When Congress passed the Clean Air Act Amendments of 1990, it required EPA to publish regulations and guidance for chemical accident prevention at facilities using extremely hazardous substances. The Risk Management Program Rule (RMP Rule) was written to implement Section 112(r) of these amendments. The rule, which built upon existing industry codes and standards, requires companies of all sizes that use certain flammable and toxic substances to develop a Risk Management Program, which includes a(n): Hazard assessment that details the potential effects of an accidental release, an accident history of the last five years, and an evaluation of worst-case and alternative accidental releases; Prevention program that includes safety precautions and maintenance, monitoring, and employee training measures; and Emergency response program that spells out emergency health care, employee training measures and procedures for informing the public and response agencies (e.g the fire department) should an accident occur.

RAATS: RCRA Administrative Action Tracking System

RCRA Administration Action Tracking System. RAATS contains records based on enforcement actions issued under RCRA pertaining to major violators and includes administrative and civil actions brought by the EPA. For administration actions after September 30, 1995, data entry in the RAATS database was discontinued. EPA will retain a copy of the database for historical records. It was necessary to terminate RAATS because a decrease in agency resources made it impossible to continue to update the information contained in the database.

HIST FTTS: FIFRA/TSCA Tracking System Administrative Case Listing
A complete administrative case listing from the FIFRA/TSCA Tracking System (FTTS) for all ten EPA regions. The information was obtained from the National Compliance Database (NCDB). NCDB supports the implementation of FIFRA (Federal Insecticide, Fungicide, and Rodenticide Act) and TSCA (Toxic Substances Control Act). Some EPA regions are now closing out records. Because of that, and the fact that some EPA regions are not providing EPA Headquarters with updated records, it was decided to create a HIST FTTS database. It included records that may not be included in the newer FTTS database updates. This database is no longer updated.

Date of Government Version: 10/19/2006

UMTRA: Uranium Mill Tailings Sites

Uranium ore was mined by private companies for federal government use in national defense programs. When the mills shut down, large piles of the sand-like material (mill tailings) remain after uranium has been extracted from the ore. Levels of human exposure to radioactive materials from the piles are low; however, in some cases tailings were used as construction materials before the potential health hazards of the tailings were recognized.

US AIRS (AFS): Aerometric Information Retrieval System Facility Subsystem (AFS)

The database is a sub-system of Aerometric Information Retrieval System (AIRS). AFS contains compliance data on air pollution point sources regulated by the U.S. EPA and/or state and local air regulatory agencies. This information comes from source reports by various stationary sources of air pollution, such as electric power plants, steel mills, factories, and universities, and provides information about the air pollutants they produce. Action, air program, air program pollutant, and general level plant data. It is used to track emissions and compliance data from industrial plants.

ABANDONED MINES: Abandoned Mines

An inventory of land and water impacted by past mining (primarily coal mining) is maintained by OSMRE to provide information needed to implement the Surface Mining Control and Reclamation Act of 1977 (SMCRA). The inventory contains information on the location, type, and extent of AML impacts, as well as, information on the cost associated with the reclamation of those problems. The inventory is based upon field surveys by State, Tribal, and OSMRE program officials. It is dynamic to the extent that it is modified as new problems are identified and existing problems are reclaimed.

HAZNET: Facility and Manifest Data

Facility and Manifest Data. The data is extracted from the copies of hazardous waste manifests received each year by the DTSC. The annual volume of manifests is typically 700,000 - 1,000,000 annually, representing approximately 350,000 - 500,000 shipments. Data are from the manifests submitted without correction, and therefore many contain some invalid values for data elements such as generator ID, TSD ID, waste category, and disposal method. This database begins with calendar year 1993.

Date of Government Version: 12/31/2019

WASTEWATER PITS: Oil Wastewater Pits Listing
Water officials discovered that oil producers have been dumping chemical-laden wastewater into hundreds of unlined pits that are operating without proper permits. Inspections completed by the Central Valley Regional Water Quality Control Board revealed the existence of previously unidentified waste sites. The water boards review found that more than one-third of the region's active disposal pits are operating without permission.

WDR: Waste Discharge Requirements Listing
In general, the Waste Discharge Requirements (WDRs) Program (sometimes also referred to as the "Non Chapter 15 (Non 15) Program") regulates point discharges that are exempt pursuant to Subsection 20090 of Title 27 and not subject to the Federal Water Pollution Control Act. Exemptions from Title 27 may be granted for nine categories of discharges (e.g., sewage, wastewater, etc.) that meet, and continue to meet, the preconditions listed for each specific exemption. The scope of the WDRs Program also includes the discharge of wastes classified as inert, pursuant to section 20230 of Title 27.

EDR HIGH RISK HISTORICAL RECORDS

EDR Exclusive Records

EDR MGP: EDR Proprietary Manufactured Gas Plants

The EDR Proprietary Manufactured Gas Plant Database includes records of coal gas plants (manufactured gas plants) compiled by EDR's researchers. Manufactured gas sites were used in the United States from the 1800's to 1950's to produce a gas that could be distributed and used as fuel. These plants used whale oil, rosin, coal, or a mixture of coal, oil, and water that also produced a significant amount of waste. Many of the byproducts of the gas production, such as coal tar (oily waste containing volatile and non-volatile chemicals), sludges, oils and other compounds are potentially hazardous to human health and the environment. The byproduct from this process was frequently disposed of directly at the plant site and can remain or spread slowly, serving as a continuous source of soil and groundwater contamination.

EDR Hist Auto: EDR Exclusive Historical Auto Stations

EDR has searched selected national collections of business directories and has collected listings of potential gas station/filling station/service station sites that were available to EDR researchers. EDR's review was limited to those categories of sources that might, in EDR's opinion, include gas station/filling station/service station establishments. The categories reviewed included, but were not limited to gas, gas station, gasoline station, filling station, auto, automobile repair, auto service station, service station, etc. This database falls within a category of information EDR classifies as "High Risk Historical Records", or HRHR. EDR's HRHR effort presents unique and sometimes proprietary data about past sites and operations that typically create environmental concerns, but may not show up in current government records searches.

LOS ANGELES CO LF METHANE: Methane Producing Landfills

This data was created on April 30, 2012 to represent known disposal sites in Los Angeles County that may produce and emanate methane gas. The shapefile contains disposal sites within Los Angeles County that once accepted degradable refuse material. Information used to create this data was extracted from a landfill survey performed by County Engineers (Major Waste System Map, 1973) as well as historical records from CalRecycle, Regional Water Quality Control Board, and Los Angeles County Department of Public Health

OTHER DATABASE(S)

Depending on the geographic area covered by this report, the data provided in these specialty databases may or may not be complete. For example, the existence of wetlands information data in a specific report does not mean that all wetlands in the area covered by the report are included. Moreover, the absence of any reported wetlands information does not necessarily mean that wetlands do not exist in the area covered by the report.

CT MANIFEST: Hazardous Waste Manifest Data
Facility and manifest data. Manifest is a document that lists and tracks hazardous waste from the generator through transporters to a tsd facility.

Sensitive Receptors: There are individuals deemed sensitive receptors due to their fragile immune systems and special sensitivity to environmental discharges. These sensitive receptors typically include the elderly, the sick, and children. While the location of all sensitive receptors cannot be determined, EDR indicates those buildings and facilities - schools, daycares, hospitals, medical centers, and nursing homes - where individuals who are sensitive receptors are likely to be located.

AHA Hospitals:
Source: American Hospital Association, Inc.
Telephone: 312-280-5991
The database includes a listing of hospitals based on the American Hospital Association's annual survey of hospitals.

Medical Centers: Provider of Services Listing

USGS TOPOGRAPHIC MAP

Target Property Map:	12021657 TAYLOR MONUMENT, CA
Version Date:	2018

EDR’s GeoCheck Physical Setting Source Addendum is provided to assist the environmental professional in forming an opinion about the impact of potential contaminant migration.

Assessment of the impact of contaminant migration generally has two principle investigative components:

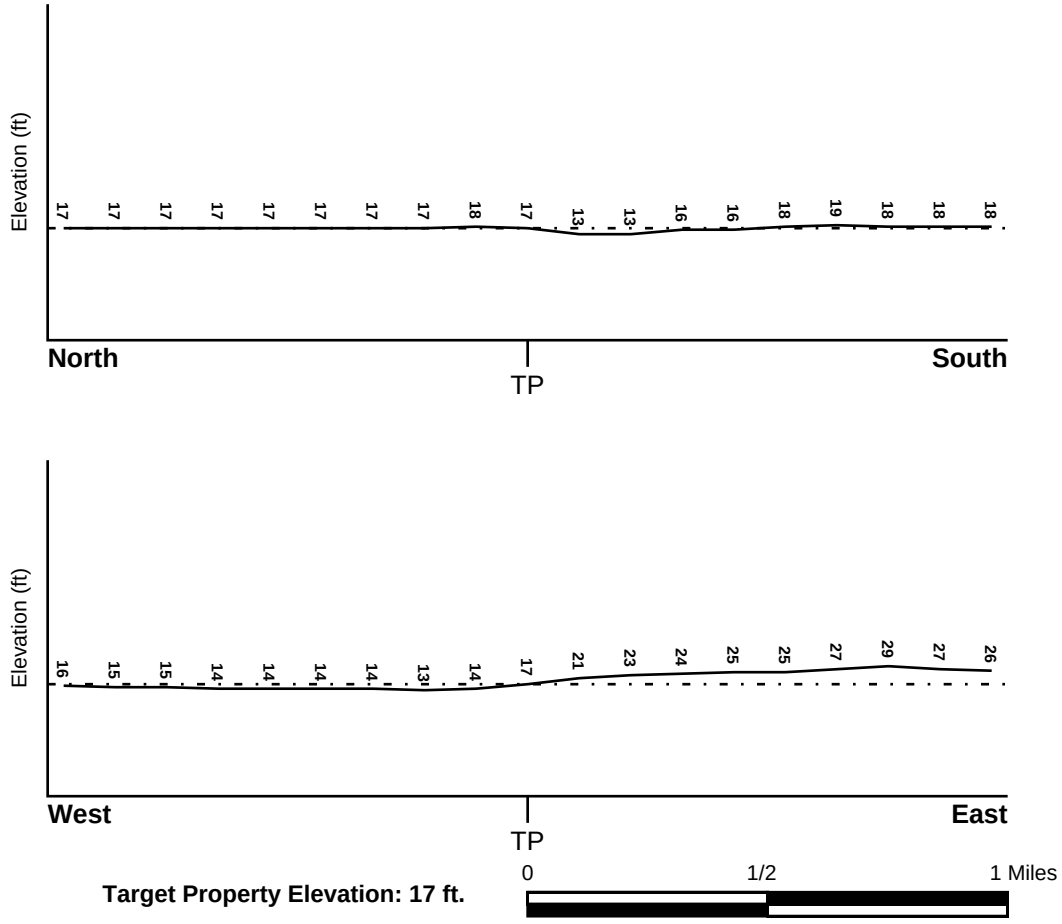
1. Groundwater flow direction, and
2. Groundwater flow velocity.

Groundwater flow direction may be impacted by surface topography, hydrology, hydrogeology, characteristics of the soil, and nearby wells. Groundwater flow velocity is generally impacted by the nature of the geologic strata.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW DIRECTION INFORMATION

Groundwater flow direction for a particular site is best determined by a qualified environmental professional using site-specific well data. If such data is not reasonably ascertainable, it may be necessary to rely on other sources of information, such as surface topographic information, hydrologic information, hydrogeologic data collected on nearby properties, and regional groundwater flow information (from deep aquifers).



TOPOGRAPHIC INFORMATION

Surface topography may be indicative of the direction of surficial groundwater flow. This information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

TARGET PROPERTY TOPOGRAPHY

General Topographic Gradient: General WSW

SURROUNDING TOPOGRAPHY: ELEVATION PROFILES

Source: Topography has been determined from the USGS 7.5' Digital Elevation Model and should be evaluated on a relative (not an absolute) basis. Relative elevation information between sites of close proximity should be field verified.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

HYDROLOGIC INFORMATION

Surface water can act as a hydrologic barrier to groundwater flow. Such hydrologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Refer to the Physical Setting Source Map following this summary for hydrologic information (major waterways and bodies of water).

HYDROGEOLOGIC INFORMATION

Hydrogeologic information obtained by installation of wells on a specific site can often be an indicator of groundwater flow direction in the immediate area. Such hydrogeologic information can be used to assist the environmental professional in forming an opinion about the impact of nearby contaminated properties or, should contamination exist on the target property, what downgradient sites might be impacted.

Site-Specific Hydrogeological Data*:

Search Radius:	1.25 miles
Status:	Not found

AQUIFLOW®

Search Radius: 1.000 Mile.

EDR has developed the AQUIFLOW Information System to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted by environmental professionals to regulatory authorities at select sites and has extracted the date of the report, groundwater flow direction as determined hydrogeologically, and the depth to water table.

All of the information and opinions presented are those of the cited EPA report(s), which were completed under a Comprehensive Environmental Response Compensation and Liability Information System (CERCLIS) investigation.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

GROUNDWATER FLOW VELOCITY INFORMATION

Groundwater flow velocity information for a particular site is best determined by a qualified environmental professional using site specific geologic and soil strata data. If such data are not reasonably ascertainable, it may be necessary to rely on other sources of information, including geologic age identification, rock stratigraphic unit and soil characteristics data collected on nearby properties and regional soil information. In general, contaminant plumes move more quickly through sandy-gravelly types of soils than silty-clayey types of soils.

GEOLOGIC INFORMATION IN GENERAL AREA OF TARGET PROPERTY

Geologic information can be used by the environmental professional in forming an opinion about the relative speed at which contaminant migration may be occurring.

GEOCHECK® - PHYSICAL SETTING SOURCE SUMMARY

DOMINANT SOIL COMPOSITION IN GENERAL AREA OF TARGET PROPERTY

The U.S. Department of Agriculture's (USDA) Soil Conservation Service (SCS) leads the National Cooperative Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. The following information is based on Soil Conservation Service SSURGO data.

Soil Map ID: 1

Soil Component Name: CLEAR LAKE

Soil Surface Texture: clay

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Somewhat poorly drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information							
	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil		
1	0 inches	14 inches	clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:
2	14 inches	33 inches	clay	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:
3	33 inches	48 inches	clay loam	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:
4	48 inches	64 inches	cemented	Silt-Clay Materials (more than 35 pct. passing No. 200), Clayey Soils.	Not reported	Max: 0.01 Min: 0	Max: Min:

Soil Map ID: 2

Soil Component Name: JACKTONE

Soil Surface Texture: clay

Hydrologic Group: Class D - Very slow infiltration rates. Soils are clayey, have a high water table, or are shallow to an impervious layer.

Soil Drainage Class: Somewhat poorly drained

Hydric Status: Partially hydric

Corrosion Potential - Uncoated Steel: High

Depth to Bedrock Min: > 0 inches

Depth to Watertable Min: > 0 inches

Soil Layer Information

	Boundary			Classification		Saturated hydraulic conductivity micro m/sec	Soil Reaction (pH)
Layer	Upper	Lower	Soil Texture Class	AASHTO Group	Unified Soil

PHYSICAL SETTING SOURCE RECORDS SEARCHED

TOPOGRAPHIC INFORMATION

USGS 7.5' Digital Elevation Model (DEM)
Source: United States Geologic Survey
EDR acquired the USGS 7.5' Digital Elevation Model in 2002 and updated it in 2006. The 7.5 minute DEM corresponds to the USGS 1:24,000- and 1:25,000-scale topographic quadrangle maps. The DEM provides elevation data with consistent elevation units and projection.

Current USGS 7.5 Minute Topographic Map
Source: U.S. Geological Survey

HYDROLOGIC INFORMATION

Flood Zone Data: This data was obtained from the Federal Emergency Management Agency (FEMA). It depicts 100-year and 500-year flood zones as defined by FEMA. It includes the National Flood Hazard Layer (NFHL) which incorporates Flood Insurance Rate Map (FIRM) data and Q3 data from FEMA in areas not covered by NFHL.
Source: FEMA
Telephone: 877-336-2627
Date of Government Version: 2003, 2015

NWI: National Wetlands Inventory. This data, available in select counties across the country, was obtained by EDR in 2002, 2005 and 2010 from the U.S. Fish and Wildlife Service.

State Wetlands Data: Wetland Inventory
Source: Department of Fish and Wildlife
Telephone: 916-445-0411

HYDROGEOLOGIC INFORMATION

AQUIFLOW^{R} Information System
Source: EDR proprietary database of groundwater flow information
EDR has developed the AQUIFLOW Information System (AIS) to provide data on the general direction of groundwater flow at specific points. EDR has reviewed reports submitted to regulatory authorities at select sites and has extracted the date of the report, hydrogeologically determined groundwater flow direction and depth to water table information.

GEOLOGIC INFORMATION

Geologic Age and Rock Stratigraphic Unit
Source: P.G. Schruben, R.E. Arndt and W.J. Bawiec, Geology of the Conterminous U.S. at 1:2,500,000 Scale - A digital representation of the 1974 P.B. King and H.M. Beikman Map, USGS Digital Data Series DDS - 11 (1994).

STATSGO: State Soil Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
The U.S. Department of Agriculture's (USDA) Natural Resources Conservation Service (NRCS) leads the national Conservation Soil Survey (NCSS) and is responsible for collecting, storing, maintaining and distributing soil survey information for privately owned lands in the United States. A soil map in a soil survey is a representation of soil patterns in a landscape. Soil maps for STATSGO are compiled by generalizing more detailed (SSURGO) soil survey maps.

SSURGO: Soil Survey Geographic Database
Source: Department of Agriculture, Natural Resources Conservation Service (NRCS)
Telephone: 800-672-5559
SSURGO is the most detailed level of mapping done by the Natural Resources Conservation Service, mapping scales generally range from 1:12,000 to 1:63,360. Field mapping methods using national standards are used to construct the soil maps in the Soil Survey Geographic (SSURGO) database. SSURGO digitizing duplicates the original soil survey maps. This level of mapping is designed for use by landowners, townships and county natural resource planning and management.

LOCAL / REGIONAL WATER AGENCY RECORDS

FEDERAL WATER WELLS

PWS: Public Water Systems
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Public Water System data from the Federal Reporting Data System. A PWS is any water system which provides water to at least 25 people for at least 60 days annually. PWSs provide water from wells, rivers and other sources.

PWS ENF: Public Water Systems Violation and Enforcement Data
Source: EPA/Office of Drinking Water
Telephone: 202-564-3750
Violation and Enforcement data for Public Water Systems from the Safe Drinking Water Information System (SDWIS) after August 1995. Prior to August 1995, the data came from the Federal Reporting Data System (FRDS).

USGS Water Wells: USGS National Water Inventory System (NWIS)
This database contains descriptive information on sites where the USGS collects or has collected data on surface water and/or groundwater. The groundwater data includes information on wells, springs, and other sources of groundwater.

OTHER STATE DATABASE INFORMATION

Groundwater Ambient Monitoring & Assessment Program
State Water Resources Control Board
Telephone: 916-341-5577
The GAMA Program is Californias comprehensive groundwater quality monitoring program. GAMA collects data by testing the untreated, raw water in different types of wells for naturally-occurring and man-made chemicals. The GAMA data includes Domestic, Monitoring and Municipal well types from the following sources, Department of Water Resources, Department of Heath Services, EDF, Agricultural Lands, Lawrence Livermore National Laboratory, Department of Pesticide Regulation, United States Geological Survey, Groundwater Ambient Monitoring and Assessment Program and Local Groundwater Projects.

Water Well Database
Source: Department of Water Resources
Telephone: 916-651-9648

California Drinking Water Quality Database
Source: Department of Public Health
Telephone: 916-324-2319
The database includes all drinking water compliance and special studies monitoring for the state of California since 1984. It consists of over 3,200,000 individual analyses along with well and water system information.

California Oil and Gas Well Locations
Source: Dept of Conservation, Geologic Energy Management Division
Telephone: 916-323-1779
Oil and Gas well locations in the state.

California Earthquake Fault Lines
Source: California Division of Mines and Geology
The fault lines displayed on EDR's Topographic map are digitized quaternary fault lines prepared in 1975 by the United State Geological Survey. Additional information (also from 1975) regarding activity at specific fault lines comes from California's Preliminary Fault Activity Map prepared by the California Division of Mines and Geology.

I. Introduction & Purpose

This Preliminary Drainage Study Report (Report) has been prepared to provide preliminary drainage study information for the project titled the Airport South Industrial (ASI) Project (Project), examining drainage and grading infrastructure information associated with the development of a future planned industrial warehouse and highway commercial project. Existing and proposed land uses, hydraulics, and proposed infrastructure-level improvements for the Project will be included as well as an XPSWMM analysis using the regional base modeling provided by Reclamation District 1000 (RD 1000). This Report is intended to provide the information needed for the entitlement application and processing, including the preparation of an Environmental Impact Report (EIR) for the Project. This work will include coordination with the City of Sacramento (City) and RD 1000 in supporting the development of a preliminary storm drainage plan and providing a description of the hydrology and hydraulics (H&H) of the on-site and off-site systems. Design-level storm drainage analysis will be provided later in conjunction with Project development subsequent to Project approvals.

The ASI Project area totals approximately 436.5 acres, and is located along Bayou Road south of Interstate 5 (I-5). The Project is currently within the County of Sacramento (County). **Exhibit A** is a Regional Location Map. The property lies south of I-5 and south and east of the Sacramento International Airport (SMF). Metro Air Park (MAP), an 1,892-acre Industrial Business Park, lies directly to the north of the Project and I-5. The Northlake (formerly Greenbriar) project lies north of I-5, and is northeast of the Project. The North Natomas Community Plan (NNCP) comprising approximately 7,440 acres in the City of Sacramento, is located east and southeast of the Project area. Agricultural and North Natomas habitat mitigation lands lie south of the Project. Undeveloped Airport Master Plan Development lands owned by SMF within the County of Sacramento are located west and southwest of the Project area. The east boundary of the Project area is the City/County boundary. This includes a 200-foot-wide City-owned buffer along the eastern boundary of the Project. Phase 1 of the new MAP Interchange has been completed on I-5, which is located directly north and comprises a portion of the Project area.

The Project is proposed for annexation from the County into the City of Sacramento. The City is the lead agency for the Project annexation and entitlements. The Project area has multiple landowners. NP Land Holding Company, LLC (NorthPoint Development) and AKT Investments, Inc. (AKT) are the Applicants and are sponsoring the entitlements for the Project.

Exhibit B is the current site plan prepared for the Project. The Project annexation area totals 474.4 acres. This area is inclusive of the State of California Department of Transportation (Caltrans) lands measured roughly to the center of I-5, and also includes the south approximate one-half of the new Metro Air Parkway Interchange. The west boundary extends to the approximate centerline of Power Line Road. Caltrans' I-5 Right-of-Way (R/W) totals approximately 37.9 acres. This leaves approximately 436.5 gross acres of lands proposed for development.

Exhibit C is the Land Use Summary for the Project. The developable lands proposed for entitlements total approximately 436.5 acres. The Project will include development of an industrial park and highway commercial areas. Developable areas will include warehousing, highway commercial, internal roadways, parking, detention basins, buffer areas, sewer and drainage pump stations and other related facilities. The industrial buildings total an estimated 6,609,300 square feet (SF). The highway commercial totals an estimated 80,940 SF. The Project is largely made up of the Applicant-sponsored area, but includes other future industrial lands not under ownership by the Applicants.

II. Drainage Background Information

Exhibit D is the applicable Federal Insurance Rate Map (FIRM) for the Project area. The Project is located within the Natomas Basin. The Natomas Basin comprises approximately 50,000 acres and is protected by a levee system under the jurisdiction of the United States Army Corps of Engineers (USACE). The levees surrounding the Natomas Basin were decertified by the USACE in December 2008. After that date, the Sacramento Area Flood Control Agency (SAFCA), the USACE, and the State of California have been, and currently are, working together to fund, design and construct levee improvements to provide 200-year protection to the Natomas Basin. Over 50 percent of the levee improvements have been constructed, and 100 percent of the funding has been allocated by local, state and federal agencies to complete all of the levee improvements. This level of levee completion and funding has allowed portions of the Natomas Basin to be classified as A-99 flood zones, including the eastern portion of the Project area. A-99 is an interim designation that allows new development to proceed without elevation verification while the improvements needed to provide 100-year protection are under construction, but it is still a special flood hazard area until construction and certification is complete and the levees are accredited by the Federal Emergency Management Agency (FEMA). The majority of the Project area is classified as Zone A, which means FEMA requires more detailed interior (local) drainage assessments to remove it from the special flood hazard area, in addition to addressing the levee flooding issues.

Drainage will be provided by the City of Sacramento and Reclamation District 1000 in a similar manner as is currently performed in North Natomas and other areas of the Natomas Basin. In the vicinity of the Project, RD 1000 owns and operates the existing canals and pumping plants that move storm drainage from the local area to the Sacramento River. RD 1000 collects all runoff within the Natomas Basin through a system of interconnected channels and directs this runoff to pumping plants in order to lift the water into the leveed rivers and channels surrounding Natomas. These channels and pumping systems rely on existing flood storage in low lying areas to dampen peak flows, metering water into the pumping plants and allowing pumping to operate more efficiently with less peaking. This is a complicated system that can move drainage from various outfall points to outside the basin.

In is anticipated that the City will own and operate the future shared system that will detain and pump storm drainage runoff from multiple parcels prior to discharge to the RD 1000 System. RD 1000 is then responsible for the off-site system conveying the drainage from the Project site to the Sacramento River, or otherwise outside of the Natomas Basin.

Exhibit E is a map of the RD 1000 System in Natomas. Off-site runoff affecting the Project in the RD 1000 System enters the Project along RD1000 L Drain of the Lone Tree Canal that flows south through three 8' x 5' box culverts under I-5 (directly north of the Project). Within the Project, RD1000 L Drain of the Lone Tree Canal bisects the easterly one-third of the Project from the westerly two-thirds of the Project. RD1000 L Drain flows south to join the West Drainage Canal that is located along the south boundary of the Project. At this confluence of the Lone Tree Canal and the West Drainage Canal, drainage runoff can either flow east and south toward Pumping Plant 3 on the Sacramento River or west and northwest toward Pumping Plant No. 5 on the Sacramento River. It should be noted that the RD 1000 system in the Lone Tree Canal and West Drainage Canal is operated with a permanent backwater condition whereby the canals contain water at all times of the year.

While the limits of the federally-recognized 100-year floodplain are not currently mapped due to the basin-wide Zone A99 designation, the Project Land was within a previously mapped Zone A. This and the basin wide modeling indicates that the Project lands provide storage of floodwaters during the 100-year storm in the undeveloped state. This floodplain mapping and modeling establishes the accepted definition of interior flooding conditions with the levees being certified.

RD 1000 provided their base XPSWMM model to Wood Rodgers in order to analyze the on-site and off-site storm drainage impacts and mitigations, discussed further in the Hydraulic Modeling Section of this Report. The design storm for the original model provided to Wood Rodgers by RD 1000 is the 100-year 10-day event. Therefore, all references to the 100-year storm herein are in reference to the 100-year 10-day event.

In order to efficiently develop the property and remove the floodplain, the developed area of the site will need to be raised above the floodplain. Given the floodplain elevations from the RD 1000 model, the buildings' finished floors would need to be raised. Furthermore, parking areas would need to be elevated to limit the 100-year flood depth to within acceptable ranges. Any existing on-site storage that is filled in will need to be mitigated. Estimates of proposed detention have been calculated based on the volume of the pre-project available storage. Preliminary grading designed to mitigate the impacts of a raised site area is discussed in the Hydraulic Modeling Section. **Exhibit C** includes the identification of the approximate footprint areas where the on-site compensating detention areas may be placed.

Within the Natomas Basin, RD 1000 requires that developed lands mitigate their post-project runoff in order not to increase above pre-project levels. In the development of North Natomas and the Greenbriar project, this has equated to discharging approximately 0.10 cubic feet per second/per acre (cfs/acre) of runoff into the RD 1000 system during a 100-year event. The interactions of existing/new storage, conveyance and pumping need to be modeled dynamically to determine the appropriate discharge rate for any project area. Detailed modeling results will be provided herein that will ultimately establish the hydraulic parameters that will govern the Project drainage characteristics. This Report will describe on-site improvements that are required for Project development including on-site detention basin sizing.

The design of on-site detention basin facilities will also be affected by the local groundwater table. Groundwater in the Natomas Basin is relatively shallow. Groundwater depths and elevations will be confirmed with future Geotechnical Investigations.

Based on the discussion above, it is important to note that the site grading and detention constraints and requirements are not unusual within the Natomas Basin. Other Project areas have experienced the same issues and have solved the problem by constructing storage basins to accomplish the following:

1. Raise developed areas out of the floodplain by generating and/or importing fill material;
2. Mitigate the lost floodplain storage with detention basin volume that stores drainage through the peak of the storm event and then releases downstream at rates sustainable by the RD 1000 system; and
3. Mitigate post-project runoff with detention basin volume and metering flows into the system during the storm events.

There is an additional mitigation strategy not currently performed in the North Natomas community for ASI. The ASI on-site detention basins will both 1) detain on-site project generated flows and pump into the RD 1000 system; and 2) include weirs to allow the RD 1000 canals to overflow into the detention basins to match the existing 100-year storage on the project site. This second function that is needed to mitigate the loss of on-site floodplain.

III. Pre-Project Site Conditions

A. Pre-Project On-Site Drainage System

Other than the existing RD 1000 ditches and canals, the existing site has no internal drainage system(s) flowing overland towards the RD 1000 canals and ditches around the perimeter and through the site.

Site topography has been flown recently in accordance with City requirements based on the City of Sacramento (vertical) Datum (COSD). **Exhibit F** is the topographic map. The western two-thirds of the site (west of RD1000 L Drain of the LTC) is relatively flat at roughly elevation 10.0 (COSD). The elevations increase in the vicinity of the new interchange from elevation 10.0 to elevation 35.0 at the existing Metro Air Parkway bridge crossing of I-5. In the eastern area of the site (east of RD1000 L Drain of the LTC), the elevations generally slope from elevation 10.0 to elevation 25.0 at the east boundary.

It is important to note that the site topographic information has been mapped using COSD. The RD 1000 XPSWMM drainage model, however, is based on topographic survey information mapped under the North American Vertical Datum of 1988 (NAVD 88). These datums differ by 1.981' vertically with the NAVD 88 elevation values being the higher of the two. It is, therefore, necessary to account for this elevation difference when identifying preliminary grading for the Project. All elevations referenced herein are based on COSD, unless otherwise noted. Elevations (results) reported herein that were obtained from the model have been 1) converted to COSD and 2) reported in NAVD88, to allow for simultaneous review and comparison by involved agencies. Elevations reported in the XPSWMM modeling (see **Exhibit M**) are still based on NAVD 88.

The following table provides the datum conversions to provide consistency between the City of Sacramento Datum (COSD), NGVD 29 and NAVD88.

Table 1 Datum Conversion

	To Datum			
From Datum		COSD	NGVD29	NAVD88
	COSD	0	-0.159	+ 1.981
	NGVD29	+0.159	0	+2.14
	NAVD88	- 1.981	-2.14	0

B. Pre-Project Off-Site Drainage System

The off-site drainage system is owned, operated and maintained by RD 1000. The RD 1000 System is shown on **Exhibit E**. For purposes of this section, RD1000 L Drain bisects the site from north to south and will be considered part of the off-site drainage system. As stated previously, RD1000 L Drain flows south to join the West Drainage Canal that is located along the south boundary of the Project. At this confluence between RD1000 L Drain and the West Drainage Canal, drainage runoff can either flow east and south toward Pumping Plant 3 on the Sacramento River, or west and northwest toward Pumping Plant No. 5 on the Sacramento River. The current capacity at Pumping Plant No. 5 is 57 cfs. Pumping Plant No. 3 has a greater existing capacity at 196 cfs.

Improvements to the RD 1000 system have been necessary over the years as the Natomas Basin has urbanized. The downstream system described above has gone through various improvements, and other improvements are still pending. Recent upstream improvements have included the widening and regrading of the Lone Tree Canal (north of I-5) as part of the Northlake project. Fairly recent downstream improvements include culvert and pumping plant improvements.

With the development approvals of Metro Air Park over 20 years ago, there are agreed-upon improvements to the downstream system (south of I-5) that have relevance to the Project. Included as **Exhibit G** are excerpts from the MAP Capital Improvement Program (CIP) dated 2004-2005. **Exhibit G** also includes

figures that detail the location and proposed improvements. **Exhibit H** includes excerpts from the MAP Finance Plan dated 2020. These detail the proposed improvements in scope, estimated costs, and timing. The projects are summarized as follows:

Table 2 Metro Air Park Drainage Projects

MAP CIP No.	Description	Status
1. RD 1000-1	Install 3-each 84″ culverts at Del Paso Road and the West Drain Canal	Completed
2. RD 1000-2	Install 3-each 84″ culverts at Powerline Road and the East/West Canal	Not Completed
3. RD 1000-3	Install 3-each 84″ culverts at the confluence of Reach 4 & Reach 5	Not Completed
4. RD 1000-5	Reconstruct Pumping Plant 3 to a total capacity of 280 cfs	Funded
5. RD 1000-6	Install Box Culvert and an 80-cfs pump to Pumping Plant No. 3	Not Completed
6. RD 1000-7	Regrade Reach 8 (RD1000 L Drain) and the LTC north of I-5; Install 2-84″ I-5 culverts	Not Completed
7. RD 1000-8	Install SMF Irrigation Pump	Completed

It is important to note that MAP CIP No. 5 lists an 80-cfs pump being added to Pumping Plant No. 3; however, the RD 1000 description of Pumping Plant No. 3 in the XPSWMM model shows an existing capacity of 196 cfs. The agreement between MAP and the County clearly states that the ultimate capacity of Pumping Plant No. 3 is intended to be 280 cfs; therefore, the pump size to be installed under this capital improvement is assumed to be 84 cfs for the purposes of this Report.

Based on the updated 2020 MAP Finance Plan excerpts in **Exhibit H**, the proposed RD 1000 improvements are scheduled at 20-percent and 30-percent build-out of MAP. Note that the ASI Project team has been informed by the County of Sacramento that current buildout has exceeded or will exceed these thresholds in the near future.

At the time of this study, it can be assumed that all improvements listed above will be constructed as part of the MAP Capital Improvement Program. Therefore, they become part of the Pre-Project Off-Site System.

As part of Improvement RD 1000-7 listed above, "*boring and jacking 2-78″ RCP culverts under I-5*" was included as a part of the original 2005 CIP, and is still included today. However, an analysis concurrent with this study and also performed by Wood Rodgers indicates that these 2-78″ RCP culverts may not be considered beneficial based on the cost vs. the benefit of reducing upstream water surface (WS) elevations (approximately 0.5′). These 2-78″ culverts added to the existing 3-each 8′ x 5′ culverts under I-5 are not necessary to mitigate impacts to the system with the containment of increased water surfaces upstream of I-5. This preliminary analysis assumes that these 2-78″ RCP culverts will not be constructed and are, therefore, excluded from pre-project and post-project conditions hydraulic modeling. While the elimination of the need for adding 2-78" culverts under I-5 for Metro Air Park is reasonable for purposes of this study, the decision is pending further evaluation by the RD 1000 and Sacramento County.

IV. Post-Project Site Conditions

A. Post-Project On-Site Drainage System

Exhibit K depicts the schematic drainage design for the on-site system. The on-site system will be owned, operated and maintained by the City of Sacramento. Maintenance agreements may need to be executed between the Project and the City to maintain the basins. The on-site design consists of a perimeter system of detention basins located adjacent to the RD 1000 ditches and canals that border the west and south Project boundaries and areas adjacent to RD1000 L Drain (which bisects the easterly one-third of the Project). The basins will each be interconnected with a 36″ diameter culvert(s) or larger in order to provide a single continuous system. In design, the culverts may be upsized, or redundant barrels may be added, for conservative operations and maintenance reasons. The basins, as stated previously, are connected to the RD 1000 system through weirs to meet the pre-project spill condition and to provide on-site floodplain storage.

This on-site system will be controlled by a pump station currently planned to be located near the intersection of RD1000 L Drain and ASI Drive. Based on the modeling included herein, the pump station discharge capacity will be 35 cfs, modeled as two 17.5-cfs pumps. A low-flow pump may also be incorporated to maintain the flood control depth needed in the basin for the winter months, or as needed to keep the basins drawn down in the summer months. Low flow pumps are typically not operated during flood control operations and are not included in the modeling. The City has stated that trash capture requirements will need to be addressed in the final design. Wood Rodgers anticipates that trash capture will be achievable at the inlet to the pump station through screen mechanisms or mesh bags. Any method of trash capture will require frequent monitoring and cleaning to keep the pump station fully operational.

It is planned for the two basin areas on the east side of RD1000 L Drain to interconnect from south to north. The north basin is then planned to connect to the proposed drainage pump station via a pipe crossing under RD1000 L Drain through box structures and manhole/vault on each side of the RD1000 L Drain prior to a connection to the proposed pump station. It is important to note that the L Drain in the RD 1000 Model includes excavation from just downstream of I-5, south to the confluence of the L Drain with the West Drainage Canal. This is pursuant to the proposed MAP CIP improvements (**Exhibit G**) presented in the Pre-Project Off-site Drainage section above, and limited by the existing elevations of the upstream culverts at I-5 and the downstream confluence. Considering the proposed deepening means that the depth of the proposed box structures will likely be on the order of elevation (-4.0′ to -7.0′) or roughly 14′ to 17′ below existing ground (approximately 20′ below future finished grade) in order to allow the east-to-west connecting pipe(s) to clear the lowered invert of RD1000 L Drain. The RD1000 standards require that pipes under drainage laterals be installed with a minimum of 5 feet of cover from top of culvert to the bottom of ditch. As the standard cover includes an allowance for future deepening, the cover may be reduced to not less than 5 feet below finish grade of the ditch bottom for this application.

The on-site system is a closed system that only experiences external influences during larger storm events like (i.e. the 100-year event). The 10-year system HGL has been preliminarily examined. It is significantly lower than 100-year levels. Based on this fact, the 10-year system and modeling has been assumed fairly straight-forward, and has not been performed with this analysis, but will be performed and detailed when the future design-level grading and drainage study is prepared for the Project. The opportunity for the on-site drainage system to be connected to the basins is also very flexible given the perimeter system of detention basins located within the Project.

The approximate volumes for pre-project and post-project detention are presented below in **Table 1**:

Table 3
Approximate Volumes for Pre-project and Post-project Detention

Property Owner	Acreage	Pre-Project Acreage Within 100-Year Floodplain	Pre-Project Max. Water Volume Stored During 100-year Event (ac-ft)	Post-Project Max Water Volume Stored During 100-year Event (ac-ft)
North Pointe AKT	353.5	308.8	174.6	362.3
Cayocca*	64.3	37.1	18.4	75.0
Campbell*	6.5	6.5	3.5	1.8
Isgur*	4.6	4.6	2.5	1.3
Patel*	0.7	0.3	0.3	0.2
Caltrans Remnant*	6.9	6.8	3.7	1.9
Total	436.5	364.1	203.0	442.5

Note: Some of the maximum water volumes reported in the table above were obtained by dividing model results by property owner boundaries, rather than watershed and/or development boundaries. An area weighting method was used to aggregate and divide post-project storage volume on a property owner basis for the Campbell, Isgur and Patel properties that share a single detention basin.
**At the time of this study, preliminary on-site grading has not been assessed. Detention volumes are preliminary.*

The table above provides a preliminary breakdown of pre-project and post-project flood storage and could be used as the basis for allocating costs and cost-sharing agreements for the implementation of any shared facilities.

B. Post-Project On-Site Grading

Post-project development is shown on **Exhibit C**. As stated previously, the site must be raised in order to bring the developed (buildable) areas of the site above the existing 100-year floodplain. The grading is, therefore, an important aspect of the site design.

Preliminary project grades were input into the grading model for the project. **Exhibit J** (Earthwork Cut-Fill Diagram) identifies general finished grades and pad grades for the industrial warehouse areas of the Project and preliminary grading volumes.

Exhibit K provides a grading cross-section that illustrates the relationship between the 100-year WS in the off-site RD 1000 canals, the basin detention basins, public roadways, parking, and industrial warehouse building elevations. Based on the XPSWMM modeling included herein, the 100-year WS in the basins is at elevation 11.9 (COSD).

C. Post-Project Off-Site Drainage System

Based on the analysis described in the Hydraulic Modeling section below, there are no proposed improvements to the post-project off-site drainage system described above. It is assumed that the pre-project condition improvements have been completed as defined in the MAP CIP and Finance Plan. This has been confirmed with RD 1000 during their review of this study.

D. Future FEMA Mapping Revisions

The project is currently mapped within a FEMA floodplain, as shown on Exhibit D. Future development of the project will likely require a Conditional Letter of Map Revision (CLOMR) and a subsequent Letter of Map Revision (LOMR) to remove floodplain designations which inhibit development. It is anticipated that the Zone A floodplain will be modified using the RD1000 modeling for interior drainage, prior to the regional Zone A99 designation being removed (after all levee improvements are constructed). Wood Rodgers assumes that RD1000 will allow and support submittal of its modeling for such a purpose.

V. Hydraulic Modeling

The revised RD 1000 modeling has been provided with the submittal of this Report to the City of Sacramento Department of Utilities (DOU) and RD 1000. A schematic diagram of the XPSWMM model nodes and links in the vicinity of the Project area is shown on **Exhibit L**. Pertinent input and output data has been included as **Exhibit M**. As stated previously, the design storm for the original model provided to Wood Rodgers by RD 1000 is the 100-year 10-day event. Therefore, all references to the 100-year storm herein are in reference to the 100-year 10-day event.

In order to identify the pre-project conditions, including storage utilized within the Project area in the 100-year storm, modifications to the original model sent from RD 1000 were made to include new detailed topographic and other information known for this specific area of the Natomas Basin. The changes to the original model are summarized as follows:

1. Incorporate all improvements to the RD 1000 system listed in the MAP Finance Plan dated 2020 that are outlined above with the corrected pumping increase at Pumping Plant 3. This is with the exception of the additional twin 78″ culverts under I-5.
2. The existing conditions Project area is modeled as two storage nodes. Based on the detailed site topography (City of Sacramento Datum) that was flown on October 12, 2021, the storage curves are updated.
3. The links that connect the Project area storage nodes to the RD1000 L Drain and West Drainage Canal confluence are simplified to 1,000′-long, 50′--wide rectangular conduits within the original model. The invert elevations of the rectangular conduits were modified to reflect the latest topography.
4. The North Lake project (formerly Greenbriar) has also been incorporated into the baseline condition, north of I-5, as a single developed watershed with a single detention basin and outlet connection to the RD1000 system.

No changes were made to the hydrology in the model to reflect pre-project (baseline) conditions. The original model hydrology was calibrated to the 1986 storm event by Mead& Hunt (formerly Ensign & Buckley) and is incorporated in the November 2021 model.

When comparing storage curves from the original model and the storage curves developed from the latest topography, the original model sent by RD 1000 estimated more storage capacity within the Project area. As a result of correcting existing storage, the WS within the West Drainage Canal and RD1000 L Drain increased approximately 0.4′ under baseline conditions. The changes in maximum WS from the original model to the pre-project conditions model are summarized in Table 2 below:

Table 4
Changes in Maximum Water Surface from Original Model to Pre-project Conditions Model

		COSD		NAVD 88	
Location Description	**Model Node Name**	**Original Model WS (feet)**	**Pre-Project Model WS (feet)**	**Original Model WS (feet)**	**Pre-Project Model WS (feet)**
Western Portion of Development Storage Node	1132	11.638	12.201	13.619	14.182
Eastern Development Storage Node	11215	11.825	12.209	13.806	14.19
RD1000 L Drain – Downstream of I-5	11536	11.481	12.579	13.462	14.56
RD1000 L Drain and West Drainage Canal Confluence	167	11.673	12.198	13.654	14.179
West Drainage Canal and Reach 6 Confluence	1103	11.812	12.219	13.793	14.2
West Drainage Canal – Node to Connect Western Development and West Drainage Canal	166	11.695	12.198	13.676	14.179
West Drainage Canal Upstream of Del Paso Road	11013	11.566	12.071	13.547	14.052

To represent the post-project conditions within the hydraulics model, the following changes were made to the pre-project model (See Model Output **Exhibit M**):

1. Storage curves were modified based on the proposed grading for the AKT (NorthPoint) and JTS Property Management (NorthPoint) (JTS) portions of the development. For the Cayocca property, the grading has not been designed yet. To estimate a conceptual storage curve, a parking lot area was assumed based on the percent parking area of the total area for the NorthPoint/AKT (Parcels 1-5) development area. A square detention basin with a bottom elevation of 3.0 (COSD) was estimated to represent the area of detention required to replace the pre-project storage under the 100-year water surface. The upper 0.9′

feet of storage was allowed to spread out over the estimated area of the parking lot (similar to the layout for AKT/JTS, NorthPoint).

2. The new storage node was added to represent the portion of eastern development to the north separately from the conceptual design of Cayocca (Parcel 8).
3. All proposed storage nodes were connected with a 24" pipe at the invert of each storage node to allow for drainage to the proposed pump station. Each pipe includes a proposed flap gate to prevent flow from backfilling between development areas.
4. A proposed new pump was added to discharge all development drainage to RD1000 L Drain. As stated above, the new pump capacity is 35 cfs, using two 17.5 cfs pumps. A new node was added to RD1000 L Drain to accommodate the new pump injection.
5. The weir spill to Cayocca (Parcel 8) was relocated from the RD1000 L Drain and West Drainage Canal confluence to a point further upstream along RD1000 L Drain. A new node was added to RD1000 L Drain to accommodate the weir flow relocation.

In a pre-project conditions model, the soils within the Project area have extremely low infiltration (0.0031 inch/hour), based on the calibration performed by others. Adding imperviousness due to development will not substantially increase runoff volumes, however, the timing of runoff entering detention can be accelerated through paved (impervious) areas of development. Therefore, at the request of RD1000, changes to the pre-project hydrology were made to represent the post-project hydrology by modifying the percentage of impervious coverage to levels consistent with industrial development land uses. It is anticipated that the very large onsite detention volumes and metered pumping will offset the impacts felt within the RD1000 system for developed conditions.

After incorporating the changes listed above into the XPSWMM model, all WS within the RD 1000 system upstream and downstream of the Project are at or below pre-project WS. A list of key locations of WS, with comparisons at some locations, are as follows:

Table 5
Water Surface at Key Locations

		COSD		NAVD 88	
Location Description	**Model Node Name**	**Pre-Project Model WSE (feet)**	**Post-Project Model WSE (feet)**	**Pre-Project Model WSE (feet)**	**Post-Project Model WSE (feet)**
Western Development Storage Node	1132	12.201	11.86	14.182	13.841
Northern Portion of Eastern Development Storage Node	Proposed Development	-	11.903	-	13.884
Patel, Isgur, Campbell and Caltrans Remnant	Node317	-	11.861	-	13.842
Cayocca Storage Node	11215	12.209	12.052	14.19	14.033
RD1000 L Drain – Downstream of I-5	11536	12.579	12.353	14.56	14.334

RD1000 L Drain – New Node to Connect New Pump to RD1000 L Drain	Node316	-	12.071	-	14.052
RD1000 L Drain – New Node to Connect Eastern Development to RD1000 L Drain	Node314	-	12.066	-	14.047
RD1000 L Drain and West Drainage Canal Confluence	167	12.198	11.986	14.179	13.967
West Drainage Canal and Reach 6 Confluence	1103	12.219	12.018	14.2	14.002
West Drainage Canal – Node to Connect Western Development and West Drainage Canal	166	12.198	11.972	14.179	13.953
West Drainage Canal – Upstream of Del Paso Road	11013	12.071	11.878	14.052	13.862

It is worth noting that peak flows within the West Drainage Canal downstream of the RD1000 L Drain and West Drainage Canal confluence decrease slightly from pre-project to post-project, from 465.5 cfs to 461.7 cfs. Water surface elevations within the short connecting channel just upstream of Pumping Plant No. 3 also decrease from 13.789′ to 13.764′. Water surface elevations within the channel just upstream of Pumping Plant No. 5 decrease from 14.589′ to 14.550′.

The results from the post-project evaluations indicate that there is some conservatism in the proposed facilities for achieving flood mitigation. The post project condition provides more storage than is required, pumping 35 cfs into the RD1000 system with no impact, while maintaining peak onsite water surface elevations below the RD1000 channel system peak water surfaces, which overflow into onsite detention. Wood Rodgers did not perform an exhaustive evaluation to determine the exact peak pumping rate that would create an increase in the RD1000 system, but pumping may be determined to exceed 35 cfs during final design, making the onsite detention system operate even more effectively. This could potentially allow for a smaller detention volume after final design features, such as inlet/outlet access ramps and encroachments, are fully accounted for during the improvement plan process.

Through rigorous hydrologic and hydraulic analysis RD1000 has established that the worst case 100-year flooding in the RD1000 system occurs during a 10-day duration storm event. It is important to recognize that different parts of the system may behave differently under shorter duration rainfall conditions. At the request of the City of Sacramento Department of Utilities, Wood Rodgers applied the 100-year 24-hour rainfall hyetograph to the RD1000 system model from this study, reflecting proposed onsite conditions for the Airport South Industrial project. The purpose of running this hydrologic scenario was to verify that the higher intensity rainfall patterns occurring in a 24-hour duration storm will not produce a higher onsite peak condition in the detention basin system. While the RD1000 system still produces elevated channel levels high enough to spill into the Airport South Industrial site during the 100-year 24-hour event, the resulting peak stage in the proposed onsite detention basin is 11.2 feet (NAVD88), which is more than 2.6 feet lower than the peak stage during the 10-day duration. Wood Rodgers understands that both the 100-year 10-day and 24-hour durations should be checked in all subsequent analysis efforts to confirm which scenario produces the highest onsite conditions.

A. Hydromodification

The Project site is located within an undesignated area of Sacramento County regarding the application of hydromodification measures. It is anticipated that the drainage from the Project, being detained and pumped into RD 1000's urban channel system before being pumped again into the Sacramento River, will be considered exempt by the City of Sacramento.

B. Low Impact Development and Storm Water Quality

All new projects must follow the requirements found in the Storm Water Quality Design Manual (SWQDM) dated July 2018 with respect to Low Impact Development (LID) and storm water quality treatment design measures. Both of these types of facilities can impact site layout given the area/footprint requirements they can include. The SWQDM provides two spreadsheet templates for calculating credits for proposed LID measures for a given project area based on proposed commercial and residential land uses. Airport South Industrial would be classified as a commercial land use under this manual's requirements. A preliminary draft spreadsheet is provided in **Exhibit N**.

The results from the preliminary LID calculations show that approximately 26.4 acres of amended soils are required for the Project to meet the requirement of 100 credits. The preliminary estimated landscaped areas of the Project site (shown on Exhibit K) are approximately 56 acres and far exceed the required area and should provide sufficient space to accommodate this requirement.

With the addition of 26.4 acres, there is a residual water quality treatment volume of 8.04 acre-feet, which can be easily configured into the final detention basin and pump station configuration during design, potentially with an additional low flow pump. The integrated operation of storm water quality treatment volume with flood storage

By 2030, communities that are permitted through the State Water Resources Control Board (SWRCB) for storm water quality must comply with the recent trash amendments. All trash that is 5 millimeters in diameter or larger must be captured and removed from storm water prior to storm water being discharged into natural or constructed waterways. The SWRCB maintains a list of certified full capture systems that are acceptable for meeting their requirements, which generally includes Bio-retention Systems, Capture and Use Systems, Detention Basins, Infiltrations Trenches or Basins, and Media Filters. The City and the project proponent(s) will work cooperatively to determine the best method(s) for meeting the state's requirements while also satisfying local concerns during the entitlement process.

Note that other LID measures may be examined and incorporated with the future design-level Drainage Study prepared for the Project.

C. CA SB 5 and 200-Year Analysis

By separate Memorandum to the City DOU, Wood Rodgers has provided documentation of the potential need for additional analysis of the 200-year flood protection. This 200-year analysis is a result of the passage of the Central Valley Flood Protection Act of 2008 enacted by Senate Bill 5 in 2007. The California Department of Water Resources (DWR) developed criteria for determining when the Urban Level of Flood Protection (ULOP) applies to a proposed project. Applying the State's criteria and definitions, Wood Rodgers concluded that the Airport South Industrial project is exempt from 200-year flood protection design and can proceed with a submittal of the project for consideration by the City of

Sacramento evaluating 100-year flooding conditions and following standard 100-year flood protection requirements.

VI. Design-Level Considerations and RD 1000 Canal Setbacks

The City of Sacramento and RD 1000 have provided comments since the original submittal of this study in August 2022. Comments have included to H & H modeling and refinements, details of the detention basins, access road requirements, pump station requirements, low flow channel and piping, public system requirements (including operations and maintenance), and proposed setbacks of the detention basin from the RD 1000 canals and ditches.

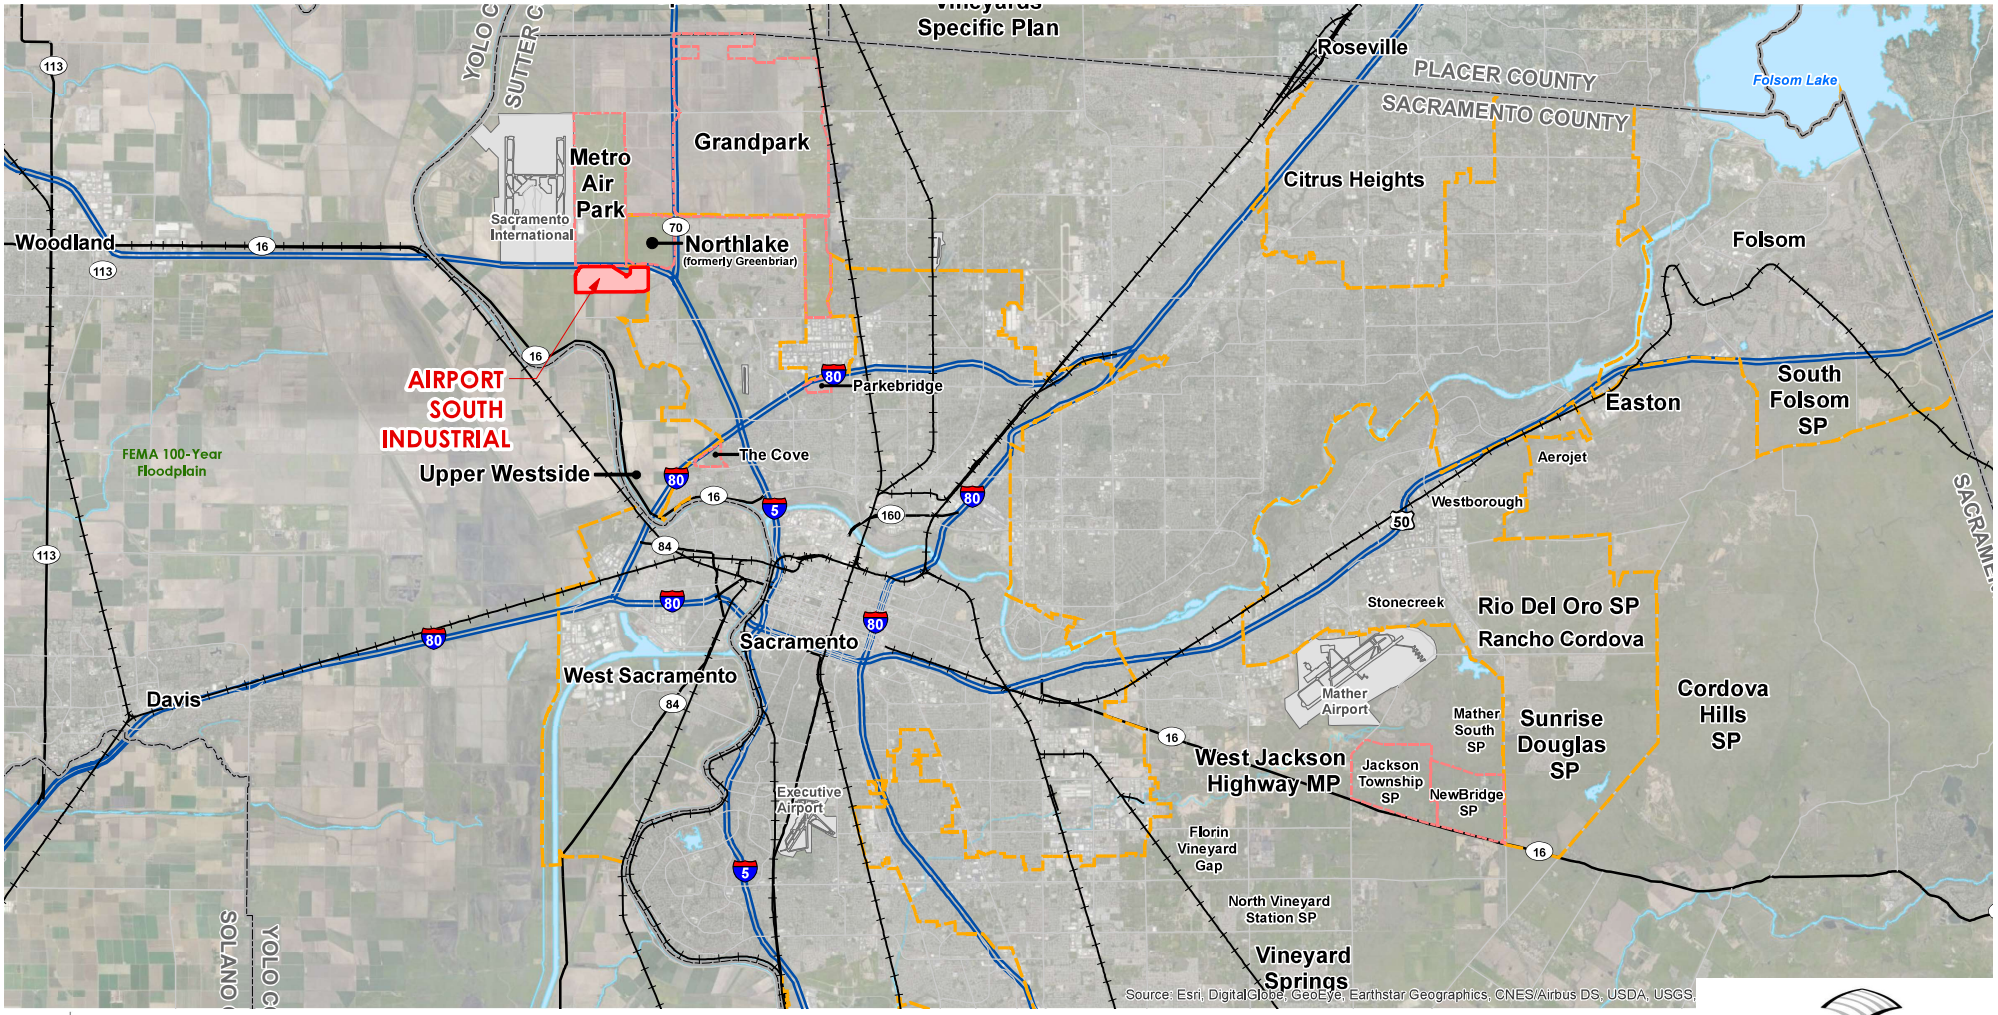

Exhibit K (K.1 and K.2) includes the Schematic design provided as part of this study. While Exhibit K does provide the general drainage design aspects, additional detail will be developed with the design-level study performed post-entitlements. The design-level study will be consistent with future site plan development and refinement, and will occur prior to, or during, preparation of the backbone Common Drainage Improvement Plans for the project.

With design development of the drainage system, both the City of Sacramento and RD 1000 have expressed a need for flexibility in the development of the proposed setback between the RD 1000 canals and ditches and the proposed detention basins. This setback may be increased (or decreased) based on additional details that will be developed in the future. The current setback from the L-Drain and West Drainage Canal has been identified at 90-feet wide. At a minimum, the development of the future canal / detention Basin setback details will be dependent upon the following:

1. Proposed USACE enhancements to the West Drainage Canal. This is part of the mitigation strategy for the perimeter levee improvements in the Natomas Basin.
2. Final recommended improvements to the L Drain through the project site.
3. Specific RD 1000 canal sideslope improvements and potential widening and deepening. This includes the MAP requirements for deepening and widening the north-south L-drain through the project and culvert improvements at Power Line Road, etc. RD 1000 has commented that the minimum sideslope for canals and ditches is 3:1.
4. Allowances for access roads and spoil areas for RD 1000 and the City of Sacramento.
5. Geotechnical analysis that will provide design parameters for separation of the Detention Basin from the Canal to mitigate potential seepage and stability issues.
6. Potential strategies to address endangered species, in particular the GGS.
7. Preparation of the drainage pump station design-report. This report will include the pipe connections from the easterly basins under the RD 1000 L Drain.
8. Other final design-level drainage study and improvement plan details.

The Applicant Team expects to receive Conditions of Approval (COA's) with the current entitlements from the City DOU and RD 1000. These COA's may also address the steps to provide future details and to determine the final proposed buffer (including RD 1000 easements) separating the RD 1000 Canals, the project detention, and developed lands.

G. OFF-SITE DRAINAGE FACILITIES

1. Introduction and Background

The purpose of this section of the report is to identify the proposed off-site drainage facility improvements and the Airport/Natomas Central Mutual Water Company (NCMWC) irrigation pump for the Metro Air Park Special Planning Area. The costs, as developed herein, are based on the off-site drainage improvements identified on the Off-Site Drainage Improvements exhibit D-2. The improvements for offsite drainage south of the plan area include upgrading Pump Station No. 3; widening, deepening and flattening the side slopes for canal Reach 8; replacing existing culverts at the Reach 4/5 confluence, Power Line Road/West Drain Canal, Del Paso Road/West Drain Canal, inlet to Pumping Plant No. 3/Fishermans Lake; and adding culverts at I-5/Reach 8.

2. Existing Facilities

The existing drainage facilities are shown on exhibit D-2 at the end of this section of the report. All existing off-site drainage facilities will be improved as described in each project description.

3. Proposed Off-Site Drainage Facilities

The off-site drainage improvements are based on maintaining the pre-project stages of all drainage facilities downstream from the project. This will be accomplished by detaining 50% of the increase in on-site project flows and improving Reach 8, and replacing and upsizing some existing culverts as identified in Exhibit D-2. Pump Station No. 3, which will convey project flows to the Sacramento River, has been reconstructed with a new parallel outfall to the Sacramento River with a total capacity of 280 CFS. See the On-Site Facilities section of this report for a description of the on-site improvements.

Currently, a portion of the project drains to the southwest through box culverts under I-5 near the Power Line Road intersection. Since the existing ground at this location is below the 100-year water surface elevation, the project will be isolated from canal Reach No. 6 which also drains the SIA. The project flows will be directed to the southeast corner of the project to be discharged by the on-site pump station into Reach No. 8. The project flows will be limited to 80 cfs in the initial project phase in order to maintain existing stages off-site. Improvements to off-site culverts at Power Line Road/West Drain Canal, Reach 4/5 intersection and Del Paso Road/West Drain Canal, replacement of existing culvert at Fishermans Lake/Pump Station No. 3 inlet, are proposed as future phase improvements.

The off-site drainage improvements will be phased based on the need to increase discharge capacity of the on-site pump station. The initial Phase project(s) will discharge at a rate not to exceed 80 cfs, which is sufficient capacity for approximately a 30% level of development of MAP. Based on this premise, the off-site drainage improvements for the southern shed will be phased as follows:

Phase 1A

1. Fair Share Contribution – Pump #3
2. Airport/NCMWC Irrigation Pump.
3. Box Culvert and add 50 cfs pump.

Phase 1C

1. No offsite drainage improvements proposed

Phase 2

1. Upsize culverts at Del Paso Road and West Drain Canal.
2. Upsize culverts at Power Line Road and West Drain Canal.
3. Upsize culverts at the Reach 4/5 confluence.

Phase 3

1. Widen and deepen Reach No. 8 including right-of-way acquisition and two new culverts under I-5.

4. Proposed Off-Site Drainage Projects

Airport/NCMWC Irrigation Pump

RD1000-8 (Phase 1A) Install an irrigation pump and drainage ditch south of I-5 on the airport property.

(Initial Bond)

Del Paso Road Culvert

RD1000-1 (Phase 2) Replace and upsize culverts at Del Paso Road and West Drain Canal

(Fee @ 20% development)

Power Line Road Canal

RD1000-2 (Phase 2) Replace and upsize culverts at Power Line Road and Canal Reach 5/7

(Fee @ 20% development)

Canal Reach 4/5 Culverts

RD1000-3 (Phase 2) Replace and upsize culverts between canal Reach No. 5 and Canal Reach No. 4

(Fee @ 20% development)

Pump Station No. 3

RD1000-5 (Phase 1A) The RD-1000 Pump Station #3 has been reconstructed with a new parallel outfall to the Sacramento River with a total capacity of 280 CFS. The existing pumps will be utilized and an additional pump will be added.

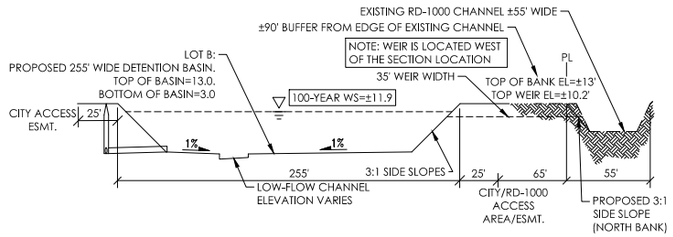
NOTES:



1. THIS EXHIBIT IDENTIFIES THE PROPOSED DETENTION BASINS, PROPOSED PUMP STATION LOCATION, GENERAL GRADING CROSS-SECTIONS AND OTHER RELATED DRAINAGE FACILITIES FOR PROJECT DEVELOPMENT.
2. THE DRAINAGE FACILITIES IDENTIFIED ARE PROPOSED IN ORDER TO MITIGATE IMPACTS TO THE EXISTING 100-YEAR FLOODPLAIN WITH SITE DEVELOPMENT.
3. THE ON-SITE 10-YEAR DRAINAGE SYSTEM AND THE ASSOCIATED CONNECTIONS TO THE DETENTION-RETENTION BASINS WILL BE DETAILED WITH FUTURE DESIGN.
4. ALL HATCHED LANDSCAPED AREAS ARE APPROXIMATE.
5. CITY & RD-1000 ACCESS AREAS, ROADS AND BUFFERS FROM EXISTING RD-1000 CANALS AND DITCHES ARE TBD WITH THE FUTURE DESIGN-LEVEL DRAINAGE STUDY.

ELEVATIONS REPORTED ARE IN REFERENCE TO THE CITY OF SACRAMENTO DATUM (COSD).

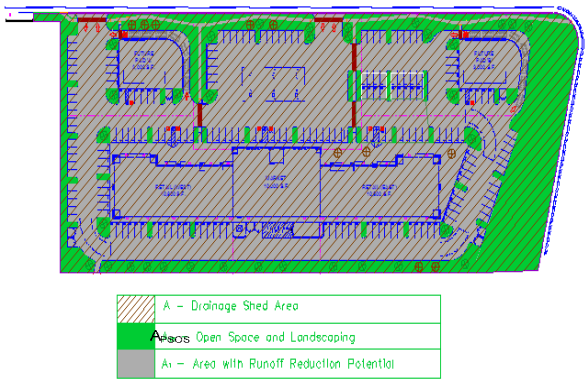
Exhibit N

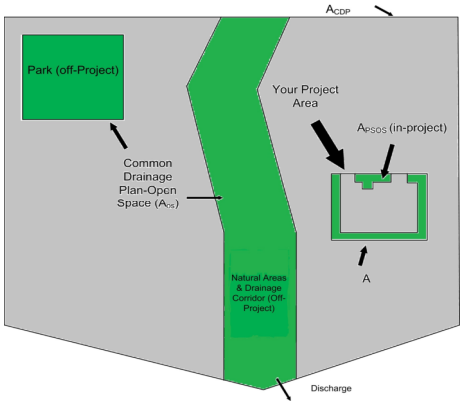
Appendix D-2: Commercial Sites: Low Impact Development (LID) Credits and Treatment BMP Sizing Calculations

Name of Drainage Shed:
Location of project: Sacramento

Fill in Blue Highlighted boxes



Step 1 - Open Space and Pervious Area Credits



Is your project within the drainage area of a common drainage plan that includes open space? If not, skip to 1 b.

1 a. Common Drainage Plan Area	0	acres	A_{CDP}	
Common Drainage Plan Open Space (Off-project)	0	acres	A_{OS}	**see area example below**
a. Natural storage reservoirs and drainage corridors	0	acres		
b. Buffer zones for natural water bodies	0	acres		
c. Natural areas including existing trees, other vegetation, and soil	0	acres		
d. Common landscape area/park	0	acres		
e. Regional Flood Control/Drainage basins	0	acres		
1 b. Project Drainage Shed Area (Total)	433.50	acres	A	
Project-Specific Open Space (In-project, communal)**	131.10	acres	A_{PSOS}	
a. Natural storage reservoirs and drainage corridors	5.50	acres		
b. Buffer zones for natural water bodies	1.20	acres		
c. Natural areas including existing trees, other vegetation, and soil	0.00	acres		**see area example below**
d. Landscape area/park	27.80	acres		
e. Flood Control/Drainage basins	96.60	acres		
Area with Runoff Reduction Potential	$A - A_{PSOS}$ = 302.40	acres	A_T	
Assumed Initial Impervious Fraction	A_T / A = 0.70		I	

** Doesn't include impervious areas within individual lots and surrounding individual units. That is accounted for below using Form D-1a in Step 2.

Open Space & Pervious Area LID Credit (Step 1)
$(A_{OS}/A_{CDP}+A_{PSOS}/A)x100$ = 30 pts

Step 2 - Runoff Reduction Credits

Runoff Reduction Treatments	Impervious Area Managed			Efficiency Factor		Effective Area Managed (A_C)	
Porous Pavement:							
Option 1: Porous Pavement (see Fact Sheet, excludes porous pavement used in Option 2)	0	acres	x		=	0.000	acres
Option 2: Disconnected Pavement (see Fact Sheet, excludes porous pavement used in Option 1)	use Form D-2a for credits →					0.00	acres
Landscaping used to Disconnect Pavement (see Fact Sheet)	0.0000	acres			=	0.00	acres
Disconnected Roof Drains (see Fact Sheet and/or Table D-2b for summary of requirements)	0	acres			=	0.00	acres
Ecoroof (see Fact Sheet)	0	acres			=	0.00	acres
Interceptor Trees (see Fact Sheet)	use Form D-2b for credits →					0.00	acres
Total Effective Area Managed by Runoff Reduction Measures				A_C		0.00	acres
Runoff Reduction Credit (Step 2)				$(A_C / A_T)*100$ =		0	pts

Table D-2a

Porous Pavement Type	Efficiency Multiplier
Cobblestone Block Pavement	0.40
Pervious Concrete/Asphalt	0.60
Modular Block Pavement &	0.75
Reinforced Grass Pavement	1.00

Table D-2b

Maximum roof size	Minimum travel distance
≤ 3,500 sq ft	21 ft
≤ 5,000 sq ft	24 ft
≤ 7,500 sq ft	28 ft
≤ 10,000 sq ft	32 ft

Form D-2a: Disconnected Pavement Worksheet

See Fact Sheet for more information regarding Disconnected Pavement credit guidelines

Effective Area Managed (A_C)

Pavement Draining to Porous Pavement

2. Enter area draining onto Porous Pavement	0.00	acres	Box K1
3. Enter area of Receiving Porous Pavement (excludes area entered in Step 2 under Porous Pavement)	0.00	acres	Box K2
4. Ratio of Areas (Box K1 / Box K2)	0.00		Box K3

5. Select multiplier using ratio from Box K3 and enter into Box K4

Ratio (Box D)	Multiplier
Ratio is ≤ 0.5	1.00
Ratio is > 0.5 and < 1.0	0.83
Ratio is > 1.0 and < 1.5	0.71
Ratio is > 1.5 and < 2.0	0.55

	1		Box K4
6. Enter Efficiency of Porous Pavement (see table below)			Box K5

Porous Pavement Type	Efficiency Multiplier
Cobblestone Block Pavement	0.40
Pervious Concrete Asphalt Pavement	0.60
Modular Block Pavement Porous Gravel Pavement	0.75
Reinforced Grass Pavement	1.00

7. Multiply Box K2 by Box K5 and enter into Box K6	0.00	acres	Box K6
8. Multiply Boxes K1,K4, and K5 and enter the result in Box K7	0.00	acres	Box K7
9. Add Box K6 to Box K7 and multiply by 60%, and enter the Result in Box K8 This is the amount of area credit to enter into the "Disconnected Pavement" Box of Form D-2			0.00 acres

Form D-2b: Interceptor Tree Worksheet

See Fact Sheet for more information regarding Interceptor Tree credit guidelines

New Evergreen Trees

1. Enter number of new evergreen trees that qualify as Interceptor Trees in Box L1.		trees	Box L1
2. Multiply Box L1 by 200 and enter result in Box L2	0	sq. ft.	Box L2

New Deciduous Trees

3. Enter number of new deciduous trees that qualify as Interceptor Trees in Box L3.		trees	Box L3
4. Multiply Box L3 by 100 and enter result in Box L4	0	sq. ft.	Box L4

Existing Tree Canopy

5. Enter square footage of existing tree canopy that qualifies as Existing Tree canopy in Box L5.	0	sq. ft.	Box L5
6. Multiply Box L5 by 0.5 and enter the result in Box L6	0	sq. ft.	Box L6

Total Interceptor Tree EAM Credits

Add Boxes L2, L4, and L6 and enter it into Box L7	0	sq. ft.	Box L7
Divide Box L7 by 43,560 and multiply by 20% to get effective area managed and enter result in Box L8 This is the amount of area credit to enter into the "Interceptor Trees" Box of Form D-2	0.00	acres	Box L8

Step 3 - Runoff Management Credits

Capture and Use Credits

Impervious Area Managed by Rain barrels, Cisterns, and automatically-emptied systems

(see Fact Sheet) | - | enter gallons, for simple rain barrels | 0.00 | acres

Automated-Control Capture and Use System

(see Fact Sheet, then enter impervious area managed by the system) | 0.00 | acres

Bioretention/Infiltration Credits

Impervious Area Managed by Bioretention BMPs

(see Fact Sheet)

Bioretention Area	-	sq ft	
Subdrain Elevation	12	inches	
Ponding Depth, inches	12	inches	0.00 acres

Impervious Area Managed by Infiltration BMPs

(see Fact Sheet)

Drawdown Time, hrs	12	drawdown_hrs_inf	
Soil Infiltration Rate, in/hr	0.50	soil_inf_rate	
Sizing Option 1: Capture Volume, acre-ft	0.00	capture_vol_inf	0.00 acres
Sizing Option 2: Infiltration BMP surface area, sq ft	0	soil_surface_area	0.00 acres
Basin or trench?		approximate BMP depth	0.50 ft

Impervious Area Managed by Amended Soil or Mulch Beds

(see Fact Sheet) | Mulched Infiltration Area, sq ft | 1,150,000 | mulch_area | 105.60 | acres

Total Effective Area Managed by Capture-and-Use/Bioretention/Infiltration BMPs | 105.60 | A_{LIDc}

Runoff Management Credit (Step 3) | A_{LIDC}/A_T*200 = | 69.8 | pts

Total LID Credits (Step 1+2+3) LID compliant, check for treatment sizing in Step 4 100.1

Does project require hydromodification management? If yes, proceed to using SacHM.

Adjusted Area for Flow-Based, Non-LID Treatment	$A_T - A_C - A_{LIDC}$ =	196.80	A_{AT}
Adjusted Impervious Fraction of A for Volume-Based, Non-LID Treatment	A_{AT} / A =	0.45	I_A

Further treatment is required, see choose flow-based or volume-based sizing in Step 4

Step 4a Treatment - Flow-Based (Rational Method)

Calculate treatment flow (cfs): Flow = Runoff Coefficient x Rainfall Intensity x Area

Look up value for i in Table D-2c (Rainfall Intensity)	0.18	i
Obtain A_{AT} from Step 3	196.80	A_{AT}
Use C = 0.95	0.95	C
Flow = 0.95 * i * A_{AT}	33.65	cfs

Table D-2c

Rainfall Intensity		
Roseville	i =	0.20 in/hr
Sacramento	i =	0.18 in/hr
Folsom	i =	0.20 in/hr

Step 4b Treatment - Volume-Based (ASCE-WEF)

Calculate water quality volume (Acre-Feet): WQV = Area x Maximized Detention Volume (P_0)

Obtain A from Step 1	433.50	A	12 hrs	Specified Draw Down time
Obtain P_0: Maximized Detention Volume from figures E-1 to E-4 in Appendix E of this manual using I_A from Step 2.	0.22	P_0		
Calculate treatment volume (acre-ft): **Treatment volume = A x (P_0 / 12)**	8.04	Acre-Feet

INTRODUCTION

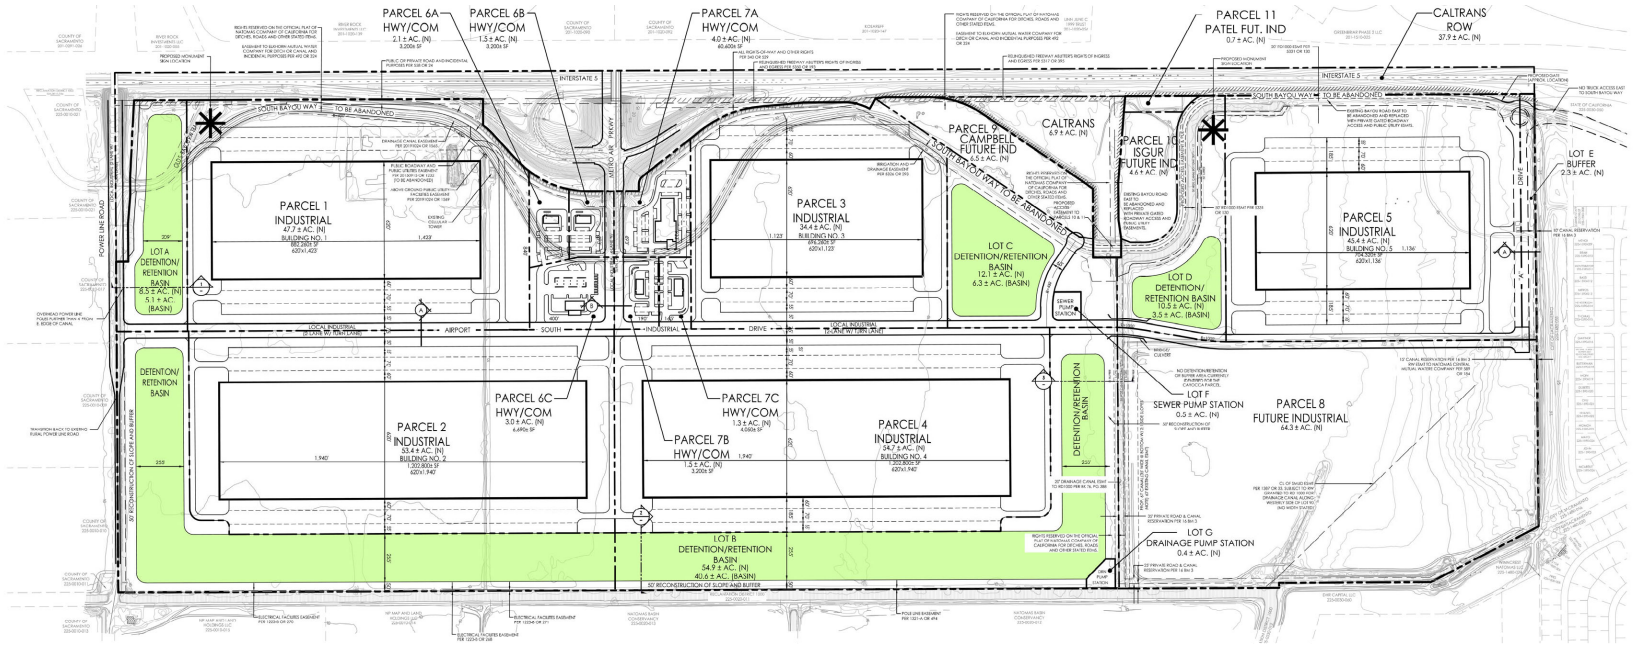
The Airport S. Industrial Park project proposes the annexation of an undeveloped site by the City of Sacramento, including the development of industrial uses and retail/highway commercial uses within an approximately 354-acre portion of the project site. The project is located south of Interstate 5 (I-5) in the City of Sacramento, California.

Surrounding land uses include single family residential uses to the south and east of the project site. While the project is located within the boundaries of the City of Sacramento, some adjacent sensitive receptors are located within of the County boundaries.

Figure 1 shows the project site plan. **Figure 2** shows an aerial photo of the project site.

ENVIRONMENTAL SETTING

BACKGROUND INFORMATION ON NOISE

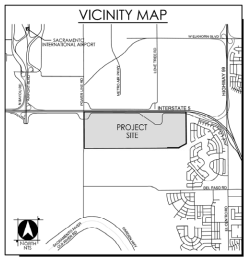


Fundamentals of Acoustics

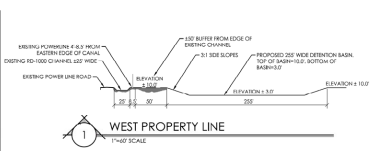
Acoustics is the science of sound. Sound may be thought of as mechanical energy of a vibrating object transmitted by pressure waves through a medium to human (or animal) ears. If the pressure variations occur frequently enough (at least 20 times per second), then they can be heard and are called sound. The number of pressure variations per second is called the frequency of sound, and is expressed as cycles per second or Hertz (Hz).

Noise is a subjective reaction to different types of sounds. Noise is typically defined as (airborne) sound that is loud, unpleasant, unexpected or undesired, and may therefore be classified as a more specific group of sounds. Perceptions of sound and noise are highly subjective from person to person.

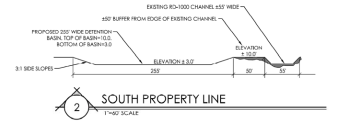
Measuring sound directly in terms of pressure would require a very large and awkward range of numbers. To avoid this, the decibel scale was devised. The decibel scale uses the hearing threshold (20 micropascals), as a point of reference, defined as 0 dB. Other sound pressures are then compared to this reference pressure, and the logarithm is taken to keep the numbers in a practical range. The decibel scale allows a million-fold increase in pressure to be expressed as 120 dB, and changes in levels (dB) correspond closely to human perception of relative loudness.



The perceived loudness of sounds is dependent upon many factors, including sound pressure level and frequency content. However, within the usual range of environmental noise levels, perception of loudness is relatively predictable, and can be approximated by A-weighted sound levels. There is a strong correlation between A-weighted sound levels (expressed as dBA) and the way the human ear perceives sound. For this reason, the A-weighted sound level has become the standard tool of environmental noise assessment.



LAND USE SUMMARY



Site Plan Lot Number	Land Owner	Proposed Land Use	GP Designation	Zone	Net Acreage	Bldg SF	Floor Area Ratio (FAR)	FAR Calc'd or Used for SF Est	Use for Est. Bldg SF

Acoustics · Noise · Vibration

The decibel scale is logarithmic, not linear. In other words, two sound levels 10-dB apart differ in acoustic energy by a factor of 10. When the standard logarithmic decibel is A-weighted, an increase of 10-dBA is generally perceived as a doubling in loudness. For example, a 70-dBA sound is half as loud as an 80-dBA sound, and twice as loud as a 60 dBA sound.

Community noise is commonly described in terms of the ambient noise level, which is defined as the all-encompassing noise level associated with a given environment. A common statistical tool is the average, or equivalent, sound level (L_{eq}), which corresponds to a steady-state A weighted sound level containing the same total energy as a time varying signal over a given time period (usually one hour). The L_{eq} is the foundation of the composite noise descriptor, L_{dn}, and shows very good correlation with community response to noise.

The day/night average level (DNL or L_{dn}) is based upon the average noise level over a 24-hour day, with a +10-decibel weighing applied to noise occurring during nighttime (10:00 p.m. to 7:00 a.m.) hours. The nighttime penalty is based upon the assumption that people react to nighttime noise exposures as though they were twice as loud as daytime exposures. Because L_{dn} represents a 24-hour average, it tends to disguise short-term variations in the noise environment.

Table 1 lists several examples of the noise levels associated with common situations. **Appendix A** provides a summary of acoustical terms used in this report.

TABLE 1: TYPICAL NOISE LEVELS

Common Outdoor Activities	Noise Level (dBA)	Common Indoor Activities
	--110--	Rock Band
Jet Fly-over at 300 m (1,000 ft.)	--100--	
Gas Lawn Mower at 1 m (3 ft.)	--90--	
Diesel Truck at 15 m (50 ft.), at 80 km/hr. (50 mph)	--80--	Food Blender at 1 m (3 ft.) Garbage Disposal at 1 m (3 ft.)
Noisy Urban Area, Daytime Gas Lawn Mower, 30 m (100 ft.)	--70--	Vacuum Cleaner at 3 m (10 ft.)
Commercial Area Heavy Traffic at 90 m (300 ft.)	--60--	Normal Speech at 1 m (3 ft.)

Effects of Noise on People

The effects of noise on people can be placed in three categories:

- Subjective effects of annoyance, nuisance, and dissatisfaction
- Interference with activities such as speech, sleep, and learning
- Physiological effects such as hearing loss or sudden startling

Environmental noise typically produces effects in the first two categories. Workers in industrial plants can experience noise in the last category. There is no completely satisfactory way to measure the subjective effects of noise or the corresponding reactions of annoyance and dissatisfaction. A wide variation in individual thresholds of annoyance exists and different tolerances to noise tend to develop based on an individual's past experiences with noise.

Thus, an important way of predicting a human reaction to a new noise environment is the way it compares to the existing environment to which one has adapted: the so-called ambient noise level. In general, the more a new noise exceeds the previously existing ambient noise level, the less acceptable the new noise will be judged by those hearing it.

With regard to increases in A-weighted noise level, the following relationships occur:

- Except in carefully controlled laboratory experiments, a change of 1-dBA cannot be perceived;
- Outside of the laboratory, a 3-dBA change is considered a just-perceivable difference;
- A change in level of at least 5-dBA is required before any noticeable change in human response would be expected; and
- A 10-dBA change is subjectively heard as approximately a doubling in loudness, and can cause an adverse response.

Stationary point sources of noise – including stationary mobile sources such as idling vehicles – attenuate (lessen) at a rate of approximately 6-dB per doubling of distance from the source, depending on environmental conditions (i.e. atmospheric conditions and either vegetative or manufactured noise barriers, etc.). Widely distributed noises, such as a large industrial facility spread over many acres, or a street with moving vehicles, would typically attenuate at a lower rate.

EXISTING AND FUTURE NOISE AND VIBRATION ENVIRONMENTS

EXISTING NOISE RECEPTORS

The existing noise environment in the project area is defined primarily by traffic on Interstate 5 and the Sacramento International Airport.

Some land uses are considered more sensitive to noise than others. Land uses often associated with sensitive receptors generally include residences, schools, libraries, hospitals, and passive recreational areas. Sensitive noise receptors may also include threatened or endangered noise sensitive biological species, although many jurisdictions have not adopted noise standards for wildlife areas. Noise sensitive land uses are typically given special attention in order to achieve protection from excessive noise.

Sensitivity is a function of noise exposure (in terms of both exposure duration and insulation from noise) and the types of activities involved. In the vicinity of the project site, sensitive land uses include existing single-family residential uses located east and south of the project site.

EXISTING GENERAL AMBIENT NOISE LEVELS

To quantify the existing ambient noise environment in the project vicinity, Saxelby Acoustics conducted continuous (24-hr.) noise level measurements at four locations around the project site. Noise measurement locations are shown on **Figure 2**. A summary of the noise level measurement survey results is provided in **Table 2**. **Appendix B** contains the complete results of the noise monitoring.

The sound level meters were programmed to record the maximum, median, and average noise levels at each site during the survey. The maximum value, denoted L_{max}, represents the highest noise level measured. The average value, denoted L_{eq}, represents the energy average of all of the noise received by the sound level meter microphone during the monitoring period. The median value, denoted L_{50}, represents the sound level exceeded 50 percent of the time during the monitoring period.

Larson Davis Laboratories (LDL) model 820 precision integrating sound level meters were used for the ambient noise level measurement survey. The meters were calibrated before and after use with a CAL 200 acoustical calibrator to ensure the accuracy of the measurements. The equipment used meets all pertinent specifications of the American National Standards Institute for Type 1 sound level meters (ANSI S1.4).

TABLE 2: SUMMARY OF EXISTING BACKGROUND NOISE MEASUREMENT DATA

EVALUATION OF TRANSPORTATION NOISE SOURCES ON THE PROJECT SITE

Sacramento International Airport Noise

The Sacramento International Airport is located approximately 1.6 miles north of the project site and aircraft overflights were observed during visits to the project site. The site is generally located within the 60-65 dBA CNEL airport noise contours. **Figure 3** shows the noise contours for the airport as published in the Sacramento County General Plan.

FUTURE TRAFFIC NOISE ENVIRONMENT AT OFF-SITE RECEPTORS

Off-Site Traffic Noise Impact Assessment Methodology

To assess noise impacts due to project-related traffic increases on the local roadway network, traffic noise levels are predicted at sensitive receptors for project and no-project conditions.

Baseline, Baseline Plus Project, Cumulative, and Cumulative Plus Project traffic noise levels are calculated using the Federal Highway Administration Highway Traffic Noise Prediction Model (FHWA RD-77-108). The model is based upon the Calveno reference noise factors for automobiles, medium trucks and heavy trucks, with consideration given to vehicle volume, speed, roadway configuration, distance to the receiver, and the acoustical characteristics of the site.

The FHWA model was developed to predict hourly L_{eq} values for free-flowing traffic conditions. To predict traffic noise levels in terms of L_{dn}, it is necessary to adjust the input volume to account for the day/night distribution of traffic.

Project trip generation volumes were provided by the project traffic engineer (DKS Associates 2023), truck usage and vehicle speeds on the local area roadways were estimated from field observations. The predicted increases in traffic noise levels on the local roadway network for Baseline, Baseline Plus Project, Cumulative, and Cumulative Plus Project conditions are provided in terms of L_{dn}.

Traffic noise levels are predicted at the sensitive receptors located at the closest typical setback distance along each project-area roadway segment. In some locations sensitive receptors may not receive full shielding from noise barriers or may be located at distances which vary from the assumed calculation distance.

Tables 3 and 4 summarize the modeled traffic noise levels at the nearest sensitive receptors along each roadway segment in the Project area. **Appendix C** provides the complete inputs and results of the FHWA traffic modeling.

TABLE 3: PREDICTED BASELINE TRAFFIC NOISE LEVEL AND PROJECT-RELATED TRAFFIC NOISE LEVEL INCREASES

Roadway	Segment	Predicted Exterior Noise Level (dBA L_{dn}) at Closest Sensitive Receptors

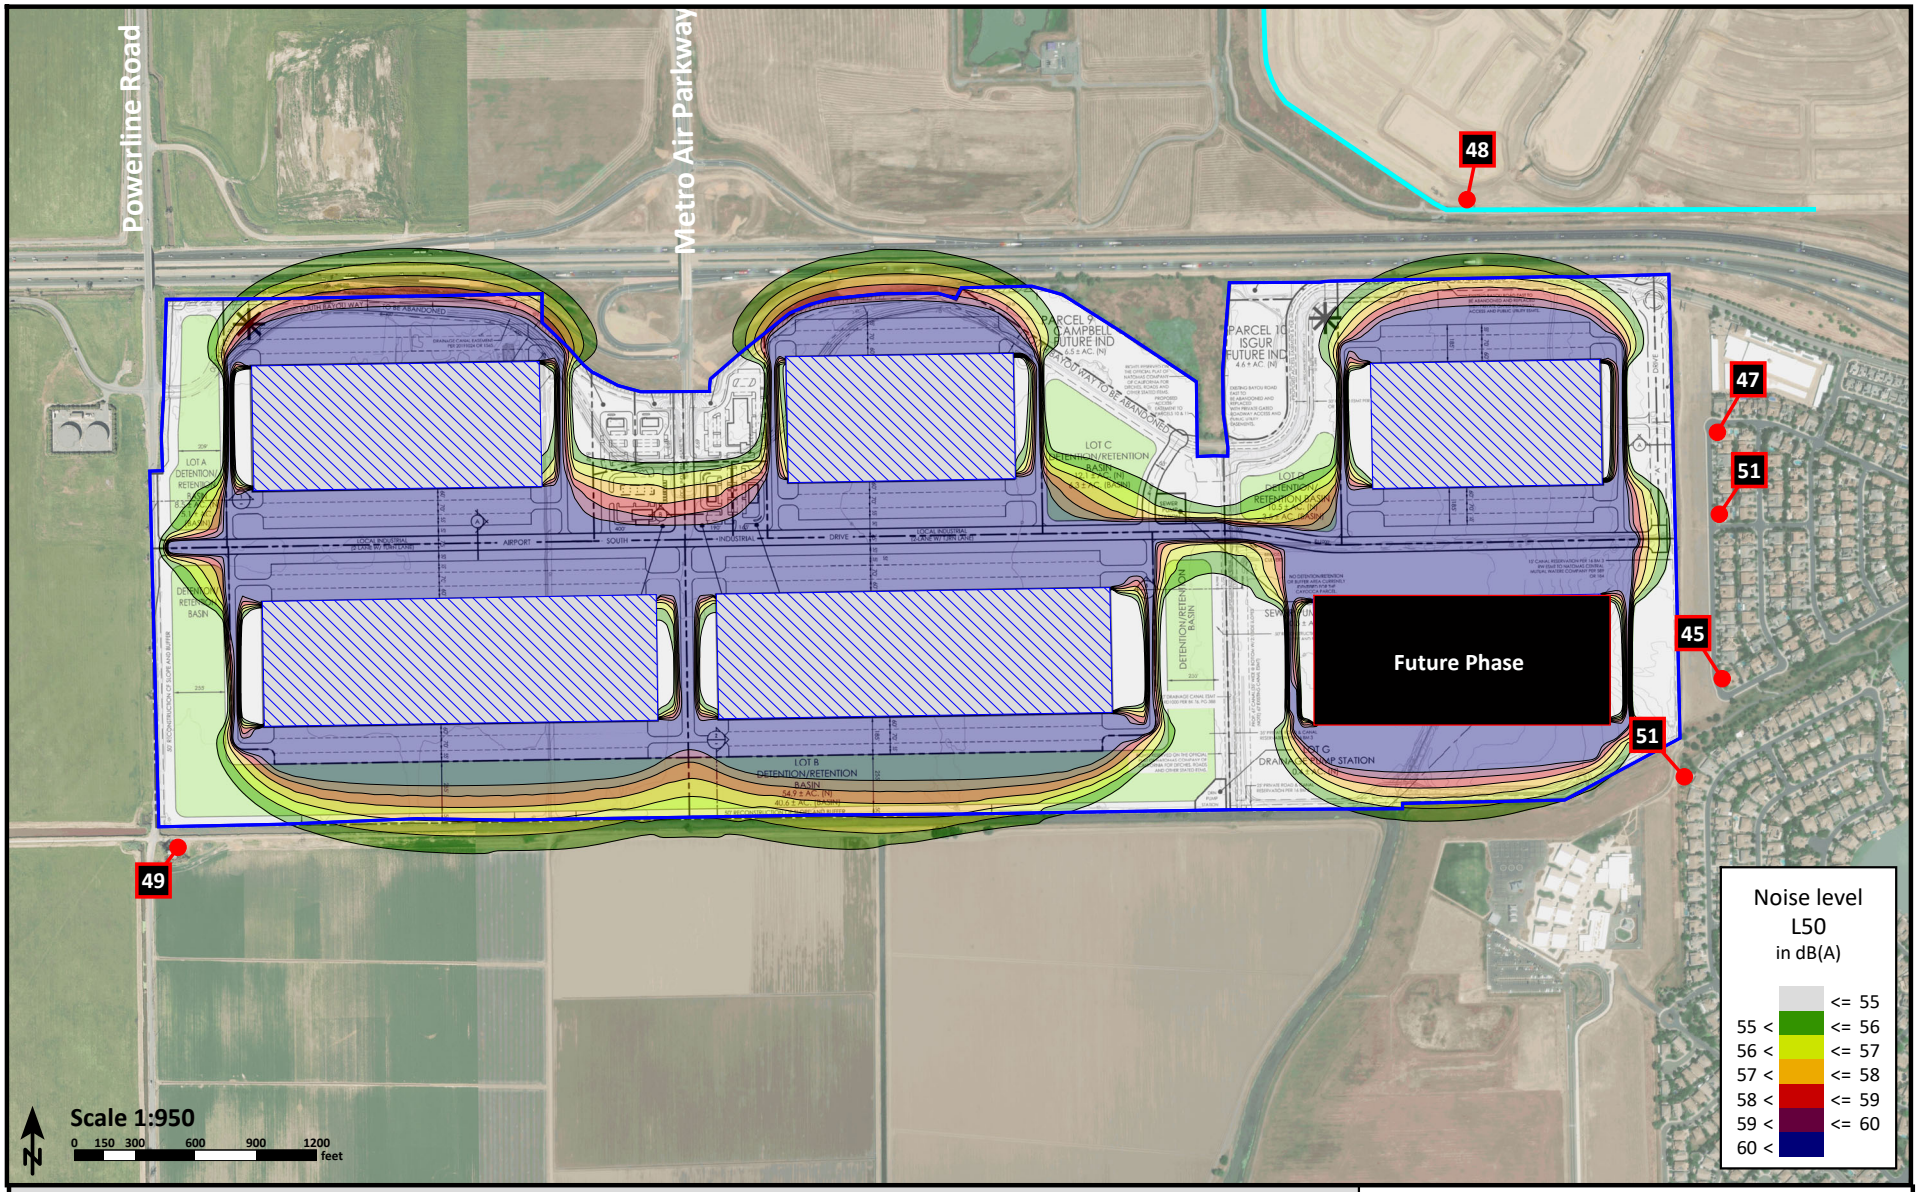
"A" Drive	Airport South Industrial Drive to Bayou Way	-	56.4	-
Bayou Way	A Drive to El Centro Road	62.9	63.8	1.0

Based upon the data in **Tables 3 and 4**, the proposed project is predicted to result in a maximum traffic noise level increase of 4.4 dBA.

EVALUATION OF PROJECT OPERATIONAL NOISE AT RESIDENTIAL RECEPTORS

Loading Dock and Truck Circulation Noise Generation



To determine typical noise levels associated with the proposed loading docks, noise level measurement data from a United Natural Foods, Inc. (UNFI) warehouse was used. The noise level measurements were conducted at a distance of 200 feet from the center of the loading dock and circulation area. Activities during the peak hour of loading dock activities included truck arrival/departures, truck idling, truck backing, air brake release, and operation of truck-mounted refrigeration units.

The results of the loading dock noise measurements indicate that a busy hour generated an average noise level of 61 dBA L_{50} at a distance of 200 feet from the center of the loading dock truck maneuvering lanes. This analysis assumes that the proposed loading docks would operate at this level of activity in a busy hour during either daytime (7:00 a.m. to 10:00 p.m.) or nighttime (10:00 p.m. to 7:00 a.m.). Noise source data was scaled up, as appropriate, for the larger proposed facility.

On-Site Circulation

The commercial component of the project is projected to generate 17,421 daily trips with 1,647 trips in the morning peak hour (DKS Associates 2023). Numbers of heavy truck trips on the project site were obtained from the project traffic report. Parking lot movements are predicted to generate a sound exposure level (SEL) of 71 dBA SEL at 50 feet for cars and 85 dBA SEL at 50 feet for trucks. Saxelby Acoustics data.

Saxelby Acoustics used the SoundPLAN noise model to calculate noise levels at the nearest sensitive receptors. Input data included the loading docks and parking lot noise generation, as discussed above. The project noise level contours for the daytime (7:00 a.m. to 10:00 p.m.) and nighttime (10:00 p.m. to 7:00 a.m.) median (L_{50}) are shown in **Figure 4 and 5**, respectively.

CONSTRUCTION NOISE ENVIRONMENT

During the construction of the proposed project noise from construction activities would temporarily add to the noise environment in the project vicinity. As shown in **Table 5**, activities involved in construction would generate maximum noise levels ranging from 76 to 90 dB at a distance of 50 feet.

TABLE 5: CONSTRUCTION EQUIPMENT NOISE

Type of Equipment	Maximum Level, dBA at 50 feet

CONSTRUCTION VIBRATION ENVIRONMENT

The primary vibration-generating activities associated with the proposed project would occur during construction when activities such as grading, utilities placement, and parking lot construction occur. **Table 6** shows the typical vibration levels produced by construction equipment.

TABLE 6: VIBRATION LEVELS FOR VARIOUS CONSTRUCTION EQUIPMENT

Type of Equipment	Peak Particle Velocity at 25 feet (inches/second)	Peak Particle Velocity at 50 feet (inches/second)	Peak Particle Velocity at 100 feet (inches/second)
Large Bulldozer	0.089	0.031	0.011
Loaded Trucks	0.076	0.027	0.010
Small Bulldozer	0.003	0.001	0.000

REGULATORY CONTEXT

FEDERAL

There are no federal regulations related to noise that apply to the Proposed Project.

STATE

California Environmental Quality Act

The California Environmental Quality Act (CEQA) Guidelines, Appendix G, indicate that a significant noise impact may occur if a project exposes persons to noise or vibration levels in excess of local general plans or noise ordinance standards, or cause a substantial permanent or temporary increase in ambient noise levels. CEQA standards are discussed more below under the Thresholds of Significance section.

LOCAL

County of Sacramento General Plan

The County of Sacramento General Plan Noise Element Table 2 (listed in **Table 7** below) establishes an acceptable exterior noise level of 55 dBA L_{50} for daytime (7:00 a.m. to 10:00 p.m.) and 50 dBA L_{50} for nighttime (10:00 p.m. to 7:00 a.m.) for non-transportation noise sources.

TABLE 7: SACRAMENTO COUNTY GENERAL PLAN NON-TRANSPORTATION NOISE STANDARDS

Receiving Land Use	Outdoor Area[2]		Interior[3]	
	Daytime	Nighttime	Interior Day & Night	Notes
All Residential	55 / 75	50 / 70	35 / 55	
Transient Lodging	55 / 75	-----	35 / 55	4
Hospitals & Nursing Home	55 / 75	-----	35 / 55	5, 6
Theaters & Auditoriums	-----	-----	30 / 50	6
Churches, Meeting Halls, Schools, Libraries, etc.	55 / 75	-----	35 / 60	6
Office Buildings	60 / 75	-----	45 / 65	6
Commercial Buildings	-----	-----	45 / 65	6
Playgrounds, Parks, etc.	60 / 75	-----	-----	6
Industry	60 / 80	-----	50 / 70	6

Notes:

1. The Table 2 standards shall be reduced by 5 dB for sounds consisting primarily of speech or music, and for recurring impulsive sounds. If the existing ambient noise level exceeds the standards of Table 2, then the noise level standards shall be increased at 5 dB increments to encompass the ambient.
2. Sensitive areas are defined acoustic terminology section.
3. Interior noise level standards are applied within noise-sensitive areas of the various land uses, with windows and doors in the closed positions.
4. Outdoor activity areas of transient lodging facilities are not commonly used during nighttime hours.
5. Hospitals are often noise-generating uses. The exterior noise level standards for hospitals are applicable only at clearly identified areas designated for outdoor relaxation by either hospital staff or patients.
6. The outdoor activity areas of these uses (if any), are not typically utilized during nighttime hours.
7. Where median (L_{50}) noise level data is not available for a particular noise source, average (Leq) values may be substituted for the standards of this table provided the noise source in question operates for at least 30 minutes of an hour. If the source in question operates less than 30 minutes per hour, then the maximum noise level standards shown would apply.

Source: Sacramento County General Plan Noise Element, 2011. Accessed November, 2019.

The County of Sacramento General Plan utilizes the Sacramento International Airport Land Use Compatibility Plan Table 1 to define an acceptable noise environment, (reproduced below in **Table 8**). A normally acceptable noise environment for warehouses and indoor storage is defined as a noise exposure level of less than 75 dBA CNEL.

TABLE 8: LAND USE COMPATIBILITY FOR SACRAMENTO INTERNATIONAL AIRPORT

Land Use Category-[1]	Exterior Noise Exposure (CNEL dB)					Criteria for Conditional Uses
› Multiple land use categories and compatibility criteria may apply to a project › Land uses not specifically listed shall be evaluated using criteria for similar uses	≤ 60	60-65	65-70	70-75	> 75	› Interior CNEL limits in yellow cells apply in addition to other listed conditions (see Policy 3.2.3) › Acoustical study may be required for noise-sensitive uses proposed in areas exposed to CNEL 60 dB or greater (see Policy 3.2.3(d))
Legend *(see last page of table for interpretation)*	***Normally Compatible***			***Conditional***		***Incompatible***
Indoor Storage: wholesale sales, warehouses, mini/other indoor storage, barns, greenhouses						
Outdoor Storage: public works yards, automobile dismantling						
Mining & Extraction

Transportation Projects

NO-9. If projected post-project traffic noise levels at existing uses exceed the noise standards of **Table 7**, then feasible methods of reducing noise to levels consistent with the **Table 7** standards shall be analyzed as part of the noise analysis. In the case of existing residential uses, sensitive outdoor areas shall be mitigated to 60 dB, when possible, through the application of feasible methods to reduce noise. If 60 dB cannot be achieved after the application of all feasible methods of reducing noise, then noise levels up to 65 dB are allowed.

If pre-project traffic noise levels for existing uses already exceed the noise standards of Table 7 and the increase is significant as defined below, feasible methods of reducing noise to levels consistent with the Table 7 standards should be applied. In no case shall the long-term noise exposure for non-industrial uses be greater than 75 dB; long-term noise exposure above this level has the potential to result in hearing loss.

A significant increase is defined as follows:

Pre-Project Noise Enviroment (L_{dn})	*Significant Increase*
Less than 60 dB	*5+ dB*
60 – 65 dB	*3+ dB*
Greater than 65 dB	*1.5+ dB*

County of Sacramento Noise Ordinance

The County of Sacramento Noise Ordinance provides an exterior noise level standard of 55 dBA L_{50} for daytime (7:00 a.m. to 10:00 p.m.) and an exterior noise level standard of 50 dBA L_{50} for nighttime (10:00 p.m. to 7:00 a.m.) for residential areas. These levels are shown in **Table 9**.

If the noise source includes speech the levels in **Table 9** are to be reduced by 5 dBA. Additionally, if the ambient noise level exceeds the permitted noise level in any of the noise level categories specified in the subdivision, the allowable noise limit shall be increased by 5 dBA increments in each category to encompass the ambient noise level.

TABLE 9: SACRAMENTO COUNTY NOISE ORDINANCE

Cumulative Duration of the Intrusive Noise	Exterior Noise Level, dB	
	Daytime	Nighttime
30 minutes per hour	55	50
15 minutes per hour	60	55
5 minutes per hour	65	60
1 minute per hour	70	65
Level not to exceed for any time per hour	75	70

Source: County of Sacramento Noise Ordinance.

City of Sacramento General Plan – Noise

ERC-10.1 Exterior Noise Standards. The City shall require noise mitigation for all development where the projected exterior noise levels exceed those shown in Table ERC-1 (**Table 10**), to the extent feasible.

TABLE 10: EXTERIOR NOISE COMPATIBILITY STANDARDS OF VARIOUS LAND USES

LAND USE TYPE	*HIGHEST LEVEL OF NOISE EXPOSURE THAT IS REGARDED AS "NORMALLY ACCEPTABLE" [a] (LDN[b] OR CNEL[c])*
Residential—Low-Density Single-Family, Duplex, Mobile Homes	60 dBA [d,e]
Residential—Multi-family [g]	65 dBA
Urban Residential Infill [h] and Mixed-Use Projects [i,j]	70 dBA
Transient Lodging—Motels, Hotels	65 dBA
Schools, Libraries, Churches, Hospitals, Nursing Homes	70 dBA
Auditoriums, Concert Halls, Amphitheaters	Mitigation based on site-specific study
Sports Arena, Outdoor Spectator Sports	Mitigation based on site-specific study
Playgrounds, Neighborhood Parks	70 dBA
Golf Courses, Riding Stables, Water Recreation, Cemeteries	75 dBA
Office Buildings—Business, Commercial, and Professional	70 dBA
Industrial, Manufacturing, Utilities, Agriculture	75 dBA

Source: Governor's Office of Planning and Research, State of California General Plan Guidelines 2003, October 2003.

a As defined in the California Office of Planning and Research Guidelines, "Normally Acceptable" means that the "specified land use is satisfactory, based upon the assumption that any building involved is of normal conventional construction, without any special noise insulation requirements.

b Ldn, or day-night average sound level, is an average 24-hour noise measurement that factors in day and night noise levels.

c CNEL, or Community Noise Equivalent Level, measurements are a weighted average of sound levels gathered throughout a 24-hour period.

d Applies to the primary open space area of a detached single-family home, duplex, or mobile home, which is typically the backyard or fenced side yard, as measured from the center of the primary open space area (not the property line). This standard does not apply to secondary open space areas, such as front yards, balconies, stoops, and porches.

e dBA, or A-weighted decibel scale, is a measurement of noise levels.

f The exterior noise standard for the residential area west of McClellan Airport known as McClellan Heights/Parker Homes is 65 dBA.

g Applies to the primary open space areas of townhomes and multi-family apartments or condominiums (private year yards for townhomes; common courtyards, roof gardens, or gathering spaces for multi-family developments). These standards shall not apply to balconies or small attached patios in multistoried multi-family structures.

h Applies to the Central City and areas with a Residential Mixed-Use designation.

i All mixed-use projects located anywhere in the City of Sacramento.

j See notes d and g above for definition of primary open space areas for single-family and multi-family developments.

ERC-10.3 Interior Noise Standards. The City shall require new development to include noise attenuation to assure acceptable interior noise levels appropriate to the land use, as follows:

- 45 dBA L_{dn} for residential, transient lodgings, hospitals, nursing homes, and other uses where people normally sleep; and
- 45 dBA L_{eq} (peak hour with windows closed) for office buildings and similar uses.

ERC-10.9 Construction Noise Controls. The City shall limit the potential noise impacts of construction activities on surrounding land uses through noise regulations in the City Code that address permitted days and hours of construction, types of work, construction equipment, and sound attenuation devices.

City of Sacramento Municipal Code – 8.86.060 Exterior Noise Standards

The City of Sacramento Municipal Code, Section 8.68.060 establishes and allowable exterior noise level limit of 55 dBA L_{50} and 75 dBA L_{max} during daytime (7:00 a.m. to 10:00 p.m.) hours and 50 dBA L_{50} and 70 dBA L_{max} during nighttime (10:00 p.m. to 7:00 a.m.) for sources of noise which occur for more than 30 minutes per hour (L_{50}).

If the existing ambient noise level exceeds the 50/55 dBA L_{50} standard the allowable limit is increased in 5 dBA increments to encompass the ambient noise level. If the existing ambient noise level exceeds the 70/75 dBA L_{max} noise standard, the limit becomes the measured L_{max} existing ambient noise level. For example, if measured existing ambient daytime noise levels are 57 dBA L_{50} and 77 dBA L_{max}, the noise ordinance limits would be 60 dBA L_{50} and 77 dBA L_{max}. The City of Sacramento Municipal Code standards are summarized in **Table 11** below.

TABLE 11: STATIONARY NOISE SOURCE NOISE STANDARDS

Noise Level Descriptor	Outdoor Activity Areas Daytime (7 a.m. to 10 p.m.)	Outdoor Activity Areas Nighttime (10 p.m. to 7 a.m.)
Hourly equivalent sound level (L_{50}), dB	55	50
Maximum sound level (L_{max}), dB	75	70

Source: City of Sacramento Municipal Code

Summary of Relevant Noise Level Criteria

The City of Sacramento and the County of Sacramento General Plan/Noise Ordinance share similar noise level standards for "Stationary" (non-transportation) noise sources. The project, which shall be considered to be a "Stationary" noise source, shall not be permitted to generate noise levels exceeding 55 dBA L_{50} or 75 dBA L_{max} during daytime (7:00 a.m. to 10:00 p.m.) hours and 50 dBA L_{50} or 70 dBA L_{max} during nighttime (10:00 p.m. to 7:00 a.m.) hours at the adjacent noise sensitive receptors.

Criteria for Acceptable Vibration

Vibration is like noise in that it involves a source, a transmission path, and a receiver. While vibration is related to noise, it differs in that in that noise is generally considered to be pressure waves transmitted through air, whereas vibration usually consists of the excitation of a structure or surface. As with noise,

vibration consists of an amplitude and frequency. A person's perception to the vibration will depend on their individual sensitivity to vibration, as well as the amplitude and frequency of the source and the response of the system which is vibrating.

Vibration can be measured in terms of acceleration, velocity, or displacement. A common practice is to monitor vibration measures in terms of peak particle velocities in inches per second. Standards pertaining to perception as well as damage to structures have been developed for vibration levels defined in terms of peak particle velocities.

Human and structural response to different vibration levels is influenced by a number of factors, including ground type, distance between source and receptor, duration, and the number of perceived vibration events. **Table 12**, which was developed by Caltrans, shows the vibration levels which would normally be required to result in damage to structures. The vibration levels are presented in terms of peak particle velocity in inches per second.

TABLE 12: EFFECTS OF VIBRATION ON PEOPLE AND BUILDINGS

Peak Particle Velocity		Human Reaction	Effect on Buildings
mm/second	in/second		
0.15-0.30	0.006-0.019	Threshold of perception; possibility of intrusion	Vibrations unlikely to cause damage of any type
2.0	0.08	Vibrations readily perceptible	Recommended upper level of the vibration to which ruins and ancient monuments should be subjected
2.5	0.10	Level at which continuous vibrations begin to annoy people	Virtually no risk of "architectural" damage to normal buildings
5.0	0.20	Vibrations annoying to people in buildings (this agrees with the levels established for people standing on bridges and subjected to relative short periods of vibrations)	Threshold at which there is a risk of "architectural" damage to normal dwelling - houses with plastered walls and ceilings. Special types of finish such as lining of walls, flexible ceiling treatment, etc., would minimize "architectural" damage
10-15	0.4-0.6	Vibrations considered unpleasant by people subjected to continuous vibrations and unacceptable to some people walking on bridges	Vibrations at a greater level than normally expected from traffic, but would cause "architectural" dam age and possibly minor structural damage

IMPACTS AND MITIGATION MEASURES

THRESHOLDS OF SIGNIFICANCE

Appendix G of the CEQA Guidelines states that a project would normally be considered to result in significant noise impacts if noise levels conflict with adopted environmental standards or plans or if noise generated by the project would substantially increase existing noise levels at sensitive receivers on a permanent or temporary basis. Significance criteria for noise impacts are drawn from CEQA Guidelines Appendix G (Items XI [a-f]).

Would the project:

a. Generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?

b. Generate excessive groundborne vibration or groundborne noise levels?

c. For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?

Noise Level Increase Criteria for Long-Term Project-Related Noise Level Increases

The California Environmental Quality Act (CEQA) guidelines define a significant impact of a project if it "increases substantially the ambient noise levels for adjoining areas." Generally, a project may have a significant effect on the environment if it will substantially increase the ambient noise levels for adjoining areas or expose people to severe noise levels. In practice, more specific professional standards have been developed. These standards state that a noise impact may be considered significant if it would generate noise that would conflict with local project criteria or ordinances, or substantially increase noise levels at noise sensitive land uses. The potential increase in traffic noise from the project is a factor in determining significance. Research into the human perception of changes in sound level indicates the following:

- A 3-dB change is barely perceptible,
- A 5-dB change is clearly perceptible, and
- A 10-dB change is perceived as being twice or half as loud.

A limitation of using a single noise level increase value to evaluate noise impacts is that it fails to account for pre-project noise conditions. **Table 13** is based upon recommendations made by the Federal Interagency Committee on Noise (FICON) to provide guidance in the assessment of changes in ambient noise levels resulting from aircraft operations. The recommendations are based upon studies that relate aircraft noise levels to the percentage of persons highly annoyed by the noise. Although the FICON recommendations were specifically developed to assess aircraft noise impacts, it has been accepted that they are applicable to all sources of noise described in terms of cumulative noise exposure metrics such as the L_{dn}.

TABLE 13: SIGNIFICANCE OF CHANGES IN NOISE EXPOSURE

Ambient Noise Level Without Project, L_{dn}	Increase Required for Significant Impact
<60 dB	+5.0 dB or more
60-65 dB	+3.0 dB or more
>65 dB	+1.5 dB or more

Source: Federal Interagency Committee on Noise (FICON).

Based on the **Table 13** data, an increase in the traffic noise level of 5 dB or more would be significant where the pre-project noise levels are less than 60 dB L_{dn}, or 3 dB or more where existing noise levels are between 60 to 65 dB L_{dn}. Extending this concept to higher noise levels, an increase in the traffic noise level of 1.5 dB or more may be significant where the pre-project traffic noise level exceeds 65 dB L_{dn}. The rationale for the **Table 13** criteria is that, as ambient noise levels increase, a smaller increase in noise resulting from a project is sufficient to cause annoyance.

PROJECT-SPECIFIC IMPACTS AND MITIGATION MEASURES

Impact 1: ***Would the project generate a substantial temporary or permanent increase in ambient noise levels in the vicinity of the project in excess of standards established in the local general plan or noise ordinance, or applicable standards of other agencies?***

Traffic Noise Increases at Off-Site Receptors

The FICON guidelines specifies criteria, as seen in **Table 13** to determine the significance of traffic noise impacts. A traffic noise increase of 5 dB or more is significant if pre-project levels are under 60 dB L_{dn}, or 3 dB or more if existing levels are 60-65 dB L_{dn}. For higher levels exceeding 65 dB L_{dn}, a 1.5 dB increase would be considered be significant. According to **Tables 3 and 4**, the maximum noise level increase along Powerline Road is predicted to be 4.4 dBA L_{dn}. For this roadway segment, the existing ambient noise level at the nearest sensitive receptor is 53.2 dBA which is less than the 5 dB significance increase criterion. The highest ambient noise level of 62.9 dBA occurs directly adjacent to Bayou Way. The noise level increase along this segment is predicted to be 1.0 dBA which is less than the 3 dB significant increase criterion where noise levels range from 60 dBA L_{dn} to 65 dBA L_{dn}.

Therefore, impacts resulting from increased traffic noise would be considered ***less-than-significant***.

Operational Noise at Sensitive Receptors

The City of Sacramento and County of Sacramento noise level standards require that new projects in the vicinity of existing sensitive receptors generate noise levels no greater than 55 dBA L_{50} and 75 dBA L_{max} during daytime (7:00 a.m. to 10:00 p.m.) hours and 50 dBA L_{50} and 70 dBA L_{max} during nighttime (10:00 p.m. to 7:00 a.m.) hours.

As shown on **Figure 4,** the proposed project, along with the future phase, is predicted to comply with the City's daytime 55 dBA L_{50} (7:00 a.m. to 10:00 p.m.) noise level standard without any additional noise control measures.

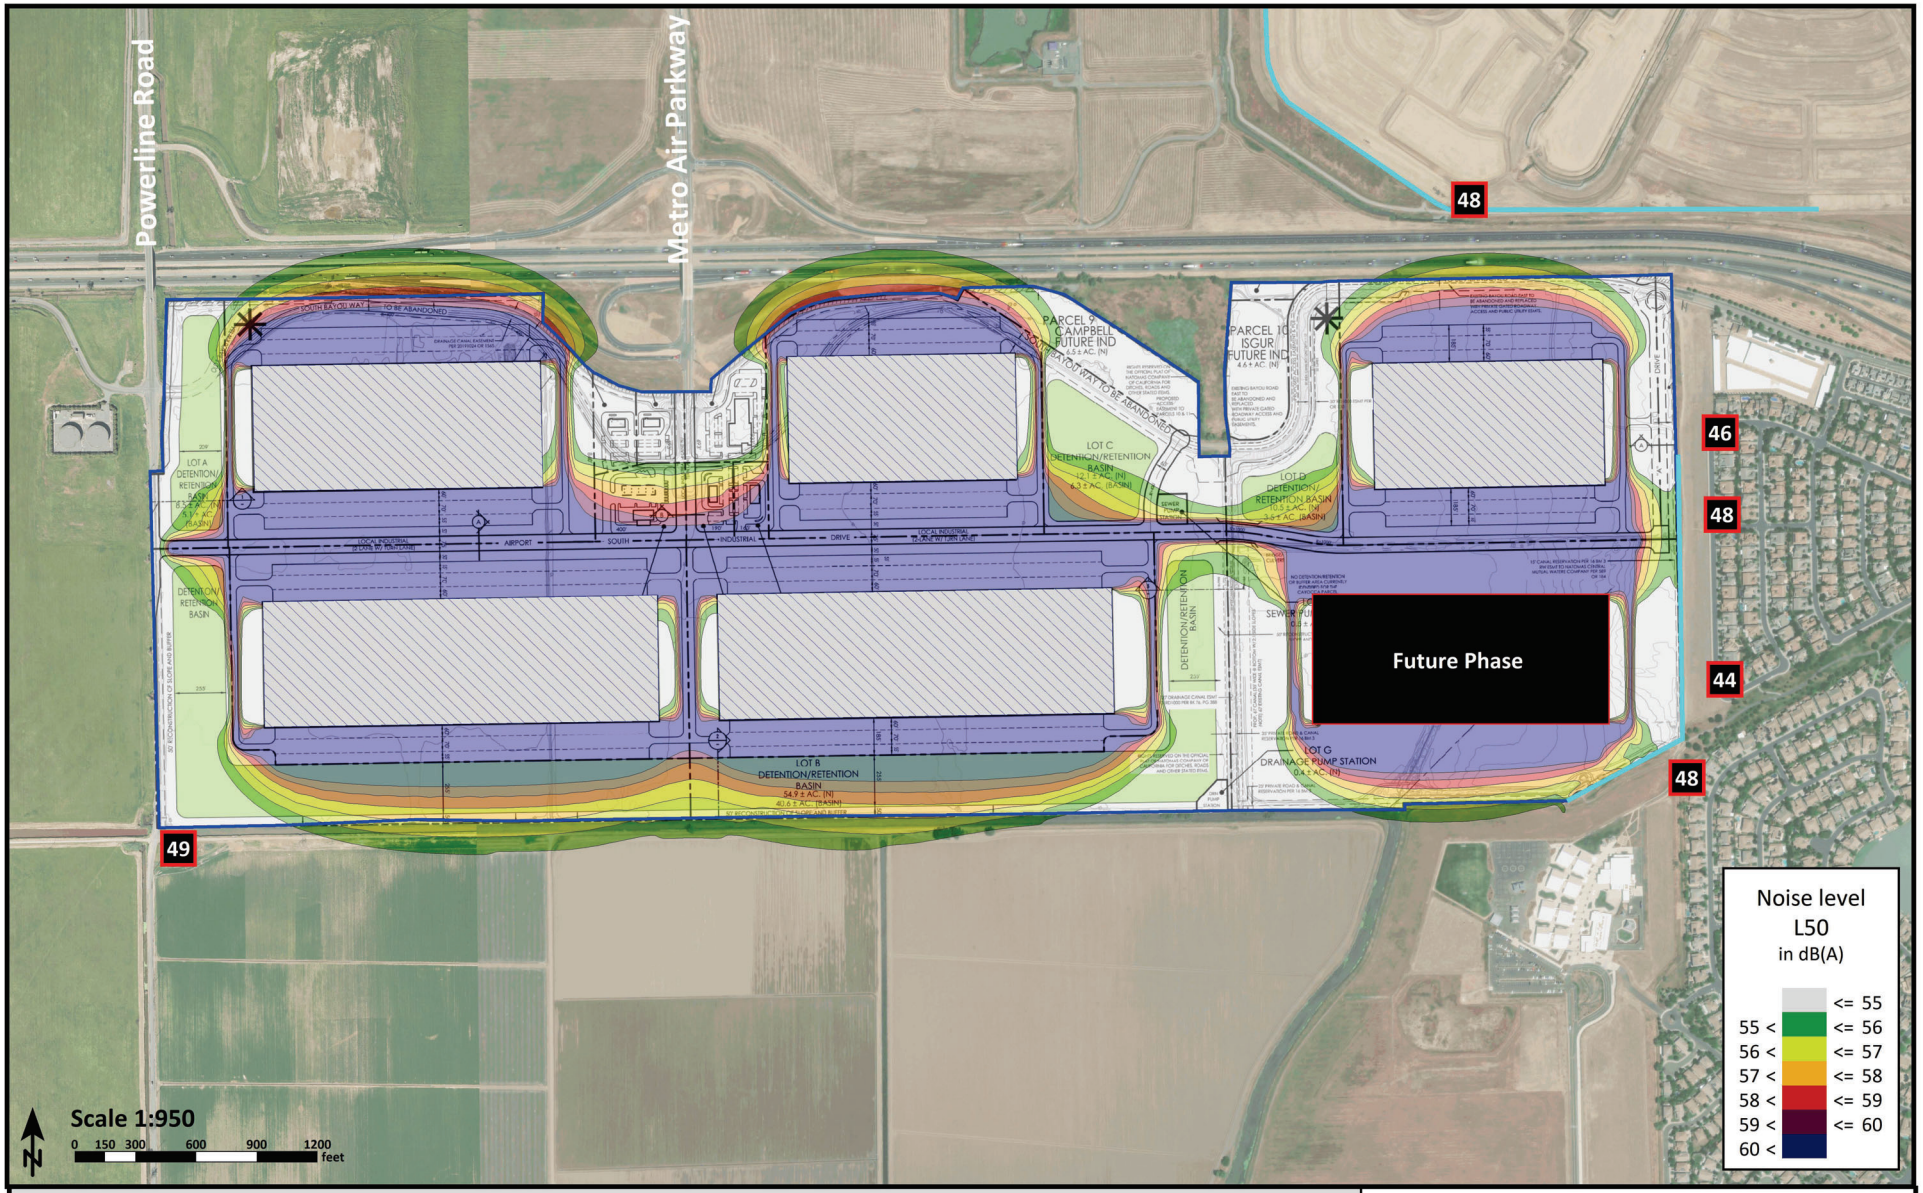
As shown on **Figure 5,** the proposed project, along with the future phase, is predicted to exceed the City's nighttime 50 dBA L_{50} (10:00 p.m. to 7:00 a.m.) noise level standard without any additional noise control measures. Therefore, impacts resulting from operational noise would be considered potentially significant and mitigation would be required.

A six-foot sound wall was assumed to enclose the single family residentials to the north of the proposed project, across I-5. It is likely that a much taller wall could be required here to shield noise from Interstate 5. Therefore, a 6-foot wall is considered conservative.

It should be noted that maximum noise levels generated by on-site vehicle circulation loading docks are predicted to be 20 dBA, or less, than the median (L_{50}) values. The maximum (L_{max}) nighttime noise level standard is 70 dBA L_{max}, which is 20 dBA higher than the median noise standard of 50 dBA L_{50}. Therefore, where median noise levels are in compliance with the L_{50} standards, maximum noise levels will also comply.

Saxelby Acoustics recommends the construction of an 8-foot-tall sound wall to reduce the noise levels emanating from the project site. The wall locations and resulting contours are shown on **Figure 6 and 7.** Implementation of this mitigation measure would reduce operational noise impacts to ***less-than-significant.***

Construction Noise



The noise increase during construction would be of short duration and would likely occur primarily during daytime hours. The City of Sacramento's Noise Ordinance of the Municipal Code exempts construction activities from the noise standards, provided that construction takes place between the hours of 7:00 AM and 6:00 PM Monday through Saturday and 9:00 AM and 6:00 PM Sundays and holidays. Although the construction activities could result in infrequent periods of high noise, the construction noise would not be sustained and would only occur only during the City's permitted construction noise hours.

This is a **less-than-significant** impact, and no mitigation is required.

Mitigation Measures

1a: An 8-foot-tall sound wall shall be constructed along the eastern project boundary in order to achieve the City's nighttime 50 L_{50} noise standards. Noise barrier walls shall be constructed of concrete panels, concrete masonry units, earthen berms, or any combination of these materials that achieve the required total height. Wood is not recommended due to eventual warping and degradation of acoustical performance. These requirements shall be included in the improvements plans prior to their approval by the City's Public Works Department. **Figures 6 and 7** shows the recommended sound wall location.

Implementation of mitigation measures 1(a) would help to reduce construction-generated noise levels. With mitigation, this impact would be considered ***less-than-significant***.

Impact 2: ***Would the project generate excessive groundborne vibration or groundborne noise levels?***

Construction vibration impacts include human annoyance and building structural damage. Human annoyance occurs when construction vibration rises significantly above the threshold of perception. Building damage can take the form of cosmetic or structural.

Table 6 data indicates that construction vibration levels anticipated for the project are less than the 0.2 in/sec threshold at distances of 26 feet. Sensitive receptors which could be impacted by construction related vibrations, especially vibratory compactors/rollers, are located approximately 150 feet, or further, from typical construction activities. At these distances construction vibrations are not predicted to exceed acceptable levels. Additionally, construction activities would be temporary in nature and would likely occur during normal daytime working hours.

This is a **less-than-significant** impact, and no mitigation is required.

Impact 3: ***For a project located within the vicinity of a private airstrip or an airport land use plan or, where such a plan has not been adopted, within two miles of a public airport or public use airport, would the project expose people residing or working in the project area to excessive noise levels?***

Based upon **Figure 4**, the proposed project is located approximately 0.43 miles outside of the predicted 75 dBA CNEL noise contour. According to **Table 8** of the Sacramento International Airport Land Use Compatibility Chart, the noise environment of the proposed project is considered normally acceptable.

This is a **less-than-significant** impact, and no mitigation is required.

Appendix A: Acoustical Terminology

Acoustics	The science of sound.
Ambient Noise	The distinctive acoustical characteristics of a given space consisting of all noise sources audible at that location. In many cases, the term ambient is used to describe an existing or pre-project condition such as the setting in an environmental noise study.
ASTC	Apparent Sound Transmission Class. Similar to STC but includes sound from flanking paths and correct for room reverberation. A larger number means more attenuation. The scale, like the decibel scale for sound, is logarithmic.
Attenuation	The reduction of an acoustic signal.
A-Weighting	A frequency-response adjustment of a sound level meter that conditions the output signal to approximate human response.
Decibel or dB	Fundamental unit of sound, A Bell is defined as the logarithm of the ratio of the sound pressure squared over the reference pressure squared. A Decibel is one-tenth of a Bell.
CNEL	Community Noise Equivalent Level. Defined as the 24-hour average noise level with noise occurring during evening hours (7 - 10 p.m.) weighted by +5 dBA and nighttime hours weighted by +10 dBA.
DNL	See definition of Ldn.
IIC	Impact Insulation Class. An integer-number rating of how well a building floor attenuates impact sounds, such as footsteps. A larger number means more attenuation. The scale, like the decibel scale for sound, is logarithmic.
Frequency	The measure of the rapidity of alterations of a periodic signal, expressed in cycles per second or hertz (Hz).
Ldn	Day/Night Average Sound Level. Similar to CNEL but with no evening weighting.
Leq	Equivalent or energy-averaged sound level.
Lmax	The highest root-mean-square (RMS) sound level measured over a given period of time.
L(n)	The sound level exceeded a described percentile over a measurement period. For instance, an hourly L50 is the sound level exceeded 50% of the time during the one-hour period.
Loudness	A subjective term for the sensation of the magnitude of sound.
NIC	Noise Isolation Class. A rating of the noise reduction between two spaces. Similar to STC but includes sound from flanking paths and no correction for room reverberation.
NNIC	Normalized Noise Isolation Class. Similar to NIC but includes a correction for room reverberation.
Noise	Unwanted sound.
NRC	Noise Reduction Coefficient. NRC is a single-number rating of the sound-absorption of a material equal to the arithmetic mean of the sound-absorption coefficients in the 250, 500, 1000, and 2,000 Hz octave frequency bands rounded to the nearest multiple of 0.05. It is a representation of the amount of sound energy absorbed upon striking a particular surface. An NRC of 0 indicates perfect reflection; an NRC of 1 indicates perfect absorption.
RT60	The time it takes reverberant sound to decay by 60 dB once the source has been removed.
Sabin	The unit of sound absorption. One square foot of material absorbing 100% of incident sound has an absorption of 1 Sabin.
SEL	Sound Exposure Level. SEL is a rating, in decibels, of a discrete event, such as an aircraft flyover or train pass by, that compresses the total sound energy into a one-second event.
SPC	Speech Privacy Class. SPC is a method of rating speech privacy in buildings. It is designed to measure the degree of speech privacy provided by a closed room, indicating the degree to which conversations occurring within are kept private from listeners outside the room.
STC	Sound Transmission Class. STC is an integer rating of how well a building partition attenuates airborne sound. It is widely used to rate interior partitions, ceilings/floors, doors, windows and exterior wall configurations. The STC rating is typically used to rate the sound transmission of a specific building element when tested in laboratory conditions where flanking paths around the assembly don't exist. A larger number means more attenuation. The scale, like the decibel scale for sound, is logarithmic.
Threshold of Hearing	The lowest sound that can be perceived by the human auditory system, generally considered to be 0 dB for persons with perfect hearing.
Threshold of Pain	Approximately 120 dB above the threshold of hearing.
Impulsive	Sound of short duration, usually less than one second, with an abrupt onset and rapid decay.
Simple Tone	Any sound which can be judged as audible as a single pitch or set of single pitches.

1. Introduction

1.1 OVERVIEW & PURPOSE OF MSR

The Airport South Industrial (ASI) Targeted Municipal Services Review (MSR) has been prepared to assist the Sacramento Local Agency Formation Commission (LAFCO) in its evaluation of an application for a Sphere of Influence (SOI) Amendment for the City of Sacramento (City) and Sacramento Area Sewer District (SacSewer). It is important to note that prior to December 26, 2023 the district currently known as SacSewer was represented by two independent special districts; Sacramento Regional County Sanitation District (Regional San) and Sacramento Area Sewer District. The districts provided wastewater treatment and collection respectively. The LAFCo Commission authorized a reorganization of the districts; dissolving SacSewer and annexing the district into Regional San and subsequently naming the wastewater special district SacSewer.

The MSR complies with the Cortese-Knox-Hertzberg (CKH) Local Government Reorganization Act of 2000 (Act), per Government Code Section 56000, et seq., and evaluates existing and future service conditions for the geographic area subject to the requested SOI amendment.

A MSR provides the means to synthesize data regarding a local agency's operations and public services, ability to provide mandated services, and/or opportunities to provide more efficient services. California Government Code Section 56375 permits a LAFCO to take action on recommendations found in an MSR, which can range from initiating studies for changes of organization, updating a SOI, or initiating a change in organization.

A MSR also provides information to help a LAFCO make decisions on a proposed Sphere of Influence boundary change. This includes data necessary to determine if an agency has the capability to serve an expanded area and data related to an agency's financial condition, revenue sources, and projected expenses. A MSR also outlines what infrastructure may be needed to accommodate expansion of public services. Finally, a MSR can recommend changes in an agency or district's organization, such as consolidation, dissolution, merger, establishment of a subsidiary district, or the creation of a new agency that typically involves a consolidation of agencies.

The ASI MSR focuses on the service areas currently outside of Sacramento's incorporated boundary. The MSR will be used as an information base to update the Spheres of Influence of the City of Sacramento and SacSewer and to provide a foundation for the public, City of Sacramento, County of Sacramento, SacSewer and Sacramento LAFCO to consider changes to the existing, respective SOI boundaries of those agencies.

1.2 LAFCO REQUIREMENTS

A primary function of the Sacramento LAFCO is to implement the Cortese-Knox-Hertzberg (CKH) Act, which specifies a LAFCO's intent, authority, responsibility, process and other operating principals and requirements. This provides a LAFCO the authority to consider and adopt a Sphere of Influence (SOI) and/or reorganize local government agencies. Emphasis is placed on providing for the logical, efficient, and most appropriate formation of local municipalities, service areas, and special districts.

The CKH Act requires that a MSR be prepared prior to, or concurrent with, an update to a SOI and/or a reorganization. It consists of a collection of data relative to public services needed to serve the SOI. The MSR also includes an evaluation of each agency's organizational structure and operational practices, and it identifies potential areas for improvement, coordination, or changes to the SOI. While it is not the role of the MSR to make specific recommendations, it does provide an information resource that can be used by LAFCO to base its determinations on an action to amend an existing SOI.

The CKH Act requires that a MSR provide a LAFCO with the information needed to make determinations in seven different issue areas. As such, this report includes the following sections in order to provide LAFCO with the information needed to make determinations regarding the following elements:

→ **Growth and Population:** Provides growth and population projections within the City's existing service boundaries, including an assessment of the City's ability to accommodate additional growth.

- **Disadvantaged Communities:** Identifies the location and characteristics of known disadvantaged unincorporated communities within, or contiguous to, the SOI. This is defined as a community with 12 or more registered voters with a median household income of 80 percent or less of the state's median.
- **Public Facilities & Services:** Outlines the current and planned capacity of public facilities and adequacy of public services, including infrastructure needs and deficiencies.
- **Financial Ability to Provide Services:** Evaluates each agency's fiscal position and rate structures to determine the viability and ability to meet demands for various public services.
- **Shared Facilities:** Assesses the status of, and opportunities for, shared facilities or services between the agencies, cities, and/or special districts, including opportunities to achieve cost savings through the reduction/elimination of redundancies.
- **Government Structure and Accountability:** Examines the current community service needs, government structure, operational efficiencies, and managerial practices of each agency, including an accountability assessment of the transparency of their respective processes.
- **Other Matters Related to Effective Service Delivery:** Assesses various policies and factors that could affect the City's ability to efficiently provide public services.

1.3 SERVICES AND ISSUES ADDRESSED

To provide the Sacramento LAFCO with the information needed to make a determination regarding each of the seven elements identified above, this MSR addresses the following public service/issue areas:

- Growth and Population Projections
- Disadvantaged Communities
- Public Facilities and Services, including:
  - Water
  - Wastewater
  - Circulation and Roadways
  - Animal Care
  - Code Enforcement
  - Law Enforcement
  - Fire Protection
  - Solid Waste
  - Storm Drainage and Flood Control
  - Parks and Recreation
  - Libraries
  - Electricity & Natural Gas
- Financial Ability to Provide Services
- Shared Facilities Opportunities
- Government Structure and Accountability
- Other Matters Related to Effective Service Delivery

2. Executive Summary

The purpose of this Targeted Municipal Services Review (MSR) is to provide a comprehensive summary and assessment of the ability of the City of Sacramento and SacSewer to provide public services within a requested Sphere of Influence (SOI) amendment area to accommodate development of the Airport South Industrial (ASI) project. The proposed development site and SOI expansion area are currently located in Sacramento County, California and

consist of approximately 472.4 acres immediately northwest of the City of Sacramento's corporate boundary. A targeted MSR, as opposed to a broader MSR for the whole City, has been prepared because the Sphere of Influence Amendment being requested is project specific and limited to the project area. It was determined in consultation with LAFCo staff that a targeted project specific MSR was appropriate for the ASI project. The City's 2040 General Plan Update (2040 GPU) will include an implementation measure that a citywide MSR will be prepared for the City of Sacramento.

As of 2019, the area within Sacramento's City limits included approximately 101 square miles (64,425 acres) and the SOI outside of the City limits consisted of approximately 22 square miles (14,018 acres). The City limits include all incorporated land within the legal jurisdiction of the City of Sacramento.

Key features adjacent to the project site include I-5 to the north, the Reclamation District 1000 (RD 1000) West Drainage Canal to the south, Powerline Road to the west, and the North Natomas Westlake Subdivision to the east, which include a City-owned 200' buffer. The project site is located south of Metro Air Park and the new Metro Air Parkway/I-5 interchange, southwest of the City of Sacramento's Northlake development (formerly Greenbriar), and west of the existing Westlake residential community, which is adjacent to the City of Sacramento's corporate boundary. The Sacramento International Airport (SMF) and the County's Metro Air Park Industrial Park (MAP) lie directly north and west of Interstate 5.

The proposed project would allow development of both industrial and commercial land uses. Industrial uses would consist of a mixture of warehouse, distribution facilities, and similar uses. Commercial uses would allow of a mixture of restaurant, hotel, fueling station, car wash, and similar uses. Public facilities, including on-site roadways, utilities, a sewer pump station, and stormwater detention basins/pumping facilities, would also be constructed. At buildout, the project would accommodate approximately 6,609,300 sq. ft. of industrial uses and 98,200 sq. ft of commercial uses. A preliminary site plan for the ASI project is included as Appendix A.

The proposed SOI amendment area is approximately 472.4 acres in size. This is inclusive of the State of California (Caltrans) lands within the I-5 corridor, and also includes the south approximate one-half of the new Metro Air Park interchange. The project site's west boundary extends to the approximate centerline of Power Line Road.

This section provides summary data and an assessment of seven elements/public services as required by the CKH Act in order to position the Sacramento LAFCO with the ability to make a formal determination of each.

2.1 POPULATION, HOUSING & EMPLOYMENT GROWTH

The greater Sacramento area has experienced significant growth and change since the mid-20th century. In the 1950's, Sacramento's economy was supported primarily by agriculture, food processing, State government, and military base operations. In more recent decades, the diversification of industries and the introduction of more technical jobs spurred steady population growth in Sacramento and throughout the region. For much of the past 30 years, Sacramento's growth rate has been similar to that of the State of California, with housing stock and employment opportunities increasing to meet the demand. The recession between 2008-2012 caused a decrease in population growth rate from 1.5% annually to 0.6% annually. However, the City has since recovered and has a current population growth rate of approximately 1.1%, which is anticipated to remain steady through 2040. Areas of the City that have experienced the most growth since the 1990's include North Natomas, South Natomas, and the South Area. Much of the housing constructed in these areas consists of suburban, single-family homes, with a lesser stock of multi-family units. Future development projections anticipate that the City's housing stock will consist of approximately 50% multi-family units by the year 2035 and that the City's total housing stock will reach 266,781 units by the year 2040. Employment is also anticipated to increase and further diversify in the region, with an approximately 18% increase in the City's employment base between the years 2016 and 2040, resulting in approximately 364,819 jobs. A detailed assessment regarding the City's growth and population is outlined in Section 4 of this MSR.

2.2 DISADVANTAGED COMMUNITIES

Approved on October 7, 2011, Senate Bill 244 (SB 244) established legislation to address the need for infrastructure improvements and provision of water, wastewater, and fire protection services in defined Disadvantaged Unincorporated Communities (DUCs). DUCs are defined as communities of ten dwelling units or more in an unincorporated area bordering a City or within a City's sphere of influence where the median household income is 80 percent or less of the State's established median household income. The proposed Airport South Industrial project/Sphere of Influence (SOI) expansion area is not developed and is located in unincorporated Sacramento County, however it lies adjacent to a portion of the Sacramento's City limit's western edge. The area surrounding the SOI expansion area consists of a combination of undeveloped properties, vacant land areas, and developed residential neighborhoods. There are no properties that meet the definition of a DUC within, or adjacent to, the proposed SOI expansion area. A detailed assessment regarding disadvantaged communities is outlined in Section 5 of this MSR.

2.3 PUBLIC FACILITIES & SERVICES

The City of Sacramento provides comprehensive municipal services including water, wastewater, solid waste, storm drainage, law enforcement, fire protection, transportation and street maintenance, parks and recreation, library, and general governmental services. The City also has a Capital Improvement Program for the advancement of its public facilities and services. Detailed information regarding the City's public facilities and services is outlined in Section 6 of this MSR, which is summarized in this sub-section.

2.3.A Water

The City of Sacramento is both a water retailer and a water wholesaler for its 101-square-mile service area and their service includes the operation and maintenance of an infrastructure system that produces, treats, stores, and delivers potable water to its customers. The City's water portfolio is generated from both surface water and groundwater. Surface water is sourced via diversions from both the Sacramento and American Rivers. Groundwater is produced from groundwater wells that are located throughout the City. The existing water infrastructure network consists of two surface water treatment facilities, two pressure zones, and a supporting system of groundwater wells, pumping facilities, storage tanks, and distribution/transmission pipelines.

In proximity to the ASI project site, the City operates and maintains a 30" water transmission main that is located in South Bayou Way. This facility terminates near the east edge of the SOI expansion area, which provides a point of connection to serve development of the ASI project. It is from this point of connection that new water infrastructure would be constructed to extend existing off-site infrastructure to the project site to serve development of the ASI project. The design and location of existing water infrastructure, including its water supply, treatment facilities, and delivery system, is sufficient to provide service to the ASI project. Additional information about the City's water utilities is outlined in Section 6.1 of this MSR.

2.3.B Wastewater

Wastewater collection and treatment services for a majority of the City of Sacramento is provided by Sacramento Area Sewer District (SacSewer), formerly known by the two special districts as Sacramento Regional County Sanitation District and Sacramento Area Sewer District. Wastewater is collected by SacSewer's trunk facilities, and it is conveyed via interceptors to the Sacramento Regional Wastewater Treatment Plant (SRWTP) for treatment and disposal. The SRWTP is a regional wastewater treatment plant that serves the City of Sacramento and several other cities and districts in the region.

The ASI project site is not currently located within SacSewer's Master Plans as a future area to be served. In order for services to be extended to the site, it must be annexed into the SOI of SacSewer and the City of Sacramento, requiring an amendment to each districts' SOI. The district must amend their Master Plans prior to or concurrent with the annexation process as part of the analysis to support the SOI expansion. Development of the ASI project includes the construction of on-site sewer pipelines, a pump station, and off-site force mains, which have been preliminarily designed to accommodate full buildout. The on-site sewer system is designed to collect wastewater from each parcel and convey it via gravity to a central pump station. From the pump station, wastewater is pumped via force main to an existing SacSewer trunk and/or

an existing interceptor located to the east of the project site. Flows will ultimately be conveyed to the SRWTP for treatment and disposal. The SRWTP maintains sufficient capacity to treat wastewater flows generated from buildout of the ASI project. Funding to support the expansion of service will be collected from impact fees as well as new service fees generated from development in the project area. Additional information about the City's wastewater systems is outlined in Section 6.2 of this MSR.

2.3.C Circulation and Roadways

The City's roadway network includes Federal interstates, State highways, and City streets (arterials, collectors, and local streets). While the roadway system has historically designed to primarily accommodate vehicular travel, the City supports all travel modes including public transit, bicycling, and walking. The Sacramento General Plan establishes roadway capacity and level of service standards for roadways in the City, which provides for a base level of service standard of LOS D. However, in specifically identified areas (such as the downtown core) where streets have a unique condition or other warrant, the base level of service standard is LOS E or LOS F during peak travel hours. Sacramento also implements Transportation Demand Management programs that are intended to reduce traffic congestion, optimize transportation system usage, and improve air quality. These consist of both a Transportation Systems Management (TSM) program that requires smaller employers to achieve a 35 percent trip reduction and a Transportation Management Plan (TMP) that requires larger employers to provide enhanced facilities that incentivize usage of alternative transportation modes.

A wide range of transit services are provided in Sacramento, which includes public bus service, light rail transit, commercial bus service, and interregional and interstate passenger train service. The Sacramento Regional Transit District (RT) provides local bus and light rail service within the City and outlying areas of the Sacramento region. RT recently adopted an updated plan for the expansion of its transportation network, which includes adding new stations, replacing its aging light rail vehicle fleet, double-tracking congested segments, and extending rail lines to the airport. Additionally, several park-and-ride facilities are located throughout the City to facilitate ridesharing, carpooling, and access to regional transit.

The City is continually implementing its adopted Bicycle Master Plan, which identifies existing and planned bicycle trails and routes. It incorporates design features for bikeway facilities, such as lane widths, signs and markings, and promotes bicycle safety and education programs to ensure adequate bikeways are constructed with new development. Similarly, the City is continually implementing its plans and programs to enhance existing pedestrian facilities. This includes the adopted Neighborhood Traffic Management Program, Pedestrian Master Plan, and Traffic Calming Guidelines, which collectively provide guidance to improve neighborhood livability by slowing vehicles to create a desirable pedestrian environment. Additionally, the City's adopted the Vision Zero Sacramento Action Plan is being implemented with the goal of eliminating traffic fatalities and serious injuries on City streets by the year 2027.

Development of the ASI project includes roadways, bikeways, and pedestrian facilities. Roadway construction will create access to all commercial and industrial parcels, with connections to existing roadways including Power Line Road, Bayou Way, and Metro Air Parkway, which provides access to I-5. Roadways have been designed consistent with Sacramento's adopted design standards and include the appropriate travel lanes to support traffic associated with project buildout. Additionally, on-street bike lanes and street-separated sidewalks for pedestrians are included in the ASI's roadway design and will be constructed in accordance with the City's requirements. Additional information about the City's roadway network and other transportation modes is outlined in Section 6.3 of this MSR.

2.3.D Animal Care

Animal Care services within the City of Sacramento are primarily operated from the Front Street Animal Shelter, located at 2172 Front Street. Unincorporated areas are served by the Sacramento County Animal Care and Regulation. Services provided include vaccination, spay and neuter, veterinary care, euthanasia, pet licensing, adoption, and boarding. The City funds its animal care services from its General Fund, which is supplemented by donations and fundraising efforts. Expansion of funding to support animal care facilities or services is decided by voters in local elections and in response to an increase in population.

Development of the ASI project would introduce a mix of industrial and commercial uses that will not impact capacity or demand for animal care services in the City of Sacramento. No improvements or extension to

animal care services in the City will be necessary as a result of the ASI project. Additional information about the City's animal care services is outlined in Section 6.4 of this MSR.

2.3.E Code Compliance

The Sacramento Code Compliance Division of the Community Development Department provides code enforcement services throughout the City. Its primary purpose is to preserve and enhance public health, safety, and welfare by addressing issues of blight and enforcing City and State codes. Code enforcement services are paid for by the City's General Fund. Development fees and property taxes generated by the ASI project will contribute to the General Fund, a portion of which is allocated to the Community Development department and the Code Compliance Division.

Development of the ASI project site with new commercial and industrial uses will be required by the City to meet all current Building Code and safety standards. As designed, the project will be structurally sound, clean, and free of hazards created by property neglect or blight. Upon buildout, business operations conducted at the project site will not require permits or licenses managed by the Code Compliance Division and the site is not anticipated to require Code Compliance services. Development of the ASI project is not anticipated to significantly impact the Code Compliance Division's service levels or require expansion of services or facilities, as the division predominantly carries out tasks related to degradation and blight of existing structures. Additional information about the City's code compliance services is outlined in Section 6.5 of this MSR.

2.3.F Law Enforcement

The City of Sacramento operates its law enforcement services from Police Headquarters at 5770 Freeport Boulevard and several substations throughout the City, each responsible for specific districts. Upon expansion of the SOI, the Airport South Industrial site would be served by the North Area Substation. Implementation of the ASI project will be subject to all applicable City regulatory requirements. This includes compliance with the laws set forth in Chapter 2.20 of the Sacramento City Code and with applicable Police Services policies contained in the City's General Plan.

Development of the ASI project site will be subject to Police Department review in order to implement appropriate Crime Prevention through Environmental Design principles. Development projects in the ASI area will be required to pay applicable development impact fees for the maintenance, improvement, and expansion of police facilities. The proposed development does not include residential uses or impact the City's resident population, therefore, the impact to calls for police services is anticipated to be minimal. Additional information about the City's law enforcement services is outlined in Section 6.6 of this MSR.

2.3.G Fire Protection

The Sacramento Fire Department (SFD) provides fire protection services to the entire City and some small unincorporated areas within the County that include Pacific-Fruitridge and Natomas Fire Protection Districts. The Fire Department headquarters are located at the Public Safety Center at 5770 Freemont Boulevard. There are 24 fire stations throughout the City, each operating within the specific response area immediately surrounding its station.

The SFD currently provides fire protection and emergency response services to the proposed ASI SOI expansion area. The ASI project would be primarily served by Fire Station #43, which is the nearest station to the project site. It is located approximately 2.5 miles to the southeast of the ASI project site at 4201 El Centro Road in unincorporated Sacramento County. Development projects in the ASI project area will be required to comply with State and local fire regulations as well as pay any City-adopted impact fees related to fire protection services, as outlined in the Sacramento City Code. Additional information about the City's fire protection services is outlined in Section 6.7 of this MSR.

2.3.H Solid Waste

The City of Sacramento's Recycling and Solid Waste Division collects residential solid waste generated throughout the City, including household waste, recycling, and organic wastes. Solid waste collected by the City is transported to the Sacramento County North Area Recovery Station (NARS), Sacramento Recycling and Transfer Station (SRTS), and various other facilities for processing, with most garbage being further

transported to the Sacramento County Kiefer Landfill for disposal. Private franchised commercial haulers service commercial and industrial properties in the City through an open market system. Commercial haulers send solid waste to a variety of facilities for processing, recycling, and disposal, including Sacramento County's Kiefer Landfill. It is estimated that the Kiefer Landfill should have capacity to serve the greater Sacramento area through the year 2052, and potentially through 2085.

Solid waste generated by construction and operation of the ASI project site will be collected by private commercial franchised haulers or self-hauled by subcontractors to a construction and demolition recycling facility. The franchised commercial waste hauling services in the City are adequate to support solid waste generated by the industrial and commercial operations of the proposed ASI project. Additional information about the solid waste services in the City is outlined in Section 6.8 of this MSR.

2.3.I Storm Drainage and Flood Control

The ASI project/SOI expansion area is located in the Natomas Basin, a 55,000-acre, 15-mile-long basin that has historically experienced flooding from the Sacramento and American Rivers. The Natomas Basin has been outfitted with levees, internal drainage channels, and pump stations to make the land useable for agricultural purposes and development. The Natomas Basin is under the jurisdiction of the United States Army Corps of Engineers (USACE). As a result of the USACE's 2008 action to decertify the basin's levees, the Sacramento Area Flood Control Agency (SAFCA) and the USACE have been, and currently are, working together to design, fund, and construct levee improvements that will provide the Natomas Basin with 200-year flood protection.

The ASI project site is served by Reclamation District 1000 (RD 1000), which provides drainage, flood control, and levee maintenance. RD 1000 maintains regional drainage facilities both adjacent to, and within, the ASI project site, which convey off-site stormwater runoff to pumping facilities where it is discharged into the Sacramento River.

Stormwater drainage services for the ASI project will be provided by the City of Sacramento and RD 1000 in a similar manner as is currently performed in North Natomas and other areas of the Natomas Basin. The ASI project's on-site drainage systems have been designed to mitigate post-project runoff levels to be equal to, or less than, pre-project levels, consistent with RD 1000's requirements. This includes a system of detention/retention basins, pumping facilities, and weirs that connect the on-site system with RD 1000's system. Additional information about the City's storm drainage and flood control systems is outlined in Section 6.9 of this MSR.

2.3.J Parks and Recreation

The City of Sacramento maintains a network of parks, open spaces, and recreation areas throughout the City, which includes over 234 parks/facilities on over 4,360 acres of parks, parkways, and open space areas Citywide. A variety of recreation programs are available to residents, operated at park sites and community centers throughout the City. The City of Sacramento is currently updating its Parks and Recreation Master Plan as part of the 2040 General Plan Update. Utilizing both professional expertise and community feedback, the updated Master Plan will evaluate current park conditions and potential areas for improvements to park facilities and recreation programs.

Demand for parks and recreation in the City is primarily generated by an increase in population resulting from the development of new housing units. The commercial and industrial uses planned for the ASI project are not anticipated to impact existing parks in the area and will not add to parks and recreation service level needs. Additional information about the City's parks and recreation facilities is outlined in Section 6.10 of this MSR.

2.3.K Libraries

The Sacramento Public Library (SPL) system includes 28 locations serving the City of Sacramento, Citrus Heights, Elk Grove, Galt, Isleton, Rancho Cordova, and the County of Sacramento. The public library system provides book lending, education programs, and welcoming community spaces. Because development of the ASI project site with commercial and industrial uses will not increase the City's residential population, it is not expected that the City's existing library services will be negatively impacted. Therefore, no expansion

of current library resources is warranted by the proposed project. Additional information about the City's library facilities is outlined in Section 6.11 of this MSR.

2.3.L Electricity & Natural Gas

The Sacramento Municipal Utility District (SMUD) provides electrical service to the City of Sacramento and most of Sacramento County, with electricity sourced from a combination of hydroelectric, thermal (natural gas), wind, and solar resources. Pacific Gas & Electric (PG&E) supplies natural gas to the Sacramento area. The City of Sacramento implements local regulations and programs that are designed to conserve energy, incorporate sustainable, green building practices into new construction, and to achieve zero net energy consumption in new construction by the year 2030.

Upon buildout of the ASI project, SMUD-supplied electricity infrastructure and PG&E natural gas service lines will be extended to the project site in order to provide electricity and natural gas services. Local regulations for energy efficiency in new construction will be applied as individual buildings on the project site are constructed. Additional information about the City's electric and natural gas utilities is outlined in Section 6.12 of this MSR.

2.4 FINANCIAL ABILITY TO PROVIDE SERVICES

City revenues are generated from a variety of sources and continually distributed to specific funds in order to provide municipal services. Revenue sources include governmental funds like the General Fund and the Measure U Fund (generated by a City sales tax), Special Revenue Funds, Debt Service Funds, Capital Projects Funds, Enterprise Funds, Internal Service Funds, and Fiduciary Funds. The City's Operating and Capital Improvement Program (CIP) Budgets allocate funding for city staffing positions as well as major projects related to the delivery of municipal services and infrastructure/facility needs.

SacSewer generates the majority of their operating revenue from monthly service charges, with the remainder collected from sewer impact fees and other fees. SacSewer operates with a balanced budget and is able to support new service areas through the collection of monthly fees from new service customers as well as impact fees collected during development.

A Public Facilities Finance Plan (PFFP) has been prepared for the proposed ASI project. The PFFP identifies costs for backbone infrastructure improvements, public facilities, and other developer obligations. It also identifies funding sources and strategies to extend utilities and associated municipal services to the proposed SOI expansion area. As shown in the PFFP, the various funding sources derived from development of the ASI project are sufficient to cover costs of backbone infrastructure, public facilities, and other developer obligations. A detailed assessment regarding the financial ability of the City, and SacSewer to provide municipal services is outlined in Section 7 of this MSR.

2.5 SHARED FACILITIES

The City aims to optimize efficiency and funding allocations for municipal services by identifying opportunities for shared facilities. As the City expands its Sphere of Influence and annexes additional land areas into its City limits, it becomes responsible for providing municipal services and public facilities to these areas that were previously served by the County and/or other special districts. The combination of department and agency efforts and resources where possible minimizes costs by reducing redundancies. Shared facilities throughout the City include flood control, library services, and public safety services for police and fire. The City cooperatively partners with other agencies and special districts to provide a comprehensive level of municipal services, which includes several types of shared resources and facilities. Formerly, Regional San and SacSewer shared facilities and infrastructure to operate a local to regional cooperative system for wastewater collection and treatment which has now been consolidated into one district known as SacSewer. A detailed assessment regarding their facilities is outlined in Section 8 of this MSR.

2.6 GOVERNMENT STRUCTURE AND ACCOUNTABILITY

The City of Sacramento's governmental structure has a long-standing history of public/citizen interaction. The Mayor, City Council, City Manager, appointed Commissions and Staff put forth a strong effort to ensure that the citizens of Sacramento, other local, State and Federal governmental agencies, special interest groups and labor unions are fully involved in the City's decision-making process. Staffing levels are reviewed annually through the budget process to ensure that staffing meets anticipated service needs and the City Council priorities. This process allows for staffing adjustments to be made in order to provide for the expansion of municipal services to the SOI expansion area. Additionally, through the City's annual budget process, each department is required to review its current operations and evaluate opportunities to implement changes that enhance their operational efficiencies.

The City of Sacramento provides municipal services that will meet the future needs for the ASI project. Where the City is not the lead provider of a service, other agencies/districts, such as SacSewer, will provide services consistent with current practices within the City.

With development of the proposed ASI project, municipal services will be extended to the project site in order to meet its service requirements. As development proceeds, the City, and SacSewer have the ability to make any necessary adjustments to staffing or facilities, which would be addressed during their respective budget processes. These service providers' existing governmental processes designed to provide levels of review and public input will be maintained in the process of expanding services to the proposed SOI expansion area. This is already weaved into the operations of SacSewer through their transparent government structure which facilitates public involvement. A detailed assessment regarding the City's government structure is outlined in Section 9 of this MSR.

2.7 OTHER MATTERS RELATED TO EFFECTIVE SERVICE DELIVERY

The application to expand SacSewer, and the City of Sacramento's Spheres of Influence (SOI) to include the ASI project site has been submitted to the Sacramento Local Agency Formation Commission (LAFCO) for consideration. As such, LAFCO policies must be applied to the proposed project to ensure that the request is reviewed with public transparency and that the availability of municipal services and potential environmental impacts are evaluated. Prior to approval of the City's request to expand its existing SOI, LAFCO must find that the proposed project is consistent with Sacramento LAFCO's policies regarding Sphere of Influence amendments. A detailed assessment regarding other matters related to effective service delivery is outlined in Section 10 of this MSR.

2.8 CONCLUSIONS

This MSR has been prepared to assist Sacramento LAFCO in its evaluation of a SOI Amendment application for the proposed ASI project. It complies with the Cortese-Knox-Hertzberg Act and it evaluates existing and future service conditions for the following public service/issue areas: Population, Housing, and Employment Growth Projections; Disadvantaged Communities; Public Facilities and Services; Financial Ability to Provide

Services; Shared Facilities Opportunities; Government Structure and Accountability; and Other Matters Related to Effective Service Delivery. Based on the information contained in this MSR, the following key findings can be made:

- The City of Sacramento is expected to continue growing, by adding jobs, housing, and a residential population.
- No defined disadvantaged communities are located on, or adjacent to, the project site.
- The City of Sacramento, in tandem with other agencies and districts such as SacSewer, have the ability to expand their public facilities and municipal services to the proposed SOI expansion area in order to serve development of the proposed ASI project.
- The City of Sacramento, and SacSewer operate with a balanced budget, and as outlined in the ASI Public Facilities Financing Plan, have the financial ability to provide municipal services to the proposed ASI project.
- The City of Sacramento, and SacSewer actively pursue opportunities to enhance its operational efficiencies, and as such, cooperatively partners with other agencies and special districts to provide a comprehensive level of municipal services, which includes several types of shared resources and facilities.
- The City of Sacramento, and SacSewer operate with a transparent governmental structure that emphasizes public involvement in their decision-making processes.
- The proposed project is consistent with the policies that LAFCO is required to apply to an application for a SOI Amendment.

3. Project Description & Relationship to Sacramento General Plan

3.1 AIRPORT SOUTH INDUSTRIAL PROJECT SITE

The Airport South Industrial (ASI) project site and Sphere of Influence (SOI) amendment area consists of approximately 472.4 acres in an unincorporated area of the County of Sacramento, immediately northwest of the City of Sacramento's corporate boundary. The site is located south of Interstate 5 (I-5), southeast of the intersection of Powerline Road and I-5 in Sacramento County, California.

Key features adjacent to the project site include I-5 to the north, the Reclamation District 1000 (RD 1000) West Drainage Canal to the south, Powerline Road to the west, and a 200' buffer and the North Natomas Westlake Subdivision to the east. The project site is located south of Metro Air Park (MAP) and the new Metro Air Parkway/I-5 interchange, southwest of the City of Sacramento's Greenbriar development (now known as Northlake), and west of the existing Westlake subdivision adjacent to the current City of Sacramento boundary. The proposed SOI expansion area for the ASI project is identified on Figure 1.

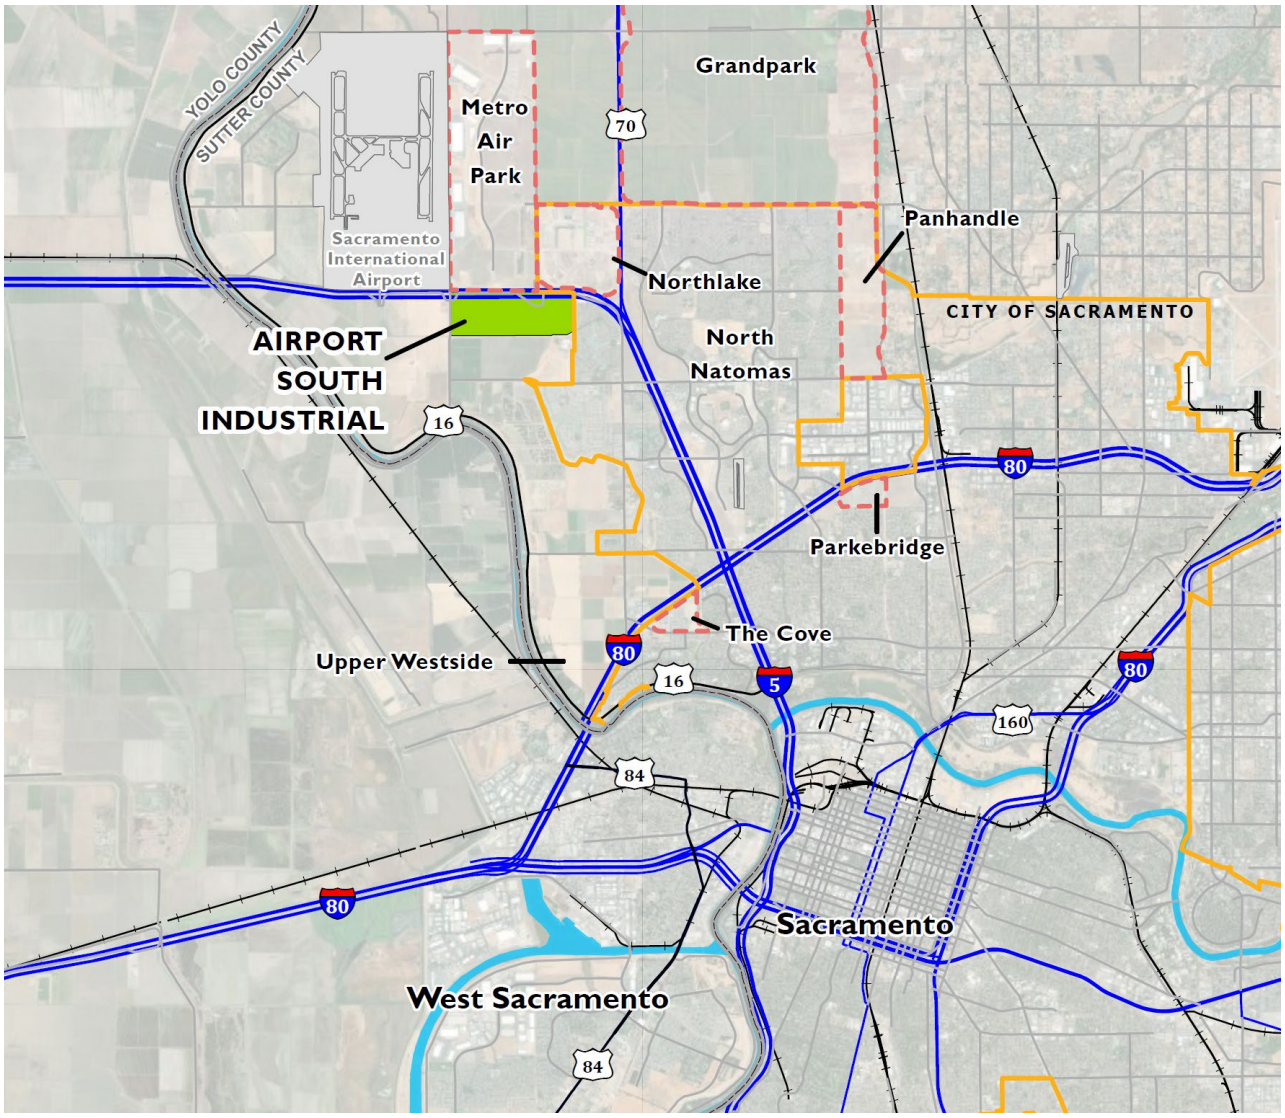

Figure 1: Airport South Industrial Study Area

3.2 SACRAMENTO GENERAL PLAN

The City of Sacramento 2035 General Plan was adopted in March 2015 in compliance with the requirements of California Government Code Section 65300 et seq. At a high level, it defines the City's roadmap to achieving Sacramento's vision to be the most livable city in America. The General Plan is a legal document and much of its content is established by statutory requirements relating to background data, analysis, maps, and exhibits. The 2015 General Plan Background Report provides much of the baseline data and existing conditions information that was used to form the goals, policies, and implementation programs of the 2035 General Plan. The City is currently in the process of updating its General Plan (GPU) with a new horizon year of 2040. As part of this effort, a new Technical Background Report (TBR) for the City was prepared to provide data and information to inform the 2040 General Plan's policy framework. While the GPU has not yet been adopted and therefore cannot be used to provide policy guidance for this MSR, the updated TBR was completed in November 2020 and provided much data and information needed for this MSR. The TBR provides a "snapshot" of Sacramento's current trends and conditions and provides a detailed description of a wide range of topics within the City, such as demographics, economic conditions, land use, public facilities, and environmental resources. Together, these resources provide much of the data used in the preparation of this MSR.

A "Targeted Municipal Services Review" (MSR) has been prepared for the Airport South Industrial Project (ASI). The document is considered a targeted MSR because it is project specific. The project site is approximately 472.4 acres in size and is bounded by Interstate 5, Powerline Road, RD-1000 canals, and City owned property, nearby open space, existing residential and Sacramento International Airport owned lands. The Sphere of Influence Amendment being proposed for the ASI Project is limited to the 475 acres that makes up the project site. As such, it was determined in consultation with LAFCo staff that a targeted project specific MSR was the appropriate document to prepare for the ASI Project. Additionally, the City's 2040 General Plan Update (2040 GPU) will include an implementation measure that a citywide MSR will be prepared for the City of Sacramento.

3.3 PROJECT DESCRIPTION

The Airport South Industrial project is a non-residential development proposal located south of Interstate 5, east of Powerline Road, and immediately west of the City of Sacramento's corporate boundary. The project site is located in unincorporated Sacramento County and is proposed to be annexed into the City of Sacramento and into the service boundaries of SacSewer. Primary access to the site is available from Metro Air Parkway at the I-5 interchange, with secondary access points via South Bayou Way and Power Line Road. The proposed project is approximately 472.4 acres in size and includes an amendment to the City's existing Sphere of Influence (SOI) and SacSewer service areas. Th project site is inclusive of the State of California (Caltrans) lands measured roughly to the center of I-5, and also includes the south approximate one-half of the new Metro Air Park interchange. The project site's west boundary extends to the approximate centerline of Power Line Road.

The proposed project would allow development of an industrial park and highway-commercial land uses. Industrial uses would consist of a mixture of warehouse, distribution facilities, and similar uses. Commercial uses would allow of a mixture of restaurant, hotel, fueling station, car wash, and similar uses. Public facilities, including on-site roadways, utilities, a sewer pump station, and stormwater detention basins/pumping facilities, are also incorporated into the proposed project. At buildout, developed land uses would provide up to approximately 6,609,300 sq. ft. of industrial uses and 98,200 sq. ft of commercial uses.

A preliminary site plan for the proposed project is included as Appendix A.

4. Population, Housing & Employment Growth

4.1 HISTORICAL GROWTH PATTERNS

The Sacramento region is an economic node in Northern California and has undergone significant changes since the 1950's when the local economy was based on agriculture and food processing, State government, and military base activity. Through the 1970s, the region retained a rural character and was considered a low-cost alternative to the Bay Area. The 1980's marked a major turning point for the region, with diversification through growth in electronics, scientific and health products, tourism, and software, which resulted in significant growth in the region's population, services-sector, and construction jobs. During the 1990's and early 2000's, the region's pace of growth surpassed that of the state, the Bay Area and the San Joaquin Valley. *(City of Sacramento, General Plan Background Report (March 2015), pp. 2-179)*

4.1.A Population Characteristics

Sacramento's population has grown steadily since 1990, largely supported by development of North Natomas, South Natomas, the South Area, and other large tracts of undeveloped land. Development in these greenfield areas primarily consists of conventional suburban family housing, in line with the population trends during the 1990's of increasing household size. As of April 1, 2010, Sacramento's population was 466,488 and the City's growth rate since 1990 has more or less equaled the overall growth in the state of California, with a slightly slower rate of growth from 1990-2000 and slightly faster rate of growth from 2000-2010. Additionally, the growth rate was slightly higher prior to the recession commencing in 2008 (1.5 percent), and in subsequent years (2008-2012) decreased significantly (0.6 percent). *(City of Sacramento, General Plan Housing Element, December 17, 2013, pp. H 3-3)* Since 2010, the City's rate of population growth was generally consistent with statewide growth, but its rate was slightly lower than surrounding areas in the region. Population growth since 2010 was primarily focused in new development areas including North Natomas and the North Sacramento Community Plan Area, and the central City. *(City of Sacramento, bae urban economics, Market Demand Study | Sacramento General Plan Update, July 23, 2019, p. i)* Between 2010 and 2018, the City's residential population grew by approximately 34,180 people, which represents a 7.3% increase. Compared to statewide population growth, Sacramento continues to surpass the statewide growth rate significantly. *(City of Sacramento, bae urban economics, Market Demand Study | Sacramento General Plan Update, July 23, 2019, pp. 3-4)* As of January 1, 2021, the City's population was estimated to be 515,673. *(City of Sacramento, 2022/2033 Proposed Budget, April 2022, p. 18; City of Sacramento, FY2022/23 Approved Budget)* Population changes for the City of Sacramento as compared to the County and the State for the time period between 1990 and 2019 are summarized in the table below.

Table 1: Historical Population Growth

Area	City of Sacramento	County of Sacramento	State of California
Total Population			
1990	369,365	1,041,218	29,760,021
2000	407,018	1,223,499	33,871,648
2010	466,488	1,418,788	37,253,956
2019	508,172	1,546,174	39,557,045
Population Changes			
1990-2000	37,653	182,281	4,111,627
Avg. Annual Change	1.0%	1.8%	1.4%
2000-2010	59,470	195,289	3,382,308
Avg. Annual Change	1.5%	1.6%	1.0%
2010-2019	41,684	127,386	2,303,089
Avg. Annual Change	1.0%	1.0%	0.7%
1990-2019	138,807	504,956	9,797,024
Avg. Annual Change	1.3%	1.7%	1.1%

(City of Sacramento, General Plan Housing Element, August 17, 2021, pp. H-1-2)

4.1.B Housing Stock

Sacramento's stock of housing has grown year over year since 1990. Between 1990 and 2006, the City issued, on average, roughly 1,900 residential permits per year, exhibiting some similar development patterns as the region. Housing construction in the City of Sacramento between the years 2000 and 2010 resulted in nearly 32,000 additional housing units, most of which was located in North Natomas. Of this new housing, approximately 20,000 units consisted of single-family homes and 11,000 units consisted of multi-family dwellings. The housing growth over this period represented the City's highest rate since the 1950s. *(City of Sacramento, General Plan Housing Element, August 17, 2021, pp. H-1-13)* The rate of housing construction was significantly less between 2007 and 2012 as a result of a recession. During this period, the City produced only about 800 units per year. *(City of Sacramento, General Plan Background Report (March 2015), pp. 2-196)* However, in 2012, a renewed interest in new home lots and an increase in new home sales signaled a rebound in home construction. *(City of Sacramento, General Plan Background Report (March 2015), pp. 2-197)*

The table below shows the housing growth over the decades spanning 1990 and 2020. Of the unit totals, approximately 66% of Sacramento's housing stock is comprised of single-unit homes, with the remaining 34% comprised of multi-unit units. The City's share of multi-family housing is higher than the County's average of 29% and its largest concentration is located in the Central City area, which accounts for approximately 81% of this area's housing.

Table 2: Historical Housing Growth

Housing Growth by Decade	1990	2000	2010	2020
Total Housing Units	153,362	163,914	190,911	198,971
Additional Units Over 10 Years Prior		10,552	26,997	8,060
Percent Change Over 10 Years Prior		6.9%	16.5%	4.2%

(City of Sacramento, General Plan Housing Element, August 17, 2021, pp. H-1-13)

4.1.C Employment

Large employment sectors in the Sacramento region consist of state government and related industries, health services, financial services, and retail. Sacramento is also increasingly capturing new jobs in the technology and energy industries. The City's current and expanding employment base has a direct effect on the City's

housing needs and creates a positive effect to the City's employment/ housing/ population balance. *(City of Sacramento, General Plan Housing Element, December 17, 2013, pp. H 3-14)*

As a result of an economic recession, the entire Sacramento region lost nearly 100,000 jobs between 2006 and 2011, which impacted the City's employment base and job availability. During this timeframe, the region lost some specialization in financial services and construction, but maintained professional & business services and gained in government. *(City of Sacramento, General Plan Background Report (March 2015), pp. 2-244)*

In 2010, the City had approximately 250,570 jobs and employment grew to approximately 302,110 jobs by 2017 with post-recession growth. Over this timeframe, the City of Sacramento's employment base grew by nearly 21%, averaging an additional 7,360 jobs per year. Annually, this equates to an average growth rate of 2.7%. Additionally, the City captured approximately 42% of the region's employment growth, indicating that the City has maintained and strengthened its position as a major employment center in the region. *(City of Sacramento, bae urban economics, Market Demand Study | Sacramento General Plan Update, July 23, 2019, p. 19)*

The City's primary jobs base continues to be concentrated in the government sector. As of 2017, nearly 120,000 jobs, or approximately 39% of the City's entire employment base, consisted of jobs in the Local, State and Federal government sector. The second-highest employment sector is healthcare and social assistance, with approximately 38,000 jobs that comprise nearly 13% of the City's employment base. Comparing employment sectors for the period between 2010 and 2017, the City's largest employment gains were in health care and social assistance, administration and waste services, accommodation and food services, and local government. While some sectors experienced significant job growth, two sectors, State government and educational services, experienced a loss of jobs in the City. *(City of Sacramento, bae urban economics, Market Demand Study | Sacramento General Plan Update, July 23, 2019, p. 19)* A comparison of the City's employment growth by industry sector for the period between 2010 and 2017 is summarized in the table below.

Table 3: Historical Employment by Sector

Employment	2010		2017		Absolute	Avg. Annual
	Jobs	% of Total	Jobs	% of Total	Change	Change
Sector Type						
Agriculture, Forestry, Fishing and Hunting	135	0.1%	116	0.0%	-19	-2.1%
Mining, Quarrying, and Oil and Gas Extraction	n/a	n/a	10	0.0%	n/a	n/a
Utilities	32	0.0%	98	0.0%	66	17.3%
Construction	7,096	2.8%	10,848	3.6%	3,752	6.3%
Manufacturing	6,403	2.6%	7,571	2.5%	1,168	2.4%
Wholesale Trade	5,027	2.0%	7,788	2.6%	2,761	6.5%
Retail Trade	15,790	6.3%	19,470	6.4%	3,680	3.0%

TOTAL	**250,571**	**100%**	**302,111**	**100%**	**51,540**	**2.7%**

(City of Sacramento, bae urban economics, Market Demand Study | Sacramento General Plan Update, July 23, 2019, p. 21)

4.2 GROWTH PROJECTIONS

Population, housing, and employment growth in the City of Sacramento and the surrounding region is expected to continue at a pace similar to historical trends. Projections for each of these subsets is summarized below.

4.2.A Population

As of 2019, the City of Sacramento was estimated to have a population of 508,172. *(City of Sacramento, General Plan Housing Element, August 17, 2021, pp. H-1-1)* The Sacramento Area Council of Governments (SACOG) routinely updates its growth projections for the six-county region. The City's growth rate since 1990 has more or less equaled the overall growth in the State of California, with a slightly slower rate of growth from 1990-2000 and slightly faster rate of growth from 2000-2019. SACOG estimates that the City will continue to add new residents at a rate of approximately 1.1% per year through the year 2040, which would increase Sacramento's population by approximately 140,000. *(City of Sacramento, General Plan Housing Element, August 17, 2021, pp. H-1-1)* By the year 2040, SACOG's projections indicate that the City's population will reach 618,439 people. *(SACOG, SACOG 2020 MTP/SCS Modeling Projections for 2016 and 2040 (https://www.sacog.org/post/sacog-2020-mtpscs-modeling-projections-2016-and-2040), 2021)*

4.2.B Housing

Based on SACOG's estimates in their 2020 MTP/SCS, the City of Sacramento is expected to have approximately 261,000 housing units by the year 2035. This accounts for approximately 20% of the region's housing growth by this horizon. This projection also suggests that by 2035, approximately 50% of the City's units will be multifamily. *(City of Sacramento, General Plan Background Report (March 2015), pp. 2-198-199)* By the year 2040, SACOG estimates that the City's housing stock will increase to 266,781 units. *(SACOG, SACOG 2020 MTP/SCS Modeling Projections for 2016 and 2040 (https://www.sacog.org/post/sacog-2020-mtpscs-modeling-projections-2016-and-2040), 2021)* Due to the differences in the data sources, the City and SACOG have slightly different housing projections, which are represented over different timelines. Despite these differences, both continue to project that housing growth will continue in the City.

4.2.C Employment

Approximately 299,732 jobs were available in the City of Sacramento in 2008. *(City of Sacramento, General Plan Housing Element, December 17, 2013, pp. H 3-14)* By 2016, the City's employment increased to 308,724 jobs, a time period that included an economic recession in which the Sacramento region lost jobs between 2006 and 2011, before employment began rebounding in 2012. Compared to 2016, SACOG's forecasting indicates that the City will experience an 18% increase in its employment base by 2040, resulting in an estimated 364,819 jobs, an increase of approximately 56,000 jobs in this time period. *(SACOG, SACOG 2020 MTP/SCS Modeling Projections for 2016 and 2040 (https://www.sacog.org/post/sacog-2020-mtpscs-modeling-projections-2016-and-2040), 2021)* This translates to a job growth rate of approximately 0.7% per year. SACOG estimates that the City's job growth will occur at a slower rate compared to the entire Sacramento region, where employment growth could add approximately 252,840 new jobs over this period at a rate of roughly 0.9% per year. *(City of Sacramento, bae urban economics, Market Demand Study | Sacramento General Plan Update, July 23, 2019, p. 90)*

Over this time period, the office employment sector is anticipated to experience the largest gains, resulting in approximately 15,225 new jobs, at a rate of 1.2% annually. Other employment areas that are anticipated to experience significant job gains include the medical, government, and retail sectors. *(City of Sacramento, bae urban economics, Market Demand Study | Sacramento General Plan Update, July 23, 2019, p. 91)* The table below summarizes the City's employment growth projections for various employment sectors during the period spanning 2016 and 2040.

Table 4: Employment Growth Projections by Sector

Employment	2016		2040		Absolute Change	Avg. Annual Change
	Jobs	% of Total	Jobs	% of Total		
Sector Type						
Education	14,257	4.6%	18,753	5.1%	4,490	1.1%
Food	20,583	6.7%	24,476	6.7%	3,884	0.7%
Government	52,622	17.0%	60,807	16.7%	8,165	0.6%
Office	82,549	26.7%	97,805	26.8%	15,225	0.7%
Retail	31,266	10.1%	37,067	10.2%	5,788	0.7%
Services	28,689	9.3%	33,645	9.2%	4,945	0.7%
Medical	27,941	9.1%	41,177	11.3%	13,222	1.6%
Industrial	30,656	9.9%	31,043	8.5%	377	0.1%
Other	20,171	6.5%	20,177	5.5%	0	n/a
TOTAL	**308,735**	**100%**	**364,949**	**100%**	**56,214**	**0.7%**

(City of Sacramento, bae urban economics, Market Demand Study | Sacramento General Plan Update, July 23, 2019, p. 92)

4.3 RESIDENTIAL LAND BUILDOUT POTENTIAL

SACOG establishes the City of Sacramento's requirement to provide its share of the region's housing need through its Regional Housing Needs Allocation (RHNA). For the period of 2021-2029, SACOG determined that the City of Sacramento's RHNA is 45,580 units. *(SACOG, Regional Housing Needs Plan (2021-2029), March 2020, pp. 4-3)* This equates to a yearly average of 5,581 housing units that the City must plan to accommodate between the period spanning June 30, 2021 through August 31, 2029. Based on its assessment of available residential capacity within the City, there is a total capacity for 51,191 housing units within planned residential developments and master planned communities, as well as on vacant land and underutilized sites. This capacity is sufficient to accommodate the RHNA of 45,580 units. *(City of Sacramento, General Plan Housing Element, August 17, 2021, p. 18)*

4.4 DETERMINATIONS

Based on the information above, the following determinations can be made:

- → Sacramento's population has grown steadily since 1990 and its growth rate since 1990 is approximately equal to the State of California's rate, with a slightly slower rate of growth from 1990-2000 and slightly faster rate of growth from 2000-2018.
- → Large employment sectors in Sacramento consist of state government and related industries, health services, financial services, and retail, and the City is increasingly capturing new jobs in the technology and energy industries. The region's current and expanding employment base has a direct effect on the City's housing needs.
- → Sacramento's stock of housing has also grown since 1990, with nearly 27,000 additional housing units added between the years 2000 and 2010, then slowing during an economic recession before a home construction rebound commenced in 2012. By 2020, approximately 8,000 additional units were constructed, resulting in a total Citywide housing stock of 198,971 units.
- → Sacramento's population is forecasted to increase by 1.1% annually between the years 2020 and 2040, with a housing stock of approximately 266,781 units by the year 2040.
- → Employment growth is expected to continue with an approximate 0.7% annual increase in jobs expected between 2020 and 2040, with total employment reaching an estimated 364,949 jobs by the year 2040.

5. Disadvantaged Communities

5.1 OVERVIEW

Legislation regarding Disadvantaged Unincorporated Communities (DUCs) in the State of California became effective in 2012 with the passage of Senate Bill 244 (SB 244) on October 7, 2011. SB 244 is intended to promote infrastructure improvement investments in DUCs by establishing new requirements for LAFCOs to identify DUCs and to consider provision of water, wastewater and fire protection services for these areas.

DUCs are broadly defined as inhabited territory, pursuant to California Government Code Section 56046, or as determined by commission policy, that constitutes all or a portion of a "disadvantaged community" as defined by Section 79505.5 of the Water Code. As more specifically defined, a DUC consists of at least 10 dwelling units in a fringe, island, or legacy community where the median household income is 80 percent or less of the State's established median household income. An unincorporated fringe community is considered any inhabited and unincorporated territory that is within a City's SOI. An unincorporated island community is defined as any inhabited and unincorporated territory that is surrounded/substantially surrounded by the boundary of one or more cities, counties, or the Pacific Ocean. An unincorporated legacy community is one that is geographically isolated that has been inhabited and/or existed for at least 50 years.

The proposed ASI SOI expansion area is not developed and is located in unincorporated Sacramento County, however it lies adjacent to a portion of the western edge of Sacramento's City limits. The area surrounding the proposed SOI expansion area consists of a combination of undeveloped/vacant land and developed residential neighborhoods. To the east of the proposed expansion area, existing development consists of single-family residential neighborhoods that are part of a gated community in the City of Sacramento. To the north of the proposed SOI expansion area, across I-5, existing and planned development consists of non-residential, industrial/warehousing uses within the Metro Air Park. To the south and west of the proposed SOI expansion area, land is vacant and a portion of these areas are designated for permanent open space for natural resources. None of these surrounding areas meet the definition of a DUC.

5.2 DETERMINATIONS

Based on the information above, the following determination can be made regarding disadvantaged communities:

→ There are no disadvantaged unincorporated communities within, or adjacent to, in the proposed ASI SOI expansion area.

6. Public Facilities & Services

The City of Sacramento provides a comprehensive level of municipal services including water, wastewater, solid waste, storm drainage, law enforcement, fire protection, transportation and street maintenance, parks and recreation, library, and general governmental services. The City also has a Capital Improvement Program for the advancement of its public facilities and services. This subsection addresses the current and planned availability of the City's various municipal services and public facilities.

6.1 WATER

Potable water supply for the City of Sacramento is sourced from the Sacramento River, the American River, and several groundwater wells located in the North and South American Subbasins. The City operates and maintains its water infrastructure network throughout the City, which consists of water treatment facilities, groundwater wells, pumping facilities, storage tanks, and transmission/distribution pipelines.

6.1.A Existing Levels of Service and Improvements

Water Service Area

The City of Sacramento is both a water retailer and a water wholesaler and it maintains facilities that produce, treat, store, and deliver drinking water to its customers. The City's retail water service area is approximately 101 square miles in size, which serves customers predominantly located within the City's corporate limits and foreseeable future City expansions. The City also serves a small number of customers outside its limits in an adjacent, unincorporated portion of Sacramento County. In addition, the Sacramento Power Authority's (SPA) Cogeneration (Cogen) Facility is located outside of the City limits and currently receives potable water from the City and recycled water through a partnership with the Regional Sanitation District. The City also provides wholesale water service to other agencies from its entitlements. Wholesale customers include Sacramento County Water Agency (including the Sacramento International Airport), Sacramento Suburban Water District, and California American Water Company. Additionally, the City "wheels" water to Sacramento County Water Agency Zone 40 by using that agency's water supply entitlements.

The City holds rights to divert surface water from both the Sacramento River and the American River, which is treated via the Sacramento River Water Treatment Plant and the E.A. Fairbairn Water Treatment Plant. The City also produces water from its groundwater wells that are located throughout its water service area. A citywide network of water pipelines, tanks, and pumping facilities is operated and maintained in order to deliver water to the City's retail and wholesale customers. *(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. ES-2)*

Surface Water Supply

The City has relied on river water for its primary source of supply since 1854 and among other rights claims pre-1914 rights to divert water from the Sacramento River. The City holds five (5) water rights permits: one (1) for diversion of Sacramento River water and four (4) for diversion of American River water. *(City of Sacramento, Urban Services Management Plan, November 2006, pp. 4-1)* Based on the above-described agreements with the United States Bureau of Reclamation (USBR), the City can divert up to 245,000 acre-feet per year (AFY) from the American River and up to 81,800 AFY from the Sacramento River. Combined, the City of Sacramento is permitted to divert up to 326,800 AFY annually for its water supply portfolio. The City's water rights, in conjunction with its USBR agreements, provide the City with a very reliable and secure surface water supply. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-31)*

Table 5: Projected Annual Surface Water Supply

	Projected Water Supply Volume				
Water District	**2025**	**2030**	**2035**	**2040**	**2045**
Sacramento River	81,800	81,800	81,800	81,800	81,800
American River	228,000	245,000	245,000	245,000	245,000
TOTAL	**309,800**	**326,800**	**326,800**	**326,800**	**326,800**

(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 6-9)

In 1957, the Bureau of Reclamation (Bureau) and the City of Sacramento executed a water rights settlement contract, which among other provisions, provides that:

- → The Bureau agreed to regulate flows at Folsom Reservoir so as to assure the City's ability to divert up to 245,000 acre-feet/year under the City's American River water rights and to operate Central Valley Project (CVP) reservoirs so as not to interfere with the City's exercise of its Sacramento River water rights.
- → The City agreed to limit its total diversion rates, including direct diversions and re-diversions of stored water release from upstream reservoirs, to 225 cfs of Sacramento River water and 675 cfs of American River water.

- The City agreed to limit its total diversions from the Sacramento and American rivers to 326,800-acre feet/year.

(City of Sacramento, General Plan Background Report (November 2020), pp. 4-30)

Under the Water Forum Agreement, the City has agreed to restrict its diversions out of the expanded Fairbairn Water Treatment Plant (FWTP) during periods when flows in the Lower American River are less than the minimum flows specified by Judge Hodge in the Environmental Defense Fund vs. East Bay Municipal Utility District litigations (i.e., Hodge Flows). Water Forum conditions also include additional restrictions during extremely dry years (when March through November Folsom inflow is less than 400,000 AF). *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-31 to 4-32)*

Groundwater Supply

As of 2020, the City operated 26 permitted municipal groundwater supply wells within the City limits. These wells supply the City with approximately 20 million gallons per day (mgd) of reliable municipal water, which is pumped from the North American and South American Groundwater Sub Basins. The City's average groundwater deliveries between 2006 to 2017 was approximately 16 mgd. The City also operated 22 non-potable groundwater wells for park irrigation. The City is a member of both the Sacramento Groundwater Authority (SGA) and Sacramento County Groundwater Forum (SCGF). The SGA and SCGF share a common goal to responsibly manage the groundwater basin through a commitment to not exceed each basin's long-term sustainable yield. The SGA sustainable yield is estimated to be approximately 131,000 AFY and the SCGF sustainable yield is estimated to be approximately 273,000 AFY according to the Water Forum Agreement (WFA) and GMPs. The sustainable yields determined through the WFA provide for sufficient groundwater pumping to meet the projected level of groundwater demand through 2030. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-34 to 4-35)*

City Water Infrastructure Facilities

The City's water infrastructure network consists of two surface water treatment facilities, two pressure zones, and a supporting system of groundwater wells, pumping facilities, storage tanks, and distribution/transmission pipelines.

- **Water Treatment Facilities:** The City treats its surface water diversions at both the Sacramento River Water Treatment Plant (SRWTP) and the E.A. Fairbairn Water Treatment Plant (EAFWTP). The SRWTP treats Sacramento River water and has a maximum processing capacity of 160 million gallons per day (MGD). The City is permitted to operate this plant at 160 MGD in the summer months and 120 MGD in the shoulder months, however treatment capacity may be lowered to 135 MGD in the summer months if certain low-river levels occur. The City is evaluating the potential to increase this plant's diversion and treatment capacity to 310 MGD. The EAFWTP treats American River water and is currently rated for a diversion capacity of 200 MGD, with a permitted treatment capacity of 160 MGD. The EAFWTP was designed to be expanded in stages to an ultimate treatment capacity of 404 MGD. However, due to several factors, the EAFWTP's current reliable capacity during peak demand periods is 80 MGD, with the ability to operate at up to 100 MGD for short time periods. *(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 3-8)*
- **Pressure Zones:** The City's water distribution system is divided into two pressure zones. High service pumps at each treatment plant pumps water into the distribution system to create a pressure zone that serves most of the City. However, a second pressure zone is utilized for a small zone in the northeast area of the City. On average the City maintains approximately 45 pounds per square inch (psi) throughout its system with a minimum pressure threshold of 30 psi. *(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 3-9)*
- **Groundwater Wells:** The City currently operates and maintains 26 permitted groundwater wells in the North American Subbasin and 2 permitted wells in the South American Subbasin. Of these, 23 are operated regularly to supply municipal water. Additionally, the City operates 22 irrigation/park supply wells, and three recently-completed, but not-yet-permitted wells. The total maximum pumping capacity of all wells is approximately 23 MGD, but factoring in a reduced availability of well production, the total pumping capacity is approximately 14 to 20 MGD. *(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 3-9)*

- **Pumping Facilities:** The City operates and maintains a combined 18 high-lift service pumps at its water treatment plants and has capacity to add an additional 6 high-lift service pumps at the EAFWTP. Each storage reservoir includes pump stations to supply water to customers as demand varies. The City maintains one additional booster pump station to serve water in a small separated pressure zone in the northeast part of the City. *(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 3-9)*
- **Storage Tanks:** The City operates and maintains 17 water storage facilities. These include 12 reservoirs that are located throughout the City, and five finished water clearwells that are located at each water treatment plants. The system's total reservoir storage capacity is 49 million gallons (MG) and its total clearwell capacity is approximately 45 MG. *(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 3-9)*
- **Distribution/Transmission Pipelines:** The City maintains approximately 1,800 miles of transmission and distribution system mains throughout the City, which range in size between 2" and 72" in diameter. Of this network, approximately 415 miles of pipelines exceed 12" in diameter, while approximately 70% consists of 6" and 8" diameter pipelines. The City has one dedicated pipeline that conveys recycled water from the Sacramento Regional Wastewater Treatment Plant to the Sacramento Power Authority Cogeneration Facility. *(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 3-9)*

Project Site Water Infrastructure Facilities

The City of Sacramento operates and maintains a 30" water transmission main in South Bayou Way that terminates near the east edge of the ASI project site. This transmission main was originally constructed to "wheel" the City's water through the County of Sacramento to nearby development areas, including the Sacramento International Airport and Metro Air Park, both located in proximity to the project site.

Existing on-site water infrastructure includes a 16"/24" transmission main and a parallel 12" redundant main in South Bayou Way, which are operated and maintained by the County of Sacramento. These facilities extend westward into the site from a City/County metering station located immediately east of the project boundary. The County's system ties to other transmission mains that serve Metro Air Park and the Sacramento International Airport and includes a two, 1.4-million gallon water tanks that are located immediately west of the project site, near the southwest intersection of I-5 and Power Line Road.

Water Conservation

The City implements several water conservation measures to reduce potable water demand from customers. This is achieved primarily by applying several types of Demand Management Measures (DMMs) that are outlined in the City's Urban Water Management Plan. These DMM's enable the City to comply with the requirements of Senate Bill X7-7 through adoption of a Water Conservation Plan in 2013. This Plan established water conservation goals to help achieve a 20 percent reduction in urban per capita water use in California by the year 2020, which was established at 225 gallons per person per day by 2020. Based on the City's water service area population and water use in 2020, the City met and exceeded its water conservation target with a per capita water use of 169 gallons per person per day. *(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. ES-3)*

6.1.B Plans and Regulatory Requirements

There are numerous Federal, State, and local laws and regulations pertaining to water resources. These include the Federal Clean Water Act (CWA), Federal Safe Drinking Water Act (SDWA), and associated State regulations that implement these Acts.

State regulations addressing drinking water standards, including water treatment and quality, have been established by the State Department of Health Services (DHS) and are included in Title 22 of the California Code of Regulations (CCR). In addition, the City of Sacramento and the SOI expansion area are within the jurisdiction of the Central Valley Regional Water Quality Control Board (CVRWQCB), which is responsible for implementing the CWA at the State level. The CVRWQCB regulates discharges to surface water and groundwater through the establishment and enforcement of waste discharge requirements, as needed to prevent pollution or nuisance and implement water quality standards (Water Quality Control Plan for the Sacramento River Basin and San Joaquin River Basin). Water quality regulations are included in Title 27

of the CCR. The diversion and use of surface water supplies by jurisdictions is subject to applicable provisions of the California Constitution and State laws. The State Water Resources Control Board (SWRCB) is responsible for the administration of appropriative water rights acquired after 1914. In addition, surface water delivery requirements under various Federal and State programs (e.g., U.S. Bureau of Reclamation CVP, State Water Project, and CALFED) must also be considered in evaluating the availability of supplies.

The various plans and regulatory requirements for water resources are summarized in this sub-section.

Federal Requirements

U.S. Environmental Protection Agency (EPA). The EPA has established primary drinking water standards in Section 304 of the Clean Water Act (CWA). It requires that all States ensure that potable water for the public meets CWA standards, which includes standards for 81 individual constituents. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-38)*

State Requirements

Water Management Planning Act. California Water Code Section 10610 (et seq.) requires that all public water systems providing municipal water to more than 3,000 customers, or supplying more than 3,000 AFY, prepare an Urban Water Management Plan (UWMP). The Department of Water Resources (DWR) provides guidance to urban water suppliers in the preparation and implementation of UWMPs. UWMPs must be updated at least every five years on or before December 31, in years ending in five and zero. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-38)* The City adopted its most recent UWMP in June 2021.

Senate Bill 610 - Water Supply Assessments. Senate Bill (SB) 610 requires that water supply and demand analysis be conducted as part of a land use planning process. SB 610 amended the statutes of the Urban Water Management Planning Act, as well as the California Water Code section 10910 et seq. A Water Supply assessment (WSA) is required for projects of a certain size and must identify the total projected water supplies that will be available during normal, single dry and multiple dry water years during a 20-year projection. The foundation document for compliance with SB 610 is the UWMP. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-38)*

Senate Bill 221- Written Verification of Water Supply. Government Code Section 66473.7(a)(1) requires an affirmative written verification of sufficient water supply prior to approval of a tentative map for projects meeting a certain size threshold. This verification, like SB 610, must include documentation of historical water deliveries for the previous 20 years, as well as a description of reasonably foreseeable impacts of the proposed subdivision on the availability of water resources of the region. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-39)*

Drinking Water Quality. The California Department of Public Health (DPH) is responsible for implementing the Federal Safe Drinking Water Act of 1974 and its updates, as well as California statutes and regulations related to drinking water. DPH inspects and provides regulatory oversight for public water systems within California. In the Sacramento region, the Central Valley Regional Water Quality Control Board (CVRWQCB) is responsible for protecting the beneficial uses of the State's municipal drinking water supply. Public water system operators are required to regularly monitor their drinking water sources for microbiological, chemical, and radiological contaminants to show that drinking water supplies meet the regulatory requirements listed in Title 22 of the California Code of Regulations as primary maximum contaminant levels (MCLs). Public water system operators are also required to monitor for a number of other contaminants and characteristics that address the aesthetic properties of drinking water. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-39)*

Senate Bill X7-7. In February 2010, the 20x2020 Water Conservation Plan was released as part of an effort to reduce stress on the environment of the Sacramento-San Joaquin Delta. The plan outlines a statewide road map to maximize urban water efficiency and conservation. The draft of this plan served as the basis for Senate Bill X7-7 (aka the Water Conservation Act of 2009), which set a goal to achieve a 20 percent reduction in urban per capita water use in California by 2020. The law requires urban water suppliers to establish water conservation targets for the years 2015 and 2020. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-39)*

Assembly Bill 1465. Assembly Bill 1465 requires that urban water suppliers include their water demand management measures in the Urban Water Management Plan. Suppliers are required to describe

opportunities to offset potable water use by utilizing water that is already available through stormwater recapture or recycled water use. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-40)*

Sustainable Groundwater Management Act. Passed in September 2014, the Sustainable Groundwater Management Act (SGMA) was a legislative package comprised of three bills: AB 1739 (Dickinson), SB 1168 (Pavley), and SB 1319 (Pavley). The legislation provides a framework for sustainable management of groundwater supplies by local authorities, with a limited role for state intervention when necessary to protect the resource. The legislation provides a process and timeline for local authorities to achieve sustainable management of groundwater basins. In order to be in compliance with SGMA, agencies must form local Groundwater Sustainability Agencies (GSAs), which must adopt Groundwater Sustainability Plans (GSPs) which must implement specific sustainability goals within 20 years. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-40 to 4-41)*

Assembly Bill 1168 and Senate Bill 606. Passed in 2018, AB 1668 and SB 606 build on existing Senate Bill X7-7 and the goal to reduce urban per capita water use by 20 percent in California by the year 2020. Key elements of the laws include requirements to establish water use objectives and long-term standards for efficient water use that apply to urban retail water suppliers. The objectives are based on indoor residential water use, outdoor residential water use, commercial, industrial and institutional irrigation with dedicated meters, water loss due to leaks in water system pipes, and other unique local uses. AB 1668 provides standards for indoor residential water use, establishing a 55 gallons per capita per day (gpcd) standard until 2025, a 52.5 gpcd standard after 2025, and a 50 gpcd standard after 2030. SB 606 requires urban water suppliers to annually calculate actual urban water use and report to the Department of Water Resources, with the first report being due by November, 2023. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-41)*

Local Requirements

Water Forum Agreement. The City of Sacramento is a member of the Water Forum. The Water Forum is a diverse group of business and agricultural leaders, citizens groups, environmentalists, water managers and local governments in the Sacramento region. These stakeholders agreed to a series of actions, or elements, to achieve the Water Forum's two co-equal objectives. These include providing a reliable and safe water supply for the region's economic health and planned development to the year 2030; and preserving the fishery, wildlife, recreational and aesthetic values of the Lower American River.

Urban Water Management Plan. The City of Sacramento's 2020 Urban Water Management Plan (UWMP) was adopted in June 2021 as a means to assess the availability and reliability of its water supplies over a 20+ year horizon. The California Water Code specifies the requirements of an UWMP, including elements that address a water supplier's water supply sources, existing facilities, water usage, service reliability, drought risk, demand reduction measures, regulatory compliance, and other factors. The data in the City's UWMP was used for this MSR to identify the City's water demands at buildout and assess its ability to serve the SOI expansion area.

City of Sacramento General Plan. The City's 2035 General Plan contains policies and implementation measures relevant to water service. Applicable policies are summarized below:

- → **Policy U 1.1.1 Provision of Adequate Utilities** that requires the City to provide and maintain adequate water, wastewater, and stormwater drainage utility services to areas in the city currently receiving these services from the City, and to provide and maintain adequate water, wastewater, and stormwater drainage utility services to areas in the city that do not currently receive these City services upon funding and construction of necessary infrastructure.
- → **Policy U 1.1.4 Timing of Urban Expansion** that requires the City to assure that new public facilities and services are phased in conjunction with the approved urban development they are intended to serve.
- → **Policy U 1.1.5 Growth and Level of Service** that directs the City to require new development to provide adequate facilities or pay its fair share of the cost for facilities needed to provide services to accommodate growth without adversely impacting current service levels.
- → **Policy U 2.1.9 New Development** that requires the City to ensure that water supply capacity is in place prior to granting building permits for new development.

City of Sacramento Design Standards. Section 13 of the City's Design Standards sets forth requirements regarding the design and operation of water distribution facilities. Those requirements include standards for pipe design, fire hydrants, and specific requirements for residential, commercial and industrial water service. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-42)*

6.1.C Study Area Level of Service Improvements

Planned Improvements

Upon approval of the SOI expansion, potable water service to the ASI project will be provided by the City of Sacramento. Project development includes construction of a City-operated and maintained domestic and fire water system that will connect to the City's existing 30" transmission main located east of the project site, east of the City/County metering station. From this point of connection, a 24" water transmission main will be constructed in new on-site roadways and will be extended to Power Line Road. These improvements may include emergency cross-ties into the County's system to the north and/or into the City's system adjacent to the Westlake community to the east. The on-site water system serving the ASI project is intended to be operated separately from the County's on-site system. However, portions of the County's transmission mains are planned to be re-routed internally as development proceeds.

City's Future Water Demand Projections

As outlined in the 2020 UWMP, the City routinely evaluates its water supply sources and prepares projections for future water demands. These projections are summarized in the tables below.

Table 6: Historical Water Demand by Use Sector (AFY)

Water Use Sector	2016	2017	2018	2019
Single Family	41,435	41,868	40,853	39,414
Multi-Family	13,825	12,892	12,171	13,470
Commercial (and Industrial)	16,751	17,949	17,889	16,572
Institutional (and Governmental)	4,029	4,464	4,668	5,478
Landscape	4,275	4,915	4,676	2,492
Other	79	127	235	492
Sub-Total Retail Demand	*80,394*	*82,215*	*80,491*	*77,919*
Wholesale Demand	958	2,460	1,027	8,465
Losses	5,803	9,147	11,379	10,998
TOTAL DEMAND	**87,155**	**93,823**	**92,897**	**97,382**

(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 4-2)

Table 7: Potable & Non-Potable Water Retail Demand Projections (AFY)

Use Type	Projected Water Use*				
	2025	2030	2035	2040	2045 (opt.)
Single Family	46,913	47,491	48,069	48,647	51,098
Multi-Family	15,334	16,085	16,837	17,588	18,474
Commercial	17,871	19,068	20,266	21,464	22,545
Institutional/Governmental	6,094	6,200	6,306	6,412	6,736
Landscape	5,087	7,144	9,200	11,257	11,824
Other Potable	2,366	4,054	5,742	7,430	7,804
Losses	13,767	13,767	13,766	13,766	14,460
TOTAL	**107,432**	**113,809**	**120,187**	**126,564**	**132,942**

** Units of measure (AF, CCF, MG) must remain consistent throughout the UWMP as reported in Table 2-3.*

(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 4-4)

The City's projected retail water demand by the year 2050 is summarized in the table below. This includes an assumed allocation for the Airport South Industrial Area, which coincides with the SOI expansion area that this the subject of this MSR.

Table 8: 2050 Retail Water Use Projections

Parameter	Projected Demand (AF)	Projected Average Day Demand (MGD)
Existing Retail Use [a]	91,867	82.0
Drought Rebound Factor for Existing Use [a]	9,187	8.2
Increase for Future Retail Use	38,266	34.2
Natomas Joint Vision Area Future Demand[b]	15,900	14.2
Airport South Industrial Area	643	0.6
TOTAL 2050 PROJECTED RETAIL USE	**155,219**	**138.6**

(a) The City's on-going Water Master Plan Update used 2018 data for exisiting retail use and drought rebound factor.

(b) Includes estimated use for the Grandpark Specific Plan and Upper Westside Specific Plan for purposes of a sensitivity analysis but recognizing that the Natomas Joint Vision Area would require annexation into the City prior to receiving any water supply and services from the City of Sacramento.

(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. 4-5)

The City has a buildout surface water allocation of 326,800 AFY and a groundwater supply estimate of 39,155, AFY, for a total supply of 365,955 AFY. This supply exceeds the projected total water demand for the year 2050, as outlined in the table above. And as noted previously, the projected 2050 water demand includes service to the ASI SOI expansion area.

In addition, to meet current and future water demands in a reliable manner, the City is evaluating several projects to increase its long-term water treatment capacities. This includes the potential expansion of the Sacramento River Water Treatment Plant and construction of the RiverArc project, a new regional water treatment plant. Additional measures are provided for in various City master plans. The City's ongoing Water Master Plan Update includes recommendations for the City to continue pursuing a rehabilitation of the E.A. Fairbairn Water Treatment Plant and a retrofit to the intake at the Sacramento Water Treatment Plant. And the City's Groundwater Master Plan includes recommendations for the City to expand its groundwater program. *(City of Sacramento, 2020 Urban Water Management Plan, June 2021, pp. ES-3)*

ASI Project Water Demands

A Preliminary Water Study was prepared to analyze the planned water infrastructure system designed to support development of the ASI project. It evaluates proposed land uses, potable water system hydraulics, and infrastructure-level improvements. The modeling conducted for this Study indicates that project buildout will generate water demands as summarized in the table below.

Table 9: ASI Project Water Demand Summary

Land Use	Acreage	ADD Unit Water Demand		Demand (gpm)		
		AFY/Acre	GPM/Acre	ADD	MDD	PHD
Mixed Use	13.4	2	1.24	17	33	43
Industrial	236.5	0.9	0.56	132	264	343
Future Industrial	83	0.9	0.56	46	93	120
TOTAL	**332.9**	**--**	**--**	**195**	**390**	**507**

(Wood Rodgers, ASI Preliminary Water Study, August 29, 2022, p. 4)

Based on the data in the table above, the total average daily demand for the proposed ASI project is approximately 314 acre-feet per year (AFY).

6.1.D Determinations

Based on the information above, the following determinations can be made:

- The City of Sacramento is both a water retailer and a water wholesaler and it maintains an infrastructure system for the production, treatment, storage, and delivery of water to customers in its 101-square-mile service area.
- The City has adequate water supply resources and water rights to serve the City of Sacramento and its other wholesale customers, including the proposed SOI expansion area.
- The City's water sources are derived from surface water diversions from both the Sacramento and American Rivers, and from the production of water from groundwater wells.
- The City's water infrastructure network consists of two surface water treatment facilities, two pressure zones, and a supporting system of groundwater wells, pumping facilities, storage tanks, and distribution/transmission pipelines.
- The City operates and maintains a 30" water transmission main in South Bayou Way that terminates near the east edge of the SOI expansion area, which provides a point of connection to serve development of the ASI project.
- The City's existing water infrastructure network, including its water supply, treatment facilities, and delivery system can be extended from adjacent development to provide service to the ASI project.

6.2 WASTEWATER

6.2.A Existing Levels of Service and Improvements

Wastewater Collection

The ASI project area is proposed for annexation into Sacramento Area Sewer District (SacSewer) service boundaries. The project site currently lies outside the Sacramento County Urban Services Boundary, and therefore is not included in the current SacSewer boundary. Upon adoption of the SOI Amendment an application will be submitted to Sacramento LAFCo to consider the project area's annexation into SacSewer's service district.

The City of Sacramento provides wastewater collection for a portion of the City. The collection system owned and operated by the City consists of a portion that collects only wastewater, and an older central-city portion that consists of a combined system that collects both storm drainage and wastewater. The local City collection system discharges wastewater to Sacramento Regional Wastewater Treatment Plan, where wastewater is collected, treated, and discharged to the Sacramento River and recycled systems within Sacramento County and other areas..

The City-operated local collection system does not include the City of Sacramento North Natomas lands and other areas of the City. The community of Natomas' collection system is owned and operated by SacSewer and includes all wastewater collection systems that carry up to 10 million gallons per day (mgd) that discharge to the interceptor system. The district provides the collection systems for Metro Air Park, the Sacramento International Airport, and existing North Natomas lands.

The district provides conveyance, treatment and single source of disposal service to a number of contributing agencies. These include the City of Folsom, the City of Sacramento, City of Citrus Heights, City of Rancho Cordova, City of Elk Grove and the City of West Sacramento. Wastewater is discharged into the district's interceptor system and treated at Sacramento Regional Wastewater Treatment Plant (SRWTP). The district provides wastewater conveyance and treatment services to approximately 1.6 million residential, industrial and commercial customers.

Wastewater Treatment

Sacramento Regional Wastewater Treatment Plant (SRWTP) began operation in 1982 and is located on 900-acres of a 3,550-acre site between Interstate 5 and Franklin Boulevard, north of Laguna Boulevard. The remaining 2,650-acres on the site serve as a "bufferland" between the SRWTP and nearby residential areas. Wastewater is treated by accelerated physical and natural biological processes before it is discharged to the Sacramento River. The SRWTP is permitted to treat an average dry weather flow (ADWF) of 181 million gallons per day (mgd). *(California Regional Water Quality Control Board Discharge Permit, April 22, 2021, pp. F-4)*

6.2.B Plans and Regulatory Requirements

Federal and State Requirements

SacSewer is regulated by the Federal government under a strict set of laws generally established under the Federal Clean Water Act (CWA) passed in 1972. Important amendments to the CWA were added in 1977 that further regulate wastewater treatment. The quality of the effluent that can be discharged to waterways in the Sacramento area by the Sacramento Regional Wastewater Treatment Plant (SRWTP) is established by the Central Valley RWQCB through waste discharge requirements (WDRs) that implement the NPDES permit. WDRs are updated at least every 5 years. A new permit must be issued in the event of a major change or expansion of the facility. In April 2021, the Central Valley RWQCB issued Order No. R5-2021-0019, NPDES No. CA 0077682, to the Sacramento Regional County Sanitation District (Regional San) for its Sacramento Regional Wastewater Treatment Plant (SRWTP), which treats wastewater from its service area before discharging the treated effluent into the Sacramento River. The Central Valley RWQCB amended the NPDES Permit (R5-2021-0019-01) to include the production of recycled water by the EchoWater Project in accordance with the 2018 conditionally accepted Title 22 Engineering Report by the Division of Drinking Water. The water quality objectives established in the Central Valley RWQCB Basin Plan are protected, in part, by Order No. R5-2021-0019-01, NPDES No. CA 0077682. Currently, the SRWTP is permitted for a discharge of up to 181 million gallons per day (mgd) of treated effluent into the Sacramento River. Local Requirements:

City of Sacramento General Plan. The City's 2035 General Plan contains policies and implementation measures relevant to wastewater services. Applicable policies are summarized below:

- → **Policy U 1.1.4 Timing of Urban Expansion** that requires the City to assure that new public facilities and services are phased in conjunction with the approved urban development they are intended to serve.
- → **Policy U 1.1.5 Growth and Level of Service** that directs the City to require new development to provide adequate facilities or pay its fair share of the cost for facilities needed to provide services to accommodate growth without adversely impacting current service levels.

6.2.C Study area Level of Service Improvements

Planned Improvements

The ASI project site is not currently located within SacSewer's Master Plans as a future area to be served. However, upon expansion of the SOI and annexation into the City of Sacramento, the project site would also be annexed into SacSewer's service areas with the expectation that sewer services be extended to the site.

A Level 1 Sewer Study was prepared to evaluate the wastewater flows and the sewer infrastructure needed to serve the ASI project. It demonstrates how project development will construct on-site sewer pipes and a sewer pump station, including several options for the construction of off-site facilities needed to convey

wastewater to existing SacSewer conveyance facilities, then ultimately to the SRWTP for treatment and disposal.

The planned on-site sewer system consists of a pipe network that gravity-flows to a central sewer pump station. Sewer pipes range from 8"-18" in size and are located in public roadways. From the pump station, wastewater is pumped via force main to an existing SacSewer trunk and/or an existing SacSewer interceptor, both of which are off-site and located to the east in the City of Sacramento's North Natomas community. Because the Sewer Study identifies several options for the construction of off-site facilities, a final alignment will be determined through subsequent studies before development of the ASI project commences. SacSewer staff have indicated that capacity exists in the existing downstream system to accommodate sewage flows from the project.

ASI Project Wastewater Generation

Based on the project site plan, the Sewer Study estimates that the ASI project's total sewer demand, expressed as equivalent single family dwelling units (ESDs), consists of approximately 81 ESDs of commercial units, 1,870 industrial (warehouse) ESDs, 516 detention basin ESDs, 152 ESDs of roadway/right-of-way, pump stations and buffer spaces. This is summarized in the table below.

Table 10: ASI Project Sewer ESDs

Land Use Code	Land Use Description	Area (ac.)	Sewer Density (du/ac)	EDSs
C	Commercial (Restaurant, Gas Station/Car Wash, Hotel)	13.4	6	80.4
Industrial	Industrial (Warehouse)	311.7	6	1,870.2
Basin	Stormwater Detention Basin	86.0	6	516.0
Buffer	Land Buffer	2.3	6	13.8
PS	Pump Station (Sewer & Stormwater)	0.9	6	5.4
Roads	Internal Roadways & Caltrans Parcel	22.2	6	133.2
I-5	Insterstate 5 Corridor	37.9	0	0.0
TOTAL		**474.4**		**2,619.0**

(Wood Rodgers, ASI Level 1 Sewer Study, August 31, 2022, p. 4)

Based on the data in the table above, the cumulative ADWF and PWWF demand is expected to be 0.81 mgd and 2.09 mgd, respectively. The project's sewer pump station will be designed to meet the ultimate peak wet weather flows (PWWF).

Wastewater Treatment

6.2.D The SRWTP began operation in 1982 and is located on 900-acres of a 3,550-acre site between Interstate 5 and Franklin Boulevard, north of Laguna Boulevard. The remaining 2,650-acres on the site serve as a "bufferland" between the SRWTP and nearby residential areas. Wastewater is treated by accelerated physical and natural biological processes before it is discharged to the Sacramento River (Regional San 2020). An upgrade of the SRWTP was completed in spring of 2023. The upgrade, known as the EchoWater Project, was built to meet new water quality requirements that were issued by the Central Valley RWQCB as part of Regional San's 2014 NPDES permit. The requirements are designed primarily to help protect the Sacramento–San Joaquin Delta ecosystem downstream by removing most of the ammonia and nitrates and improving the removal of pathogens from wastewater discharge. The upgrade will include deployment of new treatment technologies and facilities and will increase the quality of effluent discharged into the Sacramento River and ensure that the SRWTP discharge constituents are below permitted discharge limits specified in the NPDES permit. Flows to the SRWTP have decreased as a result of water conservation efforts over the last 10 years. Further, adequate capacity for wastewater treatment is anticipated well into the future. Flows in 2014 were approximately 141 mgd, compared to the current permitted capacity of 181 mgd. It is not anticipated that further improvements to the SRWTP will be required until after 2050. Determinations:

Based on the information above, the following determination can be made:

- The Sacramento Area Sewer District (SacSewer) provides wastewater collection and treatment services for the majority of the City. Wastewater is collected by SacSewer's trunk facilities and is conveyed via interceptors to the Sacramento Regional Wastewater Treatment Plant (SRWTP) for treatment.
- The SRWTP is a regional wastewater treatment plant that serves the City of Sacramento and several other cities and districts in the region.
- Development of the ASI project includes the construction of on-site sewer pipelines, a pump station, and off-site force mains.
- Planned sewer improvements, including pipelines, pump stations, and force mains have preliminarily been designed to accommodate full buildout of the ASI project.
- The ASI project site will be required to annex into SacSewer service areas to receive sanitary sewer service.
- The SRWTP maintains sufficient capacity to treat wastewater flows generated from buildout of the ASI project.

6.3 CIRCULATION AND ROADWAYS

6.3.A Existing Levels of Service and Improvements

The City's roadway network includes Federal interstates, State highways, and City streets (arterial, collector, and local streets). City streets have different roadway classifications and lane standards, which are defined in its General Plan. The City's roadway system is primarily used for vehicle travel. Citywide, approximately 85% of the City's residents travel between work and home by automobile, of which 11% utilize a carpool. Public transit serves approximately 4% of residents commuting to work, with approximately 3% walking, 2% biking to work, 5% working from home, and 2% using a different form of transportation than specified above. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-2)*

Federal and State Roadways

Interstate, U.S., and State numbered routes are an integral part of the City's transportation system. These facilities are maintained by the California Department of Transportation (Caltrans) and are described below

- **Interstate 5 (I-5)** is a principal north/south freeway that extends the length of California into Oregon and Washington. In the City, it has six to eight travel lanes, and it is aligned along the eastern bank of the Sacramento River through the downtown core, providing access to residential areas of Natomas and South Sacramento. I-5 also serves as the sole freeway in the region providing access to the Sacramento International Airport, and is a primary route used by long-distance truck traffic.
- **Interstate 80 (I-80)** is a principal east/west freeway that extends across the United States, connecting California to New Jersey. In the Sacramento region, I-80 connects San Francisco/Bay Area to Lake Tahoe and Reno, Nevada. I-80 also serves as a bypass of Sacramento's downtown core via its alignment through the northern area of the City. I-80 is also used as a major truck route between San Francisco/Bay Area, Sacramento, Lake Tahoe region, and further destinations to the east. Within the City, I-80 has six mainline travel lanes, plans are underway for a high-occupancy vehicle (HOV) lane to be added between I-5 and Business 80.
- **Business 80/Capital City Freeway** extends northeast from Sacramento's downtown core and provides access to regional destinations including Cal Expo and Arden Fair Mall. Business 80 is a six to ten lane freeway within the City, and has one HOV lane in either direction between E Street and SR 99.
- **US Highway 50 (US 50)** is a major east/west route located between I-80 in West Sacramento and the City of South Lake Tahoe, and ultimately Ocean City, Maryland. Within the City, US 50 functions as a freeway and has between 8-10 travel lanes.
- **State Route 16 (SR 16)** (AKA Jackson Highway) is a designated State Highway that links the City to eastern Sacramento County and Amador County. SR 16 primarily extends approximately 1.5 miles within the City from the US 50/Howe Avenue interchange to South Watt Avenue.

- **State Route 99 (SR 99)** is a 4-6 lane freeway that extends south from Business 80 to Elk Grove and other destinations in the Central Valley. This segment of SR 99 includes HOV lanes between the downtown core and the City's southern suburbs. A portion of SR 99 is co-designated with US 50 and I-5 through downtown and the Natomas area.
- **State Route 160 (SR 160)** within the City is controlled by Caltrans for the segment between the American River and Business 80. This spur off of the regional freeway system extends across the American River, and is a key route for trips between the downtown core and the northeastern suburbs. All other segments of this route, which are located in the City, have previously been relinquished by Caltrans to the City of Sacramento.

City Roadways

The City's roadway network consists of local, collector, and arterial roadways. Figures 3-1a and 3-1b of the 2040 General Plan Technical Background Report illustrate the City's roadways and their functional classification and travel lanes capacity. Functional classification describes the roadway purpose and use related to moving people and goods. City roadways have the following classifications:

- **Major Arterial Streets** are four to six-lane streets that serve longer distance trips and serve as the primary route for moving traffic through the city connecting urban centers, residential neighborhoods, and commercial centers to one another, or to the regional transportation network. Movement of people and goods, also known as "mobility", rather than access to adjacent land uses, is the primary function of an arterial street. These streets carry moderate-to-heavy vehicular movement, low-to-high pedestrian and bicycle movements, and moderate-to-high transit movement.
- **Minor Arterial Streets** are two-lane streets that serve longer distance trips and provide access to the regional transportation system. These streets carry low-to-moderate vehicular movement, low-to-high pedestrian and bicycle movements, and moderate-to-high transit movement. These roadways typically have high levels of access control.
- **Minor Collector Streets** are two-lane streets that connect residential uses to the major street system. These roadways are undivided and have lower levels of access control to abutting properties than arterials or major collectors.
- **Local Streets** are two-lane streets that provide direct access to abutting land uses and serve individual neighborhoods. These streets carry low vehicular movement, low-to-heavy pedestrian movement, and low-to-moderate bicycle movement.
- **Alleys** are narrow, low volume lanes, paths, or passageways that typically provide shared use for pedestrians, bicycles, and vehicles as a secondary access to abutting properties.

  (City of Sacramento, General Plan Background Report (November 2020), pp. 3-5)

Roadway Capacity and Level of Service Thresholds

Level of Service (LOS) is a general measure of traffic operating conditions whereby a letter grade, from A (the best) to F (the worst), is assigned. These grades represent the perspective of drivers and are an indication of the comfort and convenience associated with driving. The LOS grades are generally defined as:

- **LOS A:** Primarily free-flow operation. Vehicles are completely unimpeded in their ability to maneuver within the traffic stream. Control delay at boundary intersections is minimal.
- **LOS B:** Reasonably unimpeded operation. The ability to maneuver within the traffic stream is only slightly restricted and control delay at boundary intersections is not significant.
- **LOS C:** Stable operation. The ability to maneuver and change lanes at midsegment locations may be more restricted than at LOS B. Longer queues at boundary intersections may contribute to lower travel speeds.
- **LOS D:** Less stable condition where small increases in flow may cause substantial increases in delay and decreases in travel speed. This operation may be due to adverse signal progression, high volume, or inappropriate signal timing at boundary intersections.
- **LOS E:** Unstable operation and significant delay. Operations may be due to some combination of adverse progression, high volume, and inappropriate signal timing at boundary intersections.

→ **LOS F:** Extremely low speed speeds. Congestion is likely occurring at boundary intersections, with high delay and extensive queuing.

The City's LOS policy from its 2035 General Plan Mobility Element allows for flexible LOS standards, which accept LOS F operations during peak hours within the "Core Area" and on other specified roadway segments, and LOS E operations within multi-modal districts. The base level of service standard for all areas is LOS D. The roadway segment analysis conducted in 2019 for the 2040 General Plan Update evaluated daily operations on 232 roadway segments. Of the 232 segments, 188 operate at LOS D or better, 16 operate at LOS E, and 28 operate at LOS F. Of the 28 study segments reported to operate at LOS F, 19 would be categorized as "unacceptable" under the 2035 General Plan LOS thresholds. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-58)*

Vehicle Miles Traveled

In 2013, the State of California passed Senate Bill 743 (SB 743), which alters how transportation impacts from projects are measured in environmental reviews starting on July 1, 2020. The new standard that is analyzed in traffic and circulation is Vehicle Miles Traveled (VMT). VMT measures how much actual auto travel (additional miles driven) a proposed project would create on California roads. VMT per capita is calculated as the total annual miles of vehicle travel divided by the total population in a State or in an urbanized area. Caltrans has published a 2020 Vehicle Miles Traveled-Focused Transportation Impact Study Guide. The TISG replaces the Caltrans Guide for the Preparation of Traffic Impact Studies and is for use with local land use projects. *(Cal Trans, VMT Transportation Impact Study Guide, May 20, 2020, p. 3)*

The Transportation Impact Study Guide (TISG) was prepared by the State of California, Department of Transportation (Caltrans) to provide guidance to Caltrans Districts, lead agencies, tribal governments, developers and consultants regarding Caltrans review of a land use project or plan's transportation analysis using a vehicle miles traveled (VMT) metric. This guidance is not binding on public agencies and it is intended to be a reference and informational document Caltrans seeks to reduce single occupancy vehicle trips, provide a safe transportation system, reduce per capita VMT, increase accessibility to destinations via cycling, walking, carpooling, and transit, and reduce greenhouse gas (GHG) emissions. Those goals along with standard CEQA practice create the foundation of Caltrans review of proposed new land use projects. *(Cal Trans, VMT Transportation Impact Study Guide, May 20, 2020, p. 4)*

CEQA documents will now consider different types of transportation impacts than previously examined. When analyzing the impact of VMT on the State Highway System resulting from local land use projects, the focus will no longer be on traffic at intersections and roadways immediately around project sites. Instead, the focus will be on how projects are likely to influence the overall amount of automobile use. SB 743 specifies that "…automobile delay, as described solely by level of service or similar measures of vehicular capacity or traffic congestion, shall not be considered a significant impact on the environment." *(California Public Resources Code Section 21099, 2022)* and *(Cal Trans, VMT Transportation Impact Study Guide, May 20, 2020, p. 4)*

SB 743, through a new CEQA metric for transportation impacts, sought to promote the reduction of greenhouse gas emissions, the development of multimodal transportation networks, and a diversity of land uses. *(California Public Resources Code Section 21099, 2022, p. (7)(b)(1))* That is, it sought to modernize CEQA transportation analysis in a way that supports these goals. A new metric, VMT, was selected for land use development based on the expectation that a vehicle miles traveled metric will better support greenhouse gas emission reductions and improve multimodal transportation options for land use development. *(Cal Trans, VMT Transportation Impact Study Guide, May 20, 2020, p. 7)*

A lead agency has discretion to choose the most appropriate methodology to evaluate a project's VMT. *(California Public Resources Code, Section 15064.3(b)(4), 2022)* Caltrans will review an agency's VMT calculator or VMT calculation for consistency with technical considerations in OPR's Technical Advisory. *(Cal Trans, VMT Transportation Impact Study Guide, May 20, 2020, p. 93)*

The Caltrans TISG is not clear regarding the impacts of an industrial warehousing project as it pertains to a VMT analysis. In particular one that has a large number of fulfillment centers that can be used to warehouse goods in order for a more proximate delivery to local regional markets (including direct delivery to residents and businesses). Similarly, the incorporation of a highway commercial component might be considered as capturing vehicular traffic that is already traveling the freeway rather than contributing to VMT.

Transit Services

A wide range of transit services are provided in Sacramento, which includes public bus service, light rail transit, commercial bus service, and interregional and interstate passenger train service. Park-and-ride facilities are also located throughout the City to facilitate ridesharing, carpooling, and access to regional transit.

The Sacramento Regional Transit District (RT) provides local bus and light rail service within the City and portions of the Sacramento region, covering nearly 400 square miles of service area. As of 2019, RT's transit vehicle fleet included 197 compressed natural gas-powered buses, 27 shuttle vans, and 12 zero emission electric buses. RT operates 65 bus routes, including 30 regular all-day routes, 34 peak-period-only routes, 1 neighborhood ride route, and Community Bus Service routes. Three of the Community Buses, referred to as Neighborhood Ride services, deviate from published routes on demand. Fixed-route bus routes reach 3,100 bus stops. Eight bus-only transfer centers accommodate transfers between routes, while 32 transit centers facilitate transfers between bus routes and intermodal transfers to and from RT Light Rail lines. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-27)*

RT also operates a 43-mile light rail transit system to provide high-frequency, high-capacity transit service. This consists of three lines with 52 stops and 97 light rail vehicles. Figure 3-5 of the General Plan Background Report identifies the routing and station locations for RT's Blue, Gold, and Green light rail lines, park-and-ride lots, and other roadways served by RT's bus routes. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-28)*

RT's annual ridership in fiscal year 2018 was approximately 21 million passengers. In 2019, weekday light rail ridership averaged about 37,000 and weekday bus ridership averaged approximately 36,000 passengers per day. This represents a 5.3% decrease from fiscal year 2017, with a 9.3% decrease in both light rail and bus ridership. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-29)*

Approved in 2019, the SacRT Forward New Network plan supports major changes to the Sacramento bus network, including changes in service routes and frequency. RT's planned improvements include: 1) Design and construct Dos Rios light rail station located on North 12th Street; 2) Replace aging light rail vehicle fleet with new, low-floor light rail vehicles; 3) Complete double tracking of the Fold Line between the Sunrise and Historic Folsom stations. This project will enable 15-minute service between historic Folsom and downtown Sacramento; 4) Double tracking of Green Line from Sacramento Valley Station to North B Street, with a new infill station located on 7th Street; 5) The planned Green Line to the Airport project, spanning 13 miles and with a total of 13 stations, would extend service from Downtown through Natomas to the Sacramento International Airport; and 6) Develop Zero Emission Vehicle (ZEV) Conversion Plan with the goal to convert the entire fleet to zero-emission vehicles. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-29)*

Park-and-Ride Lots

Park-and-ride lots enable commuters to access the regional public transit system by automobile, or to form carpools with other drivers. As of 2019, Sacramento RT operated 22 park-and-ride lots with a total of 10,114 parking stalls. In March 2019, RT eliminated parking charges at all park-and-ride lots. Caltrans operates additional park-and-ride lots at locations throughout the region, including along SR 99 at Sheldon Road, Twin Cities Road, Elkhorn Boulevard, Calvine Road, and at the Caltrans maintenance yard in Elk Grove. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-33)*

Transportation Demand Management

Transportation Demand Management (TDM) is implemented by the City to Sacramento and includes programs intended to reduce traffic congestion, optimize transportation system usage, and improve air quality. These measures can be achieved by offering a combination of incentives and market-based strategies to increase employee and resident use of alternative travel modes. TDM includes different approaches for small versus large developments/employers. The Transportation Systems Management (TSM) program requires developers and employers with 25 to 99 employees to achieve a 35 percent trip reduction, consistent with City goals. It requires employers to post information about alternative commute modes, such as public transportation and ridesharing, and to coordinate with relevant transportation agencies to maintain current commute information. Larger projects and employers with over 100 employees

are required to produce a Transportation Management Plan (TMP). The TMP is approved and monitored by the City and may include measures such as providing carpool/vanpool spaces; parking fees; transit facilities or subsidies; a shuttle bus program; a vanpool program; showers and lockers for bicyclists; or other means of promoting alternative modes, as agreed upon by the City. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-53)*

Transportation Safety

In order to address transportation safety, the City adopted the Vision Zero Action Plan in 2018. Its primary goal is to eliminate traffic fatalities and serious injuries by the year 2027. The Plan identifies a "high injury network" that consists of roadway corridors with the highest levels of fatal and serious crashes, which should be the focus of future safety improvements. It also identifies proven safety countermeasures to address factors contributing to traffic deaths and serious injuries through education, engineering, enforcement, and evaluation. Adoption of the Vision Zero Action Plan has resulted in the City's implementation of school zone speed reductions, completion of Vision Zero school safety studies at 20 schools, and initiation of the Vision Zero top 5 high injury corridor study. This Plan illustrates the City's commitment to create safer streets for pedestrians, bicyclists, and motorists. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-55)*

Emergency Service Routes

The City's Fire and Public Works departments work collaboratively to determine emergency response routes for projects that may impact emergency response travel times. Much of their focus is given to traffic calming measures. This ensures that facilities like speed humps are not constructed on streets identified as emergency response routes. However, speeds lumps (humps with cut-outs for wheel base of larger vehicles) are sometimes approved along emergency response routes on a case-by-case basis. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-56)*

Neighborhood Traffic Issues

The City's Neighborhood Traffic Management Program (NTMP) is actively implemented to promote safety on local streets and improve the quality of life in the City's neighborhoods. The objectives of the NTMP are to improve driver awareness and behavior, reduce traffic volumes and travel speeds, and enhance neighborhood environments. The NTMP creates a partnership between the neighborhood residents and City Public Works staff. Residents provide insight into the challenges and issues facing their neighborhood roadways and City staff present a variety of traffic calming solutions to meet neighborhood needs. Traffic calming plans developed through the NTMP are voted on by the residents of the neighborhood prior to implementation. The NTMP has three major components:

- **Education:** City staff informs neighbors of traffic calming tools available to address specific concerns, such as travel speeds, cut-through traffic, etc.
- **Engineering:** A traffic calming plan is developed and implemented based on neighborhood input and engineering principles.
- **Enforcement:** Improvements will be enforced by police and parking services.

The City has implemented traffic calming plans for 109 neighborhoods as part of the NTMP, and as of 2012, an additional 13 neighborhoods are in the process. The NTMP's goal is to serve eight (8) to twelve (12) neighborhoods per year with one or more neighborhoods being selected from each Council District. *(City of Sacramento, General Plan Background Report (March 2015), pp. 3-35)*

Bicycle Master Plan

The City's adopted Bicycle Master Plan sets forth bicycle related investments, policies, programs and strategies to establish a complete bicycle system. The Plan identifies existing and planned bicycle routes, lanes, separated bikeways, and shared-use paths in the City, presents appropriate design features of bikeways, and promotes bicycle safety and education programs. Its primary purpose is to identify the recreational and commuter needs of bicyclists and to promote bicycling as an alternative transportation mode. The primary goal of the bikeway improvements included in the Bicycle Master Plan is to increase bicycle ridership for work and non-work trips. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-36)* The Bicycle Master Plan would be applied to improvements in the SOI expansion area at such time that the ASI project area is incorporated into the City.

Pedestrian Facilities

The City has implemented community programs and adopted guidelines over the past several years to enhance the pedestrian environment within Sacramento. The City's adopted Neighborhood Traffic Management Program, Pedestrian Master Plan, and Traffic Calming Guidelines collectively provide guidance to improve neighborhood livability by slowing vehicles to create a desirable pedestrian environment, to establish an implementation program for pedestrian improvement projects, and to provide LOS criteria for pedestrian facilities and design standards. These plans are used by City staff when evaluating applications for new development projects to ensure that current standards are implemented. Additionally, the City's adopted Pedestrian Safety Guidelines provide design guidance for pedestrian facilities' best practices that are intended to enhance existing facilities and to ensure that new developments provide a pedestrian friendly environment. Furthermore, the City's adopted Pedestrian Friendly Street Standards provide for narrower vehicle travel lanes and enhanced sidewalks to promote pedestrian travel within the City. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-39)*

6.3.B Plans and Regulatory Requirements

Federal Requirements

There are a significant number of Federal laws and regulations related to goods movement, homeland security, street maintenance, traffic safety, and transportation funding. The following legislation established the framework for transportation planning at the federal level: Fixing America's Surface Transportation Act (FAST Act) *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-22)*

State Requirements

Caltrans' adopted 2040 California Transportation Plan (CTP) provides broad system concepts, strategies, and performance measures for all transportation modes for the State's facilities. Caltrans prepares Route Concept Reports that identify the long-range improvements for specific State highway corridors and establish the concepts/desired level of service (LOS) for specific segments. Long-range improvements are identified to improve existing facilities up to the design concept expected to adequately serve 20-year traffic forecasts. Nearly all freeway segments the City of Sacramento have a concept LOS E or F, with the exception of I-5 west of the I-5/SR 99 interchange, which has LOS D or E.

Ongoing transportation planning for the City of Sacramento is influenced by legislation adopted by the State of California and executive orders issued by the Office of the Governor. These include:

- **Executive Order S-03-05 (2005):** Establishes State agency climate action team, and directs greenhouse gas (GHG) emission reductions as a priority.
- **AB 32 (2006):** Requires that the California Air Resources Board (CARB) identify sector-specific measures to reduce GHG emissions.
- **SB 97 (2007):** Requires that the Office of Planning & Research (OPR) adopt California Environmental Quality Act (CEQA) GHG/climate change guidelines.
- **SB 375 (2008):** Requires that MPOs develop sustainable community strategies to achieve AB 32 GHG reduction targets established through the regional targets advisory committee and provides potential CEQA relief for select development projects.
- **AB 1358 (2008):** Requires that the legislative body of a City or County, upon revision of the circulation element of their General Plan (after January 1, 2011), identify how the jurisdiction will provide for the routine accommodation of all users of the roadway (i.e., complete streets) including motorists, pedestrians, bicyclists, individuals with disabilities, seniors, and users of public transportation.
- **SB 226 (2011):** Requires that the State's OPR modify the CEQA Guidelines to set forth a streamlined review process for infill projects.
- **SB 743 (2013, 2018):** Changed the previous practice of evaluating traffic transportation impacts used road congestion and delay or level of service (LOS) and requires the amount of driving and length of trips, measured as vehicle miles traveled (VMT), be used to assess transportation impacts on the environment for CEQA review.

(City of Sacramento, General Plan Background Report (November 2020), pp. 3-24)

Regional Requirements

The Sacramento Area Council of Governments (SACOG) is responsible for the preparation of, and updates to, the Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS) and the corresponding Metropolitan Transportation Improvement Program (MTIP). The MTP/SCS provides a 20-year transportation vision and corresponding list of projects. The MTP/SCS is required to be updated every four years, and the current 2020 MTP/SCS was adopted in November 2019. The MTIP identifies short-term projects (seven-year horizon) in more detail. SACOG is also responsible for the oversight and distribution of most Federal and State transportation funding, and develops the air quality plans and compliance measures, which incorporate mobile (vehicular) pollution sources. The Sacramento Transportation Authority is responsible for administering the original Measure A half-cent sales tax and its recent extension. *(City of Sacramento, General Plan Background Report (November 2020), pp. 3-24 to 3-25)*

Local Requirements

Sacramento General Plan. The City's 2035 General Plan contains policies and implementation measures relevant to circulation and roadways. Applicable policies are summarized below:

- **Policy M 1.1.1 Right-of-Ways** that requires the City to preserve and manage rights-of-way consistent with the Circulation Diagram, Street Design Standards, the goal to provide Complete Streets, and modal priorities for specified street segments and intersections.
- **Policy M 1.1.2 Transportation System** that requires the City to manage the travel system to ensure safe operating conditions.
- **Policy M 1.1.4 Facilities and Infrastructure** that requires the City to effectively operate and maintain transportation facilities and infrastructure to preserve the system's quality.
- **Policy M 1.2.1 Multimodal Choices** that requires the City to develop an integrated, multimodal transportation system that improves the attractiveness of walking, bicycling, and riding transit to increase travel choices, resulting in reduced air pollution and greenhouse gas emissions.
- **Policy M 1.2.2 Level of Service (LOS) Standard** that requires the City to implement a flexible context sensitive LOS standard, and will measure traffic operations against established vehicle LOS thresholds, and will strive to operate the roadway network at LOS D or better for vehicles during typical weekday conditions, with limited specified exceptions.
- **Policy M 1.2.3 Transportation Evaluation** that requires the City to evaluate discretionary projects for potential impacts to traffic operations, traffic safety, transit service, bicycle facilities, and pedestrian facilities, consistent with the City's Traffic Study Guidelines.
- **Policy M 1.3.1 Grid Network** that requires the City to promotes efficient travel for all modes and require private developments to provide internal complete streets that connect to the existing roadway system.
- **Policy M 1.3.2 Eliminate Gaps** that requires the City to eliminate "gaps" in roadways, bikeways, and pedestrian networks.
- **Policy M 1.3.3 Improve Transit Access** that requires the City to work with Sacramento Regional Transit District (RT) in addressing identified gaps in public transit networks and appropriately locate passenger facilities and stations, pedestrian walkways and bicycle access to transit stations and stops, and public rights of way as necessary for transit facilities.
- **Policy M 1.3.4 Barrier Removal for Accessibility** that requires the City to remove barriers, where feasible, to allow people of all abilities to move freely and efficiently throughout the city.
- **Policy M 2.1.1 Pedestrian Master Plan** that requires the City to maintain and implement a Pedestrian Master Plan that carries out the goals and policies of the General Plan by requiring that new development be consistent with its applicable provisions.
- **Policy M 2.1.2 Sidewalk Design** that directs the City to require that sidewalks be developed at sufficient width to accommodate all users.
- **Policy M 2.1.3 Streetscape Design** that directs the City to require that pedestrian-oriented streets be designed to provide a pleasant environment for walking and other desirable uses of public space.

- **Policy M 2.1.4 Cohesive and Continuous Network** that requires the City to develop a pedestrian network of public sidewalks, street crossings, and other pedestrian paths that makes walking a convenient and safe travel mode.
- **Policy M 2.1.7 Safe Pedestrian Crossings** that requires the City to improve pedestrian safety by providing safe pedestrian crossings at appropriate intersections and mid-block crossings.
- **Policy M 2.1.9 Safe Sidewalks** that directs the City to require that pedestrian facilities be constructed in compliance with adopted design standards.
- **Policy M 4.2.2 Pedestrian and Bicycle-Friendly Streets** that indicates that, in areas with high levels of pedestrian activity, the City is to ensure that all street projects support pedestrian and bicycle travel.
- **Policy M 5.1.1 Bicycle Master Plan** that requires the City to maintain and implement a Bicycle Master Plan that carries out the goals and policies of the General Plan, which is to be applied to all new development.
- **Policy M 5.1.2 Appropriate Bikeway Facilities** that requires the City to provide bikeway facilities that are appropriate to the street classifications and type, number of lanes, traffic volume, and speed on all rights-of-way.
- **Policy M 5.1.3 Continuous Bikeway Network** that requires the City to provide a continuous bikeway network consisting of bike-friendly facilities connecting residential neighborhoods with key destinations and activity centers.
- **Policy M 5.1.6 Connections between New Development and Bicycle Facilities** that directs the City to require that new development provide connections to, and not interfere with, existing and proposed bicycle facilities.
- **Policy M 5.1.8 Connections between New Development and Bikeways** that requires the City to ensure that new commercial and residential development projects construct bikeway facilities identified in the Bicycle Master Plan that have a direct nexus with the project.

6.3.C Study Area Level of Service Improvements

The City's 2022-2027 Capital Improvement Program (CIP) includes a Transportation section that addresses circulation and roadways in the City. It is a five-year plan that is updated regularly, and its implementation relies heavily on the use of available local funds to leverage State and Federal funds, combined with road maintenance and repair funding sources derived from SB1. The Transportation Program places priority on completing projects that have secured Federal funding with the key objectives for maintenance, safety, and mobility of the overall transportation network.

The CIP' Transportation Program is divided into several sub-programs to address different areas of need. These include sections for Active Transportation (pedestrian, bikeway, lighting, and streetscape improvements); Bridges (replacement and rehabilitation); Maintenance (roadway and bikeway rehabilitation, including integration of complete streets and safety improvements); Major Transportation Improvements (major roadway construction); Parking (parking facility maintenance and upgrades); Public Rights-of-Way Accessibility (improvements to ensure full accessibility); and Traffic Operations and Safety (safety improvements, a Traffic Operations Center, traffic calming, active transportation safety, and major street light replacement). *(City of Sacramento, Capital Improvement Program 2022-2027, June 2022, pp. H-2)*

The ASI project site plan includes a network of roadways that provide access to all proposed commercial and industrial parcels, connections to existing roadways including Power Line Road, Bayou Way, and Metro Air Parkway, which provides access to I-5. Roadways and associated frontage improvements will be constructed as the project builds out, consistent with the site plan. Roadways have been designed consistent with the City of Sacramento's adopted design standards and include the appropriate travel lanes to support traffic associated with project buildout. Additionally, on-street bike lanes and street-separated sidewalks for pedestrians are included in the ASI's roadway design and will be constructed in accordance with the City's requirements.

6.3.D Determinations

Based on the information above, the following determinations can be made:

- The City maintains a roadway network consisting of arterials, collectors, and local streets and strives to provide a base level of service standards of LOS D, except for other specifically identified roadway segments where LOS E and/or E is the minimum standard.
- A wide range of transit services are provided in Sacramento, which includes public bus service, light rail transit, commercial bus service, and interregional and interstate passenger train service. Park-and-ride facilities are also located throughout the City to facilitate ridesharing, carpooling, and access to regional transit.
- The City is continually implementing its adopted General Plan Mobility Element, including its Bicycle Master Plan and a Pedestrian Master Plan, to ensure that roadway construction meets City design standards and that alternative travel modes are provided throughout the City.
- Implementation of the ASI project will be subject to all applicable regulatory requirements for compliance with State mandates and City General Plan policies.
- The Airport South Industrial (ASI) project has been designed to meet City standards for roadway design, including providing connections to existing Federal and State highways and local streets. This includes automobile lanes, bikeways, and pedestrian facilities consistent with City standards.

6.4 ANIMAL CARE

6.4.A Existing Levels of Service and Improvements

Animal Care services for the County lands surrounding the project site are currently provided by Sacramento County Animal Care and Regulation, located at 3839 Bradshaw Road, one mile south of Highway 50. For the areas within the City limits, the City of Sacramento operates from the Front Street Animal Shelter, located at Front Street and Broadway. The City of Sacramento Animal Care services include low-cost vaccination clinics, spay and neuter clinics, veterinary care, a pet food pantry, euthanasia services, pet licensing, adoption, boarding, lost and found pet services, and informative resources. The Front Street shelter has a full staff of veterinarians, service administrators, field operators, and staff who assist with animal detention, shelter, care, and placement of stray and licensed pets. Animal care also coordinates with other agencies in response to public safety, emergency, and law enforcement needs regarding animals. Animal Care services are paid for by the City's General Fund, supplemented by donations and fundraising from animal care groups. *(City of Sacramento Animal Care Services, 2022)*

6.4.B Plans and Regulatory Requirements

City Municipal Code. Regulations and standards regarding animal care are set forth in the City's Municipal Code Section 9.44. Enforcement is handled by the Animal Care division of the Public Works Department with support from police and other County departments regarding issues of public health and safety related to dangerous or stray animals.

6.4.C Study Area Level of Service Improvements

The Humane Society of the United States released a Professional Animal Services Construction Report in 2001, which stated that, generally, animal care facilities should have capacity to care for a quantity of animals equivalent to 5-7% of a community's population. *(The Humane Society of the United States Professional Animal Services Construction Report, 2021)* The report also found that although animal services in Sacramento have historically had issues with staffing, accommodating growing areas of the city has not been a problem. Funding allocations to support expansion of services must be decided by voters in local elections and is typically in response to population increase.

6.4.D Determinations

Based on the information above, the following determination can be made:

- The ASI project consists of industrial and commercial development that will not impact capacity or demand for animal care services in the City of Sacramento. No improvements to animal care in the City will be necessary as a result of the ASI project.

6.5 CODE COMPLIANCE

6.5.A Existing Levels of Service and Improvements

The Sacramento Code Compliance Division of the Community Development Department provides code enforcement services the City's neighborhoods, businesses, entertainment, and housing. This Division's overarching goal is to preserve and enhance public health, safety, and welfare by addressing issues of blight and enforcing City and State codes.

The following services fall under the jurisdiction of the Code Compliance Division:

- **Business Compliance.** Works with City departments to issue permits and licenses and enforces codes and ordinances, including tobacco retailer licenses, entertainment permits, taxi permits, and mobile food permits.
- **Housing and Dangerous Buildings.** Enforces City and State codes relating to residential and commercial structures and addresses pests and mechanical noise in conjunction with the Environmental Health section.
- **Rental Housing Inspection Program.** Works with rental property owners to register their homes and to verify compliance with all codes applicable to health and safety. This program also addresses substandard rental properties and preserves the quality of neighborhoods and housing stock.
- **Anti-Graffiti Program.** Works with the Police Department to carry out efforts to keep neighborhoods clear of graffiti and implements abatement programs, educational outreach, and community involvement programs.
- **Vacant Lot Program.** Ensures that vacant lots are maintained by property owners to prevent public health and safety issues due to blight or fires caused by neglect.

  (City of Sacramento Code Compliance, https://www.cityofsacramento.org/Community-Development/Code-Compliance, 2022)

6.5.B Plans and Regulatory Requirements

Local Requirements

Municipal Code. Code Enforcement upholds State and Local regulations, including those set forth in the City of Sacramento Municipal Code and General Plan. City ordinances which are directly related to and upheld through Code Enforcement programs include, but are not limited to:

- **Vacant Building Ordinance (Article XV of Chapter 8.100).** Neglected properties can be considered a public nuisance and imposed fines after 30 days if any of the following conditions are present: 1) Exterior issues which don't comply with current building code; 2) Boarded windows or doors; 3) Structures and properties which are neglected or with debris, broken windows, or peeling paint; 4) Structures which attract crime or transients; and 5) Overgrown lawns or no yard care.
- **Rental Housing Inspection Ordinance (Chapter 8.120).** Enforces building codes of rental properties to ensure quality and safety of rental properties throughout the city. Requires registration of the property, inspection, and abatement procedures, where necessary.
- **Graffiti Abatement Ordinance (Chapter 8.24).** Outlines procedures for graffiti removal to preserve property values, prevent crime, and decrease blighted areas throughout the City.

City of Sacramento General Plan. Applicable policies in the City's General Plan that are applicable to Code Enforcement actions include:

- **Policy PHS 6.1.1 Facilities, Services, and Staffing** that requires the City to provide facilities and staffing to maintain an aggressive and visible code enforcement program.
- **Policy PHS 6.1.2 Code Requirements** that requires the City to enforce code requirements to ensure that existing housing meets health and safety standards.
- **Policy PHS 6.1.3 Public Nuisance** that directs the City to require properties with identified public nuisance violations to eliminate or remove the conditions.
- **Policy PHS 6.1.4 Abandoned Vehicles** that requires the City to require removal of abandoned vehicles.
- **Policy PHS 6.1.5 Graffiti** that directs the City to require removal of graffiti that is in public view.
- **Policy PHS 6.1.6 Deterioration, Blight, and Deferred Maintenance** that directs the City to require that housing units are maintained to ensure a safe and healthy living environment, preventing blight and deterioration resulting from deferred maintenance.
- **Policy PHS 6.1.7 Substandard and Dangerous Buildings** that directs the City to require all building that are identified as substandard or dangerous be either repaired or demolished.
- **Policy PHS 6.1.8 Residential Rental Inspection** that directs the City to require systematic inspection of all residential rental property.
- **Policy PHS 6.1.9 Building Inspection** that requires the City to enforce code requirements by inspecting buildings requiring a fire code operational use permit and mandated for inspection by the California Health and Safety Code.
- **Policy PHS 6.1.10 Communication and Education** that requires the City to work with residents, businesses, and community organizations in conducting public outreach and educational programs to promote voluntary compliance with city ordinances.
- **Policy PHS 6.1.11 Safe and Fair Practices** that requires the City to maintain safe and fair business operations and ensure the health and safety of the general public through enforcement of State and local health and safety statutes and codes.

(City of Sacramento, 2035 General Plan, March 3, 2015, pp. 2-305 & 2-306)

6.5.C Study Area Level of Service Improvements

Code enforcement services are paid for by the City's General Fund. Development fees and property taxes generated by the ASI project will contribute to the General Fund, a portion of which is allocated to the Community Development department and the Code Enforcement Division. Development of the ASI project is not anticipated to significantly impact the Code Enforcement Division's service levels or require expansion of services or facilities, as the division predominantly carries out tasks related to degradation and blight of existing structures.

6.5.D Determinations

Based on the information above, the following determination can be made:

- The ASI project's commercial and industrial development will meet current Building Code standards and this type of development does not typically create issues of blight, structural hazard, or fire hazard due to overgrown plant matter.
- The ASI project will contribute funds to the City's Code Enforcement division, but current resources are not anticipated to be affected. The impact of the ASI project to the City's Code Enforcement division is expected to be minimal.

6.6 LAW ENFORCEMENT

6.6.A Existing Levels of Service and Improvements

The Sacramento Police Department (SPD) provides law enforcement services for the City. In 2019, the SPD was staffed with approximately 686 sworn personnel, 29 academy recruits, 291 professional staff, and 144 non-career staff. For Fiscal Year 2019/2020, the SPD was authorized to staff 747 sworn positions

and 323.46 professional staff positions. Police Headquarters is located in the Public Safety Center at 5770 Freeport Boulevard in Sacramento and is supported by several substations throughout the City. These include the William J. Kinney Police Facility serving the North Area from 3550 Marysville Boulevard, the Joseph E. Rooney Police Facility serving the South Area from 5303 Franklin Boulevard, and the Central Command Richards Police Facility located at 300 Richards Boulevard.

The North Area Substation provides police services to the northern portion of the City, from the American River on the south to the City limits on the west, north, and east. The South Area Substation provides police protection services to the southern portion of the City, from Highway 50 on the north to the City limits on the west, south, and east. Central Command provides police response to three main beats in the central portion of the City, bounded by the American River to the north, Highway 50 on the south, the Sacramento River on the west, and the city limits on the east. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-2)*

6.6.B Plans and Regulatory Requirements

Local Requirements

Sacramento City Code. Chapter 2.20 of the Sacramento City Code sets forth the guidelines for SPD and includes regulations regarding the powers and duties of the Chief of Police and the Police Department. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-11)*

Sacramento General Plan. The City's 2035 General Plan contains policies and implementation measures relevant to law enforcement services. Applicable policies are summarized below:

- → **Policy PHS 1.1.2 Response Time Standards** that requires the City to strive to achieve and maintain optimal response times for all call priority levels to provide adequate police services for the safety of all city residents and visitors.
- → **Policy PHS 1.1.3 Staffing Standards** that requires the City to maintain optimum staffing levels for both sworn police officers and civilian support staff in order to provide quality police services to the community.
- → **Policy PHS 1.1.4 Timing of Services** that requires the City to ensure that development of police facilities and delivery of services keeps pace with development and growth in the city.
- → **Policy PHS 1.1.6 Co-Location of Facilities** that requires the City to seek to co-locate police facilities with other City facilities, such as fire stations, to promote efficient use of space and provision of police protection services within dense, urban portions of the city.
- → **Policy PHS 1.1.7 Development Review** that requires the City to continue to include the Police Department in the review of development proposals to ensure that projects adequately address crime and safety, and promote the implementation of Crime Prevention through Environmental Design principles.
- → **Policy PHS 1.1.8 Development Fees for Facilities and Services** that directs the City to require development projects to contribute fees for police facilities.

The Sacramento Police Department does not have an adopted officer-to-resident ratio. The Department uses GIS data, call and crime frequency information, and available personnel to rebalance its deployment on an annual basis to meet the changing demands of the City. The Department maintains an unofficial goal of 2.0 to 2.5 sworn police officers per 1,000 residents and 1 civilian support staff per 2 sworn officers. *(City of Sacramento, General Plan Background Report (March 2015), pp. 5-5)*

6.6.C Study Area Level of Service Improvements

Upon approval of the SOI expansion area, the ASI project would be served by the Sacramento Police Department (SPD). The nearest police substation is located in Central Command Richards Police Facility at 300 Richards Boulevard in Sacramento. The SPD has identified the need to remodel existing facilities and construct new facilities, but as of 2019, did not have secured funding to do so. As the City grows in the south and north areas and traffic congestion correspondingly increases, SPD's goal is to continue decentralizing in order to maintain adequate response times to areas near the City's borders, particularly in the north and south areas. As such, the SPD has identified the need for additional facilities in the

downtown core, the Meadowview/Valley Hi/Delta Shores area south of downtown, and the Natomas area north of downtown. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-7)*

Development of the proposed project would create an increase in calls for police services, however the proposed project does not include residential uses that would increase the City's resident population. Therefore, the impact to police services resulting from increased calls is anticipated to be minimal.

The City Police Department has within its division a number of crime prevention and community outreach programs. In addition to standard police protection, the Police Department works closely with the City's Development Services to review development plans for consistency with Crime Prevention Through Environmental Design principles.

6.6.D Determinations

Based on the information above, the following determinations can be made:

- Implementation of the ASI project will be subject to all applicable City regulatory requirements. This includes compliance with the laws set forth in Chapter 2.20 of the Sacramento City Code and with applicable Police Services policies contained in the City's General Plan.
- Development of the ASI project site will be subject to Police Department review in order to implement appropriate Crime Prevention through Environmental Design principles.
- Development projects in the ASI area will be required to pay applicable development impact fees for the maintenance, improvement, and expansion of police facilities.
- While development of the proposed project would create an increase in calls for police services, because the ASI project does not include residential uses that would increase the City's resident population, the impact to calls for police services is anticipated to be minimal.

6.7 FIRE PROTECTION

6.7.A Existing Levels of Service and Improvements

The Sacramento Fire Department (SFD) provides fire protection services to the entire City of Sacramento, plus adjacent areas in unincorporated Sacramento County. SFD's service area consists of approximately 99.2 square miles within the City limits and 47.1 square miles in Sacramento County, which include two contract areas for the Pacific Fruitridge and Natomas Fire Protection Districts. SFD is a full-service fire department, with the responsibility for responding to and mitigating incidents involving fires, medical emergencies, hazardous materials, technical and water rescue within its service area. The Department also provides a full range of support services including fire prevention, public education, fire investigation, and domestic preparedness planning and response. It also participates in an automatic aid agreement with neighboring fire jurisdictions, as well as State and Federal agencies. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-11)* As of 2017, SFD had 678 budgeted personnel positions that respond to approximately 90,000 calls each year and provide service to approximately 480,000 residents and over 20,000 businesses in the City. *(City of Sacramento, Fire Department Annual Report, 2017, p. 4)*

SFD is organized into the following divisions:

- **Fire Administrative Services** that is responsible for departmental support of budget, revenues, accounts payable, procurement, contracts, council reports and grants, and various personnel services.
- **Fire/Emergency Medical Services** that responds to fires, rescues, hazardous materials incidents, wildland fires, and other emergencies and medical services.
- **Office of the Chief** that is responsible for developing and providing the Department's overall direction.
- **Technical Services** that provides essential support functions to all divisions, including equipment acquisition and repair, information technology, facility maintenance and repair coordination, and fleet maintenance. This division also enforces fire codes and ordinances, conducts plan reviews and construction inspections, and investigates fires.

→ **Training/Professional Standards** that is responsible for essential fire recruit training including in-service, continuing education, and outreach/recruitment.

(City of Sacramento, FY2022/23 Approved Budget, pp. 216-217)

SFD operates its headquarters from the Public Safety Center, located at 5770 Freeport Boulevard in Sacramento. This facility is shared with the Sacramento Police Department's headquarters. The Department operates 24 fire stations, which are strategically located throughout the City. Although each fire station operates within a specific response district encompassing the immediate geographical area around the station, all of the Sacramento County fire agencies (Sacramento Fire Department, Sacramento Metro Fire District, Sacramento International Airport Fire, Cosumnes Fire District, and the Folsom Fire Department) share an automatic aid agreement that allows response from the closest fire unit regardless of jurisdiction. The nearest fire station to the ASI project site is Fire Station #43, which is located at 4201 El Centro Road in unincorporated Sacramento County, approximately 2.5 miles southeast of the proposed SOI expansion area.

All SFD Engine companies, except one, are staffed with four personnel consisting of a Company Officer (Captain), Engineer, and two Firefighters. One Engine Company is staffed with three personnel (a Captain, an Engineer, and one Firefighter). This engine is located at fire station #3, located in the rural portion of the contracted Natomas Fire Protection District. Truck companies and one Rescue company are also staffed with four personnel consisting of a Company Officer (Captain), Engineer, and two Firefighters. Ambulances are staffed with two Firefighter/Paramedics or a Firefighter/Paramedic and Firefighter/EMT combination. When the department is fully staffed, the daily operational staff consists of 173 personnel on duty for fire and EMS first responder emergencies and 34 of these personnel are on duty for emergency ambulance transportation daily. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-11 to 5-12)*

Metro Air Park is also scheduled to provide land and facilities for a new fire station near the ASI project site. The 10,000 sq. ft. fire station site is located approximately 1.4 miles north of the ASI project site. The Fire Station will be operated by Sacramento Fire Department. Metro Air Park will dedicate the site and provide a building at a cost of $7,140,000. Construction of this facility is planned at such time that Metro Air Park reaches 30% buildout, a threshold that is rapidly approaching. *(Metro Air Park Public Facilities Financing Plan, March 2, 2004) and (Stantec, Metro Air Park Public Facilities Master Plan, March 2, 2004)*

6.7.B Plans and Regulatory Requirements

Federal Requirements

U.S. Occupational Safety and Health Administration. Passed in 1970, the Occupational Safety and Health Act created the Occupational Safety and Health Administration (OSHA) under the US Department of Labor. OSHA sets and enforces workplace standards and provides training, outreach, education, and assistance. The Federal and State Occupational Health and Safety Regulations mandate that firefighters cannot enter a burning structure that is past the small fire stage without four firefighters, with one team of two inside and the other team of two outside. The only exception to this rule is when there is a known life in danger. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-23)*

State Requirements

California Occupational Safety and Health Administration. Pursuant to Title 8, Sections 1270 "Fire Prevention" and 6773 "Fire Protection and Fire Equipment" of the California Code of Regulations, the California Occupational Safety and Health Administration (Cal OSHA) establishes the standards for fire suppression and emergency medical services. These standards address elements such as combustible materials handling, fire hose sizing, compressed air usage, access road requirements, and firefighting and emergency medical equipment maintenance and testing.

Uniform Fire Code. This Code contains regulations relating to construction, maintenance, and use of buildings, including fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, provisions intended to protect and assist fire responders, industrial processes, and many other general and specialized fire-safety requirements for new and existing buildings and the surrounding premises.

California Health and Safety Code. Sections 13000 et seq. of the California Health and Safety Code establish Statewide fire regulations, addressing building standards, fire protection and notification systems, fire protection devices such as extinguishers and smoke alarms, high-rise building and childcare facility standards, and fire suppression training.

Insurance Services Office (ISO). The ISO provides rating and statistical information for the insurance industry for all types of industries, including fire service, on risk management and also includes recommendations for the spacing of fire engine stations and ladder trucks relative to response times.

(City of Sacramento, General Plan Background Report (November 2020), pp. 5-24)

Local Requirements

Sacramento City Code. Chapter 2.24 of the Sacramento City Code provides the Sacramento Fire Department with the duties and powers to enforce various fire protection regulations, including rates and fees for services. Additionally, Chapter 15.36 provides regulations for enforcement of the fire code, control of emergency scenes, permits, general provisions for safety, fire department access, equipment, and protection systems, and other associated standards. *(City of Sacramento, General Plan Background Report (March 2015), pp. 5-27)*

Sacramento General Plan. The City's 2035 General Plan contains policies and implementation measures relevant to fire protection services. Applicable policies are summarized below:

- **Policy PHS 2.1.2: Response Time Standards** that requires the City to strive to maintain emergency response times that provide optimal fire protection and emergency medical services to the community.
- **Policy PHS 2.1.3: Staffing Standards** that requires the City to maintain optimum staffing levels for sworn, civilian, and support staff, in order to provide quality fire protection and emergency medical services to the community.
- **Policy PHS 2.1.4: Response Units and Facilities** that requires the City to provide additional response units, staffing, and related capital improvements, including constructing new fire stations, as necessary, in areas where a fire company experiences call volumes exceeding 3,500 in a year to prevent compromising emergency response and ensure optimum service to the community.
- **Policy PHS 2.1.5: Timing of Services** that requires the City to ensure that the development of fire facilities and delivery of services keeps pace with development and growth of the city.
- **Policy PHS 2.1.11: Development Fees** for Facilities and Services that directs the City to require development projects to contribute fees for fire protection services and facilities.
- **Policy PHS 2.2.2: Development Review** that requires the City to continue to include the Fire Department in the review of development proposals to ensure projects adequately address safe design and on-site fire protection and comply with applicable fire and building codes.
- **Policy PHS 2.2.4: Water Supply for Fire Suppression** that requires the City to ensure that adequate water supplies are available for fire-suppression throughout the city, and shall require development to construct all necessary fire suppression infrastructure and equipment.

6.7.C Study Area Level of Service Improvements

The SFD currently provides fire protection and emergency response services to the ASI SOI expansion area. The ASI project would be primarily served by Fire Station #43, which is the nearest station to the project site. It is located approximately 2.5 miles to the southeast of the ASI project site at 4201 El Centro Road in unincorporated Sacramento County. SFD provides fire protection services to an unincorporated area adjacent to the City, including the ASI project area, through a contract with Natomas Fire Protection District. This contact includes provisions to provide emergency, medical, rescue and fire protection services.

As of 2017, SFD's staffing included 589 full-time equivalent employees who responded to approximately 88,242 calls. The approved FY2022/23 FY Budget increased staffing to 729 positions. SFD maintains a goal to have its first responding company, which provides for fire suppression and paramedic services, arrive within four minutes. Additionally, the SFD maintains automatic aid agreements with all its neighboring agencies including the Sacramento Metropolitan Fire District and Cosumnes Fire. Under these automatic aid agreements, all related emergency calls are routed through a central dispatch center and the nearest

apparatus is dispatched to emergency incidents, regardless of political jurisdiction. *(City of Sacramento, FY2022/23 Approved Budget, p. 300)* and *(Ascent Environmental, Panhandle Annexation and PUD Plan for Services, June 2017, p. 24)*

As required for mandatory compliance with the Uniform Fire Code and Sacramento City Code Chapter 15.36, development of the ASI project site would be required to comply with regulations relating to construction, maintenance, and use of buildings. This would include mandatory elements for fire prevention and deterrence related to fire department access, fire hydrants, automatic sprinkler systems, fire alarm systems, fire and explosion hazards safety, hazardous materials storage and use, and other fire-safety requirements. *(Ascent Environmental, Panhandle Annexation and PUD Plan for Services, June 2017, p. 24)*

Development would also be required to comply with State and local fire regulations, as outlined in the California Health and Safety Code and the City Code. Compliance with these regulations would ensure that fire and other emergency service providers maintain access to all properties within the ASI project area in the event of a fire emergency. *(Ascent Environmental, Panhandle Annexation and PUD Plan for Services, June 2017, p. 24)*

6.7.D Determinations

Based on the information above, the following determinations can be made:

- The Sacramento Fire Department provides fire protection services to the entire City and some small unincorporated areas within the County that include Pacific-Fruitridge and Natomas Fire Protection Districts. This service area includes the proposed ASI SOI expansion area.
- Fire Station #43 is located approximately 2.5 miles southeast of the proposed ASI SOI expansion area at 4201 El Centro Road in unincorporated Sacramento County.
- Development projects in the ASI project area will be required to pay any City-adopted impact fees related to fire protection services, as outlined in the Sacramento City Code.
- The Metro Air Park Project is required to dedicate and fund a future fire station within its project area, and when constructed, this facility will provide additional fire protection coverage in proximity to the ASI project site.

6.8 SOLID WASTE

6.8.A Existing Levels of Service and Improvements

The City of Sacramento's Recycling and Solid Waste Division collects residential solid waste generated throughout the City, including household waste, recycling, and organic wastes. Approximately 660,000 tons of solid waste are generated annually, with the City collecting approximately 250,000 tons, and the remainder collected by franchised waste haulers and individual residents. *(City of Sacramento, http://www.cityofsacramento.org/Public-Works/RSW, 2022)* Waste collected by the City is initially transported to two locations. These include the Sacramento Recycling and Transfer Station (SRTS) and Elder Creek Transfer Station, which accepts waste from the southern region of the City, and the Sacramento County North Area Recovery Station (NARS) and Yolo County Central Landfill, which accepts waste from the north region of the City. Refuse is hauled from these locations to the Sacramento County Kiefer Landfill and several other facilities for processing. Solid waste generated by commercial uses (including multifamily residences of five units or more) is collected by private haulers and transported to the SRTS, NARS, Sacramento County Kiefer Landfill, Yolo County Landfill, L and D Landfill, Florin Perkins Landfill, Elder Creek Transfer Station, and other facilities. *(City of Sacramento, General Plan Background Report (March 2015), pp. 4-44)*

The Sacramento County Kiefer Landfill, located at Kiefer Boulevard and Grand Line Road, sits on a 1,084-acre site with approximately 660 acres of landfill area and is one of the primary locations for disposal of solid waste generated in the City of Sacramento. The waste delivered to the landfill is from municipal and industrial sources with an average of approximately 2,423 tons per day accepted. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-45)*

6.8.B Plans and Regulatory Requirements

Federal Requirements

Title 40 of the Code of Federal Regulations. Criteria for Municipal Solid Waste Landfills is established by Title 40, Part 258, of the Code of Federal Regulations. It contains regulations for municipal solid waste disposal regarding location, design, operation, groundwater safety and monitoring, and closure procedures. State permitting programs are required to incorporate these regulations.

State Requirements

California Department of Resources Recycling and Recovery (CalRecycle). Waste generated in California is overseen, managed, and tracked by CalRecycle. This entity also creates specific regulations and administers grants and loans to California cities, counties, businesses, and organizations to meet State goals for waste reduction, reuse, and recycling.

Assembly Bill (AB) 939. Written in 1989, AB 939 requires that: a) cities and counties have integrated waste management plans (IWMPs); b) approximately 50 percent of solid waste generated by municipalities is diverted from landfills; and c) Source Reduction and Recycling Elements be part of the IWMP.

Senate Bill (SB) 1016. SB 1016 (2008) requires that the 50 percent solid waste diversion requirement established by AB 939 is measured by pounds per person per day. The review process for the Source Reduction and Recycling Elements was changed by SB 1016 to include the establishment of per-year diversion rates and scheduled review of compliance.

Assembly Bill 341. Adopted in October 2011, AB 341 amended the California Integrated Waste Management Act and established a statewide policy goal to divert 75 percent of solid waste from landfills by 2020. AB 341 focused on mandatory commercial recycling and requires California commercial enterprises and public entities that generate 4 or more cubic yards per week of waste, as well as multi-family housing complexes with 5 or more units, to arrange for recycling services.

Assembly Bill 1826. Adopted in October 2014, AB 1826 established statewide requirements that businesses, including apartment complexes, must recycle organic waste starting in 2016 depending on the amount of waste generated per week. In 2020, the threshold was reduced to 2 cubic yards of total solid waste generated including trash, recycling, and organics.

Senate Bill 1383. Adopted September 2016, SB 1383 established methane emissions reduction targets in a statewide effort to reduce emissions of short-lived climate pollutants. This includes a reduction in methane by 40 percent, hydrofluorocarbon gases by 40 percent, and anthropogenic black carbon by 50 percent below 2013 levels by 2030. SB 1383 also set specific targets for reducing organic wastes in landfills, with a goal to achieve a 50 percent reduction in statewide disposal of organic waste from 2014 levels by 2020, and a 75 percent reduction by 2025.

(City of Sacramento, General Plan Background Report (November 2020), pp. 4-46)

Local Requirements

Sacramento General Plan. The City of Sacramento 2035 General Plan addresses solid waste collection in its Utilities section, which states an overarching goal to maintain efficient, high quality infrastructure facilities and services. Applicable General Plan policies are summarized below:

- → **Policy U1.1.1 Provision of Adequate Utilities** that requires the City to provide and maintain adequate water, wastewater, and stormwater drainage utility services to areas in the city, and shall provide and maintain adequate water, wastewater, and stormwater drainage utility services to areas in the city that do not currently receive these City services upon funding and construction of necessary infrastructure.
- → **Policy U1.1.4 Timing of Urban Expansion** that requires the City to assure that new public facilities and services are phased in conjunction with the approved urban development they are intended to serve.
- → **Policy U1.1.5 Growth and Level of Service** that directs the City to require new development to provide adequate facilities or pay its fair share of the cost for facilities needed to provide services to accommodate growth without adversely impacting current service levels.

- → **Policy U5.1.5 Residential and Commercial Waste Disposal** that requires the City to continue to provide curbside trash and recycling collection service to single-family residential dwellings, dwellings of up to four units, condominiums of any number, and mixed-use properties.

City of Sacramento Planning and Development Code. Section 34 of the City's Planning and Development Code requires that waste mitigation and recycling efforts be incorporated into development plans for all new multifamily and nonresidential projects. These requirements can also apply to the retrofitting of existing development.

City of Sacramento Construction and Demolition Debris Recycling Ordinance. Established in 2009, the ordinance requires all complete demolition and building permits over $250,000 in value to recycle or reuse 50 percent of all wastes generated and provide proof of meeting this requirement. These requirements have since been updated by the 2019 California Green Building Standards Code, lowering the permit value to $200,000 and increasing the recycling requirement to a minimum of 65 percent.

Sacramento Climate Action Plan. Adopted in 2012, the Sacramento Climate Action Plan included the goal of 75 percent diversion (recycling or reusing) by 2020 and zero waste to landfills by 2040.

(City of Sacramento, General Plan Background Report (November 2020), pp. 4-47)

6.8.C Study Area Level of Service Improvements

Solid waste generated by construction and operation of the ASI project site will be collected by private franchised haulers for sorting and recycling or self-hauled by subcontractors to construction and demolition recycling facilities. Much of the solid waste generated by construction and operation of the ASI project site may be transported and deposited at the Sacramento County Kiefer Landfill. As of 2018, the landfill has a remaining refuse capacity of approximately 78.5 million cubic yards. As a result, the Kiefer Landfill is currently projected to be able to serve the area between the years 2052 to 2085. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-45)* With the additional efforts realized through implementation of the City's adopted Climate Action Plan and General Plan to reduce and eventually eliminate solid waste in landfills, the impact to the City's current landfill sites should decrease and years of available capacity increase past previous projections. In light of this, the City of Sacramento's and commercial franchised haulers' waste collection services are adequate to support current service levels. The waste generated at the ASI project site will create a manageable increase in service levels.

6.8.D Determinations

Based on the information above, the following determinations can be made:

- → The commercial franchised hauler waste collection services offered in the City of Sacramento are adequate to support additional solid waste generated by the industrial and commercial operations of the ASI project.
- → One of the City's main landfill sites is expected to maintain capacity to serve the City through the years 2052 to 2085.

6.9 STORM DRAINAGE AND FLOOD CONTROL

6.9.A Existing Levels of Service and Improvements

Natomas Basin

The ASI project site/SOI expansion area is located in the Natomas Basin, a large geographic area of flat terrain in northwestern Sacramento County and southwestern Sutter County. The basin is approximately 55,000 acres in size and spans ±15 miles in a north-south direction and ±5-6 miles in an east-west direction. Most of the basin has an elevation ranging between ±10' to ±25', with portions of the basin reaching ±40'. Historically, the Natomas Basin has been subject to flooding risk from the Sacramento and American Rivers. The Natomas Basin was developed for agricultural purposes in the late 19th and early 20th centuries. Levees, internal drainage channels, and pump stations were constructed to reclaim the often-flooded land for agriculture.

The Natomas Basin is under the jurisdiction of the United States Army Corps of Engineers (USACE). The levees surrounding the Natomas Basin were decertified by the USACE in December 2008. Subsequently, the Sacramento Area Flood Control Agency (SAFCA) and the USACE have been, and currently are, working together to design, fund, and construct levee improvements that will provide the Natomas Basin with 200-year flood protection. Over 50% of the levee improvements have been constructed, and 100% of the funding has been allocated by local, State and Federal agencies to complete all planned levee improvements. This level of levee completion and funding has allowed portions of the Natomas Basin to be classified as A-99 flood zones, including the eastern portion of the ASI project site. "A-99" is an interim designation that allows new development to proceed without elevation verification while the improvements needed to provide 100-year protection are under construction. It remains within a special flood hazard area until construction is complete and the levees are accredited by the Federal Emergency Management Agency (FEMA). The majority of the project site is classified as Zone A, which means FEMA requires more detailed interior (local) drainage assessments to remove it from the special flood hazard area, in addition to addressing the levee flooding issues.

Reclamation District 1000 (RD 1000)

Reclamation District No. 1000 (RD 1000) was formed in 1911 by a Special Act of the Legislature in order to provide agricultural drainage, flood control, and levee maintenance in the Natomas Basin. The District covers the Natomas Basin and is bounded by the Sacramento River on the west, the Natomas Cross Canal on the north, Pleasant Grove Creek and the Natomas East Main Drainage Canals on the east, and the American and Sacramento Rivers on the south and west. RD 1000 has approximately 43 total miles of levees throughout its district, which are all considered "project" levees.

RD 1000's interior canal and drainage system was originally designed to convey stormwater to the pumping plant at Second Bannon (Plant 1A) for discharge into the Sacramento River. Its purpose was to provide drainage and flood protection to agricultural lands within the District. In 1920, Plant 2 was added at Pritchard Lake to serve as both an irrigation and drainage facility, and in 1939, Plant 3 was added along the Sacramento River. As urban development in the City of Sacramento began occurring in the southeastern area of the basin, additional storm drainage pumping facilities were added to increase capacity. This included the construction of 5 additional pumping plants that were located to relieve pressure on the original pumping plants. Subsequently, the District has entered into several agreements with both the City and County of Sacramento. These agreements memorialized various stormwater drainage services, whereby the District would manage urban runoff in exchange for the City and/or County either: 1) paying for increased capacity; 2) constructing facilities to increase capacity; or 3) requiring new development to compensate the District for adding capacity to accommodate increased runoff.

The ASI project site is affected by off-site stormwater runoff from RD 1000's System, which enters the site from beneath Interstate 5 to the north via Reach 8 of the Lone Tree Canal. Once on site, Reach 8 of the Lone Tree Canal flows south to join with the West Drainage Canal, which is located along the site's southern boundary. From this confluence, drainage runoff can be conveyed to either Pumping Plant 3, located to the southeast of the ASI project, or to Pumping Plan 5, located to the northwest. Both of these plants are designed to pump runoff into the Sacramento River.

Improvements to the RD 1000 system have been necessary over the years as the Natomas Basin has urbanized. The downstream system has gone through various improvements, and other improvements remain pending. Recent upstream improvements include the widening and regrading of the Lone Tree Canal (north of I-5) as part of the Northlake project. Additional Lone tree Canal widening and culvert improvements are included in the Metro Air Park Financing Plan, some of which have recently been completed, and include culvert improvements and pump station funding.

The project site is also located in a Federally-recognized internal floodplain (A-99 Zone) and within a local 100-year floodplain (A Zone, based on RD 1000's modeling). This indicates that the project's undeveloped land area provides floodwater storage during a 100-year storm event. This floodplain mapping and modeling establishes the accepted definition of interior flooding conditions with the levees being certified. The project site's interior floodplain will be mitigated with on-site storage.

Sacramento Area Flood Control Agency

The Sacramento Area Flood Control Agency (SAFCA) was formed in 1989 to address the Sacramento area's vulnerability to catastrophic flooding. This vulnerability was exposed during a record flood in 1986 when Folsom Dam exceeded its normal flood control storage capacity and several area levees nearly collapsed. In response, the City of Sacramento, the County of Sacramento, the County of Sutter, the American River Flood Control District, and RD 1000 created SAFCA through a Joint Exercise of Powers Agreement to provide the Sacramento region with increased flood protection along the Sacramento and American Rivers.

SAFCA's mission is to provide the region with at least a 100-year level of flood protection as quickly as possible while seeking a 200-year or greater level of protection over time. Under the Sacramento Area Flood Control Agency Act of 1990, the California Legislature has given SAFCA broad authority to finance flood control projects and has directed the Agency to carry out its flood control responsibilities in ways that provide optimum protection to the natural environment.

On-Site Storm Drainage Facilities

Other than the existing RD 1000 ditches and canals, the existing site has no internal drainage systems flowing overland towards the RD 1000 canals and ditches around the perimeter and through the site. Site topography is relatively flat. The western two-thirds of the site generally has an elevation of 10.0. The elevations increase in the vicinity of the new interchange from elevation 10.0 to elevation 35.0 at the existing Metro Air Parkway bridge crossing of Interstate 5. In the eastern area of the site, elevations generally slope from 10.0 to 25.0 at the east boundary. Development of the ASI project would require the construction of storm drainage facilities that meet applicable Federal, State, and Local regulations and requirements.

6.9.B Plans and Regulatory Requirements

Federal Requirements

The Federal Emergency Management Agency (FEMA). FEMA's "Title 44-Emergency Management and Assistance" (Chapter 1: Federal Emergency Management Agency, Part 65 – Identification and Mapping of Special Flood Hazard Areas) outlines the steps the community needs to take in order to assist FEMA's effort in providing up-to-date identification and publication, in the form of the maps described, on special flood, mudslide (i.e. mudflow), and flood-related erosion hazards.

Local Requirements

Sacramento General Plan. The City of Sacramento 2035 General Plan addresses stormwater drainage in its Utilities section, which includes policies designed to ensure that new drainage facilities are adequately sized and constructed. The following General Plan policies are applicable to stormwater drainage services:

- → **Policy U 4.1.1: Adequate Drainage Facilities** that requires the City to ensure that all new drainage facilities are adequately sized and constructed to accommodate stormwater runoff in urbanized areas.
- → **Policy U 4.1.4: Watershed Drainage Plans** that directs the City to require developers to prepare watershed drainage plans for proposed developments that define needed drainage improvements per City standards, estimate construction costs for these improvements, and comply with the City's National Pollutant Discharge Elimination System (NPDES) permit.
- → **Policy U 4.1.6: New Development** that directs the City to require proponents of new development to submit drainage studies that adhere to City stormwater design requirements and incorporate measures, including "green infrastructure" and Low Impact Development (LID) techniques, to prevent on- or off-site flooding.
- → **Policy ER 1.1.4: New Development** that directs the City to require new development to protect the quality of water bodies and natural drainage systems through site design (e.g., cluster development), source controls, storm water treatment, runoff reduction measures, best management practices (BMPs) and Low Impact Development (LID), and hydromodification strategies consistent with the city's NPDES Permit.

- **Policy ER 1.1.5: Limit Stormwater Peak Flows** that directs the City to require all new development to contribute no net increase in stormwater runoff peak flows over existing conditions associated with a 100-year storm event.
- **Policy ER 1.1.6: Post-Development Runoff** that directs the City to impose requirements to control the volume, frequency, duration, and peak flow rates and velocities of runoff from development projects to prevent or reduce downstream erosion and protect stream habitat.
- **Policy EC 2.1.11: New Development** that directs the City to require evaluation of potential flood hazards prior to approval of development projects and shall regulate development in urban and urbanizing areas per state law addressing 200-year level of flood protection.
- **Policy EC 2.1.24: Flood Risk Notification** that directs the City to annually notify owners of residential development protected from flooding by a levee and/or subject to inundation in the event of levee failure of the risk.
- **Policy EC 2.1.25: Deed Notification** that directs the City to require, for areas protected by levees, all new developments to include a notice within the deed that the property is protected by flooding from a levee and that the property can be subject to flooding if the levee fails or is overwhelmed.

6.9.C Study Area Level of Service Improvements

Upon approval of the SOI expansion, stormwater drainage services for the ASI project will be provided by the City of Sacramento and RD 1000 in a similar manner as is currently performed in North Natomas and other areas of the Natomas Basin. In the vicinity of the project site, RD 1000 owns and operates a system of canals and pump stations that move storm drainage from the local area to the Sacramento River. RD 1000 collects all runoff within the Natomas Basin through a system of interconnected channels and directs this runoff to pump stations in order to lift the water into the leveed rivers and channels surrounding Natomas. These channels and pumping systems rely on existing flood storage in low lying areas to dampen peak flows, metering water into the pump stations and allowing pumping to operate efficiently.

The City of Sacramento is the planned owner and operator of the future on-site drainage system that is designed to detain/retain urban runoff and pump it for discharge into RD 1000's system. RD 1000 is then responsible for the off-site system conveying the stormwater from the project site to the Sacramento River.

Development of the ASI project requires that the site's development area be raised above the previously-identified floodplain. Buildings' finished floors would be raised above RD 1000's identified floodplain elevations and parking areas would be elevated to limit 100-year flood depth to an acceptable range. To offset the loss of existing on-site stormwater storage, the ASI project design incorporates on-site detention/retention facilities to mitigate the impacts of elevating the site's development areas. The on-site storm drain facilities are planned to include a piped system to convey the 10-year storm events. Overland release through streets and parking will convey the 100-year event. All of the project's internal storm drainage will be directed to the proposed on-site detention basins and pump station.

Within the Natomas Basin, RD 1000 requires that developed lands mitigate their post-project runoff in order not to increase above pre-project levels. To achieve this requirement, the ASI project's on-site design consists of a perimeter system of detention/retention basins located adjacent to existing RD 1000 ditches/canals and areas adjacent to Reach 8 and the canals south of the site. The basins are designed to be interconnected via culverts, thereby providing a single, continuous on-site system that is controlled by a planned on-site pump station. The on-site system also connects to RD 1000's system through a series of weirs and is designed to meet the pre-project spill condition and to provide on-site floodplain storage.

6.9.D Determinations

Based on the information above, the following determinations can be made:

- The United States Army Corps of Engineers (USACE) and the Sacramento Area Flood Control Agency (SAFCA) are collaborating on the construction of levee improvements that will provide 200-year flood protection to the Natomas Basin.
- RD 1000 maintains regional drainage facilities both adjacent to, and within, the ASI project site, which convey off-site stormwater runoff to pumping facilities where it is discharged into the Sacramento River.

- The City of Sacramento, the County of Sacramento, the County of Sutter, the American River Flood Control District, and RD 1000 created the Sacramento Area Flood Control Agency (SAFCA) to provide the Sacramento region with increased flood protection along the Sacramento and American Rivers.
- The ASI project's on-site drainage systems have been designed to mitigate post-project runoff levels to be equal to, or less than, pre-project levels, consistent with RD 1000's requirements. This includes a system of detention/retention basins, pumping facilities, and weirs that connect the on-site system with RD 1000's system.

6.10 PARKS AND RECREATION

6.10.A Existing Levels of Service and Improvements

The City of Sacramento's Youth, Parks, and Community Enrichment (YPCE) Department manages its network of parks, open spaces, and recreation areas that contribute significantly to the identity and character of the City's neighborhoods and urban areas. The department is responsible for planning and acquiring land for new parks, renovating existing parks, and maintaining these facilities. Additionally, the department is responsible for preserving, protecting, and enforcing park regulations of over 234 facilities with 4,360 acres of parks, parkways, open space, community centers, aquatic facilities, and bike trails Citywide. *(City of Sacramento, FY2022/23 Approved Budget, pp. 270-271)*

The City operates and maintains 218 parks, recreation, parkway and open space sites, 21 lakes, ponds and beaches, 17 aquatic facilities, 13 community centers, and approximately 115 miles of shared-use paths. Parks and open space areas are classified as summarized below, which consists of three park types plus open space. Open space may be a component of any park type, but is most common in regional or community parks. These classifications include:

- **Neighborhood Parks.** These facilities are generally smaller than 10 acres in size and are designed to serve residents within a half-mile radius. Some facilities are located adjacent to elementary schools where park programming can be oriented to the recreational needs of children. This park classification also includes urban plazas and pocket parks, which are strictly less than five acres in size and typically sited in denser urban and mixed-use developments.
- **Community Parks.** Community parks are generally 6-60 acres in size, providing a broader range of amenities for several neighborhoods within a three-mile radius. In addition to the types of amenities provided at neighborhood parks, community parks are sized to provide additional amenities such as restrooms, on-site parking, community centers, swimming pools, lighted sports fields or courts, and/or other specialized facilities.
- **Citywide/Regional Parks/Parkways.** These are Sacramento's largest park facilities, which are designed to serve the needs of the entire City population. Citywide/Regional Parks typically incorporate amenities that are not found in smaller neighborhood or community parks and may include facilities such as golf courses, aquatic centers, marinas, amusement areas, nature areas, and/or shared-use trails. Parkways are also included in this classification and typically consist of linear, narrow corridors with limited recreational uses that are primarily used for pedestrian/bicycle linkages between residential neighborhoods, schools, parks, and shopping areas.
- **Open Space.** This classification is for natural areas within the City that are used to protect environmental amenities, such as native plant communities or wildlife habitat. As such, open space areas generally have limited recreational use. While classified separately, parkways are similar to the open space classification due to their limited recreational use and design.

(City of Sacramento, General Plan Background Report (November 2020), pp. 5-26 to 5-27)

Recreation Programs

A variety of recreation programs for all ages are offered by the YPCE Department. This includes adult and youth sports classes; special events; after-school, summer, and aquatic programs; community classes and enrichment programs; and coordinates reservations for baseball and softball fields. Additionally, the City's community centers are used to hold events such as flea markets, family nights, craft fairs, and holiday

and multicultural celebrations. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-30 to 5-33)*

Planned Improvements

The City of Sacramento is currently in the process of updating its Parks and Recreation Master Plan (PRMP) as part of the 2040 General Plan Update. The updated PRMP will utilize a combination of professional expertise and community feedback to evaluate the current conditions and potential areas for improvement of parks facilities and recreation programs. The Parks Plan will offer policy recommendations to guide maintenance of existing facilities and the development of new parks and programs for the next 20 years. The updated Master Plan is expected to be adopted in Fall 2023.

6.10.B Plans and Regulatory Requirements

Local Requirements

City of Sacramento General Plan. The Sacramento 2035 General Plan Education, Recreation and Culture Element contains goals and policies to guide the maintenance of existing parks and development of new facilities and programs. The goals and policies in the General Plan intend to integrate parks and recreation in a way that is highly accessible to neighborhoods and immersed with other public services and amenities throughout the City.

Applicable policies are summarized below:

- **Policy ERC 2.1.1 Complete System** that requires the City to develop and maintain a complete system of parks and open space areas throughout Sacramento that provide opportunities for both passive and active recreation.
- **Policy ERC 2.1.2 Connected Network** that requires the City to connect all parts of Sacramento through integration of recreation and community facilities with other public spaces and rights-of-way (e.g., buffers, medians, bikeways, sidewalks, trails, bridges, and transit routes) that are easily accessible by alternative modes of transportation.
- **Policy ERC 2.2.3 Service Level Radius** that requires the City to strive to provide accessible public park or recreational open space within one-half mile of all residences.
- **Policy ERC 2.2.4 Park Acreage Service Level Goal** that requires the City to strive to develop and maintain 5 acres of neighborhood and community parks and other recreational facilities/sites per 1,000 population.
- **Policy ERC 2.2.5 Meeting Service Level Goal** that requires the City to require new residential development to meet its fair share of the park acreage service level goal by either dedicating land for new parks, paying a fair share of the costs for new parks and recreation facilitates or renovation of existing parks and recreation facilities. For new development in urban areas where land dedication or acquisition is constrained by lack of available properties (e.g., the Central City), new development shall either construct improvements or pay fees for existing park and recreation enhancements to address increased use. Additionally, the City shall identify and pursue the best possible options for park development, such as joint use, regional park partnerships, private open space, acquisition of parkland, and use of grant funding.
- **Policy ERC 2.2.6 Urban Park Facility Improvements** that requires the City to explore creative solutions to provide neighborhood park and recreation facilities in urban areas where land dedication is not reasonably feasible.
- **Policy ERC 2.2.8 Capital Investment Priorities** that requires the City to explore creative solutions to provide neighborhood park and recreation facilities give priority to specified capital investments, including acquisition of park land in areas where adopted service levels are not being met and acquisition of large natural areas for habitat protection and passive recreation use areas.
- **Policy ERC 2.2.9 Small Public Places for New Development** that requires the City to allow new development to provide small plazas, pocket parks, civic spaces, and other gathering places that are available to the public, particularly in infill areas, to help meet recreational demands.

- → **Policy ERC 2.2.10 Range of Experience** that requires the City to provide a range of parks and recreational facilities in a range of sizes, with larger parks located at City edges and along rivers and smaller parks located in denser development areas.
- → **Policy ERC 2.2.12 Compatibility with Adjoining Uses** that requires the City to ensure that the location and design of all parks, recreation and community centers are compatible with existing and adjoining uses.
- → **Policy ERC 2.2.20 Responsiveness to Community** that requires the City to work with affected neighborhoods in the design of parks and recreational facilities to meet residents' needs and interests.

6.10.C Study Area Level of Service Improvements

The nearest parks, located just east of the ASI project site, include the 4.93-acre Egret Park and the 3.6-acre Egret Park Open Space, the 1.75-acre Sparrow Park, and the 10.35-acre Westlake Community Park. These parks serve the Westlake and Sundance Lake areas, which contain predominantly residential development. Development of the Northlake (formerly Greenbriar) community located to the northeast of the project site includes plans for five parks, totaling 37.6 acres of additional parkland. Much of the land west of the site and surrounding Sacramento International Airport is vacant or used for agricultural purposes. Recreational opportunities exist on the west side of the Sacramento River in Elkhorn Regional Park.

6.10.D Determinations

Based on the information above, the following determinations can be made:

- → Demand for parks and recreation services in the City is primarily generated by residential development. An adequate amount of parkland exists in the City to serve existing development.
- → The ASI project, which consists of industrial and commercial uses, will not generate residential uses that create an additional demand for the City's parks or recreation services.

6.11 LIBRARIES

6.11.A Existing Levels of Service and Improvements

This section summarizes the City's current library services, lists existing facilities, and identifies the need and plans for expansions. The importance of a library system is to provide to the public a major source of information, academic activities, research data, and contribute to the community's cultural activities. The libraries in the cities and County of Sacramento are functionally consolidated as a single system. The Sacramento Public Library (SPL) is a joint powers agency between the cities of Sacramento, Citrus Heights, Elk Grove, Galt, Isleton, Rancho Cordova, and the County of Sacramento. SPL serves residents of these cities and throughout unincorporated Sacramento County. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-47)*

The SPL is the fourth largest library system in California with 28 locations serving 1.4-million urban, suburban, and rural residents. In addition to lending books, the SPL offers services and programming focused on early learning, technology and creation and is committed to providing Sacramento communities with welcoming community spaces. *(https://www.saclibrary.org/About/Mission-Vision, 2022)*

SPL operates a total of 28 branches, including 12 branches within the City and 16 branches in other cities and throughout Sacramento County. SPL also operates a bookmobile. Residents of Sacramento County have access to all library branches both inside and outside the City of Sacramento.

The SPL's main branch, also known as the Central Library, was founded by community leaders in 1857 and is located in downtown Sacramento at 8th and I Streets. It now contains nearly 300,000 volumes and more than 1,000 periodical subscriptions. Many special collections are housed at the Central Library, including business, government documents, genealogy, and literature. Its Sacramento Room includes special collections on California and Sacramento history, local authors, and the library's history. The Central Library has many unique resources, including online and CD based resources, internet stations, and the Schwab-Rosenhouse College Resource Center, which provides free consultations with professional college and career counselors and access to a variety of college preparatory resources. The Tsakopoulos Library Galleria

provides a 5,400 square foot space available for a variety of events, including weddings, meetings, seminars, parties, receptions, fund raisers, and trade shows. The Galleria also includes two smaller meeting rooms. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-47)*

The North Natomas Public Library is the closest library to the ASI project site and is located approximately 2.5-miles to the east at 4660 Via Ingoglia in the City. It is a joint-use facility serving the North Natomas community, as well as the students, faculty, and staff of both Inderkum High School and the Natomas Center of American River College. As such, this library features a diverse collection of materials serving the needs of the high school and community college students, a collection for children, recreational and informational reading for adults, magazines, newspapers, and a variety of media as well as public computer workstations. On-site amenities include a book drop, a variety of computing services, public spaces, and a meeting room.

In addition, other entities operate libraries in the City of Sacramento. One such facility is the California State Library, which is operated by the State of California. The State Library operates out of three locations, the Stanley Mosk Library and Courts Building at 9th and Capitol Streets, and Library and Courts II Building at 9th and N Streets, both in downtown Sacramento. The State Library provides reference services, on-site use or loan of collections, California history information, genealogy resources, braille and recorded books, a directory of libraries, and internet access. The State Library's circulating materials are also loaned out to the public through local libraries. The State Library also provides services to the State government, local governments, and local libraries. *(City of Sacramento, General Plan Background Report (November 2020), pp. 5-49)*

6.11.B Plans and Regulatory Requirements

Local Requirements

City of Sacramento General Plan. The Sacramento 2035 General Plan's Education, Recreation and Culture Element contains goals and policies to guide provisions for the City's library services. Applicable policies are summarized below:

- **Policy ERC 3.1.1 Adequate Services and Facilities** that requires the City to ensure adequate library services and facilities are maintained for all residents.
- **Policy ERC 3.1.2 Library Siting** that requires the City to promote the siting of libraries in higher-density and infill areas along major arterials and transit service routes to provide convenient access to Sacramento residents.
- **Policy ERC 3.1.3 Under-Served Areas** that requires the City to give priority to the construction of new libraries in communities that are deficient in library services, including East Sacramento near 65th Street and Folsom Boulevard, North Sacramento, and the South Area Community Plan area.
- **Policy ERC 3.1.4 Joint Use** that requires the City to encourage the development and use of multi-functional library facilities by public and private agencies at locations such as schools, community centers, and public-private partnership venues.
- **Policy ERC 3.1.5 Digital Literacy and Access** that requires the City to encourage access to digital resources and information tools and the development of 21st Century literacy skills.
- **Policy ERC 3.1.6 Educational Awareness** that requires the City to promote public awareness of library facilities and services.
- **Policy ERC 3.1.7 Funding** that requires the City to, in conjunction with the Sacramento Library Authority, explore methods of financing new library facilities and expanding and upgrading existing facilities.

(City of Sacramento, 2035 General Plan, March 3, 2015, pp. 2-269 to 2-271)

6.11.C Study Area Level of Service Improvements

The Airport South Industrial project consists of commercial and industrial uses. Typically, level of service for community libraries is correlated with residential uses and population. Development of the ASI project site with commercial and industrial uses will not increase the City's residential population and its operation is not expected to significantly increase the need for the City's existing library services. For these reasons, level

of service improvements and/or expansion of current library resources are not warranted to serve the proposed ASI project.

6.11.D Determinations

Based on the information above, the following determinations can be made:

- → The City of Sacramento's libraries are adequate for its current population.
- → Development of the ASI project will not increase the City's residential population, and the introduction of commercial and industrial uses is not expected to significantly increase the need for the City's existing library services.
- → The ASI project does not significantly increase the demand libraries in the community, therefore, no expansion of current library resources is warranted.

6.12 ELECTRICITY & NATURAL GAS

6.12.A Existing Levels of Service and Improvements

The Sacramento Municipal Utility District (SMUD) is responsible for the acquisition, generation, transmission and distribution of electrical service throughout the City of Sacramento. In addition to the City of Sacramento, SMUD's service area includes most of Sacramento County and a portion of Placer County. Electricity is produced from a variety of resources, including hydroelectric, thermal (natural gas), wind, and solar facilities. SMUD prepares an Integrated Resource Plan (IRP) that includes targets for system demand, system energy sales, renewable energy, and greenhouse gasses. The IRP evaluates various methods and options to meet SMUD's long-term needs and evaluates the impacts of various resource portfolios on SMUD's strategic policies. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-47 to 4-51)*

Pacific Gas & Electric Company (PG&E) provides natural gas service to residents and businesses in the Sacramento Area, including the proposed SOI expansion area. In the winter months, most natural gas resources are imported from Canada on a supply and demand basis, with the balance supplied from production wells in California. In the summer months, gas is acquired at a lower price and is stored in underground storage facilities for use during winter peak use periods. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-59)*

6.12.B Plans and Regulatory Requirements

Federal Requirements

Federal Energy Regulatory Commission (FERC). FERC is an independent agency that regulates the interstate transmission of electricity, natural gas, and oil. FERC reviews proposals to build liquefied natural gas (LNG) terminals and interstate natural gas pipelines, and licenses hydropower projects. The Energy Policy Act of 2005 gave FERC additional responsibilities, including: promoting the development of a strong energy infrastructure; open access transmission tariff reform; and preventing market manipulation. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-53)*

Federal Power Act. SMUD is not a public utility as defined by the Federal Power Act. Accordingly, FERC does not regulate SMUD's rates or terms and conditions of service. Instead, SMUD's rates are set by its Board of Directors. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-53)*

Clean Power Plan. Known as the Clean Power Plan, in 2015 the EPA established the Carbon Pollution Emission Guidelines for Existing Stationary Sources. It provides guidelines directing how states must develop plans to reduce greenhouse gas emissions from existing fossil-fuel-fired electric generating units and includes state-specific goals for CO2 emission performance rates. Compliance with state emission goals begins in 2022 with full compliance with final goals required by 2030. Concurrent with the Clean Power Plan, the EPA established Standards of Performance for Greenhouse Gas Emissions from New, Modified, and Reconstructed Stationary Sources, which prescribes CO2 emission standards for newly-constructed, modified, and reconstructed affected fossil fuel-fired electric utility generating units. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-53)*

State Requirements

California Public Utilities Commission (CPUC). The CPUC is a State agency created by constitutional amendment to regulate privately-owned entities that provide public services, including those providing electricity and natural gas services. The CPUC is responsible for assuring California utility customers have safe, reliable utility services at reasonable rates. As a local publicly owned electric utility, SMUD does not fall within the jurisdiction of the California Public Utility Commission. Instead, SMUD is regulated by the Municipal Utility District Act (Public Utilities Code of the State of California, Division 6). *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-54)*

Title 24, California Code of Regulations. Energy consumption of new buildings in California is regulated by State Building Energy Efficiency Standards, of Title 24 in the California Code of Regulations. Title 24 applies to all new construction and includes energy consumption regulations for heating, cooling, ventilation, water heating, and lighting systems. Title 24 also includes CALGreen, which is formally known as the California Green Building Standards Code, Title 24, Part 11, of the California Code of Regulations. CALGreen establishes mandatory minimum green building standards and includes more stringent optional provisions known as Tier 1 and Tier 2. The City of Sacramento adopted Tier 1 Building Code standards for all new development, effective January 1, 2014. In January 2020, updated CALGreen standards took effect to include mandatory environmental performance standards for newly constructed low-rise residential and commercial projects, including state-owned buildings, schools, and hospitals. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-58)*

Senate Bill 705 (SB 705). SB 705 requires California's gas corporations to provide periodic updates to the CPUC regarding gas system safety actions. Updates must include a plan that describes how a gas corporation will implement its policies to achieve the previously identified objectives. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-62)*

Local Requirements

Sacramento Green Building Program. The City of Sacramento's Council-adopted Green Building Program promotes sustainable private development. The program includes previously adopted green building guidelines (i.e., LEED and GreenPoint), voluntary green building checklists for developers, and a Green Building Task Force. *(City of Sacramento, General Plan Background Report (March 2015), pp. 4-57)*

Sacramento Climate Action Plan. The City of Sacramento's Council-adopted Climate Action Plan incorporates goals to achieve zero net energy consumption in all new construction by the year 2030 and to achieve an overall 15% reduction in energy use in all existing residential and commercial buildings by 2020. The General Plan also includes the goal of reducing energy demand 25 percent by 2030 compared to 2005 levels. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-59)*

SMUD Transmission Guidelines. SMUD's adopted Transmission Guidelines are designed to assist developers and engineers through the process of developing property within or adjacent to SMUD's existing electric transmission easements. The Guidelines also assist in planning of new transmission lines, minimizing potential negative impacts to SMUD's facilities, and increasing public safety near transmission lines. *(City of Sacramento, General Plan Background Report (November 2020), pp. 4-59)*

6.12.C Study Area Level of Service Improvements

The ASI project site currently consists of undeveloped, vacant land and does not require energy services. Upon buildout of the ASI project, both SMUD's electric infrastructure and PG&E's natural gas service lines will be extended to the site from adjacent development areas.

6.12.D Determinations

Based on the information above, the following determinations can be made:

- → SMUD provides electrical service to the City of Sacramento and most of Sacramento County, with electricity sourced from a combination of hydroelectric, thermal (natural gas), wind, and solar resources.
- → PG&E supplies natural gas to the Sacramento area. During the winter, most natural gas is imported from Canada, and the balance is supplied from production wells in California.

- The City of Sacramento implements local regulations and programs that are designed to conserve energy, incorporate sustainable, green building practices into new construction, and to achieve zero net energy consumption in new construction by the year 2030.

7. Financial Ability to Provide Services

7.1 OVERVIEW

The purpose of this sub-section is to determine the feasibility for the City of Sacramento, and SacSewer to provide municipal services to the Airport South Industrial (ASI) project and Sphere of Influence (SOI) expansion area. As noted throughout Section 6 of this MSR, the City and other public agencies currently have financing mechanisms and policies in place to fund public facilities and services. Generally, new development is responsible for funding required public facilities and services through assessments, fees, user fees, and General Fund allotments. In some instances, other funding mechanisms are utilized to augment available revenues, such as Community Facilities Districts (CFDs) which can be used for capital improvements, maintenance, and other governmental services.

The City of Sacramento, and SacSewer adopt their operating budgets annually. Each budget is a technical document and includes information regarding department operations and estimated expenses and revenues. The City's budget also includes a forecast that outlines anticipated expenditures and revenues of all revenue sources over a 5-year horizon, as well as detailed information on Citywide staffing, revenue estimates, and proposed expenditures for governmental, enterprise, and special revenue funds. SacSewer's budget outlines monthly operating fund expenditures and revenues, including current project design/construction costs as well as lifetime operation and maintenance costs. SacSewer's budget includes operational costs and revenues and the percentage shifts between current budgeting and the previous budget cycle.

7.2 CITY FUNDS AND REVENUE SOURCES

The City's accounting system utilizes separate funds to demonstrate compliance with finance-related legal requirements. Discrete funds have been established to account for specific activities in accordance with applicable regulations, restrictions, or limitations. Several types of funds are maintained by the City, each with different functions and revenue sources. Revenue for each fund is generated by a combination of taxes, licenses and permits, and service fees.

7.2.A Governmental Funds

Governmental funds are primarily generated through by taxes, licenses and permit fees, and other charges and fees for services. Revenues for this fund are used for most of the City's basic services and are organized into the following categories:

- **General Fund.** The General Fund is the City's primary operating fund and accounts for most of the City's financial resources. It is used for general governmental services including the offices of the City Attorney, City Auditor, City Clerk, City Manager, and City Treasurer; City Council; Fire; Police; Youth, Parks, and Community Enrichment; and other support and operating departments. Revenue sources include taxes, licenses, permits, fees, fines, intergovernmental revenues, and charges for services, special assessments, interest income, and other discretionary resources. Additionally, an "economic uncertainty reserve" (EUR) fund was established in 2016 to better enable the City to manage the potential negative impacts from economic fluctuations that affect General Fund revenues. The EUR requires a minimum reserve level equal to 10% of annual General Fund revenues and a target reserve level equal to two months of regular ongoing General Fund expenditures.
- **Measure U Fund.** The Measure U Fund was originally approved by voters in 2012 to generate revenues from a half-cent transactions and use tax. And in 2018, voters approved a change to

Measure U that increased the tax to one cent. Because Measure U was approved as a general tax, this revenue source can be used for any general governmental purpose. The Measure U Fund is also subject to the EUR requirement that is applied to the General Fund.

For the 2022/23 fiscal year, combined revenue from General and Measure U Funds is estimated to be nearly $743.1 million. *(City of Sacramento, FY2022/23 Approved Budget, p. 105)*

7.2.B Other Governmental Funds

There are several types of Other Governmental Funds maintained by the City. These include:

- **Special Revenue Funds.** These are used to account for specific revenue sources that are restricted or are committed to specified expenditures. These funds are generally required by statute, charter, or ordinance to finance specific governmental functions.
- **Debt Service Funds.** These are used to account for financial resources that are restricted, committed, or assigned to expenditure for principal and interest, or that are being accumulated for principal and interest maturing in future years.
- **Capital Projects Funds.** These are used to account for financial resources that are restricted, committed, or assigned to expenditure for governmental capital assets.

For the 2022/23 fiscal year, revenue from Other Governmental Funds is estimated to be approximately $138.1 million. *(City of Sacramento, FY2022/23 Approved Budget, June 2022, p. 105)*

7.2.C Proprietary Funds

Proprietary funds providing accounting for services where customer fees are utilized to finance operational costs. The City maintains two types of proprietary funds, as summarized below.

Enterprise Funds

Enterprise funds refer to revenues from programs and services that are operated similar to transactional business-type activities. The City maintains several enterprise funds to account for services that are rendered on a fee basis. These include:

- **Community Center Fund.** This fund accounts for the operation and maintenance of the City's Convention Center Complex, including the Convention Center Theater, Memorial Auditorium, and the Community Center.
- **Parking Fund.** This fund accounts for the operation and maintenance of the City's parking garages and surface parking lots.
- **Solid Waste Fund.** This fund accounts for the collection and disposal of refuse throughout the City.
- **Storm Drainage Fund.** This fund accounts for the operation and maintenance of the City's surface storm water drainage infrastructure.
- **Wastewater Fund.** This fund accounts for the operation and maintenance of the City's wastewater system.
- **Water Fund.** This fund accounts for the operation and maintenance of the City's water treatment plants and associated and transmission and distribution systems.

For the 2022/23 fiscal year, revenue from Enterprise Funds is estimated to be approximately $373.4 million. *(City of Sacramento, FY2022/23 Approved Budget, June 2022, p. 105)*

Internal Service Funds

The City maintains several types of Internal Service Funds, which are also referred to as the City's Fleet Fund and Risk Management Fund. These funds account for various activities and/or services that are delivered by one department to another department on a cost reimbursement basis. For the 2022/23 fiscal year, revenue from Internal Service Funds is estimated to be nearly $121.6 million. *(City of Sacramento, FY2022/23 Approved Budget, June 2022, p. 105)*

7.2.D Fiduciary Funds

Fiduciary funds account for activities that most closely resemble not-for-profit organizations, including trusts and agency activities. This includes funds where the City is identified as:

- The trustee, or fiduciary, for its closed Sacramento City Employees' Retirement System pension plan;
- Responsible for other assets, held on behalf of investors, in the City's investment pool and individual investment accounts;
- Responsible for the assets received by the Successor Agency from the City's former Assembly Bill X1 26 which dissolved redevelopment agencies in California; or
- The agent for bonded assessment and Community Facilities Districts and responsible for ensuring the assets reported in these funds are used for their intended purposes.

(City of Sacramento, FY2022/23 Approved Budget, June 2022, p. 45)

7.3 CITY OPERATING BUDGET

For fiscal year 2022/2023, the City's Operating and Capital Improvement Program (CIP) Budgets was approved for $1.45 billion from all funding sources and authorizes 4.992.4 full-time equivalent (FTE) staffing positions. This includes $742 million from the City's General and Measure U Funds for operations and capital projects, as well as $708 million from the City's enterprise and other fund activities for operations and capital projects. *(City of Sacramento, FY2022/23 Approved Budget, June 2022, p. 24)*

7.4 CITY CAPITAL IMPROVEMENT PROGRAMS

Capital improvements are major projects or programs undertaken by the City in order to improve, preserve, enhance, or modernize its delivery of municipal services. The City's Capital Improvement Program (CIP) is the City's five-year financial plan that outlines its financial strategy to achieve identified infrastructure and facility needs. It reflects the City Council's adopted policies and it incorporates identified priorities for parks and recreation facilities and programming, transportation plans, utility master plans, and deferred maintenance.

The CIP, adopted annually with a rolling five-year sunset date, identifies current and future fiscal requirements and is the basis for determining annual capital budget expenditures. The five-year CIP identifies 134 projects with estimated total funding of $420.5 million. For the 2022/23 fiscal year, the CIP includes $120.8 million in funding for 123 projects or programs. The CIP's primary goals are to adhere to Federal, State, and local mandates/laws and to strategically leverage resources to maintain or improve the City's assets. *(City of Sacramento, Capital Improvement Program 2022-2027, July 2022, p. 5)*

The CIP includes several types of programs to fund various Citywide goals and initiatives. Funding for each program is derived from multiple revenue sources, as identified previously in this section. The CIP is organized into the following programs:

- **General Government Program.** This program focuses on preservation of existing facilities and a continued implementation of "green building" programs and sustainable practices. It is divided into major subprograms, including: City Facilities; Fee and Charge Supported; Fleet Management; Information Technology; and Libraries. *(City of Sacramento, Capital Improvement Program 2022-2027, July 2022, pp. D-1)*
- **Public Safety.** This program establishes and supports capital projects to help ensure that both fire and police operational facilities maintain efficient, safe, and effective operations. This program focuses resources toward programs that have ongoing funding requirements necessary to address repairs, replacement, and upgrades to the City's public safety infrastructure. *(City of Sacramento, Capital Improvement Program 2022-2027, July 2022, pp. E-1)*
- **Convention, Culture, and Leisure.** This program focuses on the City's cultural features with the intent to deliver accessible arts, leisure, and educational experiences that enhance the City's quality of life. Resources are used to help create a vibrant metropolitan region by providing exceptional cultural, artistic, and leisure opportunities. *(City of Sacramento, Capital Improvement Program 2022-2027, July 2022, pp. F-1)*
- **Parks and Recreation.** This program provides resources to provide and maintain recreational facilities, and to preserve open space areas. It focuses on improving the quality of life through a robust park system

and emphasizes renovation and rehabilitation of the City's aging park amenities. *(City of Sacramento, Capital Improvement Program 2022-2027, July 2022, pp. G-1)*

- **Transportation.** This program focuses on the maintenance of, and upgrades to, the City's aging transportation network. This includes facilities that serve automobiles, trucks, buses, trains, bikes, pedestrians, and scooters for users of all modes and abilities. Resources to maintain and improve the transportation network come from a variety of sources, primarily the countywide transportation sales tax, state gas taxes, federal and state funding, and special fees and taxes. The Transportation Program is divided into several sub-programs including: Active transportation systems for pedestrians, bikeways, lighting, and streetscape improvements; Bridges requiring replacement or rehabilitation; Major transportation improvements such as roadway construction; Parking facility maintenance and upgrades; Public rights-of-way accessibility for the installation of improvements that enhance accessibility; Maintenance projects for roadway and bikeway rehabilitation; and Traffic operations and safety to provide safety improvements, traffic calming, active transportation safety, and major streetlight replacement. *(City of Sacramento, Capital Improvement Program 2022-2027, July 2022, pp. H-1,2)*
- **City Utilities.** This program focuses on capital improvements that provide and maintain municipal services and facilities that benefit the community, promote sustainability, enhance livability, and expand economic development. It utilizes an asset management process to prioritize utility rehabilitation and replacement needs based on information collected through various Citywide sources. The program is divided into several sub-programs, including: Water; Wastewater, Storm Drainage; and Recycling and Solid Waste. *(City of Sacramento, Capital Improvement Program 2022-2027, July 2022, pp. I-1)*

7.5 SACSEWER REVENUES, BUDGET & IMPROVEMENTS

Revenue generation for SacSewer is derived from multiple sources, including monthly service charges, sewer impact fees for development, and cash interest earned. Anticipated revenues are utilized to determine appropriate operating budgets for each agency. Prior to the Sacramento Regional County Sanitation District (Regional San) and Sacramento Area Sewer District consolidation that went into effect as of January 1, 2024, for the Fiscal Year 2022/2023, Regional San approved a balanced operating budget totaling approximately $157.4 million and SacSewer approved a budget of approximately $93.6 million. The budget for SacSewer is utilized to fund system upgrades, treatment plant operations, infrastructure/system maintenance, support services, and debt service. These operating budgets are also used to fund salaries, benefits, supplies, assistance programs, and contingency funds, with undesignated cash reserves anticipated.

7.6 PUBLIC FACILITIES FINANCING PLAN

A Public Facilities Finance Plan (PFFP) has been prepared for the Airport South Industrial project. It provides an overview of the project's development approach and financing strategies for backbone infrastructure, public facilities, and various developer obligations. The PFFP also identifies the estimated cost of facilities and identifies funding sources to pay for them. The PFFP provides financing strategies for all municipal facilities and services needed to serve the project, as summarized below:

- **Backbone Infrastructure.** This consists of many essential public service-based infrastructure improvements, including roadways and underground utilities, such as storm drainage, sanitary sewer, and water systems.
- **Public Facilities.** This consists of transit facilities, such as light rail stations, library and community center facilities, parks and recreation facilities, open space areas, public parking facilities, schools, and public safety services, such as Police and Fire.
- **Other Developer Obligations.** This consists of other amenities or elements of community benefit that would be required of a developer through project buildout.

The PFFP identifies preliminary funding sources to offset the costs for the facilities and services outlined above based on City policies. Additionally, the PFFP includes phasing information for the construction timing of required facilities and services and addresses how the City's policy framework will be applied to fund all improvements and services.

The PFFP includes estimated costs and funding sources for development of the Airport South Industrial project, which are summarized in the table below.

Table 11: PFFP Cost and Funding Summary

INSERT TABLE FROM PFFP WHEN COMPLETE

As shown in the table above, the various funding sources derived from development of the ASI project are sufficient to cover costs of backbone infrastructure, public facilities, and other developer obligations.

7.7 DETERMINATIONS

Based on the information above, the following determinations can be made:

- City revenues are derived from a variety of sources that are allocated to different types of funds for different services. These include ongoing revenues, such as those from the Measure U sales tax, and fees derived from programs and services provided by the City.
- For fiscal year 2022/23, the City Council approved a balanced budget of $1.45 billion, which includes revenues from utility sales for its enterprise services such as water, wastewater, electricity, and solid waste.
- The City adopts an annual Capital Improvement Program that identifies projects and funding strategies for a five-year future timeline. The five-year CIP estimates a total funding of $420.5 million for capital projects. For the 2022/23 fiscal year, the CIP includes $120.8 million in funding for projects or programs.
- SacSewer generates ongoing revenue from a variety of sources, including service charges, sewer impact fees, and cash interest earned.
- Prior to the Sacramento Regional County Sanitation District (Regional San) and Sacramento Area Sewer District consolidation that went into effect as of January 1, 2024, for the Fiscal Year 2022/2023, Regional San and SacSewer approved balanced budgets totaling approximately $157.4 million and $93.6 million, respectively, which are utilized to fund system upgrades, infrastructure operation and maintenance, staff salaries, and other needs.
- A Public Facilities Financing Plan (PFFP) was prepared for the Airport South Industrial project, which identifies all backbone infrastructure improvements, public facilities, and associated administrative costs for project buildout. The PFFP includes financing strategies and measures to fund, or offset the cost of, extension of the City's municipal services to the proposed SOI expansion area.

8. Shared Facilities

The purpose of this section is to assess the status of, and opportunities for, shared facilities or services between the City and Sacramento County or other agencies, cities, and/or special districts, including opportunities for cost savings through the reduction/elimination of redundancies. The intent is that, by sharing resources, the costs to provide municipal services can be reduced in order to realize increased operational efficiencies. As the City of Sacramento, and SacSewer expand their respective Spheres of Influence and annex land into their respective service boundaries, the City will become the lead provider of municipal services, thereby shifting the responsibilities away from the County and various special districts that currently provide services to unincorporated areas. This transfer will prevent the duplication of services and will minimize unnecessary costs. The entities providing wastewater collection and treatment services for the City and/or County would not change, however the service area boundary for SacSewer would be expanded to extend this service capability to the project site. As noted below, some public agencies currently share facilities and resources with the City, while other opportunities are being explored to share resources and reduce costs.

8.1 WASTEWATER COLLECTION AND TREATMENT

SacSewer provides wastewater collection and treatment services for several public agencies and districts. This includes service to the City of Sacramento, the City of Folsom, The City of Rancho Cordova, the City of Elk Grove, the City of West Sacramento, and the City of Citrus Heights. All of these entities benefit from the the formation of SacSewer through the cost and administrative benefits of sharing one regional network and wastewater treatment facility, rather than each agency/district operating its own treatment plant(s) and major conveyance facilities. In this manner, wastewater services are more efficient, and costs are shared among larger populations who benefit.

SacSewer utilizes skilled contract workers from the County of Sacramento

The agency has a Master Interagency Agreement with other agencies regarding wastewater management. The facilities are already being shared across multiple agencies and jurisdictions. SacSewer provides services to unincorporated areas of Sacramento County, the cities of Citrus Heights, Elk Grove, Rancho Cordova, as well as portions of the cities of Folsom and Sacramento. The Sacramento Regional Wastewater Treatment Plant (SWTP) provides wastewater treatment services for SacSewer, the City of Folsom, and the City of Sacramento.

8.2 FLOOD CONTROL

Reclamation District 1000 (RD 1000) is one of the five contributing joint powers of the Sacramento Area Flood Control Agency (SAFCA). SAFCA was formed through a joint exercise of powers agreement, between the City of Sacramento, Sacramento County, Sutter County, the American River Flood Control District, and RD 1000. The member agencies work together towards providing flood protection to the entire area. Information is shared across the member agencies, as they are working towards the same protection.

Two RD 1000 board members serve as board members of SAFCA. RD 1000 has a mutual aid agreement with the County. During flood emergencies, the agencies share equipment, materials, and labor. RD 1000 also maintains a mutual aid agreement with the City of Sacramento.

8.3 LIBRARY SERVICES

The libraries in the cities and County of Sacramento are functionally consolidated into a single system. The Sacramento Public Library (SPL) is a joint powers agency between the cities of Sacramento, Citrus Heights, Elk Grove, Galt, Isleton, Rancho Cordova, and the County of Sacramento. SPL serves residents of these cities and throughout unincorporated Sacramento County. The SPL Authority works closely with other agencies and partners with them to provide efficient library services.

The North Natomas Library Branch is located on the campus of Inderkum High School and serves the High School, the Natomas Center of American River College, and the North Natomas community. The South Natomas Library Branch was built in conjunction with the Natomas Community Center in a residential development and services the North and South Natomas community. In addition, the two Natomas libraries have been constructed with expansion potential, allowing the facilities to be easily expanded according to future demand.

8.4 PUBLIC SAFETY SERVICES

The City of Sacramento's Police and Fire departments both operate their headquarter facilities from the Public Safety Center, located at 5770 Freeport Boulevard. This shared facility is consistent with existing General Plan policy that requires the City to seek to co-locate the City's facilities, such as police and fire stations, to promote efficient use of space. As such, the Public Safety Center was designed to be shared by both departments in order to reduce costs and increase operational efficiencies for both Police and Fire services. The City also maintains various mutual aid agreements with other regional public safety service providers. This includes the City and County's inter-agency agreements for emergency dispatch. Additionally, all of the Sacramento County fire agencies (Sacramento Fire Department, Sacramento Metro Fire District, Sacramento International Airport Fire, Cosumnes Fire District, and the Folsom Fire Department) share an automatic aid agreement that allows response from the closest fire unit regardless of jurisdiction.

8.5 DETERMINATIONS

Based on the information above, the following determination can be made:

- → The City cooperatively partners with other agencies and special districts to provide a comprehensive level of municipal services for the City, which includes several types of shared resources and facilities.
- → Additionally, SacSewer provides a comprehensive level of wastewater collection and treatment services to public jurisdictions throughout the Sacramento region, which constitutes a shared service that intentionally reduces service redundancies.

9. Government Structure and Accountability

The purpose of this section is to examine the organizational structure for the City of Sacramento, and SacSewer, their community service needs, and operational efficiencies, including an accountability assessment of each agency's transparency regarding its processes.

9.1 CITY GOVERNMENT STRUCTURE

The City of Sacramento is a charter City and was founded in 1849. It is the oldest incorporated City in the State of California. The City operates under a Council-Manager form of government and provides a comprehensive array of municipal services. These include public safety, streets, sanitation, culture, recreation, public improvements, planning and zoning, general administrative services, drainage and water utilities, transportation, and animal care.

9.1.A Mayor and City Council

The Mayor and City Council (City Council) is the highest governing and policy-making body for the City of Sacramento. This legislative body is comprised of eight District representatives, plus an elected Mayor that presides over Council meetings. Each Council member must be a registered voter and live in the District they represent. Elected members serve 4-year terms and elections are staggered every two years in even numbered years. There is no limit to the number of terms the Mayor or Council members may serve.

The City Council's primary goal is to govern the City in a manner that is financially sound and is responsive to the needs and concerns of City residents. They are responsible for passing City ordinances, providing administrative direction and authority through adoption of Resolutions, approving new programs, and approving the annual budget. In addition, the City Council acts as the City's Financing Authority, Housing Authority, Public Financing Authority, and Redevelopment Agency Successor Agency. They are also responsible for appointing key staffing positions including the City Manager, City Attorney, City Auditor, City Clerk, and City Treasurer, as well as the Director of the Office of Public Safety Accountability. *(City of Sacramento, FY2022/23 Approved Budget, June 2022, p. 136)* Upon approval of the SOI expansion area, the ASI project site would be incorporated into City Council District 1.

9.1.B City Manager

Sacramento's City Manager is the Chief Executive Officer of the City and is responsible for the leadership and direction of all operations, programs, and services, per City Charter. The City Manager facilitates the implementation of Council's policies and priorities, provides policy recommendations to the Council concerning the annual budget, future needs of the City, and oversight of all City Departments. The City Manager's office manages a wide-range of high-profile programs that handle issue-specific needs including: Innovation and Economic Development, Media and Communications, Cannabis Management, Government Affairs, Emergency Management, Youth Development, Diversity and Equity, Performance Management, and Climate Action and Sustainability. *(City of Sacramento, FY2022/23 Approved Budget, p. 164)*

The City Manager is also responsible for enforcing all laws and ordinances, coordinating all municipal programs and services, participating in City Council meetings without the right to vote, and informing the City Council regarding the City's operations and finances.

9.1.C Planning and Design Commission

The Planning and Design Commission functions as the City's first reviewing authority on land use decisions. It is comprised of nine members that are appointed by the City Council. The City's Subdivision and Zoning Ordinances (Titles 16 and 17) grant the Planning and Design Commission the authority to approve, conditionally approve, or deny variances, special permits, and development plan reviews; approve, conditionally approve, or deny Tentative Maps for subdivisions of five or more parcels, except for "Vesting Tentative Maps." The Commission also serves in an advisory role to the City Council regarding other planning matters including General Plan and Community Plan Amendments, Rezoning, Development Agreements, Planned Unit Development Permits, and Vesting Tentative Map applications.

9.1.D Advisory Commissions and Committees

The City's governmental structure also includes over 30 other Commissions and Committees that function as advisory legislative bodies to the City Council. Of these, some key legislative bodies relating to the City's governance and development structure include the Budget and Audit Committee, Law and Legislation Committee, Water Committee, Active Transportation Commission, Administration, Investment, & Fiscal Management Board, Measure U Community Advisory Committee, Parks and Community Enrichment Commission, Sacramento Community Police Review Commission, Sacramento Library Authority, and Utilities Rate Advisory Commission. Each advisory Commission and Committee has a specific purpose and focuses on matters within its purview, and collectively, these bodies provide recommendations to the City Council in consideration of new programs, policies, and initiatives.

9.2 CITY COMMUNITY SERVICE NEEDS & STAFFING LEVELS

Upon approval of the SOI expansion area, the ASI project would require municipal services from the City of Sacramento and other responsible Districts. This includes services for utility and flood control systems, roadways, animal care, code enforcement, public safety, solid waste, parks and recreation, and libraries. As noted in Section 6, service providers have been identified and are available to serve the ASI project.

The City's annual budget outlines the approved staffing levels for each department. Staffing levels are reviewed annually to ensure that staffing levels and funding are aligned with the City Council's priorities. For the 2021/22 fiscal year, the approved budget provided funding for approximately 4,891 positions, an increase of 8 positions from the year prior, as summarized in the table below.

Table 12: Approved Staffing for Fiscal Year 2022/23

Department	Approved Staffing
Mayor/Council	37.00
City Auditor	10.00
City Attorney	62.00
City Clerk	24.00
City Manager	70.00
City Treasurer	14.00
Community Development	315.00
Community Response	38.00
Convention and Cultural Services	123.00
Finance	93.90
Fire	729.50
Human Resources	83.00
Information Technology	201.50
Police	1128.96
Public Works	766.15
Utilities	572.90
Youth, Parks, and Community Enrichment	716.53
Citywide and Community Support	7.00
TOTAL	**4,992.44**

(City of Sacramento, FY2022/23 Approved Budget, p. 300)

9.3 CITY & SACSEWER OPERATIONAL EFFICIENCIES

City of Sacramento

As development occurs within the City's annexation areas, the need for additional staffing, facilities, maintenance, and equipment increases. Both the City's expanding budget and the rate increases proposed for various City services reflect the City's growth and its aging infrastructure. The City's annual budget outlines each department's mission, current fiscal year objectives, and prior year's accomplishments. Additionally, department-specific performance measures are summarized and past year data is detailed.

The City's budget reflects the City Council's priorities for public safety, economic development, culture and entertainment, sustainability and livability, and safe and affordable housing. Because the City follows a sustainable budget framework, yearly fiscal management activities include a comprehensive and continuous evaluation of spending priorities.

In the City's approved 2022/23 Budget, each department identified various efficiencies that are being implemented to optimize operations and reduce costs. These include:

- **Mayor and City Council:** Utilized the 311 system and integrated constituent management system to support constituents in tracking neighborhood complaints and requests for service. *(City of Sacramento, FY2022/23 Approved Budget, p. 137)*
- **City Attorney:** 1) Continued to pursue the highest and best use of internal space within the suite by converting spaces previously used for office equipment and supplies for use by staff; 2) Reviewed and adjusted operating costs associated with in-person staffing, suspended charges such as monthly parking, and adjusted equipment leases to save money during office telecommute; 3) Arranged immediate availability of personal testing kits to provide for fast testing of any staff exposed to COVID-19 to ensure safety and maximum availability of staff; and 4) Incorporated the current COVID-19-related protocols

into office policies and practices in preparation for return-to-work in city spaces. *(City of Sacramento, FY2022/23 Approved Budget, June 2022, pp. 146-147)*

- **City Auditor:** 1) Continued agreement with Missionmark to explore the potential for development audit software that will streamline internal audit processes and reduce processing time; 2) Developed an online Whistleblower Hotline Dashboard that provides the public with interactive information on the status of whistleblower investigations; 3) Managed the online Recommendation Follow-Up Dashboard that provides the public with interactive information on the status of audit recommendations; and 4) Managed the online Gender and Ethnic Diversity Dashboard that provides the public with interactive data on the gender and ethnic composition of City employees. *(City of Sacramento, FY2022/23 Approved Budget, pp. 153-154)*
- **City Clerk:** 1) Continued the review of operations in the City Clerk's Office and Offices of the Mayor and Council for implementation of "best practices" for a more efficient workflow and accurate deliverables; 2) Continued utilization of the Citywide Content Management System for records management; 3) Provided training opportunities to City staff to maintain institutional knowledge and provided training on new policy and legal requirements to ensure compliance; 4) Continued evaluation and implementation of new and existing information technology tools to achieve sustainable services, increase transparency, and provide new records and data to the public with an emphasis on virtual access; and 5) Utilized Microsoft Teams for better collaboration and accountability between both in office and remote workers. *(City of Sacramento, FY2022/23 Approved Budget, p. 159)*
- **City Treasurer:** 1) Automated the daily cash flow process that links the City and banking data in real-time, thus improving accuracy and efficiencies; 2) Streamlined trade processing and implemented new reconciliation methods and procedures to ensure validity and reliability of investment records; and 3) Utilized a third-party consultant to proactively monitor on an ongoing basis the credit ratings and outlook of outstanding bonds, thereby freeing up City staff to focus on other debt management-related responsibilities. *(City of Sacramento, FY2022/23 Approved Budget, pp. 174-175)*
- **Community Development:** 1) The Building Division implemented automated status update emails to keep customers informed during the plan review process; 2) The Planning Division launched a new website called Agency Counter to inform the public of pending planning applications, which includes automatic emails when a new application is filed with the City; 3) The Front Street Shelter continues to offer services with or without an appointment, which leads to decreased wait times and improved customer service; and 4) The Front Street Shelter outsourced its pet licensing program to increase efficiencies, increase revenue, and offer better customer service for pet owners. *(City of Sacramento, FY2022/23 Approved Budget, pp. 181-182)*
- **Community Response:** 1) The Office of Homelessness Services (OHS) has improved the functionality of the Motel Voucher Programs (MVP) and developed an improved method of tracking Federal Emergency Management Agency (FEMA) eligibility amongst guests in the program, allowing it to maximize reimbursable costs associated with the program. Additionally, OHS was able to secure an additional hotel in the City, providing a wider network in the community to serve families and individuals in Non-Congregate shelter; 2) In May 2021, OHS re-engaged contracted Emergency Shelter providers in regular site visits, increasing support, and maximizing efficient oversight of funded programs; 3) Successfully implemented a 311 alternative response model. Calls for services are dispatched via the City's 311 system; and 4) Contracted with Forensiclean to provide cleanup services throughout the City. *(City of Sacramento, FY2022/23 Approved Budget, pp. 189-190)*
- **Convention and Cultural Services:** 1) The cold storage vault for the Center for Sacramento History was completed in January 2022. Two films in the City's series on the History of Racism in Sacramento were completed with two more in production to be completed by June 2022; 2) OAC transitioned its longstanding Any Given Child program to the Sacramento County Office of Education. The new partnership ensures the potential of expansion of that program throughout the county, while also freeing up staff time to refocus OAC's work in the education space at a more strategic level; 3) The SAFE Credit Union Convention & Performing Arts District implemented 24/7 software to track equipment and maintenance work completed; 4) The Memorial Auditorium boilers' refractories were repaired in-house by the department's engineering team, resulting in a savings of $750,000 to the Community Center Fund; and 5) The Zoo has maintained many of the process improvements implemented in response to the pandemic, including encouraging touchless online advanced ticket sales, enhanced cleaning and safety protocols, and

streamlined menu options at the Kampala Café. In addition, in FY2021/22, the Zoo transitioned from an outsourced security contractor to an in-house security team, which both improves performance and reduces costs. *(City of Sacramento, FY2022/23 Approved Budget, p. 199)*

- **Finance:** 1) Implemented Automated Clearing House (ACH) payments with City vendors to reduce printing and processing time, improve productivity by automating a manual process, and realize cost savings by reducing check processing; 2) Added e-check payment capability which allows more businesses to pay taxes electronically; 3) Explored ways to optimize the use of districts and finance plans to build priority public improvements, fund services, and encourage private investment in the City; 4) Streamlined internal procurement processes and procedures using best practices to eliminate redundancies, increase staff effectiveness, and improve transparency; and 5) Worked with the City Treasurer to establish, implement, and streamline a wire transfer process for City department requests. *(City of Sacramento, FY2022/23 Approved Budget, pp. 209-210)*
- **Fire:** 1) Continued the use of the Emergency Vehicle Operator Course (EVOC) which provides the necessary knowledge and skill development for the safe operation of department apparatus; 2) The Fire Prevention Division is now using video technology to conduct virtual inspections; 3) The Department successfully launched a Youth Academy in October 2021 with 25 participants; 4) DOR Division launched a two-day fire camp for 33 high school girls, increasing the number of girls allowed to participate; and 5) Continued evaluations of the Emergency Medical Services (EMS) Division to determine cost effective measures that will provide proper service to the community. *(City of Sacramento, FY2022/23 Approved Budget, p. 217)*
- **Human Resources:** 1) Significantly revamped the recruitment, selection, and written examination processes, reducing the recruitment timeline by five to seven weeks; 2) Transitioned employment related medical exam scheduling to most departments, to streamline the process; 3) Completed annual open enrollment for employees and retirees using all web-based solutions; 4) Implemented ePARs for pay-rate changes (step and accelerated increases) and termination PARs; and 5) Workers' Compensation Unit implemented the paperless initiative to improve efficiencies, protect City Employees' personally identifiable information, cut down on the cost of postage and paper and strive for improved environmental sustainability. *(City of Sacramento, FY2022/23 Approved Budget, pp. 225-226)*
- **Information Technology:** 1) Implemented a Natural Language Interactive Voice Recognition (IVR) system for 311, allowing callers to speak and receive services without having to wait to speak to a 311 agent; 2) Automated hundreds of business processes throughout City departments; 3) Implemented internal efficiency processes such as the online Personnel Action Request process for hire and re-hire actions and other workflow based online processes that resulted in faster processing, more accurate information, and audit capabilities for improved transparency; and 4) The Department is committed to continuous improvement to reduce energy consumption and support the City's green initiatives. *(City of Sacramento, FY2022/23 Approved Budget, pp. 233-234)*
- **Police:** 1) Continued to evaluate and implement improvements to the hiring process, including implementation of the eSOPH backgrounds management system which is a cloud-based software system designed to efficiently process in-depth pre-employment background investigations; 2) The Department has worked collaboratively with the City and contractors to create promotional and hiring exams that are both gender and race neutral in alignment with the City's Workforce Equity Goals. Additionally, the hiring process has been converted to "blind applications" to ensure that biases are minimized or eliminated in the hiring and promotional process; 3) Continued to build upon the existing Administrative Services Division which among other units, includes the Professional Standards Unit, the Inspections and Standards Team and the Video Redaction Team; 4) The Department continues to expand and integrate the use of emerging technologies such as Police Observation Devices (PODs), Unmanned Aerial Systems (UAS), and the Real Time Crime Center (RTCC); and 5) Continued to work diligently to redact and release video, audio, and other records related to incidents which fall under the release requirements mandated by State laws. *(City of Sacramento, FY2022/23 Approved Budget, pp. 242-243)*
- **Public Works:** 1) The CNG station, partially funded through a Sacramento Air Quality Management District grant, will increase fueling efficiency time and costs for the City's waste collection fleet; 2) The City Hall Garage was re-opened after a fire to support the parking needs of surrounding businesses and employment centers; and 3) The Parking Division developed an online service and payment portal for

purchases of discounted Commuter Special parking. This provided local employees a flexible and contactless option to pay and plan for their parking needs ahead of time. *(City of Sacramento, FY2022/23 Approved Budget, p. 254)*

- **Utilities:** 1) Issued a Notice of Preparation for both the Groundwater Replacement and Water+ programs, both of which will provide future water supply projects for the City's groundwater and surface water supplies; 2) Substantially reduced overtime usage without impacting service levels by moving to a four day/week schedule for routine distribution system water quality monitoring; 3) Implemented over 78% of audit recommendations from audits conducted by the City Auditor's Office related to labor, inventory, safety, and fleet; 4) Created a Water Policy & Regional Planning section within Engineering and Water Resources to align strategic goals supporting the City's water rights and supply priorities with water use efficiency goals; 5) Improved the timeliness of vendor payments by creating a business intelligence dashboard, allowing for automated monitoring of pending invoices; and 6) Installed a secure and permanent power source in the Pocket Canal for canal aeration that reduced costs for daily fueling and delivery of portable generators. *(City of Sacramento, FY2022/23 Approved Budget, pp. 264-265)*
- **Youth, Parks, & Community Enrichment:** 1) Continue to engage with the Department's Park planning consultant in the development of the Parks Plan 2040 that addresses the City's commitment to Equity and Health within the park and recreation system. The projected completion date for the Parks Plan 2040 is Spring 2023, following the adoption of the City's General Plan Update; 2) Community Enrichment Division developed and implemented several organizational efficiencies to support internal and external customer service and communications; 3) Community Centers mobilized staffing and resources to continue serving the community through the pandemic with great success, providing critical community resources and services including year-round COVID-19 vaccine clinics in partnership with Sacramento County and UC Davis Health, administering more than 15,000 doses, and emergency response support through activation of clean air, warming and cooling centers; 4) Addressed deferred maintenance issues at several pools including the completion and initiation of resurfacing projects to support safe reopening and operations, and the installation of the Clunie pool's heater and facility updates to allow extended season aquatics safety program opportunities; 5) With the onset of the pandemic, YPCE mobilized staffing and resources to continue serving the community with great success, including the development and implementation of an online virtual activities and resources page to engage and serve people of all ages and abilities, meal service and food distribution for thousands of youths, seniors, and underserved families, and face covering distribution for independent businesses across Sacramento; and 6) YPCE partnered with Geographic Information Systems (GIS) team to map park amenities and land uses. GIS applications provide Department, City staff and the public a method to easily access and share geographic information. The database allows coordination across all divisions using the same data to support asset management and administrative functions. *(City of Sacramento, FY2022/23 Approved Budget, pp. 272-273)*

SacSewer

Operational efficiencies are identified in SacSewer's Operating Fund Budgets via undesignated cash reserves (surplus), which are an indication of short-term financial strength. The estimated ending balance of undesignated cash reserves, prior to the Sacramento Regional County Sanitation District and Sacramento Area Sewer District consolidation that went into effect January 1, 2024, for the 2022-23 Operating Fund budget was over $33M for Regional San and over $63M for Sac Sewer.

9.4 SACSEWER GOVERNMENTAL STRUCTURE

SacSewer is governed by a Board of Directors that is responsible for the entity's policymaking, budgeting, and organizational decisions. SacSewer's Board consists of five Sacramento County Supervisors, five Sacramento City Councilmembers, two Elk Grove councilmembers, and single representatives from Yolo County and the cities of Citrus Heights, Folsom, Rancho Cordova, and West Sacramento. SacSewer's Board consists of five Sacramento County Supervisors and the Mayors (or designees) of the cities of Citrus Heights, Elk Grove, Folsom, Rancho Cordova, and Sacramento. The agency holds its Board meetings the second and fourth Wednesday of each month, which are recorded, live streamed, and open to public attendance and comment.

9.5 PROCESS TRANSPARENCY

As noted above, the City operates under a Council-Manager form of government. Sacramento's governmental structure gives the City Council the final authority for decisions for Citywide policies, priorities, and budget. Their actions are supported by several advisory Commissions/Committees and by the City Manager office's oversight and implementation of laws and priorities. All governmental decision-making bodies hold public meetings and hearings to ensure that the citizens of Sacramento have the opportunity to participate in the decision-making process.

The City Council generally holds its regular meetings on Tuesdays of each week at City Hall in downtown Sacramento. Meetings typically consist of an afternoon and/or evening session and are live-aired on television and live-streamed via the City's website. Recordings are available for review following each meeting's conclusion. The Council also holds special public meetings and committee meetings. The City Clerk's office publishes City Council agendas in a variety of formats and makes them available to the public prior to each meeting.

The Planning and Design Commission generally meets on the 2nd and 4th Thursdays of each month. Meetings are open to the public and are publicly-noticed in accordance with the City Code. There is a 10-day appeal period after action by the Planning Commission. If a Planning Commission action is not appealed, it is final. If a Planning Commission action is appealed, the matter is forwarded to the City Council for consideration and City Council's action on the appeal is final.

Meetings for the City's various advisory Committees and Commissions each follow a pre-established schedule and are open to the public. Agendas and/or public hearing notices for all meetings are posted in a variety of formats and made available to the public prior to each meeting in accordance with the City Code.

Similar to the City of Sacramento, SacSewer maintains a routine schedule for Board meetings. Board meetings are typically held on the second and fourth Wednesday of each month at 9:30 a.m. at the Sacramento County Board of Supervisors' Chambers, located at 700 H Street in Sacramento. Agendas and/or notices for all meetings are posted in a variety of formats and made available to the public prior to each meeting. Meetings are live-streamed and open to public attendance. Members of the public are invited to attend and participate in Board meetings. Additionally, each year, SacSewer prepares extensive reports to ensure operational transparency and public involvement. These include a State of the District Report, Fiscal Year Budgets, Annual Comprehensive Financial Reports, and 5-year Strategic Plan that is prepared with an extensive participatory process to identify long-term goals with a strategic focus.

9.6 DETERMINATIONS

Based on the information above, the following determinations can be made:

- → The City of Sacramento's governmental structure has a long-standing history of public/citizen interaction. The Mayor, City Council, City Manager, appointed Commissions and Staff put forth a strong effort to ensure that the citizens of Sacramento, other local, State and Federal governmental agencies, special interest groups and labor unions are fully involved in the City's decision-making process.
- → The City of Sacramento's staffing levels are reviewed annually through the budget process to ensure that staffing meets the City's service needs and Council priorities, and this process allows for staffing adjustments to be made in order to provide for the expansion of municipal services to the SOI expansion area.
- → Through the City's annual budget process, department review current operations and evaluate opportunities to implement changes that enhance their operational efficiencies.
- → The City provides municipal services that will meet the future service needs associated with development of the ASI project in the SOI expansion area. Where the City is not the lead provider of a service, other agencies/districts will provide services consistent with current practices within the City.
- → SacSewer maintains a governmental structure that is administered by a Board of Directors, consisting of elected officials from the public agencies that benefit from these entities' public service.
- → The City of Sacramento and SacSewer each maintain a system of transparent governmental processes that are designed to incorporate public review, input, and involvement.

10. Conclusions

This Targeted Municipal Services Review (MSR) has been prepared to assist the Sacramento Local Agency Formation Commission (LAFCO) in its evaluation of an application for a Sphere of Influence (SOI) Amendment for the City of Sacramento (City), and Sacramento Area Sewer District (SacSewer), in order to accommodate the proposed Airport South Industrial (ASI) project. It complies with the Cortese-Knox-Hertzberg Act and it evaluates existing and future service conditions for the project site and proposed SOI expansion area described herein. As such, this MSR addresses the following public service/issue areas (**noted in blue**) and includes key findings and determinations for each (*noted in italics*):

- **Growth and Population Projections:** *The City of Sacramento is expected to continue growing, by adding jobs, housing, and a residential population.*
- **Disadvantaged Unincorporated Communities:** *No defined disadvantaged unincorporated communities are located on, or adjacent to, the project site.*
- **Public Facilities and Services:** *This MSR provides a detailed assessment for facilities and services related to water, wastewater, circulation and roadways, animal care, code enforcement, law enforcement, fire protection, solid waste, storm drainage and flood control, parks and recreation, libraries, and electricity & natural gas. As summarized herein, the City of Sacramento, in tandem with other agencies and SacSewer has the ability to expand its public facilities and municipal services to the proposed SOI expansion area in order to serve development of the proposed ASI project.*
- **Financial Ability to Provide Services:** *The City of Sacramento operates with a balanced budget, and as outlined in the ASI Public Facilities Financing Plan, has the financial ability to provide municipal services to the proposed ASI project.*
- **Shared Facilities Opportunities:** *The City of Sacramento, and SacSewer actively pursue opportunities to enhance operational efficiencies, and as such, cooperatively partner with other agencies and special districts to provide a comprehensive level of municipal services, which includes several types of shared resources and facilities.*
- **Government Structure and Accountability:** *The City of Sacramento operates with a transparent governmental structure that emphasizes public involvement in its decision-making processes.*

These findings and determinations are supported by the detailed information for each of these public service/issue areas, as outlined throughout this MSR.

Emmerson Zapata &
Megan Thomas
June 5, 2023

Revised on 2/7/24 with note to file.

Airport South Industrial Preliminary Water Study

City of Sacramento, California

Prepared For:

City of Sacramento

Department of Utilities

NOTE TO FILE: The transfer of the 4700 linear feet of 30-inch water transmission main to the City from the Sacramento County Water Authority will require reimbursement to the County for the depreciated value of the transmission main. As of January 19,2024, the depreciated value of the water transmission main is estimated at $1,012,502.78. During plan review, additional discussion between the County, City, Sacramento International Airport and Developer will be required regarding this matter. If an agreement is not reached and the transfer of ownership of the 30-inch water t-main does not occur, a revised design of the water system for the Airport South Industrial will be required.

I. INTRODUCTION AND PURPOSE

This preliminary water study (Study) report has been prepared to provide information for the Airport South Industrial (ASI) Project (Project). This Study has been prepared to analyze the proposed water infrastructure associated with the development of a future 436.5-acre planned industrial warehouse and highway commercial project in the City of Sacramento. This Study addresses proposed land uses, potable water system hydraulics, and proposed infrastructure-level improvements for the Project. Work included herein includes an Innovyze Infowater hydraulic model analysis of the conceptual piping system which was sized and laid out per the City of Sacramento (City) comments that were sent on March 9, 2023. This Study report is intended to provide the information needed for the entitlement application and processing, including the preparation of an Environmental Impact Report (EIR) for the Project. This work will include coordination with the City regarding the development of a preliminary water plan. This Study report is intended to provide a description of the potential options of the on-site and off-site water system improvements. A design-level hydraulic analysis will be provided in conjunction with Project development subsequent to Project approvals.

The Project area totals approximately 436.5 acres and is located along Bayou Road south of Interstate 5 (I-5). The Project location is currently within the county of Sacramento. **Exhibit A** is a Regional Map illustrating the location of the Project. The property lies south of I-5 and south and east of the Sacramento International Airport (SMF). Metro Air Park (MAP), a 1,892-acre Industrial Business Park, lies directly to the north of I-5. The Northlake (formerly Greenbriar) project lies north of I-5 and is northeast of the Project. The North Natomas Community Plan (NNCP) in the city of Sacramento, comprising approximately 7,440 acres, is east and southeast of the Project area. Agricultural and North Natomas habitat mitigation lands lie south of the Project. Undeveloped Airport Master Plan Development lands owned by SMF in the county of Sacramento are west and southwest of the Project area. The east boundary of the Project area is the City/County boundary. This includes a 200-foot-wide City of Sacramento-owned buffer along the eastern boundary of the Project. Phase 1 of the new MAP Interchange has been completed on I-5, which is directly north and comprises a portion of the Project area.

The Project is proposed for annexation from the County into the City of Sacramento. The City of Sacramento is the lead agency for the project annexation and entitlements. The Project area has multiple landowners. NP MAP Land Holding Company, LLC (NorthPoint Development) and AKT Investments are the Applicants and are sponsoring the entitlements for the Project.

II. PROJECT DESCRIPTION

Exhibit B illustrates the current site plan for the Project. The Project annexation area totals 474.4 acres. This is inclusive of the State of California Department of Transportation (Caltrans) lands measured roughly to the center of I-5 and includes the south approximate one-half of the new MAP Interchange. The west boundary extends to the approximate centerline of Power Line Road. Total Caltrans I-5 Right-of-Way (R/W) totals approximately 37.9 acres. This leaves approximately 436.5 gross acres of lands proposed for development. **Exhibit C** details the proposed land uses for the

Project. The developable lands proposed for entitlements total approximately 436.5 acres. The Project will include development of an industrial park and highway commercial areas. Developable areas will include warehousing, highway commercial, internal roadways, parking, detention/retention basins, buffer areas, sewer and drainage pump stations and other related facilities. The industrial buildings total an estimated 6,609,300 square feet (SF). The highway commercial totals an estimated 80,940 SF. The Project is largely made up of the Applicant-sponsored area and includes other future industrial lands not under ownership by the Applicants.

III. EXISTING WATER FACILITIES

Exhibit D identifies the existing water facilities in the vicinity of the Project site. When annexed, the City will be responsible for providing potable water to the Project. The City of Sacramento has a 30" water transmission main that terminates at the east end of the proposed project in South Bayou Way. This 30" transmission main was originally constructed to "wheel" City of Sacramento water to the west and north to County of Sacramento lands, namely SMF and MAP.

From a metering station that is currently located directly east of the Project site in South Bayou Way, the County of Sacramento (Zone 50) has extended a 30-inch and 16-inch Transmission Main to the west. This system tees to an existing 24-inch T-main crossing north under I-5 (approximately mid-Project) to serve MAP. The County system includes a dual 1.4 MG County Zone 50 Water Tank site located on the west side of Power Line Road.

It is currently proposed that this County system continue to operate as a separate system. The County's 30-inch Zone 50 T-main east of the 24-inch tee is proposed for conversion to a City T-main. This T-main will then serve the project area. The Project will construct a separate City-operated and maintained domestic and fire system connected to the City's 30" T-Main "upstream" of the relocated City/County metering station and will have two more connections in Bayou road just east of the convergence of the 24-inch main and the flow control valve. The proposed water system is further described below.

It should be noted that per the City's direction, a point of connection was added at Lanfranco Circle to the Westlake subdivision. This point of connection provides a large amount of flow and head to the project due to its pumping system and 3 MG storage capacity of the El Centro Reservoir.

IV. PROPOSED WATER FACILITIES

The proposed water system is identified on **Exhibit E**. As stated previously, there are 3 connections to the existing 30-inch City main. Per the City's comments, a 12-inch distribution line is to connect to the 30" transmission main and serve the site through ASI Drive. One of the connections in Bayou Way connects back to the public system in ASI Drive while the other connection helps create a looped system by running parallel with the City transmission line in Bayou Way and connects to the public distribution main at the western portion of ASI Drive. It should be noted that the distribution main that runs parallel with the City transmission line will be on private property, so an easement will be required. In order to create more looped connections, a 12-inch line was modeled in Metro

Air Parkway to connect the two public distribution mains. Another connection is made at Lanfranco Circle per the City's direction. A 12-inch line connects to the Lanfranco Circle point of connection, which was provided by the City, and connects to the main in ASI Drive. It is important to note that there will be no City connections to the County Zone 50 system.

12-inch loops were modeled around the private lots to represent private water infrastructure. However, this infrastructure was not a part of this study and instead will be further analyzed during later design-level analysis.

V. SYSTEM MODELING

As stated previously, the proposed water system was modeled using the Innovyze Infowater hydraulic modeling software (version 12.4.13). The proposed Project's domestic and fire demands were identified, calculated and input into the system model. The regional City system is shown on **Exhibit F**. Note that the nearest existing City water storage tank is located 4,800 feet south and east of the Project along El Centro Road and has a storage capacity of 3 million gallons (MG). The Lanfranco Circle point of connection is currently fed by the El Centro Reservoir and has pumping capacity as shown in **Exhibit F**. The potential layout for this development can be seen in **Exhibit G**. This layout was developed in accordance with the City's comments and focuses on only the public water mains that will serve the project. For visual purposes, an illustration to show the layout of the public mains vs the private mains can be seen in **Exhibit J.** It should be noted that this is a preliminary study and further analyses will be needed to refine the system configuration and confirm the hydraulic results presented herein.

A. System Modeling – Water System Boundary Conditions

As illustrated in **Exhibit F**, the Project site is located just south of Northlake (formerly Greenbriar). The Project will connect at the 30" Transmission main at three points in South Bayou Road as shown in **Exhibit G**. There is also a boundary condition modeled for Lanfranco Circle per the City's direction.

For this preliminary hydraulic analysis, the City provided a graphic showing the pressure rating curve at the connection point in Bayou Road. This updated boundary condition that takes into consideration the full build-out and losses from Northlake (formerly Greenbriar). Since this boundary condition takes into consideration all infrastructure for Northlake (formerly Greenbriar) and the other existing entities, the Northlake (formerly Greenbriar) modeling entities were omitted from this study. For the Lanfranco Circle boundary condition, the City provided a graphic showing the pressure rating curve at the connection point. It should be noted that the model is only capable of representing flow and head (or hydraulic grade line, HGL), so a conversion was performed to convert the data as required. The boundary conditions at Bayou Road and Lanfranco Circle can be seen in **Appendix D**.

B. System Modeling – Assumptions

Land use for the Project was assumed based on a preliminary site plan and land use summary which can be seen in both **Exhibit B** and **Exhibit C**. A breakdown of the land use utilized in this model can be seen in the following table.

Table 1 – Land Use	
Land Use Designation	**Total Net Acreage**
Mixed Use	13.4
Industrial	236.5
Future Industrial	83
Total	**332.9**

Node elevations were assumed to be at street elevation and were based on the preliminary earthwork exhibit included in **Appendix B**. The Project site was assumed to be under the industrial and mixed-use zoning classification. This assumption was used to calculate water demands for the Project site using the demand factors provided in the "City of Sacramento 2018 Water Study Manual" included as **Appendix C**. A summary of those demands is presented below in **Table 2.**

Table 2 – Demand Summary						
Land Use Designation	**Total Net Acreage**	**ADD Unit Water Demand**		**Demand (gpm)**		
		AFY/Acre	**GPM/Acre**	**ADD**	**MDD**	**PHD**
Mixed Use	13.4	2	1.24	17	33	43
Industrial	236.5	0.9	0.56	132	264	343
Future Industrial	83	0.9	0.56	46	93	120
Total	**332.9**	**-**	**-**	**195**	**390**	**507**

For fire flow requirements, Wood Rodgers used planning numbers that can be found in the "City of Sacramento 2018 Water Study Manual" per the City's direction. Any node that was near an industrial lot was assigned a fire flow of 4,500 gpm since they would need to serve the industrial lots fire flow. For the mixed-use buildings, a fire flow of 3,500 gpm was assigned to align with the City requirements.

C. System Modeling – Results

After modeling the system per the City's comments, it was determined that the system worked with its current boundary conditions and infrastructure. The 12-inch distribution main was able to convey the flow without pressures dropping below the City standard and without velocities reaching speeds of over 10 ft/s. Although the piping meets these standards, it does not meet the maximum headloss requirement of 10 ft/kft. However, after discussion with the City, this design variance would be acceptable due to the velocities still meeting the requirement.

This infrastructure was modeled per the City's comments**.** These comments determined the public infrastructure and noted to omit the private infrastructure for this Study. Although the model was updated to include only the public infrastructure, the model still needed to be

analyzed to ensure it could convey the demand of the future buildings. See **Exhibit J** for the private vs. public layout showing the potential future connections to private infrastructure. Nodes near industrial lots were assigned a fire flow of 4,500 gpm since they would ultimately need to convey this flow. Once the fire flows were assigned, a system wide fire flow was run in order to check the residual pressures to ensure they were above the City requirement of 20 psi. The residual pressures can be seen in **Exhibit H**. After a system wide fire flow was run, the critical node was identified (ASI-154) and a static fire flow was run to analyze the fire flows effects on the pipes. The results for this run can be seen in **Exhibit I**. It should be noted that the pipes were able to convey the flow without going over the maximum velocity of 10 ft/s per the City's requirement.

System Modeling

This layout considers having a public looped system with 4 connections (3 at the 30-inch transmission main and 1 at Lanfranco Circle) and a looped system using 12-inch distribution mains. This looped system will later serve the private infrastructure through double check valve assemblies once further design analysis are conducted.

It is important to note that the node elevations used in the model are assumed to be at the ground elevation in the street. These elevations are still in the concept phase, and any alteration to the elevations could negatively affect the pressures. **Table 3** below contains a summary of the hydraulic model results for the project site. The results are compared to the design criteria provided by the City Water Study Manual.

Table 3 – System Results

Scenario	City Criteria	Model Results
Average Day Demand Condition		
Minimum Pressure [psi]	30	51
Maximum Pressure [psi]	80	57
Maximum Head loss [ft/kft]	7	0.0
Maximum Velocity [ft/sec]	5	0.2
Minimum Velocity [ft/sec]	0.1	0.0
Maximum Day with Fire Flow Demand Condition		
Minimum Pressure at Fire Node [psi]	20	26
Maximum Head loss [ft/kft]	10	14
Maximum Velocity [ft/sec]	10	7
Peak Hour Demand Condition		
Minimum Pressure [psi]	30	51
Maximum Head loss [ft/kft]	7	0.1
Maximum Velocity [ft/sec]	7	0.6

Due to the nature of the Project land use (primarily Industrial), the potable demands are relatively small as compared to the high fire flow requirements for these large structures. Due to the extreme differences between potable and fire flow demands, some parts of the system do not meet the minimum velocity requirement for average day demand. However, the pipes were sized in order to convey the large industrial fire flows. **Exhibit H** shows the results of a maximum day plus fire flow. As illustrated, the public system is able to maintain a residual pressure of 20 psi when loaded with a 4,500 gpm fire flow. However, as mentioned before, once the critical node (ASI-154) was loaded with 4,500 gpm the public system fails to meet the cities minimum requirements for residual pressure and ft/kft. However, per the City's direction, this may be an acceptable design variance due to the fact that the pipes are able to convey this flow without going over the maximum velocity of 10 ft/s, these results can be seen in **Exhibit I**. Tabular results for this study can be seen in **Appendix A**.

CITY OF SACRAMENTO

WATER STUDY DESIGN MANUAL

This manual is intended to provide developers information needed to complete a water study for a new development project, including the form(s) necessary for a complete submittal.

January 2018

Every project, regardless of size, must fill out and submit the "SB 610/SB 221 Water Supply Assessment and Certification Form" (see Attachment 1). This form will confirm or deny the availability of water supply, per the latest Urban Water Management Plan, before the project can proceed.

Once water supply has been validated for the project, then a water study shall be completed for the project design. This study must be stamped by a licensed engineer and submitted to the Department of Utilities for review. The submittal shall include an electronic copy of every submittal, and if requested, electronic copies of the model/calculation tool.

The study must be based on a water system design that meets the City design standards for a public water system, including but not limited, to properly sizing pipe to meet both water quality and fire flow needs for the project, looping systems for redundancy and improved water supply, and hydrant placement as it relates to the surrounding area as well as the project.

Water studies shall follow the "Water Distribution System Criteria" (see Attachment 2) and incorporate the following information:

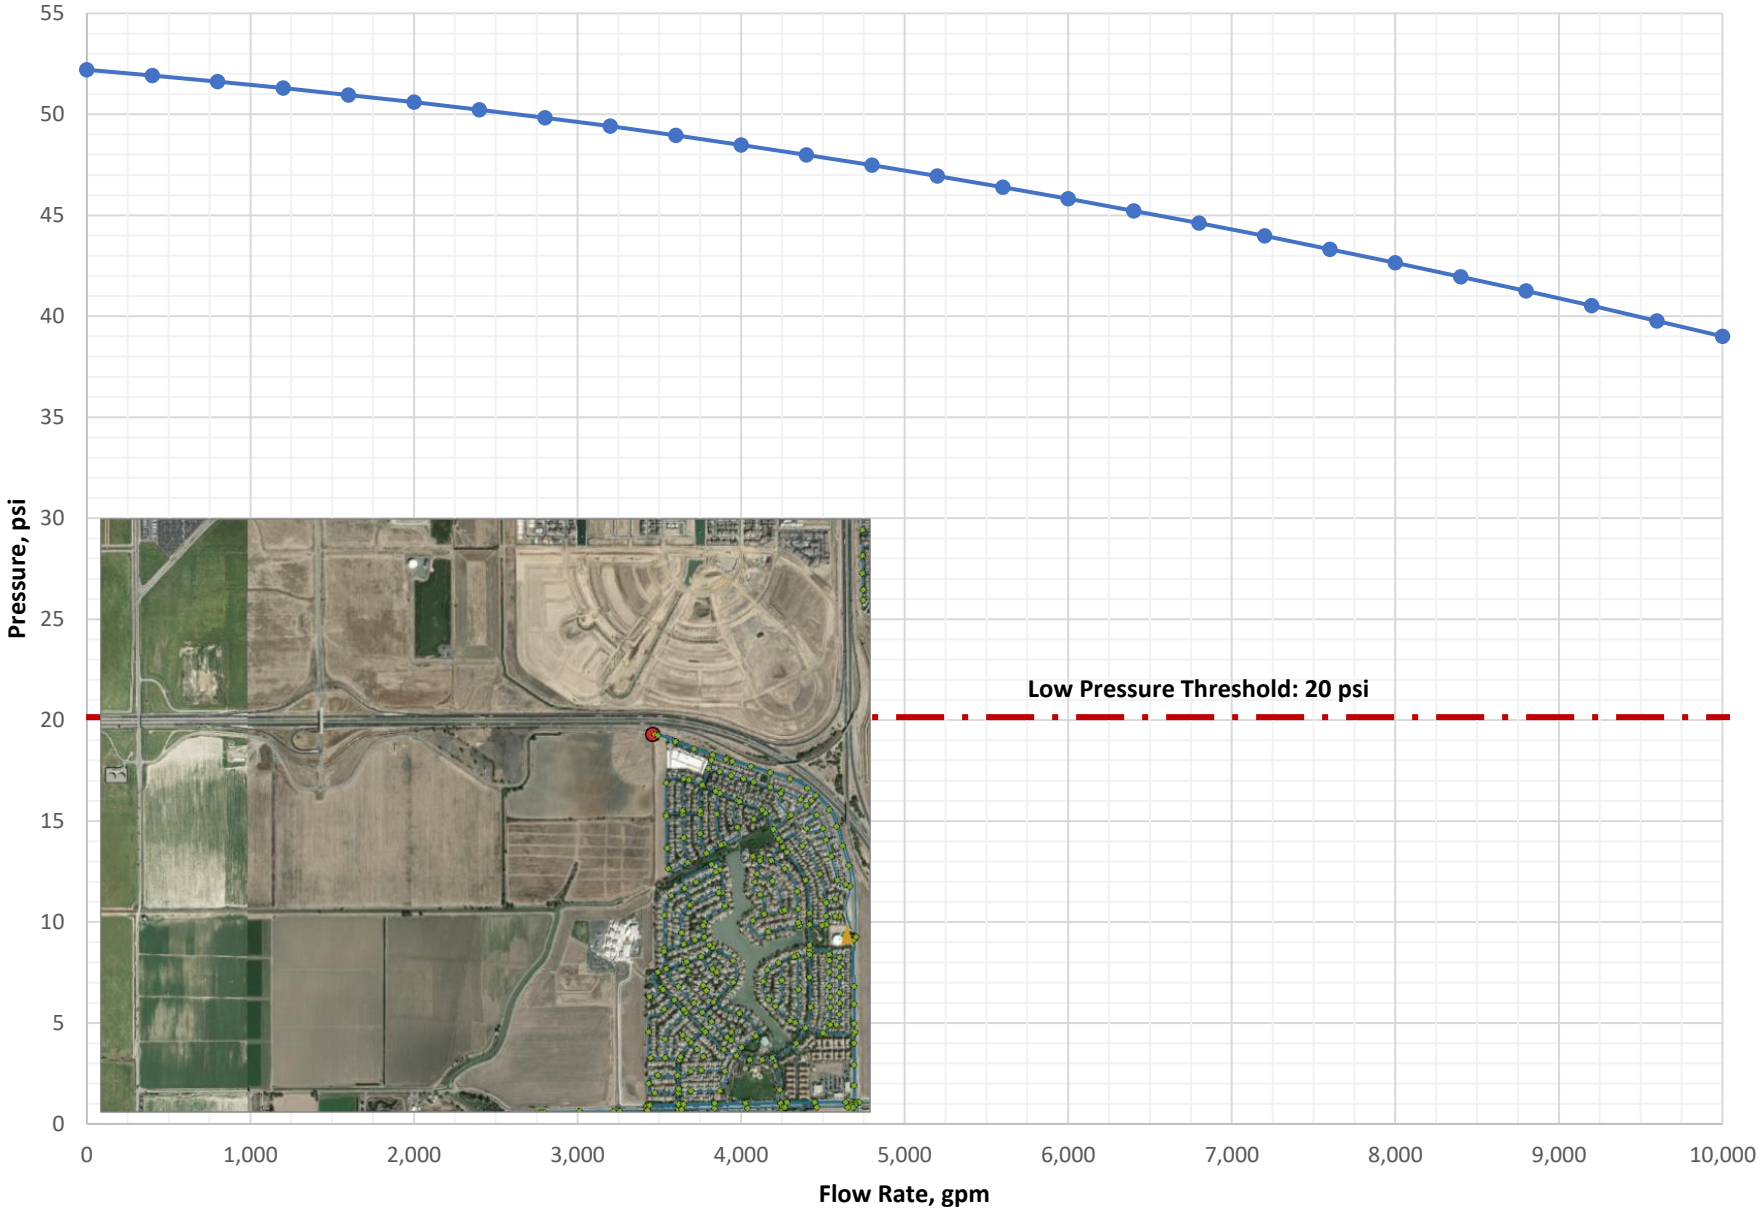
1) **Study Purpose and Objectives**
    a) Include description of the development including any proposed phasing of the improvements
        i) Geographic location of the project and the surrounding area, including elevations
        ii) Land use type of the project and the surrounding area (identify if different from the current General Plan)
        iii) Number of services being proposed
        iv) Existing water infrastructure as well as proposed new infrastructure, including pipe size, age, and material
        v) Descriptions of any non-standard proposed designs and reasons for not meeting standards
2) **Study Area**
    a) Location Map
    b) Modeled Water Distribution Layout Map – Include pipe size, demand junctions (include elevations based on project area survey results), tie-in locations, and any necessary system modifications
3) **Demands and Peaking Factors**
    a) Land Use Designation (Units, Acres, and Demand Factor – include source)
    b) Flows to be assessed (concurrently)
        i) Domestic
        ii) Irrigation
        iii) Hydrant Flow
        iv) Fire Sprinkler Loads (*Fire sprinkler loads may be waived if authorization is provided by the current City of Sacramento Fire Marshall and the report includes details of the correspondence)
    c) Demand Factor (by Land Use Designation if more than one)
        i) Average Day Demand (ADD)

ii) Maximum Day Demand (MDD) - 2.0 x Average Day
iii) Peak Hour Demand (PHD) - 2.6 x Average Day
iv) Assumed System Losses

4) **Design Criteria**
   a) City of Sacramento Design Criteria – Include Source
      i) Minimum velocity during Average Day Demand
      ii) Minimum residual pressure during Peak Hour Demand
      iii) Maximum velocity during Peak Hour Demand
      iv) Minimum residual pressure during Maximum Day Demand plus fire flow
      v) Maximum velocity during Maximum Day Demand plus fire flow
      vi) Maximum headloss per 1,000-LF
      vii) Minimum velocity during Average Day Demand
      viii) Hazen Williams "C"
      ix) Elevations at demand nodes (should reflect surveyed elevations for project)
   b) Fire Flow Requirements – As Required by the Fire Department (shall be no less than 1,000-gpm with 20-psi residual)
      i) Flow (gpm)
      ii) Residual Pressure (psi)
      iii) Duration (Hours)
5) **Hydraulic Analysis Summary**
   a) Model Description - Include software information (if applicable) and source of data
   b) Existing Boundary Conditions, including results from field hydrant testing
   c) Model Scenarios and Results
      i) Include Minimum/Maximum Pressure and Maximum Velocity for Average Day Demand, Maximum Day Demand, Maximum Day Demand plus Fire Flow, and Peak Hour Demand for each scenario (include back-up by junction and pipe segment)
      ii) Phased projects shall include intermediate and cumulative results
6) **Conclusions**

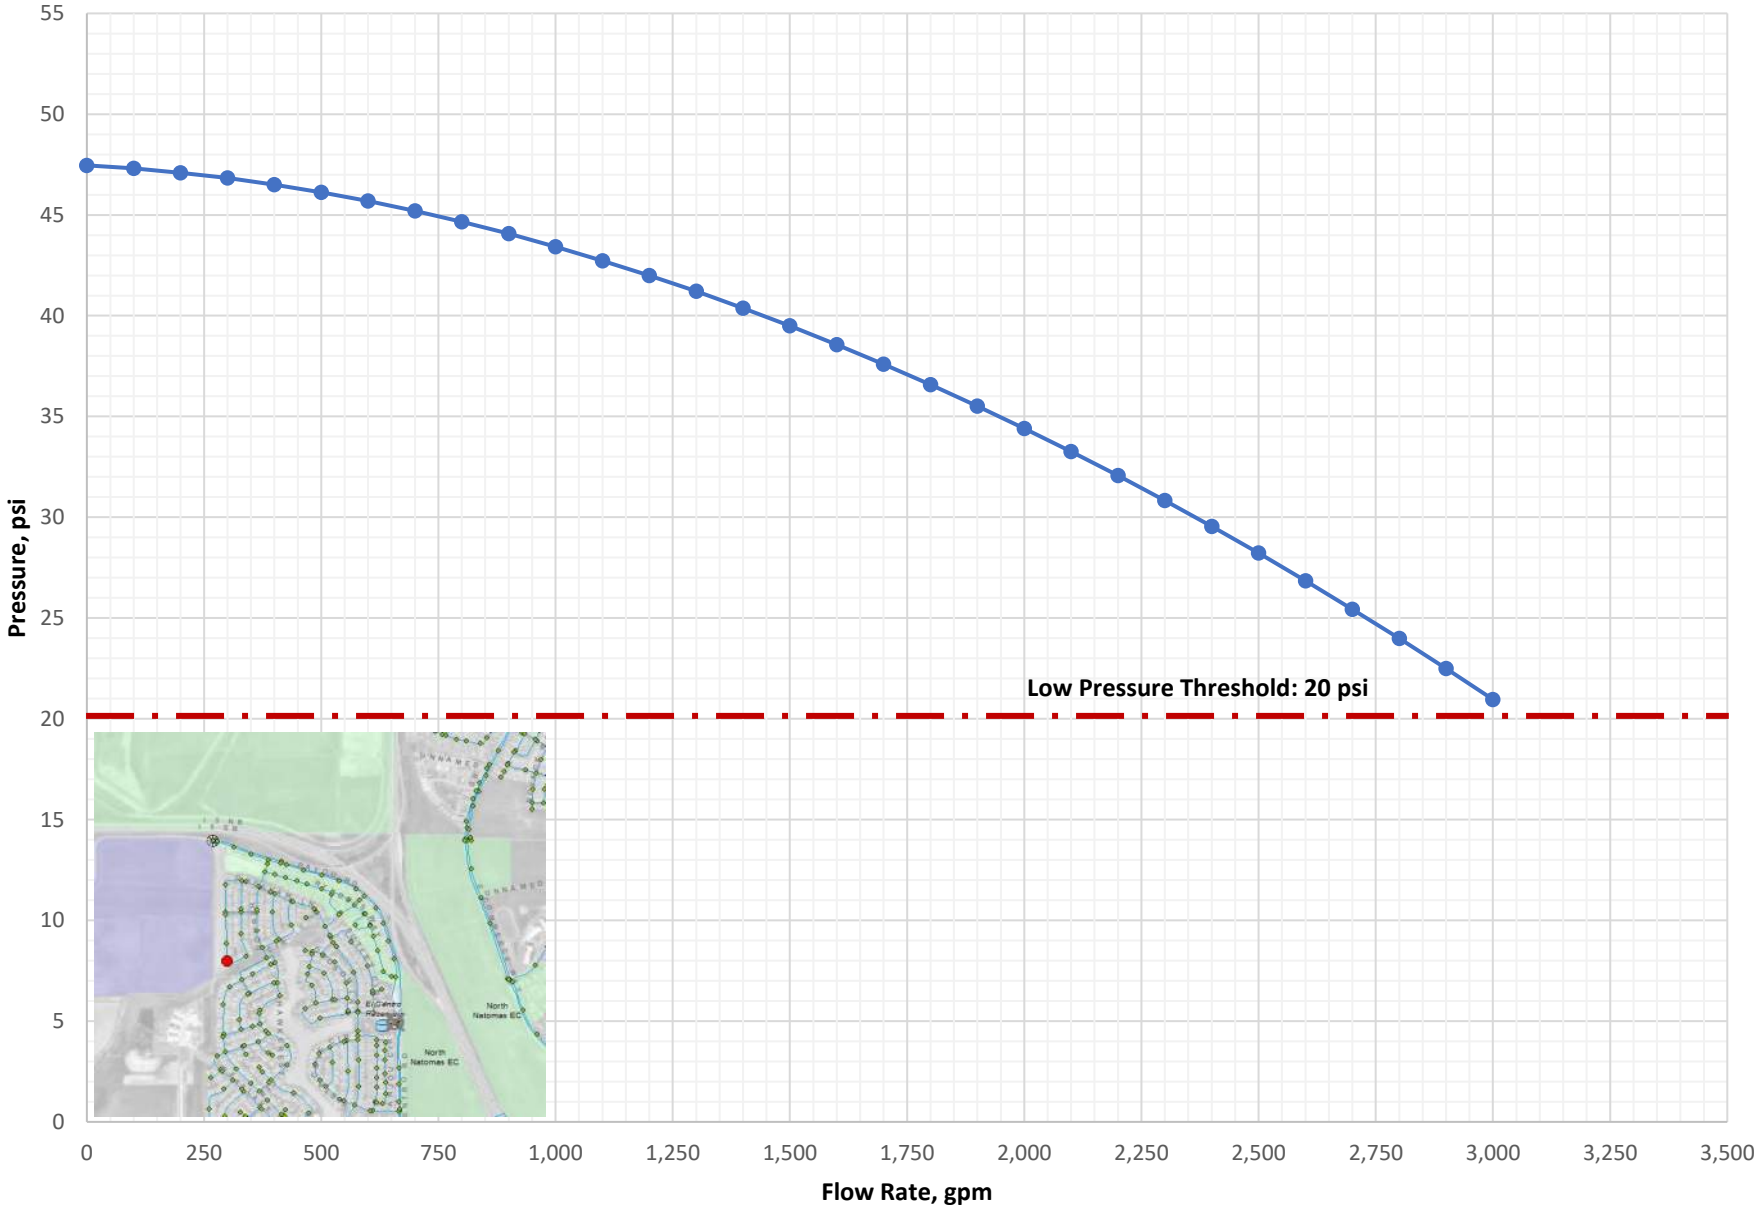
At the discretion of the City Engineer, additional information may be required for the water study. Each project is different and may require additional information dependent on the location, size of development and land use being proposed for the project.

City of Sacramento



Water Distribution System Criteria

Summary of Recommended Potable Water System Performance and Operational Criteria



Component	Criteria		Comments
Fire Flow Requirements (flow [gpm] @ duration [hours])			
Single Family Residential	1,500 gpm @ 2 hrs		Existing Development will be evaluated on a case-by-case basis because of the historical varying standard
Multi Family Residential	2,500 gpm @ 2 hrs		
Commercial	3,500 gpm @ 4 hrs (w/ approved automatic sprinkler system)		
Industrial	4,500 gpm @ 4 hrs (w/ approved automatic sprinkler system)		
Institutional	4,500 gpm @ 4 hrs (w/ approved automatic sprinkler system)		
Water Transmission Line Sizing			
Diameter	>= 18-inches		Locate new transmision pipelines within designated utility corridors wherever possible.
Average Day Demand Condition			Criteria based on requirements for new development, existing transmission mains will be evaluated on case-by-case basis. Evaluation will include age, material type, velocity, head loss, and pressure.
Minimum Pressure [psi]	30 psi		
Maximum Pressure [psi]	80 psi		
Maximum Head loss [ft/kft]	3 ft/kft		
Maximum Velocity [ft/sec]	3 ft/sec		
Minimum Velocity [ft/sec]	0.10 ft/sec		
Maximum Day Demand Condition			
Maximum Pressure [psi]	30 psi		
Maximum Head loss [ft/kft]	3 ft/kft		
Maximum Velocity [ft/sec]	5 ft/sec		
Peak Hour Demand Condition			
Minimum Pressure [psi]	30 psi		
Maximum Head loss [ft/kft]	3 ft/kft		
Maximum Velocity [ft/sec]	5 ft/sec		
Hazen Williams "C" Factor	130		For consistency in hydraulic modeling.
Pipeline Material	CCP (Concrete Cylinder Pipe), Ductile Iron, or Welded Steel		
Water Distribution Line Sizing			
Diameter	< 18-inches		Must verify pipeline size with maximum day plus fire flow analysis. Locate new distribution pipelines within designated utility corridors wherever possible
Average Day Demand Condition			Criteria based on requirements for new development, existing distribution mains will be evaluated on case-by-case basis. Evaluation will include age, material type, velocity, head loss, and pressure.
Minimum Pressure [psi]	30 psi		
Maximum Pressure [psi]	80 psi		
Maximum Head loss [ft/kft]	7 ft/kft		
Maximum Velocity [ft/sec]	5 ft/sec		
Minimum Velocity [ft/sec]	0.10 ft/sec		
Maximum Day with Fire Flow Demand Condition			
Minimum Pressure [psi] (at fire node)	20 psi		
Maximum Head loss [ft/kft]	10 ft/kft		
Maximum Velocity [ft/sec]	10 ft/sec		
Peak Hour Demand Condition			
Minimum Pressure [psi]	30 psi		
Maximum Head loss [ft/kft]	7 ft/kft		
Maximum Velocity [ft/sec]	7 ft/sec		
Minimum Pipeline Diameter			
General	8-inches		6-inch may apply where minimum velocities aren't met
Industrial	12-inches		
Distribution to cul-de-sac / dead-end street	6-inches		4-inch may apply where minimum velocities aren't met and the dead end is no longer than 250-feet. 6-inch dead end runs shall be no longer than 500-feet.
Distribution to fire hydrants	8-inches		
Hazen Williams "C" Factor	130		For consistency in hydraulic modeling.
Pipeline Material	Ductile Iron or C900 PVC		
Maximum Water Service Pressure [psi]	80 psi		Install PRV if service pressure is greater than 80 psi.
Gross Unit Water Use Factors for Retail Distribution System	Composite Residential Use Factor[(a)] [afy/dwelling unit]	Composite Non-Residential Water Use Factor[(b)] [afy/employee]	(a) Use factor includes 10% for unaccounted-for water. Public and Park uses show small increases in residential dwelling units because the spatial analysis captures small residential areas adjacent to these land uses. Average of residential category used to estimate this small residential use. Significant irrigation requirements for parks are assumed to be provided from wells not connected to the potable water system. Other use factors, such as residential categories, include neighborhood park water use, incorporate park irrigation use in the non-residential category. (b) Use factor includes 10% for unaccounted for water. Residential Low, Medium and High have small non-residential water use sample size. Therefore, Mixed Use Non-Residential used for Residential Low and Medium. Mixed Use - Higher Density used for Residential High.
Residential Low	0.61	0.09	
Residential Medium	0.39	0.09	
Residential High	0.12	0.04	
Mixed Use	0.19	0.09	
Mixed Use (Higher Density)	0.15	0.04	
Central Business Density	0.15	0.02	
Commercial/Office	0.15	0.09	
Industrial	--	0.14	
Public	0.37	0.17	
Park	0.37	0.17	
Gross Unit Water Use Factors for Study Areas	Gross Water Use Factor [afa/acre]		Use factor includes 10% for unaccounted-for water and 15% to account for rights-of-way and streets (net water use x 1.1/1.5 = gross water use).
Residential Low	3.6		
Residential Medium	3.8		
Mixed Use	2.0		
Commercial/Office	1.5		
Industrial	0.9		
Park	3.0

Subject: Airport South Industrial – Level 1 Sewer Study – SacSewer Approval

Mr. Fletter,

The Sacramento Area Sewer District (SacSewer) has reviewed the Airport South Industrial – Level 1 Sewer Study and has determined it sufficiently addresses SacSewer requirements and considers the study fully approved. Any significant change in the proposed or assumed land use presented in the document that impacts the sewer design may require a revision to this study.

If you have any questions regarding these comments please call me at 916-876-6336.

Sincerely,

Yadira Lewis

1.0 Executive Summary

Purpose

The purpose of this study is to provide environmental and financial background data for sewer infrastructure to support the Airport South Industrial (ASI) development. This development comprises commercial and industrial space along the Interstate 5 (I-5) corridor near the Sacramento Metropolitan Airport.

This study demonstrates that the development will provide onsite sewer infrastructure, including a sewer pump station that will convey sewer through one of three alternative force main alignments. The force mains will discharge to an existing sewer trunk or interceptor. The proposed onsite collectors, trunks, pump station and force main can serve the development. This infrastructure is not intended to serve any offsite areas, upstream or downstream.

This study describes the site topography, phasing and timing of the development, major components of the sewer infrastructure and how they intertie with existing and master planned Sacramento Area Sewer District (SacSewer) and Sacramento County Regional Sanitation District (Regional San) infrastructure. This Level 1 Sewer Study provides sufficient information for the preparation of environmental documentation and for financial planning.

Project and Study Characteristics

The ASI Project (Project) area totals approximately 474.4 acres and is located along Bayou Road south of I-5. The Project is currently within the County of Sacramento. The property lies south of I-5 and south and east of the Sacramento International Airport (SMF) and Metro Air Park (MAP). The Northlake (formerly Greenbriar) project lies north of I-5 and is northeast of the Project. The site is more fully described on the vicinity maps in **Exhibit A**. The North Natomas Community Plan in the City of Sacramento (City), comprising approximately 7,440 acres. Agricultural and habitat mitigation lands lie south of the Project. Undeveloped Airport Master Plan Commercial Development lands owned by SMF in the County of Sacramento are west and southwest of the Project area. The east boundary of the Project area is the City/County boundary. This includes a 200-foot-wide City-owned buffer along the eastern boundary of the Project that is located in the City. Phase 1 of the new MAP Interchange has been completed on I-5, which is directly north and comprises a portion of the Project area.

The Project is proposed for annexation into the City. The City is acting as the lead Agency. The annexation will be processed through the Local Agency Formation Commission (LAFCo). The sewer facilities are proposed to be included into SacSewer's and Regional San's expanded service area. The Project area has multiple landowners. NP MAP Land Holding Company, LLC (NorthPoint Development) and AKT Investments are the Applicants and are sponsoring the entitlements for the Project. **Exhibit D** is a Site Plan for the Project.

The Project consists of commercial and industrial land uses with supporting facilities such as detention basins, pump stations, roadways, buffer spaces and other public/quasi-public land uses. Commercial land uses total 13.4 acres, industrial totals 318.6 acres, public facilities and roadways total 142.4 acres. While total annexation acreage is 474.4, total developable acreage (Less I-5 lands) is 436.5. A preliminary Land Use Summary is included as **Exhibit C**.

The sewer equivalent single family dwelling units (ESD) that make up the sewer demand in this study includes approximately 81 ESDs of commercial units, 1,870 industrial (warehouse) ESDs, 516 detention basin ESDs, 152 ESDs of roadway/right-of-way, pump stations and buffer spaces.

All sewer facilities will be permanent. The sewer pump station that will serve the Project will be developed in a single phase to meet the ultimate average day dry weather (ADWF) and peak wet weather flows (PWWF). Based on the above land use area and ESDs, the cumulative ADWF and PWWF demand is expected to be 0.81 mgd and 2.09 mgd, respectively. The pump station will be size

for the PWWF and discharge to either a SacSewer trunk or a Regional San Interceptor. The route of the force main that will convey this demand will be through one of three alternatives shown in **Exhibit G**.

Finances

The cost to provide the backbone sewer facilities outlined in this study include onsite gravity trunks and manholes, a pump station, and a force main connecting to an existing trunk or interceptor system. The infrastructure items identified for cost estimating purpose, are those that will be reimbursed through SacSewer's Trunk Sewer financing program. While detailed preliminary design of these facilities was not completed for this study, construction costs can be estimated based on similar facilities completed in the past.

The total estimated cost for these facilities is $12,990,000. An Itemized list of those items used to arrive at this total is provided in **Exhibit H**. The total includes estimates for planning, studies, engineering, plus construction management, testing and inspection. It also includes a 20% contingency added to the construction estimate.

A summary of the itemized costs is provided in Table 1-1, below.

Table 1-1: Project cost estimate for reimbursable backbone infrastructure.

Facility Description	Cost
Pump Station	$ 3,140,000
Gravity Trunk	$ 330,000
Force Main	$ 5,950,000
Construction Cost Estimate	$9,420,000
Construction Contingency (20%)	$ 1,880,000
Planning, Studies & Engineering (10%)	$ 940,000
Construction Mgmt, Testing & Inspection (8%)	$ 750,000
Total Project Cost	$ 12,990,000

Findings

This study identifies onsite facilities and force main alternatives required to serve all phases of the Project. The peak wet weather demand from all of these phase areas is 2.09 mgd. The proposed collector, trunk, pump station and force main infrastructure will be size for the ultimate/buildout conditions and no phasing is proposed.

Once the Project area is annexed into the City of Sacramento, the Board for SacSewer and Regional San is expected to adopt the Project area into its service area.

The estimated cost for the backbone sewer infrastructure is approximately $13 million.

2.0 Introduction

Level of Study

This study is identified as **Level 1** to show the degree of compliance with master planning by SacSewer and Regional San. The study further provides information to support environmental documentation and financial analysis of the Project. The focus of this study is on topography/project setting, phasing and timing, sewer sheds and sewer demand on existing SacSewer and Regional San backbone or trunk infrastructure required to serve the plan area. This level of study is not sufficient for design, and it is anticipated that a level two and three studies will be required prior to improvement plan approval for backbone facilities.

Location

This Project is in the County of Sacramento. The property lies south of I-5, and south and east of the Sacramento International Airport (SMF) and Metro Air Park (MAP). The Northlake Subdivision lies north of I-5 and is northeast of the Project. The location of the Subdivision is further shown in **Exhibit A**.

Topography

The existing topography/setting within the Project area and surrounding it, is a combination of rural and urban. The Project sits on agricultural land. To the north, immediately across I-5, is a housing subdivision, an industrial park and the Sacramento International Airport. To the west and south is more agricultural land, wetlands and the Sacramento River. To the east there are several North Natomas housing subdivisions and commercial parks. **Exhibit B** shows the surrounding topography/setting in more detail.

Land Use and Zoning

Historically the Project site has been used for agriculture and it is currently farmland. The land is zoned by the County of Sacramento as AG, agricultural. Small portions of the land fronting the I-5 have no zoning because they are part of the interstate corridor.

Exhibit D is the current site plan prepared for the Project. As stated previously, the Project annexation area totals 474.4 acres. This is inclusive of the State of California (Caltrans) lands measured roughly to the center of I-5, and also includes the south approximate one-half of the new MAP Interchange. The west boundary extends to the approximate centerline of Power Line Road. Total Caltrans I-5 Right-of-Way (R/W) totals approximately 37.9 acres. This leaves approximately 436.5 gross acres of lands proposed for development.

The Project will include development of an industrial park and highway commercial areas. As shown on **Exhibit C**, the development will include warehouses, restaurants, a hotel and a gas station/carwash. The estimated industrial buildings total 6,609,300 SF.

The Project currently lies outside the County of Sacramento Urban Services Boundary (USB). The USB and the City boundaries represent the limit of the Sacramento County Service areas for SacSewer and SRCSD. As a result, this site has not been included in either of SacSewer and SRCSD's respective Master Plans as a future area to be served. However, when annexed into the City, the Project will also be annexed into the service areas for SacSewer and SRCSD, with the expectation that service will be extended to the Project.

Table 2-1: Land use, acreage and sewer ESDs based on sewer shed area identified in Exhibit E.

LU Code	Land Use Description	Area (ac)	Sewer Density (du/ac)	ESDs
C	Commercial - Restaurant - Gas Station / Carwash - Hotel	13.4	6	80.4
I	Industrial (Warehouse)	311.7	6	1,870.2
Basin	Stormwater Detention Basin	86.0	6	516.0
Buffer	Land Buffer	2.3	6	13.8
PS	Pump Station (Sewer & Stormwater)	0.9	6	5.4
Roads	Internal Roadways & Caltrans Parcel	22.2	6	133.2
I-5	Interstate 5 Corridor	37.9	0	0
TOTAL		461.0474.4		2,619.0

3.0 Design & Sewer Flow Information

A schematic sewer layout for the Project is provided in **Exhibit E**. **Exhibit F** provides flow calculations based upon the SacSewer minimum sewer demand of 6 ESDs per acre and the sewer shed areas shown in **Exhibit E**.

3.1 Design Assumptions

This study provides calculations of the ultimate sewer flows that are expected to be generated within the Project area by utilizing acreage and density information provided in the Preliminary Site Plan provided in **Exhibit D** and average dry weather flow (ADWF) in Section 201.1 of the SacSewer Design Standards, dated November 30, 2021.

Assumptions

There were several assumptions used in the design approach for this Level 1 Sewer Study. It is understood that refinement of these assumptions will likely be made as more detailed Level 2 and Level 3 Studies are prepared. The assumptions used for this study are provided below:

- There will be no upstream development that will need to utilize the Project sewer infrastructure. SacSewer's Expansion Trunk Shed Plans for SMF, MAP and lands south of SMF and west of the Project will convey to existing infrastructure within the MAP sewer shed.

- There will be no significant increase in on-site densities that will affect the planned on-site facilities.

- For this Level 1 study, the location of the trunk and collectors are schematic to more clearly show where sewer is loaded into the demand calculations. The exact horizontal location, rim elevation and depth of the pipe and manhole infrastructure will be determined during preparation of Level 2 and Level 3 Sewer Studies.

- Pipe sizes and flow rates were calculated based on the SacSewer design standards and adhere to SacSewer "Minimum Sewer Study Requirements" Criteria.

- Areas that are not expected to generate sewer demand are included in the demand calculations. These areas include stormwater detention basins, land buffers, pump stations, a Caltrans parcel dedication and onsite roadways.

Approach

The following general procedure was used in the development of this study.

1. Gross areas and land use information based on the Preliminary Site Plan provided as **Exhibit D** were used to calculate sewer flows.

2. Sub sheds areas were defined primarily by building sites then by topographic features.

3. ESDs were calculated for each shed based on the underlying land use and shed area.

4. 310 gallons per day is assumed to be the average dry weather flow per ESD.

5. Flows were determined based on the SacSewer Improvement Standards, and on the design criteria and assumptions identified in this study.

6. A permanent pump station will be located on Lot F as shown in the site plan in **Exhibit D**.

7. The pump station will be served by a permanent force main discharging to a Regional San interceptor. The alignment and discharge location of the force main is unknown at this time while stakeholders consider the alternatives provided in **Exhibit G**.

Design Criteria

SacSewer Standards and Specifications, dated November 30, 2021, were used as the basis for this design. The flows were generated using the information found in Chapter 201 (Capacity Design) of SacSewer Standards. Generally, the minimum allowable ESD densities identified in that chapter were utilized; however, higher densities were used as established by land use plan. The densities used for each land use is shown in **Table 2-1**, above. The flow criteria used for this report is presented in **Table 3-1**.

Table 3-1: Design Flow Criteria
Source: Sacramento Area Sewer District

Criteria		Modifier
Flow Generation		
Restaurant	6 ESD/acre	Not less than 6 ESD/acre for any land use.
Gas Station / Carwash	6 ESD/acre	
Hotel	6 ESD/acre	
Warehouse	6 ESD/acre	
Stormwater Detention Basin	6 ESD/acre	
Land Buffer	6 ESD/acre	
Pump Station (Sewer & Stormwater)	6 ESD/acre	
Minor, Major and Caltrans Roadways	6 ESD/acre	
Peaking Factor	$PF = 3.5 - 1.8 * Q_{ADWF}^{0.05}$ (Minimum PF = 1.2)	
Minimum Velocity	Minimum 2 fps at Peak Dry Weather Flow	
Rainfall Infiltration Factor	1,600 gpd per acre	
Hydraulic Grade Line	Maximum HGL at crown of pipe at Peak Wet Weather Flow	
Friction Factor (Manning's n-value)	0.01300	

3.2 Sewer Flow Information

Onsite Sewer Flows

Onsite sewer flows were generated based on design flow criteria identified in Table 3-1 overlaid with the proposed land use. The Project area totals 474.4 acres; however, the sewer demand excludes land that will be dedicated for the I-5 corridor. The remaining land totals 436.5 acres and includes industrial and commercial uses, stormwater detention basins, land buffers, pump stations and internal roadways. While these areas are included in the sewer demand calculations for this level of study, further planning may justify elimination of some of these areas.

Exhibit F summarizes ultimate PWWF conditions when the Project is built out. The ADWF and PWWF are 0.81 mgd and 2.09 mgd, respectively.

Offsite Sewer Flow

There will be no offsite sewer flows, present or future, that will utilize the infrastructure proposed here.

4.0 Sewer Alignments and Facilities

Interim Facilities

There are no interim sewer facilities proposed for the Project. Gravity and collector infrastructure may be extended from the pump station in phases as roadways and commercial facilities are developed; however, those facilities will be sized for the ultimate conditions.

Ultimate Facilities

The gravity trunks and manholes shown in **Exhibit E** are schematic due to the level of this study. The alignments shown may be modified as planning documents are finalized and adopted. Rim and invert information will not be provided until Level 2 and Level 3 studies are prepared.

4.1 Pump Station

The sewer pump station that will serve the Project is anticipated to be sized for the ultimate demand. The pump station will be located on Lot F as shown in the preliminary site plan provided in **Exhibit D**. Based on the demand calculations provided in **Exhibit F**, the ultimate build out of the pump station shed area will require capacity of 2.09 mgd. A pump station design report will be prepared that will detail the major pump station components and their layout and sizes. This report will be provided after a Level 2 or Level 3 Study is prepared.

Jurisdiction for design and construction of the pump station will primarily lie with SacSewer.

4.2 Force Main

Three alternatives for force main routing from the pump station described above are identified in **Exhibit G**. All alternatives provide for discharge to a SacSewer Trunk or a Regional San interceptor. The force main must cross under I-5 to reach these interceptors or trunk sewers.

A previous memorandum was prepared and provided to SacSewer and Regional San dated June 20, 2022, That memorandum identified seven alternative alignments for the future ASI force main. After consideration by SacSewer staff, the following three alignments shown in **Exhibit G** were identified as feasible.

Alternative Alignment #1

This alternative proposes to route the force main as described in Alternative #2 below; however, at Del Paso Road, the force main would be routed within a City freeway buffer parallel with and on the westside of I-5. About ½ mile south of Del Paso, the force main would cross under I-5 within City right-of-way and then discharge into a 48” North Natomas Interceptor within East Commerce Way.

Alternative Alignments #2 & #3:

Both force main alternatives would route east from El Centro Road at Del Paso Road then cross I-5 either north or south of the I-5 on/off ramps. Once on Del Paso Road, the force main would continue east and discharge to a 48” North Natomas Interceptor at Del Paso and East Commerce Way.

Alternative alignments 1, 2 & 3 provide for discharge points into a 48” Regional San interceptor; however, the force main lengths and costs are greater than with Alternatives 1 & 2.

Jurisdiction for design and construction of the force main will lie with SacSewer, City of Sacramento and the California Department of Transportation.

The force mains will have an inner diameter between 10 and 14 inches to maintain velocities through the pipe of 3 to 6 feet per second utilizing ductile iron or high-density polyethylene pipe.

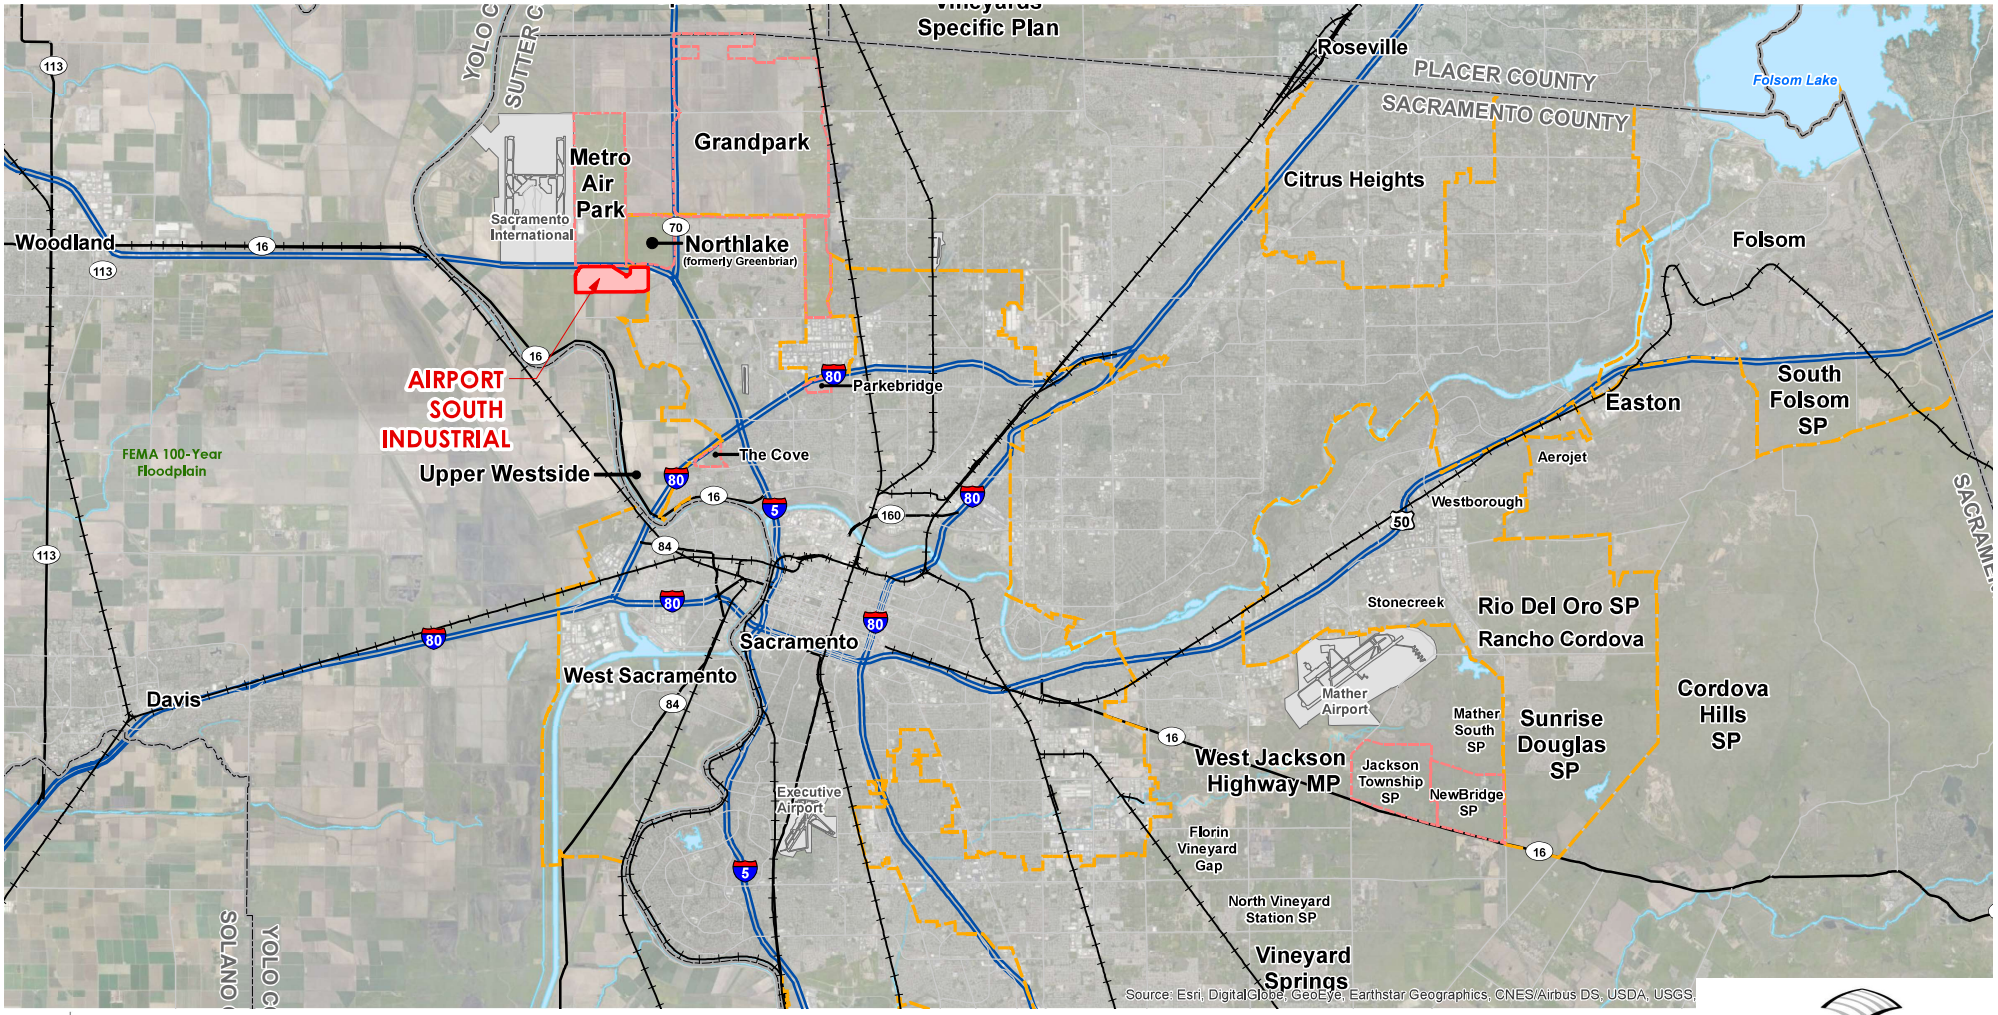
4.3 Trunk and Collector Pipeline Materials

The area within and around the subdivision is known to experience high groundwater; therefore, it is anticipated that SacSewer will prefer the use of polyvinyl chloride pipe (PVC) for all trunk and collector conveyance pipes.

4.4 Preliminary Estimate

As stated previously, the cost estimate for the backbone sewer infrastructure is included as **Exhibit H**. Force Main Alignment No. 1, shown in **Exhibit G**, was used as a basis for the force main cost because it is the longest and most costly force main alternative. The backbone infrastructure cost is estimated at $13 million.

5.0 Conclusion



This study has been prepared in accordance with SacSewer design guidelines to schematically identify backbone conveyance facilities, as well as topographic and financial conditions to serve the Airport South Industrial development. The study has been prepared as a Level 1 Sewer Study.

The total size of the Project area is 474.4, but sewer demand is based on 436.5 acres because lands to be dedicated for the I-5 highway corridor are excluded. Sewer demand is based on 2,619 ESDs and calculated buildout flows of 0.81 mgd ADWF and 2.09 mgd PWWF.

The estimated cost of the backbone infrastructure is $12,990,000 and includes those facilities that are reimbursable by SacSewer, such as gravity trunk, sewer pump stations and force mains.

Footnotes:

1. C - Commercial includes restaurants, gas station/carwash and hotel.
2. I - Warehouse / Industrial includes initial and future warehouse/industrial areas.
3. Roads include internal and Caltrans parcel. Roads does not include I-5 highway corridor.
4. All land uses are assumed to be 6 sewer ESDs per acre.
5. PS = Pump Station, INT = Ultimate force main discharge at Regional San interceptor (know shown on system layout)

Project Cost Estimate (Construction, PSE, CMI)		**$12,960,000**

Notes:

1. The Probable Construction Cost above is based on costs from similar projects. Neither Wood Rodgers nor the Client has any control over the cost of labor, materials, equipment, the Contractors' methods of determining bid prices, or other competitive bidding markets. Prices may vary from engineer's estimate due to bidding climate, competition, and materials escalation at time of receiving bids. Wood Rodgers, Inc. does not assume responsibility for the use of these costs in budget analysis and will not be held liable for capital improvement cost increases associated with the development of this project.
2. Gravity construction cost estimate excludes non-reimbursable collector system.

INTRODUCTION

This Local Transportation Analysis (LTA) addresses transportation and circulation conditions associated with a proposed development project on the south side of I-5 at the Metro Air Parkway interchange in Sacramento, CA. The analysis focuses on the project's relationship to the City and County street system, including nearby intersections, the proposed access points, and on-site circulation. The analysis also includes consideration of motorized vehicle traffic impacts on roadway capacity and potential impacts to transit, bicyclists, and pedestrians.

PROJECT DESCRIPTION

The proposed project consists of approximately 5.2 million square feet of warehouse distribution centers, 98.2 thousand square feet of food and service industry, and reserves area for a further 1.4 million square feet of future industrial uses. As illustrated in **Figure 1**, the 422-acre Sacramento Airport South Industrial Project is located on the south side of I-5 at the Metro Air Parkway interchange. The project would extend Metro Air Parkway to the newly constructed Airport South Industrial and eliminate the existing Bayou Way between Power Line Road and the east side of the project site. The project is currently located within unincorporated Sacramento County and proposes to annex into the City of Sacramento. The site is currently zoned as AG-20 and AG-80 agriculture land. **Figure 2** shows the proposed site plan.

ANALYSIS SCENARIOS

Due to the size of this project and the need for both rezoning and annexation into the City, several analysis scenarios are included and documented in this report. These scenarios are summarized in **Table 1.**

TABLE 1: PROJECT ANALYSIS SCENARIOS

SCENARIO	DESCRIPTION
Existing	Represents average traffic conditions as of approximately May 2022. This scenario is used to establish a baseline for comparison
Baseline	Represents average traffic conditions at the year of construction. This includes reasonably foreseeable developments in the short term near the project site including developments in Metro Air Park and Northlake (~2025)
Baseline with Project	Layers the project on top of the Baseline analysis
Cumulative	Includes all planned developments for the forecasting year of 2040. This effort was coordinated with the City of Sacramento's Draft 2040 General Plan for consistency and is consistent with the regional MTP/SCS
Cumulative with Project	Layers the project on top of the Cumulative analysis

ENVIRONMENTAL SETTING

The roadway, transit, bicycle, and pedestrian transportation systems within the study area are described below.

ROADWAY SYSTEM

The Mobility Element of the Sacramento 2035 General Plan identifies the following roadway system functional classifications.

Major Arterial: A four- to six-lane street that serves longer distance trips and serves as the primary route for moving traffic through the city, connecting urban centers, residential neighborhoods, and commercial centers to one another, or to the regional transportation network. Movement of people and goods (also known as *mobility*), rather than access to adjacent land uses, is the primary function of an arterial street. These streets carry moderate to heavy vehicular movement, low to high pedestrian and bicycle movements, and moderate to high transit movement. Typical major arterials have right-of-way widths of 80–150 feet. Arterials configured as boulevards have right-of-way widths of 90–180 feet.

Minor Arterial: A two-lane street that serves longer-distance trips and provides access to the regional transportation system. These streets carry low to moderate vehicular movement, low to high pedestrian and bicycle movements, and moderate to high transit movement. These roadways typically have high levels of access control. Typical minor arterial streets have right-of-way widths of 50–90 feet.

Major Collector: A two- to four-lane street that primarily provides travel between arterial streets and collector or local streets and secondarily provides access to abutting properties. These streets carry low to moderate vehicular movement, low to heavy pedestrian movements, moderate to heavy bicycle movement, and low to moderate transit movement. These roadways have medians and moderate access control. Typical major collector streets have right-of-way widths of 60–120 feet.

Minor Collector: A two-lane street that connects residential uses to the major street system. These roadways are undivided and have lower levels of access control to abutting properties than arterials or major collectors. Typical minor collector streets have right-of-way widths of 40–80 feet.

Local: A two-lane street that provides direct access to abutting land uses. Local streets serve the interior of a neighborhood. These streets carry low vehicular movement, low to heavy pedestrian movement, and low to moderate bicycle movement. Typical local streets have right-of-way widths of 40–60 feet.

The roadway system near the proposed project is described below.

Interstate 5 - I-5 is a north-south freeway facility serving local and interregional traffic within the Sacramento region. I-5 primarily links South Sacramento, the Central Business District in Downtown Sacramento, Natomas, and the Sacramento International Airport. This freeway is also used as a

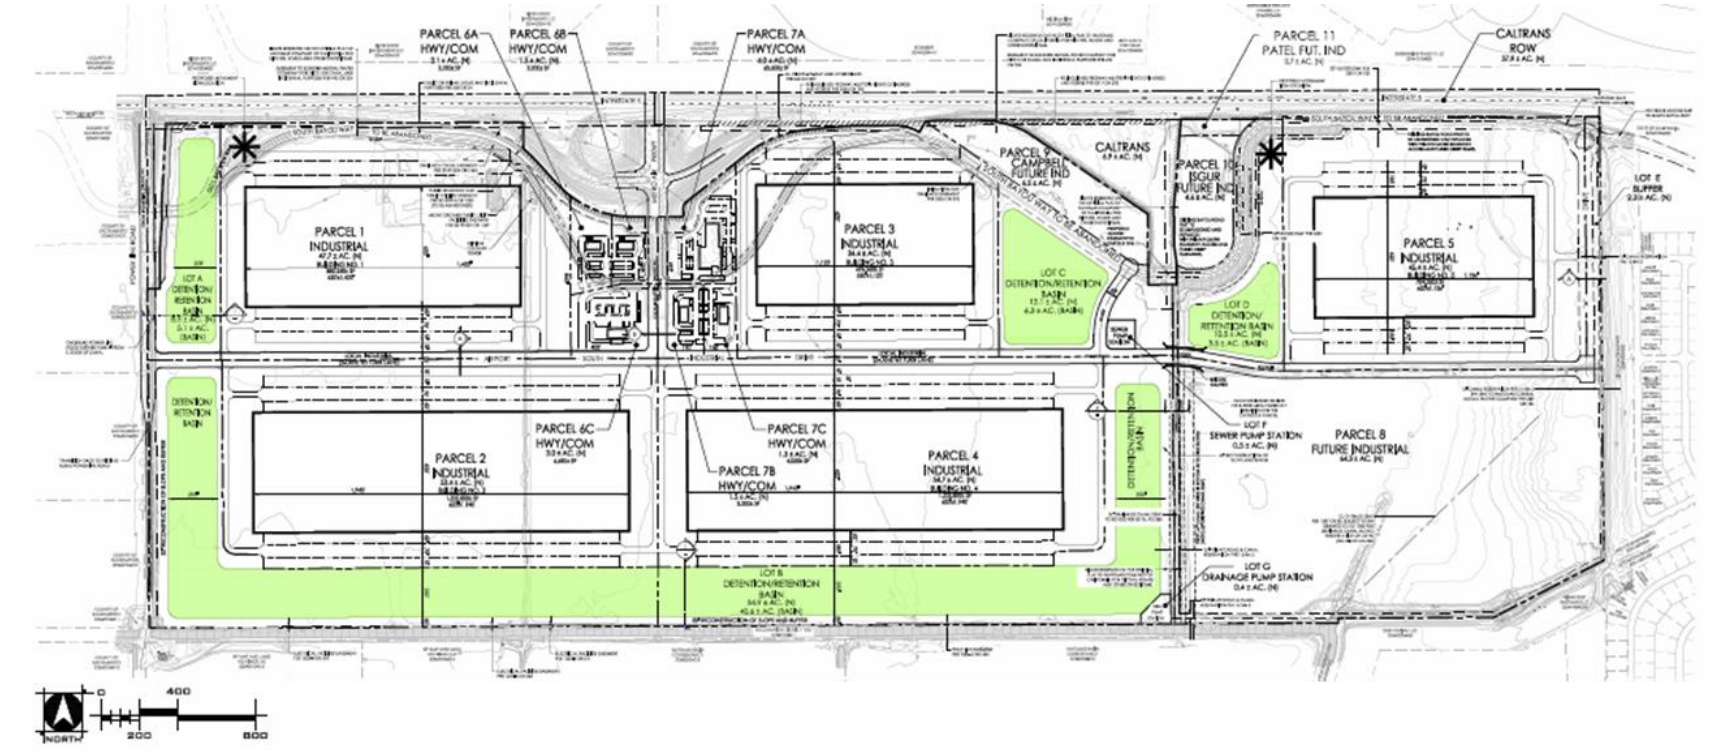
primary route by long-distance traffic, including truck traffic. I-5 is generally about two to four lanes in each direction in the project vicinity.

Power Line Road is a north-south minor collector, perpendicular to I-5, located along the west side of the project site. To the north, the roadway intersects with Bayou Way and passes over I-5. To the south, Power Line Rd intersects with Del Paso Road and ends at Garden Highway. Power Line Road has one lane in each direction with narrow, unpaved shoulders.

Bayou Way is an east-west local road located on the north side of the project site. To the west, the roadway intersects with Power Line Road. To the east, Bayou Way intersects with Metro Air Parkway and continues to the Westlake neighborhood, where it becomes El Centro Road. This roadway has one lane in each direction. East of the project site, Bayou Road is separated by a painted median and has painted bike lanes in both directions.

Del Paso Road is an east-west minor arterial located approximately ½ mile south of the project site. To the west, the roadway intersects with Power Line Road. To the east, Del Paso Road intersects Hovnanian Drive and bisects the suburban Westlake and Sundance Lake neighborhoods. To the east, the roadway has ramps connected to I-5. The segment of the roadway directly to the south of the project site has one lane in each direction. To the east, the roadway expands to two lanes in each direction with additional left turn lanes and a raised median.

El Centro Road is a north-south arterial located approximately ½ mile east of the project site. To the north, the roadway becomes Bayou Way. To the south, the roadway intersects with Del Paso Road and runs alongside the suburban neighborhoods of Westlake and Sundance Lake. North of Del Paso Road, this roadway has two southbound lanes, one northbound lane, and a raised median with left turn lanes. To the South of Del Paso Road, this roadway has two lanes in each direction with a raised median.



Metro Air Parkway is a north-south arterial perpendicular to I-5 that bisects the project site. Metro Air Parkway intersects Bayou Way to the south, passes over I-5, and continues north to intersect with West Elkhorn Boulevard. Within the Study Area, Metro Air Parkway currently has one lane per direction and is being widened to have two lanes in each direction. By 2040, this roadway will be constructed to three lanes per direction. It is considered a thoroughfare within County jurisdiction.

Elkhorn Boulevard is an east-west arterial located north of the project site. To the east, Elkhorn Boulevard connects with SR-99. To the west, Elkhorn Boulevard connects with Power Line Road. This roadway is currently one lane per direction except in front of Northlake, where it is three lanes eastbound and two lanes westbound. By 2030, this roadway will be constructed as a six-lane thoroughfare.

-Existing facilities include those which counts from prior studies were used.
-New intersections are those for which new counts were collected for this study or which did not yet exist on the ground at the time the study was initiated.

FIGURE 1. STUDY AREA

Source: Wood Rodgers, June 20, 2022.

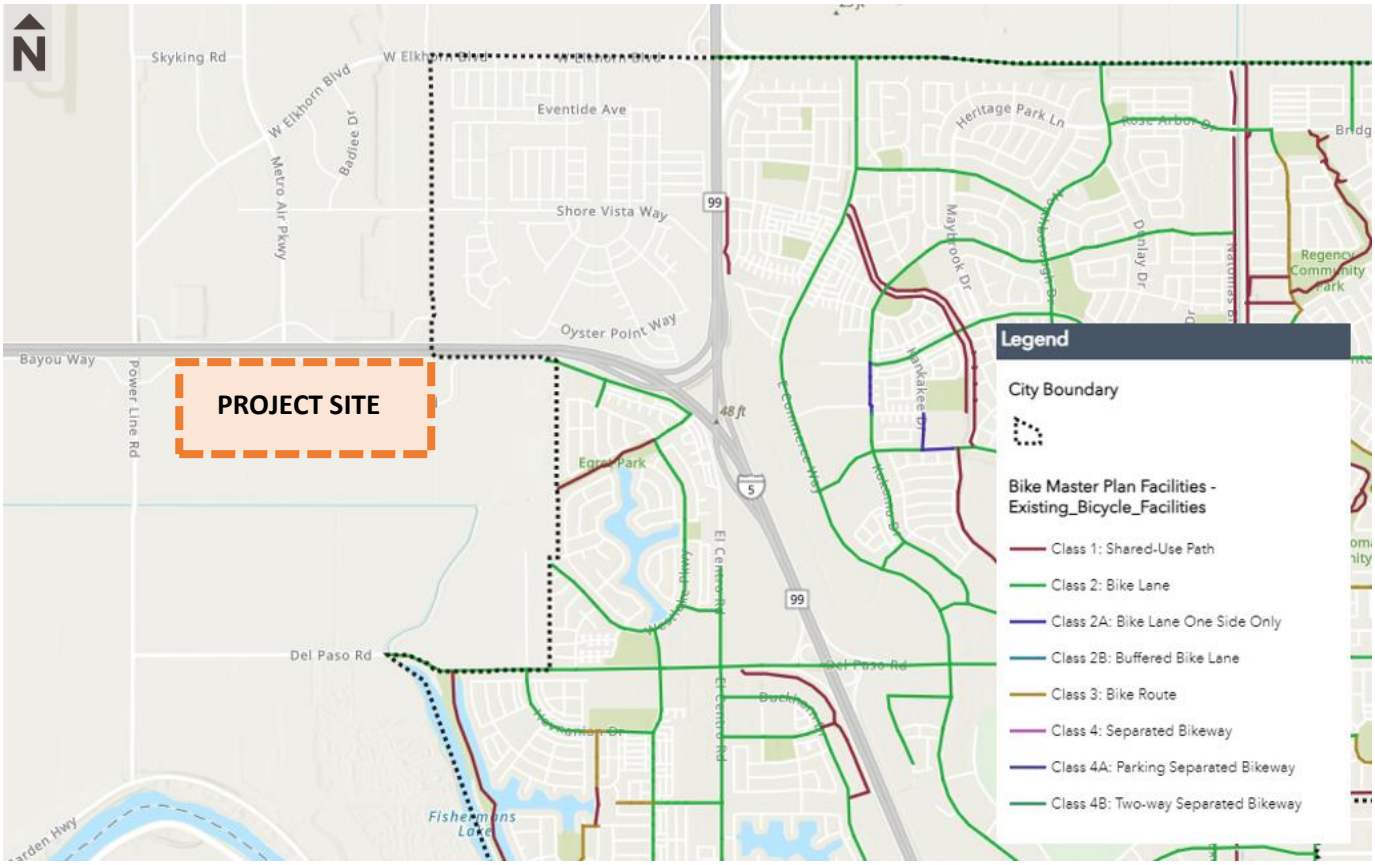


FIGURE 2. PROJECT SITE PLAN

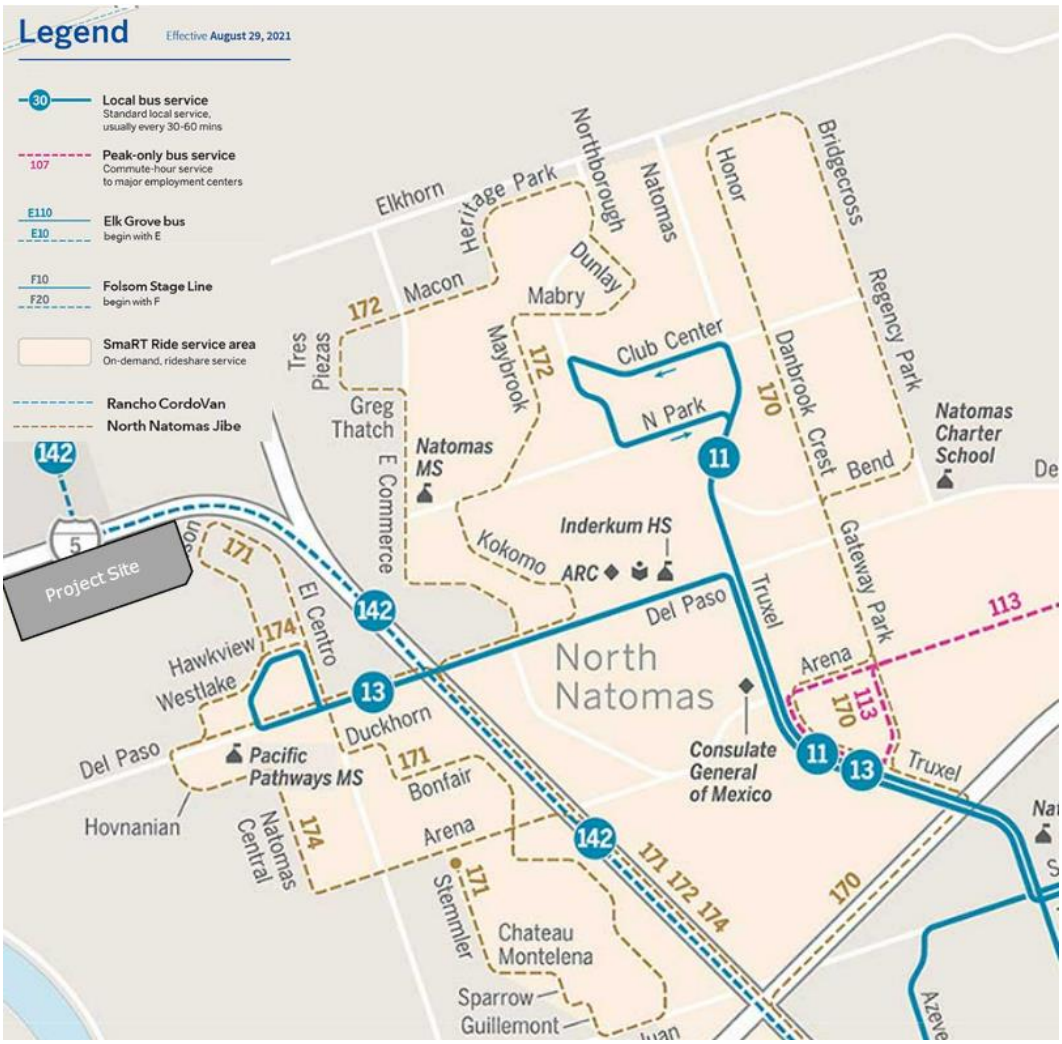
EXISTING PEDESTRIAN SYSTEM

The pedestrian system in the vicinity of the project site consists of sidewalks along Del Paso Road and El Centro Road when they pass through the Sundance Lake and Westlake Neighborhoods. There are currently no pedestrian facilities immediately adjacent to the project site as the location is currently undeveloped.

EXISTING BICYCLE SYSTEM

The bicycle system in the vicinity of the project site consists of infrastructure around the Westlake and Sundance Lake Neighborhoods. The bicycle system consists of a Class I bike path and Class II bike lanes to the south and east of the project site. **Figure 3** illustrates the existing bicycle system. The existing bicycle system ends at the Sacramento City limit.



Source: City of Sacramento Bikeway User Map, 2020

FIGURE 3. BIKEWAYS

TRANSIT SYSTEM

The area in the project vicinity is served by local SacRT bus service (Routes 13 and 142) as well as North Natomas Jibe (Lines 171 and 174), as illustrated in **Figure 4**. Bus Route 13 operates along Del Paso Road, south of the project site. Bus Route 142, which is a peak-only line, also operates along I-5, and stops north of the project site. North Natomas Jibe line 171 (a part-time service) passes along the project site on Callison Drive. North Natomas Jibe line 174 (a part-time service) also operates on Del Paso Road southeast of the project site without any stops in the vicinity of the site. Jibe routes have traditionally been oriented to peak period travel from Natomas to Downtown during the morning peak, and from Downtown to Natomas during the afternoon peak. It should be noted that, due to continued low ridership due to the pandemic, Jibe has suspended all services indefinitely.

FIGURE 4. REGIONAL TRANSIT MAP

STUDY AREA

The following intersections are included in the study area and shown in **Figure 5**:

1. Airport Blvd and I-5 northbound ramps
2. Airport Blvd and I-5 southbound ramps
3. Metro Air Parkway and I-5 northbound ramps
4. Metro Air Parkway and I-5 southbound ramps
5. Garden Highway and Power Line Road
6. Del Paso Road and Power Line Road
7. Del Paso Road and El Centro Road
8. Del Paso Road and Hovnanian Drive
9. Del Paso Road and I-5 northbound ramps
10. Del Paso Road and I-5 southbound ramps
11. Del Paso Road and East Commerce Way
12. West Elkhorn Boulevard and Metro Air Parkway
13. West Elkhorn Boulevard and SR 99 northbound ramps
14. West Elkhorn Boulevard and SR 99 southbound ramps
15. West Elkhorn Boulevard and East Commerce Way
16. North Park Drive and East Commerce Way
17. Arena Boulevard and El Centro Road
18. Bayou Road South and Power Line Road
19. Bayou Road South and Metro Air Parkway
20. Power Line Road and West Elkhorn Boulevard
21. Metro Air Parkway and Pacific Gateway Drive
22. Metro Air Parkway and Meister Way
23. West Elkhorn Boulevard and Badiee Drive
24. West Elkhorn Boulevard and Ameri Drive
25. West Elkhorn Boulevard and Lone Tree Road
26. West Elkhorn Boulevard and Lakestone Drive
27. West Elkhorn Boulevard and Wave Street
28. West Elkhorn Boulevard and Waterside Avenue
29. Bayou Way and Callison Drive
30. El Centro Road and Hawkview Drive
31. Airport South Industrial Drive and Power Line Road
32. Airport South Industrial Drive and Metro Air Parkway
33. Highway commercial access and Metro Air Parkway

The following segments are also included in the study area:

1. Metro Air Parkway - I-5 to Pacific Gateway Drive
2. Metro Air Parkway - Pacific Gateway Drive to Meister Way
3. Metro Air Parkway - Meister Way to Elkhorn Boulevard
4. West Elkhorn Boulevard - Lone Tree Road to Baidee Drive
5. Power Line Road - Garden Highway to Del Paso Road
6. Power Line Road - Bayou Road to Del Paso Road
7. Power Line Road - Bayou Road to Pacific Gateway Drive
8. Power Line Road - West Elkhorn Boulevard to Pacific Gateway Drive
9. Del Paso Road - Power Line Road to Hovnanian Drive
10. El Centro Road - Del Paso Road to Hawkview Drive

11. El Centro Road - Hawkview Drive to Bayou Way
12. Garden Highway - Power Line Road to Radio Road
13. Garden Highway - Radio Road to San Juan Road
14. Garden Highway - San Juan Road to city limit
15. Metro Air Parkway - I-5 to Airport South Industrial Drive
16. Airport South Industrial Drive - Power Line Road to Metro Air Parkway
17. Airport South Industrial Drive - Metro Air Parkway to "A" Drive
18. "A" Drive - Airport South Industrial Drive to Bayou Way
19. Bayou way - "A" Drive to El Centro Road

EXISTING INTERSECTION GEOMETRY

Existing intersection geometry (number of approach lanes and traffic control) is illustrated in **Figure 6**.

DATA COLLECTION

Project data was compiled from a combination of existing counts from recent prior projects as well as new data collected in September 2022. Count sheets are provided in **Appendix A**.

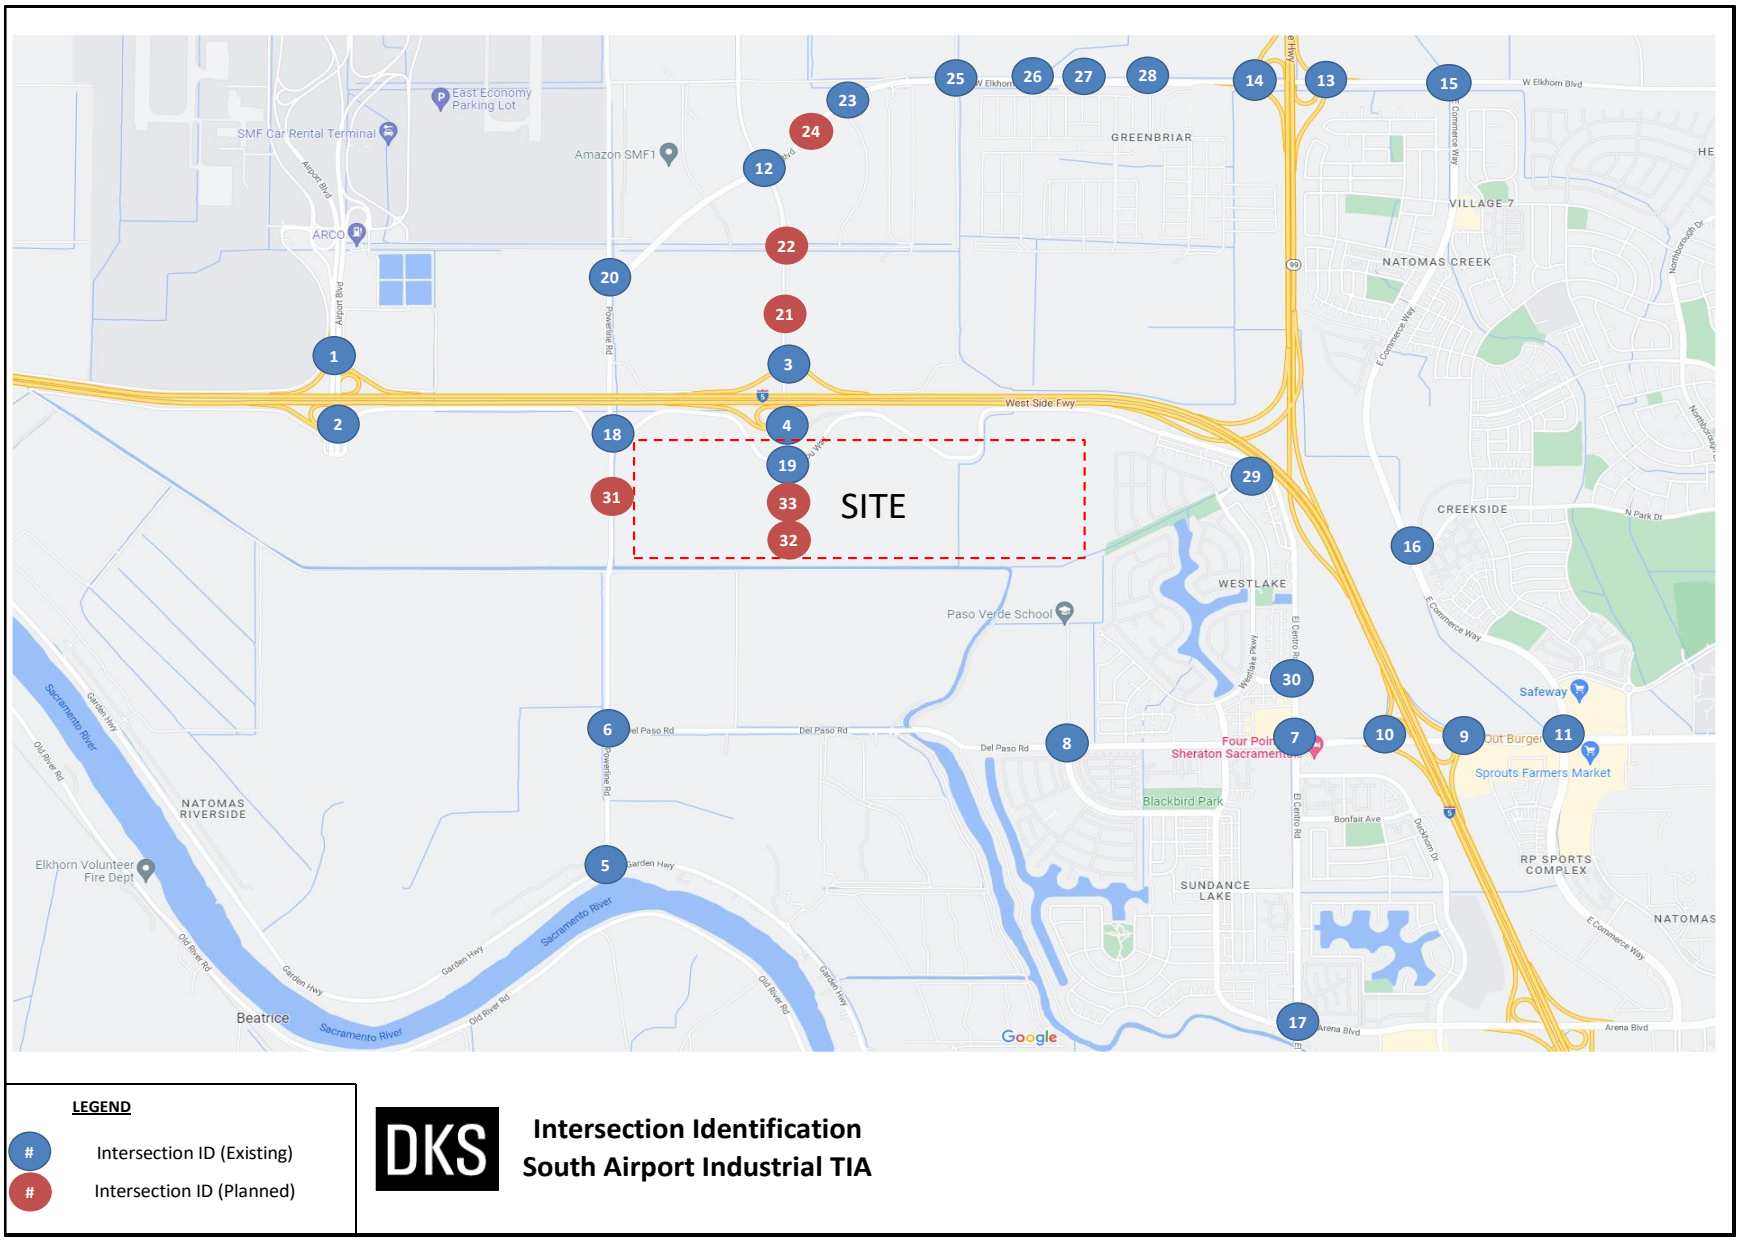

FIGURE 5. INTERSECTION IDENTIFICATION

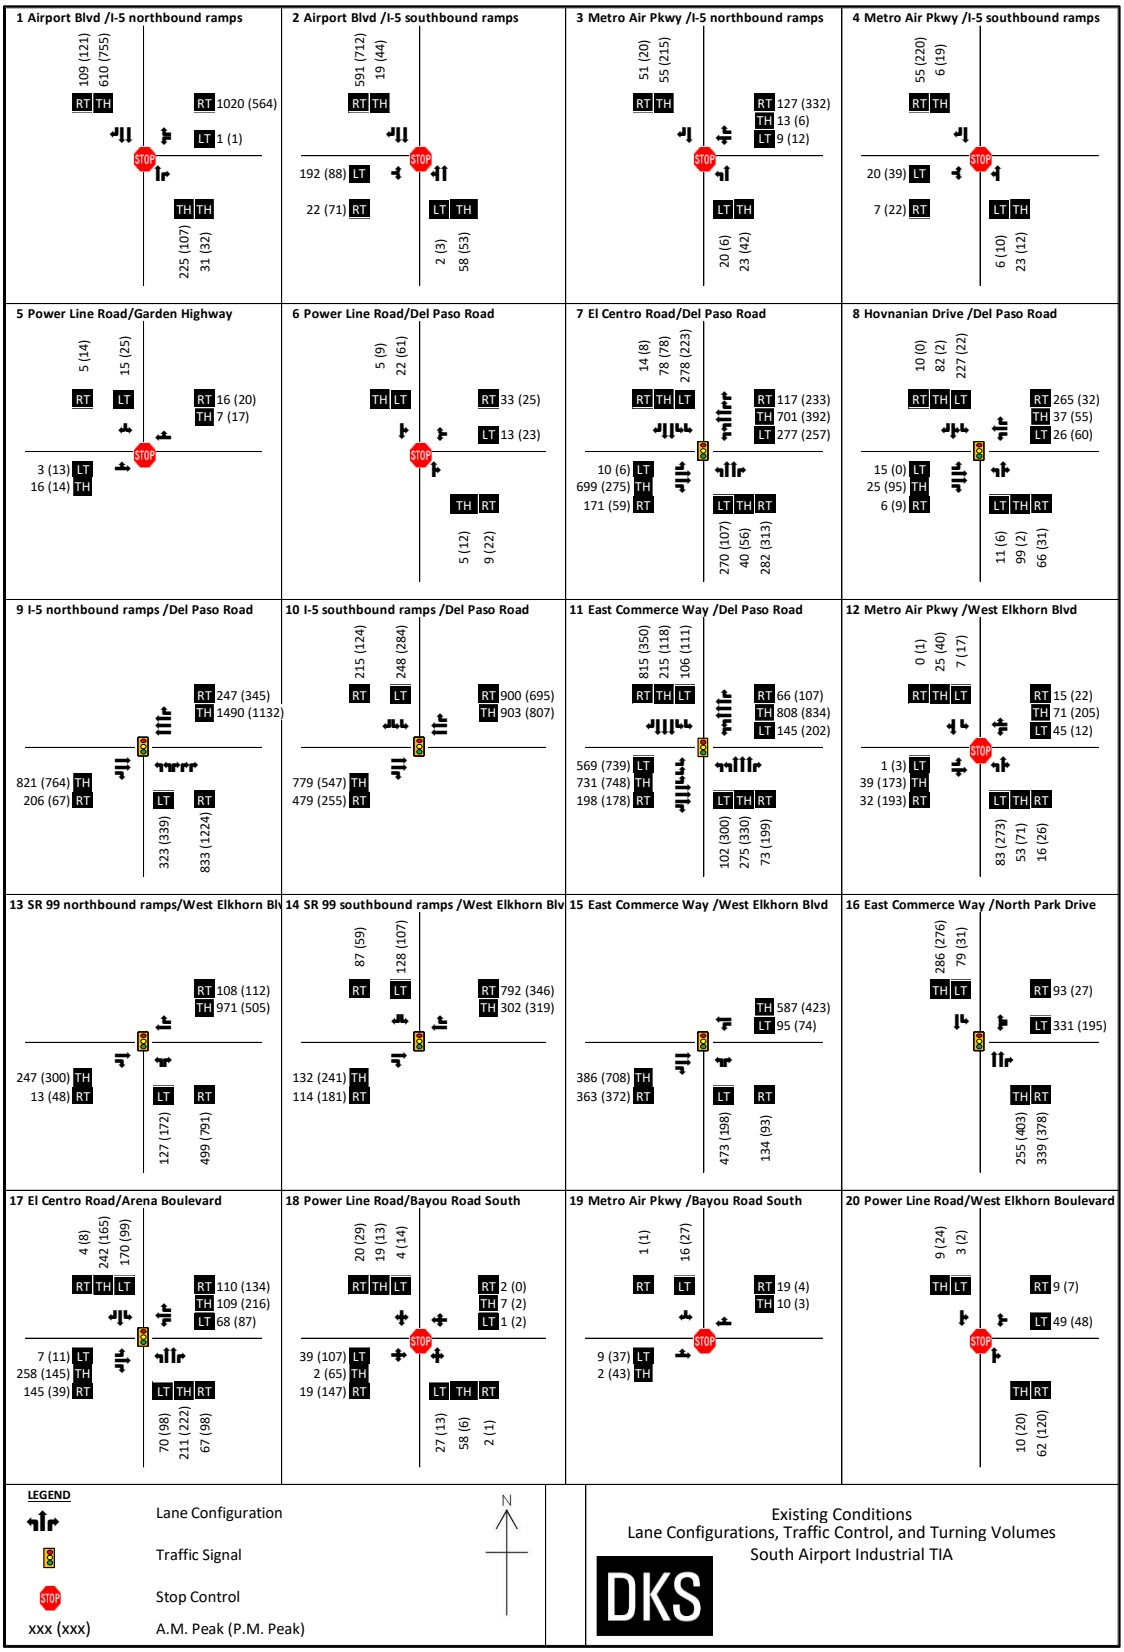

FIGURE 6. EXISTING LANE CONFIGURATIONS, TRAFFIC CONTROL, & AM AND PM VOLUMES

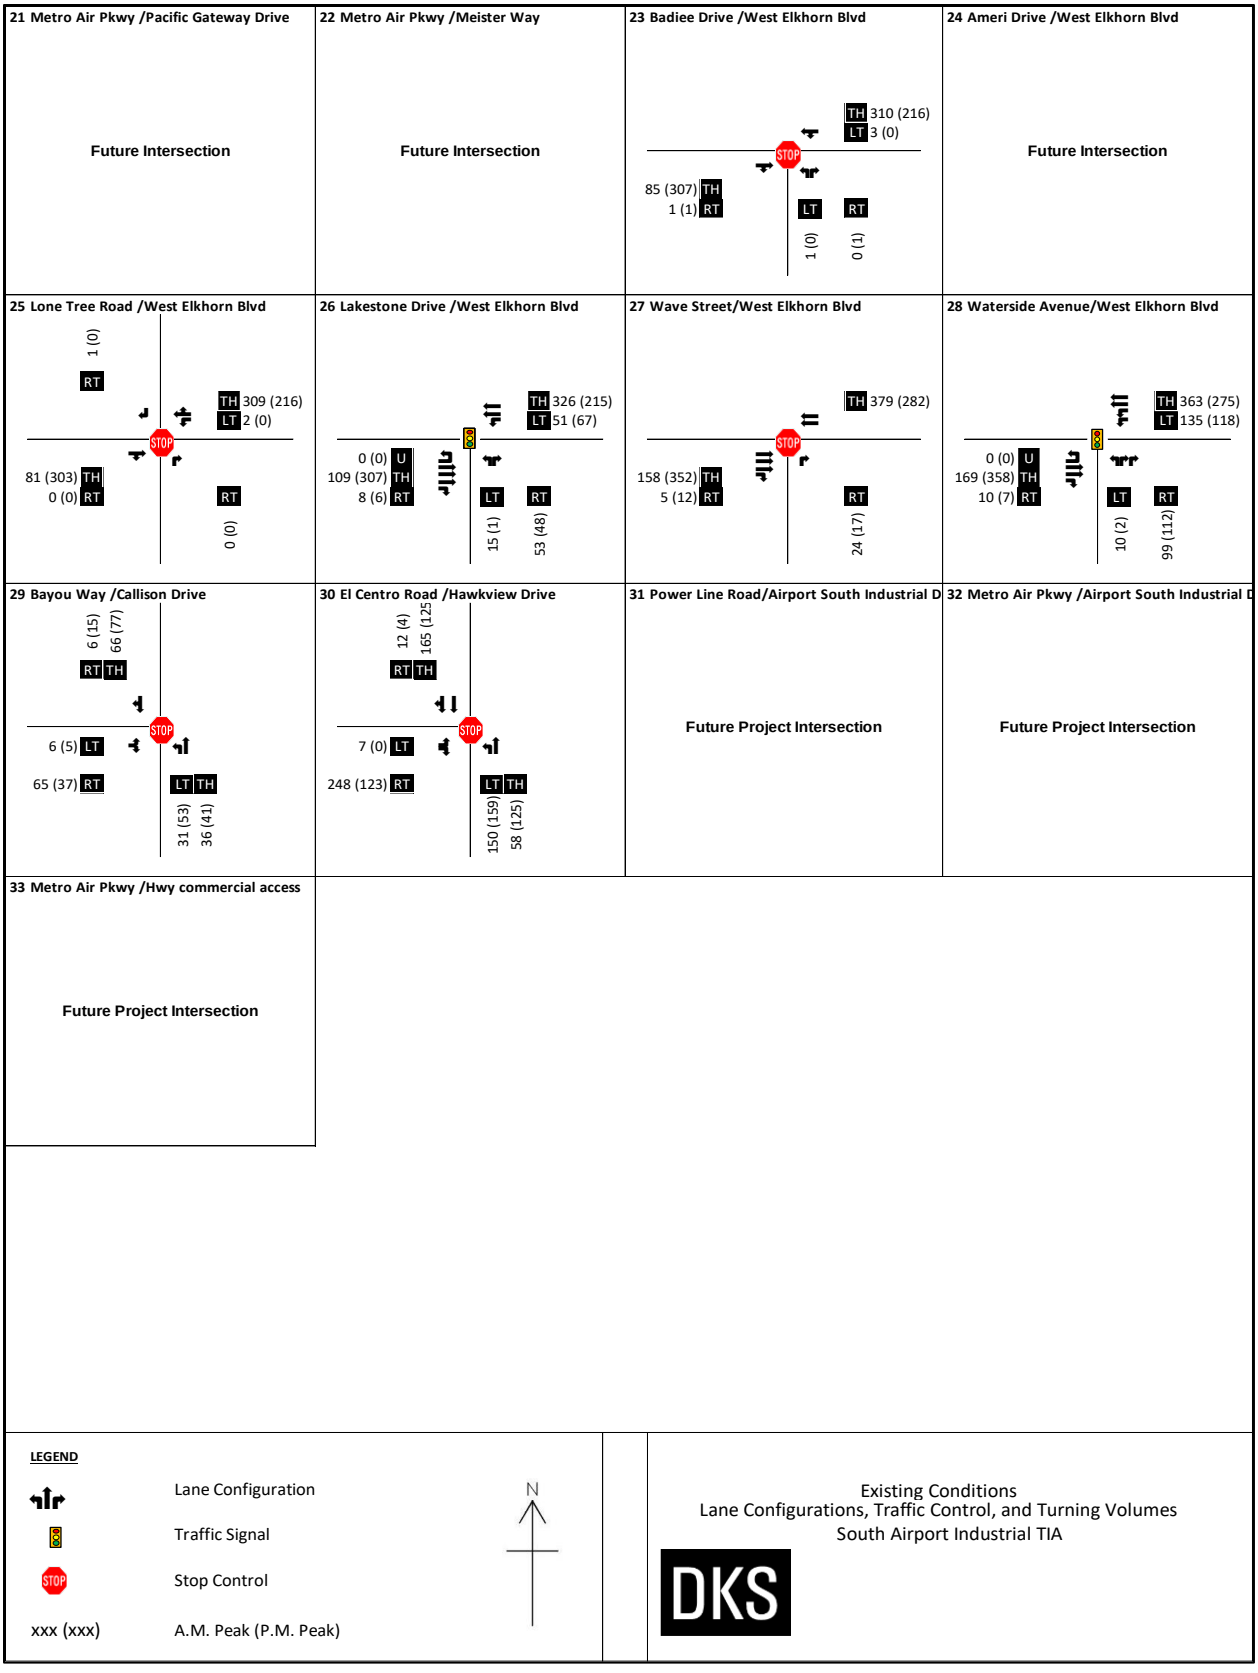

FIGURE 6. EXISTING LANE CONFIGURATIONS, TRAFFIC CONTROL, & AM AND PM VOLUMES

CITY OF SACRAMENTO TRAFFIC IMPACT GUIDELINES (2022)

The following deficiency thresholds shall be used to determine if the project results in a deficiency to City facilities and requires improvements:

Intersections

A project is considered to result in a deficiency if it would:

- Result in increasing the length of an existing queue beyond the available storage at any intersection's right- or left-turn storage pocket by more than one vehicle length (25-feet).
- Result in increasing the length of an existing queue already exceeding the available storage at any intersection's right- or left-turn storage pocket by more than one vehicle length (25-feet).
- Result in an unsignalized intersection that is not warranted for a signal without the addition of a project being warranted for a signal with the addition of the project. Whether a signal is warranted is based on the signal warrant analysis described in Section 5.1.2. The warrant analysis should be based on CA MUTCD signal warrants and will most commonly include the peak-hour, four-hour, or eight-hour signal warrants. Peak hour and four-hour warrant volumes should be plotted on CA MUTCD Figure 4C-1 or Figure 4C-3 as appropriate. Signal warrant worksheets and CA MUTCD figures should be included as an appendix.

Bicycle and Pedestrian Facilities

A project is considered to result in a deficiency if it would:

- Adversely affect an existing bikeway or pedestrian facility
- Interfere with the implementation of a planned bikeway as shown in the Bicycle Master Plan, or be in conflict with the Pedestrian Master Plan
- Fail to provide adequate access for bicyclists and pedestrians.

Transit

A project is considered to result in a deficiency if it would:

- Adversely affect existing transit operations; or
- Interfere with the implementation of transit service as planned in the Metropolitan Transportation Plan/Sustainable Communities Strategy (MTP/SCS); or
- Substantially increase transit demand and fail to provide adequate transit service.

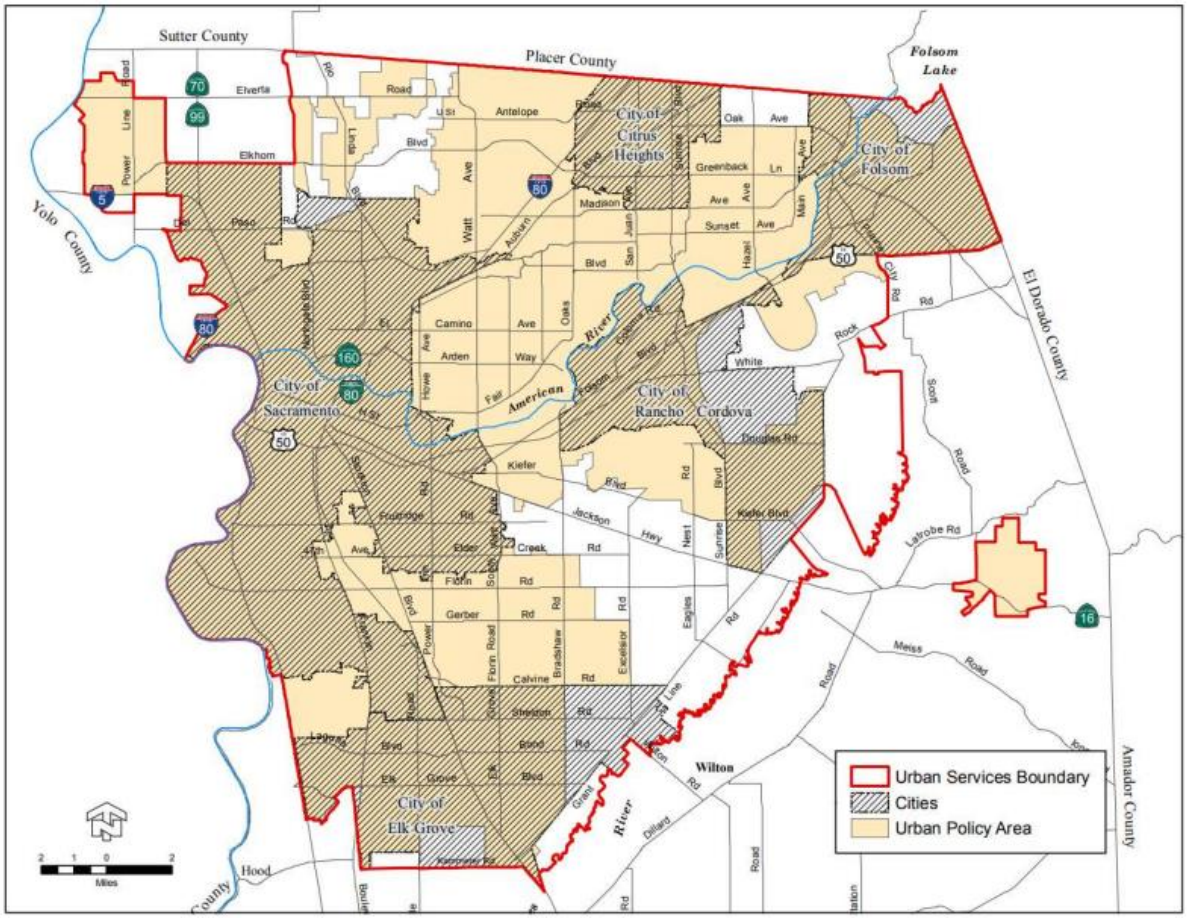
SACRAMENTO 2035 GENERAL PLAN

The Mobility Element of the Sacramento 2035 General Plan outlines goals and policies that coordinate the transportation and circulation system with planned land uses. The following level of service policy has been used in this study, as amended on January 23, 2018:

> Policy M 1.2.2 Level of Service (LOS) Standard. The City shall implement a flexible context-sensitive Level of Service (LOS) standard and will measure traffic operations against the vehicle LOS thresholds established in this policy. The City will measure Vehicle LOS based on the methodology contained in the latest version of the Highway Capacity Manual (HCM) published by the Transportation Research Board. The City's specific vehicle LOS thresholds have been defined

based on community values with respect to modal priorities, land use context, economic development, and environmental resources and constraints. As such, the City has established variable LOS thresholds appropriate for the unique characteristics of the City's diverse neighborhoods and communities. The City will strive to operate the roadway network at LOS D or better for vehicles during typical weekday conditions, including AM and PM peak hour with the following exceptions…

SACRAMENTO COUNTY



Sacramento County's Transportation Analysis Guidelines document, last updated September 10, 2020, outlines the methodologies for conducting transportation studies related to planned developed. The following policies are in place regarding what constitutes an acceptable LOS:

A. County of Sacramento - The County defines the minimum acceptable operation level for its roadways and intersections to be LOS D for rural areas and LOS E for urban areas. The urban areas are those areas that are dominated with urban type land uses and transportation infrastructure and are located within the Urban Service Boundary (USB), as shown in the Land Use Element of the Sacramento County General Plan and **Figure 7**. The rural areas are those areas that are either outside the Urban Service Boundary or are dominated with rural type land uses and transportation infrastructure and are located within the USB.

B. Caltrans – In District 3, ramp terminal intersections are typically analyzed using the LOS standard of the surrounding city or unincorporated county jurisdiction. For mainline analysis, Caltrans publishes a concept LOS in the facility's transportation concept report (TCR). The LOS policy to be used in the LTA should be confirmed with the Department of Transportation and Caltrans.

C. Other City/County Jurisdictions – The LOS policy used in the LTA should be confirmed with the applicable jurisdiction.

D. Connector JPA – The JPA Guidelines require signalized intersections to operate at LOS C or better (except at Connector Special Segments where LOS D is considered acceptable). Special Segments are currently defined from Bond Road to Calvine Road in the Sheldon community.

Source: Sacramento County Transportation Analysis Guidelines

FIGURE 7. URBAN SERVICES BOUNDARY MAP (AS OF JANUARY 1, 2020)

LEVEL OF SERVICE AND QUEUE LENGTH ANALYSIS AND METHODOLOGY

The operation or performance of roadway facilities is commonly described in terms of LOS. LOS is a qualitative measure of effectiveness describing traffic operations based on such factors as speed, travel time, delay, and freedom to change lanes for all vehicles. Six levels are defined from LOS A, as the best-operating conditions, to LOS F, or the worst operating conditions. LOS E represents "at-capacity" operations. Study intersections were analyzed to determine their LOS based on the definitions presented in the Highway Capacity Manual 6th Edition (HCM 6) with average delay taken from the traffic simulation outputs. **Table 2** presents the LOS criteria for intersections in accordance with the HCM 6 methodology. In accordance with City of Sacramento policy, at unsignalized intersection, the intersection LOS is used to determine conformity. Based upon the City's level of service policy, LOS F was utilized as the appropriate criteria in all study analyses.

Queue length analysis was performed in SimTraffic 11. SimTraffic reports 95th percentile queue length in feet, which can be compared against the available storage length for the existing intersections or be used as a basis to determine the required storage length for the planned intersections as well as the spacing between the intersections. The turn storage lengths are measured for all existing intersection turn lanes from Google Earth.

TABLE 2. INTERSECTION LEVEL OF SERVICE

LEVEL OF SERVICE (LOS)	TOTAL DELAY PER VEHICLE (SECONDS)	
	SIGNALIZED	UNSIGNALIZED
A	< 10	< 10
B	> 10 and < 20	> 10 and < 15
C	> 20 and < 35	> 15 and < 25
D	> 35 and < 55	> 25 and < 35
E	> 55 and < 80	> 35 and < 50
F	> 80	> 50

Source: Highway Capacity Manual 6th Edition, Transportation Research Board.

LOS analyses were conducted for the roadway segment in the study area based upon daily traffic volumes, number of traffic lanes between intersections, and roadway characteristics. The capacity class categories are based upon the nature of traffic flow along the facility, including number of interruptions due to intersection control and "side-friction" due to driveways and local streets. For each capacity class, relationships were developed between daily traffic volumes and roadway level of service. **Table 3** summarizes the maximum daily traffic volumes associated with each level of service designation and capacity class combination. Although the segment-based level of service calculations is based upon daily traffic volumes, the resultant levels of service are representative of peak hour conditions.

TABLE 3. LEVEL OF SERVICE THRESHOLD FOR ROADWAY SEGMENT

LEVEL OF SERVICE THRESHOLD FOR ROADWAY SEGMENTS						
OPERATIONAL CLASS	NUMBER OF LANES	ADT LEVEL-OF-SERVICE CAPACITY THRESHOLD				
		A	B	C	D	E
Arterial - Low Access Control	2	9,000	10,500	12,000	13,500	15,000
	4	18,000	21,000	24,000	27,000	30,000
	6	27,000	31,500	36,000	40,500	45,000
Arterial - Moderate Access Control	2	10,800	12,600	14,400	16,200	18,000
	4	21,600	25,200	28,800	32,400	36,000
	6	32,400	37,800	43,200	48,600	54,000
Arterial - High Access Control	2	12,000	14,000	16,000	18,000	20,000
	4	24,000	28,000	32,000	36,000	40,000

EXISTING TRAFFIC CONDITIONS

This section summarizes the analysis of current traffic conditions as of approximately May 2022. This section serves to establish current traffic conditions to provide context to the analysis provided in later sections of this document.

INTERSECTION OPERATIONS ANALYSIS

The queuing and operations of the roadway infrastructure were analyzed under existing conditions. A summary of the operational analysis is presented in **Table 4**, while the 95th percentile queues as compared with existing storage for key locations are presented in **Table 5**. **Appendix C** includes the analysis details and LOS worksheets.

Under Existing Conditions, there are no identified operational deficiencies or queueing issues identified.

TABLE 4. EXISTING INTERSECTION OPERATIONS ANALYSIS

PROJECT TRAVEL CHARACTERISTICS

TRIP GENERATION AND DISTRIBUTION

Regional trip generation and distribution for this project was performed using a combination of data from the SACOG SACSIM19 travel demand model and data from the ITE Trip Generation Manual 11th Edition. The Trip Generation and Distribution Memo from March 10th, 2023 covers the detailed calculations from this work and is attached in **Appendix B** for reference. **Table 7** summarizes the industrial and commercial trip generation. **Figure 9** and **Figure 10** illustrate the area-wide trip distribution for the industrial and highway commercial uses, respectively. For the industrial uses, separate distributions are shown for light vehicles and heavy vehicles. As part of the project description, heavy vehicle access will be prohibited via Bayou Way to the east of the project site. The traffic analyses assume that this prohibition will be in place.

Figure 11 and **Figure 12** illustrate the internal (on-site) trip distribution for the industrial and highway commercial uses, respectively.

TABLE 7: RECOMMENDED TRIP GENERATION (NET NEW TRIPS)

PROPOSED USE	DAILY	AM PEAK HOUR			PM PEAK HOUR		
		ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
INDUSTRIAL PARCELS	12,794	886	305	1,191	281	723	1,004
COMMERCIAL PARCELS (WEST PARCELS)	3,590	158	155	313	125	121	245
COMMERCIAL PARCELS (EAST PARCELS)	2,807	128	118	246	100	93	194
TOTAL	19,254	1,172	578	1,750	506	937	1,443

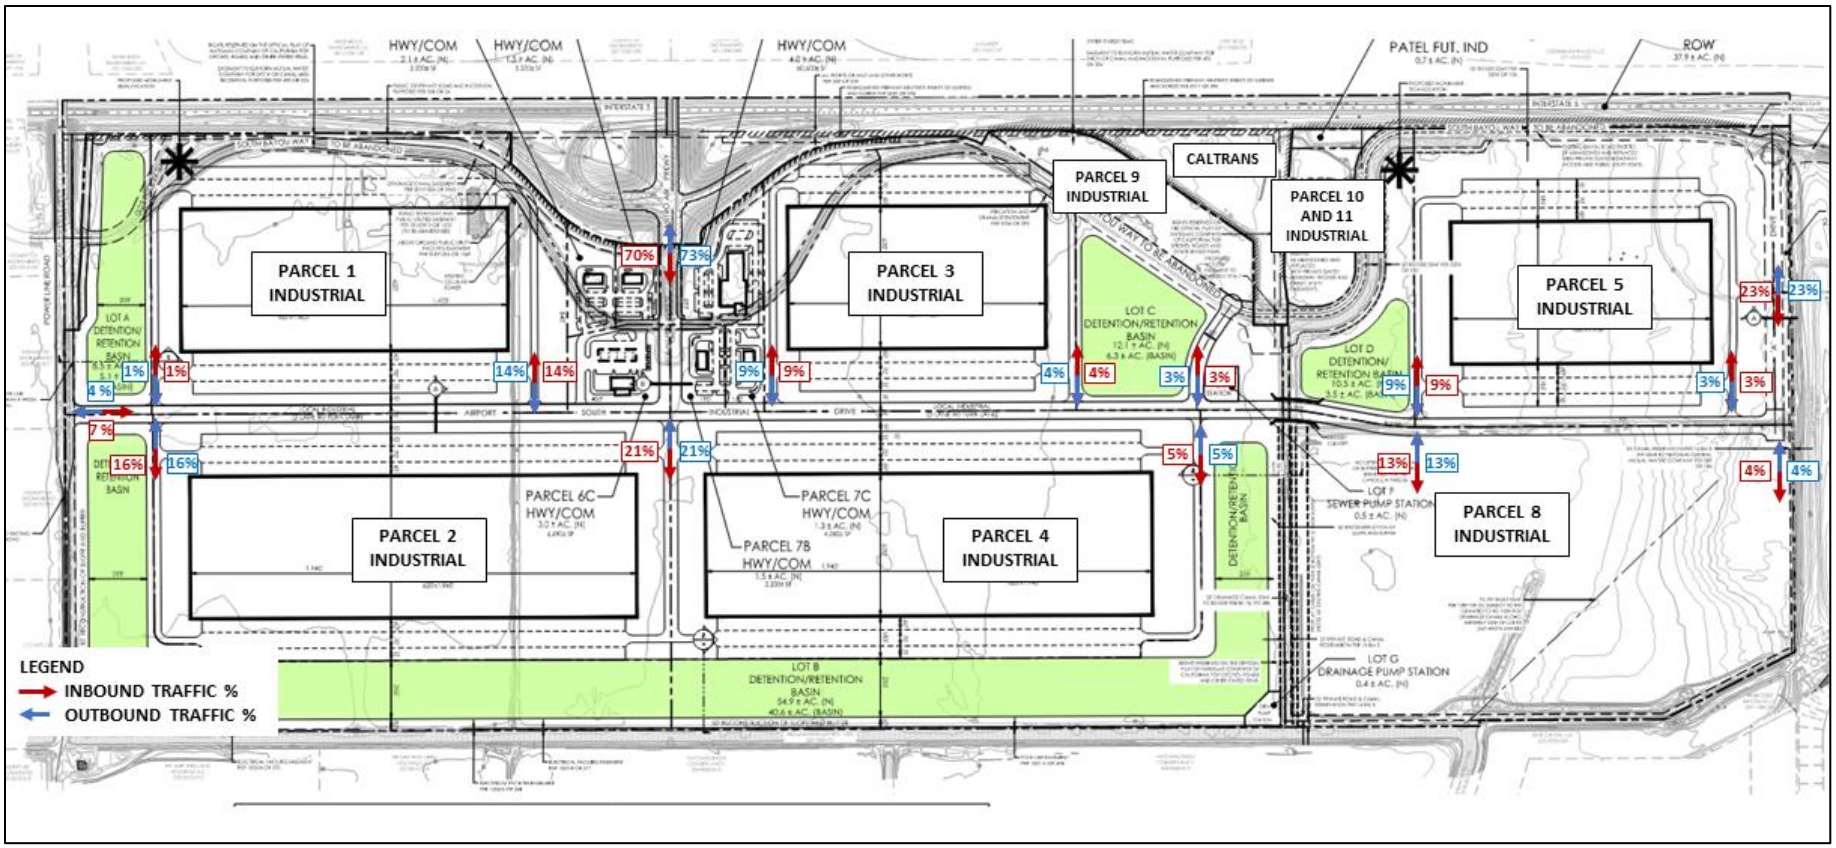

FIGURE 11: INTERNAL SITE DISTRIBUTION (INDUSTRIAL TRIPS)

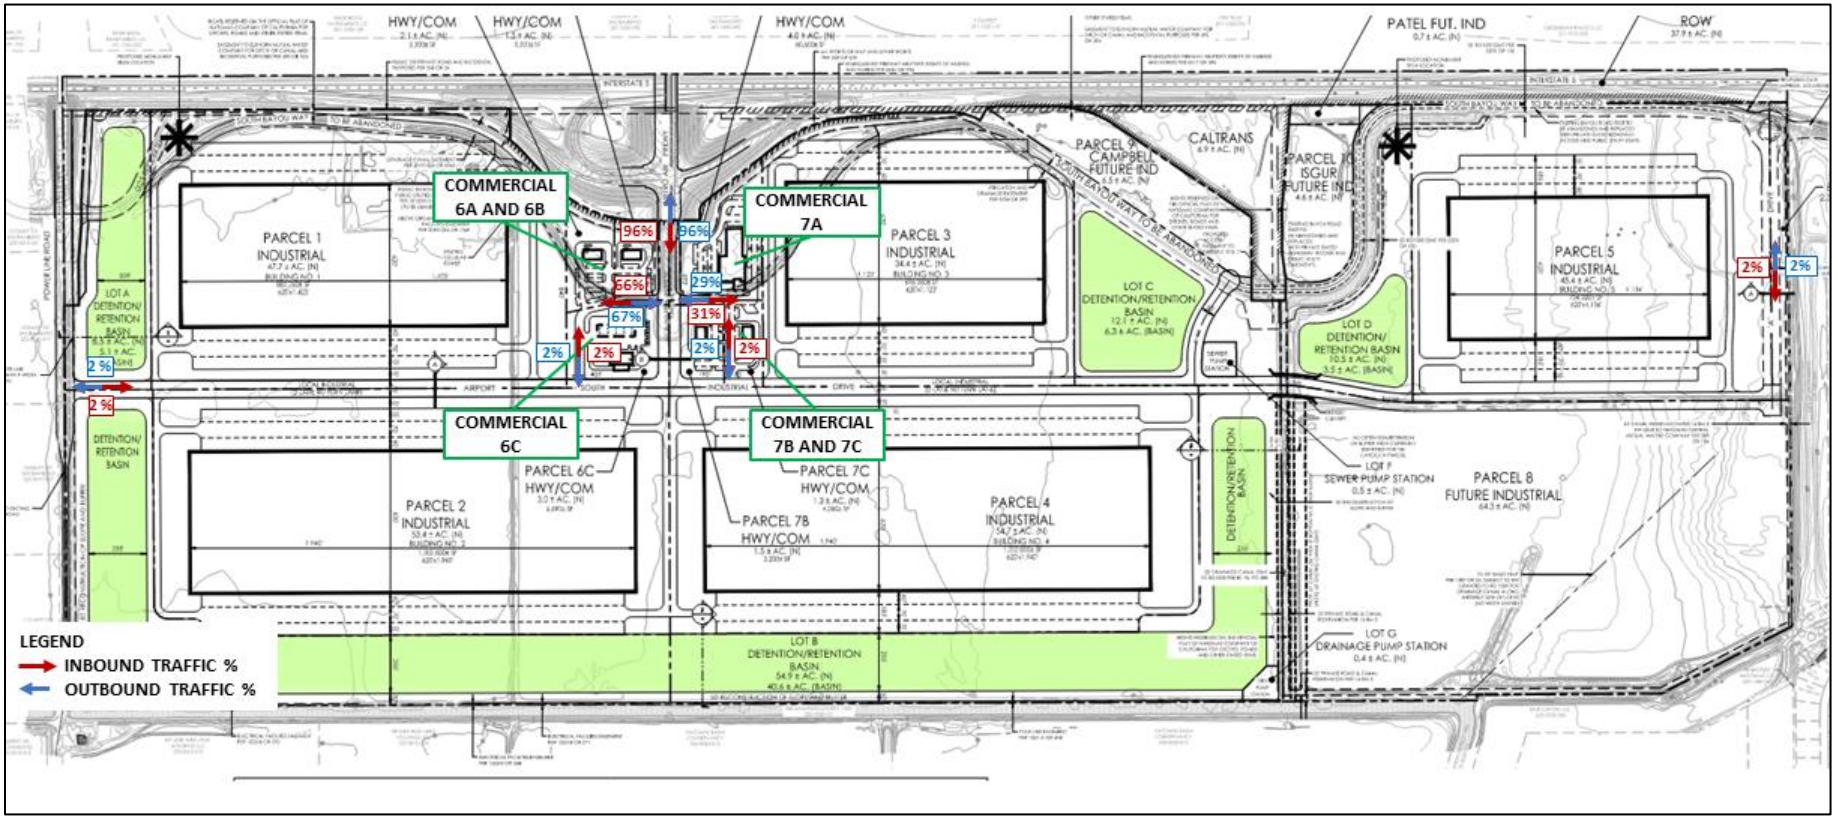

FIGURE 12: INTERNAL SITE DISTRIBUTION (COMMERCIAL TRIPS)

DEFICIENCY THRESHOLDS

Thresholds of significance adopted by the governing jurisdictions in applicable general plans and previous environmental documents, and professional judgment, a significant impact would occur if the proposed project meets the criteria in the following subsections.

INTERSECTIONS – CITY OF SACRAMENTO

- The traffic generated by the project degrades LOS from an acceptable LOS (without the project) to an unacceptable LOS (with the project),
- The LOS (without project) is unacceptable and project-generated traffic increases the average vehicle delay by 5 seconds or more.
- Note: General Plan Mobility Element Policy M 1.2.2 sets forth definitions for what is considered an acceptable LOS. As previously discussed, Policy M 1.2.2 applies to the study area roadway facilities as follows:
  - LOS D or better is acceptable on all study area roadways.
- Result in increasing the length of an existing queue beyond the available storage at any intersection's right- or left-turn storage pocket by more than one vehicle length (25-feet).
- Result in increasing the length of an existing queue already exceeding the available storage at any intersection's right- or left-turn storage pocket by more than one vehicle length (25-feet).
- Result in an unsignalized intersection that is not warranted for a signal without the addition of a project being warranted for a signal with the addition of the project.

INTERSECTIONS – SACRAMENTO COUNTY

- At signalized intersections:
  - The traffic generated by the project results in a signalized intersection operating at an acceptable LOS to deteriorate to an unacceptable LOS.
  - The traffic generated by the project results in an increase the average delay by more than 5 seconds at an intersection that is operating at an unacceptable LOS without the project.
- At unsignalized intersections:
  - The traffic generated by the project results in an unsignalized intersection movement/approach operating at an acceptable LOS to deteriorate to an unacceptable LOS, and also causes the intersection to meet a traffic signal warrant.
  - For an unsignalized intersection that meets a signal warrant, traffic generated by the project increases the delay by more than 5 seconds at a movement/approach that is operating at an unacceptable LOS without the project.
- Note: The county defines the minimum acceptable operation level for its roadways and intersections to be LOS D for rural areas and LOS E for urban areas.

SEGMENTS – CITY OF SACRAMENTO

- LOS E is allowed on all roadway segments and associated intersections located within ½ mile walking distance of light rail stations.
- Except as noted above, LOS A-D is to be maintained at all times; provided, LOS E or F may be acceptable if improvements are made to the overall transportation system and/or non-vehicular transportation and transit are promoted as part of the project or a City-initiated project.

SEGMENTS – SACRAMENTO COUNTY

- The traffic generated by the project results in a roadway segment operating at an acceptable LOS to deteriorate to an unacceptable LOS; or
- The traffic generated by the project results increases the V/C ratio by more than 0.05 at a roadway segment that is operating at an unacceptable LOS without the project.
- For substandard rural roadway segments:
  - The traffic generated by the project causes the segment to exceed an average daily traffic volume of 6,000 daily vehicles.
  - The traffic generated by the project adds 600 or more new daily vehicle trips to a substandard rural roadway that already carries 6,000 or more daily vehicles.

CALTRANS FACILITIES

- The off-ramp queue is greater than the storage capacity.

TRANSIT

- Adversely affect public transit operations,
- Fail to adequately provide access to transit.

BICYCLE FACILITIES

- Adversely affect existing or planned bicycle facilities,
- Fail to adequately provide for access by bicycle.

PEDESTRIAN CIRCULATION

- Adversely affect existing or planned pedestrian facilities,
- Fail to adequately provide for access by pedestrians.

CONSTRUCTION-RELATED TRAFFIC IMPACTS

- Degrade an intersection or roadway to an unacceptable level,
- Cause inconveniences to motorists due to prolonged road closures, or
- Result in an increased frequency of potential conflicts between vehicles, pedestrians, and bicyclists.

TRAFFIC FORECASTING METHODOLOGY

A modified version of the City of Sacramento's 2040 Draft General Plan model (itself based on SACOG's SACSIM19 travel demand model) was applied to forecast traffic volumes under Baseline and Cumulative scenarios. Specifically, unique model runs for the following scenarios were prepared:

- Existing Conditions Scenario (for post-processing purposes only)
  - City General Plan base year model with zone splits
- Baseline Scenario
  - Existing Conditions plus planned and approved land use in Metro Air Park and Northlake
- Baseline with Project Scenario
  - Baseline scenario plus Airport South Industrial project
- Cumulative Scenario
  - City General Plan Cumulative plus project with zone splits and buildout of Metro Air Park
- Cumulative with Project Scenario
  - Cumulative scenario Plus Airport South Industrial project

To better represent the study area land use and transportation network, a number of Traffic Analysis Zones (TAZs) were subdivided into smaller zones. Specifically, the four TAZs that represent Metro Air Park in the source model were subdivided into fourteen TAZs, the Westlake area and Paso Verde School were subdivided from one zone into two zones, and the Airport South Industrial area was subdivided from parts of two source zones into eight zones (six industrial zones and two highway commercial zones). Zone splits are shown in **Figure 13**.

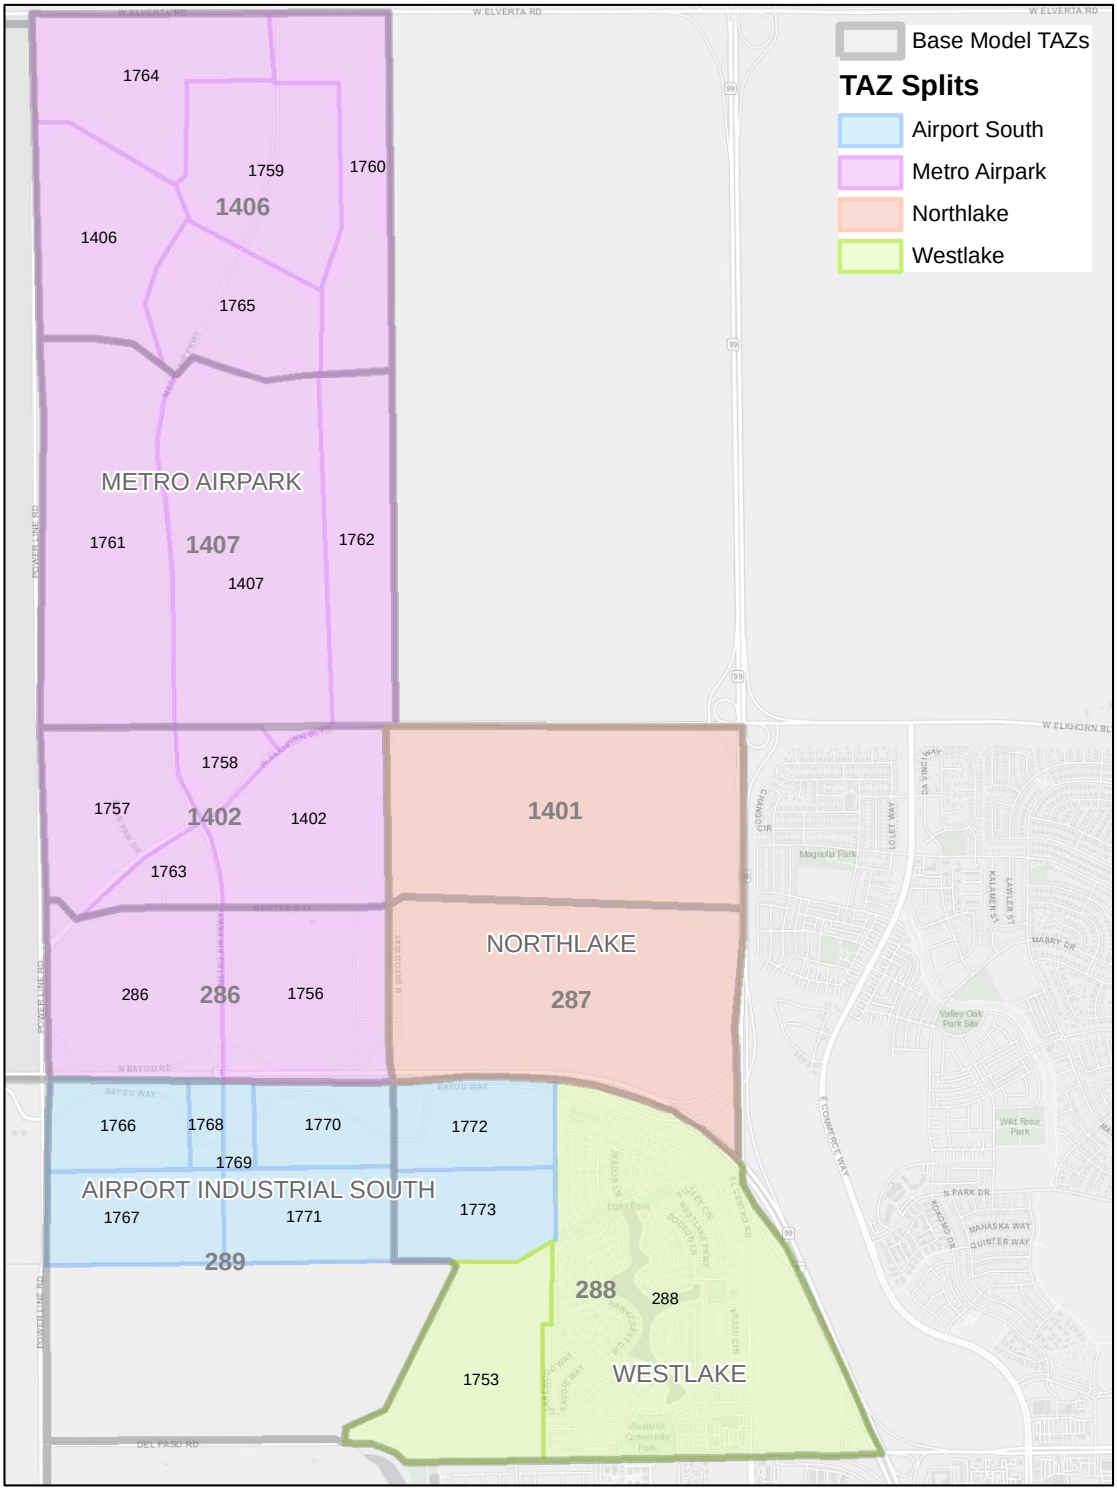

FIGURE 13: STUDY AREA TRAFFIC ANALYSIS ZONE SPLITS

Land use in the SACSIM19 travel demand model is represented at a parcel or "quasi-parcel" level by households and associated population for residential land uses and by employment for non-residential land uses. Employment is divided into nine categories, including education, food / beverage, government, office, medical, industrial, service, retail, and other. General land uses (such as industrial or commercial) are represented by combinations of more detailed employment based on proportions established by SACOG. For example, industrial land uses consist predominantly of industrial employment, but also include smaller amounts of other employment such as retail and food / beverage. Similarly, highway commercial land uses are predominantly retail and food / beverage, but also may include other uses such as service and government.

In addition, the number of employees must be estimated as an input to the model. This is typically accomplished by developing rates of square footage per employee for different employment categories. For the purposes of this project, square footage per employee rates were estimated based on existing and under construction development in Metro Air Park, as provided by Sacramento County and the developer for use in this analysis. In general, Metro Air Park (existing and currently under construction) consists of approximately six million square feet of development and approximately 4,800 jobs, yielding approximately 1,250 square feet per employee. Baseline conditions for Metro Air Park yields approximately 7,000 employees and Cumulative conditions for Metro Air Park yields approximately 13,500 employees. Additionally, employment for the proposed Airport South Industrial uses was calculated using the same assumption of square footage per employee as Metro Air Park, yielding approximately 3,781 total employees for the proposed project.

In addition to the TAZ and land use modifications, model roadway network edits were performed to reflect the roadway network in the study area in greater detail. The same zone splits applied to the model land use data were applied to the model roadway network and roadway links were added to represent additional study roadways. These edits included better reflecting the planned roadway improvements from Metro Air Park, Northlake, Grand Park, and other nearby developments. The number of lanes, capacity class, and roadway speeds were reviewed for consistency and updated as necessary to align with City and County plans for the area. Model roadway networks for Baseline with Project and Cumulative with Project are shown in **Figure 14**.

Based on the City of Sacramento's 2040 Draft General Plan model Metro Air Parkway and Elkhorn Boulevard were originally represented as a four-lane roads. This was later corrected to a six-lane configuration to align with other County specific plans in the area. To account for the six-lane configuration, manual volume changes were made to redistribute traffic to these roadways from the freeway system based on a calibrated six-lane test scenario.

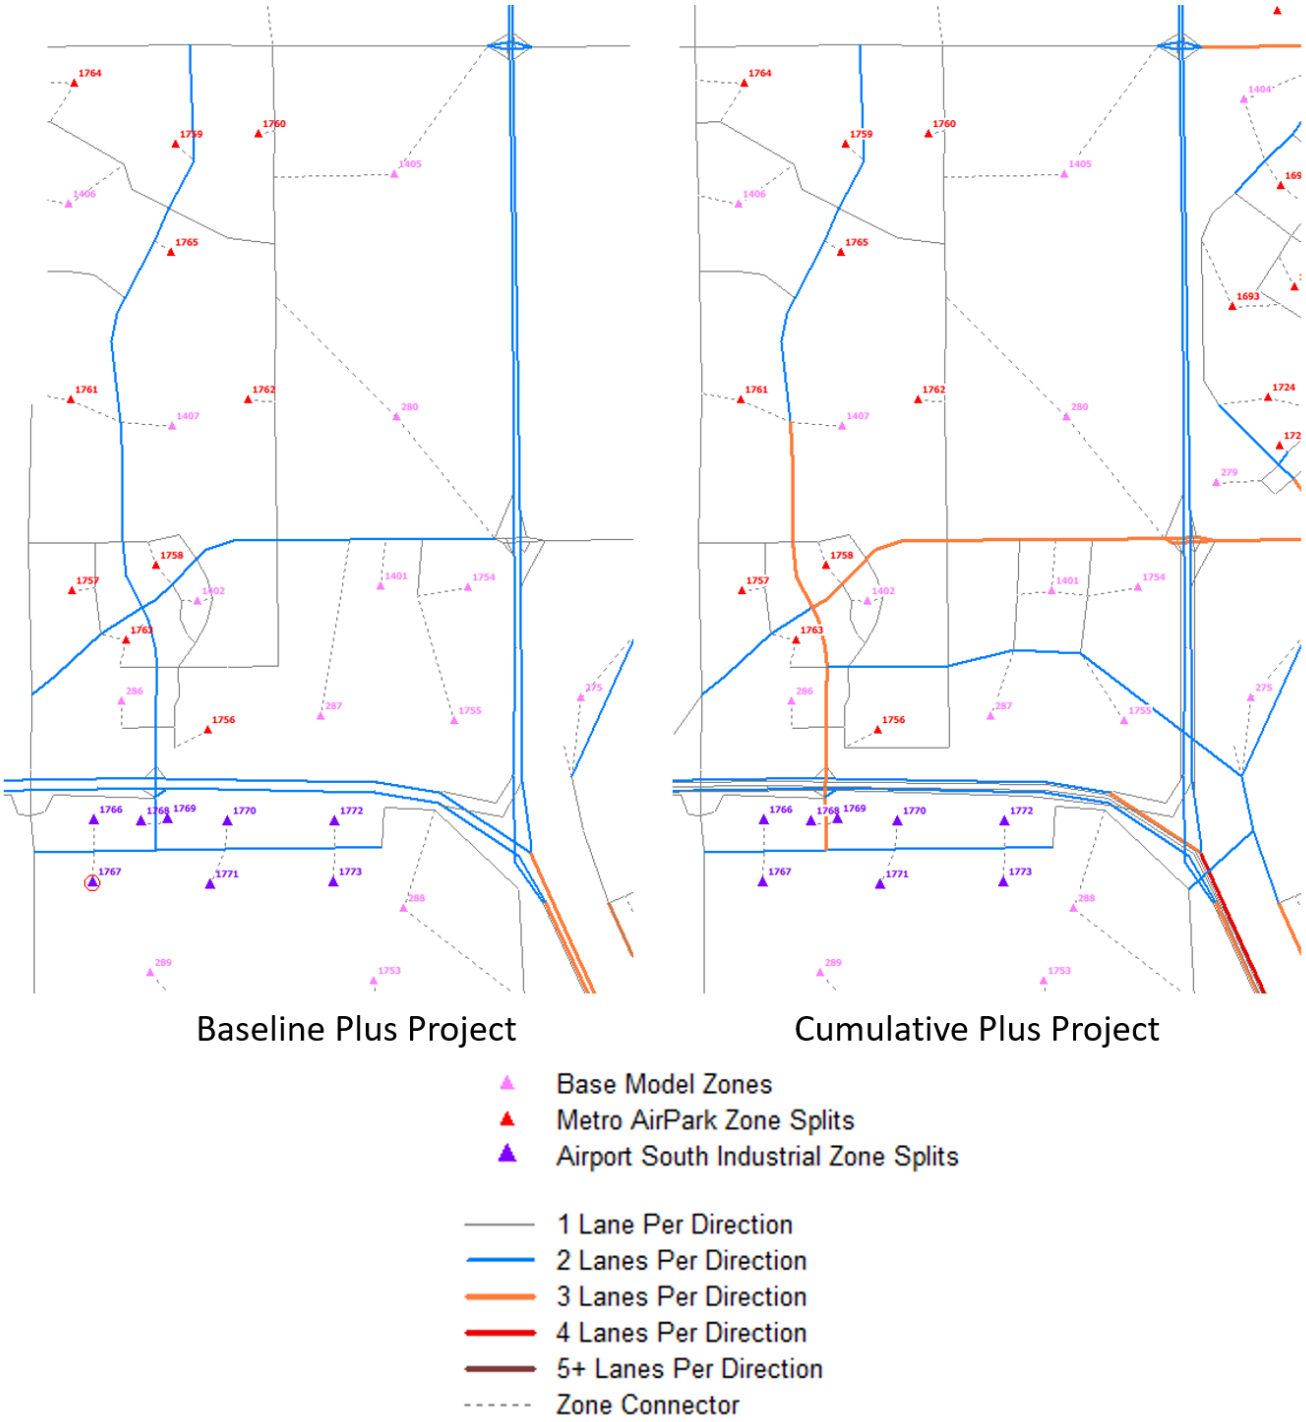

FIGURE 14: STUDY AREA TRAFFIC MODEL ROADWAY NETWORKS

BASELINE AND BASELINE WITH PROJECT TRAFFIC CONDITIONS

This section summarizes the analysis of near-term baseline conditions and includes pending and approved developments and roadway projects near the applicant's site. This analysis is based on the best information available from the City of Sacramento and County of Sacramento as of October 2022 and represents a best estimate what traffic conditions will be at the time of project opening both with and without the project.

TRAFFIC VOLUMES AND LANE CONFIGURATIONS

Baseline and Baseline with Project traffic volumes were calculated by adding the trips associated with the project to baseline traffic volumes. **Figure 15** and **Figure 16** illustrate the baseline and Baseline with Project peak hour traffic volumes and the lane configurations used in the analysis. **Table 8** summarizes the changes from existing conditions to the baseline analysis scenario. Baseline improvements from existing conditions are based on feedback from Sacramento County staff. **Table 9** summarizes the changes from the baseline to the Baseline with Project scenario. Improvements from Baseline to Baseline with Project is based on signal warrant analysis completed and minimum geometrics needed to meet City standard.

INTERSECTION OPERATIONS ANALYSIS

A summary of the intersection operations analysis is presented in **Table 10**. A summary of the intersection queueing analysis for the Baseline condition is presented in **Table 11**. A summary of the intersection queueing analysis for the Baseline with Project condition is presented in **Table 12**. Only locations where at least one movement exceeds its storage capacity are reported in these tables. **Appendix C** includes the analysis details and worksheets for all locations.

Under Baseline conditions, the Del Paso Road and East Commerce Way intersection is the only study intersection experiencing operational deficiencies, and is expected to operate at LOS E during the p.m. peak hour. Under baseline conditions, there are existing queue deficiencies for several movements at this intersection.

Under the Baseline with Project condition, signal warrant analysis was completed to determine if any intersections related to the project would require signalization. From this analysis, it was determined that the on-site intersection for the commercial access would require signalization at the time the project opens. With this assumed signal in place, none of the study intersections would experience degradation in delay when compared with the no project condition. The project does contribute to degradation in queueing at several locations:

- Intersection 7: Del Paso Road and El Centro Road
- Intersection 11: Del Paso Road and East Commerce Way
- Intersection 12: West Elkhorn Boulevard and Metro Air Parkway

Additionally, the following on-site intersection develops queues which would block access at site driveways:

- Intersection 32: Airport South Industrial Drive and Metro Air Parkway

Specific improvements for these locations will be identified as part of the project phasing and improvements funding plan. For the intersection of Airport South Industrial Drive and Metro Air Parkway, changes in driveway spacing should be considered so that queueing does not regularly block driveway access.

Note that Baseline with Project impacts identified in the LTA assumes 100 percent buildout of the Airport South Industrial development applied against the baseline condition. Given the buildout of the Project is over multiple years with additional improvements constructed off-site, the baseline plus project off-site impacts may be phased as needed with subsequent review and analysis.

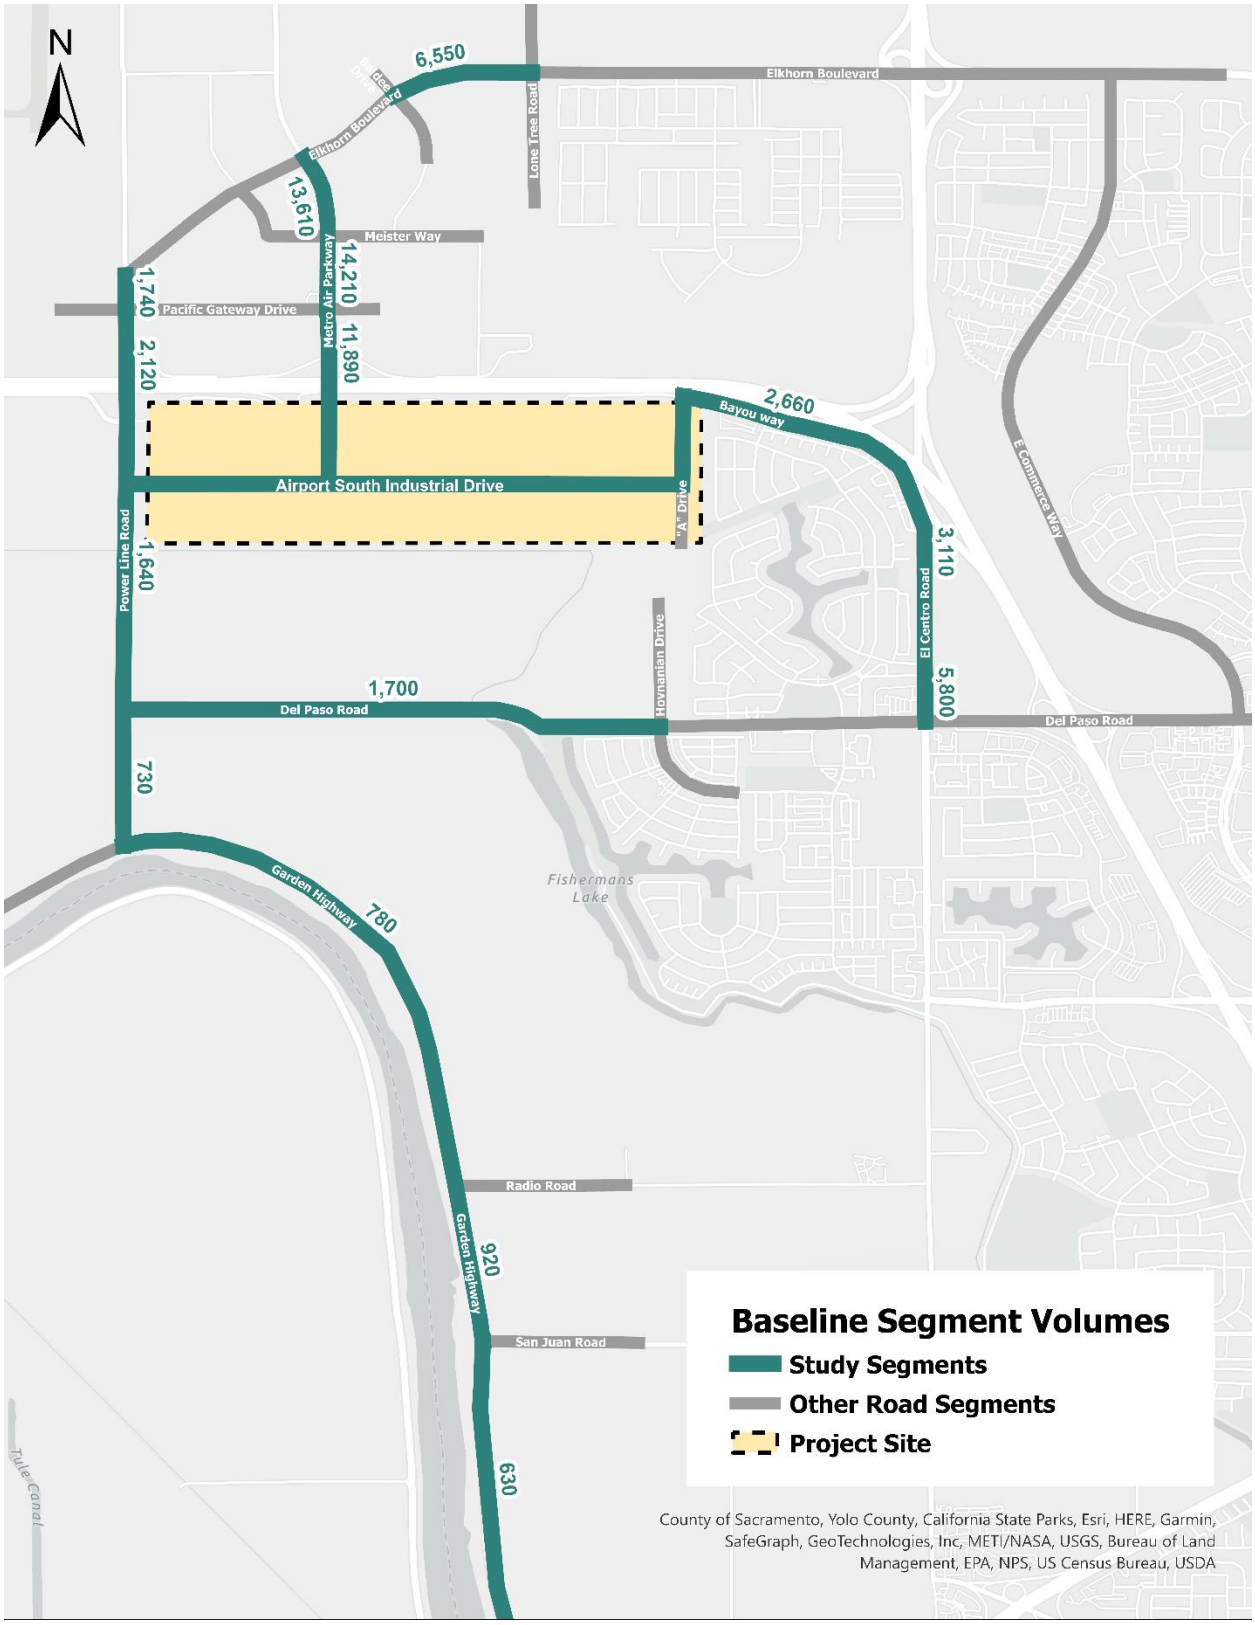

FIGURE 17: BASELINE SEGMENT VOLUMES

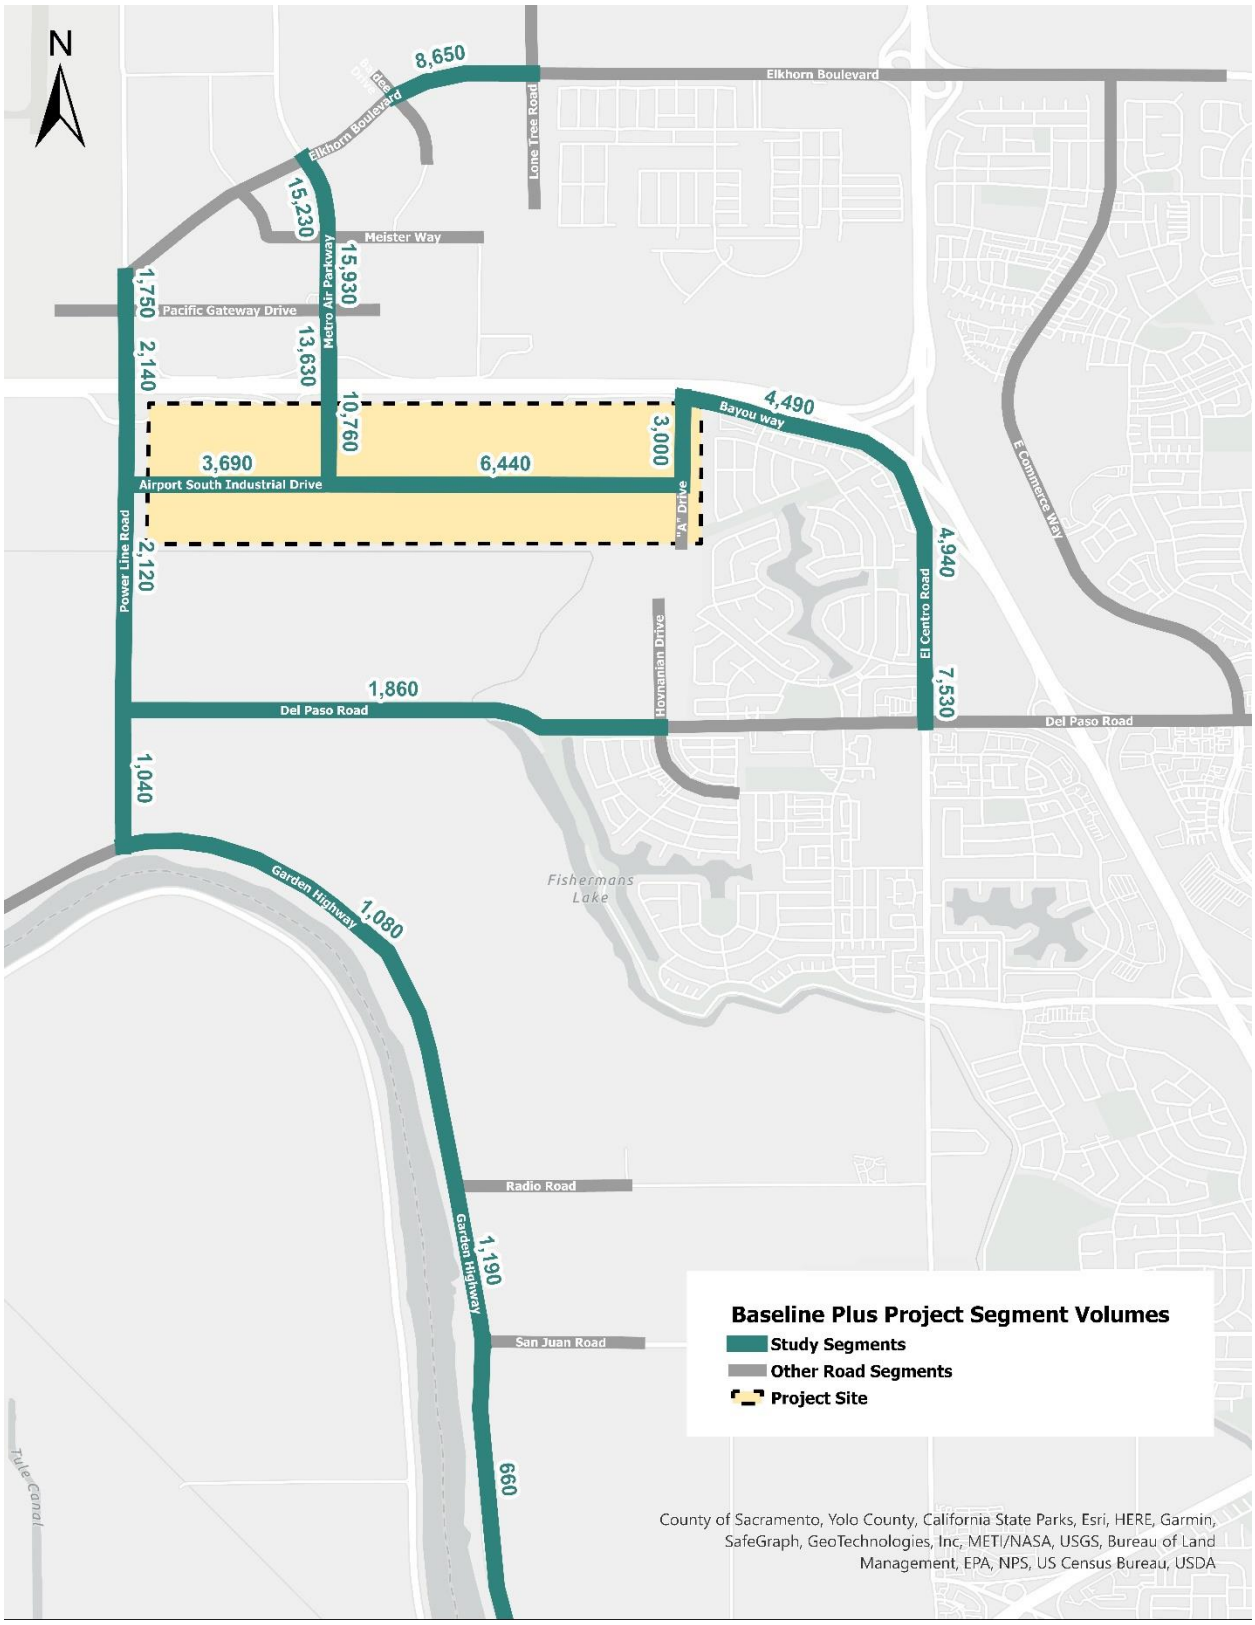

FIGURE 18: BASELINE WITH PROJECT SEGMENT VOLUMES

CUMULATIVE AND CUMULATIVE WITH PROJECT TRAFFIC CONDITIONS

This section summarizes the results of the traffic analysis conducted for cumulative conditions and includes all currently planned projects in the vicinity of the project site and their effects on local and regional traffic.

TRAFFIC VOLUMES AND LANE CONFIGURATIONS

Cumulative and Cumulative with Project traffic volumes were calculated by adding the trips associated with the project to baseline traffic volumes. **Figure 19** and **Figure 20** illustrate the cumulative and Cumulative with Project peak hour traffic volumes and the lane configurations used in the analysis. **Table 14** compares the changes from existing geometrics to the cumulative scenario. These changes include planned financially constrained improvements listed in SACOG's MTP/SCS and those expected to be constructed by other nearby projects including Metro Air Park. **Table 15** summarizes the changes from the cumulative scenario to the Cumulative with Project scenario.

INTERSECTION OPERATIONS ANALYSIS

The queuing and operations of the roadway infrastructure were analyzed under cumulative traffic conditions. **Table 16** summarizes the intersection operations analysis while **Table 17** and **Table 18** present the intersection queueing analysis for Cumulative and Cumulative with Project conditions respectively. **Appendices F** and **G** include the analysis details and worksheets.

Intersections not related to the project north of I-5 were assumed to be signalized by other development projects if they were likely to meet a peak hour signal warrant based on cumulative no project volumes. The interchange of Metro Air Parkway and I-5 was assumed to be built to its planned ultimate configuration from the plans developed by Metro Air Park including new signals and additional on-ramps. Some additional turn lanes at this interchange are necessitated by the project due to the addition of traffic south of I-5 which was not previously considered. Intersections which do not meet their respective jurisdictional operational standards are shaded in grey with bold text. Intersections which the project causes an operational deficiency at as defined in the "Thresholds of Significance" section of this report have their text shown in red.

For this analysis, queueing across multiple intersections was identified under both the cumulative project and cumulative no project conditions related to the ramp metering to the on-ramps to Caltrans facilities. These ramp meters may ultimately operate differently than was assumed for this analysis which would result in less queueing along Metro Air Parkway southbound and Del Paso Road approaching the interchange in both directions. The project contributes to queueing caused by these ramp meters.

The intersection of Del Paso Road and East Commerce Way is expected to serve a very high amount of volume in the cumulative scenarios and will be operating with several movements near or above capacity. This results in extensive queues and highly unstable flow patterns through the intersection. This queueing extends back through multiple intersections along Del Paso Road. Because of this unstable flow pattern, small changes in volumes result in large changes in delay and queueing. Intersections where the deficiency can be directly related back to this intersection are marked with an asterisk.

Based on this analysis, the project causes intersection delay deficiencies at the following intersections:

- 7. Del Paso and El Centro
- 9. Del Paso Road and I-5 Northbound Ramps*

In addition to these delay deficiencies, the project also causes or contributes to queueing deficiencies at the following locations:

- 7. El Centro Road and Del Paso Road
- 9. Del Paso Road and I-5 Northbound Ramps*
- 10. Del Paso Road and I-5 Southbound Ramps*
- 11. East Commerce Way and Del Paso Road*

Specific improvements for these locations will be identified as part of the project phasing and improvements funding plan. For the intersection of the Highway Commercial Access and Metro air Parkway, the southbound right turn pocket should be built to sufficient length to accommodate the queue and the throat depth on the western driveway should be increased by an amount to sufficiently accommodate the queue without causing blockages to internal site circulation.

In reviewing queueing on the Caltrans off-ramps, it was found that one location is expected to exceed the available queue storage in the cumulative no project condition: Del Paso Road and the I-5 Northbound Ramps. Other locations such as Del Paso Road and I-5 Southbound Ramps may exceed individual turn pocket storage but would not have queues extending back to the freeway. At Del Paso Road and the I-5 Northbound Ramps, the project contributes enough volume to increase the already deficient 95th percentile queues by several car lengths. These increases are primarily related to additional queue spillbacks from Del Paso Road and East Commerce Way.

SEGMENT OPERATIONS ANALYSIS

As seen in **Table 19**, only one segment, El Centro Road from Hawkview Drive to Bayou Way, is expected to have an operational deficiency in Cumulative and Cumulative with Project conditions. The project reduces volumes on this particular segment with the construction of Airport South Industrial providing a viable alternate route over the existing Bayou Way which is constructed to a minor rural road standard.

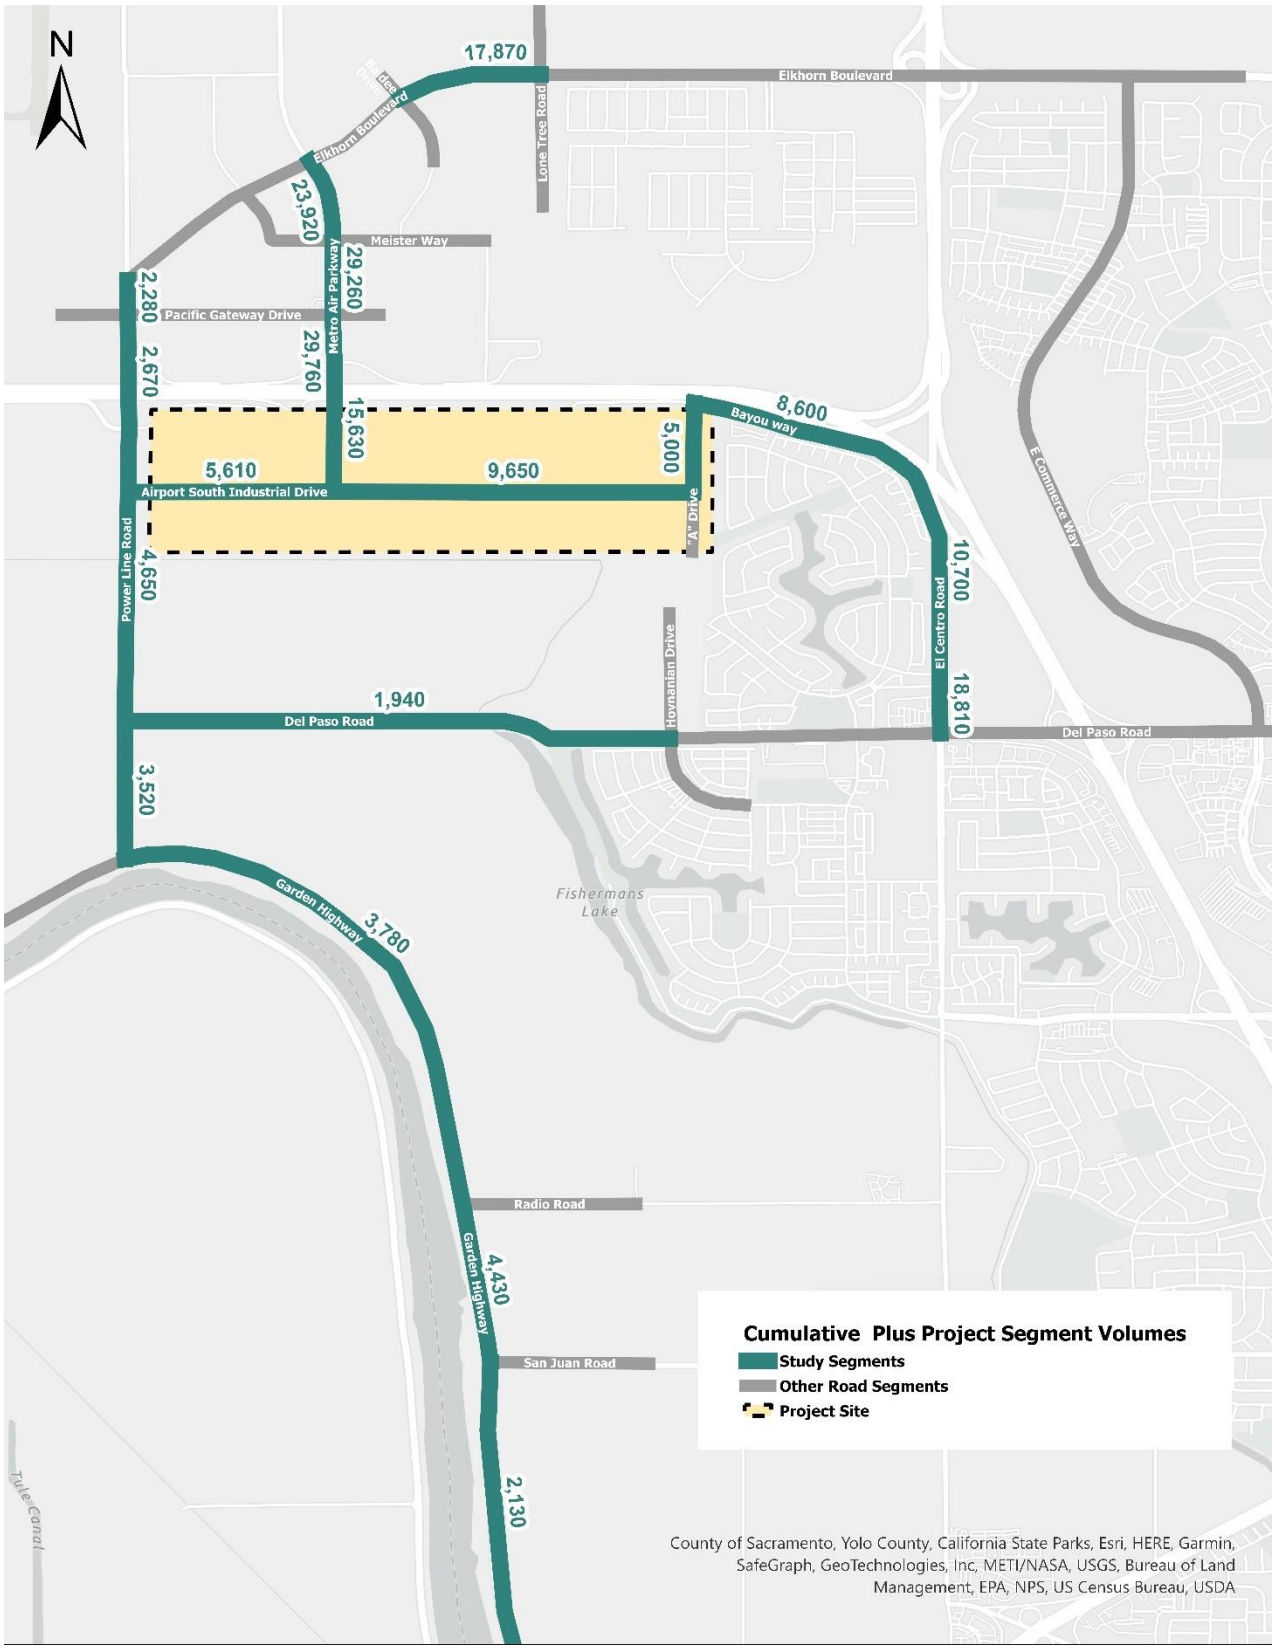

FIGURE 22: CUMULATIVE WITH PROJECT SEGMENT VOLUMES

CIRCULATION GUIDELINES REVIEW

This section includes review of the project's on-site circulation and its interface with the public travel network. This section in particular focuses on the driveway spacing, throat length, traffic control, and queueing to ensure compliance with City standards. Additionally, this section reviews the proposed pedestrian, bicycle, and transit access to the site.

DRIVEWAY CONTROL TYPE AND SPACING

The review of intersection spacing is based upon traffic engineering principles to maintain efficient movement for motorized vehicles, pedestrians, and bicyclists, and minimize conflicts and crashes. Research has shown that proper spacing of intersections and driveways reduces crash frequency, as motorists have ample time between decision points to react to other vehicles that may affect their movement.

The City of Sacramento has minimum intersection spacing for each street designation, with increased spacing for roadways intended for higher traffic volumes. Table 15.7.3 of the *Design and Procedures Manual, Section 15 – Street Design Standards* notes that intersection spacing is measured between the nearest curb returns on the through street.

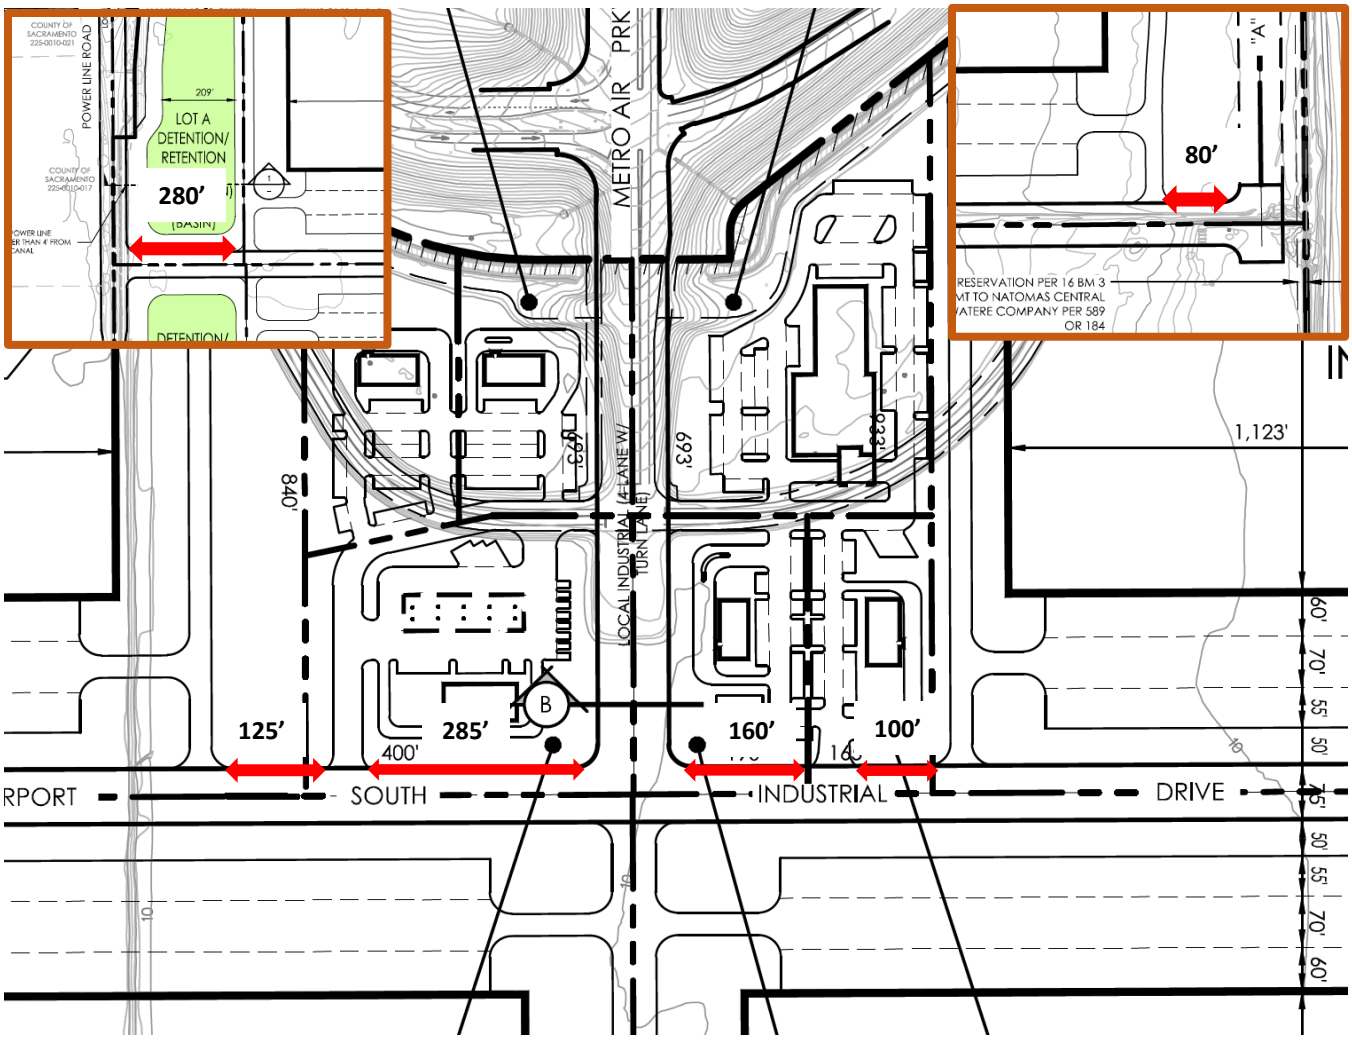

FIGURE 23: AIRPORT SOUTH INDUSTRIAL DRIVE INTERSECTION SPACING

Airport South Industrial Drive would be classified as a Local Industrial roadway; therefore, intersection spacing of at minimum 120 feet is required. As seen in **Figure 23** , the proposed intersection spacing from west to east is 280 feet, 125 feet, 285 feet, 160 feet, 100 feet, and 80 feet. All but two of these distances is greater than 120 feet; therefore, it is recommended that the spacing is increased between both intersection pairs which do not meet the standard. If this cannot be achieved, driveway consolidation should be considered for driveways which are too closely spaced. Additionally, for safety along Airport South Industrial Drive, it is recommended that driveways be kept at least 200 feet from intersections of local roadways at Power Inn Road, Metro Air Parkway, and "A" Drive. This will require relocation of driveways at Parcels 1, 2, 5, 7, and potentially 3 depending on the revised site plan.

DRIVEWAY THROAT LENGTHS

The "throat length" of a driveway is defined as the distance from the outer edge of the traveled way of the intersecting roadway to the first point along the driveway at which there are conflicting vehicular traffic movements. Conflicting movements include turning vehicles and vehicles

entering/exiting parking stalls. Adequate throat length is critical to ensure that queued exiting vehicles do not interfere with/block entering vehicles, resulting in entering queues extending onto city sidewalks and/or streets.

Trucks will access the development primarily via the Metro Air Parkway. Autos are expected to also use Metro Air Parkway in addition to Powerline Road and South Bayou Way. Trucks will be prohibited from accessing the site via South Bayou Way, as denoted on the site plan.

Minimum Throat Depths: Airport South Industrial Drive - Existing traffic volumes and queuing on Airport South Industrial Drive are such that vehicles exiting the proposed project will experience a minimal delay. A minimum throat length of 75 feet is recommended at each driveway to allow for the potential size of trucks accessing the site. Based upon the site plan as shown in **Figure 24**, the proposed driveways' throat lengths all exceed the minimum recommended throat length except for the driveway from the eastern commercial developments onto Airport South Industrial Drive. This driveway shows a throat length of approximately 35 feet and should be increased to the minimum recommendation of 75 feet.

Minimum Throat Depths: Metro Air Parkway - Based on the Cumulative with Project queueing results, there is potential for 95th percentile queues to exceed 250 feet on the eastbound approach of Metro Air Parkway and the signalized commercial access. It is recommended to increase the throat depth on this approach to minimize the impacts this queue might have on circulation within the commercial lot.

If proposed industrial uses include access gates, the applicants shall provide a queueing analysis demonstrating that inbound queued vehicles can be accommodated on-site without queuing onto City streets and sidewalks. Consideration should be given to the arrival of heavy vehicles during time periods when access may not be permitted. Heavy vehicles shall not be permitted to park / queue on City streets while awaiting access.

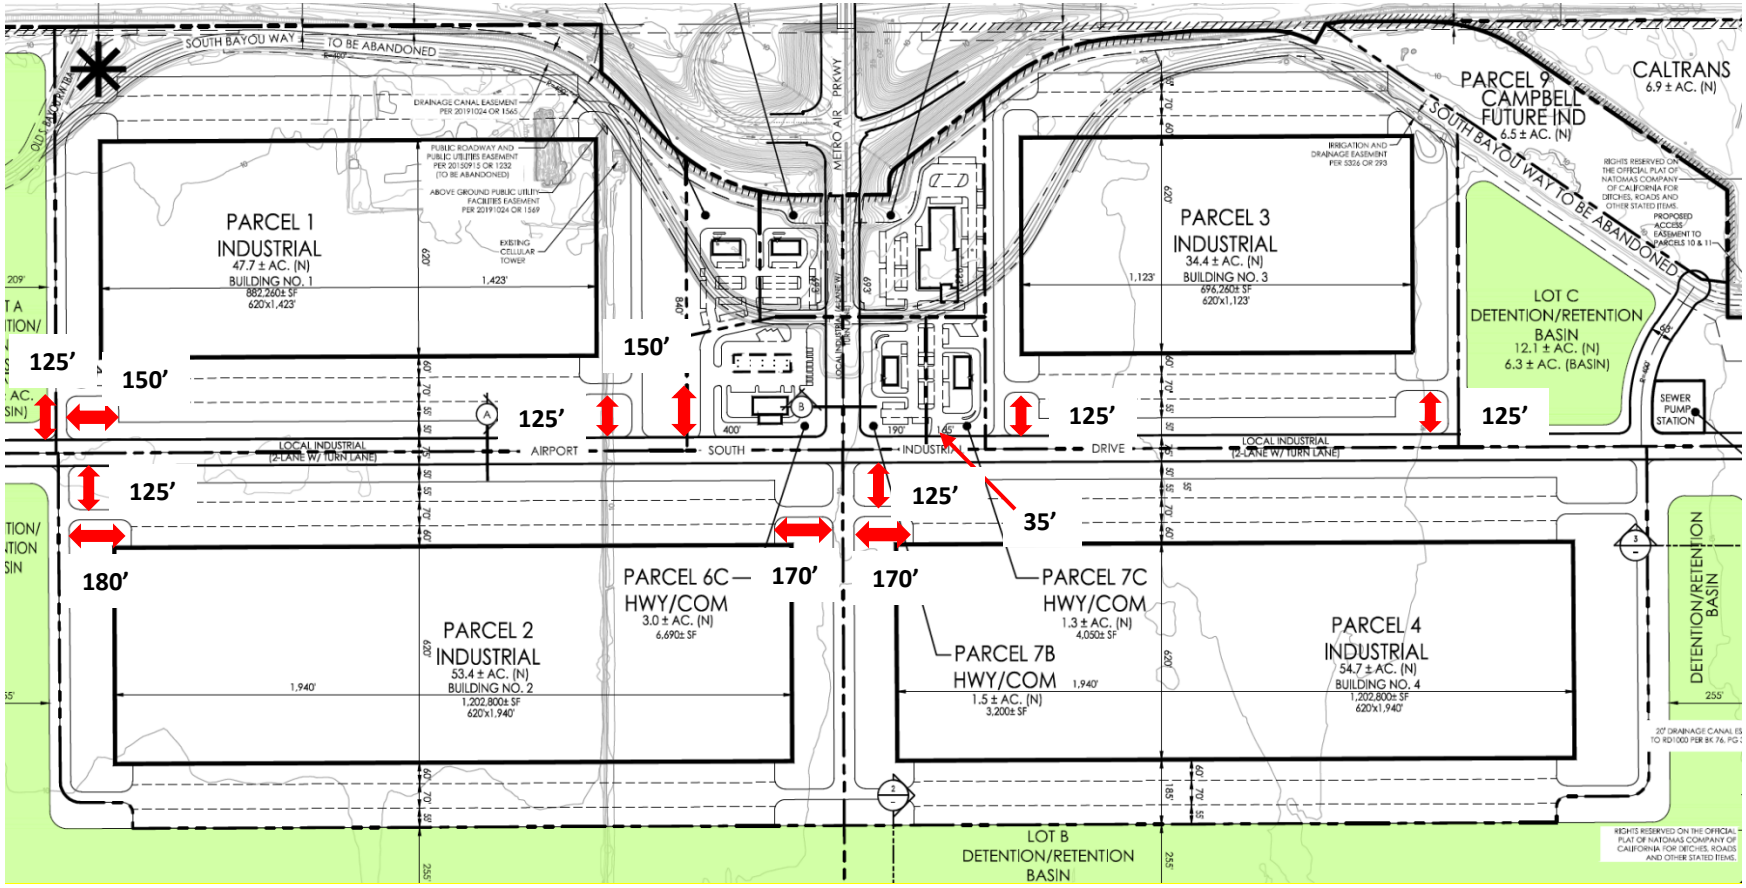

FIGURE 24. SITE PLAN THROAT LENGTH DIMENSIONS

BICYCLE ACCESS

The site is located on undeveloped greenfield which does not connect to existing bicycle facilities. Bicycle lanes should be provided along site frontage as a minimum. It is recommended that a separated bikeway be accommodated along Airport South Industrial to separate cyclists from heavy vehicle traffic and encourage non-motorized travel to and from the site for employees. This would enhance safety and contribute towards project VMT mitigations.

The existing site design does not illustrate where planned bicycle facilities would be on-site. However, bicycle facilities should be accommodated within the proposed cross section to provide separation between cyclists and heavy truck traffic.

The bicycle network shall be connected to the existing and planned City and County bikeway system, including, but not limited to, Bayou Way at the northeast corner of the site, the Class I bikeway at the southeast corner of the site, and Metro Air Parkway north of I-5. The City bikeway master plan shows an off street Class IV cycle track on the eastern side of the site. This is not shown in the current site plan and must be accommodated in the proposed plans.

PEDESTRIAN ACCESS

The site is located on undeveloped greenfield which does not connect to existing pedestrian facilities. Sidewalks should be provided along site frontage. The project would not interfere with existing or planned pedestrian facilities.

TRUCK ACCESS

Heavy vehicle access to the site will be via Metro Air Parkway and Power Line Road. Trucks should be disallowed, through developer agreement, from using Bayou Way to access the site. Sufficient signage should be placed along Airport South Industrial, "A" Drive, and Bayou Way to indicate that trucks are disallowed from exiting the site to the east. As the site plan is developed, the applicant shall show using vehicle turning templates that design vehicles can be safely and efficiently accommodated at driveway entrances without off-tracking (encroaching) into adjacent lanes.

As trucks will be prohibited to travel east of the project along Bayou Way, the proposed roundabout at this location will be required to be designed to allow for truck turnaround to return to the I-5 interchange at Metro Air Parkway. Turn templates showing this design requirement has been met should be provided to the City for design review.

It is understood that the proposed project has preliminary designs for a roundabout at the Bayou Way site access. Any proposed design is expected to be reviewed by City Staff for compliance with NCHRP 1043.

DEFICIENCIES AND RECOMMENDATIONS

A table summarizing project related operational deficiencies for baseline and cumulative scenarios is provided in **Table 20** and **Table 21**, respectively. The following section describes the operational deficiencies and recommendations.

OPERATIONAL DEFICIENCY 1:

The proposed project contributes to operational deficiencies at the following intersections in the baseline conditions to a sufficient degree to require improvements at the following intersections:

- Metro Air Parkway and I-5 Northbound Ramp (Study Intersection #3)
- Metro Air Parkway and I-5 Southbound Ramp (Study Intersection #4)
- Del Paso Road and El Centro Road (Study Intersection #7)
- Del Paso Road and East Commerce Way (Study Intersection #11)
- Metro Air Parkway and West Elkhorn Boulevard (Study Intersection #12)

The project should contribute a fair share towards improvement of these intersections, many of which have planned improvements unrelated to the project which will be required in the cumulative conditions.

For the Commercial Access and Metro Air Parkway (Study Intersection #33), project traffic necessitates a signal. The project should address internal site circulation from the intersection so that drive aisles do not become regularly blocked by the back of queue and provide adequate storage lengths to meet demand expected under the Cumulative with Project scenario. It is assumed that this intersection will be built out to operational standard.

OPERATIONAL RECOMMENDATION 1:

The project should contribute a fair share contribution towards improvement of these intersections as most of them have planned improvements which will be required in the cumulative condition.

The phasing and feasibility of all improvements will be determined in a separate report.

OPERATIONAL DEFICIENCY 2:

The proposed project contributes to operational deficiencies at the following intersections in the cumulative conditions. These deficiencies are related to either queue spillback of greater than one car length beyond the available storage and/or not meeting City/County Level of Service standards:

- Metro Air Parkway and I-5 Northbound Ramps (Study Intersection #3)
- Metro Air Parkway and I-5 Southbound Ramps (Study Intersection #4)
- El Centro Road and Del Paso Road (Study Intersection #7)
- Del Paso Road and I-5 Northbound Ramps (Study Intersection #9)*
- Del Paso Road and I-5 Southbound ramps (Study Intersection #10)*
- Del Paso Road and East Commerce Way (Study Intersection #11)*

**Deficiencies are related to queues at Del Paso Road and East Commerce Way*

As previously noted, there are significant queue spillbacks on Del Paso Road which spill into the interchange with I-5. These are all related to queues spilling back from the Del Paso Road and East Commerce Way intersection which will be operating near or over capacity across most movements during the peak hours. The project contributes a relatively small amount of traffic volume to this area compared to the total volume served in the cumulative condition and thus should only contribute a share to future improvements.

For intersections on Airport South Industrial Drive and Metro Air Parkway, the project should address driveway spacing from the intersection so that driveways do not become regularly blocked by the back of queue and provide adequate storage lengths to meet demand expected under the Cumulative with Project scenario.

For Metro Air Parkway and Commercial Site Access (Intersection #33) it is assumed that this intersection will be built out to operational standard with adequate storage lengths to meet demand.

OPERATIONAL RECOMMENDATION 2:

The project should contribute towards the extension of turn pockets where possible at these locations. The project should contribute a fair share percentage towards the improvement of the Metro Air Parkway and I-5 Interchange to its ultimate configuration. The intersection of Metro Air Parkway and the Commercial Site Access has queueing on the southbound right and eastbound left movements. These queueing concerns can be addressed by extending the southbound right turn pocket and by either increasing the throat depth of the eastbound approach, or by providing dual eastbound left turn lanes. This location should be constructed to provide adequate storage for these queues.

Some of the driveways on Airport South Industrial Drive need to be relocated and possibly consolidated to meet design standards of 120 ft spacing. Depending on how this is done, newly consolidated driveways on Airport South Industrial Drive may meet all way stop control or signal warrants in which case they should be located with at least 500 ft spacing from other fully controlled intersections. Driveway throat depth and driveway spacing will need to be further reviewed prior to building development to ensure consistency with City standards.

The phasing of all improvements will be determined in a separate report.

OPERATIONAL RECOMMENDATION 3:

Minimum Throat Depths: Airport South Industrial Drive - A minimum throat length of 75 feet is recommended at each driveway to allow for the potential size of trucks accessing the site. Based upon the site plan as shown in **Figure 24**, the proposed driveways' throat lengths all exceed the minimum recommended throat length except for the driveway from the eastern commercial developments onto Airport South Industrial Drive. This driveway shows a throat length of approximately 35 feet and should be increased to the minimum recommendation of 75 feet.

Minimum Throat Depths: Metro Air Parkway - Based on the Cumulative with Project queueing results, there is potential for 95th percentile queues to exceed 250 feet on the eastbound approach of Metro Air Parkway and the signalized commercial access. It is recommended to increase the throat depth on this approach to minimize the impacts this queue might have on circulation within the commercial lot.

If proposed industrial uses include access gates, the applicants shall provide a queueing analysis demonstrating that inbound queued vehicles can be accommodated on-site without queuing onto City streets and sidewalks. Consideration should be given to the arrival of heavy vehicles during time periods when access may not be permitted. Heavy vehicles shall not be permitted to park / queue on City streets while awaiting access.

ACTIVE TRANSPORTATION DEFICIENCY 1:

The proposed project would not adversely affect existing or planned pedestrian or bicycle facilities. The project is in a greenfield area where these facilities do not currently exist.

The existing site design does not illustrate where planned bicycle facilities would be on-site, but it is assumed that sidewalks and bicycle facilities will be provided per City standards.

Additionally, the site plan does not currently show the planned Class IV cycle track on the east side of the site, which is in the City's master bicycle network. This path should be shown and accommodated in the site plan.

ACTIVE TRANSPORTATION RECOMMENDATION 1:

The project should construct pedestrian and bicycle facilities along its frontage to City Standards. It is recommended that the provision of Class IV separated bicycle facilities should be explored due to the mix of cyclists and heavy truck traffic on an industrial roadway.

TABLE 20. BASELINE WITH PROJECT OPERATIONAL DEFICIENCY SUMMARY

STUDY INTERSECTION	DEFICIENCY NO.	DEFICIENCY TYPE	DEFICIENCY DESCRIPTION
3. METRO AIR PARKWAY AND I-5 NORTHBOUND RAMPS	3.a	Queue	NBL a.m. peak hour 95th percentile queue (150 ft) exceeds storage length (100 ft).

7. DEL PASO ROAD AND EL CENTRO ROAD	7.a	Queue	NBL a.m. peak hour 95th percentile queue (295 ft) exceeds storage length (280 ft).
11. DEL PASO ROAD AND EAST COMMERCE WAY	11.a	LOS	Intersection delay exceeds operational analysis thresholds in the a.m. peak hour.
	11.b	Queue	EBL a.m. peak hour 95th percentile queue (570 ft) exceeds storage length (375 ft).
	11.c	Queue	WBR a.m. peak hour 95th percentile queue (225 ft) exceeds storage length (140 ft).
12.WEST ELKHORN BOULEVARD AND METRO AIR PARKWAY	12.a	Queue	WBL a.m. peak hour 95th percentile queue (410 ft) exceeds storage length (350 ft).
	12.b	Queue	NBL p.m. peak hour 95th percentile queue (245 ft) exceeds storage length (400 ft).

TABLE 21. CUMULATIVE WITH PROJECT OPERATIONAL DEFICIENCY SUMMARY

STUDY INTERSECTION	DEFICIENCY NO.	DEFICIENCY TYPE	DEFICIENCY DESCRIPTION
3. METRO AIR PARKWAY AND I-5 NORTHBOUND RAMPS	3.a	Queue	SBT p.m. peak hour 95th percentile queue (705 ft) exceeds storage length (700 ft).
7. DEL PASO ROAD AND EL CENTRO ROAD	7.a	LOS	Intersection delay exceeds operational analysis thresholds in the p.m. peak hour
	7.b	Queue	EBR p.m. peak hour 95th percentile queue (145 ft) exceeds storage length (140 ft).
	7.c	Queue	NBL a.m. peak hour 95th percentile queue (410 ft) exceeds storage length (280 ft).
	7.d	Queue	NBR p.m. peak hour 95th percentile queue (215 ft) exceeds storage length (160 ft).
	7.e	Queue	SBL p.m. peak hour 95th percentile queue (445 ft) exceeds storage length (285 ft).
9. DEL PASO ROAD AND I-5 NORTHBOUND RAMPS*	9.a	LOS	Intersection delay exceeds operational analysis thresholds in the a.m. peak hour.
	9.b	LOS	Intersection delay exceeds operational analysis thresholds in the p.m. peak hour.
	9.c	Queue	NBL a.m. peak hour 95th percentile queue (2795 ft) exceeds storage length (1270 ft).
	9.d	Queue	NBL p.m. peak hour 95th percentile queue (2110 ft) exceeds storage length (1270 ft).
	9.e	Queue	NBR a.m. peak hour 95th percentile queue (2960 ft) exceeds storage length (1270 ft).
	9.a	Queue	NBR p.m. peak hour 95th percentile queue (2200 ft) exceeds storage length (1270 ft).
10. DEL PASO ROAD AND I-5 SOUTHBOUND RAMPS*	10.a	Queue	SBR a.m. peak hour 95th percentile queue (210 ft) exceeds storage length (200 ft).
	10.b	Queue	SBR p.m. peak hour 95th percentile queue (305 ft) exceeds storage length (200 ft).
11. EAST COMMERCE WAY & DEL PASO ROAD*	11.a	Queue	EBR a.m. peak hour 95th percentile queue (300 ft) exceeds storage length (205 ft).
	11.b	Queue	WBL p.m. peak hour 95th percentile queue (355 ft) exceeds storage length (235 ft).
	11.c	Queue	SBL p.m. peak hour 95th percentile queue (450 ft) exceeds storage length (285 ft).
15. EAST COMMERCE WAY & WEST ELKHORN BOULEVARD	15.a	Queue	EBR p.m. peak hour 95th percentile queue (425 ft) exceeds storage length (250 ft).
	15.b	Queue	WBL a.m. peak hour 95th percentile queue (405 ft) exceeds storage length (200 ft).
	15.c	LOS	Intersection delay exceeds operational analysis thresholds in the a.m. peak hour.

**Deficiencies are related to queues at Del Paso Road and East Commerce Way*

APPENDIX B:

Trip Generation and Distribution Memo

DKS 428 J STREET, SUITE 340 • SACRAMENTO, CA 95814 • 916.368.2000 • DKSASSOCIATES.COM

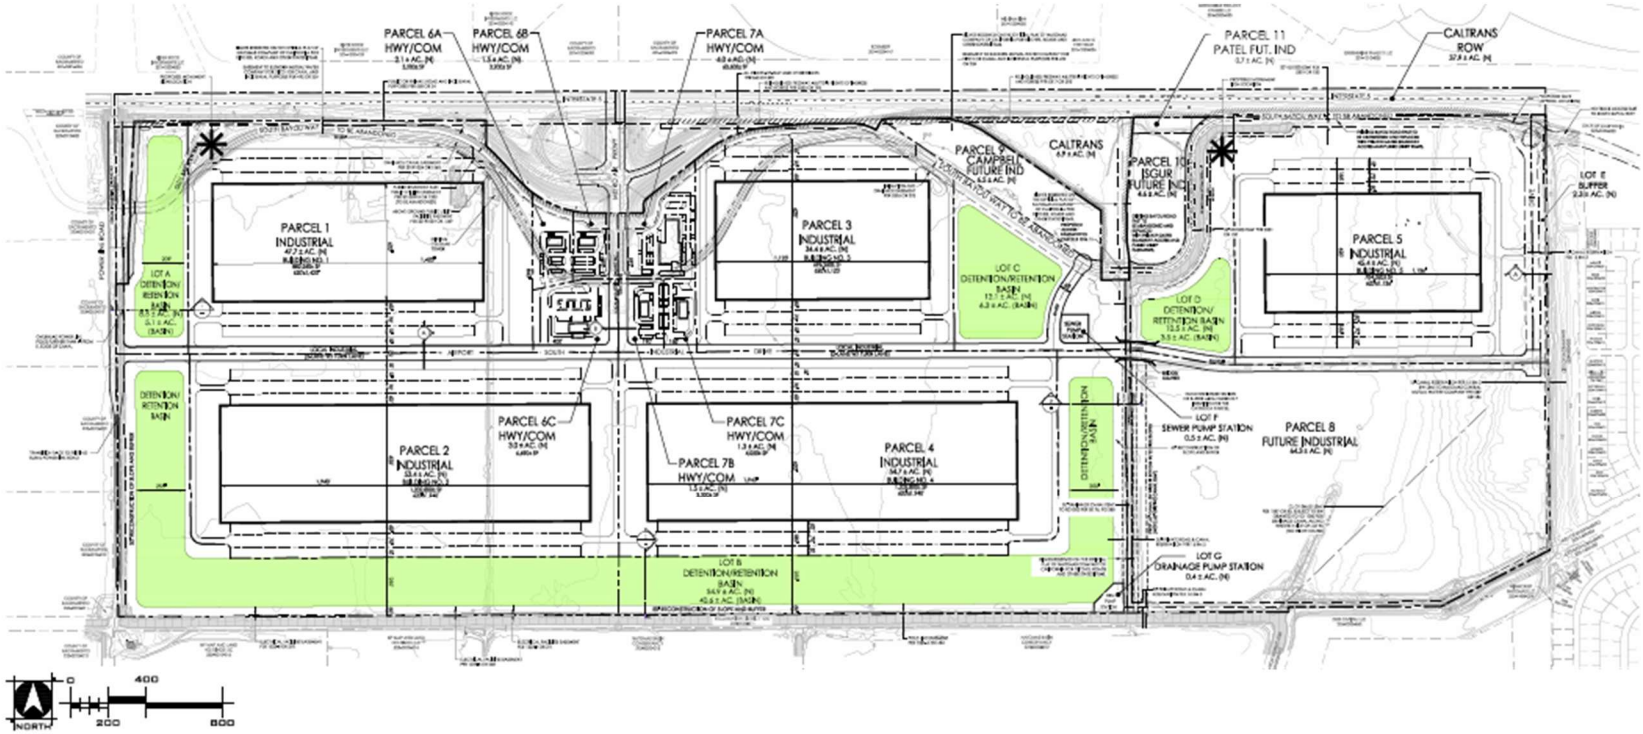
TRIP GENERATION AND DISTRIBUTION MEMORANDUM

DATE: March 10, 2023

TO: Matthew Ilagan | City of Sacramento
Pelle Clarke | City of Sacramento

FROM: Sean Carney | DKS Associates
Dave Tokarski | DKS Associates
Vic Maslanka | DKS Associates

SUBJECT: Airport South Industrial – Phase B Project #19179-024



This memorandum summarizes the results of the trip generation and distribution analysis of the proposed Airport South Industrial project, based upon the latest Baseline Plus Project model runs. The project consists of approximately 474.4 net acres of land to be annexed into the City of Sacramento and developed as M-1 (Industrial) and HC (Highway Commercial) zoning land uses.

PROJECT DESCRIPTION

As illustrated in **Figure 1**, the project is located on the south side of I-5 at the Metro Air Parkway interchange. **Figure 2** illustrates the proposed site plan. **Table 1** summarizes the land use utilized in the calculation of trip generation. This land use information was taken directly from the land use summary included in the project description information provided by the applicant to the City. The project includes over 6.6 million square feet of warehousing / distribution / industrial space, four restaurants, a fueling station / carwash, and a hotel.

TRIP GENERATION ESTIMATION

INDUSTRIAL USES

For parcels 1 - 5, 8 – 11, and Caltrans, it was assumed that the parcels would be developed in a manner comparable to Metro Airpark (located on the north side of I-5). As the travel model utilizes "employees" as the land use variable, the building size was converted to number of employees. To calculate this conversion, the applicant provided information from comparable facilities throughout the United States, including the adjacent Metro Airpark. This information was reviewed by City staff, and an employment density of 0.572 employees per 1,000 square feet was assigned (one employee per 1,748 square feet). **Table 2** summarizes the estimated number of employees for each parcel. A total of 3,781 employees were calculated.

Table 3 presents mode choice of the industrial uses for light vehicles. 96 percent of person trips are by automobile, 3 percent by walk mode, and 1 percent by bicycle. These estimates do not include heavy vehicle trips.

Table 4 summarizes the daily, AM peak hour, and PM peak hour vehicular trip generation of the industrial uses, as estimated by the travel model (Baseline Plus Project scenario). The industrial

uses are estimated to generate 12,794 daily trips, 1,191 AM peak hour trips, and 1,004 PM peak hour trips. This includes light vehicle and heavy vehicle trips.

TABLE 2: INDUSTRIAL EMPLOYMENT SUMMARY

PARCEL	PARCEL SIZE (ACRES)	BUILDING SIZE (SQUARE FEET)	EMPLOYEES
1	47.7	979,400	560
2	53.4	1,335,200	764
3	34.4	772,900	442
4	54.7	1,335,200	764
5	45.4	781,800	447
8	64.3	1,088,200	622
9	6.5	110,000	63
10	4.6	77,900	45
11	0.7	11,900	7
CALTRANS	6.9	116,800	67
INDUSTRIAL SUMMARY	318.6	6,609,300	3,781

TABLE 3: INDUSTRIAL DAILY MODE CHOICE

MODE	PERCENTAGE OF PERSON TRIPS
WALK	3%
BICYCLE	1%
AUTOMOBILE – 1 OCCUPANT (SOV)	71%
AUTOMOBILE – 2 OCCUPANTS (HOV2)	14%
AUTOMOBILE – 3 OR MORE OCCUPANTS (HOV3+)	11%

TABLE 4: ESTIMATED INDUSTRIAL TOTAL TRIP GENERATION

TOTAL VEHICLE TRIPS (LIGHT VEHICLES AND HEAVY VEHICLES)						
DAILY	AM PEAK HOUR			PM PEAK HOUR		
	ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
12,794	886	305	1,191	281	723	1,004

Table 5 compares the total vehicle trip generation rates of the travel model (trips per 1,000 square feet) to ITE Trip Generation[1], rates for similar land uses. The travel model estimates are similar to the ITE warehouse rates (model is higher for daily and AM peak hour, lower for PM peak hour), but lower than light industrial and manufacturing uses. The model projections are consistent with the warehousing and fulfillment center uses that predominate the Metro Airpark. No further adjustments to the travel model for industrial total trip generation purposes are recommended.

Table 6 summarizes the heavy vehicle trip generation estimates of the travel model. Compared to the anticipated heavy vehicle trip generation for these industrial uses, these estimates are low.

Table 7 compares the heavy vehicle trip percentages to ITE Trip Generation percentages for similar land uses, as well as data from Metro Airpark.

It is recommended that the heavy vehicle trip generation rates should be increased, and applied with a post-processor methodology to adjust the model estimates to reflect anticipated heavy vehicle travel volumes. Based upon the ITE Trip Generation data and the data from Metro Airpark, the recommended heavy vehicle trip generation estimates are presented in **Table 8**.

HIGHWAY COMMERCIAL USES

Similar to the industrial uses, the building sizes of the highway commercial uses were converted to employees for input to the travel model. Consistent with other retail and service uses in the travel model, 500 square feet per employee was assumed. This yields 33 employees for the land use west of Metro Air Parkway, and 164 employees for the land use east of Metro Air Parkway.

Table 9 presents mode choice of the highway commercial uses. 97 percent of person trips are by automobile, 3 percent by walk mode, and less than 1 percent by bicycle. The number of heavy vehicle trips associated with the highway commercial uses are small, unless a truck-oriented business is developed within this area.

TABLE 9: HIGHWAY COMMERCIAL DAILY MODE CHOICE

MODE	PERCENTAGE OF PERSON TRIPS
WALK	3%
BICYCLE	<1%
AUTOMOBILE – 1 OCCUPANT (SOV)	57%
AUTOMOBILE – 2 OCCUPANTS (HOV2)	23%
AUTOMOBILE – 3 OR MORE OCCUPANTS (HOV3+)	17%

Table 10 summarizes the highway commercial vehicle trip generation estimates of the travel model.

TABLE 10: ESTIMATED HIGHWAY COMMERCIAL TRIP GENERATION

PARCEL	EMPLOYEES	VEHICLE TRIPS						
		DAILY	AM PEAK HOUR			PM PEAK HOUR		
			ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
6A, 6B, 6C (WEST)	33	298	15	5	20	9	15	23
7A, 7B, 7C (EAST)	164	1,005	54	18	73	24	48	72
HIGHWAY COMMERCIAL SUMMARY	197	1,303	69	23	93	33	63	95

Compared to the anticipated trip generation for these highway commercial uses adjacent to an interstate freeway, these estimates are extremely low. The travel model does not include land use categories / uses specific to intense highway commercial uses, such as a convenience store / gas station. The model trip generation is also unconstrained for employment uses, which reduces the number of trips attracted to a land use not adjacent to a developed area.

It is recommended that ITE trip generation rates be used for the highway commercial uses, and applied with a post-processor methodology to adjust the model estimates to reflect anticipated travel volumes. This is especially critical for the access management review along Metro Air Parkway near the I-5 interchange, and along Airport South Industrial Drive.

The recommended trip generation of the highway commercial uses is based upon representative uses from the Institute of Transportation Engineers (ITE) Trip Generation Manual 11th Edition, Version 6.0.1, May 2022. **Table 11** summarizes the land use on each parcel and the assumed ITE land use code and statistics.

Table 12 and **Table 13** summarize the vehicle trip generation estimates for the highway commercial parcels. Parcel 6C was calculated based upon both fueling positions and convenience store size, with the results averaged. Pass-by percentages are based upon ITE data. Internal trips are limited to a maximum of 10 percent, with no trips assumed between restaurants. The appendix includes the trip generation calculations for highway commercial uses.

TABLE 11: HIGHWAY COMMERCIAL PARCEL TRIP GENERATION CHARACTERISTICS

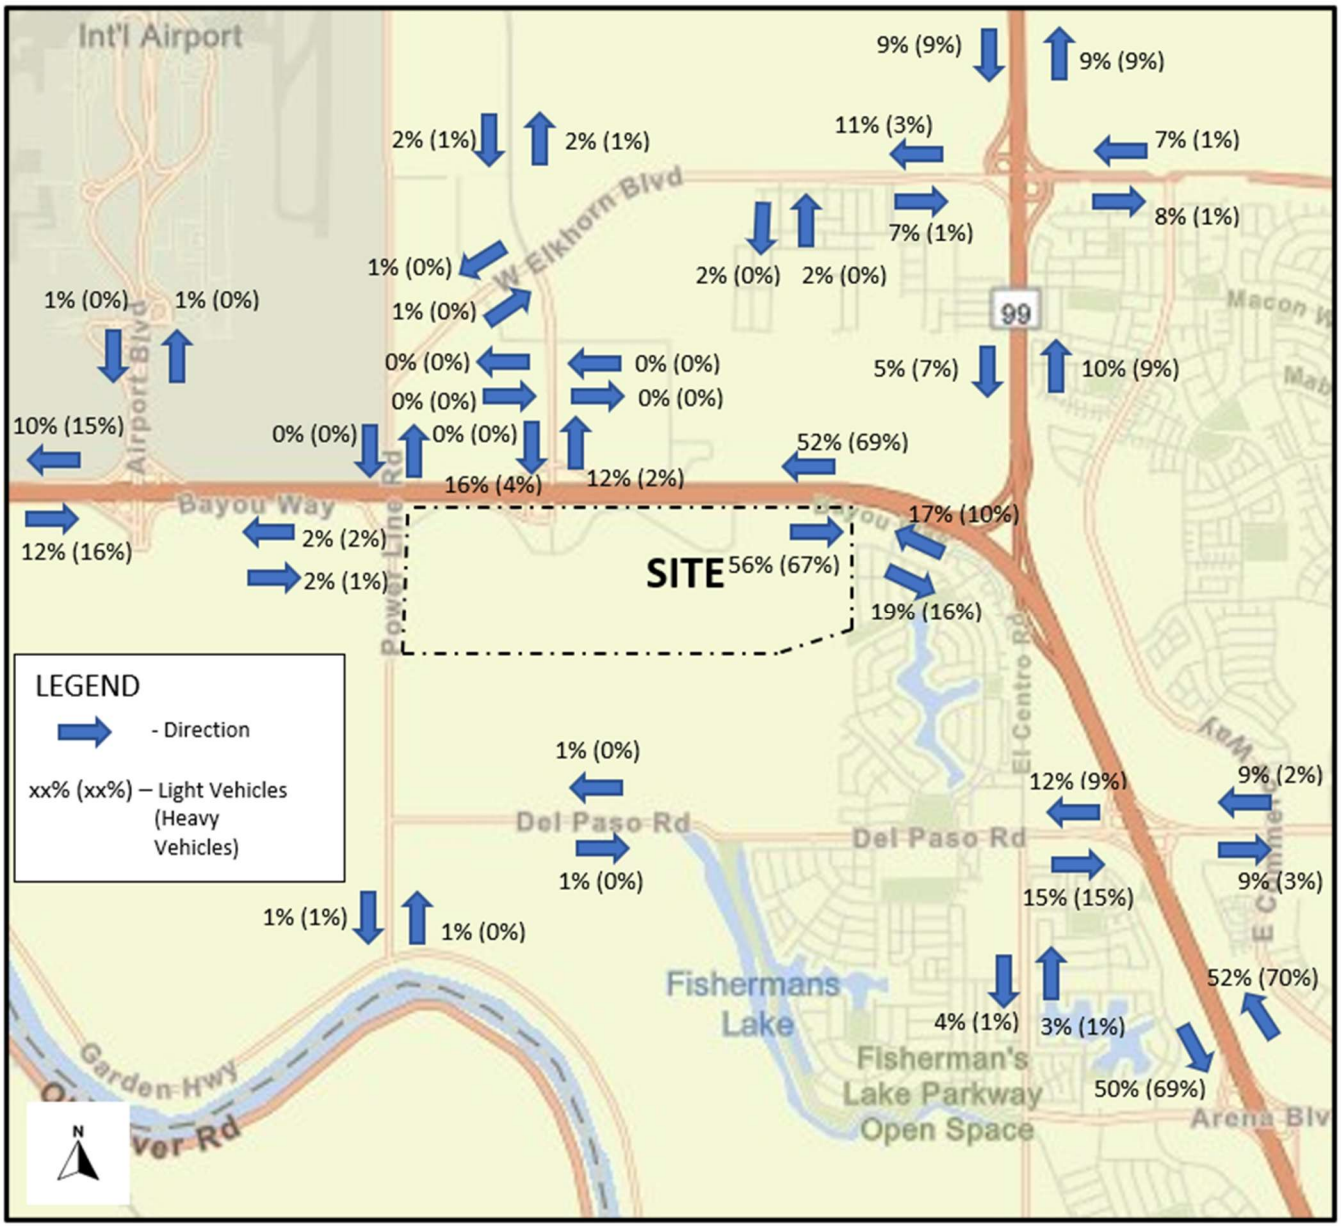
TRIP DISTRIBUTION ESTIMATES

INDUSTRIAL USES

Figure 3 illustrates the project trip distribution from the Baseline Plus Project scenario for the industrial uses. Separate distribution percentages are displayed for light vehicles (automobiles) and heavy vehicles.



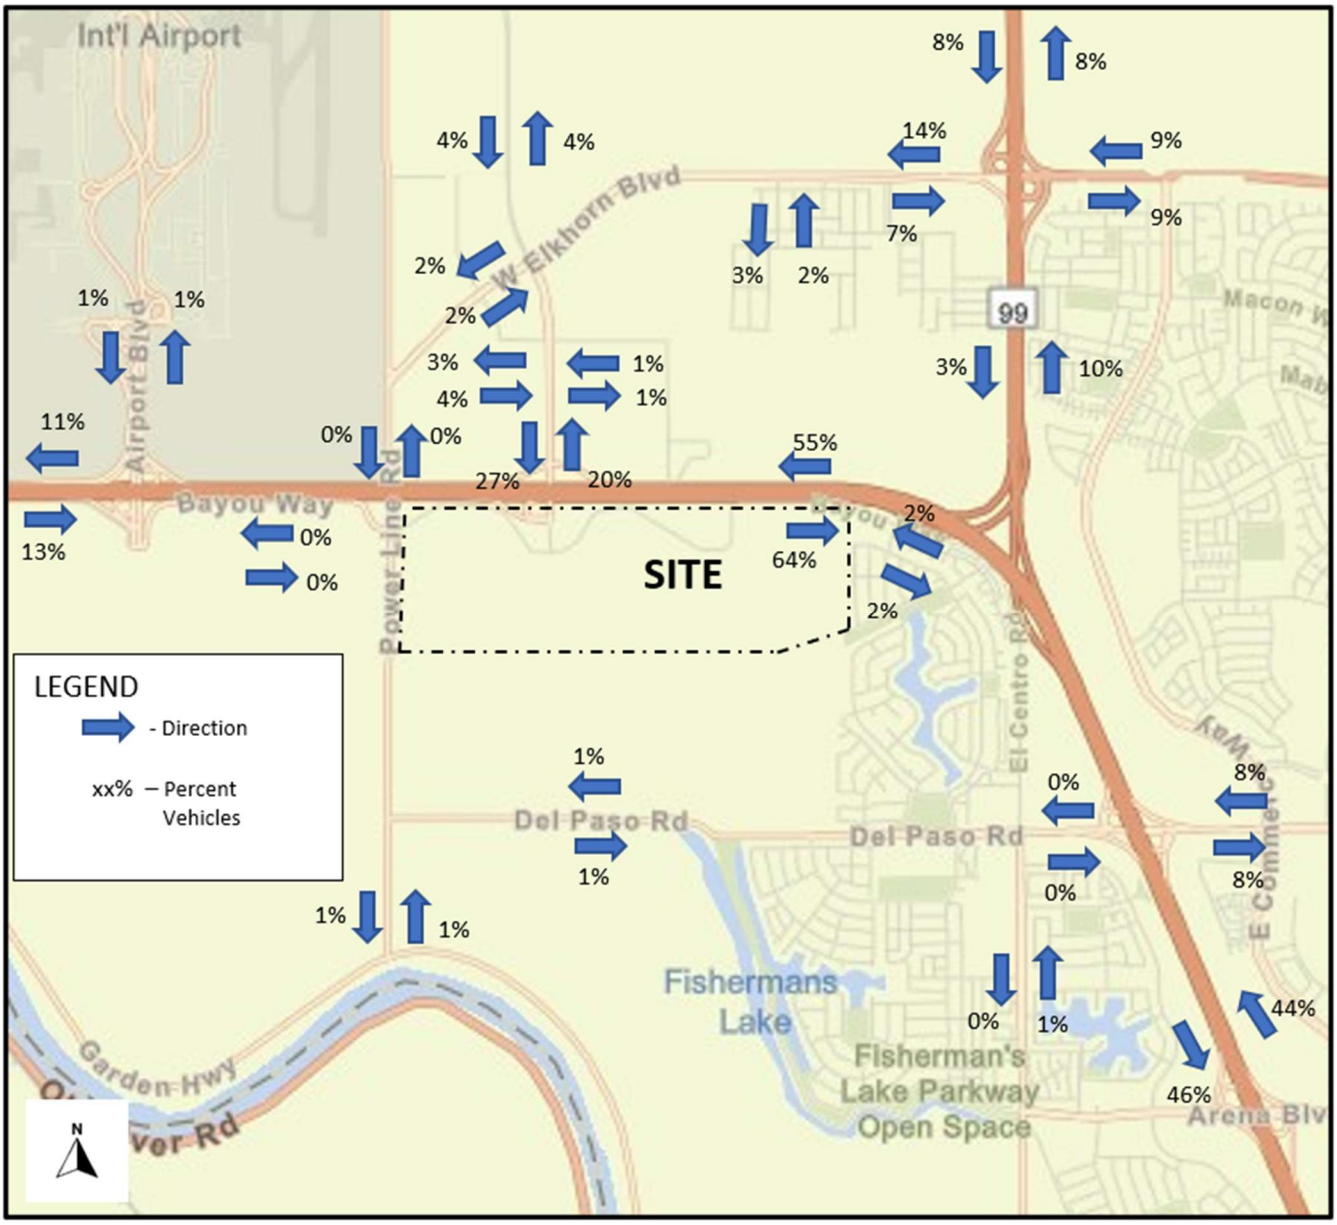


FIGURE 3: BASELINE PROJECT TRIP DISTRIBUTION FOR INDUSTRIAL USES

HIGHWAY COMMERCIAL USES

Figure 4 illustrates the project trip distribution from the Baseline Plus Project scenario for the highway commercial uses. As discussed previously, these uses will not generate a large volume of heavy vehicles. The distribution reflects new trips. Pass-by trips associated with the highway commercial uses will primarily be associated with traffic patterns on I-5.

FIGURE 4: BASELINE PROJECT TRIP DISTRIBUTION FOR HIGHWAY COMMERCIAL USES

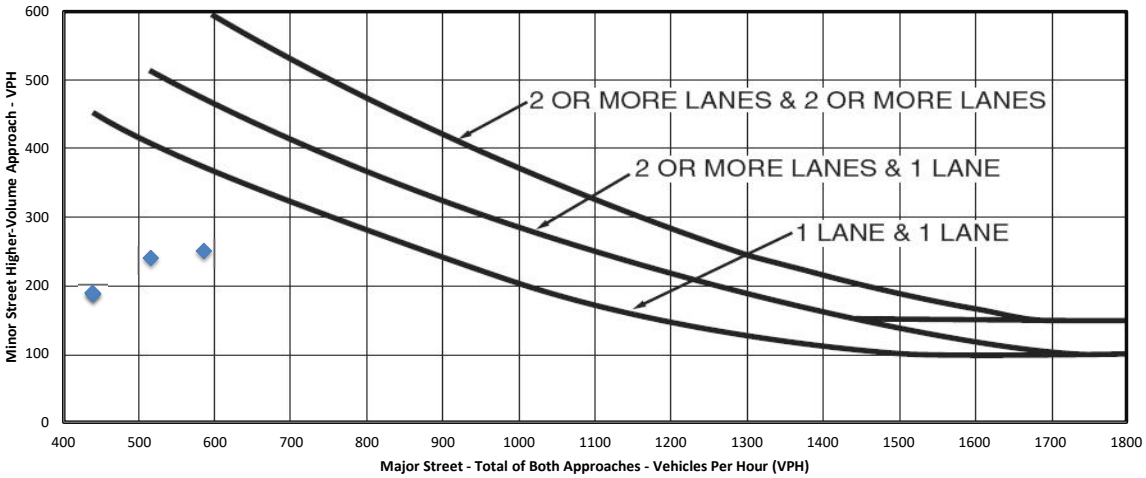
APPENDIX H:

Signal Warrant Analysis

Elkhorn Blvd at Power Line Rd - Cumulative

MUTCD WARRANT 3, PEAK HOUR

Number of Lanes for Moving Traffic on Each Approach	
Major Street:	2 or More Lanes
Minor Street:	1 Lane



Built-up Isolated Community With Less Than 10,000 Population or Above 40 MPH on Major Street?	No
Is this signal warrant being applied for an unusual case, such as office complexes, manufacturing plants, industrial complexes, or high-occupancy vehicle facilities that attract or discharge large numbers of vehicles over a short time?	Yes

Indicate whether all three of the following conditions for the same 1 hour (any four consecutive 15-minute periods) of an average day are present*	
Does the total stopped time delay experienced by the traffic on one minor-street approach (one direction only) controlled by a STOP sign equal or exceed 4 vehicle-hours for a one-lane approach or 5 vehicle-hours for a two-lane approach?	Yes
Does the volume on the same minor-street approach (one direction only) equal or exceed 100 vehicles per hour for one moving lane of traffic or 150 vehicles per hour for two moving lanes?	Yes
Does the total entering volume serviced during the hour equal or exceed 650 vehicles per hour for intersection with three approaches or 800 vehicles per hour for intersections with four or more approaches?	Yes
**If applicable, attach all supporting calculations and documentation.*

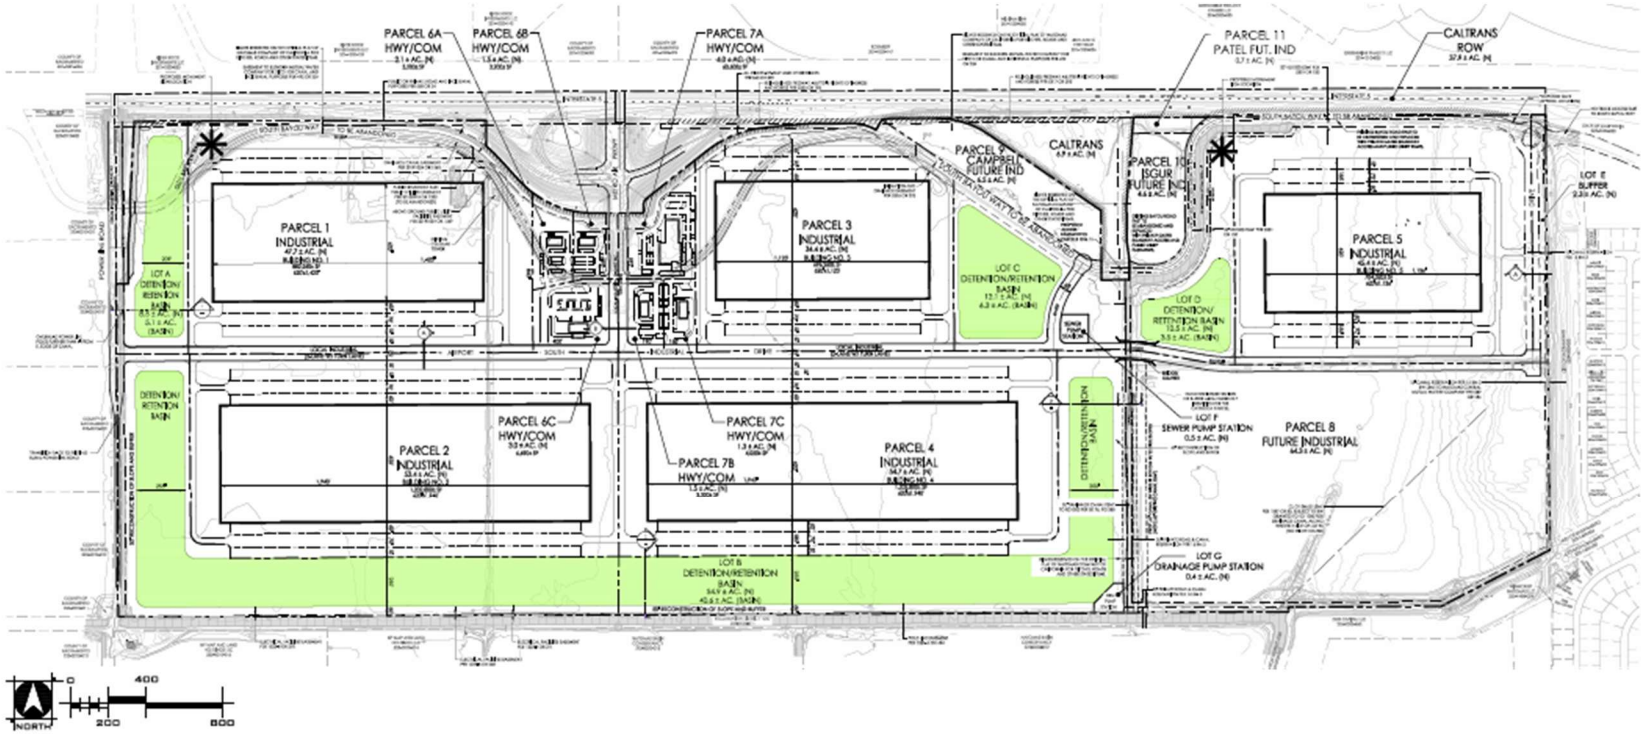
TRIP GENERATION AND DISTRIBUTION MEMORANDUM

DATE: March 10, 2023

TO: Matthew Ilagan | City of Sacramento
Pelle Clarke | City of Sacramento

FROM: Sean Carney | DKS Associates
Dave Tokarski | DKS Associates
Vic Maslanka | DKS Associates

SUBJECT: Airport South Industrial – Phase B Project #19179-024



This memorandum summarizes the results of the trip generation and distribution analysis of the proposed Airport South Industrial project, based upon the latest Baseline Plus Project model runs. The project consists of approximately 474.4 net acres of land to be annexed into the City of Sacramento and developed as M-1 (Industrial) and HC (Highway Commercial) zoning land uses.

PROJECT DESCRIPTION

As illustrated in **Figure 1**, the project is located on the south side of I-5 at the Metro Air Parkway interchange. **Figure 2** illustrates the proposed site plan. **Table 1** summarizes the land use utilized in the calculation of trip generation. This land use information was taken directly from the land use summary included in the project description information provided by the applicant to the City. The project includes over 6.6 million square feet of warehousing / distribution / industrial space, four restaurants, a fueling station / carwash, and a hotel.

TRIP GENERATION ESTIMATION

INDUSTRIAL USES

For parcels 1 - 5, 8 – 11, and Caltrans, it was assumed that the parcels would be developed in a manner comparable to Metro Airpark (located on the north side of I-5). As the travel model utilizes "employees" as the land use variable, the building size was converted to number of employees. To calculate this conversion, the applicant provided information from comparable facilities throughout the United States, including the adjacent Metro Airpark. This information was reviewed by City staff, and an employment density of 0.572 employees per 1,000 square feet was assigned (one employee per 1,748 square feet). **Table 2** summarizes the estimated number of employees for each parcel. A total of 3,781 employees were calculated.

Table 3 presents mode choice of the industrial uses for light vehicles. 96 percent of person trips are by automobile, 3 percent by walk mode, and 1 percent by bicycle. These estimates do not include heavy vehicle trips.

Table 4 summarizes the daily, AM peak hour, and PM peak hour vehicular trip generation of the industrial uses, as estimated by the travel model (Baseline Plus Project scenario). The industrial

uses are estimated to generate 12,794 daily trips, 1,191 AM peak hour trips, and 1,004 PM peak hour trips. This includes light vehicle and heavy vehicle trips.

TABLE 2: INDUSTRIAL EMPLOYMENT SUMMARY

PARCEL	PARCEL SIZE (ACRES)	BUILDING SIZE (SQUARE FEET)	EMPLOYEES
1	47.7	979,400	560
2	53.4	1,335,200	764
3	34.4	772,900	442
4	54.7	1,335,200	764
5	45.4	781,800	447
8	64.3	1,088,200	622
9	6.5	110,000	63
10	4.6	77,900	45
11	0.7	11,900	7
CALTRANS	6.9	116,800	67

TABLE 3: INDUSTRIAL DAILY MODE CHOICE

MODE	PERCENTAGE OF PERSON TRIPS
WALK	3%
BICYCLE	1%
AUTOMOBILE – 1 OCCUPANT (SOV)	71%
AUTOMOBILE – 2 OCCUPANTS (HOV2)	14%
AUTOMOBILE – 3 OR MORE OCCUPANTS (HOV3+)	11%

TABLE 4: ESTIMATED INDUSTRIAL TOTAL TRIP GENERATION

TOTAL VEHICLE TRIPS (LIGHT VEHICLES AND HEAVY VEHICLES)						
DAILY	AM PEAK HOUR			PM PEAK HOUR		
	ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
12,794	886	305	1,191	281	723	1,004

Table 5 compares the total vehicle trip generation rates of the travel model (trips per 1,000 square feet) to ITE Trip Generation[1], rates for similar land uses. The travel model estimates are similar to the ITE warehouse rates (model is higher for daily and AM peak hour, lower for PM peak hour), but lower than light industrial and manufacturing uses. The model projections are consistent with the warehousing and fulfillment center uses that predominate the Metro Airpark. No further adjustments to the travel model for industrial total trip generation purposes are recommended.

Table 6 summarizes the heavy vehicle trip generation estimates of the travel model. Compared to the anticipated heavy vehicle trip generation for these industrial uses, these estimates are low.

Table 7 compares the heavy vehicle trip percentages to ITE Trip Generation percentages for similar land uses, as well as data from Metro Airpark.

It is recommended that the heavy vehicle trip generation rates should be increased, and applied with a post-processor methodology to adjust the model estimates to reflect anticipated heavy vehicle travel volumes. Based upon the ITE Trip Generation data and the data from Metro Airpark, the recommended heavy vehicle trip generation estimates are presented in **Table 8**.

PERCENT HEAVY TRIPS	20%	10%	10%	10%	10%	10%	10%

HIGHWAY COMMERCIAL USES

Similar to the industrial uses, the building sizes of the highway commercial uses were converted to employees for input to the travel model. Consistent with other retail and service uses in the travel model, 500 square feet per employee was assumed. This yields 33 employees for the land use west of Metro Air Parkway, and 164 employees for the land use east of Metro Air Parkway.

Table 9 presents mode choice of the highway commercial uses. 97 percent of person trips are by automobile, 3 percent by walk mode, and less than 1 percent by bicycle. The number of heavy vehicle trips associated with the highway commercial uses are small, unless a truck-oriented business is developed within this area.

TABLE 9: HIGHWAY COMMERCIAL DAILY MODE CHOICE

MODE	PERCENTAGE OF PERSON TRIPS
WALK	3%
BICYCLE	<1%
AUTOMOBILE – 1 OCCUPANT (SOV)	57%
AUTOMOBILE – 2 OCCUPANTS (HOV2)	23%
AUTOMOBILE – 3 OR MORE OCCUPANTS (HOV3+)	17%

Table 10 summarizes the highway commercial vehicle trip generation estimates of the travel model.

TABLE 10: ESTIMATED HIGHWAY COMMERCIAL TRIP GENERATION

PARCEL	EMPLOYEES	VEHICLE TRIPS						
		DAILY	AM PEAK HOUR			PM PEAK HOUR		
			ENTER	EXIT	TOTAL	ENTER	EXIT	TOTAL
6A, 6B, 6C (WEST)	33	298	15	5	20	9	15	23
7A, 7B, 7C (EAST)	164	1,005	54	18	73	24	48	72
HIGHWAY COMMERCIAL SUMMARY	197	1,303	69	23	93	33	63	95

Compared to the anticipated trip generation for these highway commercial uses adjacent to an interstate freeway, these estimates are extremely low. The travel model does not include land use categories / uses specific to intense highway commercial uses, such as a convenience store / gas station. The model trip generation is also unconstrained for employment uses, which reduces the number of trips attracted to a land use not adjacent to a developed area.

It is recommended that ITE trip generation rates be used for the highway commercial uses, and applied with a post-processor methodology to adjust the model estimates to reflect anticipated travel volumes. This is especially critical for the access management review along Metro Air Parkway near the I-5 interchange, and along Airport South Industrial Drive.

The recommended trip generation of the highway commercial uses is based upon representative uses from the Institute of Transportation Engineers (ITE) Trip Generation Manual 11th Edition, Version 6.0.1, May 2022. **Table 11** summarizes the land use on each parcel and the assumed ITE land use code and statistics.

Table 12 and **Table 13** summarize the vehicle trip generation estimates for the highway commercial parcels. Parcel 6C was calculated based upon both fueling positions and convenience store size, with the results averaged. Pass-by percentages are based upon ITE data. Internal trips are limited to a maximum of 10 percent, with no trips assumed between restaurants. The appendix includes the trip generation calculations for highway commercial uses.

TABLE 11: HIGHWAY COMMERCIAL PARCEL TRIP GENERATION CHARACTERISTICS

PARCEL	PROPOSED USE	ACRES	SQUARE FEET	ITE CODE	ASSUMED USE	ASSUMPTIONS

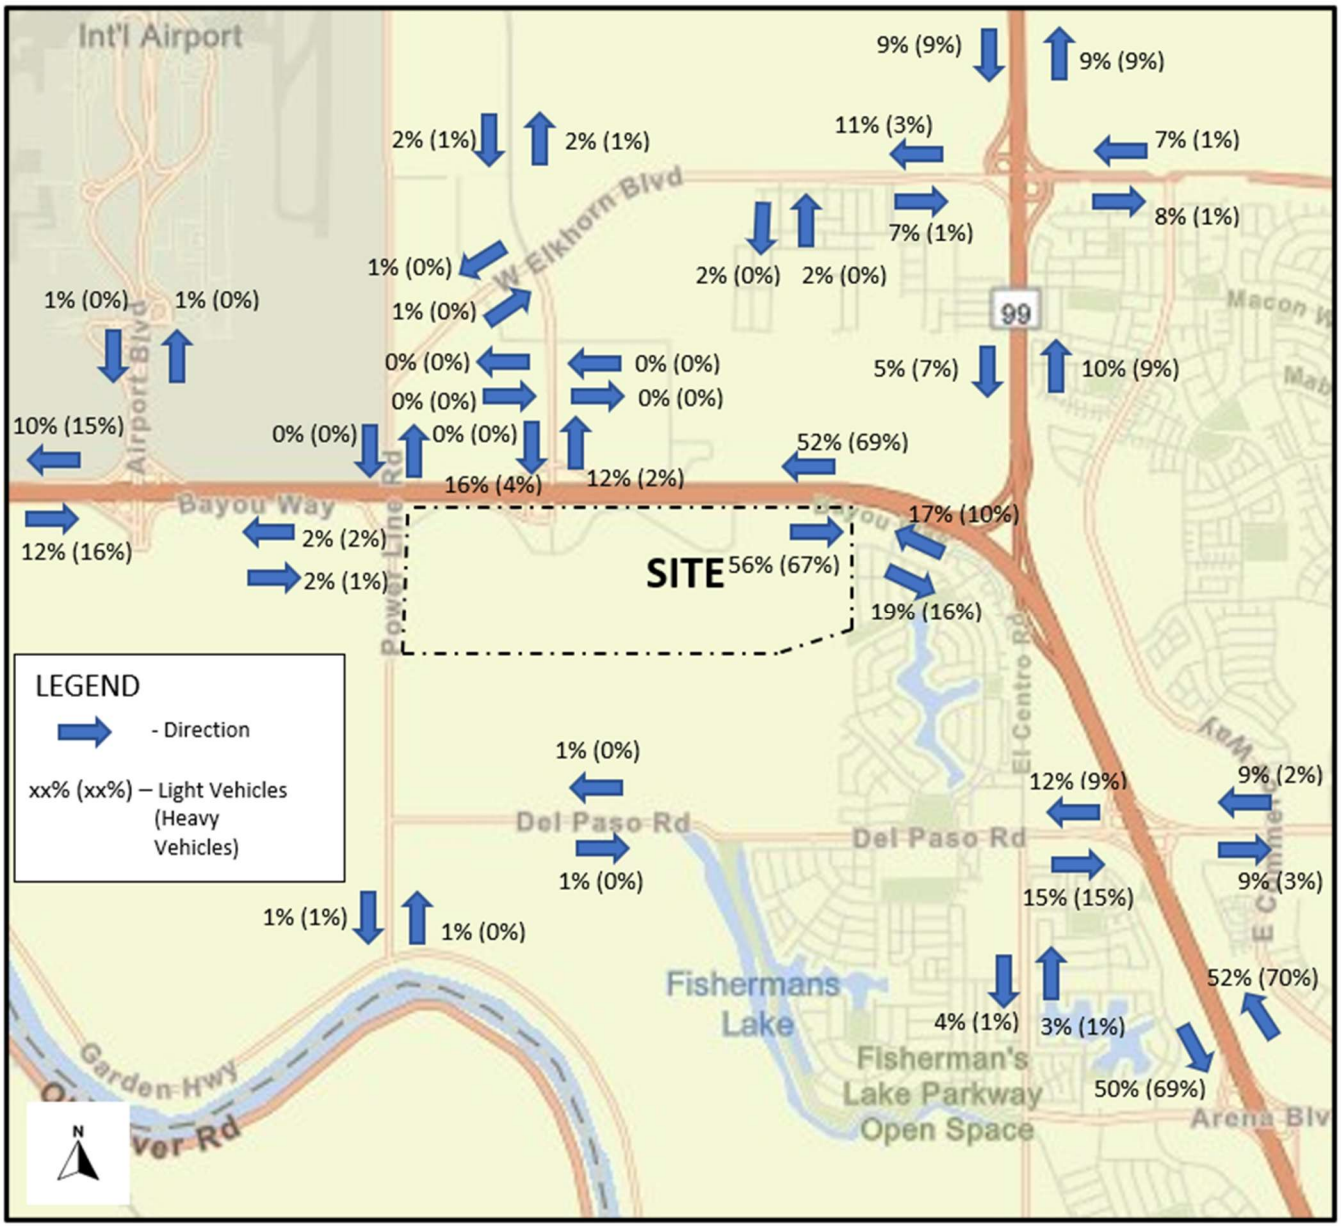
TRIP DISTRIBUTION ESTIMATES

INDUSTRIAL USES

Figure 3 illustrates the project trip distribution from the Baseline Plus Project scenario for the industrial uses. Separate distribution percentages are displayed for light vehicles (automobiles) and heavy vehicles.



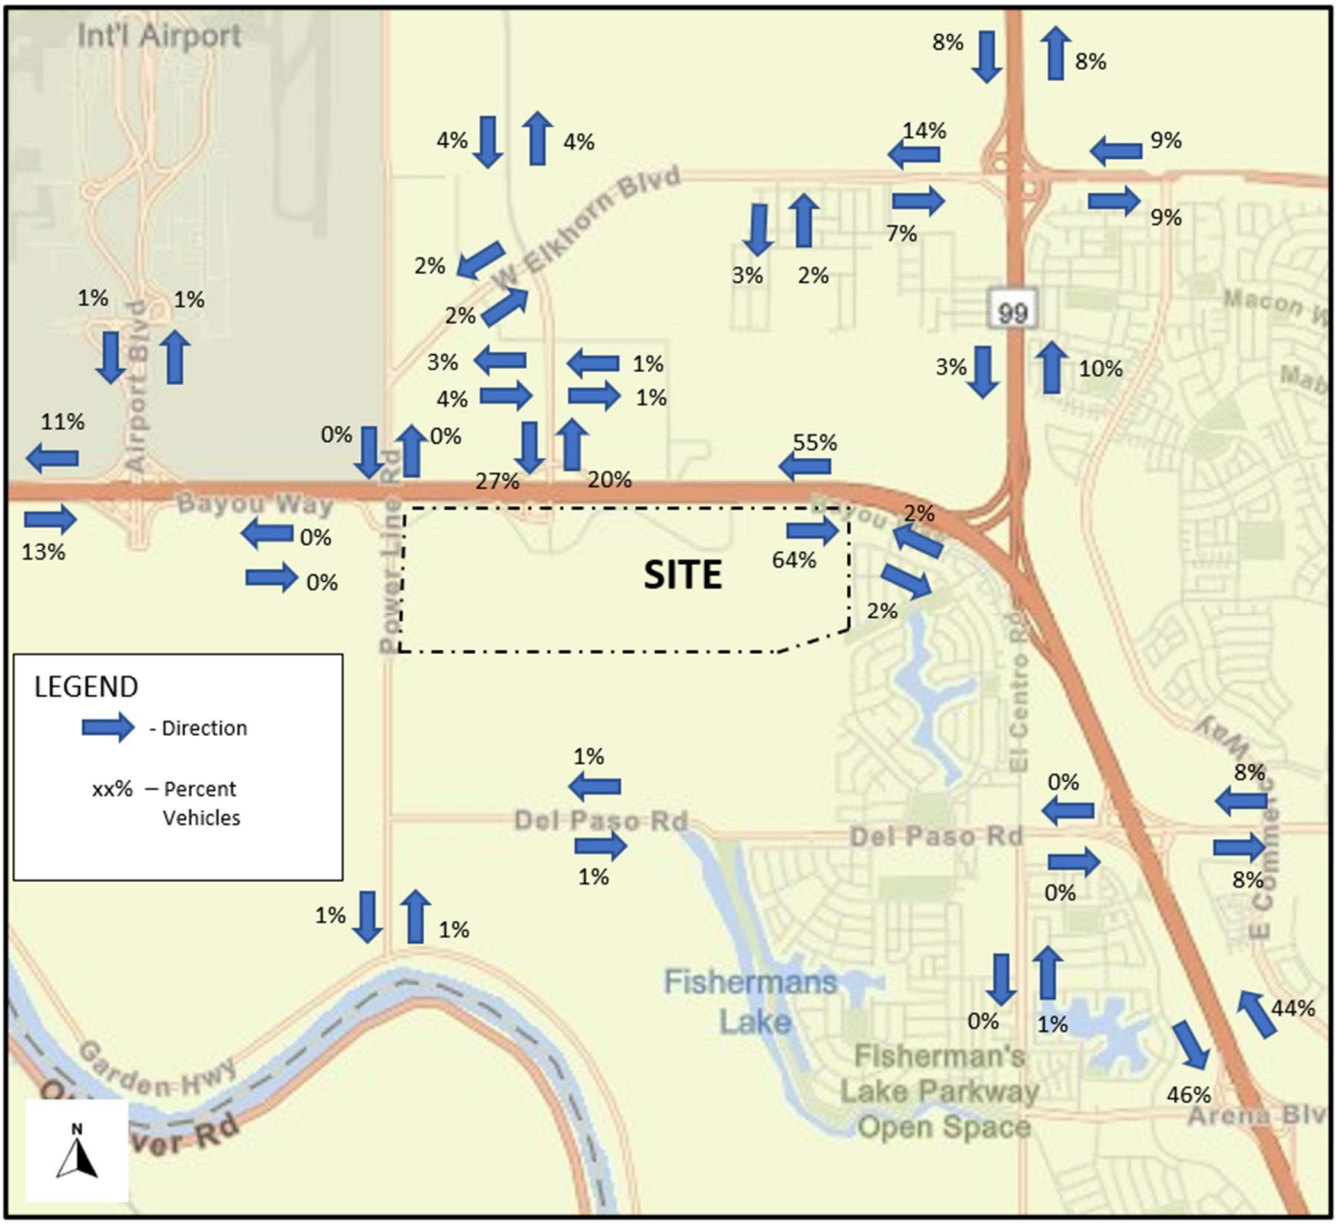


FIGURE 3: BASELINE PROJECT TRIP DISTRIBUTION FOR INDUSTRIAL USES

HIGHWAY COMMERCIAL USES

Figure 4 illustrates the project trip distribution from the Baseline Plus Project scenario for the highway commercial uses. As discussed previously, these uses will not generate a large volume of heavy vehicles. The distribution reflects new trips. Pass-by trips associated with the highway commercial uses will primarily be associated with traffic patterns on I-5.

DRAFT VMT ANALYSIS

DATE: March 10, 2023

TO: Matthew Ilagan, Pelle Clarke | City of Sacramento

FROM: Sean Carney, David Tokarski, Vic Maslanka | DKS Associates

SUBJECT: Airport South Industrial VMT Analysis Project #19179-024

INTRODUCTION

In accordance with Senate Bill 743 (SB 743) and the resulting changes to the California Environmental Quality Act (CEQA) Guidelines published by the Natural Resources Agency, local agencies may no longer use measures of vehicle delay such as Level of Service (LOS) to quantify transportation impacts on the environment. VMT is a systemic metric and is a useful indicator of overall land use and transportation efficiency, where the most efficient system is one that minimizes VMT by encouraging shorter vehicle trip lengths, more walking and biking, or increased carpooling and transit. Vehicle miles traveled (VMT) has been codified in the CEQA Guidelines as the most appropriate measure for measuring transportation impacts under CEQA. This change went into effect statewide on July 1, 2020. The City of Sacramento's draft transportation impact guidelines are consistent with OPR's recommendation of using VMT as a metric.

INDUSTRIAL USES

Based on current practice of the City of Sacramento, transportation impacts are considered significant if the proposed project would result in a VMT per capita or office VMT per employee above 85% of the regional average, consistent with technical guidance published by the Governor's Office of Planning and Research (OPR). The OPR guidance does not specify a particular significance threshold for industrial employment and recommends that local jurisdictions determine this threshold based on local conditions. Some jurisdictions in the Sacramento region (including Sacramento County (adopted) and the City of Rancho Cordova (adopted)) have determined that the significance threshold for industrial employment is 100% of regional average. The reasoning for this less restrictive threshold for industrial uses compared to other employment types is rooted in improving overall VMT efficiency of all future development in aggregate. Industrial uses generally have more zoning restrictions and are generally less densely developed than other employment types making them less desirable within urban areas. By keeping these uses outside of urban centers, the land that they would occupy can instead be used for higher density land development that can see a greater benefit from being located in VMT efficient areas. This inherently means industrial uses will have higher VMT per employee than other employment types because they are

located further from a good mix of housing and services which are necessary to achieve lower VMT levels. The draft City of Sacramento Transportation Impact Analysis Guidelines do not specify a significance threshold for industrial land uses. For consistency with other nearby jurisdictions and after discussion with City staff, this analysis applies the significance threshold of 100% of regional average for industrial uses.

HIGHWAY COMMERCIAL USES

Because new retail development often redistributes trips rather than creating new travel demand, the OPR guidance recommends that lead agencies analyze the net change in VMT to indicate the transportation impact of retail projects.[1]

The potential for VMT impacts, according to this approach, hinges on whether the project can be considered local-serving or regional. By adding retail opportunities within existing neighborhoods, local-serving retail projects can shorten trips and reduce overall VMT. In contrast, regional destination retail projects would draw customers from larger trade areas, potentially substituting for shorter trips and increasing VMT. The OPR guidance suggests that any retail projects including stores larger than 50,000 square feet might be considered regional serving retail.

This approach has been applied to the highway commercial uses. As discussed below, the individual uses were reviewed to determine whether they can be considered regional "destination" uses which would attract vehicle trips from a large area and potentially increase VMT, or whether the uses duplicate other existing projects in the nearby area and could reduce VMT.

VMT SCREENING

VMT SCREENING CRITERIA

Pursuant to SB 743 and technical guidance published by OPR, there are several screening procedures to potentially streamline project analysis (i.e., provide a presumptive non-impact finding and obviate the need for a VMT analysis). The various screening options are listed below with a brief determination of whether a given screen is triggered by the proposed project.

- Project Size: Projects that generate fewer than 110 trips per day can be presumed to have a less than significant transportation impact. Based on the trip generation data presented in the Transportation Analysis (in a separate document prepared by DKS), the proposed project does not meet this screening criteria.
- Proximity to High Quality Transit: Residential or office projects within one-half mile of an existing major transit station or stop along an existing high-quality transit corridor can be

[1] Governor's Office of Planning and Research, Technical Advisory on Evaluating Transportation Impacts in CEQA. (New York: Free Press, December 2018), 15–16.

presumed to have a less than significant transportation impact. The proposed project is not currently served by transit. The project does not meet this screening criteria.

- Affordable Housing Development: The proposed project does not include the provision of housing. The proposed project does not meet this screening criteria.
- Locally Serving Retail: Typically less than 50,000 square feet. The Highway Commercial component of the project could potentially meet this screening criteria, as discussed below.
- Infrastructure: Projects that would not likely lead to a substantial or measurable increase in vehicle travel are presumed to be VMT neutral and generally presumed to have a less than significant transportation impact (i.e., induced VMT). These include: Roadway Maintenance and Rehab Projects; Signal Timing / Synchronization / Adaptive Signal Control /Signal Preemption Improvements; Intersection Control Type and Turn Lane Channelization Improvements; Widening for Local or Local Collector Streets; and Transit / Bicycle / Pedestrian Infrastructure Improvements. The proposed project does not contain any substantial infrastructure improvements that meet this screening criteria.
- Project Location: Projects that fall within an identified location (in this case SACOG's hexagon methodology is used for screening purposes) that demonstrates VMT per Capita for residential projects below 85% of the regional average for that metric, or VMT per Employee for employment-based projects below 100% of the regional average for that metric. As discussed below, the industrial portion of the project does not meet this screening criteria.

INDUSTRIAL VMT ANALYSIS

VMT EMPLOYMENT SCREENING MAP

Figure 1 illustrates SACOG's VMT Employment Screening Map for the project vicinity. As the hexagons are based upon 2016 conditions, and the project site was vacant, there are no applicable hexagons that apply to the entirety of the project. On the northeast corner of the project site, the hexagon which includes the northwest (employment) corner of Westlake, the VMT per employee is shown as 103% of the regional average.

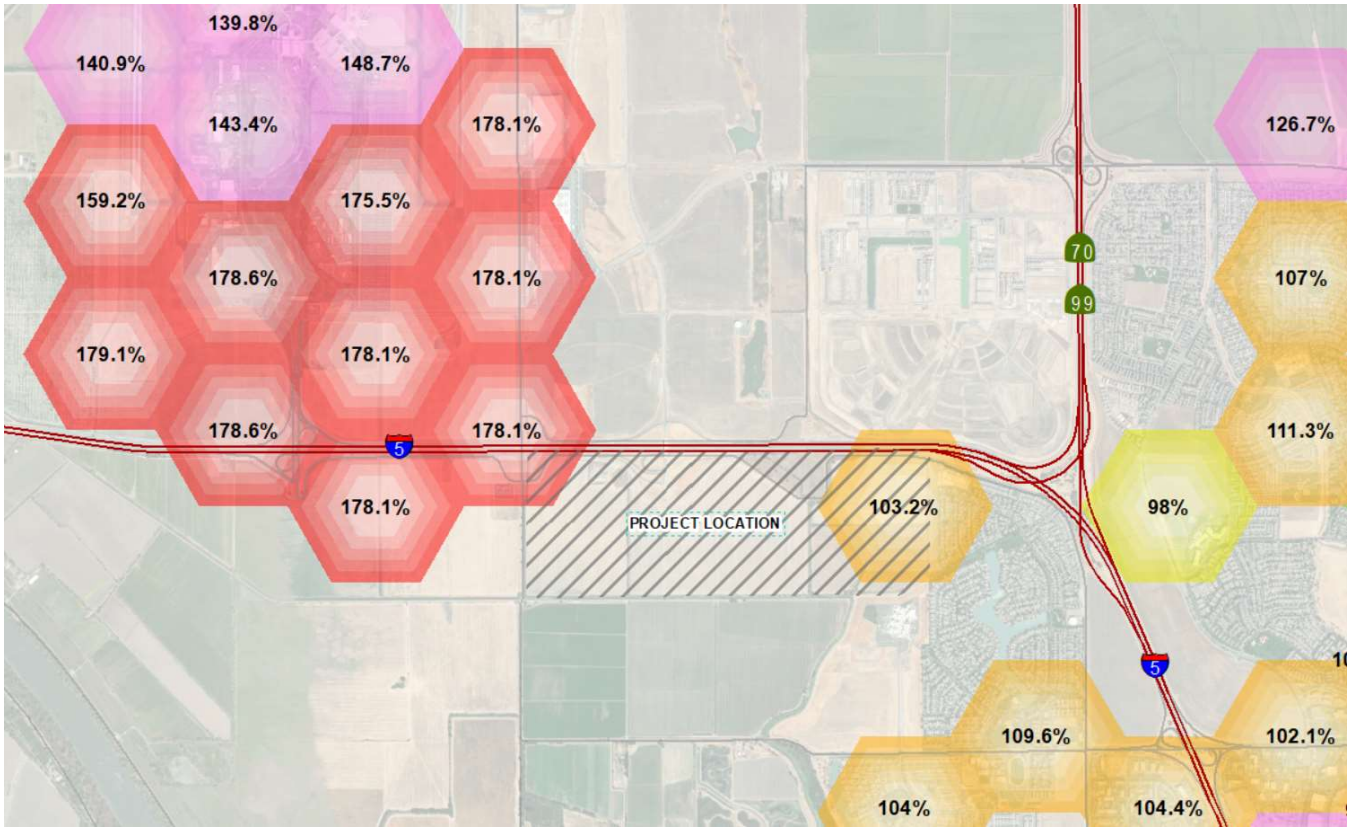

FIGURE 1: VMT EMPLOYMENT SCREENING MAP

Near the northwest corner of the project site, several hexagons are located at and adjacent to Sacramento International Airport. The VMT per employee is shown as 178% of the regional average. The SACOG screening map does not provide information for most of Metro Airpark, as the calculations are based upon 2016 conditions. Based upon this information, the industrial portion of the project does not meet the screening criteria.

TRAVEL DEMAND MODEL ANALYSIS

TRAVEL DEMAND MODEL

The CEQA VMT analysis is based on the latest SACOG SACSIM-19 activity-based travel demand model (ABM) including scripts prepared by SACOG for this very analysis purpose. The analysis is tour-based, meaning that the analysis fully accounts for trips that are linked to trips that start or end at the project. This means that intermediate trips, such as those occurring after someone has left the project area, such as a trip to pick-up lunch while at work, are accounted for in this analysis.

Based on the latest SACOG model scripts, SACSIM-19 also reflects the entire trip length, including the portion of the trip that occurs outside the SACOG region. External-internal and internal-external

VMT is calculated via a script file provided by SACOG and included in their model for VMT post-processing. The post-processor determines the added VMT that occurs outside the SACOG region (i.e., for trips that either start or end outside of the region). This interregional VMT is then added to the internal-internal VMT to determine the total VMT. Consistent with OPR guidelines, only automobile trips are considered as a part of this analysis. Heavy-duty truck and delivery vehicle VMT as well as alternative mode VMT (transit vehicles) are not reflected.

PROJECT USE (VMT PER EMPLOYEE METRIC)

For work-based land uses of the proposed project, SACSIM-19 was used with a modified version of the SACOG script to meet guidance from the Office of Planning and Research (OPR) as previously discussed. A regional baseline (2016) average VMT per employee metric was used to establish the threshold set at 100% of the regional average.

For the industrial portion of the project, the average VMT is calculated as 128% of the regional average.

HIGHWAY COMMERCIAL VMT ANALYSIS

The highway commercial area of the project includes the uses shown in **Table 1**.

TABLE 1: HIGHWAY COMMERCIAL LAND USE SUMMARY

PARCEL	USE	PARCEL SIZE (ACRES)	BUILDING SIZE (SQUARE FEET)
6A	Restaurant	2.1	3,900
6B	Restaurant	1.5	3,900
6C	Fueling Station / Carwash	3.0	8,100
7A	Hotel	4.0	73,400
7B	Restaurant	1.5	3,900
7C	Restaurant	1.3	5,000

Source: Wood Rodgers, June 20, 2022.

- The proposed uses are ubiquitous throughout the area, with many competitors at nearby I-5 interchanges (Del Paso Road and Arena Boulevard). This includes restaurants, fueling stations, carwashes, convenience stores, and hotels.
- The highway commercial uses would serve travelers and employees associated with Sacramento International Airport. These trips could reduce VMT by potentially diverting a trip from a destination located farther from the airport.
- The highway commercial uses would also serve the industrial uses of the project, as well as the development of Metro Airpark. These trips could reduce VMT by potentially diverting a trip from a destination located farther from the project and Metro Airpark.
- With the exception of the hotel, all of the projects are less than 50,000 square feet, which is a "rule of thumb" for VMT screening of retail projects.

VMT IMPACT

INDUSTRIAL USES

The travel model VMT analysis estimates the average VMT of the industrial uses as 128% of the regional average. This is a significant impact.

HIGHWAY COMMERCIAL USES

Based upon the nature of the highway commercial uses, it is concluded that the highway commercial uses meet the retail screening criteria. This is a less-than-significant impact.

APPENDIX Q

AVDIS & CUCCHI, LLP
LAND USE + REAL ESTATE + ADVOCACY

DRAFT MEMORANDUM

DATE: September 26, 2023

TO: Pelle Clarke, Senior Engineer

FROM: Daniel S. Cucchi, Attorney for Applicant

CC: Nick S. Avdis, Attorney for Applicant

SUBJECT: P21-017 Airport South Industrial - VMT Mitigation Measures

I. Introduction & Background

The intent of this memo is to outline the P21-017 Airport South Industrial Vehicle Miles Traveled (VMT) mitigation approach and corresponding calculations for the project. The project proposes to develop approximately 470 acres of vacant land for industrial and commercial uses in North Natomas that would be annexed into the City of Sacramento. The project is located south of I-5 and west of the Westlake community. The proposed project would connect to the I-5 Metro Air Parkway interchange as well as Powerline Road to the west and Bayou Way to the east.

Per the DKS Draft VMT Analysis dated March 10, 2023, the proposed project would result in an average VMT calculated as 128% of the regional average and is considered a significant impact. Since the Office of Planning and Research (OPR) does not specify a particular significance threshold for industrial employment, OPR recommends local jurisdictions to determine this threshold based on local conditions. Local jurisdictions in the region such as Sacramento County and City of Rancho Cordova have determined the significance threshold for industrial employment as 100% of regional average. Consistent with nearby jurisdictions, the City has established the significance threshold of 100% of regional average for industrial uses. With the 100% significance threshold, the project is required to mitigate **22%** (1-1.00/1.28 = 0.22) to achieve a less-than significant impact for VMT. Consistent with SB 743, OPR's Technical Advisory, and California Air Pollution Control Officers Association (CAPCOA), the proposed project is required to mitigate VMT utilizing CAPCOA's Handbook for Analyzing Greenhouse Gas Emission Reductions, Assessing Climate Vulnerabilities, and Advancing Health and Equity dated December 2021 (CAPCOA 2021 Handbook).

The applicant iproposes a mitigation measure which allows for the owner/operator of a building (or set of buildings) within the project site, prior to the issuance of a certificate of occupancy, to submit and receive City approval of a VMT Reduction Plan that includes a commitment to implement a selection of VMT reduction strategies (listed below) from the CAPCOA 2021 Handbook, totaling at or more than a 22% reduction in VMT for the covered building sites. The proposed VMT reduction plan must comply with the CAPCOA rules to prevent double-counting, and provide documentation calculating the VMT reduction value of each adopted measure as applied to the specific building site(s) and operations.

II. CAPCOA Transportation Quantitative GHG Reduction Measures

CAPCOA's 2021 Handbook outlines the quantitative reduction measures that can be used to mitigate VMT impacts. There are 6 categories within the Transportation section with corresponding subsections for quantifying VMT mitigation measures.

Below are the 6 categories:

1. Land Use
2. Trip Reduction Programs
3. Parking or Road Pricing/Management
4. Neighborhood Design
5. Transit
6. Clean Vehicles and Fuels

Given the largely industrial and highway commercial nature of the project and no existing or planned transit within the project's vicinity, all but the **Trip Reduction Programs** category can be eliminated when identifying applicable VMT mitigation measures for the project. Below are mitigation options within the Trip Reduction Programs category with its subsequent maximum percentages to reduce VMT, as calculated below in this memorandum:

- T-6 Implement Commute Trip Reduction Program (Mandatory Implementation & Monitoring) – 26%
- T-7 Implement Commute Trip Reduction Marketing – 4%
- T-8 Provide Ridesharing Program – 8%
- T-9 Implement Subsidized or Discounted Transit Program – 1.2%
- T-10 Provide End-of-Trip Bicycle Facilities – 2.5%
- T-11 Provide Employer-Sponsored Vanpool – 1.4%
- T-12 Price Workplace Parking – 20%
- T-13 Implement Employee Parking Cash-Out – 12%

While the Trip Reduction Programs category allows for mitigating VMT up to a maximum of 45%, it also identifies additional limitations for quantifying the mitigation percentages to reduce VMT. Each subsector of mitigation options identifies how some mitigation options have mutually exclusive measures, as well as expanded mitigation options. The mutually exclusive measures identify which measures cannot be credited together as it would be considered double counting.

III. Limitations to Avoid Double-Counting

As identified in CAPCOA's 2021 Handbook, T-6 requires the implementation of a Commute Trip Reduction (CTR) Program that allows for a maximum of 26% for mitigating VMT. Within the implementation requirements, it explicitly outlines T-7 through T-11 cannot be used with this option. The mandatory CTR includes T-7 through T-11 and therefore cannot be added if T-6 is used. The

expanded mitigation options for T-6 are identified to be T-12 or T-13 (cannot be both). Below is a list of implementation requirements for T-7 through T-11:

- T-7 Implement Commute Trip Reduction Marketing
    - Onsite or online commuter information services
    - Employee transportation coordinators
    - Onsite or online transit pass sales
    - Guaranteed ride home services
- T-8 Provide Ridesharing Program
    - Ridesharing must be promoted through a multifaceted approach
    - Designating a certain percentage of desirable parking spaces for ridesharing vehicles
    - Designating adequate passenger loading and unloading and waiting areas for ridesharing vehicles
    - Providing an app or website for coordinating rides
- T-9 Implement Subsidized or Discounted Transit Program
    - The project should be accessible either within 1 mile of high-quality transit service, 0.5 mile of local or less frequent transit service, or along a designated shuttle route providing last-mile connections to rail service
- T-10 Provide End-of-Trip Bicycle Facilities
    - End-of trip facilities should be installed at a size proportional to the number of commuting bicyclists and regularly maintained
- T-11 Provide Employer-Sponsored Vanpool
    - Vanpool programs are more appropriate for the building occupant or tenant to implement and monitor than the building owner or developer

Thus, an operator may select T-6, but cannot also select any of T-7 through T-11. Furthermore, an operator cannot select both T-12 and T-13, regardless of whether they select T-6, or one or more of T-7 through T-11.

IV. Sample Calculations For Trip Reduction Programs T-6 Through T-13

GHG Calculations for T-6

Following the GHG formula and variables for T-6, the following calculations are provided below with representation of the corresponding variables:

$$GHG\ Reduction\ Formula: A = B \times C \times D$$

ID	Variable	Value	Unit	Source
A	Percent reduction in GHG emissions from project/site employee commute VMT	0 – 26.0	%	calculated
B	Percent of employees eligible for program	0 – 100	%	User input
C	Percent reduction in vehicle mode share in employee commute trips	-26	%	Nelson\Nygaard Consulting Associates 2015
D	Adjustment from vehicle mode share to commute VMT	1	unitless	assumed

$$A = 1\ x\ (-0.26)\ x\ 1 = -\mathbf{26}\%$$

With the recommendation in CAPCOA for 100% for variable B, the resulting maximum percentage for reduction is **-26%** for mitigating VMT.

GHG Calculations for T-7

Following the GHG formula and variables for T-7, the following calculations are provided below with representation of the corresponding variables:

$$GHG\ Reduction\ Formula: A = B\ x\ C\ x\ D$$

ID	Variable	Value	Unit	Source
A	Percent reduction in GHG emissions from project/site employee commute VMT	0 – 4.0	%	calculated
B	Percent of employees eligible for program	0 – 100	%	User input
C	Percent reduction in employee commute vehicle trips	-4	%	TRB 2010
D	Adjustment from vehicle trips to VMT	1	unitless	assumed

$$A = 1\ x\ (-0.04)\ x\ 1 = -\mathbf{4}\%$$

With the recommendation in CAPCOA for 100% for variable B, the resulting maximum percentage for reduction is **-4%** for mitigating VMT.

GHG Calculations for T-8

Following the GHG formula and variables for T-8, the following calculations are provided below with representation of the corresponding variables:

$$GHG\ Reduction\ Formula: A = B\ x\ C$$

ID	Variable	Value	Unit	Source
A	Percent reduction in GHG emissions from project/site employee commute VMT	0 – 8.0	%	calculated
B	Percent of employees eligible for program	0 – 100	%	User input
C	Percent reduction in employee commute VMT	-8 (Urban)	%	SANDAG 2015

$$A = 1\ x\ (-0.08)\ x\ 1 = -\mathbf{8}\%$$

With the recommendation in CAPCOA for 100% for variable B, the resulting maximum percentage for reduction is **-8%** for mitigating VMT.

GHG Calculations for T-9

Following the GHG formula and variables for T-9, the following calculations are provided below with representation of the corresponding variables:

$$GHG\ Reduction\ Formula: A = (C/B) \times G \times D \times E \times F \times H \times I$$

ID	Variable	Value	Unit	Source
A	Percent reduction in GHG emissions from employee vehicles accessing the site	0 – 5.5	%	calculated
B	Average transit fare without subsidy	$100/mo.	$	User input
C	Subsidy Amount	$100/mo.	$	User input
D	Percent of employees eligible for subsidy	0 – 100	%	User input
E	Percent of project-generated VMT from employees	0 – 100	%	User input
F	Transit mode share of work trips	5.44% (Table T-9.1)	%	FHWA 2017
G	Elasticity of transit boardings with respect to transit fare price	-0.43	unitless	Taylor et al. 2008
H	Percent of transit trips that would otherwise be made in a vehicle	50	%	Handy & Boarnet 2013
I	Conversion factor of vehicle trips to VMT	1	unitless	assumption

$$A = (100/100 \times -0.43) \times 1 \times 1 \times 0.0544 \times 0.50 \times I$$

With the recommendation in CAPCOA for 100% for variables D and E, the resulting maximum percentage for reduction is **-1.2%** for mitigating VMT.

GHG Calculations for T-10

Following the GHG formula and variables for T-10, the following calculations are provided below with representation of the corresponding variables:

$$GHG\ Reduction\ Formula: A = [C\ x\ (E - (B\ x\ E))] / (D\ x\ F)$$

ID	Variable	Value	Unit	Source
A	Percent reduction in GHG emissions from employee project/site commute VMT	0 .1 – 4.4	%	calculated
B	Bike mode adjustment factor	1.78 or 4.86	%	Buehler 2012
C	Existing bicycle trip length for all trips in region	2.9	miles	FHWA 2017a
D	Existing vehicle trip length for all trips in region	10.9	miles	FHWA 2017a
E	Existing bicycle mode share for work trips in region	2.2	%	FHWA 2017b
F	Existing vehicle mode share for work trips in region	89.5	%	FHWA 2017b

$$A = [(2.9\ x\ (.022 - (4.86\ x\ .022))] / (10.9\ x\ .895) = -\mathbf{2.5}\%$$

The resulting maximum percentage for reduction is **-2.5%** for mitigating VMT (assuming facilities include bike parking, showers, and lockers).

GHG Calculations for T-11

Following the GHG formula and variables for T-11, the following calculations are provided below with representation of the corresponding variables:

$$GHG\ Reduction\ Formula: A = (((1 - B)\ x\ C) + (B\ x\ (D / E)) / C) - 1$$

ID	Variable	Value	Unit	Source
A	Percent reduction in project/site employee commute VMT	3.4 – 20.4	%	calculated
B	Percent of employees that participate in van pool program	2.7	%	SANDAG 2019
C	Average length of one-way vehicle commute trip in region	14.23	miles per trip	FHWA 2017
D	Average length of one-way vanpool commute trip	42	miles per trip	SANDAG 2019
E	Average vanpool occupancy (including driver)	6.25	occupants	SANDAG 2019

$$A = (((1 - .027)\ x\ 14.23) + (.027\ x\ (42 / 6.25)) / 14.23) - 1 = -\mathbf{1.4}\%$$

The resulting maximum percentage for reduction is **-1.4%** for mitigating VMT.

GHG Calculations for T-12

Following the GHG formula and variables for T-12, the following calculations are provided below with representation of the corresponding variables:

$$GHG\ Reduction\ Formula: A = ((B - C) / C)\ x\ E\ x\ D\ x\ F$$

ID	Variable	Value	Unit	Source
A	Percent reduction in GHG emissions from employee commute VMT	0 – 20.0	%	calculated
B	Proposed parking price	100/mo	$	user input
C	Baseline parking price	0	$	user input
D	Share of employees paying for parking	100	%	user input
E	Elasticity of parking demand with respecting to parking price	-0.4	unitless	Lehner & Peer 2019
F	Ratio of vehicle trip reduction to VMT	1	unitless	assumption

$$A = .50\ x\ \text{-}0.4\ x\ 1\ \text{x}\ 1 = -\mathbf{20}\%$$

Because the maximum allowed price increase of 50% is lower than the maximum increase for a new build project which by definition is 100%, the formula replaces the price increase calculation ([B – C] / C), with 50%. The resulting maximum percentage for reduction is **-20%** for mitigating VMT.

GHG Calculations for T-13

Following the GHG formula and variables for T-13, the following calculations are provided below with representation of the corresponding variables:

$$GHG\ Reduction\ Formula: A = B\ x\ C$$

ID	Variable	Value	Unit	Source
A	Percent reduction in GHG emissions from project/site commute VMT	0 – 12.0	%	calculated
B	Percent of employees eligible	100	%	User input
C	Percent reduction in commute VMT from implementation of measure	-26	%	Shoup 2005

$$A = 1\ x\ -0.12 = -\mathbf{12}\%$$

With the recommendation in CAPCOA for 100% for variable B, the resulting maximum percentage for reduction is **-12%** for mitigating VMT.

V. Viability of VMT Reduction Plan Mitigation Strategy

Some of the above Trip Reduction Programs discussed above include variables that are determined by data provided by CAPCOA for the region where the project site is located. Data provided by CAPCOA for the Sacramento Region was used as the input for that variable. In all other cases involving a variable, the applicant has the discretion to select the input (e.g., how many employees are eligible), and can therefore control the relative VMT reduction value of the selected Trip Reduction Programs.

Thus, applying the double-counting rules, and the calculated values of each of the available VMT Reduction Programs for the Sacramento Region, an operator can achieve a 22% reduction target in several different ways.

For instance, an operator may select T-6 (Maximum 26% reduction), T-6 and T-12 (Maximum 45% reduction), or T-6 and T-13 (Maximum 38% reduction), each of which is capable of meeting the mitigation requirements of a minimum 22% VMT reduction. Alternatively, an operator may select T-12 and one or more of T-7 through T-11 (maximum 37.1% reduction), or select T-13 and at least two or more of T-7 through T-11 (maximum 29.1% reduction), either of which are also capable of meeting the mitigation requirements for a minimum 22% VMT reduction. Thus, the operator has full control to ensure the selected Trip Reduction Programs will be able to meet the required -22% reduction target.

VI. Conclusion

Based on the CAPCOA calculations for T-6 through T-13 under the Trip Reduction Programs subsector, the project would be able to mitigate the **128%** VMT impact to be less-than significant through the selection of multiple Trip Reduction Programs to achieve a minimum **-22% VMT** reduction. The owner/operator of each building site(s) shall be required to submit for approval and implement a VMT Reduction Plan that includes a sufficient selection of Trip Reduction Programs T-6 through T-13, while complying with the double-counting rules and providing building site(s) specific calculations, to reduce VMT by at least 22%. Please see attached Appendices for excerpts from the CAPCOA Handbook for additional guidance on the calculations presented in this memo. The full Transportation Chapter of the CAPCOA Handbook can be found through the following link: https://www.caleemod.com/handbook/chapter_3_1transportation.html.
