 1999. The 1.76-acre former RR ROW appears to have been developed with railroad tracks by 1974. The first known subsurface investigation at the Site was conducted in 1990 for the removal of the three on-Site fuel oil underground storage tanks (USTs). The USTs were approximately 5,000-gallon, 15,000-gallon, and 20,000-gallon (Path Forward Partners, Inc. [Path Forward], 2020a). In 1990 and 1994, soil, soil vapor, and groundwater samples were collected beneath the USTs and associated piping in the former tank pit. Concentrations of total petroleum hydrocarbons as gasoline (TPH-g), TPH as diesel (TPH-d), benzene, toluene, ethylbenzene, and xylene (BTEX) were not detected above laboratory reporting limits of in soil and groundwater. Path Forward concluded that “minimum levels” of petroleum hydrocarbons, specifically methyl tert-butyl ether (MTBE), benzene, toluene, and xylene, at maximum concentrations of 3.8, 1.8, 2.3, and 5.3 micrograms per liter (mg/L), respectively, were present in soil vapor in the former UST area. A closure report was submitted to the oversight agency (San Francisco Bay Regional Water Quality Control Board [SF-RWQCB]) and closure was granted by the SF-RWQCB in a letter dated March 28, 1995 (Path Forward, 2020a).

Path Forward prepared a Phase I Environmental Site Assessment (ESA) for the Site in 2020. The Phase I ESA was prepared in support of potential property acquisition by BTC III (Path Forward, 2020a). Based on the findings of the Phase I ESA, Path Forward identified two recognized environmental conditions (RECs): (1) former fuel oil USTs and (2) current and past tenant operations.

Considering the RECs identified in the Phase I ESA, Path Forward performed a Subsurface Site Investigation in August and September 2020. As part of the Subsurface Site Investigation, Path Forward collected a total of 20 soil samples from 10 borings at depths ranging from 0.5 to 3 feet below ground surface (bgs). A total of 10 soil vapor samples were collected at 5 feet bgs with the exception of one soil vapor sample (B05-SG-2.0) collected at 2 feet bgs. Soil samples were analyzed for the following:

- TPH-g;
- TPH-d;

- TPH as motor oil (TPH-mo);
- Volatile organic compounds (VOCs);
- Semi-volatile organic compounds (SVOCs);
- Polycyclic aromatic hydrocarbons (PAHs);
- Organochlorine pesticides (OCPs);
- Polychlorinated biphenyls (PCBs); and
- Title 22 Metals.

Soil vapor samples were analyzed for VOCs. The results of the Subsurface Site Investigation indicated OCP (technical chlordane) and arsenic concentrations in soil regulatory screening levels (SLs) for commercial/industrial land use. In addition, benzene, chloroform, tetrachloroethene (PCE), and trichloroethene (TCE) concentrations in soil vapor exceeded the SLs for commercial/industrial land use. Based on the results of the Path Forward's Subsurface Site Investigation, additional investigation was recommended to evaluate the extent of VOC impacts to the subsurface.

As recommended in Path Forward's Subsurface Site Investigation, Apex Companies, Inc. (Apex), on behalf of BTC III, conducted a Site Investigation to evaluate the extent of soil and groundwater impacts in October 2020. As part of the Site Investigation, Apex collected a total of 18 soil samples at depths ranging from 0.5 to 8 feet bgs and eight groundwater samples. The soil samples were analyzed for the following:

- TPH-g;
- TPH-d;
- TPH-mo;
- VOCs;
- OCPs; and
- Title 22 Metals.

The groundwater samples were analyzed for the following:

- TPH-g;
- TPH-d;
- TPH-mo; and
- VOCs.

The soil sample results for antimony, arsenic, and lead in soil exceeded the regulatory SLs for commercial/industrial land use. The groundwater sample results for naphthalene and vinyl chloride exceeded the SF-RWQCB vapor intrusion human health risk environmental screening levels (ESLs) in two of eight samples collected but were below the California Maximum Contaminant Levels (MCLs). Apex concluded that elevated concentrations of metals in soil were associated with the former RR ROW.

In February 2021, Roux conducted a vapor intrusion (VI) investigation to evaluate subsurface soil vapor and indoor air conditions. A total of eight indoor air samples were collected, co-located with sub-slab sampling locations, and a total of three outdoor air samples were collected concurrently with indoor air samples. Benzene and methylene chloride were the only VOCs detected at concentrations exceeding the regulatory

SLs in indoor air. A comparison between the sub-slab, indoor, and outdoor air samples indicate that VOCs exceeding regulatory SLs were likely attributable to indoor and outdoor air sources and not vapor intrusion. Based on the results of Roux's VI investigation, no mitigative actions were recommended. Roux recommends sampling indoor air, sub-slab soil vapor, and outdoor air every 6 months at Building 2 only, while Building 2 is occupied, to confirm vapor intrusion conditions have not changed.

Roux conducted a Supplemental Site Investigation (SSI) concurrently with the VI investigation to define the nature and extent of environmental impacts to shallow soils along the former RR ROW and a former on-Site rail spur to the immediate north of main building (Building 2). In February 2021, Roux advanced 83 borings to depths ranging from 0.5 to 5 feet bgs and analyzed a total of 132 soil samples for gasoline range organics (GRO), diesel range organics (DRO), oil range organics (ORO), SVOCs, OCPs, PCBs, Title 22 Metals, and/or herbicides.[1] Based on the initial results of the SSI, an additional 19 borings were placed at the Site in March 2021; 29 soil samples were collected at depths ranging from 0.5 to 5 feet bgs and analyzed for GRO, DRO, ORO, and Title 22 Metals. The results of the SSI indicated that concentrations of arsenic, lead, and DRO exceeded the conservative screening thresholds.

Based on the comprehensive results of investigations performed at the Site between 2020 and 2021, Roux concludes the following:

- OCPs, PCBs, VOCs, SVOCs, and PAHs concentrations were less than the not detected above USEPA RSLs or DTSC SLs in soil samples collected at the Site.
- Herbicides concentrations were less than the not detected above laboratory RLs in soil samples collected at the Site.
- Elevated concentrations of arsenic and lead are limited to shallow soil in a few isolated areas and are entirely associated with the former rail spur and RR ROW.
- DRO concentrations in one soil sample exceeded the SF-RWQCBESLs. GRO and ORO concentrations were less than the ESLs in other soil samples.
- Soil vapor and sub-slab analytical results from the Path Forward and Roux investigations indicate that concentrations of benzene, bromodichloromethane, bromoform, chloroform, methylene chloride, PCE, and TCE exceed commercial/industrial screening levels for soil vapor when using a conservative attenuation factor of 0.03.
- The highest PCE concentrations in soil vapor are in the northwestern portion of the Site (Figure 5).

To further evaluate potential risk from exposure of Site chemicals of potential concern (COPCs) to future construction workers and/or indoor and outdoor commercial/industrial workers of the Site, a Human Health Screening Evaluation (HHSE) was performed. The risk characterization process integrated the results of the data evaluation, exposure assessment, and toxicity assessment to provide a quantitative estimation of non-carcinogenic and carcinogenic risks. The results of the HHSE for cumulative risk from soil and soil vapor exposures are summarized as follows:

[1] Carbon ranges for TPH analyses conducted by Path Forward and Apex's laboratory are: TPHg - C6 to C12; TPHd – C10 to C23; TPHo – C18 to C36. Carbon ranges for TPH analyses by Roux's laboratory are: GRO – C6 to C10; DRO – C10 to C28, and ORO – C28 to C44.

Outdoor Commercial/Industrial Workers:

- Former RR ROW: The non-cancer risk estimate for a future outdoor commercial/industrial worker exposed to soil in the former RR ROW slightly exceeds the non-cancer target risk threshold of 1 (1.7E+00). The cancer risk estimate for a former RR ROW future outdoor commercial/industrial worker is below the most conservative end of 1E-06 to 1E-04 target cancer risk range (5.5E-7).
- Main Parcel: The non-cancer risk estimate for a future outdoor commercial/industrial worker exposed to soil in the main parcel does not exceed the non-cancer target risk threshold of 1 (6.8E-01). The cancer risk estimate for a main parcel future outdoor commercial/industrial worker is within the 1E-06 to 1E-04 target cancer risk range (2.1E-06).

Construction Workers:

- Former RR ROW: The non-cancer risk estimate for a future construction worker exposed to soil in the former RR ROW exceeds the non-cancer target risk threshold of 1 (2.9E+01). The cancer risk estimate for a former RR ROW future construction worker is within the 1E-06 to 1E-04 target cancer risk range (3.1E-06).
- Main Parcel: The non-cancer risk estimate for a future construction worker exposed to soil in the main parcel exceeds the non-cancer target risk threshold of 1 (2.9E+01). The cancer risk estimate for a main parcel future construction worker is within the 1E-06 to 1E-04 target cancer risk range (3.7E-06).

Indoor Commercial/Industrial Workers:

- While the high-end cancer and non-cancer risk estimates using the 0.03 attenuation factor (AF) slightly exceed the respective cancer and non-cancer thresholds (1.6E-04 and 1.9E+00), the low-end cancer and non-cancer risk estimates using the 0.0005 AF do not exceed cancer or non-cancer thresholds for future commercial/industrial indoor worker exposure to indoor air (2.7E-06 and 3.1E-02).

Cumulative Cancer and Non-Cancer Risks by Receptor

Media Receptor	Non-Cancer Risk Total Hazard Index (HI)	Cancer Risk Total Incremental Lifetime Cancer Risk (ILCR)
Soil (Former RR ROW)		
Future Commercial/Industrial Outdoor Worker	1.7E+00	5.5E-07
Future Construction Worker	2.9E+01	3.1E-06
Soil (Main Parcel)		
Future Commercial/Industrial Outdoor Worker	6.8E+01	2.1E-06
Future Construction Worker	2.9E+01	3.7E-06
Indoor Air		
Future Commercial/Industrial Indoor Worker	3.1E-02 – 1.9E+00	2.7E-06 – 1.6E-04

Based on the results of Site investigations, risk evaluation, and the intended future industrial use of the Site, Roux considers the Site ready for preparation of a Removal Action Workplan (RAW). Conceptually, the RAW will evaluate the following elements:

- Construction of a sub-slab vapor intrusion mitigation system (VIMS);

- Limited excavation and/or on-Site management of shallow soils where lead and arsenic exceed regulatory thresholds;

- Preparation of a Soil Management Plan (SMP) for implementation during future on-Site grading activities;

- Preparation of an Operation, Monitoring, & Maintenance Plan (OM&M Plan) subject to negotiation of an OM&M Agreement to define the long-term operation, maintenance, sampling and reporting of the VIMS and any associated monitoring/sampling probes and inspection and maintenance of a cap if on-Site soil management is selected; and,

- Recording of a land use covenant (LUC) as an institutional control to disclose risks, restrictions, and conditions of the Site to future buyers and occupants.

1. Introduction

Roux Associates, Inc. (Roux), on behalf of BTC III San Jose Logistics Center LP (BTC III), prepared this *Preliminary Environmental Assessment Equivalent Report* (PEA-E Report) for the Former Frito Lay Facility, located at 650 North King Road in the City of San Jose, County of Santa Clara, California (Site; Figures 1 and 2). BTC III acquired the Site in January 2021 for industrial development. Specifically, BTC III proposes to demolish the existing buildings and develop the Site with a 208,000 square-foot (SF) light industrial building. The conceptual industrial development plan is shown on Figure 3. A Standard Voluntary Agreement (SVA) between BTC III and the California Department of Toxic Substances Control (DTSC) was executed by BTC III and sent to DTSC via email on May 3, 2021. The DTSC executed the SVA on May 6, 2021. This PEA-E Report was prepared in accordance with the DTSC's October 2015 PEA Guidance Manual (DTSC, 2015a).

The Site consists of an approximately 8.95-acre parcel developed with commercial buildings and asphalt-paved parking areas, identified as the main parcel. The Site also includes an approximately 1.76-acre linear strip of land that operated as former railroad right-of-way (RR ROW) along the northern portion of the Site. The 8.95-acre developed portion of the Site is bounded by Las Plumas Avenue to the south, King Road to the west, and commercial properties to the north and east. The 1.76-acre former RR ROW portion of the Site is bounded by King Road to the west, Educational Park Drive to the east; commercial/industrial properties to the south; and commercial/industrial and residential properties to the north. The Site was historically used for agricultural purposes, including an orchard, row crops, and farm related operations, from at least 1939 until 1963 (Path Forward, 2020a). The 1.76-acre former RR ROW appears to have been developed with railroad tracks by 1974. The following four current commercial buildings were developed on Site:

- An approximately 120,000 SF warehouse and office building (Building 2, 650 North King Road [constructed by 1968] and Building 3, 1805 Las Plumas Avenue [constructed by 1982] are connected but referred to as two different buildings);

- An approximately 7,800 SF office building (Building 1, 646 North King Road [constructed by 1975]); and

- An approximately 950 SF office building (Building 4, 658 North King Road [constructed by 1999]).

Frito-Lay occupied the Site from at least 1966 through 1996. Subsequent tenants include a printing company, computer business college, a furniture manufacturing company, produce wholesale businesses, and moving and storage companies (Path Forward, 2020a). Previous tenants at the Site do not represent a significant environmental concern to the Site, except for Frito-Lay. At the time of Roux's investigations in February and March 2021, Building 4 is vacant. The Site is currently occupied by various non-manufacturing tenants.

In 2020, BTC III retained Path Forward Partners, Inc. (Path Forward) to complete a Phase I Environmental Site Assessment (ESA) of the Site. Path Forward's Phase I ESA identified two recognized environmental conditions for the Site (RECs; Path Forward, 2020a):

1. A limited area of petroleum hydrocarbon and volatile organic compound (VOC) impacted soil vapor around the former fuel oil underground storage tank (UST) pit from the previous Frito-Lay operations; and

2. The use of hazardous materials and petroleum products by former and current industrial tenants.

In August and September 2020, Path Forward performed a Subsurface Site Investigation to evaluate identified RECs at the Site, as well as investigate former uses such as agricultural and RR ROW. Path Forward reported that concentrations of organochlorine pesticides (OCPs) and metals detected exceeded the conservative regulatory screening levels (SLs). VOCs concentrations in soil vapor also exceeded the conservative regulatory SLs. Based on its findings, Path Forward recommended further investigation. Path Forward also recommended a human health screening evaluation (HHSE) from vapor intrusion (VI) into indoor air. In October 2020, Apex Companies, LLC (Apex), on behalf of BTC III conducted an additional Site investigation. The results of the investigation showed metals in soil associated with the former RR ROW exceeded the San Francisco Bay Regional Water Quality Control Board (SF-RWQCB) environmental screening levels (ESLs) for commercial/industrial land use and isolated detections of naphthalene and vinyl chloride in groundwater exceeded the SF-RWQCB ESLs for groundwater VI human health risks.

Roux conducted a VI investigation in February 2021 and collected indoor air samples co-located with sub-slab sampling locations. Roux also conducted a Supplemental Site Investigation (SSI) to further evaluate the nature and extent of metals (arsenic and lead) impacts along the former RR ROW. In March 2021, Roux conducted an additional investigation to further delineate metal impacts along the former RR ROW, as well as along a former on-Site rail spur. The results of the VI investigation and the SSI showed no significant impacts to indoor air and delineated the impacts along the former RR ROW and on-Site rail spur, respectively. The results of these investigations are presented in this PEA-E report. The PEA-E Report includes a summary of all historical investigations, evaluation of risks to current and future users and workers of the Site (HHSE, Appendix A), a conceptual site model (CSM), and recommendations for mitigation and/or remediation in support of proposed Site industrial redevelopment.

1.1 Objectives

The objectives of the PEA-E are to:

- Present the complete history of the Site, including former uses and environmental investigations;
- Evaluate the nature and extent of chemicals of potential concern (COPCs) in Site soils and soil vapor and identify remaining data gaps, if any;
- Calculate the risks to current and future users and workers of the Site from potential exposure to COPCs at the Site;
- Evaluate the need for mitigation and/or remedial action(s) necessary to reduce or eliminate potential risks to human health and/or the environment; and
- Develop a mitigation and/or remediation strategy to allow for Site industrial redevelopment.

1.2 Scope of Work

The scope of work detailed in this report includes the following:

- Evaluation of historical data and information for the Site, as documented in Phase I ESA and Site investigation reports;
- Documentation of the VI and SSI investigations completed by Roux in 2021;

- Completion of an HHSE to quantify and evaluate risk from COPCs that have been identified at the Site.

- Completion of a CSM to identify COPCs, the media affected, potential exposure pathways, and remaining data gaps, if any; and,

1.3 Report Organization

The remaining sections of this PEA-E Report are organized as follows:

- Section 2.0 presents background information, including Site history and a summary of previous environmental investigations;

- Section 3.0 describes the Site's environmental setting and CSM;

- Section 4.0 provides a summary of results and discussion;

- Section 5.0 provides a discussion of the HHSE;

- Section 6.0 presents the summary and conclusions;

- Section 7.0 presents Roux's recommendations for the Site; and

- Section 8.0 provides a list of references used in this PEA-E Report.

2. General Background

2.1 Site Identification Information

The Site consists of two parcels: an approximately 8.95-acre parcel developed with three commercial buildings (Assessor's Parcel Number [APN] 254-54-023) and an approximately 1.76-acre former RR ROW located along the northern portion of the Site (APN 254-55-013). There are four buildings at the Site: (1) an approximately 7,800 SF building identified by street address 646 North King Road (Building 1), (2) an approximately 120,000 SF building identified by street addresses 650 North King Road and 1805 Las Plumas Avenue (Buildings 2 and 3, which are connected), and (3) an approximately 950 SF building identified by street address 658 North King Road (Building 4; Figure 2). The Site is located in an area of commercial/industrial use. The 8.95-acre developed portion of the Site is bounded by Las Plumas Avenue to the south, King Road to the west, and commercial properties to the north and east and is currently occupied by various non-manufacturing tenants. The 1.76-acre former RR ROW portion of the Site is bounded by King Road to the west, Educational Park Drive to the east; commercial/industrial properties to the south; and commercial/industrial and residential properties to the north (Figure 2).

2.2 Site Geology and Hydrogeology

2.2.1 Site Geology

The Site is situated in the Coast Ranges of California's geomorphic provinces, which are composed of thick Mesozoic and Cenozoic sedimentary strata (California Department of Conservation, 2002). The Coast Ranges are parallel to the San Andreas Fault, extending from Point Arena to the Gulf of California. The Site is also situated an area of Pliocene to Holocene-age alluvial continental deposits. The alluvial generally consists of unconsolidated to semi-consolidated gravel, sand, silt, and clay (California's Groundwater Bulletin 118, 2004). The Site is underlain by the Santa Clara Formation, which consists of bedded conglomerate, sandstone, siltstone, mudstone, and compacted siltstone and claystone.

According to the Site Investigation Report, prepared by Apex, dated January 13, 2021, soil on Site generally consists of silt and gravel in the upper 5 feet, followed by clays with lenses of sand and gravel. This was confirmed during Roux's SSI and data gap investigations conducted in February and March 2021.

2.2.2 Site Hydrogeology

The Site is located within the northwestern section of the Santa Clara Subbasin of Santa Clara Valley Groundwater Basin, which runs parallel to the Coast Ranges. The Santa Clara Subbasin is bounded on the west by the Diablo Range and on the east by the Santa Cruz Mountain (California's Groundwater Bulletin 118, 2004). An inland valley drains to the north by tributaries to San Francisco Bay, including Coyote Creek, Los Gatos Creek, and Guadalupe River. Precipitation ranges from approximately 16 inches in the valley to approximately 28 inches in the upland areas per year.

From the 1900's through the 1960's, groundwater elevation was decreasing due to over-pumping, which resulted in subsidence in the Santa Clara subbasin and saltwater intrusion (California's Groundwater Bulletin 118, 2004). With a groundwater recharge program and imported water from the Hetch Hetchy Aqueduct and South Bay Aqueduct, groundwater elevation has been increasing since 1965.

Throughout the Santa Clara Basin, the primary groundwater bearing sediments are contained within the Pleistocene to Holocene alluvium (California's Groundwater Bulletin 118, 2004). The site-specific depth to groundwater was reported at approximately 6.60 to 9.37 feet bgs (Apex, 2021).

2.3 Summary of Site History

Roux has prepared a summary of the Site's historical uses, tenants, and operations using sources from previous reports. Site history has been documented based on a review of information presented in the following reports:

- Subsurface Site Investigation Report, prepared by Path Forward, dated December 10, 2020;
- Phase I Environmental Site Assessment, prepared by Path Forward, dated December 11, 2020; and
- Site Investigation Report, prepared by Apex, dated January 13, 2021.

Analytical results of subsurface investigations conducted at the Site were compared to the following:

- Background Concentrations of Trace and Major Elements in California Soil, Kearney Foundation Special Report, Kearney Foundation of Soil Science, Division of Agriculture and Natural, Resources University of California, dated March 1996 (Kearney, 1996);
- Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region, Dylan Jacques Duvergé, dated December 2011 (Duvergé, 2011);
- California Water Boards Maximum Contaminant Levels (CA MCLs), dated April 2019 (California Water Boards, 2019);
- United States Environmental Protection Agency Regional Screening Levels (USEPA RSLs), dated November 2020 (USEPA, 2020);
- DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note Number 3 Screening Levels (DTSC SLs), dated June 2020 (DTSC, 2020); and
- SF-RWQCB ESLs, dated January 2019 (SF-RWQCB, 2019).

Historical sources referencing the Site include topographic maps dated from 1889 through 2012 and aerial photographs from 1939 through 2016 (Appendix B). Initial development of the Site is first evidenced in an aerial photograph taken in 1939, with the Site and surrounding areas appearing to be developed primarily for agricultural purposes (i.e., farm related structures, orchards, and row crops). The agricultural operations are depicted on Site in aerial photographs through 1963. The 1956 aerial photograph indicates commercial buildings to the northwest and residential development to the southeast. An increase in development is present in the surrounding area with more residences and commercial buildings in 1963, and agriculture in the surrounding area appears to be on the decline. In aerial photographs from 1968, the Site was developed with Building 2. By 1975, Building 1 was constructed. Frito-Lay occupied the Site and manufactured chips and pork rinds until 1996. Building 3 was constructed in the southeast portion of the Site by 1982 and Building 4 was constructed to the west of Building 2 by 1999. The Site appears relatively unchanged since the 2006 aerial photograph (Path Forward, 2020a).

Based on listings in City directories, Frito-Lay occupied the Site from at least 1966 through 1996. Path Forward reported that past tenants of the on-Site warehouses and commercial space also include various college institutions, self-storage, U-Haul, and other commercial/industrial businesses (Path Forward, 2020a).

2.4 Previous Environmental Investigations

Roux reviewed historical environmental investigations and other relevant studies conducted at the Site. Previous environmental investigation reports were provided to DTSC.

2.4.1 Phase I Environmental Site Assessment (Path Forward, 2020a)

In December 2020, Path Forward prepared a Phase I ESA in support of potential property acquisition by BTC III (Path Forward, 2020a). Path Forward identified two recognized environmental conditions (RECs), as summarized below:

- **Former fuel oil USTs.** Two fuel oil USTs were removed in 1986, and one additional fuel oil UST was removed in 1990. Confirmation sampling results were indicative of a release, and the impacted soil was excavated. Subsequent confirmation sampling suggested no residual contamination remain on Site. In August 1990, a soil vapor investigation was conducted in the former UST area. Path Forward concluded that VOCs and "minimal levels" of petroleum hydrocarbons, specifically methyl tert-butyl ether (MTBE), benzene, toluene, and xylene, at maximum concentrations of 3.8, 1.8, 2.3, and 5.3 micrograms per liter (mg/L), respectively, were present in the subsurface of the former UST area. Of the petroleum hydrocarbons detected in the former UST area, MTBE and benzene exceeded the calculated soil vapor screening levels (SVSLs) where an attenuation factor of 0.03 was applied to the DTSC SLs or the SF-RWQCB ESLs. A closure report was submitted to the oversight agency, the SF-RWQCB, and closure was granted on March 28, 1995. Despite the UST Case Closure status, Path Forward identified the residual soil vapor impacts associated with the historical USTs as a REC because the soil vapor concentrations exceed current regulatory SLs.

- **Current and Past Tenant Operations.** At the time of the Site reconnaissance, Path Forward observed staining on the building slab in Buildings 2 and 3. Tenants at the time, including Progressive Solutions, Air 1, and Odwalla stored and used hazardous material and petroleum products for their operations. Path Forward identified the hazardous material and petroleum products on Site and poor housekeeping protocols as a REC.

In regard to the former USTs, Frito-Lay operated three USTs on the 650 North King Road property: (i) an approximately 5,000-gallon fuel oil UST; (ii) a 15,000-gallon fuel oil UST; and (iii) an approximately 20,000-gallon fuel oil UST. During the tank removal of the 5,000-gallon and 20,000-gallon USTs in 1986, damage to the tar coating was identified, and a hole was observed in the 5,000-gallon tank. Soil samples collected beneath the two tanks were analyzed for TPH as diesel (TPH-d), and results were indicative of a release. In August 1986, impacted soils were locally excavated around the tank pit to a depth of 16 feet. In September 1986, a groundwater monitoring well was installed in the tank pit to determine whether groundwater quality was adversely affected. There were no detections of TPH-d in the groundwater sample.

In 1990, the remaining 15,000-gallon UST and associated piping were removed. The UST was observed in good condition and no visual evidence of impacts from the UST were reported. Soil samples collected beneath the tank pit and the piping trench pit were analyzed for TPH as gasoline (TPH-g), TPH-d, and benzene, toluene, ethylbenzene, and xylenes (BTEX) with no detections exceeding the laboratory RLs. In August 1990, a soil vapor investigation was conducted in the tank pit, which consisted of nine sampling locations at a depth of 4 feet bgs. Based on the soil vapor sampling results, the former tank pit was

characterized as having detectable levels of VOCs and “minimal level of petroleum hydrocarbons” (Path Forward, 2020a).

In 1994, confirmation samples were collected from one boring in the former tank pit, and the groundwater monitoring well was also resampled. Confirmation samples were analyzed for TPH-g and BTEX. No detections exceeding the laboratory reporting limits were reported in groundwater or soil samples collected at depths of 9, 12, and 15 feet bgs. The SF-RWQCB reviewed the UST removal and investigation reports and granted UST Case Closure on March 28, 1995. This confirmed completion of Site investigations and remedial actions associated with the former USTs.

Path Forward also identified two de minimis conditions, as summarized below.

- **Historical Agricultural Use.** Based on historical documents, the Site was used for agricultural purposes from at least 1393 through 1963. Although undocumented, the use of agricultural chemicals, such as pesticides, herbicides, and fertilizers, was commonplace for similar operations at that time. There is no documentation of known impacts from agricultural use. Path Forward identified the potential residual chemical use from historical agricultural operations as a de minimis condition.

- **Historical Release of PCBs**. According to a listing on the California Hazardous Material Incident Reporting System (CHMIRS), a faulty transformer released approximately 97 gallons of PCB-containing oil in February 1997. The leak was contained and cleaned up; however, there are no records of cleanup activities or subsequent confirmation sampling, which Path Forward identified as a de minimis condition.

Considering the RECs and de minimis conditions identified for the Site, a subsurface investigation was recommended to assess soil and soil gas conditions at the Site.

2.4.2 Subsurface Site Investigation (Path Forward, 2020b)

Path Forward conducted a Subsurface Site Investigation based on the findings of their Phase I ESA. In August and September 2020, a total of 10 borings were advanced using direct-push technology, and a single-nested soil vapor probe was installed at each location (Figures 4 and 5). A total of 20 soil samples were collected at 0.5 and 3 feet bgs and analyzed for TPH-g, TPH-d, and TPH as motor oil (TPH-mo), VOCs, SVOCs, polycyclic aromatic hydrocarbons (PAHs), OCPs, PCBs, and Title 22 Metals (Path Forward, 2020b).

Soil results were compared to the SF-RWQCB ESLs, dated January 2019, for unrestricted land use scenario, commercial/industrial scenario, and construction worker scenario and the Federal and California hazardous waste criteria. Given the proposed industrial redevelopment of the Site, below is a summary of soil results compared to the SF-RWQCB ESLs for commercial/industrial scenario. Refer to Appendix B for the remaining comparisons in Path Forward’s Subsurface Site Investigation Report.

- Technical chlordane was detected in one sample (B05-S-0.5) at a concentration of 7.6 milligrams per kilogram (mg/kg), exceeding the ESL of 2.2 mg/kg.

- Arsenic was detected in five samples (B01-S-0.5, B01-S-3.0, B05-S-4.0, B07-S-3.0, and B10-S-3.0) at concentrations ranging from 12 to 13 mg/kg, exceeding the SF-RWQCB ESL of 0.31 mg/kg, the USEPA RSL of 3.0 mg/kg, the DTSC SL of 0.36 mg/kg, and the upper bound background concentration of 11 mg/kg (Kearney, 1996, and Duvergé, 2011).

A total of 10 soil vapor samples were collected and analyzed for VOCs. Soil vapor results were compared to the SF-RWQCB Human Health Vapor Intrusion ESLs for commercial/industrial scenario.

- Chloroform was detected in two samples (B02-SG-5.0 and B06-SG-5.0) at concentrations ranging from 34 to 64 micrograms per cubic meter (µg/m³), exceeding the ESL of 18 µg/m³.
- PCE was detected in six samples (B01-SG-5.0, B03-SG-5.0, B04-SG-5.0, B06-SG-5.0, B07-SG-5.0, and B08-SG-5.0) at concentrations ranging from 82 to 3,250 µg/m³, exceeding the ESL of 67 µg/m³.
- TCE was detected in one sample (B01-SG-4.0) at a concentration of 165 µg/m³, exceeding the ESL of 100 µg/m³.

Of the ten soil vapor samples, seven samples had a cumulative cancer risk that exceeded the target cancer risk threshold of 1E-06 with a range from 3.1E-06 to 4.9E-05. The primary risk drivers were identified as chloroform, PCE, and TCE.

No other constituents were detected at concentrations exceeding the laboratory reporting limits (RLs) or ESLs in soil or soil vapor. The full laboratory analytical reports are included in Path Forward's Subsurface Site Investigation Report, provided as Appendix B.

Path Forward recommended additional investigation to evaluate the extent of VOC impacts to the subsurface, including groundwater, and that an evaluation of human health risk to current site workers due to VI be conducted.

2.4.3 Site Investigation Report (Apex, 2021)

In October 2020, Apex, on behalf of BTC III, conducted a Site investigation to evaluate the extent of potential impacts, specifically TPH-g, TPH-d, TPH-mo, VOCs, OCPs, and metals, to soil and groundwater. A total of 10 borings were advanced using direct-push technology (Figure 4). A total of 18 soil samples were collected at 0.5, 3, and 8 feet bgs (deeper samples were placed on hold, pending analysis of the shallower samples) and analyzed for TPH-g, TPH-d, TPH-mo, VOCs, OCPs, and Title 22 Metals (Apex, 2021).

Soil results were compared to the SF-RWQCB ESLs for commercial/industrial scenario and construction worker scenario. Given the proposed industrial redevelopment of the Site, below is a summary of soil results compared to the SF-RWQCB ESLs for commercial/industrial scenario. Refer to Appendix B for the construction worker scenario comparison in Apex's Site Investigation Report.

- Antimony was detected in one sample (B-19) at a concentration of 180 mg/kg, exceeding the ESL of 160 mg/kg and the upper bound background concentration of 1.95 mg/kg (Kearney, 1996). However, the reported concentration was below the USEPA RSL of 470 mg/kg.
- Arsenic was detected in five samples (B-11, B-12, B-17, B-19, and B-20) at concentrations ranging from 17 to 430 mg/kg, exceeding the ESL of 0.31 mg/kg, the USEPA RSL of 3.0 mg/kg, the DTSC SL of 0.36 mg/kg, and the upper bound background concentration of 11 mg/kg (Kearney, 1996, and Duvergé, 2011).
- Lead was detected in two samples (B-19 and B-20) at concentrations ranging from 440 to 1,300 mg/kg, exceeding the ESL of 320 mg/kg, the USEPA RSL of 800 mg/kg, the DTSC SL of 320 mg/kg, and/or the upper bound background concentration of 97.1 mg/kg (Kearney, 1996).

Eight temporary groundwater monitoring wells were installed at 16 and 20 feet bgs. Groundwater samples were collected from each temporary well and analyzed for TPH-g, TPH-d, TPH-mo, and VOCs. Groundwater results were compared to the SF-RWQCB Groundwater Vapor Intrusion Human Health ESLs for commercial/industrial scenario.

- Naphthalene was detected in one sample (B-15) at a concentration of 46 µg/L, exceeding the ESL of 20 µg/L. No CA MCL exists for naphthalene.

- Vinyl chloride was detected in one sample (B-13) at a concentration of 0.24 µg/L, exceeding the SF-RWQCB Groundwater Vapor Intrusion Human Health Risk Level ESL of 0.14 µg/L. However, the reported concentration was below the CA MCL of 0.5 µg/L.

No other constituents were detected at concentrations exceeding the laboratory RLs, ESLs, or MCLs in soil or groundwater. The full laboratory analytical reports are included in Apex's Site Investigation Report, provided as Appendix B.

Apex stated that the antimony, arsenic, and lead exceedances in soil were likely associated with the historical RR ROW operations.

2.4.4 Vapor Intrusion Investigation (Roux)

In February 2021, Roux conducted a VI investigation to evaluate sub-slab soil vapor and indoor air conditions and to identify potential VI risks to current tenants of Buildings 2 and 4, if any. Roux documented the VI Investigation in a Vapor Intrusion Investigation Summary Memorandum, dated May 14, 2021 (Appendix B). The scope of work included eight sub-slab Vapor-Pins® (SS-1 through SS-8) located in Buildings 2 and 4, eight indoor air samples, and three outdoor air samples (IA-1 through IA-8 and OA-1 through OA-3; Figure 5). All indoor air samples were co-located with a sub-slab sample location (Figure 5). The three outdoor air samples were selected based on the prevailing wind direction and adjusted based on Site conditions to secure sampling equipment.

Analytical results for select VOCs in indoor air, outdoor air, and sub-slab samples are summarized in Table 1. The full laboratory analytical reports are included in Appendix C. Indoor and outdoor air samples were compared to USEPA RSLs for Composite Worker Air (USEPA, 2020) and DTSC SLs for Commercial/Industrial Air (DTSC, 2020).

Consistent with the February 2020 DTSC Supplemental Guidance: Screening and Evaluating Vapor Intrusion (Draft Supplemental Guidance; DTSC, 2020a), an attenuation factor of 0.03 was applied to the USEPA RSLs and DTSC SLs to calculate soil vapor screening levels (SVSLs) to which sub-slab samples were compared.

Summary of Indoor Air, Outdoor Air, and Sub-Slab Select VOC Data

Compound	Sub-Slab Range (µg/m^3)	Number of Detections Above SLs	Indoor Air Range (µg/m^3)	Number of Detections Above SLs	Outdoor Air Maximum (µg/m^3)
1,1,1-Trichloroethane	3.2 – 19	0	<0.055[(a)]	0	<0.055
1,1-Dichloroethane	<1.2 - <10	0	<0.04	0	<0.04
1,1-Dichloroethene	<1.2 - <10	0	<0.04	0	<0.04
Acetone	6.6 – 110	0	NA[(b)]	0	NA
Benzene	<0.96 - <7.7	0	**0.49 – 1.0[(c)]**	8	**0.44**
Chloroform	6.7 – **1,600**	2	0.10 – 0.29	0	0.13
Cis-1,2-Dichloroethene	<1.2 - <9.5	0	<0.04	0	<0.04
Ethylbenzene	<1.3 - <10	0	0.15 – 1.9	0	0.14
Isopropanol (IPA)	4.7 – 26	0	NA	0	NA
Methylene Chloride	8.8 – **430**	1	1.0 - **14**	1	5.2
Tetrachloroethene	24 – **520**	2	0.072 – 0.89	0	<0.068
Toluene	1.5 – 3.9	0	0.71 - 12	0	0.65
Trans-1,2-Dichloroethene	<1.2 – <9.5	0	<0.04	0	<0.04
Trichloroethene	15	0	0.074 – 0.28	0	<0.054
Vinyl Chloride	<0.77 - <6.10	0	<0.026	0	<0.026
Xylene (total)	5.4	0	0.64 – 8.0	0	0.61

(a) <X = analyte not detected above laboratory reporting limit shown.
(b) NA = not analyzed.
(c) Bold value indicates exceedance of at least one SL.

Based on the analytical results of the VI investigation, Roux concluded the following:

- The observed PCE and TCE attenuation from sub-slab to indoor air was roughly an order of magnitude lower than the conservative USEPA attenuation factor of 0.03. PCE and TCE were not detected above their DTSC SLs in any of the indoor air samples.

- Benzene was detected in all indoor and outdoor air samples, but not detected in any sub-slab samples. Detections of benzene in outdoor air are similar to indoor air, indicating that outdoor air is most likely impacting indoor air.

- Methylene chloride was detected in all indoor and outdoor air samples and in only two sub-slab samples. Methylene chloride is commonly found in paint strippers, adhesives, lubrication products, and general cleaners, which may have contributed to concentrations detected in indoor air.

Based on the results of Roux's VI investigation, no additional mitigative actions were recommended for Buildings 2 or 4. Roux recommends repeating indoor air, sub-slab soil vapor, and outdoor air sampling every 6 months at Building 2 only (Building 4 is currently vacant), while the building is occupied, to confirm vapor intrusion conditions have not changed. Once Building 2 is no longer occupied, additional VI sampling will not be needed.

2.4.5 Supplemental Site Investigation (Roux)

In February 2021, Roux conducted an SSI to screen for and delineate potential environmental impacts to shallow soils along the former RR ROW. Roux documented the SSI Investigation in a Supplemental Site Investigation Summary Memorandum, dated May 18, 2021 (Appendix B). A total of 83 borings were advanced using a hand auger (Figures 6a through 6c) and 132 soil samples were collected at 0.5, 2, 3, and 5 feet bgs (deeper samples were placed on hold, pending analysis of the shallower samples). Soil samples were analyzed for the following (Tables 2 through 5):

- Title 22 Metals – 129 samples (3 samples were analyzed for arsenic and lead only);
- TPH-Carbon Chain (TPH-cc): GRO, DRO, and ORO[2] - 82 samples; and
- SVOCs, OCPs, PCBs, and herbicides - 12 samples.

All soil samples were analyzed for metals (some only arsenic and lead) and all 0.5-foot samples were analyzed for TPH-cc. A select number of deeper samples were also analyzed for TPH-cc. The approximately 2,300-foot-long former RR ROW was divided into roughly eight equal units. Soil samples for SVOC, OCP, PCB, and herbicides analysis were selected within the eight units to achieve coverage of the former RR ROW.

Soil results were compared to one or more of the following:

- Background Concentrations of Trace and Major Elements in California Soil, Kearney Foundation Special Report, Kearney Foundation of Soil Science, Division of Agriculture and Natural, Resources University of California, dated March 1996 (Kearney, 1996);
- Establishing Background Arsenic in Soil of the Urbanized San Francisco Bay Region, Dylan Jacques Duvergé, dated December 2011 (Duvergé, 2011);
- USEPA RSLs for Composite Worker Soil (USEPA RSLs), dated November 2020 (USEPA, 2020);
- DTSC SLs for Commercial/Industrial Soil, dated February 2020 (DTSC, 2020b); and
- SF-RWQCB Tier 1 ESLs for soil, dated January 2019 (SF-RWQCB, 2019).

Summary of Soil Metals Data

Compound	Detection Range (mg/kg)	Number of Detections Above Background	Number of Detections Above USEPA RSLs	Number of Detections Above DTSC SLs
Arsenic	**1.3 – 200**[(a)]	55	126	130
Lead	4.2 – **1,500**	22	1	11

(a) Bold value indicates exceedance of at least one SL.

Seven additional metals (antimony, cadmium, cobalt, copper, molybdenum, nickel, and zinc) exceeded their respective background concentrations, but were below their respective USEPA RSLs and DTSC SLs. The

[2] Carbon ranges for TPH analyses conducted by Path Forward and Apex's laboratory are: TPHg - C6 to C12; TPHd – C10 to C23; TPHo – C18 to C36. Carbon ranges for TPH analyses by Roux's laboratory are: GRO – C6 to C10; DRO – C10 to C28, and ORO – C28 to C44.

only other soil exceedance was DRO, which was detected in seven samples at concentrations ranging from 310 to 620 mg/kg above the ESL of 260 mg/kg. No other constituents were detected above background concentrations or regulatory SLs. The full laboratory analytical reports are included in Appendix C.

Arsenic concentrations were detected above the background concentration of 11 mg/kg (Kearney, 1996, and Duvergé, 2011) in 14 deeper soil samples at concentrations ranging from 12 to 58 mg/kg. Based on detections above the background concentration in the deeper soil samples, Roux recommended additional soil sampling to vertically delineate potential metals impacts and characterize contaminants along the former RR ROW. Additionally, a rail spur historically existed on the Site to the immediate north of Building 2, parallel to the RR ROW. Previous sampling along the rail spur was limited and Roux recommended collecting additional shallow soil samples to delineate potential metals impacts.

2.4.6 Additional SSI Soil Investigation (Roux)

In March 2021, Roux conducted an additional SSI investigation consisting of an additional 19 shallow borings along the former RR ROW and rail spur. A total of 39 soil samples were collected from depths of 0.5 to 5 feet bgs (deeper samples were placed on hold, pending analysis of the shallower samples). Soil samples were analyzed for the following (Tables 2 through 5):

- Title 22 Metals – four samples;
- Arsenic and lead only - 25 samples; and
- TPH-cc: GRO, DRO, and ORO - four samples.

Soil results were compared to the same screening criteria as in the February sampling event. A comprehensive summary of metal exceedances from the SSI and the data gap investigation is provided below. The full laboratory analytical reports are included in Appendix C.

Summary of Soil Metals Data

Compound	Detection Range (mg/kg)	Number of Detections Above Background	Number of Detections Above USEPA RSLs	Number of Detections Above DTSC SLs
Arsenic	**1.2 – 200**	68	152	158
Lead	3.5 – **1,500**	28	1	11

(a) Bold value indicates exceedance of at least one SL.

Arsenic concentrations exceeded the background concentration of 11 mg/kg (Kearney, 1996, and Duvergé, 2011) in five deeper soil samples at concentrations ranging from 12 to 41 mg/kg (Figures 6a through 6c). Further sampling to delineate the total vertical limit of arsenic above background concentrations at these five locations will be completed as part of soil excavation activities. Based on the comprehensive suite of data for the Site, horizontal and vertical delineation of soil, soil gas, and groundwater is considered complete.

3. Environmental Setting

3.1 Conceptual Site Model

American Society for Testing and Materials (ASTM, 2013) defines a CSM as a written and/or graphical representation of an environmental system and the biological, physical, and chemical processes that govern the transport of contaminants from sources through environmental media to environmental receptors within the system. The CSM is based on all available information and identifies the potential risk(s) a site may pose to human health and/or the environment such that appropriate assessment or sampling strategies can be developed. The findings of these assessments may, in turn, be used to update the CSM.

A simplified CSM for the Site is presented in the table below, including only complete or potentially complete exposure pathways. In simple terms, the Site may pose a risk to human receptors via exposure to metals in near surface soils or via exposure to chlorinated VOCs present in soil vapor. A more detailed exposure pathway analysis is included in the HHSE, which is summarized in Section 5.0 and included in its entirety as Appendix A to this report.

Primary Source	Secondary Source	Exposure Media	Exposure Route	Receptor
Historical on-Site Releases	Impacted Soil	Soil	Ingestion, dermal contact, or inhalation of particles	• Future Construction Worker • Future Outdoor Commercial/Industrial Worker
	Impacted Soil Vapor	Indoor Air	Inhalation	• Future Indoor Commercial/Industrial Worker

Historical Site activities, including use of a portion of the Site as a former RR ROW, may have introduced certain heavy metals (arsenic and lead) to shallow Site soils. As a result, these constituents have been shown to be present at concentrations that exceed regulatory thresholds in near-surface soils at a few specific locations. Therefore, a potentially complete exposure pathway exists for future construction workers and future commercial/industrial workers to be impacted by near-surface soils. This exposure could involve risk to human health resulting from inhalation, ingestion, and/or dermal contact with the potentially impacted materials.

Based on the available data, it appears that that VOCs (primarily PCE and TCE) associated with the former Frito-Lay maintenance operations were released at the Site and impacted shallow soil vapor. Conservatively considering the potential for vapor intrusion into a future on-Site building, there is a potentially complete pathway for exposure of future construction workers and future commercial/industrial workers to inhalation risks associated with VOCs.

3.2 Soil Pathway

The main parcel (APN 254-54-023) is currently developed with a concrete slab beneath the four commercial buildings with asphalt-paved parking areas. While the current soil exposure pathway is incomplete on the main parcel due to surficial asphalt and concrete cover, future exposure to disturbed soil containing COPCs is possible. Thus, the soil pathway is considered a complete exposure pathway and was quantitatively evaluated in the HHSE for future receptors. While the former RR ROW (APN 254-55-013) is mostly unpaved

with overgrown vegetation and small portions of asphalt-paved parking areas, only future exposure to surface and disturbed subsurface soil was quantitatively evaluated in the HHSE as it is protective of current exposure scenarios.

3.3 Groundwater/Surface Water Pathway

Depth to groundwater at the Site ranges from approximately 6.60 to 9.37 feet bgs (Apex, 2021). Groundwater in the vicinity of the Site is not a drinking water source. Therefore, no complete exposure pathway exists. Moreover, eight groundwater samples were analyzed for TPH-g, TPH-d, TPH-mo, and VOCs and all detections were below CA MCLs.

Because there are no surface water bodies proximal to the Site, exposure to impacted surface water is not considered a complete exposure pathway. A future land use covenant (LUC) will restrict shallow groundwater from being used for drinking water purposes at the Site.

3.4 Air Pathway

Given the detections of VOCs in soil vapor samples collected in Buildings 2 and 4 at the Site, the indoor air pathway is considered a potentially complete exposure pathway and inhalation of indoor air was quantitatively evaluated in this HHSE (Figure 2). Current exposure to indoor air was not quantitatively evaluated because the consideration of a future exposure scenario (assuming the absence of any remedial action) is protective of current conditions. That said, future construction on the main parcel will include a sub-slab vapor intrusion mitigation system (VIMS) with passive ventilation. Nevertheless, exposure via the indoor air pathway for future receptors was conservatively evaluated in the HHSE using current conditions that will not be representative of indoor air levels after these mitigating measures have been installed.

No buildings are present within the former RR ROW and no buildings are anticipated to be built on this parcel due to the unique characteristics of the parcel (a narrow right of way). Thus, indoor air is not considered a complete exposure pathway within the former RR ROW exposure unit and was not evaluated in this HHSE.

4. Results and Discussion

This section presents a summary of the findings of the previous environmental investigations conducted at the Site. Results for detected analytes in indoor air, outdoor air, sub-slab, soil vapor, groundwater, and soil are presented in Tables 1 through 5 for Roux's investigations and in Appendix B for previous investigations.

4.1 Soil Sample Results

In August and September 2020, a total of 20 soil samples were collected from 10 borings as part of Path Forward's Subsurface Site Investigation. Soil samples were analyzed for TPH-g, TPH-d, TPH-mo, VOCs, SVOCs, PAHs, OCPs, PCBs, and Title 22 Metals.

In October 2020, a total of 18 soil samples were collected from 10 borings as part of Apex's Site investigation. Soil samples were analyzed for TPH-g, TPH-d, TPH-mo, VOCs, OCPs, and Title 22 Metals.

In February and March 2021, a total of 161 soil samples were collected from 102 borings as part of Roux's SSI investigations. Soil samples were analyzed for the following:

- 28 samples were analyzed for arsenic and lead only;
- 133 samples were analyzed for Title 22 Metals;
- 86 samples were analyzed for GRO, DRO, and ORO; and
- 12 samples were analyzed for OCPs, PCBs, SVOCs, and herbicides.

The results of the soil analyses from these investigations are provided in Tables 2 through 5 and Appendix B and presented below. Site maps showing soil boring locations and concentrations of arsenic and lead are on Figures 6a through 6c.

- **Antimony**: Antimony was detected in 42 soil samples at concentrations ranging from 0.64 mg/kg (B02-S-0.5) to 180 mg/kg (B-19-0.5). Of the 42 antimony detections, none exceed the USEPA RSL (470 mg/kg). However, 28 antimony detections are greater than the upper bound background concentration of 1.95 mg/kg (Kearney, 1996).
- **Arsenic**: Arsenic was detected in 188 soil samples at concentrations ranging from 1.2 mg/kg (SB-102-2) to 430 mg/kg (B-19-0.5). Of the 188 arsenic detections, all samples exceeded the USEPA RSL (3.0 mg/kg) and/or DTSC SL (0.36 mg/kg). However, only 78 of the arsenic detections are above the upper bound background concentration of 11 mg/kg (Kearney, 1996, and Duvergé, 2011).
- **Cadmium**: Cadmium was detected in 26 soil samples at concentrations ranging from 0.47 mg/kg (SB-65-0.5) to 12 mg/kg (SB-29-0.5). Of the 26 cadmium detections, none exceed the USEPA RSL (980 mg/kg) or the DTSC SL (780 mg/kg). .
- **Cobalt**: Cobalt was detected in 163 soil samples at concentrations ranging from 1.4 mg/kg (SB-15-2) to 94 mg/kg (B-19-0.5). Of the 163 cobalt detections, none exceed the USEPA RSL (350 mg/kg).
- **Copper**: Copper was detected in 163 soil samples at concentrations ranging from 9.0mg/kg (B03-S-0.5) to 2,900 mg/kg (B-19-0.5). Of the 163 copper detections, none exceed the USEPA RSL (47,000 mg/kg).

- **Lead**: Lead was detected in 191 soil samples with concentrations ranging from 3.0 mg/kg (B03-S-0.5) to 1,500 mg/kg (SB-49-0.5). Of the 191 lead detections, 13 samples exceeded the USEPA RSL (800 mg/kg) and/or the DTSC SL (320 mg/kg), and 30 of the lead detections exceed the upper bound background concentration of 97.1 mg/kg (Kearney, 1996).

- **Molybdenum**: Molybdenum was detected in 139 soil samples at concentrations ranging from 0.51 mg/kg (B-13-0.5) to 630 mg/kg (B-19-0.5). Of the 139 molybdenum detections, none exceed the USEPA RSL (5,800 mg/kg).

- **Nickel**: Nickel was detected in 163 soil samples at concentrations ranging from 1.9 mg/kg (SB-67-2) to 2,200 mg/kg (B03-S-0.5). Of the 139 nickel detections, none exceed the USEPA RSL (22,000 mg/kg) or the DTSC SL (11,000 mg/kg).

- **Selenium**: Selenium was detected in 18 soil samples at concentrations ranging from 0.64 mg/kg (B02-S-3.0) to 2.7 mg/kg (B-19-0.5). Of the 18 selenium detections, none exceed the USEPA RSL (5,800 mg/kg).

- **Zinc**: Zinc was detected in 163 soil samples at concentrations ranging from 21 mg/kg (SB-70-2) to 3,500 mg/kg (B-19-0.5). Of the 163 zinc detections, none exceed the USEPA RSL (350,000 mg/kg).

- **Other Metals**: A total of 191 soil samples were collected and analyzed for metals. A total of seven other metals, including barium, beryllium, chromium, mercury, silver, thallium, and vanadium, were reported at concentrations greater than the laboratory RLs. However, the reported concentrations were less than the USEPA RSLs and DTSC SLs and within the typical background concentrations for California soils.

- **TPH**: TPH-d/DRO was detected in 42 soil samples at concentrations ranging from 12 mg/kg (SB-40-0.5) to 620 mg/kg (SB-5-0.5). Of the 42 TPH-d/DRO detections, 7 exceed the ESL (260 mg/kg).

- **OCPs**: A total of 50 soil samples were collected and analyzed for OCPs. A total of 14 OCPs were reported at concentrations above laboratory RL. However, the reported concentrations were below USEPA RSLs and DTSC SLs, except for technical chlordane. Technical chlordane was detected at a concentration exceeding the DTSC SL (6.1 mg/kg) in one soil sample (B05-S-0.5 at 7.6 mg/kg).

- **PCBs**: A total of 32 soil samples were collected and analyzed for PCBs. One PCB, arochlor-1260, was reported at a concentration greater than the laboratory RL in one sample. However, the reported concentration was less than the USEPA RSL and DTSC SL.

- **VOCs**: A total of 38 soil samples were collected and analyzed for VOCs. A total of four VOCs were reported at concentrations greater than the laboratory RLs. However, the reported concentrations were less than the USEPA RSLs and DTSC SLs in all the soil samples analyzed.

- **SVOCs**: A total of 32 soil samples were collected and analyzed for SVOCs. A total of three SVOCs were reported at concentrations greater than the laboratory RLs. However, the reported concentrations were less than the USEPA RSLs and DTSC SLs in all the soil samples analyzed.

- **PAHs**: A total of 20 soil samples were collected and analyzed for PAHs. A total of 15 PAHs were reported at concentrations greater than the laboratory RLs. However, the reported concentrations were less than the USEPA RSLs and DTSC SLs in all the soil samples analyzed.

- **Herbicides**: Herbicides concentrations were less than the laboratory RLs in all 12 soil samples analyzed.

Based on the comprehensive soil analytical results collected from 2020 to 2021, arsenic and lead are considered the COPCs for shallow soil along the former RR ROW and rail spur. Except for five isolated areas where arsenic concentrations at the deepest samples collected exceed general background concentrations (four along the former RR ROW and one along the former rail spur), soil has been completely investigated and delineated, and no other data gaps exist for the Site.

Given that arsenic and lead are considered the COPCs for shallow soil along the former RR ROW and rail spur at the Site, the DTSC *Proven Technologies and Remedies Guidance – Remediation of Metals in Soil* (PT&R guidance; DTSC, 2008) was used to evaluate potential remedies. The PT&R Guidance was developed by the DTSC to provide users with an expedited option for cleanup of sites impacted with metals in soils. The remedial options identified in the PT&R Guidance are (1) containment by capping and (2) excavation and off-site disposal. The PT&R Guidance describes certain site characteristics that favor the PT&R approach (Section 3.2 of the PT&R Guidance) and the following apply to the Site:

- Primarily metals impact
    - Shallow soil impacts are primarily metals.
- Low potential for surface water impact
    - The closest surface water body (Overfelt Gardens) is approximately 2,500 feet to the east of the Site.
- No ecological habitat or sensitive receptors
    - No ecological habitat or sensitive receptors are expected or have been identified in the vicinity of the Site.
- Low potential for groundwater impact
    - Metals impacts at the Site do not contact groundwater and are not detected in the capillary fringe.
- Shallow contamination
    - With a few isolated exceptions metals impacts at the Site are generally less than 5 feet bgs.

Based on the PT&R Guidance, containment by capping and/or excavation and off-Site disposal will be evaluated in a forthcoming Removal Action Workplan (RAW).

4.2 Soil Vapor Sample Results

In August and September 2020, a total of 10 soil vapor samples were collected at depths of 2 and 5 feet bgs from 10 borings as part of Path Forward's Subsurface Site Investigation. In February 2021, a total of eight sub-slab samples were collected as part of Roux's VI investigation. All soil vapor samples were analyzed for VOCs.

A total of 39 VOC analytes were detected at concentrations greater than the laboratory RLs. These concentrations were compared to the USEPA SVSLs and DTSC SVSLs, using an attenuation factor of 0.03, in accordance with the Draft Supplemental Guidance. The results of the soil vapor analyses from Roux's and Path Forward's investigations are presented in Table 1 and Appendices B and C.

- **Benzene**: Benzene was detected in nine soil vapor samples at concentrations ranging from 2.2 µg/m^3 (B06-SG-5.0) to 226 µg/m^3 (B01-SG-5.0). Of the nine soil vapor samples, five exceeded the DTSC SVSL (14 µg/m^3) and/or USEPA SVSL (53.3 µg/m^3).

- **Bromodichloromethane**: Bromodichloromethane was detected in two soil vapor samples at concentrations ranging from 7 µg/m^3 (B02-SG-5.0) to 12 µg/m^3 (SB-6-20210215) Of the two soil vapor samples, one exceeded the DTSC SVSL (11 µg/m^3) and USEPA SVSL (11 µg/m^3).

- **Bromoform**: Bromoform was detected in one soil vapor samples at a concentration of 35 µg/m^3 (SS-6-20210215). The bromoform concentration was less than the DTSC SVSL (367 µg/m^3) and USEPA SVSL (367 µg/m^3).

- **Chloroform**: Chloroform was detected in five soil vapor samples at concentrations ranging from 6.7 µg/m^3 (SS-4-20210215) to 1,600 µg/m^3 (SS-3-20210215). Of the five chloroform detections, four exceeded the USEPA SVSL (17.7 µg/m^3). No DTSC SL has been established for chloroform.

- **Methylene Chloride**: Methylene chloride was detected in six soil vapor samples at concentrations ranging from 1.3 µg/m^3 (B08-SG-5.0) to 430 µg/m^3 (SS-1-20210215). Of the six methylene chloride detections, one sample exceeded the DTSC SVSL (400 µg/m^3). Methylene chloride concentrations were less than the USEPA SVSL (40,000 µg/m^3).

- **PCE**: PCE was detected in 15 soil vapor samples at concentrations ranging from 2.0 µg/m^3 (B02-SG-5.0) to 3,250 µg/m^3 (B03-SG-5.0 and B07-SG-5.0). Of the 15 PCE detections, 8 exceed the DTSC SVSL (66.7 µg/m^3) and/or USEPA SVSL (1,567 µg/m^3).

- **TCE**: TCE was detected in six soil vapor samples at concentrations ranging from 9.1 µg/m^3 (B04-SG-5.0) to 165 µg/m^3 (B01-SG-5.0). Of the six TCE detections, one sample exceeded the USEPA SVSL (100 µg/m^3). TCE concentrations were less than the DTSC SVSL (267 µg/m^3).

- **Other VOCs**: Several additional VOCs were detected at concentrations greater than the laboratory RLs. However, the reported concentrations were less than the USEPA SVSLs and DTSC SVSLs.

- The leak check compound (LCC), helium, was detected above acceptable concentrations in one soil vapor sample from Roux's VI investigation. According to the Soil Gas Advisory, "an ambient air leak up to 5 percent is acceptable if quantitative tracer testing is performed by shrouding" (Cal/EPA, 2015). The helium detection at SS-1 (0.86 percent) was slightly above 5 percent of the average helium field readings (0.83 percent) while the sample was being collected. This indicates that indoor air could have leaked into the sub-slab sample at location SS-1 potentially biasing the sample results at this location low. However, based on the data collected as part of the VI investigation the results at SS-1 are considered useable for their intended purpose.

- The LCC, 1,1-difluoroethane, was not detected above acceptable concentrations in any soil vapor samples from Path Forward's Subsurface Site Investigation.

Based on the comprehensive soil vapor analytical results collected from 2020 to 2021, PCE is considered the COPC for soil vapor based on the concentrations of PCE detected at the northwestern portion of Building 2. Soil samples collected by Path Forward (B01 and B03) and Apex (B-12, B-13, and B-17) and groundwater samples collected by Apex (B-12, B-13, and B-17) from the western portion of the former RR ROW and rail spur were not indicative of VOC impacts. Given the absence of PCE in soil and groundwater in the presumed areas of the release, it appears that PCE concentrations are limited to soil vapor near the northern boundary of Building 2 and there are no significant sources of mass on the property. Additionally, soil vapor concentrations at locations radially away from probes B03 and B07 attenuate sharply further

supporting the conclusion that a significant source of PCE does not exist at the property. Therefore, Roux concludes that soil vapor has been completely investigated and delineated and no data gaps for soil vapor exist for the Site.

4.3 Indoor and Outdoor Air Sample Results

As part of Roux's VI investigation, a total of nine indoor air samples (eight primary, one duplicate) and three outdoor air samples were collected. All indoor and outdoor air samples were analyzed for 14 select VOCs based on the sub-slab results and PCE daughter products (Table 1).

Of the 14 VOC analytes, only 8 were detected above laboratory RLs and compared to the USEPA RSLs and DTSC SLs. The results of the indoor and outdoor air analyses from Roux's VI investigation are presented in Table 1. The full laboratory analytical reports are included in Appendix C.

- **Benzene**: Benzene was detected in all three outdoor air samples at concentrations ranging from 0.41 to 0.44 µg/m^3. Benzene was detected in all nine indoor air samples at concentrations ranging from 0.49 µg/m^3 (IA-4-20210215) to 1.0 µg/m^3 (IA-5-20210215). Of the nine benzene detections in indoor air, all exceeded the DTSC SL (0.42 µg/m^3). Benzene concentrations detected in indoor air samples were less than the USEPA RSL (1.6 µg/m^3).

- **Toluene**: Toluene was detected in all three outdoor air samples at concentrations ranging from 0.59 to 0.65 µg/m^3. Toluene was detected in all nine indoor air samples at concentrations ranging from 0.71 µg/m^3 (IA-4-20210215) to 12 µg/m^3 (IA-5-20210215). Of the nine toluene detections in indoor air, none exceeded the DTSC SL (1,300 µg/m^3) or USEPA RSL (22,000 µg/m^3).

- **Ethylbenzene**: Ethylbenzene was detected in all three outdoor air samples at concentrations ranging from 0.13 to 0.14 µg/m^3. Ethylbenzene was detected in all nine indoor air samples at concentrations ranging from 0.15 µg/m^3 (IA-4-20210215) to 1.9 µg/m^3 (IA-5-20210215). Of the nine ethylbenzene detections in indoor air, none exceeded the USEPA RSL (4.9 µg/m^3). A DTSC SL has not been established for ethylbenzene.

- **Xylenes (total)**: Xylenes (total) was detected in all three outdoor air samples at concentrations ranging from 0.56 to 0.61 µg/m^3. Xylenes (total) was detected in all nine indoor air samples at concentrations ranging from 0.64 µg/m^3 (IA-4-20210215) to 8.0 µg/m^3 (IA-5-20210215). Of the nine xylenes (total) detections in indoor air, none exceeded the USEPA RSL (440 µg/m^3). A DTSC SL has not been established for xylenes (total).

- **Chloroform**: Chloroform was detected in all three outdoor air samples at concentrations ranging from 0.085 to 0.13 µg/m^3. Chloroform was detected in all nine indoor air samples at concentrations ranging from 0.10 µg/m^3 (IA-4-20210215) to 0.29 µg/m^3 (IA-5-20210215). Of the nine chloroform detections in indoor air, none exceeded the USEPA RSL (0.53 µg/m^3). A DTSC SL has not been established for chloroform.

- **Methylene Chloride**: Methylene chloride was detected in all three outdoor air samples at concentrations ranging from 0.58 to 5.2 µg/m^3. Methylene chloride was detected in all nine indoor air samples at concentrations ranging from 0.97 µg/m^3 (IA-3-20210215) to 14 µg/m^3 (IA-5-20210215). Of the nine methylene chloride detections in indoor air, one sample exceeded the DTSC SL (12 µg/m^3). Methylene chloride concentrations detected in indoor air samples were less than the USEPA RSL (1,200 µg/m^3).

- **PCE**: PCE was detected in five indoor air samples at concentrations ranging from 0.072 µg/m^3 (IA-1-20210215) to 0.89 µg/m^3 (IA-3-20210215). Of the nine PCE detections in indoor air, none

exceeded the DTSC SL (2 µg/m^3) and USEPA RSL (47 µg/m^3). PCE was not detected in any of the three outdoor air samples.

- **TCE**: TCE was detected in three indoor air samples at concentrations ranging from 0.074 µg/m^3 (IA-6-20210215) to 0.28 µg/m^3 (IA-3-20210215). Of the three TCE detections in indoor air, none exceeded the DTSC SL (8.0 µg/m^3) and USEPA RSL (3.0 µg/m^3). TCE was not detected in any of the three outdoor air samples.

Based on the indoor and outdoor air analytical results, similar outdoor air data and indoor air data for benzene and methylene chloride indicate that indoor air concentrations of VOCs exceeding screening levels are likely related to emissions from indoor and outdoor sources and not due from vapor intrusion.

4.4 Groundwater Sample Results

In October 2020, a total of eight groundwater samples were collected from eight borings as part of Apex's Site investigation. Three groundwater samples were analyzed for TPH-d and TPH-mo, and eight groundwater samples were analyzed for TPH-g and VOCs. Groundwater results were compared to CA MCLs. The results of the groundwater analyses from these investigations are provided in Appendix B and presented below.

- **TPH**: TPH-d was detected in one groundwater sample at a concentration of 170 µg/L (B-12-W-20). TPH-mo was detected in one groundwater sample at a concentration of 320 µg/L (B-12-W-20). A CA MCL has not been established for TPH-d or TPH-mo.

- **VOCs**: Several VOCs were detected at concentrations exceeding the laboratory RLs. However, these concentrations were less than the CA MCLs.

Based on the groundwater results collected from 2020, groundwater has been completely investigated and no data gaps for groundwater exist at the Site.

4.5 Quality Control and Data Validation and Verification

Laboratory quality control (QC) and data validation and verification discussed in the sections below are for Roux's 2021 SSI and VI investigation. Any laboratory QC and data validation and verification conducted by Path Forward or Apex is included in their respective reports (Appendix B).

4.5.1 Laboratory Quality Control Samples

Laboratory quality control (QC) samples included matrix spikes and matrix spike duplicates (MS/MSD) to provide information to assess the precision and accuracy of the analysis of the target parameters within the environmental media collected at the Site. The MS portion of the sample is an aliquot of a sample that is spiked (by the laboratory) with a known concentration of the target analyte(s), which provides a measure of the method accuracy. The MSD portion of the sample is a laboratory split sample of the MS and is used to evaluate the precision of the analysis.

4.5.2 Data Validation and Verification

A Stage 2A data validation was performed by Roux as defined by USEPA's *Guidance for Labeling Externally Validated Laboratory Analytical Data for Superfund Use*, dated January 2009. Data validation was performed in accordance with the guidelines presented in and USEPA's *National Functional Guidelines for Inorganic Superfund Methods Data Review,* dated January 2017 and USEPA's *National Functional Guidelines for*

Organic Superfund Methods Data Review, dated January 2017. Stage 2A validation includes verification based on "completeness and compliance checks of sample receipt conditions and only sample-related QC results."

Sample analyses were found generally compliant with the method requirements, and the sample data were determined to be useable, with qualification of some sample results/detection limits as quantitatively estimated ("B" or "b" qualifier). A formal data validation memorandum, which details the data validation procedures, is included as Appendix D.

5. Human Health Screening Evaluation

An HHSE was conducted in accordance with DTSC's PEA Guidance Manual (DTSC, 2015a). The HHSE utilized data gathered during the previous environmental investigations conducted at the Site, including Path Forward's August/September 2020, Apex's October 2020, and Roux's February and March 2021 investigations (Path Forward, 2020a; Apex, 2021; Roux, 2021). The objective of the HHSE was to provide a conservative evaluation of the potential risk from exposure to chemicals detected in the subsurface at the Site. For the purposes of the HHSE, all chemicals detected in each evaluated media were initially considered COPCs. The HHSE then eliminated select COPCs and incomplete pathways, as appropriate, and determined that a potential risk to human receptors via exposure to metals in near surface soils or via exposure to chlorinated solvents present in soil vapor exists at the Site. The HHSE calculated the estimated risks associated with the presence of these COPCs in each medium where exposure pathways are considered potentially complete pursuant to the DTSC PEA Guidance Manual (DTSC, 2015a). Metals in shallow soil along the former RR ROW and rail spur, as well as VOCs in soil vapor were the COPCs identified for the Site.

Given the proposed redevelopment, risk to construction worker and commercial/industrial worker receptors were evaluated in the HHSE. The methodology and results of the HHSE are summarized below. The full HHSE is included as Appendix A.

5.1 Exposure Pathways and Media of Concern

The future use of the property will be limited to industrial development. As discussed below, points of potential future human contact are limited to soil and indoor air. The simplified CSM presented in Section 3.1 and summarized in the table below has been used in this HHSE. In simple terms, the Site may pose a risk to human receptors via exposure to metals in near surface soils or via exposure to chlorinated solvents present in soil vapor. Evaluation of construction worker and commercial/industrial worker receptors in the HHSE is consistent with DTSC guidance (DTSC, 2015a).

Primary Source	Secondary Source	Exposure Media	Exposure Route	Receptor
Historical on-Site Releases	Impacted Soil	Soil	Ingestion, dermal contact, or inhalation of particles	• Future Construction Worker • Future Outdoor Commercial/Industrial Worker
	Impacted Soil Vapor	Indoor Air	Inhalation	• Future Indoor Commercial/Industrial Worker

5.2 Exposure Concentrations and Chemicals

Exposure point concentrations (EPCs) are estimated concentrations of contaminants that are contacted by a receptor over an assumed duration. The Site was divided into two exposure units based on future intended use and historical operations, (1) the former RR ROW and (2) the main parcel. For the purpose of the HHSE, maximum detections were selected as EPCs in each exposure unit, consistent with the PEA Guidance Manual. DTSC recommended attenuation factors were applied, as appropriate, when evaluating soil vapor concentrations in the context of indoor air risks.

5.3 Human Health Screening Levels

To evaluate future commercial/industrial exposures to soil and soil vapor, USEPA RSLs and DTSC SLs for non-carcinogenic and carcinogenic effects were utilized in the screening. To evaluate future construction worker exposures to soil, SF-RWQCB ESLs for non-carcinogenic and carcinogenic effects were utilized in the screening.

5.4 Toxicity Values

The toxicity assessment describes the quantitative relationship between the extent of exposure to a contaminant and the increased likelihood and/or severity of adverse effects. This quantitative relationship generally takes the form of toxicity values that are identified for use in risk evaluations. Toxicity values are used to quantify the chance of observing cancer or non-cancer effects in exposed receptors. Toxicity values may be based on epidemiological studies or animal studies. DTSC SL values were used when available, otherwise USEPA RSLs were used.

5.5 Risk Characterization Summary

The risk characterization process integrates the results of the data evaluation, exposure assessment, and toxicity assessment to provide a quantitative estimation of cumulative non-carcinogenic and carcinogenic risks for a potential construction worker and commercial/industrial worker exposure to soil and indoor air at the Site as summarized in the table below:

Cumulative Cancer and Non-Cancer Risks by Receptor

Media Receptor	Non-Cancer Risk Total Hazard Index (HI)	Cancer Risk Total Incremental Lifetime Cancer Risk (ILCR)
Soil (Former RR ROW)		
Future Commercial/Industrial Outdoor Worker	1.7E+00	5.5E-07
Future Construction Worker	2.9E+01	3.1E-06
Soil (Main Parcel)		
Future Commercial/Industrial Outdoor Worker	6.8E-01	2.1E-06
Future Construction Worker	2.9E+01	3.7E-06
Indoor Air		
Future Commercial/Industrial Indoor Worker	3.1E-02 – 1.9E+00	2.7E-06 – 1.6E-04

For purposes of the risk characterization, arsenic in soil was quantified separately. Additionally, lead was evaluated separately by modeling blood lead levels.

A Site-specific arsenic action level was derived in accordance with DTSC methodology as described in Arsenic Strategies Determination of Arsenic Remediation Development of Arsenic Cleanup Goals (DTSC, 2009). Based on the two methods, the Site-specific arsenic action level ranged from 22 to 24 mg/kg. The 95% upper confidence level (UCL) of the mean concentration for arsenic at the Site is equal to 40.5 mg/kg, which is above the upper end of the Site-specific arsenic action level range. If the highest arsenic concentrations are removed, the 95% UCL of the mean concentration for arsenic at the Site is equal to 13.14 mg/kg, well below the lower end of the Site-specific arsenic action level range.

Lead in shallow soil was evaluated by modeling blood lead levels, using DTSC's modified USEPA Adult Lead Model (ALM; USEPA, 2009 and DTSC, 2011). The former RR ROW and the main parcel exposure units were evaluated separately. Within the main parcel exposure unit, only the 95% UCL of the mean concentration was evaluated, as no samples were identifiable as hot spots. In the former RR ROW exposure unit, two statistical outliers were identified in the dataset and were evaluated as hot spots (1,500 mg/kg of lead at SB-49-0.5 and 1,300 mg/kg of lead at B-19-0.5). The maximum detected concentration of these samples was evaluated (1,500 mg/kg at SB-49-0.5). The 95% UCL of the mean concentration was also evaluated for the former RR ROW and was calculated subsequent to the removal of the two hot spots.

5.6 Cancer Risks

For carcinogens, risk is expressed as the probability that an individual will develop cancer over a lifetime as a result of exposure to the carcinogen and is expressed as incremental lifetime cancer risk (ILCR). The NCP indicates that the ILCR posed by a site should not exceed a range of 1E-06 to 1E-04. Based on the results of the HHSE the following conclusions can be made regarding cancer risk related to COPCs in soil and soil vapor:

Commercial/Industrial Outdoor Workers:

- Former RR ROW: The cancer risk estimate for a former RR ROW future outdoor commercial/industrial worker is below the most conservative end of 1E-06 to 1E-04 target cancer risk range (5.5E-07).

- Main Parcel: The cancer risk estimate for a main parcel future outdoor commercial/industrial worker is within the 1E-06 to 1E-04 target cancer risk range (2.1E-06).

Construction Workers:

- Former RR ROW: The cancer risk estimate for a former RR ROW future construction worker is within the 1E-06 to 1E-04 target cancer risk range (3.1E-06).

- Main Parcel: The cancer risk estimate for a main parcel future construction worker is within the 1E-06 to 1E-04 target cancer risk range (3.7E-06).

Commercial/Industrial Indoor Workers:

- The high-end cancer risk estimate using the 0.3 attenuation factor (AF) slightly exceed the cancer threshold (1.6E-04). However, the low-end cancer risk estimates using the 0.0005 AF do not exceed cancer threshold for future commercial/industrial indoor worker exposure to indoor air (2.7E-06).

5.7 Non-Cancer Risks

Non-carcinogenic risk is calculated by dividing the EPC for each compound by its respective screening level for residential receptors to arrive at a Hazard Quotient (HQ) for each chemical. To assess the potential for non-carcinogenic health effects posed by exposure to multiple constituents, a HI approach is used. This approach assumes that non-carcinogenic hazards associated with exposure to more than one constituent are additive (HI = sum of the HQs). The HI is then compared to the DTSC threshold of 1 (DTSC, 2015). Based on the results of the HHSE the following conclusions can be made regarding non-cancer risk related to COPCs in soil and soil vapor.

Commercial/Industrial Outdoor Workers:

- Former RR ROW: The non-cancer risk estimate for a future outdoor commercial/industrial worker exposed to soil in the former RR ROW slightly exceeds the non-cancer target risk threshold of 1 (1.7E+00).

- Main Parcel: The non-cancer risk estimate for a future outdoor commercial/industrial worker exposed to soil in the main parcel does not exceed the non-cancer target risk threshold of 1 (6.8E-01).

Construction Workers:

- Former RR ROW: The non-cancer risk estimate for a future construction worker exposed to soil in the former RR ROW exceeds the non-cancer target risk threshold of 1 (2.9E+01).

- Main Parcel: The non-cancer risk estimate for a future construction worker exposed to soil in the main parcel exceeds the non-cancer target risk threshold of 1 (2.9E+01).

Commercial/Industrial Indoor Workers:

- The high-end non-cancer risk estimates using the 0.3 AF slightly exceed the non-cancer threshold (1.9E+00). However, the low-end non-cancer risk estimates using the 0.0005 AF do not exceed non-cancer threshold for future commercial/industrial indoor worker exposure to indoor air (3.1E-02).

6. Summary and Conclusions

Based on topographic maps and aerial photographs, the Site was used for agricultural purposes from at least 1939 through 1963. By 1975, Building 1 was constructed. Building 2 was constructed by 1968 and Frito-Lay occupied the Site from at least 1966 through 1996. Building 3 was constructed in the southeast portion of the Site by 1982 and Building 4 was constructed to the west of Building 2 by 1999. The 1.76-acre former RR ROW appears to have been developed with railroad tracks by 1974. The first known subsurface investigation at the Site was conducted in 1990 for the removal of the three on-Site fuel oil USTs. The USTs were approximately 5,000-gallon, 15,000-gallon, and 20,000-gallon (Path Forward, 2020a). In 1990 and 1994, soil, soil vapor, and groundwater samples were collected beneath the USTs and associated piping in the former tank pit, and no detections of TPH-g or BTEX were reported. A closure report was submitted to the oversight agency (SF-RWQCB) and closure was granted by the SF-RWQCB in a letter dated March 28, 1995 (Path Forward, 2020a).

In July 2020, Path Forward conducted a Phase I ESA for the Site. Based on the findings of the Phase I ESA, Path Forward identified two RECs, (1) former fuel oil USTs and (2) current and past tenant operations. Considering the RECs identified in the Phase I ESA, Path Forward performed a Subsurface Site Investigation and collected soil and soil vapor samples across the Site in August and September 2020. Additional subsurface investigations were conducted by Apex in October 2020 where soil samples were collected and analyzed for TPH, VOCs, OCPs, and Title 22 Metals, and groundwater samples were collected and analyzed for TPH and VOCs. In February 2021, Roux conducted an SSI and VI investigation in which soil, sub-slab, indoor air, and outdoor air samples were collected. Additional soil samples were collected by Roux in March 2021 as part of the SSI.

Below is a summary of the comprehensive results of these investigations conducted between 2020 and 2021, by Path Forward, Apex, and Roux:

- OCPs, PCBs, VOCs, SVOCs, and PAHs concentrations in soil samples collected at the Site were less than the USEPA RSLs or DTSC SLs.
- Herbicides concentrations were less than the laboratory RLs in soil samples collected at the Site.
- Elevated concentrations of arsenic and lead are limited to shallow soil in a few isolated areas and are entirely associated with the former rail spur and RR ROW.
- DRO concentrations in one soil sample exceeded the ESL. GRO and ORO concentrations were less than the ESLs in other soil samples.
- Soil vapor and sub-slab analytical results from the Path Forward and Roux investigations indicate that concentrations of benzene, bromodichloromethane, chloroform, methylene chloride, PCE, and TCE exceed commercial/industrial screening levels for soil vapor when using an attenuation factor of 0.03.
- The highest PCE concentrations in soil vapor is at the northwestern portion of Building 2.

To further evaluate the Site, an HHSE was performed using data from the previous environmental investigations conducted at the Site (Path Forward in August and September 2020; Apex in October 2020; Roux in February and March 2021), and the results are summarized below:

- The non-cancer risk to a future outdoor commercial/industrial worker exposed to soil in the former RR ROW slightly exceeds the non-cancer target risk threshold of 1. The cancer risk for a former RR ROW future outdoor commercial/industrial worker is below the most conservative end of the 1E-06 to 1E-04 target cancer risk range.

- The non-cancer risk to a future outdoor commercial/industrial worker exposed to soil in the main parcel does not exceed the non-cancer target risk threshold of 1. The cancer risk for a main parcel future outdoor commercial/industrial worker is within the 1E-06 to 1E-04 target cancer risk range.

- The non-cancer risk to a future construction worker exposed to soil in the former RR ROW exceeds the non-cancer target risk threshold of 1. The cancer risk for a former RR ROW future construction worker is within the 1E-06 to 1E-04 target cancer risk range.

- The non-cancer risk to a future construction worker exposed to soil in the main parcel exceeds the non-cancer target risk threshold of 1. The cancer risk for a main parcel future construction worker is within the 1E-06 to 1E-04 target cancer risk range.

- The high-end cancer and non-cancer risk estimates using the 0.03 AF slightly exceed the respective cancer and non-cancer thresholds. However, the low-end cancer and non-cancer risk estimates using the 0.0005 AF do not exceed cancer or non-cancer thresholds for future commercial/industrial indoor worker exposure to indoor air.

- A Site-specific arsenic action level range from 22 to 24 mg/kg was derived in accordance with DTSC methodology as described in Arsenic Strategies Determination of Arsenic Remediation Development of Arsenic Cleanup Goals (DTSC, 2009). The 95% UCL of the mean concentration for arsenic at the Site is equal to 40.5 mg/kg, which is above the upper end of the Site-specific arsenic action level range. Five samples were above site-specific arsenic value of 22 mg/kg.

- Based on the ALM output assuming the 95% UCL of the mean concentration, levels of lead at the Site do not pose unacceptable risk to a fetus of an adult worker.

Conclusions:

Based on the comprehensive results of the investigations conducted between 2020 and 2021, Roux concludes the following:

- The VI pathway does not appear to be a complete in Buildings 2 and 4 based on sub-slab, indoor air, and outdoor air data.

- The soil vapor analytical results and the HHSE indicate that estimated indoor air concentrations of VOCs exceed the more conservative cancer risk range of acceptability established in the NCP (1E-06) but remain within the upper cancer risk range (1E-04). Assuming vapor intrusion mitigation systems are installed in the future industrial building at the Site, the estimated risk is below the most conservative risk threshold.

- The soil sample analytical results and the results of the HHSE indicate that soil concentrations of metals exceed the cancer risk range of acceptability established in the NCP (1E-06 to 1E-04). Assuming limited excavation and/or capping of metals impacted soil will take place prior to redevelopment, the estimated risk is acceptable for a commercial/industrial worker and construction worker scenario.

- Based on the ALM output assuming the 95% UCL of the mean concentration, levels of lead at the Site do not pose unacceptable risk to a fetus of an adult worker.

- Except for arsenic and lead in limited areas of shallow soil (Figures 6a through 6c), data gaps at the Site have been addressed and investigation of soil and soil vapor at the Site is complete. Assuming that sampling of shallow soil for arsenic in the limited areas will take place concurrent with future remedial activities, this remaining data gap is not considered significant.

7. Recommendations

Overall, the HHSE indicates that conditions at the Site are unlikely to pose excess cancer or non-cancer risk to future receptors under a commercial/industrial land use scenario if the potential risk from exposure to arsenic and lead in soils, and VOCs in soil vapor are mitigated.

Site characteristics favor the PT&R approach as described in the PT&R Guidance. Containment by capping and/or excavation and off-Site disposal will be evaluated as remedial options for arsenic and lead impacted soils at the Site. A VIMS will also be proposed to mitigate potential vapor intrusion of VOCs in the future building.

Based on the results of Site investigations, risk evaluation, and the intended future industrial use of the Site, Roux considers the Site ready for preparation of a Removal Action Workplan (RAW). Conceptually, the RAW will evaluate the following elements:

- Construction of a sub-slab VIMS;
- Limited excavation and on-Site management and/or removal of shallow soils where lead and arsenic exceed regulatory thresholds;
- Preparation of a Soil Management Plan (SMP) for implementation during future on-Site grading activities;
- Preparation of an Operation, Monitoring, & Maintenance Plan (OM&M Plan) subject to negotiation of an OM&M Agreement to define the long-term operation, maintenance, sampling and reporting of the VIMS and any associated monitoring/sampling probes, and inspection and maintenance of a cap if on-Site soil management is selected; and,
- Recording of a LUC as an institutional control to disclose risks, restrictions, and conditions of the Site to future buyers and occupants.

Note:
SFBRWQCB ESLs = San Francisco Bay Regional Water Quality Control Board Tier 1 Environmental Screening Levels (January 2019)
<X = analyte not detected above laboratory RDL
Bgs = Below ground surface
NS = No standard established
Only analytes detected in at least one sample and major analytes are included in the table.
mg/kg = milligrams per kilogram
TPH = total petroleum hydrocarbons
B = Analyte detected above the RDL in method blank
Highlight indicates exceedance of SFBRWQC ESLs.

Table 4
Soil Analytical Results - Organochlorine Pesticides
650 North King Road, San Jose, California

Sample ID	Date Sampled	Depth (feet bgs)	4,4'-DDE	4,4'-DDD	4,4'-DDT
		Analytical Method	USEPA 8081A		
		Unit	µg/kg		
		DTSC Commercial Soil SL	9,300	6,200	7,100

- SUB-SLAB SAMPLING LOCATIONS (ROUX, 2021)
- OUTDOOR AIR SAMPLING LOCATIONS (ROUX, 2021)
- SOIL AND SOIL VAPOR LOCATIONS (PATH FORWARD, 2020)

NOTES

1. BOLDED VALUES INDICATE THAT CONSTITUENT EXCEEDS AT LEAST ONE SCREENING LEVEL (SL).
2. ALL CONCENTRATIONS ARE REPORTED IN MICROGRAMS PER CUBIC METER ($\mu G/M^3$).
3. PCE = TETRACHLOROETHENE
4. TCE = TRICHLOROETHENE

1. Introduction

Roux Associates, Inc. (Roux), on behalf of BTC III San Jose Logistics Center LP (BTC III), prepared this *Human Health Screening Evaluation* (HHSE) to estimate the potential for chronic human health risks/hazards related to exposure to contamination present at the Former Frito Lay Facility, located at 650 North King Road in the City of San Jose, County of Santa Clara, California (Site; Figure 1). BTC III acquired the Site in January 2021 for industrial development. BTC III intends to build a 208,000 square-foot (SF) light industrial building at the Site.

This HHSE incorporates results of the soil and soil vapor investigations conducted by Path Forward Partners, Inc. (Path Forward) in August and September 2020, Apex Companies, LLC (Apex) in October 2020, and Roux in February and March 2021. This HHSE has been prepared to determine if contamination present in the subsurface at the Site poses an unacceptable level of risk to future construction workers, future outdoor commercial/industrial workers, and future indoor commercial/industrial workers. The HHSE has been prepared pursuant to the California Department of Toxic Substances Control's (DTSC's) *Preliminary Endangerment Assessment (PEA) Guidance Manual* (DTSC, 2015), and consists of four components:

- **Evaluation of Exposure Pathways:** Exposure to chemicals may occur via dermal contact, ingestion, or inhalation of chemicals of potential concern (COPCs) present in soil, groundwater, or air at the Site.

- **Evaluation of Exposure to COPCs and Exposure Point Concentrations:** Identifies contaminants found in media at the Site and determines appropriate exposure point concentrations (EPCs) for COPCs.

- **Evaluation of Chemical Toxicity:** Assesses the potential adverse effects of the COPCs and compiles non-carcinogenic and carcinogenic toxicity values for use in numerical risk estimates.

- **Risk Characterization:** Integrates the results of the hazard assessment to provide a quantitative estimation of non-carcinogenic and carcinogenic risks.

Default exposure parameters from the DTSC, United States Environmental Protection Agency (USEPA), and San Francisco Bay Regional Water Quality Control Board (SFBRWQCB) were utilized to represent a Reasonable Maximum Exposure (RME) scenario. An RME scenario is the highest exposure that is reasonably expected to occur at a site. This HHSE evaluates future exposure to soil, assuming a future outdoor commercial/industrial worker scenario and a construction worker scenario, and future exposure to indoor air, assuming a future indoor commercial/industrial worker scenario, in the absence of any further remedial action or mitigating measures at the Site.

2. Background

The Site consists of two parcels: an approximately 8.95-acre parcel developed with four commercial buildings (Assessor's Parcel Number [APN] 254-54-023; referred to as the "main parcel") and an approximately 1.76-acre former railroad right-of-way (RR ROW) located along the northern portion of the Site (APN 254-55-013; Figure 2). The Site is located in a commercial/industrial area and is bounded by Las Plumas Avenue to the south, King Road to the west, and commercial properties to the north and east.

Agricultural operations on-Site are depicted on Site in aerial photographs from 1939 through 1963 (Path Forward, 2020). Frito-Lay occupied the Site and manufactured chips and pork rinds until 1996. By 1999, all four buildings on the main parcel were constructed (Figure 2). The Site appears relatively unchanged since the 2006 aerial photograph (Path Forward, 2020), and is currently occupied by various non-manufacturing, commercial tenants.

Path Forward's Phase I Environmental Site Assessment (ESA) identified two recognized environmental conditions (RECs):[1]

- A limited area of petroleum hydrocarbon and volatile organic compound (VOC) impacted soil vapor was identified around the former fuel oil underground storage tank (UST) pit from the previous Frito-Lay operations, located in the northwest corner of the main parcel;[2] and

- "Extensive use of hazardous and petroleum products" by past and current tenants.[3]

In August and September of 2020, Path Forward performed a Subsurface Site Investigation to evaluate environmental conditions. Elevated concentrations of organochlorine pesticides (OCPs) and metals in soil were observed, likely associated with historical agricultural use at the Site. VOCs were detected above regulatory screening levels in soil vapor as well. Based on the elevated concentrations of VOCs in soil vapor, Path Forward recommended further investigation to evaluate the extent of VOC impacts and that a human health risk evaluation from vapor intrusion into indoor air for current Site workers be conducted.

In October 2020, Apex conducted a Site investigation to evaluate the extent of total petroleum hydrocarbon (TPH), VOCs, OCPs, and Title 22 Metals impacts to soil and groundwater, as recommended by Path Forward's Subsurface Site Investigation. The investigation found exceedances of antimony, arsenic, and lead in soil above SFBRWQCB environmental screening levels (ESLs) for human health direct soil contact in a commercial/industrial shallow soil exposure scenario (SFBRWQCB, 2015). Apex concluded that elevated concentrations of metals in soil were associated with the former RR ROW. Exceedances of naphthalene and vinyl chloride were found in groundwater above the SFBRWQCB ESL for human health exposure to vapor intrusion (VI) from groundwater in a commercial/industrial scenario. However, Apex's sampling indicated that although isolated detections of naphthalene and vinyl chloride were present in groundwater, these compounds were not detected above laboratory reporting limits (RLs) in shallow soil samples collected from their respective borings. Furthermore, naphthalene and vinyl chloride were not detected in any of the soil vapor samples collected by Path Forward in 2020 at concentrations above

[1] *De minimis* conditions were also recognized with respect to potential residual chemicals from historical agricultural use and a contained release of polychlorinated biphenyls (PCBs) from February 1997.

[2] Path Forward, 2020. Phase I Environmental Site Assessment. Figure 3. December 11, 2020.

[3] Path Forward, 2020. Phase I Environmental Site Assessment. Page 20. December 11, 2020.

laboratory RLs Therefore, Apex concluded that these groundwater detections are not impacting indoor air and therefore do not constitute a threat to human health (Apex, 2021).

In February 2021, Roux conducted a VI investigation to evaluate subsurface and indoor air conditions and identify potential indoor air risks to current tenants in Buildings 2 and 4 (Roux, 2021a)(Figure 2). Benzene and methylene chloride were the only VOCs detected above USEPA Regional Screening Levels (RSLs) and DTSC Human and Ecological Risk Office (HERO) Human Health Risk Assessment (HHRA) Note 3 Screening Levels (DTSC SLs), for indoor air (USEPA, 2021; DTSC, 2020a). An evaluation of sub-slab, indoor, and outdoor air sampling results indicates that VOCs exceeding regulatory screening levels were likely attributable to indoor and outdoor air sources (not VI). Based on the results of Roux's VI investigation, no additional mitigating actions were recommended for Buildings 2 or 4 (Figure 2). Roux recommended continuing the sampling event every 6 months to confirm VI conditions have not changed (Roux, 2021a).

Following the VI investigation, Roux conducted a Supplemental Site Investigation (SSI) to screen for and delineate potential environmental impacts associated with the former railroad operations (Roux, 2021b). Soil samples were collected at depths ranging from 0.5 to 5 feet below ground surface (bgs) along the former RR ROW and analyzed for gasoline range organics (GRO), diesel range organics (DRO), oil range organics (ORO), semi-volatile organic compounds (SVOCs), OCPs, polychlorinated biphenyls (PCBs), and herbicides. Arsenic, lead, and DRO were the detected above their respective USEPA RSLs and DTSC SLs. Arsenic concentrations were detected above the urbanized San Francisco Bay background concentration of 11 milligrams per kilogram (mg/kg) in 14 deeper soil samples at concentrations ranging from 12 to 58 mg/kg, indicating incomplete vertical delineation of arsenic impact (Kearney, 1996, and Duvergé, 2011). Additional vertical delineation of elevated arsenic concentrations was required to complete characterization of contaminants along the RR ROW.

In March 2021, Roux conducted an additional SSI investigation to delineate potential metal impacts vertically and laterally in shallow soils along the RR ROW and along the on-Site rail spur. The results of the investigation showed arsenic concentrations exceeding the background concentration of 11 mg/kg in five deeper soil samples at concentrations ranging from 12 to 41 mg/kg (Kearney, 1996, and Duvergé, 2011). As indicated in the *Preliminary Environmental Assessment Equivalent Report* (PEA-E Report), of which this HHSE is an Appendix, Roux recommended further investigation to vertically delineate arsenic impacts in the vicinity of the former RR ROW and rail spur, followed by limited excavation of shallow soils where lead and arsenic exceed a Site-specific action level and the design and installation of a vapor intrusion mitigation (VIM) system for the planned industrial building prior to redevelopment.

3. Exposure Pathways and Media of Concern

Exposure pathways describe the course a chemical or physical agent takes from the source to the receptor (USEPA, 1989). Four components must be present for an exposure pathway to be complete:

- A primary source and mechanism of chemical release;
- A secondary source or transport medium (or media);
- A point of potential human contact with the contaminated medium (i.e., an exposure point); and
- An exposure route (e.g., ingestion, dermal contact, or inhalation).

The future intended use of the property is as an industrial development. Therefore, a future construction worker, future outdoor commercial/industrial worker, and future indoor commercial/industrial worker scenarios were evaluated in the risk evaluation. Future receptor exposure is considered protective of current exposure because the maximum concentration of COPCs in environmental media was assumed for each exposure scenario, regardless of sample depth.

As discussed below, points of potential future human contact are limited to soil and indoor air.

3.1 Soil Pathway

The main parcel (APN 254-54-023) is currently developed with a concrete slab beneath the four commercial buildings with asphalt-paved parking areas. While the current soil exposure pathway is incomplete on the main parcel due to surficial asphalt and concrete cover, future exposure to disturbed soil containing COPCs is possible. Thus, the soil pathway is considered a complete exposure pathway and was quantitatively evaluated in the HHSE for future receptors. While the former RR ROW parcel (APN 254-55-013) is currently unpaved with overgrown vegetation, only future exposure to surface and disturbed subsurface soil was quantitatively evaluated in the HHSE as it is protective of current exposure scenarios.

3.2 Groundwater/Surface Water Pathway

Depth to groundwater at the Site ranges from approximately 6.60 to 9.37 feet bgs (Apex, 2021). Groundwater in the vicinity of the Site is not a drinking water source. Therefore, no complete exposure pathway exists. Moreover, eight groundwater samples were analyzed for TPH-g, TPH-d, TPH-mo, and VOCs and all detections were below California Water Boards Maximum Contaminant Levels (CA MCLs; California Water Boards, 2019).

Because there are no surface water bodies proximal to the Site, exposure to impacted surface water is not considered a complete exposure pathway.[4]

3.3 Air Pathway

Given the detections of VOCs in soil vapor samples collected in Buildings 2 and 4 at the Site, the indoor air pathway is considered a potentially complete exposure pathway and inhalation of indoor air was quantitatively evaluated in this HHSE (Figure 2). Current exposure to indoor air was not quantitatively evaluated because the consideration of a future exposure scenario (assuming the absence of any

[4] The closest surface water bodies are in a park (the Overfelt Gardens) approximately 2,500 feet to the east.

remedial action) is protective of current conditions. That said, future construction on the main parcel will include the installation of a sub-slab VIM system within the planned industrial building. Nevertheless, exposure via the indoor air pathway for future receptors was conservatively evaluated in the HHSE using current conditions that will not be representative of indoor air levels after these mitigating measures have been installed.

No buildings are present within the RR ROW and no buildings are anticipated to be built on this parcel due to the unique characteristics of the parcel (a narrow right of way). Thus, indoor air is not considered a complete exposure pathway within the RR ROW exposure unit and was not evaluated in this HHSE.

3.4 Exposure Pathway Analysis

The future use of the property will be limited to industrial development. A conceptual site model (CSM) illustrating complete exposure pathways at the Site is provided below.

Primary Source	Secondary Source	Exposure Media	Exposure Route	Receptor
Historical on-Site Releases	Impacted Soil	Soil	Ingestion, dermal contact, or inhalation of particles	• Future Construction Worker • Future Outdoor Commercial/Industrial Worker
	Impacted Soil Vapor	Indoor Air	Inhalation	• Future Indoor Commercial/Industrial Worker

4. Exposure Concentrations and Chemicals

Chemicals detected in each evaluated media were considered COPCs in the HHSE.[5] The sampling data utilized in the HHSE included soil and soil vapor samples collected by Path Forward in August/September 2020, Apex in October 2020, and Roux in February/March 2021. A summary of soil and soil vapor data from Roux's investigations is presented in Tables 1 through 5 of the PEA-E Report, of which this HHSE is an Appendix. Soil and soil vapor data from previous investigations is provided in the Path Forward Subsurface Site Investigation Report (Path Forward, 2020) and the Apex Site Investigation Report (Apex, 2021), included in Appendix B of the PEA-E report. Metals, TPH, OCPs, PCBs, VOCs, and SVOCs were detected in soil samples collected from 0.5 to 5 feet bgs. VOCs were detected in sub-slab samples and soil vapor samples collected from 2 to 5 feet bgs. EPCs for each media were selected based on the following criteria:

- **Soil**: The Site was divided into two exposure units based on future intended use and historical operations (1) the former RR ROW and (2) the main parcel. The maximum detected concentration in the RR ROW and the main parcel, respectively, were selected as the EPC for COPCs in each exposure unit. Soil was collected from intervals ranging from 0.5 and 5 feet bgs in both exposure units. Soil impacts are limited to the upper 5 feet, and thus impacts to soil were adequately vertically delineated.[6] Moreover, the Site redevelopment plan involves over-excavating within the main parcel to a maximum depth of five feet below the current Site grade.
- **Soil vapor**: The maximum detected concentration from sub-slab and soil vapor (irrespective of depth) COPC results across the Site were used as the soil vapor EPC to evaluate exposure to indoor air, consistent with Section 2.5.2.4 of the DTSC guidance (DTSC, 2015). Indoor air concentrations were calculated from soil vapor concentrations using methodology described in DTSC's PEA Guidance (DTSC, 2015) and DTSC's Vapor Intrusion Guidance (DTSC, 2011) and Draft Supplemental Guidance: Screening and Evaluation Vapor Intrusion (DTSC, 2020b), and the formula below:

$$C_{indoor} = \alpha \times C_{soil\ vapor}$$

Where:

C_{indoor}= Indoor air concentration in micrograms per cubic meter ($\mu g/m^3$)
α= Attenuation factor (assumed to be equal to 0.0005 or 0.03 consistent with assumptions for future commercial scenarios and/or specific to soil gas, per DTSC, 2015 and DTSC, 2020b, respectively).
$C_{soil\ vapor}$= Soil vapor air concentration in $\mu g/m^3$

Summary of Soil Data Included in the HHSE

COPC	Number of Soil Samples	Number of Detections	Range of Detections (mg/kg)	EPC (mg/kg)
Former RR ROW				
Antimony	133	29	0.98 – 180	1.8E+02
Arsenic	159	157	1.2 – 430	4.3E+02
Barium	133	133	12 – 810	8.1E+02

[5] Two isomers of chlordane, chlordane-alpha and chlordane-gamma, were detected in soil samples but were not evaluated herein because soil samples were also analyzed for technical chlordane, and concentrations of technical chlordane were higher than the sum of alpha and gamma-chlordane. Similarly, isomers for total xylenes, m,p-xylene and o-xylene, were detected in soil samples but were not evaluated herein because soil samples were also analyzed for total xylene, and total xylene concentrations were higher than the sum of individual xylene isomers.
[6] After Roux's additional SSI investigation in March 2021, further vertical investigation is recommended to delineate arsenic impacts.

COPC	Number of Soil Samples	Number of Detections	Range of Detections (mg/kg)	EPC (mg/kg)

Propene	10	6	2.9 - 198	2.0E+02
Styrene	18	5	6.0 – 2,220	2.2E+03
Tetrachloroethene	18	15	2.0 – 3,250	3.3E+03
Tetrahydrofuran	10	4	4.8 - 168	1.7E+02
Toluene	18	14	1.5 - 444	4.4E+02
trans-1,2-Dichloroethene	18	1	42 - 42	4.2E+01
Trichloroethene	18	6	9.1 - 165	1.7E+02
Trichlorofluoromethane	18	8	1.3 - 73	7.3E+01
Trimethylpentane, 2,2,4-	10	9	1.4 - 462	4.6E+02
Xylene (total)	18	10	5.1 - 157	1.6E+02

(1) Soil vapor data include two sampling events (Path Forward's September 2020 and Roux's February 2021 sampling events).

Arsenic and lead were detected in soil samples collected at the Site and are compounds that require special handling. Therefore, arsenic and lead were evaluated separately from other compounds detected in Site soil, as is discussed further in **Section 7.3**.

5. Human Health Screening Levels

To evaluate potential future construction worker and future commercial/industrial worker exposure, SLs for non-carcinogenic and carcinogenic effects were utilized in the HHSE as follows:

- **Soil**: Consistent with DTSC's PEA Guidance (DTSC, 2015), DTSC HHRA Note 3 (DTSC, 2020a) carcinogenic and non-carcinogenic endpoint values were utilized for the outdoor commercial/industrial worker soil evaluation when available, and USEPA RSLs (USEPA, 2021) were utilized for compounds with no DTSC HHRA Note 3 value. USEPA RSLs at a non-cancer Target Hazard Quotient (THQ) of 1 and a cancer Target Risk (TR) of 1E-06 were adopted for all chemicals not included in DTSC HHRA Note 3. SFBRWQCB health-risk based ESLs were utilized for TPH. Construction workers were evaluated using SFBRWQCB ESLs for all COPCs. The outdoor commercial/industrial worker SLs account for an outdoor worker being exposed for 8 hours a day, 225 days a year, for 25 years. The construction worker ESLs account for a worker being exposed for 8 hours a day, 250 days a year, for 1 year.

- **Indoor Air**: Consistent with DTSC's PEA Guidance (DTSC, 2015), DTSC HHRA Note 3 (DTSC, 2020a) commercial/industrial cancer and non-cancer SLs were utilized for indoor commercial/industrial workers. If no value was provided in DTSC HHRA Note 3, USEPA 2021 Regional Screening Levels (RSLs) were utilized. The indoor commercial/industrial worker SLs account for an indoor worker being exposed for 8 hours a day, 250 days a year for 25 years. USEPA RSLs at a non-cancer Target Hazard Quotient (THQ) of 1 and a cancer Target Risk (TR) of 1E-06 were adopted for all chemicals not included in DTSC HHRA Note 3.[7]

Commercial/Industrial Soil Human Health Screening Levels Utilized in the HHSE

COPC	Commercial/Industrial Soil Screening Level Cancer (mg/kg)	Commercial/Industrial Soil Screening Level Non-Cancer (mg/kg)	Source of Screening Values

6. Toxicity Values

The toxicity assessment describes the quantitative relationship between the extent of exposure to a contaminant and the increased likelihood and/or severity of adverse effects. This quantitative relationship generally takes the form of toxicity values that are identified for use in risk evaluations. Toxicity values are used to quantify the chance of observing cancer or non-cancer effects in exposed receptors. Toxicity values may be based on epidemiological studies or animal studies.

The toxicity values corresponding to either the DTSC Note 3 SLs or USEPA RSLs were obtained from DTSC's HHRA Note 10 (DTSC, 2019) or the USEPA RSLs (USEPA, 2021), respectively. The SLs utilized in the HHSE were developed using the following toxicity values:

Toxicity Values Utilized in the HHSE Soil Evaluation

6.1 Toxicity Information for Non-Carcinogenic Effects

In assessing the potential for non-cancer health effects, USEPA assumes there is a toxicological threshold below which no adverse health effects are observable (USEPA, 1993). These toxicological thresholds are represented by reference doses (RfDs) for oral exposures and reference concentrations (RfCs) for inhalation exposures. The RfDs and RfCs are estimates (with uncertainty spanning, in some cases, an order of magnitude) of daily exposures to the human population (including sensitive subgroups) that are likely to be without an appreciable risk of deleterious effects during a lifetime. USEPA derives RfDs and RfCs using a standardized approach, considering available information from human and animal studies, which establish the levels below which toxicological effects are not observed and the uncertainties inherent in the available information (USEPA, 1993).

6.2 Toxicity Information for Carcinogenic Effects

USEPA uses a two-part evaluation in assessing potentially carcinogenic substances. In the first part, a chemical is assigned a weight-of-evidence classification, which reflects USEPA's assessment of the likelihood that the chemical is a human carcinogen. For chemicals that are classified as possible, probable, or known human carcinogens, USEPA calculates a cancer slope factor (CSF) for oral exposures and an inhalation unit risk (IUR) for inhalation exposures when sufficient information is available to support the calculation. USEPA guidance indicates that a linear, no-threshold dose-response model is appropriate for carcinogenic risk assessment (USEPA, 2005). An extremely low level of exposure to a carcinogen may result in chromosomal or enzyme changes leading to cancer. Therefore, USEPA does not generally estimate thresholds for carcinogens. CSFs or IURs are used to estimate the probability of a cancer effect occurring in a receptor exposed over their lifetime.

7. Risk Characterization Summary

The risk characterization process integrates the results of the data evaluation, exposure assessment, and toxicity assessment to provide a quantitative estimation of cumulative non-carcinogenic and carcinogenic risks for a potential future exposure to soil and indoor air at the Site as summarized below, assuming no remediation or mitigating measures:

Outdoor Commercial/Industrial Workers:

- RR ROW: The non-cancer risk estimate for a future outdoor commercial/industrial worker exposed to soil in the RR ROW slightly exceeds the non-cancer target risk threshold of 1 (1.7E+00). The cancer risk estimate for a RR ROW future outdoor commercial/industrial worker is below the most conservative end of 1E-06 to 1E-04 target cancer risk range (5.5E-7). See Table 1a.
- Main Parcel: The non-cancer risk estimate for a future outdoor commercial/industrial worker exposed to soil in the main parcel does not exceed the non-cancer target risk threshold of 1 (6.8E-01). The cancer risk estimate for a main parcel future outdoor commercial/industrial worker is within the 1E-06 to 1E-04 target cancer risk range (2.1E-06). See Table 1b.

Construction Workers:

- RR ROW: The non-cancer risk estimate for a future construction worker exposed to soil in the RR ROW exceeds the non-cancer target risk threshold of 1 (2.9E+01). The cancer risk estimate for a RR ROW future construction worker is within the 1E-06 to 1E-04 target cancer risk range (3.1E-06). See Table 2a.
- Main Parcel: The non-cancer risk estimate for a future construction worker exposed to soil in the main parcel exceeds the non-cancer target risk threshold of 1 (2.9E+01). The cancer risk estimate for a main parcel future construction worker is within the 1E-06 to 1E-04 target cancer risk range (3.7E-06). See Table 2b.

Indoor Commercial/Industrial Workers:

- While the high-end cancer and non-cancer risk estimates using the 0.03 attenuation factor (AF) slightly exceed the respective cancer and non-cancer thresholds (1.6E-04 and 1.9E+00) , the low-end cancer and non-cancer risk estimates using the 0.0005 AF do not exceed cancer or non-cancer thresholds for future commercial/industrial indoor worker exposure to indoor air (2.7E-06 and 3.1E-02). See Tables 3a and 3b.

In summary, the risk estimates indicate that conditions within the main parcel of the Site do not pose an unacceptable level of risk for the exposure scenarios listed above — except for a construction worker scenario, which may present an unacceptable level of non-cancer risk. Specifically, no unacceptable risk to a future outdoor commercial/industrial worker is present within the main parcel; and, while using the higher AF 0.03 results in slightly elevated cancer and non-cancer risk estimates above threshold values for a future indoor commercial/industrial worker, the lower AF 0.005, indicates acceptable levels of risk for the future indoor worker scenario. In the RR ROW, unacceptable non-cancer risk exists for both construction workers and outdoor commercial/industrial workers; however, for both exposure scenarios, all cancer risks are within or below the acceptable target cancer range.

Cumulative Cancer and Non-Cancer Risks by Receptor

Media Receptor	Non-Cancer Risk	Cancer Risk
	Total Hazard Index (HI)	Total Incremental Lifetime Cancer Risk (ILCR)
Soil (RR ROW)		
Future Commercial/Industrial Outdoor Worker	1.7E+00	5.5E-07
Future Construction Worker	2.9E+01	3.1E-06
Soil (Main Parcel)		
Future Commercial/Industrial Outdoor Worker	6.8E-01	2.1E-06
Future Construction Worker	2.9E+01	3.7E-06
Indoor Air		
Future Commercial/Industrial Indoor Worker	3.1E-02 to 1.9E+00	2.7E-06 to 1.6E-04

The above risk estimates for indoor air assume the DTSC-recommended AF of 0.0005 for future commercial scenarios (DTSC, 2011) for the low-end indoor air risk estimates and the AF of 0.03 to perform medium-specific, initial screening estimates for soil gas, for the high-end indoor air risk estimates, as specified in DTSC's Draft Supplemental Guidance on Vapor Intrusion (DTSC, 2020).

For purposes of the risk characterization, arsenic and lead in soil has been quantified separately (in Attachment 1 and Attachment 2, respectively) and summarized in **Section 7.3**.

7.1 Cancer Risks

For carcinogens, risk is expressed as the probability that an individual will develop cancer over a lifetime as a result of exposure to the carcinogen and is expressed as incremental lifetime cancer risk (ILCR). Carcinogenic risk is calculated by dividing the EPC for each compound by its respective SL for the appropriate receptors:

$$ILCR = \frac{EPC}{SL} \times 10^{-6}$$

The combined risk from exposure to multiple constituents is evaluated by adding the risks from individual constituents, and multiple exposure pathways known as cumulative risk. The National Oil and Hazardous Substances Pollution Contingency Plan (NCP; 40 CFR 300) indicates that the ILCR posed by a site should not exceed a range of 1E-06 to 1E-04 (NCP, 2011). None of the estimated cancer risks for future construction workers exposed or future outdoor commercial/industrial workers to soil exceed the cancer risk range of 1E-06 to 1E-04 in either the main parcel or RR ROW.

The low-end cancer risk estimate for future receptors exposed to indoor air is within the cancer risk range of 1E-06 to 1E-04; however, the high-end cancer risk estimate exceeds the target cancer risk threshold.

Media Receptor	Total Incremental Lifetime Cancer Risk (ILCR)
Soil (RR ROW)	
Future Outdoor Commercial/Industrial Worker	5.5E-07
Future Construction Worker	3.1E-06
Soil (Main Parcel)	
Future Outdoor Commercial/Industrial Worker	2.1E-06
Future Construction Worker	3.7E-06
Indoor Air	
Future Indoor Commercial/Industrial Worker	2.7E-06 to 1.6E-04

Cancer risk estimates are provided in Tables 1a through 3b.

7.2 Non-Cancer Risks

Non-carcinogenic risk is calculated by dividing the EPC for each compound by its respective SL to arrive at a Hazard Quotient (HQ) for each chemical:

$$HQ = \frac{EPC}{SL}$$

To assess the potential for non-carcinogenic health effects posed by exposure to multiple constituents, a Hazard Index (HI) approach is used. This approach assumes that non-carcinogenic hazards associated with exposure to more than one constituent are additive (HI = sum of the HQs). Synergistic or antagonistic interactions between constituents are not considered. The HI is then compared to the DTSC threshold of 1 (DTSC, 2015). Non-cancer risk estimates for future construction workers exposed to main parcel and RR ROW soil exceed the non-cancer target risk threshold of 1. However, future outdoor commercial/industrial workers exposure to soil exceed the non-cancer target risk threshold of 1 only in the RR ROW.

The low-end non-cancer risk estimate, utilizing an AF of 0.0005, for future indoor commercial/industrial scenarios, does not exceed the non-cancer target risk threshold of 1. However, when an AF of 0.03 is applied, the high-end risk estimate for future indoor commercial/industrial worker scenarios exposure exceeds the non-cancer target risk threshold of 1.

Media Receptor	Total Hazard Index (HI)
Soil (RR ROW)	
Future Commercial/Industrial Outdoor Worker	1.7E+00
Future Construction Worker	2.9E+01
Soil (Main Parcel)	
Future Commercial/Industrial Outdoor Worker	6.8E-01
Future Construction Worker	2.9E+01
Indoor Air	
Future Commercial/Industrial Indoor Worker	3.1E-02 to 1.9E+00

Non-cancer risk estimates are provided in Tables 1a through 3b.

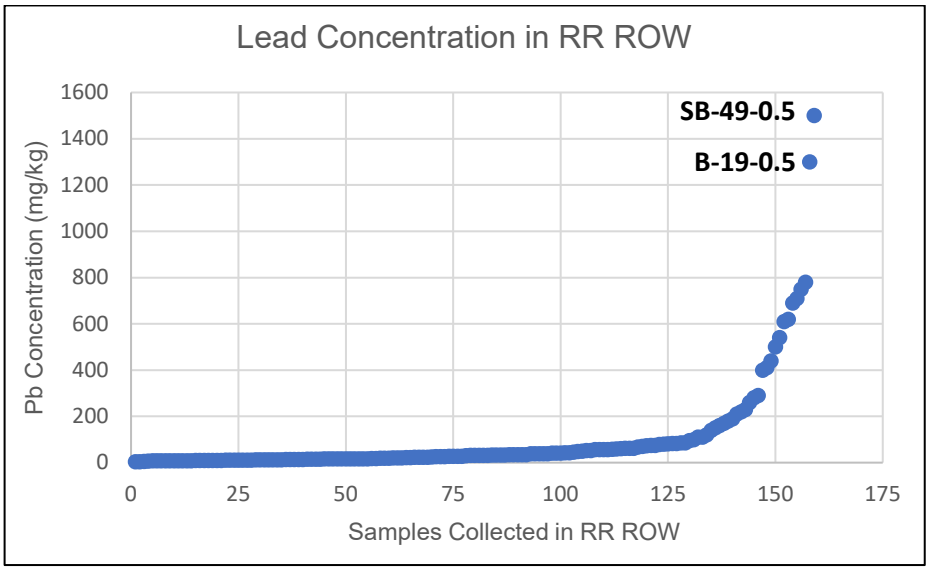
7.3 COPCs Requiring Special Handling

7.3.1 Arsenic

A site-specific arsenic action level was derived in accordance with DTSC methodology as described in *Arsenic Strategies Determination of Arsenic Remediation Development of Arsenic Cleanup Goals* (DTSC, 2009). Based on two methods, the Site-specific arsenic action level ranged from 22 to 24 mg/kg. The 95% upper confidence limit (UCL) of the mean concentration for arsenic at the Site is equal to 40.5 mg/kg, above the upper end of the Site-specific arsenic action level range. Planned targeted remediation efforts to address elevated arsenic concentrations above the Site-specific arsenic action level are discussed in the PEA-E Report, for which this HHSE is an Appendix. If the highest arsenic concentrations (i.e. statistical outliers) are removed, then the 95% UCL of the mean concentration for arsenic at the Site is equal to 13.14 mg/kg, well below the lower end of the Site-specific arsenic action level range. See Attachment 1 for the full site-specific arsenic action level determination methodology.

7.3.2 Lead

Lead was evaluated by modeling blood lead levels, using the DTSC modified USEPA Adult Lead Model (ALM, USEPA, 2009 and DTSC, 2011b). The RR ROW and the main parcel exposure units were evaluated separately. Within the main parcel exposure unit, only the 95% UCL of the mean concentration was evaluated, as no samples were identifiable as hot spots. In the RR ROW exposure unit, two statistical outliers were identified in the dataset (as indicated in the graph below) and were evaluated as hot spots (1,500 mg/kg of lead at SB-49-0.5 and 1,300 mg/kg of lead at B-19-0.5). The maximum detected concentration of these samples was evaluated (1,500 mg/kg at SB-49-0.5). The 95% UCL of the mean concentration was also evaluated for the RR ROW and was calculated subsequent to the removal of the two hot spots.



The modified USEPA ALM incorporated DTSC recommendations for evaluating industrial exposure to lead in soil. These modifications include the CalEPA's Office of Environmental Health Hazard Assessment (OEHHA) development of a new toxicity evaluation of lead replacing the 10 microgram per deciliter (µg/dL) threshold blood concentration with a source-specific "benchmark change" of 1 µg/dL (Cal/EPA OEHHA, 2007). More specifically, the 95th percentile blood lead levels among fetuses of adult workers variable were modified to the 90th percentile blood lead levels among fetuses of adult workers. Because the target blood

lead level of concern was updated to the more recent health-protective criterion of 1 µg/dL, HERO considers the 90th percentile of the distribution appropriate for use in evaluating lead exposures (DTSC, 2011c).

Based on the ALM output assuming the 95% UCL of the mean concentration of the RR ROW and of the main parcel, levels of lead at the Site do not pose unacceptable risk to a fetus of an adult worker. However, evaluation of the SB-49-0.5 hotspot indicated that exposure to lead in this location, and at B-19-0.5, would pose an unacceptable level of risk based on modeled blood lead levels (i.e., above 5% probability that a fetus' blood lead level will not exceed 1 µg/dL). Backup for DTSC's Modified Adult Lead Model (ALM) workbooks are provided as Attachment 2.

Under the USEPA 2001 dust-lead hazard standards, lead is considered a hazard when concentrations in bare soil in residential areas 1,200 mg/kg (USEPA, 2001). Because the property is used for industrial/commercial purposes, the USEPA dust-lead hazard standard is conservative comparison for this Site. That said, the maximum detected lead concentration at the Site that is not an outlier (i.e., SB-49-0.5 and B-19-0.5) is equal to 780 mg/kg (SB-70-0.5) and is below USEPA's dust-lead hazard standard for bare soil in residential areas.

7.4 Uncertainty

Risk and hazard estimates resulting from application of this screening evaluation do not represent absolute estimates at a specific site because generic assumptions for commercial/industrial land use are utilized. Overall, carcinogenic ILCRs and non-carcinogenic HIs presented in the HHSE are based upon conservative assumptions that are intended to be protective of human health by likely overestimating exposure to account for parameter uncertainty (RME exposure scenario). Therefore, the evaluation of future exposures in the HHSE is considered conservative.

Reliance on EPCs to quantify risk estimates inherently introduces uncertainty into risk and hazard estimates, due to uncertainty surrounding site characterization, and heterogeneity. Use of maximum concentrations as EPCs similarly introduces uncertainty, as maximum concentrations almost certainly overestimate actual risk encountered. The proposed redevelopment plan includes an industrial facility; however, the location of this building is currently unknown. Therefore, evaluation of maximum concentrations across the main parcel to generate cumulative risk estimates is a very conservative assumption, that is unlikely to be realized given proposed redevelopment plans. Moreover, using the maximum concentration as the EPC in the RR ROW is especially conservative as the maximum concentration of a COPC is unlikely to be representative of the entire narrow, long expanse of the parcel. Generally, the use of maximum concentrations as EPCs for soil and soil vapor concentrations likely produces a more conservative risk determination for those exposure points.

This HHSE assumed that future exposure scenarios are protective of current exposure. Future exposure scenarios evaluated in this HHSE utilize the maximum soil concentration for the EPC, irrespective of depth and assuming no remedial actions. A current outdoor commercial/industrial worker may be exposed to unpaved, surficial soil in the RR ROW, and therefore may not be exposed to undisturbed, deeper soils with high COPC concentrations. Likewise, a current indoor commercial/industrial worker may be exposed to soil vapor intruding into the indoor air within the buildings on the main parcel. Current indoor workers are likely only exposed to soil vapors intruding from the sub-slab and soil vapor samples collected from deeper intervals are not of concern for a current receptor scenario. Because both conceivable current receptor scenarios are

considered less conservative than the future receptor scenario, current receptor risk was not evaluated in this HHSE and therefore current receptor risk is not quantified.

SLs and toxicity values were not provided in DTSC HHRA Note 3, USEPA 2021 RSLs, and/or SFBRWQCB ESLs for endrin ketone; ethanol; 4-ethyltoluene; phenanthrene; benzo(g,h,i)perylene; dimethyl phthalate; and 2,2,4-trimethylpentane. Therefore, these compounds were not quantitatively evaluated in the HHSE. This omission is considered an area of uncertainty in the HHSE. However, given adoption of numerous conservative assumptions, this uncertainty is not considered to impact conclusions of the HHSE. Aroclor-1260 has no SFBRWQCB ESL for construction worker soil exposure; accordingly, the total PCB ESL for construction worker soil exposure was used as a conservative SL for Aroclor-1260.

The numerical estimates in the HHSE have uncertainties reflecting inherent limitations in appropriately characterizing Site conditions and exposure assumptions (intake rates, number of days exposed, amount of time spent at work, etc.). Risk estimates are based on multiple conservative assumptions that are intended to be protective of health by likely overestimating exposure to account for parameter uncertainty. Therefore, the results presented in this HHSE are likely conservative and biased high.

Notes:
(1) Exposure Point Concentration (EPC) = maximum detected concentration
(2) Commercial/Industrial Screening Levels (SL) as provided in HHSE text; utilized Human Health Risk Assessment Note 3: DTSC-Modified Screening Levels found in HHRA-Note-3-Tables-June-2020-A.xlsx. dated June 2020, and USEPA Regional Screening Levels (RSLs) dated May 2021 when unavailable in Note 3. USEPA RSLs utilize a TILCR of 1E-06 and a THI of 1.
(3) Incremental Lifetime Cancer Risk (ILCR)=EPC/SL*1E-06
(4) Hazard Quotient (HQ) = EPC/ SL
(5) There is no cancer and non-cancer SL established for endrin ketone; phenanthrene; benzo(g,h,i)perylene; and dimethyl phthalate.
(6) Chromium(III) non-cancer SL is used as a surrogate value for total chromium.
(7) The San Francisco Bay Regional Water Quality Control Board Commercial/Industrial Worker Shallow Soil Exposures (found in 2019_ESL_Workbook_Interim Final_Rev2.xlsx. dated 2019) Environmental Screening Level (ESL) for DRO C10-C28 and ORO C28-C44 were utilized in the absence of DTSC and USEPA SLs.
(7) NS = No Standard, -- = No Risk Estimate
(8) mg/kg = milligrams per kilogram

Table 2a: Summary of Hazard Indices and Incremental Lifetime Cancer Risk:
Construction Worker Soil based on Maximum Concentration (Railroad Right-of-Way)
650 North King Road, San Jose, California

Compound	Cas No.	EPC (mg/kg)	Construction Worker Screening Level Cancer (mg/kg)	Construction Worker Screening Level Non-Cancer (mg/kg)	Incremental Lifetime Cancer Risk (ILCR)	Hazard Quotient (HQ)

Notes:
(1) Indoor Air Exposure Point Concentration (EPC) = soil gas concentration ($\mu g/m^3$)*AF where AF=steady state attenuation factor. AF assumed to be equal to 0.0005 for a future commercial contaminant source based on Table 2 (DTSC, 2011). DTSC Guidance for the Evaluation and Mitigation of Subsurface Vapor Intrusion to Indoor Air (Vapor Intrusion Guidance). October 2011.
(2) Commercial/Industrial Screening Levels (SL) as provided in HHSE text; utilized Human Health Risk Assessment Note 3: DTSC-Modified Screening Levels found in HHRA-Note-3-Tables-June-2020-A.xlsx. dated June 2020, and USEPA Regional Screening Levels (RSLs) dated May 2021 when unavailable in Note 3. USEPA RSLs utilize a TILCR of 1E-06 and a THI of 1.
(3) Incremental Lifetime Cancer Risk (ILCR)=EPC/SL*1E-06
(4) Hazard Quotient (HQ) = EPC/ SL
(5) There is no cancer or non-cancer SL established for ethanol; ethyltoluene, 4-; and trimethylpentane, 2,2,4 .
(7) NS = No Standard, -- = No Risk Estimate
(8) $\mu g/m^3$ = micrograms per cubic meter

Notes:
(1) Indoor Air Exposure Point Concentration (EPC) = soil gas concentration ($\mu g/m^3$)*AF where AF=steady state attenuation factor. AF assumed to be equal to 0.03 for Soil Gas in Table: Medium-Specific Attenuation Factors for VI to Indoor Air. DTSC's Supplemental Guidance: Screening and Evaluating Vapor Intrusion (Draft for Public Comments). February 2020.
(2) Commercial/Industrial Screening Levels (SL) as provided in HHSE text; utilized Human Health Risk Assessment Note 3: DTSC-Modified Screening Levels found in HHRA-Note-3-Tables-June-2020-A.xlsx. dated June 2020, and USEPA Regional Screening Levels (RSLs) dated May 2021 when unavailable in Note 3 with the exception of dichloroethene, 1,2-, trans- where the USEPA RSL was more conservative and therefore utilized. USEPA RSLs utilize a TILCR of 1E-06 and a THI of 1.
(3) Incremental Lifetime Cancer Risk (ILCR)=EPC/SL*1E-06
(4) Hazard Quotient (HQ) = EPC/ SL
(5) There is no cancer or non-cancer SL established for ethanol; ethyltoluene, 4-; and trimethylpentane, 2,2,4 .

(7) NS = No Standard, -- = No Risk Estimate
(8) $\mu g/m^3$ = micrograms per cubic meter

ATTACHMENT 1

Arsenic Evaluation

Arsenic was identified as a chemical of concern at the Site, as concentrations detected at the Site exceeded the background concentration of 11 milligrams per kilograms (mg/kg) for naturally occurring soils in the urbanized San Francisco Bay region (Duvergé, 2011). However, there is no reason to believe that arsenic detected at the Site is related to past operations at the Site. Therefore, a site-specific Arsenic Action Level range of 22 – 24 mg/kg was derived, in accordance with DTSC methodology as described in *Arsenic Strategies Determination of Arsenic Remediation Development of Arsenic Cleanup Goals* (DTSC, 2009). Summary statistics for the arsenic dataset are as follows:

Table 1. Summary Statistics for full arsenic dataset collected from October 2020 to March 2021,

DESCRIPTIVE STATISTIC	VALUE
Number of Samples	191
Number of Detects	188
Minimum Detected Concentration	1.2
Maximum Detected Concentration	430
Mean Concentration	25.1
Standard Deviation	49.0

The data set for arsenic was checked for quality assurance/quality control (QA/QC) prior to evaluation. The maximum concentration was selected between duplicate and parent samples. The finalized data set was evaluated using two methodologies, consistent with DTSC, 2009:

1. **Method #1: Simple Graphical Determination of the Arsenic Action Level:** Using Method #1, the arsenic action level ranged from 16 mg/kg to 23 mg/kg based on an analysis of inflection points within the dataset, utilizing both normal and lognormal distributions.
2. **Method #2: Statistical Evaluation of the Arsenic Action Level:** Using Method #2, the arsenic action level ranged from 22.7 to 24.1 mg/kg, after adjusting for potential outliers in the dataset, and assuming a normal distribution.

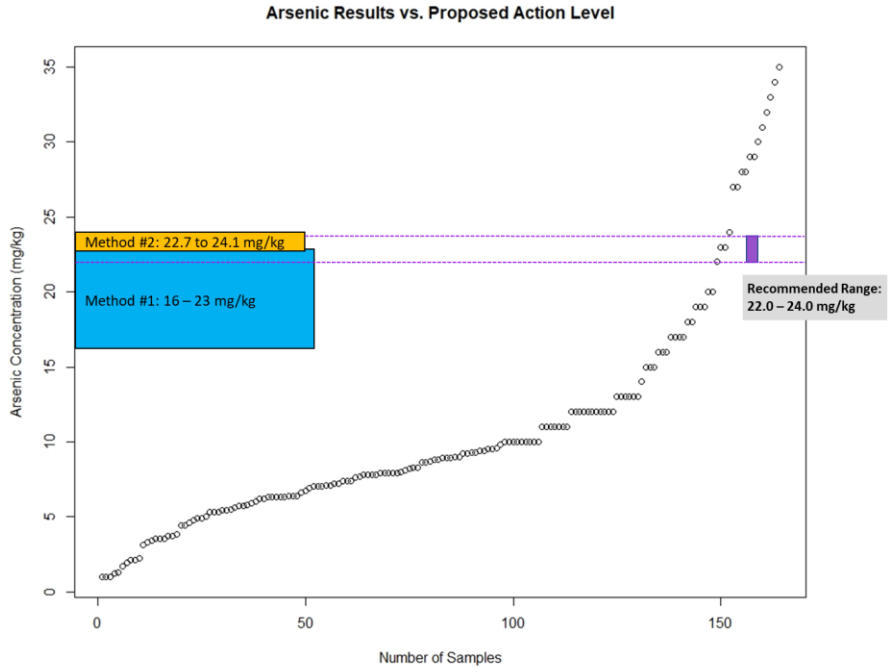
Based on an evaluation of the results produced from the two methods outlined above and past discussions with DTSC Human and Ecological Risk Office (HERO) staff, Roux referenced values from both methods above (assuming a normal distribution) to create a site-specific Arsenic Action Level range of 22 to 24 mg/kg for arsenic at the Site. Although **Method #1** identified 16 as the lowest potential arsenic action level, all other statistical lines of evidence fall within the 22.0 to 24.0 mg/kg range. **Figure 1** displays the graphical representation of the Arsenic Results vs. the Proposed Arsenic Action Level.

The recommended 95% upper confidence limit (UCL) of the mean concentration for arsenic at the Site determined via USEPA ProUCL 5.1 Software[1] is equal to 40.5 mg/kg, and therefore is above the higher range of the Site-specific Arsenic Action Level (see **Attachment 1a** for ProUCL

[1] USEPA, 2015. ProUCL 5.1.002 Statistical Software for Environmental Applications for Data Sets with and without Non-detect Observations.

Input and Output files).[2] Planned targeted remediation efforts to address elevated arsenic concentrations above the Site-specific arsenic action level are discussed in the Preliminary Environmental Assessment Equivalent Report (PEA-E) for which this attachment is appended.

Figure 1. Arsenic Results (with outliers removed) vs. Proposed Arsenic Action Level based on **Method #1** and **Method #2** analyses.



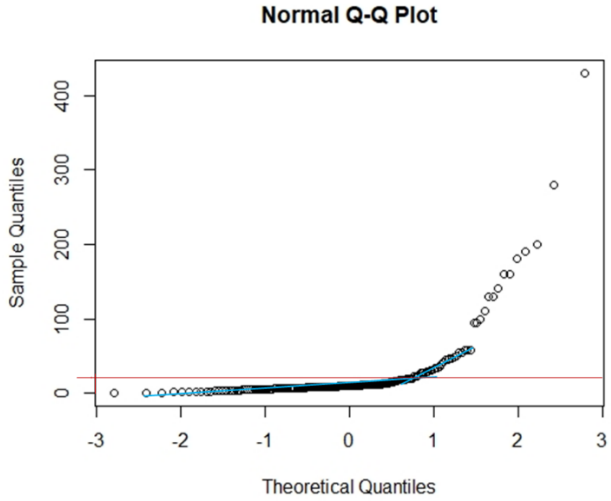
Supporting analysis for each of the two methods is provided below.

Method #1: Simple, Graphical Determination of the Arsenic Action Level

Figure 2 presents the normality plot of the raw arsenic data. Many environmental datasets do not follow a normal distribution, and therefore, the data were log-transformed as shown in the log-transformed normality plot in **Figure 3**. Potential inflection points were identified on the figures below, outlining a potential arsenic action level. The inflection points where the slope changes are indicative of a deviation from ambient levels. The samples below these inflection points would be representative of ambient arsenic in the site's urban environment.

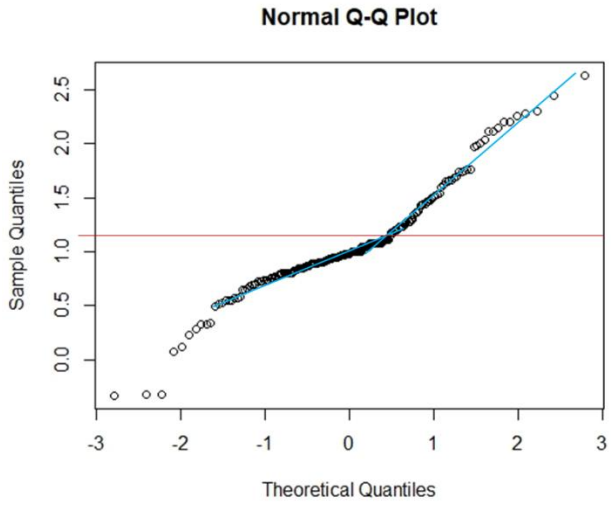
[2] Note that the 95% UCL of the mean concentration was calculated with the full dataset, including potential outliers.

Figure 2. Range for ambient arsenic in soil assuming normal distribution.



In **Figure 2**, one inflection point is discernable, equating an ambient arsenic soil value at 23 mg/kg.

Figure 3. Range for ambient arsenic in soil assuming lognormal distribution.



In **Figure 3**, the inflection point occurs around the log-transformed values of 1.2, equating to an upper-bound of approximately 16 mg/kg for ambient arsenic in soil. Since these numbers are highly subjective, **Method #2** was utilized to provide an additional estimate of arsenic action levels at the Site.

Method #2: Statistical Evaluation of the Arsenic Action Level

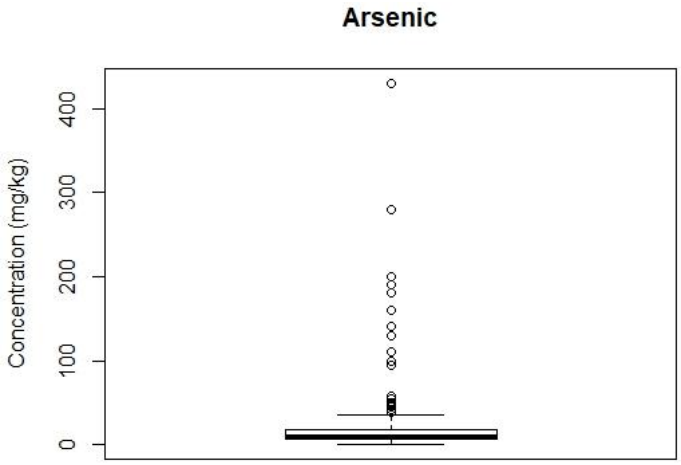
Step 1. Quartile Analysis ("Fourth Spread")

Initial summary statistics can be found in **Table 2**. A box plot for the data provided below as **Figure 4** indicates there may be several outliers in the data, identified as the "fourth spread, f_s."

Table 2. Summary Statistics of arsenic data.

Number Observations	Number Detections	Minimum Concentration	25%ile (Q1)	Median	Mean	75%ile (Q3)	Maximum Concentration
191	188	1.2	6.5	9.6	25.1	18.5	430

Figure 4. Boxplot of arsenic data.



Based on the presence of potential outliers, the fourth spread was calculated using the summary statistics from Table 1 as follows:

$$f_s = Q_3 - Q_1$$
$$18.5 - 6.5 = 12.0$$

Any observation further than 1.5*f_s from the closest fourth was determined to be an outlier.

$$f_s = Q_3 - Q_1 = 18.50 - 6.50 = 12.0$$
$$< Q_1 - 1.5f_s \quad \text{and} \quad > Q_3 + 1.5f_s$$
$$< 6.50 - 18.0 \quad \text{and} \quad > 18.50 + 18.0$$
$$< -11.50 \quad \text{and} \quad > 36.50$$

Therefore, the following arsenic data points were determined to be statistical outliers:

Table 3. Statistical outliers removed according to forth spread evaluation

Location ID	Depth (feet bgs)	Sample Date	Arsenic (mg/kg)
SB-1-2	2.0	2/3/2021	50

B-20-0.5	0.5	10/16/2020	140

Table 4 below provides summary statistics of the data after removal of the 27 outliers identified above. The data were log-transformed, and summary statistics were reevaluated and presented as the variable Log_Arsenic.

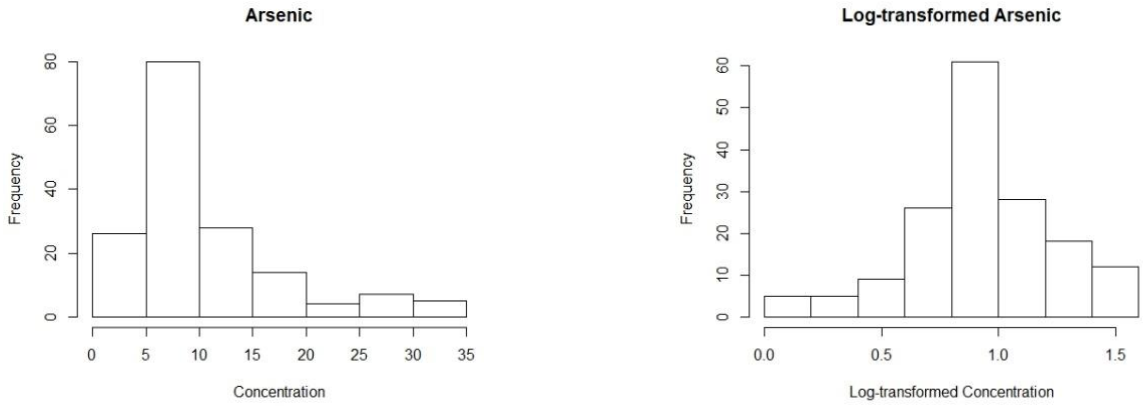
Table 4. Summary statistics for native data and log-transformed data after removal of outliers.

	Number Observations	Number Detections	Minimum Concentration	25%ile (Q1)	Median	Mean	Standard Deviation	75%ile (Q3)	Maximum Concentration
Arsenic	164	161	1.70	6.30	8.85	10.67	7.25	12.00	35.00
Log_Arsenic	164	161	0.23	0.80	0.95	0.93	0.33	1.08	1.54

Step 2. Upper Limit Identification

Figures 5a and **5b** provide histograms for the native data and log-transformed data after the removal of outliers. **Figure 5a** depicts a left-skewed distribution that is indicative of a log-normal distribution. The logarithmic transformation displayed in **Figure 5b** appears closer to a normal distribution.

Figures 5a and 5b. Histogram of data and log-transformed data after removal of outliers.



To evaluate the distribution of the dataset further, the Shapiro Wilk Goodness of Fit test was run in ProUCL to determine the appropriate distribution.

Output 1A. Background statistics assuming normal distribution.

Normal GOF Test on Detects Only		
Shapiro Wilk Test Statistic	0.833	**Normal GOF Test on Detected Observations Only**
5% Shapiro Wilk P Value	0	Data Not Normal at 5% Significance Level
Lilliefors Test Statistic	0.188	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.0702	Data Not Normal at 5% Significance Level
Data Not Normal at 5% Significance Level		

Output 1B. Background statistics assuming log-normal distribution.

Lognormal GOF Test on Detected Observations Only		
Shapiro Wilk Approximate Test Statistic	0.965	**Shapiro Wilk GOF Test**
5% Shapiro Wilk P Value	0.0101	Data Not Lognormal at 5% Significance Level
Lilliefors Test Statistic	0.0742	**Lilliefors GOF Test**
5% Lilliefors Critical Value	0.0702	Data Not Lognormal at 5% Significance Level
Data Not Lognormal at 5% Significance Level		

Output 1A and **1B** indicate that the data are not normally or log-normally distributed. Moreover, ProUCL determined that the data do not follow a discernable distribution and therefore the dataset is nonparametric.

The USEPA ProUCL Version 5.1 Technical Guide provides guidance in determining the Upper Limit of nonparametric datasets. If the standard deviation of a log-transformed dataset is less than 0.5, then the data are considered symmetric to mildly skewed (USEPA, 2015). As indicated in **Table 2**, the standard deviation of the log-transformed data is 0.3, and therefore this dataset is considered mildly skewed. Moreover, the USEPA ProUCL Technical Guide states that: "for mildly skewed nonparametric data sets with standard deviation of log-transformed data less than 0.5,

one may use a normal distribution based on Upper Tolerance Limits (UTLs) and Upper Prediction Limits (UPLs)".[3]

Although ProUCL output states the data are not normally distributed, because the data is mildly skewed, the upper limit analysis was performed by evaluating the normal distribution UTLs and UPLs to determine the **Method #2** determined arsenic action level range. A tolerance factor (K) of 1.857 was assigned by the ProUCL program during the evaluation. **Output 2** shows the results of the Kaplan Meier (KM) method, which is frequently used in environmental applications to estimate upper limit values (i.e., UTLs and UPLs) (USEPA, 2015). The background statistics range from 22.7 (95% KM UPL) to 24.1 mg/kg (95% UTL). ProUCL input files and full output files can be found in **Attachment 1b**. The 95% KM UPL and the 95% UTL presented in **Output 2** support an arsenic action level range of 22.0 to 24.0 mg/kg.

Output 2. KM method calculated background statistics assuming normal distribution.

Kaplan Meier (KM) Background Statistics Assuming Normal Distribution			
KM Mean	10.68	KM SD	7.218
95% UTL95% Coverage	24.08	95% KM UPL (t)	22.65
90% KM Percentile (z)	19.93	95% KM Percentile (z)	22.55
99% KM Percentile (z)	27.47	95% KM USL	35.01

PROFESSIONAL CERTIFICATION

This *Subsurface Site Investigation Report* for the property located at 646 to 658 North King Road and 1805 Las Plumas Avenue in San Jose, California has been prepared under the oversight of a California Professional Geologist and/or California Professional Engineer. This document is based on information available to Path Forward Partners, Inc. and current laws, policies, and regulations as of the date of this document. The opinions expressed in this document are based upon the information available to Path Forward Partners, Inc. and are given in response to a limited assignment and should be considered and implemented only in light of that assignment. The services provided by Path Forward Partners, Inc. in completing this project were consistent with normal standards of the profession. No other warranty, expressed or implied, is made.

1.0 INTRODUCTION

Path Forward Partners, Inc. (Path Forward) has prepared this *Subsurface Site Investigation Report* (Report) on behalf of BTC III San Jose Logistics Center LP (BTC) for the property located at 646 to 658 North King Road and 1805 Las Plumas Avenue in San Jose, California (Site, Figure 1). We understand BTC has requested an evaluation of Site conditions to assist in evaluating redevelopment costs including a recent *Phase I Environmental Site Assessment* (Phase I ESA; Path Forward 2020) and requested Path Forward to evaluate current environmental conditions on Site.

2.0 BACKGROUND

As described in the recent Phase I ESA (Path Forward 2020), the 8.95-acre subject property is developed with an approximate 120,000 square-foot industrial building with a two-story office area in the center of the subject property (650 Building), a 7,800 square-foot office building in the southern corner of the subject property (646 Building), and a 950 square-foot building in the western corner of the subject property (658 Building). The 650 Building also includes the 1805 Las Plumas Avenue address. Improvements also include paved surface parking and perimeter landscaping.

2.1 Site History

The Phase I ESA identified obvious subject property uses from the present back to 1939, at which time the subject property was used for agricultural purposes including an orchard and approximately five farm related structures located along the northwestern subject property boundary. The current 120,000 square-foot industrial building was constructed on the subject property in 1964. Frito-Lay occupied the building and manufactured potato chips and pork rinds at the subject property until 1996. Since 1996, various tenants have occupied the subject property buildings.

The Phase I ESA also identified several environmental conditions that may impact redevelopment of the Site. These conditions include three former underground storage tanks (USTs), historical soil gas sampling results above current health risk-based cleanup levels, extensive use of hazardous and petroleum products by previous and current tenants that may have resulted in a release, and historical agricultural land use (Path Forward 2020).

Additional files that are associated with the former USTs were reviewed from the State Water Resources Control Board (SWRCB) GeoTracker website as part of this investigation. Relevant findings are discussed below.

In 1990, Environ Corporation (Environ) was retained by Frito-Lay, Inc. (former property owner) to conduct a due diligence review of potential environmental liabilities at their facility to

prepare for divestment of the property (Environ 1990a and Environ 1990b). This review included the following findings:

- Chemicals, including acid and caustic for equipment scrubbing, solvents, and floor and wall cleaner, were stored in a sanitation shed on-Site. The sanitation shed was located near the former rail spur outside of the westernmost corner of the 650 Building (Environ 1990a).
- Chemicals, including lubricants and solvents, were used within the maintenance area within the 650 Building. It was noted that used solvents for the parts bath located in this area were recycled by Safety-Kleen. Staining was documented on the concrete floor (Environ 1990a).
- Empty lubricant and solvent drums were historically stored in an unpaved area outside of the 650 Building near the former fuel pump island. During the historical site visit, staining was apparent on the soil near the drum storage area (Environ 1990b). It is noted that the fuel pump island was located outside of the current Site boundary, and a portion of these soils were excavated during the removal of USTs; however, low levels of residual petroleum contamination may have been left in place. During a soil gas survey conducted by Target Environmental Services, Inc. near this area, the chromatogram signatures from several of the samples were identified as likely representative of chlorinated hydrocarbons; however, these peaks were not further identified or quantified (Target 1990).

2.2 Regional Geology and Hydrogeology

The subject property is located in the Santa Clara Valley physiographic province, a structural low associated with the southern end of the San Francisco Bay. Information available from the Santa Clara Valley Water District (SCVWD) website indicates that the Santa Clara Valley physiographic province is a down-dropped structural block, filled in by continental and marine sediments. The regulatory agency database report indicates that soils in the subject property area are classified as Botella and consist of clay loam, extend to depths of greater than 60 inches, have moderate infiltration rates, and are moderately well to well drained.

Historical investigations conducted at the Site identified clayey to silty sand fill to a depth ranging from 3 to 7 feet below ground surface (bgs) underlain by 6 to 12 feet of impermeable clayey soil. Beneath the clayey soil, a 6 to 7 feet thick clayey sand water bearing zone was identified. This water bearing zone was underlain by approximately 5 feet of impermeable clay. First encountered water was noted between 16.5 and 27 feet bgs (Applied Earth 1986).

According to the *Case Closure Summary* prepared by SCVWD prepared in 1995, groundwater depths in five monitoring wells, historically installed at the Site, ranged between 8.66 and 18.83 feet bgs and groundwater flowed in a northeasterly direction (SCVWD 1995). This depth to groundwater is relatively consistent with first encountered groundwater levels observed by

Cornerstone Earth Group during their recent geotechnical investigation where first encountered groundwater was noted between 6 and 12 feet bgs (Cornerstone 2020).

2.3 Objective

Based on the findings of the Phase I ESA, a subsurface investigation was recommended to assess the current soil and soil gas conditions at the Site. This investigation was designed to determine if a release of petroleum or hazardous materials had occurred on or near the Site that may impair the property and/or affect the planned future redevelopment.

3.0 PRE-FIELDWORK ACTIVITIES

The following pre-fieldwork activities were performed by Path Forward:

- Prepared a Site-specific health and safety plan (HASP) for the work proposed at the Site in accordance with the requirements of Title 29 of the Code of Federal Regulations, Section 1910.120 (29 CFR 1910.120). A copy of the HASP was kept onsite during field activities. The HASP detailed the work to be performed, safety precautions, emergency response procedures, nearest hospital information, and on-Site personnel responsible for managing emergency situations.
- Marked proposed boring locations in white paint and contacted Underground Service Alert (USA) at least 48 hours prior to sampling. Path Forward was given USA Ticket No. X023802637 on August 25, 2020.

  In addition, Path Forward hired a professional utility location firm to clear proposed boring locations of potential subsurface utilities prior to drilling and requested any existing utility plans be provided in advance of this work so that we could position our borings accordingly in the field.
- Communicated with subcontractors including drillers, laboratories, utility locators, and couriers, as needed; and
- Coordinated Site access for these investigation efforts.

4.0 FIELDWORK

The following fieldwork activities were conducted from August 31, 2020 through September 1, 2020.

4.1 Field Sampling Procedures

4.1.1 Advancement of Soil Borings and Soil Logging

Soil borings were advanced by Environmental Control Associates, Inc. (ECA), a California C-57 licensed drilling contractor. A Path Forward field geologist oversaw the field activities under the direction of a California Professional Geologist and/or Engineer. Soil cores were collected from

boreholes using direct push technology and an approximately 4-foot core barrel sampler containing a single-use acetate liner to retain a relatively undisturbed soil core. Soil cores were examined for soil classification and described on boring logs in general conformance with the Unified Soil Classification System (USCS). Soils generally consisted of clays, sandy clays, and trace gravels.

Field screening of soil cores was performed at regular intervals using a photoionization detector (PID) to evaluate the potential presence of volatile organic compounds (VOCs). Measurements from the PID were recorded on boring logs in the parts per billion (ppb) range for total VOCs. Boring logs are provided in Appendix A.

4.1.2 Soil Sampling

To characterize shallow soils, a total of 20 discrete samples were collected and analyzed from 0.5 and 3.0 feet bgs. Discrete samples were collected from 10 locations across the Site (Figure 2). The discrete soil samples for non-volatile analysis were cut directly from acetate liners and covered with Teflon tape and plastic end caps. Samples for volatiles analysis were collected following the United States Environmental Protection Agency (USEPA) Method 5035 preservation method.

4.1.3 Soil Gas Probe Installation

Following sampling, a single soil gas probe was installed at each of the 10 boring locations in general accordance with the California Environmental Protection Agency (Cal/EPA) *Advisory: Active Soil Gas Investigations* (Advisory; Cal/EPA 2015). The following procedure was followed:

- A 2.25-inch diameter boring was advanced to 5.5 feet bgs.
- The two retrieved soil cores were logged utilizing the USCS and screened using a PID.
- Six inches of No. 3 sand were emplaced at the base of the borehole.
- The soil gas probe and sampling line were emplaced in the borehole at 5.0 feet bgs[1]. The vapor implant consisted of a new stainless-steel implant with 1-inch 50-micron filter and speed-fit/push-in fitting. The sampling line consisted of new ¼-inch outer diameter Teflon tubing, cut to length with approximately 2 feet extending from the ground surface, terminated with a temporary protective plastic cap, and labeled with the probe depth.
- Six inches of sand were emplaced in the borehole, creating a 12-inch sand pack surrounding the first vapor implant.
- 12 inches of dry granular bentonite were emplaced in the borehole.
- The borehole was sealed to the ground surface with hydrated granular bentonite.

[1] Due to subsurface conditions precluding deeper installation at location B05, the soil gas probe was placed at approximately 2.0 feet bgs.

4.1.4 Soil Gas Sample Collection

In general accordance with the Advisory, following at least 2 hours equilibration time, the soil gas probes were purged and sampled. Sampling was performed no less than 5 days after a significant rain event defined as 0.5 inches or greater of rainfall during a 24-hour period. Similarly, soil gas was only sampled when the probe area was free of standing or ponded water.

Each probe was purged and sampled using a dedicated pre-cleaned and certified sampling apparatus provided by the analytical laboratory, which consisted of a sampling train with a 150 milliliter per minute (mL/min) flow controller and a 1.4-liter Summa cannister. The following procedure was generally followed.

- Prior to connecting the Summa canister to the sampling train, a shut-in test was conducted to confirm the laboratory-supplied sampling train was secure and that there were no obvious or significant leaks. This test consisted of reading the sampling train pressure gauge to confirm whether the sampling train was under full vacuum (-30 inches mercury), or less. Less than full vacuum would indicate that a small volume of ambient air had leaked into the sampling train – any ambient air leakage would ultimately be included in the collected soil gas sample.
- The Summa canister was connected to the sampling train. After this connection was made, the sampling train pressure gauge effectively displayed the canister pressure, which was confirmed to be under approximately full vacuum, i.e., -30 inches mercury. The protective plastic end cap was removed from the probe sampling line and the line was connected to the sampling train with a ¼-inch compression fitting.
- A small amount of the leak-detection compound, 1,1-difluoroethane (1,1-DFA), was applied to a rag, which was placed near the probe location and sampling train.
- The probe was purged of three probe volumes, comprising a total of approximately 1,600 mL, at an approximate flow rate of 150 mL/min, using a syringe connected to the sampling train.
- After the probe was purged, a soil gas sample was collected into the 1.4-liter Summa canister. The sample start-time and start-pressure were recorded upon opening the valve to the sample position. The decrease in canister vacuum was observed over time to confirm whether the canister was filling normally. The sample was ended when the pressure gauge indicated -5 inches mercury, *i.e.*, when the canister was nearly but not completely full. The sample end-time and end-pressure were recorded upon closing the valve.
- Following sample collection, the Summa canister and sampling line were disconnected from the sampling train.

The collected soil gas samples were labeled and later delivered to the analytical laboratory under chain of custody.

4.2 Borehole Abandonment and Waste Disposal

Upon completion of soil gas sampling, the probes were decommissioned, and the area was completed to match the surrounding grade.

A small volume (less than 55 gallons) of investigation-derived waste, consisting of soil cuttings, was placed into an appropriately sealed and labeled 55-gallon steel drum. Following waste profiling activities, the drum will be transported off-Site to an appropriate receiving facility for disposal.

5.0 ANALYTICAL PROGRAM

5.1 Soil Analytical Program

The 20 discrete soil samples were analyzed on a standard 5-day turnaround time (TAT) by McCampbell Analytical, Inc. (McCampbell) in Pittsburg, California for one or more of the following methods:

- Total petroleum hydrocarbons (TPH) quantified as gasoline (TPH-g) and VOCs by USEPA Method 8260B;
- TPH quantified as diesel (TPH-d) and motor oil (TPH-mo) by USEPA Method 8015M using silica gel cleanup preparation;
- Semi-volatile organic compounds (SVOCs) and polycyclic aromatic hydrocarbons (PAHs) by USEPA Method 8270C;
- Organochlorine pesticides (OCPs) by USEPA Method 8081A;
- Polychlorinated biphenyls (PCBs) by USEPA Method 8082;
- Title 22 total metals by USEPA Methods 6020;
- Asbestos by polarized light microscopy (PLM) by USEPA Method 600/R-93-116; and
- Moisture content by ASTM D2216.

Initial soil sampling results were compared to Federal and California hazardous waste thresholds consisting of the Total Threshold Limit Concentration (TTLC), 10 times the Soluble Threshold Limit Concentration (10×STLC), and 20 times the Toxicity Characteristic Leaching Procedure limit (20×TCLP). If any sample result tied or exceeded a 10×STLC and/or 20×TCLP threshold, that soil sample was additionally analyzed by the California WET and/or Federal TCLP, as appropriate.

5.2 Soil Gas Analytical Program

The 10 soil gas samples were submitted on a standard 10-day TAT to Pace Analytical (Pace) in Mt. Juliet, Tennessee for analysis by the following methods:

- VOCs including the leak-detection compound, 1,1-DFA, by USEPA Method TO-15; and
- Fixed gases (carbon dioxide, carbon monoxide, helium, methane, and oxygen) by ASTM Method D1946.

6.0 SOIL DATA RESULTS

The soil sampling results are presented in McCampbell report number 2009078, which is enclosed in Appendix B. No significant quality assurance/quality control (QA/QC) issues were encountered by the laboratory. The soil sampling results are summarized in Tables 1, 2, and 3 and are discussed below. Soil sampling results are evaluated below in three contexts: unrestricted land use (i.e., Tier 1 Environmental Screening Levels [ESLs]), intrusive construction (i.e., redevelopment), and commercial/industrial land use (i.e., post-redevelopment).

6.1 Unrestricted Land Use Scenario

Soil sampling results are compared in Table 1 to SFBRWQCB Tier 1 soil ESLs or background/ambient levels if higher. Target analytes were either not detected above their respective laboratory reporting limits or were detected at concentrations below their respective Tier 1 ESLs, except for the following:

- Tetrachloroethene (PCE) was detected in one soil sample (B01-S-3.0) at a concentration of 0.11 milligrams per kilogram (mg/kg), which is above the Tier 1 ESL[2] of 0.080 mg/kg.
- Dimethyl phthalate was detected in one sample (B07-S-0.5) at a concentration of 0.070 mg/kg, which is above the Tier 1 ESL of 0.035 mg/kg.
- Phenol was detected in one sample (B05-S-0.5) at a concentration of 0.17 mg/kg, which is just above the Tier 1 ESL of 0.16 mg/kg.
- Alpha-chlordane was detected in two samples (B05-S-0.5 and B08-S-0.5) at concentrations of 0.98 mg/kg and 0.11 mg/kg, respectively, which are above the Tier 1 ESL of 0.0085 mg/kg.
- Gamma-chlordane was detected in two samples (B05-S-0.5 and B08-S-0.5) at concentrations of 0.89 mg/kg and 0.11 mg/kg, respectively, which are above the Tier 1 ESL of 0.0085 mg/kg.
- Technical chlordane was detected in one sample (B05-S-0.5) at a concentration of 7.6 mg/kg, which is above the Tier 1 ESL of 0.0085 mg/kg.

[2] It is noted that the PCE Tier 1 ESL is based on soil leaching to groundwater resulting in a groundwater to indoor air vapor intrusion concern. Screening levels to evaluate the potential for soil to indoor air vapor intrusion concerns would result in a screening level below reporting limits readily achievable by laboratories and thus are not recommended for use.

- 4,4'-DDT was detected in four samples (B01-S-0.5, B02-S-0.5, B05-S-0.5, and B10-S-0.5) at concentrations of 0.0017 mg/kg, 0.16 mg/kg, 0.034 mg/kg, and 0.044 mg/kg, respectively, which are above the Tier 1 ESL of 0.0011 mg/kg.
- Dieldrin was detected in one sample (B02-S-0.5) at a concentration of 0.00088 mg/kg, which is above the Tier 1 ESL of 0.00046 mg/kg.
- Endrin was detected in one sample (B08-S-0.5) at a concentration of 0.0019 mg/kg, which is above the Tier 1 ESL of 0.0011 mg/kg.
- Heptachlor epoxide was detected in one sample (B02-S-0.5) at a concentration of 0.00022 mg/kg, which is above the Tier 1 ESL of 0.00018 mg/kg.
- Nickel was detected in 13 samples at concentrations ranging from 89 mg/kg to 2,200 mg/kg, which are above the Tier 1 ESL of 86 mg/kg. Two samples (B03-S-0.5 and B09-S-0.5) have detected concentrations of 2,200 mg/kg and 560 mg/kg, which are also above the background value of 509 mg/kg (Bradford et al. 1996).

The following sampling results exceed Tier 1 ESLs but are within the range of expected background conditions:

- Arsenic was detected in 20 samples at concentrations ranging from 1.9 mg/kg to 13 mg/kg, which are above the Tier 1 ESL of 0.067 mg/kg. Detected concentrations of arsenic in five samples (B01-S-0.5, B01-S-3.0, B05-S-4.0, B07-S-3.0, and B10-S-3.0) are above the 99th percentile background concentration of 11 mg/kg; however, are within the expected maximum background concentration of 21 mg/kg (Duvergé 2011).
- Barium was detected in one sample (B07-S-3.0) at a concentration of 610 mg/kg, which is above the Tier 1 ESL of 390 mg/kg. This detection is below the background value of 1,400 mg/kg (Bradford et al. 1996).
- Cadmium was detected in two samples (B04-S-0.5 and B07-S-0.5) at concentrations of 2.0 mg/kg and 3.0 mg/kg, respectively, which are above the Tier 1 ESL of 1.9 mg/kg. When evaluating these concentrations on a Site-wide basis (i.e. 95- UCL), the concentration is 1.162 mg/kg which is below the background concentration of 1.7 mg/kg (Appendix C).
- Chromium was detected in two samples (B03-S-3.0 and B09-S-0.5) at concentrations of 470 mg/kg and 300 mg/kg, respectively, which are above the Tier 1 ESL of 160 mg/kg. These concentrations are below the background value of 1,579 mg/kg (Bradford et al. 1996).
- Cobalt was detected in two samples (B03-S-0.5 and B09-S-0.5) at concentrations of 89 mg/kg and 30 mg/kg, respectively, which are above the Tier 1 ESL of 23 mg/kg. The detection in sample B09-S-0.5 is below the background concentration of 46.9 mg/kg (Bradford et al. 1996). When evaluating these concentrations on a Site-wide basis (i.e. 95- UCL), the concentration is 35.01 mg/kg which is below the regional background concentration (Appendix C).

- Lead was detected in two samples (B02-S-0.5 and B10-S-0.5) at concentrations of 36 mg/kg and 54 mg/kg, respectively, which are above the Tier 1 ESL of 32 mg/kg. These concentrations are below the background concentration of 509 mg/kg (Bradford et al. 1996).
- Vanadium was detected in 20 samples at concentrations ranging from 28 mg/kg to 73 mg/kg, which are above the Tier 1 ESL of 18 mg/kg. The detected concentrations are all below the background value of 288 mg/kg (Bradford et al. 1996).
- Benzo(a)pyrene was detected in three samples (B06-S-0.5, B09-S-0.5, B10-S-0.5) at concentrations of 0.29 mg/kg, 0.28 mg/kg, and 0.13 mg/kg, which are above the Tier 1 ESL of 0.11 mg/kg. Total carcinogenic polycyclic aromatic hydrocarbon (CPAH) concentrations have been calculated for these three samples in accordance with DTSC methodology (see Appendix D). Total CPAH concentrations for these samples are below the total CPAHs background value of 0.9 mg/kg (DTSC 2009).

6.2 Commercial/Industrial Land Use Scenario

Soil sampling results are compared in Table 1 to SFBRWQCB commercial/industrial land use ESLs or background/ambient levels if higher. Target analytes were either not detected above the laboratory reporting limit or were detected below their respective commercial/industrial ESLs, except for the following:

- Technical chlordane was detected in one sample (B05-S-0.5) at a concentration of 7.6 mg/kg, which is above the commercial/industrial ESL of 2.2 mg/kg.

The following sampling results exceed commercial/industrial ESLs but are within the range of expected background conditions:

- Arsenic was detected in 20 samples at concentrations ranging from 1.9 mg/kg to 13 mg/kg, which are above the commercial/industrial ESL of 0.31 mg/kg. Detected concentrations of arsenic in five samples (B01-S-0.5, B01-S-3.0, B05-S-4.0, B07-S-3.0, and B10-S-3.0) are above the 99th percentile background concentration of 11 mg/kg; however, are within the expected maximum background concentration of 21 mg/kg (Duvergé 2011).

6.3 Intrusive Construction Scenario

Soil sampling results are compared in Table 1 to SFBRWQCB intrusive construction ESLs or background/ambient levels if higher. Target analytes were either not detected above the laboratory reporting limit or were detected below their respective intrusive construction ESLs, except for the following:

- Nickel was detected in 13 samples at concentrations ranging from 89 mg/kg to 2,200 mg/kg, which are above the intrusive construction ESL of 86 mg/kg. Two samples

(B03-S-0.5 and B09-S-0.5) have detected concentrations of 2,200 mg/kg and 560 mg/kg, which are also above the background value of 509 mg/kg (Bradford et al. 1996).

The following sampling results exceed intrusive construction ESLs but are within the range of expected background conditions:

- Arsenic was detected in 20 samples at concentrations ranging from 1.9 mg/kg to 13 mg/kg, which are above the intrusive construction ESL of 0.98 mg/kg. Detected concentrations of arsenic in five samples (B01-S-0.5, B01-S-3.0, B05-S-4.0, B07-S-3.0, and B10-S-3.0) are above the 99th percentile background concentration of 11 mg/kg; however, are within the expected maximum background concentration of 21 mg/kg (Duvergé 2011).
- Cobalt was detected in two samples (B03-S-0.5 and B09-S-0.5) at concentrations of 89 mg/kg and 30 mg/kg, respectively, which are above the intrusive construction ESL of 28 mg/kg. The detection in sample B09-S-0.5 is below the background concentration of 46.9 mg/kg (Bradford et al. 1996). When evaluating these concentrations on a Site-wide basis (i.e. 95- UCL, the concentration is 35.01 mg/kg which is below the regional background concentration (Appendix C).

6.4 Comparison to Hazardous Waste Criteria

The soil sampling results from this investigation were also compared to Federal and California hazardous waste criteria consisting of the TTLC, 10×STLC, and 20×TCLP thresholds and are summarized in Table 2. Target analytes were either not detected or were detected at levels below hazardous waste criteria, except as discussed below. WET and TCLP extraction results are presented in Table 3.

- Alpha-chlordane was detected in one sample (B05-S-0.5) at a concentration of 0.98 mg/kg which is above the 20×TCLP threshold of 0.6 mg/kg. The sample was further analyzed following the TCLP and the result was 0.00048 milligrams per liter (mg/L), below the TCLP level of 0.03 mg/L.
- Gamma-chlordane was detected in one sample (B05-S-0.5) at a concentration of 0.89 mg/kg, which is above the 20×TCLP threshold of 0.6 mg/kg. The sample was further analyzed following the TCLP and the result was 0.00036 mg/L, below the TCLP level of 0.03 mg/L.
- Technical chlordane was detected in one sample (B05-S-0.5) at a concentration of 7.6 mg/kg, which is above the TTLC, 10×STLC, and 20×TCLP thresholds of 2.5 mg/kg, 2.5 mg/kg, and 0.6 mg/kg, respectively. The sample was further analyzed following the TCLP and the WET which resulted in concentrations of 0.0050 and 0.00084 mg/L which did not exceed the TCLP limit (0.03 mg/L) or STLC (0.25 mg/L), respectively.

- Chromium was detected in 16 samples at concentrations above the 10×STLC threshold of 50 mg/kg. These samples were further analyzed by the WET[3] and the highest detected concentration of 0.93 mg/L did not exceed the STLC of 5 mg/L.

  Two detections of chromium were above the 20×TCLP threshold of 100 mg/kg. These samples were further analyzed following the TCLP and were not detected above the laboratory reporting limit.

- Lead was detected in one sample (B10-S-0.5) at a concentration of 54 mg/kg, which is above the 10×STLC threshold of 50 mg/kg. The sample was further analyzed following the WET and the result was 1.4 mg/L, below the TCLP of 5.0 mg/L.

- Nickel was detected in one sample (B03-S-0.5) at a concentration of 2,200 mg/kg which is above the TTLC and 10×STLC thresholds of 2,000 mg/kg and 200 mg/kg, respectively. In addition, one sample at B09-S-0.5 was detected at a concentration of 560 mg/kg exceeding the 10×STLC. These samples were further analyzed following the WET and the highest detected concentration of 9.1 mg/L did not exceed the STLC of 5 mg/L.

With the exception of sample B03-S-0.5 and B05-S-0.5, which had target analytes above TTLC limits, target analytes were either not detected or were detected at levels below hazardous waste criteria.

7.0 SOIL GAS DATA EVALUATION

The soil gas sampling results are presented in Pace report number L1257493 and are enclosed in Appendix B. No significant QA/QC issues were encountered by the laboratory. The leak detection compound, 1,1-DFA, was detected at low levels (6.7 and 5.2 µg/m³) in two samples (B03-SG-5.0 and B05-SG-2.0), indicating that minor leaks may have occurred during purging and sampling in the field. Per the Advisory, these leaks are considered insignificant because the detected concentrations of the leak detection compound are less than 10 times the reporting limit of the target analytes (approximately 1 µg/m³). If minor leaks had occurred, it is likely the target analyte results are biased low due to dilution of the soil gas samples with ambient air. The soil gas sampling results are summarized in Tables 4 and 5 and discussed below.

7.1 Methodology

7.1.1 Comparison to Screening Levels

Soil gas sampling results are presented in Table 4 in comparison to current SFBRWQCB-recommended soil gas risk-based screening levels (RBSLs) for future commercial/industrial buildings. The soil gas results incorporate the following components:

[3] Sample B05-S-4.0 was unable to be analyzed by the California WET because it was misplaced and unable to be found by the analytical laboratory.

- Current SFBRWQCB-recommended indoor air RBSLs for commercial/industrial land use, which assume adult workers are present in an overlying building for 8 hours per day, 250 days per year, for 25 years (SFBRWQCB 2019a, USEPA 2020); and
- Current USEPA-recommended soil gas-to-indoor air attenuation factor for all buildings of 0.03 (SFBRWQCB 2019a).

For screening levels, the attenuation factor for petroleum related compounds (benzene, ethylbenzene, toluene, and xylenes [BTEX]) incorporates an additional bioattenuation factor of 0.001 to account for the microbial degradation that occurs under aerobic conditions (SWRCB 2012). The fixed gases sampling results (Table 4) confirm that oxygen concentrations are sufficient (defined as greater than 4 percent) at each of the soil gas sampling locations to support bioattenuation. Additionally, soil sampling results (Table 1) indicate the sum of TPH-g and TPH-d is less than 100 mg/kg in all shallow soil samples, as is also required to support bioattenuation.

Calculation of soil gas RBSLs, including for cancer and noncancer health effects, is documented in Table E-1. For each compound, the cancer- and noncancer-based screening levels are presented in the Table 3 summary evaluation.

Soil gas sampling results are discussed in further detail below.

7.1.2 Cumulative Vapor Intrusion Risk

The indoor air RBSLs (and by extension, the soil gas RBSLs) are based on cancer health effects (carcinogenic compounds) and/or noncancer health effects (all compounds). The cancer-based RBSLs are based on a target cancer risk level of 1×10^{-6} (1 per million), which is typically considered to be an acceptable level of risk (DTSC 2011b). The noncancer-based RBSLs are based on a target noncancer hazard quotient of 1 – exposures which produce a hazard quotient of 1 or lower are not expected to result in any adverse noncancer health effects, including in sensitive populations (DTSC 2011b).

The soil gas RBSLs can therefore be used to quantify the cancer risk and chronic noncancer hazard quotient for each individual soil gas sampling result. Cancer risk (RISK) is quantified by taking the ratio of the sampling result (CONC) to the cancer-based soil gas RBSL ($RBSL_{CA}$), and multiplying this ratio by the target cancer risk (1×10^{-6}); and noncancer hazard quotient (HQ) is quantified by taking the ratio of the sampling result to the noncancer-based soil gas RBSL ($RBSL_{NC}$), and multiplying this ratio by the target noncancer hazard quotient (1):

$$RISK = (CONC / RBSL_{CA}) \times 10^{-6}$$

$$HQ = (CONC / RBSL_{NC}) \times 1$$

Cancer risk is considered additive across chemicals; and noncancer hazard affecting the same target organ is also considered additive across chemicals. It is therefore standard vapor

intrusion risk assessment practice to sum chemical-specific cancer risks and noncancer hazard quotients (conservatively assuming all chemicals affect the same organ) to calculate the multi-chemical or cumulative vapor intrusion cancer risk and noncancer hazard index for each soil gas sample (DTSC 2015). The calculation of cancer risks and noncancer hazard indices is documented in Table E-2. Results are summarized in Table 5.

Soil gas vapor intrusion risks are further discussed below.

7.2 Results

7.2.1 Comparison to Screening Levels

Soil gas sampling results are presented in Table 4 in comparison to current soil gas RBSLs for future commercial/industrial buildings. Soil gas sampling results are below their respective RBSLs, with the following exceptions:

- Chloroform was detected in samples B02-SG-5.0 and B06-SG-5.0 at concentrations of 64 µg/m³ and 34 µg/m³, respectively, which exceed the RBSL of 18 µg/m³. The presence of chloroform may be related to chlorinated domestic water routed through underground pipelines.
- PCE was detected in samples B01-SG-5.0, B03-SG-5.0, B04-SG-5.0, B06-SG-5.0, B07-SG-5.0, and B08-SG-5.0 at concentrations ranging from 82 µg/m³ to 3,250 µg/m³, which exceed the RBSL of 67 µg/m³.
- Trichloroethene (TCE) was detected in sample B01-SG-5.0 at a concentration of 165 µg/m³, which exceeds the RBSL of 100 µg/m³.
- Although VOCs associated with petroleum hydrocarbons, including BTEX, were detected primarily in location B01 and B03, near the former USTs, these concentrations were not detected above screening levels when incorporating bioattenuation.

The sampling results which exceed RBSLs are highlighted in Table 4.

7.2.2 Cumulative Vapor Intrusion Cancer Risk

Soil gas sampling results are presented in Table 5 showing the cumulative vapor intrusion risk based on RBSLs for each sample. Seven (of 10) soil gas samples have cumulative vapor intrusion risks above the threshold of 1×10^{-6} (1 per million). B05-SG-2.0, B09-SG-5.0, and B10-SG-5.0 have cumulative cancer risk values less than the threshold of 1×10^{-6}.

Of the samples that exceed the threshold value, the cumulative cancer risk ranges from 3.1×10^{-6} (3.1 per million) to a maximum of 4.9×10^{-5} (49 per million). These risks are primarily driven by sampling results for chloroform, PCE, and TCE.

8.0 CONCLUSIONS AND RECOMMENDATIONS

Based on the findings of this investigation, Path Forward concludes that a release of one or more compounds on-Site to the subsurface has impaired the subject property. The following is a summary of main findings as well as recommendations to facilitate future redevelopment:

- Organochlorine pesticides and metals are present at elevated concentrations in shallow Site soils. It appears that pesticides may have historically been applied at this property during the historical orchard use. Similarly, elevated metals may also be associated with historical and/or current uses. During redevelopment, if surplus soils are generated requiring off-Site disposal, the soils would likely be profiled as a California Hazardous Waste and should be disposed of at an appropriate facility. Additionally, as these results exceed applicable human health risk-based screening levels, these results should be presented to an appropriate regulatory agency to ensure that proper mitigation measures are implemented to protect construction workers and future occupants of the redevelopment. It is noted that if a mitigation measure includes leaving soils in place that exceed the Tier 1 ESLs based on an unrestricted land use, such as capping, regulatory agencies may require that a land use covenant be recorded at the Site limiting acceptable redevelopments and/or requiring ongoing operations, monitoring, and maintenance.
- VOCs, consisting primarily of PCE, have been detected in both soil and soil gas at the property exceeding applicable human health screening levels, under an unrestricted and/or commercial land use scenario. Based on the presence of PCE detected in shallow soil and the documented use of solvents at the Site historically, it appears that that the origin of PCE in shallow soil and soil gas is likely from a release or releases that may have occurred during current or past land uses. As such, further assessment to evaluate the nature and extent of VOCs in the subsurface including groundwater, and/or human health risk to current Site workers from vapor intrusion into the indoor air of the building appears warranted at this time. It is noted, although VOCs associated with petroleum hydrocarbons, including BTEX, were detected primarily in location B01 and B03, near the former USTs, these concentrations were not detected above screening levels when incorporating bioattenuation.

  Under the current regulatory environment, applicable regulatory agencies are unlikely to support future redevelopment with implementation of a vapor intrusion mitigation system (VIMS) as the sole measure to address vapor intrusion concerns (SFBRWQCB 2019b). Instead, once the agencies deem that adequate characterization of the nature and extent of VOCs has been defined in all media, active remedial measures (e.g., source removal) will likely be required in addition to the VIMS. Based on the findings of subsequent investigations, additional investigatory and/or remedial measures may be necessary and could take up to several years to implement prior to facilitating redevelopment. It is also noted that if a VIMS is ultimately installed as part of the

redevelopment, regulatory agencies may require that a land use covenant be recorded at the Site requiring ongoing operations, monitoring, and maintenance.

In accordance with generally accepted professional environmental practice, the owner of the property should submit a copy of this report to the proper local regulatory agency for review. This agency may be one or more of the following: SCVWD, SFBRWQCB, and/or the DTSC.

Moisture content (ASTM D2216)	%	None	None	None	None	3.1	13	11	15	11	14	6.4	19	11	14

Table 1. Summary of Soil Sampling Results vs. Risk-Based Screening Levels

Notes:

(1) Less-than sign (<) indicates analyte was not detected above indicated laboratory reporting limit. En-dash (–) indicates sample was not analyzed for compound. For asbestos, "ND" indicates asbestos not detected; "trace" indicates asbestos detected below quantitation limit.

(2) Abbreviations:
ft bgs – feet below ground surface
mg/kg – milligrams per kilogram

(4) Sampling results are compared to San Francisco Bay Regional Water Quality Control Board (SFBRWQCB)-recommended human health risk-based screening levels for commercial/industrial soil and intrusive construction workers (SFBRWQCB 2019, DTSC 2020, USEPA 2020).

(5) Highlighting key:
– detected concentration exceeds one or more screening levels
– detected concentration exceeds one or more screening levels, but is consistent with background/ambient conditions

Table 2. Summary of Soil Sampling Results vs. Hazardous Waste Screening Criteria

Notes:

(1) Less-than sign (<) indicates analyte was not detected above indicated laboratory reporting limit. En-dash (–) indicates sample was not analyzed for compound. For asbestos, "ND" indicates asbestos not detected; "trace" indicates asbestos detected below quantitation limit.

(2) Abbreviations:

ft bgs	–	feet below ground surface
mg/kg	–	milligrams per kilogram
TTLC	–	Total Threshold Limit Concentration
10×STLC	–	10 times the Soluble Threshold Limit Concentration
20×TCLP	–	20 times the Toxicity Characteristic Leaching Procedure limit

(4) Sampling results are compared to hazardous waste screening criteria consisting of TTLC values, 10×STLC values, and 20×TCLP values.

(5) Highlighting key:

– detected concentration exceeds one or more screening criteria

Table 3. Summary of Soil Extraction Test Results

Sample ID	Analyte	Original Test Result (mg/kg)	Extraction Test		
			Test	Limit (mg/L)	Result (mg/L)
B05-S-0.5	Chlordane, alpha-	0.98	TCLP	0.03	0.00048

Table 3. Soil Gas Sampling Results – Commercial Land Use

Notes:

(1) Sample information shown consists of sample ID and date collected. Sample ID indicates boring and depth; e.g., sample B01-SG-5.0 was collected at boring B01 at depth of 5 feet below ground surface.

(2) Soil gas sampling results for VOCs reported in micrograms per cubic meter (µg/m³). Less-than sign (<) indicates analyte was not detected above indicated laboratory reporting limit.
Data qualifiers are:
B – The same analyte is found in the associated blank
E – The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial concentration

(3) Soil gas sampling results are compared to DTSC-recommended soil gas risk-based screening levels which incorporate the following components.
- SFBRWQCB-recommended indoor air risk-based screening levels for commercial/industrial land use (SFBRWQCB 2019, DTSC 2020, USEPA 2020); and
- USEPA-recommended soil gas-to-indoor air attenuation factor for all buildings of 0.03 (USEPA 2015).

The attenuation factor for petroleum hydrocarbons (benzene, ethylbenzene, naphthalene, toluene, and xylenes) incorporates an additional factor of 0.001 to account for the bioattenuation that occurs under aerobic conditions (SWRCB 2012).

Screening levels are based on cancer (CA) or noncancer (NC) health effects.

Detected concentrations that exceed screening levels are highlighted.

Table 5. Summary of Soil Gas Cumulative Vapor Intrusion Risks and Hazards

Sample ID	Depth (ft bgs)	Date Collected	Cancer Risk	Noncancer Hazard
B01-SG-5.0	5.0	2020-09-01	1.7E-05	7.6E-01
B02-SG-5.0	5.0	2020-09-01	4.2E-06	2.0E-02
B03-SG-5.0	5.0	2020-09-01	4.9E-05	8.5E-01

B07-SG-5.0	5.0	2020-08-31	4.9E-05	6.4E-01
B08-SG-5.0	5.0	2020-08-31	3.5E-06	4.3E-02
B09-SG-5.0	5.0	2020-09-01	4.0E-07	1.3E-01
B10-SG-5.0	5.0	2020-09-01	0.0E+00	0.0E+00
Maximum	**–**	**–**	**4.9E-05**	**8.5E-01**

Notes:

(1) Cumulative (multi-chemical) risks and hazards calculated in Appendix C.

(2) Highlighting key:

Risk exceeds 1×10^{-6} (1 per million) or hazard exceeds 1.

Laboratory Analytical Reports

McCampbell Analytical, Inc.

"When Quality Counts"

Analytical Report

WorkOrder:	2009078 A	**Amended:**	09/23/2020
		Revision:	2
Report Created for:	Path Forward Partners, Inc. 505 14th Street, Ste.1230 Oakland, CA 94612		
Project Contact:	David Grunat		
Project P.O.:			
Project:	124-112-101; King Road, San Jose		
Project Received:	09/01/2020		

Analytical Report reviewed & approved for release on 09/22/2020 by:

Christine Askari
Project Manager

The report shall not be reproduced except in full, without the written approval of the laboratory. The analytical results relate only to the items tested. Results reported conform to the most current NELAP standards, where applicable, unless otherwise stated in the case narrative.

Glossary of Terms & Qualifier Definitions

Client: Path Forward Partners, Inc.
Project: 124-112-101; King Road, San Jose
WorkOrder: 2009078 A

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: Path Forward Partners, Inc.
Project: 124-112-101; King Road, San Jose
WorkOrder: 2009078

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: Path Forward Partners, Inc.
Project: 124-112-101; King Road, San Jose
WorkOrder: 2009078

Analytical Qualifiers

P	Agreement between quantitative confirmation results exceed method recommended limits
S	Surragote recovery outside accepted recovery limits.
a2	Sample diluted due to cluttered chromatogram.
a3	Sample diluted due to high organic content interfering with quantitative/or qualitative analysis.
a9	Reporting limit near, but not identical to, our standard reporting limit due to variable Encore or Solid sample weight.
c1	Surrogate recovery outside of the control limits due to the dilution of the sample.
c2	Surrogate recovery outside of the control limits due to matrix interference.
e2	Diesel range compounds are significant; no recognizable pattern
e7	Oil range compounds are significant

Quality Control Qualifiers

F1	MS/MSD recovery and/or RPD is out of acceptance criteria; LCS validates the prep batch.
F2	LCS/LCSD recovery and/or RPD/RSD is out of acceptance criteria.
F3	The surrogate standard recovery and/or RPD is outside of acceptance limits.
F10	MS/MSD outside control limits. Physical or chemical interferences exist due to sample matrix.

Case Narrative

Client: Path Forward Partners, Inc. **Work Order:** 2009078
Project: 124-112-101; King Road, San Jose September 10, 2020

Percent Moisture

In accordance with SW-846, 8000, percent moisture is reported as:

[Moisture Weight (g)] / [Sample Wet Weight (g)] x 100

			TPH(g) & 8260 Scan-Sim by P&T GCMS			☐		5 days		☐	

NOTES: - STLC and TCLP extractions require 2 days to complete; therefore, all TATs begin after the extraction is completed (i.e., One-day TAT yields results in 3 days from sample submission).

- MAI assumes that all material present in the provided sampling container is considered part of the sample - MAI does not exclude any material from the sample prior to sample preparation unless requested in writing by the client.

Chain of Custody (COC) Information

Chain of custody present?	Yes	☑	No	☐		
Chain of custody signed when relinquished and received?	Yes	☑	No	☐		
Chain of custody agrees with sample labels?	Yes	☑	No	☐		
Sample IDs noted by Client on COC?	Yes	☑	No	☐		
Date and Time of collection noted by Client on COC?	Yes	☑	No	☐		
Sampler's name noted on COC?	Yes	☑	No	☐		
COC agrees with Quote?	Yes	☐	No	☐	NA	☑

Sample Receipt Information

Custody seals intact on shipping container/cooler?	Yes	☐	No	☐	NA	☑
Shipping container/cooler in good condition?	Yes	☑	No	☐		
Samples in proper containers/bottles?	Yes	☑	No	☐		
Sample containers intact?	Yes	☑	No	☐		
Sufficient sample volume for indicated test?	Yes	☑	No	☐		

Sample Preservation and Hold Time (HT) Information

All samples received within holding time?	Yes	☑	No	☐	NA	☐
Samples Received on Ice?	Yes	☑	No	☐		
(Ice Type: WET ICE)						
Sample/Temp Blank temperature	Temp: 1.8°C				NA	☐
Water - VOA vials have zero headspace / no bubbles?	Yes	☐	No	☐	NA	☑
Sample labels checked for correct preservation?	Yes	☑	No	☐		
pH acceptable upon receipt (Metal: <2; Nitrate 353.2/4500NO3: <2; 522: <4; 218.7: >8)?	Yes	☐	No	☐	NA	☑
UCMR Samples:						
pH tested and acceptable upon receipt (200.8: ≤2; 525.3: ≤4; 530: ≤7; 541: <3; 544: <6.5 & 7.5)?	Yes	☐	No	☐	NA	☑
Free Chlorine tested and acceptable upon receipt (<0.1mg/L)?	Yes	☐	No	☐	NA	☑

Tad Thrower

Tad Thrower, Laboratory Supervisor, Hayward Laboratory

Note: Limit of Quantification ('LOQ') = 1%. 'Trace' denotes the presence of asbestos below the LOQ. 'ND' = 'None Detected'.

Analytical results and reports are generated by SGS Forensic Laboratories (SGSFL) at the request of and for the exclusive use of the person or entity (client) named on such report. Results, reports or copies of same will not be released by SGSFL to any third party without prior written request from client. This report applies only to the sample(s) tested. Supporting laboratory documentation is available upon request. This report must not be reproduced except in full, unless approved by SGSFL. The client is solely responsible for the use and interpretation of test results and reports requested from SGSFL. SGSFL is not able to assess the degree of hazard resulting from materials analyzed. SGS Forensic Laboratories reserves the right to dispose of all samples after a period of thirty (30) days, according to all state and federal guidelines, unless otherwise specified. All samples were received in acceptable condition unless otherwise noted.

3777 Depot Road, Suite 409, Hayward, CA 94545 / Telephone: (510) 887-8828 (800) 827-FASI / Fax: (510) 887-4218

Glossary of Terms & Qualifier Definitions

Client: Path Forward Partners, Inc.
Project: 124-112-101; King Road, San Jose
WorkOrder: 2009143

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

Glossary of Terms & Qualifier Definitions

Client: Path Forward Partners, Inc.
Project: 124-112-101; King Road, San Jose
WorkOrder: 2009143

Analytical Qualifiers

J	Result is less than the RL/ML but greater than the MDL. The reported concentration is an estimated value.
P	Agreement between quantitative confirmation results exceed method recommended limits
S	Surragote recovery outside accepted recovery limits.
a9	Reporting limit near, but not identical to, our standard reporting limit due to variable Encore or Solid sample weight.
c1	Surrogate recovery outside of the control limits due to the dilution of the sample.
e2	Diesel range compounds are significant; no recognizable pattern.
e7	Oil range compounds are significant.

Quality Control Qualifiers

F2	LCS/LCSD recovery and/or RPD/RSD is out of acceptance criteria.

Glossary of Terms & Qualifier Definitions

Client: Path Forward Partners, Inc.
Project: 124-112-101; King Road, San Jose
WorkOrder: 2009143 A

Glossary Abbreviation

%D	Serial Dilution Percent Difference
95% Interval	95% Confident Interval
CPT	Consumer Product Testing not NELAP Accredited
DF	Dilution Factor
DI WET	(DISTLC) Waste Extraction Test using DI water
DISS	Dissolved (direct analysis of 0.45 µm filtered and acidified water sample)
DLT	Dilution Test (Serial Dilution)
DUP	Duplicate
EDL	Estimated Detection Limit
ERS	External reference sample. Second source calibration verification.
ITEF	International Toxicity Equivalence Factor
LCS	Laboratory Control Sample
LQL	Lowest Quantitation Level
MB	Method Blank
MB % Rec	% Recovery of Surrogate in Method Blank, if applicable
MDL	Method Detection Limit
ML	Minimum Level of Quantitation
MS	Matrix Spike
MSD	Matrix Spike Duplicate
N/A	Not Applicable
ND	Not detected at or above the indicated MDL or RL
NR	Data Not Reported due to matrix interference or insufficient sample amount.
PDS	Post Digestion Spike
PDSD	Post Digestion Spike Duplicate
PF	Prep Factor
RD	Relative Difference
RL	Reporting Limit (The RL is the lowest calibration standard in a multipoint calibration.)
RPD	Relative Percent Deviation
RRT	Relative Retention Time
SPK Val	Spike Value
SPKRef Val	Spike Reference Value
SPLP	Synthetic Precipitation Leachate Procedure
ST	Sorbent Tube
TCLP	Toxicity Characteristic Leachate Procedure
TEQ	Toxicity Equivalents
TZA	TimeZone Net Adjustment for sample collected outside of MAI's UTC.
WET (STLC)	Waste Extraction Test (Soluble Threshold Limit Concentration)

All sample aliquots were received at the correct temperature, in the proper containers, with the appropriate preservatives, and within method specified holding times, unless qualified or notated within the report. Where applicable, all MDL (LOD) and RDL (LOQ) values reported for environmental samples have been corrected for the dilution factor used in the analysis. All Method and Batch Quality Control are within established criteria except where addressed in this case narrative, a non-conformance form or properly qualified within the sample results. By my digital signature below, I affirm to the best of my knowledge, all problems/anomalies observed by the laboratory as having the potential to affect the quality of the data have been identified by the laboratory, and no information or data have been knowingly withheld that would affect the quality of the data.

Jennifer Gambill
Project Manager

Guide to Reading and Understanding Your Laboratory Report

The information below is designed to better explain the various terms used in your report of analytical results from the Laboratory. This is not intended as a comprehensive explanation, and if you have additional questions please contact your project representative.

Results Disclaimer - Information that may be provided by the customer, and contained within this report, include Permit Limits, Project Name, Sample ID, Sample Matrix, Sample Preservation, Field Blanks, Field Spikes, Field Duplicates, On-Site Data, Sampling Collection Dates/Times, and Sampling Location. Results relate to the accuracy of this information provided, and as the samples are received.

Abbreviations and Definitions

MDL	Method Detection Limit.
ND	Not detected at the Reporting Limit (or MDL where applicable).
RDL	Reported Detection Limit.
Rec.	Recovery.
RPD	Relative Percent Difference.
SDG	Sample Delivery Group.
(S)	Surrogate (Surrogate Standard) - Analytes added to every blank, sample, Laboratory Control Sample/Duplicate and Matrix Spike/Duplicate; used to evaluate analytical efficiency by measuring recovery. Surrogates are not expected to be detected in all environmental media.
U	Not detected at the Reporting Limit (or MDL where applicable).
Analyte	The name of the particular compound or analysis performed. Some Analyses and Methods will have multiple analytes reported.
Dilution	If the sample matrix contains an interfering material, the sample preparation volume or weight values differ from the standard, or if concentrations of analytes in the sample are higher than the highest limit of concentration that the laboratory can accurately report, the sample may be diluted for analysis. If a value different than 1 is used in this field, the result reported has already been corrected for this factor.
Limits	These are the target % recovery ranges or % difference value that the laboratory has historically determined as normal for the method and analyte being reported. Successful QC Sample analysis will target all analytes recovered or duplicated within these ranges.
Qualifier	This column provides a letter and/or number designation that corresponds to additional information concerning the result reported. If a Qualifier is present, a definition per Qualifier is provided within the Glossary and Definitions page and potentially a discussion of possible implications of the Qualifier in the Case Narrative if applicable.
Result	The actual analytical final result (corrected for any sample specific characteristics) reported for your sample. If there was no measurable result returned for a specific analyte, the result in this column may state “ND” (Not Detected) or “BDL” (Below Detectable Levels). The information in the results column should always be accompanied by either an MDL (Method Detection Limit) or RDL (Reporting Detection Limit) that defines the lowest value that the laboratory could detect or report for this analyte.
Uncertainty (Radiochemistry)	Confidence level of 2 sigma.
Case Narrative (Cn)	A brief discussion about the included sample results, including a discussion of any non-conformances to protocol observed either at sample receipt by the laboratory from the field or during the analytical process. If present, there will be a section in the Case Narrative to discuss the meaning of any data qualifiers used in the report.
Quality Control Summary (Qc)	This section of the report includes the results of the laboratory quality control analyses required by procedure or analytical methods to assist in evaluating the validity of the results reported for your samples. These analyses are not being performed on your samples typically, but on laboratory generated material.
Sample Chain of Custody (Sc)	This is the document created in the field when your samples were initially collected. This is used to verify the time and date of collection, the person collecting the samples, and the analyses that the laboratory is requested to perform. This chain of custody also documents all persons (excluding commercial shippers) that have had control or possession of the samples from the time of collection until delivery to the laboratory for analysis.
Sample Results (Sr)	This section of your report will provide the results of all testing performed on your samples. These results are provided by sample ID and are separated by the analyses performed on each sample. The header line of each analysis section for each sample will provide the name and method number for the analysis reported.
Sample Summary (Ss)	This section of the Analytical Report defines the specific analyses performed for each sample ID, including the dates and times of preparation and/or analysis.

Qualifier	Description
B	The same analyte is found in the associated blank.
E	The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial calibration (ICAL).
J	The identification of the analyte is acceptable; the reported value is an estimate.

Pace National is the only environmental laboratory accredited/certified to support your work nationwide from one location. One phone call, one point of contact, one laboratory. No other lab is as accessible or prepared to handle your needs throughout the country. Our capacity and capability from our single location laboratory is comparable to the collective totals of the network laboratories in our industry. The most significant benefit to our one location design is the design of our laboratory campus. The model is conducive to accelerated productivity, decreasing turn-around time, and preventing cross contamination, thus protecting sample integrity. Our focus on premium quality and prompt service allows us to be YOUR LAB OF CHOICE.
* Not all certifications held by the laboratory are applicable to the results reported in the attached report.
* Accreditation is only applicable to the test methods specified on each scope of accreditation held by Pace National.

80												
81	When a data set follows an approximate (e.g., normal) distribution passing one of the GOF test											
82	When applicable, it is suggested to use a UCL based upon a distribution (e.g., gamma) passing both GOF tests in ProUCL											
83												
84	Note: Suggestions regarding the selection of a 95% UCL are provided to help the user to select the most appropriate 95% UCL.											
85	Recommendations are based upon data size, data distribution, and skewness.											
86	These recommendations are based upon the results of the simulation studies summarized in Singh, Maichle, and Lee (2006).											
87	However, simulations results will not cover all Real World data sets; for additional insight the user may want to consult a statistician.											
88												
89	**Note: For highly negatively-skewed data, confidence limits (e.g., Chen, Johnson, Lognormal, and Gamma) may not be**											
90	**reliable. Chen's and Johnson's methods provide adjustments for positvely skewed data sets.**

Notes:

(1) Abbreviations:
- CPAH – carcinogenic polycyclic aromatic hydrocarbon
- B(a)P – benzo(a)pyrene
- PEF – potency equivalency factor
- mg/kg – milligrams per kilogram

Table D-1. Calculation of Total Carcinogenic Polycyclic Aromatic Hydrocarbon (CPAH) Concentrations

Sample ID and Analyte	Reported Result (mg/kg)	Value (mg/kg)	PEF	B(a)P Equivalents (mg/kg)

Notes (continued):

(2) Potency equivalency factors are those used in the Northern and Southern California PAH Studies (DTSC 2009).

(3) Each non-detect result assumed equal to one-half the reporting limit. This assumption is conservative for non-detect results with elevated reporting limits, defined as greater than 0.02 mg/kg (DTSC 2009).

Notes:

(1) Indoor air risk-based screening levels are SFBRWQCB-recommended values for commercial/industrial land use (SFBRWQCB 2019, DTSC 2019, USEPA 2019).

(2) Soil gas-to-indoor air attenuation factor is USEPA-recommended value for all buildings (USEPA 2015). "B" indicates attenuation factor incorporates an additional factor of 0.001 to account for the bioattenuation of petroleum compounds (benzene, ethylbenzene, naphthalene, toluene, and xylenes) that occurs under aerobic conditions (SWRCB 2012).

(3) Abbreviations:
RBSL – risk-based screening level
AF – attenuation factor
µg/m³ – micrograms per cubic meter
CA – cancer effects
NC – noncancer effects

Table E-2. Soil Gas Vapor Intrusion Risks and Hazards

Notes:

1) Soil gas sampling results reported in micrograms per cubic meter (µg/m³). Less-than sign (<) indicates analyte was not detected above indicated laboratory reporting limit.

(2) Data qualifiers:
E – The analyte concentration exceeds the upper limit of the calibration range of the instrument established by the initial concentration

3) Vapor intrusion cancer risk and noncancer hazard are quantified from SFBRWQCB-recommended soil gas risk-based screening levels which incorporate the following components:
- SFBRWQCB-recommended indoor air risk-based screening levels for commercial/industrial land use (SFBRWQCB 2019, DTSC 2020, USEPA 2020); and
- USEPA-recommended soil gas-to-indoor air attenuation factor for all buildings of 0.03 (USEPA 2015).

The attenuation factor for petroleum hydrocarbons (benzene, ethylbenzene, naphthalene, toluene, and xylenes) incorporates an additional factor of 0.001 to account for the bioattenuation that occurs under aerobic conditions (SWRCB 2012).

Screening levels are based on cancer (CA) or noncancer (NC) health effects.

4) Cancer risk is calculated for each individual sampling result by taking ratio of sampling result to cancer-based screening level and multiplying by target risk level of 1E-06.

5) Noncancer hazard index is calculated for each individual sampling result by taking ratio of sampling result to noncancer-based screening level and multiplying by target hazard quotient of 1.

6) For purpose of calculating risk and hazard, a non-detect result is assumed to be zero.

7) Chemical-specific risks and hazards are summed across chemicals to quantify the cumulative (multi-chemical) cancer risk and noncancer hazard index for each sample.

PHASE I ENVIRONMENTAL SITE ASSESSMENT

650 North King Road

San Jose, California

December 11, 2020

Project No.: 124-112-100

EXECUTIVE SUMMARY

BTC III San Jose Logistics Center LP retained Path Forward Partners, Inc. (Path Forward) to conduct a Phase I Environmental Site Assessment (ESA) in conjunction with a prospective acquisition of the property located at 650 North King Road in San Jose, Santa Clara County, California (subject property or Site). The subject property is identified by Assessor's Parcel Number 254-54-023 and is also known by the addresses 646-658 North King Road and 1805 Las Plumas Avenue.

Path Forward conducted this ESA in conformance with *ASTM Designation: E1527-13 Standard Practice for ESAs: Phase I ESA Process*. The scope of work and the terms and conditions are described in our Proposal No. 124-112-100 dated July 17, 2020. Exceptions and limitations encountered during this ESA are identified in the report.

The 8.95-acre subject property is developed with an approximate 120,000 square-foot warehouse building with a two-story office area in the center of the subject property (650 Building), a 7,800 square-foot office building in the southern corner of the subject property (646 Building), and a 950 square-foot building in the western corner of the subject property (658 Building). The 650 Building also includes the 1805 Las Plumas Avenue address. Improvements also include a paved surface parking and perimeter landscaping.

Path Forward identified obvious subject property uses from the present back to 1939, at which time the subject property used for agricultural purposes including an orchard and approximately five farm related structures located along the northwestern subject property boundary. The current 120,000 square-foot warehouse building was constructed on the subject property in 1964. Frito-Lay occupied the building and manufactured potato chips and pork rinds at the subject property until 1996. Since 1996, various tenants have occupied the subject property buildings. No records of manufacturing activities for the more recent tenants were found during this assessment.

This ESA has revealed no evidence of recognized environmental conditions (RECs), historical recognized environmental conditions (HRECs), or controlled recognized environmental conditions (CRECs), as defined in Section 1.1, in connection with the subject property, except the following:

- Records reviewed during this assessment indicate that three underground storage tanks (USTs) associated with Frito-Lay operations were formerly located on the subject property. The three USTs were located on the subject property southwest of the 650 Building and included a 4,500 or 5,000-gallon fuel oil UST, a 15,000-gallon fuel oil UST, and a 15,000 or 20,000-gallon fuel oil UST. The USTs were removed from the subject property in 1986 and 1990. During removal of the 5,000-gallon and 20,000-gallon USTs in 1986, damage to the tar coating of both USTs was noted. A small hole was also noted

in the 5,000-gallon UST. Soil samples were collected from the tank pits and analyzed for total petroleum hydrocarbons (TPH) as diesel (TPH-d). TPH-d was detected in both tank pits at maximum concentrations of 12,471 mg/kg (5,000-gallon UST tank pit) and 8,143 mg/kg (20,000-gallon UST tank pit). The Case Closure letter indicates that "soil found to be contaminated with diesel was excavated by WD Construction in August 1986." The tank pits were reportedly overexcavated to a depth of 16 feet. In 1994, to confirm the removal of the contaminated soil from the former tank pit area, one confirmation boring was advanced in the area where the 12,471 mg/kg TPH-d concentration was detected in 1986. Detectable concentrations of TPH as gasoline (TPH-g), TPH-d, and benzene, toluene, ethylbenzene, and xylenes (BTEX) were not detected at depths of 9, 12, and 15 feet below ground surface (bgs) in the confirmation boring.

A monitoring well (AEC-1) was installed in the tank pit area on September 4, 1986. A sample collected after well development did not contain TPH-d at a detectable concentration. The well was reportedly not sampled again until 1994 when a sample was analyzed for TPH-g, TPH-d, and BTEX which were not detected.

The 15,000-gallon diesel UST that was removed in 1990 appeared in good condition with no holes observed. Three soil samples from the tank pit were collected and analyzed. The soil samples did not contain detectable concentrations of TPH-g, TPH-d or BTEX. Approximately 40 feet of piping associated with the 15,000-gallon UST was removed and soil samples collected from the piping trench did not contain detectable concentrations of TPH-g, TPH-d, or BTEX.

A soil gas survey was conducted in the area of the former USTs in August 1990. Soil gas samples were collected at depths of 4 feet bgs from nine locations. Methyl tertiary butyl ether (MTBE), benzene, toluene, xylenes were detected at maximum concentrations of 3.8 micrograms per liter (µg/l), 1.8 µg/l, 2.3 µg/l, and 5.3 µg/l, respectively. Total volatiles were detected at concentrations ranging from <1.0 to 15 µg/l. The soil gas survey report states, "the conclusion of the survey was that the tank area contained minimal levels of petroleum hydrocarbons in the subsurface."

The RWQCB reviewed the UST removal and investigation reports and issued a UST Case Closure letter on March 28, 1995 (RWQCB 1995). The letter confirms the completion of site investigation and remedial action for the USTs formerly located at the subject property and adjoining 3.25-acre property.

Although the Site historically obtained a UST Case Closure, the concentrations observed during the historical soil gas investigation are at levels in excess of current health risk based cleanup levels. The previously documented contamination associated with the historical USTs is considered a REC.

- The subject property buildings have been occupied by a number of tenants since Frito-Lay discontinued operations in 1991. Evidence of staining was noted in several units

within the 650 and 1805 Buildings during the subject property reconnaissance. Current tenants in these units (Progressive Solutions, Air 1 Moving, and Odwalla) use and store hazardous materials. Given the evidence of heavy use of petroleum products and hazardous materials, staining on the floor surfaces in several units, poor condition of the concrete slab, and the improper storage of hazardous materials and petroleum products, it is possible that releases to the subsurface have occurred. The extensive use of hazardous and petroleum products by current tenants is considered a REC.

This ESA has revealed the following de minimis conditions, as defined in Section 1.1, in connection with the subject property:

- The subject property was used for agricultural purposes including orchard use sometime prior to 1939 until the 1960s. Although not documented at the subject property, activities commonly associated with agricultural uses may include the use and storage of hazardous materials and petroleum products (*e.g.*, agricultural chemicals). Information was not available as to the potential historical usage of pesticides, fertilizers or insecticides. Based on our experience, these residual concentrations, if present, are not typically at concentrations that would require cleanup by a regulatory agency or pose a significant human health risk to commercial or industrial site users. There is potential that the near surface soils may contain residual agricultural chemicals that may affect disposal costs in the event redevelopment is planned and such soils are removed from the property.

- Regulatory records indicate that a release of 97 gallons of polychlorinated biphenyl (PCB)-containing cooling oil from a faulty transformer occurred on February 12, 1997. The records indicate that oil leak through bushing and that the release was contained and cleaned up. No records of cleanup activities or confirmation sampling were found during this assessment.

1.0 INTRODUCTION

BTC III San Jose Logistics Center LP (User) retained Path Forward Partners Inc. (Path Forward) to conduct a Phase I Environmental Site Assessment (ESA) in conjunction with a prospective acquisition of the property located at 650 North King Road in San Jose, Santa Clara County, California (subject property or Site). The subject property is identified by Assessor's Parcel Number 254-54-023 and is also known by the addresses 646-658 North King Road and 1805 Las Plumas Avenue. Figure 1 shows the approximate subject property location.

1.1 Purpose

One purpose of this Phase I ESA is to permit a user to satisfy one of the requirements to qualify for the innocent landowner, contiguous property owner, or bona fide prospective purchaser limitations on CERCLA liability. A Phase I ESA is performed to identify recognized environmental conditions (RECs), historical recognized environmental conditions (HRECs), and controlled recognized environmental conditions (CRECs) in connection with the subject property by performing all appropriate inquiry into subject property ownership and use as well as into uses of adjoining properties and surrounding areas within approximate minimum search distances from the subject property.

ASTM Designation: E1527-13 Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessments Process (ASTM E1527) defines the terms REC, CREC, HREC and de minimis as follows (emphasis in original to indicate formally defined terms):

> **REC** – "The presence or likely presence of any *hazardous substances* or *petroleum products* in, on, or at a *property*: (1) due to any *release* to the environment; (2) under conditions indicative of a *release* to the *environment*; or (3) under conditions that pose a *material threat* of a future *release* to the *environment. De minimis* conditions are not *recognized environmental conditions*."
>
> **CREC** – "A *recognized environmental condition* resulting from a past *release* of *hazardous substances* or *petroleum products* that has been addressed to the satisfaction of the applicable regulatory authority (for example, as evidenced by the issuance of a no further action letter or equivalent, or meeting risk-based criteria established by regulatory authority), with *hazardous substances* or *petroleum products* allowed to remain in place subject to the implementation of required controls (for example, *property* use restrictions, *activity and use limitations, institutional controls*, or *engineering controls*). A condition considered by the *environmental professional* to be a *controlled recognized environmental condition* shall be listed in the findings section of the *Phase I Environmental Site Assessment report*, and as a recognized environmental condition in the conclusions section of the *Phase I Environmental Site Assessment report*."

HREC – "A past *release* of any *hazardous substances* or *petroleum products* that has occurred in connection with the *property* and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls (for example, *property* use restrictions, *activity and use limitations*, *institutional controls*, or *engineering controls*). Before calling the past release a *historical recognized environmental condition*, the *environmental professional* must determine whether the past *release* is a *recognized environmental condition* at the time the *Phase I Environmental Site Assessment* is conducted (for example, if there has been a change in the regulatory criteria). If the EP considers the past *release* to be a *recognized environmental condition* at the time the Phase I ESA is conducted, the condition shall be included in the conclusions section of the report as a *recognized environmental condition*."

De Minimis Condition – "A condition that generally does not present a threat to human health or the *environment* and that generally would not be the subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* conditions are not *recognized environmental conditions* nor *controlled recognized environmental conditions*.

1.2 Methodology

Path Forward conducted the Phase I ESA in conformance with ASTM E1527. The scope of work and the terms and conditions are described in our Proposal No. 124-112-100 dated July 17, 2020.

1.3 Limitations

Path Forward obtained information for this ESA from various sources including historical sources, public records, the User, interviews and an environmental database report. For purposes of performing this Phase I ESA, this information is assumed to be correct and complete. Path Forward is not responsible for the quality or content of information from these sources.

Path Forward encountered the following data gaps or limitations in performing this ESA:

- Path Forward was not able to access the interior of two of the units in the 650 Building. According to Mr. Schwartz, these units are vacant and unused and no hazardous materials or petroleum products are present in the units.

The information and opinions rendered in this report are exclusively for use by BTC III San Jose Logistics Center LP its successors and/or assigns. Path Forward will not distribute or publish this report without consent except as required by law or court order. The information and opinions expressed in this report are given in response to a limited assignment and should be considered and implemented only in light of that assignment. The services provided by Path Forward in

completing this project were consistent with normal standards of the profession. No other warranty, expressed or implied, is made.

2.0 RECONNAISSANCE

Date of Site Visit:	July 28, 2020
Path Forward Person(s):	David A. Grunat, P.G. C.H.G. and Neal Hughes, G.I.T.
Property Escort:	Steve Schwartz, Nova Consulting
Inaccessible Areas:	Two units in the 650 Building

The subject property reconnaissance was performed on foot. Adjoining properties were observed from the subject property and from public thoroughfares. Photographs are presented in Appendix A. Figure 2 depicts a site plan.

2.1 Subject Property Use

The 8.95-acre subject property is developed with an approximate 120,000 square-foot warehouse building with a two-story office area in the center of the subject property (650 Building), a 7,800 square-foot office building in the southern corner of the subject property (646 Building), and a 950 square-foot building in the western corner of the subject property (658 Building). The 650 Building also includes the 1805 Las Plumas Avenue address. Improvements also include a paved surface parking and perimeter landscaping. Although a formal wetlands survey was not performed, during the reconnaissance, visual evidence of wetlands were not observed.

Current tenants in the 646 Building include Our City Forest (urban forestry business) and Checker Cab Company (taxi service). Tenants in the 650 Building include Progressive Solutions (printing company), Guaranteed Express (courier service), Fresh and Best (produce wholesale distribution), and Air 1 Moving (moving and storage company). The 658 Building is currently vacant and unused. The 1805 Las Plumas building is leased to Odwalla (fruit juice company).

Utilities are provided to the subject property as follows:

Electricity: Pacific Gas & Electric

Gas: Pacific Gas & Electric

Sewer: City of San Jose

Water: San Jose Municipal Water

2.1.1 Hazardous Substances and Petroleum Products

Path Forward assessed the subject property for indications of the use, storage, or disposal of hazardous substances and petroleum products (e.g., manufacturing activities, drums, containers, stressed vegetation, stains, sheen, and heating/cooling systems). Path Forward observed no such indications, except for the following:

Progressive Solutions stores inks, solvents, and other hazardous materials used in printing operations in five gallon or smaller containers on shelving, in a flammable storage cabinet, and near printing equipment. An unused parts washer was noted in the unit. Ink and oily stains were noted on and near the parts washer and throughout the printing press area. Additionally, wastes from the parts washer were noted in open top containers (i.e. office trash can). Oil mats were noted in various locations to contain leaks and spills. Gasoline cans and propane cylinders are stored outside the unit in a side yard. Waste materials were stored in 55gallon drums located in the rear of the unit atop secondary containment pallets.

Guaranteed Express stores brake fluid and antifreeze in one-quart containers in secondary containment buckets in a storage area. Diesel exhaust fluid (DEF) is stored in one-quart containers and in an approximately 55-gallon drum in the Guaranteed Express unit. No staining was noted in the storage area or near the DEF storage areas.

Checker Cab Company personnel stated that they store small containers (less than one gallon) of oil in a closet that was locked and inaccessible during the site visit.

Our City Forest stores gasoline in three-gallon containers located outside the unit.

Fresh and Best stores small containers (less than one gallon) of oil on shelving in the unit.

Air 1 Moving stores petroleum and chemical products in small containers (five gallons or less) in a disorganized fashion on shelving and on the floor. Motor oil was observed to be stored in two approximately 55-gallon drums. Floor staining was noted throughout the Air 1 Moving unit particularly near the maintenance area. Additionally, during the visit, a significant oil leak was noted beneath a parked moving truck with a moving blanket used to contain the leak.

Odwalla stores vehicle batteries on shelving in the unit. A flammable storage cabinet is used to store various hazardous materials in five-gallon or smaller containers. Staining was noted on the concrete flooring in the Odwalla unit.

2.1.2 Underground Storage Tanks (USTs)

Path Forward assessed the subject property for indications of USTs (*e.g.*, vent piping, dispensing equipment, pavement variations, and fill ports). Path Forward observed no such indications.

Records reviewed during this assessment indicate that six USTs were formerly associated with Frito-Lay and the 650 North King Road property address. Based on review of records provided by the San Jose Fire Department (SJFD), three USTs were located on the subject property southwest of the 650 Building and included a 4,500 or 5,000-gallon fuel oil UST, a 15,000-gallon fuel oil UST, and a 15,000 or 20,000-gallon fuel oil UST. The USTs were removed from the subject property in 1986 and 1990. Additional details about UST removal is discussed in Section 5.3.3. The three remaining USTs were located in the northern corner of the Frito-Lay property, which was part of the 3.25-acre parcel that was sold to another party in 1990 and is not a part of the subject property that is addressed in this report. The off-site USTs included a 6,000-gallon gasoline UST, a 5,000-gallon diesel fuel UST, a 10,000-gallon diesel UST.

2.1.3 Aboveground Storage Tanks (ASTs)

Path Forward assessed the subject property for indications of ASTs (*e.g.*, pavement bolts, containers, reservoirs, and generators). Path Forward observed no such indications with the exception of a passenger elevator hydraulic oil tank that services the two-story office portion of the 650 Building. The elevator utilizes an above ground hydraulic oil reservoir located on the first floor. The hydraulic oil reservoir appeared to be in good condition, absent of leaks.

Records on file at the SJFD indicate that a propane AST and ASTs formerly used by Frito Lay to store peanut oil were located on the 3.25-acre off-site parcel that was sold in 1990 and is not a part of the subject property that is addressed in this report.

2.1.4 Liquid Waste

Path Forward assessed the subject property for indications of liquid waste discharge sources (*e.g.*, sumps, drains, clarifiers, pools of liquid, pits, ponds, lagoons, septic systems, wastewater, and storm water). Path Forward observed no such indications except for typical sources such as sinks in restrooms.

The subject property contains a sump and two-stage clarifier near the western corner of the 650 Building. Process wastewater generated during Frito-Lay operations was diverted through a two-stage clarifier prior to discharge into a sump that was approximately 12 feet deep and 5 feet in diameter. The sump and clarifier were located adjacent to the former boiler room. The clarifier influent piping was terminated sometime after Frito-Lay ceased operations in 1995 (Nova 2012). A Clarifier Closure Workplan was prepared in January 2012 (Nova 2012). The Clarifier Closure Workplan indicates that the clarifier was to be infilled with concrete and finished flush with the surrounding driveway. The SJFD did not require a permit for the closure work. Observations made during the subject property reconnaissance indicate that the former clarifier has been covered with concrete that is flush with the driveway surface. The sump was observed within Fresh and Best unit covered by a piece of plywood.

2.1.5 Solid Waste

Path Forward assessed the subject property for indications of solid waste disposal (*e.g.*, mounding, depressions, fill material, bins, debris, and active human use). Path Forward observed no such indications with the exception of a bin of soil in the parking lot. Dumpsters containing municipal trash and recycling were located at various locations within the parking lot.

2.1.6 Polychlorinated Biphenyls (PCBs)

Path Forward assessed the subject property for indications of PCBs (*e.g.*, transformers, capacitors, elevators, and lifts). Path Forward observed no such indications. One pad-mounted utility owned exterior transformer was observed near the southwestern exterior of the subject property. No staining was observed on the concrete base of the pad-mounted transformer.

The regulatory agency database search report prepared by EDR includes a CHMIRS listing for the subject property. The CHMIRS listing indicates that a release of 97 gallons of PCB-containing cooling oil from a faulty transformer occurred on February 12, 1997. The listing states that the cause of the release was "primary lead on transformer let go causing oil to leak through bushing. Contained and cleaned up."

2.1.7 Wells

Path Forward assessed the subject property for indications of supply, irrigation, monitor, injection, dry, abandoned, or other wells (*e.g.*, protruding pipes, cover plates, pumps, small sheds, large water storage containers, and mounded grout). Path Forward observed no such indications.

As discussed in Section 5.3.3., a groundwater monitoring well (AEC-1) historically was installed on the subject property to investigate impacts from the former USTs.

2.2 Adjoining Property and Surrounding Area Use

Adjoining property and surrounding area use are primarily commercial/industrial.

- Northwest: An undeveloped strip of land that formerly contained a railroad spur is located along the northwest subject property boundary. Industrial warehouses occupied by Thai Kee Trading Company and Hacienda Produce Company (660 North King Road) and Medius (1800 Dobbin Drive) are located beyond the undeveloped strip.
- Southeast: Las Plumas Avenue borders the subject property to the southeast. Multi-family residential properties are located beyond Las Plumas Avenue.
- Northeast: Life Storage, a self-storage company, is located northeast of the subject property at 1855 Las Plumas Avenue. This 3.25-acre property was formerly part of the Frito-Lay facility but was sold in 1990 and is not a part of the subject property.

- Southwest: North King Road borders the subject property to the southwest. Storage Pro Self Storage of San Jose is located across North King Road at 601 North King Road.

Photographs of the adjoining properties are presented in Appendix A.

3.0 USER PROVIDED INFORMATION

ASTM E 1527 defines "user" as the party seeking to use Practice E 1527 to complete an environmental site assessment of the subject property, and in this case, the user is BTC III San Jose Logistics Center LP. Betsy Kennett on behalf of the user is unaware of any environmental liens, AULs, or any other environmental issues associated with the subject property. During this ESA, the property owner provided information to the User for review by Path Forward, as noted in Section 5.5.

4.0 INTERVIEWS

4.1 Current Owner, Operators, Occupants

On July 28, 2020, David Grunat and Neal Hughes of Path Forward interviewed Steve Schwarz of Nova Consulting, a representative of the subject property owner. According to Mr. Schwarz, he has been associated with the subject property for eight years and indicated that he has no environmental information regarding the subject property beyond the records that were provided during this ESA (as discussed in Section 5.5).

4.2 Past Owners, Operators, and Occupants

Path Forward did not identify past subject property owners, operators, and occupants for interviews.

4.3 Nearby Property Owners and Occupants

The subject property is not abandoned. Therefore, Path Forward did not interview nearby property owners and occupants.

4.4 Government Officials

Path Forward did not conduct any other interviews with government officials during the preparation of this report, except as described in Section 5.3.

5.0 RECORDS REVIEW

Path Forward reviewed records pertaining to the subject property. In addition, where warranted and practical, Path Forward reviewed records pertaining to adjoining and nearby properties.

5.1 Physical Setting Sources

5.1.1 Physiography

Path Forward reviewed the United States Geological Survey's (USGS) 2012 7.5-minute Series San Jose East Quadrangle Topographic Map. The ground surface elevation at the subject property is approximately 90 feet above mean sea level (msl) with a slight downward slope to the south/southwest.

5.1.2 Geology

The subject property is located in the Santa Clara Valley physiographic province, a structural low associated with the southern end of the San Francisco Bay. Information available from the Santa Clara Valley Water District website indicates that the Santa Clara Valley physiographic province is a down-dropped structural block, filled in by continental and marine sediments. The regulatory agency database report indicates that soils in the subject property area are classified as botella and consist of clay loam, extend to depths of greater than 60 inches, have moderate infiltration rates, and are moderately well to well drained.

5.1.3 Hydrology

The 1995 Case Closure Letter includes site-specific groundwater information for the subject property (RWQCB 1995). The letter indicates that depth to groundwater in the monitoring wells installed on the subject property ranged from 8 to 18 feet below ground surface. Groundwater flow direction was to the northeast. Based on surface topography, groundwater flow direction is assumed to be to the southwest.

5.2 Historical Use Information

The following table summarizes historical uses and occupancies of the subject property as identified by the ESA. Details of reviewed records are discussed below.

Years	Development/Use
1939 to 1961	Agricultural use consisting of row crops and approximately five farm related structures located along the northwestern subject property boundary.
1964 to 1996	The current 120,000 square-foot warehouse building was constructed on the subject property in 1964. Frito-Lay occupied the building and manufactured potato chips and pork rinds at the subject property until 1996. During this time, the Frito-Lay property included a 3.25-acre property located northeast of the subject property, which is the current self-storage property that was sold in 1990 and is not a part of the subject property. The 646 Building was constructed for use as offices in 1975. The 1805 Building had been constructed as of 1982. Commercial and residential development in the subject property vicinity occurred during this time period as well. A commercial building had been constructed on the property across North King Road to the southwest of the subject property by 1963. By 1968, residential

Years	Development/Use
	development was evident southeast of the subject property and commercial buildings had been constructed northeast and northwest of the subject property.
1996 to present	Since 1996, various tenants have occupied the subject property buildings, as further discussed in this section. In 1999, the 658 Building had been constructed on the subject property for use as Park N Sell offices. The 3.25-acre property located northeast of the subject property had been developed as a self-storage facility.

5.2.1 Fire Insurance Maps

Path Forward requested a search of historical Sanborn Fire Insurance Maps from the Environmental Data Resources, Inc. (EDR) collection. According to EDR, such maps are not available.

5.2.2 Aerial Photographs

Path Forward reviewed aerial photographs of the subject property, adjoining properties, and surrounding area obtained from EDR. Photograph summaries follow:

Years Listed	Subject Property and Adjoining Property Uses
1939, 1940, 1948, 1950, 1956, 1963	The subject property is a vacant parcel that appears to be used for agricultural purposes including apparent orchards. Approximately five small farm related structures are located along the northwestern subject property boundary.
1968	The subject property appears to have been developed with the 120,000- square foot industrial warehouse building. Commercial and residential development is evident surrounding the subject property.
1968	The subject property and adjoining properties are generally unchanged.
1974	The subject property and adjoining properties are generally unchanged.
1982	The 646 and 1805 Buildings have been constructed on the subject property and adjoining properties are generally unchanged.
1998	The subject property and adjoining properties are generally unchanged.
2006	The 658 Building is evident on the subject property. The adjoining property to the northeast has been developed as a self-storage facility.
2009, 2012, 2016	The subject property and adjoining properties are generally unchanged.

5.2.3 Topographic Maps

Path Forward reviewed USGS topographic maps of the subject property, adjoining properties, and surrounding area from the EDR collection. Map summaries follow.

Years	Scale	Subject Property and Adjoining Property Uses
1889, 1897, 1899	1:62,500	The subject property and surrounding properties appear to be unused.
1953, 1961	1:24,000	The subject property appears to be used for agricultural purposes. An orchard and small farm related structures are shown on the subject property.
1968, 1973	1:24,000	The subject property has been developed with a large building. The surrounding properties have been developed with large buildings with the exception of the area to the southeast, which is identified as a residential neighborhood.
1980	1:24,000	A building has been constructed southeast of the main building on the subject property.
2012	1:24,000	The subject property and surrounding area are not depicted with features or uses.

5.2.4 Local Street Directories

Path Forward reviewed local street directory entries for the subject property and adjoining/nearby properties that EDR researched in approximately five-year intervals between the years 1922 and 2017. The subject property addresses are listed as follows:

Address	Year(s)	Tenants
646 North King Road	1985, 1986, 1994	Frito-Lay Inc.
	1996	Computer Business College, Pacific Western Career College
	2000	Setim E Inc., Ujima Aduly & Family Serv Inc.
	2004, 2006	Enhance Digital Corp., Inhance
	2009	Royal Prestige Zoraida Lading
648 North King Road	1991, 1994, 1996	Frito-Lay Inc.
	2000	No current listing
	2004	Prime Deco Furniture Mfg. Inc.
	2009	Panda Consul Trade
	1966, 1970, 1975, 1980,	Frito-Lay Inc.

Address	Year(s)	Tenants
650 North King Road	1985, 1986, 1991	
	1996	Odwalla Fresh Squeezed Fruit & Vegetable
	1999	Bay Technology Group, CBC, Odwalla Fresh Squeezed Fruit & Vegetable Juices, Computer Business College
	2000	Odwalla Fresh Squeezed Fruit, Computer Business College, Bay Tech Group
	2006	American Business School, International, Self Storage, Silicon Valley
	2009	Royal Prestige Golden Creek
	2014, 2017	Capay Inc., Guaranteed Express
652 North King Road	2004	U Haul Company
654 North King Road	1999, 2000	Caspian Trading
	2014, 2017	Fresh Produce Co., Fresh & Best Produce Co.
656 North King Road	2004	AC Family Inc., AC Foods, Allstar Plumbing
	2006	No current listing
	2014, 2017	Air 1 Moving & Storage, Capay Inc.
658 North King Road	2004	Gildardo Espinoza, Juanita Casarez, Marisol Arroyo
	2009	U Haul Company
	2017	San Jose Trucking School
1805 Las Plumas Avenue	2004, 2009	Odwalla Inc.

5.3 Regulatory Agencies

Path Forward requested records of the following agencies to obtain information regarding the subject property.

5.3.1 Tax Assessor

Path Forward reviewed records on the website of the Santa Clara County Assessor. According to the Assessor's website, the assessor's parcel number (APN) assigned to the subject property is 254-54-023. The current Assessor's Parcel Map indicates the subject property consists of 8.95 acres.

5.3.2 Building Department

Path Forward accessed San Jose's Online Permit System on July 21, 2020. Building permit applications dated 1964 to 2016 were available for review and included applications, plans, and permits for tenant improvements for Frito-Lay, Computer Business College, and other tenants, inspection records, and correspondence. Documents related to the development of the adjacent 3.25-acre property with a self-storage business are also included in the records for 650 North King Road.

5.3.3 Fire Department

Path Forward submitted a written request for records pertaining to the subject property parcel to the SJFD on July 21, 2020. The city provided responsive records in an email dated July 24, 2020. These records include the following:

Inspection Records

SJFD inspection records dated 1967 to 2011 were included in the records provided. A 1967 inspection indicates that Frito-Lay maintained permits for storage of flammable liquids, corrosive liquids, insecticides, and combustible crates as well as welding operations. In 1969, a gas-fired boiler was installed. Inspection reports indicate that violations related to material storage, labeling, and fire safety have been issued to subject property tenants throughout this time frame. Hazardous Materials Management Plans (HMMPs) and chemical inventories for the various tenants were also provided in the records. The most recent chemical inventory dated 1990 is included in Appendix D.

The SJFD conducted an inspection on January 22, 1991 and required closure plan submittal due to the closure of the Frito-Lay plant. Based on the 1991 inspection, which identified etching of the concrete flooring in a secondary containment area in the Sanitation Building, the SJFD required decontamination of this area as well as collection of soil samples. Frito-Lay's consultant conducted an investigation in this area and submitted a report dated April 4, 1991 (Crosby & Overton 1991). The report indicates that three soil samples were collected beneath the secondary containment area and analyzed for pH, ethylene glycol, and major anions (i.e., bromides, chlorides, nitrates, nitrites, phosphates and sulfites) by ion chromatography. Chloride, nitrate, and phosphate were present in almost all the samples at concentrations below Maximum Contaminant Levels (MCLs) for drinking water. The report concludes that there has been no breach of the secondary containment. A copy of the report is included in Appendix D.

UST Records

An October 2, 1985 letter from Frito-Lay to the SJFD (Frito-Lay 1985) indicates that six USTs were used by Frito-Lay. Records on file at the SJFD indicate that three USTs (two 15,000-gallon fuel oil or diesel fuel USTs and one (4,500 or 5,000-gallon fuel oil or diesel UST) were located on

the subject property in an area southwest of the 650 Building (identified as the "west tank area"), as shown on Figure 3. Three additional Frito-Lay USTs (one 5,000-gallon diesel fuel UST, one 10,000-gallon diesel fuel UST, and one 6,000-gallon gasoline UST) were located on the 3.25-acre property that was part of the Frito-Lay property until it was sold in 1990 (identified as the "east tank area"). The three former USTs in the east tank area were located northeast of the subject property on the current off-site self-storage property, as shown on Figure 3.

Frito-Lay submitted a Closure Plan for Hazardous Materials Storage Facilities (1986 Closure Plan) to the SJFD on April 16, 1986 (Frito-Lay 1986). The 1986 Closure Plan indicates that two diesel fuel USTs, a 5,000-gallon UST and a 15,000-gallon UST, were scheduled for removal from the area southwest of the 650 Building. A separate Application for Installation or Closure of Storage Facility dated June 24, 1986 indicates that a 4,500-gallon diesel UST and a 15,000-gallon diesel UST were to be removed. The reason for the discrepancy in the size of the smaller UST (4,500 or 5,000 gallons) was not provided in the records.

In 1995, the RWQCB issued a UST Case Closure letter (RWQCB 1995). The letter includes attachments from previous reports that include figures and data from the UST removal activities. These reports were not available in SJFD files. During UST removal, damage to the tar coating of both USTs was noted. A small hole was also noted in the 5,000-gallon UST. Soil samples were collected from the tank pits and analyzed for TPH-d. TPH-d was detected in both tank pits at maximum concentrations of 12,471 mg/kg (5,000-gallon UST tank pit) and 8,143 mg/kg (20,000-gallon UST tank pit; note that the UST removal documents indicate that the tank capacity was 20,000 gallons rather than 15,000 gallons as noted in the 1986 Closure Plan). The Case Closure letter indicates that "soil found to be contaminated with diesel was excavated by WD Construction in August 1986." The tank pits were reportedly overexcavated to a depth of 16 feet. In 1994, to confirm the removal of the contaminated soil from the former tank pit area, one confirmation boring was advanced in the area where the 12,471 mg/kg TPH-d concentration was detected in 1986. Detectable concentrations of TPH-g, TPH-d, and BTEX were not detected at depths of 9, 12, and 15 feet bgs in the confirmation boring.

A water sample collected from the tank pit contained 5 milligrams per liter (mg/l) TPH-d. A monitoring well (AEC-1; see Figure 3) was installed in the tank pit area on September 4, 1986. A sample collected after well development did not contain TPH-d at a detectable concentration. The well was reportedly not sampled again until 1994 when a sample was analyzed for TPH-g, TPH-d, and BTEX which were not detected.

Frito-Lay submitted an Underground Tank Closure Plan (1990 Closure Plan) to the SJFD on August 5, 1990 (Frito-Lay 1990). The 1990 Closure Plan indicates that a 15,000-gallon diesel fuel UST was scheduled for removal from the area southwest of the 650 Building. Three additional USTs located north of the subject property were also scheduled for removal by Frito-Lay.

An Underground Storage Tank Unauthorized Release (Leak)/Contamination Site Report dated October 23, 1990 (Frito-Lay 1990) indicates that no holes were observed in the 15,000-gallon

diesel UST during removal activities. Three soil samples from the tank pit were collected and analyzed. The soil samples did not contain detectable concentrations of TPH-g, TPH-d or BTEX (RWQCB 1995). Approximately 40 feet of piping associated with the 15,000-gallon UST was removed and soil samples collected from the piping trench did not contain detectable concentrations of TPH-g, TPH-d, or BTEX (RWQCB 1995). Note that the Contamination Site Report was filed with the SJFD due to a release associated with the three off-site USTs located north of the subject property.

The 1995 Case Closure letter indicates that a soil gas survey was conducted on the subject property in the area of the former USTs in August 1990. Soil gas samples were collected at depths of 4 feet bgs from nine locations. MTBE, benzene, toluene, xylenes were detected at maximum concentrations of 3.8, 1.8, 2.3, and 5.3 µg/l, respectively. It is noted the current commercial/industrial Environmental Screening Levels (ESLs) promulgated by the RWQCB for these compounds are: 1.6, 0.014, 44, and 15 µg/l, respectively. Total volatiles were detected at concentrations ranging from <1.0 to 15 µg/l. There is not an ESL for total VOCs. The Case Closure letter indicates that, "the conclusion of the survey was that the tank area contained minimal levels of petroleum hydrocarbons in the subsurface."

The RWQCB reviewed the UST removal and investigation reports and issued a UST Case Closure letter on March 28, 1995 (RWQCB 1995). The letter confirms the completion of site investigation and remedial action for the USTs formerly located at the subject property and adjoining 3.25-acre property. The letter states that no further action related to the UST release is required. A copy of the Case Closure Letter is included in Appendix D.

5.3.4 Regional Water Quality Control Board

Path Forward submitted a written request for records pertaining to the subject property parcel to the RWQCB on July 21, 2020. Melinda Wong of the RWQCB responded in an email dated July 27, 2020 that no records are available for the subject parcel addresses other than the files in the State Water Resources Control Board (SWRCB) GeoTracker database related to the former USTs at the 650 North King Road address. Path Forward reviewed the public records on the GeoTracker database, which include files related to the former USTs at the subject property including the 1995 Case Closure letter (RWQCB 1995), which are discussed in Section 5.3.3. The GeoTracker database indicates that the case is closed as of March 29, 1995.

5.3.5 Department of Toxic Substances Control

Path Forward submitted a written request for records pertaining to the subject property parcel to the DTSC on July 21, 2020. DTSC responded in an email dated July 27, 2020 that no records are available for the subject property addresses.

5.3.6 Other Agencies

Path Forward submitted a written request for any records pertaining to the subject property parcel to the Santa Clara County Department of Environmental Health (SCCDEH) on July 21, 2020. The SCCDEH responded via email on July 23, 2020 that no records are available for the subject property addresses.

Path Forward submitted a written request for any records pertaining to the subject property parcel to the Bay Area Air Quality Management District (BAAQMD) on July 21, 2020. The BAAQMD responded via email on July 22, 2020 that records are available for the 650 North King Road address and that no records are available for the other subject parcel addresses. The BAAQMD records for the 650 North King Road address include permits issued to Frito-Lay for a snack food plant (1984), oil mist eliminator (1986), and a pork rind fryer (1988). The BAAQMD records indicate that the facility discontinued operations on December 2, 1992.

5.4 Activity & Use Limitations (AULs)

Path Forward reviewed a report of title and judicial records prepared by EDR for indications of environmental liens and AULs recorded against the subject property. No environmental liens or AULs were identified.

5.5 Prior Reports

Path Forward reviewed several reports provided by the client or available from the RWQCB GeoTracker database.

5.5.1 UST Case Closure (RWQCB 1995)

The Case Closure letter indicates that three USTs were removed from the subject property in 1986 and 1990. The letter confirms the completion of site investigation and remediation for the USTs formerly located at the subject property. The letter states that no further action related to the UST release is required. Note that the Case Closure letter includes closure of three additional former USTs used by Frito-Lay. These USTs are located off-site on the 3.25-acre parcel that was sold in 1990.

5.5.2 Phase I ESA (URS 2011)

At the time of URS' site visit, much of the subject property was vacant. Four tenants occupied portions of the subject property and operated primarily office uses with some warehouse and exterior storage uses. URS identified the following RECs for the subject property:

- The potential presence of residual petroleum impact in areas of six former USTs. It should be noted that the 2011 Phase I ESA indicates that six USTs were formerly located on the subject property. However, based on Path Forward's review of the records

provided by the SJFD, three of the USTs are located on the 3.25-acre parcel that was sold in 1990 and are not located on the subject property.

- A former release of 97 gallons of PCB-containing cooling oil from a faulty transformer is noted as a REC that "is unlikely to pose an ongoing environmental concern to the subject property under a developed commercial/industrial setting, and no further assessment is warranted."

URS noted the following notable environmental issues:

- The subject property contains a sump and two-stage clarifier near the western corner of the 650 Building. URS concludes that the sump and clarifier are unlikely to pose a significant environmental concern to the subject property and that these features may require abandonment during future site improvement.

- Based on the ages of the 650 Building and 646 Building, ACM and LBP may be present and will require appropriate precautions during improvements that disturb such materials.

- Black organic looking material was observed in the boiler area of the 650 Building. URS recommended identifying and removing the source of moisture causing this material and removal of mold impacted building materials.

- Storage of hazardous materials was noted in the 650 Building. URS recommended identifying and removing all hazardous materials which remain onsite and disposing them at an appropriate offsite facility.

5.5.3 Phase II ESA (Nova 2012)

Nova conducted the Phase II ESA to address the issues identified in URS' 2011 Phase I ESA including the clarifier, sump, floor drains, former maintenance area, and former paint shed area. Nova also evaluated an elevator and aboveground hydraulic oil tank, the black organic looking material, and the suspect ACM at the subject property. The following activities were conducted by Nova:

Site Floor Drain Sampling

In 2012, the floor drains and sump were operable. Three of four floor drains associated with the former maintenance area were plugged with residual solids. A sample of the residual solids was collected and analyzed for TPH-g, TPH-d, TPH-mo, MTBE, BTEX, and volatile organic compounds (VOCs). TPH-d and TPH-mo were detected at concentrations of 300 mg/kg and 670 mg/kg, respectively. TPH-g was detected at a concentration of 5.7 mg/kg. The remaining analytes were not detected with the exception of toluene, which was detected at a concentration of 0.0074 mg/kg.

Site Sump Sampling

A water sample was collected from the sump and analyzed for TPH-g, TPH-d, TPH-mo, and VOCs. TPH-d and TPH-mo were detected at concentrations of 1,800 µg/l and 5,400 µg/l, respectively. TPH-g was detected at a concentration of 60 µg/l. The remaining analytes were not detected with the exception of xylenes, which was detected at a concentration of 0.73 µg/l. The report indicates that "trace concentrations of additional residual VOCs" were detected.

Floor Drain and Sump Cleaning Activities

The floor drains and associated cleanouts were high pressure flushed. Approximately five drains could not be cleared and will require additional mechanical means to clear, if possible. The sump and clarifier were subsequently pressure washed and cleaned.

Former Maintenance Area Soil Sample

A soil sample was collected adjacent to the clarifier and a drain that is cut into the curb in this area. The soil sample was analyzed for TPH-g, TPH-d, TPH-mo, MTBE, BTEX, and VOCs. TPH-d and TPH-mo were detected at concentrations of 3.8 mg/kg and 17 mg/kg, respectively. The remaining analytes were not detected.

Asbestos Survey and Asbestos Abatement Activities

An asbestos survey was conducted and asbestos was found in limited areas including the former boiler room and in some of the former process areas. Asbestos flooring was found in the 1805 Building. The asbestos flooring in the 1805 Building was removed and damaged asbestos construction materials were repaired. An Operations and Maintenance Plan was prepared and is appended to the Phase II report.

Elevator - Hydraulic Oil

An elevator company was retained to assess the condition of the elevator. No evidence of leaks was found and no concerns or issues associated with the elevator were identified.

Residual Chemicals

American Business College and Park N Sell discontinued operations at the subject property in 2011. Nova identified residual cans of paint, various cleaners, and a 55-gallon drum of residual oil. Nova coordinated the proper off-site disposal of these materials.

Based on the findings of the Phase II ESA, Nova recommended that the clarifier be closed as documented in the Clarifier Closure Workplan, dated January 20, 2012. Nova also recommended that a copy of the asbestos survey and site-specific O&M Plan should be made available to contractors prior to performing site work. Nova concluded that no additional work or concerns were present or associated with the subject property.

5.5.4 Clarifier Closure Plan (Nova 2012)

The Clarifier Closure Plan provides a workplan for in-place closure of a two-stage clarifier associated with past operations at the subject property.

6.0 REGULATORY DATABASE REVIEW

Path Forward reviewed a regulatory agency database search report prepared by EDR for the subject property. EDR conducted a search of publicly available information from federal, state, tribal, and local databases for information pertinent to the subject property associated with plotted addresses located within ASTM-specified search distances from the subject property. The database report identifies about 178 facilities as well as the accessed databases.

The subject property address of 650 North King Road was identified in the following databases searched by EDR:

Site Name:	Frito-Lay Inc.
Databases:	LUST, RCRA-SQG, HAZNET, CHMIRS
Frito-Lay was registered as a small quantity generator of hazardous waste in 1986. Hazardous wastes generated included other empty containers 30 gallons or more in 1990 and unspecified organic liquid mixture and waste oil and mixed oil in 1998. The LUST listing indicates the case status is completed – case closed as of March 29, 1995. The CHMIRS listing indicates that a release of 97 gallons of PCB-containing cooling oil from a faulty transformer occurred on February 12, 1997. The listing states that the cause of the release was "primary lead on transformer let go causing oil to leak through bushing. Contained and cleaned up."	

Site Name:	650 N King Road LLC
Databases:	HAZNET
Hazardous wastes generated by 650 N King Road LLC in 2012 include unspecified organic liquid mixtures, waste oil and mixed oil, unspecified oil-containing waste, latex waste, and other organic solids.	

Site Name:	Progressive Solutions
Databases:	RCRA NonGen/NLR, HAZNET
Progressive Solutions was registered as a handler that does not presently generate hazardous waste in 2015. Hazardous wastes generated by Progressive Solutions in 2015 through 2019 include unspecified organic liquid mixtures.	

No adjoining properties or nearby properties located up to cross gradient were identified with cases involving releases to groundwater, with the exception of the following:

Site Name:	Touche Manufacturing, Former Serra Silicon Valley Corporation

Address:	1875 Dobbin Drive		
Distance: 0.21 miles		**Direction:** North	**Relative Elevation:** Higher
Databases:	Envirostor		
The Envirostor listing indicates that soil and soil vapor at this property are impacted with arsenic, nickel, TPH-motor oil, TPH-diesel, and PCE at this former metal plating facility. Documents on file on the Envirostor database indicate that groundwater is impacted with TPH-d and TPH-motor oil. A land use covenant recorded for this property prohibits groundwater extraction. Although impacts to groundwater at this facility have been noted and its upgradient location, due to the relatively far distance to the subject property, this facility is unlikely to have impacted the subject property.			

7.0 FINDINGS AND OPINIONS

Path Forward identified obvious subject property uses from the present back to 1939, at which time the subject property used for agricultural purposes including an orchard and approximately five farm related structures located along the northwestern subject property boundary. The current 120,000 square-foot warehouse building was constructed on the subject property in 1964. Frito-Lay occupied the building and manufactured potato chips and pork rinds at the subject property until 1996. Since 1996, various tenants have occupied the subject property buildings. No records of manufacturing activities for the more recent tenants were found during this assessment.

This ESA identified the following findings with respect to RECs, CRECs, HRECs and de minimis conditions, as defined in Section 1.1 of this report:

- Records reviewed during this assessment indicate that three USTs associated with Frito-Lay operations were formerly located on the subject property. The three USTs were located on the subject property southwest of the 650 Building and included a 4,500 or 5,000-gallon fuel oil UST, a 15,000-gallon fuel oil UST, and a 15,000 or 20,000-gallon fuel oil UST. The USTs were removed from the subject property in 1986 and 1990. During removal of the 5,000-gallon and 20,000-gallon USTs in 1986, damage to the tar coating of both USTs was noted. A small hole was also noted in the 5,000-gallon UST. Soil samples were collected from the tank pits and analyzed for TPH-d. TPH-d was detected in both tank pits at maximum concentrations of 12,471 mg/kg (5,000-gallon UST tank pit) and 8,143 mg/kg (20,000-gallon UST tank pit). The Case Closure letter indicates that "soil found to be contaminated with diesel was excavated by WD Construction in August 1986." The tank pits were reportedly overexcavated to a depth of 16 feet. In 1994, to confirm the removal of the contaminated soil from the former tank pit area, one confirmation boring was advanced in the area where the 12,471 mg/kg TPH-d concentration was detected in 1986. Detectable concentrations of TPH-g, TPH-d, and BTEX were not detected at depths of 9, 12, and 15 feet bgs in the confirmation boring.

A monitoring well (AEC-1) was installed in the tank pit area on September 4, 1986. A sample collected after well development did not contain TPH-d at a detectable concentration. The well was reportedly not sampled again until 1994 when a sample was analyzed for TPH-g, TPH-d, and BTEX which were not detected.

The 15,000-gallon diesel UST that was removed in 1990 appeared in good condition with no holes observed. Three soil samples from the tank pit were collected and analyzed. The soil samples did not contain detectable concentrations of TPH-g, TPH-d or BTEX. Approximately 40 feet of piping associated with the 15,000-gallon UST was removed and soil samples collected from the piping trench did not contain detectable concentrations of TPH-g, TPH-d, or BTEX.

A soil gas survey was conducted in the area of the former USTs in August 1990. Soil gas samples were collected at depths of 4 feet bgs from nine locations. MTBE, benzene, toluene, xylenes were detected at maximum concentrations of 3.8 µg/l, 1.8 µg/l, 2.3 µg/l, and 5.3 µg/l, respectively. Total volatiles were detected at concentrations ranging from <1.0 to 15 µg/l. The soil gas survey report states, "the conclusion of the survey was that the tank area contained minimal levels of petroleum hydrocarbons in the subsurface."

The RWQCB reviewed the UST removal and investigation reports and issued a UST Case Closure letter on March 28, 1995 (RWQCB 1995). The letter confirms the completion of site investigation and remedial action for the USTs formerly located at the subject property and adjoining 3.25-acre property.

Although the Site historically obtained a UST Case Closure, the concentrations observed during the historical soil gas investigation are at levels in excess of current health risk based cleanup levels. The previously documented contamination associated with the historical USTs is considered a REC.

- The subject property buildings have been occupied by a number of tenants since Frito-Lay discontinued operations in 1991. Evidence of staining was noted in several units within the 650 and 1805 Buildings during the subject property reconnaissance. Current tenants in these units (Progressive Solutions, Air 1 Moving, and Odwalla) use and store hazardous materials. Given the evidence of heavy use of petroleum products and hazardous materials, staining on the floor surfaces in several units, poor condition of the concrete slab, and the improper storage of hazardous materials and petroleum products, it is possible that releases to the subsurface have occurred. The extensive use of hazardous and petroleum products by current tenants is considered a REC.

- The subject property was used for agricultural purposes including orchard use sometime prior to 1939 until the 1960s. Although not documented at the subject property, activities commonly associated with agricultural uses may include the use and storage of hazardous materials and petroleum products (*e.g.*, agricultural chemicals). Information

was not available as to the potential historical usage of pesticides, fertilizers or insecticides. Based on our experience, these residual concentrations, if present, are not typically at concentrations that would require cleanup by a regulatory agency or pose a significant human health risk to commercial or industrial site users. There is potential that the near surface soils may contain residual agricultural chemicals that may affect disposal costs in the event redevelopment is planned and such soils are removed from the property. The former agricultural uses of the subject property are considered a de minimis condition.

- Regulatory records indicate that a release of 97 gallons of PCB-containing cooling oil from a faulty transformer occurred on February 12, 1997. The records indicate that oil leak through bushing and that the release was contained and cleaned up. No records of cleanup activities or confirmation sampling were found during this assessment. The former cooling oil release is considered a de minimis condition.

8.0 CONCLUSIONS

Path Forward conducted a Phase I ESA in conformance with ASTM Designation: E1527 of the subject property located at 650 North King Road in San Jose, Santa Clara County, California. The subject property also known by the addresses 646-658 North King Road and 1805 Las Plumas Avenue. This ESA has revealed evidence of RECs in connection with the subject property, as discussed in Section 7.0.

We declare that, to the best of our professional knowledge and belief, we meet the definition of environmental professional as defined in §312.10 of 40 CFR 312. We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.

This Phase I ESA report prepared by:

Karen T. Smith

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

Site Name:	Client Name:
646-658 North King Road & 18	Path Forward Partners
646-658 North King Road & 18	505 14th Street #1230
San Jose, CA 95133	Oakland, CA 94612
EDR Inquiry # 6129092.3	Contact: Karen Smith

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Path Forward Partners were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

Certification # B7F7-459E-A0E5

PO # 124-112-100

Project 650 N King Road

UNMAPPED PROPERTY

This report certifies that the complete holdings of the Sanborn Library, LLC collection have been searched based on client supplied target property information, and fire insurance maps covering the target property were not found.

Sanborn® Library search results

Certification #: B7F7-459E-A0E5

The Sanborn Library includes more than 1.2 million fire insurance maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow and others which track historical property usage in approximately 12,000 American cities and towns. Collections searched:

- ☑ Library of Congress
- ☑ University Publications of America
- ☑ EDR Private Collection

The Sanborn Library LLC Since 1866™

Limited Permission To Make Copies

Path Forward Partners (the client) is permitted to make up to FIVE photocopies of this Sanborn Map transmittal and each fire insurance map accompanying this report solely for the limited use of its customer. No one other than the client is authorized to make copies. Upon request made directly to an EDR Account Executive, the client may be permitted to make a limited number of additional photocopies. This permission is conditioned upon compliance by the client, its customer and their agents with EDR's copyright policy; a copy of which is available upon request.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

RE: Site investigation at Frito-Lay Inc., 650 N. King Road, San Jose, California.

Dear Mr. Tarter:

Crosby & Overton, Inc. (C&O) is pleased to submit this letter report describing the methods and analytic data used to evaluate whether the secondary containment for hazardous materials had been breached at Frito-Lay Inc., located at 650 N. King Road, San Jose (Figure 1).

PROCEDURE

In preparation for sampling, C&O utilized a subcontractor, Layne Environmental, to core (10 inch diameter) a concrete slab in three locations (Figure 2). All water used for coring was removed during the operation with a wet-dry vacuum. The coring water was removed to prevent the possibility of contaminants infiltrating the soil beneath the concrete slab. After extracting, the concrete cores were visually inspected for cracks, voids, and contaminant infiltration (Figures 3 A,B,&C). The soil surface beneath each core was inspected to verify that the coring process had not disturbed the soil.

Soil samples were obtained using a slide hammer hand sampler with a single sampling cup at the end. The sampler held one (1), clean, six inch long by two inch diameter brass tube. The sampler was then inserted into the undisturbed soil and centered in the cored openings through the concrete slab. The sampler was removed, opened, and the brass tube containing the sample was extracted. Immediately after extraction the tube ends were sealed with aluminum foil, plastic cap plugs, wrapped with duct tape, and placed in a cooler containing Blue Ice®.

One sample was taken from each core hole, and an additional sample was taken from the northeast side of the property as a background reference. All samples were labeled and packed on Blue Ice® for transportation to Med-Tox Associates, Inc. in Pleasant Hill (a California State certified hazardous materials laboratory). The samples were analyzed for pH, ethylene glycol, and major anions

DOHS NO. 199

(i.e. bromides, chlorides, nitrates, nitrites, phosphates, and sulfates) by ion chromatography. Chain of Custody documentation accompanied all samples to the laboratory (cf. attached).

ANALYTIC SUMMARY

Analytic results indicated low concentrations of chloride, nitrate, and sulfate were present in nearly all of the samples. No ethylene glycol was detected in any of the samples. The pH for the samples ranged from 8.1 to 8.4 (cf. Table 1).

- Sample EC-1 yielded results of: pH, 8.1; chloride, 18 parts per million (ppm); sulfate, 10 ppm.

- Sample EC-2 yielded results of: pH, 8.2; chloride, 24 ppm; sulfate, 11 ppm.

- Sample EC-3 yielded results of: pH, 8.3; chloride, 32 ppm; nitrate, 7 ppm; sulfate, 25 ppm.

- Sample S-4 yielded results of: pH, 8.4; chloride, 7 ppm; nitrate, 7 ppm; sulfate, 25 ppm.

All concentrations listed here are below the maximum contaminant levels (MCL) standards for drinking water established by the California Regional Water Quality Control Board (WQCB), Central Valley, November 1989.

TABLE 1

SAMPLE:	EC-1	EC-2	EC-3	S-4
pH	8.1	8.2	8.3	8.4
ETHYLENE GLYCOL	ND	ND	ND	ND
CHLORINE	18	24	32	7
NITRATE-NITROGEN	ND	ND	7	7
SULFATE	10	11	25	25

All values (except pH) are given parts per million (ppm).

ND = Not Detected.

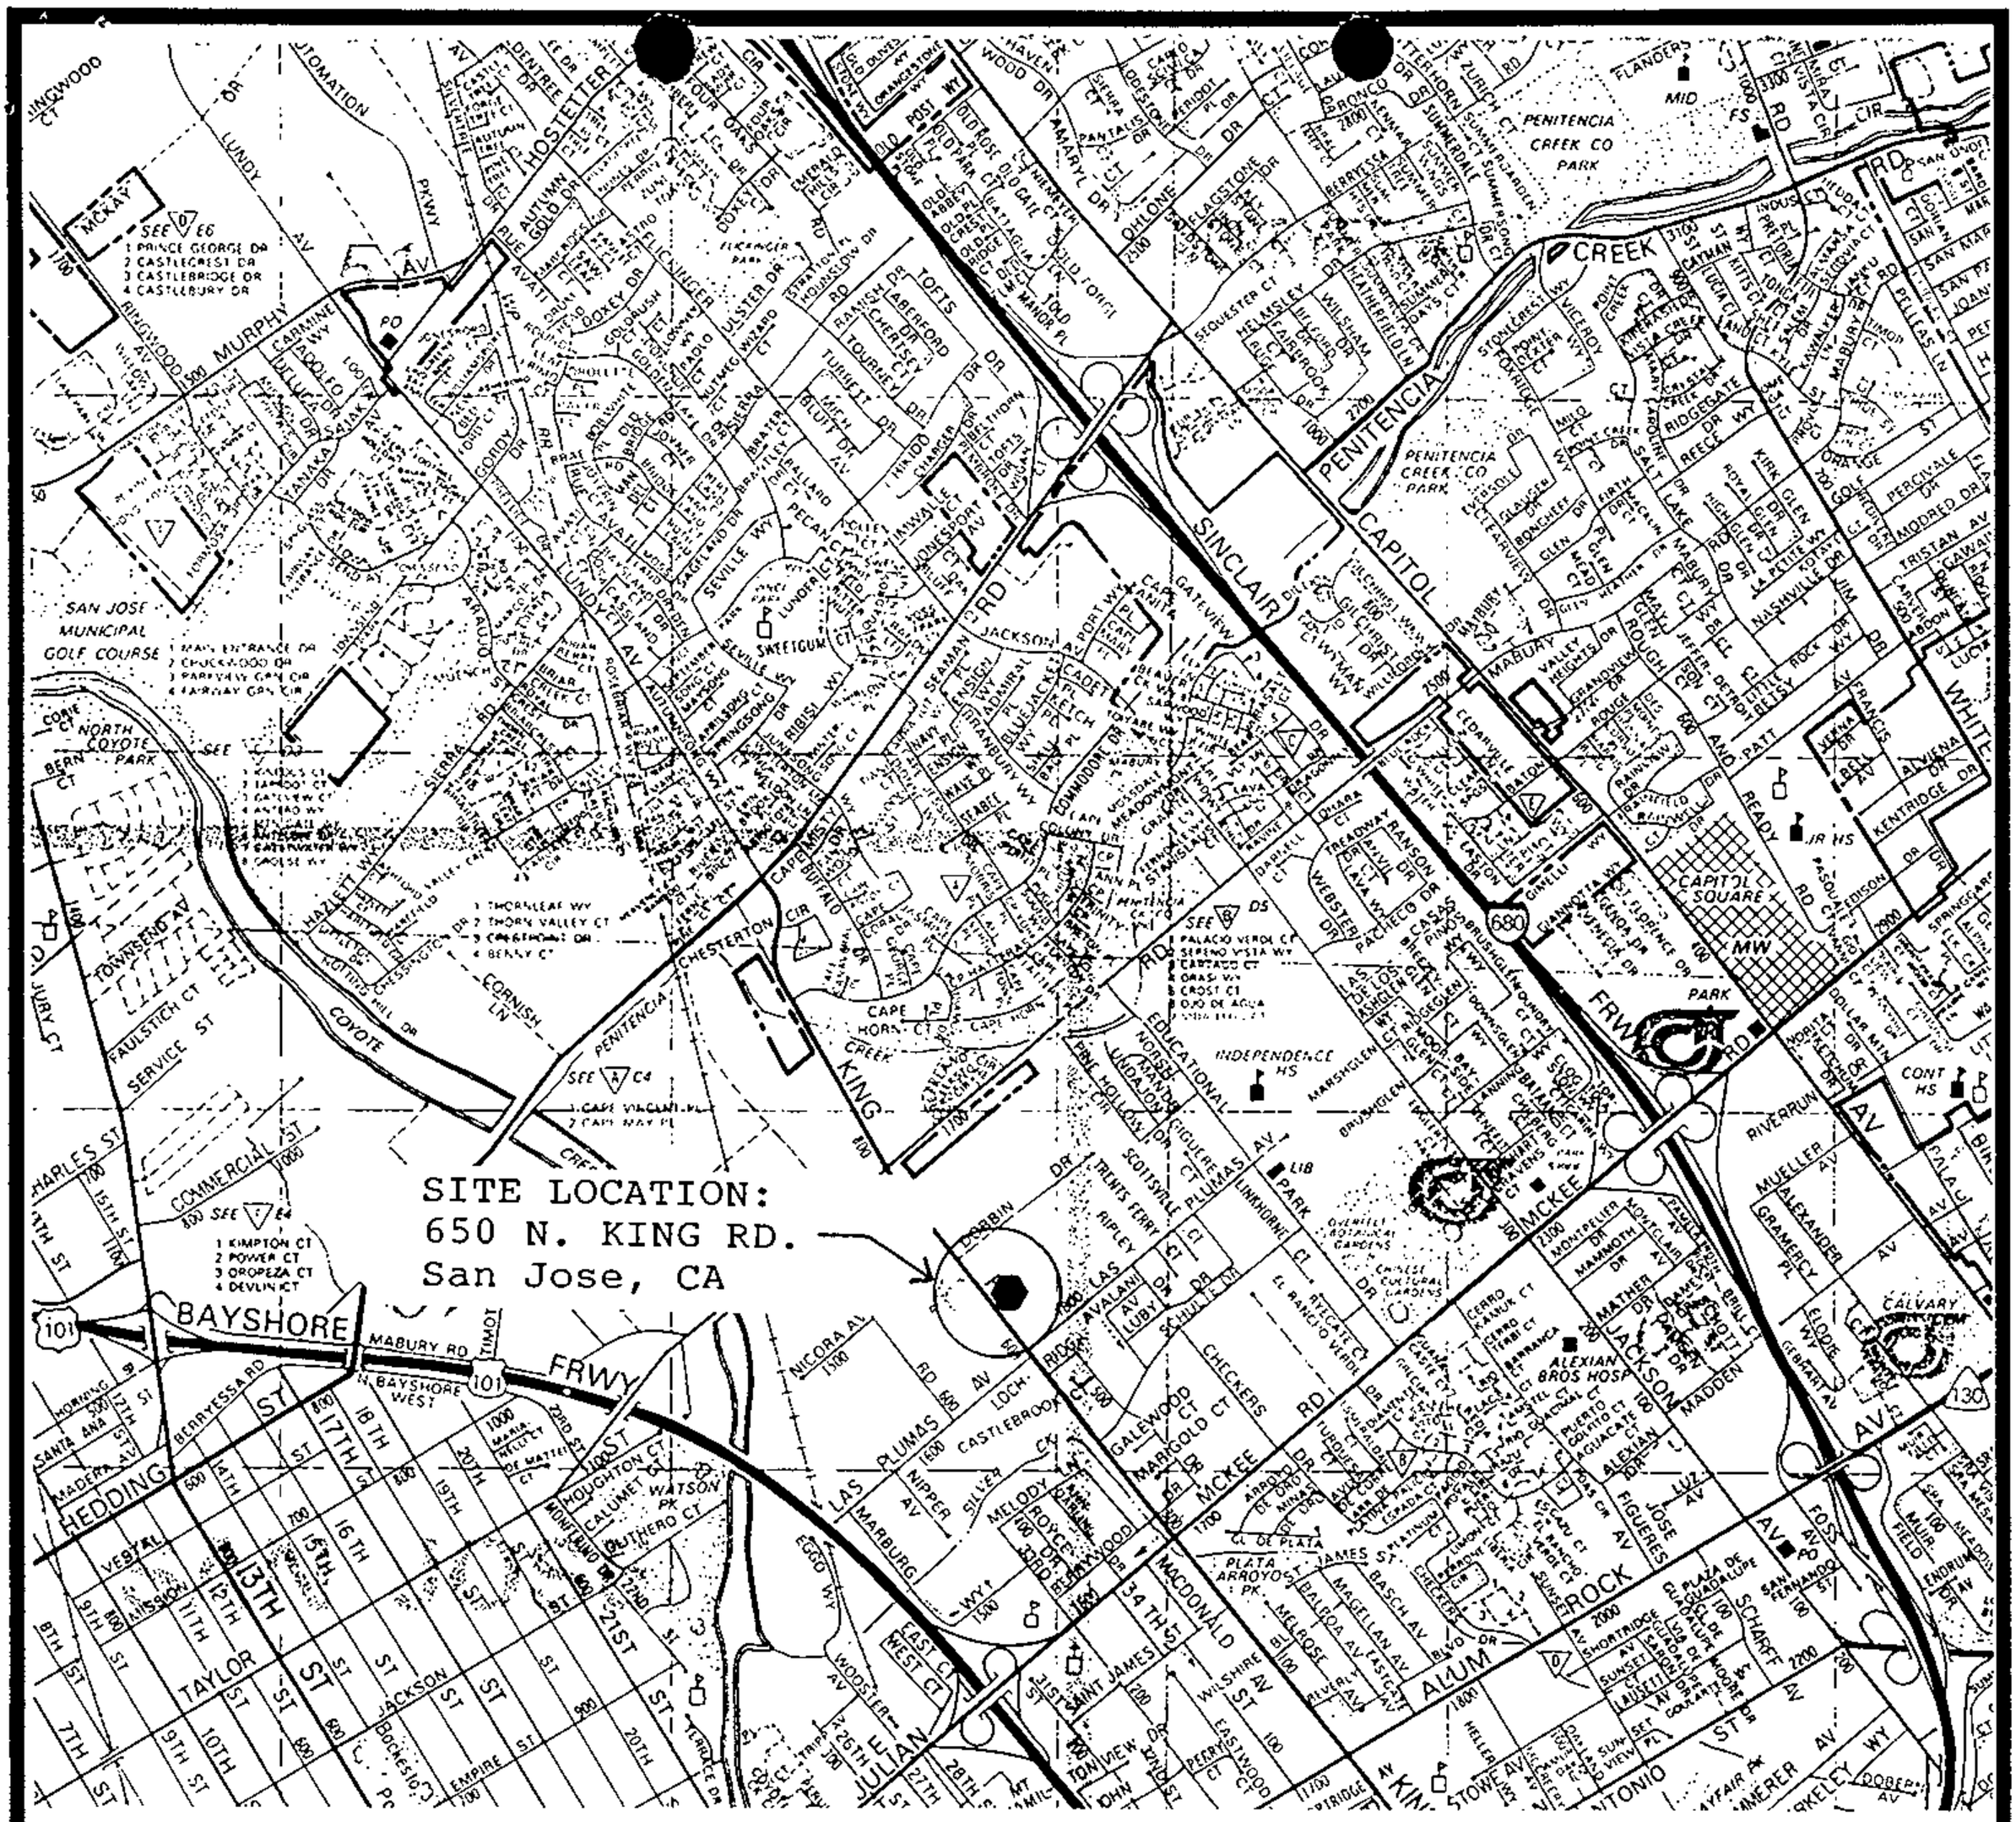
CONCLUSIONS/RECOMMENDATIONS

It is Crosby & Overton's conclusion that there has been no breach of the secondary containment, i.e. through the concrete floor, due to the chemicals previously stored at the Frito-Lay facility, 650 North King Street, San Jose. It is our recommendation that closure be permitted to proceed.

Please feel free to call us at Crosby & Overton, Inc. if we may be of further service.

Sincerely,

Matthew H. Walraven
Staff Geologist



CROSBY & OVERTON, INC.
JOB SAFETY PLAN

Project Location: Frito-Lay Inc., 650 N. King Road San Jose California. C & O Job Number: 8370-S

The possible hazards on this job are expected to be: physical hazards associated with working near a concrete coring machine and a sampling hammer. Chemical hazards from Ethylene glycol, major anions (i.e. bormides, chlorides, nitrates, nitrites, phosphates,and sulfates) and material with potentially extreme pH.

Required personal protective equipment for this project: Level D Protection (steel toe neoprene boots, coveralls, work gloves, hard hat, safety glasses, and ear plugs when necessary). Level C Protection on standby (OV cartridges).

CROSBY AND OVERTON, INC.
JOB SAFETY PLAN

1. Site: Frito-Lay Inc., 650 N. King Road, San Jose, CA

2. Location: cross street is Las Plumas Av.

3. Plan Prepared: Crosby and Overton, Inc. Date: 3/13/91

4. Plan Approved: Dave Sadoff, PM Date: 3/13/91
Ted Haavisto, HSO Date: 3/13/91

5. Facility Description: Production Facility.

6. Status (active, inactive, unknown): inactive

7. Surroundings: Site is bounded by

8. Site Map: Attached

9. Climate: Moderate dry summers, cool wet winters

10. Site history (origin of contamination and history of injuries exposure, chemical spills, complaints, etc.). Unknown.

11. Description of work: Three 10" concrete cores will be removed from a slab in the production facility. Soil samples will be taken from undisturbed soil beneath the cores using a sample hammer.

12. Chemical contaminants:

Chemical	Media	Minimum	Maximum
Ph	soil/water.	0	unknown
Ethylene glycol	soil/water.	0	unknown
Major anions	soil/water.	0	unknown

13. Procedures to mitigate hazards:

A) Mechanical Hazards

- verify that all equipment is in good condition

B) Electrical Hazards
- maintain at least 10 feet of clearance from overhead power lines
- properly ground all electrical equipment
- avoid standing in water when operating electrical equipment
- be familiar with specific operating instructions for each piece of equipment
- deactivate any source of ignition within 25 feet of work area

C) Chemical Hazards

- use personal protective equipment listed above
- conduct direct reading air monitoring to evaluate respiratory and explosion hazards
- wash hands before eating or drinking
- avoid hand to mouth contact before washing hands
- keep dust to a minimum, avoid breathing dust

D) Temperature Hazards

- Heat: when temperature exceeds 70 F, take frequent breaks in shaded area. Unzip or remove coveralls during breaks. Have cool water or electrolyte replenishment solution available. Drink small amounts frequently to avoid dehydration. Count the pulse rate for 30 seconds, as early as possible in the rest period. If the pulse rate exceeds 110 beats per minute at the beginning of the rest period, shorten the work cycle by one-third.

- Cold: wear multi-layer cold weather outfits the outer layer should be of wind-resistant fabric.

E) Acoustical Hazards

- use earplugs when noise level prevents conversation in normal voice at a distance of three feet.

F) Organic Vapors

- monitor organic vapors. If total hydrocarbons exceed 5 ppm above background, don Level C personal protective equipment

- if total hydrocarbons exceed 500 ppm, supply mechanical ventilation

- monitor lower explosive limit. If LEL exceeds 20%, leave area and call fire department

- no smoking within 25 feet of working area

14. Decontamination procedures: Steam clean equipment before leaving work area. Wash boots and gloves. Launder coveralls. Wash hands and face as soon as possible after stopping work.

15. Materials generated on-site: No materials will be generated on site.

16. Site resources: Drinking water, rest rooms and a pay Phone are available.

17. Emergency equipment: Fire extinguisher and first aid kit to be on-site at all times.

18. Emergency telephone numbers:

Ambulance 911
Police 911
Fire Department 911
Hospital: San Jose Hospital (408) 998-3212
675 E. Santa Clara St. San Jose.
Poison Control Center 800-233-3360
Project Manager: Office 633-0336 Home 834-2691

HSO: Office 633-0336 Home 537-7318

19. Emergency routes: Map attached. Route: Proceed South on King Rd to Alum Rock Av. Turn Right on to Alum Rock Av. Proceed South-East on Alum Rock Av. 15 th Street in the nearest cross street. Turn Right into San Jose Hospital Emergency entrance.

20. Project personnel list and safety plan distribution record: All project staff must sign, indicating they have read and understand the Safety Plan.

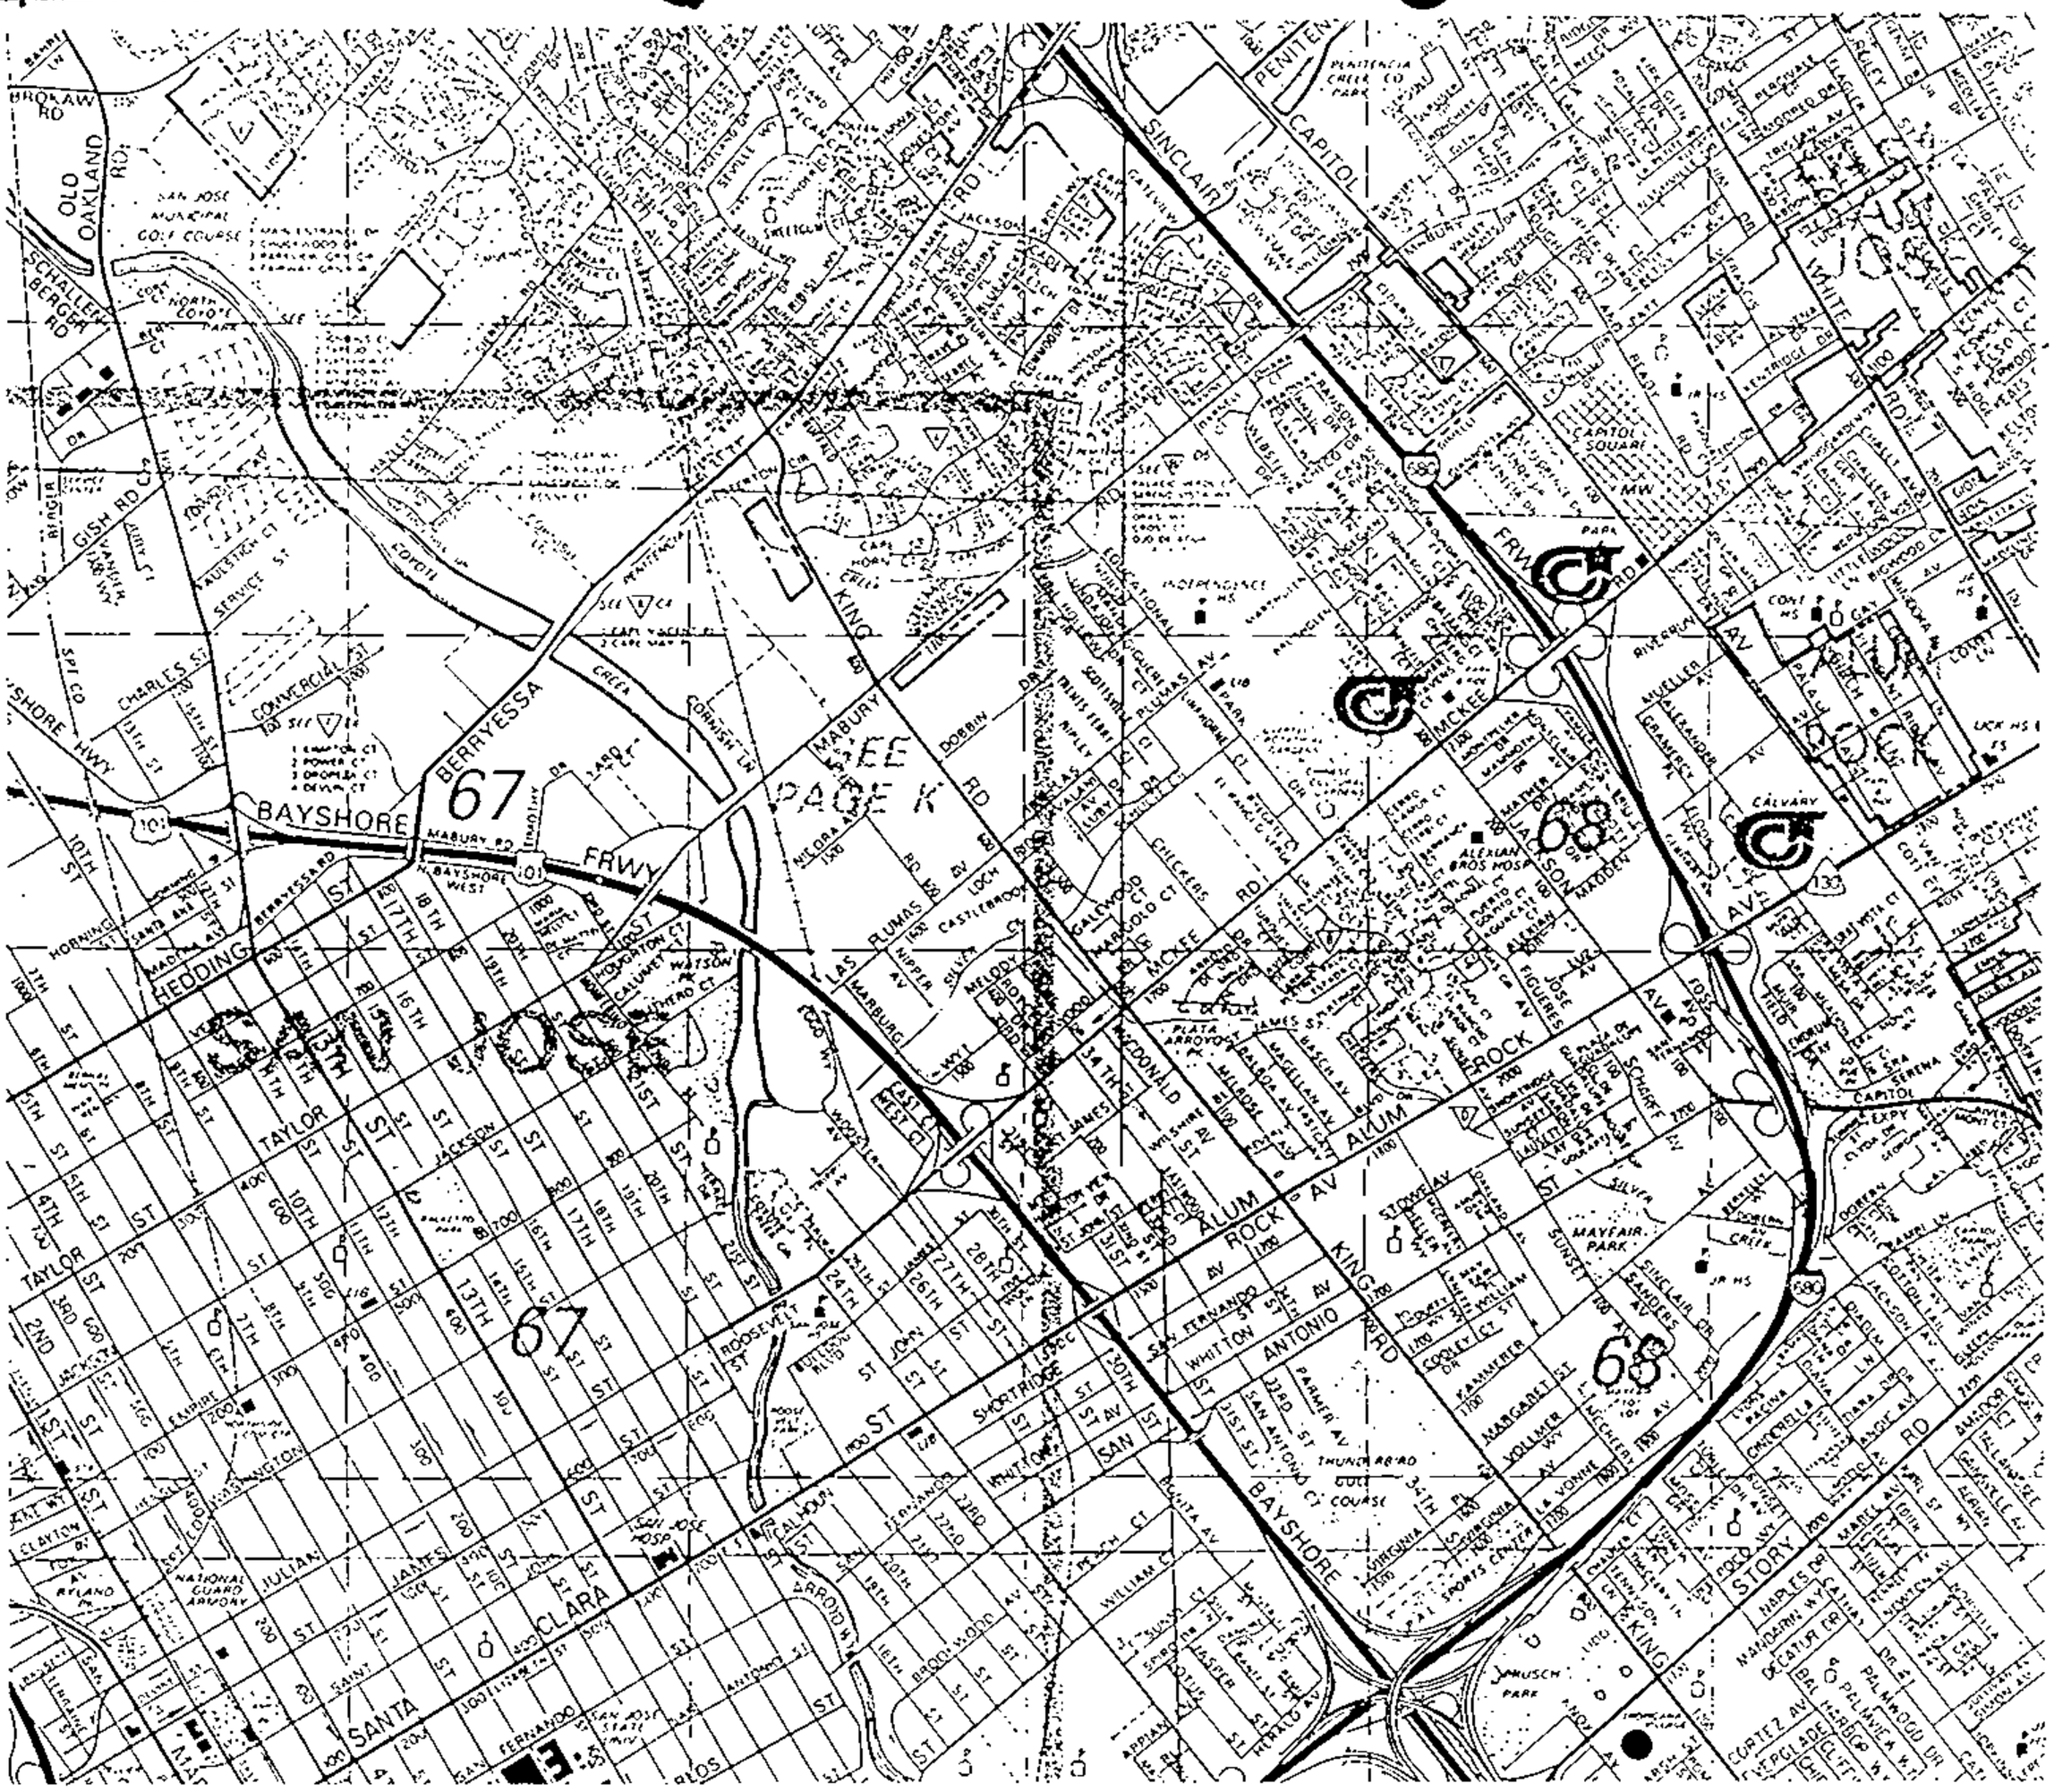
Employee Name	Date/Time	Signature
Dave Sadoff	3/14/91 08:35	Dave Sadoff
Matt Walraven	3/14/91 08:37	Matt Walraven
Sara Murguia	3/14/91 7:30	Sara Murguia

21. Health and safety meeting: All personnel participating in the project must receive initial health and safety orientation. Thereafter, a brief "tailgate" safety meeting is required as deemed necessary by the Health and Safety Officer.

Date	Topics	Name	Employee Initial

22. Visitors: It is Crosby & Overton policy that visitors must furnish his/her own personal protective equipment. All visitors are required to sign the visitor log and comply with the safety plan requirements.

Name of Visitor	Firm Name	Date/Time	Signature



Emergency routes: Map attached. Route: Proceed South on King Rd to Alum Rock Av. Turn Right on to Alum Rock Av. Proceed South-East on Alum Rock Av.. 15 th Street in the nearest cross street. Turn Right into San Jose Hospital Emergency entrance.

Jeffrey W. Tarter
Hazardous Materials Inspector
San Jose Fire Department
Four North Second Street, Suite 1100
San Jose, CA 95113-1305

RE: Site investigation at Frito-Lay Inc., 650 N. King Road, San Jose, California.

Dear Mr. Tarter:

Crosby & Overton, Inc. is pleased to submit this outline of procedures to determine whether the secondary containment for hazardous materials has been breached at Frito-Lay Inc., located at 650 N. King Road, San Jose. Please find enclosed a site plan indicating the approximate locations for soil sampling.

In preparation for sampling, the concrete slab will have three, 10 inch diameter holes cored through the concrete. The concrete will be removed, and the surface of the underlying soil will be scraped down to undisturbed soil. The samples will be analyzed for pH, ethylene glycol, and major anions (i.e. bromides, chlorides, nitrates, nitrites, phosphates, and sulfates) by ion chromatography.

Soil samples will be obtained using a slide hammer hand sampler with a single sampling cup at the end. The sampler holds one (1), clean, six inch long by two inch diameter brass tube. The sampler is inserted into the undisurbed soil beneath and centered in the cored openings in the concrete slab. The sampler will be removed, opened and the brass tube extracted. Immediately after extraction the tube ends will be sealed with aluminum foil, plastic cap plugs, and wrapped with duct tape to prevent the loss of any volatile compounds. All samples are labeled and packed on Blue Ice® for transportation to Med-Tox Associates, Inc. in Pleasant Hill (a California State certified hazardous materials laboratory). Chain of Custody documentation will accompany all samples to the laboratory.

A full report will be submitted to your office upon project completion.

Please feel free to call us at C & O if you have any questions regarding our procedures.

Sincerely,

Matthew H. Walraven
Staff Geologist

Dave Sadoff
Project Environmental Geologist

Mr. Dave Chambers
Frito-Lay, Inc.
P.O. Box 660634
Dallas, TX 75226

Dear Mr. Chambers:

Subject: Underground Storage Tank Case Closure—Frito-Lay, Inc., 650 North King Road, San Jose, CA; Case No. 12-096

This letter confirms the completion of site investigation and remedial action for the underground storage tanks formerly located at the above-described location.

Based upon the available information and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground storage tank release is required.

This notice is issued pursuant to a regulation contained in Title 23, California Code of Regulations, Division 3, Chapter 16, Section 2721 (e).

Please contact Mr. Lane Davis at the Santa Clara Valley Water District's Camden Office, (408) 927-0710, extension 2698, if you have any questions in this matter.

Sincerely,

Mr. John West
Regional Water Quality Control Board
2101 Webster Street, Suite 500
Oakland, CA 94612

Dear Mr. West:

Subject: Request for Case Closure Concurrence—Underground Storage Tank Program
Case No. 12-096, Frito-Lay, Inc., 650 North King Road, San Jose, CA

This requests your concurrence on case closure for the subject fuel leak case. Enclosed for your review is a case closure summary. Please provide comment to the Santa Clara Valley Water District (District) casehandler within 30 days from the receipt of this letter. If we have not received comment from you within that time frame, the District will issue a case closure letter for the subject case.

As you know, the District has entered into agreement with the State Water Resources Control Board to provide regulatory oversight for leaking underground fuel storage tanks. The terms of the agreement require the District to issue case closure letters after appropriate remediation for cases where soil and/or groundwater has been impacted. District evaluation of case closure is consistent with the San Francisco Bay Region, Regional Water Quality Control Board Water Quality Control Plan requirements and guidance.

Please contact Mr. Lane Davis at the Camden Office, (408) 927-0710, extension 2698, with any questions or comments that arise as you proceed with review of this proposed case closure.

Sincerely,

*Administratively destroyed, actual method of well destruction is unknown.

Surface Waters

Name of Creek, Reservoir, Bay, Etc.	Distance to Site
Miguelito Creek	1,400 feet SE
Coyote Creek	2,300 feet WSW
Upper Penitencia Creek	1,600 feet NNE

Extent of Soil Contamination

In addition to review of the case file, the District requested information pertaining to the soil and groundwater investigation at this site from the following sources: Frito-Lay (Mr. David Chambers), Environ (Ms. Jessica Donovan), SJFD (Ms. Clare Owen), and the California Regional Water Quality Control Board, San Francisco Region (Mr. John West). Additional information was also provided by Mr. Paul Walson, the current site manager, who worked at the site prior to 1986 to the present.

1986—The highest concentration of hydrocarbons detected was 12,471 ppm TPHD on the east end of the 5,000 gallon diesel tank. An additional area between the tanks, at the west end, contained 8,143 ppm TPHD retrieved 2.5 feet below a concrete slab placed below the tank. Two monitoring wells were installed on September 4, 1986, AEC-1 and AEC-2. One soil sample was retrieved from each well at the 20.5-foot level; the soil did not contain detectable levels of TPHD. According to the AEC report, dated October 15, 1986, "no odor of petroleum products was noted from any of the cuttings or samples taken from the borings," also, "no diesel was detected in either sample." The analytic data sheets for these samples are unlegible. According to the AEC report, dated October 15, 1986, "soils found to be contaminated with diesel was excavated by WD Construction in August 1986." The tank pit was overexcavated to a depth of 16 feet bgs.

June 1990—The piping trenches did not contain detectable levels of TPHG, TPHD, or BTEX. Soil samples from the 15,000-gallon diesel tank did not contain detectable levels of TPHG, TPHD, or BTEX. Soil samples from the 10,000-gallon diesel tank did not contain detectable levels of TPHG or BTEX; however, the sample from the west end of the tank contained 443 ppm TPHD. Soil samples from the 5,000-gallon diesel tank did not contain detectable levels of TPHG or BTEX; however, the sample from the west end of the tank contained 96 ppm TPHD. Soil samples from the 6,000-gallon gasoline tank did not contain detectable levels of TPHD or BTEX; however, the sample from the west end of the tank contained 15 ppm TPHG.

Additional soil samples were taken in the area of the 10,000 and 6,000-gallon tanks after overexcavation. Soil samples from the 10,000-gallon diesel tank did not contain detectable levels of TPHD or BTEX. Soil samples from the east end of the 6,000-gallon gasoline tank did not contain detectable levels of TPHD or BTEX; however, 18 ppm TPHG was detected. No contamination was detected at the west end of the tank.

Additional soil was removed from the area of the 6,000-gallon tank. Soil samples from the 6,000-gallon tank did not contain detectable levels of TPHG or BTEX.

Approximately 650 cubic yards (cy) of soil was excavated from the tank pits; 150 cy from the fuel oil tank and 500 cy from the east tank pit area. No evidence of petroleum hydrocarbon contamination was detected in the soil from the fuel oil tank pit, this was used as backfill material. The remaining 500 cy was disposed of off site at a certified disposal facility.

Stockpile samples contained a maximum 36.2 ppm TPHG, 51 ppm TPHD, 1.42 ppm Ethylbenzene, 0.092 ppm Toluene, and 1.200 ppm Xylenes. No Benzene was detected.

August 1990—A soil gas survey was conducted by Target Environmental. Two areas were studied: Area A, the west tank area; and Area B, the east tank area. Samples were taken at a depth of 4 feet bgs. The conclusion of the survey was that Area A contained minimal levels of petroleum hydrocarbons in the subsurface. Area B contained relatively low levels of total volatiles in the subsurface.

1994—To confirm the removal of the contaminated soil from the west tank pit area, one confirmation boring was advanced into the area where 12,471 ppm TPHD was detected in 1986. No TPHG, TPHD, or BTEX was detected in the soil at this location. Samples were taken at depths of 9 (vadose), 12 (groundwater interface), and 15 (saturated) feet bgs.

Extent of Groundwater Contamination

1986—Water was observed to be present in the tank pit with several gallons of diesel floating on the surface. According to Mr. Paul Wilson, the current site manager, the water and diesel was pumped from the excavation and removed from site. A sample described as "pocket water" was retrieved on June 26 after pumping was performed; this sample contained 5 ppm TPHD.

Two monitoring wells were installed on September 4, 1986, AEC-1 and AEC-2. AEC-1 was placed in the location of the west tank pit excavation, AEC-2 was placed adjacent to the east fuel tanks. Groundwater retrieved after the development of the wells did not contain detectable levels of TPHD, according to the AEC report, dated October 15, 1986. The analytics relating to these samples are unreadable.

1990—On October 15, 1990, groundwater sampling detected 1.9 parts per billion (ppb) Benzene in wells AEC-2 and MW-3, 1.0 ppb Ethylbenzene in MW-3, 0.7 ppb Toluene in AEC-2, and 1.0 ppb and 2.0 ppb Xylenes in wells MW-3 and AEC-2, respectively. No TPHG or TPHD was detected. It appears that well AEC-1 was not sampled during this round of sampling.

On October 25, 1990, groundwater sampling detected 1.9 ppb Benzene and 1.0 ppb Ethylbenzene in MW-3; no TPHG, TPHD, Toluene, or Xylenes was detected. No TPHG, TPHD, or BTEX was detected in MW-1 or MW-2. It appears that wells AEC-1 and AEC-2 were not sampled during this round of sampling.

On November 14, 1990, groundwater sampling detected 2.0 ppb Toluene and 0.7 ppb Xylenes in MW-3; no TPHG, TPHD, Benzene, or Ethylbenzene was detected. Toluene at a level of 1.0 ppb was detected in MW-2. No TPHG, TPHD, or BTEX was detected in MW-1 or MW-2's duplicate. It appears that wells AEC-1 and AEC-2 were not sampled during this round of sampling.

1994—TPHG and BTEX was below the detection limit in all wells: AEC-1, AEC-2, MW-1, MW-2, and MW-3. A split sample was retrieved from well AEC-1 and sent to a separate laboratory for analysis. Laboratory data sheets show that contamination in the Motor Oil range was detected in the equipment blank rinsate and wells AEC-1 and its duplicate and an "unknown compound" in the diesel range was also noted. According to Mr. Eric Tam, Laboratory Director of Chromalab, it was his opinion that the compound in the diesel range at a level of 100 ppb exhibited a pattern that appeared to be background clutter or interference; the Motor Oil had a pattern similar to wax or crude oil. It appears that the Motor Oil was introduced through handling error being that it was first noted in the equipment blank rinse prior to being observed in the other samples.

Beneficial Uses

The present and future beneficial uses of the groundwater aquifers underlying and adjacent to the site, as defined in the Regional Water Quality Control Board's (RWQCB) 1986 report, "Water Quality Control Plan—San Francisco Bay Region," include water supply for domestic, municipal, agricultural, and industrial uses.

Tank and Immediate Soil Removal or Remediation

1986—Small hole observed in 5,000-gallon tank; 12,471 ppm TPHD beneath tank

1990—Tanks appeared to be in good condition, no holes were observed in the tanks; 443 TPHD, 15 ppm TPHG, no BTEX, tank pit overexcavated to nondetectable levels. 650 cubic yards of soil excavated; 150 cy backfilled after confirmation samples showed nondetectable levels of contamination, 500 cy removed for off-site disposal.

Verification Monitoring

1986—There are no analytic results available to confirm the statement that the tank pit was overexcavated to nondetectable levels as stated in the AEC report dated October 15, 1986. Soil samples from the boring of well AEC-1 is described as "fill" from 0 feet to 10 feet bgs, apparently through the backfill material. Soil from a depth of 20 feet bgs showed no contamination. Mr. Walson stated that he observed the removal of the soil and pumping of the groundwater from the tank pit in 1986. **Note:** In 1994, one confirmation boring was advanced in the area that 12,471 ppm TPHD was detected. No TPHD, TPHG, or BTEX was detected.

Groundwater samples collected after development of the wells did not contain detectable levels of TPHD.

1990—The tank pit was overexcavated to nondetectable levels as demonstrated by confirmation samples. Soil samples retrieved from the monitoring well borings MW-1, MW-2, and MW-3 did not contain detectable levels of petroleum hydrocarbon contamination. Groundwater sampling detected 1.9 ppb Benzene in wells AEC-2 and MW-3, 1.0 ppb Ethylbenzene in MW-3, 0.7 ppb Toluene in AEC-2, and 1.0 ppb and 2.0 ppb Xylenes in wells MW-3 and AEC-2, respectively. No TPHG or TPHD was detected. It appears that well AEC-1 was not sampled in 1990. Mr. Walson stated that he also observed the removal of the soil from the tank pits in 1990.

Environ prepared an environmental assessment report, dated August 28, 1990, which states that "The RWQCB file contains a recommendation of no remediation for the fuel leak, and a copy of this RWQCB summary report was included in the San Jose Fire Department files." A record search from the sources listed above did not locate this document.

1994—One confirmation boring was advanced into the area where 12,471 ppm TPHD was detected. No TPHG, TPHD, or BTEX was detected in the soil from this boring. All wells were sampled. A split sample was retrieved from well AEC-1 and sent to a separate laboratory for analysis. No TPHG or BTEX was detected in the groundwater. Laboratory data sheets show that contamination in the Motor Oil range was detected in the equipment blank rinsate and wells AEC-1 and its duplicate and an "unknown compound" in the diesel range was also noted. According to Mr. Tam, Laboratory Director of Chromalab, it was his opinion that the "unknown compound" in the diesel range at a level of 100 ppb exhibited a pattern that appeared to be background clutter or interference; the "Motor Oil" had a pattern similar to wax or crude oil. It appears that the "Motor Oil" was introduced through handling error being that it was first noted in the equipment blank rinse prior to being observed in the other samples.

STAFF RECOMMENDATIONS

Based upon the results of source removal, remedial actions performed and exploratory and monitoring well borings, and verification monitoring, it appears that the extent of the soil contamination has been defined.

Based upon the results of groundwater monitoring data collected from the subject site, District staff has concluded that a continuing threat to groundwater from petroleum hydrocarbons does not exist at this site and that RWQCB objectives have not been compromised.

The investigation was performed in accordance with State and local guidelines and the results appear to indicate that significant soil or groundwater contamination does not exist at this site. Therefore, District staff recommends closure for this case.

REPORTING INFORMATION

Sample(s) were received cold and in good condition on December 8, 1994. They were refrigerated on receipt, and analyzed on the date shown on the attached report. ChromaLab followed EPA or equivalent methods for all analyses reported.

Hydrocarbons in the Motor Oil range were also observed in the following samples:

March 16, 1995

Mr. John West
Regional Water Quality Control Board
2101 Webster Street, Suite 500
Oakland, CA 94612

Dear Mr. West:

Subject: Request for Case Closure Concurrence—Underground Storage Tank Program
Case No. 12-096, Frito-Lay, Inc., 650 North King Road, San Jose, CA

This requests your concurrence on case closure for the subject fuel leak case. Enclosed for your review is a case closure summary. Please provide comment to the Santa Clara Valley Water District (District) casehandler within 30 days from the receipt of this letter. If we have not received comment from you within that time frame, the District will issue a case closure letter for the subject case.

As you know, the District has entered into agreement with the State Water Resources Control Board to provide regulatory oversight for leaking underground fuel storage tanks. The terms of the agreement require the District to issue case closure letters after appropriate remediation for cases where soil and/or groundwater has been impacted. District evaluation of case closure is consistent with the San Francisco Bay Region, Regional Water Quality Control Board Water Quality Control Plan requirements and guidance.

Please contact Mr. Lane Davis at the Camden Office, (408) 927-0710, extension 2698, with any questions or comments that arise as you proceed with review of this proposed case closure.

Sincerely,

User Questionnaire

PATH FORWARD
Environmental Engineering & Geology

PHASE I ENVIRONMENTAL SITE ASSESSMENT
USER QUESTIONNAIRE

In order to qualify for one of the Landowner Liability Protections (LLPs)[1] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "Brownfields Amendments"),188 the user must conduct the following inquiries required by 40 CFR 312.25, 312.28, 312.29, 312.30, and 312.31. These inquiries must also be conducted by EPA Brownfield Assessment and Characterization grantees. The user should provide the following information to the environmental professional. Failure to conduct these inquiries could result in a determination that "all appropriate inquiries" is not complete.

1. **Environmental liens that are filed or recorded against the property (40 CFR 312.25).** Did a search of recorded land title records (or judicial records where appropriate, see Note 1 below) identify any environmental liens filed or recorded against the property under federal, tribal, state or local law? No

   NOTE 1—In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental liens and AULs be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

2. **Activity and use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and vi)).** Did a search of recorded land title records (or judicial records where appropriate, see Note 1 above) identify any AULs, such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law? No

3. **Specialized knowledge or experience of the person seeking to qualify for the LLP** (40 CFR 312.28).
   Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?

   No

[1] Landowner Liability Protections, or LLPs, is the term used to describe the three types of potential defenses to Superfund liability in EPA's Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability ("Common Elements" Guide) issued on March 6, 2003.

4. **Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29).**
   Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?
   Yes, purchase price reflects fair market value.
5. **Commonly known or reasonably ascertainable information about the property (40 CFR 312.30).**
   Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example,
   (a.) Do you know the past uses of the property? Yes, frito lay manufacturing plant
   (b.) Do you know of specific chemicals that are present or once were present at the property? (c.) Do you know of spills or other chemical releases that have taken place at the property? (d.) Do you know of any environmental cleanups that have taken place at the property? No
6. The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by ap- propriate investigation (40 CFR 312.31).
   Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property? No

THE ABOVE REFERENCED INFORMATION IS TRUE TO THE BEST OF MY KNOWLEDGE:

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-13), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

646-658 NORTH KING ROAD & 1805 LAS PLUMAS AVENUE
SAN JOSE, CA 95133

COORDINATES

Latitude (North):	37.3639000 - 37° 21' 50.04''
Longitude (West):	121.8649330 - 121° 51' 53.75''
Universal Tranverse Mercator:	Zone 10
UTM X (Meters):	600514.7
UTM Y (Meters):	4135642.5
Elevation:	91 ft. above sea level

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

EXECUTIVE SUMMARY

STANDARD ENVIRONMENTAL RECORDS

Federal CERCLIS NFRAP site list

SEMS-ARCHIVE: SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

A review of the SEMS-ARCHIVE list, as provided by EDR, and dated 04/27/2020 has revealed that there are 3 SEMS-ARCHIVE sites within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 03/23/2020 has revealed that there are 4 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 03/23/2020 has revealed that there are 10 RCRA-SQG sites within approximately 0.25 miles of the target property.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State

Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/27/2020 has revealed that there are 11 ENVIROSTOR sites within approximately 1 mile of the target property.

CPS-SLIC: Cleanup Program Sites (CPS; also known as Site Cleanups [SC] and formerly known as Spills, Leaks, Investigations, and Cleanups [SLIC] sites) included in GeoTracker. GeoTracker is the Water Boards data management system for sites that impact, or have the potential to impact, water quality in California, with emphasis on groundwater.

A review of the CPS-SLIC list, as provided by EDR, has revealed that there are 10 CPS-SLIC sites within approximately 0.5 miles of the target property.

Local Lists of Registered Storage Tanks

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 8 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA NonGen / NLR: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA NonGen / NLR list, as provided by EDR, and dated 03/23/2020 has revealed that there are 17 RCRA NonGen / NLR sites within approximately 0.25 miles of the target property.

CUPA Listings: A listing of sites included in the county's Certified Unified Program Agency database. California's Secretary for Environmental Protection established the unified hazardous materials and hazardous waste regulatory program as required by chapter 6.11 of the California Health and Safety Code. The Unified Program consolidates the administration, permits, inspections, and enforcement activities.

A review of the CUPA Listings list, as provided by EDR, has revealed that there are 47 CUPA Listings sites within approximately 0.25 miles of the target property.

Environmental Interest/Information System:

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Description:	This is a supplemental report filed by Ray Bravo reference spill 97-0642 dated 02/13/97. The original quantity of oil spilled was reported in error by the reporting party and this serves to correct that error. The reporting party did report the corrrect quantity of oil to the local CUPA (file number 052) the spill was never reported to the NRC. This action was authorized by Ms. Laurie Smith of the OES PTAB Hazmat Unit reference phone conversation on 03/06/00. Description of original incidentis as follows, primary lead on transformer let go causing oil to leak through bushing. Contained and cleaned up.

Environmental Interest/Information System:
US National Pollutant Discharge Elimination System (NPDES) module of the Compliance Information System (ICIS) tracks surface water permits issued under the Clean Water Act. Under NPDES, all facilities that discharge pollutants from any point source into waters of the United States are required to obtain a permit. The permit will likely contain limits on what can be discharged, impose monitoring and reporting requirements, and include other provisions to ensure that the discharge does not adversely affect water quality.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

	disposing of, transporting or offering for transportation any hazardous waste.
Violation Notes:	Returned to compliance on 12/06/2016. Facility generates hazardous waste but has no EPA ID number. DTSC form 1358 was provided to facility.
Violation Division:	Santa Clara County Environmental Health
Violation Program:	HW
Violation Source:	CERS

Evaluation:

Eval General Type:	Other/Unknown
Eval Date:	12-02-2016
Violations Found:	Yes
Eval Type:	Other, not routine, done by local agency
Eval Notes:	On-site to conduct a hazardous materials business plan (HMBP) permit investigation. Facility is an automotive products distributor (automotive parts, automotive fluids, and miscellaneous goods), and does not sell to the general public. Observed the following hazardous materials at or above HMBP-reporting thresholds: -Motor oil: 1 x pallet (approximately 100-150 gallons) -Coolant: 1 x pallet (approximately 100-150 gallons) NOTES: -No CERS ID
Eval Division:	Santa Clara County Environmental Health
Eval Program:	HMRRP
Eval Source:	CERS

Eval General Type:	Other/Unknown
Eval Date:	12-02-2016
Violations Found:	Yes
Eval Type:	Other, not routine, done by local agency
Eval Notes:	On-site to conduct a hazardous waste permit investigation. Facility is an automotive products distributor (automotive parts, automotive fluids, and miscellaneous goods). According to Mr. McNamera any non-saleable automotive fluids are managed by the following methods: -RETURN TO VENDOR: Any products that are recalled by the manufacturer/supplier are returned to vendor. Any products damaged in transport are returned to vendor. -CONTINUED USE/DONATION: Any non-saleable automotive fluids that are in undamaged containers are made available for employees for continued use. -EXCLUDED RECYCLEABLE MATERIAL: Any non-saleable automotive fluids in damaged containers are managed as ERM. According to Mr. McNamera the quantity of waste managed in this manner is less than 1 gallon per month, and as a result no ERM report is required. NOTES: -No EPA ID number -Fire extinguishers were observed as maintained

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Violation Date:	11-25-2019
Citation:	22 CCR 12 66262.11 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.11
Violation Description:	Failure to determine if wastes generated are hazardous waste by using generator knowledge or applying testing method.
Violation Notes:	Digital printing has a parts washer. Filters from the machine are reportedly sent back to the manufacturer when dirty. Mr. Kumar stated that the filters are cleaned and re-used by the manufacturer. Provide documentation of this reclamation process. Observed some cardboard on the floor next to a printing machine, stained with coating material. Mr. Kumar stated that the cardboard would be recycled if/when needed. Determine whether this cardboard meets the definition of a hazardous waste, and if so, manage it appropriately.

Violation Date:	11-25-2019
Citation:	40 CFR 1 265.173 - U.S. Code of Federal Regulations, Title 40, Chapter 1, Section(s) 265.173
Violation Description:	Failure to meet the following container management requirements: (a) A container holding hazardous waste must always be closed during storage, except when it is necessary to add or remove waste. (b) A container holding hazardous waste must not be opened, handled, or stored in a manner which may rupture the container or cause it to leak.
Violation Notes:	Returned to compliance on 01/02/2020. Observed the following hazardous waste containers open without active addition or removal of wastes: 1x 55-gallon drum of waste inks 1x 55-gallon drum of used oil 1x ~1-gallon bottle of used imaging oil (in digital printing area) In addition, the secondary container in the waste flammables cabinet (for the two drums above) contains some spilled oil. A secondary container in the adjacent cabinet also contains a dark fluid. Both of these must be cleaned up, and the clean-up material managed as hazardous waste.

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	11-25-2019
Violations Found:	Yes
Eval Type:	Routine done by local agency
Eval Notes:	CERS ID 10347892 was submitted on 6/3/19. Property owner is business owner. This facility is permitted for 1-3 reportable chemicals, but the following chemicals were observed today: - >500 pounds of inks - 365 gallons of coating - 55 gallons of waste ink - 55 gallons of used oil Based on today's inspection, the permit will be revised for 4-6 reportable chemicals. Training documentation was reviewed.
Eval Division:	Santa Clara County Environmental Health
Eval Program:	HMRRP
Eval Source:	CERS

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	10-01-2015
Violations Found:	No
Eval Type:	Routine done by local agency
Eval Notes:	On-site to conduct a hazardous waste inspection. Facility is a commercial printer. Performed a facility walk-through with Mr. Kumar and observed the following hazardous waste: -Waste toner ink: 2 x 2 gallon containers in digital press area Facility recently began operating 2 x digital presses that generate waste ink after a few years of operating a press that did not generate hazardous waste. As a result, facility has applied to reactivate their EPA ID number of CAL000344591. The following violations were corrected on-site at time of inspection: -G020 (hazardous waste markings) NOTES: -Waste ink is under visible control of digital press operators -Contaminated rags are managed by a commercial laundry service -Empty toner containers are returned to vendor

BABYLON PRINTING DBA MEDIUS (Continued) **S112206417**

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	11-25-2019
Violations Found:	Yes
Eval Type:	Routine done by local agency
Eval Notes:	Onsite with Hazardous Materials Specialist Jon Blazo for a hazardous waste and Hazardous Materials Business Plan (HMBP) inspection. Completed walkthrough with manager, Ranjith Kumar. This is a printing facility that uses inks and toners. Waste generated includes water contaminated with ink, and oil (imaging oil as well as compressor blowback). State ID CAL000344591 is active. Fire extinguishers are maintained, and rags are available in case of spill. Rags used to wipe inks and oil are commercially laundered. Training is done annually. Hazardous waste manifests were reviewed. Based on records, this facility generates more than 100 kilograms of waste per year, so the 2202 permit will be increased to 2205.

CERS Description: Chemical Storage Facilities

Violations:

Site ID: 416758
Site Name: FREELAND FOODS
Violation Date: 01-04-2017
Citation: Un-Specified
Violation Description: Hazardous Waste Generator Program - Administration/Documentation - General Local Ordinance
Violation Notes: Returned to compliance on 02/03/2017. Facility is generating hazardous waste without the required permit. A permit invoice will be mailed to facility as a result of this inspection. Upon payment the permit will be issued through mail.
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS

Site ID: 416758
Site Name: FREELAND FOODS
Violation Date: 01-04-2017
Citation: 22 CCR 12 66262.12 - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.12
Violation Description: Failure to obtain an Identification Number prior to treating, storing, disposing of, transporting or offering for transportation any hazardous waste.
Violation Notes: Returned to compliance on 01/17/2017. According to the hazardous waste tracking system CAL000406147 is INACTIVE. DTSC form 1358 was provided to Mr. Olivero.
Violation Division: Santa Clara County Environmental Health
Violation Program: HW
Violation Source: CERS

Site ID: 416758
Site Name: FREELAND FOODS
Violation Date: 01-04-2017
Citation: 22 CCR 12 66262.40(a) - California Code of Regulations, Title 22, Chapter 12, Section(s) 66262.40(a)
Violation Description: Failure to keep a copy of each properly signed manifest for at least three years from the date the waste was accepted by the initial transporter. The manifest signed at the time the waste was accepted for transport shall be kept until receiving a signed copy from the designated facility which received the waste.
Violation Notes: Returned to compliance on 01/06/2017. Facility was unable to produce a TSDF-cigned copy of Manifest #013797356JJK. Obtain a copy and retain for a minimum of 3 years from the date of shipment.

Environmental Interest/Information System:

ST REGIS PAPER COMPANY (Continued) **1000355426**

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System:
US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Click this hyperlink while viewing on your computer to access additional FINDS: detail in the EDR Site Report.

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 02-08-2018
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: Submittal of Hazardous Materials Business Plan (HMBP) information via California Environmental Reporting System (CERS) website on 4/24/2017 was reviewed and Accepted. Notes: 1. Facility is located inside San Jose city limits. 2. Hazardous materials handled at the facility are Hazardous Waste lab packs and Universal Wastes.
Eval Division: Santa Clara County Environmental Health
Eval Program: HMRRP
Eval Source: CERS

Eval General Type: Compliance Evaluation Inspection
Eval Date: 02-08-2018
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: EPA ID CAL000406735 is active. Hazardous Waste tracking System (HWTS) data and hazardous waste and Universal Waste records for the past 36 months were reviewed and are in order. Facility manifests hazardous waste lab packs (primarily off-specification or surplus epoxy resin), non-empty aerosol cans, and compressed gas cylinders; and generates Universal Wastes (UW) including UW Batteries and UW Electronic Devices. Note: This facility's Hazardous Waste generator permit is for generation of less than 100 kilograms of hazardous waste per year. The permit will be adjusted upward to reflect the fact that the actual quantity of waste generated is greater than 200 kilograms but less than 5 tons per year.
Eval Division: Santa Clara County Environmental Health

Environmental Interest/Information System:
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Name:	DEPT OF FOOD AND AGRICULTURE
Address:	1890 DOBBIN DR
City,State,Zip:	SAN JOSE, CA 95133
Site ID:	24800
CERS ID:	10348219
CERS Description:	Hazardous Waste Generator

Evaluation:

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	08-28-2017
Violations Found:	No
Eval Type:	Routine done by local agency
Eval Notes:	On-site to conduct a routine hazardous waste inspection. Facility is a state agency that oversees pest detection and related response services. Performed a walk-through with Janamjeet Sohal and observed the following hazardous waste in rear storage room: -Dibrom-contaminated waste (baits, lures): 1 x 30 gallon poly drum During 12/29/15 an resolved issue was documented regarding collection of baits and lures from local county agencies. The particular chemical in question was a mixture of 16% Dibrom and Methyl Eugenol (meets hazardous waste criteria). According to Janamjeet this mixture is applied from facility vehicles only. Additionally, this mixture is no longer used. Due to these facts the unresolved issue is now considered closed with no further action required. NOTES: -CAI043072093 is ACTIVE -Fire extinguishers were observed as maintained -Emergency posting was observed -Spill control was available -Facility is operating under very small generator rules [Truncated]

DEPT OF FOOD AND AGRICULTURE (Continued) **S100857198**

Eval Date:	12-29-2015
Violations Found:	No
Eval Type:	Routine done by local agency
Eval Notes:	On-site to conduct a hazardous waste inspection. Facility is a state agency that oversees pest detection and emergency services. Performed a facility walk-through with Janamjeet Sohal and observed the following hazardous waste: -2 x 30 gallon drums of waste dibrom (insecticide), spinosad (insecticide), baits, and lures in Pesticide Room (Hazardous waste containers were empty at time of inspection.) Small quantities of this wastestream are generated throughout the year with quantity dependent on the number and size of projects. UNRESOLVED ISSUE: California Department of Food and Agriculture (CDFA) disburses insecticide-containing baits and lures to local County agencies through a contractual agreement. As part of this agreement, this particular CDFA facility picks-up and transports spent insecticide-contaminated baits and lures from bay area County agencies back to their facility at the end of each calendar year. These spent materials are consolidated on-site and [Truncated]

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Longitude: -121.861589
Record ID: PR0389277
Facility ID: FA0264105

CERS:
Name: HI TECH PRECISION MACHINING INC
Address: 1901 LAS PLUMAS AV 50
City,State,Zip: SAN JOSE, CA 95133
Site ID: 122472
CERS ID: 10348300
CERS Description: Chemical Storage Facilities

Evaluation:
Eval General Type: Compliance Evaluation Inspection
Eval Date: 12-07-2016
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: On-site to conduct a hazardous waste inspection. Facility manufacturers metal parts (80% aluminum, 20% steel/plastic/copper). Performed a walk-through with Mr. Tran and observed 17 x CNC machines. According to Mr. Tran, no hazardous waste (oily water) is generated due to revision in the facility's process described below: -CNC machines are run continuously to aerate coolant/oil mix, and if needed an additive is used to increase longevity. -Any scrap metal produced from machining activities is left on drain screen to allow coolant/oil mix to return to process. -Approximately every 3 months CNC machines are drained of coolant/oil mix and cleaned with rags to prevent build-up. Coolant/oil mix is then put back into CNC machines. It could not be determined at time of this inspection whether this process simply extends the lifespan of the coolant/oil mix or if indeed no hazardous waste is generated as Mr. Tran has stated. NOTES: -CAL000319914 is ACTIVE -Floors were [Truncated]
Eval Division: Santa Clara County Environmental Health
Eval Program: HW
Eval Source: CERS

Eval General Type: Compliance Evaluation Inspection
Eval Date: 12-07-2016
Violations Found: No
Eval Type: Routine done by local agency
Eval Notes: On-site to conduct a hazardous materials business plan (HMBP) inspection. Observed the following hazardous materials at or above HMBP-reporting thresholds: -Coolant: 1 x 55 gallon drum -Way lube: 1 x 55 gallon drum NOTES: -CERS ID: 10348300 -HMBP was submitted and accepted as complete on 8/31/16
