1.0 INTRODUCTION

1.1 Purpose and Scope of Work

This report presents the results of a Phase I Environmental Site Assessment (ESA) for the northern third of the El Camino Center located in Palo Alto, California (the site or subject property; see Plate 1). PES Environmental, Inc. (PES) was retained by The Sobrato Organization (Sobrato) to compile and evaluate available information to assess for Recognized Environmental Conditions[1] (RECs) associated with the subject property as part of the redevelopment planning process.

The ESA was performed pursuant to our proposal (Reference No. 126.076.02.P01) dated September 26, 2020, and in general accordance with ASTM International guidelines for Phase I Environmental Site Assessments (ASTM E 1527-13). These practice guidelines comply with the U.S. Environmental Protection Agency's All Appropriate Inquiries (AAI) rule adopted in November 2005 and amended December 30, 2013. PES performed the following tasks during the ESA:

- Federal, State, and local agency databases were reviewed to identify nearby sites which have reported the use, storage, or release of hazardous materials;
- Regulatory agency records regarding the site and adjacent properties were reviewed;
- Historical aerial photographs, Sanborn Fire Insurance maps, and historical topographic maps of the site and surrounding area were evaluated, as available, to assess prior land uses;
- Individuals with knowledge of the site were interviewed;
- An inspection of the site and a reconnaissance of surrounding properties were performed to assess the potential for contamination of the site from onsite or offsite sources. The site inspection was conducted by an environmental professional with qualifying experience under AAI; and
- This report was prepared presenting the results of the Phase I assessment.

A Recognized Environmental Condition, or REC, is defined in the ASTM International guidelines (ASTM E 1527-13) as the presence or likely presence of any hazardous substances or petroleum products in, on, or at a property: (1) due to release to the environment; (2) under conditions indicative of a release to the environment; or (3) under conditions that

[1] A REC is defined in the American Society for Testing and Materials guidelines for Phase I Environmental Site Assessments (ASTM E 1527-05) as *"the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property on into the ground, groundwater, or surface water of the property". RECs are equivalent to "environmental conditions" as that term is defined in Appendix A.*

pose a material threat of a future release to the environment. A controlled REC (CREC) is a REC resulting from a past release of hazardous substances or petroleum products that has been addressed to the satisfaction of the applicable regulatory authority, with hazardous substances or petroleum products allowed to remain in place subject to the implementation of required controls (e.g., property use restrictions, activity and use limitations, institutional controls, or engineering controls). A historical REC (HREC) is a past release of any hazardous substance or petroleum product that has occurred about the property and has been addressed to the satisfaction of the applicable regulatory authority or meeting unrestricted use criteria established by a regulatory authority, without subjecting the property to any required controls. *De minimis* conditions are defined by ASTM as conditions that generally do not present a threat to human health or the environment, and that generally would not be the subject of an enforcement action if brought to the attention of appropriate government agencies. A *de minimis* condition is not a REC and not a CREC.

1.2 Special Terms and Conditions

Chain-of-title documentation was not provided or obtained for this ESA.

1.3 Limitations and Exceptions

This Phase I ESA was performed in accordance with practices and procedures generally accepted in the consulting engineering field at the time they were performed. The findings, opinions, conclusions, and recommendations expressed herein are applicable as of the date the services were provided. Our professional judgment to assess the potential for contamination is based on limited data; no warranty is given or implied.

The Phase I ESA was prepared at the request of Sobrato as part of redevelopment planning the subject property and may be relied on only by Sobrato and the Sobrato affiliate(s), if any. No other party may rely on this report without the express written permission of Sobrato and PES.

2.0 USER PROVIDED INFORMATION

2.1 Title Records

Title records were not provided to PES for the preparation of this Phase I ESA.

2.2 Environmental Liens or Activity and Use Limitations

Sobrato advised PES that they are not aware of any environmental liens or activity and use limitations (AULs) recorded against the subject property, and PES is not aware of any such liens or AULs for the subject property. A search for environmental liens and AULs was conducted by GeoSearch (see Appendix A) for this Phase 1 ESA. No liens or AULs were identified.

2.3 Specialized Knowledge

Sobrato has advised PES that it is not aware of any specialized environmental knowledge regarding the subject property other then what was known as the current property owner and landlord as well as provided in a prior environmental documents for the property currently in their possession.

2.4 User Questionnaire

As part of the ESA, a User Questionnaire was transmitted to the User's representative, Ms. Phyllis Yamasaki (Senior Vice President, Commercial Property Management), as recommended in ASTM E 1527-13. This questionnaire, to be completed by the party who will rely on the ESA, facilitates the transfer of known site information to the environmental professional and promotes qualification of the relying party for one of the *Landowner Liability Protections (LLPs)*[2] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the "*Brownfields Amendments*"). A copy of the completed User Questionnaire is provided in Appendix B.

According to the responses to the questionnaire, Ms. Yamasaki provided the following information:

- Ms. Yamasaki has no knowledge of environmental liens or AULS for the subject property;
- Her specialized knowledge of the subject property is limited to operational information that is known by a current property owner and landlord;
- Ms. Yamasaki has no knowledge of specific chemicals present or once presence on the property. She also has no knowledge of chemical spills or environmental cleanups that may have taken place at the property; and
- Ms. Yamasaki has no knowledge of obvious indicators that point to the presence or likely presence of contamination or chemical releases on the subject property.

2.5 Commonly Known or Reasonably Ascertainable Information

Any commonly known or reasonably ascertainable information provided to PES during the preparation of this Phase I ESA is presented within this report.

[2] Landowner Liability Protections, or LLPs, is the term used to describe the three types of potential defenses to Superfund Liability in US EPA's Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability ("Common Elements" Guide) issued on March 6, 2003.

2.6 Owner, Property Manager, and Occupant Information

In addition to the User Questionnaire, a Key Site Manager Questionnaire was also completed by Ms. Yamasaki on November 13, 2020. Ms. Yamasaki has been associated with the subject property for 8 years. As provided in Appendix B, Ms. Henry's completed questionnaire documented negative or unknown responses to all questions regarding known or potential environmental issues on the subject or adjacent properties, with the exception of the following:

- Asbestos is likely present in building materials based on the dates of construction prior to 1980;
- Ms. Yamasaki indicated that annual inspections of the tenant space heating, ventilation, and air conditioning (HVAC) systems occur and that prompt repairs take place if needed; and
- Water damage has occurred in the building in the past from flooding, plumbing leaks or roof leaks. These issues are also addressed promptly.

3.0 SITE DESCRIPTION

3.1 Location and Site Access

The subject property consists of the northern third of the El Camino Center with the addresses of 200 – 336 Portage Avenue in the City of Palo Alto, Santa Clara County, California (Plates 1 and 2). Onsite parking to the subject property is accessed from Portage Avenue and Park Boulevard.

Historical addresses for the portion of EL Camino Center that is included in the subject property include 1518 Third Street and 3018 and 3200 Park Boulevard. The Third Street address was for a building that formerly fronted Park Boulevard. The historical Park Boulevard addresses are known included in the combined 200-210 Portage Avenue tenant space of the building.

3.2 Site and Vicinity Characteristics

The subject property, which comprises approximately 2 acres, contains one multi-segmented retail, warehouse, and office building and associated paved parking and landscaped areas. The site is identified by Santa Clara County Assessor's Parcel Numbers (SCC APNs) 132-38-071 (partial), 132-32-042, and 132-32-047.

The site is zoned as a Commercial Downtown Community (CDCP) and is located in a primarily commercial area. The site is bounded to the north by a small commercial property (3040 Park Boulevard) and Park Boulevard, to the south by the remainder of the commercial buildings of the El Camino Center, to the west by commercial and residential properties fronting Olive Avenue, and to the east by Matadero Creek.

3.3 Physical Setting

According to the United States Geological Survey (USGS) *Palo Alto, California* Quadrangle 7.5-minute series topographic map produced in 1999, the site vicinity is situated at an elevation of approximately 25 feet above mean sea level. The ground surface is relatively flat, but gently slopes regionally to the northeast.

3.4 Regional Geology and Hydrogeology

Based on the results of investigations performed in the site vicinity, the site is underlain by alluvial fan deposits associated with San Francisquito Creek to the west and Matadero Creek to the east. Soils in the area consist primarily of sandy silt and silty sand with intermittent gravel lenses; and have been subdivided into several water-bearing zones. Shallow groundwater has been encountered at approximately 16 feet below ground surface (bgs) on the subject property, and groundwater flow to the north-northeast has been measured (Stantec, 2020).

The nearest surface water is Matadero Creek, which traverses along the eastern boundary of the site. According to Federal Emergency Management Agency (FEMA) map information presented in the GeoSearch Physical Settings report (see Appendix C) , the subject property is located within a 500-year flood zone.

3.5 Descriptions of Existing On-site Structures and Improvements

3.5.1 Structures and Current Use

The subject property contains one multi-segmented single-story high-ceiling building and associated paved parking and landscaped areas. Selected portions of the building were equipped with interior mezzanines. The property is partially vacant (formerly electronics and patio furniture retail) and where currently occupied, tenant spaces are used as offices. A current list of tenants at the time of the ESA site inspection is provided in Section 6.0.

3.5.2 Other Improvements

Electricity, natural gas, water and sewage services are provided by the City of Palo Alto.

3.6 Current Uses of Adjoining Properties

PES conducted a reconnaissance of the surrounding area to assess whether neighboring properties pose potential environmental concerns to the subject property. Adjacent land uses are identified on Plate 2. Adjacent properties are used for commercial purposes, as described below.

Properties to the North

The site is bounded to the north by a small commercial property (currently operating as a fitness gym) and Park Boulevard. Across Park Boulevard are commercial businesses, including WeWork (a shared workspace facility) and Vance Brown Builders corporate office. A newly constructed commercial office building is present across Park Boulevard from the northwestern corner if the subject property. This building is not yet occupied.

Properties to the South

The site is bounded to the south by the remainder of the El Camino Center. Playground Global occupies the entire southern portion (south of the now vacant Fry's tenant space).

Properties to the West

The site is bounded to the west by a commercial property and several single-family residential properties that front Olive Avenue. The commercial warehouse property, located at 245 Olive Avenue, is not identified by external signage.

Properties to the East

The site is bounded to the east by the channelized Matadero Creek. Further to the east are commercial businesses associated with the El Camino Center including Kuni Auto Motors, .

3.7 Past Uses of Property and Adjoining Properties

3.7.1 Historical Sources

Site use information was obtained through a review of the following list of historical sources. The results of the review of these sources are summarized in the next section.

- **Aerial Photographs:** Aerial photographs obtained from GeoSearch were reviewed for the following years: 1930, 1939, 1948, 1956, 1960, 1968, 1970, 1974, 1981, 1987, 1991, 2003, 2005, 2009, 2010, 2012, 2014, 2016, and 2018. The photographs are presented in Appendix D. Copies of the aerial photos are presented in Appendix C;

- **Sanborn Fire Insurance Maps:** Sanborn Fire Insurance Maps were compiled by GeoSearch: 1904, 1908, 1925, and 1945. Fire insurance maps complied by EDR and included in the PES 2011 Phase 1 ESA were also reviewed for the following years: 1956, 1969, and 1978. Copies are provided in Appendix E;

- **Topographic Maps:** Various topographic maps of the subject property vicinity were compiled by GeoSearch. The following maps were included in the compilation: USGS*, Palo Alto, California* and *Mountain View, California* Quadrangles 7.5-minute series topographic maps produced in 1953, 1961, 1968 (1961 photo-revised), 1973 (1961 photo-revised), 1991, 1997 (1991 phot-revised), and 2012; *Palo Alto, California* Quadrangle 15-minute series topographic maps produced in 1943 and 1948; and *Palo Alto, California* Quadrangle 30-minute series topographic map produced in 1897, 1899, and 1902 were reviewed by PES. Copies of the maps are presented in Appendix F;

- **City Directories:** A search of city directories was performed by GeoSearch for the addresses on Portage Avenue and Park Boulevard for the years 1942 through 2019 in approximately 5-year intervals. A copy of the directory searches are presented in Appendix G; and

- **Previous environmental documents for the subject property:** A discussion of the documents is presented in Section 4.0.

3.7.2 Historical Review Summary

Subject Property

Earliest historical information, topographic maps from 1897, 1899 and 1902, show the subject property as undeveloped. Development of the site began in 1918 with the construction of a food canning/processing plant by Thomas Foon Chew. By 1925, Sanborn fire insurance maps show a warehouse/food processing building operated by Bayside Canning Company within the current day footprint of the former retail portion (336-340 Portage Avenue) of the El Camino Center building. The portion of the building that extends onto the subject property is listed as warehouse. The area north of this building, which now includes the 200 to 320 Portage Avenue portion of the El Camino Center building, is recorded in 1925 as vacant except for a dwelling and a small out building fronting Park Boulevard (historical address: 1518 Third Street). The urbanized area surrounding the site was known as Mayfield. In 1930, aerial photographs show the El Camino Center building on the subject property has expanded over the eastern half of the footprint northward to present day Park Boulevard. A 1939 aerial photograph shown that the dwelling had been removed and the El Camino Center structure had been completed to its current footprint. Two small buildings, the cannery warehouse and later foundry buildings, are visible adjacent to the northwest side of the main building, between the Southern Pacific right-of way and spur adjacent to the loading dock of the building Matadero Creek, present along the east side of the property, has not been channelized at time and there was no vehicle parking on the eastern side of the property In 1945, the subject property was

being operated by Sutter Packing Company, for the processing and canning of fruits and vegetables. Shown on the 1948 photograph, the parking area to the east of the main building had been improved for truck parking and storage.

No significant changes to the subject property occurred from the late 1940s until the mid 1970s when the Palo Alto foundry vacated the property and the two small buildings were demolished in the late 1970s. During this period, the subject property was used for a variety of produce packaging and canning as well as retail sales for goods. The most significant change to the subject property was the realignment of Matadero Creek which increase the parking areas on the eastern side of the site. By 1990, a portion of the main building on the subject property was used by Mercer Processing for freeze-drying fruit. This business, which operated until 1998, is further discussed in Section 4.0. Finally, from the mid-1980s until recent, the subject property was used for retail sales and office operations.

In summary, historical uses records for the subject property are as follows:

Current Address	Historical Address	Business Listings
200 Portage Avenue	3200 Park Boulevard	Bayside Canning (1918-1928); Sutter Packing Company (1928-1949); James R W Packaging (1949 – 1962); Maximart Dept Store (1964 – 1978); Hamdco Inc How (1965); Maximart Snack Bar Kestr (1965); P A Sundry Sales Inc Drug Store (1965); Maximart Automotive & Bikes (1970-1975); Maximart Camera Sales (1970); Maximart Jewelry And Luggage (1970); Maximart Radio (1970); Aximart Sundries (1970); Hamdco Inc (1975); Juvenile Shops Ltd (1975); Maximart Camera (1975); At E (1986); At E Micrographics (1986); Advanced Technology Enterprises (1986); Computer Parts Mart (1986); Nyden Eclectic Construction (1986); Mid Peninsula Access Corp (1991-1994); Cable Co Op (1991-1999); Glenda Torres (2004); Silicon Valley Community Commu (2009); Intapp Inc (2009); Integration Appliance Inc (2009); Tsunami Software (2009); No Listing (2014-2017); Intapp (2019).

Current Address	Historical Address	Business Listings
210 Portage Ave		No Listing (1942-1997); Euphonics (1997 - ?); Paycycle Inc (2009); Better Planet Investments (2014-2019); Imo Im (2014-2019); Paycycle Inc (2017).
220 Portage Ave		No Listing (1942-1991); Euphonix Inc (1994); Euphonix Incorporated (1999); Rensong Tsay (2004); Euphonix Inc (2009-2014); Boxnet Inc (2014-2017); Box.Net Inc (2019); Nauto Inc (2019).
230 Portage Ave		No Listing (1942- 1989), Mercer Processing (1989-1999); The Teak Patio (2004-2011); Blue Sky Outdoor (2014); Regency Teak (2014); No Listing (2017-2019).
336 Portage Ave	303 Portage Avenue 330 Portage Avenue 332 Portage Avenue 335 Portage Avenue 336 Portage Avenue	No Listing (1942-1960); Advance Transformer Co (1965); James R W Packaging Pkg (1965-1975); James Packaging Corp (1982); Pogo Educational Services (1991); ABC Self Storage (1991-1994); Douglas Rafferty Tech Document (1994); Carroll Publishing Co (1991); Sound Approaches (1991); Lanig Associates (1994-1999); Occupant Unknown (2004); Ready To Play (2009-2017); Neighborhood Tech Support (2014-2019); Trueinsider Inc (2014); Sunbridge Global Inc (2017); Zendo Products Inc (2019) No Listing (1986-2019).
None	3180 Park Boulevard	Palo Alto Foundry (1970-1975).

Subject Property Vicinity

Historical information indicates that the subject property vicinity was primarily undeveloped until the early to mid 1900s with sporadic residential uses and grassland agriculture. Residential infilling with gradual partial replacement by commercial and light industrial uses occurred from 1948 through the 1970s. After the 1970s, development of the subject property vicinity was largely complete with little change in site use, whether residential or commercial.

4.0 PREVIOUS ENVIRONMENTAL INVESTIGATIONS AND REMEDIATION

Several investigations and remedial activities have been performed on the El Camino Center property in its entity, including Phase I ESAs, soil and groundwater sampling, underground storage tank (UST) removals, soil excavation and other activities. Documents reviewed concerning the El Camino Center were provided by current and prior property owners (as summarized in the PES 2011 Phase 1 ESA [see below]) and obtained from the California State Water Resources Control Board's GeoTracker website at http://geotracker.swrcb.ca.gov/. PES's review of these documents is summarized below. Copies of pertinent reports are provided electronically in Appendix H.

4.1 Previous Site Investigations Including the Subject Property

4.1.1 1992 Kennedy/Jenks Phase 1 Environmental Site Assessment (K/JC, 1992a)

In January 1992, Kennedy/Jenks Consultants (K/JC) conducted a Phase 1 environmental site assessment and focus soil investigation of the Southern Pacific Railroad (SP) right-of-way that traverses north-south across the western portion of the subject property. According to the K/JC document, the SP right-of-way between El Camino Real and Park Boulevard were assessed and investigated for potential environmental risks. With the exception of a small storage structure adjacent to Park Boulevard (on the subject property), no buildings were present on the right-of-way. The rails were reportedly removed between 1985 and 1990 followed by grading to allow placement of a hardscape asphaltic cover. There was no mention of removal of the railroad ties or underlying ballast materials.

During the Phase 1 assessment, K/JC personnel found no evidence of the following:

- Surface impoundments;
- Aboveground storage tanks;
- Treatment or disposal operations involving hazardous materials or wastes;
- Stained ground surface or distressed vegetation;
- Underground storage tanks;
- Chemical handling or storage areas; or
- Asbestos- or PCB-containing materials.

Historical chemical use on the right-of-way was reportedly limited to herbicides to keep the track clear of weeds and other obstructive vegetation as well as track curve and switch greases. Curve oiling mechanisms have been used on portions of the SP tracks since the 1940s with the oil being stored in small underground storage tanks. K/JC personnel found no evidence of curve oiling mechanisms or oil storage on the right-of-way that traverses the subject property.

Other historical information provided in the K/JC Phase 1 ESA was consistent with that presented in Section 3.7.

As part of the K/JC Phase 1 assessment, soil samples were collected from 8 locations along the SP right-of-way with 4 locations in close proximity to or on the subject property. At each location, soil samples were collected from depths of 6, 10, 15 and 19 feet below ground surface (bgs). Composite samples, consisting of the 6- and 19-foot discrete samples, were created at each location and analyzed for one or more organic and inorganic constituents including total petroleum hydrocarbons quantified as gasoline (TPHg) and diesel (TPHd), volatile organic compounds (VOCs), organochlorine pesticides, PCBs, Title 22 metals, semi-volatile organic compounds, and total oil and grease (TOG). No groundwater sampling was conducted during the K/JC investigation.

The results of the soil analyses for the samples collected on the subject property identified the presence of low concentrations of TOG in one sample below current Tier 1 screening levels and metals consistent with naturally-occurring conditions. TPH, VOCs, SVOCs, pesticides, and PCBs were not detected in any samples above the laboratory reporting limits.

4.1.2 Environ Corporation Groundwater Investigation (Environ, 1992)

In February 1992, Environ Corporation (Environ) performed a cone penetration test (CPT) along the SP Right-of-Way on behalf of HP and Varian. The CPT procedure consisted of advancing a probe to approximately 80 feet bgs at three locations along the SP right-of-way with the boundary of the subject property (Environ, 1992). Grab groundwater samples were collected at selected locations at depths ranging from approximately 22 to 48 bgs and analyzed for the presence of VOCs. TCE was detected at concentrations ranging from 76 to 240 μg/L, and 1,1,1-TCA and dichloromethane (DCE) were detected in one location at 270 and 290 μg/L, respectively.

4.1.3 1992 Kennedy/Jenks Additional Groundwater Sampling (K/JC, 1992b)

In April 1992, K/JC performed additional soil sampling in the vicinity of Environ's CPT location in which TCE, 1,1,1-TCA and DCE were detected (KJC, 1992b). KJC advanced borings to a depth of approximately 20 feet bgs, and collected soil samples at approximately 5-foot intervals. TCE was detected in several samples at concentrations ranging from 2 to 10 μg/kg. K/JC concluded that the concentrations were consistent with diffusion of soil gas through the capillary fringe (associated with the HP and Varian investigation) rather than evidence of a surface spill.

4.1.4 2002 Former Mercer Processing Investigation and Remediation

Multiple documents were reviewed related to the former Mercer Processing, Inc. (Mercer) investigations and remediation conducted along the southern edge of the subject property inside the current 230 Portage Avenue tenant space (see Plate 2). A list of the reports reviewed included the following:

- IT Corporation, 2000. *Soil Sampling and Analysis Report, Former Mercer Processing Facility, 230 Portage Avenue, Palo Alto, California*. July 24 (IT, 2000);

- IT Corporation, 2000. *Additional Definition Soil Sampling and Analysis Report, Former Mercer Processing Facility, 230 Portage Avenue, Palo Alto, California*. November 21 (IT, 2001);

- PES, 2000. *Facility Closure Assessment, Former Mercer Processing Facility, 230 Portage Avenue, Palo Alto, California*. January 2000 (PES 2000);

- PES, 2001. *Final Remedial Action Plan, Former Mercer Processing Inc. Facility, 230 Portage Avenue, Palo Alto, California*. October 18 (PES, 2001);

- PES, 2001. *Remedial Action Completion Report, Former Mercer Processing, Inc. Facility, 230 Portage Avenue, Palo Alto California*. March 12 (PES, 2002); and

- California Regional Water Quality Control Board, San Francisco Bay Region, 2002, *No Further Action at 230 Portage Avenue, Palo Alto, Santa Clara County*. April 8 (RWQCB, 2002).

Mercer Processing, Inc. (Mercer) occupied the tenant space at 230 Portage Avenue from 1989 to 1999. Operations performed by Mercer at this location included freeze-drying and packaging of food products. Refrigeration equipment used in the freeze-drying process contained solvents, including TCE, and Genesolv 2000, also referred to as Refrigerant 141b and composed of 1,1-dichloro-1-fluoroethane.

In 1999, PES performed a Facility Closure Assessment to assess whether operations at the Mercer facility had adversely affected environmental conditions at the site (PES, 2000). The results of analysis performed on ten soil samples collected in the vicinity of the former refrigeration unit indicated the presence of acetone, methyl ethyl ketone, TCE, and tert-butanol in the soil samples. Additional investigations were performed to further define the lateral and vertical extent of chemicals in the vadose zone beneath the site (IT, 2000). Chemicals detected in the soil included TCE, 1,1-dichloroethene, cis-1,2-dichloroethene, and trans-1,2-dichloroethene. The highest concentrations were found beneath the former refrigeration unit.

A Remedial Action Plan (RAP) was subsequently developed to address contamination identified at the site (PES, 2001). The RAP included an evaluation of risk to human health and the environment, principally groundwater resources, development of a site-specific remedial goal for contaminated soil, an evaluation of remedial alternatives, and a description of the procedures to implement the recommended remedial alternative. Based on the results of the health and environmental risk assessment, a soil cleanup goal of 0.2 mg/kg of TCE was recommended. The risk assessment indicated that removal of TCE-affected soil exceeding 0.2 to 0.4 mg/kg would be protective of human health for residences with a concrete floor slab. Soil excavation was the selected remedial alternative. The RWQCB concurred with the RAP in a letter dated October 18, 2001.

Remedial activities were performed at the former Mercer facility during January 2002 (PES, 2002). Approximately 285 cubic yards of TCE-impacted soil was excavated to a maximum depth of approximately 20.5 feet below grade. Excavated soil was characterized and disposed offsite. On the basis of verification soil samples collected from the bottom and sidewalls of the excavation, soil with TCE concentrations exceeding the target cleanup goal was removed from the site. During excavation, several concrete footings and inactive utilities were uncovered and removed. Groundwater was not encountered during the excavation of TCE-impacted soil. The excavation was backfilled with sand cement slurry, imported clean fill, and re-usable excavated clean soil. The area of soil excavation was capped with a concrete slab. In a letter dated April 8, 2002, the RWQCB stated the remedial goal had been achieved, and that no further action was required (RWQCB, 2002).

4.1.5 2010 PES Phase 1 Environmental Site Assessment

In late 2010, PES conducted a Phase 1 ESA for the entire El Camino Center including the subject property. Addresses covered in the 2011 Phase 1 ESA included 3201 and 3225 Ash Street, 200 – 382 Portage Avenue (referred to as El Camino Center), 270 Lambert Avenue, and 3250 Park Boulevard. PES's historical research conducted for the 2011 ESA was consistent with findings presented in Section 3.7 of this report.

Of note to the subject property, the 2011 Phase 1 ESA identified several potential environmental issues including the following:

- Operation of the Palo Alto Foundry in the center of the subject property in buildings formerly constructed during the cannery days and used for warehousing (see Plate 2). A sump was noted between the two buildings;

- Historical reference to an unleaded gasoline fuel dispenser formerly located near the northwest corner of the main building; and

- Investigation and remediation activities at 230 Portage Avenue related to the former Mercer Processing operations.

Other environmental issues on the El Camino Center property that are not part of the current subject property included: (1) chemical releases and UST usage by Dura-Bond, (2) a subsurface fuel oil vault investigation along the loading dock south of the subject property, (3) several UST closures in the main parking lot south of the subject property associated with former produce packing operations conducted at the center, and (4) the regional COE chlorinated solvent groundwater plume which underlies the entire El Camino Center. A summary of these issues is presented in Section 4.1.8.

4.1.6 2010 PES Phase 2 Environmental Testing and Analysis

In late 2010, soil sampling and analysis was conducted along the former SP railroad and rail spur alignments to assess whether there may have been impacts to site soils from residual polynuclear aromatic hydrocarbons, arsenic and petroleum hydrocarbons.

Along the former Southern Pacific rail alignment there was no evidence of significant impact due to the railroad activities. There was a detection of diethyl phthalate at a concentration significantly exceeding the corresponding residential ESL. The source of this compound was not known, it was not detected at other sampling locations.

Under the footprint of the former foundry, there were concentrations of vanadium detected above residential and commercial ESLs. However, the concentrations appear to be within naturally occurring background concentrations reported for soils in California. Arsenic was detected at concentrations above background and above ESLs at two locations under the former rail spur along the northern portion of the building and at one location under the southern portion of the former foundry building. Total petroleum hydrocarbons quantified as motor oil were also detected above residential ESLs in force at the time at three locations in the same general area.

The results of the PES soil investigation suggested that while widespread environmental impacts were not identified in the areas tested there may be sporadic elevated concentrations of metals and hydrocarbons in the near surface soil consistent with the former use of the property for industrial activities.

Finally, a geophysical survey was conducted in the vicinity of the former fuel dispenser discovered during the PES Phase 1 ESA. No evidence of a UST in the vicinity of this feature was detected.

4.1.7 El Camino Center Environmental Issues Not Related to the Subject Property

4.1.7.1 Former Dura-Bond Facility, 370 Portage Avenue

The bearing manufacturer, Dura-Bond, originally maintained a sludge pond associated with a wastewater treatment system, and had gasoline, diesel, Stoddard solvent and waste oil USTs, in addition to using other hazardous materials in the facility, such as lubricant oils, acids, and metals. During the 1980s, the wastewater treatment system was closed, and the USTs were removed from the facility. Soil was excavated from beneath the sludge pond and USTs, but it did not appear that confirmation samples were collected from all areas of the excavations. Groundwater samples were collected from three to four monitoring wells installed as part of the removal activities, and were initially found to contain elevated levels of TPHg, TPHd and lead. After four years of groundwater monitoring, contaminant levels were below detectable limits. Regulatory case closure for the USTs was issued in 1998. During closure of the facility in 1989, soil sampling indicated the presence of elevated concentrations of lead and

zinc within the facility. Soil excavation was performed, but confirmation sampling was not performed in all excavated areas. A subsequent soil investigation performed to investigate the completeness of the investigation identified the presence of elevated concentrations of lead and zinc remaining in soil at depths of up to 10 feet bgs. Tentative Site Cleanup Requirements were issued by the RWQCB for the Dura-Bond facility in 1990, but do not appear to have been filed.

4.1.7.2 Subsurface Fuel Oil Vault Investigation

In 1997, while excavating for a new storm sewer pipe installation, the property owner's contractor encountered a concrete structure and petroleum hydrocarbon-affected soil on the west side of the main building (Plate 2). An inspection of the vault was made through an access port; the presence of a black, oily liquid was observed at a depth of approximately 5 feet bgs. Based on this observation, an investigation, abandonment and closure of the vault was performed by PES in 1997 (PES, 1998) under oversight of the City of Palo Alto Fire Department (PAFD).

After removing overburden from the vault, its dimensions were measured to be 13 feet wide by 36 feet long by 8 feet deep, with a capacity of approximately 28,000 gallons. The bottom, sidewalls and top of the vault were constructed of 8-inch thick reinforced concrete. Approximately 282 tons of soil and concrete debris (from the vault top) were removed from the vault and disposed offsite. Pockets of residual liquids which remained in the vault were pumped out, and the vault sidewalls and bottom were then cleaned using a citrus-based degreaser and high pressure steam rinse. Rinseate was pumped out, and approximately 2,500 gallons of residual product and rinseate were disposed offsite.

The bottom and sidewall of the vault was subsequently inspected by PES and PAFD personnel. No cracks in the walls or bottom of the vault or other visual evidence indicating the integrity of the vault was compromised was observed during the inspection. PAFD gave approval to abandon the vault in place. The eight core holes were filled with sand to allow fluids entering the vault to drain into the subsurface. The vault was backfilled with clean native material obtained onsite during site improvements activities, and the storm sewer piping was replaced. The surface was covered with asphaltic concrete pavement. The site received case closure from PAFD following confirmation sampling and abandonment of the vault (PAFD, 1998).

4.1.7.3 USTs Associated with Former Produce Packing Business

During a 2010 subsurface investigation, two undocumented USTs, with approximate capacities of 1,000 and 1150 gallons, were identified in southwestern portion of the main parking area of the El Camino Center. The USTs are believed to have stored gasoline and/or diesel fuels related to historical vehicle fueling activities conducted as part of produce packing and transportation operations formerly conducted on the site sometime in the 1950s, until an uncertain date.

The USTs and surrounding tank backfill materials were removed in October 2011 under oversight of the Santa Clara County Department of Environmental Health. Additional hydrocarbon-affected soils were also excavated to a depth of first encountered groundwater. The UST removals are documented in PES' December 22, 2011 report, *Underground Storage Tank Removal Report, El Camino Center, 340 Portage Avenue, Palo Alto, California* (PES, 2011).

Following the UST removal, which included excavation of approximately 750 cubic yards of hydrocarbon-affected soil and application of approximately 500 pounds of oxygen-releasing compound (ORC) to assist in degradation of residual hydrocarbons in the subsurface, a series of subsurface investigations were conducted in the vicinity of the former location of the USTs to document soil and groundwater conditions following the UST removals.

Petroleum residuals in soil appeared to be limited to the vicinity of the former tank and were present in three locations at concentrations slightly above 2008 environmental screening levels (ESLs)[3]. The extent of residual petroleum hydrocarbons in groundwater appears to be generally controlled by lateral groundwater flow in the downgradient north-to-northeast groundwater flow direction. Mobile non-aqueous phase liquid (NAPL) has not been observed in any groundwater samples. Dissolved residual petroleum hydrocarbons appeared to be depleted via natural attenuation, advection, and diffusion. The highest concentrations of petroleum hydrocarbon residuals in groundwater was found to be in the near vicinity of the former tanks, represented by and the downgradient extent of the residual hydrocarbon plume was documented to be less than 150 feet in length. No significant concentrations of volatile organic compounds were identified in soil or groundwater associated with the former USTs. Based on these findings, the County of Santa Clara Environmental Health Department (SCCDEH) granted case closure[4] for this UST issue on July 7, 2015.

4.1.7.4 California-Olive-Emerson Regional Groundwater Plume

Groundwater contamination associated with the California-Olive-Emerson (COE) regional chlorinated solvent plume has been identified at the subject property. The VOC plume associated with the up-gradient Varian, Eastman Kodak and Dura Bond [not related to site activities] facilities has been under investigation since 1981. Two active monitoring wells associated with the investigations are present on the subject property and are sampled on a biannual basis. Further discussion of the COE regional plume is provided in Section 5.2.2.

5.0 RECORDS REVIEW

5.1 Environmental Liens

Based on review of an environmental database search conducted by GeoSearch, there are no Federal Superfund (NPL) liens or State deed restrictions associated with the subject property (see Appendix A).

5.2 Standard Environmental Record Sources

The discussion presented in this section is based on available information provided by government agencies and various databases. An GeoSearch report dated October 23, 2020 contains listings of sites located within a 1-mile radius, which were selected in accordance with ASTM E 1527-13 standards. This information is obtained from computerized databases of Federal, State, and local records. Descriptions of the lists reviewed are presented below. The GeoSearch database report is included as Appendix I. The following regulatory agency databases were searched and reported in the GeoSearch report:

- U.S. EPA – Comprehensive Environmental Response Compensation, and Liability Information System (CERCLIS) – within ½-mile of the subject property;
- U.S. EPA – CERCLA NPL – within 1-mile of the subject property;
- U.S. EPA – Resource Conservation and Recovery Information System, Small Quantity and Large Quantity Generators of hazardous waste (RCRAGR09) and non-generators (RCRANGR09) databases within ½-mile of the subject property;
- U.S. EPA – Emergency Response Notification System (ERNS) – within ¼-mile of the subject property;
- U.S. EPA RCRA Corrective Action Report (CORRACTS) – within 1-mile of the site;
- U.S. EPA Facility Registry System (FRSCA) – within ¼-mile of the subject property;
- U.S. EPA Enforcement and Compliance History Information (ECHOR09) – the subject and adjacent properties;
- U.S. EPA Toxic Chemical Release Inventory System (TRI) – within ¼-mile of the subject property;
- U.S. Engineering Control Sites - within ½-mile of the subject property;
- U.S. Institutional Control Sites – within ½-mile of the subject property;

- California State Water Resources Control Board (SWRCB) – Leaking Underground Storage Tank Listing (LUST) sites including Indian Land – within ½-mile of the subject property;

- SWRCB – Underground Storage Tank (UST) – within ½-mile of the site;

- SWRCB – Voluntary Cleanup Sites (VCP) – within ½-mile of the site;

- DTSC – EnviroStor Database including known contamination, deed-restricted, and Brownsfield sites – within 1-mile of the subject property;

- DTSC – Voluntary Cleanup Program (VCP) – within ½-mile of the site;

- DTSC – Facility and Manifest Data (HAZNET) – the subject property; and

- California Department of Resources, Recycling, and Recovery – Solid Waste Information System (SWIS)– within ½-mile of the subject property.

In addition, local, State and Federal supplemental regulatory databases were searched (e.g., AST and Waste Discharge System databases) and summarized in the GeoSearch report. The findings of the review of the GeoSearch report are presented below.

PES also searched the following agency websites for environmental records related to the subject property and nearby properties:

- California State Water Resources Control Board's GeoTracker website located at http://geotracker.swrcb.ca.gov/. Listings from this database are also compiled in the GeoSearch report as CLEANUPSITES locations;

- Department of Toxic Substances Control's (DTSC) EnviroStor website located at http://www.envirostor.dtsc.ca.gov/public/default.asp; and

- United States Environmental Protection Agency (USEPA) website located at https://yosemite.epa.gov/r9/sfund/r9sfdocw.nsf/vWSOAlphabetic?openview.

Additionally, PES requested records for the subject property from the Santa Clara County Environmental Health Department. County personnel indicated that all records maintained by their department have been moved to the State GeoTracker system.

5.2.1 Subject Property Records

The GeoSearch Radius Report identified tenants (current and past) for the subject property on the following databases: CHMIRS, CLEANUPSITES, ECHOR09, FRSCA, HWTS, LUST, RCRAGR09, and SLIC. Many of the listings are related to the 340 Portage Street address which tenant space is shared between the subject property and the adjacent remaining

El Camino Center parcel to the south. The listings for the subject property include the following:

- **Mercer Processing**, 230 Portage, is listed on the CLEANUPSITES, FRSCA, and SLIC database. The listing refers to the soil excavation at the facility as discussed further in Section 4.1.5. The database lists the site as having received case closure as of April 8, 2002;

- **Systems Control Inc**., 220 Portage, is listed on the RCRAGR09 database. No violations are listed for the site. Tenant roles for the subject property do not have any record of Systems Control Inc. as a tenant on the subject property. No hazardous material records concerning at this address were identified in available records; and

- **Release Report – City of Palo** Alto, 210 Portage Avenue, is listed on the CHMIRS data for a sewage spill that occurred in June 2013. An underground pipe was broken and discharge was threating a nearby storm drain inlet. The spill was cleaned up with no report of violations.

PES reviewed records for the subject property from the California State Water Resources Control Board's GeoTracker website located at http://geotracker.swrcb.ca.gov/; and Department of Toxic Substances Control's (DTSC) EnviroStor website located at http://www.envirostor.dtsc.ca.gov/public/default.asp.

The discussion of regulatory agencies records for the subject property, which were limited to the Mercer Processing case, is included in Section 4.0.

5.2.2 Surrounding Area

With the exception of identified environmental issues on the adjacent El Camino Center property which are discussed in Section 4.1.8, the following is a discussion of sites listed on regulatory agency databases which have the potential to affect environmental conditions at the subject property.

Hewlett Packard (HP) at 395 and 640 Page Mill Road, Varian at 601 California Avenue

Hewlett Packard (HP) at 395 and 640 Page Mill Road, Varian at 601 California Avenue, and offsite areas (referred to as the California-Olive-Emerson (COE) Area and Perimeter Area) comprise the study area associated with a comingled VOC plume. The primary chemicals of concern are TCE, 1,1,1-TCA, 1,1-DCE, 1,1-DCA and PCE. TCE is the VOC most widely distributed and at the highest concentrations. The most recent groundwater monitoring report (2010 Annual Groundwater Monitoring) for the HP-Varian investigation is included in Appendix G.

Soil and groundwater investigations were initiated by HP in 1981 as a result of a leaking waste solvent UST (Environ, 1994). Investigations and remediation activities at HP-Varian and

offsite areas are performed under oversight by the RWQCB and in accordance with RWQCB Order 94-130 (Order; RWQCB, 1994). Cleanup standards for groundwater are U.S. EPA MCLs, California Department of Environmental Protection MCLs, or, for acetone, a target level based upon toxicity characteristics. The cleanup standard for TCE in groundwater is 5 μg/L. Remedial activities associated with the plume have included soil vapor extraction, groundwater extraction and treatment, and injection.

Two water-bearing zones were identified during the investigations, termed the A aquifer (further divided into the A1 Upper [A1U], A1 and A2 Zones) which extends between approximate depths of 13 to 55 feet bgs, and the B aquifer (further divided into the B1 and B2 Zones) which was encountered between depths of approximately 60 and 120 feet bgs. Groundwater flow to the north-northeast has been measured in both zones.

The results of the most recent groundwater monitoring event (June 2020) indicates that the TCE plume in the A1 Upper and A1 Zones extends onto the El Camino Center property but only the A1 Zone appears to significantly affect the subject property. The plume does not extend to the subject property in the A2 or B Zones. In the A1 Upper Zone, the El Camino Center property is shown partially encroached by the 5-49 μg/l contour intervals but does not extend onto the subject property. In the A1 Zone, the subject property is bisected by the 5 μg/L contour interval (Santec, 2020).

Three active monitoring wells associated with the COE investigations are present on the subject property as shown on Plates 2 and 3. Two wells are in the A1 Zone (F140A1 and F77A1) and one well is in the A2 Zone (F76A2) are sampled biannually and infrequently, respectively. TCE has been detected in Well F140A1 at consistent concentrations ranging from 0.63 and 3.4 μg/l between 1996 and 2019. In Well F77A1, TCE has been detected at concentrations ranging from 0.56 to 250 μg/l during the period of 1991 to June 2011. After this date TCE has not been detected in this well. No TCE concentrations above the cleanup standard have been detected in Well F76A2 since 1996 although very low levels of associated breakdown products have been detected. Monitoring of Well F76A2 was suspended in 2000.

Say Ray Auto, 3225 Ash Street

Say Ray Auto is listed on the Historical UST database (as Sun Ray Foreign Auto Service at 325U Park Boulevard – an apparent typographical error). The database lists the facility with a waste oil UST. Regulatory agency records did not include any information regarding the potential removal of this UST. This facility is located potentially upgradient of the subject property, and has the potential to affect groundwater beneath the subject property.

Several other sites in the subject property vicinity are listed on hazardous materials release and/or storage databases. However, the other sites listed in the databases are not expected to present significant environmental conditions to the subject property based on one or more of the following: (1) the listed site has received case closure by the appropriate regulatory agency; (2) the listed site is either crossgradient or downgradient of the subject property with

respect to the inferred regional groundwater flow direction; (3) the listed site is a soils-only affected case; and (4) the listed site is located at too great a distance to represent a significant environmental condition with respect to the subject property.

Star Graphics, 3200 Ash Street

Star Graphis is listed on the SWEEPS database. Historical site documents included a report prepared by J.V. Lowney Associates (Lowney) concerning a reconnaissance and soil quality investigation at the former Star Graphics facility formerly located at 3200 Ash Street. Lowney reported that Star Graphics had occupied the building from approximately 1974 through 1989, and used the building for production of color film negatives. A 2,000-gallon fiberglass UST (contents not specified) was present in the parking lot in front of the building, and was reportedly scheduled for removal during 1990 (Lowney, 1990). Floor drains were observed in the main processing area, and staining was observed on floors within the building. Lowney collected soil samples from approximately 1-foot beneath the concrete slab and collected liquid and residue present in floor drains. The six soil samples were composited into two samples and the four drain samples were composited into one sample. All samples were analyzed for VOCs, SVOCs, CAM-17 metal, and hexavalent chromium. One composted soil sample contained an elevated concentration of silver, but the concentration was below regulatory limits. Some organics were identified in the drain residue, suggesting that organics may have been discharged into the sanitary sewer. Lowney suggested that groundwater monitoring wells could be installed to further evaluate potential releases to the subsurface. No information was found in regulatory files concerning removal of the UST, however, a letter in a prior property owners files indicated that the UST had been removed, and that analytical data from soil samples collected from beneath the UST indicated that the UST had not leaked (Parfitt, 1990b).

5.2.3 Vapor Intrusion

As discussed above in Section 5.0, there is currently no reported use or storage of volatile organic compounds (VOCs) at the subject property. TCE was historically used by the former tenant Mercer Processing at 230 Portage Avenue, but TCE-contaminated soil was removed in 2002, and no impact to groundwater was identified (see Section 4.1.5). The presence of residual TCE in soil beneath the Mercer Processing remediation area represents a potential vapor encroachment concern for the property. A regional VOC plume is also present in the subject property vicinity, and VOCs have been detected in groundwater monitoring wells on the subject property which presents the potential for vapor intrusion to be a concern at the subject property.

6.0 SITE INSPECTION

Inspection of the subject property was conducted by Mr. James Dunn and Ms. Lucia Tropeano, both of PES, on October 14 and October 20, 2020, accompanied by Mr. Tim Steele and Ms. Shelle Barnes of Sobrato. All accessible areas of the subject

property were inspected. Site details are illustrated on Plate 3 and Site photographs are provided on Plates 4 through 15.

The subject property contains one single-story building and associated paved parking and landscaped areas. Where occupied, uses of the subject property building, which include primarily office, unoccupied space, storage, and fitness gym, are as follows:

Address	Tenant	Use
200 and 210 Portage Avenue	Earnin/Activehours, Inc.	Office – Software Development
220 Portage Avenue	NAuto, Inc.	Office – Software Development
230 Portage Avenue	Vacant	Storage for El Camino Center
336 Portage Avenue	Vacant	Vacant (former Fry's Electronics)

Hazardous material use at the subject property is limited to *de minimis* quantities of typical cleaning and maintenance supplies, except for the tenant spaces listed below. The grounds of the center were observed to be in generally good condition. Mr. Dunn did not observe any evidence of improper dumping or stressed vegetation. No evidence of sumps or pits was observed. No indications of septic systems were identified during the site inspection. No hazardous material use or storage in exterior areas was observed at the subject property. No evidence of USTs or ASTs was observed during the inspection.

5.1 Undeveloped Area

No undeveloped areas are present at the site.

5.2 Chemicals/Hazardous Substances Containers

Other than the items discussed above in Section 5.0, there were no obvious indications of hazardous materials use or storage at the site.

5.3 Underground and Aboveground Storage Tanks

No USTs or ASTs were observed at the subject property.

5.4 Back-Up Generators

No back -up generators were observed.

5.5 Elevators

There are no elevators on the subject property.

5.6 Hydraulic Trash Compactors

No hydraulic equipment was observed on the site.

5.7 Indications of Polychlorinated Biphenyls (PCBs)

One City of Palo Alto-owned transformers are present in parking and landscaped area in the center of the subject property. No leaks or stains were observed on the transformer or the concrete pad beneath the transformers. The transformer was not labeled as to PCB content.

5.8 Other Conditions

5.8.1 Asbestos

An assessment of asbestos-containing materials was not conducted as part of this Phase I ESA. Standards set by the Occupational Safety and Health Administration (OSHA) require building owners to presume that thermal system insulation (TSI) and surfacing asbestos containing material (ACM) found in buildings constructed before 1981, and floor tile installed in buildings through 1981, are asbestos containing, unless demonstrated to be less than 1 percent asbestos through sampling. The rule does not permit an assumption to be made that a material does not contain asbestos in buildings constructed after 1980. However, since the late 1970s to early 1980s, asbestos has been removed or substituted for in all but a small number of construction products. For example, asbestos is still used, although at low concentrations, in various mastics and roofing materials.

Based on the pre-1950 construction date of the El Camino Center, ACM may be present in these buildings. Removal of asbestos-containing tile and adhesive occurred in 1993 in the 210 Portage Avenue tenant space.

5.8.2 Radon

The National Radon Database includes radon information from U.S. EPA/State Residential Radon Surveys conducted between 1986 and 1992. The database includes test results from 4 sites within the subject property zip code. The average value for radon level reported in this region was 2.525 pico curies per liter (pCi/l) of air for the first floor living area. This is lower than the U.S. EPA's recommended action level of 4 pCi/l.

Based on the U.S. EPA and California DHS surveys, it is unlikely that radon levels at the site exceed the U.S. EPA's action level.

5.8.3 Solid Waste

Solid wastes generated at the subject property are limited to non-hazardous solid office wastes. Wastes are collected in collection bins which are picked up by GreenWaste for offsite disposal. No concerns were identified with solid waste storage at the subject property.

5.8.4 Lead in Paint

The Consumer Products Safety Commission limited lead content in residential paint to 0.06 percent (600 parts per million) in 1978. The use of paint containing greater than 0.06 percent lead was also prohibited in areas where consumers have direct access to painted surfaces. Based on the pre-1950 construction date of the El Camino Center building, lead-containing paint may be present in or on this building.

5.8.5 Mold

Molds are simple, microscopic organisms, which can often be seen in the form of discoloration, frequently green, gray, brown, or black. Molds grow on virtually any organic substance, as long as moisture and oxygen are present. Mold spores primarily cause health problems through the inhalation of mold spores or the toxins they emit when they are present in large numbers. This can occur primarily when there is active mold growth within places where people live or work.

Potential mold was observed on stained ceiling tiles in the 200 Portage Avenue tenant space.

6.0 FINDINGS AND CONCLUSIONS

6.1 Summary of Findings

The subject property has the addresses of 200 – 336 Portage Avenue and is a portion of the El Camino Center in the City of Palo Alto, Santa Clara County, California. The subject property, which comprises approximately 2 acres, contains one building with associated paved parking and landscaped areas. Matadero Creek, under an easement from Santa Clara Valley Water District, borders the eastern portion of the site. The site is located in a primarily commercial area. The site is bounded to the north by Park Boulevard and a commercial building, to the south by the remainder of the El Camino Center, to the east by Matadero Creek, and to west by a small commercial warehouse building and single-family residences.

PES's historical research indicates that the subject property main building were constructed prior to 1920. A railroad spur and line were present on the west side of the main building until the 1980s. Historical site uses and tenants in the subject property portion of the building included a warehouse and foundry (buildings no longer present), a food processor, a paper container manufacturer, a display manufacturer, a market, and offices.

During a 1992 investigation of the former SP right-of-way, soil samples were collected and composited to evaluate soil quality. Low levels of TCE detected immediately above the groundwater table were concluded to be associated with a known offsite source of contamination. No significant concerns were identified.

In 2002, soil contaminated with TCE was removed from the former Mercer Processing facility at 230 Portage Avenue. A TCE cleanup goal of 0.2 mg/kg (below current residential RWQCB cleanup standards) was used in excavating approximately 285 cubic yards of soil from depths up to 20.5 feet below grade. Regulatory case closure was issued in 2002. Based on the agency closure of this case with no conditions, the Mercer Processing facility is considered a HREC.

The subject property is currently used for offices. Hazardous material use is limited to the *de minimis* use of janitorial supplies. No significant concerns regarding hazardous material use at the site was identified.

Groundwater contamination associated with the offsite Hewlett Packard and Varian facilities has been identified at the subject property, and the facilities are listed on several environmental databases. A VOC plume associated with the facilities has been under investigation since 1981. Three active monitoring wells associated with the investigations are present on the subject property.

6.2 Conclusions and Recommendations

PES has performed a *Phase I Environmental Site Assessment,* in conformance with the scope and limitations of ASTM Practice E1527-13, of the northern third portion of El Camino Center in Palo Alto, California. Any exceptions to, or deletions from, this practice are described in Section 1.3 of this report. This assessment revealed the following historical recognized environmental conditions (HRECs) in connection with the property:

- In 2002, soil contaminated with TCE was removed from the former Mercer Processing facility at 230 Portage Avenue. Regulatory case closure was issued in 2002. However, if this area is disturbed during redevelopment and because the clean-up levels used in 2002 now exceed current environmental screening levels, agency closure of this case may be rescinded and additional soil mitigation may be required.

This assessment revealed the following recognized environmental conditions (RECs) in connection with the property:

- Groundwater contaminated with VOCs associated with the HP/Varian COE regional plume has been identified in groundwater monitoring wells present on the subject property.

While the presence of the COE VOC-affected groundwater plume encroaching on the subject property constitutes a vapor encroachment concern for the subject property, the relatively low concentrations identified in the on-site monitoring wells does not preclude

the use of the property as a residential development. Vapor intrusion risk mitigation (i.e., installation of a passive/active vapor barrier and subslab venting system) may be required and further evaluation of current site soil vapor conditions is warranted to assess the type and design of mitigation options that may be needed, if any.

Also, based on the historical industrial nature of the subject property and adjacent remaining parts of the El Camino Center, it is recommended that a site-specific soil management plan be prepared to address any unidentified and undocumented chemically-affected soil that may be encountered during redevelopment.

7.0 DATA GAPS

The following data gaps that may have affected our ability to identify RECs associated with the subject property were identified during the performance of this Phase I ESA are listed below:

- No information concerning activities and hazardous material use and storage practices at the foundry formerly present on the site was identified.

8.0 ADDITIONAL SERVICES

No additional services were performed as part of this Phase I ESA.

9.0 ENVIRONMENTAL PROFESSIONAL STATEMENT

We declare that to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312.

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed all the appropriate inquires in conformance with the standards and practices set forth in 40 CFR Part 312.

Resumes of the Environmental Professionals signing this report are presented in Appendix J.

Photo 1.
View of the east side of subject property looking west with building addresses of 200 through 340 Portage Avenue (partial) tenant spaces, looking northwest. Photograph taken October 14, 2020.

Photo 2.
View from the northeastern corner of the subject property, facing south, of eastern parking lot and central portion of the El Camino Center structure included in the subject property. Photograph taken October 14, 2020.

Photo 1.
View from the northeastern corner of the subject property, facing west, of the northern portion of the El Camino Center structure included in the subject property.
Photograph taken October 14, 2020.

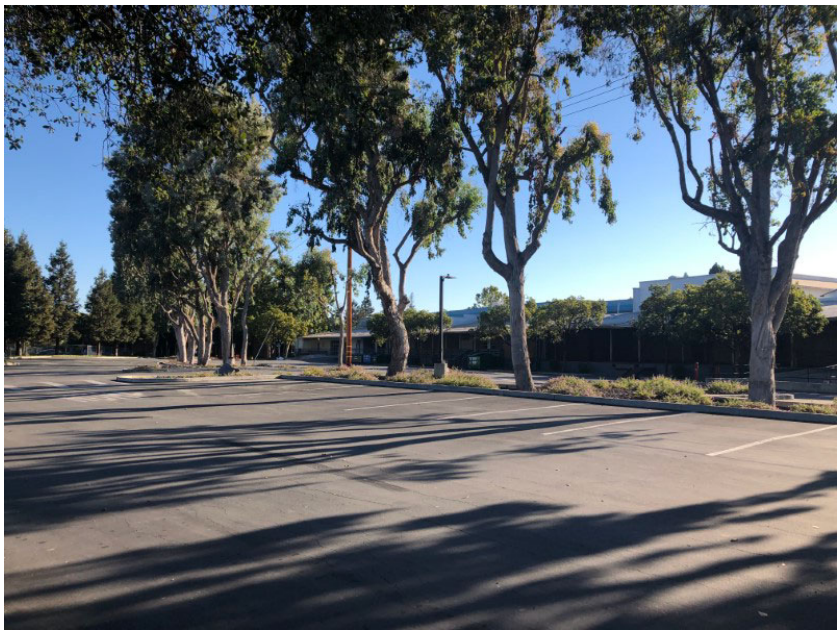

Photo 2.
View, facing northeast, of the western side of the subject property.
Photograph taken October 14, 2020.

Photo 1.
View, facing south, of the Earnin tenant space entrance on northwestern corner of the El Camino Center structure. Photograph taken October 14, 2020.

Photo 2.
View, facing south, of the loading dock area on the west side of the El Camino Center structure. The subject property line is approximately located along the metal railing which crosses the center of the photograph. Further to the south is non-subject property improvements of the El Camino Center. Photograph taken October 14. 2020.

Photo 1.
View, facing south, of same loading dock area as prior photograph also showing western parking area for the El Camino Center and ADA access. An unused electric lift gate is visible in the foreground of the photograph. All of the area further than the ADA ramp is not part of the subject property. Photograph taken October 14, 2020.

Photo 2.
View, facing north, pf the loading dock and employee gathering areas (in background) along western side of the El Camino Center structure. Photograph taken October 14, 2020.

Photo 1.
View, facing south, of the subject property western parking area. Photograph taken October 14, 2020.

Photo 2.
View, facing northeast, of El Camino Center parking area on west side of the 3040 Park Boulevard parcel. Photograph taken October 14, 2020.

Photo 1.
View, facing south, of western boundary of subject property denoted by the concrete block wall. Photograph taken October 14, 2020.

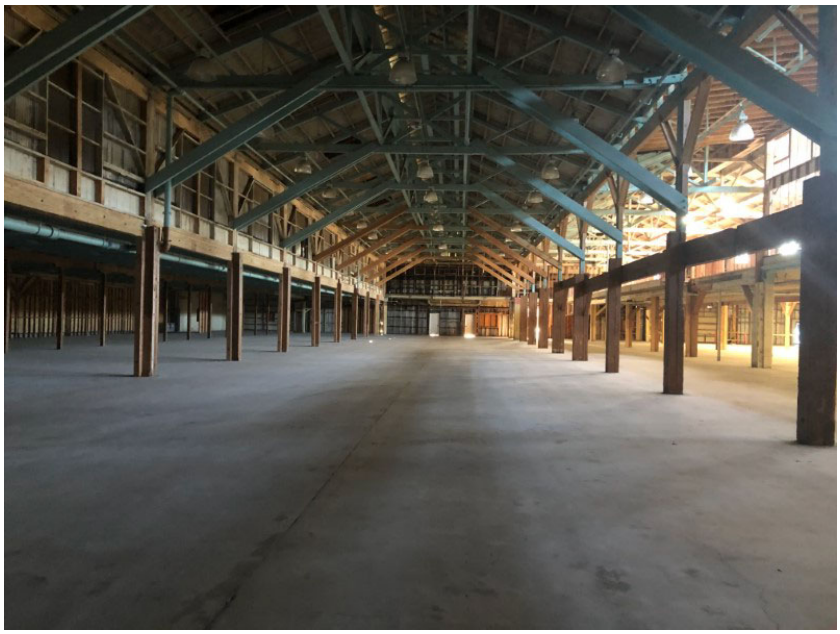

Photo 2.
View, facing east, inside the northern end of the 340 Portage Avenue tenant space under the northern high ceiling section of the building. The southern edge of the subject property begins at the column line on the left center portion of the photograph. Photograph taken October 14, 2020.

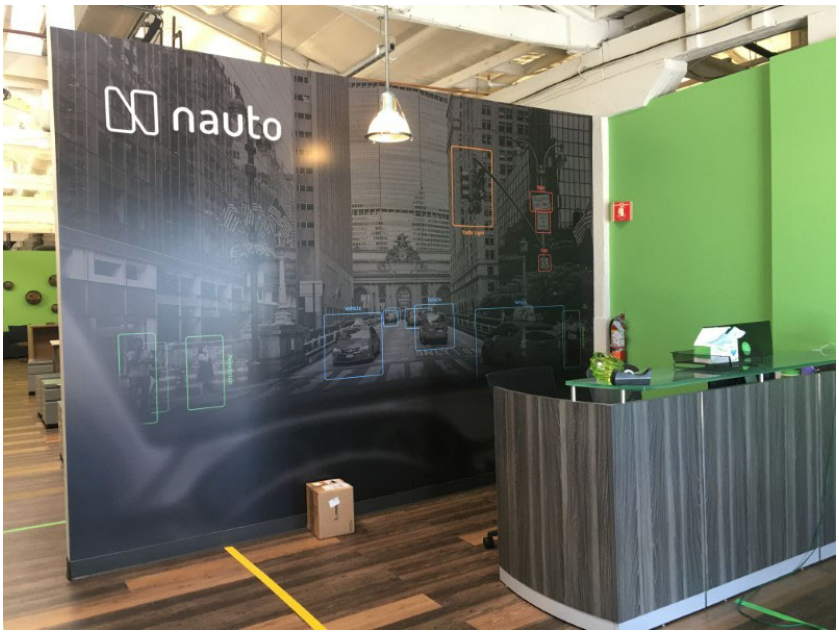

Photo 1.
View of Nauto's reception area looking northwest, the office space tenant at 220 Portage Avenue. Photograph taken October 20, 2020.

Photo 2.
View of 230 Portage Avenue tenant space. Photograph taken October 20, 2020.

Photo 1.
View of rear portion of 230 Portage Avenue tenant space. Area of Mercer Processing soil removal is area of replaced concrete. Photograph taken on October 20, 2020.

Photo 2.
View, facing west from the northern driveway on the west side of El Camino Center, of the off-site commercial building at 3040 Park Boulevard. This facility is currently being used as a fitness center. Photograph taken October 14, 2020.

Photo 1.
View of a pad-mounted transformers to the north of the west parking lot for the El Camino Center, facing north. Photograph taken October 20, 2020.

Photo 2.
View of 3045 Park Boulevard building under development to the northwestern of the subject property across Park Boulevard. Photograph taken October 20, 2020.

Photo 1.
View of commercial building occupied by wework to the north of the subject property across Park Boulevard. Photograph taken October 20, 2020.

Photo 2.
View of Vance Brown Builders to the northeastern of the subject property across Park Boulevard. Photograph taken October 20, 2020.

Photo 1.
View, facing south, of channelized drainage ditch bordering the eastern boundary of the subject property. Photograph taken October 14, 2020.

Photo 2.
View, facing west, of the portion of El Camino Center bordering but not including the subject property to the south. The subject property begins to the north of the high ceiling potion of the building (view partially obscured by the tree on the right edge of photograph). Photograph taken October 14, 2020.

Photo 1.
View, facing southwest, of El Camino parking lot bordering but not including the subject property. Photograph taken October 14, 2020.

Photo 2.
View of the commercial facility east of the subject property across the channelized drainage course. Photograph taken October 20, 2020.

ENVIRONMENTAL LIEN/AUL SEARCH

We have done a search of Santa Clara County Recorders Records for “Environmental Liens” only on the subject property as identified as 340 Portage Ave., Palo Alto, CA. Tax Parcel No. 132-38-071and find the following:

None found

We have done a search of Santa Clara County Recorders Records for “Activity and Use Limitations” (AUL’s) only on the subject property as identified as 340 Portage Ave., Palo Alto, CA. Tax Parcel No. 132-38-071and find the following:

None found

APPENDIX B

USER AND KEY SITE MANAGER QUESTIONNAIRES

USER QUESTIONNAIRE[1]
PHASE I ENVIRONMENTAL SITE ASSESSMENT

In order to qualify for one of the *Landowner Liability Protections (LLPs)*[2] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the *"Brownfields Amendments"*), the User must provide the following information (if available) to the environmental professional. Failure to provide this information could result in a determination that "all appropriate inquiry" is not complete.

User Information	
Name:	Phyllis Yamasaki
Title:	VP- Commercial PM
Company:	T30
Representing, if applicable:	N/A
Signature:	Date: 11-12-21

Site Information
Site Name:
Address:

1. Environmental liens that are filed or recorded against the property (40 CFR 312.25)

Did a search of recorded land title records (or judicial records where appropriate[3]) identify any environmental cleanup liens filed or recorded against the property under federal, tribal, state or local law?

do not know

2. Activity and land use limitations that are in place on the property or that have been filed or recorded against the property (40 CFR 312.26(a)(1)(v) and (vi))

Did a search of recorded land title records (or judicial records, where appropriate[3]) identify any activity or use limitations (AULs), such as engineering controls, land use restrictions or institutional controls that are in place at the property and/or have been filed or recorded against the property under federal, tribal, state or local law?

do not know

---

[1] In accordance with Appendix X3 of ASTM E1527-13.

[2] *Landowner Liability Protections*, or *LLPs*, is the term used to describe the three types of potential defenses to Superfund liability in EPA's *Interim Guidance Regarding Criteria Landowners Must Meet in Order to Qualify for Bona Fide Prospective Purchaser, Contiguous Property Owner, or Innocent Landowner Limitations on CERCLA Liability* (*"Common Elements"* Guide) issued on March 6, 2003.

[3] In certain jurisdictions, federal, tribal, state, or local statutes, or regulations specify that environmental lien and Activity and Use Limitations (AULs) be filed in judicial records rather than in land title records. In such cases judicial records must be searched for environmental liens and AULs.

3. Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28)

As the user of this Phase I ESA, do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business as the current or former property occupants of the property or an adjoining property so that you have specialized knowledge of the chemicals and processes used by this type of business?

NA

4. Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.29)

Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the property?

do not know

5. Commonly known or reasonably ascertainable information about the property (40 CFR 312.30)

Are you aware of commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as User:

(a) Do you know the past uses of the property? Cannery

(b) Do you know of specific chemicals that are present or once present at the property?

No

(c) Do you know of spills or other chemical releases that have taken place at the property?

No

(d) Do you know of any environmental cleanups that have taken place at the property?

No

6. The degree of obviousness of the presence or likely presence of contamination at the property, and the ability to detect the contamination by appropriate investigation (40 CFR 312.31)

As the user of this ESA, based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of releases at the property?

do not know

KEY SITE MANAGER – PRE-SURVEY QUESTIONNAIRE

Name of person completing questionnaire: Phyllis Yamasaki

Association with property: VP - Commercial Property Mgmt

Length of association with property: 8 years

Date: 11-13-2020

Phone Number: 408 858 4202

Property Name: El Camino Center

PES Project Number: do not know

Directions: Please answer all questions to the best of your knowledge and in good faith. Mark the column corresponding to the appropriate response. Additional details necessary to explain any yes or unknown responses should be provided in the "Comments" column.
Note: *U/NR* indicates *"Unknown"* or *"No Response"*.

	QUESTION	RESPONSE			COMMENTS
		Y	N	U/NR	
1A.	Is the Project used for an industrial use?		✓		
1B.	Are any adjoining properties used for an industrial use?				do not know
2A.	To the best of your knowledge, has the Project been used for an industrial use in the past?				do not know
2B.	To the best of your knowledge, has any adjoining properties been used for an industrial use in the past?				do not know
3A.	Is the Project used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?		✓		
3B.	Is any adjoining property used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?				do not know
4A.	To the best of your knowledge, has the Project been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?				do not know
4B.	To the best of your knowledge, has any adjoining property been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility?				do not know
5A.	Are there currently any automotive or industrial batteries, pesticides, paints, or other chemicals in individual containers of greater than five gallons in volume or fifty gallons in the aggregate, stored on or used at the Project?		✓		

	QUESTION	RESPONSE			COMMENTS
		Y	N	U/NR	
5B.	To the best of your knowledge, have there been previously any automotive or industrial batteries, pesticides, paints, or other chemicals in individual containers of greater than five gallons in volume or fifty gallons in the aggregate, stored on or used at the Project?				do not know
6A.	Are there currently any industrial drums (typically 55 gallon) or sacks of chemicals located on the Project?		✓		
6B.	To the best of your knowledge, have there been previously any industrial drums (typically 55 gallon) or sacks of chemicals located on the Project?				do not know
7A.	Are there currently any groundwater monitoring wells or other groundwater wells (i.e., potable drinking water wells) located on the Project?				do not know
7B.	To the best of your knowledge, have there been previously any groundwater monitoring wells or other groundwater wells (i.e., potable drinking water wells) located on the Project?				do not know
8A.	Has fill dirt been brought onto the Project which originated from a contaminated site?		✓		
8B.	Has fill dirt been brought onto the Project which is of an unknown origin?		✓		
9A.	Are there currently any pits, ponds or lagoons located on the Project in connection with waste treatment or waste disposal?		✓		
9B.	To the best of your knowledge, have there been previously any pits, ponds or lagoons located on the Project in connection with waste treatment or waste disposal?				do not know
10A.	Is there currently, any stained soil on the Project?		✓		
10B.	To the best of your knowledge, has there been previously any stained soil on the Project?				do not know
11A.	Are there currently any registered or unregistered storage tanks (above or underground) located on the Project?				do not know
11B.	To the best of your knowledge, have there been previously any registered or unregistered storage tanks (above or underground) located on the Project?				do not know
12A.	Are there currently any vent pipes, fill pipes or access ways indicating a fill pipe protruding from the ground on the Project or adjacent to any structure located on the Project?				do not know
12B.	To the best of your knowledge, have there been previously any vent pipes, fill pipes or access ways indicating a fill pipe protruding from the ground on the Project or adjacent to any structure located on the Project?				do not know
13A.	Are there currently any flooring, drains, or walls located at the Project that are stained by substances other than water or are emitting foul odors?				do not know
13B.	To the best of your knowledge, have there been previously any flooring, drains, or walls located at the Project that are stained by substances other than water or are emitting foul odors?				do not know

	QUESTION	RESPONSE			COMMENTS
		Y	N	U/NR	
14A.	If the Project is served by a private well or non-public water system, have contaminants been identified in the well or system that exceed guidelines applicable to the water system?				\N/A
14B.	If the Project is served by a private well or non-public water system, has the well been designated as contaminated by any government environmental/health agency?				\N/A
15A.	Have you been informed of the past existence of hazardous substances or petroleum products with respect to the Project or any facility located on the Project?				do not know
15B.	Have you been informed of the current existence of hazardous substances or petroleum products with respect to the Project or any facility located on the Project?				do not know
16A.	Are there any environmental liens or governmental notification relating to past or current violations of environmental laws with respect to the Project or any facility located on the Project?				do not know
16B.	Have you been informed of the past existence of environmental violations with respect to the Project or any facility located on the Project?				do not know
16C.	Are you aware of any pending, threatened, or past litigation relevant to hazardous substances of petroleum products in, on or from the property?				do not know
16D.	Are you aware of any pending, threatened, or past administrative proceedings relevant to hazardous substances or petroleum products in, on or from the property?				do not know
16E.	Are you aware of any notices from any governmental entity regarding any possible violation or environmental laws or possible liability relating to hazardous substances or petroleum products?				do not know
17.	Have there been any environmental site assessments of the Project that indicated the presence of hazardous substances or petroleum products on, or contamination of, the Project or recommended further assessment of the Project?				do not know
18.	Does the Project discharge waste water on or adjacent to the project, other than storm water, into a storm water sewer system?				do not know
19.	Does the Project discharge waste water on or adjacent to the project, other than storm water, or into a sanitary system?				do not know
20.	Have any hazardous substances or petroleum products, unidentified waste materials, tires, automotive or industrial batteries or any other waste materials been dumped above grade, buried and/or burned on the Project?				do not know
21.	Is there a transformer, capacitor or any hydraulic equipment for which there are any records indicating the presence of PCBs?		✓		
22.	Is there now or has there ever been any asbestos-containing materials (ACM), in any application, on the Project?	✓			Probably in the roof
23.	Has there ever been any ACM testing conducted on the Project?		✓		
24.	Is there an asbestos Operations and Maintenance (O&M) program in place at the Project?		✓		

	QUESTION	RESPONSE			COMMENTS
		Y	N	U/NR	
25.	Is there now or has there ever been any lead-based paint (LBP) applications on the Project?				do not know
26.	Has there ever been LBP testing conducted on the Project?		✓		
27.	Is there a Lead Paint Operations and Maintenance (O&M) Program in place at the Project?		✓		
28.	Has the water at the Project ever been tested for lead?		✓		
29.	Has Radon testing ever been conducted at the Project?		✓		
30.	Are there any other Operations and Maintenance (O&M) programs in place that we should be made aware of?		✓		
31.	Is the Project or any portion of the Project located or involved in any environmentally sensitive areas (i.e., wetlands, coastal barrier resource areas, coastal barrier improvement act areas, flood plains, endangered species, etc.)?		✓		
32.	Do you know or suspect that mold was or is present in the building(s) or HVAC system? - If "Yes", proceed to question #33. - If "No", skip question #33 and proceed to question #34.		✓		
33.	Are there reliable procedures that specify the actions (i.e. operations and maintenance) to be taken to prevent and/or respond to mold or mold producing problems?				
34.	Is there a mold Operations and Maintenance (O&M) program in place at the Project?		✓		
35.	Is the HVAC system inspected at least annually?	✓			
36.	Have identified HVAC problems been corrected in a timely manner?	✓			
37.	Is there now, or has there ever been evidence of mold or mildew present at the building(s)? If so, when?		✓		
38.	Is there now, or has there ever been any water damage in the building(s), whether from flooding, plumbing, roof leaks, or other sources? If so, when?	✓			
39.	Has there ever been any sort of Indoor Air Quality (IAQ) or mold testing conducted in the building(s)?		✓		
Summarize historical Project use (when was the Project developed with the current improvements, what modifications have taken place, what was the Project used for prior to it's current use)		See Developments Historical report. This building, or parts of it, are over 100 years old.

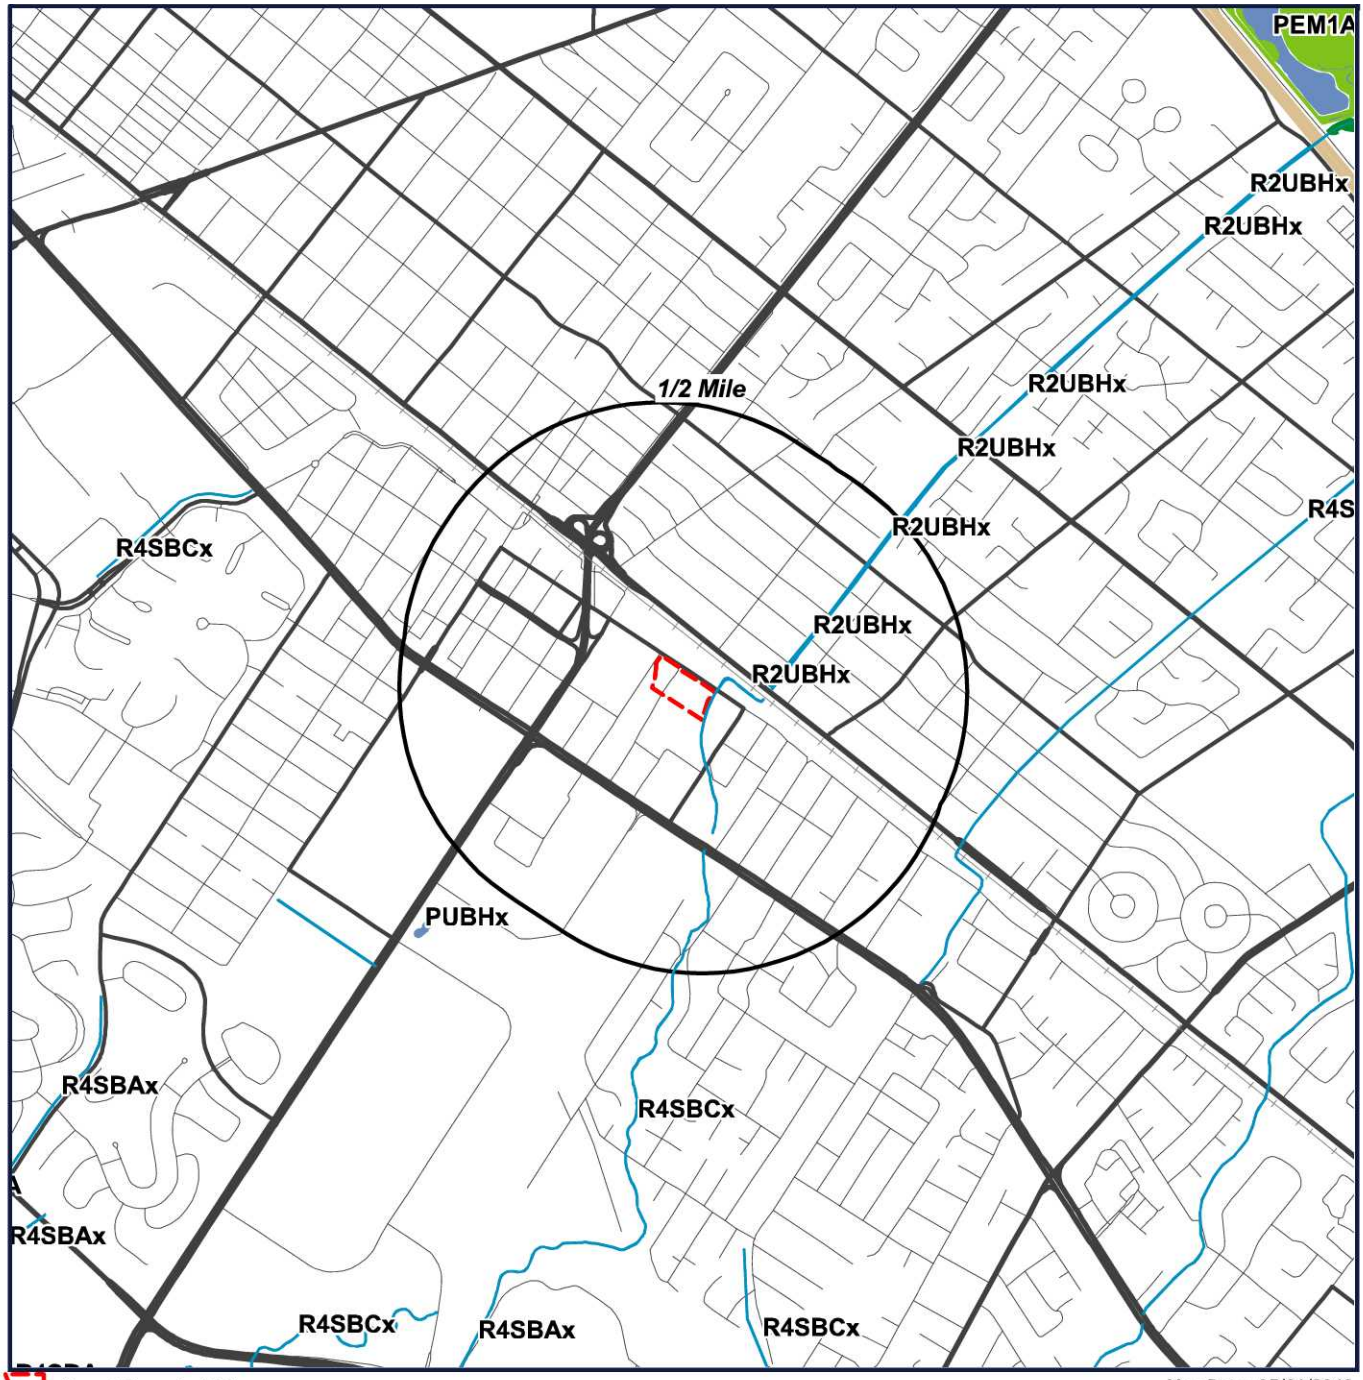
FEMA Report

FEMA - Federal Emergency Management Agency

The National Flood Hazard Layer (NFHL) data used in this report is derived from the Federal Emergency Management Agency. The NFHL dataset is a compilation of effective Flood Insurance Rate Map (FIRM) databases (a collection of the digital data that are used in GIS systems for creating new Flood Insurance Rate Maps) and Letters of Map Change (Letters of Map Amendment and Letters of Map Revision only) that create a seamless GIS data layer for United States and its territories. The NFHL is updated as new study or LOMC data becomes effective. Note: Currently, not all areas have modernized FIRM database data available. As a result, users may need to refer to the effective Flood Insurance Rate Map for effective flood hazard information.

FEMA Flood Zone Definitions within Search Radius



Zone A

Areas subject to inundation by the 1-percent-annual-chance flood event. Because detailed hydraulic analyses have not been performed, no Base Flood Elevations (BFEs) or flood depths are shown.

Zone X

An area that is determined to be outside the 100 and 500 year floodplains.

NWI Report

NWI - National Wetlands Inventory

The US NWI digital data bundle is a set of records of wetlands location and classification as defined by the U.S. Fish & Wildlife Service. This dataset is one of a series available in 7.5 minute by 7.5 minute blocks containing ground planimetric coordinates of wetlands point, line, and area features and wetlands attributes. When completed, the series will provide coverage for all of the contiguous United States, Hawaii, Alaska, and U.S. protectorates in the Pacific and Caribbean. The digital data as well as the hardcopy maps that were used as the source for the digital data are produced and distributed by the U.S. Fish & Wildlife Service's National Wetlands Inventory project. Currently, this data is only available in select counties throughout the United States.

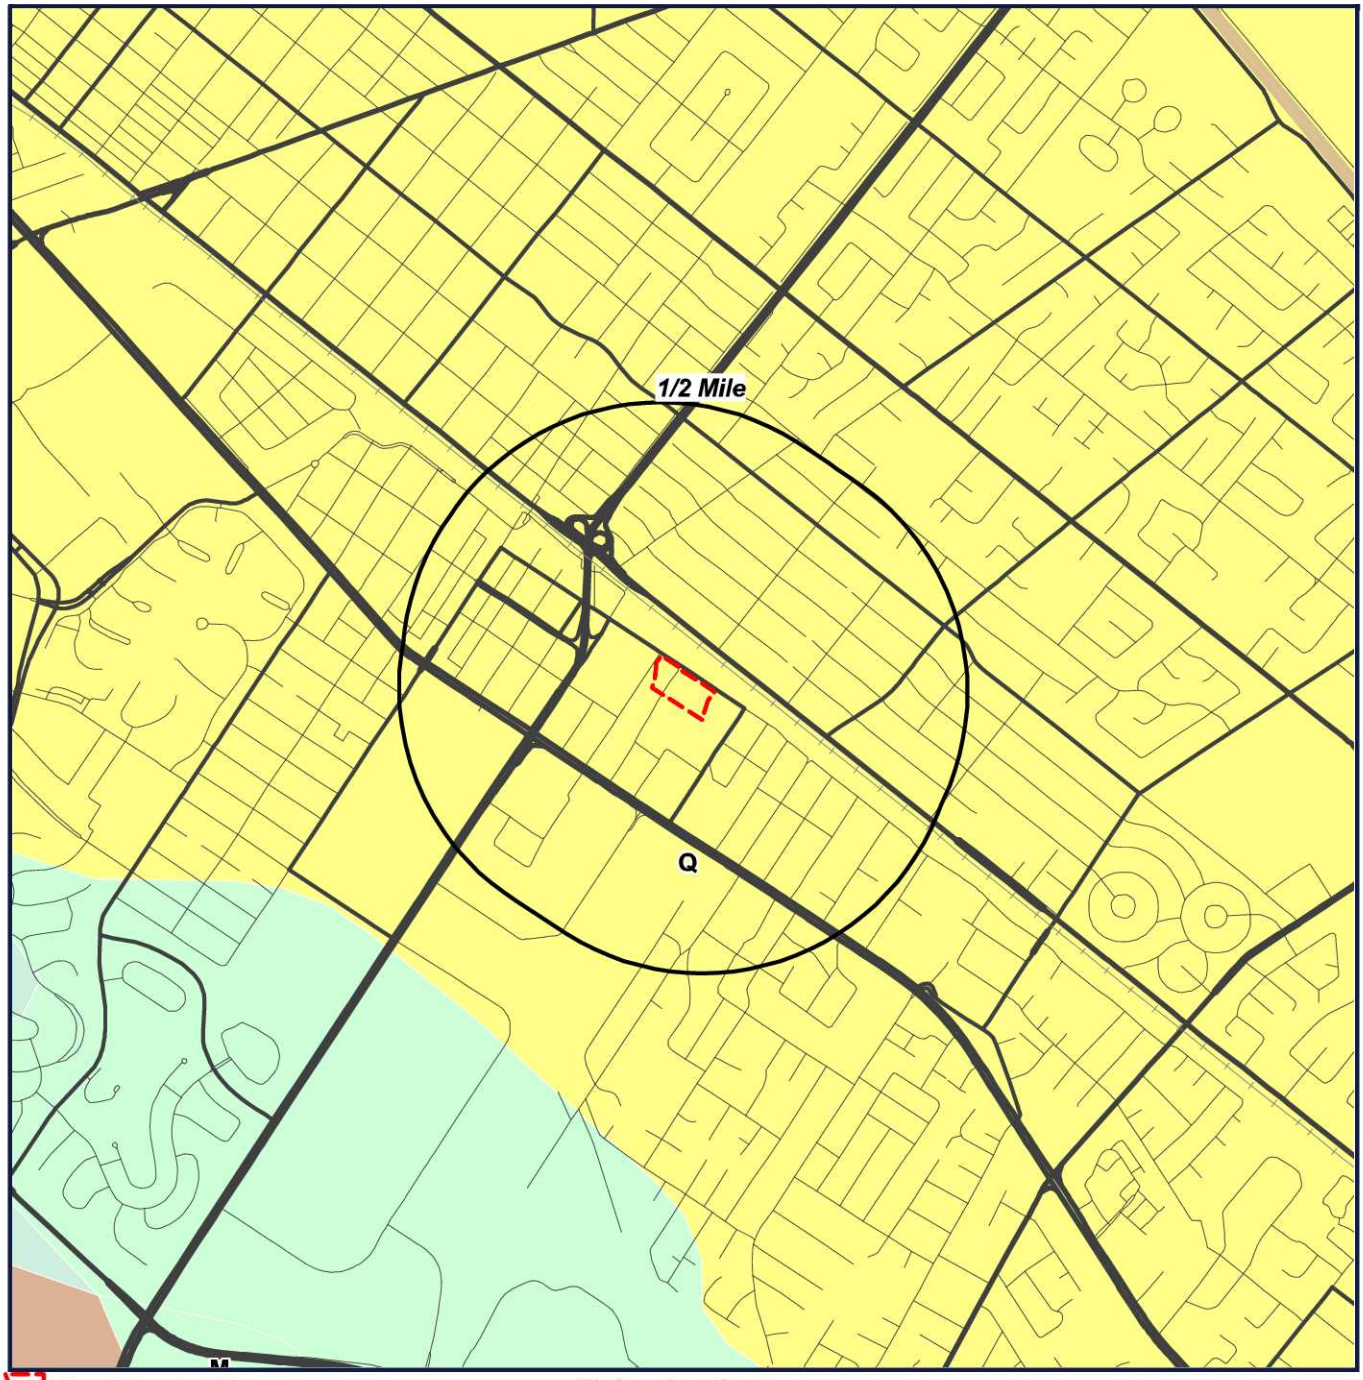
SOIL Report



Soil Surveys

The soil data used in this report is obtained from the Natural Resources Conservation Service (NRCS). The NRCS is the primary federal agency that works with private landowners to help them conserve, maintain and improve their natural resources. The soil survey contains information that can be applied in managing farms and ranches; in selecting sites for roads, ponds, buildings and other structures; and in determining the suitability of tracts of land for farming, industry and recreation. This data is available in select counties throughout the United States.

GEOLOGY Report

US GEOLOGY

THE GEOLOGY DATA USED IN THIS REPORT ORIGINATES FROM THE USGS. THE FIRST STAGE IN DEVELOPING STATE DATABASES FOR THE CONTERMINOUS UNITED STATES WAS TO ACQUIRE DIGITAL VERSIONS OF ALL EXISTING STATE GEOLOGIC MAPS. ALTHOUGH A SIGNIFICANT NUMBER OF DIGITAL STATE MAPS ALREADY EXISTED, A NUMBER OF STATES LACKED THEM. FOR THESE STATES NEW DIGITAL COMPILATIONS WERE PREPARED IN COOPERATION WITH STATE GEOLOGIC SURVEYS OR BY THE NSA (NATIONAL SURVEYS AND ANALYSIS) PROJECT. THESE NEW DIGITAL STATE GEOLOGIC MAPS AND DATABASES WERE CREATED BY DIGITIZING ALREADY EXISTING PRINTED MAPS, OR, IN A FEW CASES, BY MERGING EXISTING LARGER SCALE DIGITAL MAPS.

GEOLOGY Definitions within Search Radius

GEOLOGY SYMBOL: **Q**
UNIT NAME: **Quaternary alluvium and marine deposits**
UNIT AGE: **Pliocene to Holocene**
UNIT DESCRIPTION:
Alluvium, lake, playa, and terrace deposits; unconsolidated and semi-consolidated. Mostly nonmarine, but includes marine deposits near the coast.
ADDITIONAL UNIT INFORMATION:
NOT REPORTED
ROCKTYPE/S: **alluvium; terrace; lake or marine deposit (non-glacial)**

QUALITY CONTROL BOARD

Subject: Soil Sampling and Analysis Report
Former Mercer Processing Facility
230 Portage Avenue, Palo Alto, California

Dear Mr. Noland:

IT Corporation (IT) is pleased to submit this Soil Sampling and Analysis Report for the above-mentioned property. The activities described in this letter report were performed to determine the presence of volatile organic compounds (VOCs) in soil beneath the flooring at the subject site. Soil sampling activities described in this report were performed on June 1, 2000.

Scope of Work

The following scope of work was completed as part of the soil assessment activities:

- An underground utilities locating service was retained to mark the locations of utilities and piping beneath the warehouse floor.
- Three borings were advanced for collection of soil samples.
- Soil samples collected during the investigation were analyzed for VOCs by EPA Method 8260.
- This letter report was prepared summarizing the results of the investigation.

Methodology

Prior to the advancement of the three borings, the locations were marked and an underground locating service was dispatch to the site to identify and mark the locations of any underground utilities or conduits in the vicinity of the proposed borings.

On June 1, 2000, three concrete cores were removed from the floor to allow access to the underlying soil. A direct-push rig then advanced the split-spoon sampler to the desired depth for sample collection. The three borings (A, B, and C) were advanced in the locations illustrated in Figure 1. Boring A was advanced from beneath the concrete floor to a total depth of approximately 10 feet below grade. Borings B and C were advanced to a total depth of 6 feet below grade.

The borings were advanced using a 2-inch-diameter split-spoon sampler fitted with an acetate liner from the point soil was first encountered beneath the concrete floor to the desired depth. Soil samples for logging and laboratory analysis were continuously collected by advancing the split-spoon sampler into undisturbed soil. The sampler was driven a maximum of 4 feet using hydraulic pressure. An IT geologist logged the borings using the Unified Soil Classification System and standard geologic techniques.

Soil samples for laboratory analysis were retained in a portion of the acetate liner, capped with Teflon® sheets and plastic end caps, taped with a nonvolatile rubber-based tape, labeled, and sealed in zip-lock plastic bags. The samples were placed in an insulted chest with ice for transport to the laboratory under chain-of-custody protocol. Soil samples were analyzed in the laboratory for VOCs using EPA Method 8260B.

Following completion of the sample collection, the borings were filled with a mixture of Portland I/II cement and water. Waste soil was placed in a plastic 5-gallon pail, labeled as nonclassified waste, and stored on-site pending proper disposal.

Results

The material encountered beneath the concrete warehouse floor consisted of a base fill material consisting of a sandy, gravelly clay to approximately four feet below grade at which point a native clay was encountered to the total depth of the borings. Groundwater was not encountered during the advancement of the three borings. A description of the material encountered in the three borings is presented in the soil boring logs contained in Attachment 1.

The laboratory reported no detectable concentrations of VOCs in the six soil samples collected from boring A. The laboratory reported a trichloroethene (TCE) concentration of 0.442 milligrams per kilogram (mg/kg) in the surface sample collected from boring B (B-0). TCE concentrations of 6.8 mg/kg and 4.19 mg/kg were reported in the samples collected from the 4 and 6 feet below grade, respectively, from boring B. The laboratory also reported the presence of 0.117 mg/kg of trans-1, 2,-dichloroethene (1,2-DCE) in the six-foot sample collected from boring B (B-6).

Concentrations of TCE were reported in the 4-foot sample (0.27 mg/kg) and in the 6-foot sample (0.659 mg/kg) collected from boring C.

The two duplicate soil samples analyzed for quality control purposes exhibited similar results as the original analysis. Copies of the certified laboratory report and chain-of-custody record is presented in Attachment 2.

If you have any questions regarding information in this letter, please call me at our Concord office (925/288-9898).

Sincerely,
IT Corporation

Subject: **Additional Definition Soil Sampling and Analysis Report**
Former Mercer Processing Facility
230 Portage Avenue, Palo Alto, California
IT Corporation Project 806342

Dear Mr. Noland:

IT Corporation (IT) presents the following Additional Definition Soil Sampling and Analysis Report for 230 Portage Avenue, Palo Alto, California. The activities described in this letter were conducted to further define the vertical and lateral extent of soil contamination that was reported in the IT *Additional Definition Soil Sampling and Analysis Report* dated October 13, 2000.

Scope of Work

The following scope of work was completed as part of the soil assessment activities:

- Drilled five borings for the collection of soil samples (Figure 1, Attachment 1) to determine the vertical and lateral extent of volatile organic compounds (VOCs) in soil.
- Employed a mobile laboratory at the site to obtain quick turnaround of the soil sample analytical results.
- Prepared this report to document the findings of the additional soil investigation.

Methodology

In September, prior to the initiation of fieldwork, an underground utility locating service was dispatched to the site to identify and mark the locations of underground utilities or conduits in the vicinity of the proposed borings.

Starting on November 1, 2000, five concrete cores were removed from the floor to allow access to the underlying soil. A direct-push drill rig then advanced a split-spoon sampler fitted with an acetate liner to the desired depth for sample collection. Soil sampling was conducted during two days (November 1 and 2). Five borings (B, L, L(2), H(2) and K) were advanced in the locations illustrated in Figure 1 (Attachment 1), and a total of 25 soil samples were collected for laboratory analysis. Borings K and L(2) were advanced to a total depth of 13 feet below ground surface (bgs), boring H(2) to 25 feet bgs, boring B to 28 feet bgs and boring L to only 4 feet bgs due to a subsurface obstruction.

The borings were advanced using a 2-inch-diameter split-spoon sampler fitted with an acetate liner from the point soil was first encountered beneath the concrete floor to the desired depth. Soil samples for logging and laboratory analysis were continuously collected by advancing the split-spoon sampler into undisturbed soil. An IT geologist logged the borings using the Unified Soil Classification System and standard geologic techniques. The boring logs are presented in Attachment 3.

A portion of each soil sample collected was retained for laboratory analysis. The samples were capped with Teflon® sheets and plastic end caps, labeled, and sealed in zip-lock plastic bags. The samples were then stored in an insulated chest with ice or in the refrigerator located in the mobile laboratory while awaiting analysis. All soil samples were recorded on a laboratory chain-of-custody record (Attachment 4). To facilitate the delineation of the impacted soil, IT employed a California-certified mobile laboratory to analyze the samples on site. The soil samples were analyzed for VOCs and 2-butanone using Environmental Protection Agency Method 8260B.

For vertical definition, boring B was advanced directly adjacent to former boring B (Figure 1, Attachment 1). During IT's June 2000 investigation, this boring was advanced to approximately 8 feet bgs, at which point a sample was collected for analysis. VOCs were detected in the 8-foot sample; therefore, additional soil samples were collected at 2-foot intervals during this investigation, until VOCs were no longer detected at 24 feet bgs.

To complete the vertical definition of boring H, previously advanced to 12 feet bgs during IT's September 2000 investigation, boring H(2) was advanced to 16 feet bgs and sampled for analysis. VOCs were detected in the 14-foot sample, and additional deeper samples were collected at 2-foot intervals, until VOCs were no longer detected at 22 feet bgs.

To investigate the lateral extent of impacted soil, borings K, L and L(2) were located approximately 10 feet north and south, respectively, of former borings I and H (Figure 1, Attachment 1). A boring was not drilled to the west of boring B, or to the east of boring J, because lateral extent is defined in these directions. Soil samples in the stepout borings were collected at approximately 2-foot intervals beginning immediately beneath the concrete floor, where possible, to a total depth of 8 feet below grade. The borings were then advanced deeper if laboratory results indicated the presence of VOCs. Boring L was advanced to 4 feet bgs, where a subsurface obstruction was encountered. As a result, boring L(2) was advanced 5 feet west of boring L, due to safety concerns, to a total depth of 8 feet bgs. VOCs were not detected in any L or L(2) samples; therefore, lateral extent is defined to the south. VOCs were detected at shallower than 8 feet below grade in boring K. However, VOCs were not detected in the 10-foot sample. Additional step out borings could be drilled to the north and stay within the subject property line.

Following completion of the sample collection, all borings were backfilled with neat cement to the existing site grade. Waste soil was placed in 50-gallon drums, labeled as nonclassified waste, and removed from the site by the drilling company, pending proper disposal.

Results

The material encountered beneath the concrete warehouse floor consisted of a gravelly to sandy clay base fill material to approximately 5 to 6.5 feet bgs. Native clay interbedded with thin (< 3 feet), discontinuous sandy clay layers was encountered beneath the base fill to the total depth of the borings,

which was a maximum of 28 feet bgs. Trends evident with increasing depth included lightening of color, mottling and increased density of the clay. Groundwater was not encountered in any of the borings drilled during this investigation. A description of the materials encountered in the five borings is presented in the soil boring logs contained in Attachment 3.

The four analytes detected in soil samples include trichloroethene (TCE), 1,1-dichloroethene (1,1-DCE), trans-1,2-dichloroethene (trans-1,2 DCE), and cis-1,2-dichloroethene (cis-1,2-DCE) (Table 1, Attachment 2). The compound 2-butanone, which was detected in a previous investigation, was not detected in soil samples from this investigation.

The laboratory reported a maximum TCE concentration of 900 µg/kg in the 10 feet bgs sample from boring B. TCE concentrations typically decrease with depth in each of the borings, with the exception of boring H where TCE slightly increased to 100µg/kg at 18 feet bgs and then decreased to non-detectable levels at 22 feet bgs.

The VOC 1,1-DCE was detected above the PQL in 9 of the 25 soil samples. The highest concentration of 1,1-DCE detected was 39 µg/kg (B-18). Vertical and lateral definition of 1,1-DCE was accomplished in each of the borings. 1,1-DCE was not detected in the previous investigations.

Trans-1, 2 DCE, was detected during this investigation in 3 of the 25 samples. Maximum values of 48 µg/kg were present at 8 and 10 feet bgs in boring B. Trans-1, 2 DCE was also detected in boring K(8) at 12 µg/kg. This contaminant was vertically defined in all borings, yet north lateral definition from boring K is incomplete. This VOC was not detected in previous investigations.

Cis-1,2-DCE was detected above the PQL in 8 of the 25 samples, with a maximum of 35 µg/kg in boring B at 8 feet bgs. This VOC was successfully vertically defined in all borings, yet lateral delineation to the north of boring K was not accomplished.

Quality control data from the certified laboratory verifies the validity of all results obtained. Copies of the laboratory reports and chain-of custody records are included as Attachment 4.

If you have any questions or comments regarding this report, please do not hesitate to contact us at (925) 288-9898.

Sincerely,
IT CORPORATION

Subject: Phase I Environmental Assessment
Palo Alto, California
K/J 910056.00-G-92

Dear Mr. Jacobsen:

Kennedy/Jenks Consultants (K/J) is pleased to submit this final report of the Phase I Environmental Site Assessment conducted for a Southern Pacific Railroad property located in Palo Alto, California.

If you have any questions regarding information presented in this report, please call.

Very truly yours,

KENNEDY/JENKS CONSULTANTS

Stephen E. Fox
Project Geologist

Bert Drews
Project Manager

INTRODUCTION

Kennedy/Jenks Consultants conducted a Phase I Environmental Site Assessment and subsurface investigation on a portion of an existing Southern Pacific Railroad (SP) right-of-way located in Palo Alto, California. The objectives of the Phase I Environmental Site Assessment and subsurface investigation were to assemble environmental information on the subject property and identify areas or issues that may represent potential environmental risks.

Site Description

The subject property is an approximately 80 feet wide by 1,000 feet long railroad right-of-way bounded by El Camino Real, Park Boulevard, Olive Avenue, and Acacia Avenue in Palo Alto, California. With the exception of a small storage shed located near Park Avenue, no structures are located on the property. The rails were removed between 1985 and 1990, and the property was graded.

The site is bounded by single family residences to the north. Some of these property owners appear to have encroached on the subject property. Palo Alto Nissan is located immediately west of the subject property. Durabond, listed on the Federal CERCLIS, and Fry's Electronics bound the property to the south. Park Automotive is located immediately west of the subject property. The location of the subject property is shown on Figure 1.

Site Visit

K/J investigated the subject property and the area located within a radius of 5000 feet of the subject property on 18 December 1991. K/J walked the subject property and conducted a reconnaissance of the area surrounding the subject property by vehicle.

During the site investigation, K/J personnel did not find evidence of the following:

- surface impoundments
- aboveground storage tanks
- treatment or disposal operations involving hazardous materials or wastes
- stained ground surfaces, and stressed vegetation
- underground storage tanks
- chemical handling or storage areas
- asbestos-containing building materials

- PCB-containing electrical equipment

Two monitoring wells are located on the subject property. These wells were installed by ENVIRON for Hewlett Packard. A description of these wells and results of analytical data are discussed below.

SITE HISTORY

Since the early 1900s, the subject property has historically been used as a railroad right-of-way. According to Steven Staiger, Palo Alto Historian, the City of Palo Alto was serviced by an Urban Trolley system in the early 1900s and his records indicate that the subject property was included in this electrical train system. Mr. John Ivawusich, an engineer with Southern Pacific Railroads, stated the main Southern Pacific Railroad line, San Francisco to Palo Alto, was constructed in 1864; however, the subject property was not purchased until 1911. Upon purchase, the subject property was developed into the Los Altos Railroad line that connected Palo Alto and Santa Cruz, California.

Since the 1911 purchase, the only structures recorded on the subject property is a Southern Pacific Railroad storage shed. The shed is located adjacent to Park Avenue. The railroad tracks and shed were identified on a 1924 Sanborn Map. This map did not indicate the presence of flammable materials or underground or aboveground storage tanks.

Available aerial photographs, since 1955, show the land use of the surrounding area as a mixture of residential and commercial. Steven Staiger, Palo Alto Historian, stated the general study area was never developed by heavy industry. Single family residences predominated in the early 1900s and commercial development has occurred in the most recent years. In the 1955 aerial photograph, agriculture land is visible to the west of the property. The railroad tracks are visible on the subject property in the aerial photograph taken as late as 1990.

A historical review of articles on train accidents, at the Palo Alto City Library, showed one accident occurred in the vicinity of the subject property since the 1950s. The accident was recorded in the Palo Alto Times Newspaper on Tuesday 17, 1969 when a cement truck collided with a backing train crossing El Camino Real. The article did not indicate that any chemical release had occurred as a result of the accident.

Chemical usage on the subject property appears to have been limited to the use of herbicides to the keep the tracks clear of weed and other obstructive vegetation and curve and switch greases.

According to information developed for SP Railroad by Brunsing Associates, Inc., the use of herbicides for weed control has occurred since before World War II. Since 1986 herbicides used on the subject property may have included atrazine, diuron, sulfometuron, and glyphosphate. These compounds are

usually applied during the fall or winter and rain-activated. Typically these herbicides are short-lived and are re-applied annually.

Curve rail oiling mechanisms have been in place on portions of the sp track since the late 1940s. The curve oilers were supplied by 30-gallon underground storage tanks. During the K/J site visit, there was no evidence that a curve oil mechanism and tank ever existed on the subject property.

Switch lubricant may have been used to lubricate any switch plates located on the subject property. Historically this graphite lubricant may have been mixed with kerosene, and diesel oil. During the site visit, no hydrocarbon staining was evident on the subject property.

Aerial Photographs

Information regarding past land use and configuration was obtained by reviewing available aerial photographs from the collection maintained by Pacific Aerial Survey located in Oakland, California. The photographs often provide useful information regarding the site at the time of the photograph; however, they do not provide information about the intervening period between photographs.

Aerial photographs of the site and vicinity were reviewed for the following years: 1955, 1963, 1968, 1972, 1977, 1981, and 1990.

1955 Photograph - The railroad tracks are visible on the subject property. A railroad spur connected to the subject property line terminates at the commercial building located to the south. Agriculture land is visible southwest of the property and production appears to be wheat. Land use surrounding the subject property is a mixture of residential and commercial.

1963 Photograph - Railroad tracks are visible onsite. A structure is visible on the eastern section of the property, adjacent to Park Avenue. Single family residential properties are located to the north of the property, on Olive Street and commercial land use is located to the south and west.

1968 Photograph - The photograph resolution was poor. The site configuration appears similar to the 1963 photograph.

1972 Photograph - The land use in the vicinity of the subject property is a mixture of residential and commercial. Auto parking is visible along the south east end of the property.

1977 Photograph - Photograph is similar to the 1972 photograph. A box-style railroad car is visible on the railroad spur. Two buildings are visible near Park Avenue.

1981 Photograph - Land use surrounding the subject property continues to be a mixture of residential and commercial.

1985 Photograph - Photograph is similar to the 1981 photograph.

1990 Photograph - The railroad tracks have been removed from the subject property. No structures except for the Southern Pacific storage shed previously mentioned are visible on the site. Land use surrounding the property continues to be a mixture of commercial and residential. The Park Avenue buildings are visible east of the subject property. The area adjacent to El Camino Road is an auto dealership.

REVIEW OF REGULATORY AGENCY LISTS AND RECORDS

The discussion presented in this section is based on available information provided by regulatory agencies. A review of available agency lists from the Regional Water Quality Control Board, the California Department of Health Services, and the Environmental Protection Agency was conducted by NATEC Environmental Reporting Service, Ltd., a subcontractor to K/J, to identify potential regulatory issues at the subject property and the area within a radius of 5000 feet of the property. The records search included the review of the following regulatory records and lists.

Records Searched	Date	Sources Lists
CERCLIS	7/91	EPA-Superfund Sites
NPL	10/91	EPA-National Priority List
LIENS	3/91	Federal Superfund Liens
SWIS	7/91	California Solid Waste Information System List
SWAT	7/91	California Solid Waste Assessment Program
LUST	1/91	California Leaking Underground Storage Tanks Lists
CORTESE	11/91	California Hazardous Waste Substances Sites
RCRA	1/91	EPA-Hazardous Waste Generators

BEP	1/91	California Bond Expenditure Plan
ASPIS	1/91	California Abandoned Site Program Information System
WDS	10/90	NPDES Permits-Waste Waste Discharge
SARA	12/90	EPA-Superfund Amendments and Reauthorization Act

The subject property was not listed on the above lists and records. The records review conducted by NATEC Environmental Reporting Service, Ltd. indicated that sixteen CERCLIS, one NPL, forty-one RCRA, twenty-one LUST, thirty-two CORTESE, eighteen ASPIS and twenty-three SARA sites are located within a 5000 foot radius of the subject property. Release of volatile organic chemicals (VOCs) at several of the listed sites have resulted in groundwater contamination in the immediate vicinity of the subject property. As discussed in greater detail below, VOCs have been detected in two on-site monitoring wells. Sites that are located within a 2500 foot radius of the subject property are shown on Figure 1. Summaries of the file review are presented in Appendix A.

CERCLIS

Sixteen sites have been identified on the CERCLIS list, which is complied by the U.S. Environmental Protection Agency of contaminated properties for designation under the Federal Superfund Program pursuant to the Comprehensive Environmental Response Compensation and Liability Act (CERCLA). Sites located in the immediate vicinity of the subject property include the following;

Alza Corporation

Alza Pharmaceutical is located at 1454 Page Mill Road. The site was included on the CERCLIS list in January 1987, because of soil and groundwater contamination. Apparently the contamination resulted from the improper handling of chemicals onsite. Initial subsurface sampling identified chloroform concentrations at 4100 parts per billion (ppb), carbon tetrachloride concentrations at 130 ppb and trichloroethylene (TCE) concentrations at 19 ppb in groundwater. Under the supervision of the RWQCB, a soil gas extraction and treatment system was used for interim remedial measures followed by a groundwater extraction and treatment system. The most recent analytical results showed chloroform concentrations at 200 ppb, carbon tetrachloride concentrations below detection limits, and TCE concentrations at 4.5 ppb. The site is active and RWQCB continues to review operations at the site.

Beckman Instruments

This site is located at 1050 Page Mill Road. The RWQCB listed the site in August 1986 because of trichloroethane (TCA) detected in groundwater. Beckman's records indicate TCE has not been used onsite for the past ten years, but TCA has been detected in downgradient wells of the site. Analytical data for the monitoring wells was not available for review during the records review conducted by K/J. Apparently, no enforcement action has been taken against Beckman at this time; however, the final remedial measures for the site have not been determined by the RWQCB.

Dura-Bond

The site is located at 3201 Ash Street. RWQCB included this site on the CERCLIS in February 1981. Apparently the sources of contamination onsite were an underground storage tank and a waste impoundment from the manufacture of bearings. Sixty cubic yards of contaminated soil from the waste impoundment area were removed. Monitoring wells were also installed on the site. Chemicals identified during initial groundwater sampling showed concentrations of TCE at 708 ppb, xylene isomers and ethyl benzene at 1200 ppb and volatile fuel hydrocarbons at 9500 ppb. Apparently chlorinated solvents were detected during sampling of an upgradient monitoring well, indicating a potential offsite plume. RWQCB has required the installation of additional monitoring wells to determine the extent of the hydrocarbon plume and continued monitoring for fuel hydrocarbons.

Eastman Kodak Company

Operations at the facility located at 925 Page Mill Road included photographic film and paper processing. RWQCB's review of facility files indicate TCE was used onsite. The facility is located upgradient of an unexplained chlorinated solvent source and groundwater sampling showed TCE concentrations at 610 ppb, tetrachloroethylene (PCE) at 63 ppb and 1,1-dichloroethene (1,1-DCE) at 150 ppb. RWQCB has not determined remedial measures for the facility, because the Kodak submittal to characterize the potential contamination sources was rejected by RWQCB in February 1990.

Hewlett Packard Facility

This Hewlett Packard facility, which manufactures electronics equipment, is located at 640 Page Mill Road. Initial site investigations began in 30 June 1981. The source of contamination identified onsite was a leaking solvent waste tank. The tank was removed in July 1981 with an additional 100 cubic feet of contaminated soil. Initial analytical results showed TCE and 1,1-dichloroethane (1,1-DCA) in groundwater. An air stripper system was used for interim remedial measures. Apparently, the identified chemicals have migrated offsite and may have been intercepted by the Highway Underpass Dewatering System. The June 1991 Analytical Groundwater Report summarized by the RWQCB showed TCA

concentrations at 8900 ppb, TCE concentrations at 680 ppb, and 1,1 DCA concentrations at 380 ppb. The site is active and final remedial measures are not completed.

Hewlett Packard Facility

A second Hewlett Packard facility, identified on the CERCLIS list, is located at 395 Page Mill Road. In June 1982, sources of groundwater contamination onsite were identified as a leaking underground storage tank, chemical storage areas, and degreaser pits. Initial groundwater sampling showed chemical concentrations of 1,1,1-TCA at 93 ppb, TCE at 320, and 1,1 DCA at 7 ppb. During site characterization, in addition to onsite sources, chemical pollutants were found to be migrating onto the site from another source. A soil vapor recovery system was installed for the underground tank contamination and according to the RWQCB's records this phase of operations was completed in February 1989. The most re ent subsurface analytical sample results showed 1,1,1-TCA concentrations at 46 ppb, TCE concentrations at 230 ppb and 1,1 DCA concentrations below the detection limit. The RWQCB has required additional investigations to determine on and offsite source contributions.

Stanford Cleaners

Stanford Cleaners is located at 2875 El Camino Boulevard approximately one-tenth of a mile northwest of the subject property. The RWQCB identified contaminated subsurface conditions on 30 April 1982. Apparently soils were impacted as result of a leaking waste solvent underground storage tank. The tank along with 360 cubic feet of contaminated soil was removed and the RWQCB recommended a program of semi-annual/annual monitoring of groundwater. Initial analytical results detected 140 F Solvent, trans-1,2-dichloroethene (trans-1,2-DCE) and 1,1,1-TCA in groundwater. The RWQCB did not require a groundwater extraction system for the site. The site currently is recorded with the RWQCB as inactive.

Varian Associates Corporation Headquarters

Varian Associates located at 611 Hansen Way manufactures electronic equipment. According to RWQCB's records, three areas are under investigation at this property. The areas include VOC chemical release near Building 1, gasoline contamination release near Building 4, and VOC contamination near Building 4. Initial groundwater analytical data showed concentrations of TCE at 4,100 ppb, 1,1-DCE at 180 ppb, and 1,1 DCA at 98 ppb. During the site characterization, analytical data collected in a upgradient well indicated a potential offsite source migrating on to the site. Apparently the RWQCB has not determined the final remedial measures for site and quarterly review of monitoring data continues. The most recent available analytical data for the groundwater showed TCE concentrations at 490 ppb, 1,1-DCE concentrations at 140 ppb and 1,1-DCA concentrations at 82 ppb.

Varian Associates

The second Varian property, identified on the CERCLIS list, is located at 601 California Avenue. This facility also manufactures electronic equipment. The RWQCB identified the site in May 1986. Contamination sources were identified as a leaking underground tank and improper chemical handling. Initial groundwater sampling data showed chemical concentrations of TCA at 62 ppb, TCE at 16,000 ppb, and 1,1 DCE at 28 ppb. RWQCB required the construction of a groundwater extraction system onsite and characterization of the downgradient plume. The RWQCB has not determined the final remedial measures for the site. The most recent available analytical data submitted to the RWQCB showed concentrations of TCA at 32 ppb, TCE at 120 ppb, and 1,1 DCE at 20 ppb. The RWQCB has taken enforcement actions against the site. These regulatory actions are being addressed by Varian.

NPL

The Hewlett Packard facility located at 640 Page Mill Road, also listed on the CERCLIS list, has been listed on the NPL list. The U.S. EPA selects sites from the CERCLIS list and prioritized the sites for their significant risk to human health and the environment. A NPL site can receive remedial funding under CERCLA, because the site is considered the highest priority for remedial action. The Hewlett Packard site is located two-tenths of a mile northwest of the subject property. As stated in the CERCLIS section, the VOCs have migrated off site and the RWQCB continues to investigate the site.

RCRA

Hazardous waste generators have been identified in the vicinity of the property. Generators in this classification are required to have a U.S. Environmental Protection Agency identification number and must comply with the provisions of the Resource Conservation and Recovery Act (RCRA).

Twenty-six hazardous waste generators have been identified in the vicinity of the subject property. Many of these RCRA facilities have released VOCs into groundwater and soils. As mentioned previously, VOCs have been detected in groundwater beneath the subject property. It is unlikely, given the historical use of the property, that activities on the subject property have resulted in the release of chemicals to groundwater.

LUST

The Regional Water Quality Control Board (RWQCB) of Santa Clara County provides a list of site names and addresses of reported leaks from underground storage tanks. Six sites with leaking underground storage tanks have been identified in the immediate vicinity of the property. The sites include the following:

The Palo Alto Nissan auto dealership located at 411 Acacia Street is immediately adjacent the subject property. The Nissan site is also listed on the RCRA list. A leaking waste oil underground storage tank has been identified on the site. The extent of contamination is not known and additional investigation is necessary. Palo Alto Nissan leases a portion of the subject property. Nissan uses the property to park new and used cars. The leaking underground waste oil storage tank mentioned above is not located on the subject property.

Jost Heating and Sheet Metal, Inc. is located at 412 Olive Avenue. The site is located one-tenth of a mile from the subject property. A leak of unleaded gasoline has not been characterized and no action taken since the initial report. The RWQCB is currently reviewing the site.

Bleiber Iron Works located at 411 Page Mill Road is located two-tenths of a mile northwest of the subject property. The substance released was gasoline. An initial release leak report was submitted to the RWQCB; however, no action has been taken by the responsible party since that report. It is not known if the groundwater has been impacted by the release.

The Varian Associates site at 425 Lambert Street is located three-tenths of mile from the subject property. The substance released on site is gasoline. It is unclear if the groundwater has been impacted. It is also not apparent if an initial release report has been filed with the RWQCB.

The Chevron Service Station at 775 Page Mill Road is located three-tenths of a mile from the site. An assortment of hydrocarbon products have been released to the soil. A remediation plan was approved by the RWQCB for the treatment of contaminated soils which included excavation and onsite aeration with disposal to an approved site. It is not known if the groundwater has been impacted at this site.

The Hohback site at 216 Page Mill Road is located two-tenths of a mile northeast of the subject property. Gasoline was released and groundwater has been impacted. An initial investigation report was submitted to the RWQCB; however, no action has been taken since that report.

The remaining sites on the LUST list are not in the immediate vicinity of the subject property.

CORTESE

The CORTESE list is complied by the California State Office of Planning and Research and provides listing of hazardous waste/substances sites within the State. Fifteen sites have been identified in the immediate vicinity of the subject property. These sites have also been identified on the LUST list with the exception of a listed site located at 2901 Park Avenue. This site is also listed on the ASPIS list as a Southern Pacific Railroad property. Both Randy Smith and Rob Cranse of Southern Pacific Railroad were unaware of a contaminated site belonging to Southern Pacific

at this address. Additional information will be requested from the California Department of Health Services (California Environmental Protection Agency). Any new information obtained will be forwarded to WSJ Properties when the information is received.

ASPIS

Sites in the vicinity of the property have been identified on the Abandoned Sites Program Information System (ASPIS). The list consists of potential hazardous waste sites and is not a documentation of an incident. The Hewlett Packard facility at 640 Page Mill Road is the closest site to the subject property as previously mentioned. The site is listed on the CERCLIS and NPL lists. The remaining sites listed on the ASPIS sites are also listed on the LUST, CORTESE and CERCLIS list.

SARA

Six SARA sites have been identified within the 5000 feet radius of the subject property. Section 313 of the Emergency Planning and Community Right to Know Act (Superfund Amendments and Reauthorization Act of 1986) requires certain facilities to file annual toxic chemical release inventory forms with the U.S. Environmental Protection Agency and the California Environmental Affairs Agency. The reports to the regulatory agencies include information on releases to air, water and land. The sites listed are also included on the CERCLIS List. The closest sites are Hewlett-Packard located at 395 Page Mill Road and Varian Associates located at 611 Hansen Way. The invertory release data is presented in the summarization report (Appendix A).

OTHER AGENCY CONTACTS

In conjunction with the environmental records review, K/J contacted other local and State agencies and individuals who may have knowledge of activities conducted on the subject property. The content of these telephone conversations are summarized in Appendix B.

DESCRIPTION OF FIELD ACTIVITIES

On 19 and 20 December 1991, eight soil borings (SB-1, SB-2, SB-3, SB-4, SB-5, SB-6, SB-7 and SB-8) were drilled at the site by HEW Drilling Inc. of East Palo Alto, using a CME-75 drill rig equipped with 8-inch hollow stem augers and split-spoon samplers. The boreholes were located on an east-west line across the SP right-of-way and the borings were drilled within 10 to 15 feet of the centerline of the old railbed. The locations of the soil borings are shown on Figure 2.

From each soil boring, four soil samples were driven at the following approximate depths: from 5.0 to 6.5 feet, 10.0 to 11.5-feet, 15.0 to 16.5-feet and from 18.0 to 19.5-feet below ground surface. At each sampling interval, the split spoon sampler, which was filled with three, 2-inch 6-inches brass liners was driven 1.5-

feet. From each drive interval, a soil sample was selected from the three brass liners for analysis for TPH as gas and diesel, VOCs, organochlorine pesticides, PCBs, 17 Title 22 Priority Metals, semi-volatile organics, and oil and grease. Each boring was logged noting the soil types, contacts between the different soil intervals and other such pertinent information such as color, and moisture content.

The boring installation and sampling procedures are described in greater detail in Appendix C. Boring logs of boreholes drilled during this investigation are presented in Appendix D.

RESULTS OF SOIL AND GROUNDWATER SAMPLING

As indicated above, four soil samples were collected from each soil boring, and retained for potential laboratory analysis. From each soil boring, selected soil samples from specific sampling intervals were composited by the laboratory and analyzed as one sample. In addition, selected soil samples from each boring were analyzed as individual samples. From each soil boring, soil samples collected from the 5.0 to 6.5-foot and 18.0 to 19.5-foot intervals were composited and analyzed as one sample. These composite samples were analyzed for TPH as gas and diesel (LUFT Mod. Method 8015), VOCs by EPA Method 8240, organochlorine pesticides and PCB's by EPA Method 8080 and 17 Title 22 Priority Metals. The shallow soil samples collected from the 5.0 to 6.5-foot interval from each boring were also analyzed as individual samples for oil and grease.

Composite soil samples from soil borings SB-1, SB-4, SB-7 and SB-8 were also analyzed for semi-volatile organics by EPA Method 8270. These borings were located adjacent to commercial or industrial activities.

No grab-groundwater samples were collected from the shallowest onsite aquifer during the investigation because previous investigations (ENVIRON data submittal to K/J on 6 January 1992), detected VOCs in groundwater from onsite monitoring wells F76A2 and F77A1. Monitoring well F77A1 was screened in the shallowest onsite water bearing zone from 18.5 to 28.5 feet below ground surface. Monitoring well F76A2 was screened from 40 to 50 feet below ground surface, in what appears to be the next deepest water bearing zone. The well specifications for the monitoring wells F76A2 and F77A1 also provided by ENVIRON on 13 January 1992 are presented in Appendix E.

Laboratory data was provided to K/J by ENVIRON (6 January 1992) on groundwater samples collected from the two above mentioned monitoring wells from February 1990 through August 1991. Trichloroethylene (TCE) appears to be the primary chemical of concern detected in groundwater samples collected from monitoring well F77A1. Concentrations of up to 260 ppb of TCE were detected in monitoring well F77A1 during the monitoring period. Other VOCs detected in groundwater samples collected from well F77A1 are Methylene Chloride, Acetone, 1,1,1-TCA, 1,1-DCE, c-1,2-DCE and 1,1-DCA.

Concentrations up to 2.6 ppb of TCE and 1.2 ppb of 1,1-DCA were detected in the groundwater samples collected from the deeper monitoring well, F76A2. Laboratory results provided by ENVIRON are presented in Appendix F.

Laboratory analytical reports and chain of custody forms for the soil samples collected during the Kennedy/Jenks investigation are presented in Appendix G.

VOCs

As mentioned above, groundwater samples collected from two onsite monitoring wells, indicate that the shallow groundwater onsite contains detectable concentrations of VOCs. However, VOCs were not detected above the laboratory detection limit in the eight composite soil samples collected.

PCBs

PCB's were not detected above the laboratory detection limit in the eight composite soil samples collected.

TPH as GAS AND DIESEL

TPH as gas and diesel was not detected above the laboratory detection limit in the eight composite soil samples collected.

ORGANOCHLORINE PESTICIDES

Organochlorine pesticides were not detected above the laboratory detection limit in the eight composite soil samples collected.

SEMI-VOLATILE ORGANICS

Semi-volatile organics were not detected above the laboratory detection limit in the four composite soil samples collected.

OIL AND GREASE

Oil and grease was detected at 60 ppm in samples SB-1A, SB-4A and SB-5A. The analytical results are presented in Table 1. The elevated concentrations of oil and grease detected may be attributed to either oil and grease associated with the track maintenance or may be attributed to background organics present in the soil. These oil and grease values do not appear to represent a significant problem throughout the site.

CALIFORNIA TITLE 22 METALS

Concentrations of metals detected in the soil samples are summarized in Table 2. The detected metal concentrations are compared to average metals concentrations

in soils reported by Lindsay, I.W.L Lindsay, 1979, Chemical Equilibria in Soil, John Wiley and Sons, New York and Total Threshold Limit Concentrations (TTLCs) established for the designation of hazardous wastes by the State of California. TTLCs for the metals of concern are not exceeded.

The concentrations of metals detected in the soil samples appear to be representative and consistent with metal background soil concentrations reported by Lindsay.

FINDINGS AND CONCLUSIONS

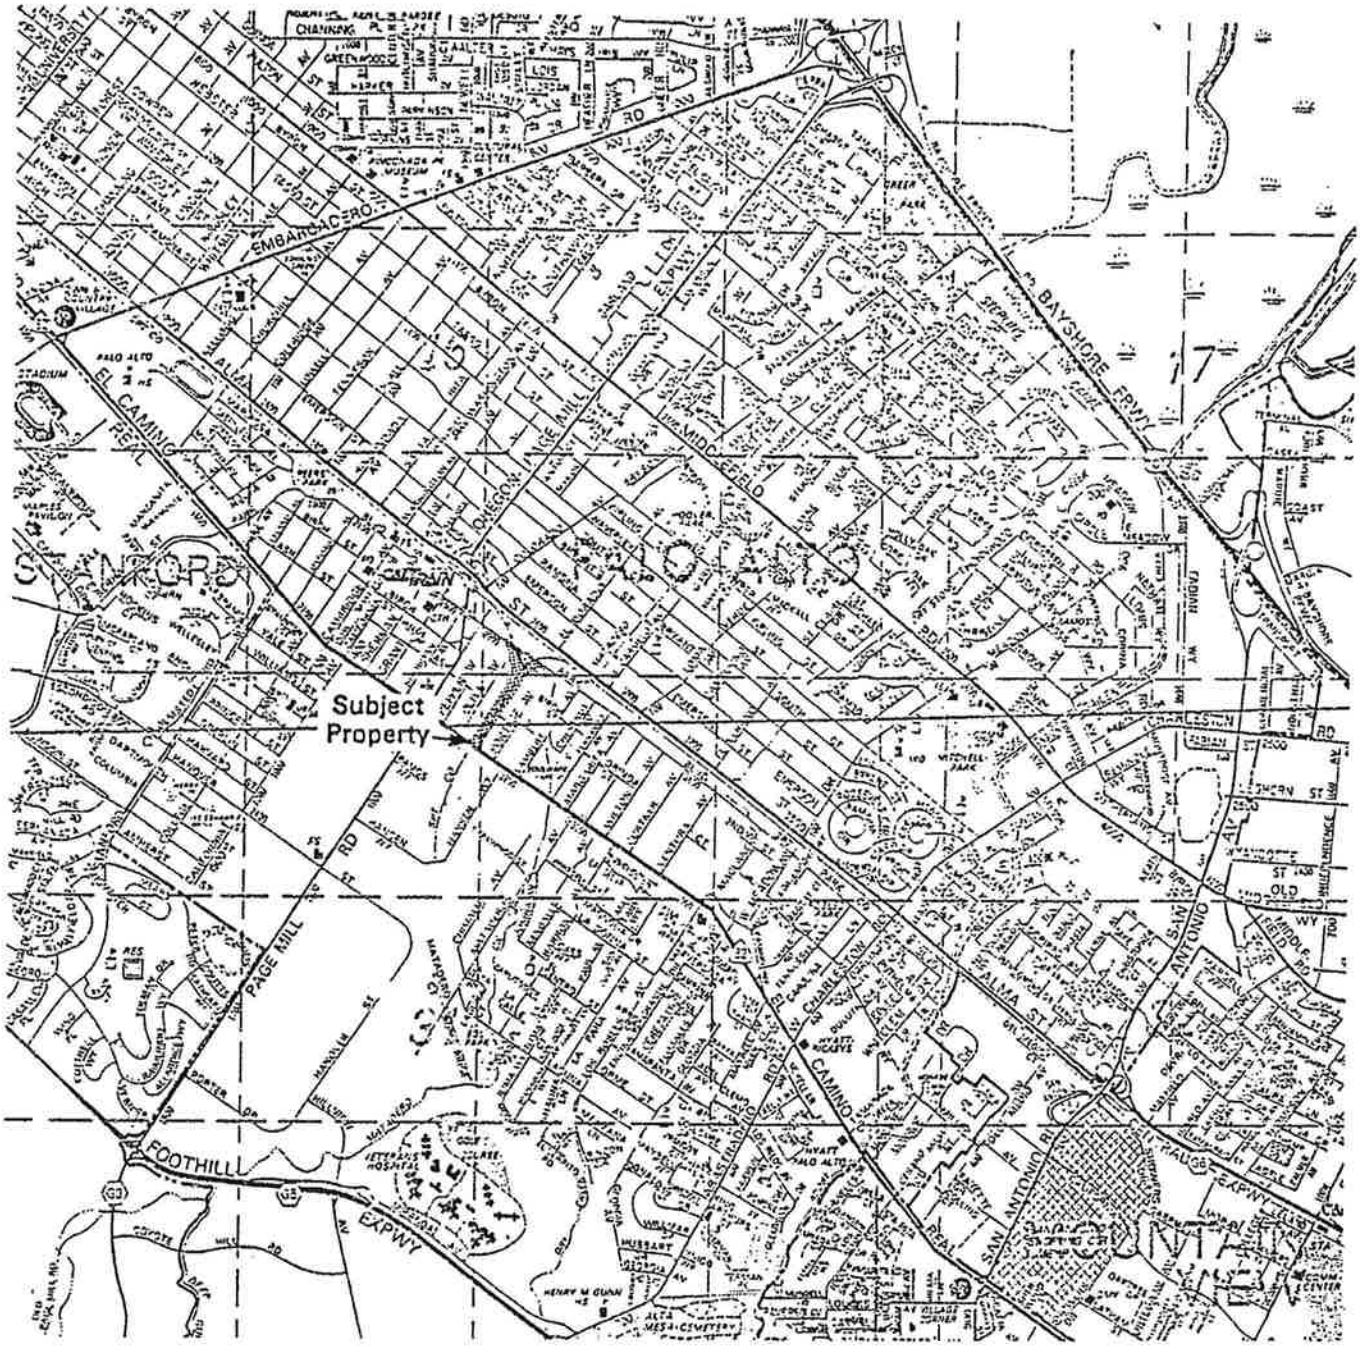
The following finding and conclusions are based on the data gathered during this investigation, the laboratory analytical results, the review of site history, and the review of regulatory agency lists and records.

- A review of the site history does not indicate that the subject site has had any other historical use other than a railroad right-of-way. The historical records also do not indicate that any major spills or industrial accidents have occurred on the site.

- A review of aerial photographs taken of the site from 1955 through 1990 do not indicate any use of the site other than as a railroad right-of-way. Between 1985 and 1990, the railroad tracks were removed from the site.

- A review of the regulatory lists and records was conducted for the subject property and the area within a radius of 5000 feet of the property. The records review indicated that sixteen CERCLIS, one NPL, forty-one RCRA, twenty-one LUST, thirty-two CORTESE, eighteen ASPIS and twenty-three SARA site are located within this 5000 foot radius. Activities at some of these listed sites have resulted in the release of chemicals to soil and groundwater in the immediate vicinity of the subject property.

- TPH as gas and diesel, VOCs, organochlorine pesticides, and PCBs were not detected above the detection limits of the analytical methods, in composite soil samples collected at the site to a depth of 19.5 feet below ground surface (borings SB-1, SB-2, SB-3, SB-4, SB-5, SB-6, SB-7 and SB-8)



- Semi-Volatile Organics were not detected above the detection limits of the analytical methods, in selected shallow composite soil samples collected at the site (borings SB-1, SB-4, SB-7 and SB-8).

- Even though the shallow groundwater at the site contains VOCs at detectable concentrations, it does not appear that the unsaturated zone is significantly impacted by chemicals of concern.

- Detectable metal concentrations were present in all of the soil samples collected at the site. The concentrations of metals appear to be consistent with background soil concentrations (I.W.L Lindsay, New York, 1979).

- Concentrations of oil and grease were detected in three shallow soil samples collected at the site. The concentrations were only slightly elevated above detection limits and do not appear to represent a significant problem.

Attention: Mr. Greg Osborn

FACILITY CLOSURE ASSESSMENT
FORMER MERCER PROCESSING FACILITY
230 PORTAGE AVENUE
PALO ALTO, CALIFORNIA

Dear Mr. Osborn:

This letter has been prepared on behalf of WSJ Properties (WSJ), and presents the findings of PES Environmental, Inc.'s (PES) facility closure assessment of the former Mercer Processing Facility, located at 230 Portage Avenue in Palo Alto, California (Plate 1). Mercer Processing has recently vacated the tenant space and WSJ Properties requested that PES conduct a facility closure assessment. We conducted the assessment in accordance with our proposal to WSJ dated December 8, 1999.

This report includes a general description of the former facility operations, a summary of our review of environmental documentation prepared by local regulatory agencies, a discussion of the shallow soil sampling procedures and results, conclusions and recommendations for additional investigation.

BACKGROUND INFORMATION

According to information presented to PES, Mercer Processing had been at this location since 1989 and had just recently ceased operations. Mercer Processing reportedly conducted freeze-drying of food at the subject property. They have reportedly relocated their freeze-dying operation to another property in Central California.

On December 1, 1999, PES conducted a site inspection of the facility. A Site Plan is presented as Plate 2, and Plate 3 shows the layout of the former Mercer Processing facility. Operations performed by Mercer Processing at this location included freeze-drying and packaging of food products. Refrigeration equipment used in the freeze-drying process

contained solvents including trichloroethylene (TCE) and Genesolv 2000. According to Mr. Dave Noland, the president of the business, the refrigeration equipment utilized TCE from approximately 1989 until 1991, and Genesolv 2000 from 1991 until the facility ceased operations. Genesolv 2000 is also referred to as Refrigerant 141b and is composed of 1,1-dichloro-1-fluoroethane.

DOCUMENT REVIEW

PES was provided facility closure documentation by Mr. Noland. These documents included: (1) a Santa Clara County Hazardous Materials Compliance Division (SCCHMCD) Hazardous Materials Business Plan (HMBP) dated September 11, 1998; (2) a SCCHMCD Hazardous Materials Facility Closure Application dated September 17, 1999; (3) a City of Palo Alto Fire Prevention Bureau (CPAFPB) Record of Additional Information dated November 9, 1999; (4) a CPAFPB Record of Additional Information dated November 11, 1999; and (5) a Record of Additional Information dated December 21, 1999. In addition, PES interviewed CPAFPB staff who had previously inspected the facility and were involved in the facility closure process. A brief summary of the findings of the document review follows. Copies of these documents are presented in Appendix A.

The SCCHMCD oversees the State of California Hazardous Materials Storage Ordinance (Chapter 6.95, Health & Safety Code, Title 22, Division 4.5, California Code of Regulations), and has designated the CPAFPB to implement the ordinance at facilities within the City of Palo Alto. Consequently, CPAFPB inspectors oversee hazardous materials business closure activities.

Review of the September 11, 1998 HMBP indicated that the Mercer Processing facility stored approximately 650 gallons of Genesolv 2000, and smaller quantities (less than 55 gallons) of water treatment chemicals and lubricating oils.

Mercer Processing submitted a Hazardous Materials Facility Closure Application on September 17, 1999. The application stated that Mercer Processing will remove the freeze drying system, the heat transfer fluid (Genesolv 2000) will be sold to a recycler, the vacuum pump oil and refrigerant will be sold to a recycler, and water treatment chemicals will be shipped to their new facility. The heat transfer fluid piping was to be disassembled and also shipped to their new facility.

The December 21, 1999 Record of Additional Information documents the findings of the final facility closure inspection performed by the CPAFPB. According to the CPAFPB report, the removal of equipment and wastes had been performed and no remaining site contamination issues were noted. The only item remaining in the permitting process was for Mercer Processing to prepare and submit a Final Closure Report. The report was to document closure

procedures performed and provide manifests for chemicals and chemical-containing equipment removed from the site.

According to Mr. Noland, the Final Closure Report will be submitted to the CPAFPB the week of January 17, 2000.

According to CPAFPB staff, no spills or hazardous materials storage violations were reported for the facility.[1] Additionally, CPAFPB staff have requested that if soil sampling was performed, that the results of the sampling be provided to them for their review and potential referral to other regulatory agencies.[2]

SITE REINSPECTION

On December 21, 1999, PES returned to the site to reinspect the condition of the floor following removal of the processing equipment. The concrete floor in the location of the former processing equipment was visually observed to be in good condition throughout without any significant cracking. Some minor staining was observed on the floor at the location that was the northern end of the refrigeration unit. Soil boring GS-5 was placed in this location (see discussion of soil sampling below).

In PES' opinion, the condition of the concrete floor at the site had not been significantly degraded by operations formerly conducted by Mercer Processing.

SHALLOW SOIL BORING AND SOIL SAMPLING METHODOLOGIES

Following reinspection of the facility, PES selected five soil sampling locations. Prior to sampling, an underground utility survey was performed using electromagnetic line location equipment by Foresite, Inc. Once the proposed sampling locations were cleared of underground utilities, the concrete floor was cored and the cores removed in preparation for hand-augering. Soil sampling locations are shown on Plate 3.

Soil borings were advanced using a hand auger. During hand-augering, concrete rubble and other coarse fill materials were encountered which made advancement of the borings difficult. Additionally, concrete rubble prevented the collection of soil samples at several locations. Due to the presence of these coarse fill materials, PES could not collect any soil samples for analysis at boring GS-1. PES proposed to collect samples at depths of 0.5, 2 and 4 feet below ground surface (bgs). The deepest sample collected from boring GS-2 was at 3.5 feet bgs, and

[1] Personal communication, January 11, 2000, between Saul Germanas of PES and Thomas Newland of CPAFPB.
[2] Personal communication, January 12, 2000, between Saul Germanas of PES and Thomas Newland of CPAFPB.

at only 0.5 feet bgs at boring GS-3. PES was able to collect deeper samples from borings GS-4 and GS-5 and retrieved samples from 0.5, 2, 4 and 6 feet bgs at these two locations. Field screening of the soil was performed using an organic vapor meter (OVM). Low PID readings (0 to 5 parts per million [ppm]) were observed during augering and sampling.

Where possible, samples were collected using a 25-pound hand-held drive sampler lined with 6-inch long stainless steel sample tubes. Once filled, the sample tubes were covered at each end with teflon sheeting and plastic end caps. End caps were sealed with silicone tape.

To avoid cross-contamination, all sampling equipment was decontaminated prior to and between sampling events. Following completion of the soil sampling, the boreholes were partially backfilled with cement. Additional sealing of the boreholes will be performed in the near future. Soil cuttings generated from sampling were stored in 5-gallon poly containers. Rinsate generated from the decontamination of sampling equipment was also stored onsite.

The shallowest soil sample collected from each boring was submitted for analysis under proper chain-of-custody control to Entech Analytical Labs, Inc. of Sunnyvale, California. The soil samples were analyzed for volatile organic compounds (VOCs) by EPA Test Method 8260B. Based on the results of the shallow sample analyses, deeper samples were subsequently submitted for analysis of VOCs. Soil sample analytical results are compiled in Table 1 and also shown on Plate 3. Laboratory analytical data sheets and chain-of-custody records are presented in Appendix B.

SOIL ANALYTICAL RESULTS

TCE was detected in two of the ten soil samples submitted for analysis. The only sample collected from boring GS-3 (at 0.5 feet bgs) was found to contain 470 micrograms per kilogram (μg/kg) of TCE. The deepest sample collected from boring GS-2 (at 3.5 feet bgs) was also found to contain TCE at a concentration of 54 ug/kg.

Acetone, methyl ethyl ketone (MEK) and tert-Butanol were detected in several of the soil samples submitted for analysis at low concentrations.

CONCLUSIONS AND RECOMMENDATIONS

Based on our review of site closure documentation and interview of the CPAFPB inspector who has handled the case, it appears that Mercer Processing has performed the required hazardous materials facility closure process to the satisfaction of the local agency, with the exception of preparing a final closure report. The CPAFPB does not require any further action other than preparation of the report. According to Mr. Noland, this report will be

prepared and submitted to CPAFPB the week of January 17, 2000. The CPAFPB also has requested that the results of soil sampling at the site be provided to them for their review. PES recommends that the results of subsurface sampling be submitted to CPAFPB by Mercer Processing representatives.

Based on the presence of TCE in soil and the absence of deeper soil samples at the locations where TCE was detected, PES recommends additional soil characterization. The objectives of the additional characterization are to better evaluate the lateral and vertical extent of TCE and other detected VOCs in soil, and to demonstrate that TCE has not affected groundwater at this location due to historical activities performed by the tenant. Due to the nature of the fill materials beneath the concrete floor of the facility, the additional sample collection will likely need to be performed utilizing a limited access drilling rig.

We trust this is the information you require at this time. If you have any questions or require any additional information, please call either of the undersigned at (415) 899-1600.

Yours very truly,

PES ENVIRONMENTAL, INC.

HAZARDOUS MATERIALS FACILITY CLOSURE APPLICATION

For Use by All Jurisdictions Within the County of Santa Clara

Please complete and submit this form prior to the closure of any aboveground hazardous materials storage system or facility. Based on the information submitted below, and the complexity of the closure, a written Closure Plan may be required (see guidelines).

1. Facility Information: *(Note: Print or type all information)*

Facility Name: Mercer Processing Facility Phone: (650) 494-8992

Site Address: 230 Portage St

City: Palo Alto State: CA Zip: 94306

Contact Name: David Noland Contact Phone: (650) 322-1827 x11

Forwarding Address: 195 Page Mill Road

City: Palo Alto State: CA Zip: 94306 Phone No.: (650) 322-1827

Property Owner Name: WSJ Properties

Property Owner Mailing Address: 3201 Ash Street Palo Alto, CA 94306
If different from site address

City: Palo Alto State: CA Zip: 94306 Phone No.: (650) 493-5310

2. Closure Information:

☒ Full Facility Closure ☐ Partial Facility Closure/Remodel | Proposed Date of Closure: 12/15/1999

Briefly describe the proposed closure activity. Indicate the previous use(s) of the area(s) intended to be closed and the types of chemicals used or stored in the area(s) (i.e. by submitting a copy of the Inventory Statements from your Hazardous Materials Business Plan, etc.). Include equipment, tanks, piping, exhaust and treatment systems, and the proposed final disposition of any hazardous materials and/or wastes. Attach additional pages if necessary.

Freeze Drying System: to be removed. Heat transfer fluid (Genesolv 2000) will be removed from system & sold back to A Recycler. Vacuum pump oil will be removed by recycler. Freon 22 will be pumped back into appropriate containers & sold to A recycler. Water treatment chemicals will be shipped to other facility at their orginal container. When heat transfer fluid piping has been completely emptied, it will be disassembled, & shipped to new facility.

Instructions for Completion of Section A of the HMBP

Page 1 is designed to conform with IOES Form No 2709 6/201

The following table describes the information required on Page 1 of the HMBP:

Section No.	Data Element	Information Required
1	Business Name	The full legal name of the business.
1	Business Phone	The business phone number; include area code and extension.
1	Site Address	The street address where the facility is located, including building number, if applicable. *(Note: Post office box numbers are not acceptable. This information must provide a means to locate the facility geographically.)*
1	City	The city where the facility is located.
1	State	The abbreviation for California has been entered on the form.
1	Zip	The 5 or 9 digit zip code for the facility.
1	Dun & Bradstreet No.	If the business has a D&B number, enter it on this line. *(Note: The Dun & Bradstreet number may be obtained by calling (610) 882-7748.)*
1	Primary SIC Code	The 4 digit primary Standard Industrial Classification code for the facility. *(Note: If your code has more than 4 digits, report only the first four.)*
1	Operator Name	The name of the business operator.
1	Operator Phone	The business operator phone number; include area code and extension.
2	Owner Name	The name of the business owner.
2	Owner Phone	The owner's phone number if different from business phone; include area code and extension.
2	Owner Mailing Address	The owner's street or P.O. Box mailing address if different from the site address.
2	City	The name of the city for the owner's mailing address.
2	State	The 2 character state abbreviation (e.g. CA, TX, NY, etc.) for the owner's mailing address.
2	Zip	The 5 or 9 digit zip code for the owner's mailing address.
3	Environmental Contact Name	The name of the person, if different from the Business Owner or Operator, who will receive environmental correspondence and will respond to enforcement activity.
3	Contact Phone	The Environmental Contact's phone number; include area code and extension.
3	Contact Mailing Address	The street or P.O. Box mailing address, if different from the site address, where all environmental correspondence should be sent.
3	City	The name of the city for the Environmental Contact's mailing address.
3	State	The 2 character state abbreviation (e.g. CA, TX, NY, etc.) for the Environmental Contact's mailing address.
3	Zip	The 5 or 9 digit zip code for the Environmental Contact's mailing address.
4	Primary Emergency Coordinator (EC) Name	The name of a facility representative who can be contacted in case of an emergency involving hazardous materials at the facility. *(Note: This person shall have full facility access, site familiarity, and authority to make decisions for the business regarding incident mitigation.)*
4	Title	The title of the Primary Emergency Coordinator.
4	Business Phone	The business phone number for the Primary Emergency Coordinator; include area code and extension.
4	24-hour Phone	A number that will be answered 24 hours a day. If not the Emergency Coordinator's home phone number, then the number of an answering service able to immediately contact the Emergency Coordinator must be provided.
4	Pager Number	The pager telephone number for the Primary Emergency Coordinator, if available.
4	Secondary Emergency Coordinator Name	The name of a facility representative who can be contacted in the event that the Primary Emergency Coordinator is not available. *(Note: This person shall have full facility access, site familiarity, and authority to make decisions for the business regarding incident mitigation.)*
4	Title	The title of the Secondary Emergency Coordinator.
4	Business Phone	The business phone number for the Secondary Emergency Coordinator; include area code and extension.
4	24-hour Phone	A number that will be answered 24 hours a day. If not the Secondary Emergency Coordinator's home phone number, then the number of an answering service able to immediately contact the Secondary EC must be provided.
4	Pager Number	The pager telephone number for the Secondary Emergency Coordinator, if available.
5	Substances Regulated Under the CalARP Program	Check the appropriate box to indicate whether any substances listed in Section 2770.5 of 19 CCR are handled at the facility in quantities greater than their listed Threshold Quantities. If "Yes" is checked, contact your local agency to obtain a California Accidental Release Prevention Program Registration Form.
6	EPA ID No.	If the facility generates hazardous waste, enter the facility's site-specific EPA ID Number. This number always includes 3 letters followed by 9 numerals (e.g. "CAL123456789").
6	Principal Type of Business	The business activity performed by the facility *(e.g. "Plating Shop", "Gas Station, etc.)*.
6	Billing Address	The street or P.O. Box mailing address, if different from the owner mailing address, where bills for permit/inspection fees should be sent.
6	City	The name of the city for the Billing Address.
6	State	The 2 character state abbreviation (e.g. CA, TX, NY, etc.) for the Billing Address.
6	Zip	The 5 or 9 digit zip code for the Billing Address.
6	Industrial Waste Discharge Contact	If the facility discharges process materials to the sewer system, enter the name of the person responsible for industrial waste compliance at the facility.
6	Phone No.	The business phone number for the Industrial Waste Discharge Contact; include area code and extension.
6	Property Owner	The name of the owner of the property on which the facility is located.
6	Phone No.	The property owner's phone number; include area code and extension.
6	Facility Hours of Operation	The days and hours during which the facility is in operation *(e.g. "M-F 8 a.m.-5 p.m.")*.
6	No. of Employees Per Shift	The total number of employees present on-site during each shift of operation.
7	Name of HMBP Document Preparer	The printed full name of the person who prepared the HMBP.
7	Title	The title of the person who prepared the HMBP.
7	Signature of Owner/Operator	The business Owner/Operator, or officially designated representative of the Owner/Operator shall sign in the space provided. This signature certifies that all information contained in the HMBP and any attachments/appendices is true, accurate, and complete.
7	Date	The date the Owner/Operator Certification was signed. (MM/DD/YY)
7	Page 1 of	The total number of pages in the HMBP must be noted on this line. All pages of the HMBP shall be numbered

Section B - Non-Waste Hazardous Materials Inventory

All non-waste hazardous materials stored at the facility must be listed on the Non-Waste Hazardous Materials Inventory Statement (printed on other side of this page). Instructions for completing the inventory are provided below. Trade secret materials should be listed separately from non-trade secret materials and each page must clearly be marked "Trade Secret". Your local agency may be capable of accepting electronic reporting of this information. Contact your local agency for details.

Report all hazardous materials handled at the facility. Group materials by storage location. Complete one row for each individual material stored at a storage location. Make additional copies of the form if needed. Number each page of the inventory appropriately.

1. Enter the facility's street address on the line at the top of each page. Include the building number, if applicable.
2. Enter the date the inventory statement was prepared in the space at the top right side of each page.
3. In column 1, list the primary hazard class of the material. Contact your local agency regarding specific information to be reported.
4. In column 2 *(Note: LC = Location Code)*, identify the location within the facility where the material is stored by entering the same location code you assigned in your HMBP storage map. *(e.g. If you have assigned letter codes to storage locations and store a material in area D, then you would write "D" in this column.)*
5. In column 3, enter the common name or trade name by which the material is generally known *(e.g. "Lacquer Thinner", "Gasoline", etc.)*.
6. In column 4, enter the chemical name and concentration of each hazardous constituent comprising 1% or more of the material.
7. In column 5, enter the CAS (Chemical Abstract Service) Number of the material, if applicable. If the material has no CAS Number, list the CAS Number for each constituent listed in Column 4.
8. In column 6, identify the physical state of the material by checking the "pure" or "mixture box and the "solid", "liquid", or "gas" box.
9. In the appropriate spaces within column 7, provide the maximum daily amount stored, the average daily amount stored, and size of the largest container in which the material is stored at the location. *(Note: The unit of measure used must be the same as that indicated in Column 8.)*
10. In column 8, check the appropriate unit of measure: gallons for liquids, pounds for solids, and cubic feet for gases. Radioactive materials may be listed in μ *(micro)* curies.
11. In column 9, list the total number of days (e.g. 365) the material is present on site during the year.
12. In the appropriate spaces within Column 10, list every type of container in which the material is stored, the storage pressure, and the storage temperature. *[Note: "amb." = ambient (standard), "> amb." = greater than ambient, "< amb." = less than ambient, and "cryo." = cryogenic.]* The following codes shall be used to indicate container type(s):

Code	Storage Type	Code	Storage Type	Code	Storage Type
A	Aboveground Tank	G	Carboy	M	Glass Bottle or Jug
B	Belowground Tank	H	Silo	N	Plastic Bottle or Jug
C	Tank Inside Building	I	Fiber Drum	O	Tote Bin
D	Steel Drum	J	Bag	P	Tank Wagon
E	Plastic or Non-metallic Drum	K	Box	Q	Rail Car
F	Can	L	Cylinder	R	Other

13. In column 11, check the box(es) which describe the SARA *(Superfund Amendment and Reauthorization Act)* physical and health hazards associated with the material. Refer to the material's Material Safety Data Sheet (MSDS) and the following table when making your determinations.

Physical Hazards			Health Hazards	
Fire	**Pressure**	**Reactive**	**Immediate** *(acute)*	**Delayed** *(chronic)*
Flammables	Explosives	Unstable Reactives	Toxic/Highly Toxic Matls.	Carcinogens
Combustible Liquids	Compressed Gases	Organic Reactives	Corrosives	
Pyrophorics		Water Reactives	Sensitizers	
Oxidizers			Irritants	

(Note: This table is intended to serve as a guideline, and is not all-inclusive.)

14. Check the box in Column 12 *(Note: IW = Industrial Waste)* if the material is discharged to the sewer, even if it is pre-treated.

Non-Waste Hazardous Materials Inventory Statement

For Use By All Jurisdictions Within the County of Santa Clara

Section C - Hazardous Waste Inventory

All hazardous wastes generated or handled at the facility must be listed on the Hazardous Waste Inventory Statement (printed on other side of this page). Instructions for completing the inventory are provided below. Trade secret materials should be listed separately from non-trade secret materials and each page must clearly be marked "Trade Secret". Your local agency may be capable of accepting electronic reporting of this information. Contact your local agency for details.

Group wastes by storage location. Complete one row for each individual hazardous waste accumulated or stored at a storage location. Make additional copies of the form if needed. Number each page of the inventory appropriately. Completion of this inventory constitutes an application for (or an amendment to) the facility's Hazardous Waste Generator Permit.

1. Enter the facility's street address on the line at the top of each page. Include the building number, if applicable.
2. Enter the facility's EPA Identification Number on the line provided at the top of each page.
3. Enter the date the inventory statement was prepared in the space at the top right side of each page.
4. In column 1, list the primary hazard class of the waste. Contact your local agency regarding specific information to be reported.
5. In column 2 *(Note: LC = Location Code)*, identify the location within the facility where the waste is accumulated or stored by entering the same location code you assigned in your HMBP storage map. *(e.g. If you have assigned letter codes to storage locations and store a waste in area B, then you would write "B" in this column.)*
6. In column 3, enter the name of the waste stream *(e.g. "Waste Oil", "Used Antifreeze", etc.)* and the chemical name and concentration of each hazardous constituent comprising 1% or more of the waste.
7. In column 4, check the box which describes how the waste stream is managed.
8. In column 5, enter the 3 digit California Waste Code most appropriate for the waste. *(Note: These codes can be found listed on the back of California Uniform Hazardous Waste Manifests. Codes beginning with 7 or 8 take precedence over other codes.)*
9. In column 6, note the physical state of the waste by checking the "pure" or "mixture box and the "solid", "liquid", or "gas" box.
10. In column 7, identify the total amount of this waste generated over the past year.
11. In the appropriate spaces within column 8, provide the maximum and average daily amounts stored, and size of the largest container in which the waste is stored at the location. *(Note: Unit of measure must be the same as that indicated in Column 9.)*
12. In column 9, check the appropriate unit of measure: gallons or pounds for liquids, and pounds for solids or gases.
13. In column 10, list the total number of days the waste is present on site during the year (e.g. 365). *(Note: This might differ from accumulation time for individual containers.)*
14. In the appropriate spaces within Column 11, list every type of container in which the waste is stored, the storage pressure, and the storage temperature. *[Note: "amb." = ambient (standard), "> amb." = greater than ambient, "< amb." = less than ambient, and "cryo." = cryogenic.]* The following codes shall be used to indicate container type(s):

Code	Storage Type	Code	Storage Type	Code	Storage Type
A	Aboveground Tank	G	Carboy	M	Glass Bottle or Jug
B	Belowground Tank	H	Silo	N	Plastic Bottle or Jug
C	Tank Inside Building	I	Fiber Drum	O	Tote Bin
D	Steel Drum	J	Bag	P	Tank Wagon
E	Plastic or Non-metallic Drum	K	Box	Q	Rail Car
F	Can	L	Cylinder	R	Other

15. In column 12, check the box(es) which describe the SARA *(Superfund Amendment and Reauthorization Act)* physical and health hazards associated with the waste. Refer to MSDSs and the following table when making your determinations.

Physical Hazards			Health Hazards	
Fire	**Pressure**	**Reactive**	**Immediate** *(acute)*	**Delayed** *(chronic)*
Flammables	Explosives	Unstable Reactives	Toxic/Highly Toxic Matls.	Carcinogens
Combustible Liquids	Compressed Gases	Organic Reactives	Corrosives	
Pyrophorics		Water Reactives	Sensitizers	
Oxidizers			Irritants	

(Note: This table is intended to serve as a guideline, and is not all-inclusive.)

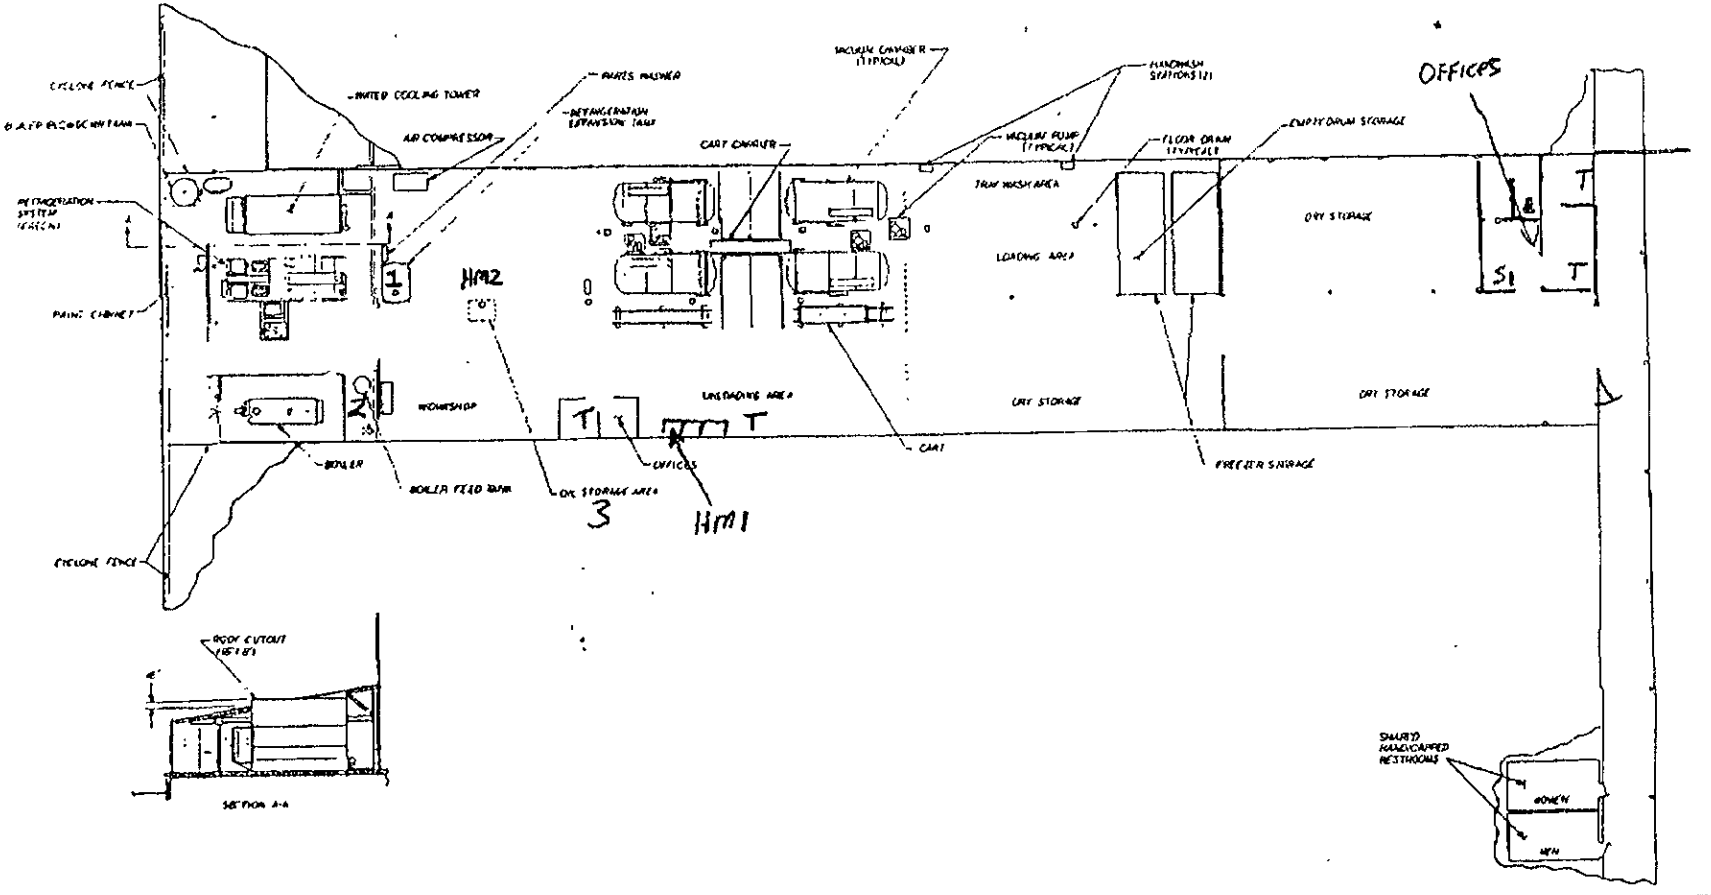
Facility Site Plan and Storage Map
(Hazardous Materials Business Plan Module)

A site plan and storage map must be included with your HMBP. For relatively small facilities, these documents may be combined into one drawing. Since these drawings are intended for use in emergency response situations, larger facilities *(generally those with complex and/or multiple buildings)* should provide an overall site plan and a separate storage map for each building/storage area. A blank Facility Site Plan/Storage Map sheet has been provided on the reverse side of this page. You may complete that page or attach any other drawing(s) which contain(s) the information required below.



1. **Site Plan:** This drawing shall contain, at a minimum, the following information:

   a. An indication of North Direction;
   b. Approximate scale *(e.g. "1 inch = 10 feet".)*;
   c. Date the map was drawn;
   d. All streets bordering the facility;
   e. Locations of all buildings and other structures;
   f. Parking lots and internal roads;
   g. Hazardous materials loading/unloading areas;
   h. Outside hazardous materials storage or use areas;
   i. Storm drain and sanitary sewer drain inlets;
   j. Wells for monitoring of underground tank systems;
   k. Primary and alternate evacuation routes, emergency exits, and primary and alternate staging areas.

2. **Storage Map(s):** The map(s) shall contain, at a minimum, the following information:

   a. General purpose of each section/area within each building *(e.g. "Office Area", "Manufacturing Area", etc.)*;
   b. Location of each hazardous material/waste storage, dispensing, use, or handling area *(e.g. individual underground tanks, aboveground tanks, storage rooms, paint booths, etc.)*. Each area shall be identified by a unique location code number, letter, or name *(e.g. "1", "2", "3"; "A", "B", "C", etc.)*;
   c. Entrances to and exits from each building and hazardous material/waste room/area;
   d. Location of each utility emergency shut-off point *(i.e. gas, water, electric.)*;
   e. Location of each monitoring system control panel *(e.g. underground tank monitoring, toxic gas monitoring, etc.)*.

scale: 3" = 100' - 0"

Emergency Response/Contingency Plan

(Hazardous Materials Business Plan Module)

Authority Cited: H&SC, Section 25504(b); Title 22, Div. 4.5, Ch. 12, Art. 3 CCR

All facilities which handle hazardous materials in specified quantities must have a written emergency response plan. In addition, facilities which generate 1,000 kilograms or more of hazardous waste per month, or accumulate more than 6,000 kilograms of hazardous waste on-site at any one time, must prepare a contingency plan. Because the requirements are similar, they have been combined in a single document, provided below, for your convenience. This plan is a required module of the Hazardous Materials Business Plan (HMBP). If you already have a plan which meets these requirements, you should not complete the blank plan, below, but you must include a copy of your existing plan as part of your HMBP.

This site-specific Emergency Response/Contingency Plan is the facility's plan for dealing with emergencies and shall be implemented immediately whenever there is a fire, explosion, or release of hazardous materials which could threaten human health and/or the environment. **At least one copy of the plan shall be maintained at the facility for use in the event of an emergency and for inspection by the local agency.** Within Santa Clara County, hospitals and police agencies have delegated receipt of these plans to the local agencies administering Hazardous Materials Business Plans, so additional copies need not be submitted. However, a copy of the plan and any revisions must be provided to any contractor, hospital, or agency with whom special (i.e. contractual) emergency services arrangements have been made *(see section 3, below)*.

1. Evacuation Plan:

a. The following alarm signal(s) will be used to begin evacuation of the facility *(check all which apply)*:

☐ Bells; ☐ Horns/Sirens; ☒ Verbal *(i.e. shouting)*; ☐ Other *(specify)* _____

b. ☐ Evacuation map is prominently displayed throughout the facility.

Note: A properly completed HMBP Site Plan satisfies contingency plan map requirements. This drawing (or any other drawing which shows primary and alternate evacuation routes, emergency exits, and primary and alternate staging areas) must be prominently posted throughout the facility in locations where it will be visible to employees and visitors.

2. a. Emergency Contacts*:

Fire/Police/Ambulance	Phone No. 911
State Office of Emergency Services	Phone No. (800) 852-7550

b. Post-Incident Contacts*:

Fire Department Hazardous Materials Program	Phone No.: (650) 329-2184
Santa Clara County Hazardous Materials Compliance Division	Phone No. (408) 299-6930
California EPA Department of Toxic Substances Control	Phone No. (510) 540-3739
Cal-OSHA Division of Occupational Safety and Health	Phone No. (415) 557-1677
Bay Area Air Quality Management District	Phone No. (415) 771-6000
Regional Water Quality Control Board	Phone No. (510) 286-1255

** These telephone numbers are provided as a general aid to emergency notification. Be advised that additional agencies may be required to be notified.*

c. Emergency Resources:

Poison Control Center ..... Phone No. (800) 876-4766

Nearest Hospital: Name: STANFORD Phone No.: (650) 723-4000

Address: 300 PASTEUR City: STANFORD

3. Arrangements With Emergency Responders:

If you have made special (i.e. contractual) arrangements with any police department, fire department, hospital, contractor, or State or local emergency response team to coordinate emergency services, describe those arrangements on the lines below:

4. **Emergency Procedures:**

Emergency Coordinator Responsibilities:

a. Whenever there is an imminent or actual emergency situation such as a explosion, fire, or release, the emergency coordinator *(or his/her designee when the emergency coordinator is on call)* shall:

   i. Identify the character, exact source, amount, and areal extent of any released hazardous materials.

   ii. Assess possible hazards to human health or the environment that may result from the explosion, fire, or release. This assessment must consider both direct and indirect effects *(e.g. the effects of any toxic, irritating, or asphyxiating gases that are generated, the effects of any hazardous surface water run-off from water or chemical agents used to control fire, etc.).*

   iii. Activate internal facility alarms or communications systems, where applicable, to notify all facility personnel.

   iv. Notify appropriate local authorities *(i.e. call 911).*

   v. Notify the State Office of Emergency Services at 1-800-852-7550.

   vi. Monitor for leaks, pressure build-up, gas generation, or ruptures in valves, pipes, or other equipment shut down in response to the incident.

   vii. Take all reasonable measures necessary to ensure that fires, explosions, and releases do not occur, recur, or spread to other hazardous materials at the facility.

b. Before facility operations are resumed in areas of the facility affected by the incident, the emergency coordinator shall:

   i. Provide for proper storage and disposal of recovered waste, contaminated soil or surface water, or any other material that results from a explosion, fire, or release at the facility.

   ii. Ensure that no material that is incompatible with the released material is transferred, stored, or disposed of in areas of the facility affected by the incident until cleanup procedures are completed.

   iii. Ensure that all emergency equipment is cleaned, fit for its intended use, and available for use.

   iv. Notify the California Environmental Protection Agency's Department of Toxic Substances Control, the County of Santa Clara's Hazardous Materials Compliance Division, and the local fire department's hazardous materials program that the facility is in compliance with requirements b-i and b-ii, above.

Responsibilities of Other Personnel:

On a separate page, list any emergency response functions not covered in the "Emergency Coordinator Responsibilities" section, above. Next to each function, list the job title or name of each person responsible for performing the function. Number the page(s) appropriately.

5. **Post-Incident Reporting/Recording:**

The time, date, and details of any hazardous materials incident that requires implementation of this plan shall be noted in the facility's operating record.

Within 15 days of any hazardous materials emergency incident or threatened hazardous materials emergency incident which triggers implementation of this plan, a written Emergency Incident Report, including, but not limited to a description of the incident and the facility's response to the incident, must be submitted to the California Environmental Protection Agency's Department of Toxic Substances Control, the County of Santa Clara's Hazardous Materials Compliance Division, and the local fire department's hazardous materials program. The report shall include:

a. Name, address, and telephone number of the facility's owner/operator;
b. Name, address, and telephone number of the facility;
c. Date, time, and type of incident *(e.g. fire, explosion, etc.)*;
d. Name and quantity of material(s) involved;
e. The extent of injuries, if any;
f. An assessment of actual or potential hazards to human health or the environment, where this is applicable;
g. Estimated quantity and disposition of recovered material that resulted from the incident;
h. Cause(es) of the incident;
i. Actions taken in response to the incident;
j. Administrative or engineering controls designed to prevent such incidents in the future.

Emergency Response/Contingency Plan

6. **Emergency Equipment:**

22 CCR, Section 66265.52(e) [as referenced by Section 66262.34(a)(3)] and the Hazardous Materials Storage Ordinance require that emergency equipment at the facility be listed. Completion of the following Emergency Equipment Inventory Table meets this requirement.

EMERGENCY EQUIPMENT INVENTORY TABLE

1. Equipment Category	2. Equipment Type	3. Locations *	4. Description**
Personal Protective, Equipment, Safety Equipment, and First Aid Equipment	☐ Cartridge Respirators		
	☐ Chemical Monitoring Equipment *(describe)*		
	☐ Chemical Protective Aprons/Coats		
	☐ Chemical Protective Boots		
	☒ Chemical Protective Gloves	HM1	
	☐ Chemical Protective Suits *(describe)*

** *Describe the equipment and its capabilities. If applicable, specify any testing/maintenance procedures/intervals. Attach additional pages, numbered appropriately, if needed.*

Employee Training Plan

(Hazardous Materials Business Plan Module)

Authority Cited: H&SC, Section 25504(c); 22 CCR, Section 66265.16

All facilities which handle hazardous materials must have a written employee training plan. This plan is a required module of the Hazardous Materials Business Plan (HMBP). A blank plan has been provided below for you to complete and submit if you do not already have such a plan. If you already have a training plan, you are not required to complete the blank plan, below, but you must include a copy of your existing plan as part of your HMBP.

Check all boxes which apply. *[Note: Items marked with an asterisk (*) are required.]*:

1. **Personnel** are trained in the following procedures:

☒	Internal alarm/notification *
☒	Evacuation/re-entry procedures & assembly point locations*
☐	Emergency incident reporting;
☐	External emergency response organization notification
☐	Location(s) and contents of Emergency Response/Contingency Plan
☐	Facility evacuation drills, which are conducted at least *(specify)* _____ *(e.g. "Quarterly", etc.)*

2. **Chemical Handlers** are additionally trained in the following:

☒	Safe methods for handling and storage of hazardous materials *
☐	Location(s) and proper use of fire and spill control equipment
☐	Spill procedures/emergency procedures
☒	Proper use of personal protective equipment *
☒	Specific hazard(s) of each chemical to which they may be exposed, including routes of exposure *(i.e. inhalation, ingestion, absorption)* *
☒	**Hazardous Waste Handlers/Managers** are trained in all aspects of hazardous waste management specific to their job duties *(e.g. container accumulation time requirements, labeling requirements, storage area inspection requirements, manifesting requirements, etc.)* *

3. **Emergency Response Team Members** are capable of and engaged in the following:

☐	Personnel rescue procedures
☒	Shutdown of operations
☐	Liaison with responding agencies
☐	Use, maintenance, and replacement of emergency response equipment
☒	Refresher training, which is provided at least annually *
☐	Emergency response drills, which are conducted at least *(specify)* _____ *(e.g. "Quarterly", etc.)*

Recordkeeping
(Hazardous Materials Business Plan Module)

All facilities which handle hazardous materials must maintain records associated with their management. A summary of your recordkeeping procedures is a required module of the Hazardous Materials Business Plan (HMBP). A blank summary has been provided below for you to complete and submit if you do not already have such a document. If you already have a brief written description of your hazardous materials recordkeeping systems which addresses all subjects covered below, you are not required to complete this page, but you must include a copy of your existing document as part of your HMBP.

Check all boxes which apply. The following records are maintained at the facility. *[Note: Items marked with an asterisk (*) are required.]*:

☒	Current employees' training records *(to be retained until closure of the facility)* *
☒	Former employees' training records *(to be retained at least three years after termination of employment)* *
☒	Training Program(s) *(i.e. written description of introductory and continuing training)* *
☒	Current copy of this Emergency Response/Contingency Plan *
☒	Record of recordable/reportable hazardous material/waste releases *
☒	Record of hazardous material/waste storage area inspections *
☒	Record of hazardous waste tank daily inspections *
☐	Description and documentation of facility emergency response drills

Note: The above list of records does not necessarily identify every type of record required to be maintained by the facility.

Per the Hazardous Materials Storage Ordinance, a sample copy of each Inspection Check Sheet or Log used in conjunction with required routine self-inspections of your facility must be submitted with your HMBP. *(Exception: Attached, you will find a Hazardous Materials/Waste Storage Area Inspection Form which you may use if you do not already have your own form. If you indicate that you use the example provided, you do not need to attach a copy.)*

Check the appropriate box:

☒	We will use the "Hazardous Materials/Waste Storage Area Inspection Form" to document inspections.
☐	We will use our own documents to record inspections. *(A blank copy of each document used must be attached to this HMBP.)*

Aboveground Separation, Containment, and Monitoring Plan

(Appendix to Hazardous Materials Business Plan)

Complete one column for each aboveground storage area shown on the Hazardous Materials Business Plan Storage Map(s). Write the appropriate location code in the box provided at the top of each column, then moving down the column, check all boxes which apply to that location. Make additional copies of this page if needed.

Location Code	1	2	3

December 30, 1999

RECEIVED JAN 12 2000

Kyle Flory
PES Environmental, Inc
1682 Novato Boulevard, Suite 100
Novato, CA 94947

Order:	18299	**Date Collected:**	12/21/99
Project Name:	Former Mercer Processing Plant	**Date Received:**	12/22/99
Project Number:	500 009.02.001	**P.O. Number:**	
Project Notes:			

On December 22, 1999, 12 samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	EPA 8260B	EPA 8260B

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#I-2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

Project Notes:

Date Collected: 12/21/99
Date Received: 12/22/99
P.O. Number:

On December 22, 1999, 12 samples were received under documentented chain of custody. Results for the following analyses are attached:

Matrix	Test	Method
Solid	EPA 8260B	EPA 8260B

Chemical analysis of these samples has been completed. Summaries of the data are contained on the following pages. USEPA protocols for sample storage and preservation were followed.

Entech Analytical Labs, Inc. is certified by the State of California (#I-2346). If you have any questions regarding procedures or results, please call me at 408-735-1550.

Sincerely,

Michelle L. Anderson
Lab Director

VAPOR PHASE MIGRATION MODELING CALCULATIONS

Calculate Soil Gas Concentration from Soil Concentration

$$Csg = \frac{H*Csoil*BD}{Pw+(Kd*BD)+(H*Pa)} = \frac{X}{Y}$$

Csg	Soil Gas Concentration (mg/Kg)
H	Henry's law Constant (unitless)
Csoil	Contaminant Soil Concentration (mg/Kg)
BD	Bulk Density (g/cm3)
Pa	Air Filled Porosity (unitless)
Pw	Water Filler Porosity = Pt-Pa (%)
Pt	Total Porosity (unitless)
Kd	Sorption Coefficient = (Koc*foc) + (Koi*foi)

H =	0.37
Csoil =	6.8
BD =	1.04
Pw =	0.32
Kd =	2.6
Pa =	0.2
Pt =	0.52

Csg = X/Y

X	2.61664
Y	3.098
Csg =	0.844622

ug/m3 =	844622.3
	8.45E+05

Table A1. Vapor Phase Migration and Risk Calculations - Mercer Processing

C_{sg}, Soil Gas Concentration (ug/m^3)
844,622

A. Calculation of Flux

formula $FLUX = (D_a * C_{sg})/X$

$= ((D_a * P_a^{3.33}/P_t^2) * C_{sg})/X$

X (m) = 1.22 P_a = 0.2 P_t = 0.52

chemical	D_a (m^2/hr)	FLUX ($ug/hr-m^2$)
TCE	0.2844	**3.42E+03**

B. Calculation of Indoor Air Concentration

formula $C_i = (Slab * Flux)/(height * E)$

chemical	Matrix Used	Flux ($ug/hr-m^2$)	Slab (unitless)	height (m)	E (1/hr)	C_{in} (ug/m^3)
TCE	Soil Gas	3.42E+03	1	3.0480	0.83	**1.35E+03**

B. Calculation Risk

formula Risk = Intake*SlopeFactor

where, Intake = (Ci*IR*ET*EF*ED)/BW*AT

	Ci (mg/m^3)	IR (m^3/day)	ET (hr/24hr)	EF (days/yr)	ED (yr)	BW (kg)	AT (days)	Intake (mg/kg-day)	SlopeFactor $(mg/kg-day)^{-1}$	Risk
TCE Exposure Industrial Setting	1.35E+00	20	12	250	25	70	25500	0.04740281	6.00E-03	2.84E-04

Cancer Risk (1/Risk)
3,516

Table A1. Vapor Phase Migration and Risk Calculations - Mercer Processing

C_{sg}, Soil Gas Concentration (ug/m^3)
844,622

A. Calculation of Flux

formula $FLUX = (D_e * C_{sg})/X$

$= ((D_a * P_a^{3.33}/P_t^2) * C_{sg})/X$

X (m) = 1.22 P_a = 0.2 P_t = 0.52

chemical	D_a (m^2/hr)	FLUX ($ug/hr\text{-}m^2$)
TCE	0.2844	**3.42E+03**

B. Calculation of Indoor Air Concentration

formula $C_I = (Slab * Flux)/(height * E)$

chemical	Matrix Used	Flux ($ug/hr\text{-}m^2$)	Slab (unitless)	height (m)	E (1/hr)	C_{In} (ug/m^3)
TCE	Soil Gas	3.42E+03	0.1	3.0480	0.83	**1.35E+02**

B. Calculation Risk

formula Risk = Intake*SlopeFactor

where, Intake = (Ci*IR*ET*EF*ED)/BW*AT

	Ci (mg/m^3)	IR (m^3/day)	ET (hr/24hr)	EF (days/yr)	ED (yr)	BW (kg)	AT (days)	Intake (mg/kg-day)	SlopeFactor $(mg/kg\text{-}day)^{-1}$	Risk
TCE Exposure Industrial Setting	1.35E-01	20	12	250	25	70	25500	0.004740281	6.00E-03	2.84E-05

Cancer Risk (1/Risk)

VLEACH (Version 2.2a, 1996)

By:
Varadhan Ravi and Jeffrey A. Johnson
(USEPA Contractors)
Center for Subsurface Modeling Support
Robert S. Kerr Environmental Research Laboratory
U.S. Environmental Protection Agency
P.O. Box 1198
Ada, OK 74820

Based on the original VLEACH (version 1.0)
developed by CH2M Hill, Redding, California
for USEPA Region IX

Cleanup concentration = 0.90 mg/kg TCE

VLEACH (Version 2.2a, 1996)

By:
Varadhan Ravi and Jeffrey A. Johnson
(USEPA Contractors)
Center for Subsurface Modeling Support
Robert S. Kerr Environmental Research Laboratory
U.S. Environmental Protection Agency
P.O. Box 1198
Ada, OK 74820

Based on the original VLEACH (version 1.0)
developed by CH2M Hill, Redding, California
for USEPA Region IX

Cleanup Concentration = 0.4 mg/kg TCE

VLEACH (Version 2.2a, 1996)

By:
Varadhan Ravi and Jeffrey A. Johnson
(USEPA Contractors)
Center for Subsurface Modeling Support
Robert S. Kerr Environmental Research Laboratory
U.S. Environmental Protection Agency
P.O. Box 1198
Ada, OK 74820

Based on the original VLEACH (version 1.0)
developed by CH2M Hill, Redding, California
for USEPA Region IX

Cleanup concentration = 0.25 mg/kg TCE

VLEACH (Version 2.2a, 1996)

By:
Varadhan Ravi and Jeffrey A. Johnson
(USEPA Contractors)
Center for Subsurface Modeling Support
Robert S. Kerr Environmental Research Laboratory
U.S. Environmental Protection Agency
P.O. Box 1198
Ada, OK 74820

Based on the original VLEACH (version 1.0)
developed by CH2M Hill, Redding, California
for USEPA Region IX

Cleanup Concentration = 0.20 mg/kg TCE

VLEACH (Version 2.2a, 1996)

By:
Varadhan Ravi and Jeffrey A. Johnson
(USEPA Contractors)
Center for Subsurface Modeling Support
Robert S. Kerr Environmental Research Laboratory
U.S. Environmental Protection Agency
P.O. Box 1198
Ada, OK 74820

Based on the original VLEACH (version 1.0)
developed by CH2M Hill, Redding, California
for USEPA Region IX

Cleanup Concentration = 0.1 mg/kg TCE

EXECUTIVE SUMMARY

This Remedial Action Plan has been prepared by PES Environmental, Inc. on behalf of El Camino Center to address soil affected by chlorinated hydrocarbons, primarily trichloroethylene, at its property, located at 230 Portage Avenue in Palo Alto, California, formerly occupied by Mercer Processing, Inc. Planning for and implementation of remedial action at the facility are being performed under the supervision of the California Regional Water Quality Control Board - San Francisco Bay Region. The objectives of this Remedial Action Plan are to: (1) evaluate remedial alternatives and identify remedies that will mitigate the potential for adverse affects to human health and groundwater quality; and (2) recommend a remedial action to address chlorinated hydrocarbons in soil at the site. Specifically, the Remedial Action Plan:

- Summarizes the results of previous subsurface remedial investigations performed at the site;
- Presents an evaluation of risk to human health and the environment, principally groundwater resources;
- Develops a site-specific remedial goal for contaminated soil;
- Presents an evaluation of remedial alternatives;
- Recommends a remedial alternative for implementation; and
- Describes procedures to implement the recommended remedial action.

In addition, PES Environmental, Inc. and El Camino Center have prepared a Community Relations Plan (Appendix A of the Remedial Action Plan). The Community Relations Plan includes provisions for notifying the public of the availability of the Remedial Action Plan for review and comment, making the Remedial Action Plan available for public review and comment for a period of 30 days, publishing a brief analysis of the site and the proposed remedial action, holding a public meeting to discuss the history of the site and proposed remedial action, addressing comments received from concerned public, and publishing the selected final remedial action for the site following expiration of the public comment period.

The subject site is located in a primarily commercial and light industrial area with some nearby residences. The entire property, with the exception of landscaped areas and one onsite structure, is covered with asphalt-concrete parking lots and concrete sidewalks. The site is located within an area that is currently undergoing groundwater remediation through extraction and treatment due to releases of chlorinated hydrocarbons at other locations.

Mercer Processing, Inc. performed freeze-drying and food product packaging at the site between 1989 and 1999. These activities involved the use of trichloroethylene at the site for refrigeration equipment from approximately 1989 to 1991. During several subsurface remedial investigations performed at the site in 1999 and 2000, chlorinated hydrocarbons were identified in subsurface soil samples collected from the vicinity of the former refrigeration equipment. Trichloroethylene was the chlorinated hydrocarbon detected most frequently and at the most elevated concentrations. The highest concentration of trichloroethylene was detected in a soil sample collected beneath the former refrigeration unit at approximately four feet below ground surface. Concentrations of trichloroethylene decrease both laterally and vertically from this sample location. Based on the results of these remedial investigations, the lateral and vertical extent of chlorinated hydrocarbons in soil in the vicinity of the former refrigeration unit appears to be adequately defined for remedial planning purposes.

The Remedial Action Plan includes a health risk evaluation and assessment of the risk of contamination of groundwater resources due to releases of hazardous substances at the site ("site risk evaluation"). On the basis of this evaluation, a target soil cleanup level of 0.2 milligrams per kilogram trichloroethylene is recommended for the site.

Five soil remedial alternatives were considered as potentially applicable for this site: (1) no action; (2) soil excavation with offsite disposal; (3) soil excavation with ex-situ on-site treatment; (4) in-situ soil vapor extraction; and (5) enhanced in-situ bioremediation. These remedial alternatives were evaluated against criteria identified in the National Oil and Hazardous Substances Pollution Contingency Plan. Based on the results of this evaluation, soil excavation with offsite disposal is recommended for remediation of chlorinated hydrocarbons in soil. This approach will effectively and economically reduce the mass of contaminants in soil, thereby significantly reducing the risk to human health and the environment posed by the releases of hazardous substances at the site. Additionally, soil excavation with offsite disposal will require the shortest duration and is the least uncertain of the technically feasible remediation measures.

If the recommended remedial alternative is adopted, soil excavation will be performed in the vicinity of the former refrigeration unit. The in-place volume of trichloroethylene-affected soil requiring removal is estimated to be 470 cubic yards (approximately equivalent to 660 tons). The actual volume will depend on the distribution of trichloroethylene in soil, and inherent limitations of soil excavation equipment and techniques. The excavated soil will be characterized, and on the basis of the characterization, transported to an appropriately permitted landfill for disposal.

If the recommended remedial alternative is adopted after the 30-day public comment period, the remediation work will commence in seven to ten working days.

1.0 INTRODUCTION

PES Environmental, Inc. (PES) has prepared this Remedial Action Plan (RAP) on behalf of El Camino Center to address soil affected by volatile organic compounds (VOCs) at the former Mercer Processing (Mercer) facility (site). The former Mercer facility, which is owned by El Camino Center, is located at 230 Portage Avenue in Palo Alto, California (Plate 1). This RAP summarizes subsurface environmental investigations conducted at the subject property. In addition, the RAP: (1) presents an evaluation of risk to human health and the environment; (2) develops site-specific remedial goals; (3) presents an evaluation of remedial alternatives; (4) identifies a remedial alternative for implementation; and (5) describes procedures to implement the selected remedial action.

This document has been prepared in response to a letter dated May 9, 2001 from the staff of the California Regional Water Quality Control Board – San Francisco Bay Region (RWQCB) to Mr. Boyd Smith of El Camino Center. RWQCB asked El Camino Center to submit a RAP to address chemicals found in soil at the site. RWQCB's request was made in response to El Camino Center's March 22, 2001 submittal consisting of technical reports describing the results of prior environmental investigations at the site.

The activities described in this document are consistent with the National Oil and Hazardous Substances Pollution Contingency Plan[1] (NCP), and the California Health and Safety Code.

Remedial planning conducted by El Camino Center includes: (1) submittal of this RAP; (2) review, comment and approval of the RAP by the RWQCB; (3) preparation and implementation of a Community Relations Plan; and (4) finalizing and implementing the RAP, as appropriate.

The Community Relations Plan includes provisions for notifying the public of the availability of the RAP for review and comment, making the RAP available for public review and comment for a period of 30 days, publishing a brief analysis of the site and the proposed remedial action. The Community Relations Plan also includes provisions for holding a public meeting to discuss the history of the site and proposed remedial action, addressing comments received from concerned public, and publishing the selected final remedial action for the site following expiration of the public comment period. A copy of the Community Relations Plan, fact sheet, fact sheet distribution list and distribution map are presented in Appendix A. In the final RAP, copies of public notice, public comments and responses to these comments will be appended.

1.1 Objectives of Remedial Action Plan

The objectives of the RAP are to: (1) identify remediation strategies that will prevent adverse impact to human health and avoid degradation of groundwater quality; and (2) present a

[1] Title 40 Code of Federal Regulations, Part 300.

program for remediation of vadose zone soils affected by VOCs, primarily trichloroethylene (TCE), at the site. The RAP: (1) assesses the potential for TCE in unsaturated soil to migrate to groundwater beneath the site; (2) evaluates potential health risks to future site occupants associated with TCE in soil; (3) establishes a risk-based site-specific cleanup level for TCE in unsaturated soils; (4) evaluates applicable remedial alternatives; (5) recommends a remedial alternative; (6) outlines the tasks to implement the recommended remedial action; and (7) provides a preliminary schedule for implementation of the proposed remedial action.

1.2 Organization

The RAP includes the following sections:

Section 1.0 – Introduction. The introduction presents a general explanation of the objectives and organization of the RAP.

Section 2.0 – Site Background This section provides a description of the site and summarizes previous investigations performed at the site.

Section 3.0 – Evaluation of Applicable TCE Cleanup Level. A risk-based approach is used to develop a site-specific soil cleanup level in this section.

Section 4.0 – Evaluation of Remedial Alternatives. This section presents an evaluation of remedial action alternatives considered applicable for implementation at the site.

Section 5.0 – Remedial Action Plan Implementation. This section presents the procedures for implementation of the recommended remedial action alternative for the site and presents a schedule for remedial action implementation and reporting.

Section 6.0 – Administrative Records. This section presents a summary of letters and reports directly related to the site and regulatory guidance documents used during the preparation of the RAP.

2.0 SITE BACKGROUND

A description of the site and discussions of previous site investigations and the site geology and hydrogeology are presented below.

2.1 Site Description

The subject site is a vacant tenant space located within a larger commercial and light industrial building near the north end of Portage Avenue, in Palo Alto (Plate 1). It is located in a primarily commercial and light industrial area with some residences present. PES understands that the property is zoned for residential use but is being used for commercial purposes

pursuant to a variance that will expire in the year 2019, if it is not terminated earlier. The property is improved with one structure. The entire property, with the exception of landscaped areas and the onsite structure, is covered with asphalt-concrete parking lots and concrete sidewalks. A site plan is included as Plate 2.

Groundwater beneath and in the vicinity of the subject property has been affected by VOCs. The site is located within a regional groundwater plume (known as the California-Olive-Emerson [COE] Study Area and Perimeter Area) that is currently undergoing remediation through pumping and treatment (SECOR, 2000).

2.2 Site Use History

The Site, which is currently vacant, is a segment near the eastern end of a larger parcel that is used for retail and office operations. The largest tenant in the parcel is Frye's Electronics, located in the space immediately to the west of the Site in a common building structure. Two other tenants utilize portions of the building to the east for office purposes.

According to El Camino Center personnel, the use of the parcel can be traced to approximately the 1940s. The parcel, including the portion now comprising the Site, was reportedly used as a fruit cannery prior to World War II (Osborn, 2001). After World War II the parcel, including the Site, was used by Safeway as a food distribution warehouse and subsequently by Maximart as a strip mall consisting of numerous retail shops. The parcel was purchased by El Camino Center in the early 1970s. At the time of the purchase the parcel was occupied by Maximart and the retail shops, miscellaneous other warehouse and storage users, and Dura-Bond Manufacturing Company (Osborn, 2001). Following the purchase of the property by El Camino Center, Maximart left and the former Mercer tenant space was used as a warehouse for the storage of dry goods. That tenant space was reportedly used for the storage of dry goods until Mercer's occupancy commenced in 1989.

Dura-Bond Manufacturing Company (Dura-Bond) was located at the western end of the parcel. Dura-Bond conducted manufacturing operations at its portion of the parcel for a number of years, and vacated its site in the 1980s. Dura-Bond conducted an environmental investigation and remedial activities at its site under the supervision of the Regional Water Quality Control Board, which approved those activities and subsequently notified Dura-Bond that its site was closed.

In June 1997, El Camino Center personnel encountered an underground concrete vault located on the parcel in the parking lot area north of the existing retail/office building and west of the Site. The vault contained oil and sediment. The oil was characterized as a degraded fuel oil or motor oil. The liquid contents of the vault were removed and transported offsite for disposal. The vault was subsequently cleaned and inspected under direct observation of the Palo Alto Fire Department. The bottom of the vault was cored to allow sampling of the underlying soil. The verification soil samples did not contain fuel oil above the laboratory reporting limit. The Palo Alto Fire Department approved in-place abandonment of the vault. The vault was

abandoned by filling the core holes with sand and backfilling the vault to surface grade. The case was subsequently closed by the Palo Alto Fire Department.

According to information provided to PES during an inspection of the Mercer tenant space in December 1999, Mercer occupied this location between 1989 and 1999. Plate 3 shows the layout of the former Mercer Processing facility.

Operations performed by Mercer at this location included freeze-drying and packaging of food products. Refrigeration equipment used in the freeze-drying process contained solvents including trichloroethylene and Genesolv 2000. According to Mr. Dave Noland, the current president of Mercer, the refrigeration equipment utilized trichloroethylene from approximately 1989 until 1991, and Genesolv 2000 from 1991 until the facility ceased operations in December 1999. Genesolv 2000, also referred to as Refrigerant 141b, is composed of 1,1-dichloro-1-fluoroethane. Review of a Santa Clara County Hazardous Materials Compliance Division Hazardous Materials Business Plan for the facility dated September 11, 1998, indicates that the Mercer facility stored onsite approximately 650 gallons of Genesolv 2000, and smaller quantities (less than 55 gallons) of water treatment chemicals and lubricating oils.

On the basis of the site use history, the former Mercer operations are the likely source of trichloroethlene in soil beneath and in the vicinity of the tenant space used by Mercer.

2.3 Remedial Investigations

Several subsurface remedial investigations have been performed at the site and are summarized below. Laboratory analytical results for soil matrix samples collected from borings at the site are summarized in Table 1. Plate 3 presents the locations of soil borings relative to features associated with the Mercer operations. The remedial investigations were summarized in the following reports:

- *Facility Closure Assessment, Former Mercer Processing Facility, 230 Portage Avenue, Palo Alto, California* dated January 12, 2000 and prepared by PES;
- *Soil Sampling and Analysis Report, Former Mercer Processing Facility, 230 Portage Avenue, Palo Alto, California* dated July 24, 2000 and prepared by IT Corporation; and
- *Additional Definition Soil Sampling and Analysis Report, Former Mercer Processing Facility, 230 Portage Avenue, Palo Alto, California*, IT Corporation Project 806342, dated November 21, 2000 and prepared by IT Corporation.

The subsurface remedial investigations were performed after Mercer had vacated the site.

2.3.1 Facility Closure Assessment (PES, 2000)

In December 1999, PES performed a Facility Closure Assessment on behalf of El Camino Center to assess whether operations at the Mercer facility had adversely affected environmental conditions at the site. Ten soil samples were collected from four shallow soil borings in the vicinity of the former refrigeration unit (Plate 3). Acetone, methyl ethyl ketone, TCE, and tert-butanol were detected in the soil samples (PES, 2000). TCE was present in two of the ten soil samples at concentrations of 54 and 470 micrograms per kilogram (μg/kg).

2.3.2 Subsurface Investigations (IT Corporation, 2000)

In June and November of 2000, IT Corporation (IT) performed subsurface investigations on behalf of Mercer to further define the lateral and vertical extent of chemicals in the vadose zone beneath the site. In order to attempt to define the lateral and vertical extents of chlorinated hydrocarbon-affected soil, IT generally positioned soil borings on approximate 10-foot centers and collected soil samples for chemical analysis at 2-foot-depth intervals (Plate 3 and Table 1). During the investigations, IT collected 82 soil samples from 14 soil borings in the vicinity of the former refrigeration unit (IT, 2000a and 2000b). TCE, 1,1-dichloroethene, cis-1,2-dichloroethene, and trans-1,2-dichloroethene were detected in the soil samples. TCE was detected most frequently, and at the highest concentrations, and was present in 48 of the 82 soil samples at concentrations ranging from an estimated value of 3 μg/kg to 6,800 μg/kg (IT, 2000b).

Based on the results of these investigations, the lateral and vertical extent of chlorinated hydrocarbons in soil in the vicinity of the former refrigeration unit appears to be adequately defined for remedial planning purposes. The highest concentration of TCE is present within Boring B (located beneath the former refrigeration unit) at approximately four feet below ground surface (bgs) (Plate 3). Concentrations of TCE decrease both laterally and vertically from Boring B (IT, 2000b).

2.4 Regional and Site-Specific Geologic Conditions

2.4.1 Regional Geologic Conditions

The subject property is located in an area of Palo Alto that is generally underlain by medium-grained alluvium of Holocene age. According to the *Geologic Map of the Palo Alto and Part of the Redwood Point 7-1/2' Quadrangles, San Mateo and Santa Clara Counties, California* published in 1993, this alluvium is unconsolidated to moderately consolidated, moderately sorted fine sand, silt and clayey silt and is generally less than 20 feet thick. This alluvium is underlain by Holocene- to Pleistocene-aged alluvial and basinal deposits that are approximately 500 feet thick. The alluvial material may be underlain by bedrock consisting of Miocene-aged Ladera Sandstone or Franciscan Complex metasedimentary or meta-igneous rock (USGS, 1993).

2.4.2 Site Specific Geologic Conditions

On the basis of the findings presented in IT's reports, the vadose zone consists of concrete slab approximately ½-foot-thick, base course fill material approximately ½ foot-thick, underlain by sandy clay to approximately 16 feet bgs and low to medium plastic clay from 16 feet bgs to 28 feet bgs, the maximum depth investigated.

2.5 Regional and Site-Specific Hydrogeologic Conditions

2.5.1 Regional Hydrogeologic Conditions

In general, first encountered groundwater is located approximately 20 to 30 feet bgs, and the regional flow direction is to the north, towards San Francisco Bay. Matadero Canal, a concrete-lined canal, is located approximately 200 feet south of the property.

2.5.2 Site-Specific Hydrogeologic Conditions

Depth to first-encountered groundwater is estimated to be approximately 28 feet bgs (Secor, 2000 and IT, 2000b). The direction of groundwater flow in the first-encountered water-bearing zone beneath the site is towards the north (Secor, 2000). According to Secor's Semi-Annual Groundwater Monitoring Report dated October 21, 2000, VOC-affected groundwater in the COE Study Area and Perimeter Area is present in three water-bearing zones: (1) A1 Upper Zone, (2) A1 Zone, and (3) A2 Zone. On the basis of TCE isoconcentration contours presented in Secor's October 2000 monitoring report, TCE concentrations in the A1 Upper Zone beneath the subject site range from approximately 50 μg/L to 85 μg/L (Secor, 2000).

Groundwater within the COE Study Area and Perimeter Area is currently undergoing remediation through groundwater extraction and treatment. Groundwater is extracted for treatment from nine extraction wells positioned in the three water-bearing zones (Secor, 2000). The groundwater extraction and treatment system generally operates continuously with the exception of brief shutdowns for maintenance. Extracted groundwater is treated with granular activated carbon and is reused for landscape irrigation and/or discharged to the storm drain system under a National Pollutant Discharge Elimination System permit (Secor, 2000).

3.0 SITE RISK EVALUATION

This section presents the methodologies and results of evaluations of site risks related to chemical hazards and presents a site-specific cleanup level for TCE in unsaturated soil. The site risk evaluation presented herein consists of the following components: (1) evaluating regional water quality standards and goals; (2) evaluating target cleanup goals for VOC- and TCE -affected soil developed by RWQCB staff for sites in similar settings; (3) assessing potential health risks to future site occupants; (4) assessing the potential for TCE in soil at the

site to migrate vertically to groundwater beneath the property; and (5) selecting the appropriate TCE soil cleanup level.

As described above, unsaturated soil at the site has been affected by releases of VOCs from refrigeration equipment used at the former Mercer facility. The VOCs present at the site include TCE, 1,1-dichloroethene, cis-1,2-dichloroethene, trans-1,2-dichloroethene, acetone, MEK and tert-butanol. Refrigeration equipment used in the freeze-drying process contained solvents, including TCE. TCE is identified as the primary chemical of concern at the site because: (1) it is the most prevalent VOC detected at the site, (2) it is present at higher concentrations than other VOCs detected in site soil, (3) it possesses the lowest regulatory action level in groundwater of the detected contaminants, and (4) it represents the greatest human health risk to site users.

3.1 Assessment of Potential Risks to Human Health and the Environment

The risk assessment described herein evaluates potential health risks to site occupants and risks to the environment. The risk assessment process employs techniques approved by the U.S. Environmental Protection Agency (USEPA), and integrates these techniques with published risk-based screening levels applicable to the site and with the results of the site investigation, in order to determine applicable and appropriate measures for protection of human health and the environment. The risk assessment consists of: (1) an exposure assessment; (2) alternative methods of chemical fate and transport modeling; and (3) an evaluation of human health and environmental risks based on the results of the fate and transport modeling.

3.1.1 Exposure Assessment of Potential Human Health Risks

3.1.1.1 Site Setting

The site is located in a primarily commercial and light industrial region of Palo Alto. It is, however, zoned for residential use as stated above in Section 2.1.

Due to low yield soil formations, high total dissolved solids and high conductivity levels typical in shallow groundwater, first-encountered water is typically not used as a drinking water source. Furthermore, the groundwater beneath and in the vicinity of the site has been affected by VOCs, including TCE, and is currently undergoing remediation (SECOR, 2000).

The property is completely covered with a concrete slab. However, when the property is redeveloped for residential purposes the concrete and structure will likely be removed.

The premises are secured and cannot be accessed by trespassers.

3.1.1.2 Potential Exposure Pathways

The basic routes of contaminant exposure are oral, dermal and inhalation exposure. Consistent with the risk assessment process and USEPA risk guidelines, only those exposure pathways with potential human exposure were evaluated for the site.

3.1.1.2.1 Current Use Potential Exposure Pathways

Because the property is currently covered with a concrete slab, direct contact with soil is not considered currently feasible. Therefore, dermal contact and ingestion of affected soil is not considered an exposure pathway. Direct exposure to and ingestion of first-encountered groundwater beneath the property is not considered a viable exposure pathway due to conditional exclusion of permits required for installation of wells to be installed for industrial, irrigation or domestic use (RWQCB, 2001c). The current potential exposure pathway occurs from secondary exposure of volatilized airborne constituents of concern from subsurface soils to enclosed-space accumulation. The primary current route of contaminant exposure is considered to be through inhalation.

3.1.1.2.2 Future Use Potential Exposure Pathways

Upon redevelopment of the property for residential purposes the asphalt pavement, concrete and structure will likely be removed. Direct contact with soil is considered feasible; therefore, dermal contact and ingestion of affected soil are considered potential exposure pathways. Secondary exposure of volatilized airborne TCE from subsurface soils to enclosed-space accumulation is also considered a potential exposure pathway under future site use conditions. However, direct exposure to and ingestion of groundwater beneath the property following redevelopment is not considered an exposure pathway due to conditional exclusion of permits required for installation of wells to be installed for industrial, irrigation or domestic use (RWQCB, 2001c). The primary routes of contaminant exposure under future use conditions are therefore considered to be through dermal contact with affected soil, ingestion of affected soil and through inhalation of volatilized airborne TCE vapors.

3.2 RWQCB Preliminary Target Cleanup Goals

As noted above, the subject site is within the boundaries of the COE Study Area and Perimeter Area. On September 21, 1994, the RWQCB issued *Revised Site Cleanup Requirements, Order 94-130 for Hewlett-Packard Company, Varian Associates, and Stanford University* for the COE area ("the Order"). The Order contains a preliminary target cleanup goal of 1.0 milligram per kilogram (mg/kg) total VOCs. This preliminary target cleanup goal is discussed in the RWQCB document *Water Quality Control Plan* for the San Francisco Bay Basin dated June 21, 1995 (Basin Plan). The RWQCB's Basin Plan also states that target cleanup levels for individual constituents at polluted sites commonly are significantly lower than 1.0 mg/kg; therefore, individual target cleanup levels well below 1.0 mg/kg may be appropriate for these constituents (RWQCB, 1995).

RWQCB has established a screening level target soil cleanup concentration of 0.4 mg/kg TCE (RWQCB, 2000 and 2001b). The target cleanup level is listed in the RWQCB document *Application of Risk-Based Screening Levels and Decision Making to Sites With Impacted Soil and Groundwater* dated August 2000. The RWQCB document presents a tiered approach to environmental risk assessments that incorporates potential risks to human health and the environment. The screening level target soil cleanup concentration of 0.4 mg/kg TCE is a Tier 1 risk-based screening level (RBSL). Under Tier 1, site-specific sample data are directly compared to RBSLs for the site and decisions are made with respect to the requirement for additional site investigation, remedial action or a more detailed risk assessment. Additional risk assessments can be conducted under Tier 2, or alternative (Tier 3) method analyses.

The TCE concentration of 0.4 mg/kg is based on a Tier 1 RBSL concentration for TCE in surface soil (less than 3 meters [9.84 feet] bgs) and subsurface soil (greater than 3 meters [9.84 feet] bgs) in residential, industrial and commercial settings where groundwater is a current or potential source of drinking water. This RBSL is protective of human health and groundwater quality.

The Tier 1 RBSLs were developed by the RWQCB to be protective of human health and the environment. The RBSLs address the following concerns: (1) Groundwater quality, (a) Protection of human health, (i) Drinking water resources, (ii) Emission of vapors to building interiors, (b) Protection of aquatic life, and (c) Protection of nuisance concerns and general source degradation; and (2) Soil quality, (a) Protection of human health, (i) Direct and indirect contact with affected soil, (ii) Emission of vapors to building interiors, (b) Protection of groundwater quality, (c) Protection of terrestrial ecological receptors, and (d) Protection against nuisance concerns and General source degradation (RWQCB, 2000).

3.3 Alternative (Tier 3) Methods Environmental Risk Evaluation

PES further evaluated risks to groundwater quality and human health associated with TCE in vadose zone soil. These assessments were conducted to further evaluate secondary exposure of volatilized TCE from surface and subsurface soils to enclosed spaces and the potential for migration downward through the vadose zone to groundwater. Further evaluation of these risks is warranted due to the potential for inhalation of affected vapors in a residential setting and the potential for impact to the shallow aquifer which may adversely impact the groundwater and might result in requirements for groundwater remediation and/or participation in ongoing area-wide groundwater remediation efforts (see Section 2.4.2, above).[2]

[2] Dermal and ingestion pathways were not reevaluated with respect to the future residential land uses, due to the likelihood that concrete slabs, surface fill and landscaping would ensure that the conservative Tier 1 RBSL of 0.4 mg/kg trichloroethylene will be protective of human health insofar as these pathways are concerned.

3.3.1 Vapor Flux Modeling and Health Risk Calculation Methods

Potential health risk to future occupants of the property were assessed under various TCE target cleanup standards. Vapor phase migration simulations were performed to estimate indoor air concentrations following a standardized one-dimensional diffusion and air-mixing model summarized in the *Site Assessment and Mitigation Manual 1998 Update* (SDCDEH, 1998). The vapor phase migration model calculates exposure levels to site users from vapors migrating from VOCs in subsurface soil gas into building interiors. Three building slab-type scenarios (no concrete slab, weathered concrete slab, and new concrete slab) were evaluated for each cleanup concentration. Input parameters required for the calculations included: (1) compound-specific diffusion coefficients; (2) soil properties; (3) site specific data; (4) building properties, and (5) site user information.

Soil gas concentrations were calculated from the soil matrix data assuming local equilibrium conditions using the methodology developed by Jury, Spencer and Farmer (Jury, et al., 1983) and widely used by others (Feenstra et al., 1991). The equations used to estimate the indoor air concentrations from calculated soil gas concentrations were based on calculation of contaminant flux using Fick's First Law. The equations used to estimate contaminant intake and associated risk are recommended by the USEPA in its Risk Assessment Guidance Manual (USEPA, 1989). These equations utilize site-specific contaminant concentrations and conservative default parameters recommended by USEPA.

Table 2 summarizes the input parameters used for the vapor flux and human health risk calculations. The calculations for each scenario are provided in Appendix D in Volume II.

3.3.2 Vapor Flux Modeling and Health Risk Calculation Results

The calculated carcinogenic risks from exposure to TCE in soil beneath the subject property range from 2.84×10^{-4} to 3.76×10^{-9} as summarized on Table 3. The range of acceptable excess cancer risk in the NCP is 10^{-4} (one in ten thousand) to 10^{-6} (one in one million), however, 10^{-6} is most often associated with residential land use.

The results of the vapor flux modeling and human health risk calculations indicate that TCE cleanup concentrations that are protective of human health vary for each floor-type scenario. The modeling results for a residential scenario, including concrete slab on-grade structures, indicate that in order to achieve an excess incremental risk of 10^{-6} a maximum TCE concentration in soil between 0.2 and 0.4 mg/kg is required.

It should be noted that the method used to model indoor TCE concentrations is conservative for several reasons: (1) the method estimates emission flux and indoor air concentrations; (2) it was assumed that contaminant concentrations are uniform and ubiquitous in the emission flux area; (3) it was assumed that no adsorption of upward diffusing soil vapor occurs; and (4) it was assumed that no reduction in contaminant concentrations from biological or chemical degradation occurs over time.

3.3.3 Vadose Zone Vertical Migration Modeling

The behavior of TCE in soil was modeled to assess the potential for migration downward through the vadose zone to groundwater. PES evaluated regional and state water quality goals associated with TCE, the primary VOC detected in soil at the site, to assist in determining an appropriate target soil cleanup level. The State of California Maximum Contaminant Level (MCL) for TCE in groundwater is 5 μg/l (RWQCB, 1995 and CADHS, 2001). PES also evaluated local conditions to establish background TCE levels in the site vicinity within the COE Study Area and Perimeter Area. Cleanup of TCE in soil to levels that would result in impact to groundwater at or below the MCL for TCE is neither practical nor warranted due to the presence of TCE -affected groundwater in the site vicinity.

PES performed computer simulations using two models developed for the USEPA and commonly used by the USEPA and other regulatory agencies for this purpose. The models used to assess downward VOC migration are the VLEACH model (Ravi and Johnson, 1995) and the Seasonal Soil Compartment (SESOIL) model (GSC, 1995). Both models are one-dimensional, numerical transport models designed for evaluation of the unsaturated zone. The following general input parameters were required for each: (1) climatic data; (2) soil properties; (3) chemical properties; and (4) physical parameters describing the model simulation (e.g., number of layers, depth to groundwater, and cross sectional area).

3.3.4 Vertical Migration Model Input Parameters

Table 4 provides a summary of the input parameters for the VLEACH and SESOIL models. In general, input parameters were obtained from: (1) site-specific data collected during previous site investigations by PES and IT; (2) literature values for similar soil types; and (3) databases provided in the SESOIL and VLEACH model documentation. The vadose zone was modeled as sandy clay from the ground surface to 16 feet bgs and lean clay from 16 feet bgs to 28 feet bgs to be consistent with the lithology identified during the subsurface investigations performed at the site. Depth to groundwater was assumed to be 28 feet bgs based on site-specific subsurface conditions described in the November 21, 2000 report prepared by IT and information obtained from regional groundwater investigations (Secor, 2000).

Climatic data were obtained from a database containing information from the nearest weather station in Palo Alto. Soil properties were obtained from site-specific data collected during previous site investigations, SESOIL database and from literature for similar soil types. Chemical properties such as aqueous solubility, diffusion coefficient in air, Henry's Law Constant, adsorption coefficient, and chemical degradation were obtained from literature and from a database provided by the SESOIL and VLEACH model documentation. The parameters utilized in the modeling are presented in Table 4 along with the references.

The output data from the SESOIL model simulations were used to predict the contaminant concentration in the aquifer beneath the area of soil contamination. SESOIL uses the Summers model equation, which requires the following input parameters: (1) saturated hydraulic conductivity; (2) hydraulic gradient; (3) thickness of saturated zone; and (4) width of contaminated zone perpendicular to groundwater flow. These input parameters are also included in Table 2 and are derived from data collected from regional groundwater investigations and literature values for similar aquifers.

3.3.5 Vertical Migration Model Simulation Methods

VLEACH and SESOIL were used to simulate vertical migration of TCE over 100 years using the distribution of TCE observed in soil matrix samples collected from the site.

For the VLEACH model, the 28-foot thick vadose zone was represented by 14 cells, each measuring 2 feet in thickness. For the SESOIL model, the vadose zone was divided into the following two primary layers: 0 to 16 feet bgs as a sandy clay and 16 to 28 feet bgs as a lean clay. Each primary layer was further divided into three sublayers of equal thickness. The highest TCE soil matrix concentration detected in each depth interval (i.e., sublayer) at the site was applied as the initial condition to all cells or sublayers in the depth interval for the model. Accordingly, the initial concentrations of TCE ranged from 6,800 μg/kg (0 to 6 feet bgs) to approximately 8 μg/kg (22 to 24 feet bgs). The initial concentration below 24 feet bgs was set to zero for both models. Model simulations were performed to assess the predicted maximum pore water concentration at the top of the water table (28 feet bgs) under initial conditions and various target cleanup levels for TCE. The model simulation output for both VLEACH and SESOIL are provided in Appendix E in Volume II.

3.3.6 Vertical Migration Model Simulation Results

The various target TCE cleanup levels and the predicted maximum pore water concentrations at the groundwater surface are summarized on Table 5. In addition, the predicted concentrations of groundwater within the shallowest aquifer (A1 Upper Zone) beneath the property based on the SESOIL modeling are also presented on Table 5. The results of the modeling indicate that cleanup of TCE in the vadose zone to concentrations of 0.2 mg/kg or less, results in the predicted impact to the shallow aquifer beneath the site of 71 μg/l TCE or less. These concentrations include the lower estimated background concentration of 50 μg/l TCE and are within the approximate background TCE concentration range for the aquifer in the regional COE plume site vicinity (50-85 μg/l). As shown on Table 5, cleanup of TCE in the vadose zone to concentrations greater than 0.2 mg/kg results in a predicted impact to the shallow aquifer beneath the site greater than 85 μg/l, considered to be the upper limit of background TCE levels in groundwater in the site vicinity. For example, TCE target cleanup level of 0.25 mg/kg results in predicted impact to groundwater of 123 μg/l. Cleanup of TCE in the vadose zone to concentrations greater than 0.2 mg/kg will therefore not prevent future adverse impacts to groundwater and may result in requirements for groundwater remediation and/or participation in ongoing area-wide groundwater remediation efforts.

It should be noted that if no remediation of TCE in soil is conducted, the VLEACH and SESOIL models predict pore water concentrations of TCE at the water table of approximately 2,100 and 6,500 μg/l, respectively. These concentrations are both well above the California MCL for TCE (5 μg/l), and background concentrations of TCE in groundwater beneath the site (50 to 85 μg/l).

3.4 Discussion and Evaluation of Applicable TCE Cleanup Level

PES has evaluated the suitability of various target cleanup goals for TCE in the vadose zone beneath the site. Table 6 summarizes cleanup criteria evaluated and identifies which criteria are achieved for several target soil cleanup levels.

The RWQCB has indicated in the Order for the COE Study Area and Perimeter Area that a preliminary soil cleanup goal of 1.0 mg/kg total VOCs may be acceptable. Additionally, the RWQCB has established a Tier 1 risk-based screening level target soil cleanup concentration of 0.4 mg/kg TCE (RWQCB, 2000). The Tier 1 target cleanup level for TCE in surface and subsurface soil may be protective of human health in residential, commercial and industrial use settings and may be protective of groundwater that is a current or future source of drinking water.

However, based on the results of the alternative (Tier 3) method human health risk calculations and vertical migration modeling, a cleanup level of 0.2 mg/kg TCE is appropriate for the site. The results of the human health risk assessment indicate that removal of TCE -affected soil exceeding 0.2 to 0.4 mg/kg will be protective of human health for residences with a concrete floor slab. Based on the results of the vertical migration modeling, removal of TCE -affected soil exceeding 0.2 mg/kg is necessary to reduce the potential impact of TCE to groundwater to within background TCE levels present in groundwater at and in the vicinity of the site. A cleanup standard less stringent than 0.2 mg/kg TCE would not ensure that groundwater will not be adversely impacted by the TCE releases at the site, and might result in requirements for groundwater remediation and/or participation in ongoing area-wide groundwater remediation efforts. Accordingly, a target soil cleanup level of 0.2 mg/kg TCE is recommended for the site.

4.0 EVALUATION OF REMEDIAL ALTERNATIVES

Based on the evaluation of cleanup goals discussed in Section 3.0, above, vadose zone soil remediation is warranted. The following sections present an evaluation of potential remedial measures to reduce the human health and environmental risks to acceptable levels. Soil remedial alternatives are evaluated in terms of the criteria identified in the NCP as discussed in the following sections.

4.1 Criteria For Evaluation

Nine evaluation criteria are set forth in the NCP and accompanying USEPA guidance documents (NCP, 1990 and USEPA, 1998) for detailed evaluation of remedial action alternatives. These nine criteria are divided into three categories: "Threshold Criteria", "Primary Balancing Criteria", and "Modifying Criteria."

In accordance with USEPA guidance in the NCP, the selected alternative is required to meet the two threshold criteria. The five primary balancing criteria provide comparisons between the alternatives and identify tradeoffs between them. The two modifying criteria consider acceptance by the State and by the local community. The nine evaluation criteria are described below.

Threshold Criteria

1. **Overall Protection of Human Health and the Environment.** This criterion addresses whether a remedial alternative is protective of human health and the environment considering long-term and short-term site-specific characteristics. The remedy's short-term effectiveness, long-term effectiveness and permanence, and ability to reduce chemical toxicity, mobility and volume affect the evaluation under this criterion. This criterion considers the degree of certainty that an alternative can meet the site-specific remedial action goals.

2. **Compliance with Applicable or Relevant and Appropriate Requirements.** Remedial action objectives are developed by considering, among other things, Applicable or Relevant and Appropriate Requirements (ARARs). As defined in the NCP, Applicable Requirements are cleanup standards, standards of control, and other substantive requirements, criteria or limitations promulgated under federal environmental or state environmental or facility siting laws that specifically address a hazardous substance, pollutant, contaminant, remedial action, location or other circumstance found at a site.

   As defined in the NCP, Relevant and Appropriate Requirements are cleanup standards, standards of control, and other substantive environmental protection requirements, criteria or limitations promulgated under federal environmental or state environmental or facility siting laws that, while not "applicable" to a hazardous substance, pollutant, contaminant, remedial action, location or other circumstance found at a site, address problems or situations sufficiently similar to those encountered at the site that their use is well-suited to the particular site.

   ARARs can be separated into three categories: (1) Chemical-specific ARARs; (2) Location-specific ARARs; and (3) Action-specific ARARs. Federal and state non-promulgated standards, policies or guidance documents, and local requirements are not ARARs. However, according to NCP guidance, these items are to be considered

when evaluating and selecting removal actions necessary to protect human health and the environment. These factors are designated "To Be Considered" or "TBCs".

Balancing Criteria

1. **Long-Term Effectiveness and Permanence.** This criterion addresses how well a remedy maintains protection of human health and the environment after the site-specific remedial goals have been met to the extent feasible. Components to be addressed include the magnitude of residual risk, the adequacy and long-term reliability of institutional controls and containment systems, and potential consequences should the remedy or some portion of it fail.

2. **Reduction of Mobility, Toxicity, or Volume.** Under this criterion, the anticipated amount of the chemical of concern destroyed or treated and the amount remaining at the site are assessed, along with the degree of expected reduction in chemical mobility, toxicity, or volume.

3. **Short-Term Effectiveness.** This criterion concerns protection of human health and the environment during construction and implementation of the remedy.

4. **Implementability.** Implementability considers both the technical and administrative feasibility of implementation. The criterion also considers the ability to construct and operate remedial facilities, ease of undertaking additional remedial actions, ability to monitor remedial effectiveness, and the ability to obtain necessary approvals and permits.

5. **Cost.** The costs to be assessed include the capital cost, annual operation and maintenance costs.

Modifying Criteria

1. **State Acceptance.** The State Acceptance criterion incorporates input from state agencies to modify the alternative selection process. This input can be obtained via formal comments received during the project comment period.

2. **Community Acceptance.** This criterion addresses input from the local citizenry and can be obtained through formal comments received during the public comment period on the draft plan and through other means.

The NCP includes a requirement for treatability studies to be conducted during the remedial investigation phase of site work. Sufficient studies and documents have been previously prepared regarding treatability of TCE that additional treatability studies were not conducted as part of the previous site investigations. Furthermore, the soil would not be considered acutely hazardous, therefore, treatment of the affected soil prior to offsite disposal is not required.

Additionally, the NCP requires that an environmental evaluation of sensitive or critical habitats be conducted. In this site setting, there are no sensitive or critical habitats requiring environmental evaluation. The primary impact from TCE -affected soil at the site is to current and future site users and to groundwater beneath the site. The groundwater beneath the site is currently subject to remediation through pump and treatment (Secor, 2000).

4.2 Description of Remedial Alternatives

Five soil remedial alternatives were considered as potentially applicable for this site: (1) no action; (2) soil excavation with offsite disposal; (3) soil excavation with ex-situ on-site treatment; (4) in-situ soil vapor extraction (SVE); and (5) enhanced in-situ bioremediation. These alternatives are summarized in Table 7 and further described below.

4.2.1 Alternative 1 – No Action

Following RWQCB guidance at sites where the ecological and/or human health risk evaluation has determined that no significant risk to human health or the environment is present, a no action alternative may be appropriate if natural biological degradation of chemicals at the site could be demonstrated to be occurring. The no action alternative provides a basis of comparison for costs and benefits in the analysis of the need for, or utility of, attempting to perform remedial actions. In order to implement a "no action" alternative, strategies for administrative controls consistent with current residential zoning may need to be developed between the property owner and the RWQCB. Administrative controls could include land use restrictions and/or zoning restrictions.

4.2.2 Alternative 2 – Soil Excavation with Offsite Disposal

Soil excavation with offsite disposal consists of removal of soil exceeding the target cleanup goal to the extent practical and replacement with clean, imported fill materials. This alternative will result in the reduction of the volume of soil containing TCE and, therefore, lower the potential human health risks and potential for impact to groundwater beneath the site. Approximately two to three weeks will be required to complete the soil excavation. The excavated soil would be characterized, and based on the results of the characterization, sent to an appropriately permitted landfill for treatment, if necessary, and subsequent disposal. On the basis of the remedial investigations conducted at the site, the soil would likely be classified so that pre-treatment prior to transport would not be required. Soil excavation would remove much of the mass of the contaminants in soil and reduce the potential for groundwater contamination.

4.2.3 Alternative 3 – Soil Excavation with Ex-Situ Onsite Treatment

Soil excavation with ex-situ on-site treatment consists of: (1) excavating soil exceeding the target cleanup goal to the extent feasible; (2) replacement with clean, imported fill materials;

(3) on-site enhanced bioremediation of the VOC-affected excavated soil; and (4) subsequent offsite disposal at a Class III landfill. This alternative will also result in the reduction of the volume of soil containing TCE and, therefore, lower the potential human health risks and potential for impact to groundwater at the site. Implementation of this alternative would require use of a relatively large area of the site to perform treatment of the excavated soil, and is expected to require at least one year for completion.

Ex-situ enhanced bioremediation consists of stimulating the growth of naturally occurring, or introduced, microorganisms that can utilize organic chemicals as a food source. Microorganisms are stimulated by one of two methods: (1) co-metabolism and (2) reductive dehalogenation. Chlorinated hydrocarbons such as TCE are not generally used as a primary food source by microorganisms. However, in a co-metabolic bioremediation system, a co-metabolite (i.e., a primary food source other than the contaminants, such as phenol or methane) is introduced into the subsurface along with oxygen and micronutrients, if necessary. In the course of consuming the primary food source, some of the contaminants are also consumed (i.e., co-metabolized) by microorganisms. In a reductive dehalogenation bioremediation system, anaerobic conditions are established in the treatment area to stimulate the activity of anaerobic microorganisms.

The advantages of ex-situ bioremediation are that the contaminants are destroyed using biological processes rather than merely transferred to a different medium. Disadvantages of ex-situ bioremediation are: (1) it is relatively unproven in full-scale applications for chlorinated VOCs; (2) the introduction of additional chemicals to the affected soil may produce other contamination concerns as it is possible that incomplete biodegradation of contaminants may produce other toxic byproducts such as vinyl chloride; (3) chlorinated VOCs are relatively resistant to biodegradation; (4) the length of time required to conduct bioremediation; and (5) the loss of use of a relatively large portion of the property. Additionally, maintaining proper soil moisture conditions and distribution of nutrients in a heterogeneous soil stockpile environment are expected to be difficult to achieve.

4.2.4 Alternative 4 – Soil Vapor Extraction

Soil vapor extraction involves applying a vacuum to establish vapor flow in soil towards extraction wells screened in the vadose zone. A zone of influence is established around the extraction point in which vapor-phase compounds migrate and are extracted through the wells. Extracted vapors are then treated by activated carbon or another technology before release to the atmosphere. Soil vapor extraction is expected to require approximately three years to implement. The advantages of SVE are that the process can remove contaminants without large-scale excavation or significant disruption to the current structures and future operations. The disadvantages of SVE are that due to the fine-grained nature of the vadose zone soil and expected corresponding low vapor flow rates, the relatively small radius of effective vacuum influence, and the possible formation of preferential vapor flow pathways, the effectiveness of SVE is uncertain. Additionally, an SVE extraction and treatment system entails significant

capital and operating expenses. It may be disruptive to occupants and it requires that a portion of the property be set aside for treatment equipment.

4.2.5 Alternative 5 - Enhanced In-Situ Bioremediation

Enhanced in-situ bioremediation consists of stimulating the growth of naturally occurring, or introduced, microorganisms that can utilize organic chemicals as a food source. As in ex-situ bioremediation discussed above, microorganisms are stimulated by either co-metabolism or reductive dehalogenation. Chlorinated hydrocarbons such as TCE are not generally used as a primary food source by microorganisms. As noted above, a co-metabolite (phenol or methane) is introduced into the subsurface along with oxygen and micronutrients, if necessary. In the course of consuming the primary food source, some of the contaminants are also consumed (i.e., co-metabolized) by microorganisms. In a reductive dehalogenation bioremediation system, anaerobic conditions are established in the treatment area to stimulate the activity of anaerobic microorganisms. A treatment period of approximately five years is expected for this alternative.

The advantages of in-situ bioremediation are that the disruption to existing structures and operations is reduced relative to soil excavation or ex-situ treatment methods. Additionally, the contaminants are destroyed using in-situ bioremediation rather than merely transferred to a different medium. Disadvantages of in-situ bioremediation are: (1) it is relatively unproven in full-scale applications for chlorinated VOCs; (2) the introduction of additional chemicals to the subsurface may produce other contamination concerns as it is possible that incomplete biodegradation of contaminants may produce other toxic byproducts such as vinyl chloride; and (3) chlorinated VOCs are relatively recalcitrant to biodegradation. Additionally, maintaining proper soil moisture conditions and distribution of nutrients in a heterogeneous vadose zone environment are expected to be difficult to achieve.

4.3 Comparative Analysis of Remedial Alternatives

This section presents an analysis of each of the remedial alternatives relative to each of the nine NCP criteria described in Section 4.1, above. Table 8 presents a summary of these analyses.

Threshold Criteria

4.3.1 Overall Protection of Human Health and the Environment

Alternative 1 (No Action) is not considered protective of human health or the environment because levels of TCE in soil exceeding the cleanup goal would remain on-site. Alternatives 2 through 5 are considered protective of human health and the environment. Remedial actions proposed for these alternatives are designed to reduce the concentration of TCE in soil to below the cleanup goal of 0.2 mg/kg. Alternative 5 is considered less protective than

Alternatives 2 through 4, due to the potential for production of more toxic byproducts, such as vinyl chloride, during implementation of the remedial action.

4.3.2 Compliance with ARARs

The selected remedial alternative must comply with ARARs, TBCs and remedial action objectives. Table 9 presents a summary of ARARs and TBCs considered in evaluation of remedial alternatives. Alternative 1 (No Action) is not considered to comply with ARARs and TBCs because levels of TCE in soil exceeding the cleanup goal and other applicable criteria would remain on-site.

Alternative 2 complies with ARARs. Affected soil would be excavated from the site and disposed off-site in accordance with federal and state classifications and requirements. Soil with concentrations of TCE that may create adverse human health or groundwater impacts would be removed from the site.

Alternative 3 is believed to comply with ARARs. Affected soil would be removed from the site through excavation and subsequently treated to an acceptable level.

Alternative 4 is believed to comply with ARARs. TCE -affected soil would be treated in-situ thereby reducing the adverse human health or groundwater impacts related to the presence of the pollutant. However, there is some uncertainty regarding the effectiveness of SVE. As a result groundwater quality may be adversely affected in the future if unaffected regions of the vadose zone allow vertical migration of TCE to occur.

Alternative 5 is believed to comply with ARARs, although this alternative presents some uncertainty regarding non-degradation of groundwater due to the introduction of a co-metabolite and possible formation of other toxic byproducts as a result of incomplete biodegradation.

Balancing Criteria

4.3.3 Long-Term Effectiveness and Permanence

Alternative 1 (No Action) is not considered to provide long-term effectiveness or permanence. TCE -affected soil exceeding the cleanup goal would remain on-site and would not be treated or contained.

Alternative 2 provides the best performance in terms of long-term effectiveness and permanence.

Long-term effectiveness of Alternative 3 is questionable due to the relatively unproven status with respect to full-scale applications and the possibility of the formation of more toxic

byproducts. Soil containing TCE greater than the target cleanup goal would be excavated, treated (Alternative 3), and disposed offsite under this alternative.

Alternative 4 may provide long-term effectiveness and permanence, however due to the fine-grained nature of the vadose zone soil and corresponding low vapor flow rates, relatively small radius of effective vacuum influence and possible formation of preferential vapor flow pathways, the effectiveness of SVE is somewhat uncertain.

Alternative 5 is considered to provide uncertain long-term effectiveness and permanence due to its relatively unproven status with respect to full-scale applications and the possibility of the formation of more toxic byproducts.

4.3.4 Reduction of Mobility, Toxicity or Volume

Alternative 1 (No Action) provides no reduction of mobility, toxicity or volume of the impacted site soil. TCE -affected soil exceeding the cleanup goal would remain on-site and would not be treated or contained.

Alternative 2 results in a relocation of the TCE -affected soil from the site to an appropriate landfill. Through the excavation and placement of the TCE -affected soil in a controlled landfill environment there is a reduction of mobility and toxicity of TCE -affected soil.

Alternative 3 provides a reduction of mobility, toxicity and volume of the impacted soil provided enough time is allowed for bioremediation. Soil containing TCE greater than the cleanup goal would be excavated, treated (Alternative 3), and disposed off-site under these two alternatives.

Alternative 4 has the potential to significantly reduce the mobility, toxicity and volume of the impacted soil, however due to the fine-grained nature of the vadose zone soil, the effectiveness of SVE is somewhat uncertain.

While effective application of Alternative 5 would reduce the mobility and volume of impacted soil, it has the potential for production of more toxic byproducts, such as vinyl chloride, during implementation of the remedial action.

4.3.5 Short-Term Effectiveness

Alternative 1 (No Action) is not considered to provide short-term effectiveness, as no work would be performed to protect human health and the environment. TCE -affected soil exceeding the cleanup goal would remain on-site and would not be treated or contained.

Alternative 2 provides the best performance in terms of short-term effectiveness because significant amounts of impacted soils would be rapidly removed from the site.

Alternative 3 is not considered to provide short-term effectiveness, due to the potential risk and unacceptability to site users and nearby residents posed by the presence of stockpiled soil undergoing treatment. Additionally, Alternative 3 would require periodic soil treatments for moisture application and tilling which could result in potential exposure of site users or nearby residents of affected dust or vapor.

Due to the fine-grained nature of the vadose zone soil and the estimated three-year period required to complete the remediation, the short-term effectiveness of Alternative 4 is uncertain.

Alternative 5 is not expected to be an effective short-term alternative.

4.3.6 Implementability

All alternatives are believed to be implementable to various degrees. The variations in implementation between alternatives are primarily a function of working conditions (i.e. presence of on-site structures) and lithologic and biologic subsurface conditions.

Implementation of Alternatives 2 and 3 may be constrained by the location and structure of the building foundation relative to the area of excavation.

Alternative 3 requires use of a relatively large portion of the property and is contingent upon the availability of outdoor space, which is limited and is needed for site operations. Implementation of Alternative 3 is uncertain given its relatively unproven status with respect to full-scale applications and the possibility of the formation of more toxic byproducts.

Implementation of Alternative 4 may be constrained by the fine-grained nature of the vadose zone soils and the associated difficulties in conducting SVE in such soil. Additionally, Alternative 4 would require capital expenditures for purchase, installation and operation of SVE equipment and loss of usable property due to the space required for the SVE system.

Implementation of Alternative 5 is contingent upon the biologic and chemical characteristics of the vadose zone. Implementation of Alternative 5 is uncertain given its relatively unproven status with respect to full-scale applications and the possibility of the formation of more toxic byproducts.

4.3.7 Cost

Table 9 summarizes the estimated capital and annual costs for each of the remedial alternatives considered. As indicated on the table, costs for Alternatives 2 and 3 are estimated to be approximately $200,000. Costs for Alternatives 4 and 5 are approximately $388,000 and $285,000, respectively. While the cost of Alternatives 2 and 3 are the same, Alternative 2 is considered more cost effective due to the loss of usable space at the subject property associated with Alternative 3. The estimate of costs associated with Alternative 3 does not include the

loss of revenue associated with use of that portion of the property nor does it consider potential costs to repair the portion of the property utilized for bioremediation.

4.3.8 State Acceptance

Alternative 1 (No Action) is not expected to be acceptable to the California RWQCB. Alternatives 2 through 4 are likely to be acceptable to State regulators; they each have been demonstrated to effectively remove TCE from the subsurface. Alternative 5 may be acceptable to State regulators, depending upon their perspective on issues pertaining to the feasibility of successfully applying a technology that is relatively unproven with respect to full-scale application.

4.3.9 Community Acceptance

The acceptance of Alternatives 1 through 5 by the community is unknown at this time, but will be ascertained during the public comment period.

4.4 Summary Comparison of Remedial Alternatives

This section provides a summary of the factors leading to selection of a recommended remedial action alternative. Table 10 presents a summary of the comparative analysis of each remedial action alternative that focuses upon the relative performance of each alternative against the NCP criteria.

As shown on Table 10, Alternative 1 is judged not to pass the threshold criteria. In particular, this option would not be effective in reducing human health and environmental exposure risks, and does not satisfy ARARs because levels of TCE in soil exceeding the cleanup goal would remain on-site. The remaining NCP criteria are not considered further because Alternative 1 is eliminated due to failure on the threshold criteria.

Alternative 2 passes the threshold criteria and provides both long- and short-term effectiveness. Excavation and offsite disposal of TCE -affected soil removes the affected soil from the site and through the removal process and placement of this soil in a controlled landfill environment there is a reduction in the toxicity and mobility of the TCE. Because the site is currently unoccupied, the soil excavation alternative would be relatively simple to implement and would be effective in reducing the overall risk to human health and the environment. Alternative 2 has lower costs as compared to other alternatives and is believed to be viable under State and community acceptance criteria. The costs of Alternative 2 are the same as Alternative 3, however, additional costs associated with the loss of useable property associated with Alternative 3 are not considered. Therefore, the costs associated with Alternative 2 are deemed lower.

Alternative 3 passes the threshold criteria and provides both long- and short-term effectiveness in addition to a reduction in the mobility, toxicity, or volume of on-site contaminants. While

soil excavation with ex-situ on-site treatment is expected to be equally effective (given enough time for completion of Alternative 3) and comparable in cost relative to soil excavation with offsite disposal, there are uncertainties associated with the duration of operation and technical effectiveness of this approach. There are also practical drawbacks to this approach due to its use of a relatively large portion of the property. The cost of such use is not included in the cost estimate for this approach. As a result, soil excavation with on-site treatment is deemed less advantageous than soil excavation with off-site disposal.

Alternative 4 may pass the threshold criteria if SVE can be expected to reduce soil concentrations to the target cleanup level, and if as a result it could reduce the mobility, toxicity, or volume of on-site contaminants. However, Alternative 4 may not be effective in this setting because the soils underlying the site are predominantly fine-grained clays, which are generally not ideal for vapor movement and may reduce the effectiveness and/or increase the complexity of an extraction system. In addition, it is assumed that an SVE system will likely require three years of operation including use of an above-ground vapor extraction and treatment system, which will limit its short-term effectiveness. Implementability of Alternative 4 is uncertain due to the loss of usable property due to the space required for the SVE treatment system. The estimated cost for soil vapor extraction is high compared with the other alternatives. Due to the high cost and uncertainties associated with the duration of operation and technical effectiveness, Alternative 4 was not recommended.

Alternative 5 may also pass the threshold criteria and may also have the potential for long-term effectiveness in addition to a reduction in the mobility and volume of on-site contaminants. Alternative 5 may not, however, provide long-term effectiveness due its unproven full-scale applicability and the relative resistance of chlorinated VOCs to biodegradation. In addition, it is assumed that enhanced in-situ bioremediation will likely require five years of operation, which will limit its short-term effectiveness. Additionally, maintaining proper soil moisture conditions and distribution of nutrients in a heterogeneous vadose zone environment will be difficult to achieve. The estimated cost for enhanced in-situ bioremediation is relatively high compared with the other alternatives. Due to the uncertainties associated with the: (1) duration of operation; (2) technical effectiveness; and (3) regulatory acceptance, enhanced in-situ bioremediation was not recommended.

4.5 Recommended Remedial Alternative

Soil excavation with offsite disposal is the recommended remediation alternative for removal of VOCs in vadose zone soils. The technique will effectively and economically reduce the mass of contaminants in soil, providing reduced risk to human health and the environment. Additionally, soil excavation with offsite disposal will require the shortest duration and is the least uncertain of the technically feasible remediation measures. Balance is struck in favor of soil excavation and offsite disposal due to the uncertainty of in-situ treatment and excavation and ex-situ treatment, due to cost, implementability, short- and long-term effectiveness, and the ability of these means to reduce the mobility, toxicity and volume of contamination. As such, it is the recommended remedial alternative for the site.

Soil excavation will be performed in the vicinity of the former refrigeration unit. The excavated soil will be characterized, and on the basis of the characterization, transported to an appropriately permitted landfill for treatment, if necessary, and subsequent disposal. A more detailed discussion of the preferred remedial alternative is presented in Section 5.0, below.

5.0 REMEDIAL ACTION PLAN IMPLEMENTATION

This section discusses the conceptual design of the recommended remedial action. Schedules for remedial action implementation and reporting are also presented.

5.1 Conceptual Remedial Action Design

5.1.1 Remediation Procedures

Based on the results of the subsurface investigations conducted at the site (PES, 2000 and IT, 2000a and 2000b), the extent of soil with TCE concentrations in excess of the target cleanup goal (0.2 mg/kg) has been adequately estimated for remedial planning purposes. The proposed limits of excavation are presented on Plate 4. Plate 4 graphically presents the aerial extent of TCE -affected soil exceeding the proposed cleanup goal at 4-foot-depth intervals (i.e., 0 to 4, 4 to 8, 8 to 12, 12 to 16, and 16 to 20 feet bgs). On the basis of the data obtained from the previous subsurface investigations, TCE -affected soil exceeding 0.2 mg/kg is expected to extend to approximately 20 feet bgs. As shown on Plate 4, the areal extent of TCE -affected soil exceeding 0.2 mg/kg is expected to range from approximately 160 square feet (ft^2) from 16 feet to 20 feet bgs, to 800 ft^2 from approximately 0 to 4 feet bgs. As such, the in-place volume of TCE -affected soil requiring removal is estimated to be approximately 470 cubic yards (approximately equivalent to 660 tons). The actual volume will depend on the distribution of TCE in soil, and inherent limitations of soil excavation equipment and techniques. Soil excavation will be conducted to remove soil with TCE concentrations in excess of the target cleanup goal to the extent practical.

5.1.1.1 Permitting and Contractor Health and Safety

The work will be conducted in accordance with applicable federal, state and local regulations. These include, but are not limited to:

- National Fire Protection Association (NFPA) NFPA 30 Flammable and Combustible Liquids;
- Occupational Safety and Health Administration (OSHA), Title 29 Code of Federal (CFR) 1910.120. Regulations applicable to hazardous waste site operations (HAZWOPER);
- Health and Safety Code Division 20, Chapters 6.5 and 6.8;

- Title 8 California Code of Regulations (CCR) GISO 5192 Hazardous Materials Storage Ordinance, and Title 8 CCR 1532.1;
- Title 22, CCR Sections 66261.2 and 66261.3; and
- City of Palo Alto Grading Ordinance.

The excavation and soil handling will be conducted by a qualified, HAZWOPER-trained, contractor using conventional earthwork equipment. The contractor will prepare a Site Specific Health and Safety Plan (HSP), which will address identification of hazards, hazard mitigation, safe work practices and emergency response procedures for the project. The site-specific HSP will be prepared to comply with 29 CFR 1910.120 and 8 CCR GISO 5192. Additionally, any remediation subcontractors selected to perform remedial work onsite will be required to prepare a HSP for its activities.

PES will attempt to obtain as-built construction drawings from El Camino Center or the city building department prior to implementing remediation. Prior to initiating soil excavation, a structural engineer will be contracted to assess the stability of the onsite building, and provide recommendations regarding excavation procedures that are protective of the building structure. Necessary permits will be obtained by the remediation contractor prior to conducting remedial activities.

Prior to conducting the remediation, a private underground utility locating service will be hired to clear the proposed excavation of subsurface utilities. In addition, Underground Service Alert will be contacted to schedule visits by public and private utility companies.

5.1.1.2 General Excavation Procedures and Soil Management

Prior to initiating soil removal activities, a geotechnical/foundation engineer will be retained to assess the structural integrity of the building and foundation. While the design specifications for the excavation procedures will not be finalized until the structural evaluation is completed, it is anticipated that excavation of soils deeper than approximately 5 feet will be performed in narrow strips or "slots" to maintain the integrity of the foundation support. Depending on the results of the evaluation, each "slot" is expected to measure approximately 4 to 5 feet wide (actual width to be determined based on results of evaluation) and will be excavated and backfilled with a two-sack cement slurry prior to excavating the next adjacent "slot".

Prior to the excavation, the concrete pad overlying the soil removal area will be removed and segregated for disposal. The soil will be removed and segregated based on field screening into two separate stockpiles: (1) potentially reusable fill stockpile; and (2) impacted soil stockpile. Impacted soil and concrete will be placed on and covered with polyethylene or in locked and covered soil bins until characterization and disposal arrangements are completed. Soil and concrete samples will be collected and submitted for chemical analyses to evaluate onsite reuse and disposal alternatives. Soil samples to evaluate waste classification will be collected at a

frequency required by the disposal or recycling facility to which the waste will be transported. Soil samples collected to evaluate potential reuse as onsite fill will be collected at an approximate frequency of one 4-point composite sample per 100 cubic yards of soil. The composite samples will be analyzed for VOCs by USEPA Test Method 8260B. Offsite disposal of the impacted soil will be conducted based on the soil stockpile analytical results under appropriate documentation and in accordance with applicable Federal, State, and local regulations.

5.1.1.3 Verification Soil Sampling

Verification soil samples will be collected from each "slot" using a hand sampler and earthmoving equipment to evaluate whether the remedial goal has been met. The sidewall soil samples will be collected at depth intervals corresponding to areas exhibiting field indications of potential contamination and at depths where previous samples indicated contaminants were present. In addition, verification soil samples will be collected from the excavation bottom for analysis to evaluate whether soil removal has met the remedial goal. Sample locations and the number of samples collected per "slot" may be adjusted in the field if necessary. Deviation from this plan will be discussed with RWQCB staff and explained in the final report documenting the excavation. Verification sample analyses will likely be performed utilizing an expedited laboratory turn-around schedule or an onsite mobile laboratory in order to reduce the likelihood for significant delays to affect the remedial action schedule. Should laboratory analytical results indicate that the cleanup goal has not been attained, additional excavation will be performed to the extent feasible. Detailed descriptions of the verification sampling procedures and analytical program are discussed in the Verification Sampling and Analysis Plan (VSAP) provided in Appendix B.

The concrete removed from the excavation area will be sampled for VOCs for waste characterization. One composite sample of the concrete will be collected and submitted to the laboratory for VOC analysis using USEPA Test Method 8260B. The sampling will be conducted in accordance with the procedures discussed in the VSAP in Appendix B. Offsite disposal or recycling of the concrete will be conducted in accordance with applicable federal, state and local regulations.

5.1.1.4 Dust and Odor Control

During excavation activities, depending on soil conditions, there is potential to generate airborne dust. Therefore, as required, the contractor will apply a water mist to the excavation and soil handling and haul roads to reduce the potential for dust generation. Soils will be wetted as needed to reduce the occurrence of visible dust. Air monitoring will be conducted in accordance with local air quality management regulations as described in the contractor's HSP.

5.1.1.5 Decontamination

Equipment used to excavate, transport and manage the VOC-affected soil will be decontaminated prior to leaving the site. The equipment will first be decontaminated in an area designated for stockpiling excavated soil by removing visible soil by sweeping or brushing. Soil that cannot be removed by this procedure will be removed from equipment by washing in a prepared decontamination area. The decontamination area will be constructed in a to be determined location. Decontamination wash water will be collected, characterized and appropriately disposed or recycled in accordance with applicable federal, state and local regulations.

5.1.1.6 Excavation Backfilling

As described above, backfilling of deeper soils (i.e. greater than approximately 5 feet bgs) will be performed concurrent with excavation activities. Backfilling of each "slot" from the maximum depth of excavation to approximately 5 feet below grade will be accomplished using a soil/cement slurry (flowable fill). Once each "slot" is backfilled to approximately 5 feet below grade, the remainder of the excavation will be backfilled with either reusable onsite fill material or imported fill material. This material will be placed in 8- to 12-inch thick lifts, and compacted to a minimum of 95 percent relative maximum density. Once backfilling is completed, an approximately 6-inch thick concrete slab will be constructed over the excavation area to match existing surface conditions.

5.2 Schedule of Remedial Action Implementation and Reporting

It is anticipated that if the recommended remedial alternative is adopted after the 30-day public comment period, the remediation site work will commence in approximately seven to ten working days. The work is expected to be completed within approximately 10 to 15 working days.

5.3 Performance Criteria

PES will evaluate the progress of the soil remediation program throughout the excavation processes. The laboratory analytical results of the soil verification samples will be compared to the proposed remedial goal for TCE. If TCE is detected in verification soil sampling above the proposed cleanup goal and further excavation is not feasible, without compromising the structural integrity of the building, PES will consult with El Camino Center and RWQCB to determine the appropriateness of instituting additional remedial measures, if warranted.

5.4 Reporting

Following completion of soil excavation activities, PES will prepare an implementation report summarizing the work performed, verification soil sample analytical results, and the soil cleanup level achieved. Copies of laboratory reports and chain-of-custody forms will be

included. The report will be submitted approximately 4 to 6 weeks following completion of site remediation activities. A request to the RWQCB for case closure will be prepared once site data and regulatory environment indicate that closure is appropriate.

6.0 ADMINISTRATIVE RECORD

A summary of administrative records is presented in Appendix C. The administrative record list consists of letters and reports directly related to the site and regulatory guidance documents utilized during the preparation of the RAP.

Notes:
µg/kg = micrograms per kilogram
bgs = below ground surface
< = compound not detected at or above the respective laboratory reporting limit
J = estimated value, less than the laboratory practical quantitation limit but greater than the method detection limit
NA = Not analyzed
NL = Not listed
NR = No sample recovery
TCE = trichloroethylene
MEK = methyl ethyl ketone
t-butanol = tert-butanol
1,1-DCE = 1,1,-dichloroethylene
cis-1,2-DCE = cis-1,2-dichloroethylene
trans-1,2-DCE = trans-1,2-dichloroethylene
[1] = Boring drilled and sampled by PES in December 1999
[2] = Boring drilled and sampled by IT Corp. in June, September or November 2000
[3] = Precise sample designation, sample depth, sample date, and laboratory reporting limits unknown; laboratory reports for these samples not provided in IT Corp. report dated November 21, 2000. Data presented graphically in IT Corp. November 21, 2000 Report.

Table 2
Summary of Input Parameters - SESOIL and VLEACH Models
Former Mercer Processing Facility
230 Portage Avenue
Palo Alto, California

Parameter	Units	Value	Reference
Vadose Zone and Chemical Properties			
Soil Type - 0 to 16 feet bgs	--	sandy clay	Reference 1
- 16 to 28 feet bgs		lean clay	Reference 1
Depth to Groundwater	ft	28	Reference 2
Bulk Soil Density	g/cm^3	1.6	SESOIL Database
Effective Porosity	unitless	0.24	SESOIL Database
Organic Carbon Content	percent	0.1	Assumption
Henry's Law Constant, K	m^3 - ATM/mole	0.0103	Reference 3 (Trichloroethene)
Solubility in Water	mg/L	1100	Reference 3 (Trichloroethene)
Adsorption Coefficient on Carbon (Koc)	unitless	94	SESOIL Database
Adsorption Coefficient on Soil (K)	unitless	0	SESOIL Database
Climate Data	--	--	SESOIL Database (Palo Alto Weather Station)
Diffusion Coefficient in Air	cm^2/sec	0.079	Reference 3 (Trichloroethene)
Recharge Rate	ft/year	0.4	Reference 4 and SESOIL Database
Degradation Rate	per day	0	Assumption
Aquifer Properties			
Horizontal Hydraulic Conductivity	cm/day	8.7	VLEACH Manual
Horizontal Hydraulic Gradient	ft/ft	0.004	Reference 2
Thickness of Groundwater Mixing Zone	ft	5	Reference 2
Width of Contaminated Zone Parallel to Groundwater Flow Direction	ft	25	Site-specific data
Background Concentration of TCE in Groundwater	µg/L	50	Reference 2

Table 4
Summary of Input Parameters - Vapor Flux and Human Health Risk Calculations
Former Mercer Processing Facility
230 Portage Avenue
Palo Alto, California

Parameter	Symbol	Value	Units	Reference
contaminant concentration in soil vapor	Ci	various	$\mu g/m^3$	Reference 1 & 2
contaminant diffusion coefficient in air (TCE)	Da	0.2844	m^2/hr	Reference 3
air-filled porosity	P_a	0.2	unitless	Reference 2
total porosity	P_t	0.52	unitless	Reference 2 & 4
depth to the contamination in the vadose zone	X	1.22	m	Reference 1
slab attenuation factor (no concrete slab)	Slab	1.0	unitless	Reference 2
slab attenuation factor (weathered concrete slab)	Slab	0.1	unitless	Reference 2
slab attenuation factor (new concrete slab)	Slab	0.01	unitless	Reference 2
room height	height	3.050	m	Assumption
indoor air exchange rate per hour	E	0.83	1/hr	Reference 2
inhalation rate	IR	20	m^3/day	Reference 5
exposure time	ET	12	hrs/day	Reference 5
exposure frequency	EF	250	days/yr	Reference 5
exposure duration	ED	25	yr	Reference 5
body weight	BW	70	kg	Reference 5
averaging time	AT	25500	days	Reference 5
contaminant carcinogenic slope factor	Slope Factor	6.00×10^{-3}	$[mg/kg\text{-}day]^{-1}$	Reference 6

Notes:
TCE = Trichloroethene
μ/m^3 - micrograms per cubic meter
m^2/hr = square meters per hour
m = meters
1/hr = one per hour
m^3/day = cubic meters per day
hrs/day = hours per day
days/yr = days per year
yr = year
kg = kilograms
$[mg/kg\text{-}day]^{-1}$ = milligrams per kilogram per day

Table 5
Summary of Vapor Flux and Human Health Risk Calculation Results
Former Mercer Processing Facility
230 Portage Avenue
Palo Alto, California

Target Soil Cleanup Level for TCE	Estimated Incremental Carcinogenic Risk		
	No Concrete Slab	Weathered Concrete Slab	New Concrete Slab
Soil Matrix = 6.8 mg/kg Calculated Soil Gas = 844,622 µg/m^3	**2.84×10^{-4}**	**2.84×10^{-5}**	**2.84×10^{-6}**
Soil Matrix = 2.0 mg/kg Calculated Soil Gas = 248,418 µg/m^3	**8.37×10^{-5}**	**8.37×10^{-6}**	8.37×10^{-7}
Soil Matrix = 1.50 mg/kg Calculated Soil Gas = 186,313 µg/m^3	**6.27×10^{-5}**	**6.27×10^{-6}**	6.27×10^{-7}
Soil Matrix = 1.3 mg/kg Calculated Soil Gas = 161,472 µg/m^3	**5.44×10^{-5}**	**5.44×10^{-6}**	5.44×10^{-7}
Soil Matrix = 1.25 mg/kg Calculated Soil Gas = 155,261 µg/m^3	**5.23×10^{-5}**	**5.23×10^{-6}**	5.23×10^{-7}
Soil Matrix = 1.0 mg/kg Calculated Soil Gas = 124,209 µg/m^3	**4.18×10^{-5}**	**4.18×10^{-6}**	4.18×10^{-7}
Soil Matrix = 0.4 mg/kg Calculated Soil Gas = 49,684 µg/m^3	**1.67×10^{-5}**	**1.67×10^{-6}**	1.67×10^{-7}
Soil Matrix = 0.2 mg/kg Calculated Soil Gas = 24,841 µg/m^3	**8.36×10^{-6}**	8.36×10^{-7}	8.36×10^{-8}
Soil Matrix= 0.1 mg/kg Calculated Soil Gas = 12,421 µg/m^3	**4.18×10^{-6}**	4.18×10^{-7}	4.18×10^{-8}
Soil Matrix = 0.08 mg/kg Calculated Soil Gas = 9,937 µg/m^3	**3.35×10^{-6}**	3.35×10^{-7}	3.35×10^{-8}
Soil Matrix = 0.05 mg/kg Calculated Soil Gas = 6,210 µg/m^3	**2.09×10^{-6}**	2.09×10^{-7}	2.09×10^{-8}
Soil Matrix = 0.025 mg/kg Calculated Soil Gas = 3,105 µg/m^3	**1.05×10^{-6}**	1.05×10^{-7}	1.05×10^{-8}
Soil Matrix = 0.01 mg/kg Calculated Soil Gas = 1,242 µg/m^3	4.18×10^{-7}	4.18×10^{-8}	4.18×10^{-9}
Soil Matrix = 0.009 mg/kg Calculated Soil Gas = 1,118 µg/m^3	3.76×10^{-7}	3.76×10^{-8}	3.76×10^{-9}

Notes:
TCE = Trichloroethene
mg/kg = milligrams per kilogram
µg/m^3 = micrograms per cubic meter
Values in bold exceed the U.S. EPA's recommended 10^{-6} (i.e., 1 in 1 million) upper bound excess cancer risk.

Table 6
Soil Remediation Cleanup Criterion
Former Mercer Processing Facility
230 Portage Avenue
Palo Alto, California

Target Soil Cleanup Level	Meets RWQCB Recomended Cleanup Level[1]	Results in No Impact to Groundwater exceeding Background Levels[2]	Protective of Human Health with Current Use[3]	Protective of Human Health with Residential Use[3]
No Soil Remediation	No	No[4]	No	No
1.0 mg/kg TVOCs	Yes[5]	No[6]	Yes	No
0.4 mg/kg TCE	Yes	No[7]	Yes	No
0.2 mg/kg TCE	Yes	Yes[8]	Yes	Yes
0.1 mg/kg TCE	Yes	Yes[9]	Yes	Yes
0.0 mg/kg TCE	Yes	Yes	Yes	Yes

Notes:

1 Cleanup levels as recommended by California Regional Water Quality Control Board, San Francisco Bay Region for nearby sites (1.0 mg/kg total VOCs) or as listed in August 2000 Guidance Document and cited in May 9, 2001 RWQCB letter to El Camino Center (0.4 mg/kg TCE).
2 Criteria based on results of SESOIL and VLEACH modeling and quarterly groundwater monitoring results reported by SECOR.
3 Criterion based on results of vapor flux and human health risk calculations.
4 Results in impact to groundwater at 1,140 ug/L TCE with maximum impact after 9 years (pore water concentration is estimated at 6,500 ug/L TCE).
5 Meets RWQCB mandated cleanup level for nearby sites (Hewlet-Packard and Varian) but does not meet cleanup level in August 2000 Guidance Document.
6 Results in impact to groundwater at approximately 280 ug/L TCE with maximum impact after 8 years (pore water concentration is estimated at 1,400 ug/L TCE).
7 Results in impact to groundwater at 157 ug/L TCE with maximum impact after 7 years (pore water concentration is estimated at 651 ug/L TCE).
8 Results in impact to groundwater at 71 ug/L TCE with maximum impact after 7 years (pore water concentration is estimated at 170 ug/L TCE).
9 Results in impact to groundwater at 58 ug/L TCE with maximum impact after 7 years (pore water concentration is estimated at 96 ug/L TCE).

Table 7
Comparison of Remedial Alternatives
Former Mercer Processing Facility

APPENDIX A

COMMUNITY RELATIONS PLAN, FACT SHEET, FACT SHEET DISTRIBUTION LIST AND MAP, AND DISPLAY ADVERTISEMENT FOR PUBLIC MEETING (TO BE INSERTED IN FINAL RAP)

APPENDIX A

Community Relations Plan

1. A notice of the availability of the draft RAP, including a brief analysis of the proposed remedial alternative, shall be published in a major Peninsula newspaper of general circulation. The notice will indicate where the draft RAP and supporting materials are located for public review and comment. A copy of the notice will be included in the final RAP.

2. The draft RAP and the supporting materials, including the reports regarding the remedial investigation, shall be made available to the public for inspection and comment in the record for the site maintained by the RWQCB at its offices in Oakland, California, at the Palo Alto public library and at the offices of WSJ Properties, 3201 Ash Street, Palo Alto, California, which offices are located adjacent to the site (hereinafter, "Information Repositories").

3. A Fact Sheet will be circulated to local residences and businesses in the vicinity of the site. The Fact Sheet will briefly discuss the contaminant and risks, contain a map of the site location, discuss the remedial alternatives evaluated in the RAP and the recommended alternative.

4. Thirty calendar days shall be provided for submissions of written and oral comments on the draft RAP and the supporting analysis and information located in the Information Repositories.

5. A public meeting regarding the draft RAP, the supporting analysis and information shall be held at or near the Site, at a location to be advertised in the notice of availability of the draft RAP, during the public comment period. The meeting will be held within the 30-day comment period.

6. A transcript of the public meeting shall be prepared and made available to the public and will be appended to the final RAP.

7. A written summary of significant comments, criticisms, and new relevant information submitted during the public comment period, along with RWQCB's response to each issue, shall be prepared and shall be made available to the public and will be included in the final RAP.

8. If new information is made available that significantly changes the basic features of the proposed remedy in the draft RAP with respect to scope, performance or cost, such that the remedy significantly differs from the original proposal in the draft RAP and the supporting analysis and information, RWQCB shall either (A) include a discussion in its written decision approving a final RAP of the significant changes and reasons for such changes, if it determines

that such changes could be reasonably anticipated by the public based on the alternatives and other information available in the draft RAP or the supporting analysis and information, or (B) seek additional public comment on a revised RAP, if it determines that the change could not have been reasonably anticipated by the public based on the information available in the RAP or the supporting analysis and information. Under such circumstances, RWQCB shall, prior to approval of a final RAP, issue a revised draft RAP which shall include a discussion of the significant changes and the reasons for such changes from the original draft RAP, in accordance with the public participation requirements set forth above.

9. Upon approval of a final RAP, a copy of the final RAP shall be made available to the public for inspection and copying at the information repositories.

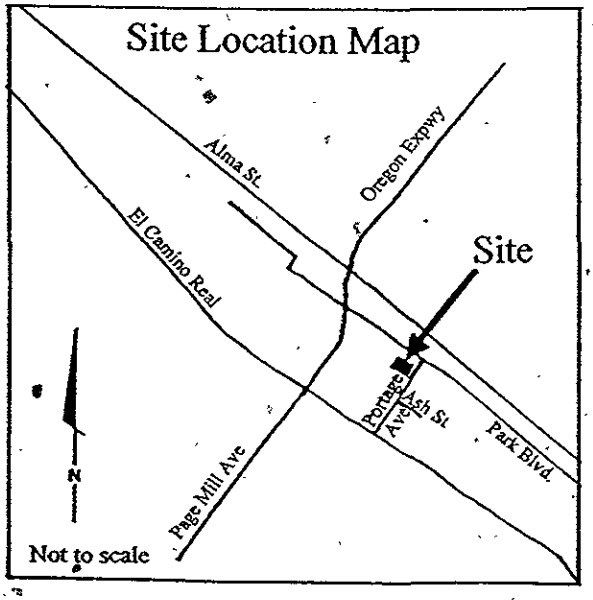
FACT SHEET: DRAFT REMEDIAL ACTION PLAN 230 PORTAGE AVENUE, PALO ALTO, CALIFORNIA

Introduction



This fact sheet presents cleanup alternatives for soil contaminated with chlorinated hydrocarbons at 230 Portage Avenue in Palo Alto (site). The Site is currently owned by El Camino Center, a California partnership.

The fact sheet describes the contamination present at the site, specifies goals for cleanup and summarizes alternative methods to achieve these goals and the proposed cleanup alternatives. This information is discussed in more detail in the Draft Remedial Action Plan (RAP), which is available for public review and comment.

Site Location and Description

The site is located within the City of Palo Alto, in an area that is a primarily commercial and light industrial with some nearby residences. The site is a vacant space located within a larger commercial and light industrial building. The entire property, with the exception of landscaped areas and one onsite structure, is covered with asphalt-concrete parking lots and concrete sidewalks.

The site is located in an area that is currently undergoing groundwater remediation due to releases of chlorinated hydrocarbons at various other locations.

Background

The larger parcel that includes the site was reportedly used as a fruit cannery prior to World War II. After World War II the parcel was used by Safeway as a food distribution warehouse and subsequently as a strip mall consisting of numerous retail shops. By the early 1970s, the parcel was still occupied by the strip mall and the retail shops, miscellaneous other warehouse and storage users, and Dura-Bond Manufacturing Company. Following the purchase of the property in the early 1970s by El Camino Center, use of the property as a strip mall was discontinued and the property was subleased to various businesses. The site was reportedly used for storage of dry goods until 1989.

Mercer Processing, Inc. (Mercer) conducted freeze-drying and food product packaging at the site between 1989 and 1999. During a portion of that period, Mercer's operations involved refrigeration equipment that used TCE. Environmental investigations were conducted in 1999 and 2000 after Mercer vacated the site. The investigations included collection and testing of soil samples from various locations beneath the site. TCE was the chemical detected most frequently and at the highest concentrations, up to 6.8 parts per million in soil. The soil contamination did not extend to groundwater.

Risk Evaluation

Data from soil samples were used to prepare a risk evaluation. This study evaluated the potential health risks to people occupying the premises and risk to groundwater quality. This evaluation was used to develop levels for soil cleanup based on current and probable future site uses.

The risk evaluation concluded that a cleanup level of 0.2 parts per million TCE in soil would be appropriate to address potential future risks to human health and groundwater.

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption. For a list of simple ways you can reduce demand and cut your energy costs, see our Web-site at http://www.swrcb.ca.gov.

Evaluation of Cleanup Alternatives
The Draft RAP details cleanup alternatives for soil contamination. The five alternatives include:

Alternative 1 – No Action. Under this alternative no removal or cleanup activities would occur at the site. Administrative controls such as land use restrictions and/or zoning restrictions may need to be developed. The no action alternative provides a baseline for comparison of costs and benefits in the analysis of other remedial alternatives.

Alternative 2 – Soil Excavation with Offsite Disposal. This involves excavation of TCE contaminated soil that exceeds the cleanup level and disposal of the soil at a permitted landfill.

Alternative 3 – Soil Excavation with Ex-Situ Onsite Treatment. This alternative is similar to Alternative 2 but prior to offsite disposal the soil is treated on the site. After treatment to decrease contamination levels, the soil is disposed off site.

Alternative 4 – Soil Vapor Extraction. This method uses a vacuum to remove contaminated soil vapors in the area of contamination, treatment of the contaminated vapors with activated carbon, and subsequent off site disposal of the activated carbon. No excavation is required for this method.

Alternative 5 – Enhanced In-Situ Bioremediation. This alternative involves injection of nutrients to soil through a series of injection points to enhance biodegradation of the contamination. No excavation is required for this method.

These five alternatives were evaluated based on criteria developed by the U.S. Environmental Protection Agency for cleanup of contaminated sites. These criteria include the overall protection of human health and the environment, compliance with other standards known as "applicable or relevant and appropriate requirements," long-term effectiveness and permanence, reduction of mobility, toxicity, or volume of hazardous substances, short-term effectiveness, implementability, cost, and acceptance by the State and by the community.

Proposed Cleanup Alternative
Soil excavation with offsite disposal, Alternative 2, is the proposed remediation alternative for the TCE contaminated soil. This technique will effectively and economically reduce the majority of contaminants in soil in the timeliest manner. If approved, the process would be implemented by a qualified general contractor in accordance with a site-specific health and safety plan. This plan would comply with both the state and federal regulations and be designed to protect the health and safety of construction workers and the public during implementation of the alternative.

If the proposed alternative is adopted, the work could commence in seven to ten days following acceptance. The work could be completed within approximately 10 to 15 working days.

Once complete, a report would be submitted to the RWQCB documenting the remediation activities.

Public Comment Period
The RWQCB will hold a public comment period from July 28, 2001, through August 27, 2001.

California Environmental Quality Act
This remedial action is being pursued to comply with laws and regulations administered by the RWQCB. As such, this action is categorically exempt from the provisions of the California Environmental Quality Act (CEQA) pursuant to Section 15321 of the Resources Agency Guidelines.

For More Information
The Draft RAP is available for public review at the following locations:

RWQCB
1515 Clay Street
Suite 1400
Oakland, CA 94612
(510) 622-2300

Palo Alto Public Library
Main Branch

WSJ Properties
3201 Ash Street
Palo Alto, CA 94306
(650) 493-5310
Attention: Ms. Elizabeth Moothart

A public meeting to describe the environmental conditions and proposed cleanup alternatives will be held at the site, 230 Portage Avenue, Palo Alto, California on August 8, 2001, at 6:30 P.M. Representatives of the RWQCB and the property owners will be available to receive comments on the proposed remediation.

If you would like to comment in writing on the Draft RAP or would like to receive more information, please contact Dr. Derek Whitworth at the RWQCB at (510) 622-2349 or email at dw@rb2.swrcb.ca.gov.

The energy challenge facing California is real. Every Californian needs to take immediate action to reduce energy consumption. For a list of simple ways you can reduce demand and cut your energy costs, see our Web-site at http://www.swrcb.ca.gov.

APPENDIX B

Verification Sampling and Analyses Plan

Performance Standards and Guidance

Work will be performed in accordance with applicable guidance and requirements set forth pursuant to Comprehensive Environmental Response Compensation Liability Act (CERCLA) as amended by Superfund Amendment and Reauthorization Act (SARA); applicable or relevant and appropriate requirements (ARARs); the National Contingency Plan (NCP); DTSC; and Superfund practices in effect at the time of performance of the activity or element of work.

Verification sampling will be conducted in general accordance with the following documents:

- Guidance for Conducting Remedial Investigations and Feasibility Studies Under CERCLA, U.S.EPA, Office of Emergency and Remedial Response, October 1988, OSWER Directive No. 9355.3-01;
- Interim Guidance on Potentially Responsible Party Participation in Remedial Investigation and Feasibility Studies, U.S.EPA, Office of Waste Programs Enforcement, Appendix A to October 1988 OSWER Directive No. 9355.3-01;
- A Compendium of Superfund Field Operations Methods, Two Volumes, USEPA, Office of Emergency and Remedial Response, EPA/540/P-87/001a, August 1987, OSWER Directive No. 9355.0-15;
- EPA NEIC Policies and Procedures Manual, May 1978, revised November 1984, EPA-330/9-78-001-R;
- OSHA Regulations in 29 CFR 1910.120 (Federal Register 45654, December 19, 1986); and
- Preparation of a U.S.EPA Region 9 Field Sampling Plan for Private and State-Lead Superfund Projects, Document Control Number 9QA-06-89, August 1993, U.S.EPA Region 9, Quality Assurance Management Section.

Design and Placement of the Sampling Locations

PES proposes a systematic verification sampling plan which will distribute sample locations uniformly over the removal area. Verification soil samples will be collected from the sidewalls of each "slot" using a hand sampler and the backhoe or excavator bucket to evaluate whether soil removal has met the remedial goal. The sidewall soil samples will be collected at depth intervals corresponding to areas exhibiting field indications of potential contamination

and at depths where previous samples indicated contaminants were present. In addition, four verification soil samples will be collected from the bottom of the excavation for chemical analysis to evaluate whether soil removal has met the remedial goal.

Concrete and Soil Sampling Field Procedures and Methodology

Following soil removal activities, the sampling locations will be identified using a graduated tape measure. One verification soil sample will be collected from each location. Samples will be collected from each location by using a hand sampler and the backhoe or excavator bucket. Sample locations and the number of samples collected per "slot" may be adjusted in the field if necessary.

The following is a summary of equipment that will be used during verification sampling activities:

- Hammer driven hand sampler;
- Tape line (in feet and inches or tenths);
- 2-inch-diameter precleaned, lab-supplied, stainless-steel tubes;
- Polypropylene end caps;
- Zip-lock plastic bags;
- Teflon and silicon tape;
- Personal protective equipment;
- Ice, insulated cooler and appropriate packing supplies;
- Buckets, brushes and detergents for equipment decontamination;
- Sample labels;
- Chain-of-custody forms; and
- Sample collection log, sub-area field map, water-resistant ink pen, and daily field report forms.

Verification soil samples will be collected from the excavation surfaces or backhoe or excavator bucket using a pre-cleaned hand sampler. Excavated concrete will be sampled for waste characterization purposes. Sampling will be conducted according to the procedures described below.

In order to avoid cross contamination of samples, soil samples will be collected from soil which does not come in direct contact with the backhoe bucket surface. Soil samples will be collected from the backhoe bucket using a hand-held drive sampler with stainless-steel liners. Following collection, each soil sample liner will be sealed with Teflon tape, polypropylene end caps and silicon tape to minimize the loss of volatile organic compounds (VOCs). The tubes will then be labeled, sealed in a zip-lock bag, and placed in a chilled, thermally-insulated cooler for shipment to a California Department of Health Services-approved laboratory for chemical analysis.

A composite sample of the removed concrete will be collected and submitted to the selected laboratory for chemical analysis. Concrete chips will be collected and placed into a resealable plastic bag and placed in a chilled, thermally-insulated cooler for shipment to a California Department of Health Services-approved laboratory for chemical analysis.

The sample collection equipment will be cleaned with a mild phosphate-free detergent solution and rinsed with potable water between sample locations. Decontamination fluids will be stored in drums or tanks pending characterization and disposal. Solid waste materials (i.e., gloves, paper towels, etc.) will be stored in drums or bins pending disposal.

Sample tubes will be labeled and placed in a thermally-insulated cooler that is chilled to a temperature of approximately four degrees Centigrade for transport to the project analytical laboratory under chain-of-custody protocol.

The samples will be identified using a numbering system, which will consist of: (1) the sample location; and (2) the date the sample was collected. Samples will be identified with a label affixed to the sample tube. The following information will be specified on each label:

- Project name;
- Project number;
- Date and time of sample collection;
- Sample identification number; and
- Analyses requested.

Individual sample tubes will be placed in sealed plastic bags to prevent intrusion of moisture into sample tubes and damage to sample labels. The coolers will be chilled using ice packaged in doubled plastic bags or "blue-ice" packs. The cooler will be sealed with strapping tape prior to transport to the analytical laboratory. Coolers will be transported to the laboratory either by laboratory couriers or field sampling personnel.

Samples will be accompanied by chain-of-custody documents. The form will accompany every sample shipment to the analytical laboratory to document sample possession from the time of collection. The form will contain the following information:

- Sample identification number;
- Signature of collector;
- Date and time of collection;
- Site name and project number;
- Sample matrix;
- Sample tube description;
- Analyses requested;
- Special analytical procedures requested;
- Remarks (expected interferences, hazards, unusual events at the time of sampling, if applicable);
- Preservatives added (if any);
- Any special sample preparation (if applicable);
- Destination of samples (laboratory name);
- Signature of persons involved in chain of possession (relinquished by and received by); and
- Date and time of sample receipt at laboratory.

The two top sheets of the chain-of-custody form will be placed in a water-tight, resealable plastic bag which will be taped to or placed in the cooler for transport.

When transferring samples, the individuals relinquishing and receiving the samples will sign, date, and record the time on the chain-of-custody form. A separate chain-of-custody form will accompany each sample shipment. The method of shipment and courier name(s) will be entered on the chain-of-custody form.

Daily field activities will be recorded on daily field report forms which indicate the date and time of field observations made by field personnel. All field forms will be signed by field personnel.

Information pertinent to soil sampling will be recorded in water-resistant ink in the daily field report. Entries in the field report will include the following information:

- Location of sampling site;
- Names and affiliations of all sampling team members;
- Surficial lithology of each sample;
- Date and time of sample collection;
- Description of deviations from sampling plan (if any);
- Sample destination (e.g., name of laboratory); and
- Signature of personnel responsible for sampling.

Original data recorded in field logs, chain-of-custody forms, and on other forms will be written in water-resistant ink. None of these documents will be destroyed or discarded, even if they are illegible or contain inaccuracies that require a replacement document.

If an error is made on a document assigned to one individual, that individual will make corrections by drawing a line through the error, entering the correct information, and initialing and dating the change. The erroneous information should not be obliterated. If possible, any subsequent error(s) discovered on a document will be corrected by the person who made the entry.

Laboratory Procedures and Methodology

Samples will be analyzed by a laboratory that is certified by the California Department of Health Services for performing the analyses specified. Sample handling procedures used by the laboratory may vary from the procedures specified herein as long as they fulfill the objective of maintaining sample integrity and traceability.

The sample custodian at the laboratory accepts custody of delivered samples and verifies the following information:

1. All samples are present;
2. All samples are in good condition;
3. All samples are accompanied by a properly completed chain-of-custody form;
4. The sample identification is complete and corresponds to the chain-of-custody form; and

5. The condition of custody seals and temperature of the chest.

If sample integrity is questionable, the sample custodian will immediately notify the laboratory's project administrator, who in turn will notify the PES project manager. Arrangements can then be made for sample replacements to be shipped to the laboratory. The sample custodian will document the sample condition on the sample custody log and sign the chain-of-custody form.

Logging of Laboratory Samples

After chain-of-custody procedures are complete and acceptable, the sample custodian will assign laboratory identification numbers to the samples. Laboratory sample identification numbers may be written on the chain-of-custody form for tracing purposes. The custodian will transfer the samples to the proper analyst(s) or store the samples in an appropriate secure area.

Laboratory personnel are responsible for the care and custody of samples from the time they are received until the sample is exhausted. Data sheets and laboratory records are retained as part of the permanent documentation for at least 3 years.

Sample Analysis

Verification soil and concrete samples will be analyzed for VOCs by U.S. EPA Test Method 8260B. The analyses may be performed utilizing expedited turn-around time in order to minimize subcontractor down-time.

Sample Storage

Samples and extracts are retained by the analytical laboratory for up to 30 days after the data are reported by the laboratory. Unless notified by the program managers, excess or unused samples will be disposed by the laboratory in a manner consistent with appropriate government regulations.

Corrective Measures Criteria

The site-specific cleanup goal for Mercer area has been established as 200 μg/kg TCE in soil.

Data Evaluation Procedures

Should the laboratory analytical results of the verification samples indicate that the soil cleanup goal is still exceeded, additional excavation may be performed, to the extent feasible.

1.0 INTRODUCTION

PES Environmental, Inc. (PES) has prepared this report on behalf of El Camino Center to describe soil remediation at the former Mercer Processing, Inc. (Mercer) facility at El Camino Center, 230 Portage Avenue, Palo Alto, California. The site location is shown on Plate 1. The remediation was performed in accordance with PES' document *Final Remedial Action Plan, Former Mercer Processing, Inc. Facility, 230 Portage Avenue, Palo Alto, California* dated October 18, 2001 (PES, 2001). The Remedial Action Plan (RAP) was approved by the Regional Water Quality Control Board - San Francisco Bay Region (RWQCB) in a letter dated October 18, 2001. A copy of the RWQCB approval letter is included in Appendix A.

Remedial planning conducted by El Camino Center included: (1) preparation of the RWQCB-approved RAP; and (2) preparation and implementation of a Community Relations Plan. The activities described in the RAP were consistent with the National Oil and Hazardous Substances Pollution Contingency Plan[1], and the California Health and Safety Code.

The Community Relations Plan included provisions for notifying the public of the availability of the RAP for review and comment, making the RAP available for public review and comment for a period of 30 days, and publishing a brief analysis of the site and the proposed remedial action. Following completion of the 30-day public comment period and minor revisions to the RAP, the RWQCB approved the RAP for implementation. The Community Relations Plan also included provisions for holding a public meeting to discuss the history of the site and proposed remedial action, addressing comments received from concerned public, and publishing the selected final remedial action for the site following expiration of the public comment period. A copy of the Community Relations Plan, public notice, fact sheet, fact sheet distribution list and distribution map, and public comments and responses were appended to the Final RAP.

This report summarizes the remedial actions performed in accordance with the Final RAP, and presents the results of verification soil sampling and waste management activities. This report also provides a brief overview of the results of previous investigations at the former Mercer facility. A more detailed overview of the previous investigations is presented in the RAP and previous investigation reports (PES, 2000; IT, 2000a and 2000b).

2.0 SITE BACKGROUND

2.1 Site Location and Description

The former Mercer facility is located at 230 Portage Avenue in Palo Alto, California within El Camino Center (Plate 1). The subject site is a vacant tenant space located within a larger commercial and light industrial building near the north end of Portage Avenue. It is located in

[1] Title 40 Code of Federal Regulations, Part 300.

a primarily commercial and light industrial area with some residences present. The property is zoned for residential use but is being used for commercial purposes pursuant to a variance that is scheduled to expire in the year 2019, if it is not terminated earlier. The property is improved with one structure. The entire property, with the exception of landscaped areas and the onsite structure, is covered with asphalt-concrete parking lots and concrete sidewalks. The floor of the former Mercer facility is elevated above the surrounding ground surface by approximately four feet. A site plan is included as Plate 2.

2.2 Former Site Use

The former Mercer tenant space is located in the eastern portion of the El Camino Center building (Plate 2). The tenant space is currently vacant. The major tenant at El Camino Center is Frye's Electronics (an electronics and appliance retailer), located west of the subject site. Two other tenants occupy segments of the building to the east for office purposes.

El Camino Center personnel approximated that the parcel has been in use since the 1940s. Prior to World War II, the parcel, including the tenant space formerly occupied by Mercer, was purportedly used as a fruit cannery (Osborn, 2001). Between World War II and the early 1970s when El Camino Center purchased the parcel, the area, including the subject site, was first used by Safeway, as a food distribution warehouse and subsequently by Maximart as a strip mall consisting of numerous retail shops (Osborn, 2001). Maximart left after El Camino Center purchased the property, and the former Mercer tenant space was reportedly used as a warehouse for the storage of dry goods until Mercer's occupancy commenced in 1989.

According to information provided to PES during an inspection of the Mercer tenant space in December 1999, Mercer occupied this location between 1989 and 1999. Plate 3 shows the layout of the former Mercer facility.

At this location, Mercer operated freeze-drying and food packing equipment. Solvents, including trichloroethylene (TCE) and Genesolv 2000, were used in the refrigeration equipment for the freeze-drying process. Documentation from Santa Clara County Hazardous Materials Compliance Division indicated that Mercer stored approximately 650 gallons of Genesolv 2000 on the site.

2.3 Previous Investigations

Several subsurface remedial investigations have been performed by PES and IT Corporation (IT) at the subject site to assess the lateral and vertical extent of contaminants in soil resulting from the former Mercer operations. The investigations are described in the RAP.

Soil samples were collected to a maximum depth of 24 feet bgs. The locations of previously sampled soil borings are shown on Plate 3. Soil samples were analyzed for volatile organic compounds (VOCs). Detected VOCs included: (1) TCE; (2) 1,1-dichloroethylene; (3) cis-1,

2-dichloroethylene; (4) trans-1,2-dichloroethylene; (5) acetone; (6) methylethyl ketone; and (7) tert-butanol.

TCE was detected at concentrations ranging from 3 micrograms per kilogram (μg/kg) to 6,800 μg/kg (IT, 2000b). In general, TCE concentrations in soil decreased laterally with increased distance away from the former location of the refrigeration equipment at the former Mercer facility. Concentrations in soil also generally decreased with depth. Tabulated soil sample analytical results from the investigations are included as Appendix B.

TCE was identified as the primary chemical of concern at the Site because: (1) it was the most prevalent VOC detected in soil; (2) it was present at higher concentrations than other VOCs detected in site soil; (3) it possesses the lowest regulatory action level in groundwater of the detected contaminants; and (4) it represented the greatest potential human health risk to site users.

2.4 Remedial Objectives

On the basis of results of previous investigations (PES, 2000; IT, 2000a and 2000b), PES prepared the RAP to: (1) select a risk-based TCE target soil cleanup concentration of 0.2 milligrams per kilogram (mg/kg); and (2) describe the procedures to implement the remedial activities. The RWQCB approved TCE target soil cleanup concentration in the final RAP is 0.2 mg/kg. The excavation area proposed in the RAP to achieve the cleanup goal was expected to range from approximately 160 square feet (ft^2) to 800 ft^2 in the vicinity of the former refrigeration unit in the former Mercer facility (Plate 3). The proposed maximum depth of the excavation was estimated to be 20 feet below grade based on analytical results from soil samples collected from previously drilled soil borings B and D (Plate 3 and Appendix B). A site plan showing the anticipated extent of the excavation is included as Plate 4.

3.0 REMEDIATION ACTIVITIES

Soil excavation was conducted at the former Mercer facility to remove soil containing concentrations of TCE exceeding the target soil cleanup concentration of 0.2 mg/kg.

Remedial activities at the site consisted of: (1) acquiring necessary permits; (2) preparing health and safety plans; (3) sawcutting and removing concrete from areas above the impacted soil; (4) excavating soil with TCE concentrations exceeding the target cleanup concentration; (5) collecting and analyzing verification soil samples from the excavation to verify the target cleanup concentration was met; (6) collecting and analyzing waste characterization samples of the concrete and excavated soil for offsite recycling and disposal; and (7) backfilling and resurfacing the excavation. These activities are described in the following sections.

3.1 Preliminary Activities

El Camino Center contracted with Cornerstone Environmental Contractors, Inc. (Cornerstone) of Lafayette, California to perform soil excavation and backfilling activities. The work was conducted between January 2 and January 19, 2002. PES was present to observe and document the work. Cornerstone and PES each prepared site-specific health and safety plans prior to the remediation in accordance with Occupational Safety and Health Administration regulations[2].

An underground utility service locator was hired to clear the proposed excavation of subsurface utilities. In addition, Underground Service Alert was contacted to schedule visits by public and private utility companies.

Cornerstone acquired permits from the City of Palo Alto prior to conducting remediation at the site. As part of the permit acquisition process, a structural analysis prepared by Hohbach-Lewin, Inc. of Palo Alto, California, was submitted to the City of Palo Alto. A copy of the permit is provided in Appendix C.

3.2 Site Preparation

Before conducting remediation activities, the walls and ceiling in the rear (northern) portion of the former Mercer facility were lined with plastic sheeting to reduce dust settlement on the surfaces. Cornerstone constructed a temporary ramp consisting of baserock to create an entrance from the rear parking lot to the elevated loading dock.

The concrete slab above the excavation was sawcut and removed by a Cornerstone subcontractor on January 2 and 3, 2002. The concrete was temporarily stockpiled on plastic sheeting in a bermed area within secured fencing in the rear parking lot.

3.3 Soil Excavation

The impacted soil above the target cleanup concentration was excavated between January 8 and January 15, 2002. A test pit was excavated adjacent to the wall located in the center of the excavation in order to verify the presence of a footing beneath the wall prior to excavation activities. A concrete foundation was present beneath the wall. The foundation is approximately 1-foot wide and extends approximately 4.5-feet below grade.

Approximately 285 cubic yards (cy) of TCE-impacted soil was removed from the facility. The excavation was conducted using two track-mounted mini-excavators, a rubber-tired Bobcat, and hand-held equipment. Excavated soil was placed on and covered with plastic sheeting inside a bermed area and secured fencing in the rear parking lot north of the facility.

---

[2] Title 29 Code of Federal Regulations, 1910.120.

The TCE-impacted soil was excavated using conventional and "slot trench" techniques. Conventional excavation was first conducted to approximately 4 feet below grade across the entire excavation area. Slot trenching was then conducted to protect the integrity of the building and for worker safety when removing soil from deeper portions of the excavation (i.e., greater than 4 feet below grade). Approximately 5-foot wide slot trenches oriented in the northwest-southeast direction (parallel to the long axis of the tenant space) were excavated to remove TCE-impacted soil at depths greater than 4 feet below grade.

During excavation, several other concrete footings and inactive utilities were uncovered and removed. An active fire drain located along the wall was removed from the excavation and set aside for re-assembly during backfilling activities. A concrete footing located approximately 1 foot northwest of the wall foundation did not require removal. Soil located within the annular space between the two foundations was subsequently removed using hand excavation equipment.

In order to ensure the integrity of the wall separating the interior and exterior of the tenant space, excavation activities were performed concurrently on both sides of the wall. To reduce potential settlement during excavation, soil was excavated during benching to approximately 0.5 foot above the bottom of the foundations.

Verification of the excavation depth was performed during and after completion of each slot trench. Verification soil samples were collected from the bottom of the excavation to verify the target remedial concentration was met. Verification soil sampling was implemented by collecting samples at the bottom and the sidewalls of the slot trenches and the bottom and sidewalls of the "bench" area. The soil samples collected at the sidewalls of the slots were collected at depth intervals corresponding to areas exhibiting field indications of potential contamination and at depths where previous samples indicated the highest levels of contaminants were present. Excavation details are presented on Plate 5.

The excavated area inside of the former Mercer facility had surficial dimensions of approximately 33 feet by 50 feet (1,650 ft^2). The depth of the soil excavation ranged from approximately 4 feet below grade (bench area) to approximately 20.5 feet below grade (Plate 5). Excavation contours are depicted on Plate 5. Excavation cross-sections are shown on Plate 6. The locations of the cross-sections are shown on Plate 5.

The soil encountered during the excavation consisted of a gravelly clay fill to approximately 1.5 feet below grade. The gravelly clay fill was underlain by a sandy clay fill to approximately 6 feet below grade. Beneath the fill, a highly plastic clay was present to 20.5 feet below grade, the maximum depth of the excavation. The clay was dark gray in color to approximately 14 feet below grade where the color changed to a yellowish orange. No groundwater was encountered.

The final limits of the excavation and the verification sampling locations are presented on Plate 5. Photographs of the soil remediation activities are presented on Plates 6 through 8.

3.4 Verification Soil Sampling Methodology and Analytical Program

Verification soil samples were collected from the excavation for chemical analyses during remedial activities. The samples were collected to verify implementation of the target cleanup concentration. If the target cleanup concentration was exceeded, excavation of TCE-impacted soil was continued until the TCE concentration in soil samples was below the target concentration. The verification soil sample locations are shown on Plate 5. A total of 45 verification soil samples were collected from the bottom and sidewalls of excavated slots and benches. These samples were collected on January 9, 10 and 14, 2002.

Verification soil samples were collected directly from the bucket of the mini-excavator or exposed soil in the excavation by driving pre-cleaned 3-inch long stainless-steel tubes into the soil. After collection, the ends of the tube were sealed with Teflon™ sheeting and covered with plastic end caps. Sample tubes were labeled with project name and number, sample identification, sampling time and date.

Soil samples were transferred under chain-of-custody protocol to an onsite mobile laboratory operated by STL On-Site Technologies of Westfield, Massachusetts, a California Department of Health Services-certified laboratory. All samples were analyzed for VOCs using U.S. EPA Test Method 8260B. The laboratory analytical reports and chain of custody forms are presented in Appendix D.

3.5 Verification Soil Sample Results

Verification sample results are presented in Table 1. Results of the final verification samples are also presented on Plate 5.

As shown on Plate 5, the target cleanup concentration of 0.2 mg/kg TCE was, as anticipated, reached in the final verification samples collected from the bottom and sidewalls of the slot trenches and the bottom and the sidewalls of the bench area.

3.6 Waste Characterization Results and Waste Management

Soil excavated from the site was stockpiled in the parking lot at the rear of the facility. Excavated soil was characterized by collecting one four-point composite soil sample for VOC analyses per approximately 100 cy. The samples were collected directly from the soil stockpiles. These samples were capped, labeled, and handled under the same protocol as the verification soil samples collected from the excavation.

A total of four (4) four-point composite characterization samples were analyzed and TCE was not detected above the reporting limit of 0.025 mg/kg. The results of the chemical analyses conducted for waste characterization are presented in Appendix D.

A composite concrete sample was also collected for waste characterization purposes. Concrete was chipped from various locations within the stockpile using a clean chisel and hammer and placed in a sealed, re-sealable plastic bag. The sample was labeled with project name and number, sample identification, sampling time, and date.

The concrete sample was transported by courier under chain-of-custody protocol to STL San Francisco of Pleasanton, California, a state-certified laboratory. The composite sample was analyzed for VOCs using U.S. EPA Test Method 8260B. TCE was not detected above the reporting limit of .021 mg/kg. Total xylenes were detected at .022 mg/kg. The laboratory analytical report and chain of custody form are presented in Appendix D.

On February 6 and 7, 2002, the soil was transported to the Altamont Landfill in Livermore, California for disposal as non-hazardous solid waste. The soil was transported by Jervicon Inc. of Santa Maria, California. Approximately, 542 tons of soil was transported to and disposed at the Altamont Landfill. Soil transportation and disposal documentation is included in Appendix E.

Concrete removed from the area of excavation was transported to Harbor Sand & Gravel in Redwood City, California for recycling. On February 6 and 7, 2002 the concrete was transported by Greg's Trucking Service, Inc. of San Mateo, California. Approximately 20 tons of concrete were recycled. Concrete recycling documentation is presented in Appendix E.

3.7 Excavation Backfilling and Fire Drain Repair

The slot trench excavations were backfilled to a depth of approximately 4 feet below grade the same day they were excavated. A controlled density flowable fill was used, which consisted of a two-sack cement-sand slurry mixture. The slurry was used to rapidly stabilize the slot trenches in order to protect the integrity of the building and provide worker protection. The slurry was placed in slot trenches after final verification samples were collected and analyzed from each slot trench. A total of approximately 190 cubic yards of slurry was pumped into the slot excavations. Copies of the control density fill delivery tickets are presented in Appendix F.

Prior to backfilling the excavation using conventional earthwork techniques, two support columns in the vicinity of the excavation were reinforced by Cornerstone. The reinforcement of the columns was conducted to fulfill permit requirements.

Between January 15 and January 23, 2002, the upper four feet of the excavation was backfilled and compacted by Cornerstone. The fill material was an imported Class 2 aggregate base. Documentation of the imported Class 2 aggregate base is presented in Appendix G. Excavated soil was evaluated for geotechnical suitability by staff of Smith-Emery Company of San Francisco, California. Approximately 21 cy of the material was found to be suitable and was re-used as backfill. The backfill material was placed in lifts no greater than 8 inches thick and

compacted using a Bomag compactor. The backfill was compacted to at least 95 percent of the maximum relative dry density. Field density testing of the compacted fill was conducted by Smith-Emery Company. Copies of the field density test data are presented in Appendix H. The excavation was backfilled to within approximately 6 inches of the top of the existing concrete slab surface to allow construction of a replacement concrete floor slab.

The section of fire drain pipeline removed for the excavation was replaced by Cornerstone following placement of the underlying fill materials.

3.8 Concrete Replacement

After backfilling was completed, the concrete floor slab was replaced. Concrete was placed by Cornerstone on January 24, 2001 to match the surface of the existing slab. The concrete consisted of a 5-sack mix with a 28-day strength of 3,000 pounds per square inch, complying with ASTM C94. The replaced slab was reinforced and tied into the existing slab by drilling into the existing concrete slab, inserting and epoxying in Number 4 steel dowels in to the slab at approximately 12 inch centers. Wire mesh steel reinforcement was laid at approximately the center of the slab thickness throughout the excavation area prior to the concrete pour. A typical section of the concrete replacement is shown on Plate 5. A photograph of the replaced section of concrete is shown on Plate 7, Photograph 1. Copies of the concrete delivery tickets are presented in Appendix I.

4.0 SUMMARY AND CONCLUSIONS

Remedial action has been successfully implemented at the former Mercer facility at the El Camino Center. Approximately 285 cy of TCE-impacted soil has been excavated to a maximum depth of approximately 20.5 feet below grade. On the basis of verification soil samples collected from the bottom and sidewalls of the excavation, soil with TCE concentrations exceeding the target cleanup goal has been removed from the site. Groundwater was not encountered during the excavation of TCE-impacted soil. The excavation has been backfilled with sand cement slurry, imported clean fill, and re-usable excavated "clean" soil. The area of soil excavation has been capped with a concrete slab.

Accordingly, PES, on behalf of El Camino Center, requests a letter from the RWQCB stating that the remedial goal has been achieved and no further investigation or remedial action is required at the site.

Gray Davis
Governor

RECEIVED OCT 2 3 2001

Date: October 18, 2001
File No. 43S0965 (DAW)

El Camino Center
Attn: Mr. Boyd Smith
3201 Ash Street
Palo Alto, CA 94306

Subject: Concurrence with the Remedial Action Plan for the site at 230 Portage Avenue, Palo Alto, Santa Clara County.

Dear Mr. Smith:

This letter responds to your final Remedial Action Plan (RAP) dated October 18, 2001, describing proposed remedial actions to address the soil contamination at a site formerly occupied by Mercer Processing Inc. at 230 Portage Avenue, Palo Alto. The submittal describes the remedial investigations conducted at the site, considers alternatives for mitigating the contamination, and recommends a course of action. Board staff concur with the recommended remedial action.

Investigation reports describing the extent of contamination by trichloroethylene at the site were submitted to the Board on March 22, 2001. A meeting was held on April 3, 2001, between Board staff, yourself, your consultants, PES Environmental Inc., and your attorney, Mr. David Cooke. At that meeting additional information on the site was presented which described the threat to groundwater due to the contamination. Based on the information submitted, the Board sent a letter to El Camino Center on May 9, 2001, requesting a RAP.

A draft RAP was first submitted on June 26, 2001. Board staff reviewed the RAP and it was subsequently revised and made available for public review on July 28, 2001. The RAP recommends excavation and off-site disposal of soils contaminated with trichloroethylene. To the extent practicable, all soils containing trichloroethylene at concentrations greater than 0.2 mg/kg will be excavated and disposed off-site. Modeling studies have indicated that, at this level, if the TCE in the soil leaches into the underlying aquifer it will not further degrade the existing beneficial uses of that water. The clean up level for soil is also fully protective of public health.

A public notice of the draft RAP was published and the public was invited to submit comments to the Board between July 28 and August 27, 2001. A public meeting was held on August 8, 2001, to facilitate and receive input from the community and other interested groups.

The Board received written comments on the draft RAP as well as oral comments at the public meeting. Board staff addressed these comments in an internal memorandum. A copy of this memorandum is included as an appendix in the final RAP. There were two responses that indicated changes and amendments to the RAP. These changes and amendments have been incorporated into the final RAP submitted to the Board on October 18, 2001. Board staff concur with the selected alternative described in the RAP.

Implementation of the RAP is anticipated to start in October 2001. Please give the Board three working days notice of the start of excavation and submit a completion report within 60 days of completing the remedial work.

If you have any questions, please contact Derek Whitworth of my staff at (510) 622 2349 [e-mail dw@rb2.swrcb.ca.gov].

Sincerely,

Stephen A. Hill
Toxics Cleanup Division Chief

Notes:
µg/kg = micrograms per kilogram
bgs = below ground surface
< = compound not detected at or above the respective laboratory reporting limit
J = estimated value, less than the laboratory practical quantitation limit but greater than the method detection limit
NA = Not analyzed
NL = Not listed
NR = No sample recovery
TCE = trichloroethylene
MEK = methyl ethyl ketone
t-butanol = tert-butanol
1,1-DCE = 1,1,-dichloroethylene
cis-1,2-DCE = cis-1,2-dichloroethylene
trans-1,2-DCE = trans-1,2-dichloroethylene
[1] = Boring drilled and sampled by PES in December 1999
[2] = Boring drilled and sampled by IT Corp. in June, September or November 2000
[3] = Precise sample designation, sample depth, sample date, and laboratory reporting limits unknown; laboratory reports for these samples not provided in IT Corp. report dated November 21, 2000. Data presented graphically in IT Corp. November 21, 2000 Report.

CITY OF PALO ALTO

BUILDING PERMIT CONDITIONS & ADVISORIES

ADDRESS/LOCATION: 230 Portage Avenue

Building Permit Number	Description of Project	Application Date	Rev? (✓)	Plan Date
01-2704	**Removal & Replacement of Floor in Commercial Building; Excavation of Contaminated Soil**	10/9/01	✓	8/01

This project is approved by the Public Works Department with the following Conditions & Advisories:

GENERAL:

✓ = Required Condition or Project Advisory

1	✓	These plans have been reviewed for compliance with applicable codes, but the design remains the responsibility of the architect/engineer who prepared them.
2	✓	Any changes to these plans, other than those provided in this review, must be reviewed by the Public Works Engineering Division.
3	✓	The attached "Logistics Plan" shall made part of the approved *Building Permit*.
4		

PRIOR TO BUILDING PERMIT ISSUANCE:

✓ = Required Condition or Project Advisory

1		Permittee must obtain a Grading and Excavation Permit from the CPA Building Inspection Division if excavating more than 100 cubic yards.
2		The building/property owner will be required to obtain an approved *Encroachment Permit* for the awning(s) and/or other architectural features that will encroach over the sidewalk. This must be obtained, prior to commencing the encroachment, from the CPA Public Works Engineering Division.
3		The proposed construction will impact the use of the sidewalk, street, alley or other easement. An *Encroachment Permit* must be obtained from the CPA Public Works Engineering Division prior to commencement of the work.
4		This project is within 50 feet from a creek over which the Santa Clara Valley Water District (SCVWD) has jurisdiction. These plans must be reviewed by and a permit obtained from the SCVWD prior to the start of this work.
5		A portion of the proposed work is within or impacts the State of California or County of Santa Clara right-of-way. A permit must be obtained from the applicable agency prior to commencement of the work described in this permit.
6		The Applicant will be required to obtain an *Encroachment Permit* from the California Department of Transportation if any lane closures are needed on El Camino Real in performance of this work.

ADDITIONAL CONDITIONS

DURING CONSTRUCTION:

√ = Required Condition or Project Advisory

1	√	If groundwater or runoff water is encountered and needs to be removed from the excavation area, all excavation and/or building activities shall immediately stop. The plan for the dewatering of the excavation must be implemented at that time. Once approval of the plan implementation has been received, then the excavation and/or building activities may recommence.
2	√	Permittee shall strictly conform to the City's Noise Abatement Ordinance, detailed in Chapter 9.10 of the Palo Alto Municipal Code. The Permittee is limited to construction activity during the following hours: **Monday – Friday...8AM to 6PM, Saturday.....9AM to 6PM and Sunday/Holidays....10AM to 6PM**
3	√	Any construction within CPA right-of-way, easements or other property under City jurisdiction shall conform to standards established in the CPA Standard Specifications for the Utilities Department and the Public Works Department.
4	√	Permittee must contact the CPA Public Works Inspector prior to any work performed in the public right-of-way (650/496-6929).
5	√	It is unlawful to discharge construction debris (soil, concrete, asphalt, sawcut slurry, paint, chemicals, etc.) or other waste materials into gutters or storm drains. The Permittee shall incorporate best management practices (BMP's) for stormwater pollution prevention into all construction operations. Typical BMP's are outlined in a series of brochures published by the Santa Clara Valley Nonpoint Source Pollution Control Program and are available from the City of Palo Alto Public Works Engineering office.
6	√	No storage of construction or household materials is permitted in the street or sidewalk area. This includes storage containers, dumpsters, trailers, etc.
7	√	All dumpsters used in this permitted activity are required to be ordered through the Palo Alto Sanitation Company (PASCO) who has an exclusive contract in Palo Alto for waste disposal services.
8	√	The Permittee shall provide protection to City trees at the work site to the satisfaction of the CPA Arborist (650/496-6974).
9	√	The Permittee shall not alter pre-existing drainage patterns existing to or from adjacent properties.
10	√	The Permittee is responsible for the repair, restoration or replacement of any and all City property damaged while performing this permitted activity. Permittee shall obtain a permit from the CPA Public Works Engineering Division to perform this work.
11	√	**An approved *Permit for Construction In the Public Street* must be obtained from the CPA Public Works Department prior to commencement of any work in the sidewalk or street area.**
12		An 'in progress' elevation of the lowest floor must be certified on a wet-stamped letter by a licensed surveyor or civil engineer and accepted by Public Works Engineering as meeting Special Flood Hazard Area requirements prior to the roofing inspection. This certification should be done at the stage of construction when the "as-built" elevation of that floor is first established and still correctable with minimum effort. An accepted FEMA *Elevation Certificate* will also be required for the finished construction. This certificate must be submitted to the Public Works Inspector and approved by Public Works prior to final sign-off of the permit.

PRIOR TO FINALIZATION OF BUILDING PERMIT AND OCCUPANCY SIGN-OFF:

√ = Required Condition or Project Advisory

1	√	**The CPA Public Works Inspector must sign off the Building Permit prior to the finalization of this permit. All off-site improvements and on-site grading shall be finished prior to this sign-off.**
2		The CPA Public Works Engineering must be presented a FEMA *Elevation Certificate* certifying the "as-built" elevation of the lowest floor meets the Special Flood Hazard Area requirements. This certificate must be certified by a licensed land surveyor or qualified civil engineer. This Certificate must be presented to and accepted by Public Works Engineering Department prior to this sign-off.
3		A Certificate of Compliance is required to be obtained to remove underlying lot lines, record lot line adjustments and/or to record that a certain lot or lots are lawfully existing and are in compliance with the provisions of the Subdivision Map Act. The recordation of this document must be performed prior to the final sign-off of this Building Permit.

Logistics Plan

for

JOB COPY
These plans must be kept on the job at all times
CITY OF PALO ALTO

230 Portage Ave. (El Camino Center)

Palo Alto California

1. Project Description – Note that all work is on private property and staging areas will be in the rear parking lot. (See Attachment 1)

2. Project Schedule – (See Attachment 2)

3. Working Hours – Cornerstone work hours will be from 8:00 am to as late as 6:00 pm Monday through Friday. No weekend work will occur.

4. Noise control – No heavy equipment and/or trucks will be allowed to deliver, enter or leave the site before or after the above hours, which conforms to the CPA Noise Ordinance.

5. Notification of Residences and Businesses – No residences will be directly impacted by this project. Businesses in the El Camino Center will be notified with both seven day and 48 hour notices. The property owner WSJ Properties will make the notifications to their tenants.

6. Traffic Control - All work is on private property. The only impact on public roadways will be deliveries and off-haul of both equipment and materials. All deliveries and off-haul will be directed to enter and exit the site off from El Camino to Portage Ave. Once they make a left on Portage, they'll turn right on Ash, then make a left on Lambert, make a left on Park Blvd., traffic will then make a left into the rear parking area. A flag man will be used,as necessary, when trucks are entering or exiting onto public streets. Work areas and/or storage areas will be delineated with cones, caution tape, temporary fencing, etc. Work areas and/or storage areas will be set up so that all vehicular, bicycle and/or pedestrian traffic will not be able to enter these areas. (See Attachment 3 for haul route)

7. Material delivery – To the extent possible material delivery wil be made before 10 am.

    1 - Vicinity Map and Haul Route (see See Attachment 3)
    2 - Frequency and of delivery trucks during operations – During most of the project, the only significant deliveries will be delivering equipment to the site and bringing in fill material. Equipment deliveries will be 1 to 3

loads for up to 4 total days. Backfill deliveries will occur for up to 4 total days and will be from 2 to 10 truck per day. For off-hauling of impacted soil, final truck volume will be a total of approximately 18 – 20 loads. This will occur over a 2 day period at the very end of the project.
3 - Traffic control plans for truck delivery operations (See above Item 6)

8. Materials storage – Storage of impacted soil excavated and stockpiled will be staged in the parking lot at predetermined areas. All soil will be stockpiled on and covered with plastic. In addition these stockpiles will be bermed with sand bags or other suitable material to prevent both run-on and run-off. This prevents any material from entering storm drains, etc. If any spillage occurs, it will be removed daily and placed in the stockpiles.

9. Storage in the City Right-of-Way and Parking Lots – At no time will equipment or materials be stored in City Right-of-Way or Parking Lots.

10. Protection of existing utilities – No trees will be impacted during this project. No private property other than the owner of this property will be impacted. USA Dig Alert will be notified a minimum of 5 working days prior to excavation operations. Since all work is on private property, a private utility locator will also be used to ensure all utility lines are marked.

11. Clean-up/Maintenance – For dust control measures, water is available at the site and the exposed soils will be watered, as necessary, to control dust. This will be for both excavations and stockpiles. Note that stockpiles will be covered with plastic and when these stockpiles are loaded out they will be watered, as necessary for dust control.

12. Storm Water Pollution Prevention Plans - As stated previously all soil will be stockpiled on plastic and covered with plastic. In addition, these stockpiles will be bermed to prevent any run-on or run-off. Note that should any activities during this project cause possible run-off, potentially impacted storm drains will be sand bagged. Sand bags will be draped with plastic to prevent any run-off from entering the storm drains. All excavation work is inside the building and/or under the roof at rear of building. No water can enter or exit these areas.

13. Refuse Disposal –

1 - Clean concrete rubble generated from this project will be sent off-site for recycling.
2 - All general refuse/debris will be disposed properly at the local landfill.
3 - Impacted soil excavated from the site will be profiled and disposed at the appropriate facility. This may include Class II disposal sites and/or Class I disposal sites, which depends on analysis of the stockpiled soil.

SCOPE OF WORK

Technical specifications for the construction work are included in Appendix A. The contractor's scope of work will include the following tasks:

- Prepare interior walls and ceiling of the tenant space by lining with plastic sheeting to prevent dust from settling on the surfaces. Access to the building interior is limited to an opening measuring approximately 12 feet wide by 12 feet high (to be assessed during contractor's site inspection).

- Contractor shall obtain all required permits and notify Underground Service Alert prior to start of work as required.

- Identify underground utilities, including a fire suppression main, in and around the area of excavation.

- Saw-cut and remove an area of approximately 2,092 square feet of 6-inch thick reinforced concrete flooring overlying the excavation area within the former Mercer facility (Plate 3). Stockpile concrete on contractor-supplied plastic sheeting. Concrete shall be covered with sheeting and placed within contractor-supplied secured fencing.

- Excavate via conventional excavation techniques approximately 116 in-place cubic yards of TCE-affected soil in the saw-cut area shown on Plate 3 to a depth of 2 feet below original concrete surface. This excavation area is expected to be approximately 51 feet by 42 feet and approximately 2 feet deep (Plate 3). The actual lateral and vertical extent of the area and corresponding volume of soil to be excavated will be determined in the field by the onsite engineer based on the results of samples collected from the perimeter of the area and analyzed by the onsite mobile laboratory. Stockpile and cover soil on and with plastic sheeting placed within a secured fenced area provided by contractor. The area for soil and concrete stockpiling is to be determined at a site inspection meeting.

- Excavate via conventional excavation techniques and stockpile approximately 26 cubic yards (measured in-place) of TCE-affected soil to a depth of 4 feet below original concrete surface or to the bottom of a spread-footing foundation located beneath the wall as shown on Plate 3. The shallow soils excavated via traditional excavation techniques (from surface to the bottom of the foundation) will be stockpiled and transported separately. As detailed on the attached bid form (Appendix B), the contractor will bill for the excavation and stockpiling of those soils on a volumetric basis.

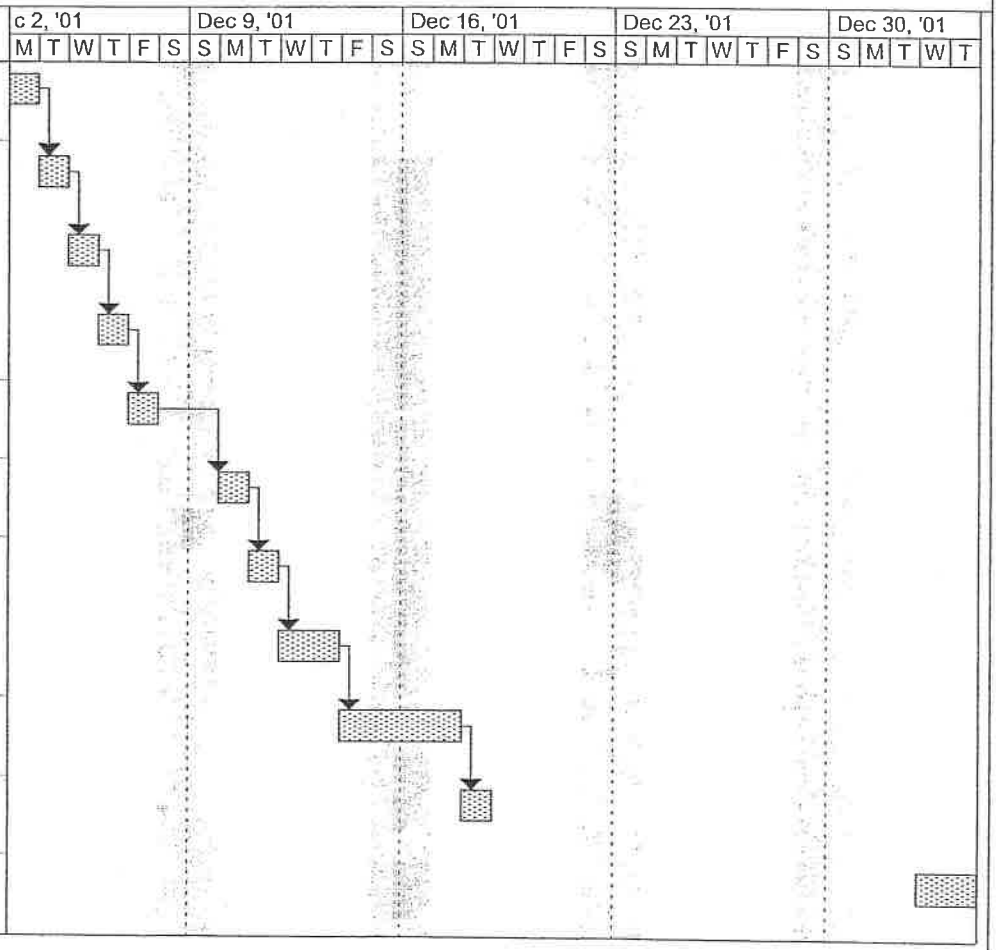
- Additionally, excavate using slot trench techniques approximately 114 in-place cubic yards of soil to a depth of approximately 20 feet below original concrete surface as shown on Plate 3. The actual lateral and vertical extent of the slot trenches will be determined by the Engineer based on site observations and sample results. Therefore, the volume of soil excavated may be more or less than estimated in this request for bid. The soils excavated from beneath the base of the foundation using slot trenching

techniques and the soils excavated from shallower depths will be stockpiled and transported separately, to the extent practicable. The contractor will bill for the excavation and stockpiling of the deeper soils removed from the slot trenches on a tonnage basis.

Excavation should be performed in 4 to 5 foot wide slot trenches, oriented in the northwest-southeast direction (parallel to the long-axis of the former Mercer space). Each trench will be excavated and then backfilled before proceeding with the next trench. The next trench shall be completed a trench width away from the previous trench. For example, if five slots are required and are lettered A, B, C, D and E with increasing distance from the northeast wall of the tenant space, the order of excavation might be A-C-E-B-D. The depth of the excavation may be increased locally to remove additional TCE-affected soil as required and to the extent practical. PES will collect and analyze soil samples from each slot for verification. The soil samples will be analyzed with an onsite mobile laboratory or via rapid turnaround at a stationary laboratory.

- Backfill each slot trench following receipt of confirmation sample data. Due to limited access to the slot trench excavation areas, place a 2-sack cement-sand slurry in the excavation as backfill from the trench bottom up to the base of the exposed foundation. The upper boundary of the cured slurry needs to be no lower than the bottom of the foundation. The slurry shall be a quickset mixture which will allow the adjacent slot trench to be excavated within 24 hours of the placement of the 2-sack cement-sand slurry.

- Following completion of slot trenching activities, backfill the upper portion of the excavation area. Backfill with select import fill in loose lifts no more than 8 inches thick and compact to a minimum relative density as specified in Appendix A – Technical Specifications.



- After backfill and compaction of the upper portion of the excavation are complete, pour a 6-inch-thick concrete slab to replace concrete previously saw cut and removed. The concrete slab shall be reinforced with a wire mesh fabric and shall be tied into the existing concrete slab with No. 4 or 5 steel dowels. The concrete shall be finished to match the adjacent concrete finish.

- Transport and dispose or recycle stockpiled concrete and soil at an appropriately-licensed disposal or recycling facility, based on the results of waste characterization and profiling activities and with PES approval. Contractor to supply unit rates for transportation and disposal of soil and identify proposed disposal or recycling facility in Appendix B.

RE:
Field Analytical Report
Mercer Site
Palo Alto, CA
January 9 - 14, 2001

Dear Mr. Flories:

Enclosed please find the results for the field analytical project conducted at the Mercer Site in Palo Alto, CA for samples received from January 9 - 14, 2002. This nine-section report provides a narrative, a summary of results, the final data results, quality control results, raw data, standard prep logs, instrument logs, sample receipt logs and chain-of-custody forms.

It was a pleasure working with you and PES on this project and we look forward to working together again. If you have any questions on this report, please do not hesitate to contact me at (413) 572-4000 ext. 103.

Very truly yours,

Narrative

A field investigation was conducted at the Mercer Site in Palo Alto, CA. The intent of this field effort was to measure the levels of contamination in the surrounding soil for for Volatile Organic Compounds (VOCs). A total of forty-eight (48) samples were collected for 8260 and received between January 9 - 14, 2002 for the following list of target compounds.

Dichlorodifluoromethane	Chloromethane	Vinyl Chloride
Bromomethane	Chloroethane	Trichlorofluoromethane
1,1-Dichloroethene	Methylene Chloride	t-1,2-Dichloroethene
1,1-Dichloroethane	c-1,2-Dichloroethene	Chloroform
1,1,1-Trichloroethane	Carbon tetrachloride	Benzene
1,2-Dichloroethane	Trichloroethene	
1,2-Dichloropropane	Dibromomethane	Bromodichloromethane
c-1,3-Dichloropropene	Toluene	
t-1,3-Dichloropropene	1,1,2-Trichloroethane	Tetrachloroethene
Dibromochloromethane	1,2-Dibromoethane	Chlorobenzene
1,1,1,2-Tetrachloroethane	Ethylbenzene	m&p-Xylene
o-Xylene	Styrene	Bromoform
Isopropylbenzene	Bromobenzene	1,1,2,2-Tetrachloroethane
1,2,3-Trichloropropane	n-Propylbenzene	2-Chlorotoluene
4-Chlorotoluene	1,3,5-Trimethylbenzene	tert-butylbenzene
1,2,4-Trimethylbenzene	sec-butylbenzene	1,3-Dichlorobenzene
4-Isopropyltoluene	1,4-Dichlorobenzene	1,2-Dichlorobenzene
1,2-Dichlorobenzene	n-Butylbenzene	1,2,4-Trichlorobenzene
Hexachlorobutadiene	Naphthalene	1,2,3-Trichlorobenzene
1,2-Dibromo-3-chloropropane		

Sample Analysis

8260

All samples were analyzed for VOC's using a Hewlett-Packard Model 5890/5970, 5971 & 5972 II Gas Chromatograph-Mass Spectrometer (GC/MS). An OI Analytical Model 4560 Purge & Trap sample concentrator was used to purge the VOC's from the sample matrix, concentrate them onto a sorbent trap and desorb them onto the GC/MS system. An OI Analytical MPM-16 multi-sampler was used to allow sample analysis to continue while the mobile laboratory was unmanned. The analytical system and parameters are similar to those used in EPA Method 8260. Data was processed on a Personal Computer using HP Chemstation Software. Reports were generated with a customized Microsoft Excel reporting program.

STL On-Site Technologies

Volatile Organics Quality Control

Listed below is a description of the QC analysis and the acceptance criteria for the volatile organics analysis conducted:

1. Initial Calibration - A 5-point initial calibration was conducted on the analytical system prior to project initiation. The instrument was calibrated and % RSD were calculated for each analyte. For all analytes the (%RSD) value for each compound should have been less than or equal to 15%. If the %RSD value was greater than 15%, then linear regression was performed and the r^2 value must be >0.990.

   Bromomethane, Dibromochloromethane and Chloroethane exceeded the 15% RSD criteria. All results for these compounds are reported as estimates.

2. Calibration Check Standards - At the beginning of each twelve-hour window, a mid-point calibration check standard was analyzed to verify that the analytical sensitivity did not change from the initial calibration. For all CCC analytes, the (%RSD) value for each compound should have been less than or equal to 20%. For the SPCC analytes Chloromethane, 1,1-DCA and Bromoform, the minimum RF should be 0.10. For the SPCC analytes Chlorobenzene and 1,1,2,2-TCA, the minimum RF should be 0.30. If significant variances were observed, the system was recalibrated.

   The following deviations have been noted in the calibration check standards:

1/9/02	Bromomethane @ 89.2 %D
	Chloroethane @ 95.4 %D
	Trichlorofluoromethane @ 89.2 %D
	Methylene Chloride @ 32.8 %D
	Carbon Tetrachloride @ 20.3 %D
1/10/02	Bromomethane @ -94.6 %D
	Chloroethane @ -45.6 %D
	Methylene Chloride @ 24.0 %D
	Bromobenzene @ -30.4 %D
	2-Chlorotoluene @ -24.1 %D
	1,2-dibromo-3-chloropropane @ 24.3 %D

3. LCS - An LCS standard was analyzed at least once per day and used to verify the accuracy of the calibration standards. The QC standard was a standard from a second source, other than the calibration standards. %R values were calculated and compared to the 75 - 125% criteria.

The following deviations have been noted in the LCS standards:

1/9 Bromomethane @ 40%
sec-Butylbenzene @ 137%
n-Butylbenzene @ 127%
1/10 Bromomethane @ 186%
Chloroethane @ 144%
1,1-Dichloroethene @ 133%
trans-1,3-Dichloropropene @ 71%
Bromoform @ 69%
Bromobenzene @ 139%
1,2,3-Trichloropropane @ 133%
sec-Butylbenzene @ 136%
n-Butylbenzene @ 143%
Hexachlorobutadiene @ 136%
1/14 Bromomethane @ 71%
Chloroethane @ 67%
1,1,2,2-Tetrachloroethane @ 138%
1,2-Dibromo-3-chloropropane @ 157%

4. Method Blanks - A sample of analyte free water was processed at the beginning of the day and after every ten sample analyses to verify that the analytical system was contaminant-free. Concentrations of detected analytes should have been less than 1/2 the method detection limit. Small contaminants may have been noted as detected in the blank and labelled with a "B". Significant contaminant levels necessitate corrective action, i.e. cleaning of the instrument.

5. Surrogate Standards - Surrogate standards were added to all samples, standards and method blanks to measure the potential for matrix interferences. % Recovery values were calculated and were compared to the criteria listed below: Small deviations were marked as outside control limits while large deviations necessitated reanalysis.

Compound	**Control Limits**
Dibromofluoromethane	80 - 120
1,2-Dichloroethane-d4	80 - 120
Toluene-d8	81 - 117
4-Bromofluorobenzene	74 - 121

All deviations in the surrogate standards have been flagged with an "*" and can be found under the accompanying result pages.

7. Matrix Spike/Matrix Spike Duplicate Analyses - Five percent (5%) of the samples analyzed are spiked with a mid-level standard. The %R values are calculated and should be 75 - 125%. Relative Percent Difference (RPD) values were calculated and compared to the 40% acceptance limit.

The following deviations have been noted in the MS/MSD analyses:

A8-4.0MS	Bromomethane @ 56 % Rec.
	Chloroethane @ 67 % Rec.
	1,1-Dichloroethene @ 73 % Rec.
	1,1,2,2-Tetrachloroethane @ 139 % Rec.

	Dichlorodifluoromethane @ 65 % RPD
	1,2,4-Trichlorobenzene @ 51 % RPD

General Comments:

1) Upon secondary review, it was discovered that the following compounds which were listed in the quote for this project were not reported in the field: Carbon Disulfide, 2,2-Dichloropropane, Bromochloromethane, 1,1-Dichloropropene and 1,3-Dichloropropane. These compounds were evaluated and all results were Not Detected.

2) The MS/MSD samples were not analyzed on a daily basis. On 1/14/02, the GC/MS instrument would not calibrate due to generator problems. The analyst ran a 2-point curve (this was approved by the client) which was above and below the site action limit. All results for these samples analyzed on 1/14/02 are screening level only. The MS/MSD samples were not able to be re-analyzed under accpetable protocol because all samples had been returned to the client for disposal.

All results are reported as obtained in the field unless otherwise noted above. This information is provided for your use in assessing overall data quality.

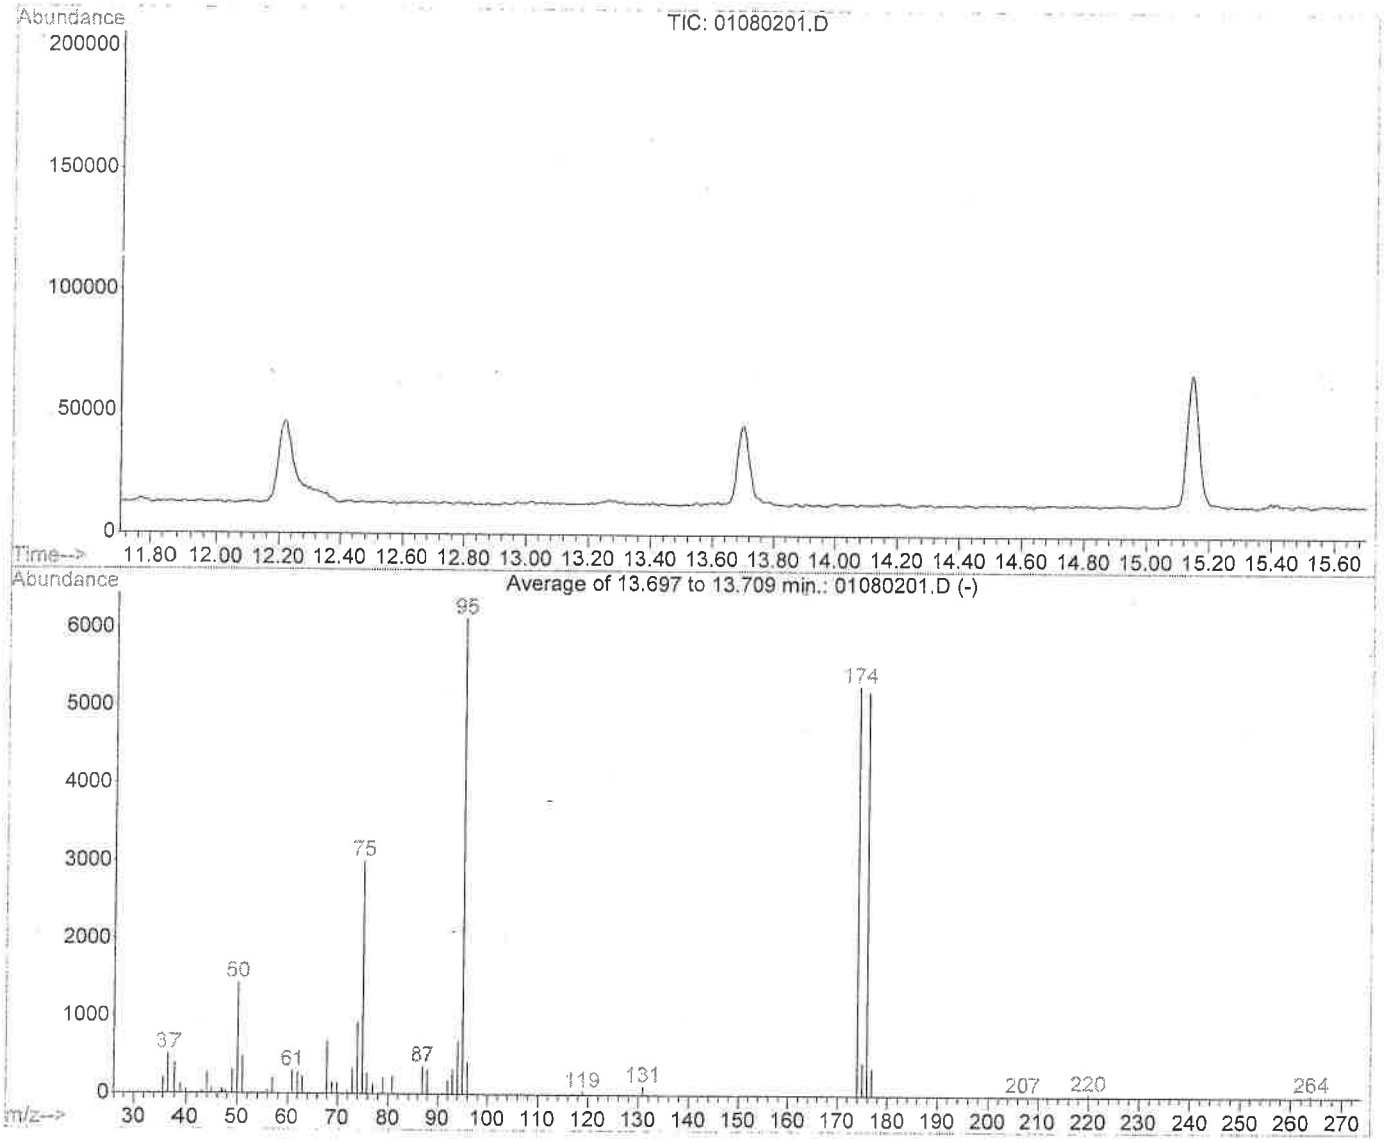
PES Project 5 Point.

* method is named 010702.M



* This is the 5 point used for the PES project that started on 01/09/02. We were on stand-by this day & ran Alameda samples while we waited. D Jaw SE 1/17/02

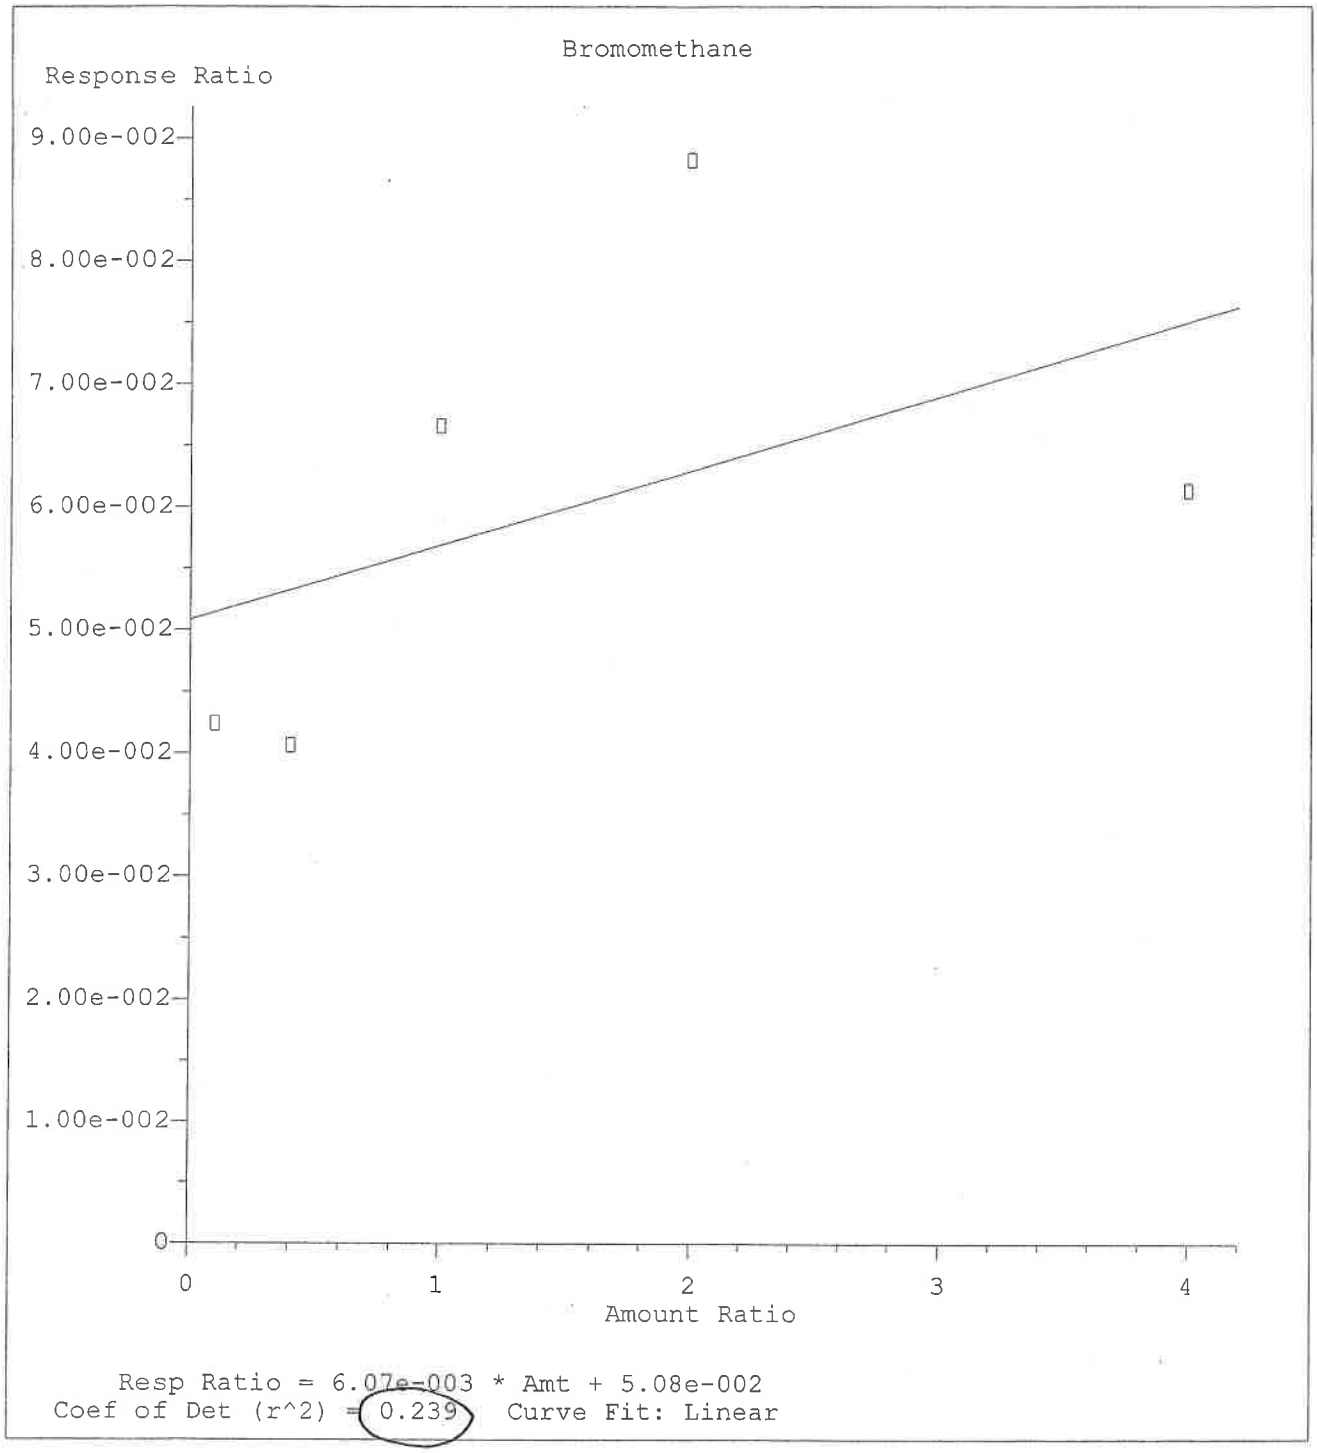
✓ Curve Provided.

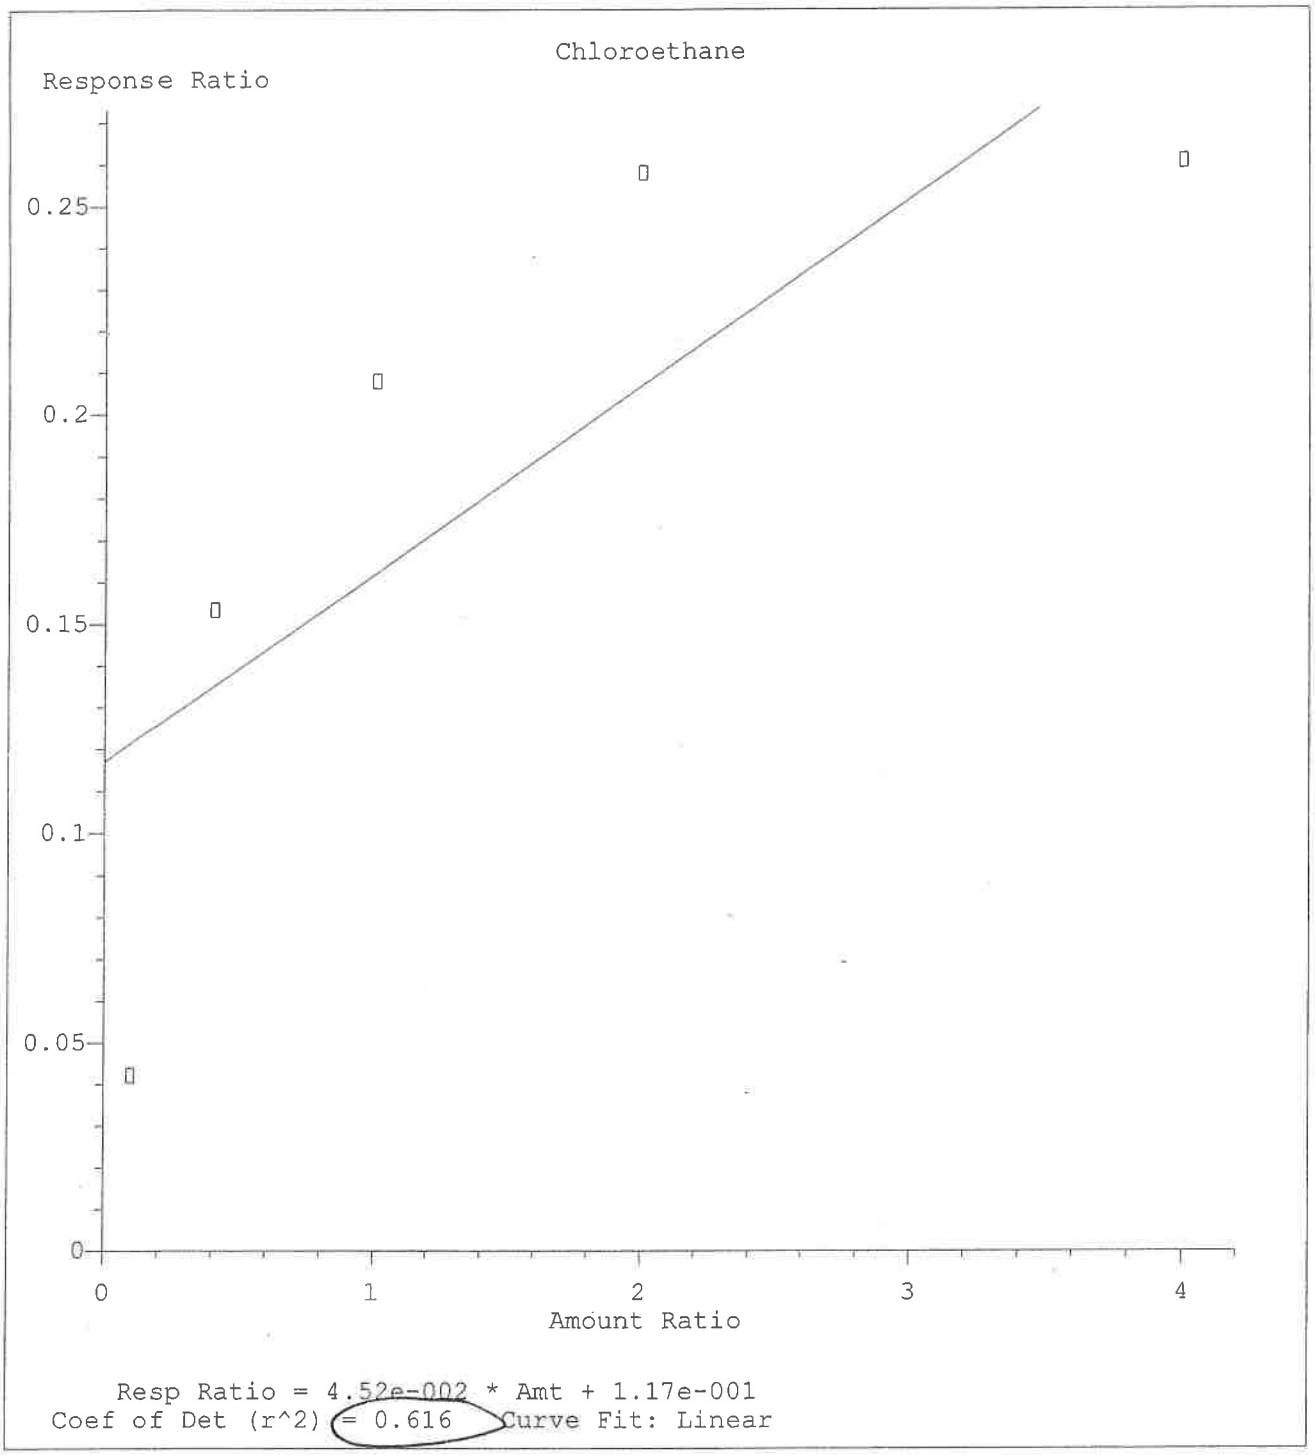


low level (25 ng) Calculation check:

$$(1\,\mu l)(25\,ppm) = (0.001\,ml)\left(25\,\frac{\mu g}{ml}\right)$$

$$= 0.025\,\mu g \times 1000\,\frac{ng}{\mu g}$$

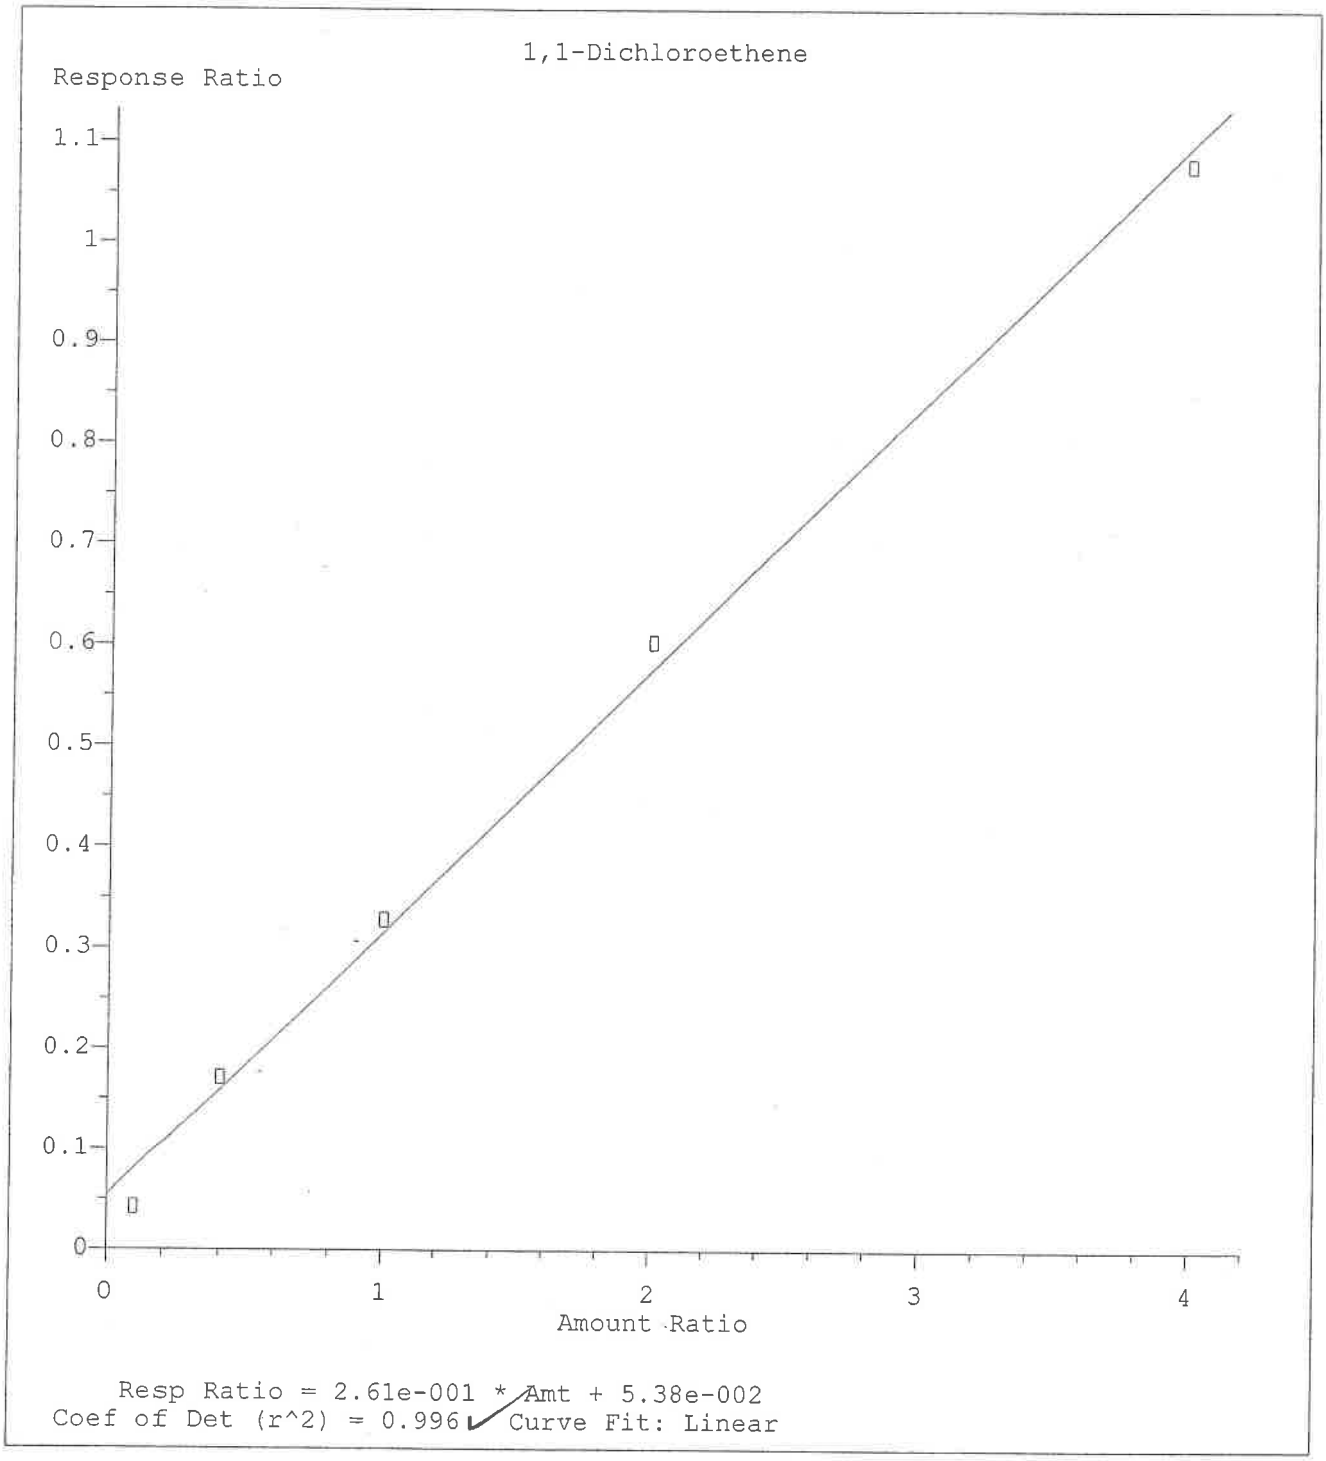
$$= 25\,ng$$



(#) = Out of Range

Method Name: C:\HPCHEM\1\METHODS\010702.M
Calibration Table Last Updated: Tue Jan 08 10:31:32 2002

Focus on this project is PCE & TCE. Need to narrate that bromomethane results are estimated.



1/17/02

Method Name: C:\HPCHEM\1\METHODS\010702.M
Calibration Table Last Updated: Thu Jan 17 10:27:07 2002

Narrate results for chloroethane are estimated.

Note: Generator was not running on Monday morning the 14th the GC/MS was cold. It fell out of Calibration. the client needed results ASAP. A 250ng and 100ng Standard were analyzed. the client was interested in TCE. TCE is the only analyte found at the site.

Attached is our report for your samples received on Monday January 14, 2002
This report has been reviewed and approved for release. Reproduction of this report is permitted only in its entirety.

The report contains a Case Narrative detailing sample receipt and analysis.

Please note that any unused portion of the samples will be discarded after February 28, 2002 unless you have requested otherwise.
We appreciate the opportunity to be of service to you. If you have any questions, please call me at (925) 484-1919.
You can also contact me via email. My email address is: asalimpour@chromalab.com

Sincerely,

Afsaneh Salimpour

RMC LONESTAR

Flowable Compacting Fill

RMC LONESTAR'S Flowable Compacting Fill (FCF) is a series of multipurpose fill materials consisting of a unique blend of aggregates, cement, pozzolans, water and admixtures. FCF is placed at a flowing to fluid consistency requiring no tamping or compacting to achieve desired density and strength. FCF's load capacity is typically higher than compacted soils yet it can be excavated by conventional means. The ease of placement of RMC LONESTAR'S FCF makes it superior to standard backfill.

Benefits

- **REQUIRES LESS INSPECTION** - Compacted-soil backfill requires spreading, compaction and time consuming inspection of individual lifts. FCF consistently exceeds the equivalent of 95% compaction in one pass (within a few hours) reducing extensive field testing.
- **WON'T SETTLE** - FCF does not form voids during placement and won't settle or rut under loading. This advantage reduces call backs to repair cracks, pot holes and dips in the road.
- **CAN BE EXCAVATED** - Flowable fill having compressive strengths of 50 to 200 psi can be excavated with conventional digging equipment yet is strong enough for most backfilling needs.
- **REDUCED COST** - FCF is easy to place and does not require spreading, compacting or shoring. It allows for narrower trenches reducing excavation. This speeds construction and reduces labor and equipment requirements.
- **IMPROVES WORKER SAFETY** - Workers can place flowable fill in a trench, without being in the trench, reducing their exposure to possible cave-ins.

Availability

Flowable compacting fill can easily be ordered from your RMC LONESTAR facilities. To order, simply select the appropriate FCF number on the guide below corresponding to the fill characteristics needed. Contact your local RMC LONESTAR representative for additional information.

MIX	DESCRIPTION	AGGREGATE	USE
2580	FCF TAILGATE	PEA GRAVEL	TAILGATE MIX
*2581	FCF 2" PUMP	PEA GRAVEL	FOR SMALL PUMPS OR LONG DISTANCES
2584	FCF 5" PUMP	PEA GRAVEL	PUMP MIX FOR BIG POURS AND PUMPS

CERTIFICATION

Flowing Compacting Fill shipped by RMC Lonestar as Mix 2580 will produce a material with the following characteristics:

Modified R-Value	70 minimum @ 1 day	
	80 minimum @ 28 days	
Compressive Strength	4000 lbs/sq. ft.	1 day
	10,000 lbs/sq. ft.	28 days

Very truly yours,

Xavier Victoria

FLOWABLE COMPACTING FILL
GUIDE SPECIFICATIONS

(This is a guide for specifying the use of *flowable compacting fill* which may be used as an alternative to or a replacement for granular fill or lean cement slurries.)

FLOWABLE COMPACTING FILL

1. *Flowable Compacting Fill* shall be accepted in lieu of cement/sand slurry or granular fill as a backfill material in any excavation. It shall be the preferred method in all situations where the prevention of subsequent settlement after placement of backfill is required.

2. STRENGTH REQUIREMENTS

   2.1 Hand excavatable, non-structural *flowable compacting fill* shall produce unconfined compressive 28-day compressive strengths from 50 psi to a maximum of 150 psi. *Flowable compacting fill* that is to be hand excavatable shall contain aggregate no larger than 1/2" top size nor shall the 1/2" aggregate comprise more than 50% of the total aggregate content.

   2.2 Structural *flowable compacting fill* shall produce unconfined compressive 28-day strengths from 150 - 1,200 psi, as determined by the project requirements. Coarse aggregate top size and coarse to fine aggregate ratios and contents shall be determined by the clearances surrounding embedded members and the workability requirements.

3. MATERIALS

   3.1 Cement shall conform to ASTM C-150, type I or II.

   3.2 Fly Ash shall conform to ASTM C-618, Class F Pozzolan. The Fly Ash shall not inhibit the entrainment of air.

   3.3 Air Entraining Agent shall conform to ASTM C-260.

   3.4 Aggregates need not conform to ASTM C-33. Non-conforming aggregates will be acceptable except that minus #200 sieve shall not exceed 10% and no plastic fines may be present.

4. MIX PROPORTIONS

4.1 *Flowable compacting fill* shall be a mixture of cement, Class F pozzolan, sand and sometimes coarse aggregate, air entraining agent, and water. It is batched by a ready mixed concrete plant and delivered to the jobsite in transit mixer trucks.

4.2 The actual mix proportions shall be determined by the producer of the *flowable compacting fill* to meet jobsite conditions, minimum or maximum strengths and unit weight. Entrained air content shal be a minimum of 5%. The actual entrained air content shall be established for each particular job with the materials and aggregates to be used to meet the placing and unit weight requirements. Entrained air content may be as high as 25% for fluidity requirements.

5. 5.1 *Flowable compacting fill* shall be discharged from the mixer by any reasonable means into the area to be filled. The fill shall be brought uniformally to the elevation as shown on the plans. Trench sections to be filled with *flowable compacting fill* shall be contained at either end by bulkheads or earth fill.

6. PAVING

6.1 Permanent pavement may be placed directly upon the *flowable compacting fill* as soon as it has sufficiently self-consolidated so that the surface will withstand the process of paving without displacement or disruption. If the placement of the fill is not completed early enough to allow for permanent paving to be completed the same day, the contractor shall provide steel plates to span the trench and prevent traffic contact with the fill overnight or until permanent paving can be placed.

7. MIX APPROVAL

7.1 Mix requests must be submitted to the lab for approval in advance of placement, due to varying job-site conditions ie. Soil conditions, temperature, time of day, soil saturation and/or embedded materials.

REED & GRAHAM LABORATORY

SERVICES

September 19, 2001
RGLS #SCQ001

Richard A. Voss
Stevens Creek Quarry
12100 Stevens Canyon Road
Cupertino, CA 95014

Subject: *Class II Aggregate Base-Lime Treated, City of San Jose Specification*

Dear Mr. Voss:

On September 11, 2001, a sample of Lime Treated Class II Aggregate Base from Stevens Creek Quarry was received in our laboratory for testing. Aggregate was tested in accordance with Caltrans test methods and checked for conformance to the City of San Jose Standard Specifications, Section 26. Results are as follows:

Aggregate Gradation, California Test (CTM) 202

Sieve Size	% Passing	City of San Jose Specification
1"	100	100
3/4"	97	90-100
1/2"	86	
3/8"	76	
#4	54	35-55
#8	39	
#16	26	
#30	18	10-30
#50	12	
#100	8	
#200	3.3	3-9
Sand Equivalent, CTM 217	Result	
	42	30
Durability, CTM 229 Coarse	46	25
Fine	26	25
Resistance ('R') Value, CTM 301	78	78

If you have any questions, or need any additional information, please give me a call at 408-287-7722.

Best Regards,

REED & GRAHAM LABORATORY SERVICES

Attention:

RE: WSJ PROPERTIES
PALO ALTO, CALIFORNIA

SUBJECT: COMPACTION TESTING

REPORT OF TESTS

In compliance with your request, Smith-Emery Company has conducted standard compaction testing for the above referenced project.

Field density tests to determine relative compaction were conducted in accordance with ASTM D2922-91, nuclear method and ASTM D1556-90, sandcone method. Test locations and results are presented on the attached Table 1.

Laboratory compaction characteristics of various soil types were determined in accordance with ASTM D1557-91, five layer method. Test results are presented on the attached Table 2.

Respectfully submitted,
SMITH-EMERY COMPANY

Patrick Morrison

PROPERTY DAMAGE RELEASE

Dear Customer: The size and weight of this truck may possibly cause damage to the premises and/or adjacent property while the materials of this load are placed where you desire it. It is our wish to help you in every way we can, but by receiving this load you must release us from, as a supplier and not as a driver, all responsibility from any damage that may occur to the premises and/or adjacent property. Buildings, sidewalks, driveway slabs etc. by the delivery of these materials, and that you agree to help us remove mud from the wheels of the vehicle so that it cannot enter the public street. Further as additional consideration, the undersigned agrees to indemnify and hold harmless the owner of this truck and this supplier for any and all damage to the premises and/or adjacent property which may occur by anyone to have access out of delivery of this order.

1.0 INTRODUCTION

1.1 Purpose and Scope of Work

This report presents the results of a Phase I Environmental Site Assessment (ESA) of the El Camino Center and associated property in Palo Alto, California (the site or subject property). A site location map is presented as Plate 1. PES Environmental, Inc. (PES) was retained by The Sobrato Companies (Sobrato) to compile and evaluate available information to assess for Recognized Environmental Conditions[1] (RECs) in consideration of purchasing the property.

The ESA was performed pursuant to our proposal (Reference No. 126.076.01.P01) dated October 11, 2011, and in general accordance with ASTM International guidelines for Phase I Environmental Site Assessments (ASTM E 1527-05). These practice guidelines comply with the U.S. Environmental Protection Agency's All Appropriate Inquiries (AAI) rule adopted in November 2005. The following tasks were conducted during this ESA:

- Reviewed Federal, State and local agency databases to identify nearby sites which have reported the use, storage, or release of hazardous materials;
- Reviewed regulatory agency records regarding the site and adjacent properties;
- Reviewed historical aerial photographs of the site and surrounding area to evaluate prior land uses;
- Conducted historical research and reviewed historical information and for the site;
- Reviewed reports concerning historical environmental investigations performed on the subject property obtained from the property owner and regulatory agencies;
- Reviewed an environmental database search, which included expanded search radii as required by AAI;
- Interviewed individuals with knowledge of the site;
- Conducted an inspection of the site and a reconnaissance of surrounding properties to assess the potential for contamination of the site from onsite or offsite sources. The site inspections were conducted by environmental professionals with qualifying experience; and
- Prepared this report presenting the results of the Phase I ESA investigation.

[1] A REC is defined in the American Society for Testing and Materials guidelines for Phase I Environmental Site Assessments (ASTM E 1527-05) as *"the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property on into the ground, groundwater, or surface water of the property". RECs are equivalent to "environmental conditions" as that term is defined in Appendix A.*

1.2 Special Terms and Conditions

Chain-of-title documentation was not provided or obtained for this ESA.

1.3 Limitations and Exceptions

This Phase I ESA was performed in accordance with practices and procedures generally accepted in the consulting engineering field at the time they were performed. The findings, opinions, conclusions, and recommendations expressed herein are applicable as of the date the services were provided. Our professional judgment to assess the potential for contamination is based on limited data; no warranty is given or implied.

The Phase I ESA was prepared at the request of Sobrato as part of the due diligence for acquisition of the property and may be relied on only by Sobrato and the Sobrato affiliate(s) formed to acquire the property, if any. No other party may rely on this report without the express written permission of Sobrato and PES.

Additionally, PES was not provided information regarding the purchase price of the subject property nor prices of comparable properties in the site vicinity. An evaluation of the purchase price to those of comparable properties should be conducted by the user of this Phase I ESA in accordance with ASTM's All Appropriate Inquiry (AAI) guidelines.

2.0 SITE DESCRIPTION

2.1 Location and Site Access

The subject property contains four single-story buildings with the addresses of 3201 and 3225 Ash Street, 200 – 382 Portage Avenue (referred to as El Camino Center), 270 Lambert Avenue, and 3250 Park Boulevard in the City of Palo Alto, Santa Clara County, California (Plate 1). The tenant space at 200 Portage Avenue also has the addresses of 3180 – 3200 Park Boulevard. Onsite parking is accessed from Portage Avenue and Park Boulevard. Street parking is available in front of the Ash Street building, and the Lambert Avenue building is accessed via an access road emanating from Lambert Avenue.

2.2 Site and Vicinity Characteristics

The subject property, which comprises approximately 15.48 acres, contains four buildings, an access road, and associated paved parking and landscaped areas. Matadero Creek, under an easement from Santa Clara Valley Water District, traverses the eastern portion of the site. The site is referred to by Santa Clara County Assessor's Parcel Numbers 132-32-037, -042, -043; 132-37-054, -057; and 132-38-043 and -059.

The site is zoned as a Commercial Downtown Community (CDCP) and is located in a primarily commercial area. The site is bounded to the northeast by Park Boulevard and a commercial building, to the southeast by commercial buildings, to the southwest by Ash Street, El Camino Real and commercial buildings, and to the northwest by residences.

2.3 Physical Setting

According to the United States Geological Survey (USGS) *Palo Alto, California* Quadrangle 7.5-minute series topographic map produced in 1999, the site vicinity is situated at an elevation of approximately 25 feet above mean sea level. The ground surface is relatively flat, but gently slopes regionally to the northeast.

2.4 Regional Geology and Hydrogeology

Based on the results of investigations performed in the site vicinity, the site is underlain by alluvial fan deposits associated with San Francisquito Creek to the west and Matadero Creek to the east. Soils in the area consist primarily of sandy silt and silty sand with intermittent gravel lenses, and have been subdivided into several water-bearing zones, as described in Section 4.2.2. Shallow groundwater has been encountered at approximately 14 to 20 feet below ground surface (bgs) in the site vicinity, and groundwater flow to the north-northeast has been measured (Stantec, 2010).

The nearest surface water is Matadero Creek, which traverses the eastern portion of the site. According to Federal Emergency Management Agency (FEMA) map information presented in the EDR report, the subject property is located within a 500-year flood zone.

2.5 Descriptions of Existing On-site Structures and Improvements

2.5.1 Structures and Current Use

The subject property contains four single-story buildings, an access road, and associated paved parking and landscaped areas. The property is used primarily for retail sales, offices and for auto repair activities. The main building at the site (200 – 382 Portage Avenue), is referred to as El Camino Center, and is occupied by multiple tenants. A listing of tenants and building use is included on Table 1.

2.5.2 Other Improvements

Electricity, natural gas, water and sewage services are provided by the City of Palo Alto.

2.6 Current Uses of Adjoining Properties

PES conducted a reconnaissance of the surrounding area to assess whether neighboring properties pose potential environmental concerns to the subject property. Adjacent land uses

are identified on Plate 2. Adjacent properties are used for commercial purposes, as described below.

Properties to the Northeast

The site is bounded to the northeast by Park Boulevard and a commercial building occupied by Park Automotive. Across Park Boulevard are commercial businesses, including Park Avenue Motors, Vance Brown Builders, Microsoft and iControl.

Properties to the Southeast

The site is bounded to the southeast by commercial businesses, including GM Advanced Technology, Say Ray Auto, Windows Systems Group and offices.

Properties to the Southwest

The site is bounded to the south by Ash Street, El Camino Real and commercial buildings. Farther southwest are commercial buildings.

Properties to the Northwest

The site is bounded to the northwest by residences.

2.7 Past Uses of Property and Adjoining Properties

Historical site use information discussed below was obtained through a review of historical aerial photos, historical topographic maps, Sanborn fire insurance maps, city directories, Palo Alto Building and Fire Department records, and interviews with persons knowledgeable of the site.

2.7.1 Aerial Photographs

PES reviewed aerial photographs for the following years provided by EDR: 1939, 1948, 1956, 1965, 1976, 1982, 1993, 1998 and 2005. Additional photographs were obtained for the following years from Pacific Aerial Surveys in Oakland, California: 1955, 1961, 1969, 1972, 1977, 1981, 1985 and 1989. The photographs are presented in Appendix A. The aerial photographs reviewed are summarized below.

Subject Property

1930s – 1940s: The 1939 aerial photograph shows the northern two-thirds of the main subject property building present. Immediately southwest of the building is a parking lot through which the existing Ash Street extends. There may some small buildings or residences in the parking lot area, but the quality of the photograph prevents further definition of small features.

A railroad spur is present along the northwest side of the building; several railcars are present. A railroad track runs along the west side of the property, diverging and forming a "V" at the northwest corner of the site. Two small buildings are adjacent to the northwest side of the main building, between the railroad tracks and the spur. Another building is present near the southeast corner of the building. The building is rectangular with a square cutout in the northeast corner. A small residence or other building is present in the area of the current office buildings. Some small sheds or outbuilding may be present in this area. Matadero Creek is present along the east side of the property. The area currently occupied by Smythe European and Comcast may be occupied by some small buildings; the quality of the photograph prevents further identification. On the 1948 photograph, three additional features which appear to be sheds or buildings are present on the east side of the subject property, between the main building and Matadero Creek. Materials which appear to be crates or other containers are stored along the length of Matadero Creek. The current office building at 3201/3225 Ash Street appears to be present in its current configuration.

1950s: On the 1955 photograph, the three buildings east of the main building and material stored along Matadero Creek observed on the 1948 photograph are no longer present. The east side of the main building appears in use as a loading dock, and several truck trailers are present in the dock area and parked along Matadero Creek. Some materials appear stored between the existing office building and the building east of the main building. The area immediately south of the two buildings on the west side of the main building appears unpaved, and some stored objects or other small features are visible in this area. The area east of Matadero Creek where buildings were previously observed is now vacant. No significant changes are apparent on the 1956 photograph.

1960s: On the 1961 photograph, there are no longer any truck trailers parked along Matadero Creek. A small shed is visible at the northeast end of the current office buildings. The area immediately southwest of the two buildings on the east side of the main building appears darkened; several items appeared stored in this area. Several truck trailers are parked on the narrow strip of land adjacent to the railroad tracks southwest of the main subject property building. It appears that demolition or grading activities are in progress on the subject property east of Matadero Creek. On the 1965 photograph, the area east of Matadero Creek has been cleared and is use as a parking lot. No apparent changes to the subject property are apparent on the 1965 and 1969 photographs.

1970s: The 1972 photograph shows the strip of land southwest of the main subject property building occupied by numerous cars, and appears to be a auto sales or staging lot rather than a parking lot. Only a few vehicles are present in this area on the 1977 photograph. On the 1977 photograph, a rectangular area with a long narrow strip is visible, which could be a structure or pavement patching, is present in the parking lot on the east central portion of the site near Matadero Creek.

1980s: The 1981 photograph shows additional long strips emanating from the rectangular feature, which suggests it may be pavement patching. On the 1985 photograph, the railroad and spur lines and the two buildings northwest of the main building have been removed, and the parking areas on the east and west side of the main building have been repaved. The 1989 photograph shows the presence of the existing Comcast building east of Matadero Creek.

1990s to 2000s: No significant changes to the subject property are apparent on aerial photographs from the 1990s. The 2005 photograph shows that the building formerly present north of the existing office building has been demolished. The existing Smythe European building is now present east of Matadero Creek.

Subject Property Vicinity

On the 1939 photograph, the subject property vicinity is shown as partially developed. A commercial building is present immediately southwest of the main subject property building, and commercial buildings are present along El Camino Real. The remainder of the area is primarily residential and undeveloped, with some commercial buildings. The 1948 photograph shows increased development in the subject property vicinity, primarily residential. Commercial buildings are present immediately east of the site along Ash Street. The existing residences west of the railroad tracks are present. The 1955 and 1956 photographs show the area between El Camino Real and Alma Street fully developed with residences and commercial properties. Some undeveloped areas remain farther north and south of the subject property. Aerial photographs from the 1960s show residential development of the area north of Alma Street, and commercial development south of El Camino Real. The 1961 photograph shows the presence of the current Park Automotive building, and the channelization of Matadero Creek. The area east of the site across Matadero Creek appears to have been redeveloped with commercial buildings and a parking area. In the 1970s, the area north of the site across Park Boulevard has been redeveloped with new commercial buildings. No significant changes to the subject property vicinity are apparent on aerial photographs from the 1980s. On the 2005 photograph, a new commercial building campus is present west of the site.

2.7.2 Sanborn Fire Insurance Maps

Sanborn Fire Insurance Maps were obtained from Environmental Data Resources, Inc. (EDR) of Milford, Connecticut. Maps for the following years were reviewed: 1956, 1969, and 1978. Copies of the maps are presented in Appendix B. The following is a summary of the maps.

Subject Property

The 1956 Sanborn map shows the main subject property building present and in use for warehousing; one of the sections is labeled as a grocery warehouse. Two very small sheds or other features are present on the northwest side of the warehouse. A railroad spur is present along the northwest side of the building, and a Southern Pacific Railroad (SPRR) line is present next to the spur. Near Park Boulevard, the SPRR splits and continues to the northwest

and northeast. Near Park Boulevard, and between the spur and SPRR, two small buildings are present. One is labeled as a warehouse; the other is labeled as open and vacant. The currently existing building at 3201/3225 Ash Street is present, although the building appears to be in two sections; the labeled use of the building is illegible. Immediately northeast of the 3201/3225 Ash Street building is an L-shaped building which appears to be labeled as a warehouse. A small oval feature is shown southeast of the site. The area of the subject property west of Matadero Creek is vacant.

On the 1969 map, the uses of the main building shown, starting from the southwest end of the building, are an electronic parts warehouse, a bearing manufacturer and warehouse, a paper container manufacturer, a paper products warehouse, a display manufacturer, and a department store. The building between the rail spur and the SPRR is labeled as a foundry, and the building immediately northeast of the 3201/3225 building is shown as a packaging and crating facility. Two small sheds or other structures are shown adjacent to the oval feature.

On the 1978 map, the labeling of the bearing manufacturer, paper container manufacturer, and paper products warehouse have been manually crossed out and labeled as "M" (which often stands for manufacturing), although it is known that the bearing manufacturer was present in the building during this period (see Section3.1). The oval adjacent to the L-shaped building is gone, but the two small buildings remain. There are no other significant changes to the subject property from the 1969 map.

Subject Property Vicinity

The 1956 map shows a Safeway Stores food warehouse immediately southwest of the main subject property building. Residences and a dry cleaner (fronting on El Camino Real) are present across the SPRR. North of the subject property, across Park Boulevard, is a building labeled as a water softening service.

On the 1969 map, an electronic lab and electrical switch warehouse is present adjacent to the water softening service. In the "V" formed by the separation the SPRR lines, two small buildings are present, labeled as auto repair and railroad storage. East of the site, across Matadero Creek, a building labeled as "printing" is present. The building formerly occupied by Safeway Stores is now occupied by General Electric and used as microwave labs. An auto service facility is immediately southwest of the General Electric building. The former dry cleaner southwest of the site has been replaced by an auto repair facility and a billiard parlor. One of the residences west of the subject property across the SPRR tracks is labeled as a store with miscellaneous storage.

On the 1978 map, the former General Electric building is shown as a merchandise warehouse. A building labeled as "M" is present southwest of the office building, across Ash Street. An auto parts warehouse and an auto sales and service facility are present east of the site, across Matadero Creek. No other significant changes in the subject property vicinity are apparent.

2.7.3 Historical Topographic Maps

PES reviewed the USGS *Santa Cruz, California* Quadrangle 30-minute series topographic map produced in 1902; USGS *Palo Alto, California* Quadrangle 15-minute series topographic maps produced in 1899, 1943, 1947, 1948 and 1961; and the USGS *Palo Alto, California* Quadrangle 7.5-minute series topographic maps produced in 1953; 1961; 1968 and 1973 photorevised from 1961; 1991; and 1997. The maps are included in Appendix C. The following is a summary of the historical topographic map review.

The 1899 and 1902 maps show the subject property as vacant. Maps from 1943 through 1973 show the main subject property building present; the remainder of the site is shown in a developed urban area, and no building footprints are shown. The SPRR tracks formerly present on the subject property are also shown on topographic maps from 1943 through 1973. Subsequent maps show the subject property and vicinity as a developed urban area, and no building footprints are shown.

The 1899 and 1902 maps show the subject property vicinity as primarily vacant, however the 1902 map shows a building in the subject property vicinity. The scale of the map precludes determining the exact location of the building. The remaining maps show the subject property vicinity as a developed urban area, and no building footprints are shown, although the 1961 map shows the addition of a building immediately southwest of the main subject property building.

2.7.4 City Directories

PES contracted with EDR to perform a search of historical city telephone directories for the site address and adjacent addresses. A search of city directories was performed by EDR for the years from 1922 through 2001 in approximately 5-year intervals. The EDR city address directory abstract is presented in Appendix D.

The results of the search are summarized below. The designation of addresses to subject property buildings has changed over the years.

Subject Property

At 3201 Ash Street, Dura-Bond is listed from 1960 through 1986, including a listing for Eaton Corporation in 1975. In 1991 and 2001, WSJ Properties and California Family Foundation are listed. There was no listing for 3225 Ash Street.

The address of 3200 Park Boulevard (currently also known as 200 Portage) is listed in 1965, 1970, 1975 and 1978 as Maximart Department Store. Listed shops/tenants include automotive & bikes, camera, cleaners & laundry, hardware, furniture, jewelry, radio, clothing, sundries and a snack bar. Subsequent listings for this address include Advanced Technology (1985 and 1986), Computer Parts Mart (1986), Nyden Eclectic Construction (1986), Mid Peninsula

Access (1991), and Cable Co-op (1991 and 2001). There was no listing for 3250 Park Boulevard, the current address for Smythe European.

There were limited listings for Portage Avenue, which is typical for warehouse use areas. Basket Galleria was listed at 340 Portage in 1986 and 1991. Pacific Data Images was listed at 370 Portage in 2001, and Varian Associates was listed at 380 Portage in 1978.

Palo Alto Foundry is listed at 3180 Park Boulevard in 1970 and 1975, at 3295 Park Boulevard in 1955, 1960 and 1965, and at 292 Lambert Way in 1975.

Subject Property Vicinity

Listings in the surrounding area include numerous commercial businesses and residences. Listings for Lambert Avenue included a printing company, machine shops, several auto repair facilities, and other businesses. Listings for Park Boulevard included a water softening facility, BMW dealer, auto repair facilities, machine shops and contractors.

2.7.5 City of Palo Alto Building and Planning Department Records

PES reviewed Palo Alto Building Department records for the subject property. Original construction permits for the subject property buildings were not available, other than for the 3250 Park Boulevard building. Pertinent findings are summarized below.

- A 1959 building permit indicated the building at 3201 Ash was "remodeled completely". A 1977 occupancy report shows the building at 3201 Ash occupied by Dura-Bond and Eaton Corporation and was used as offices. In 1985, Dura-Bond leased half of the building space to Learning Live;

- A 1968 occupancy report shows Palo Alto Foundry at 3180 Park. A 2005 occupancy report lists Green Citizen at 3180 Park, which used the facility for electronics recycling;

- A 1976 occupancy report lists Maximart at 3200 Park;

- In 1986, a permit is issued for construction of a 1,650 square foot building with antenna tower for Cable Co-op; and

- In 2003, a permit was issued for construction of an auto repair facility at 3250 Park Boulevard (current location of Smythe European).

2.7.6 City of Palo Alto Fire Department Records

PES reviewed Palo Alto Fire Department (PAFD) records for the subject property. PAFD records identifying historical tenants or hazardous material use or storage information are summarized below.

- A 1975 incident report for Palo Alto Foundry at 3180 Park indicates that foundry ovens were issuing smoke, and PAFD had been called;

- Hazardous Materials Inventory Statements from 1982 through 1984 for Dura-Bond Bearing Company list use of Amsco Solvent 140 (propylene glycol/monobutyl ether), Tonna 68 machine oil (mineral oil, triazole derivative), Cimclean 30 (ethanolamine) Tellus 32 hydraulic oil, gasoline, Stoddard solvent, Oakite Special Protective Oil (petroleum hydrocarbons), Ferrocote 364 (aliphatic solvent, mineral oils, petroleum sulfanate salt, oxidized petroleum wax, glycol ethers), Cimperial #10 (water soluble cutting fluid), machine coolant, cutting fluids, machine and lubricating oils (petroleum hydrocarbons), Kolene Flakes #1 (sodium hydroxide, sodium chloride, sodium nitrate), hydrochloric acid, muriatic acid, zinc chloride, oxygen and acetylene gases. Listed generated wastes included filter press cake (from water treatment sludge), grinder swarf, waste oil, and unspecified liquid wastes;

- A 1984 El Camino Center tenant list included Varian Associates (warehouse), Dura-Bond (manufacturing and warehouse), Bemiss-Jason (manufacturing and warehouse), Beckman (warehouse), Ellis Enterprises (automotive and warehouse), and James Packing (manufacturing and warehouse);

- A 1993 El Camino Center tenant list included Varian Associates (warehouse), Cable Coop (warehouse and offices), Coherent (warehouse), Euphonix (electronic development and warehouse), Leong/Eberh (warehouse, mini-storage, exterior auto storage), Lanig Moran (office), Fry's (retail, offices, and warehouse), Mercer Processing (food processing and warehouse), Interior & Textiles (warehouse), and W&J (offices);

- An April 28, 1993 City of Palo Alto Memorandum reported that considerable lead contamination had been identified in soil at the Dura-Bond site. The memo, which cited attached data (but which was not present in PAFD files), noted that there was no key as to where the samples were taken, but were in the general babbitting or manufacturing area. The memo also referred to a $17,500 fine levied against Dura-Bond in 1989 for wastewater and hazardous materials violations. The author indicated that there should be a closure file on the site, but staff apparently couldn't find it as the file was a "mixed-up conglomeration";

- A 1998 El Camino Center tenant list included Fry's Electronics (retail, offices and warehouse), Varian/Tell Me (warehouse and shipping), Cable Co-op (office/studio and warehouse), Euphonix (office, research and development, are warehouse), Mercer Processing (food processing and warehouse), Pacific Data Images (offices), Lanig Moran (office), California Family Foundation (offices), Rescue Now (office), and WSJ Properties (office);

- Mercer Processing at 230 Portage was issued Hazardous Material Permits from 1990 through 1998. A 1998 Hazardous Waste Inventory for Mercer Processing listed use of Genesolv 2000 solvent (contains dichlorofluoroethane), sodium hydroxide, sodium metasulfite and hydraulic oil, and generation of waste oil, all with an average of 55 gallons onsite, except for an onsite average of 650 gallons of Genesolv 2000;

- During a 1999 facility closure inspection of Mercer Processing at 230 Portage, PAFD noted the following: Genesolv 2000 refrigerant was moved to the Park Boulevard building (no address specified); major staining – primarily oil – was observed which was absorbed with absorbent; PAFD was not concerned regarding contamination traveling through the concrete floor into soil because of the type of chemicals used; floor drains were inspected and appeared to be intact with no indication of corrosion or lack of integrity; and no indication of chemical contamination to piping that contained Genesolv 2000 was observed after refrigerant was evacuated from piping. The inspection report noted that a closure report was required (no copy in PAFD files), and that a determination would need to be made regarding the need for soil sampling in areas where chemical and rust staining on the floor was observed. No further determination regarding the need for soil sampling was located in PAFD records;

- During a 2005 inspection of Teak Patio at 230 Portage, PAFD warned Teak Patio that furniture "wastewater" and refinish "wastewater" should not enter the sanitary or storm sewer. No violations were issued. During a 2007 inspection of the facility, PAFD noted the presence of five 1-gallon containers of teak sealer, less than 10 gallons of latex paint, and less than 5 gallons of other (unspecified) materials; and

- Smythe European has a Hazardous Material Business Plan on file which lists storage of motor oil, gear lube, automatic transmission fluid, antifreeze, welding gases, and generation of waste motor oil and waste antifreeze. No violations were on file for the facility.

2.7.7 WSJ Properties Records

WSJ Properties supplied numerous historical site records to PES on DVD and electronically. Information contained in the records, but not discussed in Section 3.0, which discusses historical site investigations, are summarized below.

- A map dated October 1953 labeled as Safeway Stores, Inc. shows the presence of the main subject property building, which is noted as warehouse space. A notation indicates the presence of three transformers in the main building. A gas pump is shown at the northwest corner of the building. Two buildings are shown on the northwest side of the main building. One is shown as vacant, and the other is shown as a salvage building. A sump is shown between the two buildings. The existing office building is present on Ash Street (shown as First Street on the map), and is shown as an office. Two small sheds or other structures are shown near the northeast end of the building; both structures are shown as vacant. Scales and a scale house are shown between the

office and warehouse building. An additional building is shown on the site, north of the office building and east of the warehouse building. The building has two sections, labeled as warehouse and truck maintenance. Near the northeast corner of the building, notations list a 1,000-gallon diesel oil tank and pump, and two 1,000-gallon gas tanks and pump. A circular feature and what appears to be a canopied area is shown in the vicinity of the tanks;

- Plans from 1984 for the 3200 Park Boulevard tenant space show the presence of a darkroom, stripping room, plate-making room and type-setting area. The tenant space is noted as "printing facilities". Plans from 1986 and 1987 show this tenant space occupied by Cable Co-op. Areas shown include cable casting, an electronics lab, and a "tek" area;

- Removal of asbestos-containing tile and adhesive was conducted from 210 Portage in August 1993;

- Plans from 1997 show tenant improvements for Euphonix to the tenant space at 210 Portage. Use of the tenant space appears to be primarily office use;

- Tenant improvement plans from 1998 for 210 Portage indicate PayCycle as the tenant, and used as an office;

- Pacific Data Images is shown as the tenant at 350 Portage in 1995 and 1998. Pacific Data Images is also shown as a tenant at 370 Portage in 1997;

- Idealab! Is shown as a tenant at 380 Portage in 2000, with office use of the tenant space;

- Notes from a "Toxic Meeting" dated April 9,1992 report that the original test of the sewer discharge at the Mercer facility showed the presence of carbon tetrachloride, but that a second test showed that carbon tetrachloride had decreased, but that trichloroethene (TCE) was present at 15 parts per billion; and

- In February 1992, Environ Corporation notified WSJ Properties that, while drilling borings on the subject property for installation of groundwater monitoring wells associated with the Varian and Hewlett Packard investigation (see Section 4.2.2), fuel odors were noted, and elevated concentrations were detected with an organic vapor monitor in soil removed from the borehole (Environ, 1996). Environ subsequently grouted up the borehole and moved the well installation location.

2.7.8 Interviews with Persons Knowledgeable of the Subject Property

PES interviewed Mr. Boyd Smith and Mr. Robert Wheatley of WSJ Properties, property owner, concerning historical uses of the subject property. The results of our interviews are summarized below.

- Mr. Boyd Smith believed the main subject property building had been constructed sometime between the 1930s to 1950s;

- Mr. Robert Wheatley reported that WSJ Properties purchased the subject property in approximately 1974, and managed the property until 2002. Robert Wheatley Properties has been managing the property since 2002;

- Mr. Smith reported that the north end of the main building was occupied by a market which contained several stalls with different vendors, such as a snack bar, clothing stall, hardware stall, etc.;

- According to Mr. Smith, Dura-Bond made bearings at their facility. They performed babbitting operations wherein they immersed bearings in pits in the ground; he believed they used lead. He recalled that they had a concrete, sump-like storage pit in the back of the building, and that there was regulatory involvement in removing the pit sometime in the 1980s. He noted that when Dura-Bond vacated the facility in the late 1980s, their consultants collected wipe samples from the walls of the tenant space to confirm that there was no contamination. He indicated that no contamination was found on the walls or other surfaces of the building;

- Mr. Smith indicated that the Palo Alto Foundry vacated the site in approximately 1974 to 1975. The building was subsequently occupied by a business that rebuilt and painted vintage autos. They remained at the site one to two years. The building was demolished in the late 1970s;

- Mr. Smith reported that during demolition of the former James Packing building in approximately 2000 to 2001, a UST was encountered. To the best of his recollection, the UST was either already filled with sand, or was filled with sand when encountered. He was unsure as to whether the UST was removed or left in place. Mr. Smith was unaware of any regulatory documentation concerning the UST. He reported that the building was used by James Packing for packing and crating, and was previously used by Varian Associates for storage;

- Mr. Smith stated that Beemis Jason was a former tenant at 250 Portage. They were a paper fabricator which produced paper products and displays. Mr. Smith reported that they vacated the site in approximately 1979 to 1980;

- Mr. Smith further reported that, as far as he knew, the existing office building at 3201/3225 Ash Street had always been used for offices;

- Mr. Smith reported that several years ago they had some problems with Say Ray Auto, the facility immediately adjacent to the 3201/3225 Ash building, dumping liquids and other wastes out the back of their facility on to the subject property. Say Ray removed the materials, and a fence was constructed. They have had no further problems;

- Mr. Wheatley reported that during construction of a stairway on the northwest side of the main building. Some railroad track lines were encountered and removed; and

- Mr. Wheatley indicated that there had been no concerns regarding mold or indoor air quality at the subject property buildings.

3.0 RESULTS FROM PREVIOUS SITE INVESTIGATIONS

Several investigations and remedial activities have been performed on the subject property, including Phase I ESAs, soil and groundwater sampling, underground storage tank (UST) removals, soil excavation and other activities. Records concerning the subject property were provided by Wheatley Properties and/or obtained from the Santa Clara County Department of Environmental Health (SCCDEH) and the California State Water Resources Control Board's GeoTracker website located at http://geotracker.swrcb.ca.gov/. PES's review of these documents is summarized below, and selected documents are included in Appendix E on CD.

3.1 Former Dura-Bond Facility Investigation and Remedial Activities

Dura-Bond operated at the subject property since approximately 1960 manufacturing camshaft bearings for the automotive industry. Property addresses for the site have included 360, 370 and 395 Portage Avenue, as well as 3201 Ash Street. Manufacturing operations were performed at the Portage facility, and offices were maintained at 3201 Ash Street.

Wastewater Impoundment/Treatment Facility Remediation

Dura-Bond's manufacturing process produced a wastewater stream containing elevated concentrations of chromium, cadmium, iron, lead and zinc. From 1960 to 1971, the untreated wastewater was discharged to the sanitary sewer. From 1971 to 1980, the wastewater was neutralized and sediments allowed to settle. The treated wastewater was discharged to the sanitary sewer and the settled solids were discharged to an unlined sludge pond located immediately outside the west side of the building which measured approximately 20 feet by 25 feet (Emcon, 1981a). Until 1980, the sludge was allowed to dry and then disposed offsite. Beginning in 1980, the pond was no longer used and sludge was disposed offsite while still wet.

In 1981, in a preliminary investigation of the sludge pond performed to develop a plan for closure of the pond, elevated concentrations of lead, zinc, cadmium, chromium and iron, including up to 38,600 milligrams per kilogram (mg/kg) of zinc, was found in soil beneath the pond (Emcon, 1981a). Concentrations of metals decreased with depth, but elevated concentrations of zinc remained at approximately 6 feet bgs. In 1981, the pond was closed by removing soil beneath the pond to a depth of 5 feet bgs and backfilling the excavation with silty clay. Excavated soil was disposed offsite (Emcon, 1981b).

In 1983, Dura-Bond began using a new treatment system, and performed a soil investigation in preparation for closing the remainder of the old system, which included an acid storage tank, mixing tank, sedimentation tank, pH controller and associated pumps. Soil samples collected from three locations to depths of approximately 3 feet bgs indicated the presence of elevated concentrations of lead and zinc (Emcon, 1983a). In October 1983, soil was excavated from the wastewater treatment equipment area to a depth of approximately 4 feet bgs and disposed offsite. The excavation was backfilled with clean soil, with the upper 6 inches backfilled with drain rock to facilitate construction of a concrete pad over the area (Emcon, 1983b).

Also in 1983, spillage was discovered around the riser pipe and unlined vault box surrounding the riser pipe for a 5,000-gallon underground liquid waste tank used for accumulating waste oil, coolants and corrosion preventatives (Emcon, 1983c). Staining was observed on soil in the vicinity of the riser pipe after the concrete pad covering the UST and vault box was removed. Soil samples were collected at depths of approximately 10 to 11.5 feet bgs from an exploratory boring advanced adjacent to the UST. The boring was converted to a groundwater monitoring well (E-1), and a groundwater sample was collected from this well and another downgradient monitoring well (DM-1) previously installed as part of a leak detection system for USTs present at the site. All samples were analyzed for the presence of Stoddard solvent. No Stoddard solvent was detected in any of the samples, but other unidentified compounds were detected in the samples. Additional groundwater samples were subsequently collected from these two wells and analyzed for the presence of volatile organic compounds (VOCs) and semi-volatile organic compounds SVOCs. Elevated levels of VOCs were detected in both wells; TCE was detected at 239 and 708 micrograms per liter (μg/L).

In 1984, a 1,000-gallon Stoddard solvent UST, a 500-gallon gasoline UST, and a 500-gallon diesel UST were removed from the west side of the Dura-Bond facility (Emcon, 1984). Soil contamination was observed beneath the gasoline and diesel USTs which were present in a single excavation. Emcon reported excavation of the former gasoline and diesel UST excavation to approximately 10 feet bgs. Analysis of three soil samples collected from the bottom of the excavation indicated the presence of diesel fuel in one sample at 5,200 mg/kg, "hydrocarbons resulting from gasoline contamination" in two samples at 580 and 860 mg/kg, and lead in all three samples at concentrations ranging from 9 to 26 mg/kg. Stoddard solvent was not detected in soil. Groundwater samples were collected from two existing monitoring wells near the excavation, and analyzed for the presence of Stoddard solvent and hydrocarbons as diesel. Diesel was detected in one sample at 2,600 μg/L.

Following the excavation activities, a groundwater monitoring well (E-2) was installed in the backfilled excavation area, and groundwater samples were collected from this and the two previously-existing monitoring wells near the Dura-Bond facility (Emcon, 1985b). The samples were analyzed for the presence of gasoline, diesel, Stoddard solvent, lead, TCE, 1,1,1-trichloroethane (1,1,1-TCA), and perchloroethene (PCE). Volatile hydrocarbons (gasoline) and benzene were detected in Well E-2 at concentrations of 9,500 and 150 μg/L, respectively. Lead was present in two wells at 50 and 280 μg/L. TCE and 1,1,1-TCA were detected in all three wells at concentrations up to 540 and 130 μg/L, respectively. Stoddard

solvent was detected in one well at a concentration of 20 µg/L. Emcon reported that the volatile organics (TCE and 1,1,1-TCA) appeared to be migrating onto the site from an up gradient source, because Dura-Bond had never used these chemicals in their operations. Additional groundwater samples were collected from the three wells at the request of the California Regional Water Quality Control Board (RWQCB), and both filtered and unfiltered samples were analyzed for the presence of lead. No lead was detected in any of the samples (Emcon, 1985b). Also at the request of the RWQCB, Emcon developed a Remedial Action Plan for the Dura-Bond facility (Emcon, 1985). Emcon identified groundwater extraction and treatment as the most effective treatment, but concluded that the cost for treatment was high when the potential for migration of the contaminants to a location where they would have an adverse impact was low.

In 1986, an upgradient groundwater monitoring well (E-3) was installed to evaluate groundwater flow and the potential for the presence of upgradient sources of the VOCs previously detected in the Dura-Bond wells. The well was located near the southwest corner of the main subject property building, adjacent to the tenant space in use at the time by Varian for warehousing. A soil sample collected at a depth of approximately 14 to 15.5 feet bgs from immediately above groundwater and a groundwater sample from the newly-installed well were analyzed for the presence of VOCs. TCE was detected in the soil sample at a concentration of 70 mg/kg. Several VOCs were detected in groundwater, including TCE at a concentration of 340 µg/L and 1,1,1-TCA at a concentration of 25 µg/L. Groundwater level measurements confirmed that the well was located upgradient of the Dura-Bond facility. Emcon concluded that the source of VOCs identified in wells at the Dura-Bond facility was located upgradient of the facility. As a result, subsequent groundwater monitoring did not include analysis of VOCs because the VOCs detected in groundwater had reportedly not been used by Dura-Bond.

The results of semiannual groundwater monitoring from April 1986 through March 1988 indicated that total petroleum hydrocarbons quantified as gasoline (TPHg) was detected in groundwater in decreasing concentrations (4,300 µg/L in April 1986 to 1,300 µg/L in February 1987), but the well had been dry since the September 1987 sampling round. TPHg was not detected in the other two wells for the last four sampling rounds.

1989-90 Facility Closure Activities

In January 1989, in preparation for the impending closure of the Dura-Bond facility, an inspection of the Dura-Bond facility was performed on behalf of WSJ Properties by Safety Specialists, Inc. (SSI). SSI performed a preliminary reconnaissance of the facility to identify sites that may require additional investigation. SSI identified 17 such sites, including stained concrete flooring, various sumps, a drum storage area, an electrical transformer, dust-covered areas, various storage areas, a machine shop and welding area, a lead coating area, patched floor sections, gasoline pump and UST area, and an oil/water separator (SSI, 1989a). Recommended investigations included obtaining wipe, concrete chip, fluid and soil samples for analysis.

In March 1989, Dura-Bond prepared a Facility Closure Plan which described closure of USTs and the chemical storage area, manufacturing and warehouse area, and water treatment system area (Dura-Bond, 1989). The plan described soil sampling and analysis to be performed following removal of the existing USTs and associated piping, steam cleaning of the chemical storage area, wipe and soil sampling in the manufacturing and warehouse area, steam cleaning in the babbitting area, and dismantling the wastewater treatment system.

Undated draft figures and tables included in a transmittal from Emcon to Dura-Bond indicated that some soil sampling and analysis and soil excavation was performed inside the Dura-Bond facility (Emcon, 1989a). The excavation area indicated on a figure was located in the south central portion of the building, near where SSI observed concrete patching during their January 1989 inspection (SSI, 1989a). The figure suggests that the excavation was extended laterally until concentrations of high boiling point hydrocarbons (HBPH) as diesel and oil were at or below 100 mg/kg. The depth of the excavation is unknown, but a sample collected from 5 feet bgs contained HBPH as diesel and oil at 8,500 and 3,000 mg/kg, respectively. It appears that some wipe sampling was also performed, although no analytical results were included on the tables. No reports concerning these activities were identified in WSJ Properties' or regulatory agency files.

In April 1989, a 1,000-gallon Stoddard solvent UST, a 500-gallon unleaded gasoline UST, a 5,000-gallon waste oil UST and associated piping and aboveground pumps were removed from the Dura-Bond facility (Emcon, 1989b). The gasoline and Stoddard solvent USTs were in a single excavation. Three soil samples were collected from the joint excavation and analyzed for the presence of HBPH as Stoddard solvent and one sample was analyzed for low boiling point hydrocarbons (LBPH) as gasoline and benzene, toluene, ethylbenzene and xylenes (BTEX). Only low concentrations of HBPH as Stoddard solvent (up to 26 mg/kg) were detected in the three samples, and very low levels of LBPH as gasoline and BTEX in one sample. Iterative sampling was performed to determine the limits of excavation for the waste oil UST excavation. Total oil and grease (TOG), HBPH as diesel, oil and Stoddard solvent were detected in initial samples collected from the base and sidewalls of the excavation. The excavation was ultimately extended to approximately 17 to 18 feet bgs until no significant concentration of contaminants remained in soil samples collected from the bottom and sidewalls of the excavation. A groundwater sample collected from the bottom of the excavation contained TOG, HBPH as diesel and oil, TCE and 1,1,1-TCA at concentrations of 4,200; 42,000; 8,000; 133; and 19 μg/L, respectively. No concentrations of metals above background levels or select VOCs (including TCE and 1,1,1-TCA) were detected in any of the soil samples. Emcon concluded that contaminated soil associated with the USTs had been successfully removed, but that groundwater monitoring would continue. Groundwater samples were collected from two wells in September 1989, and no petroleum hydrocarbons as gasoline or BTEX were detected (Emcon, 1989b). One of the wells was dry, so no sample was collected. Emcon's presentation of analytical data indicated that no contaminants had been detected in two of the wells since 1986, and that one well had been dry since September 1988. Prior to being dry, gasoline and benzene were detected in the well at 1,300 and 5 μg/L, respectively, in February 1988.

In September 1989, Emcon and SSI collected soil samples for analysis from beneath and adjacent to the wastewater and babbitting areas (Emcon, 1989c). A total of 43 samples were collected from 26 locations at depths ranging from approximately 1 to 10.5 feet bgs. Samples were analyzed for one or more of the following: antimony, cadmium, chromium, lead, nickel, zinc, pH and a hydrocarbon scan. Elevated concentrations of lead and zinc were detected in the babbitting area, and elevated concentrations of lead were detected in the wastewater treatment area. Zinc concentrations ranged from not detected to 40,000 mg/kg (collected from approximately 1.5 feet bgs), and lead concentrations ranged from not detected to 10,000 mg/kg (collected from approximately 1 foot bgs). Several concentrations of both lead and zinc were above the current RWQCB residential Environmental Screening Levels (ESLs) for lead and zinc of 200 and 600 mg/kg, respectively. pH ranged from 4.59 to 12.11. No hydrocarbons were detected in any of the six samples analyzed.

Based on the results of the September 1989 soil sampling, Emcon excavated five areas in the babbitting room and one area in the wastewater treatment during the period from October to December 1989 (Emcon, 1989e). The criteria for excavation was areas with lead or zinc exceeding their respective TTLC (total threshold limit concentration; a hazardous waste determination criteria) of 1,000 and 5,000 mg/kg, respectively, and soil within 2 feet of the ground surface with concentrations of 1/10 the TTLC. The areas selected for excavation included: (1) soils beneath babbitting room pits to a minimum depth of 3 feet below each pit; (2) surface soils around and underneath the babbitting room wastewater sump to a depth of 3 feet below the sump; (3) surface soils beneath damaged concrete area to a minimum depth of six inches; and (4) soil in the wastewater treatment area (approximately 3 feet by 13 feet) to a depth of approximately 4 feet. The final excavation depths ranged from approximately 1 to 17 feet bgs. Based on the results of confirmation sampling, it appears that Emcon's cleanup criteria were met; however, in one excavation, a confirmation sample was not collected following additional excavation below a sample containing 7,400 mg/kg of zinc. Additionally, although the TTLC criteria were met, concentrations of zinc up to 2,400 mg/kg, which is significantly above the residential ESL of 600 mg/kg, remained in place at depths of approximately 17 feet bgs. The excavations were backfilled with clean pea gravel and capped with concrete.

During February 1990, ENSR performed an indoor surface contamination study of the vacant Dura-Bond facility (ENSR, 1990). ENSR collected 14 samples of settled dust and dirt from roof trusses and beams, rollup doors, electrical panels, light fixtures, and roof exhaust ducts. Samples were analyzed for 24 metals. The most predominant metals detected were aluminum, iron, manganese, lead, antimony, tin, tungsten and zinc, with lead detections ranging from 0.8 to 11.9%. Because of the relatively high concentrations of lead, and moderate levels of other metals, ENSR recommended that all horizontal surfaces be cleaned by a non-dispersive method.

Groundwater sampling was performed at four groundwater monitoring wells at the site in February 1990. Well E-1 had been decommissioned and replaced with Well E-5. All four wells were analyzed for filtered and unfiltered metals; no metals were detected above U.S. EPA Maximum Contaminant Levels (MCLs). Groundwater from Wells E-4 and DM-1 was analyzed for the presence of gasoline, BTEX, Stoddard solvent, and HBPH as kerosene, diesel and oil; none of these analytes were detected above reporting limits. Groundwater from Well E-5 was analyzed for gasoline and BTEX. Benzene was detected at 0.9 μg/L, but was not detected in a duplicate sample collected from the same well.

In approximately February 1990, soil sampling and analysis was performed at the former Dura-Bond facility on behalf of the property owner to verify the completeness of site remediation performed at the facility by Emcon during October through December 1989 (Parfitt, 1990a). Soil samples were collected from 67 locations from borings extended to either approximately 4 or 10 feet bgs. Samples were collected at intervals of approximately 4 to 5 feet in the deeper borings. Analytical results indicated the concentrations of zinc present in excess of the TTLC (5,000 mg/kg) in the former babbitt room to a depth of at least 10 feet. Lead was detected above the TTLC of 1,200 mg/kg in the area of the former waste treatment area. TCE was also detected in one sample from approximately 3 feet bgs in the former babbitt room above the reporting limit, although the concentration is not reported in the available documentation.

Tentative Site Cleanup Requirements

RWQCB records for Dura-Bond include a letter transmitting Tentative Site Cleanup Requirements for Dura-Bond Bearing Company (RWQCB, 1990). The letter cites a December 1989 site closure report which documented heavy metals in the soil beneath the babbitting room pits and wastewater sumps, and lists concentrations up to 35,700 mg/kg of zinc, 2,260 mg/kg of lead and potentially hazardous levels of chromium, vanadium and other metals. Elevated levels of zinc and lead were also reportedly detected in a grab groundwater sample. Additional metal contamination beneath the manufacturing area was reportedly identified in April 1990, and included soil concentration in excess of 10,000 mg/kg of zinc, 0.4 mg/kg of chromium VI, 100 mg/kg of chromium III and 100 mg/kg of nickel. The data correlate to that reported in Emcon and Parfitt reports as discussed above. The Tentative Site Cleanup Requirements call for the performance of additional investigation, a feasibility study, and preparation and implementation of a Remedial Action Plan. RWQCB records did not indicate that the Tentative Site Cleanup Requirements for Dura-Bond Bearing Company was ever filed.

1997 Groundwater Sampling

In July, September and December1997, groundwater samples were collected from Wells E-3, E-4 and E-6. Collected samples were analyzed for HBPH as hydraulic fluid, diesel, kerosene, jet fuel and Stoddard solvent, BTEX and VOCs. HBPH as hydraulic fluid was detected in Well E-3 at concentrations ranging from 100 μg/L to 6,700 μg/L. Some VOCs were detected

in all three wells, including TCE, which was detected in two wells at concentrations ranging from 7 to 190 μg/L. PCE was detected in one well at 30 μg/L.

In 1998, the RWQCB notified Dura-Bond that chlorinated VOCs detected at the site were consistent with the regional VOC plume (COE Study Area; see Section 4.2.2) mainly attributable to Hewlett-Packard and Varian Associates. Accordingly, the RWQCB reported that neither Dura-Bond nor the property owners would be responsible for any groundwater investigation, monitoring, or remediation associated with the offsite source (RWQCB, 1998).

In January 1998, the Santa Clara Valley Water District (SCVWD) issued regulatory case closure for the USTs that had been removed from the Dura-Bond facility in 1984 and 1989 (SCVWD, 1999). In a 2006 letter, SCVWD noted that five groundwater monitoring wells associated with the UST remediation monitoring had not been destroyed in accordance with applicable SCVWQD regulations (SCVWD, 2006). However, Dura-Bond had submitted invoice documentation indicating the wells had been destroyed. SCVWD noted that the wells had been destroyed in violation of SCVWD ordinance, but would not require further corrective action.

3.2 Say Ray Soil Contamination Removal Activities

Say Ray is an auto repair facility located adjacent to the east side of the subject property office building at 3251 Ash Street. In 1990, a soil investigation was performed by J.V. Lowney Associates (Lowney) to evaluate soil quality on the subject property as a result of wastewater containing oil and grease which had been allowed to run from the Say Ray facility across the subject property and into Matadero Creek. The discharge had reportedly been ongoing for a number of years and Lowney noted staining on the asphaltic concrete extending from the Say Ray facility to Matadero Creek (Lowney, 1990). Lowney collected soil samples from depths of approximately 1, 3 and 4.5 feet bgs from three borings along the creek boundary. All samples were analyzed for the presence of oil and grease, and some samples were also analyzed for VOCs. Oil and grease was detected in five of the six samples analyzed at concentrations ranging from 50 to 27,000 mg/kg. Some VOCs, including dichlorobenzenes, acetone, methylene chloride and toluene were also detected in soil.

Wahler Associates (Wahler) subsequently performed an additional investigation to further define the contamination on the subject property and Matadero Creek (Wahler, 1990a). Three soil borings were advanced to a depth of approximately 6.5 bgs, and one soil borings was advanced to a depth of approximately 11.5 feet bgs. Nine samples were collected from the borings at varying depths. All samples were analyzed for total oil and grease (TOG), and five samples were also analyzed for VOCs. The results of analysis indicated the presence of TOG in concentrations up to 6,600 mg/kg at depths less than 2 feet bgs, and 2,700 mg/kg at depths to approximately 6.3 feet bgs. Low levels of VOCs detected in soil were not considered a significant concern. Wahler recommended the soil be excavated and replaced with clean fill.

In August 1990, soil was excavated from the subject property adjacent to the flood control channel in an area approximately 18 feet long by 6 feet wide to a depth of approximately 6.5 feet bgs. Soil was also excavated from the SCVWD flood control channel property in an area approximately 6 feet by 8 feet to depths ranging from approximately 2 to 4 feet bgs. Confirmation samples collected from the excavation bottom and sidewalls indicated that remaining soil was below the 50 mg/kg TOG cleanup level identified by SCVWD. The excavation was backfilled, and the backfilled area on SCVWD property was compacted in accordance with SCVWD's requirements.

Subsequent documentation in WSJ Properties files indicates that SCVWD appeared to have encountered additional soil contamination within the SCVWD easement during channel improvement activities. No information was present in WSJ Properties files concerning the disposition of the discovered contamination.

3.3 Former Southern Pacific Right-of-Way

In 1992, Kennedy/Jenks Consultants (KJC) performed a Phase I ESA of the former SP Right-of-Way on behalf of WSJ Properties (KJC, 1992a). The Phase I ESA appeared to have been performed prior to acquisition of the property by WSJ Properties.

The property was described as an approximately 80 feet wide by 1,000 feet long railroad right-of-way from which tracks and rails had been removed. KJC reported that with the exception of a small storage shed located near Park Boulevard, the property was vacant. KJC noted that residences present west of the right-of-way appeared to have encroached on the right-of- way.

KJC historical research indicated that the tracks were constructed on the subject property in approximately 1911. The only structures on the property appeared to be a small storage shed adjacent to Park Boulevard. The rails were removed between 1985 and 1990. KJC reported that chemical usage on the property appeared to have been limited to use of herbicides for weed control along the tracks. KJC noted that switch plate lubricant, which contained graphite, kerosene and diesel oil, may have been use at the site; however, KJC did not note any hydrocarbon staining.

KJC reported that the subject property was not listed on any environmental databases. Several facilities were found to have releases in the site vicinity which had affected soil and groundwater quality.

To evaluate soil and groundwater quality at the site, KJC advanced eight soil borings along the former right-of-way. Soil samples were collected from four depth intervals in each boring: 5.0 to 6.5 feet, 10.0 to 11.5 feet, 15.0 to 16.5 feet and from 18.0 to 19.5 feet. Samples from each boring from the 5.0 to 6.5-foot and 18.0 to 19.5-foot intervals were composited and analyzed for the presence of TPHg, TPH quantified as diesel (TPHd), organochlorine pesticides (OCPs), VOCs, PCBS and Title 22 metals. Four of the composite samples were

also analyzed for the presence of SVOCs. The samples collected from the 5.0 to 6.5-foot were also analyzed for the presence of oil and grease.

TPHg, TPHd, PCBs, OCPs, VOCS, or SVOCs were not detected above laboratory detection limits in any of the samples analyzed. No metals were detected above background concentrations. Oil and grease was detected in three samples, each at 60 mg/kg. KJC concluded that the presence of oil and grease did not present a significant concern.

In February 1992, Environ Corporation (Environ) performed a cone penetration test (CPT) along the SP Right-of-Way on behalf of HP and Varian (see Section 4.2.2.). The CPT procedure consisted of advancing a probe to approximately 80 feet bgs at eight locations along the right-of-way (Environ, 1992). At six of the locations, a total of 13 grab groundwater samples were collected at depths ranging from approximately 22 to 48 bgs which were analyzed for the presence of VOCs. TCE was detected at concentrations ranging from 76 to 240 μg/L, and 1,1,1-TCA and dichloromethane (DCE) were detected in one location at 270 and 290 μg/L, respectively.

In April 1992, KJC performed additional soil sampling in the vicinity of Environ's CPT location in which TCE, 1,1,1-TCA and DCE were detected (KJC, 1992b). KJC advanced four borings to a depth of approximately 20 feet bgs, and collected 14 soil samples at approximately 5-foot intervals. TCE was detected in ten of the 14 samples at concentrations ranging from 2 to 10 μg/kg. KJC concluded that the concentrations were consistent with diffusion of soil gas through the capillary fringe (associated with the HP and Varian investigation) rather than evidence of a surface spill.

3.4 1998 Subsurface Vault Investigation and Remediation

In 1997, while excavating for a new storm sewer pipe installation, the property owner's contractor encountered a concrete structure and petroleum hydrocarbon-affected soil on the west side of the main building (Plate 2). An inspection of the vault was made through an access port; the presence of a black, oily liquid was observed at a depth of approximately 5 feet bgs. The investigation, abandonment and closure of the vault, performed by PES in 1997 (PES, 1998) under oversight of PAFD, is summarized below.

Analysis of a sample of the liquid in the vault indicated the presence of TPH in the motor oil range at a concentration of 440,000 mg/kg. The liquid also contained low levels of trimethylbenzenes, naphthalene and other common components of fuel oil and/or degraded motor or fuel oil. The liquid was pumped from the vault and disposed offsite. Approximately 8,157 gallons of liquid was removed from the vault.

Seven soil samples were collected from the sidewalls of the excavated storm sewer trench, which was later found to be within the interior of the vault. The samples were collected from areas with visible staining. An additional eleven soil samples were collected from borings located to better define the vault orientation and dimension, including some locations outside

the apparent extent of the vault. Samples collected were analyzed for VOCs and a full scan of TPH. The results of analysis indicated the presence of TPH quantified as motor oil (TPHmo) and TPHd at concentrations up to 2,400 mg/kg and 200 mg/kg, respectively. Maximum concentrations of VOCs detected include sec-butylbenzene at 0.3 mg/kg; n-butylbenzene at 0.93 mg/kg; ethylbenzene at 0.13 mg/kg; isopropylbenzene at 0.19 mg/kg; p-isopropyltoluene at 0.81 mg/kg; naphthalene at 3.4 mg/kg; n-propylbenzene at 0.33 mg/kg; 1,2,4-trimethylbenzene at 4.3 mg/kg; and total xylenes at 0.29 mg/kg. The results indicated that, with the exception of one sample, hydrocarbon-affected soil was confined within the concrete walls of the vault. The one exception was a sample collected from approximately 5.5 feet bgs approximately 5 feet from the west corner of the vault which contained TPHmo at 100 mg/kg.

After removing overburden from the vault, its dimensions were measured to be 13 feet wide by 36 feet long by 8 feet deep, with a capacity of approximately 28,000 gallons. The bottom, sidewalls and top of the vault were constructed of 8-inch thick reinforced concrete.

Approximately 282 tons of soil and concrete debris (from the vault top) were removed from the vault and disposed offsite. Pockets of residual liquids which remained in the vault were pumped out, and the vault sidewalls and bottom were then cleaned using a citrus-based degreaser and high pressure steam rinse. Rinseate was pumped out, and approximately 2,500 gallons of residual product and rinseate were disposed offsite.

The bottom and sidewall of the vault was subsequently inspected by PES and PAFD personnel. No cracks in the walls or bottom of the vault or other visual evidence indicating the integrity of the vault was compromised was observed during the inspection.

To evaluate soil quality beneath the vault, PES cored through the vault in eight locations, and collected soil samples from four of them. The samples were analyzed for VOCs and a full scan of TPH. No analytes were detected in any of the four samples.

PAFD gave approval to abandon the vault in place. The eight core holes were filled with sand to allow fluids entering the vault to drain into the subsurface. The vault was backfilled with clean native material obtained onsite during site improvements activities, and the storm sewer piping was replaced. The surface was covered with asphaltic concrete pavement.

The site received case closure from PAFD following confirmation sampling and abandonment of the vault (PAFD, 1998).

3.5 2002 Former Mercer Processing Remediation

Mercer Processing, Inc. (Mercer) occupied the tenant space at 230 Portage Avenue (currently occupied by Teak Patio) from 1989 to 1999. Operations performed by Mercer at this location included freeze-drying and packaging of food products. Refrigeration equipment used in the

freeze-drying process contained solvents, including TCE, and Genesolv 2000, also referred to as Refrigerant 141b and composed of 1,1-dichloro-1-fluoroethane.

In 1999, PES performed a Facility Closure Assessment to assess whether operations at the Mercer facility had adversely affected environmental conditions at the site (PES, 2000). The results of analysis performed on ten soil samples collected in the vicinity of the former refrigeration unit indicated the presence of acetone, methyl ethyl ketone, TCE, and tert-butanol in the soil samples. Additional investigations were performed to further define the lateral and vertical extent of chemicals in the vadose zone beneath the site (IT, 2000). Chemicals detected in the soil included TCE, 1,1-dichloroethene, cis-1,2-dichloroethene, and trans-1,2-dichloroethene. The highest concentrations were found beneath the former refrigeration unit.

A Remedial Action Plan (RAP) was subsequently developed to address contamination identified at the site (PES, 2001). The RAP included an evaluation of risk to human health and the environment, principally groundwater resources, development of a site-specific remedial goal for contaminated soil, an evaluation of remedial alternatives, and a description of the procedures to implement the recommended remedial alternative. Based on the results of the health and environmental risk assessment, a soil cleanup goal of 0.2 mg/kg of TCE was recommended. The risk assessment indicated that removal of TCE-affected soil exceeding 0.2 to 0.4 mg/kg would be protective of human health for residences with a concrete floor slab. Soil excavation was the selected remedial alternative. The RWQCB concurred with the RAP in a letter dated October 18, 2001.

Remedial activities were performed at the former Mercer facility during January 2002 (PES, 2002). Approximately 285 cubic yards of TCE-impacted soil was excavated to a maximum depth of approximately 20.5 feet below grade. Excavated soil was characterized and disposed offsite. On the basis of verification soil samples collected from the bottom and sidewalls of the excavation, soil with TCE concentrations exceeding the target cleanup goal was removed from the site. During excavation, several concrete footings and inactive utilities were uncovered and removed. Groundwater was not encountered during the excavation of TCE-impacted soil. The excavation was backfilled with sand cement slurry, imported clean fill, and re-usable excavated clean soil. The area of soil excavation was capped with a concrete slab. In a letter dated April 8, 2002, the RWQCB stated the remedial goal had been achieved, and that no further action was required (RWQCB, 2002).

Note that the current RWQCB residential ESL for TCE for shallow or deep soil where groundwater is a drinking water source is 0.46 mg/kg.

4.0 RECORDS REVIEW

4.1 Environmental Liens

Based on review of an environmental database search conducted by Environmental Data Resources, Inc. (EDR) there are no Federal Superfund (NPL) liens or State deed restrictions associated with the subject property.

4.2 Standard Environmental Record Sources

The discussion presented in this section is based on available information provided by government agencies and various databases. An EDR report dated October 19, 2010 contains listings of sites located within a 1-mile radius, which were selected in accordance with ASTM E 1527-05 standards. This information is obtained from computerized databases of Federal, State, and local records. Descriptions of the lists reviewed are presented below. The EDR database report is included as Appendix F.

The ASTM Standard Environmental Record Source regulatory agency databases for the following sites were searched and reported in the EDR report:

- U.S. Environmental Protection Agency (EPA) – National Priorities List (NPL) sites, proposed NPL sites, and Delisted NPL sites – within 1 mile of the subject property;
- U.S. EPA – Comprehensive Environmental Response Compensation, and Liability Information System (CERCLIS) sites and CERCLIS No Further Remedial Action Planned (NFRAP) sites – within ¼ mile of the subject property;
- U.S. EPA – RCRA Corrective Action Report (CORRACTS) facilities – within ¼ mile of the site;
- U.S. EPA – Resource Conservation and Recovery Act (RCRA), Treatment, Storage, or Disposal (TSD) facilities - within ½ mile of the subject property);
- U.S. EPA – RCRA Small Quantity and Large Quantity Generators of hazardous waste (SQG and LQG) - within ¼ mile of the subject property;
- U.S. EPA - Engineering Control sites and Institutional Control sites - within ½ mile of the subject property;
- U.S. EPA – Emergency Response Notification System (ERNS) sites –the subject property;
- California Department of Toxic Substances Control (DTSC) – State response sites – within 1 mile of the subject property;

- California Integrated Waste Management Board (IWMB) – Solid Waste Information System (SWIS) solid waste disposal and landfill sites – within ½ mile of the subject property;

- California State Water Resources Control Board (SWRCB) – Leaking Underground Storage Tank Listing (LUST) sites – within ½ mile of the subject property;

- U.S. EPA – LUST sites on Tribal Lands – within ½ mile of the subject property;

- SWRCB – Underground Storage Tank (UST) sites – within ¼ mile of the site;

- U.S. EPA – UST sites on Tribal Lands – within ½ mile of the subject property;

- DTSC – EnviroStor Database including known contamination, deed-restricted, and Brownsfield sites – within 1 mile of the subject property; and

- DTSC – Voluntary Cleanup Program (VCP) – within ½ mile of the site.

In addition, various non-ASTM, supplemental local, State, and Federal regulatory databases were searched (e.g., AST, Coal Gasification Plants, and Waste Discharge System databases) and summarized in the EDR report. The findings of the review of the EDR report are presented below.

4.2.1 Subject Property Records

Database Listings

Current and former businesses at the subject property are listed on the following environmental databases:

- **Dura-Bond Bearing**, 3201 Ash Street, is listed on the CERCLIS-NFRAP, SLIC and LUST databases. The 3201 Ash Street address was the location of Dura-Bond's former office. The CERCLIS-NFRAP database indicates that a CERCLA Preliminary Assessment was completed in 1987, resulting in a determination that no further remedial action was planned. The SLIC database lists the site as open, but inactive, as of March 17, 2009. Solvents are listed as the potential contaminants of concern. The LUST database reports that case closure was received in 1999, as was discussed further in Section 3.1;

- **Dura-Bond Bearing**, 370 Portage, is listed on the SLIC and EMI databases. The database and RWQCB records list the site as open but inactive as of August 1, 1997. The facility is also listed as having an air emission in 1987 permitted with Bay Area Air Quality Management District (BAAQMD);

- **Dura-Bond Bearing**, 395 Portage Avenue, is listed on the RCRA-SQG, CA FID UST, Historical UST, and ENVIROSTOR databases. The RCRA-SQG database indicates the facility was historically a Large Quantity Generator (LQG) in 1980. No violations are listed for the facility. The Historical UST database lists a 1,000-gallon gasoline UST and a 500-gallon unleaded gasoline UST installed in 1960, a 5,000-gallon waste UST installed in 1981, a 374-gallon waste UST installed in 1982, and a 224-gallon waste UST installed in 1983. The Envirostor database lists the site as de-certified as of November 15, 1993. The database notes closure of a surface impoundment and removal of 100 cy of contaminated soil in December 1983, closure of a water treatment system including removal of 28 cy of soil approved by DTSC, and reports that the facility had been working with RWQCB concerning fuel spills and groundwater contamination from an offsite source since 1984. The status of the site shows as referred to RWQCB. Historical remedial activities at the former Dura-Bond facility are discussed in Section 3.1;

- **Mercer Processing**, 230 Portage, is listed on the SLIC database. The listing refers to the soil excavation at the facility as discussed further in Section 3.5. The database lists the site as having received case closure as of April 8, 2002;

- **Park Avenue Motors**, 3250 Park Boulevard, is listed on the RCRA-SQG database. The database indicates the registration was initiated in 2004. No violations are listed. This site corresponds to the existing Smythe European facility;

- **Systems Control Inc**., 220 Portage, is listed on the RCRA-SQG database. No violations are listed for the site. WSJ Properties reported that they did not have any record of Systems Control Inc. as a tenant on the subject property. No hazardous material records concerning at this address were identified in PAFD records;

- **Varian Associates**, 380 Portage, is listed on the RCRA-Non-Generators and HAZNET databases. The facility is listed as a non-hazardous waste generator as of 1999; however, the database indicates the facility was historically listed as a generator as of 1996. No violations were listed for the facility. The HAZNET database lists offsite disposal of aqueous solutions with metals, laboratory waste chemicals, inorganic solid wastes, waste and mixed oil, and unspecified sludge waste; and

- **WSJ Properties**, 3200 Park Boulevard, is listed on the HAZNET database for offsite disposal of approximately 34 tons of oil-containing waste. This appears to be associated with the subsurface vault excavation activities described in Section 3.4.

Regulatory Agency Records

PES reviewed records for the subject property from the Santa Clara County Department of Environmental Health (SCCDEH); California State Water Resources Control Board's GeoTracker website located at http://geotracker.swrcb.ca.gov/; and Department of Toxic

Substances Control's (DTSC) EnviroStor website located at http://www.envirostor.dtsc.ca.gov/public/default.asp.

The discussion of regulatory agencies records for the subject property is included in Section 3.0.

4.2.2 Surrounding Area

The following is a discussion of sites listed on regulatory agency databases which have the potential to affect environmental conditions at the subject property.

Hewlett Packard (HP) at 395 and 640 Page Mill Road, Varian at 601 California Avenue

Hewlett Packard (HP) at 395 and 640 Page Mill Road, Varian at 601 California Avenue, and offsite areas (referred to as the California-Olive-Emerson (COE) Area and Perimeter Area) comprise the study area associated with a comingled VOC plume. The primary chemicals of concern are TCE, 1,1,1-TCA, 1,1-DCE, 1,1-DCA and PCE. TCE is the VOC most widely distributed and at the highest concentrations. The most recent groundwater monitoring report (2010 Annual Groundwater Monitoring) for the HP-Varian investigation is included in Appendix G.

Soil and groundwater investigations were initiated by HP in 1981 as a result of a leaking waste solvent UST (Environ, 1994). Investigations and remediation activities at HP-Varian and offsite areas are performed under oversight by the RWQCB and in accordance with RWQCB Order 94-130 (Order; RWQCB, 1994). Cleanup standards for groundwater are U.S. EPA MCLs, California Department of Environmental Protection MCLs, or, for acetone, a target level based upon toxicity characteristics. The cleanup standard for TCE in groundwater is 5 μg/L. Remedial activities associated with the plume have included soil vapor extraction, groundwater extraction and treatment, and injection.

Two water-bearing zones were identified during the investigations, termed the A aquifer (further divided into the A1 Upper [A1U], A1 and A2 Zones) which extends between approximate depths of 13 to 55 feet bgs, and the B aquifer (further divided into the B1 and B2 Zones) which was encountered between depths of approximately 60 and 120 feet bgs. Groundwater flow to the north-northeast has been measured in both zones.

The results of the most recent groundwater monitoring event (June 2010) indicates that the TCE plume in the A1 Upper and A1 Zones extend across the site to north of Alma Street, but does not extend to the site in the A2 or B Zones. In the A1 Upper Zone, the subject property is shown between the 10 and 100 μg/L contour intervals, and approximately within the 10 μg/L contour interval in the A1 Zone.

Four active monitoring wells associated with the COE investigations are present on the subject property as shown on Plate 2. Two of the wells are in the A1 Upper Zone (F77A1U and F138A1U), and two are in the A1 Zone (F139A1 and F140A1). Wells F138A1U and F139A1 are sampled annually, and wells F77A1U and F140A1 are sampled biennially. In Well F77A1U, TCE concentrations have ranged from 32 to 47 μg/L since 2005, but in Well F138A1U, TCE has not been detected since 2004. In Well F139A1, TCE has not been detected since 2004, and in Well F140A1, no TCE concentrations above the cleanup standard have been detected in the well since its 1996 installation.

A soil gas investigation was performed in 2008 in a residential area northwest of the subject property across Page Mill Road where TCE concentrations are relatively similar to those on the subject property (Secor, 2008). The results indicated that none of the shallow soil gas samples contained VOC concentrations above the corresponding RWQCB residential ESLs for potential migration of VOCs from soil gas to indoor air.

Say Ray Auto

Say Ray Auto is listed on the Historical UST database (as Sun Ray Foreign Auto Service at 325U Park Boulevard – an apparent typographical error). The database lists the facility with a waste oil UST. Regulatory agency records did not include any information regarding the potential removal of this UST. This facility is located potentially upgradient of the subject property, and has the potential to affect groundwater beneath the subject property.

Star Graphics

WSJ Properties files included a report prepared by J.V. Lowney Associates (Lowney) concerning a reconnaissance and soil quality investigation at the former Star Graphics facility at 3200 Park Boulevard. Lowney reported that Star Graphics had occupied the building from approximately 1974 through 1989, and used the building for production of color film negatives. A 2,000-gallon fiberglass UST (contents not specified) was present in the parking lot in front of the building, and was reportedly scheduled for removal during 1990 (Lowney, 1990). Floor drains were observed in the main processing area, and staining was observed on floors within the building. Lowney collected soil samples from approximately 1 foot beneath the concrete slab and collected liquid and residue present in floor drains. The six soil samples were composited into two samples and the four drain samples were composited into one sample. All samples were analyzed for VOCs, SVOCs, CAM-17 metal, and hexavalent chromium. One composted soil sample contained an elevated concentration of silver, but the concentration was below regulatory limits. Some organics were identified in the drain residue, suggesting that organics may have been discharged into the sanitary sewer. Lowney suggested that groundwater monitoring wells could be installed to further evaluate potential releases to the subsurface. No information was found in regulatory files concerning removal of the UST, however, a letter in WSJ Properties files indicated that the UST had been removed, and that analytical data from soil samples collected from beneath the UST indicated that the UST had not leaked (Parfitt, 1990b).

Several other sites in the subject property vicinity are listed on hazardous materials release and/or storage databases. However, the other sites listed in the databases are not expected to present significant environmental conditions to the subject property based on one or more of the following: (1) the listed site has received case closure by the appropriate regulatory agency; (2) the listed site is either crossgradient or downgradient of the subject property with respect to the inferred regional groundwater flow direction; (3) the listed site is a soils-only affected case; and (4) the listed site is located at too great a distance to represent a significant environmental condition with respect to the subject property.

5.0 SITE INSPECTION

Inspection of the subject property was conducted by Julie Turnross, R.E.A. of PES on October 27, 2010, accompanied by Mr. Lund Smith of WSJ Properties. All accessible areas of the site building common and exterior areas were inspected. Site photographs are provided on Plates 3 through 14.

The subject property contains four single-story buildings, an access road, and associated paved parking and landscaped areas. Uses of the subject property buildings, which include primarily office, retail and auto repair activities, are as listed on Table 1. Hazardous material use at the subject property is limited to *de minimis* quantities of typical cleaning and maintenance supplies, except for the tenant spaces listed below.

Regency Teak/The Teak Patio, 230 Portage Avenue

Regency Teak uses a water-based cleaner to rinse off imported furniture, and then occasionally seals the wood with a petroleum-based sealant (Semco Teak Sealer) before sold or placed on the showroom flow. The rinsing is performed in a bay at the rear of the building. It appears that runoff from the washing activities may enter storm drains in the parking area on the west side of El Camino Center.

Hazardous materials observed at the facility included one 5-gallon container of teak cleaner, one 5-gallon container of teak sealer, less than 10 1-gallon containers of paint, and small containers of adhesives. Approximately 100 1-gallon containers of teak sealer were also present at the site which were in factory-sealed containers for retail sale.

Fry's Electronics, 340 Portage Avenue

Fry's Electronics sells various computer cleaning materials, including acetone. All materials are stored and sold in original factory packing. No concerns were identified with the storage or handling of these materials.

Approximately 10 5-gallon and 15 1-gallon containers of latex paint were observed stored on the dock area behind Fry's Electronics. No paint staining was observed in the dock area.

Lyncean Technologies, 370 Portage Avenue

Lyncean Technologies is a start-up firm which develops x-ray light sources. Chemical use at the facility includes various chemicals in containers of 1-gallon or less which are stored in flammable cabinets. Stored chemicals included acetone, isopropyl alcohol, buffer, and various adhesives, cleaners and paints. No staining or other evidence of a release was observed in the vicinity of the cabinets or in laboratory areas. Two empty and one partially full container of an electrical insulating oil were stored on the floor without secondary containment. No staining was observed in the vicinity of the drums. The equipment which required the oil is no longer present at the facility, and the drums are awaiting disposal. A liquid nitrogen dewar is also present at the facility.

Smythe European, 3250 Park Boulevard

Smythe European performs auto repairs and maintenance, and sells parts, including batteries. Hazardous materials used and stored at the facility include two 240-gallon containers of motor oil, approximately 25 1-gallon containers of antifreeze, one 55-gallon container of automatic transmission fluid, one 55-gallon container of gear lubricant, welding gases, and small (1-quart or less) of various cleaners, lubricants and adhesives. All materials were stored in units with secondary containment. Hazardous wastes generated at the facility include waste antifreeze and waste motor oil, both of which were stored in labeled units of 55-gallons and 350 gallons, respectively, with secondary containment. Waste materials are transferred to the storage containers via mobile work station units. Some minor staining was observed on the floor in the shop area, however, the floor was coated with an epoxy-containing paint. No concerns regarding hazardous material use and storage at the facility were identified.

5.1 Undeveloped Area

No undeveloped areas are present at the site.

5.2 Chemicals/Hazardous Substances Containers

Other than the items discussed above in Section 5.0, there were no obvious indications of hazardous materials use or storage at the site.

5.3 Underground and Aboveground Storage Tanks

No USTs or ASTs were observed at the subject property. However, historical documents suggest one to two USTs are likely present at the site as discussed in Section 2.7.7. Additionally, USTs were formerly present on the site as discussed in Section 3.0.

5.4 Back-Up Generators

There are two back-up generators present at the subject property at the Comcast Cable tenant building at 270 Lambert. A newly-installed generator with a 50-gallon internal diesel tank is present on the site. The generator was not yet operational at the time of PES's site inspection; no fuel was present in the diesel tank. The diesel-powered generator had been installed to replace the existing natural gas-powered generator present at the site. No concerns were identified with either generator.

5.5 Elevators

There are no elevators on the subject property.

5.6 Hydraulic Trash Compactors

A hydraulic trash compactor is present at the Fry's tenant space. No leaks or other concerns were identified associated with the trash compactor.

5.7 Indications of Polychlorinated Biphenyls (PCBs)

Nine City of Palo Alto-owned transformers are present in parking and landscaped areas throughout the subject property. No leaks or stains were observed on the transformers or the concrete pads beneath the transformers. The transformers were not labeled as to PCB content.

As discussed in Section 2.7.7, a 1953 map indicated the presence of three transformers in the main building. This map was not available prior to our site inspection, and these transformers were not observed during our site inspection. WSJ Properties indicates that they are not aware as to whether the transformers have been removed.

5.8 Other Conditions

5.8.1 Asbestos

An assessment of asbestos-containing materials was not conducted as part of this Phase I ESA. Standards set by the Occupational Safety and Health Administration (OSHA) require building owners to presume that thermal system insulation (TSI) and surfacing asbestos containing material (ACM) found in buildings constructed before 1981, and floor tile installed in buildings through 1981, are asbestos containing, unless demonstrated to be less than 1 percent asbestos through sampling. The rule does not permit an assumption to be made that a material does not contain asbestos in buildings constructed after 1980. However, since the late 1970s to early 1980s, asbestos has been removed or substituted for in all but a small number of construction products. For example, asbestos is still used, although at low concentrations, in various mastics and roofing materials.

Based on the pre-1950 construction date of the El Camino Center and Ash Street buildings, ACM may be present in these buildings. ACM is not considered an environmental concern at the Comcast building (constructed in 1986) or the Smythe European building at 3250 Park Boulevard (constructed in 2003).

As discussed above in Section 2.7.7, removal of asbestos tile and adhesive was removed from 210 Portage in 1993.

5.8.2 Radon

The National Radon Database includes radon information from U.S. EPA/State Residential Radon Surveys conducted between 1986 and 1992. The database includes test results from 4 sites within the subject property zip code. The average value for radon level reported in this region was 2.525 pico curies per liter (pCi/l) of air for the first floor living area. This is lower than the U.S. EPA's recommended action level of 4 pCi/l.

Based on the U.S. EPA and California DHS surveys, it is unlikely that radon levels at the site exceed the U.S. EPA's action level.

5.8.3 Solid Waste

Solid wastes generated at the subject property are limited to non-hazardous solid office wastes. Wastes are collected in collection bins which are picked up by GreenWaste for offsite disposal. No concerns were identified with solid waste storage at the subject property.

5.8.4 Lead in Paint

The Consumer Products Safety Commission limited lead content in residential paint to 0.06 percent (600 parts per million) in 1978. The use of paint containing greater than 0.06 percent lead was also prohibited in areas where consumers have direct access to painted surfaces. Based on the pre-1950 construction date of the El Camino Center and Ash Street buildings, lead-containing paint may be present in these buildings. Lead-based paint is not considered an environmental concern at the Comcast building (constructed in 1986) or the Smythe European building at 3250 Park Boulevard (constructed in 2003).

5.8.5 Mold

Molds are simple, microscopic organisms, which can often be seen in the form of discoloration, frequently green, gray, brown, or black. Molds grow on virtually any organic substance, as long as moisture and oxygen are present. Mold spores primarily cause health problems through the inhalation of mold spores or the toxins they emit when they are present in large numbers. This can occur primarily when there is active mold growth within places where people live or work.

As discussed in Section 2.7.8, the property owners reported that mold has not been a concern at the subject property. No mold was observed during the site inspection.

5.8.6 Vapor Intrusion

As discussed above in Section 5.0, there is currently no reported use or storage of volatile organic compounds (VOCs) at the subject property. TCE was historically used by the former tenant Mercer Processing at 230 Portage Avenue, but TCE-contaminated soil was removed in 2002, and no impact to groundwater was identified (see Section 3.5). A regional VOC plume is present in the subject property vicinity, and VOCs have been detected in groundwater monitoring wells on the subject property which presents the potential for vapor intrusion to be a concern at the subject property. However, a soil gas study for VOCs was performed north of the subject in an area of the regional plume where concentrations are higher than those detected at the subject property was performed in 2008, and no concerns were identified regarding vapor intrusion (see Section 4.2.2).

6.0 FINDINGS AND CONCLUSIONS

6.1 Summary of Findings

The subject property has the addresses of 3201 and 3225 Ash Street, 200 – 382 Portage Avenue (referred to as El Camino Center), 270 Lambert Avenue, and 3250 Park Boulevard in the City of Palo Alto, Santa Clara County, California. The subject property, which comprises approximately 15.48 acres, contains four buildings, an access road, and associated paved parking and landscaped areas. Matadero Creek, under an easement from Santa Clara Valley Water District, traverses the eastern portion of the site. The site is located in a primarily commercial area. The site is bounded to the northeast by Park Boulevard and a commercial building, to the southeast by commercial buildings, to the southwest by Ash Street, El Camino Real and commercial buildings, and to the northwest by residences.

PES's historical research indicates that the subject property main and office buildings were constructed prior to the 1950s (likely in the 1930s to 1940s), the building at 270 Lambert was constructed in 1986, and the 3250 Park Boulevard building was constructed in 2003. A railroad spur and line were present on the west side of the main building until the 1980s. Historical site uses and tenants have included warehouse, a bearing manufacturer, a foundry (buildings no longer present), a food processor, a paper container manufacturer, a display manufacturer, a market, auto/truck maintenance, and offices. Historical maps indicate the potential presence of one or two USTs remaining at the subject property.

The bearing manufacturer, Dura-Bond, originally maintained a sludge pond associated with a wastewater treatment system, and had gasoline, diesel, Stoddard solvent and waste oil USTs, in addition to using other hazardous materials in the facility, such as lubricant oils, acids, and metals. During the 1980s, the wastewater treatment system was closed, and the USTs were

removed from the facility. Soil was excavated from beneath the sludge pond and USTs, but it did not appear that confirmation samples were collected from all areas of the excavations. Groundwater samples were collected from three to four monitoring wells installed as part of the removal activities, and were initially found to contain elevated levels of TPHg, TPHd and lead. After four years of groundwater monitoring, contaminant levels were below detectable limits. Regulatory case closure for the USTs was issued in 1998. During closure of the facility in 1989, soil sampling indicated the presence of elevated concentrations of lead and zinc within the facility. Soil excavation was performed, but confirmation sampling was not performed in all excavated areas. A subsequent soil investigation performed to investigate the completeness of the investigation identified the presence of elevated concentrations of lead and zinc remaining in soil at depths of up to 10 feet bgs. Tentative Site Cleanup Requirements were issued by the RWQCB for the Dura-Bond facility in 1990, but do not appear to have been filed.

Wastewater containing oil and grease was discharged from the Say Ray facility adjacent to the subject property office, and allowed to run across the subject property to Matadero Creek. A soil investigation and subsequent soil excavation was performed in the vicinity of Matadero Creek. The investigation, which was performed at the request of SCVWD, appeared to be limited to the Matadero Creek area.

During a 1992 investigation of the former SP right-of-way, soil samples were collected and composited to evaluate soil quality. Low levels of TCE detected immediately above the groundwater table were concluded to be associated with a known offsite source of contamination. No significant concerns were identified.

In 1997, an investigation, abandonment and closure of a subsurface vault encountered beneath the main building was performed. More than 8,000 gallons of a liquid with high concentrations of motor oil was removed from the vault, and approximately 282 tons of soil and concrete debris were removed and disposed offsite. With PAFD approval, the vault was abandoned in place by backfilling with clean soil.

In 2002, soil contaminated with TCE was removed from the former Mercer Processing facility at 230 Portage Avenue. A TCE cleanup goal of 0.2 mg/kg (below current residential RWQCB cleanup standards) was used in excavating approximately 285 cubic yards of soil from depths up to 20.5 feet below grade. Regulatory case closure was issued in 2002.

The subject property is currently used for offices, retail sales, an electronic hub, research, and auto repair and maintenance activities. Hazardous material use is limited to auto maintenance chemicals, laboratory chemicals, and teak sealer. No significant concerns regarding hazardous material use at the site was identified. There appears to be a potential for wastewater from teak cleaning activities at Teak Patio (230 Portage Avenue) to enter the storm sewer in the parking area.

Historical subject property tenants are listed on several environmental databases as a result of the remedial activities discussed above. Dura-Bond is listed on the SLIC database as an open, but inactive, site. Current tenants listed on regulatory databases are limited to Park Avenue Motors (Smythe European) listed as a RCRA small quantity generator, and WSJ Properties for offsite disposal of oil-containing waste apparently associated with the Mercer facility remediation discussed above.

Groundwater contamination associated with the offsite Hewlett Packard and Varian facilities has been identified at the subject property, and the facilities are listed on several environmental databases. A VOC plume associated with the facilities has been under investigation since 1981. Four active monitoring wells associated with the investigations are present on the subject property. In one well, TCE concentrations have ranged from 32 to 47 μg/L since 2005. A soil gas investigation performed in 2008 in a residential area northwest of the subject property indicated that none of the shallow soil gas samples contained chlorinated VOC concentrations above the corresponding RWQCB residential ESLs for potential migration of VOCs from soil gas to indoor air.

Say Ray Auto is listed on the Historical UST database with a waste oil UST. Regulatory agency records did not include any information regarding the potential removal of this UST. This facility is located potentially upgradient of the subject property, and has the potential to affect groundwater beneath the subject property.

6.2 Conclusions

PES has performed a *Phase I Environmental Site Assessment,* in conformance with the scope and limitations of ASTM Practice E 1527, of the El Camino Center and associated properties in Palo Alto, California. Any exceptions to, or deletions from, this practice are described in Section 1.3 of this report. This assessment revealed the following historical recognized environmental conditions (RECs) in connection with the property:

- Contaminated soil was excavated from the site in the 1980s during removal of a wastewater treatment system and seven USTs. Groundwater monitoring was performed until contaminant concentrations were below detectable limits. Regulatory case closure was issued in 1998;

- Contaminated soil was excavated from near Matadero Creek in 1990 as a result of a wastewater discharge from the Say Ray facility;

- A subsurface vault was abandoned in place beneath the main building in 1998 following removal of vault contents and excavation of contaminated soil. Regulatory approval was issued by PAFD; and

- In 2002, soil contaminated with TCE was removed from the former Mercer Processing facility at 230 Portage Avenue. Regulatory case closure was issued in 2002.

This assessment revealed the following recognized environmental conditions (RECs) in connection with the property:

- Historical maps show the former presence of historical USTs at the subject property, although no information concerning the potential removal of these USTs was identified. Soil contamination was encountered in this area during 1992 well installation activities performed as part of an offsite investigation;

- Elevated concentrations of lead and zinc remain in soil beneath the former Dura-Bond facility following 1989 excavation activities; and

- Groundwater contaminated with VOCs associated with the HP/Varian plume has been identified in groundwater monitoring wells present on the subject property.

PES makes the following noteworthy observations in connection with the subject property:

- It does not appear that adequate soil confirmation sampling was performed at the Dura-Bond facility during the wastewater treatment system closure and UST removals performed in the 1980s;

- It does not appear that a complete investigation of the subject property was performed during the 1990 investigation of the Say Ray facility wastewater discharge;

- During the 1990 investigation of the former SP right-of-way, no near-surface samples were collected; and

- Based on the age of the main and office buildings, the potential exists that asbestos-containing materials and lead-based paint may be present.

7.0 DATA GAPS

The following data gaps that may have affected our ability to identify RECs associated with the subject property were identified during the performance of this Phase I ESA are listed below:

- No information concerning activities and hazardous material use and storage practices at the foundry formerly present on the site was identified;

- No information concerning the removal of former USTs present on the east side of the subject property associated with historical Safeway Stores operations was identified; and

- A soil verification investigation was performed at the former Dura-Bond facility in 1990. Incomplete data was available regarding the investigation. The presence of TCE was reportedly detected in soil, but no data were available.

8.0 ADDITIONAL SERVICES

No additional services were performed as part of this Phase I ESA.

9.0 ENVIRONMENTAL PROFESSIONAL STATEMENT

We declare that to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in §312.10 of 40 CFR 312.

We have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed the all appropriate inquires in conformance with the standards and practices set forth in 40 CFR Part 312.

Resumes of the Environmental Professionals signing this report are presented in Appendix H.

EDR Aerial Photo Decade Package

Environmental Data Resources, Inc. (EDR) Aerial Photo Decade Package is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's professional researchers provide digitally reproduced historical aerial photographs, and when available, provide one photo per decade.

When delivered electronically by EDR, the aerial photo images included with this report are for ONE TIME USE ONLY. Further reproduction of these aerial photo images is prohibited without permission from EDR. For more information contact your EDR Account Executive.

Thank you for your business.
Please contact EDR at 1-800-352-0050
with any questions or comments.

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1922 through 2006. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RESEARCH SUMMARY

The following research sources were consulted in the preparation of this report. An "X" indicates where information was identified in the source and provided in this report.
