to Technical Comments of Dominic DiGiulio, PhD:
Qualifications and Experience

Dominic DiGiulio

dom.c.digiulio@gmail.com
https://www.linkedin.com/in/dominic-digiulio-79835bbb

Background

I am a retired geoscientist from the U.S. Environmental Protection Agency. I have conducted research on: emissions of volatile organic compounds from abandoned wells, leakage of produced water, condensate, and drilling fluids from impoundments to groundwater, contamination of groundwater from hydraulic fracturing, subsurface methane and carbon dioxide migration (stray gas), intrusion of subsurface vapors into indoor air (vapor intrusion), gas flow-based subsurface remediation (soil vacuum extraction, bioventing), groundwater sampling methodology, soil-gas sampling methodology, gas permeability testing, and solute transport of contaminants in soil. I assisted in the development of EPA's original guidance on vapor intrusion and the EPA's Class VI Rule on geologic sequestration of carbon dioxide. I have served as an expert witness in litigation relevant to oil and gas development, testified before State oil and gas commissions on proposed regulation, and testified before Congress on the impact of oil and gas development on water resources. My consulting services have included reports on: stray methane gas migration, geological carbon storage in Louisiana, storage of natural gas liquids in solution mined caverns, proposed oil and gas regulations in Colorado, impact to groundwater resources from Class II disposal wells in Ohio, Idaho, and Florida, produced water transport in barges along the Ohio River, proposed EPA regulation on discharge of produced water to surface water, and Bureau of Land Management leases in Wyoming, Montana, and Colorado.

Education

B.S., Environmental Engineering, Temple University, Philadelphia, PA (1982)
M.S., Environmental Science, Drexel University, Philadelphia, PA (1988)
Ph.D., Soil, Water, and Environmental Science, University of Arizona, Tucson, AZ (2000)

Employment

Independent Consultant: Feb 2023 - present

Research Affiliate: University of Colorado, Boulder, CO: October 2020 - present. I conduct research on the impact of abandoned wells on air, surface water, and groundwater quality.

Senior Research Scientist: PSE Healthy Energy, Oakland, CA: Jan 2017 – Feb 2023. My research focused on evaluating the impact of oil and gas development on water resources and air quality. In addition to publishing findings of my research in peer-reviewed journals and reports, I provided testimony on oil and gas development rule-making, served as an expert witness in litigation against oil and gas corporations, and have testified before Congress on the impact of oil and gas development on water resources.

Research Associate: Stanford University, Stanford, CA: Apr 2014 – May 2019. I conducted research on the impact of oil and gas development to groundwater.

Environmental Engineer: U.S. Environmental Protection Agency, Office of Research and Development, Ada, OK: Sep 1988 – Mar 2014 (retired). Duties included providing regulatory oversight assistance to

EPA remedial project managers and conducting research related to subsurface gas flow and vapor transport. Research included: (1) Development of methods to improve the effectiveness of soil vapor extraction, bioventing, and air sparging subsurface remediation systems including lead authorship of EPA's primary technical resource document in these areas; (2) Co-development of analytical solutions and associated codes for estimation of gas permeability and gas flow in soil; (3) Development of analytical solutions to simulate combined solute and vapor transport in soil including lead authorship of the model *VFLUX;* (4) Development of field methods to improve active soil-gas sampling especially pertaining to leak and purge testing; (5) Development of forensic techniques (use of hydrocarbon degradation products and radon) and assistance in development of EPA guidance to evaluate vapor intrusion (migration of organic compounds from ground water to indoor air); (6) Development of ground water and soil gas monitoring strategies including assistance in development of EPA's Class VI rule on geologic sequestration of carbon dioxide; (7) Development of methods to evaluate impact to Underground Sources of Drinking Water (USDWs) under the Safe Drinking Water Act and stray gas migration due to hydraulic fracturing. Research activities included conducting seminars, workshops, and short courses to States.

Environmental Engineer (Remedial Project Manager: U.S. Environmental Protection Agency, Region III, Philadelphia, PA: Jun 1980 – Dec. 1981 and Sep 1982 – Jan 1988. Duties included: conducting investigations (e.g., remedial investigations, risk assessments, feasibility studies, sample collection) under the Comprehensive Environmental Response and Liability Act (CERCLA) and Resource Conservation and Recovery Act (RCRA), federal contractor oversight, preparation of consent orders and initiation of enforcement actions.

Military Service: U.S. Marine Corps: Active duty 1975-1978, Camp Pendleton, CA, Honorable Discharge in 1981.

Scientific Awards

5 EPA Bronze Medals: (1) Development of EPA Guidance Document on Soil Vacuum Extraction, (2) Technical Support to EPA's Program and Regional offices on Subsurface Gas Flow and Vapor Transport, (3) Development of EPA Guidance on Vapor Intrusion, (4) Research on Vapor Intrusion, (5) Development of Class VI Rule on Geologic Sequestration of Carbon Dioxide

3 EPA Honor Awards: (1) Development of a National Risk Management Research Laboratory Strategic Research Plan, (2) Development of a Protocol to Assess Vapor Intrusion; (3) Technical support at Leaking Underground Storage Tank Sites

3 EPA Scientific and Technological Achievement Awards: (1) Innovative Design of Soil Vacuum Extraction Systems, (2) Development of Analytical Model to Simulate Transient Flux of Volatile Organic Compounds in Soil to Ground Water and the Atmosphere, (3) Simulation of Geochemical Impacts to Ground Water from Leakage of Carbon Dioxide

Re: Observations concerning Kern County's Draft Environmental Impact Report ("DEIR") on the TerraVault I Carbon Capture and Storage Project ("Project").

A. Summary of DEIR.

The above referenced DEIR makes many statements that are confusing or misleading, lacking critical information to allow decision makers, including the public, to make an informed evaluation and decision about the proposed Project from this document. It appears that many of these statements relate to safety jurisdiction of various agencies, which based on my extensive experience, are confusing, if not misleading. It appears that the Project is getting ahead of badly needed safety regulatory efforts, either at the state or federal level before prudent safety regulations can be developed and implemented. Section 3 below identifies eight areas where the DEIR needs to be supplemented with important details before this Project is allowed to proceed. Lack of such detail has served to be a recurring problem across the U.S. as states and local governments wrestle with serious gaps in pipeline safety regulations for CO_2 pipelines as a result of an onslaught of multibillion dollar proposals incentivized by recent federal tax credits. A 2022 paper identifies at least eight serious deficiencies in current federal minimum pipeline safety regulations concerning liquid CO_2 pipelines summarized as follows:[1]

1. The definition of carbon dioxide needs to be updated.
2. Scientifically based regulation on impact areas for CO_2 pipeline ruptures needs to be promulgated.
3. Regulatory reference to industry recommended practices should be avoided.
4. Fracture propagation protection on CO_2 pipelines needs to be codified.
5. The use of odorant in CO_2 pipelines should be mandated.
6. Pipeline operations and maintenance manuals should require specific coordination with local emergency response personnel.
7. Maximum contaminant impurities for CO_2 pipelines should be specified.
8. Regulations for conversion of existing pipelines to CO_2 service should be developed.

[1] Richard B. Kuprewicz, President of Accufacts Inc., prepared for the Pipeline Safety Trust, "Accufacts' Perspectives on the State of Federal Carbon Dioxide Transmission Pipeline Safety Regulations as it Relates to Carbon Capture, Utilization, and Sequestration within the U.S.," March 23, 2022, pp. 12 &13.

B. The TerraVault 1 Carbon Capture and Storage Project DEIR - a simple synopsis.

The TerraVault 1 Project proposes to capture CO_2 from the existing Elk Hills oil field, produced by separating a portion of the pre-combustion field gas production into "high-purity" CO_2 streams at two existing or relocated cryogenic and fractionation natural gas plant facilities identified as "CGP-1." The term high purity is not defined in the DEIR, but is a critical parameter given that existing federal minimum pipeline safety jurisdiction currently establishes a CO_2 purity of more than 90% in a poorly worded definition of carbon dioxide.[2]

The high-purity CO_2 streams will then be transported from the two CGP-1 processing/treating locations by "Facility Pipelines" which will be newly constructed pipelines.[3] The DEIR also uses the term Injection Pipelines. The definition of both Facility Pipelines and Injection Pipelines needs to be clarified as well as their transition boundaries as these terms have specific meaning in the industry and affect regulatory safety jurisdictions, if any, of various federal and state agencies that might become involved.

The DEIR indicates that new pipelines of up to 16-inches in diameter, approximately 5.61 miles long for phase 1, and approximately 7.59 miles long for phase 2, will transport CO_2 to six injection wells at two sequestration reservoir sites within the site plan (to 26R Monterey Formation Reservoir at an approximate depth of 6,000 feet for phase 1's four injection well sites, and to A1-A2 Monterey Formation Reservoir, approximately 8,500 feet deep for phase 2's two injector well sites).[4]

C. Critically important and needed pipeline information is missing in the DEIR.

Important pipeline information is missing in the DEIR that will not permit decisionmakers to make an informed decision about this Project. For example, some of the many major shortcomings in the DEIR related to pipeline issues are:

1. The purity of the claimed "high-purity" CO_2 stream has not been provided.

The CO_2 purity sets a simple bar as to whether the Pipeline and Hazardous Materials Safety Administration, or PHMSA, the federal agency chartered with transportation pipeline safety regulations, or for that matter the California Office of the State Fire Marshal, or OSFM, the state agency chartered with intrastate liquid transportation pipeline safety oversight in California, has any pipeline safety jurisdiction under current transportation pipeline safety regulations. The DEIR needs to provide the minimum purity of the CO_2 stream for reinjection and how this minimum will be controlled/maintained and assured. If the CO_2 purity is not above 90 %, the pipeline facilities are not regulated as transportation pipelines under current federal pipeline safety regulations.

---

[2] 49CFR§195.2 Definitions - *Carbon Dioxide*.
[3] DEIR, Volume 1, pp. 3-18 & 3-19.
[4] DEIR, Volume 1, pp. 3-21 & 3-22.

Since the CO_2 will be produced from the oil/gas field, the DEIR also needs to present how possible impurities in the CO_2 stream will be limited and controlled. This is especially important for water as water in CO_2 pipelines is not tolerated well in carbon steel pipeline systems. Water in such CO_2 systems can experience extremely unpredictable and high corrosion rates that can quickly result in pipeline rupture failure.

2. **The DEIR discussion of Facility Pipelines and Injection Pipelines is not clear.**

   Facility Pipelines and Injection Pipelines usually have special meaning/distinction within the industry and whether any pipeline safety agency has any jurisdiction. The DEIR is very confusing on this important issue, labeling for example Injection Pipelines under the heading Facility Pipelines in the figures' legends.[5] PHMSA, or for that matter the OSFM, may not have any jurisdiction on this Project or parts of this Project.

3. **The DEIR indicates that the Facility Pipelines will operate at pressures roughly 1,700 to 2,100 psig for "dense phase" transport.[6]**

   Psig, or pounds per square inch gauge, is a pressure measurement used in the industry. The pressure range for this system, while higher than conventional liquid transportation pipelines, is not unusual for dense phase CO_2 pipelines. Dense phase is a term used to mean either liquid **or** supercritical CO_2 phase for a liquid pipeline, and is not defined in either Federal or California pipeline safety regulations.[7] What phase a specific CO_2 liquid pipeline segment is in (liquid or supercritical) at the time of a pipeline rupture can have a significant impact on rupture release dynamics, the tonnage of pipeline inventory that will be vented even after mainline valves are closed, and associated attempts to model possible rupture impact zones and attempts at establishing realistic safety buffer zones.

4. **The DEIR does not provide important pipeline parameters.**

   At this stage of the Project, the pipeline operator should be able to provide the pipeline specifics such as: pipe grade, thickness, diameter, and maximum operating pressure, or MOP, a term defined in federal pipeline safety regulation having a specific meaning related to pipeline safety. As previously mentioned, the DEIR should also clearly delineate the general pipeline route, possible pipeline safety jurisdictional boundaries, and approximate location of main equipment such as pump/compressor stations. The lack of such basic information makes it difficult to determine a simple process flow scheme for the Project. This lack of such basic information also prevents decisionmakers from assessing impacts and to develop feasible mitigations for the Project. Not only does the DEIR lack such critical basic pipeline information, what information is supplied is also confusing. It appears the Project is being rushed and

[5] DEIR, Volume 1, p. 3-20, Figures 3-8 and 3-9, Location of Phase 1 Wells: 373-35R, 353X-35R, 345-36R, and 363-27R, and Location of the Phase 2 Wells: 357-7R and 355-7R, respectively.
[6] DEIR, Volume 1, p. 3-16.
[7] 49CFR§195 and California Code, Chapter 5.5. The Elder California Pipeline Safety Act of 1981.

missing basic information to permit independent evaluation and verification of the Project.

5. The location of compressor equipment is not well defined.

The DEIR states "Two new CO_2 compressor packages are proposed for installation at the facility. Compressors would be of the reciprocating type and driven by electric motors."[8] The general location and specific phase of the CO_2 feeding into such equipment is very important to the safe operation of the system and, more importantly, the compressors. One way to blow up a reciprocating compressor is to inadvertently introduce liquid into the compressor. I cannot determine from the limited and confusing information provided in the DEIR whether the location of the proposed compressors will be safely placed within the system to assure liquid CO_2 cannot be inadvertently introduced into the compressors.

6. The placement of mainline valves along the pipelines are not defined.

The DEIR states: "New valves would be installed based on regulatory and owner requirements."[9] As should become obvious from reading this report, such important valve determinations have not been clearly defined, so this DEIR citation is meaningless. Also, the DEIR does not identify whether mainline valves will be manually operated or remotely operated. Manually operated valves can take considerable time to reach and then close (especially for larger diameter pipelines such as a 16-inch mainline valve) increasing the tonnage of CO_2 released upon pipeline rupture.

As a point of reference, a 16-inch diameter CO_2 pipeline, depending on whether the CO_2 inventory is in a supercritical or liquid phase and its associated density, will release approximately 110 to 200 tons per mile of CO_2 upon a pipeline rupture once pipeline mainlines have been closed. What makes transportation pipelines unique, especially for CO_2, is the amount of tonnage undergoing phase change from cooling, that can be de-inventoried from a ruptured pipeline, releasing tons of CO_2 between mainline valves once such valves have been closed. The lack of timely closure of valves was a significant contributing factor for the Satartia, MS rupture CO_2 release as discussed later in this report.

7. The CO_2 temperature along the pipelines is not provided.

An important variable in the DEIR, approximate CO_2 temperature along the pipelines, dictates the CO_2, whether liquid or supercritical phase (which can change) along the pipelines as temperature changes at the expected pipeline operating pressure. This important temperature parameter is not mentioned nor discussed anywhere in the DEIR. What phase a segment of a pipeline is transporting CO_2 in can have serious significance on issues such as safety jurisdiction, design/operation, and pipeline rupture

[8] DEIR, Volume 1, p. 3-17.
[9] DEIR, Volume 1, p. 3-18.

release dynamics and safety buffer zones. For example, current federal minimum pipeline safety regulations do not regulate pipelines operating in liquid CO_2 phase. I have previously mentioned the importance of assuring that reciprocating compressors do not inadvertently receive liquid. Without understanding the initial phase CO_2 will most likely be in in a specific pipeline segment, attempts to establish safe buffer or impact zones are meaningless. Two temperature extreme boundary cases for CO_2 are usually necessary; a high temperature season and a low temperature season to assist in defining the range of CO_2 phases (liquid or supercritical), and associated release modeling/pipeline buffer safety margins for the operation.

8. The DEIR misses the importance of CO_2 phase.

The DEIR also misses the important differences associated with varying phases of CO_2 in a liquid pipeline operation that are not properly addressed in current pipeline safety regulations, leaving such pipelines basically unregulated in many critically important areas. While the DEIR attempts to address certain environmental impacts related to the Project, the real issue relates to pipeline safety and the possible impact to public safety. The DEIR is incomplete in this important area and needs to be supplemented with this missing information before this Project can move forward.

While not mentioned in the DEIR, at the expected pressures and temperatures of the proposed Project's pipelines, I would anticipate the Project's pipelines to be operated in either liquid CO_2 or supercritical CO_2 phases, with the phases changing somewhat with time depending on the temperature of the buried pipelines. Whether a pipeline segment is liquid or supercritical phase at the time of rupture affects the expected phase change occurring at the rupture site, the rate of release, the tonnage that will be released between closed valves, and expected buffer impact zones.

D. The California OSFM is limited in what pipeline safety regulations it can enforce for intrastate liquid carbon dioxide transportation pipelines.

Despite the best of recent intentions to enact improvements in carbon dioxide pipeline safety regulations within California, the California Legislature has failed to pass meaningful improvements in pipeline safety regulations as it applies to intrastate carbon dioxide pipelines. Without such new legislation, the California OSFM can only implement and enforce pipeline safety regulations for intrastate CO_2 liquid pipelines within the state as codified in federal minimum pipeline safety regulations (49CFR§195) intended for liquid transportation pipelines. Based on my extensive experience in California liquid pipeline operation and many pipeline investigations within the state, it is my understanding that the OSFM can only enforce federal pipeline safety regulations for CO_2 liquid pipelines codified in current federal regulations.

Federal regulations for carbon dioxide pipelines are currently woefully inadequate as discussed in more detail in my recently referenced March 23, 2022 CO_2 public paper. In addition, announcements by PHMSA to move forward with carbon dioxide safety regulations may miss many of the safety issues and concerns related to carbon dioxide liquid pipelines

which can take some time to properly address, given the highly unusual restrictive regulatory process imposed on PHMSA.[10]

E. The DEIR attempts to minimize the impact of the Satartia rupture on the public.

Some additional information might be helpful to add to the February 22, 2020 Satartia, MS 24-inch pipeline rupture discussion in the DEIR.[11] Depending on the density one assumes in the pipeline, the rupture released 3,000 to 5,000 tons of carbon dioxide after the mainline valves were eventually closed on the 24-inch pipeline, which took considerable time to isolate the ruptured segment**.** The CO_2 plume went beyond the Town of Satartia, crossing the Yazoo River, extending well over a mile from the pipeline release site which was basically downhill from the rupture releasing heavier than air CO_2. The DEIR fails to mention that the Town of Satartia was not identified as a high consequence area in the pipeline operator's integrity management program and the air dispersion model was unfit for the 24-inch pipeline. The high rain situations and steep terrain should not come as a surprise in this challenging location, and the wording in the DEIR appears to try to downplay that the rupture threat was a unique situation in that area of Mississippi. PHMSA's corrective action order requiring review of geohazard potential along the pipeline should dispel any illusion that breakaway landslide was an unusual threat. Despite the release of a PHMSA Advisory following the Satartia rupture, PHMSA knows that there have been pipeline regulations in effect for many decades that place the responsibility on the pipeline operator to monitor their pipeline right-of-way for signs of possible abnormal loading such as massive landslide potential (what is known in the industry as a breakaway landslide threat) that can easily result in pipeline rupture.[12]

F. Well Blowout prevention and Aliso Canyon similarities.

While not a specific pipeline associated matter, I have an ethical responsibility to note that the DEIR does not address the possibility of a CO_2 injection well blowout on any of the six proposed CO_2 injection wells. In late 2015, California was associated with an underground natural gas storage well blowout, the Aliso Canyon failure, that released well over 100,000 tons of natural gas which is normally lighter than air as compared to CO_2 which is heavier than air. The Aliso Canyon failure demonstrated to the public some of the risk of large high pressure underground storage reservoirs. I would advise that the Project incorporate some form of well blowout prevention design to prevent release of massive quantities of heavier than air CO_2 from the underground reservoirs should an injection well experience a blowout. The safety design should incorporate an approach with prudent independent safeties to assure that the installation will actually work and stop the release of CO_2 from the high-pressure reservoir if a well blowout occurs. Without getting into specific design issues, there are various ways to approach this possible threat, such as incorporating an automatic subservice safety valve as a blowout preventor on each injection well. The tonnage of CO_2 released from a well blowout

[10] "PHMSA Announces New Safety Measures to Protect Americans From Carbon Dioxide Pipeline Failures After Satartia, MS Leak," May 26, 2022 at PHMSA website: https://www.phmsa.dot.gov/news/phmsa-announces-new-safety-measures-protect-americans-carbon-dioxide-pipeline-failures.
[11] DEIR, Volume 1, pp. 4.9-8 & 4.9-9.
[12] PHMSA updated ADB-2022-01, "Pipeline Safety: Potential for Damage to Pipeline Facilities Caused by Earth Movement and Other Geological Hazards," June 2, 2022.

can easily exceed, by many orders of magnitude, the tonnage of CO_2 released from a pipeline rupture. As history has often demonstrated, well blowouts can release many thousands of tons from essentially an infinite supple of CO_2 in the reservoir, easily surpassing pipeline rupture releases.

G. Background/Experience.

Accufacts was asked to review the DEIR for the Project recently released in December 2023.[13] I have over fifty years of experience in the energy industry, including almost 25 years as president of Accufacts Inc. ("Accufacts"). Accufacts provides independent expert consulting services to assist decision makers in making informed decisions concerning pipelines. Pipeline safety expertise is provided in areas including, but not limited to; pipeline failure investigation, risk management, siting, construction, design, operation, maintenance, training, control room management including Supervisory Control and Data Acquisition ("SCADA") approaches, leak/rupture detection, integrity management, emergency response, and pipeline safety regulatory development and compliance. Much of my background is grounded in pipeline incident investigations following numerous pipeline rupture tragedies spanning several decades.

For the past two decades I have been involved as a representative of the public, which carries special obligations to avoid a conflict of interest, in advancing pipeline safety regulations at the federal and various state levels as demonstrated by my CV. For example, I played a significant role representing the public in developing integrity management federal pipeline safety regulations in the early 2000s for both liquid and gas transmission pipelines. These regulatory approaches emulated a safety process approach that I instituted and developed for the City of Bellingham, WA. This process, identified as the Safety Immediate Action Plan, or SIAP, identified steps that the pipeline operator was to complete following the Bellingham rupture tragedy of June 10, 1999, before that pipeline could be permitted to be returned to service.

H. Conclusion.

The DEIR is seriously incomplete and deficient in many areas as discussed above. These deficiencies need to be properly addressed before a DEIR can be deemed complete and sufficient for the Project to move forward. It is my understanding that the County can require that such critical information related to pipeline safety and CO_2 pipelines can be ordered to be provided, or supplemented, before this Project can be allowed to move forward.

Attachment A
to Technical Comments of Richard Kuprewicz:
Qualifications and Experience

Curriculum Vitae.

Richard B. Kuprewicz

8151 164th Ave NE
Redmond, WA 98052

Tel: 425-802-1200 (Office)
E-mail: kuprewicz@comcast.net

Profile:

As president of Accufacts Inc., I specialize in gas and liquid pipeline investigation, auditing, risk management, siting, construction, design, operation, maintenance, training, SCADA, leak detection, management review, emergency response, and regulatory development and compliance. I have consulted for various local, state and federal agencies, NGOs, the public, and pipeline industry members on pipeline regulation, operation and design, with particular emphasis on operation in unusually sensitive areas of high population density or environmental sensitivity.

Employment:

Accufacts Inc. **1999 – Present**

Pipeline regulatory advisor, incident investigator, and expert witness on all matters related to gas and liquid pipeline siting, design, operation, maintenance, risk analysis, and management.

Position: President
Duties:
> Full business responsibility
> Technical Expert

Alaska Anvil Inc. **1993 – 1999**

Engineering, procurement, and construction (EPC) oversight for various clients on oil production facilities, refining, and transportation pipeline design/operations in Alaska.

Position: Process Team Leader
Duties:
> Led process engineers group
> Review process designs
> Perform hazard analysis
> HAZOP Team leader
> Assure regulatory compliance in pipeline and process safety management

ARCO Transportation Alaska, Inc. **1991 - 1993**

Oversight of Trans Alaska Pipeline System (TAPS) and other Alaska pipeline assets for Arco after the Exxon Valdez event.

Position: Senior Technical Advisor
Duties:
> Access to all Alaska operations with partial Arco ownership
> Review, analysis of major Alaska pipeline projects

ARCO Transportation Co. **1989 – 1991**

Responsible for strategic planning, design, government interface, and construction of new gas pipeline projects, as well as gas pipeline acquisition/conversions.

Position: Manager Gas Pipeline Projects
Duties:
> Project management
> Oil pipeline conversion to gas transmission
> New distribution pipeline installation
> Full turnkey responsibility for new gas transmission pipeline, including FERC filing

Four Corners Pipeline Co. **1985 – 1989**

Managed operations of crude oil and product pipelines/terminals/berths/tank farms operating in western U.S., including regulatory compliance, emergency and spill response, and telecommunications and SCADA organizations supporting operations.

Position: Vice President and Manager of Operations
Duties:
> Full operational responsibility
> Major ship berth operations
> New acquisitions
> Several thousand miles of common carrier and private pipelines

Arco Product CQC Kiln **1985**

Operations manager of new plant acquisition, including major cogeneration power generation, with full profit center responsibility.

Position: Plant Manager
Duties:
> Team building of new facility that had been failing
> Plant design modifications and troubleshooting
> Setting expense and capital budgets, including key gas supply negotiations
> Modification of steam plant, power generation, and environmental controls

Arco Products Co. **1981 - 1985**

Operated Refined Product Blending, Storage and Handling Tank Farms, as well as Utility and Waste Water Treatment Operations for the third largest refinery on the west coast.

Position: Operations Manager of Process Services
Duties:
> Modernize refinery utilities and storage/blending operations
> Develop hydrocarbon product blends, including RFGs
> Modification of steam plants, power generation, and environmental controls
> Coordinate new major cogeneration installation, 400 MW plus

Arco Products Co. **1977 - 1981**

Coordinated short and long-range operational and capital planning, and major expansion for two west coast refineries.

Position: Manager of Refinery Planning and Evaluation
Duties:
> Establish monthly refinery volumetric plans
> Develop 5-year refinery long range plans
> Perform economic analysis for refinery enhancements
> Issue authorization for capital/expense major expenditures

Arco Products Co. **1973 - 1977**

Operating Supervisor and Process Engineer for various major refinery complexes.

Position: Operations Supervisor/Process Engineer
Duties:
> FCC Complex Supervisor
> Hydrocracker Complex Supervisor
> Process engineer throughout major integrated refinery improving process yield and energy efficiency

Qualifications:

Served for over fifteen years as a member representing the public on the federal Technical Hazardous Liquid Pipeline Safety Standards Committee (THLPSSC), a technical committee established by Congress to advise PHMSA on pipeline safety regulations.

Committee members are appointed by the Secretary of Transportation.

Served seven years, including position as its chairman, on the Washington State Citizens Committee on Pipeline Safety (CCOPS).

Positions are appointed by the governor of the state to advise federal, state, and local governments on regulatory matters related to pipeline safety, routing, construction, operation and maintenance.

Served on Executive subcommittee advising Congress and PHMSA on a report that culminated in new federal rules concerning Distribution Integrity Management Program (DIMP) gas distribution pipeline safety regulations.

As a representative of the public, advised the Office of Pipeline Safety on proposed new liquid and gas transmission pipeline integrity management rulemaking following the pipeline tragedies in Bellingham, Washington (1999) and Carlsbad, New Mexico (2000).

Member of Control Room Management committee assisting PHMSA on development of pipeline safety Control Room Management (CRM) regulations.

Certified and experienced HAZOP Team Leader associated with process safety management and application.

Education:

MBA (1976)	Pepperdine University, Los Angeles, CA
BS Chemical Engineering (1973)	University of California, Davis, CA
BS Chemistry (1973)	University of California, Davis, CA

PHMSA's Proposed Rule on Safety of Gas Transmission and Gathering Pipelines," prepared for Pipeline Safety Trust by Richard B. Kuprewicz, dated May 16, 2016.

53. Accufacts' Report on Atmos Energy Corporation ("Atmos") filing to the Mississippi Public Utilities Staff, "Accufacts Review of Atmos Spending Proposal 2017 – 2021 (Docket N. 2015-UN-049)," prepared by Richard B. Kuprewicz, dated August 15, 2016.

54. Accufacts Report, "Accufacts Review of the U.S. Army Corps of Engineers (USACE) Environmental Assessment (EA) for the Dakota Access Pipeline ("DAPL")," prepared for Earthjustice by Richard B. Kuprewicz, dated October 28, 2016.

55. Accufacts' Report on Mariner East 2 Expansion Project Affecting West Goshen Township, dated January 6, 2017, to Township Manager of West Goshen Township, PA, and prepared by Richard B. Kuprewicz.

56. Accufacts Review of Puget Sound Energy's Energize Eastside Transmission project along Olympic Pipe Line's two petroleum pipelines crossing the City of Newcastle, for the City of Newcastle, WA, June 20, 2017.

57. Accufacts Review of the Draft Environmental Impact Statement for the Line 3 Pipeline Project Prepared for the Minnesota Department of Commerce, July 9, 2017, filed on behalf of Friends of the Headwaters, to Minnesota State Department of Commerce for Docket Nos. CN-14-916 & PPL-15-137.

58. Testimony of Richard B. Kuprewicz, president of Accufacts Inc., in the matter West Goshen Township and Concerned Citizens of West Goshen Township v. Sunoco Pipelines, L.P. before the Pennsylvania Public Utilities Commission, Docket No. C-2017-2589346, on July 18, 2017, on Behalf of West Goshen Township and Concerned Citizens of West Goshen Township.

59. Direct Testimony of Richard B. Kuprewicz, president of Accufacts Inc., on Behalf of Friends of the Headwaters regarding Enbridge Energy, Limited Partnership proposal to replace and reroute an existing Line 3 to the Minnesota Office of Administrative Hearings for the Minnesota Public Utilities Commission (MPUC PL-9/CN-14-916 and MPUC PL-9/PPL-15-137), September 11, 2017 and October 23, 2017.

60. Direct Testimony of Richard B. Kuprewicz On Behalf of The District of Columbia Government, before the Public Service Commission of the District of Columbia, in the matter of the merger of AltaGas Ltd. and WGL Holdings, Inc., Formal Case No. 1142, September 29, 2017.

61. Report to Mississippi Public Utilities Staff ("MPUS"), "Accufacts Review on Atmos Energy Corporation's Proposed Capital Budget for Fiscal Year 2018 related to System Integrity Program Spending (Docket N. 2015-UN-049)," prepared by Richard B. Kuprewicz, dated December 4, 2017.

62. Report to Hugh A. Donaghue, Esquire, Concord Township Solicitor, "Accufacts Comments on Adelphia Project Application to FERC (Docket No. CP18-46-000) as it might impact Concord Township," dated May 30, 2018.

63. Report to Mississippi Public Utilities Staff ("MPUS"), "Accufacts Review on Atmos Energy Corporation's Proposed Capital Budget for Fiscal Year 2019 related to System Integrity Program Spending (Docket N. 2015-UN-049)," prepared by Richard B. Kuprewicz, dated August 20, 2018.

64. Report to West Goshen Township Manager, PA, "Accufacts report on the repurposing of an existing 12-inch Sunoco pipeline segment to interconnect with the Mariner East 2 and Mariner East 2X crossing West Goshen Township," dated November 8, 2018.

65. Report to West Whiteland Township Manager, PA, "Accufacts Observations on Possible Pennsylvania State Pipeline Safety Regulations," prepared by Richard B. Kuprewicz, dated March 22, 2019.

66. Accufacts Public Comments on the Proposed Joint Settlement, BI&E v. Sunoco Pipeline L.P. ("SPLP"), Docket No. C-2018-3006534 ("Proposed Settlement"), submitted on August 15, 2019 to the Pennsylvania Public Utility Commission on the behalf of West Goshen Township as an intervener.

67. Report to West Whiteland Township Manager, Ms. Mimi Gleason, "Accufacts Perspective on Two Questions from West Whiteland's Board of Supervisors on Proposed Changes to ME 2 and ME 2X Construction/Operational Activities within West Whiteland," dated September 5, 2019."

68. Report to West Goshen Township Manager, Mr. Casey LaLonde, “Accufacts Report on the episode on the evening of 8-5-19 at the Mariner East Boot Road Pump Station (“Event”), Boot Road, West Goshen Township, PA,” dated September 16, 2019.

69. Provided direct testimony before the Arizona Corporation Commission, In the Matter of the Application of Southwest Gas Corporation for the Establishment of Just and Reasonable Rates and Charges Designed to Realize a Reasonable Rate of Return on Fair Value of the Properties of Southwest Gas Corporation Devoted to its Arizona Operations (Docket No. G-01551A-19-0055), testified on behalf of Utilities Division Arizona Corporation Commission, February 19, 2020.

70. Report to West Goshen Township Manager, Mr. Casey LaLonde, “Accufacts Report on the Mariner East 2X Pipeline Affecting West Goshen Township,” dated July 23, 2020.

71. Assisted the Commonwealth of Massachusetts, Office of the Attorney General in developing pipeline safety processes to be incorporated into the settlement agreement related to Columbia Gas’ sale of Assets to Eversource following the Merrimack Valley, Massachusetts overpressure event of September 13, 2018.

72. Report to Natural Resources Defense Council, Inc., “Accufacts’ Observations on the Use of Keystone XL Pipeline Pipe Exhibiting External Coating Deterioration Issues from Long Term Storage Exposure to the Elements,” October 1, 2020.

73. Report to Pennsylvania Public Utilities Commission (“PAPUC”), “Accufacts Comments on Proposed Pennsylvania Intrastate Liquid Pipeline Safety Regulations,” dated October 29, 2021, prepared for West Whiteland Township Board of Supervisors, West Whiteland Township, PA. Filed to PAPUC public web docket November 5, 2021 by West Whiteland Township under Reference Docket Number L-2019-3010267. Addresses suggested improvements in proposed pipeline safety rules for PA intrastate liquid transmission pipelines.

74. Submitted written testimony of Richard B. Kuprewicz on Behalf of Bay Mills Indian Community to ALJ Dennis Mack, dated December 14, 2021, in the matter of the Application of Enbridge Energy, Limited Partnership for Authority to Replace and Relocate the Segment of Line 5 Crossing the Straits of Mackinac into a Tunnel Beneath the Straits of Mackinac, before the State of Michigan Public Service Commission, U-20763.

75. Public presentation to New York State Indian Point Nuclear Facility Decommissioning Oversight Board on Holtec removal activities in proximity to Enbridge three Natural Gas Transmission Pipelines, March 17, 2022.

76. Report to Pipeline Safety Trust and Bold Alliance, “Accufacts’ Perspectives on the State of Federal Carbon Dioxide Transmission Pipeline Safety Regulations as it Relates to Carbon Capture, Utilization, and Sequestration within the U.S.,” March 23, 2022.

77. Accufacts Inc., Public Presentation For the National Academies of Science Engineering Medicine and The Transportation Research Board, “To Committee on Criteria for Installing Automatic and Remote-Controlled Shutoff Valves on Existing Gas and Hazardous Liquid Transmission Pipelines,” 4/27/22.

78. Accufacts Inc, “6/13/22 Webinar to Illinois Emergency Responders, Healthcare Providers, & Local Officials on Responses to CO_2 Transmission Pipeline Releases,“ 6/13/22.

79. Accufacts Report for Pipeline Safety Trust, “Safety of Hydrogen Transportation by Gas Pipelines,” 11/28/22.

80. Completed a series of testimonies related to Enbridge’s Line 5 proposal to replace 2 – 20-inch diameter existing submerged pipelines currently lying across the bottom of the Straits of Mackinac with a 30-inch diameter grade X-70 pipeline, proposed to be installed in a 21-foot diameter concrete tunnel to be installed across the approximate 4 mile span of the Straits of Mackinac. Testified on Behalf of the Bay Mill Indian Community before the State of Michigan Public Service Commission, Docket U-20763, in opposition to this very poorly designed proposal/installation allowing for movement of the pipeline on rollers within the tunnel. Final testimony to the docket submitted May 19, 2023. This is the only pipeline proposal I am aware of in the world that would place a crude oil and liquid propane pipeline, especially a 30-inch diameter pipeline, within a tunnel.

81. Issued to Ms. Niroop Srivatsa, City Manager, “Accufacts Report for the City of Lafayette on the Status of the Tree Assessment Process with PG&E,” indicating most of the trees identified for removal by PG&E risk management

approach have nothing to do with gas pipeline safety, June 15, 2023.

82. Issued Direct Testimony to Illinois Commerce Commission (“ICC”) on the Navigator Heartland Greenway LLC Application for a Carbon Dioxide Transportation and Sequestration pipeline, under Docket 23-0161, on behalf of Citizens Against Heartland Pipeline (“CAHGP”), McDonough County, Christian County and Hancock County (the “Counties”) (jointly, “Citizen and County Intervenors” of “CCI”), raising serious questions as to PHMSA’s recent assertions of pipeline safety jurisdiction, and underscoring the ICC’s authority for pipeline siting jurisdiction of said pipeline proposal in the State of Illinois, filed June15, 2023.

Subject: LULAC Council 3272 Comments on the Carbon Terra Vault Project

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

As President of the Kern County LULAC, Council 3272, our organization stands in support of California Resources Corporation (CRC) proposed Carbon Terra Vault Project. LULAC Council 3272 continues to be committed to our Mission of advancing opportunities that benefit our community through jobs, economic conditions, health, and education. This project aligns perfectly with our Mission. LULAC Kern County Council 3272 stands in support of the CRC Carbon Terra Vault Project which not only will reduce carbon emissions but will also create technical high paying jobs that will benefit disadvantaged communities in Kern County.

Subject: Support note for Elk Hills CCS Project
Date: Monday, March 18, 2024 9:47:06 AM

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

I write this note in support of CTV's CCS project at Elk Hills.

California has very ambitious GHG reduction goals, and CCS is an important technology that is needed to get to net-zero in California. CCS is a proven technology. As of November 2023, there were 41 operational CCS projects across the globe with a total capture capacity of 49 million tonnes of CO2 per year. These projects capture and store safely emissions from power plants, oil refineries, natural gas processing plants, and industrial facilities making iron, steel, cement, hydrogen, ammonia, fertilizer and other chemicals. The earliest capture project came online in 1972. Since then, well over 200 million tonnes of CO2 has been captured and safely stored in deep geologic formations.

The Elk Hills project contains many elements making it optimally-suited to be the first CCS project in the State of California. It has the proper geology for permanent storage of CO2, including a deep reservoir with sufficient injectivity and capacity and an impermeable top seal. It is not near any Quaternary faults or adjacent to locations with recent seismicity. It is also not near any large population centers. The carbon capture will be done at facilities on site, negating the need for construction of a CO2 pipeline.

Kern County has some of the worst air quality in the state. Emerging modeling suggests that CCS will not worsen air quality and, in fact, it has the potential to do the opposite. During capture, chemical scrubbers strip the CO_2 from the gasses that would otherwise be emitted. The Clean Air Task Force found that carbon capture retrofits reduce particulate emissions by >90% and nearly eliminate sulfur emissions that are responsible for acid rain. The Great Plains Institute, and others, went a step further and modeled the positive health benefits and the economic value of copollutant removal. Both studies included the small additional emissions associated with running the capture facility.

CCS is a vital tool available today to tackle the carbon dioxide emissions that drive climate change without degrading the local environment or threatening health. The Elk Hills project meets the criteria to be the first CCS project for the State of California.

Sincerely,
Sarah Saltzer

Subject: ***Reject*** Carbon TerraVault I carbon capture and storage scheme
Date: Friday, February 23, 2024 4:02:02 PM

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will ***prolong*** the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have ***consistently*** over-promised and under-delivered, but oil companies are promoting this *flawed* technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition ***off*** fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes ****threaten**** the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses ***other serious*** safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's ****fragile**** water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where ****water is already limited**** is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Subject: A Liability in the Making: Reject Carbon TerraVault I carbon capture & storage scheme
Date: Friday, February 23, 2024 7:50:42 PM

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

My family spent several days visiting the Carrizo Plain and Antelope Valley last spring to experience California's intoxicating wildflower display. Enroute we passed miles upon miles of toxic oil and gas derricks, where a noxious haze stung our eyes, burned our throats, and obscured the mountain vistas. It was late the night we headed home, and it would have been so easy to overnight in Kern County and inject some of our tourist dollars into your economy. Instead, we drove through the night to sleep in our own beds in Ventura County -- because we didn't want to drink your water or breathe your air for one minute more than we had to. The fossil fuel era is coming to an end, and building carbon capture infrastructure is a short-sighted mistake that will saddle your area with yet more expensive, stranded assets; if you are wise, you will start diversifying Kern County's economy now.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will only prolong your dependence on polluting fossil fuel operations and divert critical resources away from truly clean and affordable renewable energy. The project will threaten both public health and Kern County’s limited water supplies while doing nothing to protect your, and our, climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only exacerbate an already toxic situation, while driving dangerous impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region. The fossil fuel industry publicly promotes CCS as a "fledgling" technology that they’re scaling up; but CCS is a mature technology, not a new one. Way back in 1980, Imperial Oil (a subsidiary of Exxon) admitted, "Technology exists to remove CO2 from stack gases but removal of only 50% of the CO2 would double the cost of power generation." Only a year later, Exxon internally assessed the climate problem accurately: "The cost of scrubbing large quantities of CO2 from flue gases is exorbitant ... energy conservation or shifting to renewable energy sources, represent the only options that might make sense." ." Renewables are already cheaper than fossil fuels plus CCS; and they’re widening that gap every single day. Don’t be suckered into letting the industry make their problem your problem.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have “significant and unavoidable” impacts on air quality in an air basin that is already considered one of the most polluted in the entire country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death do an internet search for "Satartia gas leak" -- for which you could be held liable as society turns against enablers of the death and destruction resulting from intensifying fossil-fueled disasters.

The project also threatens Kern County’s fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of clean air and water, human health, climate stability, and Kern's future economic prospects, I urge you to reject this dangerous project.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

So-called Carbon capture doesn't really take carbon out of the environment, It merely moves it around. There is no good way to store carbon that will improve our current climate disaster.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already

overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Dear Mr. Alvidrez,

Please see attached for comments opposing the Elk Hills Carbon TerraVault I project. I am submitting them on behalf of 1406 Californians.

The comments in both files are the same, I'm just submitting in excel and csv formats, in case one or the other is more easily compatible with your systems.

Please let me know if you have any questions regarding the comment files.

Thank you,
Woody Little

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

I am begging you to care about OUR environment and health and that of other people. This is not safe nor healthy. Please please please stop this project. It will not work.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

A voter, a tax payer, a constituent,

Mary

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

I hope you're aware that the Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. It will also threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Projects like this have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

Posing serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions which will pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

To add to the litany of what's wrong, the project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

I urge you to reject this dangerous project for the sake of our air, water, health, and climate!!!

Kern County,

To the Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

I have heard about the Carbon TerraVault I Elk Hills carbon capture project. I have learned that projects of this sort are frequently unsafe and ineffective. Therefore, I believe this is a dangerous distraction that will prolong the life of polluting fossil fuel operations and divert critical resources away from truly clean, renewable energy. Moreover, the project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered. Carbon TerraVault I will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is

already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

There is no positive side to carbon capture and storage. It is just another false solution. It causes harm, rather than relief from harm.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

We know that it is the mining, transport, and burning of fossil fuels that drive the climate crisis. We know that Kern County is fast becoming a sacrifice zone. We understand that carbon capture is an unproven technology that bodes ill for future generations. This terrible environmental degradation must STOP!
The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

Carbon Capture and Storage, in all its manifestations and as-proposed for Kern County, is nothing more than a scam and a distraction from meaningful action on climate change. Deny another example of this cynical greenwashing scheme, which pays fossil fuel interests as they deceive societies into believing that CCS is an actual solution. It is not.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department,
and Dear EPA Region 9 Administrator Guzman,

“TerraVault” carbon-capture is a gimmick devised by floundering fossil fuel purveyors to keep dollars flowing to their companies. This kind of carbon capturing,, sequestering, and piping is ineffective and will require more expenditure of energy, more combustion of fuels, and more production of greenhouse gases than it could hope to “capture.”

This project will only introduce more hazards to our communities. Please quit trying to forestall the end of the fossil-fuel era.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County’s limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

We have a moral imperative to protect our air, water, health, and climate, I urge you to reject this dangerous project.

The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

I grew up in the Centrtl Valley and frequently visited Bakersfield, where so much petroleum pumping was going on--and still is.

I view the Carbon TerraVault I Elk Hills carbon capture project as dangerous to health of valley residents, because it will prolong the life of polluting fossil fuel operations while also taking away vital resources from clean and renewable energy sources. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

The problem with DACS is that it is techno-hopium; a wishful solution that is unproven at scale and economically not viable. But it sounds nice and therefore is a favorite strategy touted by fossil fuel companies to avoid rapid reductions in fossil fuel emissions. We need to cut our GHG emissions in half by 2030 according to the Intergovernmental Panel on Climate Change (IPCC) to have any hope of keeping the Paris stretch goal of 2 degrees in sight. DACS and CCS technologies allow the California Resources Corporation - a fossil fuel company - to say they care about our climate, while what they do is to continue to sell their proven assets in fossil fuels to generate record profits for their shareholders – at the expense of our climate. The oldest and best-known Direct Air Capture company – Switzerland-based Climeworks – has been building Direct Air Capture plants since 2017. The entire worldwide direct air capture capacity in 2022 was 2714 tons of CO2. Those are the annual emissions equivalent to 590 average US passenger cars, or the amount of CO2 the world emits in 2.3 seconds. And then there's the cost of DACS of $700 - $1100 per metric ton of CO2 captured. That cost – even if it were to come down substantially – is never going to compete with not burning fossil fuels. Climeworks CEO said last week that DACS cost by 2050 will likely still be $300-500 per ton of CO2 captured. Renewables (photovoltaic, on- and offshore wind plus storage) are far cheaper to build and operate compared the operation of even existing fossil fuel coal plants and fracked methane plants – even without considering the equity aspects of who suffers the worst consequences of continuing to burn fossil fuels. Proponents of carbon capture and storage will point to the fact that the IPCC's reports do call for carbon capture approaches as part of the solution to our gargantuan emissions problem. What the California DAC hub and its fossil fuel partners are conveniently leaving out, is that the IPCC envisions Direct Air Capture to remove at most a fraction of a gigaton of CO2 per year, and no earlier than 2050. The International Energy Agency (hardly known as a bastion of raging environmental concern) puts that number at less than 0.7 gigaton of CO2 per year or 1.4% of global annual GHG emissions. In other words, DACS will at best be a very expensive niche application that we might have to use for

truly hard-to-abate emissions in the second half of the century. If the California Resources Corporation wants to be responsive to the IPCC, they should scale down their production to meet the IPCC recommended 50% cuts in GHG emissions from the oil and gas they extract by 2030. Of course CRC does not want this; fossil companies favor carbon capture technologies as they offer a reasonable-sounding approach that underwrites a greenwashing narrative where fossil fuel companies can continue fossil fuel extraction under a business-as-usual scenario while appearing to be responsive and part of the solution to our climate crisis.

Vote as if the lives and livelihoods of your communities depend on this decision, because they are.

The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

CAUTION: This email originated from outside of the organization. Do not click links, open attachments, or provide information unless you recognize the sender and know the content is safe.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations in CA and divert our resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies continue to promote this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition away from fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquake risk, pipeline safety, and animal and plant species in the region.

The depleted oil field that CRC wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified further in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns, including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences, including asphyxiation, seizures, loss of consciousness, and even death.

Further, the project threatens Kern County's fragile water supply, since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should outright reject.

For the sake of our communities, our air, water, health, and climate, I urge you to stop this

dangerous project in its tracks.

Thank you.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

This is a project that over-promises benefits while manipulating a community that has other needs that should be addressed. Instead of supporting and restoring natural carbon sinks, like forests and wetlands, flashy newer technology is being sold to the community of Bakersfield, though the true benefits are not yet there. This technology has a long way to go. These companies are hoping the community won't see the clear flaws and therefore won't push back.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

Carbon capture and storage has not been proven to be effective at preventing emissions, making it a dangerous distraction from renewable energy sources which we know have very little to no greenhouse gas emissions. I am concerned about the impacts of climate change, from wildfires to drought to extreme storms, and I implore Kern County to reject fake and dangerous solutions and promote real solutions.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

I am deeply concerned about the proposed Carbon TerraVault I Elk Hills carbon capture project, which I believe presents a dangerous distraction from our urgent need to transition to clean, renewable energy sources. This project threatens to prolong the reliance on dirty fossil fuels while diverting vital resources away from sustainable solutions.

It is evident that carbon capture and storage (CCS) projects like Carbon TerraVault I have a history of over-promising and under-delivering, ultimately failing to address the root causes of climate change. Instead of investing in genuine solutions, oil companies are pushing flawed technologies that serve their interests at the expense of our environment and public health.

The deployment of outdated and costly CCS technology, as proposed in this project, will only delay our shift away from fossil fuels. Moreover, the use of a depleted oil field for carbon storage poses significant risks, particularly in a seismically active region like Kern County. The potential for leaks and other safety hazards threatens the well-being of local communities and ecosystems.

The draft Environmental Impact Report highlights unavoidable consequences on air quality, further burdening already vulnerable communities with pollution-related health risks. Additionally, the project's proximity to McKittrick Elementary School raises alarming concerns about safety, especially considering the potential dangers associated with carbon dioxide leaks.

Furthermore, the project's reliance on already strained water resources poses a grave risk to Kern County's water supply, exacerbating existing challenges of groundwater depletion.

In light of these concerns, I urge you to reject the Carbon TerraVault I project to safeguard our air, water, health, and climate.

Sincerely,
Bella Bertaud

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

Kern County Planning and Natural Resources Department,

Dear Kern County Planning and Natural Resources Department,

I'm writing as a health researcher and a California parent to urge you to reject the Carbon TerraVault I Elk Hills carbon capture project. This effort is a dangerous distraction that will prolong the life of fossil fuel operations and divert critical resources away from renewable energy that would improve air quality in Kern County and beyond. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, earthquakes, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities, Latine, and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and even death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our communities, our air, water, health, and climate, I urge you to reject this dangerous project.

Thank you.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

I am a grandfather, within the past year, and this is a huge motivation for me to act against climate change.

I know that Carbon Capture is touted as a means of resolving the climate crisis. Sadly, I know that this technology has shown very little promise and amounts to a sham PR stunt to distract the public from concern about the use of fossil fuels.

The Carbon TerraVault I Elk Hills carbon capture project is an example: it is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

I don't like form letters because I imagine the recipients won't deemed them as meaningful as an original letter.
However, this letter contains all the relevant data that you need to consider.
What more could I add to this discussion than what is already presented here.
You need to pay attention to all the letters you receive whether an original or a form letter.
This letter does address my concerns on this issue.
I hope you will give it the weight that it deserves.

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

Kern County,

Dear Kern County Planning and Natural Resources Department and EPA Region 9 Administrator Guzman,

The Carbon TerraVault I Elk Hills carbon capture project is a dangerous distraction that will prolong the life of dirty fossil fuel operations and divert critical resources away from truly clean, renewable energy. The project will threaten public health and Kern County's limited water supplies while doing nothing to protect our climate.

Carbon capture and storage (CCS) projects have consistently over-promised and under-delivered, but oil companies are promoting this flawed technology to keep themselves in business. Carbon TerraVault I is no exception: The project will deploy expensive and failed CCS technology that will only serve to delay our transition off fossil fuels, while leading to harmful impacts to air, climate, water, health and safety, seismicity, pipeline safety, and animal and plant species in the region.

For example, the depleted oil field that California Resources Corporation wants to use to store the carbon dioxide has hundreds of old drilling sites that have not been properly sealed, which increases the risk of dangerous leaks from the storage site. These risks are amplified in a seismically active region like Kern County, where frequent earthquakes threaten the safe storage of carbon.

According to its draft Environmental Impact Report, the project will also have "significant and unavoidable" impacts on air quality in an air basin that is already considered one of the most polluted in the country. Low-income communities and communities of color, who are already bearing the brunt of environmental injustice, will once again pay the price with their health and safety.

The project poses other serious safety concerns including over 13 miles of pipeline to transport carbon dioxide, portions of which pass dangerously close to McKittrick Elementary School. Carbon dioxide leaks can have devastating consequences including asphyxiation, seizures, loss of consciousness, and potentially death.

The project also threatens Kern County's fragile water supply since it will rely on an already overdrafted water source. Compromising groundwater supply in a County where water is already limited is an impermissible risk that your agency should reject.

For the sake of our air, water, health, and climate, I urge you to reject this dangerous project.
