Regional Water Quality Control Board
Room 6040
1111 Jackson Street
Oakland, California 94617

Attention: Ms. Jennifer Haley

Gentlemen:

This letter report summarizes the results of our analyses of water samples from three ground-water monitoring wells at the Dura-Bond Bearing Company located at 3201 Ash Street, Palo Alto, California. The purpose of this investigation was to continue monitoring the water quality at the Dura-Bond facility, and to report any significant changes.

BACKGROUND

In September 1984, Dura-Bond reported to the California Regional Water Quality Control Board (RWQCB) a gasoline and diesel spill that had come from two 500 gallon underground storage tanks. The gasoline and a third tank used to store Stoddard solvent were used by Dura-Bond up to the time that the tanks were removed. The diesel fuel tank belonged to the property owner. The history of use for this tank is not known. Results of soil and ground-water analyses at the time the tanks were removed indicated that a spill of gasoline and diesel fuel had occurred. It was decided shortly after the tanks had been removed, that as a precaution, the soil beneath the tanks would be excavated to ground water and that a ground-water monitoring well should be installed in the north corner of the excavation (Figure 1). The three monitoring wells were sampled on June 4, 1985 and the ground water from the wells was tested for lead, gasoline, Stoddard solvent, diesel, Trichloroethylene (TCE), 1,1,1-Trichloroethane (TCA), and Tetrachloroethylene (PCE).

Testing of the ground-water samples for gasoline, Stoddard solvent, and lead were done because they are used by Dura-Bond. Testing for diesel was done to monitor changes in water quality from the spill of diesel from the landlord's tank, and the tests for solvents were done to monitor changes in water quality due to what is believed to be migration of contaminants from an offsite source or sources.

Headquarters:
90 Archer Street, San Jose, California 95112, (408) 275-1444
Branch office: 445 W. Garfield Avenue, Glendale, California 91204

SAMPLING PROCEDURE

The depth of water was measured in each of the wells and the water was checked for floating petroleum product. A minimum of one casing volume of water was purged from each well using a low discharge (0.5 gpm) submersible pump. The samples were collected from the pump's Teflon discharge tube and placed in EPA approved containers.

RESULTS

The results of the ground-water testing indicate that the highest concentration of gasoline is present in the former tank excavation and that the level of gasoline in monitoring Well DM-1 has decreased significantly since the tanks were removed. Ground water from Well E-1 was not tested for gasoline when the tanks were removed, however, the current concentration is similar to that found in Well DM-1.

All three monitoring wells were tested for Stoddard solvent. Stoddard solvent was present in Well E-2, and not detected in Well DM-1 and E-1.

Diesel was not detected in any of the monitoring wells, however, the detection limit for diesel was significantly higher in Well E-2 because of the relatively high concentration of gasoline in the well.

The concentration of lead found in Well DM-1 is considerably higher than the EPA Primary Drinking Water Standards, but much lower than lead levels found in soils tested from below the removed underground storage tanks. The concentration of lead in Well E-1 is at the EPA Primary Drinking Water Standard of 0.05 ppm and water from Well E-2 is below detection limits. The source of the lead in the two monitoring wells away from the tank excavation is not clear at this time. The high concentrations of lead found in the soils beneath the removed tanks may be the result of lead from leaded gasoline, from naturally occurring lead in the soil, or from past activities of Dura-Bond.

Solvents were tested because TCE has been detected in early 1984. Dura-Bond does not use this or any other related solvents in any of its manufacturing processes. Analyses for TCE, TCA, and PCE were done on all of the monitoring wells. These solvents are thought to be migrating on site from an offsite source or sources. Currently, the level of TCE is rising in Well DM-1 and has decreased in Well E-1. TCA, which was not detected in previous tests, has been detected in all three monitoring wells suggesting that contaminated water from an offsite source is migrating through the Dura-Bond site. The level of PCE has decreased in Well DM-1 and not changed in Well E-1.

CONCLUSIONS

Based on the evidence gathered to date, the major contaminant problem at the Dura-Bond site is the presence of solvents typically used in the electronics industry. The gasoline and diesel spill reported in

September 1984 are currently confined to the backfill of the tank excavation. The concentrations of gasoline, Stoddard solvent, and diesel should be monitored on a regular basis to detect any significant changes in water quality.

Following are the results of our analyses for the presence of certain hydrocarbons in three samples of water received on June 4, 1985.

For the analysis of volatile fuel hydrocarbons, the samples were examined using the purge and trap technique and a gas chromatograph equipped with a flame ionization detector as well as a photoionization detector and a Carbopack B/3% SP-1500 column.

For the analysis of Stoddard solvent, the samples were examined using the purge and trap technique. Final detection was by gas chromatography using a flame ionization detector and a 5% AT-1200 + 1.75% Bentone 34/Chromosorb W column.

For the analysis of fuel hydrocarbons in the diesel range, the samples were partitioned with distilled hexane. Final detection was by gas chromatography using a flame ionization detector and a 10m SPB-1/ WCOT column.

= none detected

Dear Mr. Ko:

On July 12 we met to discuss the status of the groundwater contamination investigation going on at your site.

A history of the site beginning with Dura Bond's occupation of the site in 1960 was reviewed. The first monitoring well, DM-1, was installed in the approximate downgradient direction of groundwater flow from your underground waste storage tank pursuant to the Regional Board's underground tank leak detection program.

In 1983 you discovered that the filler pipe to this tank was not sealed properly, and some liquid had spilled into the sand beneath the overlaying cement layer. EMCON was contracted to construct well E-1 to determine if material had reached the ground water. None of the compounds listed as being used at the site were found in the water samples; however, other organic chemicals, subsequently identified as TCE and DCA, were found.

In the summer of 1984, 3 underground storage tanks containing gasoline, diesel fuel and Stoddard solvent were removed. At this time a casing was installed in the excavation approximately 14 feet below the ground surface to the top of the groundwater table. This unslotted well is referred to as E-2.

The most recent groundwater samples were taken in June 1985. Hydrocarbons characteristic of gasoline were found in the sample from E-2. Detectable levels of lead were found in the samples from DM-1 and E-1, and TCE and TCA were detected in all three samples at the 100 to 500 ppb level.

It is possible that the chlorinated hydrocarbons originated off-site and have migrated onto your property; however, unless further

investigation proves otherwise, Dura Bond is still considered a potential source. In order to determine contaminant levels in surrounding groundwater, Stanford Cleaners, a neighboring site, has been requested to run a scan for purgeable organic chemicals in a water sample from their well.

At this time I request the following for your site:

1. A proposal and time schedule for evaluating at least three alternatives, for clean-up of the remaining hydrocarbon compounds detected in the groundwater below the excavated area. The proposal will include the methods that will be used to evaluate different cleanup alternatives. A copy of the "Regional Board Staff Guidelines With Respect to Establishing A Procedure to Identify Water Quality Objectives For Hazardous Material Site Clean-up" is enclosed for your use in developing your proposal alternatives.

2. The wells should be resampled and analyzed for lead with both filtered and unfiltered samples tested to determine the amount of lead held on suspended sediment. Remedial action alternatives should be outlined for this contamination also.

3. As discussed in our meeting, to determine whether the Dura Bond site is a source of the chlorinated organics detected, the following information is requested.
   a) Soil borings in the vicinity of the waste storage tank analyzed for the compounds detected in the groundwater.
   b) A monitoring well located at the upgradient property boundary analyzed for the compounds detected in the groundwater.

Your proposal for Phase II of this investigation should be provided in about 30 days at which time another meeting may be arranged. If you have any questions you may call me at (415) 464-1247.

Sincerely,

Jennifer L. Haley
Water Resources Engineer

FACILITY AND MANUFACTURING PROCESS

Dura-Bond Bearing Company has been manufacturing camshaft bearings at present location since 1958. The manufacturing process uses caustic and acidic material, machine coolants, lube oil, hydraulic oil, solvent, etc. (see attached list of material). Cleaning process generated waste water which contains iron, lead, zinc, cadmium, etc. Machining process generated hazardous waste, liquid and solid and also metal chips, shavings, etc.

In 1982, Dura-Bond installed one 5000-gal. underground tank for collection of hazardous waste.

Closure of old water treatment system has taken place in summer of 1982, following with installation of modern and compact water treatment system in September 1982.

At that time, there were two additional underground storage tank in use. One, 1000-gal. virgin solvent tank and one, 500-gal. unleaded gasoline tank. Both tanks were replaced with identical capacity but double-wall storage tanks in 1984. Above-ground storage facility included liquid hydrochloric acid and caustic soda tanks, lube oil, rust preventive oil, machine coolant concentrate, solid hazardous waste drums (17H), grease drums, etc.--see map for locations.

To comply with applicable regulations and minimize future liabilities, facility closure will address the following:

PHASE I - Underground storage tanks and chemical storage area

PHASE II - Manufacturing and warehouse area

PHASE III - Water treatment system area

PHASE I

1. Underground Storage Tank Removal

The tanks must be closed according with RWQCB Guidelines and City of Palo Alto Fire Department Hazardous Materials Storage Ordinance.

Procedure

a. Permit Application - Secure permit to remove tanks.
b. Remove all pumpable liquids from three tanks and dispose of according to EPA regulations.
c. Break off concrete slab and excavate tanks.

d. Transport to hazardous waste facility for cleaning, testing and certification for future use/or dispose of at permitted hazardous waste disposal site.

e. SOIL SAMPLING

After each tank is removed, EMCON will collect samples of native soil at the soil/backfill interface at the base of each tank excavation. The soil will be brought to the surface with a backhoe, approximately 3 inches of soil will be scraped away from the surface, and a clean stainless steel ring will be driven into the soil. The ring will be removed from the soil and the ends of the ring will then be covered with Teflon® tape and capped with plastic end caps. The capped ring will be put in a glass jar, placed on ice, and transported to a state-certified laboratory for analysis. Chain-of custody documentation will be maintained and submitted for all samples.

After tank piping and product lines are removed, one soil sample will be taken for every 20 feet of piping trench. Soil samples from the piping trenches will be collected in rings, capped, kept cool, and transported as described above.

ANALYTICAL METHODS

The attached table lists the number of soil samples for each tank, their respective analyses, and the laboratory that will perform the analysis.

See Table 1

f. Backfill, compaction and resurfacing upon approval from local agencies.
g. Closure reporting including soil snalysis and chain-of-custody documentation, any manifest used to document final disposition of tank contain's, tanks, piping, etc.--by EMCON Assoc.

2. Chemical Storage Area

Chemical storage facility appears to be in good condition and according to Dura-Bond and EMCON site inspection and knowledge of plant operation, no sampling of concrete/asphalt surface will be conducted.

Procedure
a. Inspection of manufacturing and warehouse area.
b. Steam clean and scrub surface.
c. Analyze final rinse and dispose according to hazardous waste disposal requirement if necessary.
d. Include analytical reports if necessary.

PHASE II Manufacturing and Warehouse Area and
PHASE III Water Treatment System

A. Sampling and Analysis Plan

To determine whether facility operations have impacted structure surfaces or underlying soil, wipe and soil samples will be collected and analyzed. Wipe samples will be collected by wiping selected surface areas within the facility. The analysis of these samples will determine if surfaces within certain areas need to be cleaned during facility closure. Soil samples will be collected beneath or adjacent to the bottoms of most pits and sumps. The analysis of these samples will determine whether soils excavation will be required during facility closure. Wipe and soil samples will be analyzed for hazardous materials used or generated in the areas from which they were collected. The following sections outline how wipe and soil sampling will be conducted and what analyses will be used.

Wipe Sampling

Wipe samples will be collected from four areas to determine whether particulates generated during machining operations have affected the facility structure (see Figure 2). These locations are:

- On the ceiling structure outside of and adjacent to the southeast corner of the facility (background sample)
- On top of the southeast office
- On a support beam in the ceiling structure near the middle office
- On a support beam in the ceiling structure in the machining area

Wipe samples will no be taken from the cleaning and lead babbitting rooms since they are clearly stained from facility operations.

Samples will be collected by wiping a measured surface area with a moistened Whatman 541 filter paper (or equivalent). The wipe samples will then be placed in a glass jar, sealed with a Teflon® lined lid, and sent with chain-of-custody documentation to a state-certified laboratory for analysis.

Soil Sampling

Seven soil samples will be collected from six locations at the facility to determine the effectiveness of pits and sumps in preventing the migration of chemicals to underlying soils. These locations (see Figure 2) are generally

as close to the sumps or pits as access allows. Whereever possible, liners will be removed, the integrity of the sumps or pits will be inspected, and sampling locations adjusted as necessary before a sample is obtained. One soil sample will be collected beneath the sump in the wastewater treatment area and five soil samples will be collected along side the bottom of the four sumps in the cleaning and babbitting rooms. A background soil sample will also be collected. No soil samples will be taken beneath the coolant sumps in the manufacturing area because they are small (1 foot x 3 feet x 1/2 foot), clean, and without cracks or chips.

Soil samples will be collected using a small portable drill rig or hand augering equipment after coring through the concrete at the surface. In the wastewater treatment area, the sample will be collected at the native soil interface below the invert of the sump. In the cleaning and babbitting rooms, soil samples will be collected along side the pits between 12 and 18 inches below the elevation of the pit invert. In addition, a background sample will be collected from a sampling location in the babbitting room, at an approximate depth of 6 to 12 inches below the concrete at the surface.

Soil samples for inorganic analysis (metals and pH) will be collected from auger returns and placed in a 250 milliliter glass jar and sealed with a Teflon® lined screw-top lid. Samples for organic analysis (petroleum hydrocarbons) will be collected with a drive sampler equipped with stainless steel liners. The sampler will be driven into undisturbed soil beyond the tip of the auger. The liners will be removed, and Teflon® tape will be placed over the ends. The tape will be held in place with polypropylene caps. The samples will be placed in a Mason jar and transported on ice with chain-of-custody documentation to a state-certified laboratory for analysis.

ANALYSES

Wipe and soil samples will be generally analyzed for hazardous materials used or generated in the areas from which they were collected. All wipe samples will be analyzed for lead because it is the predominant hazardous metal machined at the site. Similarly, all soil samples will be analyzed for lead and high boiling point hydrocarbons (oils). Three of the soil samples will also be analyzed for pH and hazardous metals commonly associated with babbitting and machining operations (antimony, cadmium, chromium, copper, nickel, and zinc). The three samples to be analyzed will be (1) the wastewater treatment area sample, (2) the cleaning room sample, and (3) background sample from the babbitting room. The first two samples are from the areas with the highest potential for hazardous materials migrating into underlying soil, i.e., where process waters were stored or collected.

The attached Table 2 presents the number of samples that will be analyzed for

each parameter, the analytical methods that will be used, and the laboratory that will perform the analyses.

B. PHASE II and PHASE III WORK CLOSURE PLAN

1. Cleaning and Babbitting Room

- Dismantle Babbitt Machine and Prebore Machine
- Clean and prepare for transport
- Remove Kolene tank, rinse tank and acid tank. Inspect, clean and dispose of according to hazardous material regulations, if necessary. Transport to Dura-Bond for reuse.
- Disassemble, plug all natural gas pipeline, close gas valves and disconnect service.
- Drain, clean and transport wooden tank to Dura-Bond.
- Dismantle, clean and dispose babbitt room exhause fans.
- Steam clean walls, floor and pits in cleaning and babbitt room.
- Analyze and discharge according to local requirement/or dispose as hazardous waste.
- Implement sampling and analysis plan - babbitt room including core drilling.
- Backfill, and resurface as necessary.

2. Manufacturing Area and Warehouse Area

- Sampling and analysis plan.
- Implement wipe sample and analyze.
- Close concrete (epoxy coated) sumps.
- Clean floor in manufacturing area using mechanical scrubber, hot water blaster, and/or sandblasting.
- Dispose of sand and metal chips/or recycle.
- Remove 1/2 to 1" of surface using mechanical grinder if necessary and resurface.
- Alternative: Upon approval from local agency and or building owner, apply top coating.

- Leave floor as is upon approval from local agency and/or building owner.

WASTE TREATMENT FACILITY CLOSURE PLAN FOR:

DURA-BOND BEARING COMPANY

RE: Title 40 C.F.R., Part 264, Sub-part G.

S264.112.a.1.: Description of Facility Closure

A. When to close the facility:

1. When the Babbitting and Kolene operation are stopped permanently and no corrosive waste is generated anymore.

B. How to close the facility:

1. Close down the Babbitting and Kolene Operation.
2. Treat all chemicals and corrosive waste through the treatment system and then run fresh water through the treatment system until the fluid in the system is neutral.
3. Rinse the treatment system and pump all the sludges into the sludge thickening compartment.
4. De-water the sludge with the filter press until the sludge thickening compartment is rinsed and empty.

11-16 →

5. Turn the treatment system off by switching off the main circuit breakers.
6. Turn fused disconnect switch off and remove fuses.
7. Disconnect power line to the treatment system.
8. Empty the filter press and rinse and clean the filter press.
9. Discard the filter press cloth and filter press cake in solid waste barrels for disposal to a Class I disposal site.
10. Disconnect and remove all electrical panels, pumps, agitators, pH sensors, level controls, piping, and valves. Dura-Bond

WASTE TREATMENT FACILITY CLOSURE PLAN (continued)

11. Wash and rinse all pipes, valves, pumps, agitators, and all other components.

12. Rinse and clean water treatment area.

13. Rinse and clean wash down sump and pump the sump out into the liquid waste tank, for disposal to a Class I T.S.D.F.

14. All components for re-use must be thoroughly washed, cleaned and then tested for pH.

15. All contaminated material or components should be cut-up and strapped on pallets and covered with plastic or when applicable, kept in D.O.T. approved drums.

16. Call hazardous waste hauler to remove solid and liquid waste to a Class I disposal site. (See Hazardous Waste Shipping Procedures.)

S264.112.a.2.: Estimated Max. Waste Inventory

A. Rinse and wash down liquid - 4,000 gallons.

B. Solid Waste:

1. Filter Press Cake 5 drums

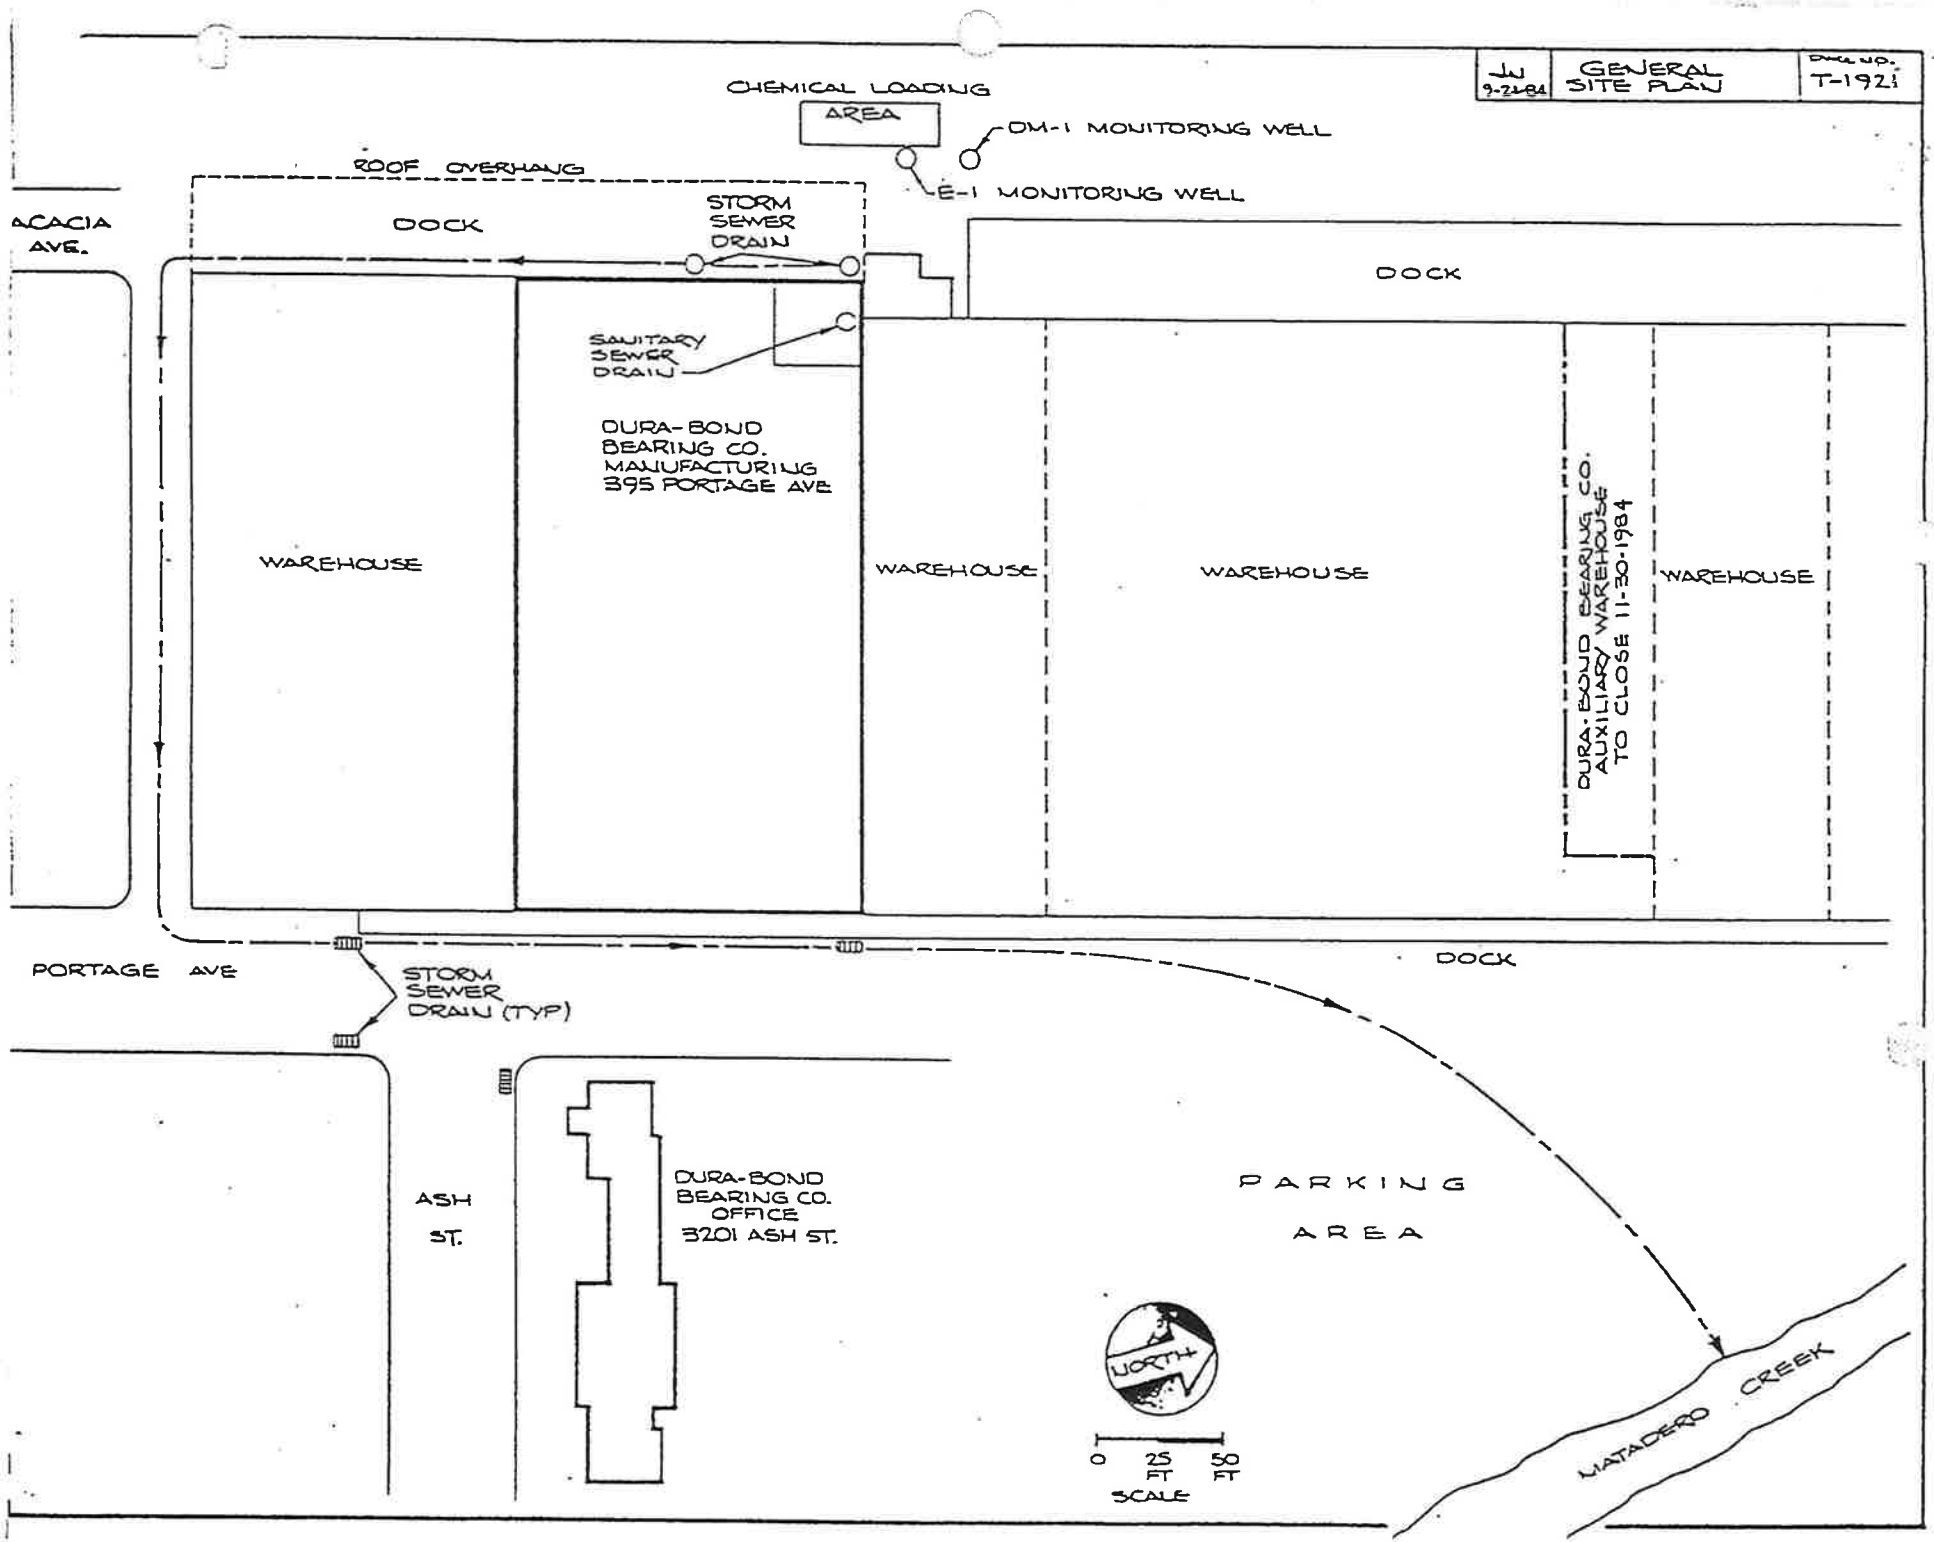
2. Discarded Material 10 cu. yards

FACILITY CLOSURE COST FOR:

DURA-BOND BEARING COMPANY

RE: TITLE 40 C.F.R., Part 264, Sub-part H.

S264.142: Cost Estimate, 1988



A.	Disposal of Waste Inventory	
	1. Liquid Waste	
	4,000 gallons: $1.00 (.70 + tax)/Gallon	$ 4,000.00
	2. Filter Press Cake	
	1.5 cu.yd.: $355/cu. yd.	532.00
	3. Contaminated Material	
	10 cu. yards: $355/cu. yd.	3,550.00
B.	Removing Structures	
	1. Roof Structure	2,000.00
	2. Removing concrete floor and back filling	4,000.00
C.	Laboratory Analysis	2,000.00
D.	Labor: 100 man hours	2,000.00
E.	Contingencies	2,000.00
		$ 20,000.00

Re: Closure of Wastewater Treatment and Babbitting Areas

Dear Mr. Pavkovic:

This letter report presents EMCON Associates' (EMCON) documentation of closure activities performed in the wastewater treatment and babbitting areas at the former Dura-Bond Bearing Company (Dura-Bond) manufacturing facility, 360 Portage Avenue, Palo Alto, California (see Figure 1). This work satisfies the closure requirements for the facility as described in the closure plan approved by the Palo Alto Fire Department, and complies with specific closure recommendations presented in a September 20, 1989, EMCON letter.

Dura-Bond retained Miholovich Concrete Company to implement EMCON's recommendations for closure. These closure activities consisted of excavating impacted soil in the wastewater treatment and babbitting areas and backfilling the excavations. Hauling contractors were retained to dispose of the excavated soil. EMCON's consulting services consisted of collecting soil samples from the excavations, coordinating laboratory analyses, and observing and documenting closure activities.

ENV PJ3760108.DOC

BACKGROUND

Dura-Bond used the babbitting and wastewater treatment areas in its Palo Alto facility from 1960 to August 31, 1989. The manufacturing process consisted of babbitting steel pipes; wastewater was generated during this process. The wastewater treatment and babbitting areas, cover approximately 2,400 square feet in the southwest corner of the former Dura-Bond facility.

Closure recommendations were made based on the findings of a sampling and analysis program. The results of the investigation (letter report, EMCON September 20, 1989) indicated that metal-impacted soils were present in the former babbitting and wastewater treatment areas. The recommendations for closure included excavating the impacted soils until cleanup criteria were met, and backfilling the excavations with clean fill.

INITIAL SAMPLING AND ANALYSIS

During the previously mentioned sampling and analysis program, soil samples were collected from 26 locations within the wastewater treatment and babbitting areas and analyzed for selected metals and hydrocarbons (see Figure 2). The results of the analyses are summarized as follows:

- high concentrations of lead and zinc and pH extremes were found beneath the pits in the babbitting area except where soil had previously been removed for pit repair
- high concentrations of lead and zinc in shallow soil in the babbitting area were associated with areas of concrete damage
- high concentrations of lead in soil beneath the wastewater treatment area appeared limited to a 13-foot by 3-foot strip along one warehouse wall.

CLOSURE CRITERIA AND RECOMMENDATIONS

In the September 20, 1989, EMCON letter report, site closure criteria to minimize the future threat to human health and the environment were established in conjunction with closure recommendations. We recommended excavating the soil impacted with concentrations of zinc and lead exceeding the Total Threshold

Limit Concentration (TTLC) or Soluble Threshold Limit Concentration (STLC) to minimize the potential for impacting the ground water. We also recommended a cleanup criteria of 1/10 of the TTLCs for soil within 2 feet of the ground surface to limit direct contact and uptake by any future edible plants. The TTLCs for lead and zinc are 1,000 milligrams per kilogram (mg/kg) and 5,000 mg/kg respectively; their STLCs are 5 milligrams per liter (mg/l) and 250 mg/l.

The following areas were recommended to be excavated to minimum depths or until closure criteria were met, whichever depth was greater:

- the soils underneath the pits in the babbitting area, to a minimum depth of 3 feet below the bottom of each pit
- the surface soils around and underneath the wastewater sump in the babbitting area, to a depth of 3 feet below the sump
- the surface soils underneath old, damaged concrete areas, to a minimum depth of 6 inches.
- the soils in the wastewater treatment area (about 3 feet wide and 13 feet long), to a depth of approximately 4 feet.

CLOSURE ACTIVITIES

To gain access to the impacted soils in the former babbitting area, the floor slab and concrete pit linings were demolished. Two of the interior warehouse walls were also dismantled (see Figure 3) before excavation could proceed. Arbitrary excavation numbers have been assigned for clarity. The excavation areas referenced here are the babbitting pits (B-1 and B-2), the sump in the cleaning room (C-1), and the wastewater sump (WW-1). The area east of WW-1 was also excavated when potential contamination was noted in the field; this excavation is referred to as WW-2. Excavation in other areas (not designated by number) included the entire babbitting floor area and a small area in the wastewater treatment room.

Excavation of the impacted soils proceeded in stages. Soil samples were collected ahead of excavation, analyzed, and compared to the cleanup criteria. The subsurface soils were continually excavated to the minimum depths or until

the cleanup criteria were met, whichever depth was greater. The excavation limits are shown on Figure 3.

Verification Sampling and Analysis

Soil samples were collected from the base and sidewalls of the excavations using a backhoe, hand packed into glass jars, sealed, placed on ice, and transported to a state-certified laboratory for analysis. Discrete samples (S designation) were obtained from the base of the excavations and tested, and composite samples (SC designation) were obtained from the sidewalls of the excavations and analyzed. Two discrete samples (Sub Exc A and S26) and one ground-water sample (Exc 1) were obtained, by drilling with a hollow-stem auger drilling rig, from beneath B-2 after the excavation had been backfilled. Each soil sample was analyzed for total lead and zinc using either U.S. Environmental Protection Agency (EPA) atomic adsorption or Inductively Coupled Argon Plasma (ICAP) techniques. The water sample was tested for lead and zinc using EPA Methods 238.1 and 289.1, respectively. The soil test results are summarized in Table 1 and the certified analytical reports (CARs) are presented in Appendix A.

Babbitting Excavation B-1

Soil beneath the babbitting pit was excavated 3 feet below the bottom of the pit and sampled (S1, S2, and SC1), and the samples were analyzed. The results indicated that the cleanup criteria were met in the south half of B-1 for the sidewalls and the base at a depth of 15 feet. The south half of B-1 was excavated to 17 feet before it was backfilled. Additional soil was excavated and samples were collected (S14 and S18) from the north half of B-1. Analysis results indicated cleanup criteria were met at a depth of 12.5 feet. The north half of B-1 was excavated to a depth of 14 feet before it was backfilled.

Babbitting Excavation B-2

Soil beneath the babbitting pit was excavated to 3 feet below the bottom of the pit and sampled (S8, S9, S10, and SC2), and the samples were analyzed. The results for the sidewall sample met the cleanup criteria, but the results from the sample taken at a depth of 11 feet indicated that the cleanup criteria had not

been met. The excavation was continued to 14 feet and sampled (S17) before the excavation was completed to a depth of 16.5 feet. Two confirmation samples (Sub Exc A and S26) were taken at depths of 17.0 feet and 17.5 feet by drilling a boring after the excavation had been backfilled. Analysis of these samples indicated that the cleanup criteria were met. A sample (Exc 1) of ground water (encountered at a depth of 18.5 feet) was also collected from the boring and analyzed. Very low levels of lead (0.05 ppm) and zinc (3.1 ppm) were detected in the water sample.

Cleaning Room Excavation C-1

Soil beneath the sump in the cleaning room was excavated 3 feet below the bottom of the sump and sampled (S6 and SC3), and the samples were analyzed. The cleanup criteria were met for the sample obtained from the sidewall, but the criteria were not met for the sample obtained from the base of the excavation at 8 feet. The excavation was continued and analyses were performed on samples (S16 and S19) obtained at greater depths. The cleanup criteria were met at a depth of 10.5 feet and the excavation was completed to a depth of 14 feet before it was backfilled.

Wastewater Excavations WW-1 and WW-2

Soil samples (S3, S4, S5, and S7) collected from excavations WW-1 and WW-2 were analyzed and compared to the cleanup criteria. The soil sample obtained from WW-1 (4 feet deep) and WW-2 (15 feet deep) met the cleanup criteria. WW-1 and WW-2 were over-excavated to depths of 8 feet and 16 feet, respectively, before they were backfilled.

Babbitting Floor Area Excavation

Soil samples (S11, S12, and S13) obtained from the surficial 6 inches of the babbitting area were analyzed and met the cleanup criteria; however, 1 foot of soil was removed from the entire babbitting area before a new reinforced concrete floor was constructed.

Wastewater Treatment Area Excavation

A strip of soil (3.5 feet by 10 feet) in the wastewater treatment area was excavated to a depth of 3 feet, and a sample (W1) was collected and analyzed. The analyses indicated that the cleanup criteria were not met; the excavation was continued to a depth of 8 feet and another sample (S25) was collected and analyzed. The cleanup criteria were met for this sample and the excavation was backfilled.

Excavation Backfilling

The completed excavations were backfilled with clean pea gravel (washed free of fines) and capped with concrete. The gravel backfill was "rained" into the excavations to within 5 feet of the finished grades. The gravel was then placed in 2-foot lifts and compacted in place using vibration. The babbitting area's 6-inch-thick reinforced concrete floor slab was replaced when closure activities were completed. A 6-inch-thick reinforced concrete slab was also constructed in the wastewater treatment area.

Disposal of Excavated Soils

The soils excavated from the wastewater treatment and babbitting areas were stockpiled on site, tested, and properly disposed of. Because excavation proceeded in stages, two separate soil stockpiles were generated. One composite soil sample (comprising 4 discrete samples) from each stockpile was analyzed for each 50 cubic yards of soil to be disposed of. The analytical results are presented in Table 1. Analysis of the composited soil sample from the first stockpile (SP1-4), which was comprised primarily of surface material from the babbitting area, indicated that the concentrations were less than the TTLCs; the soil was disposed of at a Class III landfill. Analyses from the second soil stockpile (S21-24) detected concentrations exceeding the TTLCs; the soil was disposed of at a hazardous waste landfill. The CARs are in Appendix A and disposal manifests for the excavated soils are presented in Appendix B.

CONCLUSIONS

Based on the results of our observations and testing, we conclude that the wastewater treatment and babbitting areas of the Dura-Bond facility have been closed consistant with the approved closure plan and recommendations presented in the September 20, 1989, EMCON letter.

Please call if you have any questions.

Very truly yours,

EMCON Associates

Martha J. Watson
Senior Project Engineer

Russell J. Scharlin
Executive Manager

RECEIVED, subject to the classifications and lawfully filed tariffs in effect on the date of issue of this Bill of Lading, the property described above in apparent good order, except as noted (contents and condition of contents of packages unknown), marked, consigned, and destined as indicated above which said carrier (the word carrier being understood throughout this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to its usual place of delivery at said destination, if on its route; otherwise to deliver to another carrier on the route to said destination. It is mutually agreed as to each carrier of all or any of, said property over all or any portion of said route to destination and as to each party at any time interested in all or any said property, that every service to be performed hereunder shall be subject to all the bill of lading terms and conditions in the governing classification on the date of shipment.
Shipper hereby certifies that he is familiar with all the bill of lading terms and conditions in the governing classification and the said terms and conditions are hereby agreed to by the shipper and accepted for himself and his assigns.

This is to certify that the above-named materials are properly classified, described, packaged, marked and labeled and are in proper condition for transportation according to the applicable regulations of the Department of Transportation.

RECEIVED, subject to the classifications and lawfully filed tariffs in effect on the date of issue of this Bill of Lading, the property described above in apparent good order, except as noted (contents and condition of contents of packages unknown), marked, consigned, and destined as indicated above which said carrier (the word carrier being understood throughout this contract as meaning any person or corporation in possession of the property under the contract) agrees to carry to its usual place of delivery at said destination, if on its route, otherwise to deliver to another carrier on the route to said destination. It is mutually agreed as to each carrier of all or any of, said property over all or any portion of said route to destination and as to each party at any time interested in all or any said property, that every service to be performed hereunder shall be subject to all the bill of lading terms and conditions in the governing classification on the date of shipment.
Shipper hereby certifies that he is familiar with all the bill of lading terms and conditions in the governing classification and the said terms and conditions are hereby agreed to by the shipper and accepted for himself and his assigns.

This is to certify that the above-named materials are property classified, described, packaged, marked and labeled and are in proper condition for transportation according to the applicable regulations of the Department of Transportation

January 19, 1999

Mr. Charles J. Barnett
Dura Bond Bearing Company
P.O. Box 2008
Carson City, NV 89702

El Camino Center
3200 Park Boulevard
Palo Alto, CA 94306

Ladies and Gentlemen:

Subject: Fuel Leak Site Case Closure—Dura Bond Bearing Company, 3201 Ash Street, Palo Alto, CA 94306; Case No. 14-216

This letter transmits the enclosed underground storage tank (UST) case closure letter in accordance with Chapter 6.75 (Article 4, Section 25299.37[h]). The State Water Resources Control Board adopted this letter on February 20, 1997. As of March 1, 1997, the Santa Clara Valley Water District is required to use this case closure letter for all UST leak sites. We are also transmitting to you the enclosed case closure summary. These documents confirm the completion of the investigation and cleanup of the reported release at the subject site. The subject fuel leak case is closed.

SITE INVESTIGATION AND CLEANUP SUMMARY

Please be advised that the following conditions exist at the site:

- Residual petroleum hydrocarbons exist in soil (10 parts per million [ppm] Total Petroleum Hydrocarbons as Diesel (TPHD), 8 ppm Total Petroleum Hydrocarbons as Gasoline, 26 ppm Total Petroleum Hydrocarbons [TPH] Stoddard Solvent, 0.54 ppm Benzene, 0.7 ppm Toluene, and 20 ppm Oil and Grease).

- TPHD and TPH Stoddard Solvent concentrations in groundwater are below the method detection limit of 500 parts per billion for both analytes. The levels that remain do not require further cleanup and are not of regulatory concern.

  This site is located within a regional solvent plume. The San Francisco Bay Regional Water Quality Control Board has concluded that the chlorinated volatile organic compounds detected beneath the property are likely the result of the migration of pollutants from upgradient site.

If you have any questions, please call Mr. Peter Thiemann at the Camden Office, (408) 927-0710, extension 2651. Thank you.

Sincerely,

Palo Alto, CA 94306

Ladies and Gentlemen:

Subject: Fuel Leak Site Case Closure—Dura Bond Bearing Company, 3201 Ash Street, Palo Alto, CA 94306; Case No. 14-216

This letter confirms the completion of a site investigation and remedial action for the underground storage tank(s) formerly located at the above-described location. Thank you for your cooperation throughout this investigation. Your willingness and promptness in responding to our inquiries concerning the former underground storage tank(s) are greatly appreciated.

Based on information in the above-referenced file and with the provision that the information provided to this agency was accurate and representative of site conditions, no further action related to the underground tank release is required.

This notice is issued pursuant to a regulation contained in Section 2721(e) of Title 23 of the California Code of Regulations.

Please contact our office if you have any questions regarding this matter.

Sincerely,

ORIGINAL SIGNED BY

James S. Crowley, P.E.

6	5,000	Waste oil	Removed	1989
Piping			Assumed removed with tanks	—

III. RELEASE AND SITE CHARACTERIZATION INFORMATION

Cause and Type of Release: Unknown		
Site characterization complete? Yes	Date Approved By Oversight Agency: 07/21/98	
Monitoring wells installed? Yes	Number: 7	Proper screened interval? Yes
Highest GW Depth Below Ground Surface: 12.81	Lowest Depth: 19.24	Flow Direction: Northeasterly
Most Sensitive Current Use: Potential drinking water supply		

Summary of Production Wells in Vicinity: Several groundwater extraction wells used in the cleanup of a regional solvent plume were identified within ¼ mile of the site. One active water supply well, 06S03W12R010, is located 1,300 feet to the southwest. It is considered unlikely that the Dura Bond release will affect this well.	
Are drinking water wells affected? No	Aquifer Name: Santa Clara Valley Groundwater Basin
Is surface water affected? No	Nearest SW Name: Matadero Creek, 500 feet east
Off-Site Beneficial Use Impacts (Addresses/Locations): None reported	
Reports on file? Yes	Where are reports filed? Santa Clara Valley Water District

TREATMENT AND DISPOSAL OF AFFECTED MATERIAL			
Material	Amount (Include Units)	Action (Treatment or Disposal w/Destination)	Date
Tank	Two at 500-gallons One at 1,000-gallons	Presumed disposed of off site	1984
	One at 500-gallons One at 1,000-gallons One at 5,000-gallons	Hauled to Richmond, CA—Rinsed and transported to Dura Bond facility in Carson City, NV, to be reused	1989
Piping	Unknown	—	—
Free Product	N/A	—	—
Soil	Unknown volume	Presumed disposed of off site	1984
	150 cubic yards	Presumed disposed of off site	1989
Groundwater	N/A	—	—
Barrels	Unknown	—	—

1984 TANK REMOVALS (SOIL)
MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS

Contaminant	Soil (ppm)		Water (ppb)		Contaminant	Soil (ppm)		Water (ppb)	
	Before	After	Before	After		Before	After	Before	After
TPH (Gas)	860	—	—	—	Xylene	NA	—	—	—
TPH (Diesel)	5,200	—	—	—	Ethylbenzene	NA	—	—	—
Benzene	NA	—	—	—	Oil & Grease	NA	—	—	—
Toluene	NA	—	—	—	Heavy Metals	NA	—	—	—
Other (8240/8270)	#	—	—	—	MTBE	NA	—	—	—

Description of Interim Remediation Activities: An unknown amount of soil was overexcavated following tank removal in 1984. Confirmatory soil samples were not collected.

1989 TANK REMOVALS (SOIL); 1984 AND 1989 TANK REMOVAL (GROUNDWATER)
MAXIMUM DOCUMENTED CONTAMINANT CONCENTRATIONS—BEFORE AND AFTER CLEANUP

Contaminant	Soil (ppm)		Water (ppb)		Contaminant	Soil (ppm)		Water (ppb)	
	Before	After	Before	After		Before	After	Before	After
TPH (Gas)	8	—	9,500	ND	Xylene	0.022	ND	10	ND
TPH (Diesel)	2,100	10	42,000	<500	Ethylbenzene	0.017	ND	10	ND
Stoddard Solvent	790	26	20	ND (<500)					
Benzene	0.54	—	150	ND	Oil & Grease	1,200	20	4,200	NA
Toluene	0.7	—	88	ND	Heavy Metals	*	*	—	—
Other (8240/8270)	#	—	—	[2]	MTBE	NA	NA	NA	<3[1]

Description of Interim Remediation Activities: Information about interim remediation at the site is limited. Apparently overexcavation was performed following tank removal in 1984 and was performed following tank removal in 1989. It appears that no groundwater remediation was performed at the site.

NA = Not analyzed ND = Not detected — = No action performed (e.g., overexcavation)

[1]Method 8020

[2]1,1,1 Trichloroethane (TCA), Tetrachloroethylene, Trichloroethylene (TCE), and Chloroform detected in monitoring well groundwater samples. See Attachment 5.

#See Attachment 3 for information about the investigation of chlorinated solvents at the site.

*See Attachment 4, Table 4

IV. CLOSURE

Does completed corrective action protect existing beneficial uses per the Regional Board Basin Plan? Yes		
Does completed corrective action protect potential beneficial uses per the Regional Board Basin Plan? Yes		
Does corrective action protect public health for current land use? Santa Clara Valley Water District staff does not make specific determinations concerning public health risk. However, it does not appear that the release would present a risk to human health.		
Site Management Requirements: No specific requirements		
Should corrective action be reviewed if land use changes? No		
Monitoring Wells Decommissioned: Yes	Number Decommissioned: 2	Number Retained: 5
List Enforcement Actions Taken: None taken		
List Enforcement Actions Rescinded: None rescinded		

V. ADDITIONAL COMMENTS, DATA, ETC.

Background: Three underground storage tanks (UST), one 500-gallon capacity which stored gasoline, one 500-gallon capacity which stored diesel, and one 1,000-gallon capacity which stored Stoddard solvent were removed from the site in September 1984. The gasoline and diesel USTs were placed in a common excavation. The Stoddard solvent tank was placed in a separate excavation. Soil samples collected from beneath the tanks contained up to 5,200 parts per million (ppm) Total Petroleum Hydrocarbons as Diesel (TPHD) and 860 ppm Total Petroleum Hydrocarbons as Gasoline (TPHG). A sample from the soil stockpile contained 1,500 ppm of TPHG. Groundwater samples collected from two preexisting monitoring wells on site (DM-1 and E-1) contained up to 2,600 parts per billion (ppb) TPHG and 300 ppb unidentified compounds. Stoddard solvent was not detected in groundwater samples from either monitoring well. An undetermined amount of material above groundwater was overexcavated after the tanks were removed. A single excavation was created during removal of the three tanks. Soil samples quantifying residual contamination were not collected.

A monitoring well was placed in the backfilled tank pit (E-2). In June 1985, a sample from this well contained 150 ppb Benzene, 9,500 ppb volatile hydrocarbons, and 20 ppb Stoddard solvent. The two other wells at the site did not contain detectable concentrations of Benzene, Toluene, Ethylbenzene, Xylenes (BTEX), or Stoddard solvent during this sampling event. A fourth monitoring well (E-3) was installed upgradient of the former tank pit in November 1985. A soil sample from the well boring collected from immediately above groundwater contained 0.07 ppm TCE. A groundwater sample from this well contained 340 ppb TCE and relatively low concentrations of Chloroform, 1,1,1 TCA, 1,1 Dichloroethene, and 1,2 Dichloroethene (1,2 DCA).

In March 1988, Benzene was detected in groundwater samples from monitoring wells DM-1 and E-1 at a concentration of 0.5 ppb. No Toluene, Ethylbenzene, or Xylenes were detected in these groundwater samples. Monitoring well E-2 was not sampled because it was dry. From August 1988 to February 1989, samples from monitoring wells DM-1 and E-1 did not contain detectable concentrations of BTEX, and well E-2 was not sampled because it was dry. Monitoring well E-4 was installed as a replacement for decommissioned monitoring well E-1. A groundwater sample from this well contained 1,300 ppb TPHD.

In April 1989, one 500-gallon tank which stored unleaded gasoline and one 1,000-gallon tank which stored Stoddard solvent were removed from a common tank pit. A 5,000-gallon tank which stored waste oil was also removed from a separate tank pit. The floor and sidewalls of the waste oil tank pit were overexcavated.

Monitoring well E-5, immediately downgradient of the source area, and monitoring well E-6, located downgradient of the source area, were installed in November 1989.

Methyl tert-Butyl Ether was not detected by Environmental Protection Agency (EPA) Method 8020 analysis in groundwater samples from monitoring wells E-3, E-4, and E-6 during the September 1997 and December 1997 sampling events and was not detected in groundwater samples from monitoring wells E-4 and E-6 during the July 1997 sampling event.

1,2 DCA was not detected by EPA Method 8010 analysis in groundwater samples from monitoring wells E-4 and E-6 during the July 1997 sampling event. The 1,2 DCA method detection limit for the sample from E-4 was 5 ppb; that for the sample from E-6 was 0.5 ppb.

1,2 DCA was not detected by EPA Method 8010 analysis in groundwater samples from monitoring wells E-3, E-4, and E-6 during the December 1997 sampling event. The 1,2 DCA method detection limit for samples from E-3 and E-4 was 5 ppb; that for the sample from E-6 was 0.5 ppb.

Ethylene Dibromide (EDB) was not quantified during the July 1997 or the December 1997 analysis.

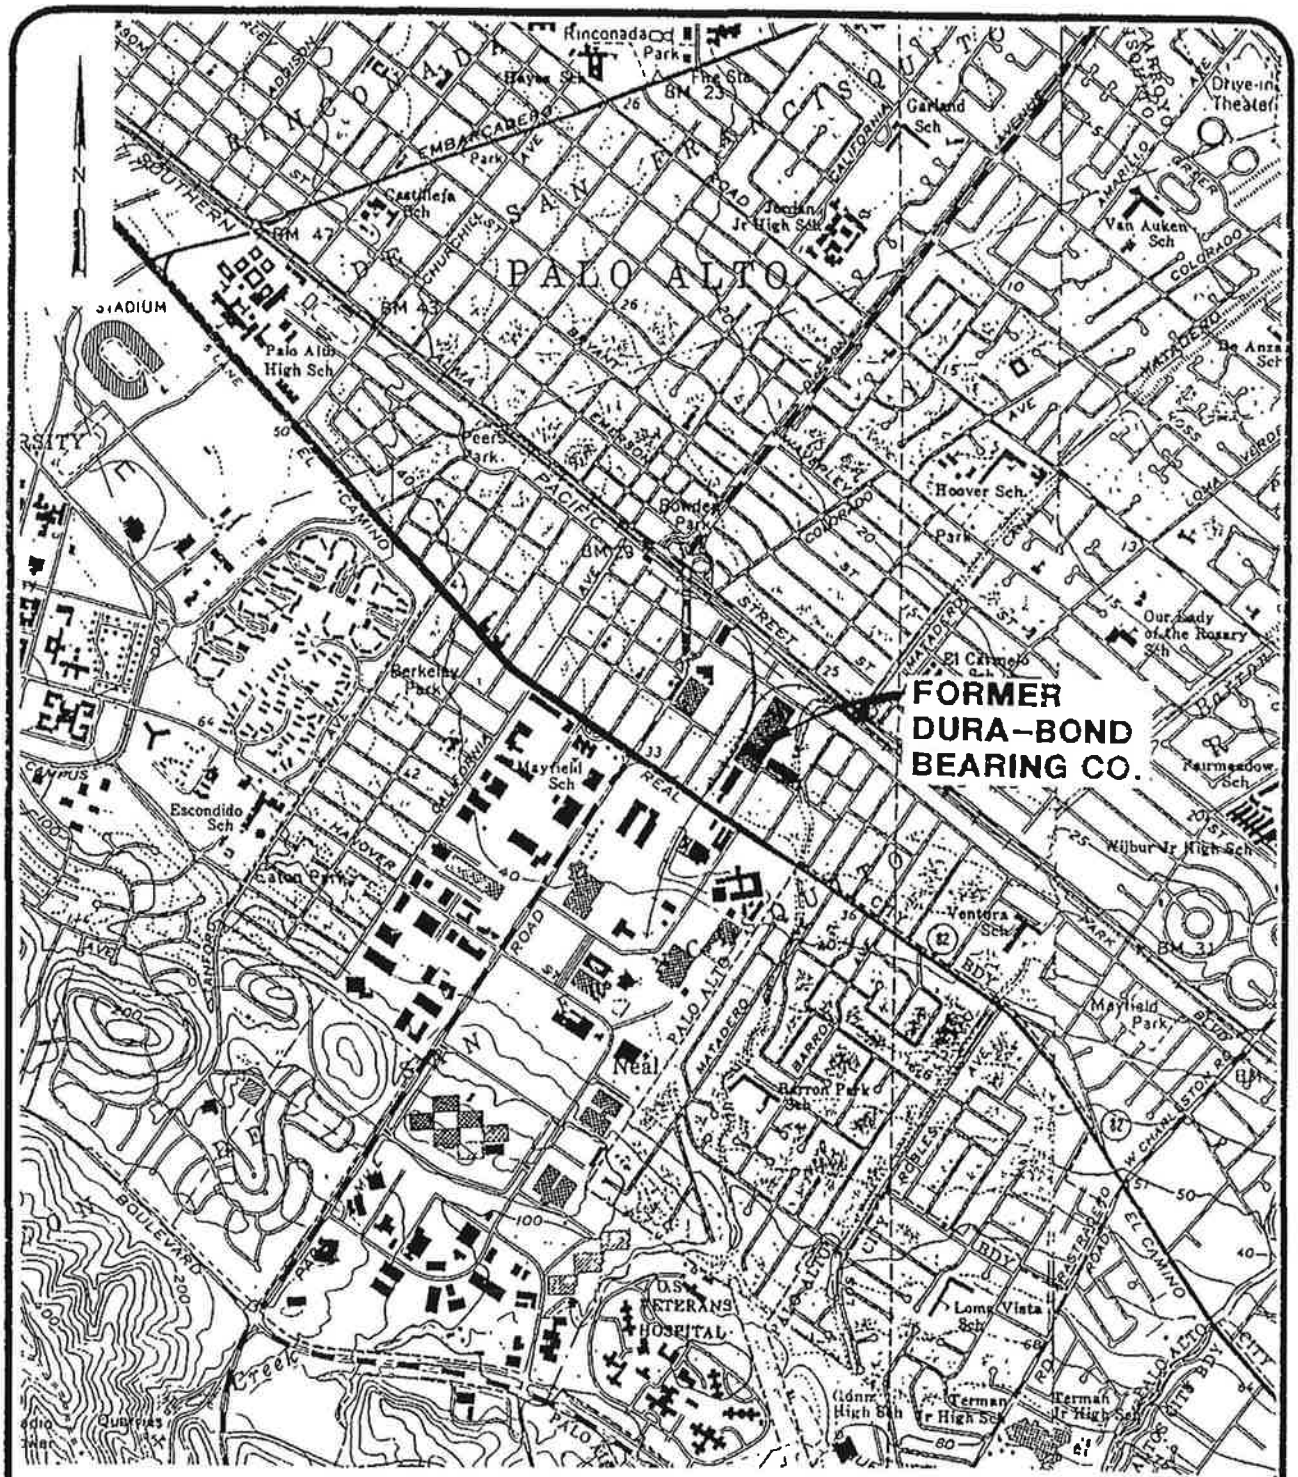
Conclusion: Based on the poorly documented amount of overexcavation performed in 1984 and the overexcavation performed in 1989, it appears that the residual petroleum hydrocarbon source for continued groundwater degradation has been effectively remediated. Groundwater monitoring activities demonstrate that the dissolved petroleum hydrocarbon plume was of limited extent and has attenuated to nondetectable concentrations. Analytical results from the latest monitoring events demonstrate that if 1,2 DCA is present in groundwater, it is of limited extent. Although EDB analytical data is not present for the most recent sampling events, we do not expect significant EDB contamination of groundwater. Relatively low concentrations of TPHG found in soil samples, groundwater analytical results indicating limited groundwater impact, and the small volumes of product stored in two 500-gallon tanks suggest that the mass of gasoline released is relatively minor and that significant EDB contamination of groundwater is unlikely. We expect that the residual mass of contamination in soil and groundwater will further decrease in the future due to natural attenuation processes.

The investigation was performed in accordance with State and local guidelines. Santa Clara Valley Water District staff has concluded that a continuing threat to groundwater, human health, and the environment from residual petroleum hydrocarbons does not exist at this site and that Regional Water Quality Control Board objectives have not been compromised. Santa Clara Valley Water District staff recommends closure for this case.

VI. LOCAL AGENCY REPRESENTATIVE DATA

Prepared by: Peter A. Thiemann	Title: Water Quality Specialist
Signature: Peter Thiemann	Date: 1/11/99
Approved by: James M. Crowley, P.E.	Title: Special Programs Engineer (acting)
Signature:	Date: 1/13/99

This closure approval is based upon the available information and with the provision that the information provided to this agency was accurate and representative of site conditions.



VII. REGIONAL BOARD NOTIFICATION

Regional Board Staff Name: Chuck Headlee	Title: Engineering Geologist
RB Response: Concur, based solely upon information contained in this case closure summary.	Date Submitted to RB: 1/13/99
Signature: Chuck Headlee	Date: 1/13/99

Subject: Phase I Environmental Assessment
Palo Alto, California
K/J 910056.00-G-92

Dear Mr. Jacobsen:

Kennedy/Jenks Consultants (K/J) is pleased to submit this final report of the Phase I Environmental Site Assessment conducted for a Southern Pacific Railroad property located in Palo Alto, California.

If you have any questions regarding information presented in this report, please call.

Very truly yours,

KENNEDY/JENKS CONSULTANTS

Stephen E. Fox
Project Geologist

Bert Drews
Project Manager

INTRODUCTION

Kennedy/Jenks Consultants conducted a Phase I Environmental Site Assessment and subsurface investigation on a portion of an existing Southern Pacific Railroad (SP) right-of-way located in Palo Alto, California. The objectives of the Phase I Environmental Site Assessment and subsurface investigation were to assemble environmental information on the subject property and identify areas or issues that may represent potential environmental risks.

Site Description

The subject property is an approximately 80 feet wide by 1,000 feet long railroad right-of-way bounded by El Camino Real, Park Boulevard, Olive Avenue, and Acacia Avenue in Palo Alto, California. With the exception of a small storage shed located near Park Avenue, no structures are located on the property. The rails were removed between 1985 and 1990, and the property was graded.

The site is bounded by single family residences to the north. Some of these property owners appear to have encroached on the subject property. Palo Alto Nissan is located immediately west of the subject property. Durabond, listed on the Federal CERCLIS, and Fry's Electronics bound the property to the south. Park Automotive is located immediately west of the subject property. The location of the subject property is shown on Figure 1.

Site Visit

K/J investigated the subject property and the area located within a radius of 5000 feet of the subject property on 18 December 1991. K/J walked the subject property and conducted a reconnaissance of the area surrounding the subject property by vehicle.

During the site investigation, K/J personnel did not find evidence of the following:

- surface impoundments
- aboveground storage tanks
- treatment or disposal operations involving hazardous materials or wastes
- stained ground surfaces, and stressed vegetation
- underground storage tanks
- chemical handling or storage areas
- asbestos-containing building materials

- PCB-containing electrical equipment

Two monitoring wells are located on the subject property. These wells were installed by ENVIRON for Hewlett Packard. A description of these wells and results of analytical data are discussed below.

SITE HISTORY

Since the early 1900s, the subject property has historically been used as a railroad right-of-way. According to Steven Staiger, Palo Alto Historian, the City of Palo Alto was serviced by an Urban Trolley system in the early 1900s and his records indicate that the subject property was included in this electrical train system. Mr. John Ivawusich, an engineer with Southern Pacific Railroads, stated the main Southern Pacific Railroad line, San Francisco to Palo Alto, was constructed in 1864; however, the subject property was not purchased until 1911. Upon purchase, the subject property was developed into the Los Altos Railroad line that connected Palo Alto and Santa Cruz, California.

Since the 1911 purchase, the only structures recorded on the subject property is a Southern Pacific Railroad storage shed. The shed is located adjacent to Park Avenue. The railroad tracks and shed were identified on a 1924 Sanborn Map. This map did not indicate the presence of flammable materials or underground or aboveground storage tanks.

Available aerial photographs, since 1955, show the land use of the surrounding area as a mixture of residential and commercial. Steven Staiger, Palo Alto Historian, stated the general study area was never developed by heavy industry. Single family residences predominated in the early 1900s and commercial development has occurred in the most recent years. In the 1955 aerial photograph, agriculture land is visible to the west of the property. The railroad tracks are visible on the subject property in the aerial photograph taken as late as 1990.

A historical review of articles on train accidents, at the Palo Alto City Library, showed one accident occurred in the vicinity of the subject property since the 1950s. The accident was recorded in the Palo Alto Times Newspaper on Tuesday 17, 1969 when a cement truck collided with a backing train crossing El Camino Real. The article did not indicate that any chemical release had occurred as a result of the accident.

Chemical usage on the subject property appears to have been limited to the use of herbicides to the keep the tracks clear of weed and other obstructive vegetation and curve and switch greases.

According to information developed for SP Railroad by Brunsing Associates, Inc., the use of herbicides for weed control has occurred since before World War II. Since 1986 herbicides used on the subject property may have included atrazine, diuron, sulfometuron, and glyphosphate. These compounds are

usually applied during the fall or winter and rain-activated. Typically these herbicides are short-lived and are re-applied annually.

Curve rail oiling mechanisms have been in place on portions of the sp track since the late 1940s. The curve oilers were supplied by 30-gallon underground storage tanks. During the K/J site visit, there was no evidence that a curve oil mechanism and tank ever existed on the subject property.

Switch lubricant may have been used to lubricate any switch plates located on the subject property. Historically this graphite lubricant may have been mixed with kerosene, and diesel oil. During the site visit, no hydrocarbon staining was evident on the subject property.

Aerial Photographs

Information regarding past land use and configuration was obtained by reviewing available aerial photographs from the collection maintained by Pacific Aerial Survey located in Oakland, California. The photographs often provide useful information regarding the site at the time of the photograph; however, they do not provide information about the intervening period between photographs.

Aerial photographs of the site and vicinity were reviewed for the following years: 1955, 1963, 1968, 1972, 1977, 1981, and 1990.

1955 Photograph - The railroad tracks are visible on the subject property. A railroad spur connected to the subject property line terminates at the commercial building located to the south. Agriculture land is visible southwest of the property and production appears to be wheat. Land use surrounding the subject property is a mixture of residential and commercial.

1963 Photograph - Railroad tracks are visible onsite. A structure is visible on the eastern section of the property, adjacent to Park Avenue. Single family residential properties are located to the north of the property, on Olive Street and commercial land use is located to the south and west.

1968 Photograph - The photograph resolution was poor. The site configuration appears similar to the 1963 photograph.

1972 Photograph - The land use in the vicinity of the subject property is a mixture of residential and commercial. Auto parking is visible along the south east end of the property.

1977 Photograph - Photograph is similar to the 1972 photograph. A box-style railroad car is visible on the railroad spur. Two buildings are visible near Park Avenue.

1981 Photograph - Land use surrounding the subject property continues to be a mixture of residential and commercial.

1985 Photograph - Photograph is similar to the 1981 photograph.

1990 Photograph - The railroad tracks have been removed from the subject property. No structures except for the Southern Pacific storage shed previously mentioned are visible on the site. Land use surrounding the property continues to be a mixture of commercial and residential. The Park Avenue buildings are visible east of the subject property. The area adjacent to El Camino Road is an auto dealership.

REVIEW OF REGULATORY AGENCY LISTS AND RECORDS

The discussion presented in this section is based on available information provided by regulatory agencies. A review of available agency lists from the Regional Water Quality Control Board, the California Department of Health Services, and the Environmental Protection Agency was conducted by NATEC Environmental Reporting Service, Ltd., a subcontractor to K/J, to identify potential regulatory issues at the subject property and the area within a radius of 5000 feet of the property. The records search included the review of the following regulatory records and lists.

Records Searched	Date	Sources Lists
CERCLIS	7/91	EPA-Superfund Sites
NPL	10/91	EPA-National Priority List
LIENS	3/91	Federal Superfund Liens
SWIS	7/91	California Solid Waste Information System List
SWAT	7/91	California Solid Waste Assessment Program
LUST	1/91	California Leaking Underground Storage Tanks Lists
CORTESE	11/91	California Hazardous Waste Substances Sites
RCRA	1/91	EPA-Hazardous Waste Generators

BEP	1/91	California Bond Expenditure Plan
ASPIS	1/91	California Abandoned Site Program Information System
WDS	10/90	NPDES Permits-Waste Waste Discharge
SARA	12/90	EPA-Superfund Amendments and Reauthorization Act

The subject property was not listed on the above lists and records. The records review conducted by NATEC Environmental Reporting Service, Ltd. indicated that sixteen CERCLIS, one NPL, forty-one RCRA, twenty-one LUST, thirty-two CORTESE, eighteen ASPIS and twenty-three SARA sites are located within a 5000 foot radius of the subject property. Release of volatile organic chemicals (VOCs) at several of the listed sites have resulted in groundwater contamination in the immediate vicinity of the subject property. As discussed in greater detail below, VOCs have been detected in two on-site monitoring wells. Sites that are located within a 2500 foot radius of the subject property are shown on Figure 1. Summaries of the file review are presented in Appendix A.

CERCLIS

Sixteen sites have been identified on the CERCLIS list, which is complied by the U.S. Environmental Protection Agency of contaminated properties for designation under the Federal Superfund Program pursuant to the Comprehensive Environmental Response Compensation and Liability Act (CERCLA). Sites located in the immediate vicinity of the subject property include the following;

Alza Corporation

Alza Pharmaceutical is located at 1454 Page Mill Road. The site was included on the CERCLIS list in January 1987, because of soil and groundwater contamination. Apparently the contamination resulted from the improper handling of chemicals onsite. Initial subsurface sampling identified chloroform concentrations at 4100 parts per billion (ppb), carbon tetrachloride concentrations at 130 ppb and trichloroethylene (TCE) concentrations at 19 ppb in groundwater. Under the supervision of the RWQCB, a soil gas extraction and treatment system was used for interim remedial measures followed by a groundwater extraction and treatment system. The most recent analytical results showed chloroform concentrations at 200 ppb, carbon tetrachloride concentrations below detection limits, and TCE concentrations at 4.5 ppb. The site is active and RWQCB continues to review operations at the site.

Beckman Instruments

This site is located at 1050 Page Mill Road. The RWQCB listed the site in August 1986 because of trichloroethane (TCA) detected in groundwater. Beckman's records indicate TCE has not been used onsite for the past ten years, but TCA has been detected in downgradient wells of the site. Analytical data for the monitoring wells was not available for review during the records review conducted by K/J. Apparently, no enforcement action has been taken against Beckman at this time; however, the final remedial measures for the site have not been determined by the RWQCB.

Dura-Bond

The site is located at 3201 Ash Street. RWQCB included this site on the CERCLIS in February 1981. Apparently the sources of contamination onsite were an underground storage tank and a waste impoundment from the manufacture of bearings. Sixty cubic yards of contaminated soil from the waste impoundment area were removed. Monitoring wells were also installed on the site. Chemicals identified during initial groundwater sampling showed concentrations of TCE at 708 ppb, xylene isomers and ethyl benzene at 1200 ppb and volatile fuel hydrocarbons at 9500 ppb. Apparently chlorinated solvents were detected during sampling of an upgradient monitoring well, indicating a potential offsite plume. RWQCB has required the installation of additional monitoring wells to determine the extent of the hydrocarbon plume and continued monitoring for fuel hydrocarbons.

Eastman Kodak Company

Operations at the facility located at 925 Page Mill Road included photographic film and paper processing. RWQCB's review of facility files indicate TCE was used onsite. The facility is located upgradient of an unexplained chlorinated solvent source and groundwater sampling showed TCE concentrations at 610 ppb, tetrachloroethylene (PCE) at 63 ppb and 1,1-dichloroethene (1,1-DCE) at 150 ppb. RWQCB has not determined remedial measures for the facility, because the Kodak submittal to characterize the potential contamination sources was rejected by RWQCB in February 1990.

Hewlett Packard Facility

This Hewlett Packard facility, which manufactures electronics equipment, is located at 640 Page Mill Road. Initial site investigations began in 30 June 1981. The source of contamination identified onsite was a leaking solvent waste tank. The tank was removed in July 1981 with an additional 100 cubic feet of contaminated soil. Initial analytical results showed TCE and 1,1-dichloroethane (1,1-DCA) in groundwater. An air stripper system was used for interim remedial measures. Apparently, the identified chemicals have migrated offsite and may have been intercepted by the Highway Underpass Dewatering System. The June 1991 Analytical Groundwater Report summarized by the RWQCB showed TCA

concentrations at 8900 ppb, TCE concentrations at 680 ppb, and 1,1 DCA concentrations at 380 ppb. The site is active and final remedial measures are not completed.

Hewlett Packard Facility

A second Hewlett Packard facility, identified on the CERCLIS list, is located at 395 Page Mill Road. In June 1982, sources of groundwater contamination onsite were identified as a leaking underground storage tank, chemical storage areas, and degreaser pits. Initial groundwater sampling showed chemical concentrations of 1,1,1-TCA at 93 ppb, TCE at 320, and 1,1 DCA at 7 ppb. During site characterization, in addition to onsite sources, chemical pollutants were found to be migrating onto the site from another source. A soil vapor recovery system was installed for the underground tank contamination and according to the RWQCB's records this phase of operations was completed in February 1989. The most re ent subsurface analytical sample results showed 1,1,1-TCA concentrations at 46 ppb, TCE concentrations at 230 ppb and 1,1 DCA concentrations below the detection limit. The RWQCB has required additional investigations to determine on and offsite source contributions.

Stanford Cleaners

Stanford Cleaners is located at 2875 El Camino Boulevard approximately one-tenth of a mile northwest of the subject property. The RWQCB identified contaminated subsurface conditions on 30 April 1982. Apparently soils were impacted as result of a leaking waste solvent underground storage tank. The tank along with 360 cubic feet of contaminated soil was removed and the RWQCB recommended a program of semi-annual/annual monitoring of groundwater. Initial analytical results detected 140 F Solvent, trans-1,2-dichloroethene (trans-1,2-DCE) and 1,1,1-TCA in groundwater. The RWQCB did not require a groundwater extraction system for the site. The site currently is recorded with the RWQCB as inactive.

Varian Associates Corporation Headquarters

Varian Associates located at 611 Hansen Way manufactures electronic equipment. According to RWQCB's records, three areas are under investigation at this property. The areas include VOC chemical release near Building 1, gasoline contamination release near Building 4, and VOC contamination near Building 4. Initial groundwater analytical data showed concentrations of TCE at 4,100 ppb, 1,1-DCE at 180 ppb, and 1,1 DCA at 98 ppb. During the site characterization, analytical data collected in a upgradient well indicated a potential offsite source migrating on to the site. Apparently the RWQCB has not determined the final remedial measures for site and quarterly review of monitoring data continues. The most recent available analytical data for the groundwater showed TCE concentrations at 490 ppb, 1,1-DCE concentrations at 140 ppb and 1,1-DCA concentrations at 82 ppb.

Varian Associates

The second Varian property, identified on the CERCLIS list, is located at 601 California Avenue. This facility also manufactures electronic equipment. The RWQCB identified the site in May 1986. Contamination sources were identified as a leaking underground tank and improper chemical handling. Initial groundwater sampling data showed chemical concentrations of TCA at 62 ppb, TCE at 16,000 ppb, and 1,1 DCE at 28 ppb. RWQCB required the construction of a groundwater extraction system onsite and characterization of the downgradient plume. The RWQCB has not determined the final remedial measures for the site. The most recent available analytical data submitted to the RWQCB showed concentrations of TCA at 32 ppb, TCE at 120 ppb, and 1,1 DCE at 20 ppb. The RWQCB has taken enforcement actions against the site. These regulatory actions are being addressed by Varian.

NPL

The Hewlett Packard facility located at 640 Page Mill Road, also listed on the CERCLIS list, has been listed on the NPL list. The U.S. EPA selects sites from the CERCLIS list and prioritized the sites for their significant risk to human health and the environment. A NPL site can receive remedial funding under CERCLA, because the site is considered the highest priority for remedial action. The Hewlett Packard site is located two-tenths of a mile northwest of the subject property. As stated in the CERCLIS section, the VOCs have migrated off site and the RWQCB continues to investigate the site.

RCRA

Hazardous waste generators have been identified in the vicinity of the property. Generators in this classification are required to have a U.S. Environmental Protection Agency identification number and must comply with the provisions of the Resource Conservation and Recovery Act (RCRA).

Twenty-six hazardous waste generators have been identified in the vicinity of the subject property. Many of these RCRA facilities have released VOCs into groundwater and soils. As mentioned previously, VOCs have been detected in groundwater beneath the subject property. It is unlikely, given the historical use of the property, that activities on the subject property have resulted in the release of chemicals to groundwater.

LUST

The Regional Water Quality Control Board (RWQCB) of Santa Clara County provides a list of site names and addresses of reported leaks from underground storage tanks. Six sites with leaking underground storage tanks have been identified in the immediate vicinity of the property. The sites include the following:

The Palo Alto Nissan auto dealership located at 411 Acacia Street is immediately adjacent the subject property. The Nissan site is also listed on the RCRA list. A leaking waste oil underground storage tank has been identified on the site. The extent of contamination is not known and additional investigation is necessary. Palo Alto Nissan leases a portion of the subject property. Nissan uses the property to park new and used cars. The leaking underground waste oil storage tank mentioned above is not located on the subject property.

Jost Heating and Sheet Metal, Inc. is located at 412 Olive Avenue. The site is located one-tenth of a mile from the subject property. A leak of unleaded gasoline has not been characterized and no action taken since the initial report. The RWQCB is currently reviewing the site.

Bleiber Iron Works located at 411 Page Mill Road is located two-tenths of a mile northwest of the subject property. The substance released was gasoline. An initial release leak report was submitted to the RWQCB; however, no action has been taken by the responsible party since that report. It is not known if the groundwater has been impacted by the release.

The Varian Associates site at 425 Lambert Street is located three-tenths of mile from the subject property. The substance released on site is gasoline. It is unclear if the groundwater has been impacted. It is also not apparent if an initial release report has been filed with the RWQCB.

The Chevron Service Station at 775 Page Mill Road is located three-tenths of a mile from the site. An assortment of hydrocarbon products have been released to the soil. A remediation plan was approved by the RWQCB for the treatment of contaminated soils which included excavation and onsite aeration with disposal to an approved site. It is not known if the groundwater has been impacted at this site.

The Hohback site at 216 Page Mill Road is located two-tenths of a mile northeast of the subject property. Gasoline was released and groundwater has been impacted. An initial investigation report was submitted to the RWQCB; however, no action has been taken since that report.

The remaining sites on the LUST list are not in the immediate vicinity of the subject property.

CORTESE

The CORTESE list is complied by the California State Office of Planning and Research and provides listing of hazardous waste/substances sites within the State. Fifteen sites have been identified in the immediate vicinity of the subject property. These sites have also been identified on the LUST list with the exception of a listed site located at 2901 Park Avenue. This site is also listed on the ASPIS list as a Southern Pacific Railroad property. Both Randy Smith and Rob Cranse of Southern Pacific Railroad were unaware of a contaminated site belonging to Southern Pacific

at this address. Additional information will be requested from the California Department of Health Services (California Environmental Protection Agency). Any new information obtained will be forwarded to WSJ Properties when the information is received.

ASPIS

Sites in the vicinity of the property have been identified on the Abandoned Sites Program Information System (ASPIS). The list consists of potential hazardous waste sites and is not a documentation of an incident. The Hewlett Packard facility at 640 Page Mill Road is the closest site to the subject property as previously mentioned. The site is listed on the CERCLIS and NPL lists. The remaining sites listed on the ASPIS sites are also listed on the LUST, CORTESE and CERCLIS list.

SARA

Six SARA sites have been identified within the 5000 feet radius of the subject property. Section 313 of the Emergency Planning and Community Right to Know Act (Superfund Amendments and Reauthorization Act of 1986) requires certain facilities to file annual toxic chemical release inventory forms with the U.S. Environmental Protection Agency and the California Environmental Affairs Agency. The reports to the regulatory agencies include information on releases to air, water and land. The sites listed are also included on the CERCLIS List. The closest sites are Hewlett-Packard located at 395 Page Mill Road and Varian Associates located at 611 Hansen Way. The invertory release data is presented in the summarization report (Appendix A).

OTHER AGENCY CONTACTS

In conjunction with the environmental records review, K/J contacted other local and State agencies and individuals who may have knowledge of activities conducted on the subject property. The content of these telephone conversations are summarized in Appendix B.

DESCRIPTION OF FIELD ACTIVITIES

On 19 and 20 December 1991, eight soil borings (SB-1, SB-2, SB-3, SB-4, SB-5, SB-6, SB-7 and SB-8) were drilled at the site by HEW Drilling Inc. of East Palo Alto, using a CME-75 drill rig equipped with 8-inch hollow stem augers and split-spoon samplers. The boreholes were located on an east-west line across the SP right-of-way and the borings were drilled within 10 to 15 feet of the centerline of the old railbed. The locations of the soil borings are shown on Figure 2.

From each soil boring, four soil samples were driven at the following approximate depths: from 5.0 to 6.5 feet, 10.0 to 11.5-feet, 15.0 to 16.5-feet and from 18.0 to 19.5-feet below ground surface. At each sampling interval, the split spoon sampler, which was filled with three, 2-inch 6-inches brass liners was driven 1.5-

feet. From each drive interval, a soil sample was selected from the three brass liners for analysis for TPH as gas and diesel, VOCs, organochlorine pesticides, PCBs, 17 Title 22 Priority Metals, semi-volatile organics, and oil and grease. Each boring was logged noting the soil types, contacts between the different soil intervals and other such pertinent information such as color, and moisture content.

The boring installation and sampling procedures are described in greater detail in Appendix C. Boring logs of boreholes drilled during this investigation are presented in Appendix D.

RESULTS OF SOIL AND GROUNDWATER SAMPLING

As indicated above, four soil samples were collected from each soil boring, and retained for potential laboratory analysis. From each soil boring, selected soil samples from specific sampling intervals were composited by the laboratory and analyzed as one sample. In addition, selected soil samples from each boring were analyzed as individual samples. From each soil boring, soil samples collected from the 5.0 to 6.5-foot and 18.0 to 19.5-foot intervals were composited and analyzed as one sample. These composite samples were analyzed for TPH as gas and diesel (LUFT Mod. Method 8015), VOCs by EPA Method 8240, organochlorine pesticides and PCB's by EPA Method 8080 and 17 Title 22 Priority Metals. The shallow soil samples collected from the 5.0 to 6.5-foot interval from each boring were also analyzed as individual samples for oil and grease.

Composite soil samples from soil borings SB-1, SB-4, SB-7 and SB-8 were also analyzed for semi-volatile organics by EPA Method 8270. These borings were located adjacent to commercial or industrial activities.

No grab-groundwater samples were collected from the shallowest onsite aquifer during the investigation because previous investigations (ENVIRON data submittal to K/J on 6 January 1992), detected VOCs in groundwater from onsite monitoring wells F76A2 and F77A1. Monitoring well F77A1 was screened in the shallowest onsite water bearing zone from 18.5 to 28.5 feet below ground surface. Monitoring well F76A2 was screened from 40 to 50 feet below ground surface, in what appears to be the next deepest water bearing zone. The well specifications for the monitoring wells F76A2 and F77A1 also provided by ENVIRON on 13 January 1992 are presented in Appendix E.

Laboratory data was provided to K/J by ENVIRON (6 January 1992) on groundwater samples collected from the two above mentioned monitoring wells from February 1990 through August 1991. Trichloroethylene (TCE) appears to be the primary chemical of concern detected in groundwater samples collected from monitoring well F77A1. Concentrations of up to 260 ppb of TCE were detected in monitoring well F77A1 during the monitoring period. Other VOCs detected in groundwater samples collected from well F77A1 are Methylene Chloride, Acetone, 1,1,1-TCA, 1,1-DCE, c-1,2-DCE and 1,1-DCA.

Concentrations up to 2.6 ppb of TCE and 1.2 ppb of 1,1-DCA were detected in the groundwater samples collected from the deeper monitoring well, F76A2. Laboratory results provided by ENVIRON are presented in Appendix F.

Laboratory analytical reports and chain of custody forms for the soil samples collected during the Kennedy/Jenks investigation are presented in Appendix G.

VOCs

As mentioned above, groundwater samples collected from two onsite monitoring wells, indicate that the shallow groundwater onsite contains detectable concentrations of VOCs. However, VOCs were not detected above the laboratory detection limit in the eight composite soil samples collected.

PCBs

PCB's were not detected above the laboratory detection limit in the eight composite soil samples collected.

TPH as GAS AND DIESEL

TPH as gas and diesel was not detected above the laboratory detection limit in the eight composite soil samples collected.

ORGANOCHLORINE PESTICIDES

Organochlorine pesticides were not detected above the laboratory detection limit in the eight composite soil samples collected.

SEMI-VOLATILE ORGANICS

Semi-volatile organics were not detected above the laboratory detection limit in the four composite soil samples collected.

OIL AND GREASE

Oil and grease was detected at 60 ppm in samples SB-1A, SB-4A and SB-5A. The analytical results are presented in Table 1. The elevated concentrations of oil and grease detected may be attributed to either oil and grease associated with the track maintenance or may be attributed to background organics present in the soil. These oil and grease values do not appear to represent a significant problem throughout the site.

CALIFORNIA TITLE 22 METALS

Concentrations of metals detected in the soil samples are summarized in Table 2. The detected metal concentrations are compared to average metals concentrations

in soils reported by Lindsay, I.W.L Lindsay, 1979, Chemical Equilibria in Soil, John Wiley and Sons, New York and Total Threshold Limit Concentrations (TTLCs) established for the designation of hazardous wastes by the State of California. TTLCs for the metals of concern are not exceeded.

The concentrations of metals detected in the soil samples appear to be representative and consistent with metal background soil concentrations reported by Lindsay.

FINDINGS AND CONCLUSIONS

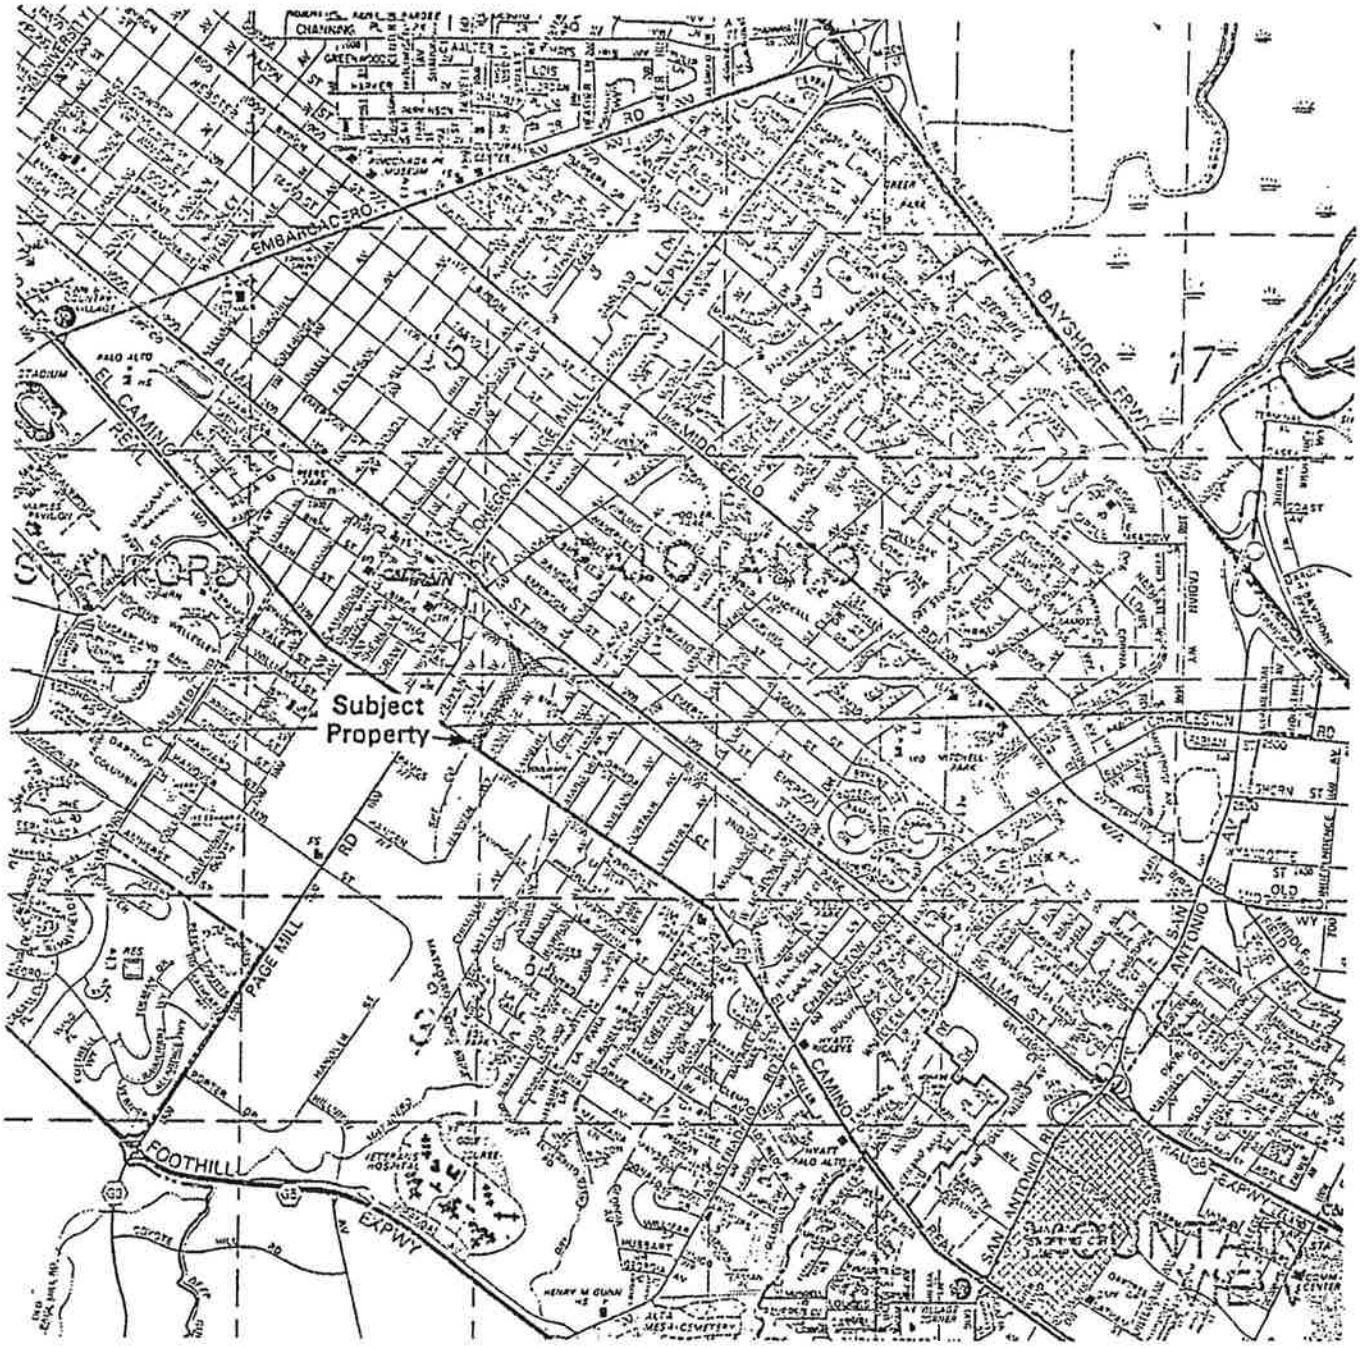
The following finding and conclusions are based on the data gathered during this investigation, the laboratory analytical results, the review of site history, and the review of regulatory agency lists and records.

- A review of the site history does not indicate that the subject site has had any other historical use other than a railroad right-of-way. The historical records also do not indicate that any major spills or industrial accidents have occurred on the site.

- A review of aerial photographs taken of the site from 1955 through 1990 do not indicate any use of the site other than as a railroad right-of-way. Between 1985 and 1990, the railroad tracks were removed from the site.

- A review of the regulatory lists and records was conducted for the subject property and the area within a radius of 5000 feet of the property. The records review indicated that sixteen CERCLIS, one NPL, forty-one RCRA, twenty-one LUST, thirty-two CORTESE, eighteen ASPIS and twenty-three SARA site are located within this 5000 foot radius. Activities at some of these listed sites have resulted in the release of chemicals to soil and groundwater in the immediate vicinity of the subject property.

- TPH as gas and diesel, VOCs, organochlorine pesticides, and PCBs were not detected above the detection limits of the analytical methods, in composite soil samples collected at the site to a depth of 19.5 feet below ground surface (borings SB-1, SB-2, SB-3, SB-4, SB-5, SB-6, SB-7 and SB-8)



- Semi-Volatile Organics were not detected above the detection limits of the analytical methods, in selected shallow composite soil samples collected at the site (borings SB-1, SB-4, SB-7 and SB-8).

- Even though the shallow groundwater at the site contains VOCs at detectable concentrations, it does not appear that the unsaturated zone is significantly impacted by chemicals of concern.

- Detectable metal concentrations were present in all of the soil samples collected at the site. The concentrations of metals appear to be consistent with background soil concentrations (I.W.L Lindsay, New York, 1979).

- Concentrations of oil and grease were detected in three shallow soil samples collected at the site. The concentrations were only slightly elevated above detection limits and do not appear to represent a significant problem.

SUBSURFACE VAULT INVESTIGATION AND CLOSURE REPORT
EL CAMINO CENTER
3200 PARK BOULEVARD
PALO ALTO, CALIFORNIA

Dear Ms. Sullivan:

This letter report has been prepared by PES Environmental, Inc. (PES) to present the results of the investigation, abandonment and closure of an underground concrete vault (vault) located at El Camino Center, a commercial and retail center located at 3200 Park Boulevard in Palo Alto, California (Plate 1). PES conducted the site work on behalf of El Camino Center Partners, the owner of the subject property. Plate 2 presents a vicinity map showing the general area of the vault. Field activities at the site included: (1) chemical characterization, removal and disposal of residual liquid contents from within the vault; (2) verification of the dimensions and orientation of the vault; (3) evaluation and investigation to confirm surrounding soils had not been affected by the vault contents; and (4) abandonment and closure of the vault.

BACKGROUND INFORMATION

The subject property contains several structures including a large warehouse building currently occupied by Fry's Electronics (retail sales) and professional offices (Plate 2). Historical site use of the warehouse building was obtained through review of Sanborn Fire Insurance Maps. The subject property had been the location of a cannery prior to World War II, and after the war, was used as a warehouse by several businesses. The area of the vault, which is immediately north of the large warehouse building, was previously the location of a Southern Pacific Railroad and spur track. The railroad tracks are no longer present at ground surface in the area of the vault.

On June 13, 1997, El Camino Center Partners' building contractor encountered below-grade concrete structures and hydrocarbon-affected soil while excavating to install a new storm sewer conveyance pipe (Plate 3) in a new location. The original sewer pipe was not in the vicinity of the vault. PES conducted a site inspection on June 16, 1997, and inspected the interior of the vault through an access port located at the northeastern corner of the vault. The interior inspection indicated that the vault contained an unknown volume of a black-oily liquid. The depth to the liquid in the vault was approximately 5 feet below ground surface (bgs). Palo Alto Fire Department (PAFD) was notified and provided oversight during the investigation, abandonment and closure proceedings of the vault. The following presents the methods and results of PES' investigation, abandonment and closure of the vault.

MANAGEMENT OF LIQUID CONTENTS OF VAULT

Sampling of Vault Contents

To characterize the oily liquid in the vault, on June 16, 1997, PES collected a sample of the vault liquid using a disposable Teflon™ bailer. The sample was decanted into laboratory supplied containers, labeled and placed in a chilled, thermally-insulated cooler. The sample was submitted to Superior Analytical Laboratories (Superior) of San Francisco, California, a state certified laboratory, accompanied by chain-of-custody documentation. The sample was analyzed for full scan of total petroleum hydrocarbons (TPH) and volatile organic compounds (VOCs) using U.S. Environmental Protection Agency (U.S.EPA) Test Method 8015 Modified and 8260, respectively.

Results of Vault Sample Analyses

The results of the TPH analysis of the liquid sample indicated that TPH in the motor oil range was detected at a concentration of 440,000 milligrams per kilogram (mg/kg). No other TPH parameters (i.e., gasoline, diesel, and motor oil) were detected above the laboratory reporting limits. The following VOCs were detected above the laboratory reporting limits: (1) 1,3,5-Trimethylbenzene at 13 mg/kg; (2) total Xylenes at 12 mg/kg; (3) p-Isopropyltoluene at 31 mg/kg; (4) n-Butylbenzene at 40 mg/kg; (5) 1,2,4-Trimethylbenzene at 170 mg/kg; and (6) Naphthalene at 400 mg/kg. The laboratory report sheets and chain-of-custody form are included in Appendix A.

The chemical analyses indicated that the oily liquid in the vault was composed of approximately 44 percent petroleum hydrocarbons, quantified as motor oil. Ethylbenzene, trimethylbenzenes and naphthalene are common components of fuel oil and used motor oil. The suite of VOCs detected in the sample of oily liquid are indicative of a degraded fuel oil or motor oil.

Liquid Removal From Vault

Oily liquid in the vault was pumped out on June 17 and 18, 1997 by Allwaste of Benicia, California using a vacuum truck. Approximately 8,157 gallons of oily liquid were removed from the vault during purging of the vault contents.

Liquid Disposal

Based on analytical results of the liquid sample collected from the vault, the evacuated liquids were disposed of as a non-RCRA California-regulated hazardous waste. The liquid waste was transported to Americlean, Inc. in Silver Springs, Nevada for disposal. Copies of the Uniform Hazardous Waste Manifests for the management of the liquid are included in Appendix B.

STORM SEWER TRENCH SOIL SAMPLING

Sampling and Analytical Procedures

On June 17, 1997, PES conducted soil sampling of the sidewalls of the storm sewer trench at the subject property. At the time the sampling was conducted, the size of the vault and its relationship to the storm sewer trench was unknown. As will be later confirmed and described, the trench was routed over the vault, and all soil contamination described hereinafter was actually within the interior of the vault (Plate 4). Soil with visible hydrocarbon-staining was observed on the excavation sidewalls. PES personnel collected seven soil samples from the sidewalls for chemical analysis to confirm that the source of the hydrocarbon-staining on the trench sidewalls was the liquid in the vault and to evaluate the lateral extent of hydrocarbon-affected soil. Five soil samples were collected from the north wall of the excavation; and two samples were collected from the south wall of the excavation. The approximate extent of the visibility stained soil on the trench sidewalls is presented on Plate 3.

The soil samples were collected by driving pre-cleaned 2-inch-diameter by 6-inch-long stainless-steel tubes into the soil exposed in the trench sidewalls. Following sample collection, the tubes were covered with teflon sheets and plastic end caps and sealed with silicon tape. The sealed tubes were labeled, placed in a chilled, thermally-insulated, cooler and transported to Superior accompanied by chain-of-custody documentation. The samples were analyzed for full scan of TPH and VOCs using U.S.EPA Test Methods 8015 Modified and 8260, respectively. Copies of the laboratory analytical reports and chain-of-custody documentation are presented in Appendix A.

Storm Sewer Trench Soil Sampling Results

The results of the chemical analyses performed on the soil samples collected from the storm sewer trench sidewalls indicated hydrocarbon-affected soil was present in both trench sidewalls. TPH quantified as motor oil was detected in all samples at concentrations ranging from 32 mg/kg to 2,400 mg/kg. Maximum concentrations of VOCs detected above the laboratory reporting limits include: (1) sec-Butylbenzene at 0.3 mg/kg; (2) n-Butylbenzene at 0.93 mg/kg; (3) Ethylbenzene at 0.13 mg/kg; (4) Isopropylbenzene at 0.19 mg/kg; (5) p-Isopropyltoluene at 0.81 mg/kg; (6) Naphthalene at 3.4 mg/kg; (7) n-Propylbenzene at 0.33 mg/kg; (8) 1,2,4-Trimethylbenzene at 4.3 mg/kg; and (9) Total Xylenes at 0.29 mg/kg.

SUBSURFACE INVESTIGATION

On June 25, 1997, PES performed a subsurface investigation to better define the vault orientation and dimensions. In addition, the investigation was performed to ascertain whether soils at the perimeter of the vault had been affected by the tank contents due to releases from the vault. Precision Drilling of San Rafael, California was contracted by PES to perform soil borings at nine locations. Using a direct push method, four soil borings (B-1, B-2, B-3 and B-4) were advanced to a depth of 13 feet bgs. Soil borings B-5, B-7 and B-9 were terminated at approximately 10 to 11 feet bgs and soil borings B-6 and B-8 were terminated at approximately 2.5 feet bgs due to refusal. Soil boring locations are presented on Plate 3.

Soil samples were collected at approximately 3-foot intervals, when possible, for logging of the borehole lithology and field screening using a Photo Ionization Detector (PID). The boring logs are presented in Appendix C. Based on field screening observations, eleven soil samples from six boring locations were collected for chemical analyses. Samples were collected in 6-inch long pre-cleaned stainless-steel sample tubes.

Following sample collection, the tubes were covered with teflon sheets, plastic end caps and sealed with silicon tape. The samples were labeled, placed in a chilled, thermally-insulated, cooler and transported to Superior accompanied by chain-of-custody documentation. The samples were analyzed for full scan of TPH and VOCs by U.S.EPA Test Method 8015 Modified and 8260, respectively.

The full scan TPH analysis of the eleven soil samples detected only TPH quantified as diesel and TPH quantified as motor oil at concentrations ranging from below the reporting limit of 200 mg/kg and below laboratory reporting limit of 280 mg/kg, respectively. Low concentrations of the following VOCs were detected in soil sample B5-D: (1) p-Isopropyltoluene at 0.024 mg/kg; (2) n-Butylbenzene at 0.027 mg/kg; (3) 1,2,4-Trimethylbenzene at 0.12 mg/kg; and (4) Naphthalene at 0.2 mg/kg. Sample results

are presented on Plate 3 and summarized in Table 2. Laboratory reports and chain-of-custody forms are presented in Appendix A.

The results of the subsurface investigation indicated that, with one minor exception, soil north, east and west (Borings B-1, B-2, B-3, B-4 and B-7) of the vault had not been significantly affected by hydrocarbons. The one minor exception being 100 mg/kg TPH quantified as motor oil detected in the 5.5-foot-depth sample from boring B-1. The 12.5-foot-depth sample from boring B-1 did not contain detectable concentrations of petroleum hydrocarbons. Soil analytical results of samples from boring B-5 and visual observations made during the drilling of boring B-9 indicated that soil in the vicinity of these borings had been affected by hydrocarbons. Based on the results of the subsurface investigation, soil excavation was initiated.

On the basis of the soil analytical results, hydrocarbon-affected soil was confined within the concrete walls of the vault. As discussed below, chemical analysis of verification soil samples indicated that the oily liquid was not released into underlying soil through the concrete bottom of the vault.

VAULT ABANDONMENT ACTIVITIES

Initial Uncovering of Vault

On July 6, 1997, Allwaste of Benicia, California, under supervision of PES, began removal of overburden using a track-mounted excavator to expose the top of the vault. Upon exposing the vault, its dimensions were measured to be 13 feet wide by 36 feet long and 8 feet deep, having a potential capacity of approximately 28,000 gallons. Plate 4 presents a plan view displaying the dimensions and orientation of the vault. The bottom, sidewalls and top of the vault were constructed of 8-inch-thick reinforced concrete. Concrete reinforcement consisted of 1/4-inch-thick to 1-inch-thick steel rebar. The vault was found to contain the newly installed storm sewer pipe in addition to soil and debris. Inspections of the vault revealed that portions of the vault top had collapsed into the vault, potentially due to historical construction or demolition activities. Material consisting of soil and debris had accumulated in the vault through the collapsed sections of the vault top. El Camino Center Partners and PES determined that it was appropriate to close the vault through in-place abandonment.

Vault Abandonment Permitting

Vault abandonment activities were performed between July 7 and July 14, 1997, under Permit Number H002-98, issued by PAFD, Bureau of Fire Prevention. A copy of the Uniform Underground Storage Tank System Closure Permit, issued by PAFD, is provided in Appendix D.

Vault Opening and Removal of Contents

In order to expose the interior of the vault, the perimeter of the top was broken away from the vault sidewalls using a hydraulic hammer attached to a track-mounted excavator. The remainder of the concrete top was then removed from the vault. The storm sewer pipe and associated backfill material were removed from the area directly over the vault. To the greatest degree that was practical, debris generated during removal of the vault top was prevented from falling into the vault and coming in contact with residual liquids contained in the vault which were subsequently removed.

Soil and debris which fell into the vault during removal of the vault top or had fallen through collapsed portions prior to abandonment were removed from the vault using a track-mounted excavator and hand tools. Approximately 282 tons of soil and concrete debris were removed from the vault. Soil and debris removed from the vault were placed in 21 roll-off bins and stored onsite pending offsite disposal. Prior to placement of soil and debris in the bins, the bins were double-lined with plastic tarping and an absorbent was placed in the bottom of the bin to soak up potential free liquids. The bins were then covered and labeled.

Following removal of soil and debris from the vault interior, pockets of residual liquids which remained in the vault were pumped out by Allwaste using a vacuum truck. The vault sidewalls and bottom were then cleaned using a citrus-based degreasing agent and high pressure steam rinse. Rinsate which accumulated in the vault was pumped out using a vacuum truck. Approximately 2,500 gallons of residual product and rinsate were pumped out of the vault and subsequently transported by Allwaste for disposal at Americlean, Inc. in Silver Springs, Nevada (Appendix B).

Vault Inspection

On July 14, 1997, the bottom and sidewalls of the vault were inspected by Mr. Kyle Flory of PES and Ms. Angela Sullivan of the PAFD. No cracks in the walls or bottom of the vault or other visual evidence indicating that the integrity of the vault was compromised were observed during the inspection. During the July 14, 1997 vault inspection, PES recommended perforation of the vault floor by coring eight 4-inch-diameter holes through the bottom of the vault. Following coring of the concrete, confirmation soil samples would be collected from beneath four of the concrete cores. Each soil sample would be analyzed for full scan of TPH and VOCs using U.S.EPA Test Methods 8015 Modified and 8260, respectively. Upon receipt of the laboratory analytical results, the analytical results would be submitted by PES to Ms. Sullivan of the PAFD. Ms. Sullivan verbally concurred with PES' recommendation and indicated that backfilling of the concrete core holes with sand and subsequent backfilling of the vault could proceed pending the results of the chemical analyses performed on the confirmation soil samples.

Vault Bottom Coring and Verification Soil Sampling

On July 15, 1997, eight 4-inch-diameter holes were cored into the vault bottom. PES collected verification soil samples from four of the core locations using a slide hammer and stainless-steel sample tubes. Following sample collection, each sample tube was covered with teflon sheets and plastic end caps and sealed with silicon tape. The sample tubes were then labeled and placed in a chilled, thermally-insulated, cooler pending transport to the project laboratory. Sample locations are presented on Plate 4.

The verification soil samples were submitted to Superior on July 15, 1997, accompanied by chain-of-custody documentation. The samples were analyzed for full scan of TPH and VOCs by U.S.EPA Test Method 8015 Modified and 8260, respectively. The four verification soil samples did not contain TPH or VOCs above the respective laboratory reporting limits. The results of the soil sample analyses were submitted by PES to Ms. Sullivan of PAFD. Ms. Sullivan provided verbal authorization to abandon the vault in-place and proceed with backfilling. Laboratory report sheets and the chain-of-custody form are included in Appendix A.

Vault Backfilling

On July 17, 1997, El Camino Center Partners' construction contractor initiated backfilling of the former vault. The eight core holes were filled with sand to allow fluids entering the vault to drain into the subsurface. The remainder of the vault was backfilled with clean native material obtained onsite during site improvement activities. During backfilling activities, the new storm sewer piping which was removed during vault abandonment activities was replaced. Following the backfilling of the vault and replacement of the storm sewer piping, the surface was covered with asphaltic concrete pavement.

SOLID WASTE MANAGEMENT

Samples were collected from material in the bins to characterize soil and debris removed from the vault for waste disposal. Samples were collected in 6-inch long stainless steel sample tubes. The sample tubes were covered with teflon sheeting and plastic end caps and sealed with silicon tape. Bin samples were labeled and placed in a chilled, thermally-insulated, cooler pending transport to Superior and were accompanied by chain-of-custody documentation. The bin samples were composited and analyzed at the laboratory. Composited bin samples were analyzed for full scan of TPH using U.S.EPA Test Method 8015 Modified and VOCs using U.S.EPA Test Method 8260. In addition, the samples were also analyzed for total lead by U.S.EPA Test Method 7010. Copies of the laboratory reports and chain-of-custody forms are included in Appendix A.

The soil and debris were classified as a non-hazardous waste based on waste characterization sample results. The waste was transported for disposal to B and J Landfill at 6426 Hay Road in Vacaville, California. Bin transport was performed by Allwaste. Copies of the Non-Hazardous Waste Manifests and Weighmaster Certificates are provided in Appendix B.

Elsewhere on site, railroad ties were encountered during site improvement excavation activities conducted by El Camino Center Partners' building contractor. The railroad ties were placed by Allwaste into one roll-off bin for subsequent transportation and offsite disposal. Approximately 4.2 tons of railroad ties were transported by Allwaste to B and J Landfill for disposal as a non-hazardous waste. A copy of the Non-Hazardous Waste Manifest is presented in Appendix B.

RECOMMENDATION FOR CASE CLOSURE

PES recommends that case closure be granted for the in-place abandonment of the vault. The dimensions of the vault were 13 feet wide by 36 feet long and 8 feet deep, with a potential capacity of approximately 28,000 gallons. The bottom, sidewalls and top of the vault were constructed of 8-inch-thick reinforced concrete. No cracks in the vault bottom or walls or other visual evidence indicating that the vault integrity had been compromised were noted during inspection of the vault. Soil investigation results indicated that the surrounding soils were not affected by petroleum hydrocarbons, with the exception of one isolated sample with 100 mg/kg TPH quantified as motor oil. Chemical analysis of four soil samples collected beneath the vault bottom indicated no release of the vault contents into the underlying soil had occurred.

In accordance with PAFD's request, potential future use of the vault has been eliminated through perforation of the vault bottom. Prior to backfilling he vault, the eight core holes were filled with sand to allow drainage of surface water potentially seeping into the vault. The vault has been backfilled with clean native material and capped with asphalt concrete pavement. The new storm sewer piping was replaced during backfilling activities. On behalf of El Camino Center Partners, PES requests that PAFD grant case closure for the vault and provide written documentation to that effect.

We trust this information meets your needs at this time. If you have any questions, please call Kyle Flory at (415) 899-1600.

Very truly yours,

1.0 INTRODUCTION

PES Environmental, Inc. (PES) has prepared this report on behalf of El Camino Center to describe soil remediation at the former Mercer Processing, Inc. (Mercer) facility at El Camino Center, 230 Portage Avenue, Palo Alto, California. The site location is shown on Plate 1. The remediation was performed in accordance with PES' document *Final Remedial Action Plan, Former Mercer Processing, Inc. Facility, 230 Portage Avenue, Palo Alto, California* dated October 18, 2001 (PES, 2001). The Remedial Action Plan (RAP) was approved by the Regional Water Quality Control Board – San Francisco Bay Region (RWQCB) in a letter dated October 18, 2001. A copy of the RWQCB approval letter is included in Appendix A.

Remedial planning conducted by El Camino Center included: (1) preparation of the RWQCB-approved RAP; and (2) preparation and implementation of a Community Relations Plan. The activities described in the RAP were consistent with the National Oil and Hazardous Substances Pollution Contingency Plan[1], and the California Health and Safety Code.

The Community Relations Plan included provisions for notifying the public of the availability of the RAP for review and comment, making the RAP available for public review and comment for a period of 30 days, and publishing a brief analysis of the site and the proposed remedial action. Following completion of the 30-day public comment period and minor revisions to the RAP, the RWQCB approved the RAP for implementation. The Community Relations Plan also included provisions for holding a public meeting to discuss the history of the site and proposed remedial action, addressing comments received from concerned public, and publishing the selected final remedial action for the site following expiration of the public comment period. A copy of the Community Relations Plan, public notice, fact sheet, fact sheet distribution list and distribution map, and public comments and responses were appended to the Final RAP.

This report summarizes the remedial actions performed in accordance with the Final RAP, and presents the results of verification soil sampling and waste management activities. This report also provides a brief overview of the results of previous investigations at the former Mercer facility. A more detailed overview of the previous investigations is presented in the RAP and previous investigation reports (PES, 2000; IT, 2000a and 2000b).

2.0 SITE BACKGROUND

2.1 Site Location and Description

The former Mercer facility is located at 230 Portage Avenue in Palo Alto, California within El Camino Center (Plate 1). The subject site is a vacant tenant space located within a larger commercial and light industrial building near the north end of Portage Avenue. It is located in

[1] Title 40 Code of Federal Regulations, Part 300.

a primarily commercial and light industrial area with some residences present. The property is zoned for residential use but is being used for commercial purposes pursuant to a variance that is scheduled to expire in the year 2019, if it is not terminated earlier. The property is improved with one structure. The entire property, with the exception of landscaped areas and the onsite structure, is covered with asphalt-concrete parking lots and concrete sidewalks. The floor of the former Mercer facility is elevated above the surrounding ground surface by approximately four feet. A site plan is included as Plate 2.

2.2 Former Site Use

The former Mercer tenant space is located in the eastern portion of the El Camino Center building (Plate 2). The tenant space is currently vacant. The major tenant at El Camino Center is Frye's Electronics (an electronics and appliance retailer), located west of the subject site. Two other tenants occupy segments of the building to the east for office purposes.

El Camino Center personnel approximated that the parcel has been in use since the 1940s. Prior to World War II, the parcel, including the tenant space formerly occupied by Mercer, was purportedly used as a fruit cannery (Osborn, 2001). Between World War II and the early 1970s when El Camino Center purchased the parcel, the area, including the subject site, was first used by Safeway, as a food distribution warehouse and subsequently by Maximart as a strip mall consisting of numerous retail shops (Osborn, 2001). Maximart left after El Camino Center purchased the property, and the former Mercer tenant space was reportedly used as a warehouse for the storage of dry goods until Mercer's occupancy commenced in 1989.

According to information provided to PES during an inspection of the Mercer tenant space in December 1999, Mercer occupied this location between 1989 and 1999. Plate 3 shows the layout of the former Mercer facility.

At this location, Mercer operated freeze-drying and food packing equipment. Solvents, including trichloroethylene (TCE) and Genesolv 2000, were used in the refrigeration equipment for the freeze-drying process. Documentation from Santa Clara County Hazardous Materials Compliance Division indicated that Mercer stored approximately 650 gallons of Genesolv 2000 on the site.

2.3 Previous Investigations

Several subsurface remedial investigations have been performed by PES and IT Corporation (IT) at the subject site to assess the lateral and vertical extent of contaminants in soil resulting from the former Mercer operations. The investigations are described in the RAP.

Soil samples were collected to a maximum depth of 24 feet bgs. The locations of previously sampled soil borings are shown on Plate 3. Soil samples were analyzed for volatile organic compounds (VOCs). Detected VOCs included: (1) TCE; (2) 1,1-dichloroethylene; (3) cis-1,

2-dichloroethylene; (4) trans-1,2-dichloroethylene; (5) acetone; (6) methylethyl ketone; and (7) tert-butanol.

TCE was detected at concentrations ranging from 3 micrograms per kilogram (μg/kg) to 6,800 μg/kg (IT, 2000b). In general, TCE concentrations in soil decreased laterally with increased distance away from the former location of the refrigeration equipment at the former Mercer facility. Concentrations in soil also generally decreased with depth. Tabulated soil sample analytical results from the investigations are included as Appendix B.

TCE was identified as the primary chemical of concern at the Site because: (1) it was the most prevalent VOC detected in soil; (2) it was present at higher concentrations than other VOCs detected in site soil; (3) it possesses the lowest regulatory action level in groundwater of the detected contaminants; and (4) it represented the greatest potential human health risk to site users.

2.4 Remedial Objectives

On the basis of results of previous investigations (PES, 2000; IT, 2000a and 2000b), PES prepared the RAP to: (1) select a risk-based TCE target soil cleanup concentration of 0.2 milligrams per kilogram (mg/kg); and (2) describe the procedures to implement the remedial activities. The RWQCB approved TCE target soil cleanup concentration in the final RAP is 0.2 mg/kg. The excavation area proposed in the RAP to achieve the cleanup goal was expected to range from approximately 160 square feet (ft^2) to 800 ft^2 in the vicinity of the former refrigeration unit in the former Mercer facility (Plate 3). The proposed maximum depth of the excavation was estimated to be 20 feet below grade based on analytical results from soil samples collected from previously drilled soil borings B and D (Plate 3 and Appendix B). A site plan showing the anticipated extent of the excavation is included as Plate 4.

3.0 REMEDIATION ACTIVITIES

Soil excavation was conducted at the former Mercer facility to remove soil containing concentrations of TCE exceeding the target soil cleanup concentration of 0.2 mg/kg.

Remedial activities at the site consisted of: (1) acquiring necessary permits; (2) preparing health and safety plans; (3) sawcutting and removing concrete from areas above the impacted soil; (4) excavating soil with TCE concentrations exceeding the target cleanup concentration; (5) collecting and analyzing verification soil samples from the excavation to verify the target cleanup concentration was met; (6) collecting and analyzing waste characterization samples of the concrete and excavated soil for offsite recycling and disposal; and (7) backfilling and resurfacing the excavation. These activities are described in the following sections.

3.1 Preliminary Activities

El Camino Center contracted with Cornerstone Environmental Contractors, Inc. (Cornerstone) of Lafayette, California to perform soil excavation and backfilling activities. The work was conducted between January 2 and January 19, 2002. PES was present to observe and document the work. Cornerstone and PES each prepared site-specific health and safety plans prior to the remediation in accordance with Occupational Safety and Health Administration regulations[2].

An underground utility service locator was hired to clear the proposed excavation of subsurface utilities. In addition, Underground Service Alert was contacted to schedule visits by public and private utility companies.

Cornerstone acquired permits from the City of Palo Alto prior to conducting remediation at the site. As part of the permit acquisition process, a structural analysis prepared by Hohbach-Lewin, Inc. of Palo Alto, California, was submitted to the City of Palo Alto. A copy of the permit is provided in Appendix C.

3.2 Site Preparation

Before conducting remediation activities, the walls and ceiling in the rear (northern) portion of the former Mercer facility were lined with plastic sheeting to reduce dust settlement on the surfaces. Cornerstone constructed a temporary ramp consisting of baserock to create an entrance from the rear parking lot to the elevated loading dock.

The concrete slab above the excavation was sawcut and removed by a Cornerstone subcontractor on January 2 and 3, 2002. The concrete was temporarily stockpiled on plastic sheeting in a bermed area within secured fencing in the rear parking lot.

3.3 Soil Excavation

The impacted soil above the target cleanup concentration was excavated between January 8 and January 15, 2002. A test pit was excavated adjacent to the wall located in the center of the excavation in order to verify the presence of a footing beneath the wall prior to excavation activities. A concrete foundation was present beneath the wall. The foundation is approximately 1-foot wide and extends approximately 4.5-feet below grade.

Approximately 285 cubic yards (cy) of TCE-impacted soil was removed from the facility. The excavation was conducted using two track-mounted mini-excavators, a rubber-tired Bobcat, and hand-held equipment. Excavated soil was placed on and covered with plastic sheeting inside a bermed area and secured fencing in the rear parking lot north of the facility.

---

[2] Title 29 Code of Federal Regulations, 1910.120.

The TCE-impacted soil was excavated using conventional and "slot trench" techniques. Conventional excavation was first conducted to approximately 4 feet below grade across the entire excavation area. Slot trenching was then conducted to protect the integrity of the building and for worker safety when removing soil from deeper portions of the excavation (i.e., greater than 4 feet below grade). Approximately 5-foot wide slot trenches oriented in the northwest-southeast direction (parallel to the long axis of the tenant space) were excavated to remove TCE-impacted soil at depths greater than 4 feet below grade.

During excavation, several other concrete footings and inactive utilities were uncovered and removed. An active fire drain located along the wall was removed from the excavation and set aside for re-assembly during backfilling activities. A concrete footing located approximately 1 foot northwest of the wall foundation did not require removal. Soil located within the annular space between the two foundations was subsequently removed using hand excavation equipment.

In order to ensure the integrity of the wall separating the interior and exterior of the tenant space, excavation activities were performed concurrently on both sides of the wall. To reduce potential settlement during excavation, soil was excavated during benching to approximately 0.5 foot above the bottom of the foundations.

Verification of the excavation depth was performed during and after completion of each slot trench. Verification soil samples were collected from the bottom of the excavation to verify the target remedial concentration was met. Verification soil sampling was implemented by collecting samples at the bottom and the sidewalls of the slot trenches and the bottom and sidewalls of the "bench" area. The soil samples collected at the sidewalls of the slots were collected at depth intervals corresponding to areas exhibiting field indications of potential contamination and at depths where previous samples indicated the highest levels of contaminants were present. Excavation details are presented on Plate 5.

The excavated area inside of the former Mercer facility had surficial dimensions of approximately 33 feet by 50 feet (1,650 ft^2). The depth of the soil excavation ranged from approximately 4 feet below grade (bench area) to approximately 20.5 feet below grade (Plate 5). Excavation contours are depicted on Plate 5. Excavation cross-sections are shown on Plate 6. The locations of the cross-sections are shown on Plate 5.

The soil encountered during the excavation consisted of a gravelly clay fill to approximately 1.5 feet below grade. The gravelly clay fill was underlain by a sandy clay fill to approximately 6 feet below grade. Beneath the fill, a highly plastic clay was present to 20.5 feet below grade, the maximum depth of the excavation. The clay was dark gray in color to approximately 14 feet below grade where the color changed to a yellowish orange. No groundwater was encountered.

The final limits of the excavation and the verification sampling locations are presented on Plate 5. Photographs of the soil remediation activities are presented on Plates 6 through 8.

3.4 Verification Soil Sampling Methodology and Analytical Program

Verification soil samples were collected from the excavation for chemical analyses during remedial activities. The samples were collected to verify implementation of the target cleanup concentration. If the target cleanup concentration was exceeded, excavation of TCE-impacted soil was continued until the TCE concentration in soil samples was below the target concentration. The verification soil sample locations are shown on Plate 5. A total of 45 verification soil samples were collected from the bottom and sidewalls of excavated slots and benches. These samples were collected on January 9, 10 and 14, 2002.

Verification soil samples were collected directly from the bucket of the mini-excavator or exposed soil in the excavation by driving pre-cleaned 3-inch long stainless-steel tubes into the soil. After collection, the ends of the tube were sealed with Teflon™ sheeting and covered with plastic end caps. Sample tubes were labeled with project name and number, sample identification, sampling time and date.

Soil samples were transferred under chain-of-custody protocol to an onsite mobile laboratory operated by STL On-Site Technologies of Westfield, Massachusetts, a California Department of Health Services-certified laboratory. All samples were analyzed for VOCs using U.S. EPA Test Method 8260B. The laboratory analytical reports and chain of custody forms are presented in Appendix D.

3.5 Verification Soil Sample Results

Verification sample results are presented in Table 1. Results of the final verification samples are also presented on Plate 5.

As shown on Plate 5, the target cleanup concentration of 0.2 mg/kg TCE was, as anticipated, reached in the final verification samples collected from the bottom and sidewalls of the slot trenches and the bottom and the sidewalls of the bench area.

3.6 Waste Characterization Results and Waste Management

Soil excavated from the site was stockpiled in the parking lot at the rear of the facility. Excavated soil was characterized by collecting one four-point composite soil sample for VOC analyses per approximately 100 cy. The samples were collected directly from the soil stockpiles. These samples were capped, labeled, and handled under the same protocol as the verification soil samples collected from the excavation.

A total of four (4) four-point composite characterization samples were analyzed and TCE was not detected above the reporting limit of 0.025 mg/kg. The results of the chemical analyses conducted for waste characterization are presented in Appendix D.

A composite concrete sample was also collected for waste characterization purposes. Concrete was chipped from various locations within the stockpile using a clean chisel and hammer and placed in a sealed, re-sealable plastic bag. The sample was labeled with project name and number, sample identification, sampling time, and date.

The concrete sample was transported by courier under chain-of-custody protocol to STL San Francisco of Pleasanton, California, a state-certified laboratory. The composite sample was analyzed for VOCs using U.S. EPA Test Method 8260B. TCE was not detected above the reporting limit of .021 mg/kg. Total xylenes were detected at .022 mg/kg. The laboratory analytical report and chain of custody form are presented in Appendix D.

On February 6 and 7, 2002, the soil was transported to the Altamont Landfill in Livermore, California for disposal as non-hazardous solid waste. The soil was transported by Jervicon Inc. of Santa Maria, California. Approximately, 542 tons of soil was transported to and disposed at the Altamont Landfill. Soil transportation and disposal documentation is included in Appendix E.

Concrete removed from the area of excavation was transported to Harbor Sand & Gravel in Redwood City, California for recycling. On February 6 and 7, 2002 the concrete was transported by Greg's Trucking Service, Inc. of San Mateo, California. Approximately 20 tons of concrete were recycled. Concrete recycling documentation is presented in Appendix E.

3.7 Excavation Backfilling and Fire Drain Repair

The slot trench excavations were backfilled to a depth of approximately 4 feet below grade the same day they were excavated. A controlled density flowable fill was used, which consisted of a two-sack cement-sand slurry mixture. The slurry was used to rapidly stabilize the slot trenches in order to protect the integrity of the building and provide worker protection. The slurry was placed in slot trenches after final verification samples were collected and analyzed from each slot trench. A total of approximately 190 cubic yards of slurry was pumped into the slot excavations. Copies of the control density fill delivery tickets are presented in Appendix F.

Prior to backfilling the excavation using conventional earthwork techniques, two support columns in the vicinity of the excavation were reinforced by Cornerstone. The reinforcement of the columns was conducted to fulfill permit requirements.

Between January 15 and January 23, 2002, the upper four feet of the excavation was backfilled and compacted by Cornerstone. The fill material was an imported Class 2 aggregate base. Documentation of the imported Class 2 aggregate base is presented in Appendix G. Excavated soil was evaluated for geotechnical suitability by staff of Smith-Emery Company of San Francisco, California. Approximately 21 cy of the material was found to be suitable and was re-used as backfill. The backfill material was placed in lifts no greater than 8 inches thick and

compacted using a Bomag compactor. The backfill was compacted to at least 95 percent of the maximum relative dry density. Field density testing of the compacted fill was conducted by Smith-Emery Company. Copies of the field density test data are presented in Appendix H. The excavation was backfilled to within approximately 6 inches of the top of the existing concrete slab surface to allow construction of a replacement concrete floor slab.

The section of fire drain pipeline removed for the excavation was replaced by Cornerstone following placement of the underlying fill materials.

3.8 Concrete Replacement

After backfilling was completed, the concrete floor slab was replaced. Concrete was placed by Cornerstone on January 24, 2001 to match the surface of the existing slab. The concrete consisted of a 5-sack mix with a 28-day strength of 3,000 pounds per square inch, complying with ASTM C94. The replaced slab was reinforced and tied into the existing slab by drilling into the existing concrete slab, inserting and epoxying in Number 4 steel dowels in to the slab at approximately 12 inch centers. Wire mesh steel reinforcement was laid at approximately the center of the slab thickness throughout the excavation area prior to the concrete pour. A typical section of the concrete replacement is shown on Plate 5. A photograph of the replaced section of concrete is shown on Plate 7, Photograph 1. Copies of the concrete delivery tickets are presented in Appendix I.

4.0 SUMMARY AND CONCLUSIONS

Remedial action has been successfully implemented at the former Mercer facility at the El Camino Center. Approximately 285 cy of TCE-impacted soil has been excavated to a maximum depth of approximately 20.5 feet below grade. On the basis of verification soil samples collected from the bottom and sidewalls of the excavation, soil with TCE concentrations exceeding the target cleanup goal has been removed from the site. Groundwater was not encountered during the excavation of TCE-impacted soil. The excavation has been backfilled with sand cement slurry, imported clean fill, and re-usable excavated "clean" soil. The area of soil excavation has been capped with a concrete slab.

Accordingly, PES, on behalf of El Camino Center, requests a letter from the RWQCB stating that the remedial goal has been achieved and no further investigation or remedial action is required at the site.

Gray Davis
Governor

RECEIVED OCT 2 3 2001

Date: October 18, 2001
File No. 43S0965 (DAW)

El Camino Center
Attn: Mr. Boyd Smith
3201 Ash Street
Palo Alto, CA 94306

Subject: Concurrence with the Remedial Action Plan for the site at 230 Portage Avenue, Palo Alto, Santa Clara County.

Dear Mr. Smith:

This letter responds to your final Remedial Action Plan (RAP) dated October 18, 2001, describing proposed remedial actions to address the soil contamination at a site formerly occupied by Mercer Processing Inc. at 230 Portage Avenue, Palo Alto. The submittal describes the remedial investigations conducted at the site, considers alternatives for mitigating the contamination, and recommends a course of action. Board staff concur with the recommended remedial action.

Investigation reports describing the extent of contamination by trichloroethylene at the site were submitted to the Board on March 22, 2001. A meeting was held on April 3, 2001, between Board staff, yourself, your consultants, PES Environmental Inc., and your attorney, Mr. David Cooke. At that meeting additional information on the site was presented which described the threat to groundwater due to the contamination. Based on the information submitted, the Board sent a letter to El Camino Center on May 9, 2001, requesting a RAP.

A draft RAP was first submitted on June 26, 2001. Board staff reviewed the RAP and it was subsequently revised and made available for public review on July 28, 2001. The RAP recommends excavation and off-site disposal of soils contaminated with trichloroethylene. To the extent practicable, all soils containing trichloroethylene at concentrations greater than 0.2 mg/kg will be excavated and disposed off-site. Modeling studies have indicated that, at this level, if the TCE in the soil leaches into the underlying aquifer it will not further degrade the existing beneficial uses of that water. The clean up level for soil is also fully protective of public health.

A public notice of the draft RAP was published and the public was invited to submit comments to the Board between July 28 and August 27, 2001. A public meeting was held on August 8, 2001, to facilitate and receive input from the community and other interested groups.

The Board received written comments on the draft RAP as well as oral comments at the public meeting. Board staff addressed these comments in an internal memorandum. A copy of this memorandum is included as an appendix in the final RAP. There were two responses that indicated changes and amendments to the RAP. These changes and amendments have been incorporated into the final RAP submitted to the Board on October 18, 2001. Board staff concur with the selected alternative described in the RAP.

Implementation of the RAP is anticipated to start in October 2001. Please give the Board three working days notice of the start of excavation and submit a completion report within 60 days of completing the remedial work.

If you have any questions, please contact Derek Whitworth of my staff at (510) 622 2349 [e-mail dw@rb2.swrcb.ca.gov].

Sincerely,

Stephen A. Hill
Toxics Cleanup Division Chief

Notes:
µg/kg = micrograms per kilogram
bgs = below ground surface
< = compound not detected at or above the respective laboratory reporting limit
J = estimated value, less than the laboratory practical quantitation limit but greater than the method detection limit
NA = Not analyzed
NL = Not listed
NR = No sample recovery
TCE = trichloroethylene
MEK = methyl ethyl ketone
t-butanol = tert-butanol
1,1-DCE = 1,1,-dichloroethylene
cis-1,2-DCE = cis-1,2-dichloroethylene
trans-1,2-DCE = trans-1,2-dichloroethylene
[1] = Boring drilled and sampled by PES in December 1999
[2] = Boring drilled and sampled by IT Corp. in June, September or November 2000
[3] = Precise sample designation, sample depth, sample date, and laboratory reporting limits unknown; laboratory reports for these samples not provided in IT Corp. report dated November 21, 2000. Data presented graphically in IT Corp. November 21, 2000 Report.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E 1527-05) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

TARGET PROPERTY INFORMATION

ADDRESS

3200 PARK BOULEVARD
PALO ALTO, CA 94306

COORDINATES

Latitude (North):	37.423500 - 37° 25' 24.6''

RADINFO ---- Radiation Information Database
FINDS ---- Facility Index System/Facility Registry System
RAATS ---- RCRA Administrative Action Tracking System
NPDES ---- NPDES Permits Listing
WDS ---- Waste Discharge System
SAN JOSE HAZMAT ---- Hazardous Material Facilities
WIP ---- Well Investigation Program Case List

EMI ---------- Emissions Inventory Data
INDIAN RESERV ---------- Indian Reservations
SCRD DRYCLEANERS ---------- State Coalition for Remediation of Drycleaners Listing
PCB TRANSFORMER ---------- PCB Transformer Registration Database
PROC ---------- Certified Processors Database
MWMP ---------- Medical Waste Management Program Listing
COAL ASH DOE ---------- Sleam-Electric Plan Operation Data
COAL ASH EPA ---------- Coal Combustion Residues Surface Impoundments List
HWT ---------- Registered Hazardous Waste Transporter Database
FINANCIAL ASSURANCE ---------- Financial Assurance Information Listing

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants ---------- EDR Proprietary Manufactured Gas Plants
EDR Historical Auto Stations ---------- EDR Proprietary Historic Gas Stations
EDR Historical Cleaners ---------- EDR Proprietary Historic Dry Cleaners

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Federal NPL site list

NPL: Also known as Superfund, the National Priority List database is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund program. The source of this database is the U.S. EPA.

A review of the NPL list, as provided by EDR, and dated 07/02/2010 has revealed that there are 2 NPL sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

Federal CERCLIS list

CERCLIS: The Comprehensive Environmental Response, Compensation and Liability Information System contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

A review of the CERCLIS list, as provided by EDR, and dated 01/29/2010 has revealed that there is 1 CERCLIS site within approximately 0.5 miles of the target property.

HEWLETT-PACKARD (620-640 PAGE	***620 - 640 PAGE MILL RD.***	***0 - 1/8 (0.000 mi.)***	***0***	***8***

Federal CERCLIS NFRAP site List

CERC-NFRAP: Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

A review of the CERC-NFRAP list, as provided by EDR, and dated 06/23/2009 has revealed that there are 9 CERC-NFRAP sites within approximately 0.5 miles of the target property.

Federal RCRA CORRACTS facilities list

CORRACTS: CORRACTS is a list of handlers with RCRA Corrective Action Activity. This report shows which nationally-defined corrective action core events have occurred for every handler that has had corrective action activity.

A review of the CORRACTS list, as provided by EDR, and dated 05/25/2010 has revealed that there are 4 CORRACTS sites within approximately 1 mile of the target property.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

A review of the RCRA-TSDF list, as provided by EDR, and dated 02/17/2010 has revealed that there is 1 RCRA-TSDF site within approximately 0.5 miles of the target property.

Federal RCRA generators list

RCRA-LQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Large quantity generators (LQGs) generate over 1,000 kilograms (kg) of hazardous waste, or over 1 kg of acutely hazardous waste per month.

A review of the RCRA-LQG list, as provided by EDR, and dated 02/17/2010 has revealed that there are 2 RCRA-LQG sites within approximately 0.25 miles of the target property.

RCRA-SQG: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Small quantity generators (SQGs) generate between 100 kg and 1,000 kg of hazardous waste per month.

A review of the RCRA-SQG list, as provided by EDR, and dated 02/17/2010 has revealed that there are 21 RCRA-SQG sites within approximately 0.25 miles of the target property.

US INST CONTROL: A listing of sites with institutional controls in place. Institutional controls include administrative measures, such as groundwater use restrictions, construction restrictions, property use restrictions, and post remediation care requirements intended to prevent exposure to contaminants remaining on site. Deed restrictions are generally required as part of the institutional controls.

A review of the US INST CONTROL list, as provided by EDR, and dated 12/20/2009 has revealed that there is 1 US INST CONTROL site within approximately 0.5 miles of the target property.

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 08/18/2010 has revealed that there are 14 ENVIROSTOR sites within approximately 1 mile of the target property.

EXECUTIVE SUMMARY

State and tribal leaking storage tank lists

LUST: The Leaking Underground Storage Tank Incident Reports contain an inventory of reported leaking underground storage tank incidents. The data come from the State Water Resources Control Board Leaking Underground Storage Tank Information System.

A review of the LUST list, as provided by EDR, and dated 09/20/2010 has revealed that there are 25 LUST sites within approximately 0.5 miles of the target property.

HIST LUST: A listing of open and closed leaking underground storage tanks. This listing is no longer updated by the county. Leaking underground storage tanks are now handled by the Department of Environmental Health.

A review of the HIST LUST list, as provided by EDR, and dated 03/29/2005 has revealed that there are 24 HIST LUST sites within approximately 0.5 miles of the target property.

State and tribal registered storage tank lists

UST: The Underground Storage Tank database contains registered USTs. USTs are regulated under Subtitle I of the Resource Conservation and Recovery Act (RCRA). The data come from the State Water Resources Control Board's Hazardous Substance Storage Container Database.

A review of the UST list, as provided by EDR, and dated 09/20/2010 has revealed that there is 1 UST site within approximately 0.25 miles of the target property.

SWEEPS UST: Statewide Environmental Evaluation and Planning System. This underground storage tank listing was updated and maintained by a company contacted by the SWRCB in the early 1990's. The listing is no longer updated or maintained. The local agency is the contact for more information on a site on the SWEEPS list.

A review of the SWEEPS UST list, as provided by EDR, and dated 06/01/1994 has revealed that there are 12 SWEEPS UST sites within approximately 0.25 miles of the target property.

Other Ascertainable Records

RCRA-NonGen: RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

A review of the RCRA-NonGen list, as provided by EDR, and dated 02/17/2010 has revealed that there are 4 RCRA-NonGen sites within approximately 0.25 miles of the target property.

Summary Details:

Conditions at proposal June 24, 1988): Hewlett-Packard manufactured optoelectronic equipment on a 10-acre site at 620-640 Page Mill Road in Palo Alto, Santa Clara County, California, until 1986. In July 1981, at least 300 gallons of waste solvents, including 1,1,1-trichloroethane, trichloroethylene, toluene, xylene, and alcohols, leaked from a buried storage tank for a period of at least 3 weeks. The company excavated the tank and approximately 100 cubic yards of contaminated soil and transported the materials to a ha ardous waste facility regulated under Subtitle C of the Resource Conservation and Recovery Act. Since 1982, the company has been pumping and treating contaminated ground water. Tests conducted in 1986 by a consultant to Hewlett-Packard detected trans-1,2-dichloroethylene, 1,1-dichloroethylene, trichloroethylene, 1,1,1-trichloroethane, and xylene, several in high concentrations 290,000 parts per billion) in ground water under the tank area. An estimated 57,000 people obtain drinking water from municipal wells within 3 miles of the site. In 1987, Hewlett-Packard excavated an

HEWLETT-PACKARD (620-640 PAGE MILL ROAD) (Continued) **1000281842**

additional 810 cubic yards of soil around the former tank area. Status February 21, 1990): Hewlett-Packard is conducting a remedial investigation/feasibility study RI/FS) to determine the type and extent of off-site contamination and identify alternatives for remedial action. A report on the RI/FS is due in February 1990.

Site Description: The Hewlett-Packard 620-640 Page Mill Road (HP-640 PMR) Superfund site is located in Palo Alto, California within the Stanford Research Park, a light-industrial and research area owned by Stanford University. Leaks from an underground waste solvent storage tank have resulted in soil and ground water contamination at the site. Land use in the vicinity of the site is predominantly commercial and industrial, with smaller areas of residential development. The nearest residential areas are located approximately 1/8 mile northeast of the facility. Five municipal backup supply wells drawing from a deep aquifer are within three miles of the site but are not currently used. All of the City of Palo Alto drinking water is supplied by the San Francisco Water Department's Hetch Hetchy System. The HP-640 PMR site is located near the western margin of the Santa Clara Valley. The valley surface in this area is a gently sloping alluvial plain that extends northeast from the foothills to San Francisco Bay, located approximately three miles to the northeast. The area is underlain by interbedded alluvial fan deposits and fine-grained floodplain deposits. The only surface water in the vicinity of HP-640 PMR is Matadero Creek, located to the east of the site. Matadero Creek is an intermittent stream that originates near the Los Altos Hills and flows in a northerly direction through the residential, commercial and industrial areas of Palo Alto. Two areas have been designated as ground water study areas: the California Olive Emerson (COE) Study Area (named by the bordering streets) and the Perimeter Area which represents the limits of the known ground water contamination plume. The COE and Perimeter Areas, are underlain by two primary aquifers, the upper A Aquifer and the lower B Aquifer. Each of these two aquifers contain distinct sand zones. The A Aquifer extends up to 55 feet below ground surface, and groundwater is first encountered at depths between 15 and 30 feet. Within the A Aquifer, the A1 Upper (A1U) Zone is generally found between the depths of 15 and 30 feet, the A1 Zone between 30 and 40 feet, and the A2 Zone between 40 and 55 feet. The general groundwater gradient in the A Aquifer is to the north-northeast. Within the B Aquifer, the B1 Zone occurs below an approximate depth of 60 feet below ground surface. This zone is typically about 10 feet thick. Where encountered, the B2 Zone begins at approximately 85 feet below the surface and is between six and 33 feet thick. The Oregon Expressway Underpass (OEU) serves as a subsurface roadway beneath the Southern Pacific Railroad tracks, Alma Street and Park Boulevard. The underpass, built in 1958, extends 24 feet below ground surface into the aquifer A1U Zone. A dewatering system installed beneath the underpass controls natural groundwater inflow and surface runoff. This dewatering appears to affect groundwater flow in the A1U, A1 and A2 Zones, and does not allow contaminants to bypass the subdrain to the north. During low flow periods, the average rate of groundwater discharge is typically 140 gallons per minute (gpm), with total Volatile Organic Compounds (VOCs) concentrations ranging between 200 and 300 parts per billion (ppb). This water is discharged to the City of Palo Alto sanitary sewer. The discharge during high flow periods consists of both surface water and groundwater; excess is pumped via auxiliary pumps and discharged to the City of Palo Alto storm drain system.Hewlett Packard Company (HP) manufactured gallium arsenide- and silicon-based semiconductors at the property from 1962 until operations ceased in 1986. The facility consisted of two main buildings (#10 and #11) and a storage building. Both buildings have since been demolished and the site redeveloped for an office building with an underground garage. Site investigation began in 1981 after a leaking 1000-gallon underground solvent

HEWLETT-PACKARD (620-640 PAGE MILL ROAD) (Continued) **1000281842**

storage tank was discovered between Building 11 and the storage building. Sources of metals were found in Building 10, associated with acid neutralization pumps, piping and operations areas in the building. The primary contaminants detected at the site were trichloroethene (TCE); 1,1,1-trichloroethane (1,1,1-TCA); tetrachloroethene (PCE); gallium; and arsenic. Interim Remedial Measures (IRMs) have been conducted since 1982. Soil excavations at the HP-640 PM) site between 1987 and 1992 removed approximately 7,700 cubic yards of contaminated soil to Class I landfills and approximately 3,000 cubic yards to Class III landfills. Additional areas of the site were also excavated to remove above-background concentrations of arsenic, gallium and several other metals. Groundwater remediation at HP-640 PMR was initiated in 1982 for seven months; extraction was restarted in 1987 and has continued to the present. On June 24, 1988, the U.S. EPA proposed adding the HP-640 PMR site to the National Priorities List (NPL), subject to the requirements of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). On February 1, 1990, the HP-640 PMR facility was added to the NPL. Since the listing, the groundwater contamination plume emanating from the HP-640 PMR site was found to be commingled in part with groundwater contamination plumes associated with other potential sources beyond the HP-640 PMR facility boundaries. Pursuant to the South Bay Multi-Site Cooperative Agreement and the South Bay Groundwater Contamination Enforcement Agreement entered into by the California Regional Water Quality Control Board (RWQCB), EPA and the California Department of Toxic Substances Control (DTSC) (formerly the California Department of Health Services (DHS)), the RWQCB has been acting as lead regulatory agency for the site. In July 1994, the RWQCB released a Proposed Plan fact sheet for the site that described the proposed remedy for the site. A public notice was published allowing 30 days for public comment on the RI/FS and Proposed Plan. A public meeting was held on July 26, 1994.

Handler Activities Summary:

U.S. importer of hazardous waste:	No
Mixed waste (haz. and radioactive):	Unknown
Recycler of hazardous waste:	No
Transporter of hazardous waste:	No
Treater, storer or disposer of HW:	No
Underground injection activity:	No
On-site burner exemption:	No
Furnace exemption:	No
Used oil fuel burner:	No
Used oil processor:	No
User oil refiner:	No
Used oil fuel marketer to burner:	No
Used oil Specification marketer:	No
Used oil transfer facility:	No
Used oil transporter:	No
Off-site waste receiver:	Verified to be non-commercial

PARK AVENUE MOTORS (Continued) **1004677569**

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Violation Status: No violations found

Completed Info:
Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: De-Certification
Completed Date: 1993-11-15 00:00:00
Comments: In September 1992; closure of surface impoundments and 100 cubic yards of contaminated soil ware removed. In December 1983; company closed a water treatment system which the Department of Toxic Substances Control approved and 28 cubic yards of soil were removed and disposed of during the closure of the water treatment system. Dura Bond has been working with RWQCB concerning fuel spills and some groundwater contamination problems from an off-site source since 1984. Therefore, the site has been "decertified" and the previous cert is considered a removal action. The status of the site shows as referred to the RWQCB.

Environmental Interest/Information System
California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Reponsible Party:	TIER 3 (MINIMUM HAZARD THRESHOLD SITE) REPORT
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	Not reported
Site Description:	A ditch adjacent to an auto body shop located at the above address was identified by the Department as being contaminated with an oily black material containing lead. It is suspected that this material accumulated in the ditch from runoff at the auto body shop location. Subsequent to discovery, the area containing the ditch was graded and paved with asphalt. An auto dealership is now located on the site of the former ditch.
Hazardous Waste Desc:	Analysis of the oily material indicated the presence of petroleum products and moderate concentrations of lead.
Threat To Public Health & Env:	Not reported
Site Activity Status:	As a Tier 3 site, this site will be listed annually in this report. If the asphalt cap is removed and the property is proposed for development for other usage, DHS may order that some additional abatement be conducted.

Longitude:	-122.137047
Case Type:	Cleanup Program Site
Case Worker:	LG
Local Agency:	Not reported
RB Case Number:	43s1044
File Location:	Not reported
Potential Media Affected:	Other Groundwater (uses other than drinking water)
Potential Contaminants of Concern:	* Solvents
Site History:	No Water Board oversight of cleanup at this site. This case is included in Geotracker because the site is covered by the Water Board s NPDES general permits for discharges from pump and treat systems to surface waters (one each for fuels- and VOC-impacted sites). This can happen for two reasons: (i) the site is overseen by another agency (e.g., USEPA or DTSC) and needs coverage under one of the NPDES general permits or (ii) construction dewatering in an area of groundwater contamination necessitates NPDES general permit coverage. Including this case in Geotracker helps staff to receive and review required NPDES reports.

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

COMMUNICATIONS & POWER INDUSTRIES, INC. (Continued) **1001023035**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Generated waste on-site: Unknown

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D007
Waste name: CHROMIUM

Waste code: D008
Waste name: LEAD

Waste code: D018
Waste name: BENZENE

Waste code: D035
Waste name: METHYL ETHYL KETONE

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F006
Waste name: WASTEWATER TREATMENT SLUDGES FROM ELECTROPLATING OPERATIONS EXCEPT FROM THE FOLLOWING PROCESSES: (1) SULFURIC ACID ANODIZING OF ALUMINUM;

COMMUNICATIONS & POWER INDUSTRIES, INC. (Continued) **1007198605**

(2) TIN PLATING ON CARBON STEEL; (3) ZINC PLATING (SEGREGATED BASIS) ON CARBON STEEL; (4) ALUMINUM OR ZINC-ALUMINUM PLATING ON CARBON STEEL; (5) CLEANING/STRIPPING ASSOCIATED WITH TIN, ZINC AND ALUMINUM PLATING ON CARBON STEEL; AND (6) CHEMICAL ETCHING AND MILLING OF ALUMINUM.

Waste code: F007
Waste name: SPENT CYANIDE PLATING BATH SOLUTIONS FROM ELECTROPLATING OPERATIONS

Waste code: F008
Waste name: PLATING BATH RESIDUES FROM THE BOTTOM OF PLATING BATHS FROM ELECTROPLATING OPERATIONS WHERE CYANIDES ARE USED IN THE PROCESS.

Waste code: LABP
Waste name: LAB PACK

Violation Status: No violations found

CA BOND EXP. PLAN:
Reponsible Party: RESPONSIBLE PARTY-LEAD SITE CLEANUP WORKPLAN
Project Revenue Source Company: Not reported
Project Revenue Source Addr: Not reported
Project Revenue Source City,St,Zip: Not reported
Project Revenue Source Desc: The RPs will be issued a remedial action order and are expected to comply with it. DHS has budgeted $50,000 to provide for oversight and monitoring of investigation and cleanup efforts. DHS will recover 100 percent of direct costs plus staff costs and overhead related to the project. The responsible parties will pay all costs associated with remedial investigations and cleanup activities.
Site Description: Varian, an electronics manufacturing firm, has occupied the site since 1952. Investigations were initiated by Varian as part of a regional investigation in the Stanford Research Park.
Hazardous Waste Desc: Investigations are ongoing in three areas of the facility. At the north end of the site, chlorinated solvents, including up to 1,500 parts per billion (ppb) of trichloroethene (TCE) have been detected in shallow ground water. Gasoline contamination has been found in soil and shallow ground water near Building 4. Investigations at an adjacent site, Aydin, revealed TCE at up to 1,400 ppb and DCE an 190 ppb in shallow ground water at the south end of the Varian facility.
Threat To Public Health & Env: Contamination of shallow ground water poses a potential threat to deeper aquifers currently used as backup municipal water supplies. There are three municipal wells within a two mile radius of the site.
Site Activity Status: DHS will prepare a consent order or a remedial action order requiring further investigation and site cleanup. Varian is continuing its investigation work and is expected to comply with the order.

VARIAN (Continued) **S100833273**

Completed Date: 1997-08-21 00:00:00
Comments: Certified Site. Amended Order to include operation and maintenance of the remedial system. Groundwater extraction and treatment will continue in accordance with the approved operation and maintenance plan.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Initial Study/ Neg. Declaration
Completed Date: 1995-01-05 00:00:00
Comments: Negative declaration approved for RAP.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Initial Study/ Neg. Declaration
Completed Date: 1991-12-10 00:00:00
Comments: Completed negative declaration for Interim Removal Action of groundwater extraction and treatment in building 1 area.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Initial Study/ Neg. Declaration
Completed Date: 1991-08-15 00:00:00
Comments: Completed CEQA Negative Declaration for soil vapor extraction in building 3 area.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Consent Order
Completed Date: 1989-05-30 00:00:00
Comments: Consent Order signed with Varian Associates to investigate and remediate soil and groundwater at the site.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Amendment - Order/Agreement
Completed Date: 1998-12-11 00:00:00
Comments: Amendment to consent order per chapter 6.5 transition.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: CEQA - Notice of Exemption
Completed Date: 2007-04-04 00:00:00
Comments: Notice of exemption approved for modification to the final remedy from groundwater extraction and treatment to injection of sodium permanganate.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: 5 Year Review Reports
Completed Date: 2006-09-25 00:00:00
Comments: Five-Year Review determined that treatment system continues to achieve plume containment but many areas remain above celanup goals. Based on the in-situ chemical oxidation pilot study results, site wide in-situ chemical oxidation is recommended.

Completed Area Name: PROJECT WIDE

VARIAN (Continued) **S100833273**

Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Report
Completed Date: 1996-09-06 00:00:00
Comments: Approved O&M Plan for groundwater system. Treatment system incorporates instrumentation for automatic operation which requires only periodic observation and maintenance.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: 5 Year Review Reports
Completed Date: 2002-04-12 00:00:00
Comments: Completed Five-Year Review. Based on this review, Varian plans to conduct an in-situ pilot test in 2003 to evaluate techniques to reduce the high concentrations of PCE which remain in the groundwater.
Not reported

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Completion Report
Completed Date: 1996-06-11 00:00:00
Comments: Completed FRA for the site which includes groundwater extraction and treatment.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Design/Implementation Workplan
Completed Date: 1995-07-02 00:00:00
Comments: Approved Design documents for groundwater treatment system.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Removal Action Completion Report
Completed Date: 1995-04-06 00:00:00
Comments: Completed RA. Soil Vapor Extraction (SVE) system treated soils impacted with benzene, toluene, ethylbenzene, xylenes (BTEX) and total extractable petroleum hydrocarbons (TPH-G) which were detected near Building 3 onsite. Chemical concentrations have been reduced below remedial action objectives for the site. Verification sampling indicated that the SVE was successful in remediating affected soils. SVE system was shut down and is being removed from the site. The system extracted a cumulative mass of about 15,352 pounds of TPH-G from February 1992 through December 1993.

Event date:	09/06/1996
Event:	CMI Workplan Approved
Event date:	08/21/1997
Event:	Certification Of Remedy Completion Or Construction Completion
Event date:	04/21/1998
Event:	Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and

VARIAN ASSOCIATES CORP HDQTRS (Continued) **1000840764**

reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Event date: 04/21/1998
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Event date: 04/21/1998
Event: CA Responsibility Referred To A Non-RCRA Federal Authority

Event date: 08/11/2000
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Event date: 08/11/2000
Event: Current Human Exposures under Control, Yes, Current Human Exposures Under Control has been verified. Based on a review of information contained in the EI determination, current human exposures are expected to be under control at the facility under current and reasonably expected conditions. This determination will be re-evaluated when the Agency/State becomes aware of significant changes at the facility.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA

VARIAN ASSOCIATES CORP HDQTRS (Continued) **1000840764**

program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System
The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Local Agency: Not reported
RB Case Number: 43S0121
File Location: Regional Board
Potential Media Affected: Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern: Tetrachloroethylene (PCE)
Site History: The developer of this "Brownfield" site is in the proces of completing investigation - mostly to completely delineate the PCE soil gas and groundwater plumes. The remedial investigation report is due 31July09 with anticipated followup review and response by the end of Aug09. No public participation notification requirement is necessary until the developer has completed the site investigation. Based on investigative results, the developer will submit a Remedial Action Plan. After determining the RAP to be approve-able, our PPN protocol requires a Fact Sheet with a 30-day comment period on the RAP. With an RI report submittal at the end of July09 and anticipated review/response by the end of Aug09, the 30-day comment period would begin in either Sept09 or Oct09.

Corrective Action Summary:

Event date: 01/01/1986
Event: Stabilization Measures Implemented, Groundwater extraction and treatment (e.g., to achieve groundwater containment, to achieve MCL).

Event date: 01/01/1986
Event: Stabilization Measures Implemented, Primary measure is source removal and/or treatment (e.g., soil or waste excavation, in-situ soil treatment, off-site treatment).

Event date: 10/01/1987
Event: RFA Completed

Event date: 10/01/1987
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 10/01/1987
Event: CA074HI

Event date: 10/01/1987
Event: CA049PA

Event date: 10/01/1987
Event: CA029ST

Event date: 12/31/1987
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Event date: 04/19/1989

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Potential Media Affected:	Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern:	1,1,1-Trichloroethane (TCA), Other Chlorinated Hydrocarbons, Tetrachloroethylene (PCE), Trichloroethylene (TCE)
Site History:	This site is part of the COE Study Area - bounded by California, Olive, and Emerson Streets - that includes HP 640 PMR (MSCA site) and Varian 601 California. As part of the dual phase extraction (DPE) system GWET was shut down after reaching asymptotic groundwater-CVOC levels in 2001. Subsequent In-Situ Chemical Oxidation (ISCO) began late 2007 when groundwater CVOC levels in well RW-5 were still peaking at over 800 parts per billion (ppb). ISCO baseline groundwater sampling indicated that well OB11-2 - that had not been sampled since 1997 - contained PCE at 120,000 ppb. Subsequent ISCO injections reduced PCE levels below 50 ppb that rebounded to over 1,000 ppb by the next ISCO monitoring event. When elevated groundwater-PCE levels were noted in OB11-2, the Water Board required a workplan to evaluate potential vapor intrusion assessment that was reviewed and approved in January 2008.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Environmental Interest/Information System

California Department of Toxic Substances Control EnviroStor System (DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

CA BOND EXP. PLAN:

Reponsible Party:	RWQCB REFERRAL SITE
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	This site is proposed for the National Priority List. The RWQCB will continue to have lead responsibility for monitoring the RP's remedial actions. Until such time as the RWQCB refers the site to DHS for follow-up using Bond funds, no money will be budgeted from the fund for this site.
Site Description:	The Hewlett-Packard Optoelectric Division (OED) is located on a 10-acre site in Palo Alto on the western edge of the Santa Clara Valley. The surrounding land use is both industrial and commercial.
Hazardous Waste Desc:	Historic releases of 20 chemicals into the soil and ground water onsite have been observed. Waste chemicals including 1,1,1-trichloroethane (TCA) trichloroethylene (TCE), toluene, acetone, xylene, alcohols and other chemicals used in the manufacturing process at the facility were stored in a tank. The concentration of chemicals are highest in the areas immediately below the tank's former location, particularly in the unsaturated zone.
Threat To Public Health & Env:	There are six municipal standby wells as close as 4,000 feet from the site and several private wells located within a 3-mile radius. The standby wells serve a population of approximately 59,000 people during emergency situations. TCE has been detected in the ground water at concentrations as high as 340,000 parts per billion (ppb). Acetone and isopropyl (IPA) were also detected at high levels in the wells near the former tank area. The highest concentration detected in wells located approximately 800 feet down gradient from the source

HEWLETT-PACKARD OPTOELECTRIC DIVISION (Continued) **S100833464**

was 3800 ppb TCE in samples taken in November, 1985.

Site Activity Status: The subsurface soil and ground water at this site are contaminated with organic solvents believed to have leaked from an underground storage tank installed in 1967. The tank and 100 cubic yards of contaminated soil (to a maximum depth of 12.5 feet) were excavated and disposed of offsite in July, 1981. The RWQCB adopted site cleanup requirements for Hewlett-Packard on October 21, 1987.

Environmental Interest/Information System

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Comments: The Oregon Expressway Underpass site is the location of a dewatering system that collects local groundwater for discharge into a culvert.

OREGON EXPRESSWAY UNDERPASS (Continued) **1000236244**

This helps in maintaining a dry roadway and has been in operation since 1959. The site is adjacent to the Hewlett-Packard (HP) facility located at 640 Page Mill Road where groundwater con- tamination has been discovered. Contaminants have migrated from HP far enough to be intercepted by the Oregon Expressway Underpass dewatering system. In addition to HP, other faciliteies like Alza Corp, Aydin Energy, Commodoze, etc. are believed to have contributed to the plume. The RWQCB is the lead agency for the site and has issued order 87-129 to address the problem. Contaminants detected at this site include the following: trichloroethylene 190 PPB; perchloroethylene 110 PPB; trichloroetgabe 25 PPB; 1,-1-dichloroethylene 3.1 PPB; and TRANS -1,2-dichloroethylene 24 PPB; U.S. EPA FIT has recommended NFA under CERCLIS.

Hazardous Waste Summary:

Waste code:	D001
Waste name:	IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS

GENENCOR INTERNATIONAL (Continued) **1000414981**

CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D009
Waste name: MERCURY

Waste code: D010
Waste name: SELENIUM

Waste code: D011
Waste name: SILVER

Waste code: D022
Waste name: CHLOROFORM

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of

GENENCOR INTERNATIONAL (Continued) **1000414981**

events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Environmental Interest/Information System
RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Potential Media Affected: Other Groundwater (uses other than drinking water), Soil
Potential Contaminants of Concern: 1,1,1-Trichloroethane (TCA), Other Chlorinated Hydrocarbons, Trichloroethylene (TCE)

VARIAN ASSOCIATES (Continued) **S106235038**

Site History: The Varian site is a non-Superfund SCP site located within the COE plume - that includes the Hewlett Packard 395 and 640 Page Mill Road (PMR) sites - and is west of and adjacent to the 640 PMR site. Varian conducted remedial actions at the site including: - Soil excavation of the on-site dry well source in 1990 - On-site soil vapor extraction for a few years - On- and off-site groundwater extraction from 1987 until 2003. - On-site In-situ chemical oxidation (ISCO) for the last several years After several years of in-situ chemical oxidation (ISCO), TCE DNAPL conditions persist in the courtyard area through the present time. Varian is about to conduct additonal RI in preparation for changing the remedy from ISCO to enhanced in-situ bioremediation. The Water Board is in the process of reviewing a limited remedial investigationi workplan related to an anticipated EISB pilot study.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

Event: CA049SI

Event date: 09/29/1988
Event: CA036WQ

Event date: 01/01/1990
Event: Stabilization Measures Implemented, Primary measure is source removal and/or treatment (e.g., soil or waste excavation, in-situ soil treatment, off-site treatment).

Event date: 01/01/1990
Event: Stabilization Measures Implemented, Groundwater extraction and treatment (e.g., to achieve groundwater containment, to achieve MCL).

Event date: 12/01/1993
Event: Stabilization Construction Completed

Event date: 12/01/1993
Event: Igration of Contaminated Groundwater under Control, Yes, Migration of Contaminated Groundwater Under Control has been verified. Based on a review of information contained in the EI determination, it has been determined that migration of contaminated groundwater is under control at the facility. Specifically, this determination indicates that the migration of contaminated groundwater is under control, and that monitoring will be conducted to confirm that contaminated groundwater remains within the existing area of contaminated groundwater. This determination will be re-evaluated when the Agency becomes aware of significant changes at the facility.

Event date: 12/01/1993
Event: Stabilization Construction Completed

Event date: 05/02/1994
Event: RFA Completed

Event date: 08/12/1994
Event: Stabilization Measures Evaluation,This facility is not amenable to stabilization activity at the present time for reasons other than 1- it appears to be technically infeasible or inappropriate (NF) or 2- there is a lack of technical information (IN). Reasons for this

VARIAN ASSOCIATES (Continued) **1000880997**

conclusion may be the status of closure at the facility, the degree of risk, timing considerations, the status of corrective action work at the facility, or other administrative considerations.

Event date: 08/12/1994
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 09/21/1994
Event: RFI Approved

Event date: 09/21/1994
Event: Date For Remedy Selection (CM Imposed)

Event date: 09/21/1994

Hazardous Waste Summary:
Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

ALZA PHARMACEUTICALS (Continued) **S102519540**

Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Site Screening
Completed Date:	1993-03-30 00:00:00
Comments:	No further action per EPA's preliminary assessment for this site only determined that its hazard ranking score (hrs) would not admit it into the National Priority List (NPL). Recommentdation by dtsc on reevaluation of the site reflects DTSC's own criteria. This 3.6 acre currently active site, mostly paved or landscaped, has been the site of several interests associated with research and development in food, medicine, genetics and biology. Through various leases and subleases, Alza has been the lessee since 1972 and sole operator at the site since March 1986. Sampling since 1987 indicated that surface soil was contaminated with chloroform (520 mg/kg), carbon tetrachloride (250 mg/kg), freon (1.1 mg/kg) and DCE (120mg/kg) and groundwater in the uppermost interconnected aquifers was contaminated with chloroform (4100 mg/kg), carbon tetrachloride and TCE. Bore hole soil samples also detected presence of chloroform (2000mg/kg). Soil gas and groundwter treatment systems have been in operation at site under oversight of Regional Water Quality Control Board. Deeper potable aquifer of wide use as drinking water source has not been impacted. This site screening was based in part on the CERCLA screening site inspection report prepared by Ecology and Environment for USEPA (contained in DTSC file). DTSC files were reviewed. REQCB and county files were not located or reviewed. Extent of soil contamination was about 200 sf. groundwater contamination extends at least 200 feet from soil contamination area and one well screened in deeper aquifer detected 1.5 mg/l of chloroform.

Hazardous Waste Summary:
Waste code: D000
Waste name: Not Defined

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D008
Waste name: LEAD

Waste code: F001
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS USED IN DEGREASING: TETRACHLOROETHYLENE, TRICHLOROETHYLENE, METHYLENE CHLORIDE, 1,1,1-TRICHLOROETHANE, CARBON TETRACHLORIDE, AND CHLORINATED FLUOROCARBONS; ALL SPENT SOLVENT MIXTURES/BLENDS USED IN DEGREASING CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F002
Waste name: THE FOLLOWING SPENT HALOGENATED SOLVENTS: TETRACHLOROETHYLENE, METHYLENE CHLORIDE, TRICHLOROETHYLENE, 1,1,1-TRICHLOROETHANE, CHLOROBENZENE, 1,1,2-TRICHLORO-1,2,2-TRIFLUOROETHANE, ORTHO-DICHLOROBENZENE, TRICHLOROFLUOROMETHANE, AND 1,1,2-TRICHLOROETHANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE HALOGENATED SOLVENTS OR THOSE LISTED IN F001, F004, OR F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL

AGILENT TECHNOLOGIES INC (Continued) **1000208805**

ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.

Facility Has Received Notices of Violations:
Regulation violated: FR - 262.10-12.A

Environmental Interest/Information System

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CA WDS:
Facility ID: San Francisco Bay 43I015508
Facility Type: Industrial - Facility that treats and/or disposes of liquid or

AGILENT TECHNOLOGIES INC (Continued) **1000208805**

semisolid wastes from any servicing, producing, manufacturing or processing operation of whatever nature, including mining, gravel washing, geothermal operations, air conditioning, ship building and repairing, oil production, storage and disposal operations, water pumping.

Facility Status: Active - Any facility with a continuous or seasonal discharge that is under Waste Discharge Requirements.
NPDES Number: CAS000001 The 1st 2 characters designate the state. The remaining 7 are assigned by the Regional Board

Treat To Water: Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity: Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Alternate Address:	3180 HANOVER STREET
Alternate City,St,Zip:	PALO ALTO, CA 94304
Background Info:	The site is located in Stanford Industrial Park in Palo Alto and was formerly occupied by Aydin Energy Corporation. Aydin Energy Corporation is a manufacturing and repair firm for transformers and other electrical power equipment. The company began its operations in 1968, and vacated the site in 1984.
Comments Date:	04211995
Comments:	RAP - A Remedial action Plan was approved to address PCBs and
Comments Date:	04211995
Comments:	organic solvents in both soil and groundwater. The RAP required
Comments Date:	04211995
Comments:	partial excavation and capping of soils and enhancement of the
Comments Date:	04211995
Comments:	existing grounwater extraction and treatment system.
Comments Date:	06182002
Comments:	5YEAR - A Five Year Review was conducted to assess the
Comments Date:	06182002
Comments:	effectiveness of the groundwater monitoring, extraction and
Comments Date:	06182002
Comments:	treatment sysrem. The Five Year Report was approved on June 18,
Comments Date:	06182002
Comments:	2002 and found the system to effectively contain offsite
Comments Date:	06182002
Comments:	migration.
Comments Date:	06271997
Comments:	DEED - A Deed Restriction was recorded in June 1997 limiting
Comments Date:	06271997
Comments:	land use to commercial.

AYDIN ENERGY (Continued) **S100833241**

costs associated with site cleanup.

Site Description: A manufacturer and repair firm for transformers and other electrical power equipment formerly operated on this site.

Hazardous Waste Desc: Polychlorinated biphenyls (PCBs) have been detected in soils and volatile organic compounds (VOCs) have been detected in soil and ground water at this site.

Threat To Public Health & Env: The volatile organic compounds in the ground water have migrated offsite. There are 29 water supply wells within a three mile radius of the site which could be impacted by contaminants.

Site Activity Status: The property is owned by Stanford University. Hewlett-Packard took over the lease in 1983. The site has been fenced and posted. A remedial action order has been issued to Aydin and Stanford University. Aydin Energy has nearly completed a remedial investigation and has prepared a FS/RAP workplan which is currently being implemented.

Completed Document Type: Operations and Maintenance Plan
Completed Date: 1997-05-15 00:00:00
Comments: O&M Plan for the soil cap and the groundwater monitoring and extraction treatment system.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Remedial Action Completion Report
Completed Date: 1996-11-15 00:00:00

AYDIN ENERGY (Continued) **S100833241**

Comments:	RMDL - The soil remediation consisted of partial excavation and installation of a multi-layer cap where cleanup levels could not be achieved. The groundwater treatment system installed in 1986 was enhanced.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Design/Implementation Workplan
Completed Date:	1995-09-21 00:00:00
Comments:	Not reported
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Remedial Action Plan
Completed Date:	1995-04-21 00:00:00
Comments:	RAP - A Remedial action Plan was approved to address PCBs and organic solvents in both soil and groundwater. The RAP required partial excavation and capping of soils and enhancement of the existing grounwater extraction and treatment system.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Completion Report
Completed Date:	1992-11-16 00:00:00
Comments:	RA - SOIL - Removal actions were conducted to excavate and dispose offsite soils contaminated with PCBs, organic compounds and total petroleum hydrocarbons.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Public Participation Plan / Community Relations Plan
Completed Date:	1988-12-30 00:00:00
Comments:	Not reported
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Completion Report
Completed Date:	1986-12-30 00:00:00
Comments:	An Interim Remedial Measure was initiated in 1986 to remediate the onsite shallow groundwater contamination which consisted of extracting the groundwater and treating it in a carbon absorption system.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Operations and Maintenance Report
Completed Date:	2005-12-12 00:00:00
Comments:	Aydin made revisions to the semi-annual groundwater monitoring report. Not reported
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Remedial Investigation / Feasibility Study
Completed Date:	1994-09-16 00:00:00
Comments:	RIFS - Elevated levels of polychlorinated biphenyls (PCBs) were found to a depth of 60 feet. Trichloroethane, dichloroethane, trichloroethylene, perchloroethylene and chlorobenzene were detected

AYDIN ENERGY (Continued) **S100833241**

at the Site in soil and groundwater.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Operations and Maintenance Report
Completed Date: 2006-03-20 00:00:00
Comments: The Report indicates VOC concentrations are within historic variations.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported

CA BOND EXP. PLAN:

Reponsible Party:	RWQCB REFERRAL SITE
Project Revenue Source Company:	Not reported
Project Revenue Source Addr:	Not reported
Project Revenue Source City,St,Zip:	Not reported
Project Revenue Source Desc:	Hewlett Packard, the responsible party, has assumed responsibility for cleanup activities under the direction of the RWQCB. The RWQCB will continue to have lead responsibility for monitoring Hewlett Packard's progress under an existing South Bay Enforcement Agreement betweeen the RWQCB, EPA and DHS. The RWQCB is conducting the work with support from the EPA through a Cooperative Agreement. Until such time as the RWQCB refers the site for follow-up using Bond funds, no money will be budgeted from the fund for this site. The DHS regional facilities permitting unit is maintaining liaison with RWQCB and EPA.
Site Description:	Two divisions of this corporation share the facility's 50 acre site: Stanford Park Division, principally a plating and chemical millings shop, and the Hewlett-Packard Laboratories, a research and development branch for microelectronic components. The surrounding land use is both industrial and commercial. Several underground storage tanks existed at the site from 1965 to 1983. These tanks stored chemical products and wastes.
Hazardous Waste Desc:	In 1981 Chlorinated and aromatic solvents were discovered in soil and ground water. The following chemicals have been detected in soil and ground water: Freon, benzene, toluene, dichloroethane (DCA), trichloroethylene (TCE), ethylbenzene, methylcyclohexane and methylene chloride.
Threat To Public Health & Env:	About 56,000 people live within a 3 mile radius of the facility and depend on ground water as a standby source of drinking water. To date, no contamination of nearby wells has been detected. The closest well to the site is the Matadero well located near the southeast corner of Matadero Creek and Whitsell Street, a distance of 4,530 feet from contaminated monitoring wells.
Site Activity Status:	As an initial remedial measure, leaking tanks and contaminated soil have been removed.

Hazardous Waste Summary:

Waste code: D001
Waste name: IGNITABLE HAZARDOUS WASTES ARE THOSE WASTES WHICH HAVE A FLASHPOINT OF LESS THAN 140 DEGREES FAHRENHEIT AS DETERMINED BY A PENSKY-MARTENS CLOSED CUP FLASH POINT TESTER. ANOTHER METHOD OF DETERMINING THE FLASH POINT OF A WASTE IS TO REVIEW THE MATERIAL SAFETY DATA SHEET, WHICH CAN BE OBTAINED FROM THE MANUFACTURER OR DISTRIBUTOR OF THE MATERIAL. LACQUER THINNER IS AN EXAMPLE OF A COMMONLY USED SOLVENT WHICH WOULD BE CONSIDERED AS IGNITABLE HAZARDOUS WASTE.

Waste code: D002
Waste name: A WASTE WHICH HAS A PH OF LESS THAN 2 OR GREATER THAN 12.5 IS CONSIDERED TO BE A CORROSIVE HAZARDOUS WASTE. SODIUM HYDROXIDE, A CAUSTIC SOLUTION WITH A HIGH PH, IS OFTEN USED BY INDUSTRIES TO CLEAN OR DEGREASE PARTS. HYDROCHLORIC ACID, A SOLUTION WITH A LOW PH, IS USED BY MANY INDUSTRIES TO CLEAN METAL PARTS PRIOR TO PAINTING. WHEN THESE CAUSTIC OR ACID SOLUTIONS BECOME CONTAMINATED AND MUST BE DISPOSED, THE WASTE WOULD BE A CORROSIVE HAZARDOUS WASTE.

Waste code: D003
Waste name: A MATERIAL IS CONSIDERED TO BE A REACTIVE HAZARDOUS WASTE IF IT IS NORMALLY UNSTABLE, REACTS VIOLENTLY WITH WATER, GENERATES TOXIC GASES WHEN EXPOSED TO WATER OR CORROSIVE MATERIALS, OR IF IT IS CAPABLE OF DETONATION OR EXPLOSION WHEN EXPOSED TO HEAT OR A FLAME. ONE EXAMPLE OF SUCH WASTE WOULD BY WASTE GUNPOWDER.

Waste code: D004
Waste name: ARSENIC

Waste code: D007
Waste name: CHROMIUM

Waste code: D008
Waste name: LEAD

Waste code: D009
Waste name: MERCURY

Waste code: D021

Waste code: F003
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: XYLENE, ACETONE, ETHYL ACETATE, ETHYL BENZENE, ETHYL ETHER, METHYL ISOBUTYL KETONE, N-BUTYL ALCOHOL, CYCLOHEXANONE, AND METHANOL; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONLY THE ABOVE SPENT NON-HALOGENATED SOLVENTS; AND ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS, AND, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THOSE SOLVENTS LISTED IN F001, F002, F004, AND F005, AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Amount (Lbs): 5294

Waste code: F005
Waste name: THE FOLLOWING SPENT NON-HALOGENATED SOLVENTS: TOLUENE, METHYL ETHYL KETONE, CARBON DISULFIDE, ISOBUTANOL, PYRIDINE, BENZENE, 2-ETHOXYETHANOL, AND 2-NITROPROPANE; ALL SPENT SOLVENT MIXTURES/BLENDS CONTAINING, BEFORE USE, A TOTAL OF TEN PERCENT OR MORE (BY VOLUME) OF ONE OR MORE OF THE ABOVE NON-HALOGENATED SOLVENTS OR THOSE SOLVENTS LISTED IN F001, F002, OR F004; AND STILL BOTTOMS FROM THE RECOVERY OF THESE SPENT SOLVENTS AND SPENT SOLVENT MIXTURES.
Amount (Lbs): 957

Waste code: U134
Waste name: HYDROFLUORIC ACID (C,T)
Amount (Lbs): 45

Waste code: U213
Waste name: FURAN, TETRAHYDRO-(I)
Amount (Lbs): 57

Corrective Action Summary:

Event date: 01/01/1982
Event: Stabilization Measures Implemented, Primary measure is source removal and/or treatment (e.g., soil or waste excavation, in-situ soil treatment, off-site treatment).

Event date: 01/01/1982
Event: Stabilization Measures Implemented, Groundwater extraction and treatment (e.g., to achieve groundwater containment, to achieve MCL).

Event date: 07/01/1984
Event: CA Prioritization, Facility or area was assigned a high corrective action priority.

Event date: 07/01/1984
Event: CA074HI

Event date: 07/01/1984
Event: CA029WQ

Environmental Interest/Information System
California Department of Toxic Substances Control EnviroStor System

HEWLETT PACKARD CO (Continued) **1000281820**

(DTSC-EnviroStor) is an online search and Geographic Information System (GIS) tool for identifying sites that have known contamination or sites for which there may be reasons to investigate further. The EnviroStor database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites.

NCDB (National Compliance Data Base) supports implementation of the Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) and the Toxic Substances Control Act (TSCA). The system tracks inspections in regions and states with cooperative agreements, enforcement actions, and settlements.

The NEI (National Emissions Inventory) database contains information on stationary and mobile sources that emit criteria air pollutants and their precursors, as well as hazardous air pollutants (HAPs).

California Hazardous Waste Tracking System - Datamart (HWTS-DATAMART) provides California with information on hazardous waste shipments for generators, transporters, and treatment, storage, and disposal facilities.

US EPA TRIS (Toxics Release Inventory System) contains information from facilities on the amounts of over 300 listed toxic chemicals that these facilities release directly to air, water, land, or that are transported off-site.

RCRAInfo is a national information system that supports the Resource Conservation and Recovery Act (RCRA) program through the tracking of events and activities related to facilities that generate, transport, and treat, store, or dispose of hazardous waste. RCRAInfo allows RCRA program staff to track the notification, permit, compliance, and corrective action activities required under RCRA.

CERCLIS (Comprehensive Environmental Response, Compensation, and Liability Information System) is the Superfund database that is used to support management in all phases of the Superfund program. The system contains information on all aspects of hazardous waste sites, including an inventory of sites, planned and actual site activities, and financial information.

Treat To Water:	Minor Threat to Water Quality. A violation of a regional board order should cause a relatively minor impairment of beneficial uses compared to a major or minor threat. Not: All nurds without a TTWQ will be considered a minor threat to water quality unless coded at a higher Level. A Zero (0) may be used to code those NURDS that are found to represent no threat to water quality.
Complexity:	Category C - Facilities having no waste treatment systems, such as cooling water dischargers or thosewho must comply through best management practices, facilities with passive waste treatment and disposal systems, such as septic systems with subsurface disposal, or dischargers having waste storage systems with land disposal such as dairy waste ponds.

Alternate Address:	STANFORD INDUSTRIAL PARK
Alternate City,St,Zip:	PALO ALTO, CA
Alternate Address:	HILLVIEW AVENUE AND PORTER DRIVE
Alternate City,St,Zip:	PALO ALTO, CA 94304
Background Info:	The Hillview Porter site is a regional problem of commingled groundwater and surface water contamination. The site boundaries encompass several sources of contamination within about 320 acres of the Stanford Research Park (SRP). The Hillview Porter region is divided into the "site" and "area of investigation." The "site" is comprised of nine separate sites within the SRP which represents the source areas of groundwater contamination within the SRP. Commingled plumes migrating from the sites have impacted groundwater beneath the "area of investigation" (comprised of the adjoining Barron Park neighborhood, Veterans Administration, Matadero Creek). Groundwater flow from the site follows the direction of Matadero Creek towards Barron Park. Since the late 1950's, SRP has been occupied primarily by companies conducting electronics research and manufacturing operations. Many current and historic tenants used volatile organic chemicals (VOCs) in their operations. The site was referred to the Department by the Regional Water Control Board in November 1985, as the sources of groundwater contamination in the region were unknown. The Department conducted a preliminary assessment, a regional soil gas survey, sampled Matadero Creek and private wells within the Barron Park, conducted an extensive potential responsible party search, and began overseeing site-specific investigations at facilities which were potential sources of contamination. DTSC also oversees remedial actions at the nine facilities identified as source areas for the regional problem. Contaminants found in the region are primarily chlorinated VOCs such as trichloroethene (TCE), perchloroethene (PCE), 1,1,1, -trichloroethane (1,1,1-TCA), and freon. These chemicals have been found in monitoring wells within SRP at depths up to about 100 feet. They have also been detected in Matadero Creek and/or several private

HILLVIEW PORTER PLUME (Continued) **S101272882**

wells in Barron Park. Currently, the Department is continuing to separately oversee remedial actions at the nine facilities identified as source areas for the regional problem. Specific details on each site can be found in the specific profile report as identified below. The nine facilities are: Teledyne-Singer, 3176 Porter Drive; Lockheed Building 255, 3170 Porter Drive; Hewlett Packard Build ing 15, 3215 Porter Drive; Hewlett Packard Buildings 28A, B and C, corner of Page Mill Road and Porter Drive; Teledyne MEC, 3165 Porter Drive; Coherent, Inc., 3210 Porter Drive; Watkins Johnson, 3333 Hillview Avenue; Syntex, 3300 Hillview Avenue; and Smith- Kline & French Laboratories, 3400 Hillview Avenue. Groundwater and surface water sampling and water level measurements are collected simultaneously by RPs for the site-specific and regional investigations. DTSC will continue to review periodic performance evaluation reports for the groundwater extraction and treatment system.

Completed Sub Area Name: Not reported
Completed Document Type: Remedy Constructed: Operating Properly & Successfully
Completed Date: 1996-09-05 00:00:00
Comments: Completed Remedial Action. The final remedial action for the Hillview Porter Regional Plume consisted of installation and operation of a groundwater extraction and treatment system. Groundwater is extracted from two 750-foot long horizontal extraction wells and 15 vertical extraction wells and is treated using activated carbon at a treatment system located at 3215 Porter Drive. Treated water is discharged to Matadero Creek under an NPDES permit. Three additional wells discharge extracted water directly to the sanitary sewer under a permit from the Palo Alto Regional Water Quality Control Plant.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported
Completed Document Type: Design/Implementation Workplan
Completed Date: 1995-10-02 00:00:00
Comments: Approved revised remedial design to allow groundwater extracted from three wells located on McGregor Way to be discharge directly to the sanitary sewer under a permit from the Palo Alto Regional Water Quality Control Plant. This modification was required due to unresolvable access issues.

Completed Area Name: PROJECT WIDE
Completed Sub Area Name: Not reported

Completed Document Type:	Removal Action Completion Report
Completed Date:	1995-01-25 00:00:00
Comments:	Groundwater is extracted from 11 extraction wells near the Bike Path in Bol Park and conveyed via pipeline to a treatment plant located at 3215 Porter Drive in Palo Alto. Extracted groundwater is treated with granular activated carbon and discharged to matadero Creek via the storm drain under an NPDES permit from the Water Board.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Remedial Action Plan
Completed Date:	1994-12-19 00:00:00
Comments:	Remedial Action Plan approved. Public comment period ran from October 7 through November 7, 1994, with a pubilc meeting held October 20, 1994. The approved remedy incorporates the interim remedial measures installed and adds more extraction wells on the Veterans Administration property and in the Barron Park Neighborhood.
Completed Area Name:	PROJECT WIDE
Completed Sub Area Name:	Not reported
Completed Document Type:	Removal Action Completion Report
Completed Date:	1993-03-17 00:00:00
Comments:	Interim action to treat VOCs in Matadero Creek surface water using instream aeration system to bubble air into the Creek through diffusers, stripping the VOCs from the Creek. System was required to prevent contaminated creek water from recharging groundwater and further contaminating groundwater and to prevent contaminated creek water from flowing into the Barron Park Neighborhood.

Completed Document Type:	Remedy Constructed: Operating Properly & Successfully
Completed Date:	1996-09-05 00:00:00
Comments:	Completed Remedial Action. The final remedial action for the Hillview Porter Regional Plume consisted of installation and operation of a groundwater extraction and treatment system. Groundwater is extracted from two 750-foot long horizontal extraction wells and 15 vertical extraction wells and is treated using activated carbon at a treatment system located at 3215 Porter Drive. Treated water is discharged to Matadero Creek under an NPDES permit. Three additional wells discharge extracted water directly to the sanitary sewer under a permit from the Palo Alto Regional Water Quality Control Plant.

Federal NPL site list

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

Federal Delisted NPL site list

DELISTED NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

Federal CERCLIS list

CERCLIS: Comprehensive Environmental Response, Compensation, and Liability Information System

CERCLIS contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). CERCLIS contains sites which are either proposed to or on the National Priorities List (NPL) and sites which are in the screening and assessment phase for possible inclusion on the NPL.

Federal CERCLIS NFRAP site List

CERCLIS-NFRAP: CERCLIS No Further Remedial Action Planned

Archived sites are sites that have been removed and archived from the inventory of CERCLIS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list this site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. This decision does not necessarily mean that there is no hazard associated with a given site; it only means that, based upon available information, the location is not judged to be a potential NPL site.

Federal RCRA non-CORRACTS TSD facilities list

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

State- and tribal - equivalent CERCLIS

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites
Included in the listing are brownfields properties addresses by Cooperative Agreement Recipients and brownfields properties addressed by Targeted Brownfields Assessments. Targeted Brownfields Assessments-EPA's Targeted Brownfields Assessments (TBA) program is designed to help states, tribes, and municipalities--especially those without EPA Brownfields Assessment Demonstration Pilots--minimize the uncertainties of contamination often associated with brownfields. Under the TBA program, EPA provides funding and/or technical assistance for environmental assessments at brownfields sites throughout the country. Targeted Brownfields Assessments supplement and work with other efforts under EPA's Brownfields Initiative to promote cleanup and redevelopment of brownfields. Cooperative Agreement Recipients-States, political subdivisions, territories, and Indian tribes become Brownfields Cleanup Revolving Loan Fund (BCRLF) cooperative agreement recipients when they enter into BCRLF cooperative agreements with the U.S. EPA. EPA selects BCRLF cooperative agreement recipients based on a proposal and application process. BCRLF cooperative agreement recipients must use EPA funds provided through BCRLF cooperative agreement for specified brownfields-related cleanup activities.

Local Lists of Hazardous waste / Contaminated Sites

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Date of Government Version: 05/07/2010

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA-NonGen: RCRA - Non Generators

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing

A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

EDR PROPRIETARY RECORDS

EDR Proprietary Records

Manufactured Gas Plants: EDR Proprietary Manufactured Gas Plants
The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Oil/Gas Pipelines: This data was obtained by EDR from the USGS in 1994. It is referred to by USGS as GeoData Digital Line Graphs from 1:100,000-Scale Maps. It was extracted from the transportation category including some oil, but primarily gas pipelines.

Electric Power Transmission Line Data
Source: Rextag Strategies Corp.
Telephone: (281) 769-2247
U.S. Electric Transmission and Power Plants Systems Digital GIS Data

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing
Source: Centers for Medicare & Medicaid Services
Telephone: 410-786-3000
A listing of hospitals with Medicare provider number, produced by Centers of Medicare & Medicaid Services, a federal agency within the U.S. Department of Health and Human Services.

Nursing Homes
Source: National Institutes of Health
Telephone: 301-594-6248
Information on Medicare and Medicaid certified nursing homes in the United States.

Public Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on elementary and secondary public education in the United States. It is a comprehensive, annual, national statistical database of all public elementary and secondary schools and school districts, which contains data that are comparable across all states.

Private Schools
Source: National Center for Education Statistics
Telephone: 202-502-7300
The National Center for Education Statistics' primary database on private school locations in the United States.

Daycare Centers: Licensed Facilities
Source: Department of Social Services
Telephone: 916-657-4041

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2009 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

East Map:	37122-D1 MOUNTAIN VIEW, CA
Most Recent Revision:	1999

EDR's GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

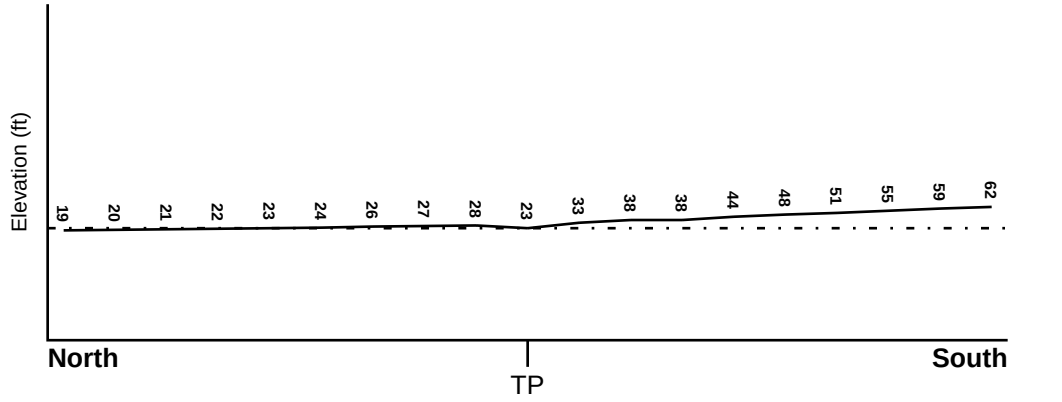
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

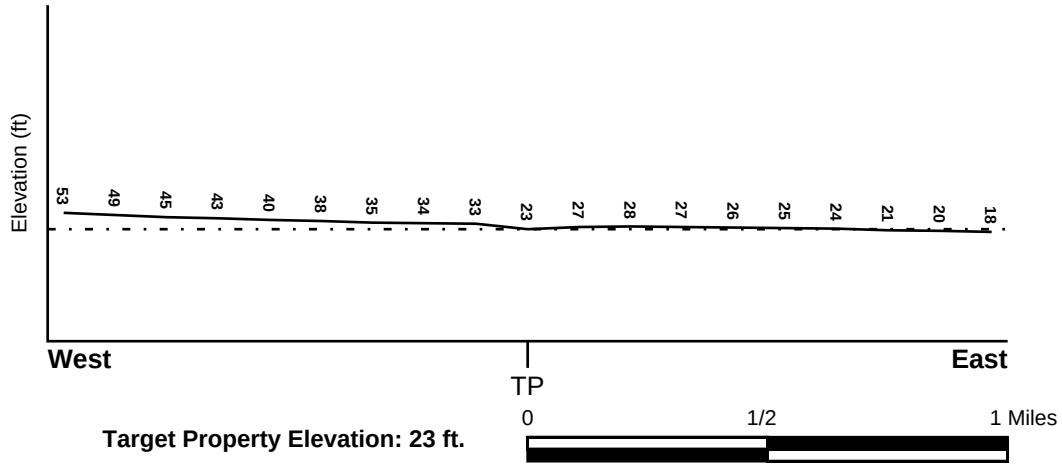
GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION



Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General NNE

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Target Property Elevation: 23 ft.

0 1/2 1 Miles

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

FEMA FLOOD ZONE

Target Property County	FEMA Flood Electronic Data
SANTA CLARA, CA	YES - refer to the Overview Map and Detail Map

Flood Plain Panel at Target Property: 06085C - FEMA DFIRM Flood data

Additional Panels in search area: Not Reported

NATIONAL WETLAND INVENTORY

NWI Quad at Target Property	NWI Electronic Data Coverage
PALO ALTO	YES - refer to the Overview Map and Detail Map

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Location Relative to TP:	1/4 - 1/2 Mile WSW
Site Name:	STANFORD CLEANERS
Site EPA ID Number:	CAD028879765
Groundwater Flow Direction:	Northeast
Measured Depth to Water:	15.7 feet.
Hydraulic Connection:	Information is not available regarding the hydraulic connection between aquifers underlying the site.
Sole Source Aquifer:	No information about a sole source aquifer is available
Data Quality:	Information based on site-specific subsurface investigations is documented in the CERCLIS investigation report(s)

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

MAP ID	LOCATION FROM TP	GENERAL DIRECTION GROUNDWATER FLOW
Not Reported		

* ©1996 Site--specific hydrogeological data gathered by CERCLIS Alerts, Inc., Bainbridge Island, WA. All rights reserved. All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

ROCK STRATIGRAPHIC UNIT

Era:	Cenozoic
System:	Quaternary
Series:	Quaternary
Code:	Q *(decoded above as Era, System & Series)*

GEOLOGIC AGE IDENTIFICATION

Category: Stratifed Sequence

Geologic Age and Rock Stratigraphic Unit Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - a digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps. The following information is based on Soil Conservation Service STATSGO data.

Soil Component Name:	BOTELLA
Soil Surface Texture:	clay loam
Hydrologic Group:	Class B - Moderate infiltration rates. Deep and moderately deep, moderately well and well drained soils with moderately coarse textures.
Soil Drainage Class:	Not reported

Hydric Status: Soil does not meet the requirements for a hydric soil.

Corrosion Potential - Uncoated Steel:	MODERATE
Depth to Bedrock Min:	> 60 inches
Depth to Bedrock Max:	> 60 inches

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

Soil Layer Information							
	Boundary			Classification			
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil	Permeability Rate (in/hr)	Soil Reaction (pH)
1	0 inches	9 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.30 Min: 5.60
2	9 inches	41 inches	silty clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	FINE-GRAINED SOILS, Silts and Clays (liquid limit less than 50%), Lean Clay	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60
3	41 inches	76 inches	sandy clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	COARSE-GRAINED SOILS, Sands, Sands with fines, Clayey sand.	Max: 0.60 Min: 0.20	Max: 7.80 Min: 5.60

OTHER SOIL TYPES IN AREA

Based on Soil Conservation Service STATSGO data, the following additional subordinant soil types may appear within the general area of target property.

Soil Surface Textures: No Other Soil Types

Surficial Soil Types: No Other Soil Types

Shallow Soil Types: No Other Soil Types

Deeper Soil Types: No Other Soil Types

LOCAL / REGIONAL WATER AGENCY RECORDS

EDR Local/Regional Water Agency records provide water well information to assist the environmental professional in assessing sources that may impact ground water flow direction, and in forming an opinion about the impact of contaminant migration on nearby drinking water wells.

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Scanned Digital USGS 7.5' Topographic Map (DRG)
Source: United States Geologic Survey
A digital raster graphic (DRG) is a scanned image of a U.S. Geological Survey topographic map. The map images are made by scanning published paper maps on high-resolution scanners. The raster image is georeferenced and fit to the Universal Transverse Mercator (UTM) projection.

HYDROLOGIC INFORMATION

Flood Zone Data: This data, available in select counties across the country, was obtained by EDR in 2003 & 2009 from the Federal Emergency Management Agency (FEMA). Data depicts 100-year and 500-year flood zones as defined by FEMA.

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002 and 2005 from the U.S. Fish and Wildlife Service.

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Services (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Services, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

Transmittal of the Thrid Five-Year Status Report and Effectiveness Evaluation for 640 Page Mill Road, 395 Page Mill Road, 601 California Avenue, and the Off-Site Area, Palo Alto, California.

Dear Mr. Papler:

Hewlett-Packard Company and Varian Medical Systems, Inc. are pleased to submit the attached "Third Five-Year Status Report and Effectiveness Evaluation" for the above referenced sites and the Off-Site Area (the California-Olive-Emerson (COE) Area and Perimeter Area), Palo Alto, California. This document is submitted in accordance with Provision 7(a) of Revised Site Cleanup Requirements Order 94-130 dated September 21, 1994, issued by the San Francisco Bay Regional Water Quality Control Board.

To the best of our knowledge, the contents of this report are true and correct. Please call if you have any questions regarding this report.

Please call if you have any questions regarding this report.

Sincerely,

Hewlett-Packard Company

1.0 Introduction

This *Third Five-Year Status Report and Effectiveness Evaluation* (the "Evaluation") has been prepared on behalf of Hewlett-Packard Company (HP) and Varian Medical Systems, Inc. (Varian) by Stantec Consulting Corporation (Stantec). This Evaluation is for the:

- HP 640 Page Mill Road Site, Palo Alto, California (the "640 PMR Site");
- HP 395 Page Mill Road Site, Palo Alto, California (the "395 PMR Site");
- Varian 601 California Avenue Site, Palo Alto, California (the "601 CA Site"); and
- Off-Site Area

The 640 PMR Site, 395 PMR Site and 601 CA Site are collectively referred to as "the Sites." The Off-Site Area consists of the California-Olive-Emerson (COE) Area (the "COE Area") and the "Perimeter Area." The Off-Site Area is described in Section 2.1. Figure 1-1 shows the location of the Sites and the Off-Site Area. The Sites and Off-Site Area are collectively referred to as the "Study Area."

The *Five-Year Status Report and Effectiveness Evaluation* (First Five-Year Report; SECOR, 2000) was submitted to the California Regional Water Quality Control Board, San Francisco Bay Region (RWQCB) on June 1, 2000 and covered the period from January 1, 1995 through December 31, 1999 (the "first five-year reporting period"). The RWQCB approved the First Five-Year Report in August 2000 (RWQCB, 2000). The *Second Five-Year Status Report and Effectiveness Evaluation* (Second Five-Year Report; SECOR, 2005b) was submitted to the RWQCB on November 17, 2005 and covered the period from January 1, 2000 through August 31, 2005 (the "second five-year reporting period"). An *Addendum to the Second Five-Year Status Report and Effectiveness Evaluation* (Addendum; SECOR, 2006a) was submitted to the RWQCB on June 16, 2006 to convey additional recommendations for the 395 PMR Site. The RWQCB approved the Second Five-Year Report and Addendum in a Letter to HP and Varian dated February 9, 2007 (Second Five-Year Approval Letter, RWQCB, 2007). A September 2008 letter from the RWQCB specified February 1, 2010 as the due date for the current Evaluation (RWQCB, 2008c). An extension to this due date was authorized by RWQCB staff via email correspondence with HP.

This Evaluation is submitted in accordance with Provision C.7(a) of the *Revised Site Cleanup Requirements, Order No. 94-130* (the "Order"), issued on September 21, 1994, by the RWQCB. This Evaluation covers the period from September 1, 2005 through December 31, 2009 (the "Reporting Period").

Consistent with the requirements of Provision 7(a) of the Order, this Evaluation presents:

- Results of additional investigation (completed since the Second Five-Year Report was issued);

- An evaluation of the effectiveness of installed final cleanup measures and final cleanup costs;
- Additional recommended measures to achieve final cleanup objectives, if necessary;
- Estimated projected costs necessary to achieve cleanup objectives and standards;
- Tasks and estimated time schedule necessary to implement any additional final cleanup measures, if necessary;
- A description of the reuse of extracted groundwater; and
- A discussion regarding the feasibility of achieving cleanup objectives using the existing remedial systems.

The remaining portions of this Evaluation are organized as follows.

- Section 2.0 presents background information on the Sites and Off-Site Area, a summary of the chemicals of concern and cleanup objectives for both soil and groundwater, a summary of the local hydrogeology, and a review of the extent of volatile organic compounds (VOCs) in groundwater (and soil) at the Sites and in the Off-Site Area.
- Section 3.0 presents a summary of soil and groundwater remedial measures implemented at the Sites and the Off-Site Area to date (both interim and final), including reuse measures for extracted and treated groundwater, and discusses the current groundwater self-monitoring program (SMP).
- Section 4.0 describes additional investigative activities conducted at the Sites and Off-Site Area during this reporting period.
- Section 5.0 presents an evaluation of the effectiveness the final groundwater cleanup remedy and recorded land use restrictions, and provides information regarding projected costs to achieve cleanup objectives.
- Section 6.0 presents conclusions regarding the effectiveness of the remedial systems in making progress towards achieving the remedial objectives, and recommendations.

2.0 Project Background

Unless otherwise noted below, the information presented in Section 2.0 is taken from the *Remedial Investigation Report – Revised* for the Study Area (the Area RI; ENVIRON, 1994b).

2.1 SITE SETTING AND HISTORY

Figure 1-1 shows the location of the Sites and the Off-Site Area, which is subdivided into the COE Area and the Perimeter Area. The COE Area excludes the Sites and is bounded by California Avenue to the west, Olive Avenue to the east, Emerson Avenue to the north, and the southernmost extent of the 640 PMR Site to the south. The southernmost extent is also defined by a line that extends eastward from Cornell Street and terminates at California Avenue in the southwest corner of the Study Area. Figure 1-1 also identifies the Perimeter Area that adjoins the COE Area to the east. The Perimeter Area is bounded to the south by the Varian 611 Hansen Way General Study Area boundary (Fluor-Daniel GTI, 1996). Emerson Street defines the limits of the Perimeter Area to the north, and Fernando, Margarita, and El Carmelo Avenues define the eastern extent. HP and Varian have cooperated in implementing remedial measures for the Off-Site Area with oversight from the RWQCB.

2.2 HYDROGEOLOGY

The local hydrogeology has been studied extensively. Figure 2-1 indicates the locations of existing wells installed at the Sites and Off-Site Area. The following sections describe the local stratigraphy and groundwater flow.

2.2.1 Stratigraphy

The Sites and Off-Site Area are underlain by alluvial fan deposits associated with the San Francisquito Creek to the west and Matadero Creek to the east. Two primary water-bearing aquifers were identified within the alluvial fan deposits. These have been termed the A aquifer (A1 Upper [A1U], A1, and A2 Zones), which extends between approximate depths of 13 to 55 feet below ground surface (bgs), and the B aquifer (B1 and B2 Zones), which was encountered between depths of approximately 60 to 120 feet bgs. Thin sandy lenses that extend into the upper portion of the A/B aquitard have been designated as A2 Deep (A2D).

Predominant directions of deposition were identified based on the occurrence and distribution of the alluvial fan deposits. The predominant depositional directions correspond generally with current ground surface topography at the Sites and within the Off-Site Area, which indicates they are situated along the transition zone between the San Francisquito Creek alluvial fan to the west and the Matadero Creek fan to the east. As a result, the predominant depositional orientation of channels developed is easterly in the general area west of Page Mill Road, becoming northerly in the vicinity of Matadero Creek, particularly southeast of the Off-Site Area.

2.2.2 Groundwater Flow

The regional direction of groundwater flow is northeasterly, from the hills toward San Francisco Bay. Within the Off-Site Area (and at the Sites to varying degrees), groundwater flow patterns in the A aquifer are affected by the Oregon Expressway Underpass (OEU) dewatering system (Figures 2-2 through 2-4), which draws groundwater toward the subdrain collection system. The general direction of groundwater flow in the A aquifer within the Off-Site Area is from south to north toward the OEU. The groundwater flow direction in the deeper B aquifer is from south-southwest to north-northeast (Figure 2-5).

The OEU dewatering system has a substantial hydraulic effect on groundwater flow within the Study Area. Previously presented hydraulic evaluations, including a computerized groundwater flow model, indicated that the capture area created by pumping from the subdrain was effective in capturing chemicals in the A aquifer, particularly in the northern portion of the COE Area and portions of the Perimeter Area.

2.3 CHEMICALS OF CONCERN IN GROUNDWATER

The principal chemicals of concern in groundwater at the Sites and within the Off-Site Area are chlorinated VOCs, including trichloroethene (TCE), 1,1,1-trichloroethane (1,1,1-TCA), 1,1-dichloroethene (1,1-DCE), 1,2-dichloroethene (1,2-DCE), 1,1-dichloroethane (1,1-DCA), and tetrachloroethene (PCE). TCE is the VOC most widely distributed and detected at highest concentrations (Figures 2-6 through 2-8). The primary VOC originating at the 395 PMR Site, however, is PCE.

At the time the Area RI was finalized, analytical results indicated that VOCs were restricted vertically to depths less than 45 feet, or within the A aquifer, except at the 640 PMR Site where VOCs had been detected at the base of the A aquifer at an approximate depth of 55 feet bgs. VOCs generally had not been detected in the B aquifer, except at the 640 PMR Site in the immediate vicinity of the location of a former underground storage tank (UST). Confirmed detections of VOCs in the B aquifer at this location had been at concentrations below Primary Drinking Water Standard Maximum Contaminant Levels (MCLs). VOCs were also detected at concentrations above MCLs in five groundwater grab samples collected from the B aquifer at or near Clocktower Plaza in the Perimeter Area. Data collected since 1994 indicate that the chemicals of concern listed in Table 2-1 have been detected only sporadically in the B Zone and generally at concentrations near the method detection limits, which are below MCLs. None of the chemicals of concern listed in Table 2-1 were detected in the samples collected from B Zone wells during this reporting period.

2.4 CLEANUP STANDARDS

Chemicals of concern at the Sites and within the Off-Site Area are VOCs. Finding 18 of the Order stipulates the cleanup standards for VOCs in soil and groundwater. For unsaturated zone soil, the cleanup standard is one (1) milligram per kilogram (mg/kg) total VOCs. This standard is based on groundwater protection. Groundwater cleanup standards established pursuant to

the Order are U.S. Environmental Protection Agency (USEPA) MCLs, California Department of Environmental Protection MCLs, or for acetone, a target level based on toxicity characteristics published by USEPA. The chemical specific groundwater cleanup standards are listed in Table 2-1.

3.0 Remedial Measures and Monitoring Program

The following sections describe remedial measures implemented for soil and groundwater. Reuse of extracted and treated groundwater and the groundwater SMP are also discussed.

3.1 REMEDIAL MEASURES FOR SOIL

3.1.1 640 Page Mill Road

Details of the remedial investigation and historical remedial actions completed at the 640 PMR Site through 1994 were previously presented in Appendix B of the Area RI, and Appendix A of the Study Area *Feasibility Study – Revised* (ENVIRON, 1994c), hereinafter referred to as the "Area FS." Pre-1994 remedial actions primarily involved removal of tanks, piping, and other facilities associated with past site activities, and excavation of impacted soils with off-site treatment or disposal. During April 1994 through August 1997, soil vapor extraction and treatment (SVET) was used to remove residual VOCs from soil at the 640 PMR Site. The SVET system includes 28 soil vapor extraction (SVE) wells screened in an upper coarse-grained unit (16 to 21 feet bgs), a lower coarse-grained unit (26 to 38 feet bgs), or an intermediate fine-grained unit located between the upper and lower (ENVIRON, 1996). VOCs were removed from extracted vapors by vapor-phase granular activated carbon (GAC).

An effectiveness evaluation of SVET system operation was submitted per requirements of the Order in a July 1995 report to the RWQCB (ENVIRON, 1995b), and was subsequently approved.

Conclusions presented in the Effectiveness Evaluation included:

- The influent VOC concentration to the SVET system had decreased by approximately 99 percent and the remediation goals for VOCs and acetone had likely been achieved in the upper zone soils; and
- Groundwater levels had risen since installation of the SVE wells, partially or completely re-saturating the gravel packed intervals for most of the lower zone SVE wells.

The SVET system has not operated for any significant time since August 1997.

3.1.2 395 Page Mill Road

Details of the remedial investigation and remedial action activities completed at the 395 PMR Site through 1995 were previously presented in Appendix C of the Area RI, Appendix B of the Area FS, *Vadose Zone Soil Remediation and Additional Soil Investigation Report* (Montgomery-Watson, 1993), *Area X Remedial Design Sampling Report* (ENVIRON, 1994a), *Area X Remediation Work Plan* (ENVIRON, 1995a) and *Addendum to Area X Remediation Work Plan* (ENVIRON, 1995c).

Several areas beneath buildings at the 395 PMR Site were inaccessible during the above referenced investigation and remediation activities. These areas were identified and addressed in 1998 and 1999 during building demolition and site redevelopment activities. Data and information regarding soil investigation and remediation activities completed during and after demolition of 395 PMR Site buildings was provided to the RWQCB in a report titled *Soil Investigation of Areas Exposed by Building Demolition* (ENVIRON, 2001). Based on these results, remaining areas underlying the buildings that were previously inaccessible were investigated and no further investigation or remediation of soils in those areas was deemed necessary.

Two underground storage tanks, not identified during previous investigations, were encountered in 1999 during the site redevelopment activities. The tanks (approximately 350 gallons each in capacity) contained accumulated rainwater with low concentrations of petroleum hydrocarbons. The tanks were subsequently removed, and appropriate sampling and investigation activities were performed. Data and information regarding the tanks, the removal operation, and post-removal sampling were forwarded to the Santa Clara Valley Water District (SCVWD) at various times as the work progressed. Based on a review of those data, and with the concurrence from the RWQCB, the SCVWD issued a case closure letter to HP in August 1999 (SCVWD, 1999).

Construction of the Area X (ten) remedial system was completed in July 1996 to address soil and groundwater impacted by VOCs. The Area X soil remediation consisted of the following:

- Dual-phase extraction (DPE) of soil vapors and groundwater from six A1U Zone extraction wells (RW-1 through RW-6) screened from 10 to 30 feet bgs using a high vacuum blower;
- SVE from seven vertical and one shallow horizontal vadose zone wells extending to less than 10 feet bgs using the DPE blower; and
- Treatment of the soil vapors from the DPE and SVE wells by vapor-phase GAC.

Full time operation of the DPE system began in September 1996. Vapor extraction from the SVE wells was conducted for a period during 1997 and then permanently curtailed with approval from the RWQCB (RWQCB, 1998).

The DPE system was operated until June 7, 2001, when it was shut down as part of a RWQCB-approved trial shutdown (RWQCB, 2001a). The system has remained shut down since that time in accordance with the findings and recommendations of the DPE system trial shutdown evaluation report (SECOR, 2002b).

Based on results of October 2007 soil sampling and analysis results, the RWQCB concurred that the soil cleanup standard of 1 mg/kg had been achieved in Area X (SECOR, 2007e, RWQCB, 2008b). However, the RWQCB did not approve decommissioning the DPE system due to concerns about potential for vapor intrusion at the 395 PMR Site. Potential for vapor intrusion has since been evaluated (see Section 4.2.2), and Decommissioning of the DPE system is expected to be re-evaluated by the RWQCB during 2010.

3.1.3 601 California Avenue

Details of the remedial investigation and remedial action activities completed at the 601 CA Site are presented in Appendix D of the Area RI, and Section 2.2 and Appendix C of the Area FS.

Remedial measures for soil at the 601 CA Site began as an SVET interim remedial measure (IRM) in 1991 (Erler and Kalinowski [EKI], 1991). The IRM was expanded in 1992 as the final remedial measure and implemented in four areas: Areas A, B, C and D (EKI, 1992). The system consisted of 18 extraction points and a central blower/treatment compound.

The SVET system was shut down and the extraction points for Areas A, B and C were decommissioned, per RWQCB approval, in February 1996 prior to site redevelopment (EKI, 1996). The remaining Area D SVET system extraction wells were decommissioned after the RWQCB approved completion of the soil cleanup at the 601 CA Site in August 1996 (EKI, 1997).

3.2 REMEDIAL MEASURES FOR GROUNDWATER

3.2.1 640 Page Mill Road and COE Area

Groundwater extraction as an IRM was implemented at the 640 PMR Site from 1982 through December 1993. Groundwater extraction and treatment was performed from wells O1A, O47A, OB5-2 and OB5-5, which were installed near the 640 PMR source area in the A1 and/or A2 Zones.

The expanded groundwater extraction and treatment (GWET) system for the 640 PMR Site and COE Area final groundwater remedy began full time operation in 1994, and originally included three on-site and six off-site extraction wells.

<u>On-Site Wells</u>

- EW-4 – screened in the A1 and A2 Zones
- EW-5 – screened in the A1 and A2 Zones
- EW-7 – screened in the A1 Zone

<u>Off-Site Wells</u>

- EW-1 – screened in A1U Zone on the former Mayfield School property
- EW-2 – screened in the A1U Zone on the former Mayfield School property
- EW-6 – Screened in the A1/A2 Zone on the former Mayfield School property
- EW-8 – Screened in the A1 Zone on the Palo Alto Square property
- EW-9 – Screened in the A1U Zone northeast of the Palo Alto Square property
- EW-10 – Screened in the A1 Zone northeast of the Palo Alto Square property

Locations of these wells are shown on Figure 2-1 and corresponding water bearing zone-specific figures.

Extraction wells of the expanded groundwater extraction network were connected to the groundwater treatment system located in the southwest corner of the 640 PMR Site. The 640 PMR groundwater treatment system has a maximum capacity of 160 gallons per minute (gpm) and was designed to remove of VOCs from extracted groundwater. Treatment currently consists of ozone followed by GAC. Treated groundwater may be discharged to Matadero Creek or reused on-site to satisfy landscape irrigation needs (to the extent practical) pursuant to the requirements of the National Pollution Discharge Elimination System (NPDES), VOC General Permit (RWQCB, 2009e). Treated groundwater may also be discharged to the City of Palo Alto sanitary sewer system (i.e., publicly owned treatment works or POTW) per Groundwater Discharge Permit #061238.

Per RWQCB approval, groundwater extraction from the following extraction wells has been permanently curtailed: EW-1, EW-2, EW-6 (RWQCB 2005a), and EW-9 (RWQCB 2007). Wells EW-1, EW-2 and EW-6 have been decommissioned. During the reporting period, extraction at wells EW-4, EW-5, and EW-10 has been curtailed on a trial basis with RWQCB concurrence (RWQCB, 2008a).

In situ chemical oxidation (ISCO) was conducted in the vicinity of extraction well EW-6 in 2005 prior to that well being decommissioned. ISCO work, and decommissioning of wells EW-1, EW-2, EW-6, F23A, F43A1U, F45A1U, O24A1U, OB6-1, OB6-2, F44A, and T2A, was conducted with RWQCB approval in association with redevelopment of the area known as the Former Mayfield School site by Stanford University (Stanford, the property owner). Redevelopment plans involved constructing a soccer complex on the site. Details of this work are provided in the December 2005 *Site Status and Six-Month Post-Treatment Effectiveness Evaluation Report, Former Mayfield School Site and Northeast End of 640 Page Mill Road Site, Palo Alto, California* (SECOR, 2005c).

3.2.2 395 Page Mill Road

Investigation and remediation of groundwater at the 395 PMR Site was primarily addressed as part of the Area RI and Area FS. VOC impacted groundwater (and soil) in Area X (ten) was addressed separately because investigations were not complete at the time the RI and FS documents were finalized.

Groundwater remediation in Area X has consisted of A1U and A1 Zone groundwater extraction and treatment, and ISCO in the vicinity of A1U Zone DPE well RW-5. Extraction of groundwater and soil vapor from DPE wells RW-1 through RW-6 began in September 1996. Well RW-3 was decommissioned and well RW-5 was taken out of service in May 1998, per RWQCB approval (RWQCB, 1998). Groundwater extraction from well EW-11R began in 1996. Extracted groundwater from the DPE system and well EW-11R was discharged to the sanitary sewer system under the requirements of a Groundwater Discharge Permit issued by the City of Palo Alto. Locations of the existing DPE wells and well 11R are shown on Figure 2-1.

The DPE system was shut down on a trial basis on June 7, 2001 per RWQCB approval (RWQCB, 2001a), and has remained shut down since that time. Extraction well EW-11R was shut down on June 14, 2003, per verbal authorization from the RWQCB.

Results of the trial shutdown were initially submitted to the RWQCB on August 9, 2002 (SECOR, 2002a). Based on the trial shutdown results, permanent shutdown of the DPE system and extraction well EW-11R was recommended in a report submitted to the RWQCB on September 27, 2002 (SECOR, 2002b). It was also recommended that the groundwater extraction and treatment system at the OEU be used to continue to contain and remediate VOC-impacted groundwater originating from the 395 PMR Site. During a teleconference on January 17, 2007, RWQCB staff conveyed to HP their concurrence with permanent shutdown of the DPE system and extraction well EW-11R for the purpose of groundwater remediation.

Consistent with recommendations in the Addendum to the Second Five Year Report, ISCO injections were conducted to address localized elevated PCE concentrations in the vicinity of well RW-5. SECOR directed one-time injections of sodium permanganate into three temporary injection points and one observation well, OB11-2 in October 2007. A report describing the injection activities and the results of the one-, three-, and six-month post-treatment monitoring was submitted to the RWQCB in July 2008 (Stantec, 2008b).

3.2.3 601 California Avenue

Remedial measures for groundwater at the 601 CA Site began in 1987 with extraction from a single well, V8-2X screened in the combined A1/ A2 Zone (see Figure 2-3 for well location). Extracted groundwater from V8-2X was treated by liquid-phase GAC and discharged to the sanitary sewer system. The system was expanded and modified in 1992 to include four A1/A2 extraction wells: V8-2X, V8-8X and V-9X, and V8-14X. The system was shutdown in July 2003 while Varian implemented ISCO using permanganate.

MWH conducted an ISCO pilot study in November 2000, to evaluate the potential for ISCO to expedite groundwater cleanup at the 601 CA Site. Injections of permanganate were conducted in the courtyard area and the west parking lot. Findings of the pilot study indicated that *in situ* oxidation was a viable treatment technology (MWH, 2001).

MWH and SECOR, as part of the pilot study and subsequent full-scale ISCO program, installed 20 wells with the dual purpose of facilitating ISCO treatment and further defining the distribution of VOCs in the courtyard and west parking lot. These wells include:

- P1 through P4, TW-1/P7, TW-2/OBS, and TW-3/P8 in the west parking lot area; and
- P9 through P14, P16 through P21, and OBS in the courtyard area.

A figure showing ISCO injection well locations and plume configuration is provided in Appendix A.

MWH and SECOR conducted three full-scale ISCO treatments as follows.

- December 2003/January 2004 (MWH, 2005).
- July 2005 (SECOR, 2006b).
- September 2006 (SECOR, 2007c).

ISCO treatment was successful at reducing the overall size of the VOC-impacted area although VOC concentrations in the center of the courtyard, around well P17, persisted following treatment.

In November of 2007, SECOR submitted a work plan to the RWQCB (SECOR, 2007d) proposing additional ISCO injections in the vicinity of well P17 and the installation of an injection well in the courtyard upgradient of P17 (well P21). Additional ISCO injections were not completed as proposed because evidence of separate-phase TCE was identified in the vicinity of well P21 (TCE concentration of 200,000 µg/L). Because of this, in a July 2008 memorandum to the RWQCB (Stantec, 2008c), Stantec proposed a change from ISCO to enhanced *in situ* bioremediation (EISB). The change was proposed due to the anticipated limited effectiveness of ISCO to treat separate-phase TCE.

In May 2009, Stantec proposed to the RWQCB that additional borings be advanced to characterize the extent of VOC impacts in the vicinity of well P21 and that a bench scale study be conducted to evaluate treatment requirements for EISB (Stantec, 2009a). The RWQCB approved the work plan in June 25, 2009 (RWQCB, 2009c). Implementation of the work plan has been delayed by Site access and permitting issues. It is anticipated that field work will be initiated in February 2010. Implementation of EISB is expected to occur in August 2010, assuming that the bench scale study results are favorable. EISB would be designed to address on-site areas of elevated concentration and to mitigate off-site migration.

3.2.4 OEU Dewatering System

The OEU serves as a subsurface roadway beneath the Southern Pacific Railroad tracks, Alma Street and Park Boulevard. The underpass, built in 1958, extends approximately 24 feet bgs into the A1 Zone. A dewatering system was constructed to control (prevent) flooding of the underpass from groundwater seepage and storm water accumulation. The dewatering system has a substantial impact on groundwater flow in the Off-Site Area. The OEU dewatering system effectively captures groundwater from surrounding areas and acts to limit the potential for the migration of VOC-affected groundwater in the A aquifer beyond the OEU subdrain.

Groundwater captured by the OEU dewatering system, along with surface water from the underpass and surrounding area is directed to a sump within the OEU pump station located at the corner of the transition road from eastbound Oregon Expressway to southbound Alma Street. The OEU pump station is shown on Figure 2-2. Historically, VOC-impacted water collected in the OEU pump station sump was discharged to the sanitary sewer system under a

permit from the City of Palo Alto POTW. Periodically, during times of high surface water inflow, water was pumped into a box culvert approximately 25 feet above the OEU, which discharges to Matadero Creek approximately 2200 feet downstream (southeast) of the OEU pump station.

National Pollutant Discharge Elimination System (NPDES) Permit No. CA0038784 was issued to the County of Santa Clara Roads and Airports Division (the County) by the RWQCB on August 16, 2000, allowing further discharge of water from the OEU pump station to Matadero Creek. The permit required the installation of a VOC removal system, on or in the box culvert that transports groundwater and surface water from the pump station to Matadero Creek.

SECOR subsequently designed and constructed a VOC treatment system. The treatment system consists of two sequential operations: the first being removal of VOCs by pumping water through a vacuum air stripping unit that discharges under gravity into the box culvert. The second operation is further removal of VOCs by passive air stripping as water flows approximately 2200 feet in the box culvert toward Matadero Creek. This system was put into operation during the first quarter of 2002.

On June 29, 2007 the County of Santa Clara submitted a NOI to the RWQCB proposing the OEU discharge be covered under the VOC General Permit. The RWQCB authorized discharge of treated groundwater from OEU under the requirement of Order No. R2-2004-0055, NPDES Permit No. CAG912003 in a letter dated July 27, 2009. Coverage under the General Permit was renewed in 2009. Water from the OEU dewatering system is also periodically discharged to the sanitary sewer system under a POTW discharge permit.

3.2.5 Perimeter Area

Groundwater remedial measures in the Perimeter Area began in March 1993 with the installation of IRM extraction well EW-13 (A1 Zone) near the intersection of Lambert and Ash Avenues. EW-13 operated temporarily as an IRM extraction well from January 1995 through December 1, 1995. EW-13 was connected to the IRM treatment system at the Varian 611 Hansen Way site, treated via GAC, and reused onsite for either landscape irrigation or to fill ornamental ponds. EW-13 was subsequently connected to the 611 Hansen Way treatment system as part of the final remedy. The 611 Hansen Way treatment system began full-time operation on March 28, 1996. Connection of extraction well EW-13 was completed in September 1996 with full-time operation of the well beginning in December 1996 (Flour-Daniel GTI, 1997; ENVIRON, 1997).

Four additional wells were proposed as part of the final groundwater remedy approved in the FS. Extraction well EW-12 (A1U Zone) was installed in August 1996 near the intersection of Lambert and Ash Avenues. Extraction well EW-14 (A1 Zone) was installed in October 1995 near the intersection of Portage Avenue and Ash Street. Both EW-12 and EW-14 were connected to the 611 Hansen Way treatment system in November 1996 and began full-time operation on November 15, 1996 (ENVIRON, 1997). The 611 Hansen Way treatment system operated continuously until March 2006 when a power spike damaged the treatment plant control system.

When operational, up to 12.5 percent of the groundwater treated at the 611 Hansen Way treatment system was reused at that site (Table 3-1).

Extraction wells EW-15 (A1U Zone) and EW-16 (A1 Zone) were installed in October 1995 near the intersection of Park Boulevard and Portage Avenue and began full-time operation in June 1996. Extracted groundwater from these two wells is discharged directly to the POTW without treatment under a Groundwater Discharge Permit issued by the City of Palo Alto.

Extraction well EW-12 operated until January 2006 when flooding of the control vault rendered well EW-12 non-operational. The well was left off with RWQCB approval pending authorization from the RWQCB to permanently shutdown the extraction well. The RWQCB approved permanent shut down of EW-12 in the Second Five-Year Report approval letter (RWQCB, 2007).

Extraction wells EW-13 and EW-14 operated until March 2006 when these wells were shut down due to the 611 Hansen Way treatment system shutdown. The RWQCB approved trial shut down of well EW-13 in the Second Five-Year Report approval letter. Extraction well EW-13 has remained off throughout the remainder of this reporting period.

In situ chemical oxidation work (one-time permanganate injection) and decommissioning of extraction well EW-14 was completed pursuant to RWQCB approval in an email from Mr. Roger Papler of the RWQCB to Ms. Denise Kato of Varian, dated June 26, 2006. The *in situ* chemical oxidation work was completed on July 10, 2006. Well EW-14 was destroyed (pressure grouted) on July 11, 2006. This work is documented in the report titled *Chemical Oxidation and Well Decommissioning at Extraction Well EW-14, located on Portage Avenue, Palo Alto, California*, submitted to the RWQCB on September 12, 2006 (SECOR, 2006c).

Extraction wells EW-15 and EW-16 operated throughout the reporting period with no major changes.

3.3 GROUNDWATER SELF-MONITORING PROGRAM

Revised Site Cleanup Requirements, Order 94-130, was adopted by the RWQCB on September 21, 1994. A groundwater Self-Monitoring Program (SMP) was also adopted on this date. The SMP specified that ground water elevations would be measured quarterly and provided a schedule for groundwater sampling and analysis. In response to requests from Hewlett Packard and Varian, a revised SMP was approved on December 18, 1997 (RWQCB, 1997). The revisions included discontinuing sampling from selected wells, reducing the sampling frequency in selected wells, and changing the analytical methods used.

The RWQCB approved a modified SMP in a letter to HP, Varian, and Stanford Management Company dated May 4, 2001 (RWQCB, 2001b). There have been no further RWQCB-approved modifications to the SMP. The current SMP consists of the following elements:

- Annual groundwater level measurements for 177 wells in June of each year;

- Annual groundwater sample collection and analysis for 28 wells (sampling in June, analysis using EPA Method 8021B or equivalent);
- Biennial groundwater sample collection and analysis for 131 wells and the OEU Manhole (sampling in June, analysis using EPA Method 8021B or equivalent); and
- Submittal of Annual groundwater self-monitoring reports to the RWQCB by September 30 of each year

Table 3-2 presents the wells from which the groundwater levels are collected along with the annual groundwater elevation data for 2006 through 2009. Table 3-3 summarizes the SMP sampling schedule for the Sites ("Annual" sampling occurs during June-second quarter).

Pursuant to RWQCB concurrence (RWQCB, 2005b) with the recommendations from a 2004 passive diffusion bag sampler (PDBS) demonstration study (SECOR, 2005a), PDBS have been used as the primary method of collecting ground water samples since June 2005.

The Second Five-Year Report included the following recommendations to modify the existing SMP:

- Increase the monitoring frequency for select wells from biennial to annual (EW-7, O67A2, O120A1, V8-1, V8-5, V8-8, F21A1U and F22A1U);
- Remove extraction wells EW-1, EW-2 and EW-6, and EW-9 and monitoring wells F44A1, F45A1U, OB6-1, OB6-2, O24A1U, F23A and F43A1U from the SMP; and
- Add monitoring well T1A and F29A1U to the SMP and monitor on an annual basis.

The RWQCB did not specifically approve the changes to the SMP in the February 9, 2007 Second Five-Year Report approval letter. However, HP and Varian have implemented most of these recommendations on a self-directed basis.

The following wells are listed in the May 2001 SMP but have since been approved by RWQCB for destruction, and thus are no longer sampled.

- W9A1U (destroyed 1998)
- BW-4 (destroyed March 2002)
- EW-1, EW-2, EW-6, F23A, F43A1U, F44A and F45A1U (destroyed July 2005)
- EW-14 (destroyed July 2006)
- EW-9 (not yet destroyed)

During June 2009, the following 19 wells that are not included in the SMP were monitored on a self-directed basis:

- Well F29A1U, which was sampled to monitor VOC concentrations northeast of the Stanford/Palo Alto Community Playing Fields (the "soccer complex" – also known as the former Mayfield School Site);

- Well O152B, which was constructed at the 640 Page Mill Road site in June 2009 to assess B Zone water quality in the east portion of that Site;
- Wells P1-A1, P2-A2, P3-A2, P4A2, and P5A2, which are located on the 640 Page Mill Road site, were sampled to monitor VOC concentrations in the east and northeast portion of that Site;
- Wells OB5-2, OB5-3, OB5-4 and OB5-5 were sampled to assess VOC concentrations in the immediate vicinity of the building located on the 640 Page Mill Road site;
- Well T1A1, which was constructed in the vicinity of wells EW-6 and F44A, which were decommissioned when the soccer complex was constructed in 2005, is typically monitored biennially; and
- Wells F126A2, F137A1, P13, P17, TW-2 and F86A2 were sampled in support of the Third Five-Year Report.

3.4 LAND USE RESTRICTIONS

Pursuant to Provisions C.3(c), C.4(c), and C.5(b) of the Order, each of the Sites has had a *Covenant and Environmental Restriction of Property* Covenant recorded with the Santa Clara County Recorder (Agilent, 2006; Stanford, 2003a; Stanford, 2003b). Each of the restrictions enumerated in the covenants "run with the land" and is enforceable by the RWQCB. Restrictions on development and use specified in each covenant include the following:

- The integrity of remedial measures, equipment and groundwater monitoring systems must be preserved; and
- Owners and occupants of the Site shall not extract contaminated groundwater for any use unless expressly permitted in writing by the RWQCB.

An additional restriction is included in the 395 PMR Site covenant: "No residential buildings shall be constructed over the area of RW-5 and OB11-2, located in the east corner of the site, without further evaluation of potential vapor intrusion."

4.0 Additional Investigative Activities During the Reporting Period

Additional investigative activities were completed by HP at the 640 PMR and 395 PMR Sites, by Varian at the 601 CA Site, and by HP and Varian in the COE Area during the reporting period.

4.1 640 PMR SITE INVESTIGATIVE ACTIVITIES

The 0investigative activities described below were conducted for the 640 PMR Site during the reporting period. The primary focus of these investigative activities was to assess VOC concentration increases in the vicinity of A1 Zone well O119A1 and A2 Zone wells O67A2 and O52A2, located east of the current building at the site, which were noted in the Second Five-Year Report.

- During January and February 2007, six groundwater monitoring wells were installed in the northeast portion of the 640 PMR Site parking lot (wells P1-A1, P1-A2, P2-A2, P3-A2, P4-A2 and P5-A2). Details of this work are reported in the *Groundwater Monitoring Well Installation Report for Hewlett-Packard Company* (SECOR, 2007a).

- During January 2007, groundwater samples were collected and analyzed from eight soil vapor extraction points in the basement parking garage of the 640 PMR Site building. Five membrane interface probe (MIP) borings were completed in the vicinity of O119A1, O68A1 and O67A2 in February 2007, and selected groundwater monitoring and extraction wells on the 640 PMR Site were sampled and analyzed for VOCs in March 2007. Results of this work were submitted to the RWQCB in the report titled *Results of Additional Investigation in the Vicinity of Wells O119A1, O68A1 and O67A2, 640 Page Mill Road, Palo Alto, California* (SECOR, 2007b).

- During September 2007 through August 2008, the following additional work was conducted:

    - Redevelopment, down-hole video logging and groundwater pump replacement at EW-7;
    - Step drawdown and constant rate pumping test at EW-7; Tracer testing at well O119A1, including tracer monitoring at various wells in the vicinity of O119A1 and EW-7;
    - A total of 27 additional MIP borings in the vicinity of wells O119A1 and O67A2 including 37 grab groundwater samples for VOC analysis;
    - A total of 5 cone penetrometer (CPT) borings along Page Mill Road and collection of 18 grab groundwater samples for VOC analysis;
    - Groundwater elevation data were collected in the A1 and A2 zones in the vicinity of the 640 PMR Site; and

- Additional groundwater samples were collected from wells O28A1, O52A2, F123A1, F124A2, EW-5, EW-7 and EW-8, i.e. in addition to sampling conducted as part of the current self-monitoring program (SMP).

Methodologies and results of the above investigations, along with remedial pumping system optimization activities, were provided to the RWQCB in the October 2008 *Report of Recent Investigation Activities, Hewlett-Packard Company, 640 Page Mill Road Site, Palo Alto, California* (Stantec, 2008e). The RWQCB approved the October 2008 report in a letter issued to HP on April 30, 2009 (RWQCB, 2009b)

- During June 2009, one B Zone groundwater monitoring well (well O152B) was installed in the northeast portion of the 640 PMR Site. Details regarding the well construction, and subsequent development and sampling are reported in the *Installation Report for B-Zone Well O152B, Hewlett-Packard Company, 640 Page Mill Road Site, Palo Alto, California* (Stantec, 2009c). A letter was issued by the RWQCB on November 12, 2009 approving the B Zone well installation report (RWQCB, 2009d). The letter, however, expressed concern that the newly installed well did not characterize the upper portion of the B Zone, and required that an updated conceptual site model (CSM) be submitted, and include an evaluation, based on the model, of the need for additional characterization. The RWQCB letter also included a request to evaluate the potential influence and proper decommissioning of long screened wells that were constructed near the former on-site underground solvent storage tank in the late 1980s.

- A report titled *Updated Conceptual Site Model - A1 Zone near Well O119A1 and A2 Zone near Well O67A2* was submitted to the RWQCB on January 19, 2010 (Stantec, 2010b) in compliance with the November 12, 2009 RWQCB letter. The report also included documentation of proper well decommissioning as requested by the Water Board.

Key conclusions from the above investigative activities are as follows.

- The lateral and vertical limits of chlorinated VOCs in the A1, A2, and A2D zones have been defined. No further investigation is required to evaluate the extent of chlorinated VOCs in these zones.
- Operation of wells EW-7 and EW-8 at higher than originally designed flow rates is providing improved hydraulic control of the VOC plume and has substantially increased the VOC mass removal rate from the A1 Zone.
- Water quality monitoring data and MIP data suggest that the VOC plume in the A2 Zone in the vicinity of well 067A2 is not currently expanding (i.e., is stable). It is possible that groundwater extraction at A1 Zone well EW-7 is causing upwelling of groundwater from the A2 Zone to the A1 Zone resulting in localized hydraulic influence of A2 zone groundwater.

- Groundwater collected from well O152B in June 2009 did not contain detectable concentrations of VOCs. No additional evaluation of the B Zone is warranted.

4.2 395 PMR INVESTIGATIVE ACTIVITIES

The following investigative activities were completed at the 395 PMR Site during the reporting period.

4.2.1 Area X Soil Sampling

Soil boring and sampling was conducted in October 2007 at nine locations in the portion of Area X that was previously identified as containing soil concentrations above the 1 mg/Kg total VOC cleanup standard. The objective of this work was to assess whether soil remediation efforts had reduced concentrations to below the cleanup standard. As reported in the December 14, 2007 *Report of Soil Sampling to Assess Achievement of Final Cleanup Standards in Soil in Area X (ten), Former Hewlett-Packard Company 395 Page Mill Road Site, Palo Alto, California* (SECOR, 2007e), none of the soil samples collected contained total VOC concentrations above the soil cleanup standard. Based on these results decommissioning of the DPE system was recommended.

The RWQCB approved the portion of the December 2007 report that documents achievement of the final soil clean up standards (RWQCB, 2008b). RWQCB did not approve decommissioning of the DPE system due to elevated PCE concentrations in a groundwater sample collected from OB11-2 in October 2007, and required HP to submit a work plan to assess the potential for vapor intrusion at the 395 PMR Site. The RWQCB letter states that the recommendation for DPE system decommissioning would be re-evaluated by the RWQCB after the results of post-*in situ* chemical oxidation treatment groundwater sampling and results and the vapor intrusion evaluation are submitted.

4.2.2 Soil Gas Sampling to Assess Potential for Vapor Intrusion

Soil gas sampling and analysis was conducted at the 395 PMR Site during May and October 2009 in accordance with a work plan approved by the RWQCB (Stantec, 2008a, Stantec 2008f, RWQCB, 2009a). Initial soil gas sampling was conducted in May 2009, and a report documenting that effort was submitted to the RWQCB on June 30, 2009 (Stantec, 2009b). As conveyed in the May 30 report, low- or no-flow conditions were encountered at each sampling location. Data from just one of four samples collected (location SG-1) was considered acceptable for quantitative comparison to corresponding RWQCB Commercial/Industrial Land-Use Environmental Screening Levels (ESLs) for potential migration of VOCs from soil gas to indoor air, as specified in the RWQCB approved work plan. The sample from SG-1 did not contain VOC concentrations above corresponding ESLs.

As described in the January 14, 2010 report, *Results of October 2009 Soil Gas Sampling to Assess Potential for Vapor Intrusion at 395 Page Mill Road, Palo Alto, California* (Stantec 2010a), additional soil gas sampling and analysis was conducted October 2009. Soil gas

samples were obtained each of eight intended locations, and data were determined to be acceptable for quantitative evaluation. VOCs were not detected at concentrations above corresponding Commercial/Industrial Land-Use ESLs in any of the samples. The report concluded that since VOCs were not detected in soil gas samples at concentrations exceeding Commercial/Industrial ESLs, no additional investigation to complete characterization was necessary.

4.3 601 CA INVESTIGATIVE ACTIVITIES

In 2005 SECOR installed 16 additional wells at the 601 CA Site for the dual purpose of facilitating ISCO injections and evaluating the lateral distribution of VOCs in the west parking lot and the courtyard (see section 3.2.3 for well names, and Appendix A for a well location and VOC distribution map).

The well installations confirmed the conceptual site model which identified the courtyard as the primary area of concern. The highest concentrations were observed in wells P17, P13, and P16. As a result of persistent elevated VOC concentrations in well P17, SECOR proposed installation of well P21 in the courtyard upgradient of well P17. As described in Section 3.2.3, evidence of separate-phase TCE was observed in well P21.

In an effort to evaluate the extent of the elevated VOC concentrations in the vicinity of well P21, Stantec has proposed additional investigation activities (Stantec, 2009a), both in the courtyard and along the eastern downgradient side of the Site building. The purpose of the downgradient borings is to evaluate VOC migration for future implementation of EISB to mitigate potential off-site migration. The work plan for further characterization and EISB bench scale study was approved by the RWQCB (RWQCB, 2009c) in August of 2009; however, implementation has been delayed by Site access and permitting issues. Work is expected to begin in February of 2010.

4.4 COE AREA INVESTIGATIVE ACTIVITIES

Soil gas samples were collected at 14 locations within the COE area In April, 2008. Fourteen shallow and four deep soil gas samples were collected and submitted for laboratory analysis for VOCs. A *Report of Soil Gas Sampling, California-Olive-Emerson Study Area, Palo Alto, California* was submitted to the RWQCB in May 2008 (SECOR, 2008). The results indicated that none of the shallow soil gas samples contained VOC concentrations greater than the corresponding RWQCB Residential Land-Use ESLs for potential migration of VOCs from soil gas to indoor air. TCE was detected above the Residential ESL in one deep (11 feet bgs) sample, near a subterranean parking garage. An addendum to the soil gas report (Stantec, 2008d) was submitted to the RWQCB to provide additional information regarding sampling locations, building structures and the ventilation system of the parking garage. The soil gas report and addendum were approved by the RWQCB in a letter to HP and Varian dated November 18, 2008 (RWQCB, 2008d) and no further soil gas investigations in the COE Study Area were required.

5.0 Effectiveness Evaluation

The following sections present an evaluation of the effectiveness of the final groundwater remediation remedy and recorded land use restrictions, and information regarding projected costs.

5.1 GROUNDWATER REMEDIATION

The Study Area generally consists of the Sites, with associated historic VOC sources, and subsequent downgradient commingling of the off-site VOC plumes in the Off-Site Areas. Historic remedial activities at the Sites and in the Off-Site Area have reduced VOC concentrations in groundwater throughout the Study Area. VOC concentrations in groundwater have been reduced at the individual Sites, in groundwater of the commingled down-gradient areas, and in the groundwater captured at the OEU.

Table 5-1 provides a summary of VOC mass removed, groundwater volumes extracted and VOC mass removal efficiencies for the remediation systems at the Sites and the Off-Site Area. Figures 5-1 through 5-7 graphically depict groundwater remediation system performance information. Table 4-1 is a historical summary of data for VOCs detected most frequently and extensively in groundwater samples from the Sites and the Off-Site Area. Concentration versus time plots showing PCE, 1,1,1-TCA, TCE and 1,1-DCE concentration trends for A1U, A1 and A2 wells currently in the SMP are provided in Appendix B. Graphs for B Zone wells were not prepared because chemicals of concern have not been detected in the B Zone at significant concentrations: VOCs were not detected in samples collected from B Zone wells during the reporting period.

5.1.1 395 PMR Site

Remedies implemented at the 395 PMR Site, including soil vapor, groundwater extraction and localized *in situ* chemical oxidation, have been effective at reducing VOC concentrations in soil and groundwater. Active remedial systems have been shut down with regulatory agency approval. Concentrations of VOCs in groundwater at the 395 PMR Site and immediately down-gradient of this site are stable to decreasing. For example, as shown on the trend graph in Appendix B, concentrations of PCE, 1,1,1-TCA, and 1,1-DCE at down-gradient well W-10A1U have decreased to near non-detectable levels. TCE concentrations at this well, which are not directly associated with the 395 PMR site, are also stable to decreasing.

5.1.2 OEU and Off-Site Areas

The influent concentrations of groundwater to the OEU are an indication of remedial progress in the Study Area. As shown on the trend graph in Appendix B, the VOC concentrations at the OEU decreased consistently between about 1996 and 2003 demonstrating significant remedial progress throughout the Off-Site Area. Since that time, PCE, 1,1,1-TCA, and 1,1-DCE

concentrations have remained very low (17 µg/L, 3.2 µg/L and 1.6, respectively), and have exhibited a stable to decreasing trend. The trend data for these compounds, particularly PCE, is a reflection of remedial effectiveness at the 395 PMR site.

The TCE concentrations at the OEU have remained stable since 2003, with a concentration of 68 µg/L in both the 2003 and 2009 sampling events. These data suggest that the localized increased TCE concentrations observed at and downgradient of the 601 CA and 640 PMR Sites has not resulted in similar concentration increases at the OEU. TCE concentrations at monitoring wells down-gradient of El Camino Real (not including F127A1 and F129A1 which are discussed below) have for the most part also remained stable over this same time period. The TCE concentration at well F34A has ranged from 41 µg/L to 58 µg/L between 2004 and 2009. Similarly, the TCE concentration at F62A1 ranged from 82 µg/L to 97 µg/L over this same time period not including the potentially anomalously low 18 µg/L result for the 2009 event. Data collected over the next five-year period will determine if the lower 2009 TCE result at F62A1 is anomalous or represents improved remedial effectiveness in the COE Area.

5.1.3 Wells F127A1 and F129A1

Wells F127A1 and F129A1 are located northeast and downgradient of El Camino Real and extraction well EW-8. As shown on the graphs in Appendix B, concentrations of TCE, 1,1,1-TCA, and 1,1-DCE increased over the last five years at well F127A1. Concentrations of 1,1,1-TCA and 1,1-DCE also increased at well F129A1, which is located approximately 300 feet down-gradient of F127A1. These increases are directly associated with plume migration from the 640 PMR Site, which is discussed in the following paragraph. VOC concentrations at further downgradient well F145A1 do not exhibit increasing trends. These data, coupled with the minimal VOC increase at F129A1, suggest that the F129A1 location represents the down-gradient limit of recent VOC plume expansion. Stable VOC concentrations in the downgradient Off-Site Area and at the OEU as discussed above further support this. HP is currently implementing increased pumping at wells EW-7 and EW-8, as discussed below, to both reduce the VOC concentrations in these pumping areas and to improve hydraulic control and thus further minimize downgradient migration of VOC mass.

5.1.4 640 PMR – A1 Zone

Several monitoring wells of the A1 and A2 Zones on and immediately downgradient of the 640 PMR site exhibited increasing VOC concentrations over the last 5 to 10 years. Key monitoring wells exhibiting increasing trends include O119A1 and O67A2 on the 640 PMR Site, and F123A1 and F42A1 downgradient of the Site (see trend graphs in Appendix B). Data from the A1 Zone monitoring wells indicate expansion of the VOC plume, including both TCE and 1,1,1-TCA at and downgradient of the 640 PMR Site. As detailed in Section 4.1 of this report, HP completed several actions between 2007 and 2009 to address this plume expansion including modifications to pumping rates at wells EW-7 and EW-8. As shown in Appendix B, VOC concentrations have decreased substantially at off-Site well F123A1 since the pumping rate at well EW-7 was increased in December 2007. Similar reductions in VOC concentrations are

anticipated at wells F42A1, F127A1, and F129A1 over the next several years with continued pumping at EW-7 and the increase in pumping rate at EW-8 that was initiated in late 2009.

Table 5-1 provides a summary of VOC mass removed, groundwater volumes extracted and VOC mass removal efficiencies. Figures 5-1 through 5-5 graphically depict GWET system performance information. The increased pumping rate at EW-7 and EW-8 and the associated improvement in remedial effectiveness is evident on this table and associated figures. For example, the average mass removal rate for the 640 PMR GWET system has increased from 7.4 pounds per/million gallons (lbs/mgal) during January 2000 through December 2004 to 20.1 lbs/mgal for January 2005 to December 2009 period. This improvement in mass removal efficiency is a result of the shutdown of extraction wells that had low VOC concentrations (wells EW-4 and EW-5) and increasing the pumping rate of wells EW-7 and EW-8.

5.1.5 640 PMR – A2 Zone

VOC concentrations in well O67A2 on the 640 PMR Site increased substantially between June 1998 and June 2001, and again between June 2005 and June 2006. Since that time, VOC concentrations at this well have decreased and then have remained relatively stable since about June 2008. Downgradient A2 Zone monitoring well O52A2 exhibited a VOC concentration increase in a similar timeframes as O67A2, although at much lower concentrations, and well F124A2 exhibited a VOC concentration increase between June 2005 and June 2007 with a maximum TCE concentration of 61 µg/L. Well F126A2, located southeast of F124A2, remains non-detect for VOCs. VOC concentrations at O67A2, F124A2, and O52A2 have remained stable to decreasing in concentration since June 2007.

Although VOC concentrations remain elevated at the O67A2 location, data do not suggest continued migration of the A2 Zone VOC plume to the downgradient areas. As shown on the trend graphs in Appendix B, VOC concentrations at wells P1-A2 to P5-A2 indicate stable to decreasing concentrations since their installation was completed and sampling was initiated in February 2007. Further, VOC concentrations at wells O111A2 and O114A2 located on the 640 PMR Site to the northwest of O67A2 did not indicate a VOC increase in the same timeframe as well O67A2. VOC concentrations at these two wells have remained stable to decreasing in concentration over the last 10 years.

In summary, the VOC plume in the A2 Zone expanded from 1998 until approximately 2007 and has since stabilized. There is no indication the VOC plume is migrating further or contributing substantial VOC mass to the downgradient areas. Additional monitoring well sampling will be conducted to monitor temporal trends in the A2 Zone wells.

5.1.6 601 California

Pursuant to RWQCB authorization, the GWET system was shut down on July 15, 2003. Three full-scale *in situ* chemical oxidation injection events were subsequently completed, two with potassium permanganate (December 2003/January 2004, and October 2005) and one with sodium permanganate (September 2006). To date, injections have resulted in TCE

concentration reductions in wells along the entrance to the courtyard and in the parking lot west of the building. However, VOC concentrations rebounded to pre-treatment levels in wells located within the interior of the courtyard area. The most significant VOC concentration rebound has been observed around wells P13 and P17 (39,000 and 34,000 µg/L, respectively in March 2008). The newly installed well (P21), located between P13 and P17, was found to contain a TCE concentration of 200,000 µg/L. Based on the results of the March 2008 sampling, Varian has proposed to discontinue ISCO and evaluate further *in situ* treatment using EISB.

As shown on trend graphs in Appendix B, data from downgradient monitoring wells V-9, V-9X, and F98A suggest migration of the TCE plume from the 601 California Site to the area immediately downgradient of the Site. The concentration increase in F98A appears to have started in the 2003 to 2005 timeframe. Well F97A, located down and cross-gradient of F98A has also exhibited a minor TCE increase over this same time period (1.9 µg/L in 2003 to 35 µg/L in 2009). The goal of the proposed EISB program is to reduce VOC concentrations within the source area and mitigate potential migration of VOCs from the Site to downgradient areas.

5.1.7 Perimeter Area Extraction Wells EW-15 and EW-16

Extraction wells EW-15 and EW-16 are located in the north portion of the Perimeter Area. These extraction wells supplement hydraulic capture of the OEU and remove VOCs, primarily PCE (see Appendix B). VOC concentrations at both pumping wells are stable to decreasing over the last 10 years. Operation of these wells does not provide appreciable hydraulic capture or VOC mass removal, and the downgradient OEU would provide equivalent effectiveness. In the recommendations section below, it is proposed to shut down both wells on a trial basis and monitor downgradient wells to observe conditions and confirm continued capture of low VOC concentrations in this area by the OEU.

5.1.8 Summary of Effectiveness Evaluation

VOC concentrations at the OEU and monitoring wells in the downgradient Off-Site Area are stable to decreasing. These data suggest that the localized VOC concentration increases and plume migration observed in the vicinity of the 601 CA and 640 PMR Sites over the last five years has not adversely impacted water quality in the downgradient Off-Site Area. Actions taken by HP at the 640 PMR Site since 2008 have increased mass removal rates, stabilized and/or are reduced concentrations, and have mitigated further plume migration to the downgradient areas. This is expected to continue with ongoing remedial pumping at wells EW-7 and EW-8. Remedial plans by Varian at the 601 CA Site (EISB) are also intended to provide further VOC treatment and mitigate potential VOC migration to downgradient areas.

5.2 LAND USE RESTRICTIONS

Stantec retained Old Republic National Title Insurance Company (Old Republic) to provide Recorded Document Guarantee (RDG) reports, similar to property transaction Title Searches, for the 640 PMR Site, 395 PMR Site and 601 CA Site. The RDG reports were obtained to

assess whether the institutional controls (land use restrictions) specified in the Order were recorded. The RDG reports identify the Covenant and Land Use Restriction recorded for each of the Sites. Copies of the RDG reports are provided in Appendix C.

5.3 PROJECTED COSTS

Costs incurred to date and projected future costs, assuming an additional 15 years of operation, maintenance and/or monitoring, are on the order of those projected in the RI/FS.

6.0 Conclusions and Recommendations

Remedial measures for the Sites and Off-Site Area are generally performing as intended. VOC concentrations at the OEU and monitoring wells in the downgradient Off-Site Area are stable to decreasing. These data suggest that the localized VOC concentration increases and plume migration observed in the vicinity of the 601 CA and 640 PMR Sites over the last five years has not adversely impacted water quality in the downgradient Off-Site Area. Actions taken by HP at the 640 PMR Site since 2008 have increased mass removal rates, stabilized and/or are reduced concentrations, and have mitigated further plume migration to the downgradient areas. Remedial plans by Varian at the 601 CA Site (EISB) are also intended to provide further VOC treatment and mitigate potential plume migration to downgradient areas.

As anticipated in the discussion of the selected remedy in the Order, concentrations of VOCs remaining after over 15 years of operation of the groundwater remedial systems are still above cleanup standards in many areas. As observed at many other VOC impacted groundwater sites, groundwater pump and treat technology is generally effective at removing dissolved chemicals and controlling plume migration, but requires very long periods of time to achieve groundwater cleanup objectives. This is discussed in the Area FS and recognized by the RWQCB in the Order as part of the discussion of long-term effectiveness of the selected alternative.

Per applicable provisions of the Order, a *Covenant and Environmental Restriction of Property* has been recorded with the Santa Clara County Recorder for each of the Sites. RDG reports by Old Republic identify the recorded Covenant and Land Use Restriction for each of the Sites.

Specific recommendations for each of the Sites, the COE Area and the Perimeter Area are presented in the following subsections.

6.1 640 PAGE MILL ROAD AND COE AREA

A1 Zone extraction well EW-7 will continue to be operated to reduce on-site VOC concentrations and mitigate off-site migration of VOC-impacted groundwater. COE Area extraction well EW-8 will continue to be operated to address the portion of the A1 Zone plume that extends off-site northeast of the 640 PMR Site. Operational adjustments and modifications, such as extraction flow rates, will continue to be made as necessary to improve and/or maintain the performance and efficiency of the GWET system. Investigations recommended in the Updated CSM include the following.

- Collect water level measurements at key A1 and A2 Zone monitoring wells on a monthly basis through June 2010 to document the hydraulic conditions of the aquifer associated with the increased pumping rates at extraction wells EW-7 and EW-8;
- Sample the following on- and off-site A1 and A2 Zone wells in March 2010 to supplement the June 2010 COE annual monitoring event: on-site wells EW-7, O52A2,

O67A2, and O119A1; and off-site wells EW-8, F123A1, F124A2, F125A1, F42A1, F127A1, and F129A1;

- Conduct a tracer test by injecting tracer dye in well F127A1 and monitoring for tracer at extraction well EW-8 and down-gradient well F129A1; and
- Conduct an eight-hour groundwater pumping test at well O67A2 to define the hydraulic properties of the associated A2 Zone sediments (water levels will be collected at surrounding wells, and groundwater samples will be collected from O67A2 during pumping to observe potential changes in groundwater chemistry over time).

These recommendations are expected to be conducted during 2010 pursuant to RWQCB approval.

It is recommended that the SMP be modified as follows.

- Remove extraction wells EW-1, EW-2 and EW-6 and monitoring wells F23A, F43A1U, F44A1, F45A1U, OB6-1, OB6-2 and O24A1U from the current SMP. These wells were decommissioned in July 2005 pursuant to RWQCB approval.
- Add monitoring well T1A to the current SMP and monitor on an annual basis to provide long-term performance monitoring data for the in situ chemical oxidation treatment.
- Add monitoring wells P1-A1, P1-A2, P2-A2, P3-A2, P4-A2, and P5-A2 to the current SMP and monitor on an annual basis.
- Add monitoring well F29A1U to the current SMP to provide additional groundwater quality data downgradient of where extraction well EW-1 was formerly located.
- Increase the monitoring frequency for wells F21A1U, F22A1U, F97A and F98A from biennial to annual, to provide more frequent groundwater quality data for the area immediately downgradient of the former Mayfield School Site, where extraction wells EW-1, EW-2 and EW-6 were decommissioned.

6.2 395 PAGE MILL ROAD

No change to remediation activities associated with the 395 PMR Site is recommended at this time. Given the results of the 2009 vapor intrusion assessment, existing land use restrictions, and use of the 395 PMR Site (i.e., office building, parking lot and open-air parking garage), further assessment of potential vapor intrusion is not warranted at this time.

Permanent shutdown of the remedial systems at the 395 Page Mill Road site was proposed in September 2002, and reiterated in the Second Five Year Report and Work Plan for Assessing Achievement of Final Cleanup Standards in Soil in Area X. The RWQCB has concurred that soil cleanup standard have been achieved in Area X, but has not yet approved decommissioning of the remedial systems, pending completion of a vapor intrusion assessment and post-chemical oxidation treatment monitoring. Decommissioning of the DPE system is recommended.

6.3 601 CALIFORNIA AVENUE

The GWET system shutdown should continue and the RWQCB-approved work plan for site investigations and EISB pilot study should be implemented. This work is currently scheduled to begin in February of 2010 once access and work permit issues have been resolved.

6.4 OEU DEWATERING SYSTEM

Operation of the OEU dewatering and treatment system should be continued with no significant modifications.

6.5 PERIMETER AREA

Based on the stable and relatively low VOC concentrations in extraction well EW-13, a change in the shutdown status of this well from temporary to permanent is recommended. Well EW-13 should continue to be monitored on an annual basis.

It is recommended that A1U Zone extraction well EW-15 and A1-Zone well EW-16 be shut down on a trial basis. VOC concentrations in these wells have been stable to decreasing, neither well provides appreciable hydraulic capture or VOC mass removal, and the downgradient OEU dewatering system would provide equivalent remedial effectiveness. Wells EW-15 and EW-16 will continue to be monitored on a routine basis per the SMP. Concentrations in wells downgradient of wells EW-15 and EW-15 will be monitored to confirm continued capture of low VOC concentrations in this area by the OEU dewatering system.

Within this area, A1 and A2 sands are in direct contact and form a single A1/A2 hydraulic unit. Within this area, the water level data are representative of this single A1/A2 Zone and are shown on both the A1 and A2 Zone maps. Where the A1 and A2 sands are not in direct contact outside this area, data for the A1 Zone are shown only on the A1 Zone map, while data for the A2 Zone are presented on the A2 Zone map.

RESUMES OF ENVIRONMENTAL PROFESSIONALS

JULIE TURNROSS

Senior Hydrogeologist

Ms. Turnross has over 26 years experience serving in technical and management capacities on a variety of projects in the areas of groundwater hydrogeology and geophysics. Her projects have included Phase I environmental site assessments, remedial investigations, feasibility studies, risk characterizations, and implementation of remedial alternatives at RCRA, CERCLA, and other facilities with soil, groundwater, surface water, and air contamination. Contaminants of concern have included organic solvents, petroleum hydrocarbons, metals, and explosives.

Ms. Turnross has provided litigation support and peer review for a wide variety of cases, and has served as an expert witness. She has also worked extensively with regulatory agencies throughout California and the west coast.

EDUCATION

University of California, Berkeley: M.S., Engineering Geoscience, 1984
University of Arizona, Tucson: B.S., Geoscience, 1982

EXPERIENCE

2005 – present	PES Environmental, Inc., Novato, California
1995 - present	JTEC Environmental, Sebastopol, California
1991 - 1995	Treadwell and Rollo, San Francisco, California
1984 - 1991	Harding Lawson Associates, Novato, California
1982 - 1984	U.S. Geological Survey, Denver, Colorado & Berkeley, California
1983	Laurence Berkeley Laboratory, Berkeley, California
1981	ARCO Exploration Company, Lafayette, Louisiana

REGISTRATION

California Registered Environmental Assessor No. 7862

REPRESENTATIVE PROJECTS

Naval Air Station: Performed review of remedial investigation, risk characterization, remedial alternative selection, remediation, and remediation verification for a Naval facility. Contaminants of concern included ordnance, solvents, metals, and petroleum hydrocarbons.

Litigation Support: Provided peer review of soil and groundwater investigation and remediation in support of lawsuit resulting from incomplete site cleanup. Analyzed investigation design and procedures, remedial alternative evaluation, cleanup methods, and confirmation testing.

Phase I Environmental Site Assessments: Performed or reviewed over 250 Phase I Environmental Site Assessments using ASTM standards. Clients have included lending institutions, real estate developers, insurance companies, law firms, and property owners. Properties assessed have included manufacturing facilities, office buildings, industrial sites, residential properties, and shopping centers.

Navy Shipyard: Provided technical review of Navy investigation and remedial activities and support for developer of former Navy shipyard. Site contaminants included metals, solvents, PCBs, and radiological material. Remediation included innovative technologies and implementation of land use controls.

Explosives Manufacturing Facility: Project manager for demolition of former explosives manufacturing facility, soil and groundwater investigation, and preparation of remedial investigation report. Project included development of facility use history, preparation of bid specifications, and coordination and documentation of demolition, and hazardous waste identification and disposal process.

Semiconductor Facility: Project manager for remedial investigation and feasibility study at CERCLA facility in Mountain View, California. Investigations included soil gas surveys, geophysical surveys, and soil, groundwater, and air sampling. Soil vapor extraction and groundwater extraction and treatment were used as interim remedial measures. Monitored effectiveness of 100-foot-deep, 3400-foot-perimeter slurry wall to be used to isolate contaminant source to allow dewatering and subsequent remediation by soil vapor extraction.

Chemical Facility: Project manager for remedial field investigation and corrective measures study for highly contaminated RCRA facility in Oregon. Contamination included presence of numerous free-phase and dissolved chemicals. Investigation included soil gas survey, soil borings, monitoring well installations, and air monitoring. Part of the investigation was conducted in Level B protection.

Geothermal Investigation: Performed integrated analysis of geophysical, hydrogeologic, and geologic data to develop conceptual model for geothermal basin. Designed geophysical field program using prototype equipment to evaluate geothermal reserve.

Water Supply Study: Provided water supply evaluation for proposed 300-family development with golf course and conference facility. Project included investigation of groundwater resources and water quality, and aquifer testing.

Oil Refinery: Served as technical advisor for remedial investigation and cleanup at oil refinery in southern California. Tasks included aquifer testing, investigating potential of supplying water supply well, estimating effects of saltwater intrusion on contaminant movement, and designing groundwater extraction system.

Groundwater Flow Modeling: Used three-dimensional finite-difference groundwater flow model to optimize groundwater extraction well locations and to evaluate extraction system efficiency at electronics facility in Santa Clara, California. The site was comprised of multiple discontinuous aquifers with considerable variances in thickness and hydraulic conductivity.

WILLIAM F. FRIZZELL

President
Principal Engineer

Mr. Frizzell is a civil/environmental engineer with 30 years of experience, specializing in environmental assessments of properties, soil and groundwater investigations and remediation, and hazardous and solid waste management. He has been the project manager responsible for all phases of Remedial Investigations/Feasibility Studies and remedial action planning and design. He has evaluated hazardous waste disposal facilities throughout the U.S., focusing on facilities' compliance with Federal and State regulations, and hydrogeological characteristics of the disposal sites. For real estate transfer projects, Mr. Frizzell has performed and/or managed more than 200 environmental assessments for developers, lenders, and attorneys. He has worked closely with developers on residential and commercial projects, which require environmental cleanup strategies and remediation of soils and/or groundwater. He also provides third party review of environmental projects for preparation of Environmental Impact Reports and litigation support. Mr. Frizzell has developed plans and specifications for hazardous waste site closures and has been involved in the design of gas, leachate, and surface water control systems. In addition, he has designed and prepared plans and specifications for slurry walls to control the migration of contaminated groundwater, and have been responsible for the selection and installation of synthetic liners for hazardous waste applications.

Mr. Frizzell's project experience also includes dredging feasibility studies for open water and land disposal sites. These projects have included characterization of sediments in contaminated and uncontaminated environments, biological and water quality assessments, monitoring programs and maintenance of disposal areas.

Mr. Frizzell has also performed site investigations for foundation studies and has experience in design and construction of projects involving structural grouting, dam construction, and earthwork.

EDUCATION

B.S., Civil Engineering, University of California, Berkeley, 1978

Postgraduate education has included courses and seminars in Storm Water Management, Geotechnical Engineering of Waste Management Systems, Groundwater Hydrology, Hazardous Materials Management and Handling, Stabilization and Solidification of Hazardous Waste, and Management Training.

SAFETY TRAINING

Health and safety training and update courses following EPA and OSHA requirements. Courses included training in physical, chemical, and toxicological properties of hazardous materials; hazard evaluation and control; selection and use of personal protective equipment; sampling and monitoring techniques and equipment; site entrance and decontamination procedures; and safety plan development.

EXPERIENCE

1989 - Present:	PES Environmental, Inc., Novato, California
1981 - 1989:	Harding Lawson Associates, Novato, California
1978 - 1981:	Woodward Clyde Consultants, San Francisco, California.

REGISTRATION

Civil Engineer - California, Arizona, Washington

Environmental Assessor - California, Washington

REPRESENTATIVE PROJECTS

Storm Water Management – Program manager for assisting various clients in compliance with the State of California Industrial Activities Storm Water General Permit. Activities included preparation of storm water pollution prevention plans, storm water monitoring plans and annual reports.

Litigation Support/Expert Witness Projects - Litigation support and expert witness services have included the areas of soil and groundwater remediation cost recovery actions; standard of care evaluations for environmental site assessments; assessment of damages due to releases from underground storage tanks; and claims due to a residential development over contaminated soils and groundwater. Client: Various Law Firms

Real Estate Assessment Projects - Program and project manager responsible for all phases of numerous real estate transfer assessment projects. Projects involve evaluating properties for potential liability due to hazardous waste contamination, site history evaluations, site inspections, regulatory review, and preparation of assessment reports. Program responsibilities include marketing, business development, training, and quality assurance/

quality control program development. Clients: Various Lending Institutions, Insurance Companies, Attorneys, Finance Companies and Developers

Dredging Feasibility Studies, Port of Oakland, California - Project manager responsible for dredged sediment disposal project involving site characterization and geochemical and surface water modeling to predict effluent water quality. Project involved conducting a feasibility study to dispose highly saline and contaminated sediments in an upland environment and development of control measures. Client: Port of Oakland

Richmond Marsh Restoration, Richmond, California - Large amounts of paint residue were uncovered during construction of new channels to restore marshland on edge of San Francisco Bay. As project manager: developed and implemented site-characterization plans; developed, tested, and analyzed potential remedial actions; selected preferred remedial action; prepared draft and final Remedial Action Plans; attended public hearings; developed community Relations Plan; and developed construction plans and specifications and post-construction monitoring plans. Managed all negotiations with state regulatory agencies. Client: City of Richmond

Hazardous-Waste Investigation, State Superfund Site, Richmond, California - Project manager for investigation at former pesticide formulating and packaging site. Responsible for all phases of investigation, including hydrogeological studies, analytical testing program, contaminant transport evaluations, study of offshore contaminant migration in marine sediments, evaluation of bioavailability of contaminants to marine organisms, and dredging of contaminated sediments. Planned and implemented remedial actions involving construction of temporary waste piles, installing synthetic membranes, and removing and transporting contaminated soils and debris. Project has included close coordination and involvement with various state regulatory agencies. Client: Levin Richmond Terminal Corporation

PCB Spill Investigation and Cleanup, Northern California State Superfund Site - Engineer for study to determine extent of contamination from PCB spill. Organized hydrogeologic study to determine contaminant migration potential, examined cleanup options, and prepared economic analysis of alternatives. Client: MGM Brakes

Landfill Closure Plans and Specifications, Alameda, California - Project manager responsible for preparing plans and specifications for closing 43-acre sanitary landfill adjacent to San Francisco Bay. Project included construction of surface impoundments for placing dredge spoils for use as cover material and preparation of earthwork plans and specifications for cover system. Project also included designing and installing post-closure groundwater monitoring system and performing leachate characterization study and contingency plan. Client: City of Alameda

Soil Process and Treatment Program, Richmond, California - Project manager for site remediation involving processing and treatment of 35,000 cubic yards of lead-contaminated

soil. Processing involved physical separation through screening; treatment involved proprietary fixation process. Responsible for regulatory negotiations, contractor selection, and quality control program. Client: City of Richmond

Site Remediation Program, Pittsburg, California - Project engineer responsible for plans and specifications to remediate 4-acre asbestos-contaminated site. Project involved examination and evaluation of cover options, selection of contractors, regulatory negotiations, and construction observation. Client: John Mansville

Slurry-Wall Design, Martinez, California - Project engineer responsible for designing 3300-foot-long slurry wall through existing surface impoundments containing effluent from oil refinery. Responsible for setting up and evaluating effluent/bentonite slurry permeability testing program for development of design criteria. Duties also included preparing plans and specifications, evaluating contractors' bids, and reviewing construction-control program for slurry-wall installation. Client: Shell Oil

Surveys of Hazardous-Waste Treatment, Storage, and Disposal Sites, Nationwide - Project manager responsible for conducting surveys and preparing evaluation reports for over 50 commercial hazardous-waste facilities. Evaluations focus on hydrogeologic, managerial, environmental, regulatory, financial, and safety aspects of disposal-site operations. Projects have been performed in response to generator concern for "cradle to grave" responsibility for hazardous waste. Clients: Shell Oil Company, Chevron U.S.A. Inc., and IBM Corporation

Landfill Assessment and Geotechnical Studies, Albany and Berkeley, California - Project manager for investigating and evaluating inactive sanitary landfills in regard to generation and migration of leachate and methane, providing recommendations for developing landfills to support various structures, assessing potential impact of landfill on future development, and preparing preliminary closure plans. Project has also included preliminary geotechnical studies for landfills involving geohazards evaluation, general foundation recommendations, and slope-stability studies. Client: Hall, Goodhue, Haisley and Barker, for Santa Fe Land Improvement Company

Closure Plan Development, Tucson, Arizona - Project engineer for closure plan for 18 sludge-drying beds from wastewater treatment plant. Project included developing analytical testing program, decontamination procedures, and plans for closing system. Client: Hughes Aircraft Company

Hazardous-Waste Investigation, State Superfund Site, Richmond, California - Project manager for site investigation and remedial-action planning at site contaminated with heavy metals from uncontrolled releases from waste piles and buried drums. Duties included setting up field investigations and analytical programs for site characterization and planning remedial actions. Client: Summer del Caribe

RCRA Part B Permit Application Review, Hazardous-Waste Facility - Responsible for reviewing Part B permit applications for various treatment, storage, and disposal facilities.

Reviews focus on operators' compliance with federal regulations. Client: A. T. Kearney, for U.S. Environmental Protection Agency

Hydrogeological and Geotechnical Investigation of Dioxin Contamination, Times Beach, Missouri - Served as alternate field operations manager. Conducted drilling and sampling and implemented decontamination and chain-of-custody procedures. Client: CH2M Hill, for U.S. EPA

Environmental Risk Assessment, Santa Rosa, California - Developed risk assessment report focusing on environmental risks associated with City of Santa Rosa operations, including sewer treatment plants, sludge disposal, and hazardous-material storage. Client: Environmental Risk Assessors, U.S.A.

Hazardous Waste Investigation, Sacramento, California - Engineer and assistant project manager for site investigation to characterize unknown wastes and to determine lateral and vertical extent of contamination due to unmanaged-disposal practices. Client: Aerojet

Hazardous Waste Investigation, Santa Rosa, California - Engineer for site investigation to determine existence and direction of migration of organic solvents from point sources of pollution. Organized analytical testing program to determine amounts and extent of groundwater pollution. Client: Hewlett-Packard

Landfill Closure, Alameda, California - Project engineer responsible for preparing all phases of plans and specifications for combination sanitary landfill closure and dredge spoils pond construction on 110-acre site. Project involved design of landfill closure system, slurry wall for leachate control, passive methane gas venting system, dike construction, seawall repair, decant structure, and hydraulic control systems. Client: U.S. Navy

Hazardous Waste Investigation, Martinez, California - Field engineer during investigation to determine extent of contamination due to leaching from disposal pond containing tetra ethyl lead. Supervised drilling activities and safety procedures for initial phase of cleanup study. Client: E.I. DuPont Nemours

Gasoline Spill Investigation, Novato, California - Project engineer during investigation conducted to determine extent of groundwater and soil contamination resulting from leaking underground gasoline storage ranks. Project involved using soil-gas and groundwater monitoring techniques. Client: Texaco Incorporated

Gasoline Spill Investigation, Stockton, California - Conducted post-remedial-action investigation to assess potential for future migration of gasoline from service station with residual soil contamination. Client: Exxon Company U.S.A.

Tailings Dam, Green River, Wyoming - Resident engineer during construction of tailings dam for solid-waste management program. Responsible for quality control, redesigned plans to accommodate field conditions, and prepared final earthwork report. Client: Allied Chemical

Hillside Development, Walnut Creek, California - Resident engineer in charge of construction for many phases of earthwork. Supervised mass grading operations including landslide repair, installation of subsurface drainage, and rebuilding of cut slopes. Installed and monitored hydraugers and piezometers for groundwater control. Client: Terra California

Gravel Island, Beaufort Sea, Alaska - Design verification agent during construction of island for drilling platform. Reviewed design criteria and observed construction in arctic environment. Client: Exxon Company, U.S.A.

Foundation Construction, Oakland, California - Field engineer during construction of drilled-pier foundations. Client: Peralta Hospital

Structural Grouting, Port Clinton, Ohio - Field engineer for stabilization of power plant foundation. Designed grout mixes according to varying subsurface conditions, supervised grouting batch plant operation, and installed extensometers to measure rock displacement during construction. Client: Toledo Edison Company

Earthquake Engineering, San Francisco, California - Developed seismic-response spectra for several sites in California using various computer programs and data-retrieval systems. Client: Nuclear Regulatory Commission

ENVIRONMENTAL SUMMARY
EL CAMINO CENTER
PALO ALTO, CALIFORNIA

MAY 24, 2019

The subject property has the addresses of 3201 and 3225 Ash Street, 200 – 382 Portage Avenue (referred to as El Camino Center), 270 Lambert Avenue, and 3250 Park Boulevard in the City of Palo Alto, Santa Clara County, California (see Plate 1). The subject property, which comprises approximately 15.48 acres, contains four buildings, an access road, and associated paved parking and landscaped areas. Matadero Creek, under an easement from Santa Clara Valley Water District, traverses the eastern portion of the site. The site is located in a primarily commercial area. The site is bounded to the northeast by Park Boulevard and a commercial building, to the southeast by commercial buildings, to the southwest by Ash Street, El Camino Real and commercial buildings, and to the northwest by residences.

OVERVIEW OF HISTORICAL SITE ENVIRONMENTAL ACTIVITIES

PES's historical research indicates that the subject property main and office buildings were constructed prior to the 1950s (likely in the 1930s to 1940s), the building at 270 Lambert was constructed in 1986, and the 3250 Park Boulevard building was constructed in 2003. A railroad spur and line were present on the west side of the main building until the 1980s. Historical site uses and tenants have included warehouse, a bearing manufacturer, a foundry (buildings no longer present), a food processor, a paper container manufacturer, a display manufacturer, a market, produce packing and transportation, auto/truck maintenance, and offices. Environmental information for selected historical on-site and adjacent property uses as well as off-site regional environmental concerns are discussed in the following sections. See Plate 2 for the locations of these areas.

Historical Site Use - Dura-Bond

Dura-Bond operated at the subject property since approximately 1960 manufacturing camshaft bearings for the automotive industry. Property addresses for the site have included 360, 370 and 395 Portage Avenue, as well as 3201 Ash Street. Manufacturing operations were performed at the Portage facility, and offices were maintained at 3201 Ash Street.

Wastewater Impoundment/Treatment Facility Remediation

Dura-Bond's manufacturing process produced a wastewater stream containing elevated concentrations of chromium, cadmium, iron, lead and zinc. From 1960 to 1971, the untreated wastewater was discharged directly to the sanitary sewer. From 1971 to 1980, the wastewater was neutralized, and solids allowed to settle prior to discharge. The treated wastewater was discharged to the sanitary sewer and the settled solids were discharged to an unlined sludge pond located immediately outside the west side of the building which measured approximately 20 feet by 25 feet (Emcon, 1981a). Until 1980, the sludge was allowed to dry and then disposed offsite. Beginning in 1980, the pond was no longer used, and sludge was disposed offsite while still wet.

In 1981, in a preliminary investigation of the sludge pond performed to develop a plan for closure of the pond, elevated concentrations of lead, zinc, cadmium, chromium and iron, including up to 38,600 milligrams per kilogram (mg/kg) of zinc, was found in soil beneath the pond (Emcon, 1981a). Concentrations of metals decreased with depth, but elevated concentrations of zinc remained at approximately 6 feet below ground surface (bgs). In 1981, the pond was closed by removing soil beneath the pond to a depth of 5 feet bgs and backfilling the excavation with silty clay. Excavated soil was disposed offsite (Emcon, 1981b).

In 1983, Dura-Bond began using a new treatment system, and performed a soil investigation in preparation for closing the remainder of the old system, which included an acid storage tank, mixing tank, sedimentation tank, pH controller and associated pumps. Soil samples collected from three locations to depths of approximately 3 feet bgs indicated the presence of elevated concentrations of lead and zinc (Emcon, 1983a). In October 1983, soil was excavated from the wastewater treatment equipment area to a depth of approximately 4 feet bgs and disposed offsite. The excavation was backfilled with clean soil, with the upper 6 inches backfilled with drain rock to facilitate construction of a concrete pad over the area (Emcon, 1983b).

Underground Storage Tank Investigations and Removals

In 1983, spillage was discovered around the riser pipe and unlined vault box surrounding the riser pipe for a 5,000-gallon underground liquid waste tank used for accumulating waste oil, coolants and corrosion preventatives (Emcon, 1983c). Staining was observed on soil in the vicinity of the riser pipe after the concrete pad covering the UST and vault box was removed. Soil samples were collected at depths of approximately 10 to 11.5 feet bgs from an exploratory boring advanced adjacent to the UST. The boring was converted to a groundwater monitoring well (E-1), and a groundwater sample was collected from this well and another downgradient monitoring well (DM-1) previously installed as part of a leak detection system for USTs present at the site. All samples were analyzed for the presence of Stoddard solvent. No Stoddard solvent was detected in any of the samples, but other unidentified compounds were detected in the samples. Additional groundwater samples were subsequently collected from

these two wells and analyzed for the presence of volatile organic compounds (VOCs) and semi-volatile organic compounds (SVOCs). Elevated levels of VOCs were detected in both wells; TCE was detected at 239 and 708 micrograms per liter (μg/L).

In 1984, a 1,000-gallon Stoddard solvent UST, a 500-gallon gasoline UST, and a 500-gallon diesel UST were removed from the west side of the Dura-Bond facility (Emcon, 1984). Soil contamination was observed beneath the gasoline and diesel USTs which were present in a single excavation.

Following tank removals and affected-soil excavation activities, a groundwater monitoring well was installed in the backfilled excavation area, and groundwater samples were collected from this and the two previously-existing monitoring wells near the Dura-Bond facility (Emcon, 1985b). Volatile hydrocarbons (gasoline) and benzene were detected in Well E-2 as well as lead being present in two wells at low concentrations. Chlorinated solvents (trichloroethene [TCE] and 1,1,1-trichloroethane [TCA]) detected in all three wells appeared to be migrating onto the site from an up gradient source, because Dura-Bond had never used these chemicals in their operations. In 1986, an upgradient groundwater monitoring well (E-3) was installed to evaluate groundwater flow and the potential for the presence of upgradient sources of the VOCs previously detected in the Dura-Bond wells. The well was located near the southwest corner of the main subject property building, adjacent to the tenant space in use at the time by Varian for warehousing. VOCs were detected in groundwater sampled from this upgradient well confirmed that the well that the source of VOCs identified in wells at the Dura-Bond facility was located upgradient of the facility (see discussion of regional groundwater plume below).

The results of semiannual groundwater monitoring from April 1986 through March 1988 indicated that total petroleum hydrocarbons quantified as gasoline (TPHg) was detected in groundwater in decreasing concentrations at the former UST location. TPHg was not detected in the other two wells for the last four sampling rounds.

In April 1989, a second set of USTs were removed from the Dura-Bond facility (Emcon, 1989b). The gasoline and Stoddard solvent USTs were in a single excavation. During removal, the excavation was ultimately extended to approximately 17 to 18 feet bgs until no significant concentration of contaminants remained in soil samples collected from the bottom and sidewalls of the excavation. Groundwater monitoring in September 1989 did not detect petroleum hydrocarbons as gasoline or BTEX at this former UST location.

In January 1998, the Santa Clara Valley Water District (SCVWD) issued regulatory case closure for the USTs that had been removed from the Dura-Bond facility in 1984 and 1989 (SCVWD, 1999).

1989-90 Facility Closure Activities

In January 1989, in preparation for the impending closure of the Dura-Bond facility, an inspection of the Dura-Bond facility was performed on behalf of WSJ Properties by Safety Specialists, Inc. (SSI). SSI performed a preliminary reconnaissance of the facility to identify sites that may require additional investigation. SSI identified 17 such sites, including stained concrete flooring, various sumps, a drum storage area, an electrical transformer, dust-covered areas, various storage areas, a machine shop and welding area, a lead coating area, patched floor sections, gasoline pump and UST area, and an oil/water separator (SSI, 1989a). Recommended investigations included obtaining wipe, concrete chip, fluid and soil samples for analysis.

In March 1989, Dura-Bond prepared a Facility Closure Plan which described closure of USTs and the chemical storage area, manufacturing and warehouse area, and water treatment system area (Dura-Bond, 1989). The plan described soil sampling and analysis to be performed following removal of the existing USTs and associated piping, steam cleaning of the chemical storage area, wipe and soil sampling in the manufacturing and warehouse area, steam cleaning in the babbitting area, and dismantling the wastewater treatment system.

Undated draft figures and tables included in a transmittal from Emcon to Dura-Bond indicated that some soil sampling and analysis and soil excavation was performed inside the Dura-Bond facility (Emcon, 1989a). The excavation area indicated on a figure was located in the south-central portion of the building, near where SSI observed concrete patching during their January 1989 inspection (SSI, 1989a). The figure suggests that the excavation was extended laterally until concentrations of TPH quantified as diesel (TPHd) and oil (TPHmo) were at or below 100 mg/kg. The depth of the excavation is unknown, but a sample collected from 5 feet bgs contained TPH as diesel and oil at 8,500 and 3,000 mg/kg, respectively. It appears that some wipe sampling was also performed, although no analytical results were included on the tables.

In September 1989, Emcon and SSI collected soil samples for analysis from beneath and adjacent to the wastewater and babbitting areas (Emcon, 1989c). A total of 43 samples were collected from 26 locations at depths ranging from approximately 1 to 10.5 feet bgs. Samples were analyzed for one or more of the following: antimony, cadmium, chromium, lead, nickel, zinc, pH, and a hydrocarbon scan. Elevated concentrations of lead and zinc were detected in the babbitting area, and elevated concentrations of lead were detected in the wastewater treatment area. Zinc concentrations ranged from not detected to 40,000 mg/kg (collected from approximately 1.5 feet bgs), and lead concentrations ranged from not detected to 10,000 mg/kg (collected from approximately 1-foot bgs). Several concentrations of both lead and zinc were above residential screening levels for lead and zinc.

Based on the results of the September 1989 soil sampling, Emcon excavated five areas in the babbitting room and one area in the wastewater treatment during the period from October to December 1989 (Emcon, 1989e). The criteria for excavation was areas with lead or zinc exceeding their respective TTLC (total threshold limit concentration; a hazardous waste determination criteria) of 1,000 and 5,000 mg/kg, respectively, and soil within 2 feet of the ground surface with concentrations of 1/10 the TTLC. The areas selected for excavation included: (1) soils beneath babbitting room pits to a minimum depth of 3 feet below each pit; (2) surface soils around and underneath the babbitting room wastewater sump to a depth of 3 feet below the sump; (3) surface soils beneath damaged concrete area to a minimum depth of six inches; and (4) soil in the wastewater treatment area (approximately 3 feet by 13 feet) to a depth of approximately 4 feet. The final excavation depths ranged from approximately 1 to 17 feet bgs. Based on the results of confirmation sampling, it appears that Emcon's cleanup criteria were met. Although the TTLC criteria were met, concentrations of zinc up to 2,400 mg/kg, which is significantly above the residential screening level, remained in place at depths of approximately 17 feet bgs. The excavations were backfilled with clean pea gravel and capped with concrete.

Groundwater sampling was performed at four groundwater monitoring wells at the site in February 1990. All four wells were analyzed for filtered and unfiltered metals; no metals were detected above U.S. EPA Maximum Contaminant Levels (MCLs). Groundwater from two wells were analyzed for the presence of gasoline, petroleum hydrocarbon aromatics such as benzene, toluene, ethylbenzene and xylenes (BTEX), Stoddard solvent, and TPH as kerosene, TPHd, TPHmo; none of these analytes were detected above reporting limits. Groundwater from one well was analyzed for TPHg and BTEX. Benzene was detected at very low concentrations but was not detected in a duplicate sample collected from the same well.

In approximately February 1990, soil sampling and analysis was performed at the former Dura-Bond facility on behalf of the property owner to verify the completeness of site remediation performed at the facility by Emcon during October through December 1989 (Parfitt, 1990a). Soil samples were collected from 67 locations from borings extended to either approximately 4 or 10 feet bgs. Samples were collected at intervals of approximately 4 to 5 feet in the deeper borings. Analytical results indicated the concentrations of zinc present in excess of the TTLC (5,000 mg/kg) in the former babbitt room to a depth of at least 10 feet. Lead was detected above the TTLC of 1,200 mg/kg in the area of the former waste treatment area. TCE was also detected in one sample from approximately 3 feet bgs in the former babbitt room above the reporting limit, although the concentration is not reported in the available documentation.

In July, September and December 1997, groundwater samples were again collected from three monitoring wells associated with the Dura-Bond facility. Collected samples were analyzed for total petroleum hydrocarbons quantified as diesel, kerosene, jet fuel and Stoddard solvent, BTEX and VOCs. TPH as hydraulic fluid was detected in one well at concentrations ranging

from 100 μg/L to 6,700 μg/L. Some VOCs were detected in all three wells, including TCE, which was detected in two wells at concentrations ranging from 7 to 190 μg/L. PCE was detected in one well at 30 μg/L.

In 1998, the RWQCB notified Dura-Bond that chlorinated VOCs detected at the site were consistent with the regional VOC plume (COE Study Area; see below) mainly attributable to Hewlett-Packard and Varian Associates. Accordingly, the RWQCB reported that neither Dura-Bond nor the property owners would be responsible for any groundwater investigation, monitoring, or remediation associated with the offsite source (RWQCB, 1998).

Historical Site Use – Subsurface Vault

In 1997, while excavating for a new storm sewer pipe installation, the former property owner encountered a concrete structure and petroleum hydrocarbon-affected soil on the west side of the main building. It is unclear what on-site operation used this vault. An inspection of the vault was made through an access port; the presence of a black, oily liquid was observed at a depth of approximately 5 feet bgs. Analysis of a sample of the liquid in the vault indicated the presence of petroleum hydrocarbons in the motor oil range at a concentration of 440,000 mg/kg. The liquid also contained low levels of trimethylbenzenes, naphthalene and other common components of fuel oil and/or degraded motor or fuel oil. The liquid was pumped from the vault and disposed offsite. Approximately 8,157 gallons of liquid was removed from the vault.

Soil samples were collected from the sidewalls of the excavated storm sewer trench, which was later found to be within the interior of the vault. The samples were collected from areas with visible staining. Additional eleven soil samples were collected from borings located to better define the vault orientation and dimension, including some locations outside the apparent extent of the vault. Samples collected were analyzed for VOCs and a full scan of TPH. The results of analysis indicated the presence of residual TPHmo and TPHd and selected VOCs related to petroleum hydrocarbons. The results indicated that, with the exception of one sample, hydrocarbon-affected soil was confined within the concrete walls of the vault. The one exception was a sample collected from approximately 5.5 feet bgs approximately 5 feet from the west corner of the vault which contained TPHmo at 100 mg/kg.

After removing overburden from the vault, its dimensions were measured to be 13 feet wide by 36 feet long by 8 feet deep, with a capacity of approximately 28,000 gallons. The bottom, sidewalls and top of the vault were constructed of 8-inch thick reinforced concrete.

Approximately 282 tons of soil and concrete debris (from the vault top) were removed from the vault and disposed offsite. Pockets of residual liquids which remained in the vault were pumped out, and the vault sidewalls and bottom were then cleaned using a citrus-based degreaser and high-pressure steam rinse. Rinsate was pumped out, and approximately 2,500 gallons of residual product and rinsate were disposed offsite.

The bottom and sidewall of the vault was subsequently inspected by Palo Alto Fire Department (PAFD) personnel. No cracks in the walls or bottom of the vault or other visual evidence indicating the integrity of the vault was compromised was observed during the inspection.

To evaluate soil quality beneath the vault, the vault was cored in eight locations and soil samples were collected from four of them. The samples were analyzed for VOCs and a full scan of TPH. No analytes were detected in any of the four samples.

PAFD gave approval to abandon the vault in place. The vault was backfilled with clean native material obtained onsite during site improvements activities, and the storm sewer piping was replaced. The surface was covered with asphaltic concrete pavement. The site received case closure from PAFD following confirmation sampling and abandonment of the vault (PAFD, 1998).

Historical Site Use - Mercer Processing

Mercer Processing, Inc. (Mercer) occupied the tenant space at 230 Portage Avenue from 1989 to 1999. Operations performed by Mercer at this location included freeze-drying and packaging of food products. Refrigeration equipment used in the freeze-drying process contained solvents, including TCE, and Genesolv 2000, also referred to as Refrigerant 141b and composed of 1,1-dichloro-1-fluoroethane.

In 1999, a Facility Closure Assessment to assess whether operations at the Mercer facility had adversely affected environmental conditions at the site (PES, 2000). The results of analysis performed on ten soil samples collected in the vicinity of the former refrigeration unit indicated the presence of acetone, methyl ethyl ketone, TCE, and tert-butanol in the soil samples. Additional investigations were performed to further define the lateral and vertical extent of chemicals in the vadose zone beneath the site (IT, 2000). Chemicals detected in the soil included TCE, 1,1-dichloroethene, cis-1,2-dichloroethene, and trans-1,2-dichloroethene. The highest concentrations were found beneath the former refrigeration unit.

A Remedial Action Plan (RAP) was subsequently developed to address contamination identified at the site (PES, 2001). The RAP included an evaluation of risk to human health and the environment, principally groundwater resources, development of a site-specific remedial goal for contaminated soil, an evaluation of remedial alternatives, and a description of the procedures to implement the recommended remedial alternative. Based on the results of the health and environmental risk assessment, a soil cleanup goal of 0.2 mg/kg of TCE was recommended. The risk assessment indicated that removal of TCE-affected soil exceeding 0.2 to 0.4 mg/kg would be protective of human health for residences with a concrete floor slab. Soil excavation was the selected remedial alternative. The RWQCB concurred with the RAP in a letter dated October 18, 2001.

Remedial activities were performed at the former Mercer facility during January 2002 (PES, 2002). Approximately 285 cubic yards of TCE-impacted soil was excavated to a maximum depth of approximately 20.5 feet below grade. Excavated soil was characterized and disposed offsite. On the basis of verification soil samples collected from the bottom and sidewalls of the excavation, soil with TCE concentrations exceeding the target cleanup goal was removed from the site. During excavation, several concrete footings and inactive utilities were uncovered and removed. Groundwater was not encountered during the excavation of TCE-impacted soil. The excavation was backfilled with sand cement slurry, imported clean fill, and re-usable excavated clean soil. The area of soil excavation was capped with a concrete slab. In a letter dated April 8, 2002, the RWQCB stated the remedial goal had been achieved, and that no further action was required (RWQCB, 2002).

Historical Site Use – USTs Associated with Former Produce Packing Business

During a 2010 subsurface investigation, two undocumented USTs, with approximate capacities of 1,000 and 1150 gallons, were identified in southwestern portion of the main parking area of the El Camino Center. The USTs are believed to have stored gasoline and/or diesel fuels related to historical vehicle fueling activities conducted as part of produce packing and transportation operations formerly conducted on the site sometime in the 1950s, until an uncertain date.

The USTs and surrounding tank backfill materials were removed in October 2011 under oversight of the Santa Clara County Department of Environmental Health. Additional hydrocarbon-affected soils were also excavated to a depth of first encountered groundwater. The UST removals are documented in PES' December 22, 2011 report, *Underground Storage Tank Removal Report, El Camino Center, 340 Portage Avenue, Palo Alto, California*.

Following the UST removal, which included excavation of approximately 750 cubic yards of hydrocarbon-affected soil and application of approximately 500 pounds of oxygen-releasing compound (ORC) to assist in degradation of residual hydrocarbons in the subsurface, a series of subsurface investigations were conducted in the vicinity of the former location of the USTs to document soil and groundwater conditions following the UST removals.

Petroleum residuals in soil appeared to be limited to the vicinity of the former tank and were present in three locations at concentrations slightly above 2008 environmental screening levels (ESLs)[1]. The extent of residual petroleum hydrocarbons in groundwater appears to be generally controlled by lateral groundwater flow in the downgradient north-to-northeast groundwater flow direction. Mobile non-aqueous phase liquid (NAPL) has not been observed in any groundwater samples. Dissolved residual petroleum hydrocarbons appeared to be

[1] California Regional Water Quality Control Board (RWQCB) Environmental Screening Levels (ESLs), May 2008.

depleted via natural attenuation, advection, and diffusion. The highest concentrations of petroleum hydrocarbon residuals in groundwater was found to be in the near vicinity of the former tanks, represented by and the downgradient extent of the residual hydrocarbon plume was documented to be less than 150 feet in length. No significant concentrations of volatile organic compounds were identified in soil or groundwater associated with the former USTs. Based on these findings, the County of Santa Clara Environmental Health Department (SCCDEH) granted case closure[2] for this UST issue on July 7, 2015.

Adjacent Property Use - Say Ray Auto Facility

Say Ray is an auto repair facility located adjacent to the east side of the subject property office building at 3251 Ash Street. Say Ray Auto is listed on the Historical UST database with a waste oil UST. Regulatory agency records did not include any information regarding the potential removal of this UST. This facility is located potentially upgradient of the subject property and had the potential to affect groundwater beneath the subject property.

In addition, wastewater containing oil and grease was discharged from the Say Ray facility adjacent to the subject property office, and allowed to run across the subject property to Matadero Creek. A soil investigation and subsequent soil excavation was performed in the vicinity of Matadero Creek. The investigation, which was performed at the request of SCVWD, appeared to be limited to the Matadero Creek area.

In 1997, an investigation, abandonment and closure of a subsurface vault encountered beneath the main building was performed. More than 8,000 gallons of a liquid with high concentrations of motor oil was removed from the vault, and approximately 282 tons of soil and concrete debris were removed and disposed offsite. With PAFD approval, the vault was abandoned in place by backfilling with clean soil.

In 2002, soil contaminated with TCE was removed from the former Mercer Processing facility at 230 Portage Avenue. A TCE cleanup goal of 0.2 mg/kg (below current residential RWQCB cleanup standards) was used in excavating approximately 285 cubic yards of soil from depths up to 20.5 feet below grade. Regulatory case closure was issued in 2002.

California-Olive-Emerson Regional Groundwater Plume

Groundwater contamination associated with the California-Olive-Emerson (COE) regional chlorinated solvent plume has been identified at the subject property. The VOC plume associated with the up-gradient Varian, Eastman Kodak and Dura Bond [not related to site activities] facilities has been under investigation since 1981. Four active monitoring wells

[2] County of Santa Clara Department of Environmental Health, 2015. *Fuel Leak Site Case Closure at El Camino Center, 340 Portage Avenue, Palo Alto, CA; Case No. 14-825, SCVWDID No. 06S3W12J02f, July 7.*

associated with the investigations are present on the subject property and are sampled on a biannual basis. In one well located near the southern corner of the main building, TCE concentrations have ranged from 32 to 65 μg/L since 2005. A soil gas investigation performed in 2008 in a residential area northwest of the subject property indicated that none of the shallow soil gas samples contained chlorinated VOC concentrations above the corresponding RWQCB residential ESLs for potential migration of VOCs from soil gas to indoor air.

SUMMARY OF SITE ENVIRONMENTAL CONDITIONS

Based on a review of prior environmental site assessments and subsurface investigations, the following can be established for the subject property:

- Historical industrial and commercial uses have occurred on the site that included the use of hazardous materials and has resulted in documented releases to the subsurface;

- Several historical USTs present at the site have been removed in accordance with regulatory guidelines by prior tenants and former property owners. No information or site evidence exists to suggest that other USTs remain on the site. During removal of the USTs, residual petroleum hydrocarbons have been identified in subsurface soils and shallow groundwater in close proximity to the former USTs. Where sampled and analyzed, concentrations of petroleum hydrocarbons in soil and groundwater were typically below current environmental screening levels for residential use except in close proximity to the former UST locations. However, because the source of these hydrocarbons [USTs and surrounding significantly-affected soil] were removed, it is likely that the remaining residual petroleum hydrocarbons are naturally degrading, and concentrations are decreasing over time. For the produce packing USTs, introduction of ORC has likely accelerated this degradation process. Regulatory oversight agencies overseeing these closures concur and have granted case closure for all UST removals conducted at the site;

- Extensive remediation has been conducted at the Dura-Bond facility to remove soils containing elevated concentrations of regulated metals. However, based on available data, it appears that soils containing elevated concentrations of zinc and other regulated metals remain under the floor slab of the main site building in the Dura-Bond area. It has been estimated that approximately 500 cubic yards of metal-affected soil is present in this area and it is anticipated that the residual soils containing lead and zinc above ESLs would be removed at the time of site redevelopment. To initiate process, a Removal Action Plan (RAP) would likely be required for agency review and approval. Upon implementation of the removal activity, the results of the removal activity and all the previous data collected on the former Dura-Bond site would be compiled in a request for case closure report with the objective of having the site formally closed;

- Based on available information, the Mercer Processing and Subsurface Vault remediation appear to be successful and were granted case closure by the overseeing regulatory agencies. Residual chemicals of concern left in these areas that contained concentrations below clean up goals are below current residential regulatory screening levels;

- Much of the site investigation and remediation activities were conducted over 5 years ago prior to the regulatory agency increased focus of vapor intrusion issues. Limited sampling that was completed at the site (in 2008) identified the presence of VOCs (typically benzene and TCE) at concentrations in excess of current regulatory screening levels. Benzene vapors were primarily found in close proximity and downgradient of the UST area associated with the former produce packing facility (southern main parking area). Since these vapor samples were collected, the USTs were removed, and it expected that the source of the benzene vapors is naturally degrading. The TCE in soil vapor is likely the result of the low-level VOCs present in the shallow groundwater from the COE plume. Another potential area of elevated TCE vapors is associated with the Mercer Processing remediation area where residual TCE (below the approved clean up goal) likely remains in shallow soil;

- Based on subsurface investigations conducted in 2010, no residual affects were identified from the adjacent Say Ray Auto facility operations; and

- The subject property is located with the identified area of the regional COE solvent plume. Shallow groundwater beneath the site has been affected and is currently undergoing annual monitoring by responsible parties. While present at low concentrations, the VOCs represent a potential vapor intrusion concern for the subject property.

RECOMMENDATIONS (EXCLUDE IF NOT NEEDED)

Based on historical uses and environmental conditions at the subject property, the following recommendations are provided:

- Based on the varied historical use of the property, it is recommended that a project-specific site management plan (SMP) be prepared to address unexpected discovery of chemically-affected soils, if any, during development. The SMP will provide procedures and protocols for the proper characterization, handling, management, and disposal of the discovered chemically-affected soil and groundwater; and

- With the location of the subject property within the regional COE plume and the identification of chemical vapors in soil above the regulatory screening level, it is recommended that future occupied structures planned for the subject property take into consideration the incorporation of vapor mitigation systems into their design. These passive (convertible to active) systems typically consist of a vapor mitigation sub-slab barrier and vent piping to convey any captured chemical vapors to the atmosphere.

Dear Mr. Papler,

Reference: 2020 Annual Groundwater Self-Monitoring Report, California-Olive-Emerson (COE) Study Area and Perimeter Area, Palo Alto, California

Stantec Consulting Services Inc., on behalf of Varian Medical Systems, Inc. (Varian) and HP Inc. (HP) and as HP's designated authorized representative, is submitting the attached 2020 Annual Groundwater Self-Monitoring Report for the California-Olive-Emerson (COE) Study Area and Perimeter Area, Palo Alto, California. This document is submitted in accordance with the San Francisco Regional Water Quality Control Board Site Cleanup Requirements, Order 94-130 (the "Order"), dated September 21, 1994, as revised by the Self-Monitoring Program dated May 4, 2001. To the best of my knowledge, the contents of this report are true and correct. Please contact me if you have any questions regarding this report.

Regards,

Stantec Consulting Services Inc.

1.0 INTRODUCTION

This *2020 Annual Groundwater Self-Monitoring Report* for California-Olive-Emerson (COE) Study Area and Perimeter Area (Annual Report) has been prepared by Stantec Consulting Services Inc. (Stantec) on behalf of HP Inc. (HP) and Varian Medical Systems, Inc. (Varian). The COE Study Area and Perimeter Area (hereinafter referred to collectively as the "Site") are located in Palo Alto, California. The Site location is depicted on Figure 1. This Annual Report is submitted in accordance with San Francisco Regional Water Quality Control Board (Water Board) Site Cleanup Requirements Order 94-130, dated September 21, 1994, as revised by the Self-Monitoring Program (SMP) dated May 4, 2001.

This report is organized as follows:

- Section 2.0 summarizes work completed during the reporting period (September 2019 through August 2020), and tasks anticipated to be completed during the next reporting period (September 2020 through August 2021); and,

- Section 3.0 presents the results of groundwater monitoring activities conducted during the reporting period.

Supporting documents are attached as figures, tables, and appendices to this report.

2.0 SITE STATUS REPORT

This section details work performed, with the exception of groundwater monitoring, during the reporting period and describes work anticipated to be completed during the next reporting period. Groundwater monitoring conducted during the reporting period is discussed in Section 3.0.

2.1 OPERATION AND MAINTENANCE OF THE REMEDIAL SYSTEMS

2.1.1 640 Page Mill Road Soil Vapor Extraction and Treatment System

A soil vapor extraction and treatment (SVET) system was historically operated at the 640 Page Mill Road Site. SVET system operation began in 1994. An SVET system effectiveness evaluation report was submitted to the Water Board in July 1995 and was subsequently approved. The report concluded that the influent volatile organic compounds (VOCs) concentration to the SVET system had decreased by approximately 99 percent, and the remediation goals for VOCs and acetone had likely been achieved in the upper zone soils. The SVET system was shut down in August 1997 as groundwater partially or completely saturated the gravel-packed intervals at most of the lower zone SVE wells. The SVET system remained shut down throughout this reporting period. Based on groundwater levels recorded in monitoring wells, the soil surrounding the lower zone SVE wells remains fully or partially saturated.

2.1.2 640 Page Mill Road/COE Groundwater Extraction and Treatment System

Groundwater was extracted from four of the seven 640 Page Mill Road/COE groundwater extraction and treatment (GWET) system extraction wells (EW-8, EW-10, TW-1, and TW-2) from September 1, 2019 through August 31, 2020. Wells EW-8, EW-10, and TW-1 are screened across the A1 zone and well TW-2 is screened across the A2 zone. Well EW-8 operated at an average pumping rate of 17 gallons per minute (gpm); EW-10 operated at an average pumping rate of 4.9 gpm; TW-1 operated at an average pumping rate of 2.8 gpm; and TW-2 operated at an average pumping rate of 19 gpm.

Extracted groundwater was treated using advanced oxidation, which consists of ozone and hydrogen peroxide, and granular activated carbon (GAC) as a polish. Treated groundwater was discharged to Matadero Creek via the City of Palo Alto storm drain system pursuant to the requirements of Water Board Order No. R2-2018-0050 (National Pollutant Discharge Elimination System [NPDES] Permit No. CAG912002, the VOC and Fuel General Permit). Notice of Coverage Under the Requirements of Order No. R2-2018-0050 was issued to HP on December 18, 2018. Periodically (e.g., during GAC change-outs) treated groundwater was discharged to the sanitary sewer under Groundwater Discharge Permit No. 181238 issued by the Palo Alto Public Works Department.

The GWET system operated continuously from September 1, 2019 through August 31, 2020, except for planned and unplanned downtime for periodic maintenance including carbon change outs. Carbon change outs took place on September 9, 2019, December 16, 2019, March 28, 2020, and June 23, 2020. There were no shutdowns that lasted for more than one day during the reporting period.

Table 1 presents flow volumes and average flow rates for individual extraction wells and the entire extraction system during the reporting period. Estimated total VOC mass removal and VOC mass removal rates are also included in Table 1. Historical annual VOC mass removal estimates and VOC mass removal rates for the GWET system are presented in Appendix A. The average daily VOC removal rate for the reporting period was approximately 0.67 pounds per day (lbs/day).

2.1.3 395 Page Mill Road Area X Remediation

A dual phase extraction and treatment (DPET) system was historically operated in Area X at the 395 Page Mill Road Site. While operating, the DPET system simultaneously extracted soil vapor and groundwater from five A1 Upper zone dual phase extraction (DPE) wells (wells RW-1, RW-2, RW-4, RW-5, and RW-6). The system also included a single A1 zone groundwater-only extraction well (well EW-11R). The DPE wells and well EW-11R were shutdown with Water Board approval in June 2001 and June 2003, respectively Vadose zone soil sampling conducted in 2007 demonstrated that the cleanup standard for soil had been achieved in Area X. The Water Board authorized curtailment and decommissioning of the DPET system in a letter to HP dated March 20, 2017, and decommissioning was completed between November 27 to December 5, 2017. Historical annual groundwater VOC mass removal estimates and VOC mass removal rates are presented in Appendix A.

In October 2007, in situ chemical oxidation (ISCO) was implemented in Area X to address localized elevated VOC concentrations near A1 Upper zone well RW-5. ISCO injections were effective in reducing dissolved phase VOC concentrations in the treatment area; however, contaminant concentrations subsequently rebounded.

An enhanced in situ bioremediation (EISB) program was implemented in Area X beginning in 2013 pursuant to Water Board approval of a March 5, 2013 work plan titled *Enhanced In Situ Bioremediation (EISB) Work Plan*. The EISB program was designed to reduce residual VOC concentrations in the A1 Upper zone near wells RW-5 and OB11-2, and in the A1 zone near well EW-11R. EISB injections took place in May 2013, August 2014, December 2015, September 2017, and November 2019. Area X EISB performance monitoring results are discussed in Section 3.5.

2.1.4 601 California Groundwater Remediation

A GWET system was historically operated at the 601 California Avenue Site. While operational, the GWET system extracted groundwater from three wells (V8-2X, V8-8X, and V-9X). The GWET system was shutdown with Water Board approval in July 2003, prior to implementing an ISCO program consisting of potassium permanganate injections into the subsurface. The GWET system remained inactive throughout the reporting period. Historical annual VOC mass removal estimates and VOC mass removal rates are presented in Appendix A.

EISB has been implemented in two phases and in two areas of the 601 California Avenue Site. The Phase 1 EISB pilot study area is located northeast and hydraulically downgradient of the 601 California Avenue Site building and on-Site source area. The Phase 1 EISB pilot study was implemented in 2012 to test EISB efficacy in reducing groundwater VOC concentrations and inhibiting off-site migration of VOC-impacted

groundwater (i.e., as a bio-barrier). Supplemental treatment injections were completed in the Phase I bio-barrier area in October 2013, August 2014, December 2015, November 2017, and August 2019. Based on the success of the Phase 1 pilot study, the Phase 2 EISB pilot study was implemented in 2014 in the northwestern facing courtyard of the Site building. Supplemental treatment injections have been completed in the Phase 2 (i.e., "courtyard area") pilot study area in November and December 2014, April 2015, September 2015, September 2016, December 2017, and July 2019 based on the positive performance data from the initial treatment. EISB performance monitoring results for the 601 California Avenue Site are discussed in Section 3.6.

2.1.5 COE Perimeter Area Groundwater Extraction Wells

Extraction Wells EW-12, EW-13, and EW-14: Groundwater was historically extracted from three wells (EW-12, EW-13, and EW-14) located in the Perimeter Area, southeast of the COE Study Area. Extracted groundwater was conveyed to and treated at the Varian 611 Hansen Way site. Well EW-14 was decommissioned with Water Board authorization in 2006. Permanent shutdown of well EW-12 and trial shutdown of well EW-13 was authorized by Water Board in February 2007. Final shutdown and destruction of extraction well EW-13 was authorized by the Water Board in September 2017 and well EW-13 was destroyed in December 2017. Historical annual VOC mass removal estimates and VOC mass removal rates for wells EW-12, EW-13, and EW-14 are presented in Appendix A.

Extraction Wells EW-15 and EW-16: In November 2013, groundwater extraction wells EW-15 and EW-16, located in the Perimeter Area at 3101 Park Boulevard, were shut down with Water Board authorization. The Water Board approved a 12-month trial shutdown in a letter dated October 8, 2013. During the 12-month long trial shutdown, wells EW-15 and EW-16 and several nearby monitoring wells were sounded for depth to water and sampled for VOCs on a quarterly basis. In December 2014, HP and Varian submitted a report titled *Trial Shutdown Evaluation Report for California-Olive-Emerson (COE) Perimeter Area Groundwater Extraction Wells EW-15 and EW-16* documenting the trial shutdown results. The report recommended that trial shutdown continue and that the associated groundwater monitoring program continue on a semi-annual basis. As specified in the *2016 Annual Groundwater Monitoring Report*, monitoring frequency has been changed to annual. Wells EW-15 and EW-16 remained shut down throughout the reporting period. Trial shutdown monitoring results are discussed in Section 3.6. Historical annual VOC mass removal estimates and VOC mass removal rates are presented in Appendix A.

2.2 OTHER WORK COMPLETED DURING THE REPORTING PERIOD

Other work completed by HP and Varian during the reporting period is described in the following sections.

2.2.1 640 Page Mill Road Site/COE Off-Site Area

The following work was completed at the 640 Page Mill Road Site and the Off-Site Area.

- Stantec periodically collected depth to groundwater measurements and groundwater samples from select wells on a self-directed basis in support of ongoing extraction well flow rate optimization.

Analytical results for the additionally collected samples are included in Appendix B. Groundwater elevation and chemical data are used to optimize extraction well pumping rates.

- Windy Hill Property Ventures, with support from TRC Companies (TRC), secured authorization from the Water Board on June 6, 2019 to destroy well F41A1 in advance of a planned property redevelopment. Well F41A1 was destroyed on June 10, 2019. Stantec uploaded to GeoTracker well destruction documentation provided by TRC.

- Groundwater monitoring wells F65A1U and F66A were destroyed on July 14, 2020 pursuant to Water Board approval in email correspondence dated April 15, 2020. The wells were destroyed to accommodate a City of Palo Alto redevelopment project. Stantec submitted a well destruction report for wells F65A and F66A to the Water Board on behalf of HP and Varian on July 31, 2020.

2.2.2 395 Page Mill Road Site

Supplemental EISB treatment injections were performed in November 2019. EISB performance monitoring was conducted between June 2 and 5, 2020. Table C-1 in Appendix C summarizes the Area X EISB injection activities completed to date. Table C-2 in Appendix C summarizes the performance monitoring activities.

2.2.3 601 California Site

The following work was completed at the 601 California site.

- Injection wells IW-9, IW-10, and IW-14, located on the northeast side of the Site building (bio-barrier area), were redeveloped in August 2019 to remove sediment and biofilm accumulation.

- An additional round of substrate injections (the sixth round) was completed in the Phase 1 (bio-barrier) pilot study area August 17 through 18, 2019, and in the Phase 2 (courtyard) pilot study area July 20, 27 and 28, 2019.

- EISB performance monitoring was completed in May 2020.

2.3 WORK TO BE CONDUCTED DURING THE NEXT REPORTING PERIOD

It is anticipated that the following work will be performed during the next reporting period.

- Continue operation and maintenance of the 640 Page Mill Road/COE GWET system.

- Submit and, pursuant to Water Board approval, implement a revised 640 Page Mill Road Site EISB pilot testing work plan. The revised work plan will supersede the EISB work plan previously approved by the Water Board.

- Conduct EISB performance monitoring at the 395 Page Mill Road Site concurrent with the annual COE monitoring event in June 2021.

- Conduct 601 California Ave. Site Phase 1 and Phase 2 EISB area performance monitoring during the fourth quarter of 2020. Monitoring will include collection and laboratory analysis of groundwater and soil vapor, as well as field-measured parameters. Post-injection monitoring data will be evaluated to assess whether additional injections are warranted.

- Conduct routine annual COE monitoring in June 2021.

3.0 GROUNDWATER MONITORING

3.1 GROUNDWATER ELEVATION MONITORING

Site-wide water level measurements were recorded during the second quarter, on June 2, 2020. Water levels were measured using battery-powered water level meters. Downhole equipment was decontaminated prior to use and between each well to minimize the potential for cross-contamination. Water levels measured during the second quarter 2020 are shown on Table 2. Well locations are shown on Figure 2.

Historically, a separate groundwater elevation contour map for the A1 Upper zone was prepared and included in the self-monitoring reports. Since a large portion of the A1 Upper zone underlying the southern and western portions of the COE Study Area is unsaturated, a groundwater elevation contour map referred to as the first-encountered groundwater zone is now included as Figure 3. The first-encountered groundwater zone map includes data from saturated A1 Upper zone wells and data from A1 zone wells located in portions of the COE Study Area where the A1 Upper zone is unsaturated. Groundwater elevation contour maps for the A1 zone, the A2 zone, and the B zone are presented on Figures 4 through 6, respectively.

Groundwater flow direction in each of these zones is generally to the north-northeast towards the Oregon Expressway Underpass (OEU). Groundwater flow patterns in the second quarter 2020 are consistent with previous interpretations. Cones of depression are evident around extraction wells TW-1 and EW-10 in the A1 zone and TW-2 in the A2 zone. A cone of depression is created by the OEU dewatering system in both the saturated A1 Upper zone and A1 zone.

3.2 GROUNDWATER QUALITY MONITORING ACTIVITIES

Table 3 summarizes the SMP sampling schedule for the Site (sampling occurs during the second quarter). Table 4 presents a summary of the specific sampling activities conducted during second quarter 2020. A total of 88 wells were sampled from June 2 through 4, with additional sampling at two locations on June 23, 2020. This total included 22 wells scheduled to be sampled in accordance with the Revised SMP and 66 wells that were monitored on a self-directed basis. Additionally, monitoring data for four well locations (P17, P21, V8-2, and V-9) sampled in May 2020, as part of the quarterly EISB monitoring at the 601 California Site, are also included in this report.

Groundwater sampling methods are described below.

- Four (4) active extraction wells (EW-8, EW-10, TW-1, and TW-2) were sampled directly from a sample port located in the wellhead piping.
- Three (3) inactive extraction wells (EW-4, EW-7, and EW-16) were purged and sampled from sample ports located in wellhead piping.

- Five (5) monitoring wells were sampled using a low-flow purge method.
- Ten (10) wells, including two (2) inactive extraction wells (EW-12 and EW-15) and eight (8) monitoring wells (F29A1U, F40A, F83A1U, F126A2, F137A1, F145A1, O28A1, OB11-2), were sampled using a conventional three-volume purge method.
- Sixty-four (64) monitoring wells were sampled using a passive diffusive bag sampler (PDBS).
- Six (6) monitoring wells were sampled using a PDBS followed by a Hydrasleeve™ sampling device for non-volatile analytes.

Active/Inactive Extraction Well Sampling Method: Active extraction wells are regularly refreshed with formation water so specific purging procedures are not required. Inactive wells were purged of a sufficient volume of water to obtain a representative sample of formation water. See Table 5 for specific volumes removed prior to sampling. Samples were collected by opening a sample port located in the wellhead piping. Temperature, pH, and specific conductance were measured at the time of sample collection.

Low-Flow Sampling Method: Groundwater samples were collected using a 2-inch-diameter bladder pump with dedicated tubing. A flow-through cell was utilized to collect indicator parameter data to confirm stabilization prior to sampling.

Conventional 3-Volume Purge Method: Wells were purged of at least three casing volumes prior to sampling to obtain samples characteristic of formation water. Temperature, pH, and specific conductance were measured while purging. Wells were purged using an existing extraction well pump, a portable submersible pump, or a new disposable bailer. Following purging, groundwater samples were collected from the sample port located in the wellhead piping or using a new disposable bailer.

PDBS Method: Each PDBS was filled with laboratory-supplied analyte-free de-ionized water, sealed, attached to the PDBS assembly, and lowered to a predetermined deployment depth within the saturated screened interval of a well. The PDBS was subsequently removed from the well after a minimum of two weeks, and the water in the PDBS was transferred directly to sample containers.

Hydrasleeve™ Method: A Hydrasleeve™ sampling device was utilized for non-volatile analytes. The sleeve was deployed to the center of the screened interval and then retrieved for sample container filling.

Purge water and excess PDBS and Hydrasleeve™ groundwater were collected in temporary storage tanks and subsequently treated at the groundwater treatment system located at 640 Page Mill Road.

Sampling details, water quality parameters (as applicable), and chain-of-custody documentation were recorded on Field Data Sheets and Chain-of-Custody forms. Groundwater samples were packed on ice and delivered under chain-of-custody documentation to Eurofins TestAmerica (TestAmerica), a California State Certified laboratory, in Pleasanton, California.

Water quality indicator parameters measured during purging (for wells sampled by the conventional sampling method) are presented in Table 5. Table 6 lists the PDBS deployment depths and respective well screen intervals.

A total of 107 water samples were submitted for analysis as follows.

- Ninety-two (92) primary samples.
- Nine (9) duplicate samples.
- One (1) equipment blank sample.
- Four (4) trip blank samples.
- One (1) Source Blank sample.

All groundwater samples were analyzed for the former U.S. Environmental Protection Agency (USEPA) Method 8010 list of VOCs and Freon® 113 using USEPA Method 8260B. Select wells were additionally analyzed for EISB parameters as described in Section 3.5. Results were reported by the laboratory in an electronic data deliverable format.

3.3 QUALITY ASSURANCE / QUALITY CONTROL MEASURES

Quality assurance/quality control (QA/QC) measures were implemented during the sample collection and chemical analysis process. The objective of these QA/QC measures is to ensure that the data are valid and are of adequate quality for their intended purpose. Tables 7 and 8 summarize the field sample collection and laboratory QA/QC findings for the current reporting period. Data quality issues and associated resolutions relative to those issues are identified therein.

During the second quarter 2020 monitoring event, field QA/QC samples included: nine (9) field duplicate samples from wells F29A1U, F58A, F85A1, F126A2, F145A1, O28A1, O120A2, V8-4 and W-3A1U; one (1) equipment blank sample collected prior to sampling well EW-15; and four (4) trip blank samples.

Review of the field and laboratory QA/QC results indicate that data are valid and of adequate quality for their intended purpose.

3.4 GROUNDWATER QUALITY MONITORING RESULTS

A summary of analytes detected during the second quarter 2020 monitoring event is presented in Table 9. Trichloroethene (TCE) and tetrachloroethene (PCE) isoconcentration contour maps for the first-encountered groundwater zone, the A1 zone, and the A2 zone are presented in Figures 7 through 12, respectively. Tabulated historical analytical data are presented in Appendix B.

3.4.1 Identification of Significant Increases

Significant increases in analyte concentrations are identified and discussed below. To be consistent with the historical methods, a "significant increase" is noted if the current sample result is greater than two times the historical maximum concentration for each well/analyte pair, or if an analyte is detected for the first time at a given location.

Table 10 identifies wells that had first-time detections (i.e., the respective compound was not previously detected at or above the laboratory reporting limit indicated on the table) and/or a significant concentration increase for one or more compounds. Those wells with first time detections and/or significant concentration increases are identified below by well location.

640 Page Mill Road Site: Three (3) wells (O67A2, O111A2, and O120A2)

- Increased concentrations of 1,3-dichlorobenzene and 1,4-dichlorobenzene in well O67A2 (15 µg/L and 82 µg/L in June 2020, respectively; prior maximum detections were 5.4 µg/L and 7.3 µg/L, respectively). Groundwater in the vicinity of well O67A2 is expected to be captured by extraction well TW-2.

- First time detection of trans-1,2-dichloroethene (trans-1,2-DCE) concentration in A2 zone well O111A2 (0.90 µg/L in June 2020). This concentration is below the corresponding cleanup level.

- First time detection of 1,3-dichlorobenzene in A2 zone well O120A2 (0.54/0.59 µg/L in June 2020).

395 Page Mill Road Site: One (1) well (OB11-2).

- Increased concentration of cis-1,2-dichloroethene (cis-1,2-DCE) in well OB11-2 (3,800 µg/L in June 2020; prior maximum detection was 720 µg/L) is attributed to anaerobic degradation of PCE due to ongoing EISB treatment.

601 California Site: Three (3) wells (V8-4, V8-7, and V8-8).

- Increased concentrations of trans-1,2-DCE and VC in well V8-4 (51/55 µg/L and 61/64 µg/L in June 2020, respectively; prior maximum detections were 3.7 µg/L and 0.30 µg/L, respectively), is attributable to anaerobic degradation of TCE due to ongoing EISB treatment.

- Increased concentrations of trans-1,2-DCE in well V8-7 (56 µg/L in June 2020; prior maximum detection was 12 µg/L) is attributable to anaerobic degradation of TCE due to ongoing EISB treatment.

- Increased concentrations of trans-1,2-DCE in well V8-8 (16 µg/L in June 2020; prior maximum detection was 6.7 µg/L) is attributable to anaerobic degradation of TCE due to ongoing EISB treatment.

Off-Site Area: Five (5) wells (F127A1R, F129A1, F156A1U, F166A1 and V-9).

- First time detection of trichlorofluoromethane (Freon 113) in A1 Upper zone wells F127A1R and F129A1 (0.84 µg/L and 1.3 µg/L in June 2020, respectively). These concentrations are below the corresponding clean-up level.

- First time detection of chloroform in A1 Upper zone well F156A1U (0.54 µg/L in June 2020). This concentration is below the corresponding cleanup level.

- Increased concentrations of 1,1,1-trichloroethane (1,1,1-TCA), 1,1-Dichloroethene (1,1-DCE), and cis-1,2-DCE in A1 zone well F166A1 (28 µg/L, 21 µg/L, and 61 µg/L in June 2020, respectively; prior maximum detections were 11 µg/L, 8.2 µg/L, 13 µg/L, respectively).

The significant increases identified above are being addressed by on-going remedial actions.

3.5 395 PAGE MILL ROAD AREA X EISB PERFORMANCE MONITORING

Performance monitoring results and planned future work related to the 395 Page Mill Road Area X EISB program are discussed below. The EISB pilot study treatment areas are shown on Figures C-1 and C-2 in Appendix C.

Field Measured Parameters: Parameters measured in the field at the time of sample collection included temperature, pH, electrical conductivity, dissolved oxygen (DO), oxidation-reduction potential (ORP), and ferrous iron (Fe^{+2}). These parameters provide information on groundwater geochemical conditions and are indicators for the suitability for biologically-mediated reductive de-chlorination processes. Groundwater field parameter measurement results are presented in Table C-3 in Appendix C.

Field parameter results reveal that geochemical conditions within the treatment areas remain favorable for biologically-mediated reductive de-chlorination. ORP values were negative in all wells, indicating reducing conditions. Fe^{+2} was detected in all wells at concentrations up to 3.8 milligrams per liter (mg/L) also indicating reducing conditions. pH levels remain circumneutral and favorable for biodegradation, ranging from 6.34 to 7.27.

Laboratory Measured Parameters: Groundwater samples were analyzed for VOCs, volatile dissolved gases, and total organic carbon (TOC). Samples from wells RW-1, RW-5, and W-16A1 were additionally analyzed for the presence of Dehalococcoides and vinyl chloride reductase gene (Dhc and vcrA). VOC results are summarized in Table C-4 in Appendix C. Results for other groundwater analytes are tabulated in Table C-5 in Appendix C.

PCE is the primary groundwater contaminant present in Area X. Concentration trend plots for A1 Upper zone and A1 zone treatment area wells depicting PCE, TCE, cis-1,2-DCE, VC, and ethene concentrations over time are presented in Figures C-3 and C-6 in Appendix C, respectively. Molarity trend plots for the A1 Upper zone and A1 zone treatment area wells depicting molar trends for PCE, TCE, cis-1,2-DCE, VC, and

ethene are presented in Figures C-4 and C-7 in Appendix C, respectively. PCE, TCE, and cis-1,2-DCE concentration trend plots for wells RW-2 and RW-6, which are located down gradient from the A1 Upper zone treatment areas, are presented in Figure C-5 in Appendix C.

A1 Upper Zone: PCE concentrations in treatment area wells RW-1 and RW-5 remain below the cleanup goal (5 µg/L) in June 2020. The PCE concentration in treatment area well OB11-2 has fluctuated between 15 µg/L and 89,000 µg/L since beginning EISB treatment. In June 2020, PCE was reported in OB11-2 at 89,000 µg/L, which is the highest level reported since beginning EISB. Fluctuations in dissolved phase PCE concentration in well OB11-2 indicate EISB treatment is enhancing the solubilization of sorbed-phase contaminant mass in the vicinity of the well. PCE concentrations in well OB11-2 are expected to eventually stabilize and decline over time, as the sorbed-phase contaminant is depleted. TCE concentrations in treatment area wells remain below the cleanup goal (5 µg/L) in June 2020.

Concentration increases in daughter products (cis- and trans-1,2-DCE, VC, and ethene) in treatment area wells demonstrate complete reductive de-chlorination of PCE is occurring. Since beginning EISB treatment, total chlorinated ethenes (molar basis) in treatment area wells RW-1 and RW-5 have declined by 99 percent and 98 percent, respectively, while total chlorinated ethenes in treatment area well OB11-2 have increased by nearly 1,000 percent. As depicted on Figure C-3, PCE and TCE concentrations in down gradient wells RW-2 and RW-6 have declined to below the cleanup goal.

June 2020 microbe test results were positive for Dhc and vcrA in treatment area wells RW-1 and RW-5. As expected, microbe populations increased following the most recent bioaugmentation event in November 2019 but remain below historical high population values reported during prior EISB monitoring events. The lower population values observed in RW-1 and RW-5 are attributed to chlorinated ethene depletion in these two monitoring wells. TOC concentrations in June 2020 remain above baseline values, ranging from 6.4 milligrams per liter (mg/L) to 53 mg/L.

A1 Zone: The PCE concentration in treatment area well EW-11R has steadily declined from a baseline of 450 µg/L to below the laboratory reporting limit (e.g., not detected) and has remained not detected since 2017. The PCE concentration in treatment area well W-16A1 declined from a baseline of 510 µg/L to below the laboratory reporting limit within three months after beginning EISB treatment and has remained not detected since 2013. TCE concentration trends in wells EW-11R and W-16A1 are similar to PCE trends.

Concentration increases in daughter products (cis- and trans-1,2-DCE, VC, and ethene) in treatment area wells demonstrate complete reductive de-chlorination of PCE is occurring. Since beginning EISB treatment, the total chlorinated ethenes (molar basis) in treatment area well EW-11R and W-16A1 have increased by 68% and 15%, respectively. The molarity increase is attributable to daughter product increases in response to ongoing treatment.

June 2020 microbe test results for W-16A1 were positive for both Dhc and vcrA. Microbial populations increased following the most recent bioaugmentation event in November 2019 to levels favorable for robust de-chlorination. TOC concentrations in June 2020 remain above baseline values, with a maximum value of 5.9 mg/L in W-16A1.

The next EISB performance monitoring event will be conducted in June 2021 concurrent with the annual COE monitoring event.

3.6 601 CALIFORNIA AVENUE EISB PERFORMANCE MONITORING

Two EISB pilot studies have been implemented at the 601 California Avenue site, both of which are currently active. As noted in Section 2.1, the Phase I EISB pilot study area is located northeast and hydraulically down gradient of the on-site building and is intended as a bio-barrier to reduce VOC concentrations in this area and inhibit downgradient migration of VOC-impacted groundwater. The Phase 2 (courtyard) EISB pilot study was implemented in the northwest courtyard of the on-site building to reduce groundwater VOC concentrations in that area. The locations and layout of the EISB pilot study areas are illustrated in Figure D-1 in Appendix D.

Stantec conducted EISB performance monitoring in both study areas on May 3 and May 4, 2020, following the sixth injection event in July and August 2019. Data associated with the 601 California Avenue EISB program are presented in Appendix D

Field Measured Parameters: Temperature, pH, conductivity, DO, ORP, and Fe^{+2} measurements are collected in the field at the time of sample collection to provide information on geochemical conditions in groundwater and suitability for biologically-mediated anaerobic degradation processes. Groundwater field parameter measurement results are presented in Table D-1 in Appendix D.

Field parameter results reveal that geochemical conditions remain favorable for anaerobic degradation in both treatment zones.

Laboratory Measured Parameters: Groundwater samples were analyzed for VOCs, and select wells were analyzed for dissolved gases and/or TOC. VOC results are summarized in Table D-2 in Appendix D. Results for other groundwater analytes are tabulated in Table D-3 in Appendix D.

TCE is the primary groundwater contaminant present in groundwater beneath the 601 California site. Concentration and molarity trend plots for select treatment area wells depicting TCE and degradation products over time are presented in Figures D-2 and D-3 in Appendix D, respectively.

Soil vapor probes SVP-1 through SVP-7 were scheduled for sampling in May 2020; however, SVP-5, SVP-6, and SVP-7 were unable to be sampled due to saturated conditions observed in the vapor probes. Soil vapor probes SVP-1 through SVP-4 were successfully sampled in May 2020. Soil vapor data are summarized in Tables D-4a and D-4b.

EISB Program Conditions: Groundwater chemical data from courtyard-area monitoring wells indicate that reductive de-chlorination of TCE is occurring at a robust rate in response to iterative injections of carbon substrate. The significant spikes in TCE concentrations originally observed in several wells during the December 2014 monitoring event, approximately one month after initial substrate injections in November 2014, have steadily attenuated over time to near historical low concentrations in many wells. Significant increases in concentrations of degradation products (cis-1,2-DCE and vinyl chloride) in key site wells indicate that reductive de-chlorination processes are robust (particularly in wells P21, and P26) and do not

appear to be stalled. However, significant concentrations of TCE remain in several wells (P13, P17, P18, P21, and P26), and TOC concentrations were low in several wells, including P17, P21 and P26. These elevated concentrations may reflect an increased dissolution gradient for TCE mass sorbed to subsurface soils, driven by the strong anaerobic degradation observed in the treatment area and presence of EVO and the surfactant used to emulsify it. This effect is illustrated by the fluctuating TCE concentrations in wells P13, and P21 over time. Based on the persistent high TCE concentrations and low TOC concentrations observed in several wells, a sixth injection event was completed in the courtyard area in July 2019 to provide additional substrate to drive the de-chlorination process and further reduce these concentrations.

Groundwater chemical data from the Phase 1 bio-barrier area indicate that TCE concentrations in this area have remained relatively low over the last several years. TCE concentrations in May 2020 ranged from 20 µg/L to 510 µg/L in bio-barrier wells P25, P27, P28, and P29, with the reported TCE concentration in well P25 (510 µg/L) representing a historical low in this well. Well P-25 is located down gradient of the Phase 2 treatment area and up gradient of the Phase 1 bio-barrier area. Although the concentration of TCE in well P29 (located immediately downgradient of the bio-barrier area) was low (20 µg/L) in May 2020, TCE concentrations in well V-9 (located off-site to the northeast and downgradient of the bio-barrier area) was 430 µg/L during the same sampling event. TCE concentrations in well V-9 have decreased significantly since the start of EISB treatment. These results confirm that the bio-barrier treatment area is functioning as intended to inhibit off-site migration of VOC-impacted groundwater.

Samples collected in May 2020 from soil vapor probes SVP-1 and SVP-2 indicate that TCE concentrations have declined to historical low concentrations of 1,200 µg/m^3, and 470 µg/m^3, respectively. Soil vapor TCE concentrations near SVP-3 and SVP-4 have also significantly decreased to near-historic and historic low concentrations of 100 µg/m^3 and 580 µg/m^3, respectively, since the previous sampling event in December 2018. A consequence of this enhanced de-chlorination process was a noted increase in vinyl chloride concentration at SVP-4 (from 7,200 µg/m^3 in August 2018 to 24,800 µg/m^3 in December 2018, and 42,000 µg/m^3 in May 2020). These results, and those from the upcoming 13-month post-treatment monitoring event will be used to determine whether additional treatment is warranted.

Despite efforts to withhold irrigation of the area, monitoring of soil vapor probes SVP-5 and SVP-6 has repeatedly been hampered by saturated subsurface conditions, precluding collection of soil vapor samples from the vadose zone in these locations. Stantec will continue to monitor the status of soil vapor probes SVP-1 through SVP-7 and sample as scheduled when field conditions permit.

3.7 EW-15 AND EW-16 TRIAL SHUTDOWN RESULTS

A data table summarizing VOC results from the eight wells included in the trial shutdown monitoring program is included in Table E-1 in Appendix E. VOC concentration versus time plots for the trial shutdown monitoring wells are also included as Figures E-1 and E-2 in Appendix E. The plots illustrate VOC concentration trends over time, starting in 1995, when the wells in the area were first sampled. The plots also illustrate how VOC concentrations have changed since beginning the trial shutdown in November 2013. Notable VOC trends are described below.

An increase in PCE concentration was observed in both wells EW-15 and EW-16 after pumping began in 1996. Following the initial PCE increase, PCE concentrations in the extraction wells remained relatively stable. The lateral extent of PCE within the A1 Upper zone appears to extend about 140 feet down gradient to well F88A1U. In the A1 zone, PCE occurrence is limited to extraction well EW-16.

Following cessation of pumping at EW-15 and EW-16, PCE concentrations in wells EW-15 and EW-16 declined rapidly. Approximately 7 years after beginning the trial shutdown, the PCE concentration in well EW-15 has declined from a baseline of 230 µg/L to below the laboratory reporting limit (<0.5 µg/L) in June 2020. Over the same period, the PCE concentration in well EW-16 has declined from a baseline of 270 µg/L to 7.1 µg/L in June 2020. The concentration declines are in part attributed to sequential reductive de-chlorination to less chlorinated daughter products (predominantly cis- and trans-1,2-DCE and VC). TCE concentrations in well EW-15 increased following the shutdown, but subsequently declined to 3.5 µg/L in June 2020. TCE concentrations in well EW-16 steadily declined from a baseline of 56 µg/L to 4.9 µg/L in June 2020. Other daughter products (cis- and trans-1,2-DCE and VC) concentrations in EW-15 and EW-16 initially increased following the shutdown and have since declined to near or below pre-shutdown levels.

The PCE concentration in the nearest downgradient A1 Upper zone well F88A1U initially increased after pumping ceased in November 2013. Since February 2014, the PCE concentration has declined reaching a trial shutdown low of 9.6 µg/L in June 2018. VOC data from well F141A1U, located approximately 330 feet northeast of EW-15 and near the estimated OEU capture boundary indicate this well has not historically nor is presently impacted by VOCs above cleanup goals. Well F161A1U, which is located approximately 300 feet north of EW-15 and within the estimated OEU capture area, has been sampled since August 2011 and has not been impacted by PCE. Relatively low concentrations of TCE, ranging from around 10 to 20 µg/L have been detected in this well since sampling began in 2011. The TCE concentration reported in well F161A1U in June 2020 (7.3 µg/L) is a historical low since beginning the trial shutdown.

PCE has not been detected in A1 zone well F89A, located approximately 120 feet northwest of EW-16. Low concentrations of TCE have historically been detected in A1 zone well F89A. Since turning off well EW-16, the TCE concentration increased to a maximum of 14 µg/L in June 2014. Well F89A, which is located within the CalTrain railroad right-of-way, was not sampled in June 2020. VOC data from well F142A1, located approximately 480 feet northeast and outside the estimated OEU capture area for the A1 zone indicate this well has not historically nor is presently impacted by VOCs [note that samples from 1995 and 1996 are non-detect for VOCs at elevated detection limits]. Well F74A, also located outside the estimated OEU capture area for the A1 zone and approximately 640 feet north and downgradient of EW-16, appears to be impacted historically by TCE at concentrations ranging from non-detect to 42 µg/L. Since the cessation of pumping at EW-16, TCE concentrations have remained unchanged, ranging between 31 to 42 µg/L (34 µg/L in June 2020).

Post-shutdown monitoring results reveal contaminant concentrations in former pumping wells EW-15 and EW-16 have declined to below or near cleanup levels and contaminant concentration trends in downgradient wells are stable or declining. Based on the favorable post-shutdown monitoring results, it is recommended that the status of former extraction wells EW-15 and EW-16 16 be modified from trial shutdown to permanent curtailment and trial shutdown monitoring be discontinued.

Reporting Period Totals

Total system flow volume treated: [4]	21,606,510	gallons
Treated flow volume discharged to the storm drain:	21,519,530	gallons
Treated flow volume diverted to POTW: [5]	14,640	gallons
Treated flow volume diverted for reuse:	0	gallons
Approximate percent of treated water reused:	0	%
Average system flow rate for reporting period: [6]	41.4	gpm
VOC mass removed:	243.1	lbs
VOC mass removal rate per day: [7]	0.67	lbs/day

Notes:

(1) Volume per Period = volume of water extracted over the period.
(2) Average Flow Rate = volume per period divided by the period duration.
(3) Total system flow is the influent water totalizer reading.
(4) The "Treatment System" flow volume may not match the sum of the individual well flow volumes due to the minor inherent differences expected between the electronic flow measuring devices (wellheads) and the mechanical flow measuring device (treatment system).
(5) This value represents city water discharged from the slurry truck to the POTW during Carbon Change Out Events.
(6) The average system flow rate is calculated by dividing the total flow volume for the period by the duration of the period.
(7) VOC mass removal rate per day equals the VOC mass removed for the period divided by the number of days in the year.

Abbreviations:

lbs/day = pounds per day
gal = gallons
gpm = gallons per minute
VOC = volatile organic compounds
lbs = pounds

Notes:

(1) Well BW-4 was decommissioned on March 15, 2002.

(2) Wells F23A, F43A1U, F44A, F45A1U, EW-1, EW-2, and EW-6 were decommissioned in July 2005.

(3) Approved for removal from SMP on February 9, 2007.

(4) To facilitate property redevelopment monitoring well EW-13 was destroyed on December 14, 2017.

(5) Well EW-14 was decommissioned in July of 2006, per RWQCB approval.

(6) To facilitate property redevelopment monitoring wells F38A and F101B were destroyed on April 5, 2018. A replacement well is to be installed once property development is complete.

(7) At the request of the RWQCB, F42A1 was overdrilled and replaced with F42A1R in the same borehole on March 12, 2013.

(8) To facilitate property redevelopment monitoring well F127A1 was destroyed and replaced with F127A1R just outside of the property boundary on January 24, 2012.

(9) To facilitate property redevelopment former extraction well V-9X was destroyed on August 30, 2019 per RWQCB approval.

(10) To facilitate property redevelopment monitoring wells V-23 and V-33A2D were destroyed. Replacement monitoring well V-23R was installed within the property boundary on February 6, 2017.

(11) To facilitate property redevelopment, monitoring well VB-1 was destroyed on October 5, 2017 per RWQCB approval.

(12) Well W-9A1U/A1 was decomissioned in 1998, per RWQCB approval.

(13) Per RWQCB approval on May 14, 2020, monitoring frequency of wells F62A1 and F92A2, located in the Caltrain right of way, were reduced to biennial.

* Well is being monitored more frequently on a self-directed basis.

Abbreviations:

8010+Freon® 113 = Reporting EPA Method 8010 analytes plus Freon® 113 analyzed by EPA Method 8260B

OEU = Oregon Expressway Underpass

Biennial = Sampled in odd years (e.g. 2019, 2021)

Notes:

(1) Well Volume = The volume of one well interval is used in calculating the total pre-sample purge. This interval is generally considered to be the length of submerged casing.

(2) Purged Dry = Well completely evacuated and allowed to recharge.

(3) Well purged using low-flow method

* = approximate depth to water; Oily layer caused difficulty in collected water level

Abbreviations:

IE - Inactive Extraction Well

gal = gallons

deg C = degrees Celsius

µmhos/cm = micromhos per centimeter

ft btoc = feet below top of casing

L = liters

NA = Not available/applicable

Notes:

(1) PDBS deployment depth equates to the midpoint of the PDBS. The PDBS is 18 inches long.

Abbreviations:

in. = inches

ft bgs = Feet below ground surface

PDBS = Passive diffusion bag sampler

Table 7
Groundwater Sample Collection QA/QC Results - June 2020
COE Study Area and Perimeter Area, Palo Alto, California

Who performed the sampling? **(i.e., firm name, address, phone)**	Blaine Tech Services 1680 Rogers Avenue San Jose, California 95112 Phone: (408) 573-0555 Fax: (408) 573-7771 Contact: Greg Roberts
Chain-of-custody forms were completed for all samples?	Yes
Field parameters stabilized prior to taking samples?	Yes, where applicable to sampling method
Zero head space in sample containers (VOCs only)?	No
Samples were preserved according to analytical method?	No
Required field QA/QC samples were taken?	
Appropriate number of field duplicates taken?	Yes
Trip blanks included with all sample shipments?	Yes
Appropriate number of equipment blank samples taken?	Yes

Explain any "Exception" answers below:

The following volatile sample was analyzed with significant headspace in the sample vial(s) due to multiple runs performed: C0620-V84, C0620-DUP4, and C0620-TB4. Significant headspace is defined as a bubble greater than 6 mm in diameter.

The following sample(s) was collected in a properly preserved vial; however, the pH of 3 was outside the required criteria when verified by the laboratory. The sample was analyzed within the 7-day holding time specified for unpreserved samples: C0620-OB112.

The following sample was collected in a properly preserved vial; however, the sample pH of 4 was outside the required criteria when verified by the laboratory. The sample was analyzed within the 7-day holding time specified for unpreserved sample: C0620-OB112

Abbreviations:

QA/QC = Quality assurance/quality control

VOCs = Volatile organic compounds

Table 8
Groundwater Sample Chemical Analysis QA/QC Results - June 2020
COE Study Area and Perimeter Area, Palo Alto, California

Who performed analysis? **(i.e., lab name, address, contact, phone)**	Eurofins TestAmerica 1220 Quarry Lane Pleasanton, California 94566 Phone: (925) 484-1919 Fax: (925) 484-1096 contact: Afsaneh Salimpour Pace Analytical 7979 Innovation Park Dr. Baton Rouge, LA 70820 Phone: (225) 769-4900 Contact: Ruth Welch SiREM 130 Stone Rd. West Guelph, Ontario, Canada N1G 3Z2 Phone: +1 (519) 822-2265 Contact: Ximena Druar
Analytical methods used? **(method number and chemical category)**	EPA Method 8260B for Halogenated Volatile Organic Compounds (former EPA Method 8010 list) + Freon® 113 EPA SM 5310C for Total Organic Carbon EPA Method RSK175 Gene-Trac® Dehalococcoides Assay Gene-Trac® Functional Gene Assay
Is the lab state-certified for the above analytical methods?	Yes
Analysis performed according to standard methods?	Yes
Sample holding times met?	Yes
QA/QC analyses run consistent with analytical methods (includes blanks, MS/MSDs, etc.)	Yes
QA/QC results meet all acceptance criteria?	
Trip blank samples non-detect for all analytes?	Yes
Surrogate recovery acceptable to analytical laboratory?	No
MS/MSD samples within acceptance criteria?	No
LCS/LCSD samples within acceptance criteria?	No
Field duplicate within acceptable relative percent difference?	Yes
QA/QC results and acceptance criteria on file?	Yes

Explain any "No" answers below:

Surrogate recovery for the following sample was outside the upper control limit: C0620-TB4. This sample did not contain any target analytes; therefore, re-analysis was not performed. 1,2-dichloroethane (Surr) high.

The MS/MSD recoveries for the following sample associated with analytical batch 440-612852 were outside control limits: (720-98776-B-5 MS) and (720-98776-B-5 MSD). The associated LCS recovery met acceptance criteria.

The MS/MSD recoveries for analytical batch 440-611759 were outside control limits. Sample matrix interference is suspected because the associated LCS recovery was within acceptance limits.

Table 8
Groundwater Sample Chemical Analysis QA/QC Results - June 2020
COE Study Area and Perimeter Area, Palo Alto, California

Explain any "No" answers below (continued):

Reanalysis of the following sample was performed outside of the analytical holding time due to client requesting confirmation analysis after hold time: C0620-DUP6.

Sample C0620-RW2 was analyzed outside holding time. The sample was originally analyzed within holding time but required re-analysis at a 2X to bracket the concentration of Methane within the calibration range of the instrument. The dilution is reflected in elevated detection limits.

The continuing calibration verification (CCV) associated with batch 440-611759 recovered above the upper control limit for Chloromethane, Dichlorodifluoromethane, Bromomethane and Chloroethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: C0620-EW11R and (CCVIS 440-611759/2).

The CCV associated with batch 440-612163 recovered above the upper control limit for Vinyl chloride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: C0620-O28A1, C0620-DUP3, C0620-O67A2 and (CCVIS 440-612163/2).

The CCV associated with batch 440-612410 recovered above the upper control limit for Vinyl chloride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: C0620-O115A1, C0620-O121A2, C0620-O162A2, C0620-P5A2, C0620-T1A and (CCVIS 440-612410/2).

The CCV associated with batch 440-611396 recovered above the upper control limit for Vinyl chloride, Chloroethane, Dichlorodifluoromethane, Chloromethane and Bromomethane. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: C0620-EW10, C0620-TB1, C0620-F77A1U, C0620-EW8, C0620-F155A1U, C0620-F73A1, C0620-F34A, C0620-F53A1U, C0620-F49A1, C0620-F32A, C0620-F42A1R, C0620-F156A1U, C0620-F130A1U, C0620-TW1, C0620-TW2, C0620-EW4, C0620-O118B (CCVIS 440-611396/2) and (720-98726-A-4).

The CCV associated with batch 440-611750 recovered above the upper control limit for Tetrachloroethene. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported. The associated samples are impacted: C0620-F98A, C0620-F124A2, C0620-F126A2, C0620-DUP8, C0620-F127A1R, C0620-F129A1 and (CCVIS 440-611750/2).

The continuing calibration verification (CCV) associated with batch 440-611625 recovered above the upper control limit for Vinyl chloride. The samples associated with this CCV were non-detects for the affected analytes; therefore, the data have been reported.

The LCS for analytical batch 440-611396 recovered outside control limits for the following analytes: Vinyl chloride, Chloroethane, Dichlorodifluoromethane, Chloromethane and Bromomethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

The LCS for analytical batch 440-611750 recovered outside control limits for the following analyte: Tetrachloroethene. This analyte was biased high in the LCS and was not detected in the associated samples; therefore, the data have been reported.

The LCS for analytical batch 440-611759 recovered outside control limits for the following analytes: Chloromethane, Dichlorodifluoromethane, Vinyl chloride and Bromomethane. These analytes were biased high in the LCS and were not detected in the associated samples; therefore, the data have been reported.

Abbreviations:
QA/QC = Quality assurance/quality control
MS/MSD = Matrix spike/matrix spike duplicate
LCS/LCSD = Laboratory control sample/laboratory control sample duplicate
CCV = Continuing calibration verification
RPD = Relative percent difference

Notes:

Analyzed using EPA Method 8260B for the EPA Method 8010 list of halogenated VOCs, including Freon 113. EPA Method 8260B superseded EPA Method 8010, which is the analytical method specified in the modified Self-Monitoring Program dated May 4, 2001.

All data reported in µg/L unless otherwise noted.

H = Sample was prepped or analysed beyond the specified holding time.

J = Estimated value; Result is less than the laboratory reporting limit (RL) but more than the method detection limit (MDL).

Abbreviations:

DUP = Field Duplicate
EB = Equipment Blank
SB = Source Blank
TB = Trip Blank
PCE = Tetrachloroethene
TCE = Trichloroethene
1,1,1-TCA = 1,1,1-Trichloroethane
1,1-DCA = 1,1-Dichloroethane
1,1-DCE = 1,1-Dichloroethene
1,2-DCA = 1,2-Dichloroethane
1,2-DCB = 1,2-Dichlorobenzene
cis-1,2-DCE = cis-1,2-Dichloroethene
trans-1,2-DCE = trans-1,2-Dichloroethene
Freon 113 = 1,1,2-Trichloro-1,2,2-Trifluoroethane
VC = Vinyl Chloride
EC = Chloroethane
1,2,4-TCB = 1,2,4-Trichlorobenzene
1,3,5-TCB = 1,3,5-Trichlorobenzene
1,3-DCB = 1,3-Dichlorobenzene
1,4-DCB = 1,4-Dichlorobenzene
Freon 11 = Trichlorofluoromethane
CHLFM = Chloroform
MC = Methylene Chloride
1,2-DCP = 1,2-Dichloropropane
1,1,2-TCA = 1,1,2-Trichloroethane
1,1,2,2-PCA = 1,1,2,2-Tetrachloroethane
1,2,3-TCP = 1,2,3-Trichloropropane
PB = Propylbenzene

Table 10
Summary of Significant Increases* and First Time Detections - June 2020
COE Study Area and Perimeter Area, Palo Alto, California

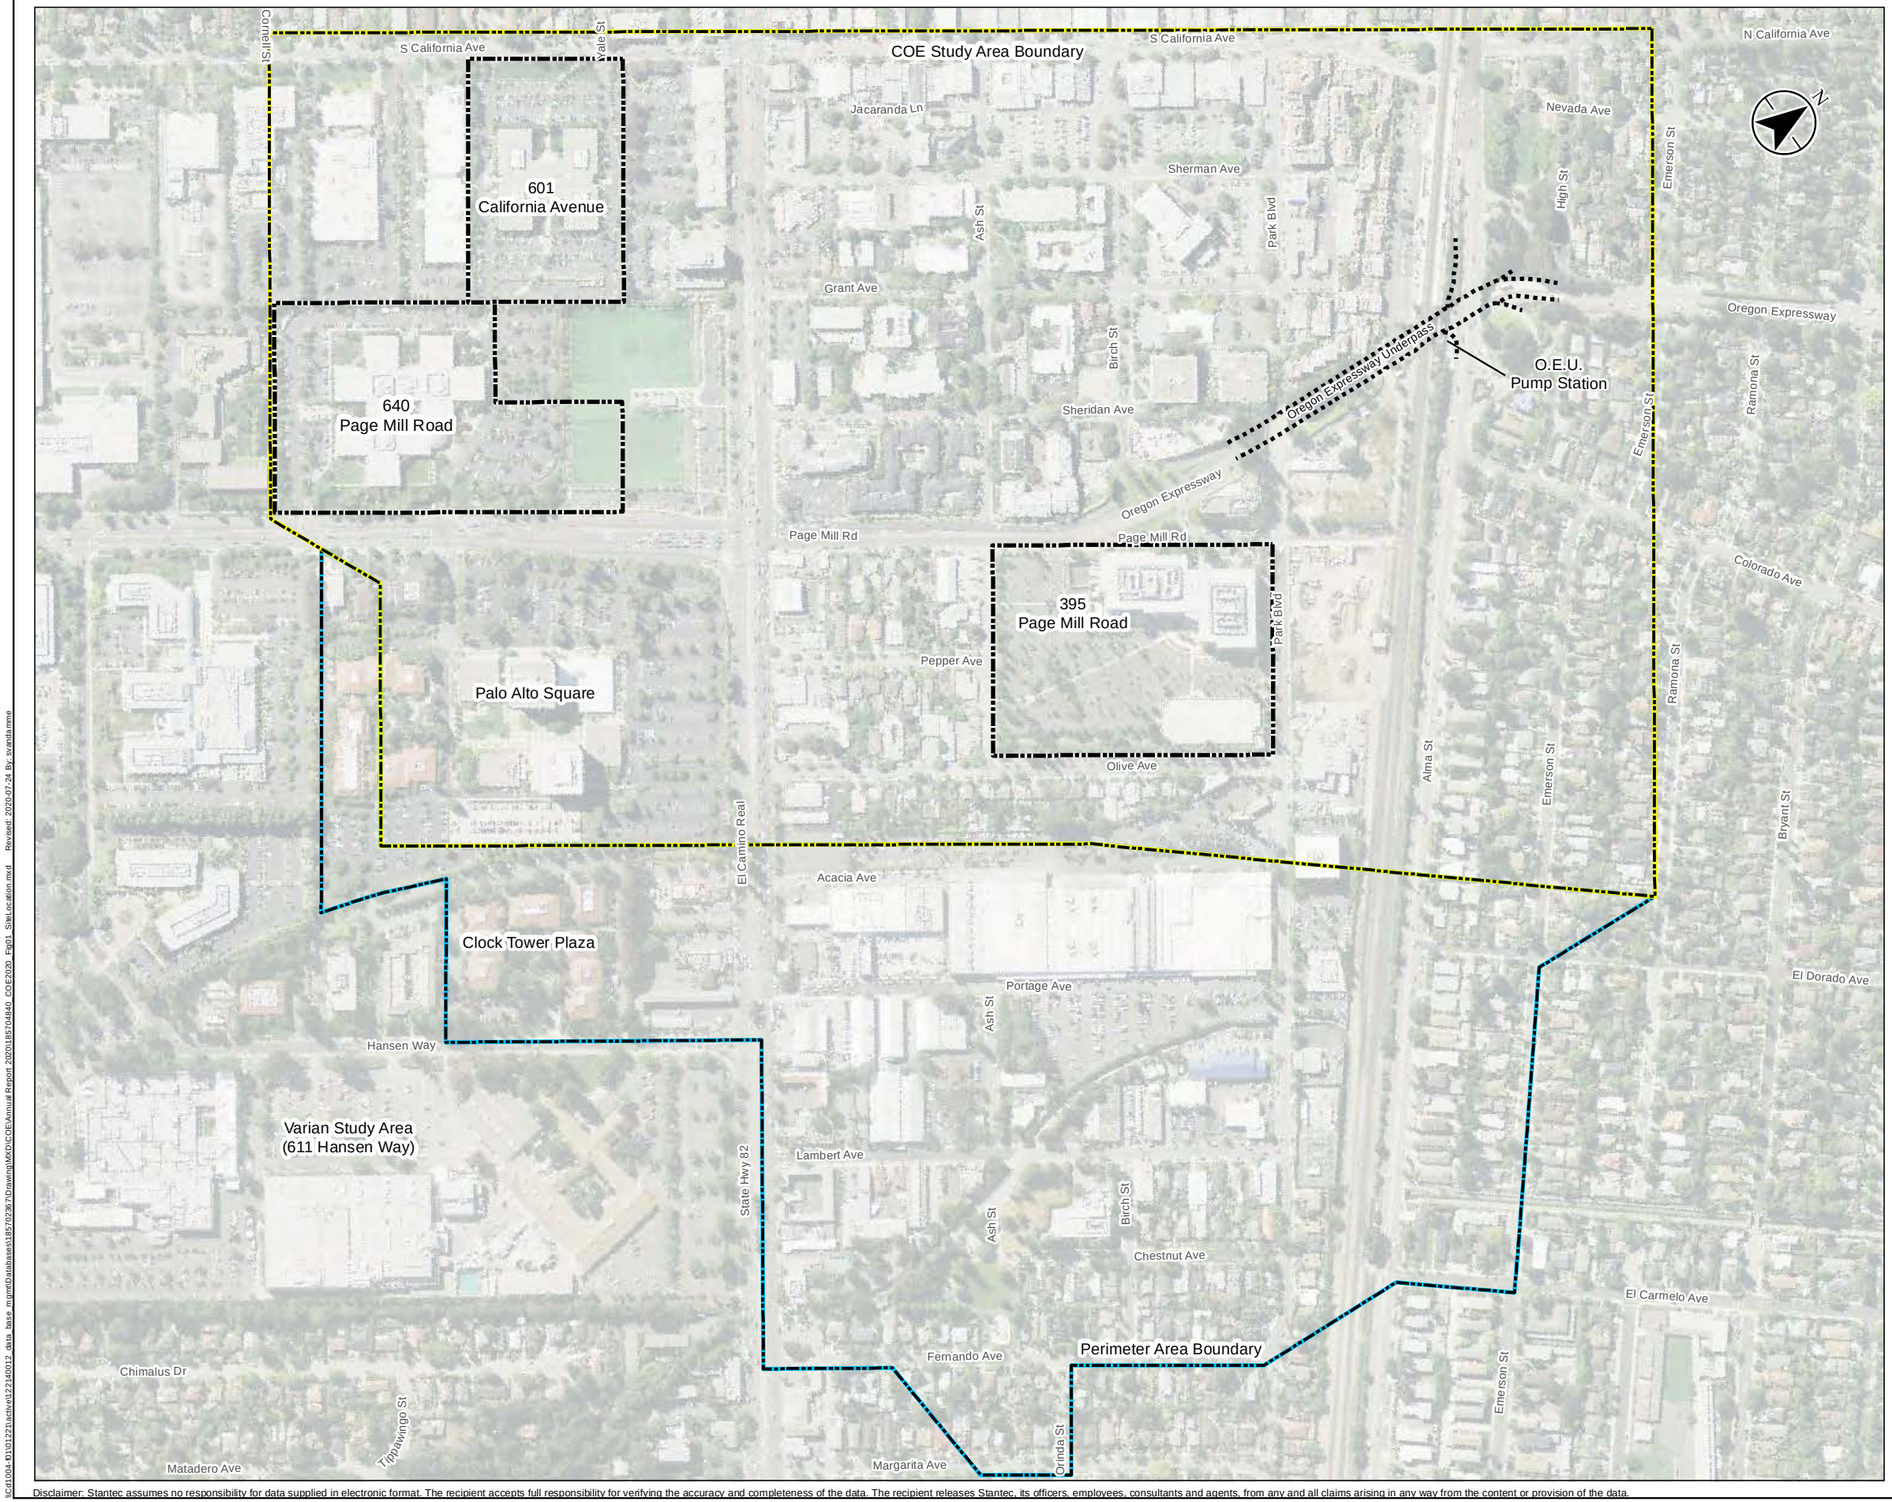
		Vinyl Chloride	61/64	0.30	0.50	
V8-7	6/3/2020	trans-1,2-Dichloroethene	56	12	10	
V8-8	6/3/2020	trans-1,2-Dichloroethene	16	6.7	10	
V-9	5/3/2020	trans-1,2-Dichloroethene	2.5 J	ND	10	first time detection

Notes:

* A signicant increase is noted if the current sample result is greater than two times the historical maximum concentration for each well/analyte pair, or if an analyte is detected above the corresponding laboratory reporting limit for the first time.

ND = Not previously detected above laboratory reporting limit(s). See Appendix B for laboratory reporting limits.



NA = Not available/applicable

XX/XX = Duplicate Pair values

J = Estimated value; Result is less than the laboratory reporting limit (RL) but more than the method detection limit (MDL).

Within this area, A1 and A2 sands are in direct contact and form a single A1/A2 hydraulic unit. Within this area, the water level data are representative for this single A1/A2 Zone and are shown on both the A1 and A2 Zone maps. Where the A1 and A2 sands are not in direct contact outside this area, data for the A1 Zone are shown only on the A1 Zone map, while data for the A2 Zone are presented on the A2 Zone map.

Groundwater Elevation Contours A1 Zone - June 4, 2020

Within this area, A1 and A2 sands are in direct contact and form a single A1/A2 hydraulic unit. Within this area, the water level data are representative for this single A1/A2 Zone and are shown on both the A1 and A2 Zone maps. Where the A1 and A2 sands are not in direct contact outside this area, data for the A1 Zone are shown only on the A1 Zone map, while data for the A2 Zone are presented on the A2 Zone map.

Sept 2017 - Aug 2018	327.80 lbs 0.90 lbs/day	0.00 lbs 0.00 lbs/day	0.00 lbs 0.00 lbs/day	0.00 lbs 0.00 lbs/day	0.00 lbs 0.00 lbs/day
Sept 2018 - Aug 2019	245.33 lbs 0.67 lbs/day	0.00 lbs 0.00 lbs/day	0.00 lbs 0.00 lbs/day	0.00 lbs 0.00 lbs/day	0.00 lbs 0.00 lbs/day
Sept 2019 - Aug 2020	243.14 lbs 0.67 lbs/day	0.00 lbs 0.00 lbs/day	0.00 lbs 0.00 lbs/day	0.00 lbs 0.00 lbs/day	0.00 lbs 0.00 lbs/day

Notes:

(1) Extraction well EW-13 was destroyed on December 14, 2017.

(2) lbs/day was calculated by dividing the mass removal at a site by the number of days in the year.

(3) The estimated mass/removal rate has been revised from that presented in previous monitoring reports in order to correct a calculation error.

Abbreviations:

lbs = pounds

lbs/day = pounds per day

GWET = Groundwater Extraction and Treatment
