Any impact on the canals operated by RD 1000 and Natomas Mutual should be examined in the EIR. "The NBHCP conservation strategy emphasizes maintaining connectivity between TNBC reserves to allow giant garter snake movement within the Natomas Basin. This species is highlighted for two reasons: 1) giant garter snake is the most prevalent Covered Species within the Basin that requires land/water connectivity to travel within the Basin and 2) if adequate connectivity is provided for giant garter snake, then, it is anticipated that other Covered Species will also be afforded adequate opportunities to migrate within the Basin. The primary opportunity for connectivity between reserves is the system of agricultural canals maintained and operated by RD 1000 and Natomas Mutual." (NBHCP, p. IV-8), including the West Drainage Canal which borders the project and Lone Tree Canal, which runs through the project site and joins the West Drainage Canal.

e. Impacts on Fisherman's Lake Preserve Area and Connectivity to Other Preserves in the NBC. Section IV.C.1.e of the NBHCP requires preserve lands be held in a 2,500-acre preserve and at least three 400 acre preserves. The NBHCP at IV-14 states "In order to ensure adequately sized reserves that will support long-term viability of Covered Species, the NBHCP requires that by the end of the 50-year permits, one habitat block within the reserve system shall be a minimum of 2,500 acres in size and the balance of reserve lands shall be in habitat blocks that are a minimum of 400 acres in size."

The Conservation Strategy states (at NBHCP IV-7):

> "TNBC reserves will generally be consolidated into large, biologically viable units with connectivity between individual reserve units."

The Fisherman's Lake preserve has a total of 413 acres. Of the six parcels, only 4 are contiguous (approximately 300 acres). This preserve's success depends on acquiring more land in the area between I-5, Sacramento River, and I-80. Approval of more development in this area will interfere with development of a biologically sound preserve in this part of the Basin.

This preserve is immediately south of the project area and is already affected by neighboring urban areas. This is a crucial but constrained habitat space, less than a mile wide in some parts. At present the project area provides support and habitat value to the Preserve area. The project properties are in farm and open space, host nesting Swainson's Hawks and provide

canal habitat protection for aquatic species. The loss of that buffering and enhancement will hurt the preserve area. That loss cannot be mitigated by preserving land elsewhere because this is part of a wildlife preserve area.

The Fisherman's Lake Preserve will be further negatively impacted by increased human activities, loss and/or degradation of connectivity, and edge effects, if the project is developed. Connectivity is provided primarily through the Lone Tree Canal, included within the project Area and West Drainage Canal which is the southern boundary of the project. Development next to Lone Tree and West Drainage Canals will degrade these canals role in providing habitat for the threatened aquatic Giant Garter Snake and aquatic connectivity within the NBC reserve system. The ability of NBC to acquire contiguous properties to the Fisherman's Lake preserve is critical to the success of this preserve area for multiple species. Development at this site will compromise and degrade

Please consult the North Natomas Community Plan FEIR (1986) for the habitat assessment of the general area of Fisherman's Lake and the City's assurances that the area would be protected from development and its preservation would help mitigate for loss of habitat in the development of the North Natomas Community Plan. These assurances were not superseded by the adoption of the 2003 NBHCP. (See page I-5 of 2003 NBHCP, "All proponents of new development in the City shall comply with the applicable mitigation measures identified in the Mitigation Monitoring Plans approved with each community plan, as well as the measures of this NBHCP.")

f. I mpacts on Swainson's Hawk Foraging and Nesting Habitat in the Project Area. The project area has provided Swainson's Hawk foraging and nesting habitat, and if developed, these positive contributions to the conservation of listed species in the Basin will be removed. Please note that the City's adoption of the NBHCP included additional requirements for City developments including no removal of Swainson's Hawk nesting trees (see P. I-27, NBHCP), and all mitigation to take place within the Natomas Basin. (See IA, 5.3 In-Basin Acquisition. All Mitigation Lands shall be acquired within the Natomas Basin as provided in the NBHCP.")

The NBHCP at V-3 states:

> "In order to generally minimize the impacts of development on Covered Species, the City of Sacramento and Sutter County shall impose the following requirements on Authorized Development when approving Urban Development Permits within the Natomas Basin:
>
> > a. Tree Preservation: Valley oaks and other large trees should be preserved whenever possible. Preserve and restore stands of riparian trees used by Swainson's hawks and other animals for nesting, particularly adjacent to Fisherman's Lake."

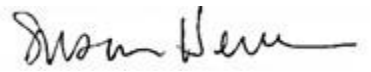
See also Section 3.1.2 of the Implementation Agreement entitled " 3.1.2 EXCLUSION OF DEVELOPMENT FROM SWAINSON's HAWK ZONE" and determine if any portion of the project area is in the Swainson's Haw Zone.

g. Cumulative Impacts on the Natomas Basin Habitat Conservation Plan and the Natomas Basin Conservancy's Ability to Implement the Plan. The DEIR must assess the cumulative impact of this project, along with both all approved and unbuilt development projects and all proposed development projects within the Natomas Basin on the ability of the Natomas Basin HCP to implement the Natomas Basin HCP and its Conservation Policy. This assessment should identify the cumulative loss of habitat with buildout of all existing and proposed projects, the amount of mitigation acres required, the amount of qualified mitigation acres available on the remaining land in within the Natomas Basin HCP, the ratio between mitigation acres required and mitigation acres available, the resulting impact on mitigation land cost, and the ability of the NBC to fund and acquire the required acreage. Finally, the assessment should finally determine how full buildout of the combined projects will impact the listed species that the HCP is supposed to be protecting

7. Drainage Issues must be addressed by the EIR and mitigated.

The project site is the bottom of former Upper American Lake, which was drained for agriculture many years ago. Rainwater and irrigation wastewater drain southward from north of I-5, runs under I-5 via two north-south canals which runs through the project site and join the West Drainage canal, which is the south boundary of the project site. The West drainage canal drains a large area north and west of the project site, runs alongside the project site, passes through the City's Natomas area, eventually joins the Main Drainage Canal, and is pumped up over the Sacramento River levee. The area immediately north of I-5 is former agricultural land which is rapidly being converted to hard-surface industrial and residential development (Greenbriar and Metro Air Park, four square miles total) which can no longer absorb storm water, thereby increasing the volume of storm water run-off which travels southward via the canals into the project site. There is a levee along the south side of the West Drainage Canal, but none on the north side (project site). Shallow flooding of the project site has been observed during heavy rain conditions, from overflow from the canals, plus standing rainwater. Storm water runoff from north of the project site will increase as MetroAirPark and Greenbriar build out and pave over the once-absorbent farmland. The proposed project annexation area will no longer absorb storm water as it paved over by proposed development. The West Drainage Canal is at capacity during major storm events and may be unable to accommodate the additional drainage volume from the project site without risking flooding downstream in the City.

Reclamation District 1000 is responsible for drainage within Natomas Basin. The EIR should include a drainage plan, approved by RD 1000 and paid for by the developer that will provide drainage of storm water during major rain events. This will likely require a new canal from the



project site to the Sacramento River Levee, and an appropriately sized new pumping plant, at developer expense.

8. **The EIR must address the impacts of lights and noise on the neighboring residential neighborhood.**

The east boundary of the project site is separated from the adjoining Westlake residential neighborhood by only a 200-foot buffer. Industrial projects, including warehouses and distribution centers, are typically very brightly lighted at night for operations and security reasons. Truck traffic associated with warehouses and distribution centers typically operates day and night. These impacts on neighboring Westlake will be significant and would likely devalue the economic value of these homes. Prospective homebuyers typically avoid areas subject to round-the-clock truck noise and strong floodlights. The EIR must quantify and mitigate for these impacts.

Thank you for this opportunity to comment.

Please notify each of our organizations of any future public hearings and issuance of further documents on this proposal. Our addresses are on the letterhead of this letter.

RE: Airport South Industrial Project

Dear Mr Johnson,

I live in the Westlake community. I am an avid supporter of development for jobs, and taxes for the county and city. When Walmart and Amazon built the fulfilment centers I thought it was great for the same reasons. I have used Bayou Way and Del Paso as it is shorter and easier for me to make my commute to Woodland where my office is located. If you have ever driven on Bayou Way or Del Paso after going west past the Westlake Community it is very apparent neither of these roads can handle all the traffic now being used to allow all the workers going to and froe from these two warehouses. The roads should not be having this much traffic on them. I do not understand why with the new Metro PKWY opening up that all these workers are not required by Amazon & Walmart to use rather than the roads not made for all this traffic

With this new project I would have to say I am opposed to any new developments without serious thought to improve the infrastructure to handle the additional traffic. I Cannot believe I am opposing development but the Walmart and Amazon warehouses was not thought through very well at all to determine the roads needed for all the extra traffic

Sincerely,

Jeff Phillips

Subject: Airport South Industrial Project scoping meeting last night
Date: Thursday, March 17, 2022 8:53:23 AM

Please add my husband Case Butterman and me, Jan Schori, to your list of interested parties in this project for the purpose of receiving all notices and documents related to the project's approval seeking process. Our address is 191 Lanfranco Circle, Sacramento, CA 95835 (directly across from the proposed project, in the Avenues subdivision of Westlake). Also, while walking I met one of my neighbors late last week who knew nothing about the scoping meeting, as the USPS centralized mailbox for half of the houses on Lanfranco was vandalized and mail is not being delivered apparently. I gave him a copy of my notice but you may wish to send another notice to be sure that people are receiving appropriate communications regarding this proposal. Thank you--Jan Schori

From: Nick Zuvela
To: Scott Johnson
Subject: Airport South Industrial Project/ Flood.
Date: Friday, March 18, 2022 10:33:12 AM

Hello Scott,

If the Airport South project proceeds to completion, in the event of each of a 10, 25, 50, and 100 year rain/snowmelt/flood event:

what are the projected water depths, AND, what is the increased percentage of flood depths (over and above no project) for:

the Westlake subdivision in its entirety;

my residence at 24 Parnell Ct, 95835;

It seems logical all this project asphalt will exacerbate flooding from extreme downpours or sustained floodwater levee topping, in spite of any planned catch basins.

We are already in a very low basin. Any further loss of ground soil in Natomas seems not wise flood planning and could lead to life threatening flood.

Put on a different hat here. Please educate me in some detail re what the flood danger arguments say about this project exacerbating flood potential for my home and Westlake in general.

Thanks,
Nick Zuvela

Subject: Airport South Industrial Project
Date: Saturday, March 26, 2022 12:04:01 PM

Dear Mr. Johnson, I am providing my comments regarding the Airport South Industrial Project.

I have lived in Natomas since the year 2000 initially near Arena Blvd but within the Westlake Community since 2006. As you are well aware, Natomas is undergoing significant development previously hampered by the building moratorium pending levee system upgrades which have almost been completed.

Foremost on most residents minds presently is the incredible growth without any concomitant infrastructure development. Over the last few years we have witnessed significant increases in high density apartment housing, hotel development and large commercial projects such as the Centene facility along I-5. In more recent months we have learned of plans to bring a large teaching hospital to the prior Arco Arena site and a Natomas Costco facility despite having two relatively close Costco sites in Woodland and Sacramento. Although many of these projects have not yet shown their full impact on the area due to the Pandemic (working from home) and projects pending completion, we have seen a dramatic worsening of traffic congestion, failing roads with poor maintenance and decline in our quality of life.

As an avid cyclist, I have been cycling along the back roads and Garden Highway for many years now and have watched as the Metro Airpark has filled in with warehouses and semi trucks worsening traffic and making roads more dangerous for cyclists.

I was dismayed with the proposed annexation of land for the Airport South Industrial project and what that would mean for our community. We do not need additional hotel growth, more wearhouses and/or a truck stop backing right up to our community (one is already present 2-3 miles away) and within earshot of the recently completed Paso Verde elementary school. This project will ruin the value of the homes in Westlake (especially along the western edge of the community), add to air and noise pollution to the area and be an eyesore. Presently, Bayou road which runs along the north side of our community has the occasional semi truck but I can only image how much more traffic will surround our community on surface streets and the freeway if this project progresses. This project will further endanger the cyclists who have long enjoyed this area and the numerous migratory birds that utilize this space as well.

Currently, Metro Airpark continues to have significant open space and multiple warehouses that are not even being utilized and any further expansion should be directed to this area or the areas further west of the Westlake community. Warehouses abutting residential communities will result in decay within the community as people seek alternate living options.

I strongly oppose the proposed annexation and, as a resident, taxpayer and small

business owner, my views and the views of the community should matter. Development at the expense of our quality of life is not acceptable. When combined with the impact of recurrent wildfire and air quality issues in this area, I could easily see myself moving should this project proceed.

Thank you for taking the time to consider these points.

All,

I also wanted to express my concerns regarding the Airport South Industrial Project.

I too am a long-standing member of the Natomas community. The quality of life in our residential area of Natomas is significantly threatened by the proposed development. There are plenty of warehouses North of I-5, hotels in North Natomas, and a truck stop 2-5 minutes from this site. Placing a major industrial development near families, an elementary school and an area that is one of the few remaining wildlife corridors would severely impact our quality of life and the neighborhood/area at large. Furthermore, building an industrial site will undoubtedly impact housing values as these type of commercial properties tend to degrade the neighborhood/community feel of a neighborhood. We also have health concerns regarding what additional truck traffic so close to a neighborhood and a school. As someone who commutes outside of Natomas to two hospitals in this area, with all of the ongoing construction and the additional proposed project, my already considerable commute is only going to get longer further hampering quality of life.

In sum, these proposed changes threaten to degrade the Westlake community and cause us to rethink whether this area is the right place for us to raise our family. A community is about the well-being of children and families first and this expansion does not achieve this goal. If additional warehouse space or hotels are needed, there are other areas that are nonresidential in close proximity that would serve the purpose without impacting the established Westlake Community.

I appreciate your time and consideration.

Sincerely,

Archana Maniar MD

Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	357.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

ASIP - No Future Development Included - Sacramento Metropolitan AQMD Air District, Summer

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

ASIP - No Future Development Included - Sacramento Metropolitan AQMD Air District, Winter

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Industrial Park	6,609.30	1000sqft	318.60	6,609,300.00	0
Parking Lot	3,670.00	Space	33.03	1,468,000.00	0
Fast Food Restaurant with Drive Thru	16.70	1000sqft	6.40	16,700.00	0
Hotel	122.00	Room	4.00	73,400.00	0
Convenience Market with Gas Pumps	20.00	Pump	3.00	8,100.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2033
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	357.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

Airport South Industrial Project - Full Buildout of Annexation Area - Sacramento Metropolitan AQMD Air District, Annual

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

Airport South Industrial Project - Full Buildout of Annexation Area - Sacramento Metropolitan AQMD Air District, Summer

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

Construction Off-road Equipment Mitigation - Required by implementation of MM 4.3-1 of EIR.

ASIP - No Future Development Included_Tier 4 Mitigation - Sacramento Metropolitan AQMD Air District, Annual

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

Construction Off-road Equipment Mitigation - Required by implementation of MM 4.3-1 of EIR.

ASIP - No Future Development Included_Tier 4 Mitigation - Sacramento Metropolitan AQMD Air District, Summer

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

Construction Off-road Equipment Mitigation - Required by implementation of MM 4.3-1 of EIR.

ASIP - No Future Development Included_Tier 4 Mitigation - Sacramento Metropolitan AQMD Air District, Winter

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Industrial Park	6,609.30	1000sqft	318.60	6,609,300.00	0
Parking Lot	3,670.00	Space	33.03	1,468,000.00	0
Fast Food Restaurant with Drive Thru	16.70	1000sqft	6.40	16,700.00	0
Hotel	122.00	Room	4.00	73,400.00	0
Convenience Market with Gas Pumps	20.00	Pump	3.00	8,100.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2033
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	357.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

Construction Off-road Equipment Mitigation - Required with implementation of MM 4.3-1 of EIR.

Airport South Industrial Project - Full Buildout of Annexation Area_Tier 4 Mitigation - Sacramento Metropolitan AQMD Air District, Annual

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2033
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	357.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

Construction Off-road Equipment Mitigation - Required with implementation of MM 4.3-1 of EIR.

Airport South Industrial Project - Full Buildout of Annexation Area_Tier 4 Mitigation - Sacramento Metropolitan AQMD Air District, Summer

Airport South Industrial Project - Full Buildout of Annexation Area_Tier 4 Mitigation

Sacramento Metropolitan AQMD Air District, Winter

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Industrial Park	6,609.30	1000sqft	318.60	6,609,300.00	0
Parking Lot	3,670.00	Space	33.03	1,468,000.00	0
Fast Food Restaurant with Drive Thru	16.70	1000sqft	6.40	16,700.00	0
Hotel	122.00	Room	4.00	73,400.00	0
Convenience Market with Gas Pumps	20.00	Pump	3.00	8,100.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2033
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	357.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Water Mitigation - Compliant with MWELO.

Operational Off-Road Equipment - Based on applicant provided AQ questionnaire.

Construction Off-road Equipment Mitigation - Required with implementation of MM 4.3-1 of EIR.

Airport South Industrial Project - Full Buildout of Annexation Area_Tier 4 Mitigation - Sacramento Metropolitan AQMD Air District, Winter

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Road Construction Emissions Model
Data Entry Worksheet

Version 9.0.0

Note: Required data input sections have a yellow background.
Optional data input sections have a blue background. Only areas with a yellow or blue background can be modified. Program defaults have a white background.
The user is required to enter information in cells D10 through D24, E28 through G35, and D38 through D41 for all project types.
Please use "Clear Data Input & User Overrides" button first before changing the Project Type or begin a new project.

To begin a new project, click this button to clear data previously entered. This button will only work if you opted not to disable macros when loading this spreadsheet.

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

Input Type

Project Name	ASIP - Off-Site Pipeline	
Construction Start Year	2023	Enter a Year between 2014 and 2040 (inclusive)
Project Type For 4: Other Linear Project Type, please provide project specific off-road equipment population and vehicle trip data	4	1) New Road Construction : Project to build a roadway from bare ground, which generally requires more site preparation than widening an existing roadway 2) Road Widening : Project to add a new lane to an existing roadway 3) Bridge/Overpass Construction : Project to build an elevated roadway, which generally requires some different equipment than a new roadway, such as a crane 4) Other Linear Project Type: Non-roadway project such as a pipeline, transmission line, or levee construction
Project Construction Time	1.00	month
Working Days per Month	22.00	days (assume 22 if unknown)
Predominant Soil/Site Type: Enter 1, 2, or 3 (for project within "Sacramento County", follow soil type selection instructions in cells E18 to E20 otherwise see instructions provided in cells J18 to J22)	1	1) Sand Gravel : Use for quaternary deposits (Delta/West County) 2) Weathered Rock-Earth : Use for Laguna formation (Jackson Highway area) or the Ione formation (Scott Road, Rancho Murieta) 3) Blasted Rock : Use for Salt Springs Slate or Copper Hill Volcanics (Folsom South of Highway 50, Rancho Murieta)
Project Length	2.32	miles
Total Project Area	1.69	acres
Maximum Area Disturbed/Day	1.69	acres
Water Trucks Used?	2	1. Yes 2. No

Please note that the soil type instructions provided in cells E18 to E20 are specific to Sacramento County. Maps available from the California Geologic Survey (see weblink below) can be used to determine soil type outside Sacramento County.

http://www.conservation.ca.gov/cgs/information/geologic_mapping/Pages/googlemaps.aspx#regionalseries

Material Hauling Quantity Input

Material Type	Phase	Haul Truck Capacity (yd^3) (assume 20 if unknown)	Import Volume (yd^3/day)	Export Volume (yd^3/day)
Soil	Grubbing/Land Clearing	20.00	0.00	0.00
	Grading/Excavation	20.00	0.00	0.00
	Drainage/Utilities/Sub-Grade	20.00	0.00	330.07

	Drainage/Utilities/Sub-Grade	20.00	0.00	0.00
	Paving	20.00	0.00	0.00

Mitigation Options

On-road Fleet Emissions Mitigation	2010 and Newer On-road Vehicles Fleet	Select "2010 and Newer On-road Vehicles Fleet" option when the on-road heavy-duty truck fleet for the project will be limited to vehicles of model year 2010 or newer
Off-road Equipment Emissions Mitigation	No Mitigation	Select "20% NOx and 45% Exhaust PM reduction" option if the project will be required to use a lower emitting off-road construction fleet. The SMAQMD Construction Mitigation Calculator can be used to confirm compliance with this mitigation measure (http://www.airquality.org/Businesses/CEQA-Land-Use-Planning/Mitigation). Select "Tier 4 Equipment" option if some or all off-road equipment used for the project meets CARB Tier 4 Standard

The remaining sections of this sheet contain areas that require modification when 'Other Project Type' is selected.

Note: The program's estimates of construction period phase length can be overridden in cells D50 through D53, and F50 through F53.

Notes:

Project Start Year ->	2023
Project Length (months) ->	1
Total Project Area (acres) ->	2
Maximum Area Disturbed/Day (acres) ->	2
Water Truck Used? ->	No

	Total Material Imported/Exported Volume (yd^3/day)		Daily VMT (miles/day)			
Phase	Soil	Asphalt	Soil Hauling	Asphalt Hauling	Worker Commute	Water Truck
Grubbing/Land Clearing	0	0	0	0	0	0
Grading/Excavation	0	0	0	0	0	0
Drainage/Utilities/Sub-Grade	330	0	255	0	0	0
Paving	0	0	0	0	0	0

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

Total Emission Estimates by Phase for -> ASIP - Off-Site Pipeline

Project Phases (Tons for all except CO2e. Metric tonnes for CO2e)	ROG (tons/phase)	CO (tons/phase)	NOx (tons/phase)	Total PM10 (tons/phase)	Exhaust PM10 (tons/phase)	Fugitive Dust PM10 (tons/phase)	Total PM2.5 (tons/phase)	Exhaust PM2.5 (tons/phase)	Fugitive Dust PM2.5 (tons/phase)	SOx (tons/phase)	CO2 (tons/phase)	CH4 (tons/phase)	N2O (tons/phase)	CO2e (MT/phase)

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

The CO2e emissions are reported as metric tons per phase.

Road Construction Emissions Model
Data Entry Worksheet

Version 9.0.0

Note: Required data input sections have a yellow background.
Optional data input sections have a blue background. Only areas with a yellow or blue background can be modified. Program defaults have a white background.
The user is required to enter information in cells D10 through D24, E28 through G35, and D38 through D41 for all project types.
Please use "Clear Data Input & User Overrides" button first before changing the Project Type or begin a new project.

To begin a new project, click this button to clear data previously entered. This button will only work if you opted not to disable macros when loading this spreadsheet.

SACRAMENTO METROPOLITAN AIR QUALITY MANAGEMENT DISTRICT

Input Type

Project Name	ASIP - Off-Site Pipeline (Mitigated)	
Construction Start Year	2023	Enter a Year between 2014 and 2040 (inclusive)
Project Type For 4: Other Linear Project Type, please provide project specific off-road equipment population and vehicle trip data	4	1) New Road Construction : Project to build a roadway from bare ground, which generally requires more site preparation than widening an existing roadway 2) Road Widening : Project to add a new lane to an existing roadway 3) Bridge/Overpass Construction : Project to build an elevated roadway, which generally requires some different equipment than a new roadway, such as a crane 4) Other Linear Project Type: Non-roadway project such as a pipeline, transmission line, or levee construction
Project Construction Time	1.00	month
Working Days per Month	22.00	days (assume 22 if unknown)
Predominant Soil/Site Type: Enter 1, 2, or 3 (for project within "Sacramento County", follow soil type selection instructions in cells E18 to E20 otherwise see instructions provided in cells J18 to J22)	1	1) Sand Gravel : Use for quaternary deposits (Delta/West County) 2) Weathered Rock-Earth : Use for Laguna formation (Jackson Highway area) or the Ione formation (Scott Road, Rancho Murieta) 3) Blasted Rock : Use for Salt Springs Slate or Copper Hill Volcanics (Folsom South of Highway 50, Rancho Murieta)
Project Length	2.32	miles
Total Project Area	1.69	acres
Maximum Area Disturbed/Day	1.69	acres
Water Trucks Used?	2	1. Yes 2. No

Please note that the soil type instructions provided in cells E18 to E20 are specific to Sacramento County. Maps available from the California Geologic Survey (see weblink below) can be used to determine soil type outside Sacramento County.

http://www.conservation.ca.gov/cgs/information/geologic_mapping/Pages/googlemaps.aspx#regionalseries

Material Hauling Quantity Input

Material Type	Phase	Haul Truck Capacity (yd^3) (assume 20 if unknown)	Import Volume (yd^3/day)	Export Volume (yd^3/day)
Soil	Grubbing/Land Clearing	20.00	0.00	0.00
	Grading/Excavation	20.00	0.00	0.00
	Drainage/Utilities/Sub-Grade	20.00	0.00	330.07
	Paving	20.00	0.00	0.00
Asphalt	Grubbing/Land Clearing	20.00	0.00	0.00

	Drainage/Utilities/Sub-Grade	20.00	0.00	0.00
	Paving	20.00	0.00	0.00

Mitigation Options

On-road Fleet Emissions Mitigation	2010 and Newer On-road Vehicles Fleet	Select "2010 and Newer On-road Vehicles Fleet" option when the on-road heavy-duty truck fleet for the project will be limited to vehicles of model year 2010 or newer
Off-road Equipment Emissions Mitigation	Tier 4 Equipment	Select "20% NOx and 45% Exhaust PM reduction" option if the project will be required to use a lower emitting off-road construction fleet. The SMAQMD Construction Mitigation Calculator can be used to confirm compliance with this mitigation measure (http://www.airquality.org/Businesses/CEQA-Land-Use-Planning/Mitigation).
Will all off-road equipment be tier 4?	All Tier 4 Equipment	Select "Tier 4 Equipment" option if some or all off-road equipment used for the project meets CARB Tier 4 Standard

The remaining sections of this sheet contain areas that require modification when 'Other Project Type' is selected.

Note: The program's estimates of construction period phase length can be overridden in cells D50 through D53, and F50 through F53.

Construction Periods	User Override of Construction Months	Program Calculated Months	User Override of Phase Starting Date	Program Default Phase Starting Date
Grubbing/Land Clearing	0.00	0.10		1/1/2023
Grading/Excavation	0.00	0.40		1/1/2023
Drainage/Utilities/Sub-Grade	1.00	0.35		1/1/2023
Paving	0.00	0.15		2/1/2023
Totals (Months)	1			

Note: Soil Hauling emission default values can be overridden in cells D61 through D64, and F61 through F64.

Notes:

Project Start Year ->	2023
Project Length (months) ->	1
Total Project Area (acres) ->	2
Maximum Area Disturbed/Day (acres) ->	2
Water Truck Used? ->	No

	Total Material Imported/Exported Volume (yd^3/day)		Daily VMT (miles/day)			
Phase	Soil	Asphalt	Soil Hauling	Asphalt Hauling	Worker Commute	Water Truck
Grubbing/Land Clearing	0	0	0	0	0	0
Grading/Excavation	0	0	0	0	0	0
Drainage/Utilities/Sub-Grade	330	0	255	0	0	0
Paving	0	0	0	0	0	0

PM10 and PM2.5 estimates assume 50% control of fugitive dust from watering and associated dust control measures if a minimum number of water trucks are specified.

Total PM10 emissions shown in column F are the sum of exhaust and fugitive dust emissions shown in columns G and H. Total PM2.5 emissions shown in Column I are the sum of exhaust and fugitive dust emissions shown in columns J and K.

CO2e emissions are estimated by multiplying mass emissions for each GHG by its global warming potential (GWP), 1 , 25 and 298 for CO2, CH4 and N2O, respectively. Total CO2e is then estimated by summing CO2e estimates over all GHGs.

Total Emission Estimates by Phase for -> ASIP - Off-Site Pipeline (Mitigated)

Project Phases (Tons for all except CO2e. Metric tonnes for CO2e)	ROG (tons/phase)	CO (tons/phase)	NOx (tons/phase)	Total PM10 (tons/phase)	Exhaust PM10 (tons/phase)	Fugitive Dust PM10 (tons/phase)	Total PM2.5 (tons/phase)	Exhaust PM2.5 (tons/phase)	Fugitive Dust PM2.5 (tons/phase)	SOx (tons/phase)	CO2 (tons/phase)	CH4 (tons/phase)	N2O (tons/phase)	CO2e (MT/phase)

Mortality, Non-Accidental	0 - 99	0.32	0.26	0.00084%	30386

1. Affected age ranges are shown. Other age ranges are available, but the endpoints and age ranges shown here are the ones used by the USEPA in their health assessments. The age ranges are consistent with the epidemiological study that is the basis of the health function.
2. Health effects are shown in terms of incidences of each health endpoint and how it compares to the base (2035 base year health effect incidences, or "background health incidence") values. Health effects are shown for the Reduced Sacramento 4-km Modeling Domain and the 5-Air-District Region.
3. The percent of background health incidence uses the mean incidence. The background health incidence is an estimate of the average number of people that are affected by the health endpoint in a given population over a given period of time. In this case, the background incidence rates cover the 5-Air-District Region (estimated 2035 population of 3,271,451 persons). Health incidence rates and other health data are typically collected by the government as well as the World Health Organization. The background incidence rates used here are obtained from BenMAP.

4. The total number of health incidences across the 5-Air-District Region is calculated based on the modeling data. The information is presented to assist in providing overall health context.

5. The technical specifications and map for the Reduced Sacramento 4-km Modeling Domain are included in Appendix A, Table A-1 and Appendix B, Figure B-2 of the *Guidance to Address the Friant Ranch Ruling for CEQA Projects in the Sac Metro Air District.*

APPENDIX D

Operational Air Quality Mitigation Plan (AQMP)/Greenhouse Gas Reduction Plan (GHGRP) Form

Instructions: Please complete this form and submit it to ProjectReview@airquality.org for review. Include modeling files and other files as indicated.

The sections expand as you type so you will not run out of space.

Basic Information	
Project name (Include any previous names.)	Airport South Industrial Park
Land use types and sizes	6,609 ksf industrial park, 16.7 ksf fast food with drive through, 122 room hotel, 20 pump, convenience market with gas pumps, 3,670 parking spaces.
Targeted buildout year	2033 full buildout
Type of plan	✓ Air Quality Mitigation Plan (AQMP/AQ-15/AQ-35) ☐ Greenhouse Gas Reduction Plan (GHGRP) ☐ Combination Air Quality Mitigation Plan and Greenhouse Gas Reduction Plan (AQMP/GHGRP) ☐ Other type of plan: Enter information here.
Plan name	Airport South Industrial Park 35% Air Quality Mitigation Plan

Applicant	
Business name	NorthPoint Development
Contact name	Andrew Burrer
Phone (office)	419-320-5956
Phone (other)	N/A
Email	aburrer@northpointkc.com

Consultant	
Business name	Raney Planning & Management
Consultant name	Rod Stinson
Phone (office)	(916) 372-6100
Phone (other)	N/A
Email	rods@raneymanagement.com

Land Use Jurisdiction	
Jurisdiction (city/county/other)	City of Sacramento, Sacramento LAFCo
Planner name	Scott Johnson, Senior Planner
Phone (office)	916-808-5842
Phone (other)	N/A
Email	srjohnson@cityofsacramento.org

Existing Land Use Designations	
List all existing or planned specific plans, master plans, community plans, design guidelines, AQMP/GHGRPs, special zoning or other related land use requirements that the project is currently subject to. Append or provide links to the documents.	Sacramento County LAFCo approval of a Sphere of Influence Amendment (SOIA) (including a related Municipal Services Review) and Reorganization (annexation and related detachments); and City of Sacramento approval of a Prezone, General Plan Amendment (GPA), Tentative Master Parcel Map, Development Agreement (DA) and Planned Unit Development (PUD).
Status of public facilities financing plan/urban services plan, if applicable. Append or provide links to the documents.	In process.
Is this project requesting a change to the Urban Services Boundary or the Urban Planning Area?	Yes, a change to both the USB and UPA.
Is the project as proposed assumed in the currently adopted MTP/SCS (year 2020)?	The project is not assumed in the MTP/SCS.

Environmental Review Timeline	
Date of most recent NOP	March 4, 2022
Level of review requested (preliminary/admin stage, DEIR stage, revision review, etc.)	Preliminary/admin stage.
Is this a recirculation or does this supersede a previous version?	First version.
Status of environmental review (for example, Admin, DEIR, FEIR)	DEIR is being prepared currently.

Air Quality Mitigation Plan			
Reduction Goal(s)	Threshold(s) of Significance	Source of Thresholds	Notes
35% reduction in ozone precursors. All feasible PM10 reductions.	65 lbs/day ROG, 65 lbs/day NOx, 80 lbs/day PM10	SMAQMD	Using CalEEMod 2020.4.0 and AQMP guidance version 4.3

Traffic Analysis Fill out this section if a traffic analysis was used to determine trip information.	
Name	Sacramento Airport South Industrial Development Local Transportation Analysis - Draft Report; Airport South Industrial VMT Analysis
Date	February 5, 2024; March 10, 2023
List any other projects that share this traffic analysis.	None

Concerns & Considerations for Individual Emissions Reduction Measures

Global and Categorical Maximums (aka caps): Be sure to remain under the caps described in the CAPCOA Guidance. See CAPCOA's Understanding and Using Fact Sheets.

Project Setting: CalEEMod project setting must match CAPCOA's project setting in which caps are determined.

Enforcement Mechanisms: Include a description of the enforcement mechanisms necessary to fund and carry out activities such as TMA membership, transportation passes, etc.

Mobile Emissions	
Were the mobile emissions calculated in CalEEMod or off-model? If CalEEMod was used, what version?	CalEEMod 2020.4.0 was used for baseline and proposed project analyses.
List the EMFAC version, if not using CalEEMod.	N/A
Include any additional relevant information.	Baseline uses CalEEMod default mobile trip info. Proposed project uses mobile trips modified based on the project traffic impact analysis.
Energy Emissions	
SMUD year	2033
California Building Standards Code (Title 24 energy compliance year)	2019 as noted in CalEEMod 2020.4.0.

Emissions Summary Table Complete for the applicable pollutants.				
Pollutant	*Unmitigated Business-As-Usual Baseline (tons/year)*	*Mitigated Project (tons/year)*	*Reduction target (tons/year, efficiency metrics, performance standards)*	Target met? (Yes/No)
NO_X	103.66 tons/year	38.03 tons/year	30.06 tons/year	Yes
ROG	42.53 tons/year	8.56 tons/year	3.56 tons/year	Yes
PM_{10}	23.03 tons/year	16.26 tons/year	All feasible	Yes
$PM_{2.5}$	N/A	N/A	N/A	N/A
GHG (CO_2e)	N/A	N/A	N/A	N/A

AQMP/GHGRP Reduction Measures

Measure Name: Traffic study (TS)

Type of measure
✓ Design feature/NOT assumed in baseline
☐ Condition of approval #: specify
☐ Mitigation measure #: specify

Quantification method
☐ CAPCOA Guidance
✓ Traffic study
☐ Off-model calculation
☐ Air District staff guidance
✓ Air District CEQA Guide
☐ Other specify

Provide a brief description of measure and how it is valid to your project:

SMAQMD's Recommended Guidance for Land Use Emission Reductions Version 4.3 (pg. 16) recognizes project specific information is preferred to using CalEEMod model defaults in analyzing a project's emissions. DKS prepared a Local Transportation Analysis (February 5, 2024) and a VMT Analysis (March 10, 2023) for the project, which are being utilized for trip generation rates and trip lengths for the emissions calculations in mitigated project and the AQMP. The traffic impact analyses included therein used a combination of data from SACOG's SACSIM 19 travel demand model (a modified version of the City of Sacramento's 2040 Draft General Plan model) and data from the ITE Trip Generation Manual 11th Edition (pg. 29).

Describe the enforcement mechanism for this measure.

The traffic study includes the conditions of the transportation system planned for the project and the surrounding properties, intersections, roadways and freeway access. The transportation improvements are intrinsically part of the design of the project.

You may provide more details in an attachment.

Measure Name: Natural gas infrastructure prohibited, except for restaurant uses

Type of measure
☐ Design feature/assumed in baseline
✓ Condition of approval #: Required to be included as a Condition of Approval.
✓ Mitigation measure #: Mitigation Measure 4.3-2 (1)

Quantification method
✓ CAPCOA Guidance
☐ Traffic study
☐ Off-model calculation
☐ Air District staff guidance
✓ Air District CEQA Guide
☐ Other specify

Provide a brief description of measure and how it is valid to your project:

All land uses in the project will be constructed without natural gas infrastructure except for the restaurant uses (currently estimated as 16,700 square feet, fast food restaurants), in compliance with SMAQMD GHG measure BMP-1.

Describe the enforcement mechanism for this measure.

The exclusion of natural gas infrastructure will be required as a Condition of Approval and will be included in improvement plans reviewed/approved by the City to ensure the natural gas infrastructure is only constructed to service the restaurant land uses in the project site. The City Community Development Department will review and confirm the requirement is met during plan review.

You may provide more details in an attachment.

Measure Name: Funding and membership in the TMA for TDM services

Type of measure
☐ Design feature/assumed in baseline
✓ Condition of approval #: Required to be included as a Condition of Approval.
✓ Mitigation measure #: Mitigation Measure 4.3-2 (2)

Quantification method
✓ CAPCOA Guidance
☐ Traffic study
☐ Off-model calculation
☐ Air District staff guidance
✓ Air District CEQA Guide
☐ Other specify

Provide a brief description of measure and how it is valid to your project:

All the project land uses are non-residential, providing future employment opportunities. Each business will be required to join the North Natomas Jibe Transportation Management Association (TMA) or the Metro Air Park Property Owners Association, MAP Transportation Systems Management Committee (MAP TSMC), either through annual dues or through an assessment on the property. The North Natomas Jibe TMA or MAP TSMC will provide transportation demand management (TDM) services to the employees of the businesses located in the Airport South Industrial Park after consultation with the applicant and the City on the most efficient and effective TDM options for the proposed businesses. The project applicant will coordinate with the City of Sacramento and the TMA or MAP TSMC to determine the appropriate funding mechanism.

Describe the enforcement mechanism for this measure.

Funding will be provided either through a property assessment that would be implemented through annexation into the Community Facilities District (CFD), or through a development agreement where fees are required to be paid to the TMA or MAP TSMC for services annually. The applicant and TMA or MAP TSMC shall meet and discuss TDM fees that will be required for TMA services needed prior to the project being annexed into the City. The applicant or its representative will coordinate with the TMA or MAP TSMC on a regular basis, at a minimum annually, to set TDM goals, evaluate if the services provided are effective, and determine if service modifications are needed. Proof of the established funding mechanism shall be provided to the City Community Development Department and the SMAQMD.

You may provide more details in an attachment.

Measure Name: Zero emission forklifts

Type of measure
☐ Design feature/assumed in baseline
✓ Condition of approval #: Required to be included as a Condition of Approval
✓ Mitigation measure #: Mitigation Measure 4.3-2, (3)

Quantification method
✓ CAPCOA Guidance
☐ Traffic study
☐ Off-model calculation
☐ Air District staff guidance
✓ Air District CEQA Guide
✓ Other Targeted mobile NOx emissions that could be reduced using available technology.

Provide a brief description of measure and how it is valid to your project:

To reduce NOx emissions associated with the expected operation of diesel-powered forklifts in the industrial/warehouse land uses, the applicant will require the tenants to utilize zero emission forklifts.

Describe the enforcement mechanism for this measure.

The requirement to use zero emission forklifts will be included as a Condition of Approval on the project and included in lease and purchase agreements for the parcels/businesses. Documentation of the requirements contained in the lease/purchase agreements shall be provided to the City of Sacramento Community Development Department and the SMAQMD. Additionally, recordkeeping of forklift fleet information to demonstrate compliance shall also be provided to the City and SMAQMD.

You may provide more details in an attachment.

Measure Name: Zero emission heavy-duty truck fleet

Type of measure
☐ Design feature/assumed in baseline
✓ Condition of approval #: Required to be included as a Condition of Approval
✓ Mitigation measure #: Mitigation Measure 4.3-2, (4)

Quantification method
✓ CAPCOA Guidance
☐ Traffic study
☐ Off-model calculation
☐ Air District staff guidance
✓ Air District CEQA Guide
✓ Other Targeted mobile NOx emissions that could be reduced using available technology.

Provide a brief description of measure and how it is valid to your project:

Diesel-powered heavy-duty truck fleets are expected to serve the 6.6 million square feet of industrial land uses proposed for the project. Emissions from the estimated truck fleet dominate the NOx emissions from the proposed project. With the California Air Resources Board's Advanced Clean Fleet Regulation requiring the use of zero emission vehicles (trucks and buses) and the State's 2045 carbon neutrality goal, vehicle fleet technologies are evolving to meet the regulation and carbon neutrality goal. The project applicant will commit to requiring 4.5 percent of all heavy duty vehicles trips from the project to utilize zero emission heavy duty trucks by full buildout of the Annexation area.

Describe the enforcement mechanism for this measure.

The requirement to use zero emission trucks will be included as a Condition of Approval on the project and included in lease and purchase agreements for the parcels/businesses. Documentation of the requirements contained in the lease/purchase agreements shall be provided to the City of Sacramento Community Development Department and the SMAQMD. Additionally, recordkeeping of the heavy duty truck fleet information to demonstrate compliance shall also be provided to the City and SMAQMD. In the event that there is a disruption in the manufacturing of zero emission vehicles/trucks or that sufficient vehicles/trucks are not commercially available for the intended application, the "clean fleet requirements" may be adjusted as minimally as possible by the CDD to accommodate the manufacturing disruption or unavailability of commercially available vehicles/trucks

You may provide more details in an attachment.

Measure Name: Improve pedestrian network (SDT-1 in CalEEMod)

Type of measure
☐ Design feature/assumed in baseline
✓ Condition of approval #: Required to be included as a Condition of Approval
✓ Mitigation measure #: Mitigation Measure 4.3-2 (5)

Quantification method
✓ CAPCOA Guidance
☐ Traffic study
☐ Off-model calculation
☐ Air District staff guidance
✓ Air District CEQA Guide
☐ Other specify

Provide a brief description of measure and how it is valid to your project:

The project shall provide complete sidewalks separated from roadway throughout the project site and pedestrian crossing at intersections onsite to ensure employees and visitors can walk between land uses/businesses. The project shall also connect the pedestrian network on-site to the adjacent properties off-site (including South Bayou Way, Power Line Road and potential future connections) as indicated on the preliminary site plan.

Describe the enforcement mechanism for this measure.

Pedestrian infrastructure shall be clearly shown on project site improvement plans that will be reviewed and approved by the City of Sacramento Community Development Department.

You may provide more details in an attachment.

Measure Name: Provide EV Ready parking spaces at the ratio with which the current CalGreen Tier 2 standards require EV Capable spaces

Type of measure
☐ Design feature/assumed in baseline
✓ Condition of approval #: Required to be included as a Condition of Approval
✓ Mitigation measure #: Mitigation Measure 4.3-2 (6)

Quantification method
☐ CAPCOA Guidance
☐ Traffic study
✓ Off-model calculation
☐ Air District staff guidance
☐ Air District CEQA Guide
☐ Other specify

Provide a brief description of measure and how it is valid to your project:

The proposed project shall provide EV Ready parking spaces at the ratio with which the current CalGreen Tier 2 standards require EV Capable spaces. Given that the proposed project is anticipated to include a total of approximately 3,670 parking stalls, the project would be required to provide 1,652 EV Ready spaces, and 545 of the EV Ready spaces would be required to have EVSE, which are installed charging receptacles or permanently installed chargers.

Describe the enforcement mechanism for this measure.

EV Ready infrastructure shall be clearly shown on project site improvement plans that will be reviewed and approved by the City of Sacramento Community Development Department.

You may provide more details in an attachment.

☒I have appended all relevant air quality and greenhouse gas calculations including modeling files (for example, CalEEMod files), hand calculations, etc. for review.

1.0 Project Characteristics

1.1 Land Usage

Land Uses	Size	Metric	Lot Acreage	Floor Surface Area	Population
Industrial Park	6,609.30	1000sqft	318.60	6,609,300.00	0
Parking Lot	3,670.00	Space	33.03	1,468,000.00	0
Fast Food Restaurant with Drive Thru	16.70	1000sqft	6.40	16,700.00	0
Hotel	122.00	Room	4.00	73,400.00	0
Convenience Market with Gas Pumps	20.00	Pump	3.00	8,100.00	0

1.2 Other Project Characteristics

Urbanization	Urban	**Wind Speed (m/s)**	3.5	**Precipitation Freq (Days)**	58
Climate Zone	6			**Operational Year**	2033
Utility Company	Sacramento Municipal Utility District				
CO2 Intensity (lb/MWhr)	357.98	**CH4 Intensity (lb/MWhr)**	0.033	**N2O Intensity (lb/MWhr)**	0.004

1.3 User Entered Comments & Non-Default Data

Project Characteristics -

Land Use - Square footage and lot acreages adjusted per site plan.

Construction Phase - Phase timing adjusted per applicant-provided questionnaire.

Grading - Based on applicant provided AQ questionnaire.

Vehicle Trips - Based on project-specific information provided by DKS.

Energy Use - No natural gas usage except restaurants. 11% reduction in Title 24 natural gas usage (moving from 2019 Title 24 assumed in CalEEMod 2020 version to current regulation, Title 24 2022). 59.07 kbu/size/yr Title 24 natural gas adjusted to 52.57 kbtu/size/yr.

Operational Off-Road Equipment - all electric forklifts will be used.

Airport South Industrial Project - Full Buildout of Annexation Area Mitigated - Sacramento Metropolitan AQMD Air District, Annual

EMFAC Off-Model Adjustment Factors for Gasoline Light Duty Vehicle to Account for the SAFE Vehicle Rule Applied

Mobile Land Use Mitigation -

Mobile Commute Mitigation - TMA membership

T-14. Provide Electric Vehicle Charging Infrastructure

GHG Mitigation Potential

Up to 11.9% of GHG emissions from vehicles accessing the commercial or multifamily housing building

Co-Benefits (icon key on pg. 34)

Climate Resilience

Providing electric vehicle charging infrastructure increases fuel redundancy for electric vehicles even if an extreme weather event disrupts other fuel sources. Electric vehicles could also provide benefits to buildings and the grid, such as emergency backup, energy reserves, and demand response.

Health and Equity Considerations

Differential costs of PHEVs compared to conventional vehicles are decreasing over time, but at present are more expensive, which means this measure could disproportionately benefit those of greater economic means. As costs come into parity over time, this will be less of an issue. Employer, electricity provider, and state incentives for PHEV purchase could help address near-term disparities.

Measure Description

Install onsite electric vehicle chargers in an amount beyond what is required by the 2019 California Green Building Standards (CALGreen) at buildings with designated parking areas (e.g., commercial, educational, retail, multifamily). This will enable drivers of PHEVs to drive a larger share of miles in electric mode (eVMT), as opposed to gasoline-powered mode, thereby displacing GHG emissions from gasoline consumption with a lesser amount of indirect emissions from electricity. Most PHEVs owners charge their vehicles at home overnight. When making trips during the day, the vehicle will switch to gasoline mode if/when it reaches its maximum all-electric range.

Subsector

Parking or Road Pricing/Management

Locational Context

Urban, suburban, rural

Scale of Application

Project/Site

Implementation Requirements

Parking at the chargers must be limited to electric vehicles.

Cost Considerations

The primary costs associated with electric vehicle charging infrastructure include the capital costs of purchasing and installing charging stations, electricity costs from use of stations, and maintenance costs of keeping the charging stations in working order. Costs initially fall to the station owners, either municipalities or private owners, but can be passed along to station users with usage fees. Depending on station placement and charging times required for PHEVs, businesses near charging stations can derive benefits from patronage of station users.

Expanded Mitigation Options

In addition to increasing the percentage of electric miles for PHEVs, the increased availability of chargers from implementation of this measure could mitigate consumer "range anxiety" concerns and increase the adoption and use of battery electric vehicles (BEVs), but this potential effect is not included in the calculations as a conservative assumption. Expanded mitigation could include quantification of the effect of this measure on BEV use.

GHG Reduction Formula

$$A = \frac{B \times D \times (F - E) \times (G - (H \times I \times K \times L))}{-C \times J}$$

GHG Calculation Variables

ID	Variable	Value	Unit	Source
Output				
A	Percent reduction in GHG emissions from vehicles accessing the office building or housing	0–11.9	%	calculated
User Inputs				
B	Number of chargers installed at site	[ ]	integer	user input
C	Total vehicles accessing the site per day	[ ]	integer	user input
Constants, Assumptions, and Available Defaults				
D	Average number of PHEVs served per day per charger installed	2	integer	CARB 2019
E	Percent of PHEV miles in electric mode without measure	46	%	CARB 2020a
F	Percent of PHEV miles in electric mode with measure	80	%	CARB 2017
G	Average emission factor of PHEV in gasoline mode	205.1	g CO_2e per mile	CARB 2020a; U.S. DOE 2021
H	Energy efficiency of PHEV in electric mode	0.327	kilowatt hours (kWh) per mile	CARB 2020b; U.S. DOE 2021
I	Carbon intensity of local electricity provider	Tables E-4.3 and E-4.4	lb CO_2e per megawatt hour (MWh)	CA Utilities 2021
J	Average emission factor of non-electric vehicles accessing the site	307.5	g CO_2e per mile	CARB 2020a
K	conversion from lb to g	454	g per lb	conversion
L	Conversion from kWh to MWh	0.001	MWh per kWh	conversion

Further explanation of key variables:

- (D) – The average number of PHEVs served per day per charger installed is 2 vehicles (CARB 2019). If the user can provide a project-specific value, they should replace the default in the GHG reduction formula.
- (E) - Based on the EMFAC2017 model (v1.0.3), 46 percent of miles traveled by PHEVs in California are eVMT, and 54 percent are in gasoline mode (CARB 2020a).

- (F) – A review of EV user surveys and analytics included in the CARB's *Advanced Clean Cars Mid-Term Report* suggest that PHEV owners can reach 80 percent eVMT with access to adequate supportive charging infrastructure (CARB 2017).
- (G) – As described for (J), the average GHG emission factor for gasoline vehicles is 307.5 grams of CO_2e per mile.
- The fuel efficiency of a PHEV in gasoline mode is calculated as 66.7 percent of the fuel consumption rate of a gasoline vehicle, based on the assumption that a gasoline hybrid vehicle has 50 percent higher fuel economy (miles per gal [mpg]) than a comparable gasoline vehicle, based on a comparison of the gasoline and hybrid Toyota Camry and Corolla models (U.S. DOE 2021). This percentage is applied to the average GHG emission factor for gasoline vehicles to determine the average emission factor for PHEVs in gasoline mode as (66.7%×307.5 g CO_2e per mile). If the user can provide a project-specific value by running EMFAC based on the future year of a project, they should replace the default in the GHG reduction formula.
- (H) – Scaled from a light-duty automobile gasoline equivalent fuel economy 30.3 mpg (CARB 2020a), an energy efficiency ratio (EER) of 2.5 (CARB 2020b), and an assumption of 33.7 kWh electricity per gallon of gasoline (U.S. DOE 2021).
- (I) – GHG intensity factors for major California electricity providers are provided in Tables E-4.3 and E-4.4 in Appendix C. If the project study area is not serviced by a listed electricity provider, or the user is able to provide a project-specific value (i.e., for the future year not referenced in Appendix C), the user should replace the default in the GHG calculation formula. If the electricity provider is not known, the user may elect to use the statewide grid average carbon intensity.
- (J) – The average GHG emission factor for non-electric vehicles accessing the site was calculated in terms of CO_2e per mile using EMFAC2017 (v1.0.3). The model was run for a 2020 statewide average of LDA, LDT1, and LDT2 vehicles using diesel and gasoline fuel. The running emission factors for CO_2, CH_4, and N_2O (CARB 2020a) were multiplied by the corresponding 100-year GWP values from the IPCC's Fourth Assessment Report (IPCC 2007). If the user can provide a project-specific value (i.e., for a future year and project location), the user should run EMFAC to replace the default in the GHG reduction formula.

GHG Calculation Caps or Maximums

Measure Maximum

(A_{max}) The percent reduction in GHG emissions (A) is capped at 11.9 percent, which is based on the following assumptions used to generate a maximum scenario:

- (B) – number of chargers installed = 20. CALGreen provides a non-residential voluntary Tier 2 measure that requires projects with 201 or more parking spaces to allocate 10 percent of total parking spaces for "EV Capable" parking spaces (or 20 parking spaces) (CBSC 2019). Note that EV Capable parking spaces do not actually have EV chargers installed, though they do have electrical panel capacity, a dedicated branch circuit, and a raceway to the EV parking spot to support future installation of charging stations. Therefore, using the number of EV Capable parking spaces as a proxy for EV chargers as a high-end estimate is conservative.

- (C) – total vehicles accessing the site = 200. Per the CALGreen voluntary measure, the number of total parking spaces that correspond with 20 "EV Capable" parking spaces is 201.
- (D) – PHEVs served per day per charger installed = 7. This value is the max (D_{max}). This assumes that all PHEV drivers would coordinate sharing of the limited number of chargers at the site. Value is based on data from the National Renewable Energy Laboratory (CARB 2019).
- (I) – carbon intensity of local electricity provider = 0 lb CO_2e per MWh. This assumes that the local electricity provider is powered 100 percent by renewables and thus has a carbon intensity of zero.

Subsector Maximum

($\sum A_{max_{T\text{-}14 \text{ through } T\text{-}16}} \leq 35\%$) This measure is in the Parking or Road Pricing/Management subsector. This subcategory includes Measures T-14 through T-16. The VMT reduction from the combined implementation of all measures within this subsector is capped at 35 percent.

Example GHG Reduction Quantification

The user will install electric vehicle chargers at their proposed office or multifamily housing development, which will enable employees or residents with PHEVs to drive a larger share of miles in electric mode, as opposed to gasoline-powered mode, thereby displacing GHG emissions from gasoline consumption with a lesser amount of indirect emissions from indirect electricity. In this example, 20 chargers (B) will be installed at a workplace with 200 daily employee vehicles accessing the site (C). The electricity provider for the project area is the Sacramento Municipal Utility District (SMUD) and the analysis year is 2022. The carbon intensity of electricity is therefore 344 lb CO_2e per MWh (I). The GHG impact is calculated as a 3.4 percent reduction from the total emissions from vehicles accessing the site.

$$A = \frac{20 \times 2\frac{\text{PHEVs}}{\text{charger}\cdot\text{day}} \times (80\% - 46\%) \times (205.1\ \frac{\text{g } CO_2e}{\text{miles}} - (0.327\frac{\text{kWh}}{\text{mile}} \times 344\ \frac{\text{lb } CO_2e}{\text{MWh}} \times 454\frac{\text{g}}{\text{lb}} \times 0.001\frac{\text{MWh}}{\text{kWh}}))}{200 \text{ vehicles} \times 307.5\ \frac{\text{g } CO_2e}{\text{miles}}} = 3.4\%$$

Quantified Co-Benefits

While the measure will achieve fuel savings, it will also increase electricity consumption. This section defines the methods for quantifying Improved Local Air Quality and fuel savings, as well as increased electricity consumption.

Improved Local Air Quality

Local criteria pollutants will be reduced by the reduction in fossil fuel combustion. The percent reduction in criteria pollutants can be calculated using the GHG reduction formula. Electricity supplied by statewide fossil-fueled or bioenergy power plants will generate criteria pollutants. However, because these power plants are located throughout the state, electricity consumption from vehicles charging will not generate localized criteria pollutant emissions. Consequently, for the quantification

of criteria pollutant emission reductions, either the electricity portion of the equation can be removed, or the electricity intensity (I) can be set to zero.

Fuel Savings (Increased Electricity)

The percent reduction in vehicle fuel consumption would be the same as the percent reduction in criteria pollutant emissions. The percent increase in electricity use (M) from this measure can be calculated as follows.

Electricity Use Increase Formula

$$M = \frac{B \times D \times (F - E) \times J \times N \times O}{-C \times P}$$

Electricity Use Increase Calculation Variables

ID	Variable	Value	Unit	Source
Output				
M	Increase in electricity from PHEVs	[ ]	%	calculated
User Inputs				
N	Existing electricity consumption of project/site	[ ]	kWh per year	user input
O	Days per year with vehicles accessing the site	260–365	days per year	user input
P	Average annual VMT of vehicles accessing the site	[ ]	miles per day per vehicle	user input
Constants, Assumptions, and Available Defaults				
	None			

Further explanation of key variables:

- (N) – The user should take care to properly quantify building electricity using accepted methodologies (such as CalEEMod).
- (O) – If the proposed development is a workplace in which employees access the site an average of 5 days per week, the user should input 260 workdays. If the development is multifamily dwelling, the user should input 365 days.
- Please refer to the GHG Calculation Variables table above for definitions of variables that have been previously defined.

1 Introduction

Bargas Environmental Consulting, LLC (Bargas) has prepared this Biological Resources Assessment (hereafter, **Assessment**) on behalf of Raney Planning & Management, Inc. The Airport South Industrial Park (**Project**) proposes to develop an industrial park on approximately 340 acres of agricultural land.

1.1 Project Location

The Project site is 340 acres in size and located in unincorporated Sacramento County, south of the Sacramento International Airport and west of the community of North Natomas and approximately 6.9 miles northwest of downtown Sacramento, California (**Exhibit 1**). The Project site is bounded by Powerline Road on the west, Interstate 5 on the north, a fire break along Lanfranco Circle on the east, and the West Drainage Canal on the south.

Lands within the Project site are mostly fallowed agricultural fields with some undeveloped land present within and adjacent to road and highway rights-of-way within the northern boundary. Existing Sacramento County General Plan Land Use designations include Agricultural Cropland within the Project site and to the south and west, with Low Density Residential to the east and undeveloped/vacant parcels within the Metro Air Park Special Planning Area to the north of the Project and Interstate 5.

1.2 Project Description

The proposed Project would include the development of an industrial park within an approximately 340-acre portion of the project site, located immediately south of Bayou Way. The industrial park would allow for construction of up to 6,610,000 square feet (sf) of industrial uses, as well as approximately 80,940 sf of retail/highway commercial uses, including approximately 60,600 sf of hotel/hospitality, on approximately 13.4 acres of the overall site. Parcels 6A through 6C and 7A through 7C are proposed retail/highway commercial uses generally situated south of the intersection of I-5 and Metro Air Parkway. Parcels 1 through 4, all planned for industrial use, generally surrounding the proposed retail/highway commercial uses; Parcel 5, the remaining proposed industrial use, would be located in the northeast corner of the site. The proposed Project would require approval of the following entitlements: Sacramento County LAFCo approval of a Sphere of Influence Amendment (including a related Municipal Services Review) and Reorganization (annexation and related detachments); and City of Sacramento approval of a Prezone, General Plan Amendment, Tentative Master Parcel Map, Development Agreement and Planned Unit Development.

1.3 Definitions

This report will use the following definitions for areas referred to herein:

- **Project site:** The Project site is defined as the 340 acres being analyzed for Project entitlements.
- **Annexation Area:** The Annexation Area is defined as the 475 acres proposed for annexation by the City of Sacramento and is inclusive of the Project Area.
- **Biological Study Area:** The Biological Study Area is defined as the Project site and a 250-foot buffer. This is the area within which biological resources were fully analyzed.

- **Regional Study Area:** The Regional Study Area is defined as the Project site and a 5-mile buffer. The Regional Study Area was used as the basis for determining special status biological resource records for consideration in this report.

A map depicting these areas is provided as **Exhibit 2.**

Exhibit 1. Project Site and Vicinity Map

Exhibit 2. Area Reference

2 Regulatory Setting

2.1 Federal

2.1.1 Federal Endangered Species Act

The Federal Endangered Species Act (FESA) is the federal government's regulations protecting rare and declining plant and wildlife species. FESA is jointly implemented by the United States Fish and Wildlife Service (USFWS) and the National Marine Fisheries Service (NMFS, marine resources only). FESA protects species using the following status designations:

- A federally **endangered** species is a species of invertebrate, plant, or wildlife formally listed by the USFWS under FESA as facing extinction throughout all or a significant portion of its geographic range.
- A federally **threatened** species is one formally listed by the USFWS as likely to become endangered within the foreseeable future throughout all or a significant portion of its range.
- A **proposed** threatened or endangered species is one officially proposed by the USFWS for addition to the federal threatened or endangered species lists.
- **Candidate** species are "plants and animals for which the USFWS has sufficient information on their biological status and threats to propose them as endangered or threatened under FESA, but for which development of a proposed listing regulation is precluded by other higher priority listing activities"(USFWS 2017).

"Take" of a federally endangered or threatened species or its habitat is prohibited by federal law without a special permit. The term "take," under FESA, means to harass, harm, pursue, hunt, shoot, wound, kill, trap, capture, or collect, or to attempt to engage in such conduct. "Harm" is defined by the USFWS to encompass "an act which actually kills or injures wildlife. Such an act may include significant habitat modification or degradation where it actually kills or injures wildlife by significantly impairing essential behavioral patterns, including breeding, feeding or sheltering" (50 CFR § 17.3).

Section 10(a)(1)(B) of the FESA allows for take of a threatened or endangered species incidental to development activities once a Habitat Conservation Plan (HCP) has been prepared to the satisfaction of the USFWS and a Section 10(a) incidental take permit has been issued to an applicant. For federal projects (including those involving federal funding), Section 7 of the FESA allows for consultation between the affected agency and the USFWS to determine what measures may be necessary to compensate for the incidental take of a listed species. A federal project is any project that is proposed by a federal agency or is at least partially funded or authorized by a federal agency. Additionally, if the listed species or its habitat occurs in a portion of the project subject to federal jurisdiction (such as Waters of the United States by the United States Army Corps of Engineers under Section 404 of the Clean Water Act), then consultation under Section 7 of the FESA is usually permissible and may be required.

FESA also requires the USFWS to consider whether there are areas of habitat essential to conservation for each listed species. **Critical habitat** designations protect these areas, including habitat that is currently unoccupied but may be essential to the recovery of a species. An area is designated as critical habitat after the USFWS publishes a proposed Federal regulation in the Federal Register and then receives and considers public comments on the proposal. The final boundaries of critical habitat are officially designated when published in the Federal Register.

2.1.2 Migratory Bird Treaty Act

The Migratory Bird Treaty Act of 1918 (MBTA) is a federal law governing the taking, killing, possession, transportation, and importation of various birds, their eggs, parts, and nests. The take of any number of a bird species listed as protected on any one of four treaty lists is governed by the MBTA's regulation of taking migratory birds for educational, scientific, and recreational purposes and requiring harvest to be limited to levels that prevent over utilization. The MBTA also prohibits taking, possession, import, export, transport, selling, purchase, barter, or offering for sale, purchase or barter, certain bird species, their eggs, parts, and nests, except as authorized under a valid permit (50 CFR 21.11).

2.1.3 Clean Water Act of the United States

The regulatory setting with regards to aquatic resources is framed by current enabling legislation and case law. Under Section 404 of the Clean Water Act (CWA), the US Army Corps of Engineers (USACE) regulates the discharge of dredged and fill materials into “waters of the U.S.” Jurisdictional waters of the U.S. include “territorial seas, and waters which are currently used, or were used in the past, or may be susceptible to use in interstate or foreign commerce, including waters which are subject to the ebb and flow of the tide; tributaries; lakes and ponds, and impoundments of jurisdictional waters; and adjacent wetlands” (33 Code of Federal Regulations [CFR] § 328.3). Certain waters of the U.S. are considered “special aquatic sites” because they are generally recognized as having ecological value; such sites include sanctuaries and refuges, wetlands, mudflats, vegetated shallows, and riffle and pool complexes (40 CFR § 230). Special aquatic sites are defined by the U.S. Environmental Protection Agency (USEPA) and may be afforded additional consideration in a project’s permit process. The USACE also regulates navigable waters under Section 10 of the Rivers and Harbors Act of 1899. Navigable waters are defined as “… those waters of the U.S. that… are presently used, or have been used in the past, or may be susceptible to use to transport interstate or foreign commerce” (33 CFR § 322.2). Projects that place fill in jurisdictional wetlands and non-wetland waters of the U.S. require a permit from the USACE under Section 404 of the CWA. The USACE issues nationwide permits for specific types of activities with minimal individual or cumulative adverse environmental impacts. Individual permits are required for large and/or complex projects or projects that exceed the impact threshold for nationwide permits. Recent federal rulemaking has modified how the USACE defines certain waters of the U.S. The most pertinent rules are summarized below.

The USEPA published a revised definition of "waters of the United States" on December 7, 2021 in response to President Biden’s Executive Order 13990 (86 Federal Register 7037) and after Pascua Yaqui Tribe v. EPA in which the U.S. District Court of the District of Arizona "vacated and remanded" the Navigable Waters Protection Rule (86 Federal Register 69372). The proposed revision has not been finalized at the time of this report, but since the district court vacated the Navigable Water Protection Rule on August 30, 2021, the agencies have halted implementing the Navigable Waters Protection Rule and have interpreted the definition that is consistent with pre-2015 regulations and the Supreme Court cases of Rapanos vs. United States and Carabell vs. United States (USEPA 2008), meaning the USACE will assert jurisdiction over traditional navigable waters (TNW) and the following types of features determined to have "significant nexus" to a TNW:

1. wetlands adjacent to TNWs
2. non-navigable tributaries of TNWs that are relatively permanent where the tributaries typically flow year-round or have continuous flow at least seasonally
3. wetlands that directly abut non-navigable tributaries of TNWs

2.2 State of California

2.2.1 California Environmental Quality Act

CEQA is a public disclosure process codified by California Public Resources Code 21000, requiring decision-makers to analyze the environmental impacts of a project, disclose those impacts to the public, and mitigate environmental impacts to the extent feasible. The state or local lead agency provides an evaluation of project effects on biological resources; determining the significance of those effects is guided by Appendix G of the CEQA guidelines. These evaluations must consider direct effects on a biological resource within the project site itself, indirect effects on adjacent resources, and cumulative effects within a larger area or region. Effects can be locally important but not significant according to CEQA if they would not substantially affect the regional population of the biological resource. Significant adverse impacts on biological resources would include the following:

- Substantial adverse effects on any species identified as candidate, sensitive, or special status in local or regional plans, policies, or regulations or by the CDFW or the USFWS (these effects could be either direct or via habitat modification);
- Substantial adverse impacts to species designated by the CDFW as Species of Special Concern (SSC);
- Substantial adverse effects on riparian habitat or other sensitive habitat identified in local or regional plans, policies, or regulations or by CDFW and USFWS;
- Substantial adverse effects on federally protected wetlands defined under Section 404 of the CWA (these effects include direct removal, filling, or hydrologic interruption of marshes, vernal pools, coastal wetlands, or other wetland types);
- Substantial interference with movements of native resident or migratory fish or wildlife species population, or with use of native wildlife nursery sites;
- Conflicts with local policies or ordinances protecting biological resources (e.g., tree preservation policies); and;
- Conflict with provisions of an adopted HCP, NCCP, or another approved local, regional, or state habitat conservation plan.

2.2.2 California Endangered Species Act

The California Endangered Species Act (CESA) prohibits the take of state-listed threatened and endangered species. Under CESA, state agencies are required to consult with CDFW when preparing CEQA documents. Under CESA, CDFW is responsible for maintaining a list of rare, threatened, and endangered species designated under state law (California Fish and Game Code § 2070-2079). CDFW also maintains lists of candidate species, SSC, and fully-protected species. Candidate species are those taxa that have been formally recognized by the CDFW and are under review for addition to the state threatened and endangered list. Species of special concern are those taxa that are considered sensitive, and this list serves as a "watch list." The CDFW can authorize "take" if an incidental take permit is issued by the Secretary of the Interior or Commerce in compliance with FESA, or if the director of the CDFW issues a permit under Section 2080 in those cases where it is demonstrated that the impacts are minimized and mitigated.

2.2.3 California Fish and Game Code

Section 1600 et seq. – Lake and Streambed Alteration Agreement. Section 1600 provides provisions for protecting riparian systems, including the bed, banks, and riparian habitat of lakes, seasonal and perennial streams, and rivers. This section requires an applicant to notify CDFW and obtain a Lake and Streambed Alteration Agreement (LSAA) if their project would divert or obstruct the natural flow of any river, stream, or lake; change the bed, channel, or bank of any river, stream, or lake; use material from any river, stream, or lake; or deposit or dispose of material into any river, stream, or lake.

Section 2050 et seq. – California Endangered Species Act. CESA establishes the policy of the state to conserve, protect, restore, and enhance threatened or endangered species and their habitats. CESA is administered by CDFW and prohibits the take of any species that the California Fish and Game Commission (CFGC) determines to be a threatened or endangered species. CESA also mandates that "state agencies should not approve projects as proposed which would jeopardize the continued existence of any endangered species or threatened species" if reasonable and prudent alternatives are available that would avoid jeopardy. CDFW administers CESA and authorizes take through California Fish and Game Code Section 2081 Incidental Take Permits or through Section 2080.1 (for species also listed under FESA, consistency determination with a USFWS Biological Opinion).

Section 3511 – Fully Protected Species. The legislature of the State of California designated certain species as "fully protected" prior to the creation of CESA. Section 3511 states that "fully protected" birds or parts thereof may not be taken or possessed at any time. Lists of fully protected species were initially developed to provide protection to those animals that were rare or faced possible extinction and included fish, mammals, amphibians and reptiles, and birds. Most fully protected species have since been listed as threatened or endangered under CESA and/or FESA.

Sections 3503, 3503.5, 3505, 3513 — Birds. These California Fish and Game Code sections protect all birds, birds of prey, and all nongame birds, as well as their eggs and nests, for species that are not already listed as fully protected and that occur naturally within the state. Sections 3503 and 3503.5 of the CFGC stipulate the following regarding eggs and nests: Section 3503 states that it is unlawful to take, possess, or needlessly destroy the nest or eggs of any bird, except as otherwise provided by CFGC or any regulation made pursuant thereto; and Section 3503.5 states that is it unlawful to take, possess, or destroy any birds in the orders Falconiformes or Strigiformes (birds-of-prey) or to take, possess, or destroy the nest or eggs of any such bird except as otherwise provided by CFGC or any regulation adopted pursuant thereto. Section 3513 states that it is unlawful to take or possess any migratory nongame bird as designated in the MBTA or any part of such migratory nongame bird except as provided by rules and regulations adopted by the Secretary of the Interior under provisions of the MBTA.

2.2.4 California Native Plant Protection Act

The California Native Plant Protection Act of 1977 (California Fish and Game Code § 1900-1913) affords the CDFW Commission the authority to designate native plants as endangered or rare and protect them from "take." The California Native Plant Society (CNPS) maintains a list of sensitive plant species native to California and assigns each a rank in the California Rare Plant Rank (CRPR) system defined below:

- List 1A: Plants presumed extirpated in California and either rare or extinct elsewhere;
- List 1B: Plants are rare, threatened, or endangered in California and elsewhere;

- List 2A: Plants presumed extirpated in California, but more common elsewhere;
- List 2B: Plant are rare, threatened, or endangered in California, but more common elsewhere;
- List 3: Plants about which more information is needed (on a review list);
- List 4: Plants of limited distribution (on a watch list).

This list is further defined as described below:

- 0.1: Seriously threatened in California, meaning there is a high degree (over 80% of occurrences) and immediacy of threat;
- 0.2: Moderately threatened in California, meaning there is a moderate degree (20-80% of occurrences) and immediacy of threat;
- 0.3: Not very threatened in California, meaning there is a low degree (less than 20% of occurrences) and immediacy of threat.

All plants on Lists 1 and 2 meet the standards for state listing under the CEQA Guidelines (14 CCR § 15380). CNPS recommends that plants on Lists 3 and 4 be evaluated for consideration under CEQA.

2.2.5 Porter-Cologne Water Quality Control Act

The Porter-Cologne Water Quality Control Act of 1969 established the State Water Resources Control Board (SWRCB) and the nine Regional Water Quality Control Boards (RWQCB), collectively referred to as the Water Boards, and authorized them to provide oversight for water rights and water quality. It uses the National Pollutant Discharge Elimination System (NPDES) to monitor point source discharges into the waters of the State to prevent water quality degradation. It also protects wetlands, surface waters, and groundwater from both point and nonpoint sources of pollution.

2.2.6 State Wetland Definition and Procedures

The SWRCB adopted the State Wetland Definition and Procedures for Discharges or Fill Material to Waters of the State in 2019 and completed revisions to this set of procedures in 2021 (SWRCB 2021). Four major elements are included in these procedures as described below, in addition to procedures for the submittal, review and approval of CWA Section 401 permits not described in this report.

1. Wetland definition:

   An area is wetland if, under normal circumstances, (1) the area has continuous or recurrent saturation of the upper substrate caused by groundwater, or shallow surface water, or both; (2) the duration such saturation is sufficient to cause anaerobic conditions in the upper substrate; and 3) the area's vegetation is dominated by hydrophytes or the area lacks vegetation.

2. Framework for determining waters of the state:

   Waters of the state are broadly defined by the Porter-Cologne Water Quality Control Act as "any surface water or groundwater, including saline waters, within the boundaries of the state." The 2021 procedures expand upon this definition to clearly include natural wetlands, wetlands created by modification of a surface water of the state, and artificial wetlands meeting specific criteria.

The criteria for an artificial wetland include wetlands created for agency-approved compensatory mitigation; those identified in a water quality control plan; and those greater than or equal to one acre in size unless they are constructed and maintained for wastewater treatment or disposal, sediment settling, stormwater permitting program pollutant or runoff management, surface water treatment, agricultural crop irrigation or stock watering, fire suppression, industrial processing and cooling, active surface mining, log storage, recycled water management, maximizing groundwater recharge, and rice paddies.

3. Wetland delineation procedures:

   USACE-defined procedures for aquatic resources delineation (USACE 1987; USACE 2008, USACE 2010) used to assess the presence or absence of hydrophytic vegetation, hydric soils, and wetland hydrology are required by the SWRCB to delineate waters of the state, with one modification being that "the lack of vegetation does not preclude the determination of such an area that meets the definition of wetland."

2.3 Habitat Conservation Plans

An HCP is a planning document required as part of an application for an incidental take permit under Section 10(a)(1)(B) of FESA. Such permits are issued by the USFWS when take is not the intention of, and is incidental to, otherwise legal activities. An application for an incidental take permit under Section 10 of FESA must be accompanied by an HCP. HCPs describe the impacts of the proposed action that may result in take of federally listed species; how those impacts will be minimized or mitigated; and how the HCP is to be funded. HCPs can apply to both listed and non-listed species, including those that are candidates or have been proposed for listing. Conserving species before they are in danger of extinction or are likely to become so can also provide early benefits and prevent the need for listing.

The Project site and Annexation Area are within the Natomas Basin and the boundaries of the Natomas Basin Habitat Conservation Plan (NBHCP). The NBHCP (City of Sacramento et al. 2003) provides for the conservation of 22 wildlife and plant species within the Natomas Basin. The NBHCP establishes a multispecies conservation program to minimize and mitigate the expected loss of habitat values and incidental take of Covered Species that could result from urban development, operation and maintenance of irrigation and drainage systems, and certain activities associated with The Natomas Basin Conservancy (TNBC) management of its system of reserves established under the NBHCP. The NBHCP applies to the 53,537-acre area interior to the toe of levees surrounding the Natomas Basin, located in the northern portion of Sacramento County and the southern portion of Sutter County. The Basin contains incorporated and unincorporated areas within Sacramento County and Sutter County.

Management of the NBHCP is heavily focused on the two most widely distributed covered species in the Natomas Basin: Swainson's Hawk (*Buteo swainsoni*) and Giant Gartersnake (*Thamnophis gigas*):

- Swainson's Hawk is an upland foraging species. It nests along the Sacramento River and in isolated trees and groves throughout the Natomas Basin. The NBHCP seeks to avoid development in the Swainson's Hawk Zone[1] and to acquire upland habitat as Mitigation Lands inside the Swainson's Hawk Zone.

[1] The NBCHP Swainson's Hawk Zone is defined as the lands which are not currently developed [excluding the 250 acres of land designated "Urban" on the City of Sacramento General Plan and the North Natomas Community Plan located within the City of Sacramento] and which are located within the Natomas Basin and within one mile east of the toe of the inside levee of the Sacramento River and extending from the Natomas Cross Canal on the north and Interstate 80 on the south.

- Giant Gartersnake is found primarily in agricultural wetlands (such as rice fields) and other waterways such as drainage canals as well as adjacent uplands in many portions of the Natomas Basin[2].

It is anticipated that management of habitat for Swainson's Hawk and Giant Gartersnake will benefit the other covered species: Aleutian Cackling Goose (*Branta hutchinsii leucopareia*), Bank Swallow (*Riparia riparia*), Burrowing Owl (*Athene cunicularia*), Loggerhead Shrike (*Lanius ludovicianus*), Tricolored Blackbird (*Agelaius tricolor*), White-faced Ibis (*Plegadis chihi*), Northwestern Pond Turtle (*Actinemys marmorata*), California Tiger Salamander (*Ambystoma californiense*), Western Spadefoot Toad (*Spea hammondii*), Valley Elderberry Longhorn Beetle (*Desmocerus californicus dimorphus*), Midvalley Fairy Shrimp (*Branchinecta mesovallensis*), Vernal Pool Fairy Shrimp (*Branchinecta lynchi*), Vernal Pool Tadpole Shrimp (*Lepidurus packardi*), Boggs Lake Hedge-Hyssop (*Gratiola heterosepala*), Colusa Grass (*Neostapfia colusana*), Delta Tule Pea (*Lathyrus jepsonii* var. *jepsonii*), Legenere (*Legenere limosa*), Sacramento Orcutt Grass (*Orcuttia viscida*), Slender Orcutt Grass (*Orcuttia tenuis*), and Sanford's Arrowhead (*Sagittaria sanfordii*).

Adaptive management is a key provision of the NBHCP, allowing examination of "alternative strategies for meeting measurable goals and objectives, and then, if necessary, adjusting future conservation and management actions according to what is learned" (NBCHP Page I-41).

2.4 Local Policies and Ordinances

The Project site is located in an area of unincorporated Sacramento County that is being annexed within the City of Sacramento (City) jurisdiction, and therefore is subject to the following local and regional regulations.

2.4.1 City of Sacramento General Plan

The City of Sacramento General Plan is a set of goals, objectives, policies, implementation measures, and maps that form a blueprint for physical development within the limits of City. The General Plan contains numerous goals, policies, and strategies to protect and/or preserve environmental resources (City of Sacramento 2015).

The Environmental Resources section of the General Plan Part 2 Citywide Goals and Policies include policies to guide development and infrastructure practices with goals aimed to preserve and maintain the quality of the City's water resources, biological species and habitats, urban forest, agricultural land, mineral resources, air, and scenic amenities.

The Water Resources element includes the goal of water quality protection through protecting local watersheds, water bodies and groundwater resources, including creeks, reservoirs, the Sacramento and American Rivers, and their shorelines. This element includes policies for conservation of open space areas, regional planning, stormwater quality, new development, limiting stormwater peak flows, post-development runoff, construction site impacts, clean watershed, groundwater recharge, and watershed education.

The Biological Resources element includes the goal of natural and open space protection through protecting and enhancing open space, natural areas, and significant wildlife and vegetation in the City as integral parts of a sustainable environment within a larger regional ecosystem. This element includes policies for resource preservation, conservation of open space, natural lands management, retaining habitat areas, riparian habitat integrity, wetland protection, annual grassland protection, oak woodland protection, wildlife corridor protection,

[2] https://www.fws.gov/sacramento/es_species/Accounts/Amphibians-Reptiles/giant_garter_snake/

habitat assessments, agency coordination, Natomas Basin HCP, supporting regional habitat conservation plan efforts, climate change-related habitat shifts and habitat restoration and enhancement, public education, and community involvement.

The Agricultural element includes the goal of urban agriculture and access to locally grown foods through expanding urban agriculture and food production and increasing the distribution and sale of locally grown fresh food.

2.4.2 City of Sacramento Code Chapter 12.56: Tree Planting, Maintenance, and Conservation

The City has adopted a tree ordinance "to provide for the conservation of existing tree resources; to optimize tree canopy coverage throughout the city while recognizing individual rights to develop and make reasonable use of private property consistent with the general plan; and to provide clear standards for protection, removal, and replacement of city trees and private protected trees" (City Code § 12.56.010). For the purposes of this ordinance, the two categories of protected trees are defined as:

> *"City Tree" means any tree the trunk of which, when measured four and one-half feet above ground, is partially or completely located in a city park, on real property the city owns in fee, or on a public right-of-way, including any street, road, sidewalk, park strip, mow strip, or alley.*
>
> *"Private Protected Tree" means:*
>
> - *A tree that is designated by city council resolution to have special historical value, special environmental value, or significant community benefit, and is located on private property;*
> - *Any native Valley Oak (Quercus lobata), Blue Oak (Quercus douglasii), Interior Live Oak (Quercus wislizenii), Coast Live Oak (Quercus agrifolia), California Buckeye (Aesculus californica), or California Sycamore (Platanus racemose), that has a* [diameter at standard height (DSH)] *of twelve inches (12) inches or more, and is located on private property;*
> - *A tree that has a DSH of twenty-four (24) inches or more located on private property that is an undeveloped lot or does not include any single unit or duplex dwellings; or*
> - *A tree that has a DSH of thirty-two (32) inches or more located on private property that includes any single unit or duplex dwelling.*

The City recognizes that "trees are a signature of the city and are an important element in promoting the well-being of the citizens of Sacramento" (City Code § 12.56.010). The City requires a tree permit to perform any activity, not including routine maintenance, that could adversely impact the health of a city tree or private protected tree (City Code Section 12.56.020). These regulated work activities include to following:

- Removal of a tree;
- Pruning of branches or roots;
- Affixing signs, lights, or other hardware to a tree;
- Grading, clearing, excavating, adding fill soil, trenching, boring, compacting, or paving within the tree protection zone;
- Placing or storing construction equipment or construction material within the tree protection zone;
- Application of any harmful substance within the tree protection zone; and
- Topping of a tree.

3 Methods

This Assessment is informed by data from a desktop analysis of the literature and numerous resource databases, as well as field surveys. The methods used to complete these surveys and desktop analyses are described below.

3.1 Desktop Review

Prior to conducting field surveys, Bargas conducted an initial review of literature and data sources to characterize biological conditions and to compile records of sensitive biological resources that could potentially occur in the Biological Study Area. The methods used for this analysis are described below.

3.1.1 Biological Setting

The biological setting includes terrain, hydrology, soils, land uses, and other features that support or inhibit biological resources in an area. In order to better understand the biological setting of the project, the following resources were reviewed in detail:

- US Fish and Wildlife Service's *National Wetlands Inventory* (USFWS 2021) to determine if surface waters and wetlands have been mapped on or adjacent to the Biological Study Area.
- US Geological Survey's *National Hydrography Dataset* (USGS 2021) to determine if hydrological features have been mapped on or adjacent to the Biological Study Area.
- US Department of Agriculture National Resource Conservation Service *Web Soil Survey* (NRCS 2021) to map and describe soil(s) within the Biological Study Area.

Google Earth Pro aerial map images of the Biological Study Area, including historical aerial images.

3.1.2 Special Status Species & Habitats

It is important to create a well-defined list of habitats and species that could reasonably be expected to occur on the Project site in order to analyze potential Project effects on biological resources effectively. The following describes how the list of potentially-occurring special status biological resources was assembled.

3.1.2.1 Data Sources

Species and habitat occurrences were queried from the following resources:

- US Fish and Wildlife Service's *Information for Planning and Consultation* portal (IPaC) (USFWS 2022) for a list of federally listed species and designated critical habitat recommended for impact analysis consideration, based on an upload of the Biological Study Area limits.
- California Department of Fish and Wildlife's *California Natural Diversity Database* (CNDDB) (CDFW 2022) for special status species and habitat records within the Regional Study Area.
- California Native Plant Society's *Inventory of Rare and Endangered Plants* (CNPSa 2022) for a list of special status plant species occurrences within the USGS 7.5-minute quadrangles that overlap the Regional Study Area.

3.1.2.2 Special Status Designations Considered

A variety of agencies and respected non-profit organizations assess the conservation status of plant and wildlife species, however, not all are applicable to this Assessment. The following special status designations were considered when determining special status species to be discussed in this Assessment:

- **Federal Status:** Species listed as **Endangered (FE)** or **Threatened (FT)**, as well as species **Proposed as Endangered (FPE)**, **Proposed as Threatened (FPT)**, **Proposed for Delisting (FPD)**, and **Candidates (FC)** for listing under the Federal Endangered Species Act.
- **California Status:** Species listed as **Endangered (CE)** or **Threatened (CT)**, as well as species that are **Candidates** for **Endangered (CCE)** status, **Threatened (CCT)** status, or **Delisting (CCD)** under the California Endangered Species Act. Also considered are species listed as **Fully Protected (FP)** and **Species of Special Concern (SSC)**.
- **CNPS Status:** All California Rare Plant Ranks (CRPR) maintained by the CNPS *Inventory of Rare and Endangered Plants*.
- **Vegetation Communities:** All vegetation communities mapped by the CNDDB.

3.1.3 Occurrence Potential

Following the desktop review, field surveys, and habitat analyses, Bargas assessed the potential for the occurrence of special status species in the Biological Study Area. Biological conditions (vegetation communities, wildlife habitats, disturbances, etc.) and the habitat and life cycle requirements of special status species identified for analysis in the desktop review were considered. "Recent" occurrences are defined as observed within the past 30 years. Based on these considerations, species were assigned to the following categories:

- **Present:** Species is known to occur in Biological Study Area based on recent surveys, CNDDB (within 30 years), or other records.
- **High**: Species with known recent recorded occurrences/populations near the Biological Study Area and highly suitable habitat occurs within the Biological Study Area. Highly suitable habitat includes all necessary elements to support the species (e.g., elevation, hydrology, soils, cover, habitat type, food resources).
- **Moderate.** Species with known recent recorded occurrences/populations near the Biological Study Area; however, habitat within the Biological Study Area has been moderately disturbed, fragmented, or is small in extent. Moderately suitable habitat includes several elements to support the species (e.g., elevation, hydrology, soils, cover, habitat type, food resources). Furthermore, moderately suitable habitat may also be located at the edge of the species' range, or there are no reported occurrences nearby.
- **Low**. Species with few known recent recorded occurrences/populations near the Biological Study Area and habitat within the Biological Study Area is highly disturbed or extremely limited. A low potential is assigned to annual or perennial plant species that may have been detectable during a focused survey in the appropriate blooming period but was not found; however, small populations or scattered individuals are still considered to have a low potential to occur. Additionally, species for which poor-quality habitat may support the species within the Biological Study Area, but the reported extant range is far outside the Biological Study Area and/or any species observations would anticipate being migratory (i.e., not likely to reproduce within the Biological Study Area).

- **Presumed Absent/No Potential**. Focused surveys were conducted and the species was not detected, or the species was found in the desktop review, but suitable habitat (soil, vegetation, elevational range) was not found in the BSA, or the BSA is not within the known geographic range of the species.

The potential for bird species were further distinguished into those that may: 1) nest within or near the Biological Study Area; 2) forage within or near the Biological Study Area; and/or 3) occur on or near the Biological Study Area only as transients during migratory flights or other dispersal events.

3.2 Field Surveys

Bargas biologists conducted five survey site visits for biological resources from October 2021 to July 2022. Survey dates, times, personnel, and weather conditions are summarized in **Table 1** below. The biological survey was conducted across two site visits conducted in March and April 2022. These pedestrian surveys consisted of transects through the Project site, scanning adjacent areas within the Biological Study Area and Annexation Area using binoculars. The entirety of the Project site and areas within the Biological Study Area and Annexation Area accessible from public rights-of-way or visible from the Project site were evaluated for the presence of habitat components that could support special status plant and wildlife species identified during the literature and database review described above. The biological surveys conducted were comprehensive but do not equate to protocol-level surveys defined by regulating and/or resource protection agencies.

The surveys also included a formal aquatic resources delineation conducted in October 2021 and July 2022, for which the detailed USACE methodology can be found in the Aquatic Resources Delineation Report prepared for the Project (Bargas 2022). A site visit was also conducted in May 2022 with the Applicant and staff from various agencies during which additional bird species observations were documented.

The surveys occurred within the typical nesting bird season (February 15 – August 31) and within the blooming period of all 27 special status plant species identified in the literature and database review.

Table 1. Survey Summary Table

Date	Biologist(s)	Time	Start Conditions			End Conditions		
			Temp	Clouds	Wind	Temp	Clouds	Wind
October 27, 2021	Krystal Pulsipher, Bekah Christianson	0845 - 1300	52°F	Mostly Cloudy	Light Breeze out of the South	64°F	Mostly Clear	Light Breeze out of the Northwest
October 28, 2021	Krystal Pulsipher, Bekah Christianson	0845 - 1500	54°F	Mostly Clear	Light Breeze out of the Southeast	72°F	Mostly Clear	Calm
March 9, 2022	Krystal Pulsipher, Bekah Christianson	0830 - 1545	50°F	Partly Cloudy	Moderate Breeze out of the Southwest	70°F	Partly Cloudy	Light Breeze out of the Northwest

Date	Biologist(s)	Time	Start Conditions			End Conditions		
			Temp	Clouds	Wind	Temp	Clouds	Wind
April 12, 2022	Owen Routt, Sophia Chau	0900 - 1345	57°F	Partly Cloudy	Calm	61°F	Clear	Calm
May 27, 2022	Krystal Pulsipher, Marcus England	0845 - 1100	70°F	Clear	Calm	75°F	Clear	Calm
July 5, 2022	Krystal Pulsipher	1400 – 1350	87°F	Mostly Clear	Light Breeze out of the Southwest	89°F	Mostly Clear	Light Breeze out of the Southwest

3.3 Taxonomy and Nomenclature

Every effort was made to use naming standards that are recognized by the scientific community, with the understanding that – for many wildlife groups – scientists may not always agree on a standard source. Because of this, some common names used in this report may not be the same as those used by the underlying data sources for species records. Bargas maintains a yearly-updated reference species list which uses the following taxonomic sources:

- **Birds** – American Ornithological Society Check-list and Supplements (AOS 1998).
- **Mammals** – The reference list in the CDFW's California Wildlife Habitats Relationships Database (CDFW 2014), with updates based on the American Society of Mammologists Mammal Diversity Database (2020).
- **Reptiles and Amphibians** – The technical website californiaherps.com, which is regularly updated based on the latest taxonomic literature.
- **Fish** – Common and Scientific Names of Fishes from the United States, Canada, and Mexico, 7th edition (AFS 2013)
- **Invertebrates** – no naming standard was identified that was current and applicable to freshwater and terrestrial invertebrates. Names used by the underlying data sources when a species was first identified were retained.
- **Plants** – the Jepson eFlora (Jepson Flora Project 2021)

Birds have the most well-established naming standards of all taxonomic groups. These standards include instructions for the proper use of capitalization for common names to make clear that, for example, someone mentioning a Blue-winged Teal refers to the species "Blue-winged Teal" and not any species of teal with blue wings. The capitalization standards used for birds have been used with other taxa as well throughout this report.

4 Results

This section discusses in detail what is known about biological resources in the Biological Study Area based on information from field surveys, 151 CNDDB records, 21 CNPS records, 8 IPaC records, and 4 critical habitat determinations in the Regional Study Area.

4.1 Biological Setting

When viewing the Regional Study Area limits in its entirety on aerial photography, the defining land use of the region is agriculture. Urban land uses are also significant and comprise the majority land use of the southeastern third of the Regional Study Area. Natural habitats are present, however, including interspersed and sometimes substantial annual grasslands, shrublands, and riparian woodlands along the margins of the Sacramento River in the west and American River in the southeast. Special status habitats such as vernal pools are also present in the region, particularly on sites with lesser disturbance. There are no significant terrain features present in the Regional Study Area: elevations range from approximately 15 to 100 feet above mean sea level. The Regional Study Area is within the Lower Sacramento watershed, Hydrologic Unit Code-8 18020109.

4.2 Soils

Six soil types exist within the Project site, as summarized in **Table 2** below with the types, parent material, drainage class, and hydric rating. A map showing soils is provided as **Exhibit 3**. The NRCS soil report for the Project site is included in **Appendix D**. These same soil types also continue off-site into the Annexation Area as also shown on Exhibit 3.

Table 2. Soil Series within the Biological Study Area

Soil Series	Map Unit Number	Map Unit Symbol	Parent Material	Drainage Class	Hydric Rating
Capay clay loam, 0 – 2% slopes, occasionally flooded	113	hhlm	Alluvium	Moderately well drained	No
Clear Lake clay, hardpan substratum, drained, 0-1% slopes	115	hhlp	Alluvium	Somewhat poorly drained	Yes
Cosumnes silt loam, partially drained, 0-2% slopes	127	2x415	Alluvium derived from igneous and metamorphic rock	Somewhat poorly drained	Yes
Jacktone clay, drained, 0-2% slopes	161	hhn5	Alluvium	Somewhat poorly drained	Yes
San Joaquin silt loam, leveled, 0-1% slopes	213	hhpv	Alluvium derived from granite	Moderately well drained	No
San Joaquin silt loam, 0-3% slopes	214	hhpw	Alluvium derived from granite	Moderately well drained	No

Source: NRCS 2022

Exhibit 3. Soils

4.3 Aquatic Resources

4.3.1 Project Site

A total of 2.018 acres (15,424 linear feet) of potential jurisdictional tributary drainages and other waters of the U.S. have been identified within the Project site. **Table 3** below provides a summary of these features, including feature type, acreage, and length. **Exhibit 4** displays each feature identified in the Project site. These features are subject to the interpretation and verification of the U.S. Army Corps of Engineers Sacramento District Regulatory Division.

Table 3. Aquatic Features Observed in the Study Area

Feature Name	Area (acres)*	Length (linear feet)
Tributary Drainages		
Canal-1	0.04	2,149
Canal-2	1.46	3,204
Canal-3	0.001	5,335
Subtotal:	**1.501**	**10,688**
Other Waters		
Ditch-1	0.19	2,278
Ditch-2	0.39	2,458
Subtotal:	**0.58**	**4,736**
Grand Total:	**2.081**	**15,424**

Source: Bargas, 2022. *Acreages are calculated estimations that are subject to modification pending formal verification by USACE.

These features are best described as canals and ditches artificially excavated. The canals are operated and maintained by Reclamation District 1000 for the purpose of conveying stormwater and irrigation runoff collected in various smaller ditches and stormwater infrastructure in the local vicinity to one of several main drainage canals. Pumping plants along the main drainage canals then release water to the Sacramento River in a controlled manner. Canal-3 is the West Drainage Canal, one of the main drainage canals. The canals vary in size with OHWM widths ranging from approximately 25 to 54 feet with unknown depths. Duckweed (*Lemna* species) and dead material from Floating Water Primrose (*Ludwigia peploides*) were observed within the canals. The canal banks were relatively steep and vegetated by weedy species that grow in disturbed places, including Black Mustard (*Brassica nigra*), Milk Thistle (*Silybum marianum*), Ripgut Grass (*Bromus diandrus*), Rye Grass (*Festuca perennis*), Poison Hemlock (*Conium maculatum*), and Fennel (*Foeniculum vulgare*). The ditches convey stormwater and irrigation runoff from adjacent lands to one of several of the canals described above. The ditches vary in size with OHWM widths ranging from 3 to 7 feet and depths of 1 to 1.5 feet. Ditch-1 contained several large patches of shrub cover in the form of Himalayan Blackberry (*Rubus armeniacus*) with dominant plant species observed were Common Tule (*Schoenoplectus acutus* var. *occidentalis*), Tall Flatsedge (*Cyperus eragrostis*), Curly Dock (*Rumex crispus*), Johnson Grass (*Sorghum halepense*), and Bristly Ox-Tongue (*Helminthotheca echioides*). Ditch-2 did not contain any shrub cover and the dominant plant species observed were Annual Beard Grass (*Polypogon*

monspeliensis), Tall Flatsedge, and Curly Dock. The ditch banks were also relatively steep and vegetated by similar weedy type plant species as described for the canals above.

Canal-1 and Canal-2 are direct tributaries to Canal-3 (West Drainage Canal). Ditch-1 has direct hydrologic connectivity to Canal-3 within the Project site and Ditch-2 has direct hydrologic connectivity to Canal-1 outside of the Project site. Canal-3 is tributary to the Sacramento River, a USACE designated traditional navigable waterway, via multiple pumping stations managed by Reclamation District 1000. These features are subject to the interpretation and verification of the USACE Sacramento District Regulatory Division.

4.3.2 Annexation Area

Bargas examined data layers within the NHD and NWI to determine potential jurisdictional features within the Annexation Area. For linear features, both datasets show the area's canals and no other feature types. Several wetland features, however, are mapped by the NWI within the Annexation Area. These are discussed below and shown on **Exhibit 5**.

4.3.2.1 PEM1A

NWI features classified as PEM1A are located in the northwest corner of the Annexation Area (approximately 1.4 acres) and north-central portion of the Annexation Area (approximately 2.3 acres), the latter of which is connected to an area mapped as PEM1C (discussed below in **Section 4.3.2.2**). The NWI's definition of PEM1A features is as follows:

> *Palustrine - Emergent Persistent - Temporarily Flooded*
>
> *Palustrine wetlands are often dominated by trees, shrubs, or other emergent vegetation and include habitats traditionally called marsh, swamp, bog, fen, or prairie. Wetlands lacking emergent vegetation but that are smaller than 20 acres (8 ha), have little wave action, are < 8.2 feet (2.5 m) deep, and have salinity < 0.5 ppt are also classified as Palustrine.*
>
> *Persistent Emergent wetlands are dominated by plants which have leaves and stems above the surface of the water during the entire year. In these wetlands emergent plants are the tallest life form and cover > 30% of the area.*
>
> *This wetland is Temporarily Flooded with surface water present for a few days to a few weeks during the growing season. The water table usually lies well below the ground surface for the most of the season.*
>
> *Typical species include:*
>
> *Cattails (*Typha*), Bulrushes (*Scirpus*), Saw grass (*Cladium jamaicense*), Sedges (*Carex*), Manna grasses (*Glyceria*), Slough grass (*Beckmannia syzigachne*), Common river grass (*Scolochloa festucacea*), Purple loosestrife (*Lythrum salicaria*), Mexican dock (*Rumex mexicanus*), Swamp loosestrife (*Decodon verticillatus*), Smartweeds (*Polygonum*)*

4.3.2.2 PEM1C

An NWI feature classified as PEM1C measuring approximately 4 acres in extent is located in the north-central portion of the Annexation Area and is connected to an area mapped as PEM1A (discussed above in **Section 4.3.2.1**). The NWI's definition of PEM1C features is as follows:

Palustrine- Emergent Persistent - Seasonally Flooded

Palustrine wetlands are often dominated by trees, shrubs, or other emergent vegetation and include habitats traditionally called marsh, swamp, bog, fen, or prairie. Wetlands lacking emergent vegetation but that are smaller than 20 acres (8 ha), have little wave action, are < 8.2 feet (2.5 m) deep, and have salinity < 0.5 ppt are also classified as Palustrine.

Persistent Emergent wetlands are dominated by plants which have leaves and stems above the surface of the water during the entire year. In these wetlands emergent plants are the tallest life form and cover > 30% of the area.

This wetland is Seasonally Flooded with surface water present for extended periods during the growing season but absent by the end of the season in most years. When surface water is absent the depth to substrate saturation may vary considerably among sites and among years.

Typical species include:

*Cattails (*Typha*), Bulrushes (*Scirpus*), Saw grass (*Cladium jamaicense*), Sedges (*Carex*), Manna grasses (*Glyceria*), Slough grass (*Beckmannia syzigachne*), Common river grass (*Scolochloa festucacea*), Purple loosestrife (*Lythrum salicaria*), Mexican dock (*Rumex mexicanus*), Swamp loosestrife (*Decodon verticillatus*), Smartweeds (*Polygonum*)*

4.3.2.3 PSSC

An NWI feature classified as PSSC measuring approximately 1.5 acres in extent is located in the southeast portion of the Annexation Area. The NWI's definition of PSSC features is as follows:

Palustrine - Shrub/Scrub - Seasonally Flooded

Palustrine wetlands are often dominated by trees, shrubs, or other emergent vegetation and include habitats traditionally called marsh, swamp, bog, fen, or prairie. Wetlands lacking emergent vegetation but that are smaller than 20 acres (8 ha), have little wave action, are < 8.2 feet (2.5 m) deep, and have salinity < 0.5 ppt are also classified as Palustrine.

Shrub/Scrub wetlands are dominated by woody plants < 6m (20 ft) tall that cover > 30% of the area. While these wetlands only occur in the Estuarine and Palustrine Systems, they are one of the most widespread wetland classes in the United States.

This wetland is Seasonally Flooded with surface water present for extended periods during the growing season but absent by the end of the season in most years. When surface water is absent the depth to substrate saturation may vary considerably among sites and among years.

Exhibit 4. Aquatic Resources Delineation

Exhibit 5. National Wetlands Inventory Within Annexation Area

4.4 Habitats and Vegetation Communities

4.4.1 Extant Vegetation Communities

The following sections describe the vegetation communities and other landcover types found within the Biological Study Area. Plant community names follow *A Manual of California Vegetation: Second Edition* (CNPS 2022), where applicable. The majority of the Biological Study Area, including the Project site, is composed of semi-natural vegetation alliances. The forest/woodland communities described below contain an understory more typical of these semi-natural vegetation alliances. **Table 4** below provides a summary of the vegetation communities and land cover observed within the Biological Study Area. Photographs showing vegetation conditions during the field surveys are provided in **Appendix C**.

Table 4. Vegetation Community Summary.

Common Name	Scientific Name	Project Site Acres	Biological Study Area Only Acres	TOTAL Acres
Perennial Rye Grass Fields	*Lolium perenne* Herbaceous Semi-Natural Alliance	260.49	9.44	269.93
Upland Mustards or Star-thistle Fields	*Brassica nigra - Centaurea* (*solstitialis, melitensis*) Herbaceous Semi-Natural Alliance	69.44	60.66	130.10
Disturbed/Developed	Disturbed/Developed	5.23	36.58	41.81
Open Water	Open Water	1.93	9.20	11.13
Unknown Row Crops	Unknown Row Crops	0.00	4.58	4.58
Poison Hemlock or Fennel Patches	*Conium maculatum - Foeniculum vulgare* Herbaceous Semi-Natural Alliance	1.28	2.63	3.91
Himalayan Blackberry - Rattlebox - Edible Fig Riparian Scrub	*Rubus armeniacus - Sesbania punicea - Ficus carica* Shrubland Semi-Natural Alliance	0.53	0.75	1.28
Goodding's Willow - Red Willow Riparian Woodland and Forest	*Salix gooddingii - Salix laevigata* Forest & Woodland Alliance	0.37	0.40	0.77
Valley Oak Riparian Forest and Woodland	*Quercus lobata* Riparian Forest & Woodland Alliance	0.07	0.69	0.75
Hardstem and California Bulrush Marshes	*Schoenoplectus* (*acutus, californicus*) Herbaceous Alliance	0.22	0.00	0.22
Cattail Marsh	*Typha* (*angustifolia, domingensis, latifolia*) Herbaceous Alliance	0.02	0.00	0.02
	Grand Total	**339.57**	**124.93**	**464.50**

4.4.1.1 Perennial Rye Grass Fields

Perennial Rye Grass Fields (*Lolium perenne* [now *Festuca perennis*] Herbaceous Semi-Natural Alliance) can be found on 260.49 acres, or 76.71%, of the Project site and on 9.44 acres, or 2.03% of the Biological Study Area beyond the Project site boundary. Historic aerial imagery and field observations suggest the vegetation in these areas may be managed through mowing or shallow tilling for fire fuel abatement. This vegetation community was observed within two large fallowed agricultural fields, lower topographical roadside areas that receive sheet flow storm water runoff from the roads including the areas west and east of Metro Air Parkway north of Bayou Way,

and Ditch-2. The dominant plant species observed in these areas was Rye Grass with smaller amounts of the following species also observed: Perennial Pepperweed (*Lepidium latifolium*), Ripgut Grass, Little-seeded Canary Grass (*Phalaris minor*), and Johnson Grass.

4.4.1.2 Upland Mustards or Star-thistle Fields

Upland Mustards or Star-thistle Fields (*Brassica nigra – Centaurea* [*solstitialis, melitensis*] Herbaceous Semi-Natural Alliance) can be found on 60.44 acres, or 20.45%, of the Project site and on 60.66 acres, or 13.06% of the Biological Study Area beyond the Project site boundary. Historic aerial imagery and field observations suggest the vegetation in most areas of these areas may be managed through mowing or shallow tilling for fire fuel abatement. This vegetation community was observed within one large fallowed agricultural field and most roadside areas. The dominant plants species observed in these areas included Black Mustard, Jointed Charlock (*Raphanus raphinastrum*), Little Mallow (*Malva parviflora*), Bristly Ox-Tongue, and Ripgut Grass.

4.4.1.3 Developed / Disturbed

Developed / disturbed land cover can be found on 5.23 acres, or 1.54%, of the Project site and on 36.58 acres, or 7.87% of the Biological Study Area beyond the Project site boundary. Several paved roads transect the Biological Study Area and Project site, including Powerline Road, Bayou Way, Interstate 5, and an irrigation district access road. Bayou Way transects the northern end of the Project site and the southern end of Metro Air Parkway terminates at Bayou Way within the Project site boundary. A paved irrigation district access road also transects the northern end of the Project site along the south side of Ditch-2 between Bayou Way and Interstate 5. Interstate 5 is present within the northern end of the Biological Study Area beyond the Project site. The east side of the Biological Study Area also overlaps the edge of a line of homes in a residential neighborhood. The areas described above are best described as developed. Gravel road shoulders adjacent to paved roads, an unpaved farm road south of Canal-3, a construction yard on the south side of Bayou Way west of Metro Air Park, and a fire break and unpaved fire road along the east side of the Biological Study Area are best described as disturbed.

4.4.1.4 Open Water

Open water in the form of canals and ditches can be found on 1.93 acres, or 0.57%, of the Project site and 9.20 acres, or 1.98%, of the Biological Study Area beyond the Project site. These areas include aquatic features Canal-1, Canal-2, Canal-3, and Ditch-2 mapped during the formal aquatic resources delineation. These four features were observed to be inundated and lacking significant amounts of living emergent vegetation during most of the surveys.

4.4.1.5 Unknown Row Crops

Unknown row crop land cover can be found on 4.58 acres, or 1.98% of the Biological Study Area beyond the Project site boundary. The agricultural field present south of Canal-3 and adjacent to Powerline Road is best described as row crop agriculture and the species being cultivated and those plant species otherwise present are unknown.

4.4.1.6 Poison Hemlock or Fennel Patches

Poison Hemlock or Fennel Patches (*Conium maculatum – Foeniculum vulgare* Herbaceous Semi-Natural Alliance) can be found on 1.28 acres, or 0.38%, of the Project site and 2.63 acres, 0.57%, of the Biological Study Area beyond the Project site boundary. Historic aerial imagery and field observations suggest the vegetation in these areas may not be as regularly managed for fire fuel abatement due to their locations along the corners or edges of fields.

The dominant plant species observed in these areas include Poison Hemlock, Fennel, Milk Thistle, Wild Teasel (*Dipsacus fullonum*), Little Mallow, and Ripgut.

4.4.1.7 Himalayan Blackberry – Rattlebox – Edible Fig Riparian Scrub

Himalayan Blackberry – Rattlebox – Edible Fig Riparian Scrub (*Rubus armeniacus - Sesbania punicea – Ficus carica* Shrubland Semi-Natural Alliance) can be found on 0.37 acres, or 0.11%, of the Project site and 0.75 acres, or 0.16%, of the Biological Study Area beyond the Project site boundary. This community is present in large patches along Ditch-1 and along a smaller ditch present just outside of the southeastern Project site boundary. These patches are predominantly composed of Himalayan Blackberry with smaller amounts of the following species also observed: Western Poison Oak (*Toxicodendron diversilobum*), Edible Fig (*Ficus carica*), Wild Teasel, Poison Hemlock, and Fennel.

4.4.1.8 Goodding's Willow – Red Willow Riparian Woodland and Forest

Goodding's Willow – Red Willow Riparian Woodland and Forest (*Salix gooddingii – Salix laevigata* Forest and Woodland Alliance) can be found on 0.37 acres, or 0.11%, of the Project site and 0.40 acres, or 0.09% of the Biological Study Area beyond the Project site boundary. This community is present adjacent to the south bank of Canal-2 where it turns east to follow parallel to Bayou Way, and along a ditch on the north side of Bayou Way within the Biological Study Area but outside of the Project site boundary. The trees are all of a single species, Goodding's Willow (*Salix gooddingii*), and range in height from approximately 15 to 25 feet tall. Himalayan Blackberry, Common Tule, Tall Flatsedge, Curly Dock, and Johnson Grass are present in the understory along the ditch. Other parts of the understory are characterized by weedy species more typical of the Perennial Rye Grass Field, Upland Mustards and Star-thistle Field, and Poison Hemlock or Fennel Patch communities described in the sections above.

4.4.1.9 Valley Oak Riparian Forest Woodland

Valley Oak Riparian Forest Woodland (*Quercus lobata* Riparian Forest and Woodland Alliance) can be found on 0.07 acres, or 0.02%, of the Project site and 0.69 acres, or 0.15%, of the Biological Study Area beyond the Project site boundary. This community is present within and adjacent to both banks of Canal-2 where it meets Canal-3 on the southern side of the Biological Study Area. Several small groves of trees are also present along both banks of Canal-3 to the west of Canal-2. The trees are all of a single species, Valley Oak (*Quercus lobata*), and range in height from approximately 15 to 40 feet tall. Many of the trees are rooted within the bank and are failing as the bank erodes into the canal. The understory is characterized by weedy species more typical of the Perennial Rye Grass Field, Upland Mustards and Star-thistle Field, and Poison Hemlock or Fennel Patch communities described in the sections above.

4.4.1.10 Hardstem and California Bullrush Marsh

Hardstem and California Bulrush Marsh (*Schoenoplectus* [*acutus, californicus*] Herbaceous Alliance) can be found on 0.22 acres, or 0.07%, of the Project site only. The dominant plant species observed in these areas included Common Tule, Tall Flatsedge, Curly Dock, Johnson Grass, and Bristly Ox-Tongue. A few Fremont Cottonwood (*Populus fremonti*) trees, ranging from approximately 15 to 30 feet in height, are present and rooted within or adjacent to Ditch-1 where this community is present.

4.4.1.11 Cattail Marsh

Cattail Marsh (*Typha* [*angustifolia, domingensis, latifolia*] Herbaceous Alliance) can be found on 0.02 acres, or 0.01%, of the Project site only. The southern end of Ditch-1 widens just north of where it discharges to the West Drainage Canal and contains two patches of this vegetation community. These areas are dominated by Cattail species (*Typha* sp.) with smaller amounts of Common Tule.

4.4.2 Sensitive Vegetation Communities

The Biological Study Area contains two vegetation community alliances identified by CDFW and CNPS as sensitive communities (CNPSb 2022). Goodding's Willow – Red Willow Riparian Woodland and Valley Oak Riparian Forest and Woodland alliances described above as being present within the Biological Study Area are S3-ranked sensitive vegetation communities. Hardstem and California Bulrush Marsh is also present in the Biological Study Area and is an S3/S4-ranked sensitive vegetation community.

A total of two sensitive vegetation communities were mapped by the CNDDB within the Regional Study Area. These communities and their potential for occurrence are discussed below:

- **Great Valley Cottonwood Riparian Forest**
  1 CNDDB record(s) in the Regional Study Area. Potential for Occurrence: None. Nearest CNDDB record is more than 4 miles to the south along the Sacramento River. Community is not present on the Project site, Biological Study Area, or Annexation Area based on aerial photography and surveys.
- **Northern Claypan Vernal Pool**
  1 CNDDB record(s) in the Regional Study Area. Potential for Occurrence: None. The only CNDDB record for this community is 4 miles to the east along Dry Creek. Community is not present on the Project site, Biological Study Area, or Annexation Area based on aerial photography and surveys.

4.4.3 Communities in the Annexation Area

Vegetation communities in the Annexation Area are a continuation of and consistent with the Biological Study Area's vegetation. Cover is dominated by Perennial Rye Grass Fields, Upland Mustards or Star-thistle Fields, and Disturbed with some riparian communities associated with the areas mapped by the NWI as described in **Section 4.3.2.**

Exhibit 6. Vegetation and Land Cover

4.5 Plants

4.5.1 Plant Diversity

A total 53 plant taxa were detected during field surveys. A list of all plant taxa detected during field surveys is provided in **Appendix A**. Of the species detected, only thirteen are native to California and 19 of the non-native species observed are recognized as invasive. Areas heavily disturbed by anthropogenic activities such as rural and urban development and agricultural activities can be expected to have lower floral diversity than areas containing intact natural plant communities and habitats. The majority of the Biological Study Area is composed of semi-natural vegetation alliances, as described in **Section 4.4**, which are dominated by non-native species. The understory of the forest/woodland alliances described above are dominated by non-native species, and the natural alliances present within the ditches are heavily infiltrated by non-native species.

4.5.2 Special Status Plants

The desktop review determined that 20 plant taxa with special status had been documented as occurring within the Regional Study Area. These taxa and their occurrence potential are discussed below and summarized in **Appendix B**.

4.5.2.1 Taxa Confirmed Present

No special status plant taxa from desktop analysis were determined to be **Present** in the Biological Study Area. None would be expected in the Annexation Area.

4.5.2.2 Taxa With High Potential for Occurrence

No special status plant taxa from desktop analysis were determined to have **High** potential for occurrence in the Biological Study Area. None would be expected in the Annexation Area.

4.5.2.3 Taxa with Moderate Potential for Occurrence

No special status plant taxa from desktop analysis were determined to have **Moderate** potential for occurrence in the Biological Study Area. None would be expected in the Annexation Area.

4.5.2.4 Taxa with Low Potential for Occurrence

The following six special status plant taxa from desktop analysis were determined to have **Low** potential for occurrence in the Biological Study Area. Likewise, all six would be expected to have the same potential for occurrence in the Annexation Area.

- **Pappose Tarplant**
  Asteraceae > Centromadia parryi ssp. parryi
  FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	annual herb blooms May-Nov
Habitat Requirements:	Chaparral, Coastal prairie, Marshes and swamps, Meadows and seeps, Valley and foothill grassland at elevations ranging from 0 to 1,380 feet.
Microhabitat:	Alkaline (often)
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles

Habitat Present:	Low Quality
Soils Present:	Unknown
Determination Reason:	Nearest records are 8.5 miles to the southwest. All records are west and south of the Biological Study Area, which may be outside of the range of the species. Not expected due to agriculture-related site disturbance.

Heckard's Pepper-Grass

Brassicaceae > Lepidium latipes var. heckardii

FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	annual herb blooms Mar-May
Habitat Requirements:	Valley and foothill grassland at elevations ranging from 5 to 655 feet.
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Low Quality
Soils Present:	Unknown
Determination Reason:	Nearest extant occurrence is 7.5 miles to the southwest. Not expected due to agriculture-related site disturbance.

San Joaquin Spearscale

Chenopodiaceae > Extriplex joaquinana

FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	annual herb blooms Apr-Oct
Habitat Requirements:	Chenopod scrub, Meadows and seeps, Playas, Valley and foothill grassland at elevations ranging from 5 to 2,740 feet.
Microhabitat:	Alkaline
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Low Quality
Soils Present:	Unknown
Determination Reason:	Nearest records are 7.5 miles to the west. All records are west of the Project site, which may be outside of the range of the species. Not expected due to agriculture-related site disturbance.

Woolly Rose-Mallow

Malvaceae > Hibiscus lasiocarpos var. occidentalis

FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	perennial rhizomatous herb (emergent) blooms Jun-Sep
Habitat Requirements:	Marshes and swamps at elevations ranging from 0 to 395 feet.
Inclusion Source(s):	CNDDB, CNPS
CNDDB Records:	2

Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Low Quality
Soils Present:	Unknown
Determination Reason:	Nearest record was at the margins of a canal. Unlikely to be present because of site disturbance, but cannot be entirely dismissed.

- **Palmate-bracted Bird's-Beak**

Orobanchaceae > Chloropyron palmatum
FESA: Federal Endangered, CESA: California Endangered, CRPR 1B.1

California Endemic:	True
Growth Habit:	annual herb (hemiparasitic) blooms May-Oct
Habitat Requirements:	Chenopod scrub, Valley and foothill grassland at elevations ranging from 15 to 510 feet.
Microhabitat:	Alkaline
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Low Quality
Soils Present:	Unknown
Determination Reason:	Nearest records are 7.5 miles west of the Project site, which may be outside of the species' range. Unlikely to be present because of site disturbance, but cannot be entirely dismissed.

- **Sanford's Arrowhead**

Alismataceae > Sagittaria sanfordii
FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	perennial rhizomatous herb (emergent) blooms May-Oct (Nov)
Habitat Requirements:	Marshes and swamps at elevations ranging from 0 to 2,135 feet.
Inclusion Source(s):	CNDDB, CNPS, HCP
CNDDB Records:	1
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Low Quality
Soils Present:	Unknown
Determination Reason:	Known to occur along roadside ditches and canals, however, all records are to the east and southeast and the Project site appears to be at the edge or outside of its distribution.

4.5.2.5 Taxa with No Potential for Occurrence

The following 14 special status plant taxa from desktop analysis were determined to have **No** potential for occurrence in the Biological Study Area. Likewise, none of these taxa would be expected to occur in the Annexation Area.

- **Suisun Marsh Aster**

Asteraceae > Symphyotrichum lentum

FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	perennial rhizomatous herb blooms (Apr) May-Nov
Habitat Requirements:	Marshes and swamps at elevations ranging from 0 to 10 feet.
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest record is 7.5 miles to the southwest. Outside of species' known distribution range.

Dwarf Downingia

Campanulaceae > Downingia pusilla

FESA: None, CESA: None, CRPR 2B.2

California Endemic:	False
Growth Habit:	annual herb blooms Mar-May
Habitat Requirements:	Valley and foothill grassland, Vernal pools at elevations ranging from 5 to 1,460 feet.
Inclusion Source(s):	CNDDB, CNPS
CNDDB Records:	3
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest CNDDB records are 3.8 miles to the east. Biological Study Area lacks required habitat components (vernal pool).

Legenere

Campanulaceae > Legenere limosa

FESA: None, CESA: None, CRPR 1B.1

California Endemic:	True
Growth Habit:	annual herb blooms Apr-Jun
Habitat Requirements:	Vernal pools at elevations ranging from 5 to 2,885 feet.
Inclusion Source(s):	CNPS, HCP
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest CNDDB record is 5.5 miles to the east. Biological Study Area lacks required habitat components (vernal pool).

Heartscale

Chenopodiaceae > Atriplex cordulata var. cordulata

FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True

Growth Habit:	annual herb blooms Apr-Oct
Habitat Requirements:	Chenopod scrub, Meadows and seeps, Valley and foothill grassland at elevations ranging from 0 to 1,835 feet.
Microhabitat:	Alkaline (sometimes)
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest extant occurrence is 25 miles to the southwest. Outside of species' known distribution range.

Brittlescale

Chenopodiaceae > Atriplex depressa

FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	annual herb blooms Apr-Oct
Habitat Requirements:	Chenopod scrub, Meadows and seeps, Playas, Valley and foothill grassland, Vernal pools at elevations ranging from 5 to 1,050 feet.
Microhabitat:	Alkaline, Clay
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest CNDDB records are 6.7 miles to the west. Biological Study Area lacks required habitat components (playas).

Ferris' Milk-Vetch

Fabaceae > Astragalus tener var. ferrisiae

FESA: None, CESA: None, CRPR 1B.1

California Endemic:	True
Growth Habit:	annual herb blooms Apr-May
Habitat Requirements:	Meadows and seeps, Valley and foothill grassland at elevations ranging from 5 to 245 feet.
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest CNDDB records are 6.2 miles to the south. Biological Study Area lacks required habitat components (alkaline flats, vernally moist meadows).

Alkali Milk-Vetch

Fabaceae > Astragalus tener var. tener
FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	annual herb blooms Mar-Jun
Habitat Requirements:	Playas, Valley and foothill grassland, Vernal pools at elevations ranging from 5 to 195 feet.
Microhabitat:	Alkaline
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest CNDDB records are 7.5 miles to the southwest. Biological Study Area lacks required habitat components (playas, vernal pools).

Delta Tule Pea

Fabaceae > Lathyrus jepsonii var. jepsonii
FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	perennial herb blooms May-Jul (Aug-Sep)
Habitat Requirements:	Marshes and swamps at elevations ranging from 0 to 15 feet.
Inclusion Source(s):	HCP
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest CNDDB record is 25 miles to the south. Outside of species' known distribution range.

Saline Clover

Fabaceae > Trifolium hydrophilum
FESA: None, CESA: None, CRPR 1B.2

California Endemic:	True
Growth Habit:	annual herb blooms Apr-Jun
Habitat Requirements:	Marshes and swamps, Valley and foothill grassland, Vernal pools at elevations ranging from 0 to 985 feet.
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest records are 7.5 miles to the west. All records are west and south of the Project site, which may be outside of the range of the species. Biological Study Area lacks required habitat components (salt marsh).

- **Boggs Lake Hedge-Hyssop**

  Plantaginaceae > Gratiola heterosepala

  FESA: None, CESA: California Endangered, CRPR 1B.2

  California Endemic: False
  Growth Habit: annual herb blooms Apr-Aug
  Habitat Requirements: Marshes and swamps (lake margins), Vernal pools at elevations ranging from 35 to 7,790 feet.
  Microhabitat: Clay
  Inclusion Source(s): CNPS, HCP
  CNDDB Records: 0
  Nearest CNDDB Record: > 3 Miles
  Habitat Present: Not Present
  Soils Present: Unknown
  Determination Reason: Nearest CNDDB records are 5.6 miles to the northeast. Biological Study Area lacks required habitat components (lake margins, vernal pools).

- **Colusa Grass**

  Poaceae > Neostapfia colusana

  FESA: Federal Threatened, CESA: California Endangered, CRPR 1B.1

  California Endemic: True
  Growth Habit: annual herb blooms May-Aug
  Habitat Requirements: Vernal pools at elevations ranging from 15 to 655 feet.
  Inclusion Source(s): HCP
  CNDDB Records: 0
  Nearest CNDDB Record: > 3 Miles
  Habitat Present: Not Present
  Soils Present: Unknown
  Determination Reason: Nearest CNDDB records are 13 miles to the southwest. Outside of species' known distribution range.

- **Slender Orcutt Grass**

  Poaceae > Orcuttia tenuis

  FESA: Federal Threatened, CESA: California Endangered, CRPR 1B.1

  California Endemic: True
  Growth Habit: annual herb blooms May-Sep (Oct)
  Habitat Requirements: Vernal pools at elevations ranging from 115 to 5,775 feet.
  Inclusion Source(s): HCP
  CNDDB Records: 0
  Nearest CNDDB Record: > 3 Miles
  Habitat Present: Not Present
  Soils Present: Unknown
  Determination Reason: Nearest record is 20 miles to the southeast. Outside of species' known distribution range.

- **Sacramento Orcutt Grass**

Poaceae > Orcuttia viscida
FESA: Federal Endangered, CESA: California Endangered, CRPR 1B.1

California Endemic:	True
Growth Habit:	annual herb blooms Apr-Jul (Sep)
Habitat Requirements:	Vernal pools at elevations ranging from 100 to 330 feet.
Inclusion Source(s):	HCP
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	No
Determination Reason:	Nearest records are 17 miles to the east. Outside of species' known distribution range.

- **California Alkali Grass**

Poaceae > Puccinellia simplex
FESA: None, CESA: None, CRPR 1B.2

California Endemic:	False
Growth Habit:	annual herb blooms Mar-May
Habitat Requirements:	Chenopod scrub, Meadows and seeps, Valley and foothill grassland, Vernal pools at elevations ranging from 5 to 3,050 feet.
Inclusion Source(s):	CNPS
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Soils Present:	Unknown
Determination Reason:	Nearest CNDDB records are 7 miles to the west and southwest. Biological Study Area lacks required habitat components (saline flats, mineral springs).

4.6 Wildlife

4.6.1 Wildlife Diversity

A total of 51 wildlife taxa were detected during field surveys including 45 bird species, three mammal species, four reptile species, and one amphibian species. A list of all wildlife taxa detected during field surveys is provided in **Appendix A**.

4.6.2 Special Status Wildlife

The desktop review determined that 28 wildlife taxa with special status had been documented as occurring within the Regional Study Area. These taxa and their occurrence potential are discussed below and summarized in **Appendix B**.

4.6.2.1 Taxa Confirmed Present

The following four special status wildlife taxa from desktop analysis were determined to be **Present** in the Biological Study Area. Likewise, all four would be present in the Annexation Area.

Giant Gartersnake

Colubridae > Thamnophis gigas

Federal Threatened; California Threatened

Life History: Historically ranged in the Sacramento and San Joaquin valleys. Its current range is much reduced, and it is apparently extirpated south of Fresno County except for western Kern County. Primarily associated with marshes and sloughs, less with slow-moving creeks, and absent from larger rivers. Active from mid-March until October. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*

Inclusion Source(s): CNDDB; IPaC; HCP

CNDDB Records: 53

Nearest CNDDB Record: Overlaps

Habitat Present: Medium Quality

Determination Reason: The species was not observed during any of Bargas' five surveys. There are several CNDDB records within the past 20 years documenting the presence of Giant Gartersnake in the West Drainage Canal in the vicinity of the Project site. The West Drainage Canal is hydrologically connected to Fisherman's Lake, located approximately 0.5-mile south of the Project site, where there is a known population of Giant Gartersnake. Habitat for this species in the Biological Study Area is best described as marginal as it contains some of the elements required by this species and could support transient individuals. Habitat in the Biological Study Area consists of interconnected drainage canals (i.e. Canal-1, Canal-2, Canal-3/West Drainage Canal). These canals are likely inundated during the summer as they collect irrigation and storm water run-off from surround lands during the growing season. All canals were observed to contain some cover of emergent aquatic vegetation dominated by Floating Water Primrose (*Ludwigia peploides*), with small areas of Cattail, and Common Tule. Cover of these emergent aquatic species was low at the time of the April survey. However, large areas of open water had remnants of Floating Water Primrose from the previous growing season indicating that cover of this species may be substantial mid-summer. Much of the canal banks are vertical and undercut with few visible burrows suitable for this species. The top of the canal banks are highly compacted and show evidence of repeated mowing and grading along many reaches. No burrows capable of supporting overwintering Giant Gartersnake were observed during the April survey. Habitat in the Biological Study Area is unlikely to support a permanent population due to its lack of suitable burrows and high levels of vegetation management. However, the marginal habitat present provides connectivity to occupied sites to the north and south of the Biological Study Area within the American Basin. Though not ideal for Giant Gartersnake, the canals within Biological Study Area could support transient individuals on a temporary basis.

Northwestern Pond Turtle

Emydidae > Actinemys marmorata

California Species of Special Concern

Life History: Actinemys species are uncommon to common in suitable aquatic habitat throughout California, west of the Sierra-Cascade crest and absent from desert regions, except in the Mojave Desert along the Mojave River and its tributaries. Elevation range extends from near sea level to 1,430 meters (4,690 feet). Associated with permanent or nearly permanent water in a wide variety of habitat types. Western Pond Turtle was split into two species in 2014, with A. marmorata ranging from the Central Valley north. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*

Inclusion Source(s): CNDDB; Bargas; HCP

CNDDB Records: 1

Nearest CNDDB Record: 1 to 3 Miles

Habitat Present: Medium Quality

Determination Reason: Was detected during three of Bargas' five surveys in Canal-2 and Canal-3 (West Drainage Canal) within the Biological Study Area. Individuals were observed sunning on floating debris and/or vegetation within the canals. Adjacent upland habitats are marginal for this species as much of the canal banks are vertical and undercut. Further, the top of the canal banks are highly compacted and show evidence of repeated mowing and grading along many reaches.

Northern Harrier

Accipitridae > Circus hudsonius

California Species of Special Concern

Life History: Occurs from annual grassland up to lodgepole pine and alpine meadow habitats, as high as 3,000 m (10,000 ft). Breeds from sea level to 1,700 m (0-5,700 ft) in the Central Valley and Sierra Nevada, and up to 800 m (3,600 ft) in northeastern California. Frequents meadows, grasslands, open rangelands, desert sinks, fresh and saltwater emergent wetlands; seldom found in wooded areas. Permanent resident of the northeastern plateau and coastal areas; less common resident of the Central Valley. Widespread winter resident and migrant in suitable habitat. California population has decreased in recent decades, but can be locally abundant where suitable habitat remains free of disturbance, especially from intensive agriculture. Breeding population much reduced, especially in southern coastal district. Destruction of wetland habitat, native grassland, and moist meadows, and burning and plowing of nesting areas during early stages of breeding cycle, are major reasons for the decline. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*

Inclusion Source(s): Bargas

CNDDB Records: 0

Nearest CNDDB Record: > 3 Miles

Habitat Present: High Quality

Determination Reason: Observed foraging on and flying over the Project site on two of the five surveys conducted by Bargas biologists.

- **Swainson's Hawk**
  Accipitridae > Buteo swainsoni
  California Threatened

Life History:	Uncommon breeding resident and migrant in the Central Valley, Klamath Basin, Northeastern Plateau, Lassen County, and Mojave Desert. Very limited breeding reported from Lanfair Valley, Owens Valley, Fish Lake Valley, and Antelope Valley. Breeds in stands with few trees in juniper-sage flats, riparian areas, and in oak savannah in the Central Valley. Forages in adjacent grasslands or suitable grain or alfalfa fields, or livestock pastures. In southern California, now mostly limited to spring and fall transient. Formerly abundant in California with wider breeding range. Decline resulted in part from loss of nesting habitat. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*
Inclusion Source(s):	CNDDB; Bargas; HCP
CNDDB Records:	47
Nearest CNDDB Record:	Overlaps
Habitat Present:	High Quality
Determination Reason:	Present and observed during April and May surveys. Nesting activity was not detected, however, a nesting survey has not been conducted. Nesting habitat is limited in the Biological Study Area.

4.6.2.2 Taxa With High Potential for Occurrence

The following special status wildlife taxon from desktop analysis was determined to have **High** potential for occurrence in the Biological Study Area. Likewise, this taxon would be expected to have the same potential for occurrence in the Annexation Area.

- **White-tailed Kite**
  Accipitridae > Elanus leucurus
  California Fully Protected

Life History:	Common to uncommon, yearlong resident in coastal and valley lowlands; rarely found away from agricultural areas. Inhabits herbaceous and open stages of most habitats mostly in cismontane California. Has extended range and increased numbers in recent decades. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*
Inclusion Source(s):	CNDDB
CNDDB Records:	4
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	High Quality
Determination Reason:	The Project site contains foraging habitat that could support this species; however, nesting habitat is limited and composed of the relatively few Goodding's Black Willow, Valley Oak, and other trees along the canal and ditch banks.

4.6.2.3 Taxa With Moderate Potential for Occurrence

The following special status wildlife taxon from desktop analysis was determined to have **Moderate** potential for occurrence in the Biological Study Area. Likewise, this taxon would be expected to have the same potential for occurrence in the Annexation Area.

- **Burrowing Owl**
  Strigidae > Athene cunicularia
  California Species of Special Concern

Life History:	A yearlong resident of open, dry grassland and desert habitats, and in grass, forb and open shrub stages of Pinyon-Juniper and Ponderosa Pine habitats. Formerly common in appropriate habitats throughout the state, excluding the humid northwest coastal forests and high mountains. Numbers markedly reduced in recent decades. Present on the larger offshore islands. Found as high as 1600 meters (5300 feet) in Lassen County. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*
Inclusion Source(s):	CNDDB; HCP
CNDDB Records:	17
Nearest CNDDB Record:	1 to 3 Miles
Habitat Present:	Medium Quality
Determination Reason:	Most regional records are east of Highway 99. There are, however, recent CNDDB records from the Sacramento International Airport. Has the potential to occur widely during migration and winter in appropriate open habitats and disturbed areas. The Biological Study Area contains some open disturbed areas, primarily in the construction staging area along the south side of Bayou Way and west of Metro Air Parkway, that provide marginal habitat for this species; however, existing suitable burrows and ground-squirrels were not observed.

4.6.2.4 Taxa With Low Potential for Occurrence

The following 6 special status wildlife taxa from desktop analysis were determined to have **Low** potential for occurrence in the Biological Study Area. Likewise, all six would be expected to have the same potential for occurrence in the Annexation Area.

- **Monarch - California Overwintering Population**
  Nymphalidae > Danaus plexippus pop. 1
  Federal Candidate

Life History:	The iconic black and orange Monarch butterfly is known for its astonishing long-distance annual migration and reliance on milkweed as its obligate larval host plant. Though genetically similar, there are two subpopulations of Monarchs in North America, with the eastern population overwintering in Mexico and breeding in the midwestern states, and the western population overwintering in coastal California and fanning out across the west from Arizona to Idaho. Both North American migratory populations have declined over the past twenty years due to a suite of interrelated factors including habitat loss in breeding and overwintering sites, habitat

degradation, disease, pesticide exposure, and climate change. Recently the western population has experienced dramatic swings, for a low of less than 2,000 in 2020-21 to over 200,000 in 2021-22. While it is unclear which of the many factors are driving these dynamics, insect population commonly fluctuate from year to year. Though more research is needed, a stable population for western monarchs is likely closer to the historic averages in the 1980's, which are estimated to have ranged between one to four million overwintering butterflies. *Source: https://wildlife.ca.gov/Conservation/Invertebrates/Monarch-Butterfly*

Inclusion Source(s): IPaC
CNDDB Records: 0
Nearest CNDDB Record: > 3 Miles
Habitat Present: Low Quality
Determination Reason: Nearest CNDDB records are 38 miles to the southwest. As a migratory species with flight capability, has potential to occur anywhere during movements. Unlikely to be resident on the Project site due to agricultural land uses and lack of suitable host plants.

Cackling Goose

Anatidae > Branta hutchinsii

No special status

Life History: The only subspecies of B. hudsonii in California (B.h. leucoparia) was once considered a subspecies of B. canadensis, the Canada Goose (B.c. leucoparia). Preferred habitats include lacustrine, fresh emergent wetlands, and moist grasslands, croplands, pastures, and meadows. This species occurs mainly in these habitats during winter in Del Norte county, the San Francisco bay-delta, and southern Central Valley. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*

Inclusion Source(s): HCP
CNDDB Records: 0
Nearest CNDDB Record: > 3 Miles
Habitat Present: Low Quality
Determination Reason: Nearest CNDDB record is 28 miles to the north. While this is an NBHCP Covered Species, it has not been recorded within the Natomas Basin. Sometimes occurs singly or in small numbers with more numerous Canada Geese, which will often feed in agricultural fields, especially during winter months.

White-faced Ibis

Threskiornithidae > Plegadis chihi

No special status

Life History: The White-faced Ibis is an uncommon summer resident in sections of southern California, a rare visitor in the Central Valley, and is more widespread in migration. It prefers to feed in fresh emergent wetland, shallow lacustrine waters, muddy ground of wet meadows, and irrigated

	or flooded pastures and croplands. Nests in dense, fresh emergent wetland. Formerly more common, especially in the San Joaquin Valley, this species no longer breeds regularly anywhere in California. A few pairs bred in 1977 and 1978 at the Salton Sea, and in 1979 at Buena Vista Lagoon, San Diego County. Has nested at Honey Lake, in the Klamath Basin, and at a few isolated areas in Central Valley. At Salton Sea area, fairly common April to September, and uncommon through winter; uncommon transient elsewhere in southern California, and very local winter visitant along coast. Rare in San Joaquin Valley, occurring mainly near Los Banos, August to April; and rare on northeastern plateau April to September. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*
Inclusion Source(s):	HCP
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Low Quality
Determination Reason:	Nearest CNDDB records are 8 miles to west, though also present in significant numbers at Yolo Bypass 5 miles to the southwest. Has some potential to be observed on the Project site at the margins of canals or adjacent agricultural areas for foraging. Project site does not contain habitat to support nesting.

Loggerhead Shrike

Laniidae > Lanius ludovicianus

California Species of Special Concern

Life History:	A common resident and winter visitor in lowlands and foothills throughout California. Prefers open habitats with scattered shrubs, trees, posts, fences, utility lines, or other perches. Highest density occurs in open-canopied valley foothill hardwood, valley foothill hardwood-conifer, valley foothill riparian, pinyon-juniper, juniper, desert riparian, and Joshua Tree habitats. In the Great Basin, from Inyo County north, population declines markedly from November through March. Rare on coastal slope north of Mendocino County, occurring only in winter. Occurs only rarely in heavily urbanized areas, but often found in open cropland. Sometimes uses edges of denser habitats. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*
Inclusion Source(s):	HCP
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Low Quality
Determination Reason:	Under-reported in the CNDDB, the nearest records are more than 50 miles distant. Occurs sparingly in the Natomas Basin. Unlikely to be present on the Project site due to lack of scrubby habitat which is normally present in preferred areas.

Song Sparrow (Modesto Population)

Passerellidae > Melospiza melodia

California Species of Special Concern

Life History:	A common resident of most of California, but avoids higher mountains and occurs only locally in southern deserts. In winter, most leave montane habitats; more abundant and widespread then in lowlands and deserts. At all seasons, prefers riparian, fresh or saline emergent wetland, and wet meadow habitats. Breeds in riparian thickets of willows, other shrubs, vines, tall herbs, and in fresh or saline emergent vegetation. The Modesto Song Sparrow is endemic to California, where it resides only in the north-central portion of the Central Valley. Highest densities occur in the Butte Sink area of the Sacramento Valley and in the Sacramento–San Joaquin River Delta. *Source: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=10461*
Inclusion Source(s):	CNDDB
CNDDB Records:	4
Nearest CNDDB Record:	1 to 3 Miles
Habitat Present:	Low Quality
Determination Reason:	While populations have dropped by 90% from historical highs, this resident form of the Song Sparrow has been recorded in sparsely-vegetated margins of canals, such as those bordering the Project site. Project site contains limited habitat that could support nesting.

Tricolored Blackbird

Icteridae > Agelaius tricolor

California Threatened; California Species of Special Concern

Life History:	Mostly a resident in California. Common locally throughout Central Valley and in coastal districts from Sonoma County south. Breeds near fresh water, preferably in emergent wetland with tall, dense cattails or tules, but also in thickets of willow, blackberry, wild rose, tall herbs. Feeds in grassland and cropland habitats. Breeds locally in northeastern California. In winter, becomes more widespread along central coast and San Francisco Bay area and is found in portions of the Colorado Desert. Numbers appear to be declining in California. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*
Inclusion Source(s):	CNDDB; HCP
CNDDB Records:	2
Nearest CNDDB Record:	< 1 Mile
Habitat Present:	Low Quality
Determination Reason:	Appropriate breeding habitat not present. Will often forage in agricultural fields, especially in winter.

4.6.2.5 Taxa With No Potential for Occurrence

The following 16 special status wildlife taxa from desktop analysis were determined to have **No** potential for occurrence in the Biological Study Area. Likewise, none of these taxa would be expected to occur in the Annexation Area.

- **Vernal Pool Fairy Shrimp**

  Branchinectidae > Branchinecta lynchi

  Federal Threatened

  Life History: The Vernal Pool Fairy Shrimp inhabits ephemeral pools with clear to tea-colored water. This species has been most commonly observed in grass or mud bottomed swales, earth sump, or basalt flow depression pools in unplowed grasslands. The Vernal Pool Fairy Shrimp has been collected from early December to early May. The water in pools inhabited by this species has a pH averaging 7.0; and low TDS, conductivity, alkalinity, and chloride. Although the Vernal Pool Fairy Shrimp is found at a number of sites, it is not abundant at any of them. It often occurs with other fairy shrimp species, but is never the numerically dominant one. *Source: https://www.govinfo.gov/content/pkg/FR-1992-05-08/pdf/FR-1992-05-08.pdf#page=76*

  Inclusion Source(s): CNDDB; IPaC; HCP

  CNDDB Records: 7

  Nearest CNDDB Record: > 3 Miles

  Habitat Present: Not Present

  Determination Reason: The majority of CNDDB records are greater than 5 miles to the northeast, east, and southeast. Appropriate vernal pool habitat is not present on the Project site.

- **Midvalley Fairy Shrimp**

  Branchinectidae > Branchinecta mesovallensis

  No special status

  Life History: Midvalley Fairy Shrimp are small freshwater crustaceans found in vernal pools, vernal swales, and ephemeral wetlands in the Central Valley of California. They are known to occur in five different vernal pool regions: Southeastern Sacramento Valley, Livermore, Southern Sierra Foothills, San Joaquin Valley, and the Solano-Colusa region. They were only recently documented as an individual species in 2000 due to their similarities to similar species (male Conservancy Fairy Shrimp and female Vernal Pool Fairy Shrimp. Midvalley Fairy Shrimp swim on their backs and use their phyllopods to paddle and extract oxygen and food from the water. *Source: https://www.govinfo.gov/content/pkg/FR-2004-01-26/pdf/04-1510.pdf#page=1*

  Inclusion Source(s): HCP

  CNDDB Records: 0

  Nearest CNDDB Record: None

  Habitat Present: Not Present

Determination Reason: Not tracked by the CNDDB. Appropriate vernal pool habitat is not present on the Project site.

Vernal Pool Tadpole Shrimp

Triopsidae > Lepidurus packardi

Federal Endangered

Life History: Vernal Pool Tadpole Shrimp inhabits vernal pools and swales containing clear to highly turbid water. The Vernal Pool Tadpole Shrimp is found at 14 vernal pool complexes in the Sacramento Valley from the Vina Plains in Butte County south of the Sacramento area in Sacramento County and west to the Jepson Prairie region of Salano County. The pools inhabited by the Vernal Pool Tadpole Shrimp range in size from 5 square meters (16.4 square ft) in the Mather Air Force Base area of Sacramento County to the 38 hectare (89 acre) Olcott Lake at Jepson Prairie. The pools at Jepson Prairie and Vina Plains have a neutral pH, and very low conductivity, TDS, and alkalinity. These pools are most commonly located in grass bottomed swales of unplowed grasslands in old alluvial soils underlain by hardpan, or in mud- bottomed pools containing highly turbid water. All pools known to be inhabited by this species are filled by winter and spring rains and may last until June. *Source: https://www.govinfo.gov/content/pkg/FR-1992-05-08/pdf/FR-1992-05-08.pdf#page=76*

Inclusion Source(s): IPaC; HCP

CNDDB Records: 0

Nearest CNDDB Record: > 3 Miles

Habitat Present: Not Present

Determination Reason: Several records in all directions 6-10 miles from the Project site. No appropriate vernal pool habitat within the Project site's boundaries.

Valley Elderberry Longhorn Beetle

Cerambycidae > Desmocerus californicus dimorphus

Federal Threatened

Life History: Valley elderberry longhorn beetle is a medium sized beetle that is endemic to the Central Valley of California. The beetle is found only in association with its host plant, elderberry (Sambucus spp.) and originally occured in elderberry thickets in moist valley oak woodland along the margins of the Sacramento and San Joaquin Rivers in the Central Valley of California. The habitat of this insect has now largely disappeared throughout much of its former range due to agricultural conversion, levee construction, and stream channelization. The clearing of undergrowth (including elderberry) and planting of lawns has resulted in further habitat degradation. *Source: https://ecos.fws.gov/ecp/species/7850*

Inclusion Source(s): CNDDB; IPaC; HCP

CNDDB Records: 5

Nearest CNDDB Record: 1 to 3 Miles

Habitat Present: Not Present

Determination Reason: Numerous records along the Sacramento River 1.5 miles to the southwest. Elderberry not present on the Project site.

Green Sturgeon - Southern DPS

Acipenseridae > Acipenser medirostris pop. 1

Federal Threatened; California Species of Special Concern

Life History: The Green Sturgeon (Acipenser medirostris) is an anadromous fish species that is long-lived and among the most marine oriented sturgeon species in the family Acipenseridae. NMFS has determined green sturgeon are comprised of at least two distinct population segments (DPSs): (1) A Northern DPS consisting of populations originating from coastal watersheds northward of and including the Eel River; and (2) a southern DPS consisting of populations originating from coastal watersheds south of the Eel River, with the only known spawning population in the Sacramento River. Adult Green Sturgeon spawn every 2-4 years. Adult Green Sturgeon begin spawining migrations in late February. Spawning occurs from March to July, with peak activity from mid-April to mid-June. Threats include loss of habitat and spawning grounds due to dams and diversions; habitat degradation from pollution, agricultural runoff, and dredging; and the loss of prey species from pesticide application. *Source: https://www.federalregister.gov/documents/2009/10/09/E9-24067/endangered-and-threatened-wildlife-and-plants-final-rulemaking-to-designate-critical-habitat-for-the*

Inclusion Source(s): CH

CNDDB Records: 0

Nearest CNDDB Record: > 3 Miles

Habitat Present: Not Present

Determination Reason: Occurs in the Sacramento River one mile or more south and west of the Project site. No appropriate riverine habitat is present on or near the Project site.

Steelhead - Central Valley DPS

Salmonidae > Oncorhynchus mykiss irideus pop. 11

Federal Threatened

Life History: Steelhead and rainbow trout are the same species. In general, steelhead refers to the anadromous form of the species. Steelhead typically migrate to marine waters after spending two years in fresh water. They reside in marine waters for typically two or three years prior to returning to their natal stream to spawn as four- or five-yearolds. The Central Valley Distinct Population Segment, or DPS, includes naturally spawned anadromous O. mykiss (steelhead) originating below natural and manmade impassable barriers from the Sacramento and San Joaquin Rivers and their tributaries; excludes such fish originating from San Francisco and San Pablo Bays and their tributaries. Main threats to this DPS include habitat degradation and destruction, blockage of freshwater habitats, water allocation problems, the pervasive opportunity for genetic introgression resulting from widespread production of hatchery steelhead and the potential ecological interaction between introduced stocks and native stocks. *Source:*

https://www.fisheries.noaa.gov/west-coast/endangered-species-conservation/sacramento-river-winter-run-chinook-salmon

Inclusion Source(s): CNDDB; CH
CNDDB Records: 3
Nearest CNDDB Record: < 1 Mile
Habitat Present: Not Present
Determination Reason: Found in the Sacramento River 1.5 miles to the west.

Chinook Salmon - Central Valley Spring-Run ESU

Salmonidae > Oncorhynchus tshawytscha pop. 11
Federal Threatened; California Threatened

Life History: Chinook salmon are the largest of the Pacific salmon. Adult Central Valley spring-run Chinook salmon leave the ocean to begin their upstream migration in late January and early February and enter the Sacramento River between March and September, primarily in May and June. Spring-run Chinook salmon generally enter rivers as sexually immature fish and must hold in freshwater for up to several months before spawning. Spawning normally occurs between mid-August and early October, peaking in September. This evolutionarily significant unit, or ESU, includes naturally spawned spring-run Chinook salmon originating from the Sacramento River and its tributaries, and also spring-run Chinook salmon from the Feather River Hatchery Spring-run Chinook Program. The Central Valley spring-run ESU is currently faced with three primary threats: loss of spawning habitat; degradation of the remaining habitat; and genetic introgression with the Feather River Fish Hatchery spring-run strays. *Source: https://www.fisheries.noaa.gov/west-coast/endangered-species-conservation/central-valley-spring-run-chinook-salmon*

Inclusion Source(s): CH
CNDDB Records: 0
Nearest CNDDB Record: None
Habitat Present: Not Present
Determination Reason: Occurs in the Sacramento River one mile or more south and west of the Project site. No appropriate riverine habitat is present on or near the Project site.

Chinook Salmon - Sacramento River Winter-Run ESU

Salmonidae > Oncorhynchus tshawytscha pop. 7
Federal Endangered; California Endangered

Life History: Adult winter-run Chinook salmonupstream spawning migration through the Delta and into the lower Sacramento River occurs from December through July, with a peak during the period extending from January through April. Spawning occurs between late-April and mid-August, with a peak in June and July. The Sacramento River winter-run Chinook salmon ESU includes winter-run Chinook salmon spawning naturally in the Sacramento River and its tributaries, as well as winter-run Chinook salmon that are part of the conservation hatchery program at the Livingston Stone National Fish Hatchery. Main threats facing this ESU include a single

	population source of small size, habitat loss and degradation, the introduction of non-native predators, and overfishing by commercial and recreational fisheries. *Source: https://www.fisheries.noaa.gov/west-coast/endangered-species-conservation/sacramento-river-winter-run-chinook-salmon*
Inclusion Source(s):	CH
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Determination Reason:	Occurs in the Sacramento River one mile or more south and west of the Project site. No appropriate riverine habitat is present on or near the Project site.

Delta Smelt

Osmeridae > Hypomesus transpacificus

Federal Threatened; California Endangered

Life History:	The Delta Smelt is a small fish, endemic to California that only occurs in the San Francisco Estuary. The slender-bodied fish typically reaches about 60-70 mm to a maximum size of about 120 mm (Figures 1, 2 and 3). The Delta Smelt life cycle follows the four seasons—spring spawning in fresh water, summer migration/rearing in the low salinity zone, fall maturation in the low salinity zone, and winter upstream migration shortly before spawning (Figure 4). Most spawning happens in tidally influenced backwater sloughs and channel edgewaters. Eggs are adhesive, and thought to be released in batches over firm substrates or sand. Delta Smelt is a euryhaline species, able to tolerate a wide salinity range. *Source: https://wildlife.ca.gov/Conservation/Fishes/Delta-Smelt*
Inclusion Source(s):	IPaC
CNDDB Records:	0
Nearest CNDDB Record:	> 3 Miles
Habitat Present:	Not Present
Determination Reason:	Nearest CNDDB record is 23 miles southwest. No appropriate riverine habitat is present on or near the Project site.

Longfin Smelt

Osmeridae > Spirinchus thaleichthys

Federal Candidate; California Threatened

Life History:	Longfin Smelt Spirinchus thaleichthys is a small fish in the family Osmeridae found along the Pacific coast of the United States from Alaska to California. In California, Longfin Smelt is historically found in the San Francisco Estuary and the Sacramento/San Joaquin Delta (Bay-Delta), Humboldt Bay, and the estuaries of the Eel River and Klamath River. Spawning occurs from November through May, with a peak from February through April. The causes of decline from northern estuaries are not clearly known, but they are probably similar to those of the Bay-Delta, which include: reduction in freshwater outflows, entrainment losses to water diversion, changes in food organisms, toxic substances, disease,

competition, introduced species, and loss of genetic integrity. *Source: https://wildlife.ca.gov/Conservation/Fishes/Longfin-Smelt*

Inclusion Source(s): CNDDB
CNDDB Records: 1
Nearest CNDDB Record: 1 to 3 Miles
Habitat Present: Not Present
Determination Reason: Occurs in the Sacramento River one mile or more south and west of the Project site. No appropriate riverine habitat is present on or near the Project site.

Sacramento Splittail

Cyprinidae > Pogonichthys macrolepidotus
California Species of Special Concern

Life History: Splittail are large cyprinids and are distinctive in having the upper lobe of the caudal fin larger than the lower lobe. The body shape is elongate with a blunt head. Small barbels may be present on either side of the subterminal mouth. Splittail depend both on brackish-water rearing habitats in the San Francisco Estuary and on floodplain and river-edge spawning habitats immediately above the estuary. Most migrate between these two habitat types on a near annual basis. The Sacramento splittail is endemic to California's Central Valley and was once distributed in lakes and rivers throughout the Central Valley. Threats include reduced outflow and estuary degradation due to damming, competition from invasive species, and habitat degradation from agricultural runoff. *Source: https://nrm.dfg.ca.gov/FileHandler.ashx?DocumentID=104370*

Inclusion Source(s): CNDDB
CNDDB Records: 1
Nearest CNDDB Record: 1 to 3 Miles
Habitat Present: Not Present
Determination Reason: Found on the Sacramento River 1.5 miles to the west.

California Red-legged Frog

Ranidae > Rana draytonii
Federal Threatened; California Species of Special Concern

Life History: The California Red-legged Frog inhabits quiet pools of streams, marshes, and occasionally ponds. Occurs along the Coast Ranges from Mendocino County south and in portions of the Sierra Nevada and Cascades ranges, usually below 1200 m (3936 ft). This species was once a subspecies of Rana aurora, then known as the Red-legged Frog, and has been elevated to species-level status. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*

Inclusion Source(s): IPaC
CNDDB Records: 0
Nearest CNDDB Record: > 3 Miles
Habitat Present: Not Present

Determination Reason: Nearest CNDDB records are 38 miles to the east. There is no habitat on or in the vicinity of the Project site. It is unclear why this species was returned in the IPaC search.

Western Spadefoot

Scaphiopodidae > Spea hammondii

California Species of Special Concern

Life History: The Western Spadefoot ranges throughout the Central Valley and adjacent foothills, and is usually quite common where it occurs. In the Coast Ranges it is found from Point Conception, Santa Barbara County, south to the Mexican border. Elevations of occurrence extend from near sea level to 1363 m (4460 ft) in the southern Sierra foothills. This species occurs primarily in grasslands, but occasional populations also occur in valley-foothill hardwood woodlands. Some populations persist for a few years in orchard or vineyard habitats. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*

Inclusion Source(s): HCP

CNDDB Records: 0

Nearest CNDDB Record: > 3 Miles

Habitat Present: Not Present

Determination Reason: Nearest CNDDB record is 13 miles to the northeast.

California Tiger Salamander

Ambystomatidae > Ambystoma californiense

Federal Endangered; California Endangered

Life History: Most commonly found in Annual Grassland habitat, but also occurs in the grassy understory of Valley-Foothill Hardwood habitats, and uncommonly along stream courses in Valley-Foothill Riparian habitats. The species occurs from near Petaluma, Sonoma County, east through the Central Valley to Yolo and Sacramento counties and south to Tulare County; and from the vicinity of San Francisco Bay south to Santa Barbara County. They occur at elevations from 3 meters up to 1,054 meters (3,200 feet). *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*

Inclusion Source(s): IPaC; HCP

CNDDB Records: 0

Nearest CNDDB Record: > 3 Miles

Habitat Present: Not Present

Determination Reason: Nearest non-extirpated CNDDB records are 13 miles to the southwest. While this is an NBHCP Covered Species, it has not been documented in the Natomas Basin.

Least Bell's Vireo

Vireonidae > Vireo bellii pusillus

Federal Endangered; California Endangered

Life History: null *Source:*

Inclusion Source(s): CNDDB

CNDDB Records: 1

Nearest CNDDB Record: > 3 Miles

Habitat Present: Not Present

Determination Reason: Single CNDDB record is from 1877. There is no suitable habitat for this species on or near the Project site, and likely none within the Regional Study Area.

Bank Swallow

Hirundinidae > Riparia riparia

California Threatened

Life History: A neotropical migrant found primarily in riparian and other lowland habitats in California west of the deserts during the spring-fall period. A spring and fall migrant in the interior, less common on coast; an uncommon and very local summer resident. Casual in southern California in winter; a few winter records along central coast to San Mateo County. In summer, restricted to riparian, lacustrine, and coastal areas with vertical banks, bluffs, and cliffs with fine-textured or sandy soils, into which it digs nesting holes. In migration, flocks with other swallows over many open habitats. Range in California estimated to be reduced 50% since 1900. Formerly more common as breeder in California. Now, only approximately 110-120 colonies remain within the state. Perhaps 75% of the current breeding population in California occurs along banks of the Sacramento and Feather rivers in the northern Central Valley. About 50-60 colonies remain along the middle Sacramento River and 15-25 colonies occur along lower Feather River where the river meanders still in a mostly natural state. Other colonies persist along the central coast from Monterey to San Mateo counties, and northeastern California in Shasta, Siskiyou, Lassen, Plumas, and Modoc counties. *Source: California Department of Fish and Wildlife. California Interagency Wildlife Task Group. 2014. CWHR version 9.0 personal computer program. Sacramento, CA.*

Inclusion Source(s): HCP

CNDDB Records: 0

Nearest CNDDB Record: > 3 Miles

Habitat Present: Not Present

Determination Reason: Nearest CNDDB records are along the Sacramento River 7.5 miles northwest of the Project site. There is no habitat on or near the Project site for breeding, nor does the Project site provide suitable foraging habitat. Like many bird species, there is always a possibility of viewing this species in the area as a flyover.

4.7 Other Considerations

4.7.1 Wildlife Movement

Effects on wildlife movement are an important consideration when assessing the potential anthropogenic effects of any project. At a small enough scale, any project or activity can potentially affect the movement of wildlife if any wildlife are present at all. In general, however, the term "wildlife movement corridor" means an area of habitat that is important for the movement of wildlife between larger habitat areas. Wildlife movement corridors are important for maintaining population levels and genetic diversity.

Wildlife require space to roam in search of food, shelter, mates, or for seasonal migration. Fragmentation of wildlife movement from human development can disrupt the normal flow of essential ecosystem functions. The extent of habitat movement requirements is dependent on the taxa and is crucial to the survival of many species. Overall wildlife movement has become restricted due to man-made barriers, such as roads, structures, development, walls or fencing, and even agricultural fields. It is particularly important to maintain habitat and landscape connectivity and wildlife movement between regional habitat blocks for wide-ranging and low-density mammalian carnivores that require a large home range for survival, including Bobcat (*Lynx rufus*), Coyote (*Canis latrans*), and Mountain Lion (*Puma concolor*).

The drainage canals and ditches present in the Biological Study Area and Annexation Area could serve as movement corridors to aquatic or semi-aquatic wildlife species such as Giant Gartersnake and Northwestern Pond Turtle, the latter of which was observed during the three of the five Bargas surveys within both Canal-2 and Canal-3. Both ditches and Canal-1 and Canal-2 are all ultimately hydrologically connected to Canal-3, the West Drainage Canal. There are several CNDDB records within the past 20 years documenting the presence of Giant Gartersnake in the West Drainage Canal. The West Drainage Canal is hydrologically connected to Fisherman's Lake, located approximately 0.5-mile south of the Project site, where there is a known population of Giant Gartersnake. The West Drainage Canal and other canals have steep banks that may impede use of adjacent uplands by both species. Further, the uplands adjacent to the canals and ditches are heavily disturbed and provide low quality habitat for use in nesting / egg-laying by both species and winter aestivation by Giant Gartersnake. Regardless, the Canal-1, Canal-2 and both ditches (when inundated) may be used by both species for foraging and dispersal.

The Biological Study Area and, by extension, the Annexation Area, does not function as a movement corridor for terrestrial wildlife in general. The Project site contains three large agricultural fields, either fallowed or possibly being utilized for hay production, that are bordered by either paved roads or large drainage canals which functionally serve as barriers to the movement of terrestrial wildlife outside of birds. On all sides of the Project site lie either additional active agricultural fields or urban development which generally do not serve has high quality larger habitat areas which would potentially attract wildlife.

The Biological Study Area and Annexation Area do contain semi-natural and natural vegetation communities that provide foraging habitat for a number of bird species, including Swainson's Hawk, Northern Harrier, and other avian taxa discussed in **Section 4.6.2** above, year-long including during migration. Both the Biological Study Area and Annexation Area contain limited habitat to support nesting birds. The canals and roads present both would not present a barrier to movement to birds since they can fly over them; however, they do not contain areas of natural land cover with tree and/or shrub canopy and limited anthropogenic disturbances that are continuous with areas of natural land cover beyond to provide a high quality wildlife movement corridor for birds.

4.7.2 Nesting Birds

Birds – including native species protected by the Migratory Bird Treaty Act (MBTA) and California Fish and Game Code – have the potential to nest in nearly any environment, including those heavily altered by anthropogenic activity. There is limited tree and shrub canopy along the canals and ditches within the Biological Study Area and Annexation Area. Depending upon the nature of the agricultural activities and fire management practices within these areas, there may be large areas that would contain tall herbaceous vegetation or bare ground to support bird species with those nesting substrate preferences.

4.7.3 Bird Impact Risk and the Sacramento International Airport

Figure 1. A flight taking off from the Sacramento Airport climbs over the Project site.

The Project site and Annexation Area are located immediately southeast of the Sacramento International Airport (Airport) and adjoining Airport-owned property. The current lack of development surrounding the Airport provides for substantial risk of bird strikes with departing or arriving aircraft, with such large species resident as several species of raptor (e.g., Red-tailed Hawk and Swainson's Hawk) and numerous waterbirds (e.g., Double-crested Cormorant, Great Blue Heron, and Great Egret). The impact of bird weighing 3 kg (6.6 lb.) with an aircraft is equivalent to a force of 40 tons (Rosenthal 1998). Such collisions are a major wildlife hazard to the aviation industry, costing the global airline industry over $1.2 billion dollars annually as well as putting passenger safety at risk (Cheng et al. 2015, Uhlfelder 2013). Sacramento International Airport has one of the highest bird/aircraft collision rates in the United States[3].

[3] https://www.npr.org/2009/04/27/103530836/pinpointing-airports-with-high-rate-of-bird-strikes

The Project site and Annexation Area are located within the Federal Aviation Administration's (FAA) 10,000 foot separation area for wildlife attractants[4]. Wildlife attractants are defined by the FAA[5] as:

> *Constructed or natural areas— such as poorly drained locations, detention/retention ponds, roosting habitats on buildings, landscaping, odor-causing rotting organic matter (putrescible waste) disposal operations, wastewater treatment plants, agricultural or aquaculture activities, surface mining, wetlands, or some conservation-based land uses — can provide wildlife with ideal locations for feeding, loafing, reproduction, and escape.*

The above conditions represent typical current conditions on the Project site and Annexation Area (see **Figure 1**).

Airport operators are required by the U.S. Department of Transportation's Federal Aviation Administration (FAA) to conduct Wildlife Hazard Assessments (WHA) and prepare Wildlife Hazard Management Plans (WHMP) when certain criteria are met (FAA 2021). Sacramento International Airport has a WHMP that has been periodically updated per the results of WHA conducted in response to events such as land use changes on and around the airport, including in 2010 in response to new terminal construction on the airport lands and a Natomas Basin levee improvement project nearby the airport (Sacramento County Department of Airports 2015). The WHA identified several actions for the airport to undertake to address wildlife population management, habitat modification, and land use changes.

The WHMP at the Sacramento International Airport is primarily implemented by the biologists of their Wildlife Team in order to alleviate wildlife-aircraft interactions (i.e. bird strikes) to the maximum extent possible. Airport personnel are trained in the avoidance and minimization measures implemented to protect special status wildlife species found on or in proximity to the airport. The lands immediately north and south of the airport (Airport Management Areas) and on the airport itself are managed to minimize attractiveness to wildlife by limiting and/or removing features in the landscape such as dense vegetation cover and aquatic features that could function as habitat for different types of wildlife. Wildlife activity and attractants on and near the airport are monitored by the Wildlife Team biologists. The parcels across from Powerline Road to the west of the Project site are owned by the airport and are monitored and managed per their WHMP.

5 Effects and Minimization Measures

5.1 Grading Impacts and Avoidance

Current plans for the Project propose direct impacts, via grading, to the entire 340 acres of the Project site. As proposed, Project-related grading would impact the following habitat and land cover types:

- **Perennial Rye Grass Fields** comprise 260.49-acres of the Project site.
- **Upland Mustards or Star-thistle Fields** comprise 69.44-acres of the Project site.
- **Disturbed/Developed** comprise 5.23-acres of the Project site.
- **Open Water** comprise 1.93-acres of the Project site.
- **Poison Hemlock or Fennel Patches** comprise 1.28-acres of the Project site.
- **Himalayan Blackberry – Rattlebox – Edible Fig Riparian Scrub** comprise 0.53-acres of the Project site.
- **Goodding's Willow – Red Willow Riparian Woodland and Forest** comprise 0.37-acres of the Project site.
- **Hardstem and California Bulrush Marsh** comprise 0.22-acres of the Project site.
- **Valley Oak Riparian Forest and Woodland** comprise 0.07-acres of the Project site.
- **Cattail Marsh** comprise 0.02-acres of the Project site.

Vegetation impacts are not proposed in the Annexation Area.

5.2 Project Effects on Candidate, Sensitive, or Special Status Species

The Project will need to implement appropriate mitigation measures to avoid effects to special status species, minimize them as much as feasible, or mitigate for unavoidable substantial adverse effects. A discussion of the Project effects on special status species and the need for avoidance, minimization, and mitigation measures is included in the subsections below.

USFWS and CDFW may need to be consulted regarding the potential for the proposed Project to result in the take of listed species and any avoidance, minimization, or mitigation measures suggested by USFWS and CDFW should be implemented.

5.2.1 Special Status Species with No Potential to Occur in the Biological Study Area

As detailed in **Section 4** above, the following 14 special status plant taxa with occurrences in the Regional Study Area were determined to have no potential to occur in the Biological Study Area:

- **Suisun Marsh Aster**: Nearest record is 7.5 miles to the southwest. Outside of species' known distribution range.
- **Dwarf Downingia**: Nearest CNDDB records are 3.8 miles to the east. Biological Study Area lacks required habitat components (vernal pool).
- **Legenere**: Nearest CNDDB record is 5.5 miles to the east. Biological Study Area lacks required habitat components (vernal pool).
- **Heartscale**: Nearest extant occurrence is 25 miles to the southwest. Outside of species' known distribution range.
- **Brittlescale**: Nearest CNDDB records are 6.7 miles to the west. Biological Study Area lacks required habitat components (playas).

- **Ferris' Milk-Vetch**: Nearest CNDDB records are 6.2 miles to the south. Biological Study Area lacks required habitat components (alkaline flats, vernally moist meadows).
- **Alkali Milk-Vetch**: Nearest CNDDB records are 7.5 miles to the southwest.
- **Delta Tule Pea**: Nearest CNDDB record is 25 miles to the south. Outside of species' known distribution range.
- **Saline Clover**: Nearest records are 7.5 miles to the west. All records are west and south of the Project site, which may be outside of the range of the species. Biological Study Area lacks required habitat components (salt marsh).
- **Boggs Lake Hedge-Hyssop**: Nearest CNDDB records are 5.6 miles to the northeast. Biological Study Area lacks required habitat components (lake margins, vernal pools).
- **Colusa Grass**: Nearest CNDDB records are 13 miles to the southwest. Outside of species' known distribution range.
- **Slender Orcutt Grass**: Nearest record is 20 miles to the southeast. Outside of species' known distribution range.
- **Sacramento Orcutt Grass**: Nearest records are 17 miles to the east. Outside of species' known distribution range.
- **California Alkali Grass**: Nearest CNDDB records are 7 miles to the west and southwest. Biological Study Area lacks required habitat components (saline flats, mineral springs).

Likewise, the following 16 special status wildlife taxa with occurrences in the Regional Study Area were determined to have no potential to occur in the Biological Study Area:

- **Vernal Pool Fairy Shrimp**: The majority of CNDDB records are greater than 5 miles to the northeast, east, and southeast. Appropriate vernal pool habitat is not present on the Project site.
- **Midvalley Fairy Shrimp**: Not tracked by the CNDDB. Appropriate vernal pool habitat is not present on the Project site.
- **Vernal Pool Tadpole Shrimp**: Several records in all directions 6-10 miles from the Project site. No appropriate vernal pool habitat within the Project site's boundaries.
- **Valley Elderberry Longhorn Beetle**: Numerous records along the Sacramento River 1.5 miles to the southwest. Elderberry not present on the Project site.
- **Green Sturgeon - Southern DPS**: Occurs in the Sacramento River one mile or more south and west of the Project site. No appropriate riverine habitat is present on or near the Project site.
- **Steelhead - Central Valley DPS**: Found in the Sacramento River 1.5 miles to the west.
- **Chinook Salmon - Central Valley Spring-Run ESU**: Occurs in the Sacramento River one mile or more south and west of the Project site. No appropriate riverine habitat is present on or near the Project site.
- **Chinook Salmon - Sacramento River Winter-Run ESU**: Occurs in the Sacramento River one mile or more south and west of the Project site. No appropriate riverine habitat is present on or near the Project site.
- **Delta Smelt**: Nearest CNDDB record is 23 miles southwest. No appropriate riverine habitat is present on or near the Project site.
- **Longfin Smelt**: Occurs in the Sacramento River one mile or more south and west of the Project site. No appropriate riverine habitat is present on or near the Project site.
- **Sacramento Splittail**: Found on the Sacramento River 1.5 miles to the west.

- **California Red-legged Frog**: Nearest CNDDB records are 38 miles to the east. There is no habitat on or in the vicinity of the Project site. It is unclear why this species was returned in the IPaC search.
- **Western Spadefoot**: Nearest CNDDB record is 13 miles to the northeast.
- **California Tiger Salamander**: Nearest non-extirpated CNDDB records are 13 miles to the southwest. While this is an NBHCP Covered Species, it has not been documented in the Natomas Basin.
- **Least Bell's Vireo**: Single CNDDB record is from 1877. There is no suitable habitat for this species on or near the Project site, and likely none within the Regional Study Area.
- **Bank Swallow**: Nearest CNDDB records are along the Sacramento River 7.5 miles northwest of the Project site. There is no habitat on or near the Project site for breeding, nor does the Project site provide suitable foraging habitat. Like many bird species, there is always a possibility of viewing this species in the area as a flyover.

These taxa have no potential to be adversely affected by the Project and will not be discussed further.

5.2.2 Special Status Species with Low Potential to Occur in the Biological Study Area

As detailed in **Section 4** above, the following six special status plant taxa with occurrences in the Regional Study Area were determined to have low potential to occur in the Biological Study Area:

- **Pappose Tarplant**: Nearest records are 8.5 miles to the southwest. All records are west and south of the Project site, which may be outside of the range of the species. This species is not expected to occur due to agriculture-related site disturbance. Avoidance, minimization, or mitigation measures are not recommended for this species as it is highly unlikely to occur in the Project site.
- **Heckard's Pepper-Grass**: Nearest extant occurrence is 7.5 miles to the southwest. This species is not expected to occur due to agriculture-related site disturbance. Avoidance, minimization, or mitigation measures are not recommended for this species as it is highly unlikely to occur in the Project site.
- **San Joaquin Spearscale**: Nearest records are 7.5 miles to the west. All records are west of the Project site, which may be outside of the range of the species. This species is not expected to occur due to agriculture-related site disturbance. Avoidance, minimization, or mitigation measures are not recommended for this species as it is highly unlikely to occur in the Project site.
- **Woolly Rose-Mallow**: Nearest record was at the margins of a canal. This species is unlikely to be present because of site disturbance, but cannot be entirely dismissed. Avoidance, minimization, or mitigation measures are not recommended for this species as it is highly unlikely to occur in the Project site.
- **Palmate-bracted Bird's-Beak**: Nearest records are 7.5 miles west of the Project site, which may be outside of the species' range. This species is unlikely to be present because of site disturbance, but cannot be entirely dismissed. Avoidance, minimization, or mitigation measures are not recommended for this species as it is highly unlikely to occur in the Project site.
- **Sanford's Arrowhead**: Known to occur along roadside ditches and canals, however, all records are to the east and southeast and the Project site appears to be at the edge or outside of its distribution. The Project has potential to directly affect Sanford's Arrowhead through habitat modification or conversion of Ditch-1 and/or Ditch-2 if this species were to be present at those locations. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this species.

Likewise, the following 6 special status wildlife taxa with occurrences in the Regional Study Area were determined to have low potential to occur in the Biological Study Area:

- **Monarch - California Overwintering Population**: Nearest CNDDB records are 38 miles to the southwest. As a migratory species with flight capability, has potential to occur anywhere during movements. Unlikely to be resident on the Project site due to agricultural land uses and lack of suitable host plants. Avoidance, minimization, or mitigation measures are not recommended for this species as it is highly unlikely to occur on the Project site.
- **Cackling Goose**: Nearest CNDDB record is 28 miles to the north. While this is an NBHCP Covered Species, it has not been recorded within the Natomas Basin. Sometimes occurs singly or in small numbers with more numerous Canada Geese, which will often feed in agricultural fields, especially during winter months. Avoidance, minimization, or mitigation measures are not recommended for this species as it is highly unlikely to occur on the Project site.
- **White-faced Ibis**: Nearest CNDDB records are 8 miles to west, though also present in significant numbers at Yolo Bypass 5 miles to the southwest. Has some potential to be observed on the Project site at the margins of canals or adjacent agricultural areas for foraging. Project site does not contain habitat to support nesting. Avoidance, minimization, or mitigation measures are not recommended for this species as it highly unlikely to occur on the Project and is anticipated to avoid foraging on adjacent lands and forage elsewhere while construction disturbance is occurring.
- **Loggerhead Shrike**: Under-reported in the CNDDB, the nearest records are more than 50 miles distant. Occurs sparingly in the Natomas Basin. Unlikely to be present on the Project site due to lack of scrubby habitat which is normally present in preferred areas. In the unlikely event this species would be nesting within the Biological Study Area, the Project has potential to directly affect the success of nesting Loggerhead Shrike through destruction of active nests and young or visual and/or audible disturbance from construction activities. The Project also has potential to affect this species through the loss of suitable foraging habitat. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this species.
- **Song Sparrow (Modesto Population)**: While populations have dropped by 90% from historical highs, this resident form of the Song Sparrow has been recorded in sparsely-vegetated margins of canals, such as those bordering the Project site. Project site contains limited habitat that could support nesting. In the unlikely event this species would be nesting within the Biological Study Area, the Project has potential to directly affect the success of nesting Song Sparrow through destruction of active nests and young or visual and/or audible disturbance from construction activities. The Project also has potential to affect this species through the loss of suitable foraging habitat. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this species.
- **Tricolored Blackbird**: Appropriate breeding habitat not present. Will often forage in agricultural fields, especially in winter. Avoidance, minimization, or mitigation measures are not recommended for this species as it highly unlikely to occur on the Project and is anticipated to avoid foraging on adjacent lands and forage elsewhere while construction disturbance is occurring.

5.2.3 Special Status Species with Moderate Potential to Occur in the Biological Study Area

As detailed in **Section 4** above, there are no special status plant taxa with occurrences in the Regional Study Area that were determined to have moderate potential to occur in the Biological Study Area.

The following one special status wildlife taxa with occurrences in the Regional Study Area were determined to have moderate potential to occur in the Biological Study Area:

- **Burrowing Owl**: Most regional records are east of Highway 99. There are, however, recent CNDDB records from the Sacramento International Airport. Has the potential to occur widely during migration and winter in appropriate open habitats and disturbed areas. The Biological Study Area contains some open disturbed areas, primarily in the construction staging area along the south side of Bayou Way and west of Metro Air Parkway, that provide marginal habitat for this species; however, existing suitable burrows and ground-squirrels were not observed. In the event this species would be utilizing burrows within the Biological Study Area, the Project has potential to directly affect

Burrowing Owl through destruction of burrows containing overwintering or nesting individuals or visual and/or audible disturbance from construction activities. The Project also has potential to affect this species through the loss of suitable foraging habitat. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this species.

5.2.4 Special Status Species with High Potential to Occur in the Biological Study Area

As detailed in **Section 4** above, there are no special status plant taxa with occurrences in the Regional Study Area that were determined to have high potential to occur in the Biological Study Area.

The following one special status wildlife taxa with occurrences in the Regional Study Area were determined to have high potential to occur in the Biological Study Area:

- **White-tailed Kite**: The Project site contains foraging habitat that could support this species; however, nesting habitat is limited and composed of the relatively few Goodding's Black Willow, Valley Oak, and other trees along the canal and ditch banks. In the event this species would be nesting within the Biological Study Area, the Project has potential to directly affect the success of nesting White-tailed Kite through destruction of pre-existing nests, active nests, and young or visual and/or audible disturbance from construction activities. The Project also has potential to affect this species through the loss of suitable foraging habitat. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this species.

5.2.5 Special Status Species Present in the Biological Study Area

As detailed in **Section 4** above, there are no special status plant taxa that were determined to be present in the Biological Study Area**.**

The following 4 special status wildlife taxa were determined to be present in the Biological Study Area:

- **Giant Gartersnake:** The species was not observed during any of Bargas' five surveys. There are several CNDDB records within the past 20 years documenting the presence of Giant Gartersnake in the West Drainage Canal in the vicinity of the Project site. The West Drainage Canal is hydrologically connected to Fisherman's Lake, located approximately 0.5-mile south of the Project site, where there is a known population of Giant Gartersnake. Habitat for this species in the Biological Study Area is best described as marginal as it contains some of the elements required by this species and could support transient individuals. Habitat in the Biological Study Area consists of interconnected drainage canals (i.e. Canal-1, Canal-2, Canal-3/West Drainage Canal). These canals are likely inundated during the summer as they collect irrigation and storm water run-off from surround lands during the growing season. All canals were observed to contain some cover of emergent aquatic vegetation dominated by Floating Water Primrose (*Ludwigia peploides*), with small areas of Cattail, and Common Tule. Cover of these emergent aquatic species was low at the time of the April survey. However, large areas of open water had remnants of Floating Water Primrose from the previous growing season indicating that cover of this species may be substantial mid-summer. Much of the canal banks are vertical and undercut with few visible burrows suitable for this species. The top of the canal banks are highly compacted and show evidence of repeated mowing and grading along many reaches. No burrows capable of supporting overwintering Giant Gartersnake were observed during the April survey. Habitat in the Biological Study Area is unlikely to support a permanent population due to its lack of suitable burrows and high levels of vegetation management. However, the marginal habitat present provides connectivity to occupied sites to the north and south of the Biological Study Area within the American Basin. Though not ideal for Giant Gartersnake, the canals within Biological Study Area could support transient individuals on a temporary basis. In the event this species would be present in the uplands adjacent to the canals, the Project has potential to directly affect Giant Gartersnake through crushing of individuals beneath heavy machinery or other equipment and/or entombed in or excavated from their winter burrows. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this species.

- **Northwestern Pond Turtle:** Was detected during three of Bargas' five surveys in Canal-2 and Canal-3 (West Drainage Canal) within the Biological Study Area. Individuals were observed sunning on floating debris and/or vegetation within the canals. Adjacent upland habitats are marginal for this species as much of the canal banks are vertical and undercut. Further, the top of the canal banks are highly compacted and show evidence of repeated mowing and grading along many reaches. In the event this species would be present in the uplands adjacent to the canals, the Project has potential to directly affect Northwestern Pond Turtle through crushing of individuals or nests beneath heavy machinery or other equipment and/or nests being buried/covered by spoils / fill or excavated. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this species.
- **Northern Harrier:** Observed foraging on and flying over the Project site on two of the five surveys conducted by Bargas biologists. In the event this species would be nesting within the Biological Study Area, the Project has potential to directly affect the success of nesting Northern Harrier through destruction of active nests and young or visual and/or audible disturbance from construction activities. The Project also has potential to affect this species through the loss of suitable foraging habitat. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this species.
- **Swainson's Hawk**: Present and observed during April and May surveys. Nesting activity was not detected, however, a nesting survey has not been conducted. In the event this species would be nesting within the Biological Study Area, the Project has potential to directly affect the success of nesting Swainson's Hawk through destruction of pre-existing nests, active nests, and young or visual and/or audible disturbance from construction activities. The Project also has potential to affect this species through the loss of suitable foraging habitat. Nesting habitat is limited in the Biological Study Area. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this species.

5.3 Project Effects on Riparian Habitat or Other Sensitive Natural Community

The desktop review identified Northern Claypan Vernal Pool and Great Valley Cottonwood Riparian Forest as the only sensitive vegetation communities recorded within the area analyzed. As described previously in **Section 4.4.2,** none of these communities are present within the Biological Study Area.

Goodding's Willow – Red Willow Riparian Woodland and Forest and Valley Oak Riparian Forest and Woodland are riparian habitats that comprise a combined total of 0.44 acres of the Project site. The Project proposes direct impacts to 0.44 acres, or 100% of these riparian habitats combined within the Project site. Accordingly, appropriate mitigation measures are recommended for this sensitive riparian habitat.

Hardstem and California Bulrush Marsh is a freshwater wetland habitat that comprises 0.02 acres of the Project site. The Project proposes direct impacts to 0.02 acres, or 100% of this freshwater wetland habitat within the Project site. Accordingly, appropriate mitigation measures are recommended for this sensitive wetland habitat.

5.4 Project Effects on State or Federally Protected Wetlands

The proposed Project is likely to have adverse effects, either directly or through indirect impacts to downstream water quality, to state and federally protected aquatic resources. Current plans for the Project propose direct impacts, via grading, to the entire 340 acres of the Project site. Based upon the aquatic resources delineation conducted for the Project, a total of 1.501 acres (10,688 linear feet) of tributary waters and 0.58 acres (4,736 linear feet) of other waters potentially subject to USACE jurisdiction pursuant to CWA Section 404 are present within the proposed grading limits of the Project. These acreages have not yet been formally verified by USACE and may be subject to change. **Exhibit 5** displays each feature identified within the Project site with the proposed grading limit indicated by the hatching.

These features are also potential tributary waters and other waters of the state subject to Central Valley RWQCB (CVRWQCB) jurisdiction and aquatic / riparian habitat subject to CDFW jurisdiction pursuant to CWA Section 401 and California Fish and Game Code Section 1600 respectively.

Consultations with the agencies is recommended and may result in the need to acquire one or more of the following permits and regulatory approvals:

- **USACE CWA 404 Permit:** Authorization for the fill of jurisdictional waters of the U.S. shall be secured prior to placing any fill in jurisdictional wetlands from the USACE through the CWA Section 404 permitting process. Timing for compliance with the specific conditions of the 404 permit shall be per conditions specified by the USACE as part of permit issuance. It is expected that the Project would require an Individual Permit because wetland impacts would total more than 0.5 acre.
- **CVRWQCB CWA Section 401 Water Quality Certification:** Prior to construction in any areas containing wetlands or waters of the U.S. and state, the Applicant shall obtain a water quality certification pursuant to Section 401 of the CWA for the project. Any measures required as part of the issuance of the water quality certification shall be implemented.
- **CDFW Section 1602 LSAA**: The Applicant shall obtain a Streambed Alteration Agreement under Section 1600 et seq. of the California Fish & Game Code for impacts to Waters of the State as defined under Section 1602 of the California Fish & Game Code. Any measures required as part of the issuance of the Agreement shall be implemented.
- **CVRWQCB Waste Discharge Requirements**: The Applicant shall file a report of waste discharge with the CVRWQCB for activities affecting wetlands or waters of the state not also under USACE jurisdiction, if applicable.

5.5 Project Effects on Wildlife Movement and Nursery Sites

As discussed in **Section 4.7**, the Biological Study Area does not function as a wildlife corridor to terrestrial wildlife due to being bounded by physical barriers (i.e. canals, roads, urban development, agricultural fields). The canals and ditches present in the Biological Study Area could serve as movement corridors for aquatic and semi-aquatic species (i.e. Giant Gartersnake, Northwestern Pond Turtle). Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended for this potential wildlife corridor. Although there are no barriers blocking the movement of birds into and out of the Biological Study Area, there are no habitats present that could provide sufficient shelter and other resources that are contiguous with similar habitats beyond the Biological Study Area to provide a high quality wildlife movement corridor for birds. The Project site does contain foraging habitat that could attract a variety of bird species to the Project site. The development of the Project will modify the habitats present and significantly reduce the attractiveness of the Project site to birds moving about the vicinity searching for foraging opportunities. This would overall potentially benefit the operations of the nearby Sacramento International Airport by possibly reducing the number of birds flying through the airport's managed airspace present directly adjacent to the Project site.

The Project could impact nesting birds protected by the federal MBTA. Accordingly, appropriate avoidance, minimization, or mitigation measures are recommended to address impacts to nesting raptors and other birds in the Project site or immediately adjacent properties.

5.6 Project Effects on the Provisions of an Adopted Habitat Conservation Plan

The Project would result in development within the NBHCP. The NBHCP has an overall goal of creating a multi-species conservation program to mitigate impacts to covered species that may result from development in the Natomas Basin. Accordingly, appropriate avoidance, minimization, or mitigation measures that are consistent with the goals of the HCP are recommended for the Project.

5.7 Project Effects on Local Policies or Ordinances Protecting Biological Resources

As previously described in **Section 2.4**, the City of Sacramento County has one ordinance pertaining to protection of biological resources:

- **Tree Planting, Maintenance, and Conservation Ordinance:** the City's tree ordinance is intended "to provide for the conservation of existing tree resources; to optimize tree canopy coverage throughout the city while recognizing individual rights to develop and make reasonable use of private property consistent with the general plan; and to provide clear standards for protection, removal, and replacement of city trees and private protected trees" (City Code § 12.56.010). The Applicant will comply with the ordinance by implementing one of the following:
    - Minor modifications to the grading plan to avoid impacting protected trees.
    - Tree replacement on-site or in an off-site reserve, or payment of an in-lieu fee, following the City's requirements as defined in City Code § 12.56.060.

Appendix A. Floral & Faunal Compendia

Bargas has documented the presence of 53 plant taxa and 51 wildlife taxa. Taxa are presented in taxonomic order.

Plants

Common Name	Scientific Name	Family	Major Clade	Nativity
Duckweed species	Lemna sp.	Araceae	Monocots	Native
Cattail species	Typha sp.	Typhaceae	Monocots	Native
Bristly Ox-Tongue	Helminthotheca echioides	Asteraceae	Eudicots	Naturalized
Rough Cat's-Ear	Hypochaeris radicata	Asteraceae	Eudicots	Naturalized
Hairy Hawkbit	Leontodon saxatilis	Asteraceae	Eudicots	Naturalized
Milk Thistle	Silybum marianum	Asteraceae	Eudicots	Naturalized
Common Fiddleneck	Amsinckia intermedia	Boraginaceae	Eudicots	Native
Black Mustard	Brassica nigra	Brassicaceae	Eudicots	Naturalized
Perennial Pepperweed	Lepidium latifolium	Brassicaceae	Eudicots	Naturalized
Jointed Charlock	Raphanus raphanistrum	Brassicaceae	Eudicots	Naturalized
Sticky Mouse-Ear Chickweed	Cerastium glomeratum	Caryophyllaceae	Eudicots	Naturalized
Western Poison Oak	Toxicodendron diversilobum	Anacardiaceae	Eudicots	Native
Bindweed, Orchard Morning-Glory	Convolvulus arvensis	Convolvulaceae	Eudicots	Naturalized
Poison Hemlock	Conium maculatum	Apiaceae	Eudicots	Naturalized
Wild Teasel	Dipsacus fullonum	Dipsacaceae	Eudicots	Naturalized
Doveweed, Turkey-Mullein	Croton setiger	Euphorbiaceae	Eudicots	Native
Fennel	Foeniculum vulgare	Apiaceae	Eudicots	Naturalized
Bird’s Foot Trefoil	Lotus corniculatus	Fabaceae	Eudicots	Naturalized
Valley Sky Lupine	Lupinus nanus	Fabaceae	Eudicots	Native
Black Medick	Medicago lupulina	Fabaceae	Eudicots	Naturalized
California Burclover	Medicago polymorpha	Fabaceae	Eudicots	Naturalized

Common Name	Scientific Name	Family	Major Clade	Nativity
Rose Clover	Trifolium hirtum	Fabaceae	Eudicots	Naturalized
Hairy Vetch, Winter Vetch	Vicia villosa	Fabaceae	Eudicots	Naturalized
Valley Oak, Roble	Quercus lobata	Fagaceae	Eudicots	Native
Broad Leaf Filaree	Erodium botrys	Geraniaceae	Eudicots	Naturalized
Short Fruited Filaree	Erodium brachycarpum	Geraniaceae	Eudicots	Naturalized
Hyssop Loosestrife	Lythrum hyssopifolia	Lythraceae	Eudicots	Naturalized
Little Mallow	Malva parviflora	Malvaceae	Eudicots	Naturalized
Red Maids	Calandrinia menziesii	Montiaceae	Eudicots	Native
Miner's Lettuce	Claytonia parviflora	Montiaceae	Eudicots	Native
Edible Fig	Ficus carica	Moraceae	Eudicots	Naturalized
White Mulberry	Morus alba	Moraceae	Eudicots	Naturalized
Floating Water Primrose	Ludwigia peploides	Onagraceae	Eudicots	Naturalized
Knotweed, Knotgrass	Polygonum aviculare	Polygonaceae	Eudicots	Naturalized
Curly Dock	Rumex crispus	Polygonaceae	Eudicots	Naturalized
Himalayan Blackberry	Rubus armeniacus	Rosaceae	Eudicots	Naturalized
Alamo Or Fremont Cottonwood	Populus fremontii subsp. fremontii	Salicaceae	Eudicots	Native
Goodding's Black Willow	Salix gooddingii	Salicaceae	Eudicots	Native
Italian Thistle	Carduus pycnocephalus subsp. pycnocephalus	Asteraceae	Eudicots	Naturalized
Yellow Star-Thistle	Centaurea solstitialis	Asteraceae	Eudicots	Naturalized
Tall Flatsedge	Cyperus eragrostis	Cyperaceae	Monocots	Native
Common Tule	Schoenoplectus acutus var. occidentalis	Cyperaceae	Monocots	Native
Chicory	Cichorium intybus	Asteraceae	Eudicots	Naturalized
Wild Oat	Avena fatua	Poaceae	Monocots	Naturalized

Common Name	Scientific Name	Family	Major Clade	Nativity
Ripgut Grass	Bromus diandrus	Poaceae	Monocots	Naturalized
Bermuda Grass	Cynodon dactylon	Poaceae	Monocots	Naturalized
Hairy Crab Grass	Digitaria sanguinalis	Poaceae	Monocots	Naturalized
Rye Grass	Festuca perennis	Poaceae	Monocots	Naturalized
Annual Beard Grass	Polypogon monspeliensis	Poaceae	Monocots	Naturalized
Little-Seeded Canary Grass	Phalaris minor	Poaceae	Monocots	Naturalized
Johnson Grass	Sorghum halepense	Poaceae	Monocots	Naturalized
Common Wheat	Triticum aestivum	Poaceae	Monocots	Naturalized
Walnut species	Juglans sp.	Juglandaceae	Eudicots	—

Wildlife

Common Name	Scientific Name	Family	Introduced/Endemic
American Bullfrog	Lithobates catesbeianus	Ranidae (True Frogs)	Introduced
Western Fence Lizard	Sceloporus occidentalis	Phrynosomatidae (Zebra-tailed, Earless, Fringe-toed, Spiny, Tree, Side-blotched, and Horned Lizards)	—
Gopher Snake	Pituophis catenifer	Colubridae (Harmless Egg-Laying Snakes)	—
Northwestern Pond Turtle	Actinemys marmorata	Emydidae (Box and Basking Turtles)	—
Red-eared Slider	Trachemys scripta elegans	Emydidae (Box and Basking Turtles)	Introduced
Canada Goose	Branta canadensis	Anatidae (Ducks, Geese, and Swans)	—
Mallard	Anas platyrhynchos	Anatidae (Ducks, Geese, and Swans)	—
Rock Pigeon	Columba livia	Columbidae (Pigeons and Doves)	Introduced

Common Name	Scientific Name	Family	Introduced/Endemic
Mourning Dove	Zenaida macroura	Columbidae (Pigeons and Doves)	—
White-throated Swift	Aeronautes saxatalis	Apodidae (Swifts)	—
Anna's Hummingbird	Calypte anna	Trochilidae (Hummingbirds)	—
Killdeer	Charadrius vociferus	Charadriidae (Lapwings and Plovers)	—
Double-crested Cormorant	Phalacrocorax auritus	Phalacrocoracidae (Cormorants)	—
Great Blue Heron	Ardea herodias	Ardeidae (Herons, Bitterns, and Allies)	—
Great Egret	Ardea alba	Ardeidae (Herons, Bitterns, and Allies)	—
Snowy Egret	Egretta thula	Ardeidae (Herons, Bitterns, and Allies)	—
Turkey Vulture	Cathartes aura	Cathartidae (New World Vultures)	—
Northern Harrier	Circus hudsonius	Accipitridae (Hawks, Kites, Eagles, and Allies)	—
Cooper's Hawk	Accipiter cooperii	Accipitridae (Hawks, Kites, Eagles, and Allies)	—
Swainson's Hawk	Buteo swainsoni	Accipitridae (Hawks, Kites, Eagles, and Allies)	—
Red-tailed Hawk	Buteo jamaicensis	Accipitridae (Hawks, Kites, Eagles, and Allies)	—
Northern Flicker	Colaptes auratus	Picidae (Woodpeckers and Allies)	—
American Kestrel	Falco sparverius	Falconidae (Caracaras and Falcons)	—
Western Kingbird	Tyrannus verticalis	Tyrannidae (Tyrant Flycatchers)	—
Pacific-slope Flycatcher	Empidonax difficilis	Tyrannidae (Tyrant Flycatchers)	—

Common Name	Scientific Name	Family	Introduced/Endemic
Black Phoebe	Sayornis nigricans	Tyrannidae (Tyrant Flycatchers)	—
Say's Phoebe	Sayornis saya	Tyrannidae (Tyrant Flycatchers)	—
American Crow	Corvus brachyrhynchos	Corvidae (Crows and Jays)	—
Common Raven	Corvus corax	Corvidae (Crows and Jays)	—
Tree Swallow	Tachycineta bicolor	Hirundinidae (Swallows)	—
Northern Rough-winged Swallow	Stelgidopteryx serripennis	Hirundinidae (Swallows)	—
Barn Swallow	Hirundo rustica	Hirundinidae (Swallows)	—
Cliff Swallow	Petrochelidon pyrrhonota	Hirundinidae (Swallows)	—
Bewick's Wren	Thryomanes bewickii	Troglodytidae (Wrens)	—
Northern Mockingbird	Mimus polyglottos	Mimidae (Mockingbirds and Thrashers)	—
European Starling	Sturnus vulgaris	Sturnidae (Starlings)	Introduced
American Robin	Turdus migratorius	Turdidae (Thrushes)	—
House Finch	Haemorhous mexicanus	Fringillidae (Fringilline and Cardueline Finches and Allies)	—
Lesser Goldfinch	Spinus psaltria	Fringillidae (Fringilline and Cardueline Finches and Allies)	—
White-crowned Sparrow	Zonotrichia leucophrys	Passerellidae (New World Sparrows)	—
Savannah Sparrow	Passerculus sandwichensis	Passerellidae (New World Sparrows)	—
Western Meadowlark	Sturnella neglecta	Icteridae (Blackbirds)	—
Bullock's Oriole	Icterus bullockii	Icteridae (Blackbirds)	—
Red-winged Blackbird	Agelaius phoeniceus	Icteridae (Blackbirds)	—
Brown-headed Cowbird	Molothrus ater	Icteridae (Blackbirds)	—
Brewer's Blackbird	Euphagus cyanocephalus	Icteridae (Blackbirds)	—

Common Name	Scientific Name	Family	Introduced/Endemic
Common Yellowthroat	Geothlypis trichas	Parulidae (Wood-Warblers)	—
Yellow-rumped Warbler	Setophaga coronata	Parulidae (Wood-Warblers)	—
Brush Rabbit	Sylvilagus bachmani	Leporidae (Hares and Rabbits)	—
Black-tailed Jackrabbit	Lepus californicus	Leporidae (Hares and Rabbits)	—
Northern River Otter	Lontra canadensis	Mustelidae (Weasels, Otters, and Badgers)	—

Appendix B. Special Status Biological Resource Summary

The research conducted for this report included a desktop review of numerous resource databases in order to determine a list of special status biological resources, including 20 plant taxa and 28 wildlife taxa to be analyzed for potential occurrence. The result of this analysis is summarized in the tables below. Table column definitions:

- **Common Name:** The most widely-accepted English common name for the taxon.
- **Scientific Name:** The most widely-accepted scientific name for the taxon.
- **Source(s):** The desktop review source(s) that contained this taxon.
- **Legal Status:** The legal protected status of the taxon. These terms are described in detail in the Methods section of this report.
- **Habitat:** The quality of the habitat on the Project site for supporting the taxon. Classification of habitats is described in detail in the Methods section of this report.
- **Soils:** The suitability of soils on the Project site to support the taxon, if known. Classification of soils is described in detail in the Methods section of this report.
- **Potential:** The potential for the taxon to be found on the Project site. Ranking of potential is described in detail in the Methods section of this report.

Plants

Common Name	Scientific Name	Source(s)	Legal Status	Habitat	Soils	Potential
Pappose Tarplant	Centromadia parryi ssp. parryi	CNPS	CRPR 1B.2	Low Quality	Unknown	Low
Suisun Marsh Aster	Symphyotrichum lentum	CNPS	CRPR 1B.2	Not Present	Unknown	None
Heckard's Pepper-Grass	Lepidium latipes var. heckardii	CNPS	CRPR 1B.2	Low Quality	Unknown	Low
Dwarf Downingia	Downingia pusilla	CNDDB, CNPS	CRPR 2B.2	Not Present	Unknown	Low
Legenere	Legenere limosa	CNPS, HCP	CRPR 1B.1	Not Present	Unknown	None
Heartscale	Atriplex cordulata var. cordulata	CNPS	CRPR 1B.2	Not Present	Unknown	None
San Joaquin Spearscale	Extriplex joaquinana	CNPS	CRPR 1B.2	Low Quality	Unknown	Low
Brittlescale	Atriplex depressa	CNPS	CRPR 1B.2	Not Present	Unknown	None
Alkali Milk-Vetch	Astragalus tener var. tener	CNPS	CRPR 1B.2	Not Present	Unknown	None

Common Name	Scientific Name	Source(s)	Legal Status	Habitat	Soils	Potential
Ferris' Milk-Vetch	Astragalus tener var. ferrisiae	CNPS	CRPR 1B.1	Not Present	Unknown	Low
Delta Tule Pea	Lathyrus jepsonii var. jepsonii	HCP	CRPR 1B.2	Not Present	Unknown	None
Saline Clover	Trifolium hydrophilum	CNPS	CRPR 1B.2	Not Present	Unknown	Low
Woolly Rose-Mallow	Hibiscus lasiocarpos var. occidentalis	CNDDB, CNPS	CRPR 1B.2	Low Quality	Unknown	Low
Palmate-bracted Bird's-Beak	Chloropyron palmatum	CNPS	FE, CE, CRPR 1B.1	Low Quality	Unknown	Low
Boggs Lake Hedge-Hyssop	Gratiola heterosepala	CNPS, HCP	CE, CRPR 1B.2	Not Present	Unknown	None
Sanford's Arrowhead	Sagittaria sanfordii	CNDDB, CNPS, HCP	CRPR 1B.2	Low Quality	Unknown	Low
Colusa Grass	Neostapfia colusana	HCP	FT, CE, CRPR 1B.1	Not Present	Unknown	None
Slender Orcutt Grass	Orcuttia tenuis	HCP	FT, CE, CRPR 1B.1	Not Present	Unknown	None
Sacramento Orcutt Grass	Orcuttia viscida	HCP	FE, CE, CRPR 1B.1	Not Present	No	None
California Alkali Grass	Puccinellia simplex	CNPS	CRPR 1B.2	Not Present	Unknown	None

Wildlife

Common Name	Scientific Name	Source(s)	Legal Status	Habitat	Potential
Vernal Pool Fairy Shrimp	Branchinecta lynchi	CNDDB; IPaC; HCP	Federal Threatened	Not Present	None
Midvalley Fairy Shrimp	Branchinecta mesovallensis	HCP	—	Not Present	None
Vernal Pool Tadpole Shrimp	Lepidurus packardi	IPaC; HCP	Federal Endangered	Not Present	None
Valley Elderberry Longhorn Beetle	Desmocerus californicus dimorphus	CNDDB; IPaC; HCP	Federal Threatened	Not Present	None

Common Name	Scientific Name	Source(s)	Legal Status	Habitat	Potential
Monarch - California Overwintering Population	Danaus plexippus pop. 1	IPaC	Federal Candidate	Low Quality	Low
Green Sturgeon - Southern DPS	Acipenser medirostris pop. 1	CH	Federal Threatened; California Species of Special Concern	Not Present	None
Steelhead - Central Valley DPS	Oncorhynchus mykiss irideus pop. 11	CNDDB; CH	Federal Threatened	Not Present	None
Chinook Salmon - Central Valley Spring-Run ESU	Oncorhynchus tshawytscha pop. 11	CH	Federal Threatened; California Threatened	Not Present	None
Chinook Salmon - Sacramento River Winter-Run ESU	Oncorhynchus tshawytscha pop. 7	CH	Federal Endangered; California Endangered	Not Present	None
Delta Smelt	Hypomesus transpacificus	IPaC	Federal Threatened; California Endangered	Not Present	None
Longfin Smelt	Spirinchus thaleichthys	CNDDB	Federal Candidate; California Threatened	Not Present	None
Sacramento Splittail	Pogonichthys macrolepidotus	CNDDB	California Species of Special Concern	Not Present	None
California Red-legged Frog	Rana draytonii	IPaC	Federal Threatened; California Species of Special Concern	Not Present	None
Western Spadefoot	Spea hammondii	HCP	California Species of Special Concern	Not Present	None
California Tiger Salamander	Ambystoma californiense	IPaC; HCP	Federal Endangered; California Endangered	Not Present	None
Giant Gartersnake	Thamnophis gigas	CNDDB; IPaC; HCP	Federal Threatened; California Threatened	Medium Quality	Present
Northwestern Pond Turtle	Actinemys marmorata	CNDDB; Bargas; HCP	California Species of Special Concern	Medium Quality	Present
Cackling Goose	Branta hutchinsii	HCP	—	Low Quality	Low
White-faced Ibis	Plegadis chihi	HCP	—	Low Quality	Low
White-tailed Kite	Elanus leucurus	CNDDB	California Fully Protected	High Quality	High
Northern Harrier	Circus hudsonius	Bargas	California Species of Special Concern	High Quality	Present
Swainson's Hawk	Buteo swainsoni	CNDDB; Bargas; HCP	California Threatened	High Quality	Present

Common Name	Scientific Name	Source(s)	Legal Status	Habitat	Potential
Burrowing Owl	Athene cunicularia	CNDDB; HCP	California Species of Special Concern	Medium Quality	Moderate
Least Bell's Vireo	Vireo bellii pusillus	CNDDB	Federal Endangered; California Endangered	Not Present	None
Loggerhead Shrike	Lanius ludovicianus	HCP	California Species of Special Concern	Low Quality	Low
Bank Swallow	Riparia riparia	HCP	California Threatened	Not Present	None
Song Sparrow (Modesto Population)	Melospiza melodia	CNDDB	California Species of Special Concern	Low Quality	Low

1 Introduction

This report presents the results of the aquatic resources delineation (ARD) conducted by Bargas Environmental Consulting, LLC (Bargas) for the Airport South Industrial Park project (Project) located within unincorporated Sacramento County, California. The purpose of the delineation was to identify whether aquatic resources occur within the Project site and to provide the U.S. Army Corps of Engineers (USACE) with sufficient information to determine if these aquatic resources are jurisdictional wetlands or other waters of the United States (U.S.), as defined by the USACE under Section 404 of the Clean Water Act (CWA). Permission to enter the Project site to complete field verification by USACE must be verified in writing by the Applicant and Applicant's Agent prior to access.

1.1 Project Site Location

The Project site is 340 acres in size and located in unincorporated Sacramento County, south of the Sacramento International Airport and west of the community of North Natomas and approximately 6.9 miles northwest of downtown Sacramento, California (**Exhibits 1** and **2**). The Project site is equivalent to the Project boundary and is roughly bordered by Powerline Road on the west, the Caltrans Interstate-5 (I-5) right-of-way on the north, a fire break along Lanfranco Circle on the east, and the West Drainage Canal on the south. The Project site is comprised of several APNs including 225-0020-022, 225-0020-024, 225-0020-034, 225-0020-035, 225-0020-030, 225-0020-026, 225-0020-027, 225-0020-021, 225-0020-016, 225-0020-017, 225-0020-010, and 225-0030-023. The approximate center point is located at 38.667115°, -121.565371° (WGS84), within Section 5 of Township 9 North in Range 6 East of the US Geological Survey (USGS) Taylor Mountain 7.5-minute quadrangle

From downtown Sacramento, the Project site may be accessed via I-5 north for approximately 7 miles. Take exit 527 then turn left (south) onto Metro Air Parkway. Follow Metro Air Parkway for approximately 0.3 mile to Bayou Way and the north side of the Project site.

1.2 Definitions

This report will use the following definitions for areas referred to herein:

- **Project site:** The Project site is defined as the 340 acres being analyzed for Project entitlements. The Project site is the primary Study Area for the formal Aquatic Resources Delineation.
- **Annexation Area:** The Annexation Area is defined as the 450 acres proposed for annexation by the City of Sacramento and is inclusive of the Project Area. As used herein, however, references to resources in the Annexation Area are exclusive of the Project site.

A map depicting these areas is provided as **Exhibit 2.**

DRAFT

2 Regulatory Setting

The regulatory setting is framed by current enabling legislation and case law. Under Section 404 of the CWA, the USACE regulates the discharge of dredged and fill materials into “waters of the U.S.”

The Environmental Protection Agency (USEPA) published a revised definition of "waters of the United States" on December 7, 2021, in response to the U.S. District Court of the District of Arizona ruling resulting in "vacating and remanding" the Navigable Waters Protection Rule (Federal Register 2021). This revised definition is consistent with the pre-2015 regulations based upon the Supreme Court cases of Rapanos vs. United States and Carabell vs. United States (USEPA and USACE 2008), over traditional navigable waters (TNW) and the following types of features determined to have "significant nexus" to a TNW:

1. wetlands adjacent to TNWs
2. non-navigable tributaries of TNWs that are relatively permanent where the tributaries typically flow year-round or have continuous flow at least seasonally
3. wetlands that directly abut non-navigable tributaries of TNWs

Projects that place fill in jurisdictional wetlands and non-wetland waters of the U.S. require a permit from the USACE under Section 404 of the CWA. The USACE issues nationwide permits for specific types of activities with minimal individual or cumulative adverse environmental impacts. Individual permits are required for large and/or complex projects or projects that exceed the impact threshold for nationwide permits.

These waters may be sorted into two broader categories of waters: wetlands and non-wetland waters.

2.1 Wetlands

Wetlands are defined under 33 C.F.R. 328.3(c)(16) as:

> *Those areas that are inundated or saturated by surface or ground water at a frequency and duration sufficient to support, and that under normal circumstances do support, a prevalence of vegetation typically adapted for life in saturated soil conditions. Wetlands generally include swamps, marshes, bogs, and similar areas.*

In order for an area to be considered a wetland under Section 404, it must possess three wetland characteristics: hydrophytic vegetation, hydric soils, and wetland hydrology. Several indicators may be analyzed to determine if the criteria are satisfied.

2.1.1 Hydrophytic Vegetation

Hydrophytic vegetation is typically adapted to live in permanently or periodically saturated soils. Hydrophytic indicator species are those included on the *National Wetland Plant List, version 3.5: Arid West Region* (USACE 2020). Each species on the list is rated according to a wetland indicatory category, as shown in **Table 1** below.

Table 1. Indicator Status' for Hydrophytic Vegetation

Category	Indicator Status	Probability
Obligate Wetland	OBL	Almost always occur in wetlands (estimated probability > 99 percent)
Facultative Wetland	FACW	Usually occur in wetlands (estimated probability 67–99 percent)
Facultative	FAC	Equally likely to occur in wetlands and non-wetlands (estimated probability 34–66 percent)
Facultative Upland	FACU	Usually occur in non-wetlands (estimated probability 67–99 percent)
Obligate Upland	OBL	Almost always occur in non-wetlands (estimated probability > 99 percent)
No Investigation	NI	Undetermined

*Source: USACE 2020.

To be considered hydrophytic, more than 50% of the dominant species of each stratum must have wetland indicator status (i.e., be rated as obligate [OBL], facultative wetland [FACW], or facultative [FAC]).

2.1.2 Hydric Soils

Hydric soils are defined as soils that formed under conditions of saturation, flooding, or ponding long enough during the growing season to develop anaerobic conditions in the upper part. Soils are considered likely to meet the definition of a hydric soil when one or more of the following criteria are met:

1. All Histels except Folistels and Histosols except Folists; or
2. Soils that are frequently ponded for long duration or very long duration during the growing season; or
3. Soils that are frequently flooded for long duration or very long duration during the growing season.

Hydric soils develop under conditions of saturation and inundation combined with microbial activity in the soil that causes a depletion of oxygen. The *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West (Version 2.0)* (USACE 2008a) has a number of field indicators that may be used to identify hydric soils. The Natural Resources Conservation Service (NRCS) has also developed field indicators that may demonstrate the presence of hydric soils (NRCS 2018). These indicators include hydrogen sulfide generation; accumulation of organic matter; and reduction, translocation, and/or accumulation of iron and other reducible elements. These processes result in soil characteristics that persist during both wet and dry periods. Separate indicators have been developed for sandy soils and for loamy and clayey soils.

2.1.3 Wetland Hydrology

Areas with wetland hydrology are those where the presence of water has an overriding influence on vegetation and soil characteristics due to anaerobic and reducing conditions, respectively (USACE 1987). Hydrology is often the most difficult criterion to measure in the field due to seasonal and annual variations in water availability. Some of the indicators that are commonly used to identify wetland hydrology include visual observation of inundation

or saturation, watermarks, recent sediment deposits, surface scour, and oxidized root channels (rhizospheres) resulting from prolonged anaerobic conditions.

2.2 Non-Wetland Waters

Tributary non-tidal waters that may be regulated by the USACE extend to the Ordinary High Water Mark (OHWM), which is defined under 33 CFR 328.3(c)(7) as:

> *That line on the shore established by the fluctuations of water and indicated by physical characteristics such as clear, natural line impresses on the bank, shelving, changes in the character of soil, destruction of terrestrial vegetation, the presence of litter and debris, or other appropriate means that consider the characteristics of the surrounding areas.*

2.3 Non-Aquatic Hydrologic Features

The *Corps of Engineers Wetlands Delineation Manual* (USACE 1987) defines non-aquatic features as:

> *Upland and lowland areas that are neither deep water aquatic habitats, wetlands nor other special aquatic sites. They are seldom or never inundated, or if frequently inundated, they have saturated soils for only a brief period of time during the growing season. If these features are vegetated, they normally support species that are predominantly adapted to aerobic soil conditions.*

Determined on a case-by-case basis, USACE and EPA guidance on the extent of CWA geographic jurisdiction define certain categories of "upland ditches" and "upland swales" that generally are not subject to CWA jurisdiction. An irrigation ditch is a man-made feature and/or upland swale that either conveys water to an ultimate irrigation use or place of use, or that moves and/or conveys irrigation water (i.e. "run-off from irrigation) away from irrigated lands (USACE 2007).

As described in *Defining "Waters of the United States": Canals, Ditches, and Drains* (University of Arkansas School of Law 2004), irrigation ditches and canals are generally not subject to federal CWA jurisdiction when these waters do not establish a "significant nexus" with traditional navigable waters. Irrigation ditches that receive water from natural streams and lakes, and divert water to streams and creeks, are considered tributaries to other "waters of the United States."

DRAFT

3 Methodology

This report has been prepared per the USACE South Pacific Division and Sacramento District Regulatory Programs minimum standards (USACE 2016a, 2016b). In addition, the following manuals and guidance were used to delineate waters of the U.S. and wetlands that are potentially subject to USACE jurisdiction under Section 404 of the CWA:

- *Corps of Engineers Wetlands Delineation Manual* (USACE 1987);
- *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Arid West (Version 2.0)* (USACE 2008a);
- *A Field Guide to the Identification of the Ordinary High Water Mark in the Arid West Region of the Western United States, A Delineation Manual* (USACE 2008b)

Prior to conducting the field aquatic resources delineation, the following information sources were reviewed:

- Aerial imagery of the Project site and the vicinity (Google 2022);
- Natural Resources Conservation Service (NRCS) soil survey maps and unit descriptions, Web Soil Survey, Sacramento County (NRCS 2022);
- U.S. Fish and Wildlife Service (USFWS) National Wetlands Inventory (NWI) - Wetlands Online Mapper (USFWS 2022);
- U.S. Geological Survey's National Hydrography Dataset (NHD) (USGS 2022) to determine if hydrological features have been mapped on or adjacent to the Project site.

The Web Soil Survey, NWI, and NHD were used to analyze the Annexation Area, supplemented by field observations of the area.

3.1 Delineation Survey and Field Conditions

Bargas biologists Krystal Pulsipher and Bekah Christianson conducted the aquatic resources delineation on Wednesday, October 27 and Thursday, October 28, 2021. An additional site visit was conducted on July 5, 2022, by Krystal Pulsipher to collect additional data. The site assessment consisted of walking meandering transects throughout the Project site, but remaining south of Bayou Way, to identify wetlands or waterways potentially under the jurisdiction of the USACE. Where wetlands were suspected to be present based on aerial signatures and conditions observed in the field, soil pits were excavated to a depth of approximately 18 inches or until an impermeable layer was reached. The three wetland criteria (hydrophytic vegetation, hydric soils, and wetland hydrology) were evaluated following the USACE protocol for the Arid West (USACE 2008a). The locations of the sample points and aquatic features were noted on aerial images of the Project site. Mapped soil types in the Project site were determined using the NRCS Web Soil Survey, Custom Soil Resource Report (NRCS 2022). A standard Munsell® Soil Color Chart was used to determine soil matrix and mottle colors (Kollmorgen Instruments Company 2000) in the field. Where present, the OHWM for all potential non-wetland waters of the U.S. present were delineated (USACE 2008b). Plant community names follow *A Manual of California Vegetation: Second Edition* (CNPS 2022), where applicable. Plant nomenclature followed *Jepson eFlora* (2022). The *USACE National Wetland Plant List, version 3.5* (USACE 2020), was used to determine the status of observed plants as wetland indicator species. Site photographs are presented in **Appendix A**. A list of plant species observed, and their National Wetland Plant List indicator status is provided in **Appendix B**. Datasheets are presented in **Appendix C.**

3.2 Mapping

Boundaries of hydrologic features (including man-made features) within the Project site were surveyed and mapped using a Eos Arrow 100 receiver paired with the Eos Pro Tools and ESRI Field Maps applications. This GPS is capable of real-time differential correction and sub-meter accuracy. The GPS data were downloaded through ArcGIS Online and converted into ESRI shapefile format. The geographic coordinate system used to reference the data was Universal Transverse Mercator (UTM–Zone 10), North American Datum (NAD83) in meters.

Each wetland was assessed by determining the wetland feature/upland edges and by observing the mandatory wetland indicators at selected points along each transect as defined by the 1987 Manual (USACE 1987), the Regional Supplemental Manual (USACE 2008a), and Guide to OHWM (USACE 2008b). Potential wetland boundaries were mapped at a level of accuracy of less than one meter. Soil pits were hand-excavated to obtain soil data for wetlands. Data were overlaid on an aerial photograph provided by ESRI ArcGIS World Imagery. The top of bank was mapped for non-wetland waters (canals) and the bankfull width and location of OHWM in relation to top of bank noted. Desktop methods were then utilized to map the location of OHWM on both banks of each non-wetland feature and top of bank opposite the bank mapped with GPS in the field. The ESRI data and GIS software were used to calculate the acreage of each polygon. Mapping requirements, as set forth by *Updated Map and Drawing Standards for the South Pacific Division Regulatory Program* (USACE 2016a) and the *Minimum Standards for Acceptance of Aquatic Resources Delineation Reports* (USACE 2016b) for the Sacramento District were followed.

3.3 Determination Methods

Data for each potential wetland were collected using the *USACE Wetland Determination Data Form – Arid West Region* (USACE 2013). Data forms were completed at representative locations to determine whether suspect features qualify as jurisdictional wetlands or other waters of the U.S. (**Appendix C**). Wetlands were determined based on the presence of the three factors that define wetlands – the presence of dominant hydrophytic vegetation, the presence of hydric soils, and wetland hydrology indicators.

Data for each potential non-wetland water were collected using the *USACE Arid West Ephemeral and Intermittent Streams OHWM Datasheet* (USACE 2008b, 2010). Data for each linear feature were collected at representative cross sections with observations on sediment texture and vegetation characteristics summarized for each floodplain unit present. The OHWM for each linear feature were determined based upon the presence of certain indicators which can include a change in average sediment texture, vegetation species, vegetation cover, and breaks in bank slope.

DRAFT

4 Environmental Setting

The Project site is located within the Sacramento Valley between the North Coast Ranges on the west and the Northern Sierra Nevada Mountains on the east. This region is characterized by a Mediterranean climate, generally experiencing warm, dry conditions April through October and wet, cool conditions from November through March. The topography within the Project site has an elevation range of approximately 13 to 20 feet above mean sea level and is open and relatively flat throughout.

The Project site is currently characterized primarily by fallow agricultural fields with a construction yard present along the northern side adjacent to Bayou Way and west of Metro Air Parkway. Very few dirt access roads exist within the Project site. There is an overhead electrical utility pole alignment along the southern boundary adjacent to the West Drainage Canal. Two large canals partially overlap the west and south boundaries and a third transects the eastern third of the Project site. These canals are part of the facilities managed and operated by Reclamation District 1000 (RD1000 2022). An irrigation drainage ditch transects the western third of the Project site and a second transects the northern extent of the Project site.

4.1 Soils

Mapped soil series in the Project site were determined using the Soil Survey Geographic Database (SSURGO) and NRCS Web Soil Survey, Custom Soil Resource Report (NRCS 2021). **Table 2** identifies the soil type by series and subgroup, map symbol, and hydric characteristics (**Exhibit 3**). The NRCS soil report for the Project site is included in **Appendix D**.

Table 2. Soil Series within the Project site

Soil Series	Map Unit Number	Map Unit Symbol	Parent Material	Drainage Class	Hydric Rating
Capay clay loam, 0 – 2% slopes, occasionally flooded	113	hhlm	Alluvium	Moderately well drained	No
Clear Lake clay, hardpan substratum, drained, 0-1% slopes	115	hhlp	Alluvium	Somewhat poorly drained	Yes
Cosumnes silt loam, partially drained, 0-2% slopes	127	2x415	Alluvium derived from igneous and metamorphic rock	Somewhat poorly drained	Yes
Jacktone clay, drained, 0-2% slopes	161	hhn5	Alluvium	Somewhat poorly drained	Yes
San Joaquin silt loam, leveled, 0-1% slopes	213	hhpv	Alluvium derived from granite	Moderately well drained	No
San Joaquin silt loam, 0-3% slopes	214	hhpw	Alluvium derived from granite	Moderately well drained	No

Source: NRCS 2022

As shown in Exhibit 3, these same soil types continue outside of the Project site into the adjacent portions of the Annexation Area.

4.2 Vegetation Communities

The Project site is primarily characterized by semi-natural vegetation community alliances dominated by non-native plant species. A list of plant species observed, and their National Wetland Plant List indicator status is provided in **Appendix B**.

4.2.1 Perennial Rye Grass Fields

The majority of the Project site can be best described as Perennial Rye Grass Fields (*Lolium perenne* [now *Festuca perennis*] Herbaceous Semi-Natural Alliance). This vegetation community was observed within two large fallowed agricultural fields, lower topographical roadside areas that receive sheet flow storm water runoff from the roads including the areas west and east of Metro Air Parkway north of Bayou Way, and a ditch that transects the northern end of the Project site. The dominant plant species observed in these areas was Rye Grass (*Festuca perennis*; FAC) with smaller amounts of Perennial Pepperweed (*Lepidium latifolium*; FAC), Ripgut Grass (*Bromus diandrus*; not listed [NL] assumed UPL), and Little-seeded Canary Grass (*Phalaris minor*; NL) observed. Historic aerial imagery and field observations suggest the vegetation in most areas containing Perennial Rye Grass Fields community may be managed through mowing or shallow tilling for fire fuel abatement.

4.2.2 Upland Mustards or Star-thistle Fields

The second most prevalent vegetation community observed within the Project site can best be described as Upland Mustards or Star-thistle Fields (*Brassica nigra – Centaurea* [*solstitialis, melitensis*] Herbaceous Semi-Natural Alliance). This vegetation community was observed within one large fallowed agricultural field and most roadside areas within the Project site. The dominant plants species observed in these areas included Black Mustard (*Brassica nigra*; NL), Jointed Charlock (*Raphanus raphinastrum*; NL), Little Mallow (*Malva parviflora*; NL), Bristly Ox-Tongue (*Helminthotheca echioides*; FAC), and Ripgut Grass (NL). Historic aerial imagery and field observations suggest the vegetation in most areas containing Upland Mustards or Star-thistle Fields community may be managed through mowing or shallow tilling for fire fuel abatement.

4.2.3 Poison Hemlock or Fennel Patches

The Project site also contains locations best described as Poison Hemlock or Fennel Patches (*Conium maculatum – Foeniculum vulgare* Herbaceous Semi-Natural Alliance). The dominant plant species observed in these areas include Poison Hemlock (*Conium maculatum*; FACW), Fennel (*Foeniculum vulgare*; NL), Milk Thistle (*Silybum marianum*; NL), Wild Teasel (*Dipsacus fullonum*; FAC), Little Mallow, and Ripgut Grass (NL). Other species observed in smaller amounts included Bristly Ox-Tongue (FAC), Italian Thistle (*Carduus pycnocephalus* ssp. *pycnocephalus*; NL), Chicory (*Cichorium intybus*; FACU), Black Mustard (NL), and Perennial Pepperweed (FAC). Poison Hemlock or Fennel Patches appear limited to places where fire fuel abatement equipment may not have as much access to operate, including the corners of fields and along the edge of one field immediately adjacent to an irrigation drainage ditch.

4.2.4 Hardstem and California Bulrush Marsh

The vegetation within the drainage ditch that transects the western third of the Project site can be best described primarily as Hardstem and California Bulrush Marsh (*Schoenoplectus* [*acutus, californicus*] Herbaceous Alliance. The dominant plant species observed in these areas included Common Tule (*Schoenoplectus acutus* var. *occidentalis*; OBL), Tall Flatsedge (*Cyperus eragrostis*; FACW), Curly Dock (*Rumex crispus*; FAC), Johnson Grass

(*Sorghum halepense*; FACU) and Bristly Ox-Tongue (FAC). A few Fremont Cottonwood (*Populus fremonti*; NL) trees, ranging from approximately 15 to 30 feet in height, are present and rooted within or adjacent to the irrigation drainage ditch where this community is present.

4.2.5 Cattail Marsh

The southern end of this drainage ditch widens just north of where it discharges to the West Drainage Canal and contains two patches of vegetation best described as Cattail Marshes (*Typha* [*angustifolia*, *domingensis*, *latifolia*] Herbaceous alliance. These areas are dominated by Cattail species (*Typha* sp.; OBL) with smaller amounts of Common Tule (OBL).

4.2.6 Himalayan Blackberry – Rattlebox – Edible Fig Riparian Scrub

There are patches of vegetation along the irrigation drainage ditch transecting the western third of the Project site and along a smaller ditch present just outside of the southeastern Project site boundary that are best characterized as Himalayan Blackberry – Rattlebox – Edible Fig Riparian Scrub (*Rubus armeniacus* - *Sesbania punicea* – *Ficus carica* Shrubland Semi-Natural Alliance. These patches are predominantly composed of Himalayan Blackberry (*Rubus armeniacus*; FAC) with smaller amounts of Western Poison Oak (*Toxicodendron diversilobum*; FACU), Edible Fig (*Ficus carica*; FACU), Wild Teasel (FAC), Poison Hemlock (FACW), and Fennel (NL).

4.2.7 Goodding's Willow – Red Willow Riparian Woodland and Forest

A small grove of trees best characterized as Goodding's Willow – Red Willow Riparian Woodland and Forest (*Salix gooddingii – Salix laevigata* Forest and Woodland Alliance) is present adjacent to the south bank of the eastern canal where it turns east to follow parallel to Bayou Way. The trees are all of a single species, Gooding's Willow (*Salix gooddingii*; FACW), and range in height from approximately 15 to 25 feet tall.

4.2.8 Valley Oak Riparian Forest Woodland

Several small groves of trees best characterized as Valley Oak Riparian Forest Woodland (*Quercus lobata* Riparian Forest and Woodland Alliance) are present within and adjacent to the west bank of the eastern canal just north of the West Drainage Canal on the south boundary of the Project site. Several small groves of trees are also present along the north bank of the West Drainage Canal to the west of the eastern canal. The trees are all of a single species, Valley Oak (*Quercus lobata*; FACU), and range in height from approximately 15 to 40 feet tall. Many of the trees are rooted within the bank and are failing as the bank erodes into the canal.

4.3 Hydrology

The hydrologic regime in the Project site is influenced by seasonal precipitation, stormwater runoff from the lands adjacent to the Project site, and overflow from the irrigation drainage ditch and canals present within or partially overlapping the Project site during abnormally large storm events. One such large storm event occurred between October 23 to 25, 2021, two days prior to the day one of this survey, and output approximately 4.5 inches of precipitation (Weather Underground 2022). This amount of rainfall is significantly greater than the 30-year normal precipitation for the month of October which is 0.8 to 1.2 inches (PRISM Climate Group 2022).

The two north-south oriented canals (one along Powerline Road, the other bisecting the eastern third of the Project site) are direct tributaries to the canal along the southern boundary, West Drainage Canal. All three canals and the drainage ditch transecting the northern edge of the Project site are features mapped in the NWI and NHD

in addition to being blueline features on the USGS topographic map. The irrigation drainage ditch feature observed bisecting the western third of the Project site is not mapped in the databases listed above or on the topographic map but discharges to the West Drainage Canal. The West Drainage Canal is tributary to the Sacramento River via multiple pumping stations managed by Reclamation District 1000 (RD1000 2022).

The Project site is situated within of the Natomas Main Drainage Canal-Sacramento River subwatershed (12-digit hydrologic unit code [HUC] 180201610402; USGS 2022) within the Upper Coon-Upper Auburn watershed (8-digit HUC 18020161). The Natomas Main Drainage Canal-Sacramento River subwatershed encompasses an area to the east of the Sacramento River and north of the American River, west of the Natomas Main Drainage Canal (Steelhead Creek) and south of the Cross Canal located just west of the community of Pleasant Grove.

Exhibit 3. Soils Map

DRAFT

5 Delineation Results

Survey efforts identified a total of 2.081 acres (15,424 linear feet) of aquatic features composed of three tributary drainages (Canal-1, Canal-2, Canal-3) and two other waters (Ditch-1, Ditch-2) (**Table 3** and **Exhibit 4**). Delineation data sheets are included in **Appendix C**, and representative photographs are included in **Appendix A**.

Table 3. Aquatic Features Observed in the Project site

Feature Name	Area (acres)*	Length (linear feet)
Tributary Drainages		
Canal-1	0.04	2,149
Canal-2	1.46	3,204
Canal-3	0.001	5,335
Subtotal:	**1.501**	**10,688**
Other Waters		
Ditch-1	0.19	2,278
Ditch-2	0.39	2,458
Subtotal:	**0.58**	**4,736**
Grand Total:	**2.081**	**15,424**

Source: Bargas, 2022. *Acreages are calculated estimations that are subject to modification pending formal verification by USACE.

5.1 Tributary Drainages

5.1.1 Canal-1

Canal-1 is a north-south oriented man-excavated drainage canal that partially overlaps the Project site's western boundary. This canal's origin can be traced on the topographic map and the RD1000 facilities map as beginning within the Sacramento International Airport grounds approximately 2 to 3 miles northwest of the Project site. Canal-1 is a direct tributary to Canal-3 (West Drainage Canal) as it directly connects at the southwest corner of the Project site. This feature conveys stormwater and irrigation runoff collected in various small ditches and stormwater infrastructure in the local vicinity. Canal-1 exhibited an OHWM that was not prominent, with one indicator observed being a change in bank slope, particularly on the east bank where a slight shelf was observed, creating an upside-down trapezoidal-like cross-sectional profile. The OHWM of the entire feature appeared to vary between approximately 25 to 30 feet wide, with 30-foot width observed at OHWM SP-3. The depth at OHWM and the sediment characteristics were unable to be determined due to safety concerns. The second OHWM indicator observed was a shift from open water and floating aquatic vegetation such as Duckweed (*Lemna* species; OBL) and an unidentified dead floating-leaved rooted vascular plant species to Black Mustard (NL), Milk Thistle (NL), Ripgut Grass (NL), Rye Grass (FAC), Poison Hemlock (FACW), and Fennel (NL) in Upland Mustards or Star-thistle Fields, Perennial Rye Grass Fields, or Poison Hemlock or Fennel Patches communities. Evidence of a recent flooding event was observed in the form of ponded water and aquatic vegetation present in the field adjacent to the east bank of the canal.

5.1.2 Canal-2

Canal-2 north-south oriented man-excavated drainage canal that transects the eastern third of the Project site. This canal's origin can be traced on the topographic map and the RD1000 facilities map as beginning along Lone Tree Road just north of West Elkhorn Boulevard, approximately 2 to 3 miles north of the Project site. Canal-2 is a direct tributary to Canal-3 (West Drainage Canal) as it directly connects at the south boundary of the Project site. This feature conveys stormwater and irrigation runoff collected in various small ditches and stormwater infrastructure in the local vicinity. Canal-2 exhibited an OHWM that was not prominent, with one indicator observed being a change in bank slope creating an upside-down trapezoidal-like cross-sectional profile. The OHWM of the entire feature appeared to vary between approximately 26 to 30 feet wide, with 28-foot width observed at OHWM SP-4. Both banks of this feature are experiencing erosion. The depth at OHWM and the sediment characteristics were unable to be determined due to safety concerns. The second OHWM indicator observed was a shift from open water and floating aquatic vegetation such as Duckweed (OBL) and an unidentified dead floating-leaved rooted vascular plant species to Black Mustard (NL), Milk Thistle (NL), Ripgut Grass (NL), Rye Grass (FAC), Poison Hemlock (FACW), and Fennel (NL) in Upland Mustards or Star-thistle Fields or Poison Hemlock or Fennel Patches communities. There are trees present along the banks of this feature, either individual specimens or small groves of either Goodding's Black Willow (FACW) or Valley Oak (FACU).

5.1.3 Canal-3 (West Drainage Canal)

Canal-3 is a named feature, the West Drainage Canal, and is a west-east oriented man-excavated drainage canal that partially overlaps the south boundary of the Project site. This canal's origin can be traced on the topographic map and the RD1000 facilities map as beginning along Elkhorn Boulevard east of Garden Highway, approximately 3 miles northwest of the Project site. The canal receives water from several other smaller drainage canals that convey stormwater and irrigation runoff collected in various small ditches and stormwater infrastructure in the local vicinity. This water ultimately gets discharged to the Sacramento River in a controlled and managed way via several different pump stations. Canal-3 exhibited an OHWM that was moderately prominent with one indicator observed being a change in bank slope, especially on the south bank where there was an obvious scour mark below where the bank was being undercut, creating an upside-down trapezoidal-like cross-sectional profile. The OWHM of this feature appeared to vary between 49 to 54 feet wide, with a 52-foot width observed at OHWM SP-5 and a 50-foot width at OHWM SP-6. Both banks of this feature are experiencing erosion. The depth at OHWM and the sediment characteristics were unable to be determined due to safety concerns. The second OHWM indicator observed was a shift from open water and floating aquatic vegetation to Black Mustard (NL), Milk Thistle (NL), Ripgut Grass (NL), Rye Grass (FAC), Poison Hemlock (FACW), and Fennel (NL) in Upland Mustards or Star-thistle Fields or Poison Hemlock or Fennel Patches communities. There are trees present along the banks of this feature, either individual specimens or small groves of Valley Oak (FACU) and Black Walnut (*Juglans nigra*; UPL). Evidence of a recent flooding event was observed in the form of ponded water and aquatic vegetation present in the field adjacent to the north bank of the canal.

5.2 Other Waters

5.2.1 Ditch-1

Ditch-1 is a north-south oriented man-excavated irrigation drainage ditch that transects the western third of the Project site, starting at Bayou Way on its north terminus and discharging to Canal-3 (West Drainage Canal) on its

DRAFT

south terminus. This feature conveys excess irrigation water and stormwater runoff from the adjacent agricultural fields to Canal-3. Ditch-1 exhibited an OHWM that was not prominent, with one indicator observed being a change in bank slope creating an upside-down trapezoidal-like cross-sectional profile. The OHWM varied in width from being approximately 16 feet wide and 1 foot deep at its south end (OHWM SP-1) and approximately 3 feet wide and 1.5 feet deep near the north end (OHWM SP-2), with 3 feet wide being the average width observed. The substrate within the channel bed is best characterized as silt. The second OHWM indicator observed included a change in vegetation species. The majority of Ditch-1 is best characterized as Hardstem and California Bulrush Marsh with the dominant plant species being Common Tule (OBL), Tall Flatsedge (FACW), Curly Dock (FAC), Johnson Grass (FACU), and Bristly Ox-Tongue (FAC). Other plant species observed in smaller amounts include Cattail (OBL), Himalayan Blackberry (FAC), and Fremont Cottonwood (not listed [NL], assumed UPL). The vegetation shifted to Perennial Rye Grass Fields primarily on the west side of the feature with dominant vegetation being Rye Grass (FAC) and Ripgut Grass (NL), and Poison Hemlock or Fennel Patches primarily on the west side of the feature with dominant vegetation being Fennel (NL), Poison Hemlock (FACW), Milk Thistle (NL), Black Mustard (NL), and Ripgut Grass.

5.2.2 Ditch-2

Ditch-2 is an east-west oriented man-excavated drainage ditch that transects the northern edge of the Project site. The ditch starts outside of the Project site on the north side of Bayou Way across the road from Canal-2, passes through the Project site, then ultimately discharges to an extension of Canal-1 outside of the Project site. This feature conveys stormwater runoff from the adjacent roads and uplands within the Caltrans I-5 right-of-way to Canal-1. Ditch-2 exhibited a prominent OHWM that was approximately 7 feet wide and 1 foot deep with several indicators observed. A slight break in slope was present at the OHWM and there was a large coverage of biotic crust and soil cracks observed below the OHWM. The vegetation cover changed from approximately 25% below the OHWM to approximately 75% above the OHWM. When not inundated with water, Ditch-2 is best characterized as Perennial Rye Grass Field vegetation community. The dominant vegetation species changed from Annual Beard Grass (*Polypogon monspeliensis*; FACW), Tall Flatsedge (FACW), and Curly Dock (FAC) below the OHWM to Wild Oats (NL), Chicory (FACU), Bird's Foot Trefoil (*Lotus corniculatus*; FAC), and Perennial Pepperweed (FAC). There was surface water present in this ditch feature at the time of the October 2021 surveys but the feature was dry at the time of the July 2022 survey.

5.3 Annexation Area

Bargas examined data layers within the NHD and NWI to determine potential jurisdictional features within the Annexation Area. For linear features, both datasets show the area's canals and no other feature types. Several wetland features, however, are mapped by the NWI within the Annexation Area. These are discussed below and shown on **Exhibit 5**.

5.3.1 PEM1A

NWI features classified as PEM1A are located in the northwest corner of the Annexation Area (approximately 1.4 acres) and north-central portion of the Annexation Area (approximately 2.3 acres), the latter of which is connected to an area mapped as PEM1C (discussed below in **Section 5.3.2**). The NWI's definition of PEM1A features is as follows:

> *Palustrine - Emergent Persistent - Temporarily Flooded*

Palustrine wetlands are often dominated by trees, shrubs, or other emergent vegetation and include habitats traditionally called marsh, swamp, bog, fen, or prairie. Wetlands lacking emergent vegetation but that are smaller than 20 acres (8 ha), have little wave action, are < 8.2 feet (2.5 m) deep, and have salinity < 0.5 ppt are also classified as Palustrine.

Persistent Emergent wetlands are dominated by plants which have leaves and stems above the surface of the water during the entire year. In these wetlands emergent plants are the tallest life form and cover > 30% of the area.

This wetland is Temporarily Flooded with surface water present for a few days to a few weeks during the growing season. The water table usually lies well below the ground surface for the most of the season.

Typical species include:

*Cattails (*Typha*), Bulrushes (*Scirpus*), Saw grass (*Cladium jamaicense*), Sedges (*Carex*), Manna grasses (*Glyceria*), Slough grass (*Beckmannia syzigachne*), Common river grass (*Scolochloa festucacea*), Purple loosestrife (*Lythrum salicaria*), Mexican dock (*Rumex mexicanus*), Swamp loosestrife (*Decodon verticillatus*), Smartweeds (*Polygonum*)*

5.3.2 PEM1C

An NWI feature classified as PEM1C measuring approximately 4 acres in extent is located in the north-central portion of the Annexation Area and is connected to an area mapped as PEM1A (discussed above in **Section 5.3.1**). The NWI's definition of PEM1C features is as follows:

Palustrine- Emergent Persistent - Seasonally Flooded

Palustrine wetlands are often dominated by trees, shrubs, or other emergent vegetation and include habitats traditionally called marsh, swamp, bog, fen, or prairie. Wetlands lacking emergent vegetation but that are smaller than 20 acres (8 ha), have little wave action, are < 8.2 feet (2.5 m) deep, and have salinity < 0.5 ppt are also classified as Palustrine.

Persistent Emergent wetlands are dominated by plants which have leaves and stems above the surface of the water during the entire year. In these wetlands emergent plants are the tallest life form and cover > 30% of the area.

This wetland is Seasonally Flooded with surface water present for extended periods during the growing season but absent by the end of the season in most years. When surface water is absent the depth to substrate saturation may vary considerably among sites and among years.

Typical species include:

*Cattails (*Typha*), Bulrushes (*Scirpus*), Saw grass (*Cladium jamaicense*), Sedges (*Carex*), Manna grasses (*Glyceria*), Slough grass (*Beckmannia syzigachne*), Common river grass (*Scolochloa festucacea*), Purple loosestrife (*Lythrum salicaria*), Mexican dock (*Rumex mexicanus*), Swamp loosestrife (*Decodon verticillatus*), Smartweeds (*Polygonum*)*

5.3.3 PSSC

An NWI feature classified as PSSC measuring approximately 1.5 acres in extent is located in the southeast portion of the Annexation Area. The NWI's definition of PSSC features is as follows:

> *Palustrine - Shrub/Scrub - Seasonally Flooded*
>
> *Palustrine wetlands are often dominated by trees, shrubs, or other emergent vegetation and include habitats traditionally called marsh, swamp, bog, fen, or prairie. Wetlands lacking emergent vegetation but that are smaller than 20 acres (8 ha), have little wave action, are < 8.2 feet (2.5 m) deep, and have salinity < 0.5 ppt are also classified as Palustrine.*
>
> *Shrub/Scrub wetlands are dominated by woody plants < 6m (20 ft) tall that cover > 30% of the area. While these wetlands only occur in the Estuarine and Palustrine Systems, they are one of the most widespread wetland classes in the United States.*
>
> *This wetland is Seasonally Flooded with surface water present for extended periods during the growing season but absent by the end of the season in most years. When surface water is absent the depth to substrate saturation may vary considerably among sites and among years.*

6 Conclusion

A total of **2.081 acres (15,424 linear feet)** of aquatic features have been identified within the Project site, composed of three tributary drainages (three canals; Canal-1, Canal-2, Canal-3) and one other water (one irrigation drainage ditch; Ditch-1). Canal-3, the West Drainage Canal, is a managed (via pump stations) tributary to the Sacramento River, a USACE-designated traditional navigable waterway located approximately 1.3 miles to the southwest of the approximate center of the Project site. RD1000 operates several pumping plants to release water from the drainage canals to the Sacramento River in a controlled manner including the following:

- Pumping Plants 1A and 1B on the Natomas Main Drainage Canal connected to Canal-3 via box culvert under I-80, located approximately 0.6 miles west of Gateway Oaks Drive and approximately 4.6 miles southeast of the Project site center;
- Pumping Plant #3 on a lateral canal connected to Canal-3 via box culvert under a farm road, located along Garden Highway approximately 0.75 miles north of Radio Road and approximately 1.5 miles south of the Project site center; and
- Pumping Plant #5 on a lateral canal connected to Canal-3 via culvert pipes under a farm road, located along Garden Highway approximately 0.75 miles southeast of I-5 and approximately 2.5 miles west of the Project site center.

Canal-1 and Canal-2 are direct tributaries of Canal-3 and Ditch-1 has direct surface hydrologic connection to Canal-3. All features observed and mapped within the Project site are potentially USACE jurisdictional features. These features are subject to the interpretation and verification of the USACE Sacramento District Regulatory Division. All features observed are depicted in **Exhibit 4**.

Four wetland features mapped by the NWI as measuring approximately 9.4 acres in extent are potentially present within the Annexation Area. These features, however, have not been verified with a field delineation.

On April 6, 2022, the US Supreme Court voted to re-instate portions of the previous administration's USEPA – Clean Water Act wetland regulations criteria. It is not known at this time if this recent ruling will influence the USACE Sacramento Regulatory District as they process a wetland jurisdictional determination for this Project. Upon the USACE and USEPA issuing modified regulations based upon the recent court ruling, Bargas will relay the changes to the applicant to discuss if any of the regulation changes modify the aquatic resources delineation for the proposed Project.

PRELIMINARY GEOTECHNICAL EXPLORATION

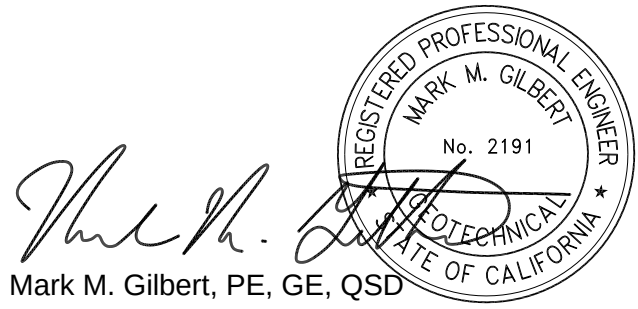
Dear Mr. Stinson:

ENGEO prepared this geotechnical report for Raney Planning & Management, Inc. as outlined in our agreement dated January 11, 2022. We characterized the subsurface conditions at the site to provide the enclosed preliminary geotechnical recommendations.



Based upon our initial assessment, it is our opinion that the proposed development is feasible from a geotechnical standpoint. Design-level exploration should be conducted prior to site development once information is available regarding the building layout, structural loads, and proposed grading.

We are pleased to have been of service on this project and are prepared to consult further with you and your design team as the project progresses. If you have any questions or comments regarding this preliminary geotechnical report, please call and we will be glad to discuss them with you.

Sincerely,

ENGEO Incorporated

Travis Chatters, PE, QSD

1.0 INTRODUCTION

1.1 PURPOSE AND SCOPE

We prepared this preliminary geotechnical report for the proposed Airport South Industrial Park in Sacramento, California. As outlined in our agreement dated January 11, 2022, you authorized ENGEO to conduct the following scope of services.

- Service plan development
- Subsurface field exploration
- Soil laboratory testing
- Data analysis and conclusions
- Report preparation

For our use, we received the following.

- Concept Site Plan A1, Airport South Industrial Park, Sacramento, California, August 23, 2021, 1:500 scale.

- Preliminary Site Plan #1, Airport South Industrial, City of Sacramento, California, March 14, 2022, prepared by Wood Rodgers.

This report was prepared for the exclusive use of our client and their consultants for preliminary design of this project. If any changes are made in the character, design, or layout of the development, we must be contacted to review the conclusions and preliminary recommendations contained in this report to evaluate whether modifications are recommended. This document may not be reproduced in whole or in part by any means whatsoever, nor may it be quoted or excerpted without our express written consent.

1.2 PROJECT LOCATION

The proposed project is to be located on an approximately 450-acre site that lies south of Interstate 5 at the Metro Air Parkway interchange in Sacramento, California. Figure 1 displays a Site Vicinity Map. The site is bordered by Interstate 5 to the north, Power Line Road to the west, farmland to the south, and residential subdivisions to the east. Figure 2 shows site boundaries and our exploration locations.

1.3 PROJECT DESCRIPTION

We understand from the Preliminary Site Plan prepared in March 2022, that the proposed Airport South Industrial Park project will consist of multiple large acreage parcels that will include industrial use, detention basins, “highway” parcels, paved roadways and parking areas, underground utilities, and a sewer pump station. Five of the parcels will include buildings ranging in size from 696,260 to 1,202,800 square feet in area. Basins on the site range in size from 3.5 to 40.6 acres.

The Concept Site Plan dated August 2021, which was used to prepare our proposal, had similar site features as the Preliminary Site Plan, but with different building and basin configurations. We understand that the Preliminary Site Plan is the most recent and more applicable document for the proposed development.

Based on our discussions with you, we understand the buildings will be tilt-up warehouse type structures. We assume that the structures will be no more than two stories in height. Structural loads and grading are yet to be determined; however, we assume that structural loads will be representative for this type of construction and that only minor grading will be required.

2.0 FINDINGS

2.1 AERIAL PHOTO REVIEW

We reviewed aerial photographs of the site dating back to 1947. We observed the following features in the historic aerial photographs.

- The site has historically been used for agriculture, which included rice farming and row crops.
- Several structures were observed near the northern and eastern borders of the site as far back as the 1947. The structures in the eastern portion of the site were no longer visible by 1984, and the structures along the northern border were no longer visible by 2009.
- Bayou Way was observed as of the 1993 photograph in its current alignment.
- Soil was stockpiled in the numerous smaller piles in the northeastern corner of the site in 2007 and 2008. We did not observe any stockpiles in the area during our exploration.
- Earthwork of the adjacent Metro Air Parkway overcrossing was observed as of 2020.

2.2 FIELD EXPLORATION

Our field exploration included drilling six borings and advancing two cone penetration test (CPT) soundings at the site. We performed our field exploration on March 22, 23, and 30, 2022. The location and elevations of our explorations are approximate and were estimated by using handheld GPS devices; they should be considered accurate only to the degree implied by the method used. We provide a brief description of the borings and CPTs below.

2.2.1 Borings

We observed drilling of six borings at the locations shown on the Site Plan, Figure 2. An ENGEO representative observed the drilling and logged the subsurface conditions at each location. We retained a truck-mounted CME-55 drill rig and crew to advance the borings using 4-inch-diameter solid-flight auger methods. The borings were advanced to depths ranging from 11½ to 18 feet below existing grade.

We obtained bulk soil samples from drill cuttings and retrieved samples at various intervals in the borings using split-spoon samplers. The blow counts were obtained by dropping a 140-pound hammer through a 30-inch free fall. The 3-inch outside diameter (O.D.) modified California split-spoon sampler was driven 18 inches and the number of blows was recorded for each 6 inches of penetration. Unless otherwise indicated, the blows per foot recorded on the boring log represent the accumulated number of blows to drive the last 1 foot of penetration; the blow counts have not been converted using any correction factors. When sampler driving was difficult, penetration was recorded only as inches penetrated for 50 hammer blows.

The logs depict subsurface conditions at the exploration locations for the date of exploration; however, subsurface conditions may vary with time. The exploration logs are included in Appendix A.

2.2.2 Cone Penetration Tests

We retained a CPT rig to push the cone penetrometer to a maximum depth of about 50 feet. The CPT has a 20-ton compression-type cone with a 15-square-centimeter (cm^2) base area, an apex angle of 60 degrees, and a friction sleeve with a surface area of 225 cm^2. The cone, connected with a series of rods, is pushed into the ground at a constant rate. Cone readings are taken at approximately 5-cm intervals with a penetration rate of 2 cm per second in accordance with ASTM D-5778. Measurements include the tip resistance to penetration of the cone (Qc), the resistance of the surface sleeve (Fs), and pore pressure (U) (Robertson and Campanella, 1988). CPT logs are presented in Appendix B.

2.3 GEOLOGY

The site is located in the Great Valley geomorphic province. The Great Valley is an elongate, northwest-trending structural trough bound by the Coast Range on the west and the Sierra Nevada on the east. The Great Valley has been and is presently being filled with sediments primarily derived from the Sierra Nevada. The impact of periodic glaciation of the Sierra Nevada during the last global climate change was strongly felt by the Sacramento Valley River systems. Huge quantities of sediments were moved through the river systems fed by alpine glaciers during episodic Pleistocene glaciations. As these periods of glaciation ended, rivers draining the Sierra Nevada were made even more powerful by the considerably wetter climate and abundant meltwater. Abundant sediments left from the retreating glaciers were carried downstream into the Sierra Foothills and into the Sacramento Valley. At least four pulses of glacial outwash deposition are known to have taken place during glacial episodes of the past 2 million years (Harden, 1997). These deposits extend to depths of up to 3 miles on the western side of the Sacramento Valley and gradually thin out on the eastern side (Harwood and Helley, 1982).

As shown on Figure 3, the site was mapped as Holocene Alluvium, Holocene Basin Deposits, and the Middle Unit of the Riverbank Formation (Gutierrez, 2011 and Helley and Harwood, 1985). The Holocene Alluvium is described as unweathered gravel, sand, and silt that are poorly to moderately sorted deposited by the Sacramento River; we did not encounter sediments of this description in our explorations. Our explorations within the Holocene Alluvium area encountered sediments indicative of Holocene Basin Deposits (Qhb), which is mapped in the eastern portion of the site. Holocene Basin deposits are described as dark gray to black, fine-grained sediments deposited by standing or slow-moving water in topographic lows. The older Pleistocene Riverbank Formation is mapped along the eastern site boundary and is described as compact alluvium consisting of gravel, sand, silt, and clay deposits. Based on our exploration, it appears the Riverbank Formation underlies the Holocene Basin Deposits.

2.4 SEISMICITY

The Northern California region contains numerous active faults. An active fault is defined by the California Geologic Survey as one that has had surface displacement within Holocene time (about the last 11,700 years) (CGS, 2018). The site is not located within a currently designated Alquist-Priolo Earthquake Fault Zone and no known surface expression of active faults is believed to exist within the site. Figure 4, Regional Faulting and Seismicity, shows mapped active and historic faults and historic earthquake centers.

In Table 2.4-1, Nearby Seismic Sources, we summarize the distance to the fault rupture surface (R_{RUP}) and the associated moment magnitude for nearby seismic sources used for the National Seismic Hazard Maps, which are incorporated into the California Building Code (CBC). We obtained the data using the USGS Unified Hazard Tool (Dynamic Conterminous U.S. 2014 (update, v4.2.0) and disaggregated the hazard at the peak ground acceleration (PGA) for 2,475-year return period, and Site Class D. These results represent fault sources contributing at least one percent to the seismic hazard at the site; gridded or areal sources are not presented.

TABLE 2.4-1: Nearby Seismic Sources (Latitude: 38.4926 Longitude: -121.3220)

SOURCE	R_{RUP}		MOMENT MAGNITUDE M_W
	(km)	(miles)	
Great Valley 04a – Trout Creek [2]	43.2	26.8	7.11
Great Valley 03a Dunnigan Hills [0]	21.1	13.1	6.19
Hunting Creek – Berryessa [3]	60.2	37.4	7.49
Great Valley 06 (Midland) alt1 [0]	35.8	22.2	6.87

Source: USGS Unified Hazard Tool (USGS, n.d.)

Although the Foothill Fault System is not mapped in the USGS database, the Cleveland Hills Fault Segment near Oroville, part of the Foothill Fault System, is approximately 55 miles from the site and produced a Magnitude 5.8 earthquake in 1975. Segments of the Foothills Fault System located as close as 27 miles from the site are not considered active but could be capable of a large magnitude earthquake.

2.5 SURFACE CONDITIONS

While no topographic information was provided, we relied on data from Google Earth (Datum WGS84). Site topography generally slopes gently from the east to the west. Site grades from Google Earth range from Elevation 27 feet along the eastern border to Elevation 11 feet along the western border.

We observed the following site features during our reconnaissance.

- Seasonal grasses covered the site.
- Drainage channels cross the site in north-south and east-west directions. Additional channels border the site along the southern and western borders.
- Agricultural rows from former site usage in select areas of the site.

Please refer to the Site Plan, Figure 2, for more information on site features.

2.6 SUBSURFACE CONDITIONS

Our explorations generally encountered surficial soil consisting of hard lean to fat clay underlain by stiff to hard fat clay. Borings 1-B5 and 1-B6 encountered poorly graded sand with clay and gravel and well graded sand with silt, respectively, below the lean clay, at depths ranging from 13 to 16 feet below ground surface. Undocumented fill was encountered at Boring 1-B5 to a depth of approximately 4 feet below ground surface. We performed plasticity index (PI) tests on select soil samples, which yielded results of 36, 41, and 55, indicating high to very high shrink/swell

potential. Additionally, we performed expansion index (EI) tests, which yielded EI results of 83 and 110, indicating moderate to high expansion potential. We did not encounter any noticeably weak or compressible soil in our exploratory borings.

Consult the Site Plan and boring logs for specific subsurface conditions at each location. We include our exploration logs in Appendix A. The logs contain the soil type, color, consistency, and visual classification in general accordance with the Unified Soil Classification System. The logs graphically depict the subsurface conditions encountered at the time of the exploration.

2.7 GROUNDWATER CONDITIONS

We observed groundwater in two of our subsurface explorations. We summarize our observations in the table below:

TABLE 2.7-1: Groundwater Observations

EXPLORATION LOCATION	APPROX. DEPTH TO GROUNDWATER (feet)
1-B5	18
1-B6	10

We also performed pore pressure dissipation tests in our CPTs to measure hydrostatic conditions and estimate the depth to groundwater. We summarize the results of the pore pressure dissipation tests in the table below.

TABLE 2.7-2: Groundwater Depths Based on Pore Pressure Dissipation Tests

EXPLORATION ID	INTERPRETED DEPTH TO GROUNDWATER (feet)
1-CPT1	5.5
1-CPT2	3.8

Fluctuations in the level of groundwater may occur due to variations in rainfall, irrigation practice, and other factors not evident at the time measurements were made.

2.8 LABORATORY TESTING

We performed laboratory tests on selected soil samples to evaluate their engineering properties. For this project, we performed moisture content, dry density, unconfined compression, plasticity index, expansion index, and soil corrosion potential testing. Moisture contents and dry densities are recorded on the boring logs in Appendix A; other laboratory data is included in Appendix C.

2.9 PRELIMINARY LIQUEFACTION ANALYSES

Soil liquefaction results from loss of strength during cyclic loading, such as that imposed by an earthquake. Soil most susceptible to liquefaction is clean, loose, saturated, uniformly graded fine sands below the groundwater table. Empirical evidence indicates that loose silty sands as well as lean silts and some clays are also potentially liquefiable. When seismic ground shaking occurs, the soil is subjected to cyclic shear stresses that can cause excess hydrostatic pressures to develop. If excess hydrostatic pressures exceed the effective confining stress of the soil, it is said to have liquefied, and if the sand consolidates or vents to the surface during and following liquefaction, ground settlement and surface deformation may occur. In some cases, observed

settlement has been amplified directly beneath a building, due to the cyclic rocking of the building foundation, as compared to the surrounding ground surface. This is referred to as the “ratcheting” effect and is thought to be caused by the interaction of the building foundation and the surrounding soil during seismic shaking.

In accordance with the 2019 California Building Code (CBC) and the American Society of Civil Engineers (ASCE) Standard for Minimum Design Loads for Buildings and Other Structures (ASCE 7-16), we used the mapped MCE_G peak ground acceleration (PGA_M) of 0.34g for evaluation of liquefaction. We used an earthquake magnitude of 6.5 and a depth to groundwater of 4½ feet to evaluate potential liquefaction. Our depth to groundwater was based on the results of the pore dissipation tests.

For our CPT-based liquefaction analysis, we calculated potential liquefaction-induced triggering and vertical settlement using the commercially available program CLiq. We utilized the method published by Robertson (2009). The analysis indicates that there is a layer from approximately 25 to 30 feet that could potentially liquefy during a design earthquake event. The Cliq calculations suggest liquefaction-induced settlements would be up to 1½ inches under a design earthquake event at the CPT locations.

Based on the findings published by Youd and Garris in 1995, sufficiently thick non-liquefiable soil that overlies liquefiable layers provide a capping effect, which has been observed to result in much less ground surface deformation than indicated by theoretical liquefaction analyses. At the CPT location where potentially liquefiable sand was encountered, overlying layers of non-liquefiable soil approximately 25 feet thick were encountered.

Based on the information presented above, it is our opinion that the non-liquefiable surface soil layer should provide significant capping effect, and the overall ground surface deformation as a result of theoretical liquefaction-induced settlement will likely be less than the estimated theoretical values. These settlement estimates are preliminary and should be further evaluated during a design-level geotechnical exploration.

3.0 PRELIMINARY CONCLUSIONS

From a geotechnical engineering viewpoint, in our opinion, the site is suitable for commercial development, provided the preliminary geotechnical recommendations in this report are properly incorporated into future development planning. Based on our preliminary exploration, the primary geotechnical concern that could affect development on the site is expansive soil. We summarize this and other conclusions below.

3.1 EXPANSIVE SOIL

We observed expansive clay in our borings. Our laboratory testing indicates that this soil exhibits high to very high shrink/swell potential with variations in moisture content. Expansive soil changes in volume with changes in moisture. It can shrink or swell and cause heaving and cracking of slabs-on-grade, pavements, and structures founded on shallow foundations. Damage due to volume changes associated with expansive soil can be reduced by capping the expansive soil with a blanket of low-expansive soil, using a rigid mat foundation that is designed to resist the settlement and heave of expansive soil, or by deepening footings to below the zone of significant moisture fluctuation.

To reduce the potential for damage to the planned building, we recommend that the upper 2 feet of building pads extending at least 10 feet laterally beyond building areas be underlain by low-expansive fill. Due to the relatively flat nature of the site, selective grading to mitigate expansive soil will not be a practical alternative and imported fill is recommended. In lieu of importing low-expansive fill, lime treatment may be considered. We recommend that other structural elements, such as pavements and flatwork, be designed for highly expansive soil conditions.

Successful performance of structures on expansive soil requires special attention during construction. It is imperative that exposed soil be kept moist prior to placement of concrete for foundation construction. It can be difficult to remoisturize clayey soil without excavation, moisture conditioning, and recompaction.

We also provide preliminary grading recommendations for compaction of expansive clay soil. The purpose of these recommendations is to reduce the swell potential of the clay by compacting the soil at a higher moisture content and controlling the amount of compaction.

3.2 EXISTING FILL

Our borings encountered undocumented fill at Boing 1-B5 to a depth of approximately 4 feet below ground surface. Non-engineered fill can undergo excessive settlement, especially under new fill or building loads. We recommend complete removal and recompaction of existing fill. We present fill removal recommendations in Section 4.2.

3.3 SEISMIC HAZARDS

Potential seismic hazards resulting from a nearby moderate to major earthquake can generally be classified as primary and secondary. The primary effect is ground rupture, also called surface faulting. Common secondary seismic hazards include ground shaking and liquefaction. These hazards are discussed below as they apply to the site. Based on topographic and lithologic data, the risk of regional subsidence or uplift, lateral spreading, landslides, tsunamis, or seiches is considered low to negligible at the site.

3.3.1 Ground Rupture

Since there are no known active faults crossing the property and the site is not located within an Earthquake Fault Special Study Zone, it is our opinion that ground rupture is unlikely at the subject property.

3.3.2 Ground Shaking

To mitigate the shaking effects, structures should be designed using sound engineering judgment and the 2019 California Building Code (CBC) requirements, as a minimum. Seismic design provisions of current building codes generally prescribe minimum lateral forces, applied statically to the structure, combined with the gravity forces of dead and live loads. The code-prescribed lateral forces are generally considered to be substantially smaller than the comparable forces that would be associated with a major earthquake. Therefore, structures should be able to: (1) resist minor earthquakes without damage, (2) resist moderate earthquakes without structural damage but with some nonstructural damage, and (3) resist major earthquakes without collapse but with some structural as well as nonstructural damage. Conformance to the current building code recommendations does not constitute any kind of guarantee that significant structural damage

would not occur in the event of a maximum magnitude earthquake; however, it is reasonable to expect that a well-designed and well-constructed structure will not collapse or cause loss of life in a major earthquake (SEAOC, 1996).

3.3.3 Liquefaction

Soil liquefaction results from loss of strength during cyclic loading, such as imposed by earthquakes. Soil most susceptible to liquefaction is clean, loose, saturated, uniformly graded, fine-grained sand. Liquefiable soil was identified at 1-CPT1 at a depth of 25 to 30 feet below ground surface, and a predicted liquefaction-induced vertical settlement of up to 1½ inches was calculated. However, there is a sufficiently thick non-liquefiable "capping" layer above the liquefiable soil as to prevent significant vertical settlement at the site. Based on our engineering judgement, we determined that while liquefaction of the select subsurface soil layers is possible at the site, the overall ground surface deformation, as a result of theoretical liquefaction-induced settlement, will likely be less than the estimated theoretical values.

Further liquefaction analysis should be performed as part of the design-level study.

3.3.4 Flooding

According to the Federal Emergency Management Agency (FEMA) Flood Insurance Maps for Sacramento County (Maps No. 06067C0040J and 06067C0045J) dated June 16, 2015, the site is mapped in Zone A, which is identified as a special flood hazard area without base flood elevation. According to FEMA, this designation means that the site is lower than the Base Flood Elevation. The civil engineer should review pertinent information relating to possible flood levels for the subject site based on final pad elevations and provide appropriate design measures for development of the project, if recommended.

3.4 SOIL CORROSION POTENTIAL

We obtained two representative soil samples and submitted them to an analytical lab for determination of pH, resistivity, sulfate, and chloride. The results are included in Appendix C and summarized in Table 3.4-1.

TABLE 3.4-1: Corrosivity Test Results

SAMPLE LOCATION	DEPTH	PH	RESISTIVITY (ohms-cm)	CHLORIDE (ppm)	SULFATE (ppm)
1-B1	3.5	7.76	1,260	15.2	84.3
1-B6	3.5	7.51	1,020	10.5	37.0

The sulfate results of up to 84.3 ppm correspond to 0.00843% by weight sulfate. In accordance with ACI 318-14, Section 19.3.1 for concrete durability requirements, the results are classified as Exposure Class S0 since they are below 0.1% by weight. The 2019 CBC and ACI 318 do not specify cement type and water-cement ratio for Exposure Class S0. We defer to the structural engineer for concrete specifications.

Soil with a resistivity between 1,000 to 3,000 ohms-cm is considered highly corrosive to buried metal piping (Roberge, 2006). Based on the resistivity measurements the soil is considered highly corrosive to buried metal piping. Values tested for chloride do not appear to pose a significant impact to metals or concrete.

If desired to investigate this further, we recommend a corrosion consultant be retained to evaluate if specific corrosion recommendations are advised for the project.

3.5 2019 CBC SEISMIC DESIGN PARAMETERS

The 2019 CBC utilizes seismic design criteria established in the ASCE/SEI Standard "Minimum Design Loads and Associated Criteria for Buildings and Other Structures," (ASCE 7-16). Based on the subsurface conditions encountered, we characterized the site as Site Class D.

ASCE 7-16 requires a site-specific ground-motion hazard analysis for Site Class D sites with a mapped S_1 value greater than or equal to 0.2; however, Section 11.4.8 of ASCE 7-16 and Supplement No. 3 provide an exception to this requirement. A site-specific ground-motion hazard analysis is not required where the value of the parameter S_{M1} determined by Equation 11.4-2 and shown in Table 1 is increased by 50 percent for developing the mapped Risk-Targeted Maximum Considered Earthquake (MCE_R) spectral response, calculating S_{D1}, and evaluating C_s in accordance with Chapter 12 of ASCE 7-16.

In Table 3.5-1 below, we provide the CBC seismic parameters based on the United States Geological Survey's (USGS) Seismic Design Maps for your use. When using this table, considerations should be given to exceptions in Section 11.4.8 of ASCE 7-16, as described in this report.

TABLE 3.5-1: 2019 CBC Seismic Design Parameters, Latitude: 38.6670° Longitude: -121.5642°

PARAMETER	VALUE
Site Class	D
Mapped MCE_R Spectral Response Acceleration at Short Periods, S_S (g)	0.602
Mapped MCE_R Spectral Response Acceleration at 1-second Period, S_1 (g)	0.262
Site Coefficient, F_a	1.318
Site Coefficient, F_v	Null*
MCE_R Spectral Response Acceleration at Short Periods, S_{MS} (g)	0.794
MCE_R Spectral Response Acceleration at 1-second Period, S_{M1} (g)	Null*
Design Spectral Response Acceleration at Short Periods, S_{DS} (g)	0.529
Design Spectral Response Acceleration at 1-second Period, S_{D1} (g)	Null*
Mapped MCE Geometric Mean (MCE_G) Peak Ground Acceleration, PGA (g)	0.253
Site Coefficient, F_{PGA}	1.347
MCE_G Peak Ground Acceleration adjusted for Site Class effects, PGA_M (g)	0.341
Long period transition-period, T_L (sec)	12

*The parameters above should only be used for calculation of T_s, determination of Seismic Design Category, and, when taking the exceptions under Items 1 and 2 of ASCE 7-16 Section 11.4.8. (Supplement Number 3 https://ascelibrary.org/doi/epdf/10.1061/9780784414248.sup3).

We recommend that we collaborate with the structural engineer of record to further evaluate the effects of taking the exception on the structural design and identify the need for performing a site-specific ground-motion hazard analysis. We can prepare a proposal for a site-specific ground-motion hazard analysis, if requested.

4.0 PRELIMINARY EARTHWORK RECOMMENDATIONS

The preliminary recommendations included in this report should be utilized for project planning purposes and are intended for the areas of the site that will be developed with structural improvements. These areas include, but are not limited to building pads, sidewalks, pavement areas, and retaining walls. Prior to development, we should be retained to provide a design-level geotechnical report for the development.

4.1 EXPANSIVE SOIL MITIGATION

As previously mentioned, potentially expansive clay was encountered in our explorations. To reduce the risk of structural damage associated with the highly expansive soil conditions, we recommend constructing the upper 2 feet of building pads with low-expansive fill. As an alternative to importing low-expansive fill for the building pads, lime treatment may also be considered. Low-expansive soil is defined as having a plasticity index less than 12.

4.2 EXISTING FILL REMOVAL

On a preliminary basis, the undocumented fill should be removed to competent native soil, as evaluated by ENGEO. Figure 2 displays the approximate lateral extent of the previously mentioned undocumented fill at the site. The lateral extent and depth of fill is expected to vary and should be further evaluated during a design-level report.

4.3 GENERAL SITE CLEARING

Areas to be developed should be cleared of surface and subsurface deleterious materials, including existing building foundations, slabs, buried utility and irrigation lines, water and irrigation wells, pavements, debris, and designated trees, shrubs, and associated roots. Clean and backfill excavations extending below the planned finished site grades with suitable material compacted to the recommendations presented in Section 4.6. ENGEO should be retained to observe and test backfilling.

Following clearing, the site should be stripped to remove surface organic materials. Strip organics from the ground surface to a depth of at least 2 to 3 inches below the surface. Remove stripping's from the site or, if considered suitable by the landscape architect and owner, use them in landscape fill.

4.4 ACCEPTABLE FILL

On-site soil is suitable as fill material provided it is processed to remove concentrations of organic material, debris, deleterious material, and particles greater than 6 inches in maximum dimension. Imported fill materials should meet the above requirements and have a plasticity index less than 12. Allow ENGEO to sample and test proposed imported fill materials at least 5 days prior to delivery to the site.

4.5 OVER-OPTIMUM SOIL MOISTURE CONDITIONS

The contractor should anticipate encountering excessively over-optimum (wet) soil moisture conditions during winter or spring grading, during or following periods of rain, or within swale areas. Wet soil can make proper compaction difficult or impossible. Wet soil conditions can be mitigated by:

1. Frequent spreading and mixing during warm dry weather,
2. Mixing with drier materials,
3. Mixing with a lime, lime-flyash, or cement product, or
4. Stabilizing with aggregate or geotextile stabilization fabric, or both.

Options 3 and 4 should be evaluated by ENGEO prior to implementation.

4.6 FILL COMPACTION

We recommend removal of existing fill, stripping of organics, scarification, moisture conditioning, and compaction of the soil prior to fill placement, following cutting operations, and in areas left at grade. Areas to receive fill should be scarified to a depth of 8 inches, moisture conditioned, and recompacted to provide adequate bonding with the initial lift of fill. Fill should be placed with a loose lift thickness no greater than 8 inches. The following compaction recommendations should be used for the placement and compaction of fill.

TABLE 4.6-1: Compaction and Moisture Content Requirements

DESCRIPTION	SOIL CHARACTERISTICS	RECOMMENDED RELATIVE COMPACTION (%)	MINIMUM MOISTURE CONTENT (percentage points above optimum)
Grading in Structural Areas	Expansive (PI≥12)	87 to 92	3
	Low-expansive soil (PI<12)	90	1

Relative compaction refers to in-place dry density of the fill material expressed as a percentage of the maximum dry density as determined by ASTM D-1557. Optimum moisture is the moisture content corresponding to the maximum dry density. We recommend that the expansive soil be compacted at higher than optimum moisture contents as shown above to reduce potential swell.

Compact the upper 6 inches of expansive soil in pavement subgrade areas to at least 90 percent relative compaction at a moisture content at least 3 percentage points over optimum; compact low-expansive soil to at least 95 percent relative compaction at a moisture content at least 1 percentage point over optimum. Compact pavement Caltrans Class 2 aggregate base section to at least 95 percent relative compaction (ASTM D1557). Moisture condition aggregate base to or slightly above the optimum moisture content prior to compaction. Landscape fill can generally be compacted to a minimum of 85 percent relative compaction.

5.0 PRELIMINARY FOUNDATION RECOMMENDATIONS

We anticipate that one- to two-story commercial buildings can be supported on conventional footings and slab-on-grade systems over a building pad that has been mitigated for the highly expansive soil conditions (see Section 4.1). On a preliminary basis, shallow footings would need to be at least 1 foot wide and at least 2 feet deep. Footings may be designed for a maximum allowable bearing pressure of 4,000 pounds per square foot (psf) for dead-plus-live loads. This value can be increased by one-third for the short-term effects of wind or seismic loading.

While structural loads and column spacings are not yet known, we anticipate that total and differential settlements of the above-described foundations will be tolerable for the intended structures. Foundation settlements should be evaluated as part of the design level study.

Typical interior concrete slabs-on-grade are generally a minimum 5 inches thick and reinforced with No. 3 rebar on 18-inch centers each way within the middle third of the slab; thicker slabs-on-grade may be needed for industrial applications involving forklifts, rack, or equipment loading. The structural engineer would be involved in the final design thickness and additional reinforcement, as needed, for the intended structural loads and uses. When water vapor migrating through the slab-on-grade would be undesirable, interior concrete slabs-on-grade floors would likely be constructed over a moisture reduction system that utilizes a Class A vapor retarder membrane (ASTM E1745, latest edition) underlain by 4 inches of clean crushed rock.

6.0 PRELIMINARY RETAINING WALL RECOMMENDATIONS

Retaining walls should be designed to resist lateral earth pressures from adjoining natural material and/or backfill and from any surcharge loads. On a preliminary basis and provided that adequate drainage is included, design retaining walls to resist the equivalent fluid pressures summarized in Table 6.0-1.

TABLE 6.0-1: Recommended Lateral Soil Pressures

WALL CONDITION	EQUIVALENT FLUID PRESSURE (pounds per cubic foot, pcf)
Restrained Wall – Level Backfill	60
Unrestrained Wall – Level Backfill	45

Design restrained walls to resist an additional uniform pressure equivalent to one-half of any surcharge loads applied at the surface. Design unrestrained retaining walls to resist an additional uniform pressure equivalent to one-third of any surcharge loads applied at the surface.

The above lateral earth pressures assume sufficient drainage behind the walls to prevent any build-up of hydrostatic pressures from surface water infiltration and/or a rise in the groundwater level. If adequate drainage is not provided, we recommend that an additional equivalent fluid pressure of 40 pcf be added to the values recommended above for both restrained and unrestrained walls. Typical drainage systems include a 12-inch-thick layer of drainrock placed directly behind the wall with a perforated pipe at the bottom.

7.0 PRELIMINARY PAVEMENT RECOMMENDATIONS

7.1 FLEXIBLE PAVEMENTS

Due to the highly expansive clay that was encountered near the ground surface of our borings, it is our opinion that an R value of 5 is applicable for preliminary design. Using estimated traffic indices for various pavement-loading requirements, we developed the following recommended pavement sections using Topic 633 of the Caltrans Highway Design Manual (including the asphalt factor of safety), presented in the table below.

As an alternative, the pavement subgrade may be lime treated to increase the subgrade R-Value to a minimum of 40 and reduce the overall pavement section.

TABLE 7.1-1: Recommended Hot Mix Asphalt Concrete Pavement Sections

TRAFFIC INDEX	HOT MIX ASPHALT CONCRETE (inches)	CLASS 2 AB (inches)	
		NATIVE SUBGRADE	LIME-TREATED SUBGRADE
5	3	10	4
6	3½	13	6
7	4	16	7
8	5	18	9
9	5½	21	10
10	6½	23	12

The civil engineer should determine the appropriate traffic indices based on the estimated traffic loads and frequencies. Aggregate base (AB) should meet the requirements for ¾-inch maximum Class 2 AB in accordance with Section 26-1.02B of the latest Caltrans Standard Specifications. Compact pavement Class 2 AB to at least 95 percent relative compaction (ASTM D1557). Moisture condition AB to or slightly above the optimum moisture content prior to compaction.

The design-level report should include R-value testing to verify the appropriate design R-value.

7.2 RIGID PAVEMENTS

Rigid pavements are commonly used to resist heavy loads and turning forces in areas such as fire lanes, trash enclosures, and loading docks. Final design of rigid pavement sections, and accompanying reinforcement, should be performed based on estimated traffic loads and frequencies. On a preliminary basis, we recommend the following minimum design sections for rigid pavements.

- Use a minimum section of 6 inches of Portland Cement concrete over 8 inches of Caltrans Class 2 aggregate base.
- Concrete pavement should have a minimum 28-day compressive strength of 3,500 psi.
- Provide minimum control joint spacing in accordance with Portland Cement Association Guidelines.

Aggregate base should meet the requirements stated in Section 6.1.

8.0 PRELIMINARY EXTERIOR FLATWORK RECOMMENDATIONS

Exterior flatwork includes items such as concrete sidewalks, steps, and outdoor courtyards exposed to foot traffic only. Because of the highly expansive soil conditions at the site, thicker than normal concrete and aggregate base sections will be necessary to provide adequate long-term performance of exterior flatwork. For preliminary consideration, a section of 6 inches of concrete over 4 inches of aggregate base may be considered. Alternatively, subgrade soil for exterior flatwork can be lime-treated at least 18 inches deep to reduce the expansion potential and allow conventional flatwork construction. Flatwork edges can also be thickened so they extend to the subgrade soil to help control moisture variations in the subgrade. Lastly, flatwork can be reinforced with wire mesh or rebar within the middle third of the slab to help control the width and offset of cracks. Control and construction joints should be constructed in accordance with current Portland Cement Association Guidelines.

9.0 DESIGN-LEVEL GEOTECHNICAL REPORT

This report presents findings, conclusions, and preliminary geotechnical recommendations intended for planning purposes only. Design-level geotechnical explorations should be performed when development plans are finalized. We anticipate the design-level geotechnical report will include:

- Additional field exploration and laboratory testing to support design-level recommendations, as needed.
- Design-level analyses related to geologic and geotechnical hazards.
- Seismic-hazard analyses based on the current building code, including a detailed liquefaction analysis.
- Design-level earthwork, foundations, and retaining wall recommendations.

10.0 LIMITATIONS AND UNIFORMITY OF CONDITIONS

This report presents preliminary geotechnical recommendations for project planning purposes of the improvements discussed in Section 1.3 for the Airport South Industrial Park project. If changes occur in the nature of the project, we should be allowed to review this report and provide additional recommendations, if any. It is the responsibility of the owner to transmit the information and recommendations of this report to the appropriate organizations or people involved in design of the project, including but not limited to developers, owners, buyers, architects, engineers, and designers. The conclusions and recommendations contained in this report are solely professional opinions and are valid for a period of no more than 2 years from the date of report issuance.

We strived to perform our professional services in accordance with generally accepted principles and practices currently employed in the area; there is no warranty, express or implied. There are risks of earth movement and property damages inherent in building on or with earth materials. We are unable to eliminate all risks; therefore, we are unable to guarantee or warrant the results of our services.

This report is based upon field and other conditions discovered at the time of report preparation. We developed this report with limited subsurface exploration data. We assumed that our subsurface exploration data are representative of the actual subsurface conditions across the site. Considering possible underground variability of soil and groundwater, additional costs may be required to complete the project. We recommend that the owner establish a contingency fund to cover such costs. If unexpected conditions are encountered, ENGEO must be notified immediately to review these conditions and provide additional and/or modified recommendations, as necessary.

Our services did not include excavation sloping or shoring, soil volume change factors, flood potential, or a geohazard exploration. In addition, our geotechnical exploration did not include work to determine the existence of possible hazardous materials. If any hazardous materials are encountered during construction, the proper regulatory officials must be notified immediately.

This document must not be subject to unauthorized reuse, that is, reusing without written authorization of ENGEO. Such authorization is essential because it requires ENGEO to evaluate the document's applicability given new circumstances, not the least of which is passage of time.

Actual field or other conditions will necessitate clarifications, adjustments, modifications, or other changes to ENGEO's documents. Therefore, ENGEO must be engaged to prepare the necessary clarifications, adjustments, modifications, or other changes before construction activities commence or further activity proceeds. If ENGEO's scope of services does not include on-site construction observation, or if other persons or entities are retained to provide such services, ENGEO cannot be held responsible for any or all claims arising from or resulting from the performance of such services by other persons or entities, and from any or all claims arising from or resulting from clarifications, adjustments, modifications, discrepancies, or other changes necessary to reflect changed field or other conditions.

We determined the lines designating the interface between layers on the exploration logs using visual observations. The transition between the materials may be abrupt or gradual. The exploration logs contain information concerning samples recovered, indications of the presence of various materials such as clay, sand, silt, rock, existing fill, etc., and observations of groundwater encountered. The field logs also contain our interpretation of the subsurface conditions between sample locations. Therefore, the logs contain both factual and interpretative information. Our recommendations are based on the contents of the final logs, which represent our interpretation of the field logs.

CPT DATA

CPT Data Report

Geo-Ex Subsurface Exploration
Dixon, CA

Date: March 30, 2022

CPT Report 022-001-08 rev a

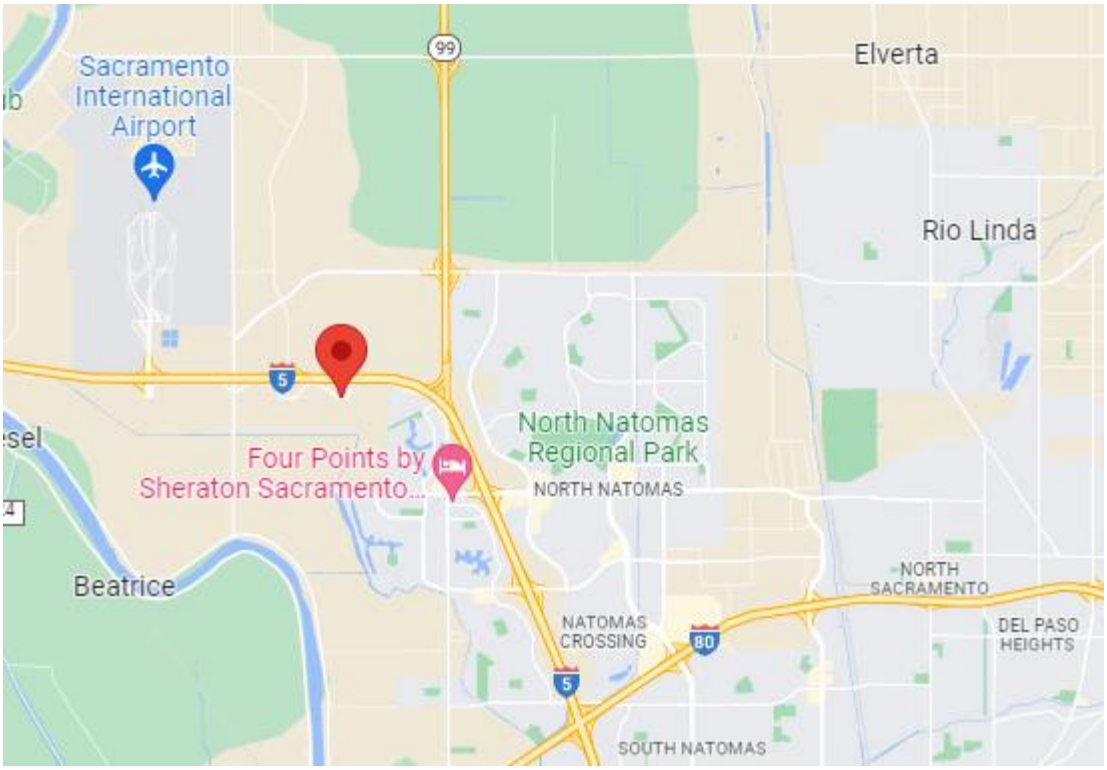
1. Introduction

This report has been prepared by Geo-Ex Subsurface Exploration on March 30, 2022. It contains the data of cone penetration tests at the South Airport Parkway in Natomas, CA using the CPeT-it software (version 3.2.1.7).

Geo-Ex Subsurface Exploration is a registered California Small Business Enterprise (Micro Business), located in Dixon, CA, providing among others CPT services to the geotechnical, environmental and construction industries.

Our corporate goal is to provide quality services as well as innovative solutions for our clients ever changing needs. We are also committed to providing cost-effective solutions, quality project management, schedule control and ensuring that all services are in compliance with all applicable regulatory requirements.

For more information, including a more complete listing of the services we can provide, please visit our website (www.geoexsubsurface.com) and for clarifications or additional information please contact our offices:



Tom Scott
Geo-Ex Subsubsurface Exploration

WARNING:
Geo-Ex Subsubsurface Exploration uses a commercial CPT interpretation and plotting software CPeT-IT (https://geologismiki.gr/products/cpet-it/). The software takes the CPT data and performs basic interpretation in terms of soil behavior type (SBT) and various geotechnical parameters using current published empirical correlations based on the comprehensive review by Lunne, Robertson and Powell (1997) and updated by Robertson and Cabal (2015). The interpretation is presented in tabular format. The interpretations are presented only as a guide for geotechnical use and should be carefully reviewed. Geo-Ex Subsubsurface does not warranty the correctness or the applicability of any of the geotechnical parameters interpreted by the software and does not assume any liability for any use of the results in any design or review. The user should be fully aware of the techniques and limitations of any method used in the software.

2. Project Location

Geo-Ex Subsubsurface Exploration has performed cone penetration tests for the South Airport Parkway in Natomas, CA.

3. General Project Information

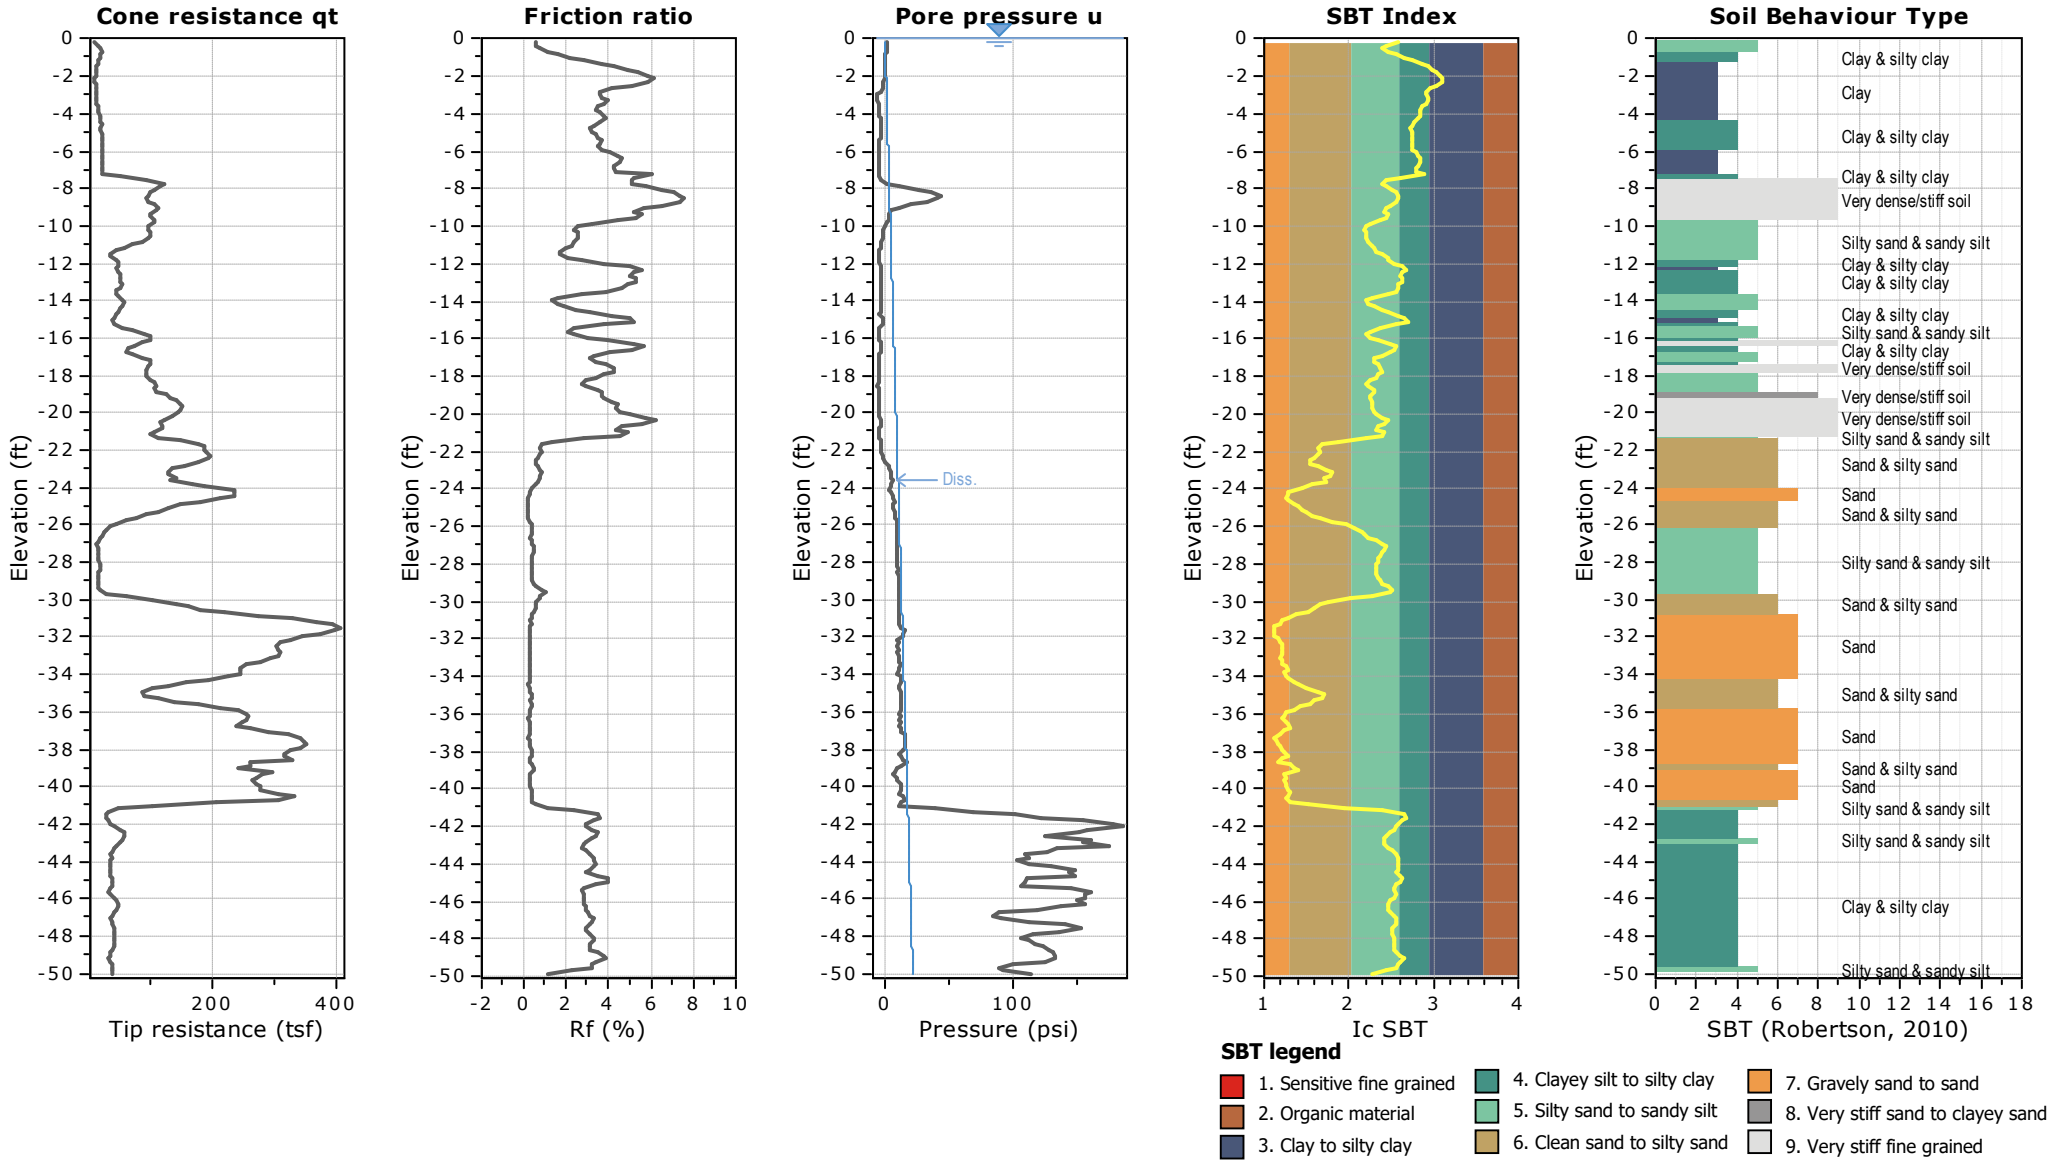
Operator name (or initials)	Nick Maher
Project designation	Natomas, CA
Ground surface elevation	0 ft
Ground water surface elevation	this was not confirmed during the testing; therefore all plots have been generated assuming an elevation of 0 ft;
Sounding locations	SCPT-1 and CPT-2
Sounding date	March 23, 2022,

Equipment Used

Cone manufacturer	Hogentogler
Cone type used	10 cm^2 piezocone
Cone serial number	DDG1501
Type of thrust machine	20 kN pusher
Method used to provide reaction force	vehicle dead weight
Location and type of friction reduction system	none
Calibration data	see section 5

Any special difficulties or other observations concerning performance of the equipment
none

Information on other sensing devices used during the sounding
N/A



Any observations concerning the quality of the recorded data
N/A

4. CPT Plots

Dissipation Tests Results

Dissipation tests

Dissipation tests consists of stopping the piezocone penetration and observing porepressures (u) with elapsed time (t). The data are automatic recorded by the field computer and should take place until a minimum of 50% dissipation.

The porepressures are plotted as a function of square root of (t). The graphical technique suggested by Robertson and Campanella (1989), yields a value for t_{50}, which corresponds to the time for 50% consolidation.

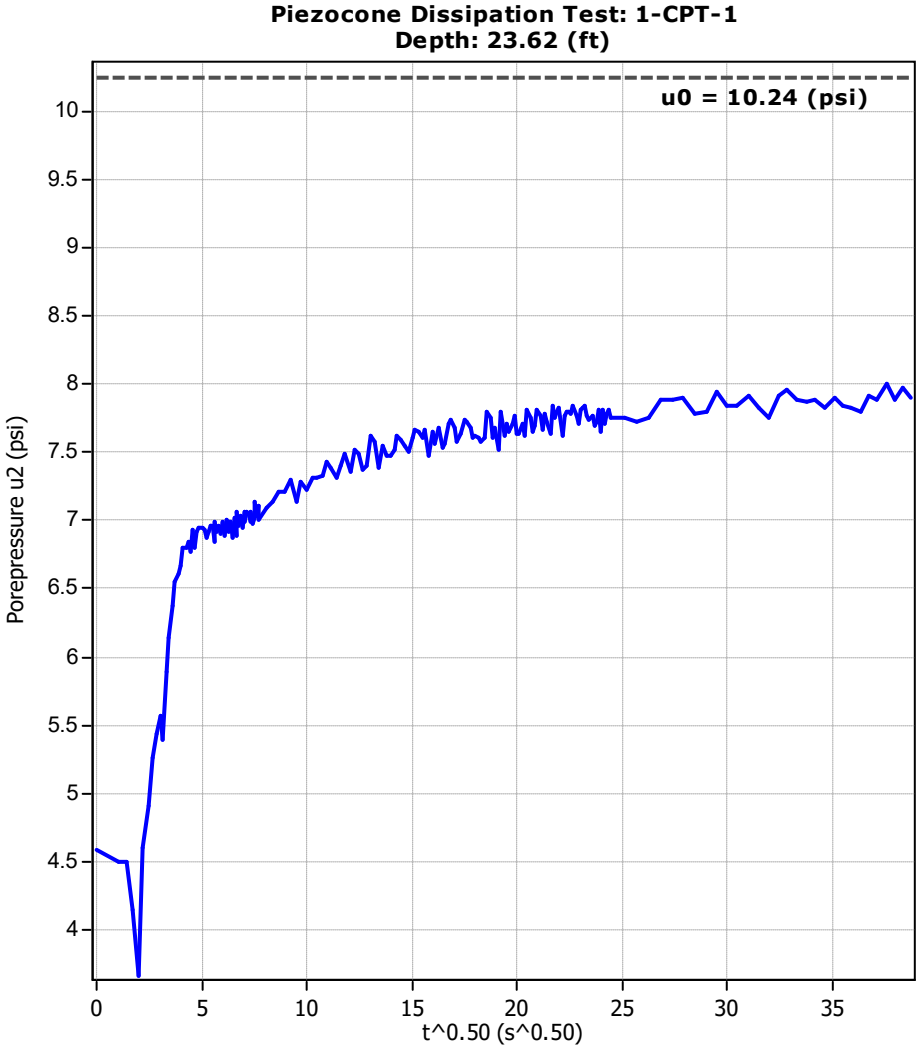
The value of the coefficient of consolidation in the radial or horizontal direction c_h was then calculated by Houlsby and Teh's (1988) theory using the following equation:

$$c_h = \frac{T \times r^2 \times I_r^{0.5}}{t_{50}}$$

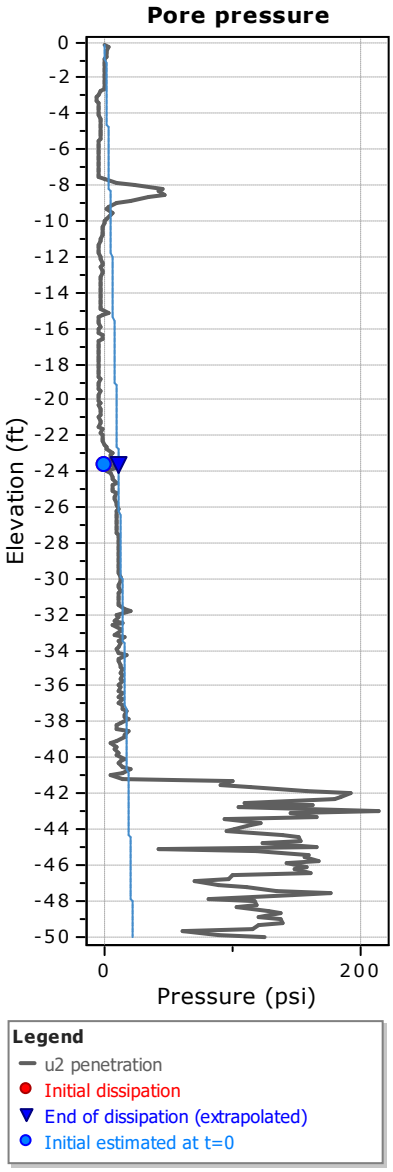
where:

T: time factor given by Houlsby and Teh's (1988) theory corresponding to the porepressure position
r: piezocone radius
I_r: stiffness index, equal to shear modulus G divided by the undrained strength of clay (S_u).
t_{50}: time corresponding to 50% consolidation

Permeability estimates based on dissipation test



The dissipation of pore pressures during a CPTu dissipation test is controlled by the coefficient of consolidation in the horizontal direction (c_h) which is influenced by a combination of the soil permeability (k_h) and compressibility (M), as defined by the following:



$$k_h = c_h \times \gamma_w / M$$

where: M is the 1-D constrained modulus and γ_w is the unit weight of water, in compatible units.

Tabular results

EXECUTIVE SUMMARY

Environmental Investigation Services Inc. (EIS) has completed a Phase I Environmental Site Assessment (ESA) for the properties at 3880, 3990, 4690 and 4696 Bayou Way with Assessor Parcel Numbers (APNs) 225-0020-022, 225-0020-023, 225-0020-024, 225-0020-034, 225-0020-035, 225-0020-033, 225-0020-030, 225-0020-026, 225-0020-027, 225-0020-021, 225-0020-016, 225-0020-032, 225-0020-017, 225-0020-010, 225-0030-048, 225-0030-024, 225-0030-023, 225-0030-045, Sacramento County, California (subject property).

This ESA was prepared in accordance with EIS's Proposal No. 2217-1 and ASTM Designation: E 1527-13 *Standard Practice for Environmental Site Assessments: Phase I ESA Process.* The work is limited to the services agreed to by NorthPoint Development, LLC. The objective of this assessment was to evaluate the subject property for potential recognized environmental concerns, as outlined in the above-referenced standard. EIS's professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in the location of the subject property at the time of our investigation. This warranty is in lieu of all other warranties, expressed or implied. Exceptions to E 1527-13 and limitations encountered during this ESA are identified in the report.

The approximately 472-acre subject property is currently vacant, fallow agricultural land. The property is bordered by Bayou Way and Interstate 5 to the north, a dirt road to the east, a dirt road and the West Drainage Canal to the south, and an unnamed drainage canal and Powerline Road to the west. Unnamed drainage canals run roughly north-south in both the western and eastern portions of the property. Numerous unimproved dirt roads provide access to the interior of the property which is subdivided into multiple agricultural plots. A cell tower with a diesel generator and a front-loading tractor are located in northwestern part of property, along Bayou Road. Stockpiled soils were located to the west of the cell tower area. Portions of the subject property lie between Bayou Way and Interstate 5. The subject property is surrounded by vacant fields to the north (across I-5) and west, active fields to the south, and a multi-lot residential and commercial development to the east.

EIS identified obvious subject property uses from the present back to 1937, at which time the subject property was in agricultural use as hay fields and possibly intermittent rice fields continued until at least 2020.

Surrounding properties appeared predominantly as agricultural fields with rice fields or hay fields by 1937. Similar uses continue through the present, with the exception of a single family residence to the south and multi-unit residential and commercial development constructed around 2006 to the east.

EIS has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13. This assessment has revealed no evidence of recognized environmental conditions (RECs), historical recognized environmental conditions (HRECs), or controlled recognized environmental conditions (CRECs) in connection with the subject property.

EIS recommends no further investigation at this time.
Prior to any commercial redevelopment of the property, it would be prudent to sample shallow soils for residual pesticides and the unknown fill soil stockpile.

1.0 INTRODUCTION

Environmental Investigation Services Inc. (EIS) has completed a Phase I Environmental Site Assessment of the properties at 3880, 3990, 4690 and 4696 Bayou Way with Assessor Parcel Numbers (APNs) 225-0020-022, 225-0020-023, 225-0020-024, 225-0020-034, 225-0020-035, 225-0020-033, 225-0020-030, 225-0020-026, 225-0020-027, 225-0020-021, 225-0020-016, 225-0020-032, 225-0020-017, 225-0020-010, 225-0030-048, 225-0030-024, 225-0030-023, 225-0030-045, Sacramento County, California (subject property). Peter Littman, Environmental Professional, prepared this report according to ASTM Standard E 1527-13. Any deviations from the ASTM Standard are cited in the report. Mr. Littman's qualifications as an Environmental Professional are presented in Appendix A. EIS understands that this ESA is being conducted as part of a real estate transaction.

1.1 PURPOSE

The purpose of this Phase I Environmental Site Assessment was to identify, to the extent feasible pursuant to the processes prescribed herein, recognized environmental conditions in connection with the subject property. The term recognized environmental conditions refers to the presence or likely presence of any hazardous substances or petroleum products on a property under conditions that indicate an existing release, a past release, or a material threat of a release of any hazardous substances or petroleum products into structures on the property or into the ground, groundwater, or surface water of the property. The term is not intended to include *de minimis* conditions that generally do not present a threat to human health or the environment and that generally would not be subject of an enforcement action if brought to the attention of appropriate governmental agencies. Conditions determined to be *de minimis* are not recognized environmental conditions.

1.2 DETAILED SCOPE OF SERVICES

This Phase I Environmental Assessment (ESA) was prepared in accordance with EIS's Proposal No. 2217-1 with respect to the properties at 3880, 3990, 4690 and 4696 Bayou Way with Assessor Parcel Numbers (APNs) 225-0020-022, 225-

0020-023, 225-0020-024, 225-0020-034, 225-0020-035, 225-0020-033, 225-0020-030, 225-0020-026, 225-0020-027, 225-0020-021, 225-0020-016, 225-0020-032, 225-0020-017, 225-0020-010, 225-0030-048, 225-0030-024, 225-0030-023, 225-0030-045, Sacramento County, California (subject property). This investigation was conducted in general accordance with ASTM E 1527-13. The work conducted by EIS is limited to the services agreed to by NorthPoint Development, LLC and no other services beyond those explicitly stated should be inferred or are implied. The objective of this assessment was to evaluate the subject property for potential recognized environmental concerns, as outlined in the above-referenced standard. EIS's professional services have been performed using that degree of care and skill ordinarily exercised, under similar circumstances, by reputable environmental consultants practicing in the location of the subject property at the time of our investigation. This warranty is in lieu of all other warranties, expressed or implied. This ESA includes the following parts: reconnaissance, interviews, records review, and evaluation. In addition, this ESA addresses the following non-ASTM considerations: asbestos, lead-based paint, mold, radon and wetlands.

1.3 LIMITATIONS

Our professional judgment regarding the potential for environmental impacts is based on limited data and our investigation was not intended to be a definitive investigation of contamination at the subject property. Unless specifically set forth in our proposal, the scope of work did not include sampling of soil or groundwater, or a compliance audit pertaining to hazardous material use and storage, hazardous waste storage, or personnel health and safety training. In addition, this assessment did not include analyses of indoor air quality, asbestos, lead-based paint, formaldehyde, radon, or other hazardous materials.

Regarding any reviewed subsurface investigations and sampling and analysis data, our opinions are limited to specific areas and analytes evaluated. EIS will not be held accountable for detected analytes occurring at concentrations below laboratory detection limits. EIS does not warrant or guarantee that the subject property is suitable for any particular purpose or certify the subject property as "clean" or free from contamination. As with any assessment, it is possible that past or existing contamination remains undiscovered.

The professional opinions set forth in this report are based solely upon and limited to EIS's visual observations of the subject property and immediate vicinity, and upon EIS's interpretations of the readily available historical information, interviews with personnel knowledgeable about the subject property, and other readily available information (Appendix B). Consequently, this report is complete and accurate only to the extent that cited reports, agency information and recollections of persons interviewed are complete and accurate.

The opinions and recommendations in this report apply to observed conditions and features of the subject property, as they existed at the time of EIS's

investigation. They cannot necessarily apply to conditions and features of which EIS is unaware and has not had the opportunity to evaluate. Future regulatory modifications, agency interpretations, and/or policy changes may also affect the compliance status of the subject property. EIS has made no attempt to address future financial impacts to the site (e.g., reduced property values) as a result of potential on-site subsurface contamination.

1.4 DATA GAPS

EIS encountered no significant data gaps or limitations during the completion of this report, except for the following:

- EIS submitted a file review request with the Sacramento County Agricultural Commissioner (SCAC) on September 13, 2022. As of the date of this report, SCAC has not responded to this request. If SCSC provided EIS with additional relevant, non- duplicative information when it fulfils this request, EIS will issue and addendum to this report.

- EIS submitted a records request to the Sacramento County Environmental Management District (SCEMD) on August 23, 2022 to obtain information regarding the subject property. As of the date of this report, EIS has not received any documents from SCEMD. If SCEMD provides EIS with additional new, relevant, non-duplicative information when it fulfils this request, EIS will issue and addendum to this report.

Given the historical use of the subject property as agricultural land, EIS does not anticipate any of the above sources to have critical, relevant, non-duplicative information on file for the subject property. Therefore, these data failures do not represent significant data gaps.

1.5 USER RELIANCE

This Phase I Environmental Site Assessment was prepared for the sole and exclusive use of NorthPoint Development, LLC. This report is intended exclusively for the purpose outlined herein for the subject property and is intended to be used in its entirety. No excerpts may be taken to be representative of the findings of this assessment. The scope of services performed in execution of this investigation may not be appropriate to satisfy other users, and any use or reuse of this document or its findings, or conclusions presented herein is at the sole risk of the user. This report is not a specification for further work.

2.0 SITE RECONNAISSANCE

On September 2, 2022, Staff Geologist Peter Willits of EIS performed a visual reconnaissance of the subject property, adjoining properties, and surrounding areas to ascertain current and historical uses. Mr. Willits was generally unaccompanied during his reconnaissance. The subject property was

systematically traversed on foot; adjoining properties were observed from the subject property and from public thoroughfares. Photographs are appended. Figure 2 depicts the site plan.

2.1 CURRENT USE OF SUBJECT PROPERTY

The approximately 472-acre subject property is currently vacant, fallow agricultural land. The property is bordered by Bayou Way and Interstate 5 to the north, a dirt road to the east, a dirt road and the West Drainage Canal to the south, and an unnamed drainage canal and Powerline Road to the west. Unnamed drainage canals run roughly north-south in both the western and eastern portions of the property. Numerous unimproved dirt roads provide access to the interior of the property which is subdivided into multiple agricultural plots. A cell tower with a diesel generator and a front-loading tractor are located in northwestern part of property, along Bayou Road. Stockpiled soils were located to the west of the cell tower area. Portions of the subject property lie between Bayou Way and Interstate 5. The subject property is surrounded by vacant fields to the north (across I-5) and west, active fields to the south, and a multi-lot residential and commercial development to the east.

2.1.1 HAZARDOUS SUBSTANCES AND PETROLEUM PRODUCTS

EIS inspected the subject property for indications of the use, storage, or disposal of hazardous substances and petroleum products (e.g., manufacturing activities, drums, containers, stressed vegetation, stains, sheen, and heating/cooling systems). EIS observed no such indications except for the following:

- Small quantities (≤2-quarts) used motor oil and oil-stained cardboard near the intersection of the eastern unnamed drainage canal and Bayou Way (on parcel 225-0020-017).

- One above ground diesel-powered generator associated with the cell tower near Bayou Way is located in the northwest portion of the subject property (on parcel 225-0020-035). No leaking or staining was observed.

The subject property appeared unpaved, so no pavement cracking was observed.

2.1.2 UNDERGROUND STORAGE TANKS (USTS)

EIS inspected the subject property for indications of USTs (e.g., vent piping, dispensing equipment, pavement variations, and fill ports). EIS observed no such indications.

2.1.3 ABOVEGROUND STORAGE TANKS (ASTS)

EIS inspected the subject property for indications of ASTs (e.g., pavement bolts, containers, reservoirs, and generators). EIS observed no such indications, except the following:

- One building permit described the installation of an emergency backup generator with a 190-gallon subbase diesel fuel tank on existing concrete pad, in the area of the cell tower in the northwest portion of the subject property (on parcel 225-0020-035). No leaking or staining was observed.

- One approximately 300-gallon caged tote water tank located near the eastern subject property boundary.

- One approximately 500-gallon trailer-mounted water tank located near the eastern subject property boundary.

2.1.4 LIQUID WASTE

EIS inspected the subject property for indications of liquid waste discharge sources (e.g., sumps, drains, clarifiers, pools of liquid, pits, ponds, lagoons, septic systems, wastewater, and storm water). EIS observed no such indications.

2.1.5 SOLID WASTE

EIS inspected the subject property for indications of solid waste disposal (e.g., mounding, depressions, fill material, bins, debris, and active human use). EIS observed no such indications.

- Minor scattered solid waste near the intersection of the eastern unnamed drainage canal and Bayou Way (on parcel 225-0020-017).

- Scattered solid waste including tires and waste cement between Bayou Way and I-5 (on parcel 225-0030-024).

- Stockpiled soils near Bayou Way near the northwest portion of the subject property (on parcel 225-0020-033).

2.1.6 POLYCHLORINATED BIPHENYLS (PCBS)

EIS inspected the subject property for indications of PCBs (e.g., transformers, capacitors, elevators, and lifts). EIS observed no such indications, except for the following:

- One pad-mounted transformer associated with the cell tower near Bayou Way in the northwest portion of the subject property (on parcel 225-0020-035). No leaking or staining was observed.

2.1.7 WELLS

EIS inspected the subject property for indications of supply, irrigation, monitor, injection, dry, abandoned, or other wells (e.g., protruding pipes, cover plates, pumps, small sheds, large water storage containers, and mounded grout). EIS observed no such indications.

2.2 CURRENT USE OF ADJOINING PROPERTIES

All adjoining and nearby properties generally consist of agricultural properties or vacant fields. The uses and features of the adjoining properties are described below:

- Southern adjoining: Agricultural land across irrigation canal (APNs 225-0020-012, -013, -014, and -015).
- Western Adjoining: Agricultural land across powerline road including two large water tanks (APNs 225-0010-009, -010, -017, and -021).
- Northern Adjoining: Agricultural land across I-5
- Eastern Adjoining: Multi-unit residential and commercial development

3.0 USER PROVIDED INFORMATION

ASTM E1527-13 defines “User” as the party seeking to use Practice E1527 to complete an environmental site assessment of the subject property. EIS understands that NorthPoint Development is the User as defined by ASTM E1527-13. ASTM E1527-13 specifies that certain tasks associated with identifying potential recognized environmental conditions at the subject property should be performed by the user and provided to the Environmental Professional (i.e., User Responsibilities).

Based on EIS’s review of the User-provided information, no readily apparent evidence of potential recognized environmental conditions at the subject property was noted. Information obtained from the User is provided below.

3.1 TITLE RECORDS

EIS was not provided with a title report for the subject property.

3.2 ENVIRONMENTAL LIENS OR ACTIVITY & USE LIMITATIONS

There are no known environmental liens or activity and use limitations (AULs) associated with the subject property that the User is aware of.

3.3 SPECIALIZED KNOWLEDGE

The User provided no additional relevant, non-duplicative specialized knowledge pertaining to the subject property.

3.4 COMMONLY KNOWN OR REASONABLY ASCERTAINABLE INFORMATION

The User provided no additional relevant, non-duplicative information pertaining to the subject property.

3.5 VALUATION REDUCTIONS FOR ENVIRONMENTAL ISSUES

The User stated no valuation reduction for environmental issues.

3.6 REASON FOR PERFORMING PHASE I

The Phase I is being performed as part of CEQA requirement.

4.0 INTERVIEWS

4.1 SUBJECT PROPERTY OWNER/KEY SITE MANAGER

EIS interviewed Geoff Griffin of Northpoint Development, part owner of the subject property, for this assessment. Mr. Griffin Stated that Northpoint owns approximately 290-acres of the subject property, and that the entire property is slated for annexation and commercial development. Mr. Griffin also stated that he believed the stockpiled soils observed in the northwestern portion of the subject property to be associated with the recent construction of the Metro Air Parkway-I-5 bridge and interchange. Mr. Griffin did not provide any additional relevant, non-duplicative information.

4.2 TENANT-SPACE KEY SITE MANAGERS

EIS did not interview any tenant-space key site managers.

4.3 PREVIOUS OWNERS, OPERATORS, AND OCCUPANTS

EIS identified no previous subject property owners, operators, or occupants.

4.4 NEARBY PROPERTY OWNERS AND OCCUPANTS

EIS did not interview nearby property owners or occupants.

4.5 GOVERNMENT OFFICIALS

EIS did not interview government officials.

5.0 RECORDS REVIEW

EIS reviewed records pertaining to the subject property. In addition, where practicable and relevant, EIS reviewed records indicating uses at adjoining

properties and nearby properties or surrounding areas within approximate minimum search distances from the subject property.

5.1 PHYSICAL SETTING

5.1.1 PHYSIOGRAPHY

EIS reviewed the United States Geological Survey's (USGS) 2018 7.5-Minute Series Taylor Monument, California, Quadrangle Topographic Map. The ground surface elevation at the subject property is approximately 17 feet above mean sea level (msl). The subject property is relatively flat. A man-made drainage canal runs north-south through the eastern portion of the subject property. The subject property is bordered to the west, south, and east by man-made drainage canals. Fisherman's Lake is located approximately ½-mile south of the subject property, and the Sacramento River is located approximately ¾-mile to the south

5.1.2 GEOLOGY

The subject property is underlain by Quaternary-age alluvium and riverbank deposits (CGS 2011). Soils encountered during monitoring well installation approximately 2 miles northwest of the subject property consist of silty sand and sandy silt to approximately 16 feet below ground surface (bgs) (ERM, 2005).

5.1.3 HYDROGEOLOGY

For the above-noted site approximately 2 miles northwest of the subject property, groundwater data indicated that groundwater depths range from 9 to 7-feet bgs, with a southwest flow direction towards the Sacramento River. The local groundwater flow direction and gradient under the subject property may be influenced naturally by zones of higher or lower permeability, or artificially by nearby groundwater pumping or recharge and may deviate from the regional trend.

5.2 SANBORN FIRE INSURANCE MAPS

EIS requested Sanborn Fire Insurance Maps for the subject property, adjoining properties, and surrounding area from the Environmental Data Resources, Inc. (EDR) collection. According to EDR, such maps were not available (Appendix D).

5.3 AERIAL PHOTOGRAPHS

EIS reviewed aerial photographs for the years of 1937, 1947, 1957, 1964, 1966, 1972, 1984, 1993, 1998, 1999, 2006, 2009, 2012, and 2016 obtained from the EDR collection. The photographs are included in the appendices. Photograph descriptions for the subject property and adjoining properties follow.

Date	Aerial Photographs – Subject and Adjoining Properties
1937	The subject property appears in agricultural use as a hayfield and rice fields. All adjoining properties appear in similar agricultural use as

	hayfields or rice fields. There is a structure on the east side of the property surrounded by haybales and other miscellaneous farm equipment. On the northwestern portion of the property there are two more structures that abut the property line as well as a circular structure on the western portion of the property. Interstate 5 trends east-west immediately to the north of the subject property. An unnamed canal is located immediately to the south of the subject property and is oriented east-west, until it veers sharply to the south once it reaches the eastern portion of the property.
1947	The subject property and adjoining properties appear generally unchanged from the 1937 photograph, with the exception that the circular structure is no longer present.
1957-1984	The subject property and all adjoining properties appear generally unchanged from the 1947 photograph. As of 1972 there is only one structure that is near the northern property boundary on the western side of the property. In addition, as of 1972, there is the addition of a potential irrigation canal in the eastern portion of the subject property that trends north south and connects to the canal that is immediately south of the subject property.
1993	The subject property and all adjoining properties appear generally unchanged from the 1984 aerial photograph.
1998-1999	Both images are not fully mapped. The 1998 image is missing approximately 1/3 of the western portion of the subject property and the 1999 image is missing approximately 1/3 of the eastern portion of the subject property. The portions of the subject property and all adjoining properties that are available appear generally unchanged from the 1993 photograph.
2006	The subject property and all adjoining properties appear generally unchanged from the 1999 photograph, except that there is the addition of what appears to be a residential development east of the subject property. In addition, there is a small structure that is visible in the north-western portion of the subject property which is likely a cell phone tower.
2009-2016	The subject property and all adjoining properties appear generally unchanged from the 2006 photograph, with the exception of numerous white, square boxes or construction materials that are visible in the northwest portion of the subject property.

5.4 TOPOGRAPHIC MAPS

EIS reviewed topographic maps for the years of 1907, 1915, 1950, 1951, 1954, 1967, 1975, 1980, 2012, 2015 and 2018 obtained from the US Geologic Survey's website. Map descriptions follow.

Date	Topographic Maps – Subject Property and Adjoining Properties
1907-1915	The subject property is partially on what is potentially an intermittent lake which extends to the western, southern, and northern adjoining property. The eastern portion of the property is depicted as vacant land as well as the eastern adjoining property. A large river identified as Fishermans Lake is depicted connecting to the intermittent lake on the 1907 and 1915 maps.
1950-1954	The subject property is depicted as vacant land. The intermittent lake is no longer depicted, and Fisherman's Lake is depicted as connecting to a west-east trending canal that is adjacent to the southern subject property boundary. This layout appears to match that of the present day. There is a road network that is depicted surrounding the subject property in a grid.
1967-1980	The subject property and all nearby and adjoining properties appear generally unchanged from the 1954 map with the exception of the I-5 that is depicted in the 1967 map as well as a set of potential unpaved roads depicted along the northern portion of the property in the 1975 map.
2012-2018	The subject property and all nearby and adjoining properties appear generally unchanged from the 1980 map with the addition of a housing development east of the subject property. As of 2012 the layout of the roads matched the present.

5.5 CITY DIRECTORIES

As the subject property did not have a street address and neighboring sites did not have street addresses, there were no listings for the subject property or neighboring sites in available City Directories.

5.6 REGULATORY AGENCIES

5.6.1 TAX ASSESSOR

EIS reviewed Sacramento County Tax Assessor's Records online on August 22, 2022. According to information obtained from the assessor's website, the Assessor's Parcel Number (APNs) for the subject property are as follows:

- 225-0020-022
- 225-0020-023
- 225-0020-024
- 225-0020-034
- 225-0020-035
- 225-0020-033
- 225-0020-030
- 225-0020-026
- 225-0020-027
- 225-0020-021
- 225-0020-016
- 225-0020-032
- 225-0020-017
- 225-0020-010
- 225-0030-048
- 225-0030-024
- 225-0030-023
- 225-0030-045

All parcels are zoned for agricultural use.

5.6.2 AGRICULTURAL COMMISSIONER

EIS submitted a file review request with the Sacramento County Agricultural Commissioner (SCAC) on September 13, 2022. As of the date of this report, SCAC has not responded to this request.

5.6.3 BUILDING DEPARTMENT

EIS submitted a file review request with the Sacramento County Department of Community Development (SCDCD) on August 22, 2022. SCDCD responded on August 24, 2022, with one record pertaining solely to assessor information and nine building permits. The building permits are summarized as follows:

- Two permits issued for the replacement of a conductor at pump motors in 2011, 2014, on the following parcel: 225-0030-045.

- Three permits issued on multiple dates for the following parcels: 225-0020-003 and 225-0020-004. One for agricultural Power Pole (1999), dry rot repair (1978) and tear down single family dwelling (2005).

- Five permits issued on from 1996-2022 for the construction of a cell phone tower on the following parcel: 225-0020-030. One permit described the installation of an emergency backup generator with a 190-gallon subbase diesel fuel tank acoustic enclosure on existing concrete pad. There was one permit for the demolition of a barn in 2005. There was one permit for demolition of a single family house in 2005.

5.6.4 SACRAMENTO COUNTY FIRE DEPARTMENT

The Sacramento Metropolitan Fire District (SMFD) is not the official CUPA agency for properties located in unincorporated Sacramento County which includes the subject property. As such, EIS did not submit a records request to the SMFD. Any hazardous materials/hazardous waste records for the subject property would be maintained by the Sacramento County Environmental Management Department (section 5.6.4 below).

5.6.5 DEPARTMENT OF ENVIRONMENTAL HEALTH

EIS submitted an online file review request to the Sacramento County Environmental Management Department (SCEMD) on August 23, 2022. As of the date of this report SCEMD had not responded to this request.

5.6.6 STATE WATER RESOURCES CONTROL BOARD

EIS reviewed the State Water Resources Control Board's (SWRCB's) GeoTracker database website on September 12, 2022 and identified no records pertaining to the subject property.

Additionally, EIS reviewed the GeoTracker Database and identified no sites located up- to cross-gradient of the subject property with cases involving soil or groundwater within a half mile radius.

5.6.7 DEPARTMENT OF TOXIC SUBSTANCES CONTROL

EIS reviewed the Department of Toxic Substance Control's (DTSC's) Envirostor database website on September 13, 2022 and found no records pertaining to the subject property.

Additionally, EIS reviewed the Envirostor database and identified no sites located up- to cross-gradient of the subject property with cases involving soil or groundwater within the ASTM-specified search distance of ¼ of a mile.

5.7 PREVIOUS REPORTS

EIS was not provided with any previous reports by the User.

5.8 DATABASE REVIEW

EIS reviewed a regulatory agency database search report summary prepared by EDR for information pertinent to the subject property and offsite facilities located within ASTM-specified search distances from the subject property. The database report is included in the appendices. The database report identifies 12 plotted sites, as well as the accessed databases for these sites and the dates when information was updated. According to the EDR report, the following database listings were included for the subject property.

AT&T Mobility - (USID20672) – *4690 Bayou Way, Sacramento, CA (Subject Property). SACRAMENTO CO. ML. CERS*

- These records pertain to the cell tower located on the subject property and indicates that no hazardous materials are stored onsite. No violations were listed according to a July 2020 inspection.

This listing is incorrectly plotted on the EDR database as outside of the subject property; however, this listing appears to pertain to the cell tower located on the subject property.

Kaweah Construction Co. – *4401 N Bayou Way, Sacramento, CA* (Adjoining Property). *HWTS HAZNET.*

- Occupant was identified as a generator as 7.5 tons of unspecified oil-containing waste and 0.1 tons of other organic waste in 2006.

This address is plotted on the EDR report as on the subject property however the listed address is associated with the northern adjoining address across I-5. According to the aerial imagery the northern adjoining property was under constriction around 2006, the time of this database listing. EIS considers it likely that this database listing refers to the northern adjoining property rather than to the subject property.

MSA: Metroair Park Storm Drain D-49 – *4565 West Bayou Rd, Sacramento, CA (Subject Property*). *SACRAMENTO CO. MASTER LIST (ML), AST*

- Plotted along Bayou way identifying the location of a storm drain pump.

Additionally, no adjoining properties or nearby properties were identified in the EDR report that are located up- to cross-gradient of the subject property with cases involving groundwater or potentially impacting the subject property. All additional plotted database listings are summarized below:

West Lakeside middle school/high school expansion – *Snelling Lane/Westlake Parkway (~1/4-mile south-southeast). ENVIROSTOR SCH.*

- Based on a 2007 report soil sampling results from this site indicated there were no contaminants found and the DTSC issued a no action determination.

West Lakeside middle school/high school expansion – *Snelling Lane/Westlake Parkway (~1/4-mile south-southeast). ENVIROSTOR SCH.*

- Based on a 2006 report numerous insecticides were detected in soil at this site. Despite this the DTSC issued a no action determination.

Northborough Elementary School – *Banfield Drive/Minden Way, Sacramento, CA (~1/2-mile south-southwest). ENVIROSTOR SCH.*

- Based on a 2002 report soil sampling results from this site indicated there were no contaminants found and the DTSC issued a no action determination.

Westlake Elementary School – *Del Paso Road/Wyndview Way*, *Sacramento, CA (~1/2-mile southeast). ENVIROSTOR SCH.*

- There are no reported chemicals of concern and as of 2013 the DTSC considers this site inactive.

Natomas Middle School – *3700 Del Paso Rd., Sacramento, CA (~1/2-mile southeast). ENVIROSTOR SCH., SWEEPS UST, CA FID UST*

- Based on a 2001 report numerous insecticides were detected in soil at this site. Despite this the DTSC issued a no action determination.

Proposed Terrace Park Elementary School – *Greg Thatch Circle & Tres Peizas Way, Sacramento, CA (~1-mile northeast). ENVIROSTOR SCH., SWEEPS UST, CA FID UST*

- Based on a 2007 report numerous insecticides were detected in soil at this site. Despite this the DTSC issued a no action determination.

It is important to consider that the listing of nearby properties in environmental databases does not necessarily constitute an environmental concern.

6.0 NON-ASTM CONSIDERATIONS

6.1 ASBESTOS

The subject property was previous developed with structures constructed before was constructed sometime before 1937. Due to the age of the structures, there is a potential that asbestos-containing materials (ACMs) are present in the areas of former structures and/or any miscellaneous items on the subject property. Suspect ACMs were not observed during the site reconnaissance. However, prior to redevelopment of the site, it is recommended that an AHERA and State Certified Inspector Asbestos Consultant survey and test all suspect ACM that could potentially be disturbed by the work. If ACMs are found, have the Certified Asbestos Consultant prepare and implement work procedures and associated Operations and Maintenance (O&M) Plans, as applicable.

6.2 LEAD-BASED PAINT

Due to the age of the structures formerly located on the subject property, there is a possibility that lead paint was utilized to paint surfaces within the structures. Painted surfaces are not expected to pose a health and safety concern to the occupants of the subject property at this time. However, prior to redevelopment of the site, the borrower should have a State Licensed Lead-Based Paint Consultant test all suspect LBP that could potentially be disturbed by the work. If LBP is identified, the borrower should have the State-licensed Lead-Based Paint Consultant prepare and implement work procedures and associated O&M Plans, as applicable.

6.3 MOLD

A visual inspection of observable portions of subject property for evidence of moisture incursion and visible fungal growth was performed. The inspection was not intended to disclose all possible microbial reservoirs or growth sites; rather, it was designed to screen the subject property for evidence of potential microbial issues in the areas inspected. Physical sampling and analysis of materials or air was not conducted during the assessment. During the inspection, evidence of visible water staining/damage and possible fungal growth was not observed.

6.4 RADON

Radon gas is a by-product of uranium. The gas forms as uranium molecules eject some protons and neutrons from their nuclei changing first into thorium, then radium, and finally radon. Radon tends to accumulate in uranium-rich metamorphic rocks, glacial moraines and till deposits derived from uranium-bearing rocks, marine organic shales, soils derived from carbonate rocks, and uranium-containing alluvial sediments deposited by rivers, deltas, lakes, etc. Outgassing of radon has not been identified as a problem in this region of Sacramento County. According to radon survey results provided by the EDR, the subject property is located within Region 2 with average radon gas levels reported at 2 to 3 picocuries per liter of air (pCi/l). The level above which the U.S. Environmental Protection Agency recommends that action be taken to reduce radon levels is 4 pCi/l.

6.5 WETLANDS

EIS made visual observations for indications of the presence or potential presence of wetland areas on or immediately adjacent to the subject property. During reconnaissance, EIS observed no such indications of wetlands. No wetlands survey was performed. No wetlands occur within the boundaries of the subject property or on the adjoining properties.

7.0 FINDINGS AND OPINIONS

Environmental Investigation Services Inc. (EIS) has completed a Phase I Environmental Site Assessment (ESA) for the properties at 3880, 3990, 4690 and 4696 Bayou Way with Assessor Parcel Numbers (APNs) 225-0020-022, 225-0020-023, 225-0020-024, 225-0020-034, 225-0020-035, 225-0020-033, 225-0020-030, 225-0020-026, 225-0020-027, 225-0020-021, 225-0020-016, 225-0020-032, 225-0020-017, 225-0020-010, 225-0030-048, 225-0030-024, 225-0030-023, 225-0030-045, Sacramento County, California (subject property).

The approximately 472-acre subject property is currently vacant, fallow agricultural land. The property is bordered by Bayou Way and Interstate 5 to the north, a dirt road to the east, a dirt road and the West Drainage Canal to the south, and an unnamed drainage canal and Powerline Road to the west. Unnamed drainage canals run roughly north-south in both the western and eastern portions of the property. Numerous unimproved dirt roads provide access to the interior of the property which is subdivided into multiple agricultural plots. A cell tower with a diesel generator and a front-loading tractor are located in northwestern part of property, along Bayou Road. Stockpiled soils were located to the west of the cell tower area. Portions of the subject property lie between Bayou Way and Interstate 5. The subject property is surrounded by vacant fields to the north (across I-5) and west, active fields to the south, and a multi-lot residential and commercial development to the east.

EIS identified obvious subject property uses from the present back to 1937, at which time the subject property was in agricultural use as hay fields and possibly intermittent rice fields continued until at least 2020.

Surrounding properties appeared predominantly as agricultural fields with rice fields or hay fields by 1937. Similar uses continue through the present, with the exception of a single family residence to the south and multi-unit residential and commercial development constructed around 2006 to the east.

This ESA revealed the following notable findings:

- The subject property was used for agricultural purposes as hay fields and rice fields from at least 1937 through at least 2020. Although not documented at the subject property, agricultural chemicals including organochlorine pesticides and metal compounds may have been applied to the property. This use can result in concentrations of residual agricultural chemicals being present in the near surface soil (i.e., 1 to 3 feet bgs). However, residual agricultural chemicals typically are not present at concentrations that would influence offsite disposal of soil or pose a health risk to commercial site users when the land use is limited to rice fields and hay fields. Therefore, this finding is *de minimis*.

- One building permit described the installation of an emergency backup generator with a 190-gallon subbase diesel fuel tank on the existing concrete pad, in the area of the cell tower in the northwest portion of the subject property (on parcel 225-0020-035). No leaking or staining was observed. This finding is *de minimis*.

- Stockpiled soils were observed in the northwest portion of the subject property, to the east of the cell tower (Figure 2). Mr. Griffin stated that these soils were likely associated with the recent construction of the Metro Air Parkway-I-5 bridge and interchange. EIS was not provided with any documentation for the source of these stockpiled soils. The presence of unknown origin soil stockpiles on the subject property is a potential environmental concern.

- Small amounts of solid waste, including discarded tires and burnt debris, were observed at various locations around the subject property. Additionally, a small amount of used motor oil and oil-stained cardboard were observed near the intersection of the eastern drainage canal and Bayou Way. While the small quantities of these wastes make this finding *de minimis*, it would be prudent to remove these wastes prior to redevelopment.

- The plotted and orphan facilities that were identified in the database search report are not expected to present an environmental concern to the subject property because: i) they only hold an operating permit (which does not imply a problem); ii) they are not required to perform further action; iii) the nature of the identified environmental concern does not suggest that the subject property would be impacted; or iv) based upon EIS's review, are too distant and/or hydraulically downgradient or cross-gradient relative to the subject property to reasonably affect it. This finding is *de minimis*.

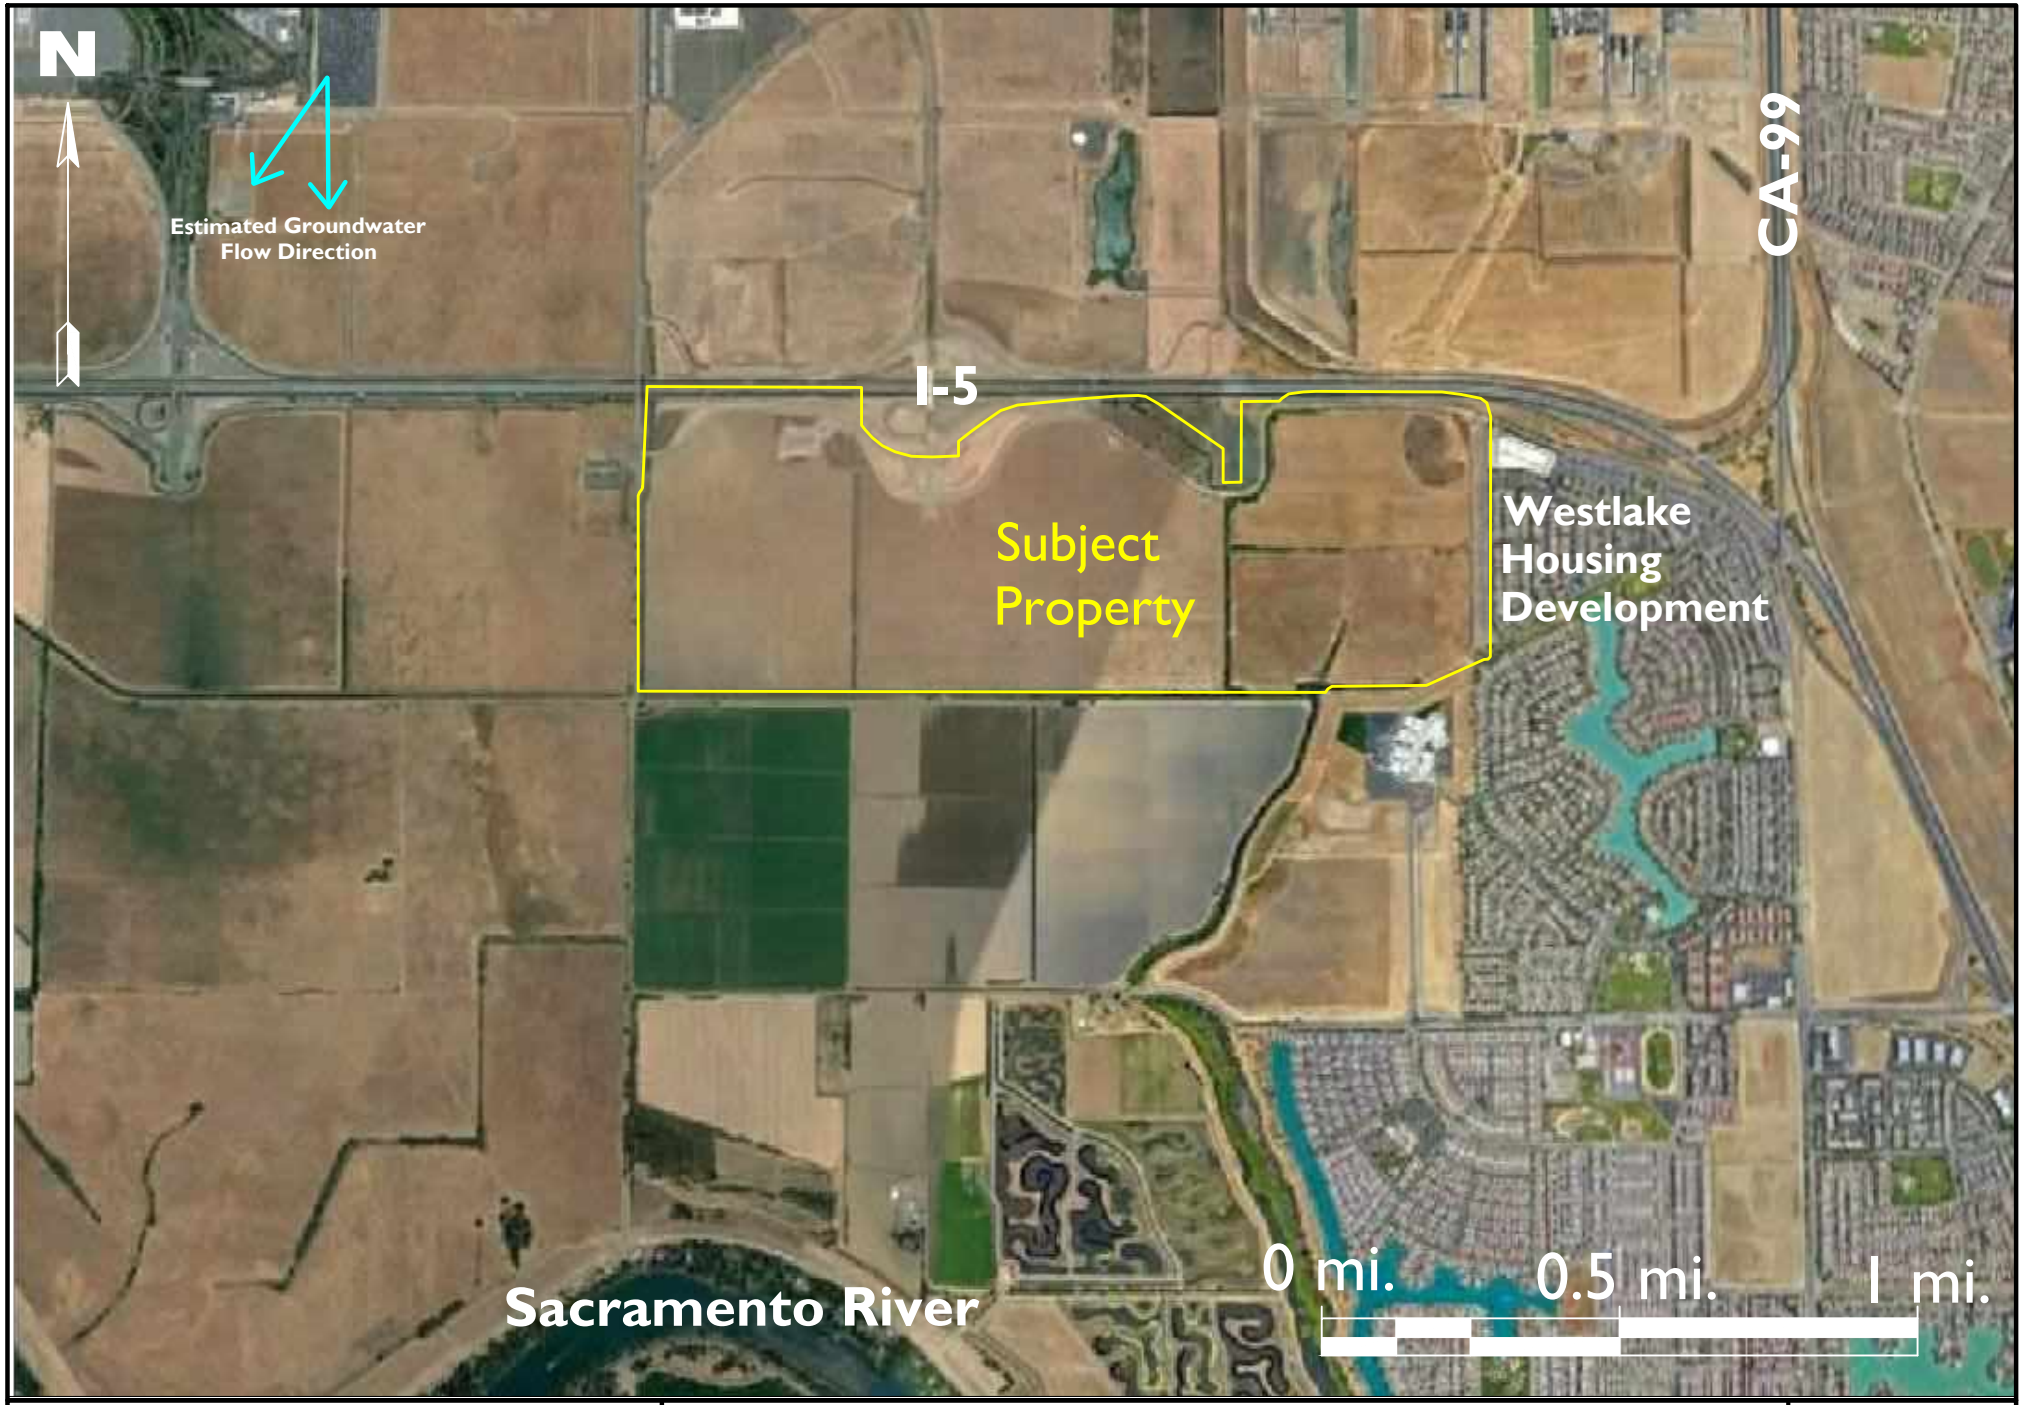
8.0 CONCLUSION & RECOMMENDATIONS

EIS has performed a Phase I Environmental Site Assessment in conformance with the scope and limitations of ASTM Practice E 1527-13. This assessment has revealed no evidence of recognized environmental conditions (RECs), historical recognized environmental conditions (HRECs), or controlled recognized environmental conditions (CRECs) in connection with the subject property. However, the presence of unknown soil stockpiles on the subject property is a potential environmental concern.

EIS recommends no further investigation at this time.
Prior to any commercial redevelopment of the property, it would be prudent to sample shallow soils for residual pesticides and the unknown fill soil stockpile.

9.0 SIGNATURE(S) OF ENVIRONMENTAL PROFESSIONAL(S)

"We declare that, to the best of our professional knowledge and belief, we meet the definition of Environmental Professional as defined in 312.10 of 40 CFR 312" and we have the specific qualifications based on education, training, and experience to assess a property of the nature, history, and setting of the subject property. We have developed and performed all appropriate inquiries in conformance with the standards and practices set forth in 40 CFR Part 312.



Peter Littman, Sr. Project Manager

APPENDIX A
QUALIFICATIONS

QUALIFICATIONS OF ENVIRONMENTAL PROFESSIONAL(S)

Mr. Peter Littman, Project Manager has 25 years of experience managing environmental due diligence investigations as a Cal/EPA Registered Environmental Assessor (#03829) for property transactions including a large variety of commercial, industrial, and agricultural properties.

Mr. Littman excels at assessing property to determine whether further investigations are necessary to ensure compliance with laws or to complete due diligence and estimating the investigation and cleanup costs. He has successfully coordinated and completed numerous complex due diligence investigations within tight budget and time constraints.

Prior to forming EIS in 1996, Mr. Littman provided environmental consulting services for four years. As a Cal/EPA Registered Environmental Assessor, Mr. Littman has performed over 800 Phase 1 Environmental Assessments. As a project manager, he has completed over 120 soil and groundwater investigations, 60 tank removals, 25 soil remediation projects, 80 asbestos inspections, 50 lead paint inspections, and 30 Hazardous Material Management Plans. Mr. Littman has assisted clients in qualifying for the state tank fund and under guidance of professional staff has helped design site characterization and site remediation at tank fund sites.

As a project manager with C.E.T., Inc. he managed tank removal operations, soil and groundwater investigations, and Phase I assessments. He has also held a position as Corporate Health and Safety Officer for EVAX Technologies Inc., an Environmental Engineering/Contracting firm where he performed Phase I's and site safety plans for Hazardous Waste clean-up operations and conducted Federal OSHA 40 Hour Training Sessions. As a Health & Safety Officer he worked with a team designing underground tank removals, building decontamination of solvents, excavations, soil and groundwater sampling, and installation of remedial equipment.

Credentials

- Cal/EPA Registered Environmental Assessor REA #03829
- Federal OSHA Hazardous Waste Operation & Emergency Response 40 Hr and 8 Hr Supervisor

APPENDIX C
USER QUESTIONNAIRE

ASTM E 1527 – 05 USER Questionnaire

In order to qualify for the *Landowner Liability Protection* (LLPs)[35] offered by the Small Business Liability Relief and Brownfields Revitalization Act of 2001 (the"*Brownfields Amendments*"),[36] the user must provide the following information (if available) to the environmental professional.

(1). **Environmental cleanup liens that are filed or recorded against the site (40 CFR 312.25).** Are you aware of any environmental cleanup liens against the *property* that are filed or recorded under federal, tribal, state or local law? Not to my knowledge

(2). **Activity and land use limitations that are in place on the site or that have been filed or recorded in a registry (40 CFR 312.26).** Are you aware of any AULs, such as *engineering controls*, land use restrictions or *institutional controls* that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law? Not to my knowledge

(3). **Specialized knowledge or experience of the person seeking to qualify for the LLP (40 CFR 312.28).** As the user of the ESA do you have any specialized knowledge or experience related to the *property* or nearby properties? For example, are you involved in the same line of business as the current or former occupants of the *property* or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business? No knowledge

(4). **Relationship of the purchase price to the fair market value of the property if it were not contaminated (40 CFR 312.30).** Does the purchase price being paid for this property reasonably reflect the fair market value of the *property*? Yes it reflects fair market value
If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the *property*?

(5). **Commonly Known or reasonably ascertainable information about the property (40 CFR 312.30).** Are you aware of commonly known information about the *property* that would help the environmental professional to identify conditions indicative of releases or threatened releases? For example, as user, (a.) Do you know the past uses of this *property*? To the best of my knowledge it has been agriculture

(b.) Do you know of specific chemicals that are present or once were present at the *property*?
Not to my knowledge

(c.) Do you know of spills or other chemicals releases that have taken place at the *property*?
Not to my knowledge

(d.) Do you know of any environmental cleanups that have taken place at the *property*?
Not to my knowledge

Owner Questionnaire

Site Address: +/-290 acres at Bayou Road and Metro Air Pkwy, Sacramento, CA

Question:

1.	Is the property used for an industrial use?	Yes	No	Unk
2.	Is any adjoining property used for an industrial use?	Yes	No	Unk
3.	Did you observe evidence or do you have any prior knowledge that the property has been used for an industrial use in the past?	Yes	No	Unk
4.	Did you observe evidence or do you have any prior knowledge that any adjoining property has been used for industrial use in the past?	Yes	No	Unk
5.	Is the property used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable, identify which)?	Yes	No	Unk
6.	Is any adjoining property used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or a waste treatment, storage, disposal, processing, or recycling facility (if applicable, identify which)?	Yes	No	Unk
7.	Did you observe evidence or do you have any prior knowledge that the property has been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable, identify which)?	Yes	No	Unk

8.	Did you observe evidence or do you have any prior knowledge that the adjoining property has been used as a gasoline station, motor repair facility, commercial printing facility, dry cleaners, photo developing laboratory, junkyard or landfill, or as a waste treatment, storage, disposal, processing, or recycling facility (if applicable, identify which)?	Yes	No	Unk
9.	Are there currently any damaged or discarded automotive or industrial batteries, pesticides, paints, or other chemicals in individual containers of >5 gal (19 L) in volume or 50 gal (190 L) in the aggregate, stored on or used at the property or at the facility?	Yes	No	Unk
10.	Did you observe evidence or do you have any prior knowledge that there have been previously any damaged or discarded automotive or industrial batteries, or pesticides, paints, or other chemicals in individual containers of >5 gal (19 L) in volume or 50 gal (190 L) in the aggregate, stored on or used at the property or at the facility?	Yes	No	Unk
11.	Are there currently any industrial drums (typically 55 gal (208 L)) or sacks of chemicals located on the property or at the facility?	Yes	No	Unk
12.	Did you observe evidence or do you have any prior knowledge that there have been previously any industrial drums (typically 55 gal (208 L)) or sacks of chemicals located on the property or at the facility?	Yes	No	Unk
13.	Did you observe evidence or do you have any prior knowledge that fill dirt has been brought onto the property that originated from a contaminated site?	Yes	No	Unk
14.	Did you observe evidence or do you have any prior knowledge that fill dirt has been brought onto the property that is of an unknown origin?	Yes	No	Unk
15.	Are there currently any pits, ponds, or lagoons located on the property in connection with waste treatment or waste disposal?	Yes	No	Unk

16.	Did you observe evidence or do you have any prior knowledge that there have been previously, any pits, ponds, or lagoons located on the property in connection with waste treatment or waste disposal?	Yes	**No**	Unk
17.	Is there currently any stained soil on the property?	Yes	No	**Unk**
18.	Did you observe evidence or do you have any prior knowledge that there has been previously any stained soil on the property?	Yes	**No**	Unk
19.	Are there currently any registered or unregistered storage tanks (above or underground) located on the property?	Yes	**No**	Unk
20.	Did you observe evidence or do you have any prior knowledge that there have been previously, any registered or unregistered storage tanks (above or underground) located on the property?	Yes	**No**	Unk
21.	Are there currently any vent pipes, fill pipes or access ways indicating a fill pipe protruding from the ground on the property or adjacent to any structure located on the property?	Yes	No	**Unk**
22.	Did you observe evidence or do you have any prior knowledge that there have been previously, any vent pipes, fill pipes, or access ways indicating a fill pipe protruding from the ground on the property or adjacent any structure located on the property?	Yes	No	**Unk**
23.	Is there currently evidence of leaks, spills or staining by substances other than water, or foul odors, associated with any flooring, drains, walls, ceilings, or exposed grounds on the property?	Yes	**No**	Unk
24.	Did you observe evidence or do you have any prior knowledge that there have been previously any leaks, spills, or staining by substances other than water, or foul odors, associated with any flooring drains, walls, ceilings or exposed grounds on the property?	Yes	**No**	Unk

25.	If the property is served by a private well or no-public water system, is there evidence or do you have prior knowledge that contaminants have been identified in the well or system that exceed guidelines applicable to the water system?	Yes	No	Unk
26.	If the property is served by a private well or non-public water system, is there evidence or do you have prior knowledge that the well has been designated as contaminated by any government environmental/health agency?	Yes	No	Unk
27.	Does the owner or occupant of the property have any knowledge of environmental liens or governmental notification relating to past or recurrent violations of environmental laws with respect to the property or any facility located on the property?	Yes	No	Unk
28.	Has the owner or occupant of the property been informed of the past existence of hazardous substances or petroleum products with respect to the property or any facility located on the property?	Yes	No	Unk
29.	Has the owner or occupant of the property been informed of the current existence of hazardous substances or petroleum products with respect to the property or any facility located on the property?	Yes	No	Unk
30.	Has the owner or occupant of the property been informed of the past existence of environmental violations with respect to the property or any facility located on the property?	Yes	No	Unk
31.	Has the owner or occupant of the property been informed of the current existence of environmental violations with respect to the property or any facility located on the property?	Yes	No	Unk
32.	Does the owner or occupant of the property have any knowledge of any environmental site assessment of the property or facility that indicated the presence of hazardous	Yes	No	Unk

substances or petroleum products on, or contamination of, the property or recommended further assessment of the property?

33.	Does the owner or occupant of the property know of the property know of any past, threatened, or pending lawsuits or administrative proceedings concerning a release or threatened release of any hazardous substance petroleum products involving the property by any owner or occupant of the property?	Yes	**No**	Unk
34.	Does the property discharge waste water (not including sanitary waste or storm water) onto or adjacent to the property and/or into a storm water system?	Yes	No	**Unk**
35.	Does the property discharge waste water (not including sanitary waste water or storm water) onto or adjacent to the property and/or into a sanitary sewer system?	Yes	No	**Unk**
36.	Did you observe evidence or do you have any prior knowledge that any hazardous substances or petroleum products, unidentified waste materials, tires, automotive or industrial batteries, or any other waste materials have been dumped above grade, buried and/or burned on the property?	Yes	**No**	Unk
37.	Are their any septic systems on the property?	Yes	No	**Unk**

The Sanborn Library has been searched by EDR and maps covering the target property location as provided by Env. Inv. Services, Inc. were identified for the years listed below. The Sanborn Library is the largest, most complete collection of fire insurance maps. The collection includes maps from Sanborn, Bromley, Perris & Browne, Hopkins, Barlow, and others. Only Environmental Data Resources Inc. (EDR) is authorized to grant rights for commercial reproduction of maps by the Sanborn Library LLC, the copyright holder for the collection. Results can be authenticated by visiting www.edrnet.com/sanborn.

The Sanborn Library is continually enhanced with newly identified map archives. This report accesses all maps in the collection as of the day this report was generated.

Certified Sanborn Results:

EXECUTIVE SUMMARY

DESCRIPTION

Environmental Data Resources, Inc.'s (EDR) City Directory Abstract is a screening tool designed to assist environmental professionals in evaluating potential liability on a target property resulting from past activities. EDR's City Directory Abstract includes a search and abstract of available city directory data. For each address, the directory lists the name of the corresponding occupant at five year intervals.

Business directories including city, cross reference and telephone directories were reviewed, if available, at approximately five year intervals for the years spanning 1920 through 2017. This report compiles information gathered in this review by geocoding the latitude and longitude of properties identified and gathering information about properties within 660 feet of the target property.

A summary of the information obtained is provided in the text of this report.

RECORD SOURCES

EDR's Digital Archive combines historical directory listings from sources such as Cole Information and Dun & Bradstreet. These standard sources of property information complement and enhance each other to provide a more comprehensive report.

EDR is licensed to reproduce certain City Directory works by the copyright holders of those works. The purchaser of this EDR City Directory Report may include it in report(s) delivered to a customer. Reproduction of City Directories without permission of the publisher or licensed vendor may be a violation of copyright.

EXECUTIVE SUMMARY

A search of available environmental records was conducted by Environmental Data Resources, Inc (EDR). The report was designed to assist parties seeking to meet the search requirements of EPA's Standards and Practices for All Appropriate Inquiries (40 CFR Part 312), the ASTM Standard Practice for Environmental Site Assessments (E1527-21), the ASTM Standard Practice for Environmental Site Assessments for Forestland or Rural Property (E 2247-16), the ASTM Standard Practice for Limited Environmental Due Diligence: Transaction Screen Process (E 1528-14) or custom requirements developed for the evaluation of environmental risk associated with a parcel of real estate.

SURROUNDING SITES: SEARCH RESULTS

Surrounding sites were identified in the following databases.

Elevations have been determined from the USGS Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified. Sites with an elevation equal to or higher than the target property have been differentiated below from sites with an elevation lower than the target property.
Page numbers and map identification numbers refer to the EDR Radius Map report where detailed data on individual sites can be reviewed.

Sites listed in ***bold italics*** are in multiple databases.

Unmappable (orphan) sites are not considered in the foregoing analysis.

STANDARD ENVIRONMENTAL RECORDS

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

A review of the ENVIROSTOR list, as provided by EDR, and dated 04/25/2022 has revealed that there are 6 ENVIROSTOR sites within approximately 1 mile of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
WEST LAKESIDE MIDDLE Facility Id: 60000698 Status: No Action Required	***SNELLING LANE/WESTLA***	***S 1/8 - 1/4 (0.226 mi.)***	***C7***	***16***

Lists of state and tribal registered storage tanks

AST: A listing of aboveground storage tank petroleum storage tank locations.

A review of the AST list, as provided by EDR, has revealed that there is 1 AST site within approximately 0.25 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
MSA: STORM DRAIN PUM	4565 W BAYOU RD	WNW 0 - 1/8 (0.044 mi.)	B4	13
Database: AST, Date of Government Version: 07/06/2016				

ADDITIONAL ENVIRONMENTAL RECORDS

Local Lists of Hazardous waste / Contaminated Sites

SCH: This category contains proposed and existing school sites that are being evaluated by DTSC for possible hazardous materials contamination. In some cases, these properties may be listed in the CalSites category. depending on the level of threat to public health and safety or the. environment they pose.

A review of the SCH list, as provided by EDR, and dated 04/25/2022 has revealed that there are 2 SCH sites within approximately 0.25 miles of the target property.

Equal/Higher Elevation	Address	Direction / Distance	Map ID	Page
WEST LAKESIDE MIDDLE	***SNELLING LANE/WESTLA***	***S 1/8 - 1/4 (0.226 mi.)***	***C7***	***16***

WEST LAKESIDE MIDDLE	***WESTLAKE PARKWAY/SNE***	***SSE 1/8 - 1/4 (0.232 mi.)***	***C8***	***18***
Facility Id: 34650004				
Status: No Further Action				

Other Ascertainable Records

HAZNET: The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000-1,000,000 annually, representing approximately 350,000-500,000 shipments. Data from non-California manifests & continuation sheets are not included at the present time. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, & disposal method. The source is the Department of Toxic Substance Control is the agency. This database begins with calendar year 1993.

A review of the HAZNET list, as provided by EDR, and dated 12/31/2019 has revealed that there are 2 HAZNET sites within approximately 0.001 miles of the target property.

Lower Elevation	Address	Direction / Distance	Map ID	Page
KAWEAH CONSTRUCTION GEPAID: CAC002189409	***4401 N BAYOU WAY***	***0 - 1/8 (0.000 mi.)***	***A1***	***9***

Evaluation:

Eval General Type:	Compliance Evaluation Inspection
Eval Date:	07-23-2020
Violations Found:	No
Eval Type:	Routine done by local agency
Eval Notes:	Inspection report emailed to Phil Diaz, Environmental Site Manager, at PD7683@att.com due to COVID-19. Batteries were stolen in March 2020 per Phil Diaz, Environmental Site Manager. The latest CERS submittal lists that there were no hazardous materials on site. No violations observed at the time of inspection.

GOVERNMENT RECORDS SEARCHED / DATA CURRENCY TRACKING

To maintain currency of the following federal and state databases, EDR contacts the appropriate governmental agency on a monthly or quarterly basis, as required.

Number of Days to Update: Provides confirmation that EDR is reporting records that have been updated within 90 days from the date the government agency made the information available to the public.

STANDARD ENVIRONMENTAL RECORDS

Lists of Federal NPL (Superfund) sites

NPL: National Priority List

National Priorities List (Superfund). The NPL is a subset of CERCLIS and identifies over 1,200 sites for priority cleanup under the Superfund Program. NPL sites may encompass relatively large areas. As such, EDR provides polygon coverage for over 1,000 NPL site boundaries produced by EPA's Environmental Photographic Interpretation Center (EPIC) and regional EPA offices.

Date of Government Version: 04/27/2022
Date Data Arrived at EDR: 05/05/2022
Date Made Active in Reports: 05/31/2022
Number of Days to Update: 26

Source: EPA
Telephone: N/A
Last EDR Contact: 08/02/2022
Next Scheduled EDR Contact: 10/10/2022
Data Release Frequency: Quarterly

Proposed NPL: Proposed National Priority List Sites

A site that has been proposed for listing on the National Priorities List through the issuance of a proposed rule in the Federal Register. EPA then accepts public comments on the site, responds to the comments, and places on the NPL those sites that continue to meet the requirements for listing.

Date of Government Version: 04/27/2022
Date Data Arrived at EDR: 05/05/2022
Date Made Active in Reports: 05/31/2022

NPL LIENS: Federal Superfund Liens

Federal Superfund Liens. Under the authority granted the USEPA by CERCLA of 1980, the USEPA has the authority to file liens against real property in order to recover remedial action expenditures or when the property owner received notification of potential liability. USEPA compiles a listing of filed notices of Superfund Liens.

Lists of Federal Delisted NPL sites

Delisted NPL: National Priority List Deletions

The National Oil and Hazardous Substances Pollution Contingency Plan (NCP) establishes the criteria that the EPA uses to delete sites from the NPL. In accordance with 40 CFR 300.425.(e), sites may be deleted from the NPL where no further response is appropriate.

SEMS: Superfund Enterprise Management System

SEMS (Superfund Enterprise Management System) tracks hazardous waste sites, potentially hazardous waste sites, and remedial activities performed in support of EPA's Superfund Program across the United States. The list was formerly know as CERCLIS, renamed to SEMS by the EPA in 2015. The list contains data on potentially hazardous waste sites that have been reported to the USEPA by states, municipalities, private companies and private persons, pursuant to Section 103 of the Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA). This dataset also contains sites which are either proposed to or on the National Priorities List (NPL) and the sites which are in the screening and assessment phase for possible inclusion on the NPL.

Lists of Federal CERCLA sites with NFRAP

SEMS-ARCHIVE: Superfund Enterprise Management System Archive

SEMS-ARCHIVE (Superfund Enterprise Management System Archive) tracks sites that have no further interest under the Federal Superfund Program based on available information. The list was formerly known as the CERCLIS-NFRAP, renamed to SEMS ARCHIVE by the EPA in 2015. EPA may perform a minimal level of assessment work at a site while it is archived if site conditions change and/or new information becomes available. Archived sites have been removed and archived from the inventory of SEMS sites. Archived status indicates that, to the best of EPA's knowledge, assessment at a site has been completed and that EPA has determined no further steps will be taken to list the site on the National Priorities List (NPL), unless information indicates this decision was not appropriate or other considerations require a recommendation for listing at a later time. The decision does not necessarily mean that there is no hazard associated with a given site; it only means that. based upon available information, the location is not judged to be potential NPL site.

Lists of Federal RCRA TSD facilities

RCRA-TSDF: RCRA - Treatment, Storage and Disposal

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Transporters are individuals or entities that move hazardous waste from the generator offsite to a facility that can recycle, treat, store, or dispose of the waste. TSDFs treat, store, or dispose of the waste.

Lists of state- and tribal hazardous waste facilities

ENVIROSTOR: EnviroStor Database

The Department of Toxic Substances Control's (DTSC's) Site Mitigation and Brownfields Reuse Program's (SMBRP's) EnviroStor database identifes sites that have known contamination or sites for which there may be reasons to investigate further. The database includes the following site types: Federal Superfund sites (National Priorities List (NPL)); State Response, including Military Facilities and State Superfund; Voluntary Cleanup; and School sites. EnviroStor provides similar information to the information that was available in CalSites, and provides additional site information, including, but not limited to, identification of formerly-contaminated properties that have been released for reuse, properties where environmental deed restrictions have been recorded to prevent inappropriate land uses, and risk characterization information that is used to assess potential impacts to public health and the environment at contaminated sites.

ADDITIONAL ENVIRONMENTAL RECORDS

Local Brownfield lists

US BROWNFIELDS: A Listing of Brownfields Sites

Brownfields are real property, the expansion, redevelopment, or reuse of which may be complicated by the presence or potential presence of a hazardous substance, pollutant, or contaminant. Cleaning up and reinvesting in these properties takes development pressures off of undeveloped, open land, and both improves and protects the environment. Assessment, Cleanup and Redevelopment Exchange System (ACRES) stores information reported by EPA Brownfields grant recipients on brownfields properties assessed or cleaned up with grant funding as well as information on Targeted Brownfields Assessments performed by EPA Regions. A listing of ACRES Brownfield sites is obtained from Cleanups in My Community. Cleanups in My Community provides information on Brownfields properties for which information is reported back to EPA, as well as areas served by Brownfields grant programs.

US CDL: Clandestine Drug Labs

A listing of clandestine drug lab locations. The U.S. Department of Justice ("the Department") provides this web site as a public service. It contains addresses of some locations where law enforcement agencies reported they found chemicals or other items that indicated the presence of either clandestine drug laboratories or dumpsites. In most cases, the source of the entries is not the Department, and the Department has not verified the entry and does not guarantee its accuracy. Members of the public must verify the accuracy of all entries by, for example, contacting local law enforcement and local health departments.

Data Release Frequency: Varies

LIENS 2: CERCLA Lien Information

A Federal CERCLA ('Superfund') lien can exist by operation of law at any site or property at which EPA has spent Superfund monies. These monies are spent to investigate and address releases and threatened releases of contamination. CERCLIS provides information as to the identity of these sites and properties.

DEED: Deed Restriction Listing

Site Mitigation and Brownfields Reuse Program Facility Sites with Deed Restrictions & Hazardous Waste Management Program Facility Sites with Deed / Land Use Restriction. The DTSC Site Mitigation and Brownfields Reuse Program (SMBRP) list includes sites cleaned up under the program's oversight and generally does not include current or former hazardous waste facilities that required a hazardous waste facility permit. The list represents deed restrictions that are active. Some sites have multiple deed restrictions. The DTSC Hazardous Waste Management Program (HWMP) has developed a list of current or former hazardous waste facilities that have a recorded land use restriction at the local county recorder's office. The land use restrictions on this list were required by the DTSC HWMP as a result of the presence of hazardous substances that remain on site after the facility (or part of the facility) has been closed or cleaned up. The types of land use restriction include deed notice, deed restriction, or a land use restriction that binds current and future owners.

Other Ascertainable Records

RCRA NonGen / NLR: RCRA - Non Generators / No Longer Regulated

RCRAInfo is EPA's comprehensive information system, providing access to data supporting the Resource Conservation and Recovery Act (RCRA) of 1976 and the Hazardous and Solid Waste Amendments (HSWA) of 1984. The database includes selective information on sites which generate, transport, store, treat and/or dispose of hazardous waste as defined by the Resource Conservation and Recovery Act (RCRA). Non-Generators do not presently generate hazardous waste.

EPA WATCH LIST: EPA WATCH LIST

EPA maintains a "Watch List" to facilitate dialogue between EPA, state and local environmental agencies on enforcement matters relating to facilities with alleged violations identified as either significant or high priority. Being on the Watch List does not mean that the facility has actually violated the law only that an investigation by EPA or a state or local environmental agency has led those organizations to allege that an unproven violation has in fact occurred. Being on the Watch List does not represent a higher level of concern regarding the alleged violations that were detected, but instead indicates cases requiring additional dialogue between EPA, state and local agencies - primarily because of the length of time the alleged violation has gone unaddressed or unresolved.

2020 COR ACTION: 2020 Corrective Action Program List

The EPA has set ambitious goals for the RCRA Corrective Action program by creating the 2020 Corrective Action Universe. This RCRA cleanup baseline includes facilities expected to need corrective action. The 2020 universe contains a wide variety of sites. Some properties are heavily contaminated while others were contaminated but have since been cleaned up. Still others have not been fully investigated yet, and may require little or no remediation. Inclusion in the 2020 Universe does not necessarily imply failure on the part of a facility to meet its RCRA obligations.
