The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

I agree with the Last Chance Alliance's message below. Moreover, the project of California Resources Corporation is doomed, given the Environmental Emergency we are now in. But it will save the incomes of the carbon combustion industries in our state. It might, in time, drain away tax dollars in state and federal government to repair the damages it causes in fires from escaped gas. Please read on and vote against the project.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

About a decade ago I met people from Kern Co. who could not drink the water because it was contaminated by fracking. As an agricultural area, it is also important not to contaminate crops with contaminated water.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman:

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Sincerely,
Richard L. Boyce

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Water sources and aquifers in Kern County are already stressed and falling. Adding compressed CO2 to the ground will exacerbate this and threaten people who live nearby.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

I experienced Kern County's air pollution problem when I performed in Bakersfield some years ago. I thought I was coming down with the flu, but it was drift from aerial crop spraying. This project will just produce more pollution.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy - the thing our economy and our environment desperately need. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon. It's astonishing that anyone would consider this an appropriate place to try to store CO2.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety. How is this considered just or appropriate - or even efficient?!

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death. Putting lives at risk for a fossil-fuel industry boondoggle is unacceptable.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

Carbon TerraVault I is a terrible plan, for so many reasons. For the sake of our air, water, health, and climate, I urge you to reject this dangerous greenwash project.

Thank you for the work you do to keep us all safe, to (hopefully) help us stop the devastating effects of climate change.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

On behalf of all Californians, I request that you reject a dangerous carbon capture project. Kern County and indeed, our entire state, is already inundated with toxic sites as a result of fossil fuel projects.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

Carbon capture is a false solution to the climate crisis. We need, instead, to be phasing out fossil fuel use ASAP by investing in clean, abundant and affordable wind and solar power. These are true renewables and, along with storage, provide a truly sustainable future for our progeny.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

On the one hand, this industry is aware of and concerned about the problems inherent in our overproduction of obnoxious and detrimental waste is encouraging, but this solution lacks the reality other options should be considered. For example, capture and filter all this waste before it leaves the industry's site.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Plus, most CO2 captured is used to stimulate production of more oil. Is this the plan? Will it be a plan sneaked in later.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

Please do not proceed with this project. It is nothing more than a dangerous distraction that will prolong the fossil fuels and divert critical resources away from renewable, sustainable energy. Not only that, but the project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

i do not support the carbon capture project. It is far too dangerous and the money spent should go to renewable energy projects.

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

Dear Kern County Planning and Natural Resources Department,

I am writing to oppose the Kern County Carbon Capture project. As someone who lives in rural California (Amador County), I am afraid that this project will set a dangerous precedent for residents across the state.

Not only is CCS unsafe for our neighbors (CO_2 Storage and pipelines are notoriously dangerous - In the event of a carbon pipeline rupture or leak, an explosive plume of CO_2 gas can emerge, odorless and colorless, which would suffocate all beings within range and prevent combustion vehicles like cars from starting to enable an escape to safety) BUT ALSO... CSS is not actually a climate solution!!! It regularly fails to live up to its promises.

For example in Australia, Chevron promised its CCS project would capture 80% of CO_2 emissions but captured less than half—only 30%. A Canadian CCS plant actually emitted more greenhouse gases than it captured. The uncaptured CO_2 is emitted into the air, making the climate crisis worse. The project also won't capture emissions from sourcing, transporting and storing the CO_2, and those emissions add up.

The money you would allocate to this project is better spent on phasing out oil & gas projects, investing in renewable energy and biodiversity initiatives.

Thank you for your consideration.
N

To the Kern County Planning and Natural Resources Department,

I am writing to voice my opposition to the Kern County Carbon Capture project.

First and foremost, there are criticisms regarding the effectiveness of CCS. No plant has achieved promised carbon capture levels, and significant amounts are used to extract more oil, diverting funds from proven climate solutions.

Secondly, there are safety issues associated with CO2 storage and pipelines, including the potential for explosive plumes that can be harmful and impede escape routes.

Lastly, the project's financial risks are troubling, given the owner's previous bankruptcy filing in 2020. Another bankruptcy could burden taxpayers with environmental cleanup costs.

This project must not be allowed to go ahead and pose as a climate solution when it is in fact nothing of the sort.

Thank you for your attention.

Best regards,
Pavle Cajic

Subject: Regarding the Kern County Carbon Capture Project

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

To Whom It May Concern:

I am writing regarding the planned Kern County Carbon Capture Project. There are a number of elements of the project that deeply concern me as a California resident, a young person, and a research professional in the field of environmental economics.

Carbon capture is far from the most cost effective method for mitigating emissions, and merely enables prolonged extraction of fossil fuels when the only known avenue for averting the worst effects of climate change is through decarbonizing the economy. CC projects routinely capture less carbon than promised, and the unknown potential knock-on effects are manifold. Carbon captured and stored underground can seep back into the atmosphere, contaminate groundwater, and induce seismic activity. This risks investing in entirely ineffective–even deleterious–projects all while allowing the California Resource Corporation to incorrectly include the supposedly sequestered carbon in any accounting of their progress on emissions, thereby enabling them to misrepresent their environmental impact even when the long term efficacy is unknown.

Moreover, the California Resource Corporation recently filed for bankruptcy, introducing the distinct possibility that the financial liability for the project will fall to taxpayers. This allocation of potential profit to private corporations and risk to the public lies at the heart of the private sector's inaction on the climate crisis, and so long as local governments enables this dynamic, the private sector will be shielded from the market forces that should be forcing them to decarbonize due to concerns over long term profits and stranded assets.

Best,
Stephanie Stewart

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

Hello,

I would like to post a comment on the plan for the Kern County Carbon Capture. CO2 storage and pipelines are dangerous in the event of a rupture or leak could suffocate animals and humans in the area. This is not a smart solution given its safety issues and likelihood that it will capture the amount of carbon pledged. Also, the carbon captured should not be used to extract more oil which is often the case. This directs money away from more effective climate solutions like moving toward renewable energy sources which is an imperative to protect our planet from climate catastrophe.

Thank you for your consideration,
Susan Sepanik

Subject: Reject CCS proposal -- Carbon TerraVault I (Kern County) CCS Project by California Resources Corporation Draft Environmental Impact Report

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

Saturday, February 10, 2024

Kern County Planning and Natural Resources Department
ATTN: Keith Alvidrez, Planner II
2700 "M" Street, Suite 100, Bakersfield, CA 93301

Subject: Reject CCS proposal -- Carbon TerraVault I (Kern County) CCS Project by California Resources Corporation Draft Environmental Impact Report

To Kern County Planning and Natural Resources Department Director Lorelei Oviatt:

I strongly urge the Kern County Planning and Natural Resources Department to reject the proposed Carbon Capture Project. There are many reasons the Planning and Natural Resources Department should not allow this project to proceed, including:

Continued oil drilling worsens air quality and harms public health. Oil and gas production generates toxic air pollutants such as fine particulate matter (PM2.5) which causes an estimated 1200 premature deaths in the Valley every year. PM2.5 is also linked to heart disease and stroke, and they worsen asthma.

The CCS project is unsafe for nearby communities. It will store 40–50 million metric tons of carbon dioxide (CO_2) near Buttonwillow. If this CO_2 leaks, it could cause suffocation and death. A CO_2 pipeline leak in Mississippi led to the hospitalization of hundreds of people living in a town about half a mile away. And Buttonwillow is in a remote area. If there is a pipeline leak, residents would have to make a long journey to get to a hospital.

If a CO_2 leak comes into contact with groundwater, the water can be contaminated because CO_2 reacts chemically with water to become more acidic, so contaminants dissolve into it. Injecting CO_2 underground can also trigger earthquakes.

CCS is not a climate solution. It regularly fails to live up to its promises. For example in Australia, Chevron promised its CCS project would capture 80% of CO_2 emissions but captured less than half—only 30%. A Canadian CCS plant actually emitted more greenhouse gases than it captured. The uncaptured CO_2 is emitted into the air, making the climate crisis worse. The project also won't capture emissions from sourcing, transporting and storing the CO_2, and those emissions add up.

The project is a major financial risk. The project promises that it will store the captured carbon permanently. But the project owner, California Resources Corporation, has already filed for bankruptcy once, in 2020. There is a risk that the company could file for bankruptcy again, leaving environmental cleanup bills to taxpayers.

Thank you for your consideration of my comments. Please do NOT add my name to your mailing list. I will learn about future developments on this issue from other sources.

Sincerely,
Christopher Lish
San Rafael, CA

Subject: Carbon TerraVault I (Kern County) CCS Project (PP22405);

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

I am writing to you today on behalf of 350 Bay Area Action to oppose the approval of the Carbon TerraVault I (Kern County) CCS Project, for the following reasons:

The Central Valley, and Kern County in particular, is already heavily impacted by the oil and gas industry, and as a result, has the some of the worst air quality in California due to greenhouse gas emissions produced by that industry.

In addition, Kern County is also a significant agricultural region. The potential effect of this project on the agricultural sector is therefore an important consideration.

The EIR's Executive Summary, Table 1.1, states that this project would have a cumulative effect on:

1. Air Quality:

The project's total emissions would exceed the San Joaquin Valley Air Pollution Control District thresholds for nitrogen oxides (NOX), particulate matter with a diameter of 10 micrometers or less (PM10), and particulate matter with a diameter of 2.5 micrometers or less (PM2.5), for which the project region is nonattainment under an applicable federal or State ambient air quality standard. With the implementation of Mitigation Measure (MM) 4.3-1 and MM 4.3-8, the impact would remain **significant and unavoidable.**

2. Greenhouse gas emissions:

The project has the potential to generate GHG emissions, either directly or indirectly, that may have a significant impact on the environment and conflict with an applicable plan, policy, or regulation adopted for the purpose of reducing the emissions of GHGs. With the implementation of MM 4.8-1 and MM 4.8-2, the impact would remain **significant and unavoidable.**

The project's cumulative contribution to GHG emissions after implementation of the recommended mitigation measures would remain **cumulatively significant and unavoidable.**

3. Agricultural Resources:

The project, in combination with other existing or reasonably foreseeable projects, could result in cumulative impacts on agricultural resources. Because of the importance of the region's agricultural resources, the potential impacts related to the project's incremental contribution to the cumulative farmland conversion would be cumulatively considerable. The cumulative impacts of the project when combined with other known and unknown projects are **cumulatively significant and unavoidable**. All reasonable and feasible mitigation measures have been evaluated and included.

4. Hydrology and Water Quality:

The project, in combination with other existing or reasonably foreseeable projects, could result in cumulative impacts on hydraulic resources as they relate to groundwater supply. The Kern County Subbasin is currently overdrawn and the West Kern Water District's Groundwater Sustainability Plan has been deemed inadequate, along with the other Kern subbasin plans where other similar known and unknown projects could occur. The cumulative impacts of any use of groundwater in the area are considered **cumulatively significant and unavoidable** after all feasible and reasonable mitigation.

3. Biological Resources:

The project, in combination with other existing or reasonably foreseeable projects, could result in cumulative impacts on biological resources. Although the cumulative impacts from CCS projects would be less because of the CCS Surface Land Use restrictions, other clean energy projects that are sited in the valley portion of Kern County have the potential to impact species and reduce habitats. The cumulative impacts of the project when combined with other known and unknown projects are **cumulatively significant and unavoidable**. All reasonable and feasible mitigation measures have been evaluated and included.

All of these impacts show that the implementation of this Carbon Capture project would have a deleterious effect on Kern County's residents, its farmers and its ecosystem. In addition, carbon capture technology is notoriously expensive, dangerous, and ineffective. For these reasons too, this project must be rejected.

The following resources demonstrate why CCS is not a technology that should be implemented, whether in Kern County or anywhere:

A. **Over-Promising and Under-Delivering for Half a Century: CCS is still a risky and unproven technology:** Geoengineering Monitor, January 18, 2024. This report begins with a section titled Critical Updates on CCS (copied below), which are then explained in more detail in the body of the report.

1. Critical updates on CCS:

-
- **CCS**
- **is still far from being a viable climate solution:**
- Fossil fuel and other polluting industries are marketing CCS as a safe and effective, whilst hiding the real risks, long-term costs, and high failure rate associated with many CCS projects.
-
-
- **Flagship**
- **projects show that**
- **CCS is risky**:
- CCS is often presented as proven technology by referencing flagship projects, but the unforeseen problems and challenges they have encountered are rarely mentioned.
-
-
- **Larger**
- **CCS**
- **projects may cause larger problems:**

- Extensive research into numerous small-scale CCS projects has shown that subsurface conditions are unpredictable. It is therefore doubtful that CO2 will remain effectively and safely contained whatever it is injected into in larger CCS projects with significantly
- higher CO2 injection volumes.
-
-
- **Potential**
- **for GHG leaks remains a serious risk:** There
- is no evidence that CO2 injected into geological formations will remain there in the long term, and many of the companies developing CCS projects and claiming that it is safe are also
- releasing
- large amounts of methane,
- a potent GHG, from abandoned oil and gas fields.
-
-
- **Lack**
- **of clear responsibility for high follow-up costs:**
- A common theme in many new CCS projects currently being planned is the lack of clarity over how CO2injection sites will be monitored, and who will foot the costs in the event of leaks and other problems.
-
-
- **Huge**
- **number of projects in the pipeline do not prove the efficacy of the technology:**
- According to industry, the fact that there are hundreds of planned CCS projects shows that CCS is a functioning as a climate solution. However, the
- hundreds
- of CCS projects that have
- been cancelled or (prematurely) terminated are being ignored.
-
-
- ***"50-year***
- ***track record of over-promising and under-delivering"***:
- Despite the fact that research into CO2 capture and CCS has been around
- for 100 and 50 years respectively,
- and the billions
- of taxpayers' money that has been investedin
- CCS, companies claiming to be experts in the field still have little to show in terms of results. On top of this, emissions from fossil fuels
- reached
- a new record high in 2023,
- with CCS playing no visible role in mitigation efforts.
-
-
- **Inefficient,**
- **energy-hungry and costly**:
- Many of the large-scale CCS projects currently being planned will capture only a fraction of global CO2 emissions, whilst ignoring the additional emissions created by energy-intensive CCS processes. It is also still much more
- expensive
- to remove carbon from the atmosphere
- than to avoid emitting it in the first place.
-
-
- **Only**
- **viable if taxpayer-funded or used to generate additional revenue:**CCS

- projects are often only implemented by emission-intensive industries if they receive substantial taxpayer support, earn carbon credits, or increase oil production through Enhanced Oli Recovery (EOR).
-
-
- No
- **contribution to the 1.5°C target:**
- Many of the CCS projects that have been announced to date are only due to begin operations from the 2030s and onwards, and most have not yet received final investment decisions. In addition to the unproven effectiveness of CCS, the timing and scale of these
- projects mean that they cannot contribute
- to the Paris Agreement's 1.5°C target
- in any meaningful way.
-

B. The Cost of Carbon Capture is Staggering:

1. The Hill, 12/25/24l: https://thehill.com/opinion/energy-environment/4374061-the-environment-and-economy-cant-afford-trillion-dollar-carbon-capture/

C. Safeguards are needed: Leaks can kill, whether from ruptured pipelines or transit accidents: Hear from first responders to the Satartia, MS accident, Feb. 2020: https://www.youtube.com/watch?v=RfRytGe3tis

D. CCS projects should not be built before PHMSA issues regulations.
See this letter by several Congress members regarding PHMSA regulations: https://omar.house.gov/sites/evo-subsites/omar.house.gov/files/evo-media-document/rep.-omar-and-rep.-garcia-letter-to-pres.-biden-urging-co2-pipeline-moratorium-letter.pdf

E. See this Analysis of the pros and cons of CCS from One Earth Review:https://www.cell.com/one-earth/fulltext/S2590-3322(22)00044-6?_returnURL=https%3A%2F%2Flinkinghub.elsevier.com%2Fretrieve%2Fpii%2FS2590332222000446%3Fshowall%3Dtrue

Thank you for your consideration of these comments.

Very truly yours,

Re: Carbon TerraVault I Carbon Capture and Storage Project at Elk Hills Oil Field

To the Attention of the Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman:

The undersigned 77 organizations write to express our strong opposition to the Carbon TerraVault I carbon capture and storage (CCS) project at the Elk Hills oil field in Kern County.[1] We are deeply concerned that Carbon TerraVault I will deploy expensive, dangerous, and ultimately failed CCS technology to extend the life of dirty fossil fuel facilities in frontline communities that cannot afford any more pollution. Kern County already experiences the worst pollution in the nation due to intensive oil and gas activity and this project threatens to prolong that activity for decades longer–at the expense of local residents and California's transition to clean energy. As the first CCS project to undergo environmental review in the state, the inadequate analysis of potential impacts and appropriate mitigation measures for the project sets an unacceptable precedent that must not be rubber stamped. **We urge you to reject this project and invest in <u>real</u> clean energy solutions that advance California's air, climate, public health, and environmental justice goals.**

The Carbon TerraVault I project will derail California's transition away from fossil fuels: The project intends to capture millions of metric tons of carbon dioxide from numerous polluting sources for injection underground in a depleted oil and gas field over 26 years. While Kern County has stated the project will capture CO_2 from the Elk Hills field's operations, including the gas-fired plant that powers drilling activity at the field, EPA has indicated the project could also source carbon from a new blue hydrogen facility (or hydrogen derived from fossil gas) at the field.[2] The project will therefore extend the life of existing fossil fuel facilities and lead to the build-out of new facilities that will exacerbate the climate crisis and create more pollution in nearby Kern County communities including Buttonwillow, Taft, Tupman, and Bakersfield. By keeping the oil field and gas plant operating decades longer, this project flies in the face of California's climate goal of 85% direct emissions reductions by 2045.

Real world examples prove that CCS technology has not worked as promised despite decades of development and billions of dollars of investment. Carbon capture projects have repeatedly over-

[1] CEQA Project 2022030180 / Kern County PP22405; EPA docket number EPA-R09-OW-2023-0623.
[2] https://www.regulations.gov/docket/EPA-R09-OW-2023-0623

promised and under-delivered[3] on their capture rates while providing cover for polluting industries.[4] In addition to its repeated failures, carbon capture is *not necessary* as a climate solution, according to the Intergovernmental Panel on Climate Change.[5] Frontline communities in Kern County should not be used as a testing ground for flawed and unnecessary techno-fixes like carbon capture. In order to rapidly reduce greenhouse gas emissions and actually decarbonize–first and foremost in historically overburdened areas like Kern County–California must stop permitting projects that further entrench fossil fuels that are driving the climate crisis.

The Carbon TerraVault I project poses serious risks to public health, safety, and the environment in Kern County: The project will lead to a host of harmful impacts to the region, including impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species.

To name just a few examples, Elk Hills is one of the oldest and largest oil and gas fields in the state, with a large number of old wells that increase the potential for dangerous leaks from the storage site. The project's total air emissions would also exceed the San Joaquin Valley Air Pollution Control District's limits for nitrogen oxides, particulate matter with a diameter of 10 micrometers or less, and particulate matter with a diameter of 2.5 micrometers or less, for which the region is in nonattainment under an applicable federal or State ambient air quality standard. The project would also threaten local groundwater supplies by drawing groundwater from the Kern County subbasin for its operational needs, despite the fact water levels are already compromised in the subbasin and throughout the Central Valley.[6] And by relying on 13.2 miles of pipelines that will be as close as a few miles of sensitive locations like a local elementary school for transportation of the CO_2, the project is increasing the risk of dangerous leaks and ruptures that could harm nearby residents. These impacts have not been fully considered and mitigated.

The public and decisionmakers are still missing critical details about the Carbon TerraVault I project, which prevents a full accounting of potential impacts: Despite multiple requests from the public, neither the oil company or Kern County have clarified all the sources of CO_2 for the project. In addition to the Elk Hills field's operations, the gas plant that

[4] *See, e.g.*, The Guardian, "Carbon capture project is 'Band-Aid' to greenwash $10bn LNG plant, locals say" (Feb. 3, 2023), https://www.theguardian.com/environment/2023/feb/03/carbon-capture-gas-exports-rio-grande-lng-nextdecade. For example, in July 2021, Chevron admitted that its commercial-scale carbon capture project in Australia failed to meet its five-year capture target of 80% CO_2, and instead only captured 30%. IEFFA, "If Chevron, Exxon and Shell Can't Get Gorgon's Carbon Capture and Storage to Work, Who Can?" (April, 2022), https://ieefa.org/articles/if-chevron-exxon-and-shell-cant-get-gorgons-carbon-capture-and-storage-work-who-can.

[5] The IPCC-modeled pathway with the best chance of keeping warming at or below the target of 1.5°C makes no use of fossil fuels with carbon capture and storage (CCS) or bioenergy with carbon capture and storage (BECCS). IPCC, Summary for Policymakers in Global Warming of 1.5°C: An IPCC Special Report on the impacts of global warming of 1.5°C above pre-industrial levels and related global greenhouse gas emission pathways in the context of strengthening the global response to the threat of climate change, sustainable development, and efforts to eradicate poverty (2018) at 14, Section C.1.1., Figure SPM 3b (Pathway 1); *see also id.* at Ch. 2.3.3 and Table 2.SM.12. *See also* Center for International Environmental Law, Confronting the Myth of Carbon Free Fossil Fuels at 2, https://www.ciel.org/wp-content/uploads/2021/07/Confronting-the-Myth-of-Carbon-Free-Fossil-Fuels.pdf.

[6] According to the draft EIR, the subbasin, as a whole, has an overdraft of 324,326 acre-feet per year. Draft EIR at 4.19-2.

powers the field, and the new blue hydrogen facility, the oil company and County are moving forward with plans to build additional new sources of CO_2 for capture and storage at Elk Hills, including a renewable dimethyl ether production facility, a gasoline plant, and a waste-to-energy production facility.[7] Additional sources may further include CO_2 captured from a new hydrogen facility in Tulare County and transported via tanker trucks 65 miles south to Elk Hills.[8] While the list of potential sources continues to grow, none of these facilities are disclosed or analyzed in the environmental review documents available to the public.

Other important missing details include the state of the CO_2 during transport (e.g. liquid or supercritical), the location of compressor equipment, and wellbore data including well plugging information for the hundreds of existing wells in the Elk Hills field. Without these basic details, it is impossible to support key assumptions and conclusions underlying the project.

Conclusion

The Carbon TerraVault I CCS project would prolong the life of dirty fossil fuel facilities, threaten California's progress toward its climate and clean energy goals, and put frontline communities at risk in order to benefit one of the largest oil and gas companies in the state with a history of financial failures. This project sets the wrong precedent for our state. We urge you to reject this dangerous project.

Re: Carbon TerraVault 1 (Kern Co.) CCS Project

Dear Planning Dept:

I received 2 Notices of Public Hearing and Opportunity to Comment on this project from Kern Co. in the mail here in WA. Since I now live out of CA, I checked with the State Clearing House of the CA Governor's Office to confirm that I could submit comments on the EIR on the above project. The employee read the CEQA regs and asked some questions and called me back to tell me that I could submit comments on this potential environmental disaster in CA because I am "a member of the public". I lived in CA for 80 years before I moved up here, so I have submitted comments on many EIRs in several counties in CA during that time, including your county. Please include my comments in the EIR documents on this project now.

ENVIRONMENTAL ARGUMENTS AGAINST PROJECTS

Carbon capture trades off with other critical climate solutions

Carbon capture extends the fossil fuel era instead of ending it. By now, everyone who reads knows that fossil fuel pollution in the atmosphere is the major cause of this planet's current climate crisis. Therefore, stopping the use of fossil fuels and building up alternative environmental sources actually will be the causes for stopping global warming. KEEP ALL FOSSIL FUELS IN THE GROUND!!

Carbon capture is energy intensive

Such systems require building a new power plant to run the system, creating yet another source of air and carbon pollution. That undermines the whole goal of capturing carbon in the first place. Please include in your EIR on this project exactly what studies and data you have done that refutes this specific argument against CCS. Do you have any that are not funded or provided by CA Resources Corp. or Aera Energy or Chevron or Occidental Petroleum? Show them.

Carbon capture actually increases emissions

Environmental organizations report that, due to the larger amount of energy required to power carbon capture, plus the life cycle of fossil fuel, carbon capture in this country has actually put more CO2 into the atmosphere than it has removed. Please include this argument against CCS in your EIR evaluations and, if any, what facts and arguments have been published to refute it. These published refutations are there; your planning dept. needs to include them in a fair EIR.

Storage presents significant risks

Health risks to populations is a serious safety concern. Leaks from wells and pipes can contaminate the surrounding air (depending on direction of wind) and create serious health problems for residents (or visitors) – such as asphyxiation, seizures, loss of consciousness, and potentially death. A section of the 13 miles of CO2 pipeline to transport carbon dioxide passes dangerously close to McKittrick Elementary School. Kern Co. already has permitted many fossil fuel projects that have caused documented health problems for its residents, i.e. oil wells & drilling and "produced water", particularly near small town areas like McKittrick. How many Notices of Public Hearing on this project have been sent to the families living in McKittrick? Indicate your compliance with notice of this serious notification of potential health problems and what the McKittrick population said.

Well failure during injection or a blowout could result in a release of large amounts of CO2. Storage locations can leak CO2 when they are located near fossil fuel reservoirs which can and do provide ways for CO2 to escape to the surface and contaminate air, water, and ground. Drilling and injections can cause earthquakes. Kern Co. has a history of severe earthquakes already.

Carbon capture is an expensive failure

Environmental organizations report that in public and private investments over decades, there are no carbon capture successful projects – only huge failures. This is an reason for not starting yet another likely carbon capture project failure. Two of these failures are Petra Nova plant in TX and the San Juan Generating Station in NM. Include comparisons in the EIR that would show how this project could more likely be profitable (both in being cheaper and decreasing climate change).

PROCEDURAL ERRORS IN EIR REVIEW

It is procedure that spells much of the difference between rule of law and rule by whim.
Supreme Court Justice William O. Douglas, 1951

There is an error in Kern Co.'s procedures re notification. It says "We encourage the submittal of written comments by March 12, 2024, so that those comments may be considered when Staff formulates its recommendations ..." However, your 2 letters to me were postmarked on the very same day, March 12, 2024. This notification doesn't make sense. Is it timely? You do attempt to remedy the error somewhat by adding that "written comments may be submitted any time prior to, or at, the public hearing". So here are my timely comments.

There is no mention of Alternative 3 – Nature-Based Carbon Storage Alternative - as an Environmentally Superior Alternative on pages 1-22 to 1-23. Why not? Alternative 3 would both decrease CO2 emissions and at the same time build up alternative green energy sources.

Please include an analysis examining the Alt.3 Nature-Based Carbon Storage Alternative as the Environmentally Superior Alternative. Please be sure to display this analysis in charts for the public to see when they attend community meetings.

It is a hopeful action that you have actually created this Green Alternative. I certainly hope that Alternative 3 can win out in the end of this process as it actually would help to diminish the climate crisis instead of adding to it.

Sincerely yours,

Diane Marks

Carbon TerraVault Announces Two New Storage-Only Carbon Dioxide Management Agreements and Submission of Another Class VI Permit to the EPA

01 May, 2023

LONG BEACH, Calif.--(BUSINESS WIRE)-- California Resources Corporation (NYSE: CRC) today announced a storage-only Carbon Dioxide Management Agreement (CDMA) between Carbon TerraVault Holdings, LLC (CTV), a subsidiary of CRC that provides services including the capture, transport and storage of carbon dioxide (CO_2), and Yosemite Clean Energy, LLC (Yosemite). CRC also announced a second storage-only CDMA between CTV and InEnTec Inc. (InEnTec).

“2023 began on a good note for Carbon TerraVault as we continued to expand our carbon management storage capacity by submitting another Class VI permit to the EPA and entering into two additional Carbon Dioxide Management Agreements with reputable partners who are committed to energy transition in California,” said Mac McFarland, Chairman of the CTV Board. “We expect to receive a draft Class VI permit for CTV I by the end of the year and plan to further expand and diversify CTV’s portfolio of customers across the energy spectrum in the state of California.”

Francisco Leon, CRC’s President and Chief Executive Officer, added, “We are evaluating the strategic positioning of our carbon management business which could include a potential separation from our legacy oil and gas business. We are excited about CTV’s progress to date and believe a future separation could unlock additional value for our shareholders while continuing to help California achieve its climate goals.”

Primary Highlights

Skip to main content

- Submitted a Class VI permit to the EPA for 34 million metric tons (MMT) of CO_2 storage for CTV IV, bringing CTV's total potential permitted storage to 174 MMT
- Signed storage-only CDMAs with Yosemite Clean Energy, LLC and InEnTec Inc. for 40,000 and 100,000 metric tons per annum (MTPA) of CO_2 injection, respectively, bringing the total CTV injection rate to 610,000 MTPA with 200,000 MTPA targeted to Elk Hills reservoir and 410 MTPA targeted in the Sacramento basin area

Yosemite Clean Energy, LLC CDMA

In April 2023, CTV entered into a CDMA with Yosemite, a bioenergy development company that specializes in transforming farm and forest wood waste into carbon-negative hydrogen and renewable fuel, to sequester at least 40,000 MTPA of CO_2 at CTV carbon storage vaults from a new hydrogen plant to be constructed in Oroville, Northern California. Called the Yosemite Hydrogen Facility, the plant is expected to produce 24,000 kilogram (KG) per day of hydrogen. Over the next 10 years, Yosemite plans to construct two additional hydrogen facilities in California with similar technical and production characteristics.

The initial Yosemite Hydrogen Facility will utilize dual bed gasification technology to sustainably convert woody biomass waste from local forest and agricultural producers into syngas while the generated CO_2 will be captured and then stored permanently underground by CTV. Syngas is a combination of hydrogen, methane, CO_2, carbon monoxide, and other trace gases that is used to produce other fuels. California generates an estimated 50 million tons of forest and farm woody biomass waste annually, which when left to burn, decay, and decompose, emits immense amounts of greenhouse gases and black carbon, or soot, which is part of fine particulate air pollution. Yosemite's plans to sustainably convert biomass into syngas, from which carbon negative hydrogen is produced, is in line with California's leading emission targets as it transitions to a carbon neutral economy.

"We are excited to work with such an experienced renewable fuels partner that is dedicated to powering California's future," said Francisco Leon, CRC's President and Chief Executive Officer. "This new agreement underscores the need for CCS services to help reduce emissions in the state's rapidly growing new energy economy. It also expands CRC's carbon management business in Northern California and meaningfully demonstrates our dedication to helping decarbonize California across the full spectrum of the energy value chain."

Skip to main content

"California continues to lead the country in the development of innovative, sustainable and economically feasible solutions that help reduce its carbon emissions and transition to a carbon neutral economy," added Thomas Hobby, Yosemite's Chief Executive Officer. "Our green hydrogen facilities will not only help to sustainably convert existing biomass into commercial scale carbon negative hydrogen for the California fuel markets but will also support local farmers and forest landowners to further enhance their operations and better position them for the future. CTV's unique value proposition, leading CO_2 storage permitting process, storage asset position, and expertise provides us with confidence that we have found a solid partner in our quest for a sustainable, cleaner, more resilient environment for all Californians."

Highlights of the Yosemite CDMA include:

- The Yosemite Hydrogen Project is expected to produce 24,000 KG per day of hydrogen. This translates to an initial 80,000 MTPA of associated CO_2,40,000 MTPA of which will be used for Yosemite's internal needs and the other half will be permanently sequestered at CTV locations
- Yosemite has entered into a letter of intent for a master offtake agreement with Gunvor USA in an amount up to the facility's total hydrogen production
- The project is expected to be commercial by the beginning of 2026, aligning with CTV's goal of 5 million MTPA by the end of 2027
- Yosemite plans to deliver produced CO_2 to a CTV location via a fleet of low emissions trucks
- The project's location and CO_2 transportation method provides a unique opportunity for CTV to deliver CO_2 to various sequestration locations across California
- CTV will provide a CO_2 truck offloading facility and permanent CO_2 storage site in exchange for an injection fee on a per MT basis that fits within the previously disclosed economic type-curve for projects that require a storage-only solution
- CO_2 capture capital will be effectively eliminated as CO_2 capture equipment, the most capital-intensive portion of CCS projects, is incorporated into the base design of the new Yosemite hydrogen facility
- CTV will have the right to take a stake in the total outstanding equity of the project company that holds the hydrogen project
- CTV will have a right of first look to provide storage services for subsequent Yosemite hydrogen projects in California
- The CDMA frames the contractual terms between parties by outlining the material economics and terms of the project and includes conditions precedent to close. The

Skip to main content

CDMA provides a path for the parties to reach final definitive documents and a final investment decision (FID).

InEnTec, Inc. CDMA

In April 2023, the CTV entered into a CDMA with InEnTec, an industry leader in gasification systems that economically and responsibly turns the world's waste into valuable green products, fuels and energy.

The CDMA contemplates that InEnTec will build a new renewable dimethyl ether (rDME) production facility at CRC's Net Zero Industrial Park in Kern County California, and CTV will sequester initially at the minimum 100,000 MTPA of CO_2 from InEnTec's facility in the CTV I carbon storage vault. The rDME facility is expected to produce 80 to 100 tons per day of rDME from biomass and other waste materials to help support the decarbonization of California's economy and its transportation sector.

"This promising agreement between CTV and InEnTec provides an innovative approach to production of renewable fuel at the heart of the Kern County energy hub," said Francisco Leon, CRC's President and Chief Executive Officer. "Doubling our CO_2 supply commitments at CTV I in a matter of four months at our groundbreaking Elk Hills Net Zero Industrial Park further underscores the rising need for our carbon management solutions in California."

"InEnTec's proprietary technology will reduce CO_2 emissions from the production and use of transportation fuels and help California achieve its critically important climate goals," added Jeffrey E. Surma, InEnTec's President and Chief Executive Officer. "This facility will benefit from many synergies with CTV and solidify InEnTec's company growth plans as we work to help decarbonize both the transportation and industrial sectors of the U.S. economy."

Highlights of the InEnTec CDMA include:

- The rDME facility will use InEnTec's proprietary gasification technology to convert waste materials into high quality synthesis gas, and then convert the syngas into rDME using technology expected to be supplied by InEnTec's partner Verde Clean Fuels (NASDAQ: VGAS). The facility is expected to produce 80 to 100 TPD of rDME for use as transportation fuel and subsequently at the minimum 100,000 MTPA of associated CO_2 that will be permanently sequestered at CTV I
- InEnTec entered into a master offtake agreement with Superior Plus Energy Services Inc. (Superior) to supply Superior with rDME. Superior is a U.S. operating subsidiary of

Skip to main content

Superior Plus Corp. (TSX: SPB)

- Project FID is targeted in late 2024, with operations expected to begin in the first half of 2026
- The CDMA also provides InEnTec with a lease for 50 acres at the Elk Hills Net Zero Industrial Park to construct its facility
- CTV will provide infield transportation and a permanent CO_2 sequestration site at CTV I in exchange for an injection fee on a per ton basis that fits within the previously disclosed economic type-curve for projects that require a storage-only solution
- The project's location at the Elk Hills Net Zero Industrial Park will eliminate the need for long haul CO_2 transportation and certain midstream capital requirements
- CTV and InEnTec are discussing CRC's potential financial participation in the rDME facility, including potentially a significant equity stake
- The CDMA frames the contractual terms between parties by outlining the material economics and terms of the project and includes conditions precedent to close. The CDMA provides a path for the parties to reach final definitive documents and FID

About Carbon TerraVault

Carbon TerraVault Holdings, LLC (CTV), a subsidiary of CRC, provides services that include the capture, transport and storage of carbon dioxide for its customers. CTV is engaged in a series of CCS projects that inject CO_2 captured from industrial sources into depleted underground reservoirs and permanently store CO_2 deep underground. For more information about CTV, please visit www.carbonterravault.com.

About California Resources Corporation

California Resources Corporation (CRC) is an independent energy and carbon management company committed to energy transition. CRC produces some of the lowest carbon intensity oil in the US and is focused on maximizing the value of its land, mineral and technical resources for decarbonization efforts. For more information about CRC, please visit www.crc.com.

About Yosemite

Yosemite Clean Energy, LLC (Yosemite) is a bioenergy development company that specializes in transforming farm and forest wood waste into carbon-negative biofuels, including green hydrogen and renewable natural gas. Yosemite provides renewable solutions to California's transportation and broader energy sectors while reducing risk of wildfires, raising air quality, and creating jobs and economic stimulus in underserved rural

Skip to main content

communities. Over the last decade, these areas have experienced a significant rise in catastrophic wildfire due to mismanagement of the forests, causing billions of dollars of property and environmental damage. Yosemite is developing a network of biofuels plants that are partially owned by the forest and agricultural communities they serve. The company is at various stages of development planning on biofuels plants across the state of California. For further information, visit yosemiteclean.com.

About InEnTec

InEnTec Inc.(InEnTec) is an industry leader in gasification systems that provides solutions to economically and responsibly turn the world's waste into valuable green products, fuels, and energy. To learn more about InEnTec, please visit www.inentec.com.

Forward-Looking Statements

This document contains statements that CRC believes to be “forward-looking statements” within the meaning of Section 27A of the Securities Act of 1933 and Section 21E of the Securities Exchange Act of 1934. All statements other than historical facts are forward-looking statements, and include statements regarding CRC's future financial position, business strategy, projected revenues, earnings, costs, capital expenditures and plans and objectives of management for the future. Words such as "expect," “could,” “may,” "anticipate," "intend," "plan," “ability,” "believe," "seek," "see," "will," "would," “estimate,” “forecast,” "target," “guidance,” “outlook,” “opportunity” or “strategy” or similar expressions are generally intended to identify forward-looking statements. Such forward-looking statements are subject to risks and uncertainties that could cause actual results to differ materially from those expressed in, or implied by, such statements.

Although CRC believes the expectations and forecasts reflected in CRC's forward-looking statements are reasonable, they are inherently subject to numerous risks and uncertainties, most of which are difficult to predict and many of which are beyond CRC's control. No assurance can be given that such forward-looking statements will be correct or achieved or that the assumptions are accurate or will not change over time. Particular uncertainties that could cause CRC's actual results to be materially different than those expressed in CRC's forward-looking statements include:

- CRC’s ability to finalize definitive documents and reach a final investment decision with respect to Yosemite’s and InEnTec’s projects contemplated by their respective CDMAs;
- the ability of Yosemite’s and InEnTec’s projects to achieve expected production volumes and associated CO_2 generation and the ability of the CTV to sequester such CO_2 volumes, respectively;

Skip to main content

- CRC's ability to successfully execute on the construction of Yosemite's and InEnTec projects and other aspects of infrastructure projects and enter into third party contracts on contemplated terms;
- fluctuations in commodity prices and the potential for sustained low commodity prices;
- equipment, service or labor price inflation or unavailability;
- legislative or regulatory changes, including those related to (i) the management of energy, water, land, greenhouse gases (GHGs) or other emissions, (ii) the protection of health, safety and the environment, (iii) CRC's ability to claim and utilize tax credits or other incentives, or (v) the transportation, marketing and sale of CRC's products and CO_2;
- availability or timing of, or conditions imposed on, permits and approvals necessary for drilling or development activities and carbon management projects;
- changes in business strategy and CRC's capital plan;
- CRC's ability to realize the benefits contemplated by the business strategies and initiatives related to energy transition, including carbon capture and storage projects and other renewable energy efforts;
- CRC's ability to successfully identify, develop and finance carbon capture and storage projects and other renewable energy efforts, including those in connection with the CTV;
- global geopolitical, socio-demographic and economic trends and technological innovations;
- limitations on CRC's financial flexibility due to existing and future debt;
- insufficient cash flow to fund CRC's capital plan and other planned investments, stock repurchases and dividends;
- insufficient capital or lack of liquidity in the capital markets or inability to attract potential investors;
- limitations on transportation or storage capacity;
- CRC's ability to successfully gather and verify data regarding emissions, its environmental impacts and other initiatives;
- the compliance of various third parties with CRC's policies and procedures and legal requirements as well as contracts it enters into in connection with CRC's climate-related initiatives;
- climate-related conditions and weather events;
- disruptions due to accidents, mechanical failures, power outages, transportation or storage constraints, natural disasters, labor difficulties, cyber-attacks or other catastrophic events;

Skip to main content

- pandemics, epidemics, outbreaks, or other public health events, such as the COVID-19; and
- other factors discussed in Part I, Item 1A – Risk Factors in CRC's Annual Report on Form 10-K and its other SEC filings available at www.crc.com.

CRC cautions you not to place undue reliance on forward-looking statements contained in this document, which speak only as of the filing date, and CRC undertakes no obligation to update this information. This document may also contain information from third party sources. This data may involve a number of assumptions and limitations, and CRC has not independently verified them and do not warrant the accuracy or completeness of such third-party information.

Carbon TerraVault Provides Second Quarter 2023 Update

31 Jul, 2023

CTV Doubles the Storage Reservations at the CRC's Net Zero Industrial Park at Elk Hills Field and Announces the Submission of Another Class VI permit to the U.S. EPA

LONG BEACH, Calif.--(BUSINESS WIRE)-- California Resources Corporation (NYSE: CRC) today announced a storage-only Carbon Dioxide Management Agreement (CDMA) between Carbon TerraVault JV HoldCo, LLC (CTV JV), a subsidiary of CRC that provides services including the capture, transport and storage of carbon dioxide (CO_2), and Verde Clean Fuels Inc. (Verde), a company that utilizes an innovative and proprietary liquid fuels technology to produce renewable and lower-carbon intensity gasoline and other liquid fuels from feedstocks such as biomass, agricultural waste, or flared natural gas. CRC also more than doubled the expected sequestration volume of its previously announced Lone Cypress Energy Services, LLC, (Lone Cypress) blue hydrogen project.

"The Carbon TerraVault team continued to make substantial progress through the first half of the year, with four administratively complete EPA Class VI permit applications and 191 million metric tons (MMT) of CO_2 storage capacity submitted to EPA for Class VI permits to date. The team has executed five CDMAs with promising greenfield projects that can accelerate the new energy economy in California and leverage Carbon TerraVault's decarbonization solutions," said Francisco Leon, CRC's President and Chief Executive Officer. "The most recent expansion of the Lone Cypress blue hydrogen facility and our new partnership with Verde Clean Energy further demonstrates the benefits CRC's unique asset position and carbon management strategy can deliver to California's energy transition goals."

Skip to main content

Primary Highlights

- Signed storage-only CDMA with Verde for minimum volume commitment of 100 thousand metric tons per annum (KMTPA) of CO_2 injection
- Expanded its previously announced Lone Cypress blue hydrogen project to 205 KMTPA of associated CO_2 that will be permanently sequestered at CTV I reservoir
- CTV's total projected CO_2 injection rate under CDMAs now stands at 815 KMTPA with targeted 405 KMTPA in the San Joaquin Basin and 410 KMTPA in the Sacramento basin
- Submitted a 17 MMT Class VI permit to the EPA for CTV V CO_2 reservoir in the Sacramento Basin bringing CTV's total projected storage capacity with Class VI permits submitted the EPA to 191 MMT

Verde Clean Energy, LLC CDMA

In July 2023, CTV JV entered into a CDMA with Verde to sequester a minimum of 100 KMTPA of CO_2 at the CTV I carbon storage vault from a new renewable gasoline plant to be constructed at CRC's Net Zero Industrial Park at Elk Hills in Kern County, California. This new facility is expected to produce 21,000 gallons per day of renewable gasoline from biomass and other agricultural waste feedstock to help support decarbonization of California's economy and its transportation sector.

"Doubling the CO_2 storage opportunities under CDMAs at our CRC's Net Zero Industrial Park at Elk Hills field in a matter of eight months further underscores CRC's carbon management strategy and dedication to energy transition in California," said Leon. "This new agreement between CTV JV and Verde Clean Fuels provides an innovative approach to renewable fuels at the heart of energy development in the state, and further validates CRC's decarbonization efforts by a publicly traded company looking to expand in California."

"Traditional gasoline used today is refined from crude oil and makes up over half of greenhouse gas emissions from the U.S. transportation sector. We believe our proprietary technology and our scientific approach will further enable California's consumers of gasoline to seamlessly and materially participate in the decarbonization of our atmosphere and help achieve California's climate goals," said Ernest Miller, Verde Chief Executive Officer. "Our agreement with CTV solidifies our domestic growth ambitions and provides a concrete pathway to the decarbonization of the transportation sector with the leading carbon management business in the US."

Skip to main content

Highlights of Verde CDMA include:

- The renewable gasoline facility will employ Verde proprietary and innovative liquid fuels technology to convert synthetic gas (syngas) produced by InEnTec's gasification system, into renewable gasoline. The project is expected to produce more than 7.5 million gallons per year of renewable gasoline for use as transportation fuel. A minimum of 100 KMTPA of associated CO_2 is expected to be permanently sequestered at CTV I
- Project Final Investment Decision (FID) is targeted for 2025, with operations expected to begin in 2027
- The CDMA also provides Verde with a lease for 50 acres at CRC's Net Zero Industrial Park at Elk Hills field on which to construct its facility
- CTV JV will provide in-field transportation and a permanent CO_2 sequestration site at CTV I in exchange for an injection fee on a per MT basis that fits within the previously disclosed economic type-curve for projects that require a storage-only solution
- The project's location at the CRC's Net Zero Industrial Park will eliminate the need for long haul CO_2 transportation and reduce certain midstream capital requirements
- CTV JV and Verde are discussing CRC's potential financial participation in the RG facility, including potentially a significant equity stake
- The CDMA frames the contractual terms between parties by outlining the material economics and terms of the project and includes conditions precedent to close. The CDMA provides a path for the parties to reach final definitive documents and FID

About Carbon TerraVault

Carbon TerraVault Holdings, LLC (CTV), a subsidiary of CRC, provides services that include the capture, transport and storage of carbon dioxide for its customers. CTV is engaged in a series of CCS projects that inject CO_2 captured from industrial sources into depleted underground reservoirs and permanently store CO_2 deep underground. For more information about CTV, please visit www.carbonterravault.com.

About Carbon TerraVault Joint Venture

Carbon TerraVault Joint Venture is a carbon management partnership focused on carbon capture and sequestration development, and was formed between Carbon TerraVault, a subsidiary of CRC, and Brookfield Renewable. The CTV JV develops both infrastructure and storage assets required for CCS development in California. CRC owns 51% of the CTV JV with Brookfield Renewable owning the remaining 49% interest.

About California Resources Corporation

California Resources Corporation (CRC) is an independent energy and carbon management company committed to energy transition. CRC has some of the lowest carbon intensity production in the US and it is focused on maximizing the value of its land, mineral and technical resources for decarbonization by developing CCS and other emissions reducing projects. For more information about CRC, please visit www.crc.com.

About Lone Cypress Energy Services

Lone Cypress Energy Services, LLC is an independent energy company focused on the development and operation of infrastructure across the entire energy value chain. Headquartered in Tulsa, OK, Lone Cypress offers a full suite of technology-enabled solutions including project development, project management, EPC contracting, and asset operations. Lone Cypress specializes in the development of hydrogen generation and distribution projects, waste to energy plant solutions, and traditional oil and gas midstream facilities. For more information, please visit www.lonecypressenergyservices.com.

About Verde Clean Fuels, Inc

Verde Clean Fuels, Inc. (Verde) is a renewable energy company focused on the development of commercial production plants to convert syngas, derived from diverse biomass feedstocks, such as yard waste, agricultural waste, and sorted municipal solid waste, as well as stranded or flared natural gas (including renewable natural gas) into gasoline through its innovative and proprietary liquid fuels technology, the STG+® process. Through its STG+® process, Verde converts syngas into fully finished fuels that require no additional refining, such as Reformulated Blend-stock for Oxygenate Blending (“RBOB”) gasoline. To learn more about Verde, please visit www.verdecleanfuels.com.

CLIMATE CHANGE AND ENERGY

The world's on the verge of a carbon storage boom

Hundreds of looming projects will force communities to weigh the climate claims and environmental risks of capturing, moving, and storing carbon dioxide.

By James Temple

June 12, 2024

The Elk Hills oil field in Kern County, California.

ALAMY

Pump jacks and pipelines clutter the Elk Hills oil field of California, a scrubby stretch of land in the southern Central Valley that rests above one of the nation's richest deposits of fossil fuels.

Oil production has been steadily declining in the state for decades, as tech jobs have boomed and legislators have enacted rigorous environmental and climate rules. Companies, towns, and residents across Kern County, where the poverty rate hovers around 18%, have grown

increasingly desperate for new economic opportunities.

Late last year, California Resources Corporation (CRC), one of the state's largest oil and gas producers, secured draft permits from the US Environmental Protection Agency to develop a new type of well in the oil field, which it asserts would provide just that. If the company gets final approval from regulators, it intends to drill a series of boreholes down to a sprawling sedimentary formation roughly 6,000 feet below the surface, where it will inject tens of millions of metric tons of carbon dioxide to store it away forever.

They're likely to become California's first set of what are known as Class VI wells, designed specifically for sequestering the planet-warming greenhouse gas. But many, many similar carbon storage projects are on the way across the state, the US, and the world—a trend driven by growing government subsidies, looming national climate targets, and declining revenue and growth in traditional oil and gas activities.

Since the start of 2022, companies like CRC have submitted nearly 200 applications in the US alone to develop wells of this new type. That offers one of the clearest signs yet that capturing the carbon dioxide pollution from industrial and energy operations instead of releasing it into the atmosphere is about to become a much bigger business.

Proponents hope it's the start of a sort of oil boom in reverse, kick-starting a process through which the world will eventually bury more greenhouse gas than it adds to the atmosphere. They argue that embracing carbon capture and storage (CCS) is essential to any plan to rapidly slash emissions. This is, in part, because retrofitting the world's massive existing infrastructure with carbon dioxide–scrubbing equipment could be faster and easier than rebuilding every power plant and factory. CCS can be a particularly helpful way to cut emissions in certain heavy industries, like cement, fertilizer, and paper and pulp production, where we don't have scalable, affordable ways of producing crucial goods without releasing carbon dioxide.

Related Story

The growing signs of trouble for global carbon markets

Corporations are backing away from one of their favorite climate remedies as greenwashing concerns steadily mount.

"In the right context, CCS saves time, it saves money, and it lowers risks," says Julio Friedmann, chief scientist at Carbon Direct and previously the principal deputy assistant secretary for the Department of Energy's Office of Fossil Energy.

But opponents insist these efforts will prolong the life of fossil-fuel plants, allow air and water pollution to continue, and create new health and environmental risks that could disproportionately harm disadvantaged communities surrounding the projects, including those near the Elk Hills oil field.

"It's the oil majors that are proposing and funding a lot of these projects," says Catherine Garoupa, executive director of the Central Valley Air Quality Coalition, which has tracked a surge of applications for carbon storage projects throughout the district. "They see it as a way of extending business as usual and allowing them to be carbon neutral on paper while still doing the same old dirty practices."

A slow start

The US federal government began overseeing injection wells in the 1970s. A growing number of companies had begun injecting waste underground, sparking a torrent of water pollution lawsuits and the passage of several major laws designed to ensure clean drinking water. The EPA developed standards and rules for a variety of wells and waste types, including deep Class I wells for hazardous or even radioactive refuse and shallower Class V wells for non-hazardous fluids.

In 2010, amid federal efforts to create incentives for industries to capture more carbon dioxide, the agency added Class VI wells for CO_2 sequestration. To qualify, a proposed well site must have the appropriate geology, with a deep reservoir of porous rock that can accommodate carbon dioxide molecules sitting below a layer of nonporous "cap rock" like shale. The reservoir also needs to sit well below any groundwater aquifers, so that it won't contaminate drinking water supplies, and it must be far enough from fault lines to reduce the chances that earthquakes might crack open pathways for the greenhouse gas to escape.

The carbon sequestration program got off to a slow start. As of late 2021, there were only two Class VI injection wells in operation and 22 applications pending before regulators.

But there's been a flurry of proposals since—both to the EPA and to the three states that have secured permission to authorize such wells themselves, which include North Dakota, Wyoming, and Louisiana. The Clean Air Task Force, a Boston-based energy policy think tank keeping track of such projects, says there are now more than 200 pending applications.

What changed is the federal incentives. The Inflation Reduction Act of 2022 dramatically boosted the tax credits available for permanently storing carbon dioxide in geological formations, bumping it up from $50 a ton to $85 when it's captured from industrial and power plants. The credit rose from $50 to $180 a ton when the greenhouse gas is sourced from direct-air-capture facilities, a different technology that sucks greenhouse gas out of the air. Tax credits allow companies to directly reduce their federal tax obligations, which can cover the added expense of CCS across a growing number of sectors.

The separate Bipartisan Infrastructure Law also provided billions of dollars for carbon capture demonstration and pilot projects.

A tax credit windfall

CRC became an independent company in 2014, when Occidental Petroleum, one of the world's largest oil and gas producers, spun it off along with many of its California assets. But the new company quickly ran into financial difficulties, filing for bankruptcy protection in 2020 amid plummeting energy demand during the early stages of the covid-19 pandemic. It emerged several months later, after restructuring its debt, converting loans into equity, and raising new lines of credit.

The following year, CRC created a carbon management subsidiary, Carbon TerraVault, seizing an emerging opportunity to develop a new business around putting carbon dioxide back underground, whether for itself or for customers. The company says it was also motivated by the chance to "help advance the energy transition and curb rising global temperatures at 1.5 °C."

CRC didn't respond to inquiries from *MIT Technology Review*.

In its EPA application the company, based in Long Beach, California, says that hundreds of thousands of tons of carbon dioxide would initially be captured each year from a gas treatment facility in the Elk Hills area as well as a planned plant designed to produce hydrogen from natural gas. The gas is purified and compressed before it's pumped underground.

The company says the four wells for which it has secured draft permits could store nearly 1.5 million tons of carbon dioxide per year from those and other facilities, with a total capacity of 38 million tons over 26 years. CRC says the projects will create local jobs and help the state meet its pressing climate targets.

"We are committed to supporting the state in reaching carbon neutrality and developing a more sustainable future for all Californians," Francisco Leon, chief executive of CRC, said of the draft EPA decision in a statement.

Those wells, however, are just the start of the company's carbon management plans: Carbon TerraVault has applied to develop 27 additional wells for carbon storage across the state, including two more at Elk Hills, according to the EPA's permit tracker. If those are all approved and developed, it would transform the subsidiary into a major player in the emerging business of carbon storage—and set it up for a windfall in federal tax credits.

Carbon sequestration projects can qualify for 12 years of US subsidies. If Carbon TerraVault injects half a million tons of carbon dioxide into each of the 31 wells it has applied for over that time period, the projects could secure tax credits worth more than $15.8 billion.

That figure doesn't take inflation into account and assumes the company meets the most stringent requirements of the law and sources all the carbon dioxide from industrial facilities

and power plants. The number could rise significantly if the company injects more than that amount into wells, or if a significant share of the carbon dioxide is sourced through direct air capture.

Chevron, BP, ExxonMobil, and Archer Daniels Midland, a major producer of ethanol, have also submitted Class VI well applications to the EPA and could be poised to secure significant IRA subsidies as well.

To be sure, it takes years to secure regulatory permits, and not every proposed project will move forward in the end. The companies involved will still need to raise financing, add carbon capture equipment to polluting facilities, and in many cases build out carbon dioxide pipelines that require separate approvals. But the increased IRA tax credits could drive as much as 250 million metric tons of additional annual storage or use of carbon dioxide in the US by 2035, according to the latest figures from the Princeton-led REPEAT Project.

"It's a gold rush," Garoupa says. "It's being shoved down our throats as 'Oh, it's for climate goals.'" But if we're "not doing it judiciously and really trying to achieve real emissions reductions first," she adds, it's merely a distraction from the other types of climate action needed to prevent dangerous levels of warming.

Carbon accounting

Even if CCS can help drive down emissions in the aggregate, the net climate benefits from any given project will depend on a variety of factors, including how well it's developed and run—and what other changes it brings about throughout complex, interconnected energy systems over time.

Notably, adding carbon capture equipment to a plant doesn't trap all the climate pollution. Project developers are generally aiming for around 90%. So if you build a new project with CCS, you've increased emissions, not cut them, relative to the status quo.

In addition, the carbon capture process requires a lot of power to run, which may significantly increase emissions of greenhouse gas and other pollutants elsewhere by, for example, drawing on additional generation from natural-gas plants on the grid. Plus, the added tax incentives may make it profitable for a company to continue operating a fossil-fuel plant that it would otherwise have shut down or to run the facilities more hours of the day to generate more carbon dioxide to bury.

All the uncaptured emissions associated with those changes can reduce, if not wipe out, any carbon benefits from incorporating CCS, says Danny Cullenward, a senior fellow with the Kleinman Center for Energy Policy at the University of Pennsylvania.

But none of that matters as far as the carbon storage subsidies are concerned. Businesses could even use the savings to expand their traditional oil and gas operations, he says.

"It's not about the net climate impact—it's about the gross tons you stick under ground," Cullenward says of the tax credits.

A study last year raised a warning about how that could play out in the years to come, noting that the IRA may require the US to provide hundreds of billions to trillions of dollars in tax credits for power plants that add CCS. Under the scenarios explored, those projects could collectively deliver emissions reductions of as much as 24% or increases as high as 82%. The difference depends largely on how much the incentives alter energy production and the degree to which they extend the life of coal and natural-gas plants.

Coauthor Emily Grubert, an associate professor at Notre Dame and a former deputy assistant secretary at the Department of Energy, stressed that regulators must carefully consider these complex, cascading emissions impacts when weighing whether to approve such proposals.

"Not taking this seriously risks potentially trillions of dollars and billions of tonnes of [greenhouse-gas] emissions, not to mention the trust and goodwill of the American public, which is reasonably skeptical of these potentially critically important technologies," she wrote in an op-ed in the industry outlet *Utility Dive*.

Global goals

Other nations and regions are also accelerating efforts to capture and store carbon as part of their broader efforts to lower emissions and combat climate change. The EU, which has dedicated tens of billions of euros to accelerating the development of CCS, is working to develop the capacity to store 50 million tons of carbon dioxide per year by 2030, according to the Global CCS Institute's 2023 industry report.

Likewise, Japan hopes to sequester 240 million tons annually by 2050, while Saudi Arabia is aiming for 44 million tons by 2035. The industry trade group said there were 41 CCS projects in operation around the world at the time, with another 351 under development.

A handful of US facilities have been capturing carbon dioxide for decades for a variety of uses, including processing or producing natural gas, ammonia, and soda ash, which is used in soaps, cosmetics, baking soda, and other goods.

But Ben Grove, carbon storage manager at the Clean Air Task Force, says the increased subsidies in the IRA made CCS economical for many industry segments in the US, including: chemicals, petrochemicals, hydrogen, cement, oil, gas and ethanol refineries, and steel, at least on the low end of the estimated cost ranges.

In many cases, the available subsidies still won't fully cover the added cost of CCS in power plants and certain other industrial facilities. But the broader hope is that these federal programs will help companies scale up and optimize these processes over time, driving down the cost of CCS and making it feasible for more sectors, Grove says.

'Against all evidence'

In addition to the gas treatment and hydrogen plants, CRC says, another source for the captured carbon dioxide could eventually include its own Elk Hills Power Plant, which runs on natural gas extracted from the oil field. The company has said it intends to retrofit the facility to capture 1.5 million tons of emissions a year.

Still other sources could include renewable fuels plants, which may mean biofuel facilities, steam generators, and a proposed direct-air-capture plant that would be developed by the carbon-removal startup Avnos, according to the EPA filing. Carbon TerraVault is part of a consortium, which includes Avnos, Climeworks, Southern California Gas Company, and others, that has proposed developing a direct-air-capture hub in Kern County, where the Elk Hills field is located. Last year, the Department of Energy awarded the so-called California DAC Hub nearly $12 million to conduct engineering design studies for direct-air-capture facilities.

CCS may be a helpful tool for heavy industries that are really hard to clean up, but that's largely not what CRC has proposed, says Natalia Ospina, legal director at the Center on Race, Poverty & the Environment, an environmental-justice advocacy organization in Delano, California.

"The initial source will be the Elk Hills oil field itself and the plant that refines gas in the first place," she says. "That is just going to allow them to extend the life of the oil and gas industry in Kern County, which goes against all the evidence in front of us in terms of how we should be addressing the climate crisis."

Natalia Ospina, legal director at the Center on Race, Poverty & the Environment.

NATALIA OSPINA

Critics of the project also fear that some of these facilities will continue producing other types of pollution, like volatile organic compounds and fine particulate matter, in a region that's already heavily polluted. Some analyses show that adding a carbon capture process reduces those other pollutants in certain cases. But Ospina argues that oil and gas companies can't be trusted to operate such projects in ways that reduce pollution to the levels necessary to protect neighboring communities.

'You need it'

Still, a variety of studies, from the state level to the global, conclude that CCS may play an essential role in cutting greenhouse-gas emissions fast enough to moderate the global dangers of climate change.

California is banking heavily on capturing carbon from plants or removing it from the air through various means to meet its 2045 climate neutrality goal, aiming for 20 million metric tons by 2030 and 100 million by midcentury. The Air Resources Board, the state's main climate regulator, declared that "there is no path to carbon neutrality without carbon removal and sequestration."

Recent reports from the UN's climate panel have also stressed that carbon capture could be a "critical mitigation option" for cutting emissions from cement and chemical production. The body's modeling study scenarios that limit global warming to 1.5 °C over preindustrial levels rely on significant levels of CCS, including tens to hundreds of billions of tons of carbon dioxide captured this century from plants that use biomatter to produce heat and electricity—a process known as BECCS.

Meeting global climate targets without carbon capture would require shutting down about a quarter of the world's fossil-fuel plants before they've reached the typical 50-year life span, the International Energy Agency notes. That's an expensive proposition, and one that owners, investors, industry trade groups, and even nations will fiercely resist.

"Everyone keeps coming to the same conclusion, which is that you need it," Friedmann says.

Lorelei Oviatt, director of the Kern County Planning and Natural Resources Department, declined to express an opinion about CRC's Elk Hills project while local regulators are reviewing it. But she strongly supports the development of CCS projects in general, describing it as a way to help her region restore lost tax revenue and jobs as "the state puts the area's oil companies out of business" through tighter regulations.

County officials have proposed the development of a more than 4,000-acre carbon management park, which could include hydrogen, steel, and biomass facilities with carbon-capture components. An economic analysis last year found that the campus and related activities could create more than 22,000 jobs, and generate more than $88 million in sales and property taxes for the economically challenged county and cities, under a high-end scenario.

Oviatt adds that embracing carbon capture may also allow the region to avoid the "stranded asset" problem, in which major employers are forced to shut down expensive power plants, refineries, and extraction wells that could otherwise continue operating for years to decades.

"We're the largest producer of oil in California and seventh in the country; we have trillions and trillions of dollars in infrastructure," she says. "The idea that all of that should just be abandoned does not seem like a thoughtful way to design an economy."

Carbon dioxide leaks

But critics fear that preserving it simply means creating new dangers for the disproportionately poor, unhealthy, and marginalized communities surrounding these projects.

In a 2022 letter to the EPA, the Center for Biological Diversity raised the possibility that the sequestered carbon dioxide could leak out of wells or pipelines, contributing to climate change and harming local residents.

These concerns are not without foundation.

In February 2020, Denbury Enterprises' Delta pipeline, which stretches more than 100 miles between Mississippi and Louisiana, ruptured and released more than 30,000 barrels' worth of compressed, liquid CO_2 gas near the town of Satartia, Mississippi.

The leak forced hundreds of people to evacuate their homes and sent dozens to local hospitals, some struggling to breathe and others unconscious and foaming at the mouth, as the *Huffington Post* detailed in an investigative piece. Some vehicles stopped running as well: the carbon dioxide in air displaced oxygen, which is essential to the combustion in combustion engines.

There have also been repeated carbon dioxide releases over the last two decades at an enhanced oil recovery project at the Salt Creek oil field in Wyoming. Starting in the late 1800s, a variety of operators have drilled, abandoned, sealed, and resealed thousands of wells at the site, with varying degrees of quality, reliability, and documentation, according to the Natural Resources Defense Council. A sustained leak in 2004 emitted 12,000 cubic feet of the gas per day, on average, while a 2016 release of carbon dioxide and methane forced a school near the field to relocate its classes for the remainder of the year.

Some fear that similar issues could arise at Elk Hills, which could become the nation's first carbon sequestration project developed in a depleted oil field. Companies have drilled and operated thousands of wells over decades at the site, many of which have sat idle and unplugged for years, according to a 2020 investigation by the *Los Angeles Times* and the Center for Public Integrity.

Ospina argues that CRC and county officials are asking the residents of Kern County to act as test subjects for unproven and possibly dangerous CCS use cases, compounding the health risks facing a region that is already exposed to too many.

Whether the Elk Hills project moves forward or not, the looming carbon storage boom will soon force many other areas to wrestle with similar issues. What remains to be seen is whether companies and regulators can adequately address community fears and demonstrate that the climate benefits promised in modeling studies will be delivered in reality.

Update: This story was updated to remove a photo that was not of the Elk Hills oil field and had been improperly captioned.

United States Environmental Protection Agency

Public Comments Sought on Class VI UIC Injection Well Carbon Storage Draft Permits

Carbon TerraVault LLC, Class VI UIC Injection wells

R9UIC-CA6-FY22-1.1, R9UIC-CA6-FY22-1.2,

R9UIC-CA6-FY22-1.3, R9UIC-CA6-FY22-1.4 December 2023

You are invited

EPA will hold a public workshop and a formal public hearing on the Carbon TerraVault draft permits at:

Buttonwillow Recreation and Park District Recreation Center
556 Milo Avenue
Buttonwillow, CA 93296
February 28th, 2024
Public Workshop: 3 to 5 p.m.
Public Hearing: 6 to 9 p.m.

EPA and Kern County Planning and Natural Resources staff have scheduled three additional joint workshops during the public comment period.

The details of these events are listed below:

Workshop 1 - January 17, 2024; 3:00-5:00pm PST; virtual workshop via Microsoft Live Events. Instructions for participating in this workshop will be available by January 5, 2024 on the EPA Region 9 UIC website (see web resources below).

Workshop 2 - January 30, 2024; 6:00-9:00pm PST; in-person workshop at West Side Recreation and Park District Auditorium – 500 Cascade Place Building B Taft, CA 93268.

Workshop 3 - January 31, 2024; 6:00-9:00pm PST; in-person workshop at Buttonwillow Recreation and Park District Community Center – 556 Milo Avenue Buttonwillow, CA 93206.

Web resources

https://www.epa.gov/uic/uic-permits-epas-pacific-southwest-region-9

The U.S. Environmental Protection Agency (EPA) is accepting public comments starting December 20, 2023, until March 20, 2024, on its intent to issue four Class VI Underground Injection Control (UIC) permits to Carbon TerraVault JV Storage Company Sub 1, LLC (CTV) to inject and store carbon dioxide underground at its four proposed injection wells in the Elk Hills oil field in Kern County, CA. The process of injecting carbon dioxide into the subsurface for long-term underground storage is called "geologic sequestration" or "carbon sequestration." Carbon sequestration is one method of reducing emissions of carbon dioxide into the atmosphere.

CTV plans to inject 1.46 million metric tons of carbon dioxide annually into the four proposed wells over a 26-year injection period. CTV plans to source carbon dioxide initially from Lone Cypress, a proposed hydrogen plant, Elk Hills pre-combustion gas treatment, and the proposed Avnos direct air capture facility. CTV would capture the carbon dioxide from the generating facilities, transport it via pipeline within the Elk Hills field to the injection wells, pressurize the gas into a liquid-like state, and inject the carbon dioxide stream deep into the ground through the wells.

CTV selected the locations of the proposed wells based on its research and using site-specific data to ensure that the carbon dioxide would be safely stored in the proposed injection formation. The proposed injection formation is the Monterey Formation, which is about 6,000 feet below ground. Above the injection formation is the Reef Ridge Shale Formation, an approximately 1,000-foot-thick rock layer that would ensure the injection fluid does not migrate outside of the injection formation. CTV would monitor the wells during the 26-year injection period, and at least 50 years after injection ceases, or until a demonstration of non-endangerment to underground sources of drinking water has been approved by EPA.

How to comment

In addition to accepting oral statements at the public hearing, EPA will accept written comments until March 20, 2024. EPA encourages electronic submittal of comments online at www.regulations.gov (docket EPA-R09-OW-2024-0623).

Comments may also be sent by email to Elise Nord at Nord.Elise@epa.gov. For assistance, or if you are unable to submit comments electronically, please email Ms. Nord or call her at (415) 972-3079.

When submitting written comments, please refer to Carbon TerraVault JV Storage Company Sub 1, LLC , Permit Nos. R9UIC-CA6-FY22-1.1, R9UIC-CA6-FY22-1.2, R9UIC-CA6-FY22-1.3, and/or R9UIC-CA6-FY22-1.4.

How did EPA make its tentative decision?

In reviewing CTV's permit application, EPA evaluated technical information and project-specific data, such as:

- Advanced computational modeling to determine the maximum extent of the carbon dioxide plume and pressure front defining the proposed project area;
- A detailed study of the geology and the rock layers through which the proposed injection wells would be drilled to confirm that the carbon dioxide will stay where it is injected;
- The location of drinking water resources near the project and how they will be protected.
- The proposed construction design for the injection wells;
- The characteristics of the carbon dioxide to be injected;
- The proposed approach and technologies CTV would use to operate and monitor the project during and after injection;
- The financial resources CTV will have available to responsibly operate, monitor, and close the project; and
- CTV's approach to ensure that the project will protect underground sources of drinking water, public health, and the environment.

What happens next in the permit process?

After the close of the public comment period, EPA will review all comments before making a final decision on whether to grant the permits. The Agency will respond to all significant comments on the draft permits when EPA makes a final permit decision.

Information Repository

The draft permit, fact sheet, and public notice are available at:

Buttonwillow Branch Library
101 North Main Street
Buttonwillow, CA 93206
(661) 764-5337

Kern County Planning and Natural Resources Department
2700 "M" Street, Suite 100
Bakersfield, CA 93301

Administrative Record

The full administrative record, including all data submitted by Carbon TerraVault in support of its permit application, is available for public review at EPA's regional office. The office is open 8:30 a.m. – 4:30 p.m., weekdays. To review the administrative record or for additional information please contact Elise Nord at 415-972-3079 or Nord.Elise@epa.gov.

On the Web

For more information about the Carbon TerraVault 26R project and draft Class VI UIC Permits: https://www.epa.gov/uic/uic-permits-epas-pacific-southwest-region-9

Legal Notice

To preserve your right to appeal any final permit decision, you must either participate in the public hearing or send in written comments on the draft permit decision by the end of the comment period.

The first appeal must be made to the Environmental Appeals Board; only after all agency review procedures have been exhausted may you file an action in the appropriate Circuit Court of Appeals.

Technical background and details of CTV's carbon storage project

EPA's review of CTV's permit application determined that the proposed injection would comply with the UIC regulations under the Safe Drinking Water Act. Therefore, EPA proposes to issue permits for the four proposed injection wells. Title 40 of the Code of Federal Regulations (CFR), Parts 144 and 146, requires EPA permits for carbon dioxide storage, known as Class VI UIC permits, to specify conditions for the construction, operation, monitoring, reporting, plugging, post-injection site care, and site closure of Class VI injection wells. These conditions are designed to prevent the movement of fluids into any underground source of drinking water, or USDW. Refer to 40 CFR Parts 144 and 146 for the general provisions of underground injection permits. In accordance with 40 CFR 124.8, information on the permitted activity and permit conditions for the proposed wells is provided below.

Area of Review and Corrective Action: In accordance with 40 CFR 146.84, the Area of Review, or AoR, is the region surrounding the geologic sequestration project where USDWs may be endangered by the injection activity (e.g., if there are any improperly sealed, completed, or abandoned wells that penetrate the confining zone that could provide a conduit for fluid migration). The AoR for the four proposed wells is 3.7 square miles and was delineated pursuant to 40 CFR 146.84(c)(1) using a model that predicts the movement of the carbon dioxide plume and pressure front based on available information about planned injection operations and the subsurface rock formations. Refer to Figure 1 below.

Based on CTV's search of well records, there are 157 wellbores within the AoR that require plugging because the wellbores penetrate the injection zone or confining layer and will not be used for injection or monitoring for the proposed injection project. EPA will review the plugging and abandonment plans for the 157 wells and will require CTV to properly plug and abandon the wells before authorizing injection.

As required by 40 CFR 146.84(e), CTV would re-evaluate the AoR by assessing monitoring and operational data every five years over the duration of the project to verify that the carbon dioxide plume and pressure front are moving as predicted. If there are any significant changes from the modeled predictions, CTV must revise the project-specific plans described here, and EPA will modify the permit per 40 CFR 144.39.

Underground Sources of Drinking Water: USDWs are defined by federal regulations as aquifers or portions thereof which contain less than 10,000 milligrams per liter of total dissolved solids and are being used, or could be used, as a source of drinking water. The lowest geologic unit in the Area of Review that has the potential to be a USDW is the Upper Tulare formation, with an average depth of 502 feet below ground surface. Although preliminary data submitted by CTV suggest that the Upper Tulare in the AoR is not a USDW because it is unsaturated and does not contain water, the terms and conditions of the proposed permits are written to protect this formation as a USDW. Moreover, the permits would require CTV to confirm whether the Upper Tulare formation contains a USDW during pre-injection testing, so that its status could be documented and any identified USDW would be protected.

Injection and Confining Zone: Injection for geologic sequestration is limited by the draft permits to the Monterey Formation between approximately 4,800 and 7,800 feet below ground. This zone is separated from the lowest formation that could be a USDW on average by approximately 5,000 feet of rock, including an impermeable 1,000-foot-thick confining zone of shale that would act as a barrier to fluid movement. EPA has reviewed information provided by the permittee, including maps, well logs, cores, and the results of seismic surveys and determined that the regional and local geologic features at the site would allow the Monterey Formation to receive the amounts proposed to be injected without fracturing and that the confining zone would provide a suitable trap so that the carbon dioxide would remain in place and not endanger USDWs, as required under 40 CFR 146.83.

Construction Requirements: The proposed construction of the injection wells, which includes drilling three new wells and converting one existing Class II UIC well, meets the regulatory criteria at 40 CFR 146.86. All Class VI wells must be constructed with materials and cements that can withstand exposure to carbon dioxide and carbon dioxide/water mixtures over the life of the project. Class VI wells must also be cased and cemented to prevent the movement of fluids into or between USDWs. These wells would be equipped with an automatic surface shut-off system that would shut off the well if any permitted operating parameters—such as injection pressure—diverge from permit limitations. CTV may not commence construction, including drilling, of any new well until a final permit has been issued and is effective.

Injection Fluid: The injected fluid would be at least 99.2% pure carbon dioxide. The proposed initial emission sources of carbon dioxide for the project are the Lone Cypress hydrogen plant, Avnos Direct Air Capture facility, and Elk Hills oilfield pre-combustion gas treatment. The initial expected amount of carbon dioxide to be injected from these sources is 401,500 tons per year. CTV may propose for EPA review additional sources of carbon dioxide for injection, as outlined in the draft permit, up to the maximum proposed permit limit of 1.46 million tons per year for 26 years. EPA will review whether the chemical and physical characteristics of the carbon dioxide stream from any additional proposed source meet the permit requirements. EPA will also review whether injecting carbon dioxide from the additional source would alter the project or permit requirements and result in the need for a major permit modification. The public will be notified within 30 days of EPA receiving a request for analysis of an additional source. The public will also be

notified at least 30 days before CTV injects carbon dioxide from an EPA-approved additional source.

Maximum Injection Pressure: Consistent with 40 CFR 146.88(a), to ensure that the pressure during injection does not initiate fractures in the injection or confining zones, the maximum allowable downhole injection pressure would be limited to 3,847–4,294 pounds per square inch (psi). In turn, this ensures that the injection pressure would not cause the movement of injection or formation fluids into a USDW, as prohibited by 40 CFR 146.86(a).

Monitoring and Reporting Requirements: In accordance with 40 CFR 146.90, CTV would implement an EPA-approved Testing and Monitoring Plan. The permittee would analyze the carbon dioxide stream quarterly to provide information about its chemical and physical characteristics. CTV would also be required to demonstrate well integrity before injection begins and throughout injection operations. CTV would be required to conduct and pass a two-part mechanical integrity test, in accordance with 40 CFR 146.8 and 146.89, before EPA would authorize CTV to start injecting.

After injection begins, CTV would continuously observe and record injection pressure, flow rate and volume, and the pressure on the annulus (the space between casing and tubing) to detect leaks in the casing, tubing, or packer. In addition, CTV would annually demonstrate external mechanical integrity using a temperature or noise log or another approved method to detect any fluid movement behind the casing. CTV would test the injection wells for signs of corrosion every quarter to provide early indication of any well material corrosion due to contact with carbon dioxide in the presence of water that could compromise the well. CTV would also monitor the environment near the wells to verify that the project and the injected carbon dioxide plume are behaving as predicted and that carbon dioxide is not migrating outside the injection formation. CTV would perform groundwater quality monitoring in shallow and deep wells quarterly to detect geochemical changes that may be a result of injection—such as leaching or mobilization of heavy metals and organic compounds or fluid displacement that could impact USDWs. Pressure fall-off testing would be performed at least every five years to verify that the injection zone is responding to injection as predicted. CTV would also track the movement of the carbon dioxide plume and pressure front using direct methods such as fluid monitoring of the injection zone and USDWs and pressure monitoring of the injection zone, and indirect methods such as seismicity monitoring and pulse neutron logging of well bores to verify that the carbon dioxide plume and pressure front are moving as predicted or to provide early indication if they are not. In accordance with 40 CFR 144.54 and 146.91, CTV would submit results of this monitoring to EPA semiannually or within 30 days of the completion of a mechanical integrity test or other required testing. CTV would be required to continuously monitor surface air quality including broad aerial monitoring and targeted monitoring at wells. CTV would also be required to monitor and maintain equipment at the wells that can detect leakage of carbon dioxide.

CTV would be required to develop and maintain a publicly accessible website that will include a summary section that describes the data being presented, semi-annual reports, real-time monitoring data collected for surface air monitoring and leak detection, and notification of any permit non-compliance, including the steps taken to resolve the non-compliance, and any actions taken to prevent a re-occurrence of the non-compliance.

Emergency and Remedial Response: In accordance with 40 CFR 146.94, CTV developed a site-specific Emergency and Remedial Response Plan (ERRP) that identifies key resources, including Elk Hills oil and gas production resources not associated with the CTV I Elk Hills 26R Project, the Upper Tulare formation overlying the carbon dioxide plume, and the nearest census designated area of Valley Acres, located 3.6 miles from the AoR boundary. The ERRP, an enforceable part of the permit, describes the responses that would be taken to address adverse events, and identifies the staff, equipment, and other resources available to support emergency and remedial response events. The emergency and remedial response provisions of the permit would facilitate expeditious responses and prevent or mitigate harm to public health and the environment, including USDWs.

Financial Responsibility: In accordance with 40 CFR 146.85, CTV has demonstrated, and would maintain, adequate financial responsibility to perform all needed corrective action on wells in the AoR, to plug the injection wells, to perform all required post-injection site care, to close the site, and to conduct any needed emergency and remedial response measures. The total initial cost estimates for these activities to be covered by the approved financial assurance mechanisms is $33,672,785. CTV will use a letter of credit and a third-party insurance policy to cover costs and demonstrate financial responsibility. The permits require cost estimates for the covered activities to be updated annually. These provisions ensure that resources are available to perform these USDW-protective activities without using public funds.

Plugging and Abandonment: In accordance with 40 CFR 146.92, the draft permits include an Injection Well Plugging Plan for environmentally protective well plugging at the cessation of injection operations. The wells would be plugged using approved materials that are compatible with carbon dioxide/water mixtures to ensure that the wells would not serve as a conduit for fluid movement into USDWs.

Post-Injection Site Care and Site Closure: In accordance with 40 CFR 146.93, CTV would be required to implement an EPA-approved Post-Injection Site Care and Site Closure Plan. Following the cessation of injection, CTV would be

required to continue to monitor groundwater quality and track the position of the carbon dioxide plume and pressure front in a similar manner to what is described under "Monitoring and Reporting Requirements" above. This monitoring would help confirm predictions about the behavior of the carbon dioxide plume and pressure front (e.g., that pressures are subsiding after injection ceases) and provide early indication of any potential USDW endangerment. CTV would continue this post-injection monitoring for at least 50 years and until it demonstrates USDW non-endangerment based on monitoring and other site data. At the end of the 50-year period, if site data support it, EPA may authorize CTV to close the site. Following authorization to proceed with site-closure activities, CTV would plug all monitoring wells with carbon dioxide-compatible materials to ensure they cannot serve as conduits for fluid movement and would restore the site to its original condition.

Consideration of Environmental Justice: EPA is committed to incorporating environmental justice considerations into the Agency's core mission, which is to protect human health and the environment. Executive Order 12898, Federal Actions to Address Environmental Justice in Minority Populations and Low-Income Populations, directs federal agencies, to the greatest extent practical and permitted by law, to identify and address, as appropriate, disproportionate and adverse human health or environmental impacts on people of color and low-income populations. See Exec. Order No. 12898, 59 Fed. Reg. 7629 (Feb. 11, 1994). Recently, Executive Order 14096, Revitalizing Our Nation's Commitment to Environmental Justice for All, supplemented this direction and included, among other things, consideration of "effects (including risks) and hazards… related to climate change and cumulative impacts of environmental and other burdens on communities with environmental justice concerns." See Exec. Order No. 14096, 88 Fed. Reg. 25251 (Apr. 21, 2023). It is against this backdrop that EPA has integrated environmental justice into the UIC Class VI permitting program.

As part of the decision-making process for the permit, EPA considered the above-referenced executive orders and EPA's Environmental Justice Guidance for UIC Class VI Permitting and Primacy (Aug. 17, 2023), which includes, among other things:

- Identifying communities potentially adversely and disproportionately affected by human health, environmental, climate-related, and/or other cumulative harms or risks – that is, affected communities with potential environmental justice concerns; and
- Ensuring fairness and transparency in the decision-making process – that is, allowing for meaningful involvement by communities.

EPA and CTV conducted separate environmental justice screenings to identify possible adverse impacts to communities with environmental justice concerns and opportunities for increased meaningful involvement. EPA's "EJScreen" analysis for the proposed CTV I 26R project used an 8-mile buffer beyond the AoR to incorporate census population data from the communities closest to the project, since there are no communities within the 3.7-square mile AoR. The EJScreen results from this expanded geographic analysis showed seven environmental justice indices above the 80th percentile for the United States, which highlights the potential vulnerability of nearby communities located outside the AoR and the importance of protective permit requirements and a robust outreach and public comment process. For this proposed permit, EPA is providing an extended public comment period of 90 days and multiple opportunities for public engagement through public workshops in advance of the public hearing.

The permit has several safeguards in place to prevent any adverse impacts to public health and the environment, including USDWs, from all injection-related activities throughout the lifetime of the project. For example, the permit requires CTV to run an EJScreen analysis when there is an update to the AoR, provide analysis of proposed additional carbon dioxide sources and their impact to the communities in the area they are located, notify the public of any proposed new carbon dioxide source, notify the public at least 30 days before injecting carbon dioxide from an additional source, create a public website containing monitoring data, and gather real-time monitoring data of carbon dioxide levels in the air within the AoR. Furthermore, if the gas stream of a new carbon dioxide source meets certain criteria, the permit provides that the EPA could require that its injection be subject to the "major" modification requirements of 40 CFR 124, which would trigger public notice and comment provisions.

In addition to EPA's environmental justice efforts thus far, the permit applicant has also conducted community outreach and engagement, which is documented in the CTV I Community Engagement Summary, dated October 20, 2023. EPA's EJScreen analysis and the CTV I Community Engagement Summary are included in the permit application materials and can be found on regulations.gov under docket number EPA-R09-OW-2024-0623.

Compliance with other Federal Statutes: As part of the permit process, pursuant to 40 CFR 144.4, EPA is required to consider other Federal laws, including Section 7 of the Endangered Species Act (ESA) and Section 106 of the National Historic Preservation Act (NHPA).

Endangered Species Act

The ESA and its implementing regulations require EPA to ensure that any action it authorizes does not jeopardize the continued existence of any endangered or threatened (i.e., listed) species or adversely affect their critical habitat. After

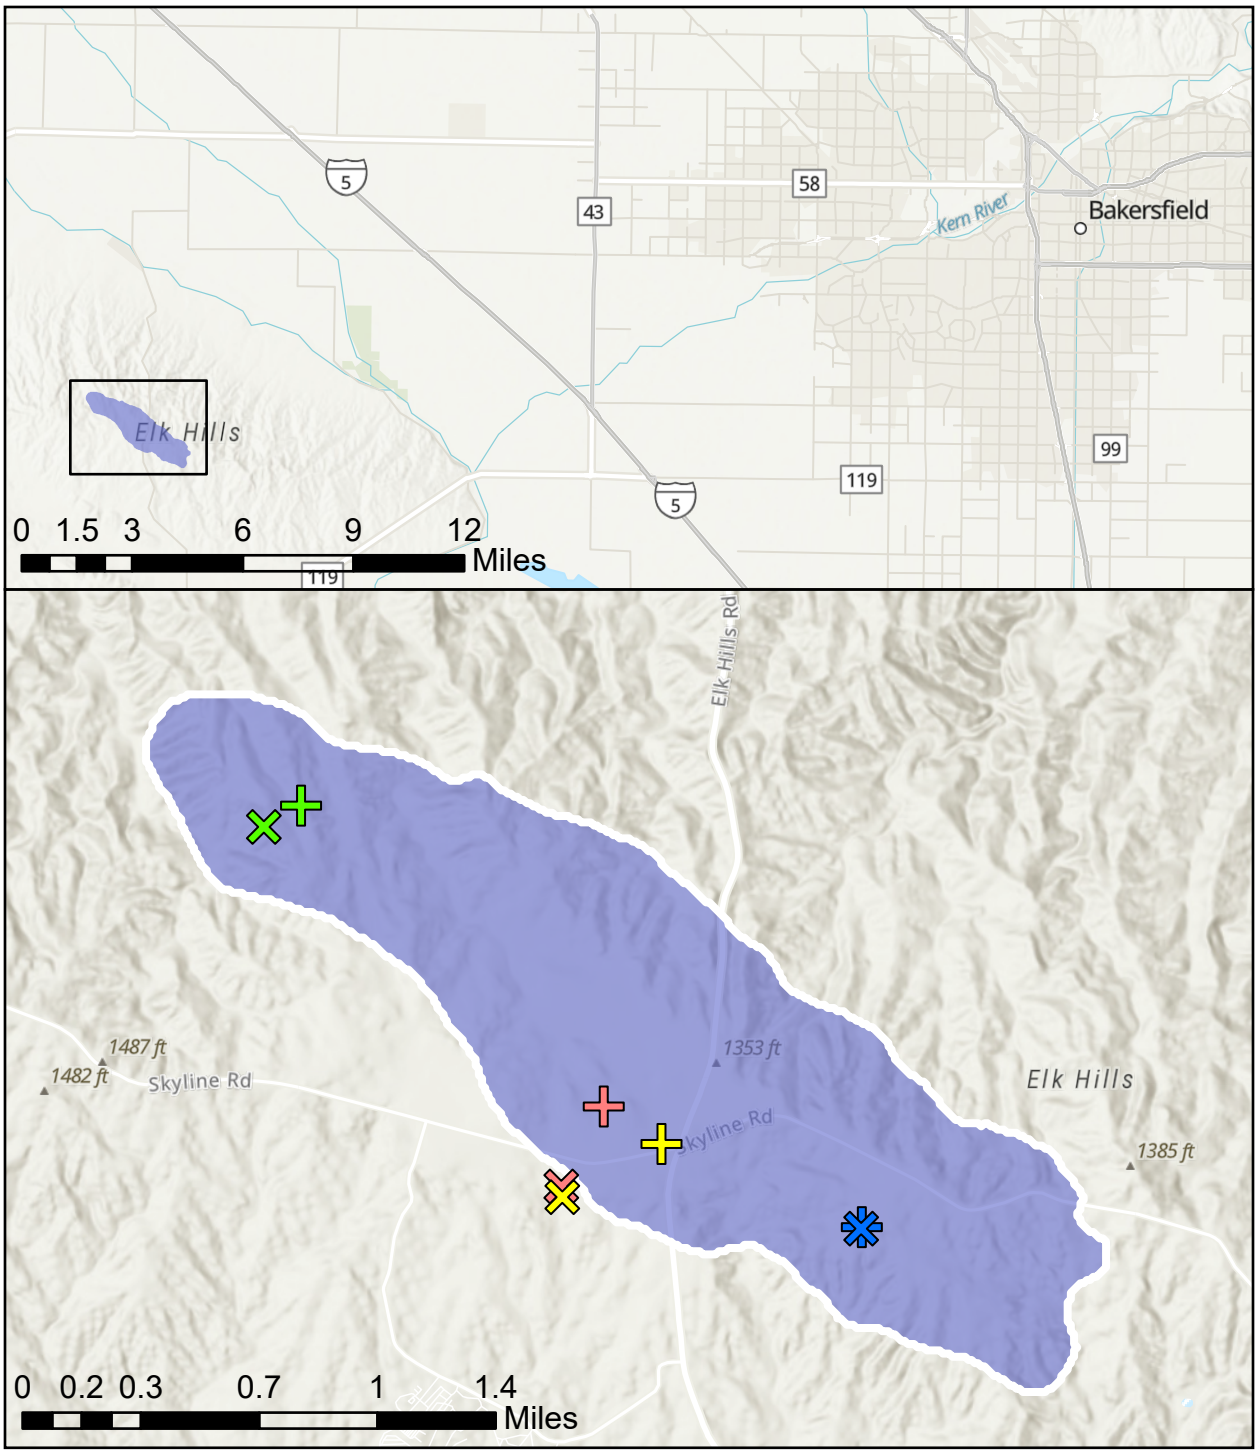
reviewing the best available science, EPA determined that CTV's proposed project may affect, but is not likely to adversely affect, four listed species that could occur in areas potentially impacted by the project. EPA is informally consulting with the U.S. Fish and Wildlife Service on this determination.

National Historic Preservation Act

The NHPA and its implementing regulations require EPA to consider the effects of its undertakings on historic properties. Because issuance of a UIC permit is a federal undertaking, EPA is consulting with the California State Historic Preservation Office (SHPO). As part of that effort, EPA provided the SHPO with a description of the project, the area of potential effect, and the steps taken to identify historic properties. EPA proposed to the SHPO a finding that no historic properties would be affected by this undertaking.

Issuance and Effective Date of Permit: In accordance with 40 CFR 124.15, the permits would become effective immediately upon issuance if no public comments are received that requested a change in the draft permits. However, if EPA receives public comments and decides to issue final permits, then the permits would become effective 45 days after the date of issuance unless the permits are appealed. In accordance with 40 CFR 144.36(a), the permits would be in effect for the duration of the project unless they are otherwise modified, revoked and reissued, or terminated as provided at 40 CFR 144.39, 144.40, and 144.41. The permits would expire in one year if CTV does not commence construction unless EPA approves a written request for an extension of this one-year period. Authorization to inject under the permits may be granted following well construction and compliance with additional requirements as outlined in the permits and regulations at 40 CFR 146.82, 146.86, 146.87, and 146.89.

Figure 1. Area of Review



PUBLIC NOTICE OF INTENT TO ISSUE A CLASS VI UNDERGROUND INJECTION CONTROL PERMIT FOR

Carbon TerraVault JV Storage Company Sub 1, LLC

Elk Hills, California

Comment period through March 20, 2024

Spanish language translation of this public notice is available at https://www.epa.gov/uic/uic-permits-epas-pacific-southwest-region-9.

La traducción al español del aviso público está disponible en https://www.epa.gov/uic/uic-permits-epas-pacific-southwest-region-9.

For assistance in other languages, please e-mail Elise Nord at Nord.Elise@epa.gov or call (415) 972-3079.

PURPOSE OF PUBLIC NOTICE

The United States Environmental Protection Agency, Region 9, Groundwater Protection Section, 75 Hawthorne Street, San Francisco, California 94105 (EPA) is providing an opportunity for the public to comment on its proposal to issue four (4) Class VI Underground Injection Control (UIC) permits for Carbon TerraVault JV Storage Company Sub 1, LLC (CTV) to construct and operate injection wells for geologic sequestration of carbon dioxide. The proposed injection wells will be located within the Elk Hills Oil Field approximately 20 miles west of Bakersfield, California. The locations of the wells are included in Table 1.

Table 1: Well Names and locations

Well Name	UIC Permit No.	Location (Lat/Long)
373-35R	R9UIC-CA6-FY22-1.1	35°16’34.5276”N 119°28’24.1836”W
345C-36R	R9UIC-CA6-FY22-1.2	35°16’30.3383”N 119°27’27.7825”W
353XC-35R	R9UIC-CA6-FY22-1.3	35°16’36.1768”N 119°28’24.4060”W
363C-27R	R9UIC-CA6-FY22-1.4	35°17’31.0601”N 119°29’21.4525”W

Class VI wells are used to inject carbon dioxide for long-term underground storage. One (1) of the proposed injection wells (UIC Permit No. R9UIC-CA6-FY22-1.1) is an existing Class II UIC well that CTV would convert to a Class VI UIC well. The other three (3) proposed wells (UIC Permit Nos. R9UIC-CA6-FY22-1.2, R9UIC-CA6-FY22-1.3, R9UIC-CA6-FY22-1.4) would be newly drilled and constructed Class VI UIC wells. The permit would authorize injection of carbon dioxide into the proposed injection wells at a depth of approximately 6,000 feet. After completing a thorough technical review of all information submitted by CTV in its permit application, as well as the operational standards, monitoring requirements, and existing geologic setting, EPA has determined that the activities authorized under the Draft Class VI UIC permits (“Draft Permits”) are protective of underground sources of drinking water as required by the Safe Drinking Water Act (SDWA).

PUBLIC COMMENTS

EPA requests public comment on the Draft UIC Permits and will accept comments in writing through the end of the comment period on March 20, 2024 (40 CFR § 124.10). During this period, EPA encourages the electronic submittal of comments online at www.regulations.gov under docket number EPA-R09-OW-2023-0623. You may also submit comments by email to Elise Nord at the email address listed above. If you are unable to submit comments electronically, or if you have any questions or require assistance submitting comments, please reach out to Ms. Nord at the phone number above.

PUBLIC WORKSHOPS

EPA and Kern County Planning and Natural Resources staff have scheduled four joint workshops during the public comment period for the Draft UIC Permits. These workshops are open to the public. The agencies will present information about EPA's UIC permitting process, the proposed UIC permits, and Kern County's draft Environmental Impact Report. All sessions will have Spanish language interpretation available.

If you are an individual with disabilities requiring a reasonable accommodation at no cost or if you need interpretation services in a language other than English, or necessitate assistance in sign language, please contact Ms. Nord by email or phone so we can make the necessary arrangements.

The public workshops will be at the following times and locations:

- January 17, 2024; 3:00-5:00pm PST; virtual workshop via Microsoft Live Events. Instructions for participating in this workshop will be available by January 5, 2024 on the EPA Region 9 UIC website at https://www.epa.gov/uic/uic-permits-epas-pacific-southwest-region-9
- January 30, 2024; 6:00-9:00pm PST; in-person workshop at West Side Recreation and Park District Auditorium – 500 Cascade Place Building B Taft, CA 93268.
- January 31, 2024; 6:00-9:00pm PST; in-person workshop at Buttonwillow Recreation and Park District Community Center – 556 Milo Avenue Buttonwillow, CA 93206.
- February 28, 2024; 3:00-5:00pm PST; in-person workshop at Buttonwillow Recreation and Park District Community Center – 556 Milo Avenue Buttonwillow, CA 93206. NOTE: at the end of this workshop, EPA will conduct a public hearing for the Draft Permits as described below.

PUBLIC HEARING

In addition to the four joint workshops with Kern County, EPA will hold an in-person public hearing for the Draft UIC Permits. The public hearing will be held on February 28, 2024, from 6:00pm to 9:00pm PST at the Buttonwillow Recreation and Park District Community Center, located at 556 Milo Avenue Buttonwillow, CA 93206.

At the hearing you can provide oral statements regarding the Draft UIC Permits, and those statements will become part of the administrative record. EPA will provide individuals up to 2 minutes for comments to allow sufficient time for all commenters and may provide additional time depending upon the number of interested commenters. Please note that written and oral comments are treated the same by EPA in our public process.

We encourage those who wish to provide oral comments at the public hearing to pre-register at: https://projects.erg.com/conferences/epa/register-elkshills.asp; however, pre-registration is not

required to provide comments at the hearing. Spanish interpretation services will be available at the hearing.

Commenters who want to supply written or other materials may do so via the online docket, following the public comment procedures outlined above. Any supporting materials for oral statements will be accepted via the online docket through the close of the comment period on March 20, 2024. In accordance with 40 CFR § 124.12(d), the hearing will be transcribed and made available to the public.

SUPPORTING MATERIALS

All data submitted by the applicant is available as part of the administrative record for the Draft Permits. This Notice, EPA's Fact Sheet, the Draft Permits, CTV's permit application, and other supporting documents are available for public review online at www.regulations.gov under docket number EPA-R09-OW-2023-0623.

These materials may also be accessed through the following web address - https://www.epa.gov/uic/uic-permits-epas-pacific-southwest-region-9

Hard copies of the Public Notice, Fact Sheet, and Draft Permits are also publicly available at the following locations:

Buttonwillow Branch Library
101 North Main Street
Buttonwillow, CA 93206
(661) 764-5337

Kern County Planning and Natural Resources Department
2700 "M" Street, Suite 100
Bakersfield, CA 93301
(661) 862-8600

If you have any difficulty accessing the supporting materials, please contact Ms. Nord at the telephone number or email address listed above for assistance.

FINAL PERMIT DECISION AND APPEALS PROCESS

After the close of the public comment period, EPA will respond to all significant comments, issue final permit decisions pursuant to 40 CFR § 124.15(a), and notify all commenters of the Agency's decisions. EPA will post its response to comments on www.regulations.gov under docket number EPA-R09-OW-2023-0623. The response to comments will contain a response to all significant comments on the Draft Permits, EPA's final permitting decisions, any permit conditions that are changed and the reasons for the changes, and procedures for appealing the decisions. The final decision shall be to either issue or deny the Permits. Each final decision shall become effective no sooner than thirty (30) days after the service of the notice of decision (40 CFR § 124.15). Within thirty (30) days after the final permit decisions have been issued, any person who filed comments on the Draft Permits, participated in any public hearing on this matter, or takes issue with any changes in the Draft Permits, may petition the Environmental Appeals Board to review any condition of the permit decisions. Commenters are referred to 40 CFR § 124.19 for the procedural requirements of the permit appeal process. If no comments request a change

in the Draft Permits, EPA's final decisions shall become effective immediately upon issuance unless a later date is specified in the notice of final decision (40 CFR § 124.15).

Via Email to EPA Region 9

June 17, 2024

David Albright
Manager, Groundwater Protection Section
U.S. Environmental Protection Agency, Region 9 (WTR-4-2)
75 Hawthorne Street
San Francisco, CA 94105
(415) 972-3971

Mr. Albright,

I am writing regarding the four (4) California Resources Corporation ("CRC") proposed 26R Class VI Underground Injection Control ("UIC") permits for geologic sequestration of carbon dioxide ("CO_2") at the Elk Hills Oil Field ("Elk Hills") in Kern County, California.[1]
